The Barbadians, or "Bims" as they are sometimes termed, are often laughed at by the inhabitants of the other West India islands for their patriotic devotion to their island but they have good grounds for pride in themselves and in their little spot of earth, for though in size and scenery it can claim no pre-eminence, its history is second in interest to that of hardly any other colony, and affords many striking pictures of loyalty, pluck and energy, often displayed under circumstances of much peril and difficulty.

Then follow some 11 pages of past history, which we skip in order to get at the more interesting parts:—

Having only a few hours to spend in the island we could not hope for more than a cursory glimpse of it. It was with great pleasure we availed ourselves of the kind invitation of the Governor and Lady Hay to accompany them on an expedition by special train to the south west of the island, which as the railroad runs right across, would give us an opportunity of getting a general impression of its characteristics. The capital, Bridgetown, is clean and picturesque, no sleepy worn-out place, with weed-choked streets and lazy inhabitants, such as West Indian towns are sometimes depicted. The shops are commodious and well stocked, the hum of business is on all sides. Tram-cars run along the principal streets, which are thronged with busy, chattering crowds of men, women and children; unkempt donkeys, carrying great loads, and drays of sugar, picturesque with many mules that form the team, the drivers cracking very formidable-looking whips. The women are mostly dressed in white, their heads being bound in white handkerchiefs very becoming to their dark skins. The houses are small and low, but generally neat, and altogether the town has a thriving, contented appearance. We passed a tavern with pink walls, on which were depicted sprays of inebriated looking roses; it bore the name of the "Rose of Devon," and the petition in large letters to "Heave to."

The suburbs of Bridgetown, through which the railway runs, are not prepossessing. The houses are so small that they resemble sentry boxes more than habitations, and are many of them in a very tumble-down condition; they are crowded closely together, and the fences and yards look shattering and neglected. Evidently the inhabitants have little cash, time or inclination to bestow on such minor matters as repairing or adorning their dwellings. Barbados is more thickly populated per acre than any other spot of earth, not excluding China. The negroes have there to encounter the hard struggle for existence from which their brethren in the other islands are exempt, and in consequence are hard working as the sternest of political economists would desire. But the island is small, the population very large, the profits from sugar cultivation are diminishing and wages consequently are low. Barbados has all her eggs in one basket, and one cannot help wondering, when hearing of diseased cane and falling-markets, what would become of the place should any number of the estates be "thrown up." Barbados altogether gives one a different impression from that one usually expects from a West Indian island. It is not

"A place for idle eyes and ears,
A cobwebbed nook of dreams."

No land in which to eat the Lotos, and gather fruit that one has not shown; man and beast must there work their hardest, the struggle for existence is in full swing. "Little England" is

"A land of settled government,
A land of just and old renown
Where freedom broadens slowly down
From precedent to precedent."

She may e'er long have the problem before her that is pressing unpleasantly close on Old England, what is to be done with a population which, should industry cease to pay, is superabundant. It is earnestly to be hoped the leading men in the island will endeavour to find a solution to the question before it is asked by a starving population for whom no work can be found.

The interior of the island is decidedly ugly and monotonous. In all directions stretch cane-pieces, with here and there, patches of sweet potatoes, yams or guinea-corn. There are no fences; occasionally come small clumps of mahogany trees of no great size, or a line of tall, slender cabbage-palms by a road-side, looking like so many green-headed mops. Hardly a flower is to be seen, every weed is turned up and hoed into the fields as manure. In one cane-piece we saw a white overseer, mounted on a sorry nag, superintending a gang of negroes. He wore a mask over the lower part of his face. We inquired the reason, and were informed that it is "the custom in the island," a custom which has probably arisen from the fact that when white people work in the fields exposed to the sun, their lips are apt to blister, and after a time to fall away from the teeth, the face becoming scarred as if from a burn. The manual labour on the estates is all done by negroes. They are divided into three gangs. The first consist of able-bodied men who each receive 10d a day; the second gang is composed of women who are paid 8d or 9d a day; in the third gang are all the children who do light work such as weeding, for which they are paid 3d to 6d a head. These wages are not high,—accordingly to ideas in England, they are ridiculously low,—but as things are in the tropics, they are sufficient to enable the negroes to live, to multiply contentedly, and though many of them would gain double or treble if they would emigrate to the other islands, their devotion to Barbados is like that of the Irish to Ireland previous to 1848, and they will not consent to seek work elsewhere. If the life of the labourer in Barbados is one of effort, that of the animals on the estates, must be one of nearly constant suffering, for all we saw looked more than half-starved. It was pitiful to see the small stunted oxen, looking almost like anatomical specimens, toiling painfully, many of them lame, dragging their heavy loads through the cane-pieces. When the weary work is over there are no refreshing pastures into which to turn them, only pens (in the English not the Jamaican sense) in ploughed up fields, where cane tops are flung to them as scanty nourishment. We passed some of the old estate "Great Houses," two-storied and substantially built. They had no gardens, the canes came close under the windows, and the "works" were hard by.

It was not till we reached the southern shore that we realized that Barbados has a claim to her share of the heritage of beauty that is the birthright of the West Indies. The coast-line rose so as to form cliffs of a considerable height, the dazzling white surf beating on a creamy coral strand at their feet, head-land stretched beyond head-land till they melted away in the blue hazy distance. The glossy foliage of manchineel trees growing luxuriantly on the shore; the green picturesque forms and beautiful colours of the sea-grapes that stretched their fine boughs towards the waves, as if to invigorate their copper-coloured and red-veined green leaves in the refreshing spray; while high over them towered the coconut palms, giving a tropical look to the scenery that hitherto has been absent. An oily substance was pointed out to us floating on the waves; this was petroleum. The rocks along the coast are coated with it, as it trickles down the cliffs. The hill form-

ing one of the highest of these cliffs still bears the name of Burnt Hill; its baked red earth is sometimes brought into Bridgetown and used for making walks and paths. This hill is said to have been found burning by the early English settlers, and so remained till it burnt itself out. The tradition is that it was set on fire by the Caribs, possibly by those who came hog-hunting from St. Vincent. At present no attempt is made to work the petroleum, which perhaps may ultimately prove a much-needed second string to the Barbadian bow.

We got out of the train—which literally drew up at the door of a sea-side lodge called "Quamine's." Long ago an old freed slave called QUAMINE had built a shanty there, and his name is kept green by the present comfortable little fishing lodge. The coast abounds in fish of all sorts and hues. There was a stage in the surf on which a fisher could sit at ease and fish in a deep pool beyond it for grunt, snapper, parrot fish, mullet; and fish of unknown names, wonderful shapes and indescribably vivid and beautiful colours. Outside the coral reef, in the deep ocean, is where the flying-fish are taken. To capture these the sea has to be "scented" with the previous day's catch, then a line is thrown out by a fisherman and as soon as he has hooked a flying-fish, it is fastened through a small aperture in the bottom of a shallow net some three or four feet in diameter. This is placed alongside the boat and in come the fish rushing headlong after their companion, and are forthwith ladled into the boat. Flying-fish are rather dry, but taste somewhat like smelts, the roes fried is a favourite dish with Barbadian epicures. As we walked down to the beach we passed a group of copper-coloured men and stopped to speak to them. They belonged to the class known in the island as "Red-legs." Though almost resembling Red Indians in colour, they are white men by race and have not mixed with the coloured population. The fierce sun of the tropics has burnt them to the hue of bricks, but the young children are quite fair-skinned. They are the poorest of the poor, eking out a scanty livelihood as fishermen; the white race cannot do hard work in the fields and survive long, they have no land or means of obtaining any, consequently their only resource is fishing. The name "Red-legs" is said to have originated in CROMWELL'S time, when his English soldiers seeing northern men advancing against them clad in kilts, called out in derision "Here come the Red-legs." * * * *

The possibilities that surround the ancestors of the "Red-legs" invest the poor people with a particular interest, though of course, the origin of many of them may be anything but romantic as now-a-days the white fishermen are all called "Red-legs." Those we saw had Scotch names and all they knew of their history was that their ancestors had come from Scotland. They were tall, well-made men, but they appeared dull and spiritless, and I was struck by the listless and cramped expression of their countenances. They seemed men who had small interest in their surroundings, and little hope in life.

Our day in Barbados was drawing to a close. It was time to return to catch the steamer, so we turned with regret from a search on the tempting beach for the tiny green shells found there sometimes in abundance and took our places in the funny little train, the lines of which curve along often in unpleasantly close proximity to the edge of the cliffs. On our way back we noticed a large building surrounded by a wall. It was the prison. This stands in a district called St. Michael's, most probably what was the St. Michael's Town of former days.

Our ship was just ready to get under weigh, as we went on board. The tropic sun was sinking serenely into its ocean bed, and as we steamed westwards to the far more lovely island of our destination and watched "Little England" fading away in the distance, we heartily wished it "good-luck," and felt we should always retain a feeling of interest in the fortunes for "weal or woe" of the island whose soil has a certain sacredness on account of the sufferings and surviving of so many of our countrymen who toiled and pined and died in "Far Barbados on the Western Main."

PARASITE AGAINST PARASITE.

WHAT LADYBIRD BEETLES ARE DOING.

During recent years many workers have been studying to good purpose, so far as the agriculturist is concerned, the often curious relationship of one insect to another, or perhaps of a plant to an insect. However small it may be, every animal is sure to have some particular plant or other animal especially suited to prey upon it if it once gets the opportunity. We have before noticed how the common house fly is attacked by a fungus. In the same way other insects are liable to serve as hosts for different kinds of fungi or moulds, and as these insects are sometimes very injurious to fruit trees and crops, advantage is now taken of the fact in just the same way in which Pasteur proposed to take advantage of the liability of rabbits to disease.

More has been done in this way in America than in Australia, and the results have been in some cases wonderfully successful. In Kansas, for example, the well-known chinch bug had become a great pest when the idea occurred to the state entomologist, Mr. F. H. Snow, of fighting it by means of one of its plant enemies, a fungus. Taking one of the chinch bugs affected with fungus he confined along with it numbers of other healthy ones. These became affected, and when released in the fields carried the infection far and wide, and by this means the insect pest was kept under control. From Kansas the disease has been introduced into several other states.

In this instance we have a plant parasite upon an animal which is itself a parasite. In other cases only animals are concerned.

Mr. Tryon, in Brisbane, has pointed out how the Moreton Bay fig tree is attacked by a small insect like a little jumping cicada, the life history of which is as follows. The insect lays its eggs upon the under surface of the leaf; the eggs are enclosed in strong leathery cases, out of which in course of time emerge little grub-like creatures. These soon begin to form a case which encloses them, and under the shelter of which they can bore their way into the soft tissues of the leaf. It is not easy to kill either the insects or the larval grub, as the former are very active and the latter only exposed for a very short time, while the eggs-cases are too thick to be penetrated by such fluids as kerosene emulsion. There is, however, another insect allied to the bee whose mission in life appears to be that of searching out the young grubs, and by means of a sharp pointed tube at the end of its body introducing its eggs right into the grub. The result is that the eggs grow at the expense of and finally kill the grub, so that here we see first an insect living as a parasite on the tree and then another insect living as a parasite on the first.

Still more interesting has been the discovery by Mr. Tryon of a special form of insect-eating insect. Though this particular insect and its habits were described in Australia by Mr. Tryon it is really better known in America than with us, owing to the fact that the Governments of the various states are far more alive to the economic importance of spending money in studying and experimenting upon such matters than we are.

There are numerous little insects which from their appearance are known as scale insects, and which do so much damage to trees, such as the orange and lemon, that if left unchecked the trees are often killed. However, fortunately for us, a natural check is close at hand; the little ladybird beetle, both in the adult and grub state, devours these scale insects by the thousand, and so effectively does it keep down the numbers that the Agricultural Department of the United States sent across an officer of the department on purpose to secure the ladybird and acclimatise it amongst the orange groves of California. It is somewhat strange to realise that the growth of oranges in California may be largely influenced by the application of knowledge derived by Mr. Tryon from the study of the life-history of so insignificant a creature as a little Australian ladybird beetle.—*Australasian*.

THE JAVA COFFEE CROP.

According to a telegram from the Governor-General of Netherlands-India, dated August 23, the Government's coffee crop in Java for this year is estimated at 338,200 piculs. It is said that there will be a deficit of 3½ million guilders on the war budget in consequence of the Lombok expedition.—*L. & C. Express*, Aug. 30.

TEA PLANTING IN THE CAUCASUS.

A Renter's telegram from St. Petersburg says that a tea planter in the Caucasus proposes to gather next month his first crop of tea. Present indications lead him to hope that this undertaking, which was an experimental one, will be crowned with entire success, in which case the area of cultivation will be very largely increased.—*Morning Post*, Aug. 27.

GREAT BRITAIN AND THE NETHERLANDS IN THE EAST.

Particulars of the arrangements made between Great Britain and the Netherlands concerning the boundaries between the possessions of the two countries in New Guinea have just been published. The boundary starts from the southern coast of the island at the middle of the mouth of the Bensbach River, situated at about 141° 1' 47.9" of east longitude (meridian of Greenwich), and proceeds to the north, following the meridian which passes through the mouth referred to up to the point where that meridian meets the Fly River. From that point the Fly River forms the boundary up to the 141st. degree of east longitude, which after this continues the boundary up to the point of intersection of the boundaries of the British, Netherlands, and German possessions. Navigation on the Fly River is free for the subjects of both contracting Powers, excepting as regards the carriage of warlike stores.—*European Mail*, Aug. 28.

BRITISH EAST AFRICA.

Mr. Alex. Whyte, in a report on the economic products of British East Africa, makes the following remarks:—

Tobacco has been extensively cultivated by the Messrs. Buchanan for some years, both at Blantyre and Zomba. They have now a large local sale for their cut tobaccos and cigars, which are excellent. They have also obtained remunerative prices for their leaf in the London market, much of which is available for "wrappers." Mr. Robert Buchanan, of this most enterprising firm, which has already done so much to develop the resources of Nyassaland, is now at home, and is busily engaged in the study of tobacco manufacture, and selecting coffee, sugar, and other machinery. There is unlimited scope for the cultivation of this promising product. In Ceylon and many other British possessions this industry has made no headway, owing to the expense of labour and the scarcity of suitable land. Here the one is perhaps the cheapest in the world, and the other almost boundless. The natives have grown tobacco for their own use for many years.

Cinchona, of best varieties, had a fair trial in the Shire Highlands, and did well, but, from the extremely low price to which bark has fallen, it has not been found remunerative. But it costs little, need not be harvested until remunerative prices are to be had, and the older the trees become the more enhanced is the value of the property.

Tea of good varieties, Assam and China, has been introduced, but is not as yet cultivated to any extent. It grows luxuriantly, and ought to do well in some districts. Our long dry season would prevent its flushing so freely as it does in Ceylon or Assam, but against this we have to put the abnormally low price of labour at from 9d. to 1s. per lb. I see no reason why it should not become a profitable cultivation. I shall do all I can to introduce seeds and plants of the very best to be procurable.—*L. & C. Express*.

AND GARDENS OF THE CANARY ISLANDS.

A paper read before the Royal Horticultural Society May 14, 1895. By D. Morris, C.M.G., M.A., D.Sc., F.L.S. Assistant Director, Royal Gardens, Kew, late Hon. Treasurer, Royal Horticultural Society. We have received from Mr. Morris a copy of this very interesting paper, which will be fully noticed later on in our *Tropical Agriculturist*.

THE METEOROLOGY OF CEYLON FOR 1894: ARE WE IN THE MIDST OF A DRY CYCLE?

This Administration Report for 1894 on the Meteorology of Ceylon is by Mr. D. G. Mantell, Surveyor-General. There is a considerable degree of monotony in reading a report of this nature, especially in the tropics, where the mercury in the barometer appears to the casual observer to be as fixed and immovable as the wall on which the instrument hangs. The thermometer, too, seems to be asleep in these latitudes. The heat at night is nearly the same as at midday in the shade, and the temperature of August differs little from that of December. What is the meaning, when we come to statistics, of the remark we sometimes make after a shower—"How deliciously cool it is now"? Briefly this, that the temperature has dropped perhaps some four or five degrees as shown by the Fahrenheit scale. What, on the other hand, do our friends at home mean when they tell us that the weather has suddenly become colder? Probably a drop of twenty or thirty degrees, or more, in the twenty-four hours. Consequently out here in stewy tropical Colombo when on an early North-East monsoon morning, our temperature sinks to the seventies (say 75 to 77°) old residents facing the keen air are apt to say, "it is bitterly cold." "Bitterly cold" with very much the temperature maintained in the palm-house, Kew Gardens! The tides seem to follow the same rule of doing as little work as possible. We get our 18 inches here; at home we may have been accustomed to get 18 feet! We note that in the Meteorological system under the Surveyor-General there are 16 principal stations, that is, stations recording daily the readings of the barometer, the "wet bulb" and "dry-bulb" thermometers, the maximum wet and dry, the minimum wet and dry, the solar radiation thermometer, terrestrial radiation thermometer, anemometer, wind vane, and rain-gauge. In addition to these, there are 73 stations reporting only the rainfall.

Some of our readers may not be aware that the heat of the sun's rays in various parts of the island averages generally from 55 to 60 degrees above the mean shade temperature of the locality. At first sight, and in view of the remarks we have made above as to the difference between a cool day and hot day, this seems excessive. But it is not so bad as it looks, as we learn from the Report under review that the solar radiation thermometer is an instrument with its bulb blackened with lampblack to make it absorb all the heat it can get, and enclosed in a glass vacuum-jacket to preserve it from air currents and enable it to retain its heat. Few substances, we suppose, would acquire by exposure to the sun's rays in the open air the temperatures indicated by the solar-radiation thermometer of the meteorologist, a form of instrument which is adopted to facilitate the comparison of readings taken in different places.

The range of variation of shade temperature is very interesting. The greatest range in any one month was at Nuwara Eliya, and amounted to 37°·8 in December. The greatest range in the whole year was also at the Sanatorium and amounted to 46°·7. The highest shade temperature registered at that station during the year being 78°·0 on the 17th May, and the lowest 31°·3 on the 27th December. Next to this comes Puttalam with a range of 38°·1; while Kandy is 35°·6, Colombo 25°·8, and Galle (the lowest) 20°·0

The barometer tables are most uninteresting to the lay reader. The barometers do very little work apparently. The Colony supports sixteen standard instruments, worth, we suppose, several pounds sterling apiece and what do they do for their living? Sometimes they move a thousandth part of an inch, sometimes a hundredth, in a day. Of the whole sixteen, with every variety of climate, and all the care and attention that a poorly-paid staff of observers can afford to bestow, not one could show a variation of half an inch in the whole year! The British householder who taps the "weather glass" in his front hall every day of the year as regularly as clock-work, and as regularly infers from his observation that it will be prudent to take his umbrella, would be quite non-plussed in Colombo. If the hand pointed to "Set Fair" today, it would point to "Set Fair" every day "till further notice" or until the nail it hung on had rusted away!

When the atmosphere is hot, it can hold in suspension more moisture than when it is cold. For every degree of temperature, therefore, there is a certain quantity of moisture which can stay in suspension, and no more. If the air gets more moisture than that quantity, or if the temperature of the air falls, the moisture is condensed and falls in the form of rain, snow, or hail according to the climate. The dew on the outside of a tumbler of iced water is produced in this way. When the atmosphere contains all the moisture it can keep, it is said to be "saturated." Meteorologists express the degrees of humidity by calling the saturation-point 100 and absolute dryness, zero. When they state that the humidity is 50, they mean to signify that the atmosphere contains half as much moisture as it would hold at saturation point at the same temperature. The Report under review shows that the humidity was lower in 1894 than in the average year, at nearly every station, by an amount varying from 1 to 5 of the degrees just mentioned. It naturally follows from a low humidity that there must be less rainfall. This we find to have been the case in 1894. Nearly every station was short of rain to an amount varying up to 27 inches. The same experience is likely to be noted for 1895, so that it would really seem as if we were in the midst of one of Tytler's "Dry Cycles."

EXPORTS OF COFFEE AND PEPPER FROM SOUTHERN INDIA.—We call attention to the interesting letter and return sent us by our old friend, Mr. Ralph Tatham, on behalf of Messrs. Arbuthnott & Co. Two new ports having been included, a fair comparison with previous years cannot, perhaps, be offered; but we may mention that while 291,621 cwt. Coffee were sent away in 1894-95; the quantity recorded in the previous three years (for the same periods, but less two ports) were 239,960; 221,553 and 308,283 cwt. respectively. As to Pepper, the figures for four seasons compare thus under the same conditions:—

Cwt.	Cwt.
1894-5 = 152,439	1892-3 = 137,355
1893-4 = 172,863	1891-2 = 135,941

LIBERIAN COFFEE.

The Editor, *Madras Mail*.

SIR,—With reference to the correspondence in your paper about Liberian coffee, kindly allow me to state I have some 85 fine trees of this variety growing on my Clifton Estate here at an elevation of 3,750 feet, and not only growing, but cropping heavily. My recollection is, they took 5 years from seedlings before they did crop, but they have gone on cropping ever since without any cultivation specially applied to them, although no doubt, they have likewise benefited from the cultivation the Arabica coffee has had among which they are growing. They resemble young jack trees. The last few years I have kept a careful account of the outturn of parchment, or seed, coffee; and all I can say is, if Liberian is going to produce on the same scale in a large acreage, then there must be a big future before it somewhere in the country. One drawback to its cultivation no doubt is the time it takes to come into bearing. It certainly stands wind and exposure better, and will no doubt flourish, more or less, where Arabica will not. Mr. W. C. Dawson quotes an instance at Manantoddy. This disposes, I think, of Mr. Winterbotham's surmise that Liberian will probably only flourish up to 3,000 feet. But, as that gentleman explains in your issue received today, he only wrote of what he had personally observed. Quite so. "Toda," no doubt, meant to have written 4,000, instead of 5,000 feet, at which his Liberians are cropping. "Nemo" says, *he should say*, the average elevation of cultivation at Nellacotta would be 3,000 to 3,500 feet, but as I agree with him that mere guesswork will not do, I am glad to be able to say that I have the average elevation of cultivation here—that is to say, $\frac{2}{3}$ ths of the cultivation—recorded at 3,500 to 4,000 feet. "Nilgiri Wynaad" has kindly determined the highest point of Avondale at 3,800 feet, but it happens just to touch 4,000 feet. I have made several tests at various times with more than one aneroid. Then, as to prices. The *Public Ledger*—the official organ of Mincing Lane—I find quotes the sale in July last of "4 bags brown Liberian Ceylon at 72s, 3 bags brown Liberian Travancore at 72s 6d, and 3 bags Liberian Wynaad at 74s." At the same time, "78 bags Liberian Johore sold, good, bold and medium yellow, at 86s. 6d." "Mr. Winterbotham quotes instances of Wynaad Liberian samples having been valued at 85s to 91s per cwt. It is to be hoped, if there is anything in curing, the bulk will be as carefully prepared as these samples appear to have been, but unless the true Liberian bean is produced—that is, I believe, a bold yellow bean—I should say, don't expect prices approaching Arabica. I understand Mr. Winterbotham to say there is Liberian and Liberian coffee. I agree with him.

H. W. SUELDRIK.

Nellacotta, 9th Sept.

PLANTING AND PRODUCE.

SPICES AND BARK IN STORE.—In an article entitled "How London is Fed" a writer in the *Westminster Gazette* refers to a visit paid to the London and India Docks and the stores of spices and bark there. He says: "What though the spicy breezes"—but one does not need to go to Ceylon to experience them. As the visitor ascends the stone stair to the cinnamon and spice departments he seems to meet all the perfumes of the Orient. Three great floors are devoted to the 'housing, working, and showing' of, among other like products, cinnamon and cloves, nutmegs, cassia, and Peruvian bark. Here at one corner are a group of men going carefully through great piles of nutmegs, examining each nut, and turning out all of inferior quality. A little further along, the 'weeding of mace, the inner covering of the nutmeg, is going on, and this membrane is actually lying on the floor in cartloads. Cloves are sorted in the same way, and emptied into cases. Cinnamon arrives in tightly packed bales, each one of which is opened out, gone through and elassed according to quality. Some of the cinnamon sticks

are beautifully fine others are coarse and much broken. Thousands and thousands of bales and cases of these spices lie around, and the wonder is wherever and how the contents are finally used up. This is especially the case as regards the Peruvian bark. The article which bears this name looks very much like the bark of an elm tree. It is peeled from the cinchona tree—a laborious and difficult operation. The name is derived from the fact that the Countess of Cinchon, the wife of the Viceroy of Peru, had been cured of an obstinate intermittent fever by means of it, and thereafter habitually distributed it to those suffering from fever. It goes, of course to the manufacture of quinine, which is carried on by only two or three firms in England. The conclusion one arrives at on glancing round the many thousands of bales at the docks is that it must take a large quantity of bark to produce a little quinine, or else there is a very large demand for the drug. But London is the market for the bark, and all the Continental supplies pass through here. The bark comes largely from Peru still. Formerly the mode of collecting it in the latter country was most wasteful, and it looked as if the tree was likely to become exterminated. The attention of European botanists was called to the matter, and there are plantations in India, British Burmah, Ceylon, and the West Indies, and it is a very important article of export from these countries. The trade in the bark has been active of late years. Has this been due to the influenza?"—*H. and C. Mail*.

INDIAN PATENTS.

Calcutta, the 29th August, 1895.

Applications in respect of the undermentioned inventions have been filed, during the week ending 24th August 1895, under the provisions of Act V of 1888:—

FOR IMPROVEMENTS IN APPARATUS FOR PACKING TEA OR OTHER SUBSTANCES INTO CHESTS.—272 of 1895.—Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, Merchant, for improvements in apparatus for packing tea or other substances into chests, boxes or other receptacles.—*Indian Engineer*.

LABOUR IN NORTH BORNEO.

It is much to be regretted that the efforts of the Government to obtain immigrant labour upon cheaper terms than have hitherto prevailed have not been more cordially backed by the planting community of the Territory. The planters base their lukewarmness chiefly on the allegation that it is impossible to obtain a class of labourer as good as those brought down at existing rates for the reduced figure offered by the Government. No coolies, with one exception, have come forward under the arrangement proposed and this objection strikes us as somewhat "too previous." Meanwhile it may be interesting to state that the agent in Hongkong for some of the estates rejected over a hundred men, brought forward by the Government officer sent there, at \$34 per head and a few days afterwards sent the same men down to an estate at a cost of over \$60 per head. No complaint was made that these men were of inferior physique or otherwise unsuitable.

Whether the planters have been wise in refusing to support a scheme which if successful would have saved from \$20 to 25 per head i.e. \$25,000 per 1,000 coolies, is a matter which they will doubtless argue out with their shareholders at home. The great majority are not of British nationality and have large discretionary powers in the matter of the labour supply.—*British North Borneo Herald, August 16th*.

NORTH BORNEO PLANTING NOTES.

Kabali.—Fair rains, coffee growing nicely, 5,000 holes made in new clearing for Trading and Planting Co. Crop for May 30 catties, June piculs 1.35, July 4.26, plants 30 months old.

Loong Piasow.—Fair rains, everything doing well, coffee blossoming freely, crop for May 4 catties, June 12 catties, July 22 catties. Oldest plants 2 years.

Byte.—Weather dry for last four months to 22nd ult. Coffee banking up, rains last week of month and picking in fair progress. Branches breaking with weight of fruit all over the estate. Crop May, piculs 12.12, June piculs 14.83, July piculs 23.58 parchment. Large increase expected for August.

The May crop was sent to Singapore for realization, and from thence the parchment portion of it was forwarded to Selangore to be husked from whence came the following report upon it: "the parchment was the finest "as regards colour that I have seen in the Straits."

Samples of *Byte* April crop sent to London were reported upon by Mr. Czarnikow the well-known coffee broker as of fair quality and valued at about 85/ p. cwt. for clean, as against 62/3 the quotation for ordinary Brazil ("fair Channel Rio") on the same date.—*North Borneo Herald*.

CINNAMON :

EXTRAORDINARY PRICES FOR CERTAIN MARKS IN THE LONDON QUARTERLY SALES.

THE news to hand by the mail of Aug. 30th, helps to explain so much of Reuter's telegram to his constituents here on the last Cinnamon sales, as was mysterious. The quarterly sale took place in London on the 26th ult., and the great news agency telegraphed an advance of 2d to 3d per lb.—at the previous sale in May there was an advance of 1d to 1½d; but added "reported large advance fictitious." As it was itself reporting an advance in price sufficiently large to delight the heart of growers—the average price for years having ranged in pence, instead of in shillings—one was puzzled to know what was fictitious. It could not be the news which it was then wiring out to its constituents; for then it would be serving up imaginary and misleading news, instead of correct information, for which alone commercial men would care to pay. The "Examiner," in a paragraph which we published in our issue of the 28th ult., surmised that "advance" was a mistake for "shipments"; and that what Reuter telegraphed was that the large shipments reported from this side being believed to be fictitious, buyers operated freely, and hence the advance in price. The explanation was ingenious; but we felt it could scarcely be the correct one, 1st, because Reuter generally telegraphs facts, and not surmises in London regarding crops in the Colonies; and 2nd, because the shipments of cinnamon from here have been large this season—certainly they have not been small as compared with past years, and those here knew better than Reuter that there was nothing fictitious about our table of exports. We preferred to suspend our judgment on Reuter's mystery. The Sale Lists to hand by the mail-steamers which came in on Monday, fully explain the mystery. The news telegraphed by the responsible agency was an advance of 2d, the advance which it warned its constituents against accepting, as being fictitious, was the much larger advance which the Sale Lists or Catalogues exhibit. The fine cinnamon which generally fetches about 33 per cent above the ordinary kinds, was represented, so far as we can see, only by two well-known marks, A. S. G. P. (Golua Poknua) and A. S. W. S. (Wester Seaton). The spice of these two estates sold at rates ranging from 10½ for fourth quality to 1s 6d for firsts—splendid prices having regard to those which have ruled for years past, and showing an advance of 2d to 3d per lb., or thereabouts, on the prices which the same marks or similar fetched at the May Sales. But what do

we find, when we turn to ordinary or unknown marks? C. H. De S. Kurnwitte, an estate belonging to the De Soysa family which never set itself to the manufacture of fine spice, or "smarts," sells 23 bales of its first quality at 1s 7d. per lb. or 1d. ahead of Golua Poknua, and 2d. a head of Wester Seaton. Then D. R. in a diamond obtains 1s 7d. for its 2nd quality! V. B. obtains the same price for its firsts, 1s 6d. for its seconds, and 1s. for its thirds; but, greater marvel yet—the 4th quality of A & S. fetches 1s 4d. per lb. whereas its thirds fell to the hammer immediately before at 10d to 10½d.—good price enough! It seems pretty clear that these could not be genuine sales; and any advance based on these figures, wired from London to Ceylon, would be fictitious. If a sudden and heavy demand for cinnamon had sprung up, the best qualities should have shared the advance in prices; but not only do the well-known marks not show a corresponding advance; they are even distanced by medium and inferior sorts!

What is the explanation of this extraordinary feature in the sale? Gambling, we suppose; or worse than that. If it be gambling, the sales would be genuine, and lots probably passed into the hands of a powerful Syndicate which means to control the market. But we fear the bids were fictitious, and represent purchases which will never be completed, or figures at which the spice was bought in with some ulterior object. We shall probably hear more about these sales on the prompt day, when accounts have to be settled.

Meanwhile, as showing that the statistical position of cinnamon cannot explain the reported rise in price, we need only refer to our Export tables. True the stocks in London just now are 2,346 bales, against 3,707 in 1893 and 2,590 in 1892; they were lower, and stood at 2,066 bales and the market was in no way excited. The last compilation by the Chamber of Commerce, making up the exports of Cinnamon up to 16th September for the past four years, gives the following figures:—

	Quills lbs.	Chips lbs.
1895 ...	1,387,332	478,048
1894 ...	1,220,203	379,543
1893 ...	1,168,344	376,878
1892 ...	1,404,767	395,316

It will be seen from the foregoing that this year is ahead of the three preceding years, and we believe of any year, in exports of both quilled Cinnamon and of Chips, and when the auctions were held a month ago, the figures were not against 1895. There can be little doubt that there is a better demand for cinnamon both locally and in London, due, we think, to new uses; but the wild bidding to which we have referred can scarcely accurately reflect this demand. We hope it may not prejudice it. Here is what a leading London Firm in the trade, reports:—

CINNAMON.

London, 27th August 1895.

The quarterly sales were held yesterday when 667 bales Ceylon were offered, comprising 267 bales "worked" quill, and 400 bales "unworked" compared with 1063 bales in May last, and 517 bales at this period last year. Most of the Cinnamon offered was sold, the small quantity of *fine* quill meeting good competition and realizing chiefly 2d to 3d per lb. advance on last sales' prices, these sorts being bought for the ordinary sources of consumption. As regards *ordinary* Ekelle descriptions, it is difficult to express an opinion as to the extravagant prices at which, in some instances, the hammer fell. Among others, the mark A.S. No. 3 was knocked down at 10d and 10½d and No. 4 of same mark at 1s 4d per lb. O R diamond No. 2 1s 7d or eleven pence higher than in May, while the *very finest* quill in the sale F. S.

W.S. and A.S. G. P. brought 1s 5d to 1s 6d per lb. These inflated hammer rates, we have reason to believe, do not represent *bona fide* sales, but must be taken as a market operation to influence prices in view of the fact that speculators are reported to have purchased recently "to arrive" about 6,000 bales of these ordinary qualities.

No chips were offered.

Stock 2,346 bales Ceylon against

	1894	1893	1892
Bales	2,066	3,707	2,590

The next sales will be held 25th November.

FORBES, FORBES & Co.

PLANT LORE.

A home correspondent asks if we can say if any attempt has been made to collect the Plant Lore of the native races of this island. He tells us that year by year he finds the interest taken in this subject to be augmenting. He was astonished to learn from a collector of works bearing on Plant Lore that his list of books dealing exclusively with the subject, numbered over 12,000 volumes, many of them, as might be expected, being of very ancient publication. When it is remembered that it has probably been from ancient Plant Lore that a great deal of our present system of medicine has been evolved, the scope of the collection mentioned need scarcely evoke surprise. Upon the traditional medicinal value of plants, all sorts of curious and superstitious beliefs have been built. In one ancient work on the subject we have seen a curious illustration, for instance, of the goose or barnacle tree, the barnacles on the growing plant having developed as they ripened into a lively flock of geese taking naturally to the water beneath the parent tree! But underlying all the quaint traditions attached to particular plants and trees, there have nearly always been valuable treatises, that have largely led to the enrichment of the modern *materia medica*. Among the natives of Ceylon even, there has existed a knowledge of herbal simples, that, if collected might prove of much value. The same may be said of nearly all the people on the face of the earth, and in very many cases their Plant Lore has been carefully collected and published. We are not aware whether this course has been attempted with any system in Ceylon. Incidentally, of course, all botanical works dealing with the vegetation of the island have embraced many references to the subject. But to fulfil all the objects desired, it is necessary that these references should be collected and arranged. It is probable that there may be native writings extant dealing with this topic, but we are unable to say whether at any time these have been so dealt with as to be readily available to modern research. It would undoubtedly form a valuable contribution towards the European literature on the subject if this could be done. What is needed is the publication of facts connected with the Plant Lore of the island quite independently of merely botanical features. The experiences of mediæval "simple" gatherers has largely contributed towards the success of modern medicine. Unsuspected, among the lore of our Sinhalese and Tamils might be found much that would aid usefully in the same direction.

A SMALL LOT OF SIX SEEDS of the Avocado Pear were lately received from Mauritius, through the post, by Mr. Barrant, who handed them for cultivation to Mr. Gueritz. We now learn that four of the seeds germinated and are planted out in four different local gardens. It will be a boon should the cultivation prove a success.—*Borneo Herald*.

BOUND FOR NORTH TRAVANCORE.

Mr. G. D. Gordon who left on the 20th. Sept. for North Travancore, via Tuticorin, will perhaps be remembered in Ceylon as one of the contractors of the Nanuoya Extension of our railway, and also of roads in Ceylon. He was here for 9 years before he went to the Straits 12 years ago, where he has since been employed in railway and road making. In working on the Perak railway, 17 miles in extent, through swamps, he contracted fever, and recently was ordered away to recruit. For the last four months he has been living at Ulapane, and owing, Mr. Gordon says, to our healthy climate, is now quite recovered. The object of his journey to North Travancore is to open out about 50 miles of estate roads through Messrs. Finlay, Muir & Co.'s land. The first road will commence from Munaar and finish at Anaikolum, in extent about 20 miles going towards the west; the other starting from the same place will go 30 miles to the north. The altitude rises from 1,000 to 4,500 ft. Mr. Benzie, of Mahavilla estate, Ulapane, is to follow Mr. Gordon in a few weeks' time for the same work.

A NEW PRIVATE ESTATES COMPANY.

We learn that the proprietors of three estates—Clyde, Kaluganga and Liskillan—in the Kaltura district are likely to unite in forming an Association or Limited Company for their properties, so saving expenditure on separate Superintendents, Factories, &c. This is a very wise procedure. Clyde has, we believe, a Factory equal to the requirements of all. The total extent is 711 acres of which 508 acres are in tea.

THE "CEYLON FORESTER."

We have, by the courtesy of the Editor, Mr. H. C. P. Armitage, Forester at Trincomalee, received the first three parts of this new contemporary, which we cordially welcome, and to which we wish every success. It is a small Magazine of about 16 pages monthly, the subscription is R5 yearly, and the cover shows an old banyan tree with many root props, and a palmyra growing out of its crown.

The first number, that for January, 1895, has an Introduction, and then a short history of the Ceylon Forest Department. There are useful botanical notes on various trees and plants of the Ceylon forests, and the first part of a paper on elephant catching in the Northern Provinces. In the February number is described the saw-mill and Depot at Batticaloa; the botanical notes are continued, and there is a further instalment of the paper on elephant catching. The March number continues these papers still further, and has an interesting account of the Satinwood tree by Mr. Brown, the Conservator. We commend this new periodical to the attention of Indian forest officers, and especially to those in South India.—*Indian Forester*.

REPORTED SALE OF A NUWARA ELIYA ESTATE.

A Kandy correspondent writes:—"That splendid property Tommagong Estate in Nuwara Eliya, the property of Mr. James McLaren, has just changed hands, the purchaser being Mr. Megginson, who, it will be remembered, lately acquired Charley Valley for the long figure of R700,000. The sum paid for Tommagong has not yet transpired, but is said to be quite a record price even in these flush days."—Tommagong and Park cover 248 acres, of which 180 are in tea, 45 fine coffee, 15 cinchona, 8 timber and grass.

... PINE HILL ESTATES COMPANY.

The following is from the Report to be presented on the 28th inst:—

Owing to an abnormally dry season, especially in the Haputale District, the actual crop of tea from the Company's estates fell short of the estimate by 30,000 lb. Coffee was 95 bushels in excess of estimate.

	lb.	₹ lb.	
Pine Hill and Wavahena			
crop was	119,016	costing cts. 32'21	} netting ₹ lb., cts. 49'21
Out-turn from purchased leaf	12,638		
Nahakettia crop was	100,590	" " 32'32	" 46'23

Average yield from the Company's acreage of Tea in full bearing was 454 lb. per acre.

The profit for the season is equivalent to 11½ per cent. on the paid-up Capital. Amount available for distribution is R16,793'36, which your Directors would propose to deal with as follows:—

	R. ct.
In writing of balance of preliminary expenses	596'49
Payment of dividend at the rate of 4 per cent.	13,916'00
To Reserve Fund	2,000'00
Leaving a balance to be carried forward of.. .. .	280'87
	<hr/>
	16,793'36

Estimates for season 1895-96 are:—255,000 lb. Tea and 250 bushels Coffee.

 JAVA CINCHONA.

Sept. 5.

The August shipments of cinchona bark from Java according to telegraphic information from that island, amounted to 697,000 half-kilos. The total shipments for the first eight months of the year were 6,013,700 half-kilos. The following are the figures for the last five years from July 1 to June 30:—

Year.....	1894-5	1893-4	1892-3	1891-2	1890-1
Half-kilos, ..	8,705,057	7,428,336	7,955,090	7,786,867	6,876,816

—Chemist and Druggist.

 PLANTING AND PRODUCE.

THE TEA TRADE OF PERSIA.—A report on the trade of Bushire makes the following reference to Indian tea: "There has been a strong demand throughout the past year for Indian and Batavian teas, which seem to be steadily supplanting the China teas in favour with the Persian consumer. Heavy consignments, chiefly from India, were received by native merchants, who found no difficulty in disposing of them at a good profit. It was, however, at the port of Bunder Abbas that this trade received its most vigorous impulse, the import being more than double that of the previous year. This largely increased import was probably to a great extent due to an effort to take advantage of a favourable opportunity for supplying the demands of regions beyond the north-eastern frontier of Persia."

TEA DIRECT TO MANCHESTER.—As announced at the last half-yearly meeting of the Ship Canal Company, Messrs. Cayzer, Irvine, and Co. have made arrangements to establish a service of steamers from Calcutta, Madras and Colombo to Manchester, the sailings to be about once in every six weeks. The first steamer, the "Clan Mackay," 2,602 tons gross register, left Calcutta for Manchester on August 6th, and is now *en route*, having left the Suez Canal on August 23th. She will call at London, and, after discharging what cargo she has for that port, will come round to Manchester with a large consignment of tea, being expected in about a fortnight. From Manchester she will proceed light to Glasgow and Birkenhead, to load outwards, "and will thereby afford," says the *Manchester Guardian*, "local shippers a striking object-lesson in the influence of steamship conferences. Although hundreds of tons of merchandise are sent away daily from Manchester to Calcutta, and although steamers

from, and bound for, Calcutta will be actually discharging in the Manchester Docks, owing to 'Conference arrangements,' those vessels must steam away to Glasgow empty, and then come back to Berkenhead for the goods, which have in the meantime been sent thither by rail or barge. It is to be hoped that the Calcutta shippers will not be content with such an anomalous state of things when it lies in their power, by combining to induce the ring to recognise Manchester as a loading port, as is now done by the Bombay and China Conferences." The next of the Clan boats to load at Calcutta for Manchester will be the "Clan Mackinnon," 2,268 tons gross register, which will leave about the end of the present month, calling at Madras and Colombo.

FRUIT GROWING IN THE SOUTHERN STATES.—The particulars given of the peach harvest in Georgia are interesting. On one farm alone 520 hands were daily engaged during the season. They gathered and packed 25,000 baskets of peaches a day. Eighty per cent. of them camped out while so engaged, and they included all kinds of people, from college boys to coloured men and women. They began their work at four o'clock in the morning, and continued it as long as they could see. Not much trouble about "hours," it will be observed here, and no strikes in the labour market. The fruit was plentiful, and two-thirds of it paid a profit of from 25 to 75 cents per crate. The industry is in its infancy, however. The negroes wanted their pay in silver dollars. They were cumbersome to everybody else, but the darkeys enjoy the weight of the silver.—*H. & C. Mail.*

 COFFEE PRODUCTION IN THE MONTANA OF PERU.

The acting British Consul at Callao says that the region which Peru offers to the coffee planter, unsurpassed in fertility, and almost unlimited in extent, is situated on the eastern slope of the Andes, at a height of from 6,000 to 12,000 feet above sea level, among the network of streams and rivulets that find their way into the great affluents of the Amazon. It is the Chauchamayo district—for most of the coffee that passes under the name of Vitoc or Huanuco comes from Chanchamayo—which is the real coffee-planting district of Peru, and it is the production of this region that has elevated Peru to the rank of a coffee exporting country. This is due to the completion of the Central or Oroya Railway, by the Peruvian Corporation, to its present terminus at Oroya, giving railway carriage over the crest of the Cordillera, and also to the opening up of the Perené and adjacent valleys which form its prolongation. Oroya is about 60 miles from Chanchamayo valley, and there is a fair road all the way, passing through the town of Tarma, the capital of a department with about 7,000 inhabitants. The Chaucamayo Valley, itself about 10 miles long, is now in the hands of private owners, but the rich and far more extensive valleys beyond it of the Perené, Paucartambo, and Rio Colorado, have now been linked on to La Merced, the last town in Chanchamayo by the extension of the Tarma-Chanchamayo road through a short but difficult defile. The output of coffee for the whole region was about 1,500 tons in 1893, but extensive planting has lately taken place and production will shortly, it is said, be trebled.—*The Cosmopolitan.*

[On which "Old Colonist" who has been to Peru, writes:—"This British Consul, writes from hearsay and hearsay in Peru is valueless. Only an ignorant idiot would talk of coffee up to 12,000 feet in any part of this earth. There is no coffee at Pacasmayo nor within 100 miles of it. One dealer I met there, however, boasted of having 6,000 trees in the interior. Not 100 acres at the famous Huanuco, nor a forest tree within 50 miles of it. Perené yes, but first get a settled Government and then talk about coffee in Peru. —Ed. T.A.]

THE NORTH TRAVANCORE COMPANY'S CONCESSION IN THE KANAN DEVAN HILL.

We have been favoured with an inspection of a map of the Kanan Devan Hills, showing the territory of which a concession was made by the Madras Government to the North Travancore Land Planting and Agricultural Society. The concession which is entirely in the State of Travancore is separated from Madras by the Cardamom Hills. It extends to about 120,000 acres between 40,000 and 50,000 acres (approximately) being suitable for cultivation. Within the area defined by the map are 27 estates. These estates were purchased from the North Travancore Society, each year a small rent being still exacted from the holders. The property of the North Travancore Society has since passed into the hands of the North and South Sylhet Tea Companies as represented by Messrs. Finlay, Muir & Co. In the last issue of our Directory was published a list of estates in the district. Since then the estates in the appended list have been opened up. From the table it will be seen that by far the largest portion of cultivable land is in the hands of the North Travancore Society or rather in those of Messrs. Finlay, Muir & Co. As shown in the Map, the Kanan Devan Hills consist for the most part of extensive tracks of grass plateaux, in the higher altitudes, and of forest land at a lower level. The land as yet is practically unopened, only 3883 acres being in cultivation.

The altitude of the Devan Hills ranges from 686 feet above sea level, on the west, to 8,840 feet—the highest point at Anemudi. Generally speaking forest land gives way to grass plateau at 5,000 feet, though at Cholemalai (6,200 feet) and in the surrounding district forest is met with at a greater altitude. In the matter of roads, as indicated, much work requires to be done. On paper the existing means of communication look somewhat imposing, but as a matter of fact the best of them is little better than a mere bridle-path. Joining a road to Nere-mangalain and Cochin a cent-road leads part of the way to Munnar Camp from which combinations of footpaths and cart roads lead to the boundary of the territory, and descending to the valleys, communicate with roads leading to Anikolam and Coimbatore, to Wattawadde and Kodikanal and to Kotagudi and Bodinakanur. From Devakulam a cut road affords a means of transit to Munnar Camp and taps the other roads to the north and east. It is also in contemplation to construct a road from the Munnar Valley so as to secure direct communication with Cochin. The road will be about 20 miles long, its whole length in the Company's territory lying through forest land. A second road to the north, 30 miles in length, will be constructed to tap a road leading to Coimbatore. The country is well watered. Five streams of no inconsiderable magnitude with their tributaries flow to the west, an equal number drain the country on its southern face while another river runs parallel to the course of the projected road to Coimbatore. The district is healthy and, as will be seen from the table, the rainfall is heavy. Under existing conditions, transport is a matter attended with some difficulty. Communication is had from Tuticorin by train to Ammanai-kanur, thence by bullock cart to Bodinai-kanur, afterwards by foot road to Devakulam. The forest land standing in name of the North Travancore Company is stated at 30,000 acres;

but this we are informed is only an approximation. At present steps are being taken to have it cleared and planted. Mr. W. Milne of Warwick Ambewella has just returned from a visit to the Kanan-Devan Hills and the work of road-making to which we have referred, will be carried out by Mr. G. D. Gordon, who, as stated in a previous issue was a Sub-contractor for the Nannoya Railway Extension, and who has acquired great experience of such work in the Straits and India. The recent visit of Mr. Milne, we are informed, has shown that large tracts in the Munnar Valley district are suitable, on the west, for tea, and on the north, for coffee. The work of clearing this locality will be pushed on with as little delay as possible.

Names of Estates.	Elevation	Average Rain-fall.	Tea under 2 years.	Coffee under 3 years.	Cinchona under 4 years.	Total Cultivated Area.	Waste Forest	Waste Grass	Total Area of Estate.	Proprietors.	Managers.

Chinnakanal	6500	17	17	8	..	25	H. G. Turner	James Turner
Total	241	60	17	318	1579	157	2054

The total extent of cultivatable land in the Northern Kanan Devan District of Travancore is now 40,000 acres (approximately) of which 4,000 acres are in cultivation—900 acres with tea, 1,300 acres with coffee, and 1,800 acres with cinchona. Of the balance 35,000 acres are forest (30,000 acres of which are alone owned by North Travancore Society) and 1,300 acres grass. Compared with the last returns, the above show an increase of 500 acres of tea and 200 acres of coffee, while the cinchona acreage has been reduced by 40 acres. The addition to the total area of estates has been 3,000 acres.

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Ear-drums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN, LONDON.

INDIAN TEA SALES.

(From Watson, Sibthorp & Co.'s Report).

CALCUTTA, Sept. 18th, 1895.

24,123 packages changed hands in the sales held on the 12th instant. The market was active, common sorts, especially Pekoes, being in very strong demand at a further slight advance, while the better grades sold irregularly with here and there a tendency in buyers' favor.

Buyers for the Colonies and Bombay were very keen, and suitable teas, particularly for the latter market, realised very full prices.

The average price of the 24,123 packages sold is As. 8-4 or about 8½d per lb. as compared with 18,967 packages sold on the 13th September 1894 at As. 8-9 or about 9½d per lb. and 15,381 packages sold on the 14th September 1893 at As. 6-7 or nearly 8½d per lb.

The exports from 1st May to 16th September from here to Great Britain are 55,798,142 lb. as compared with 55,169,921 lb. at the corresponding period last season and 47,776,962 lb. in 1893.

NOTE.—Last sale's average was As. 8-2 or about 8½d per lb.

EXCHANGE.—Document bills, 6 months' sight, 1s 1-11-16d.

FREIGHT.—Steamer £1-12-6 per ton of 50 c.ft.

THE SEASON IN MADRAS.

Yesterday the Board of Revenue telegraphed to the Government of India for the week ending the 21st instant as follows:—"Rainfall is good in Ganjam and Cuddapah; fair elsewhere, except in Coimbatore, Madura and Tinnevely. Agricultural operations are proceeding. Standing crops are generally fair and improving after the recent rains, but withered or withering in parts of Madura and Tinnevely. Want of rain is felt also in parts of Nellore, Cuddapah and North Arcot. Some harvest is going on with generally moderate yield. Pasture and fodder are generally sufficient. Cattle is in generally good condition. Prices are falling in parts of the Deccan; elsewhere generally stationary, but dry grains are slightly dearer in Godavari and Coimbatore."—*M. Mail*, Sept. 25.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, Sept. 14th.

CAFFEINE. The manufactures are very busy executing orders, and for September delivery 22s per lb. is the quotation, although it might perhaps be possible to buy a fraction below that price. For October-November delivery the makers would accept 20s and the price for December delivery has recently been reduced to 18s per lb. Most people interested in the article seem inclined to think that it will not fall below that figure.

CINCHONA.—The following figures are given concerning the movement of cinchona-bark on the Amsterdam market. The Amsterdam stock on August 31 consisted of 16,000 bales of which 1,902 were produced on the Government plantations, the remainder on private plantations. The imports in the course of the month of August amounted to 4,640 bales, and the sales to 6,076 bales.

QUININE has been very neglected through the week, and no business of any importance can be reported. The nominal quotation for second-hand German, in bulk, remains 13½d per oz. at which there are sellers, but there are no buyers over 1s 1½d per oz.

VANILLA in small supply; good qualities, however, are firmly held, and sold at an advance of about 1s last week.

CHAFED SKIN, PILES, SCALDS, BRUISES, CUTS, STINGS, NEURALGIC and RHEUMATIC PAINS, SORE EYES, EAR-ACHE, THROAT COLDS, and SKIN AFFECTIONS quickly relieved by use of CALVERT'S CARBOLIC OINTMENT, Large Pots 13½d. each (English rate.) Sold at Chemists, Stores, &c.

F. C. CALVERT & CO., Manchester.

CEYLON TEA IN AUSTRALIA.

(Alfred Harvey & Co.'s Monthly Tea Report.)

MELBOURNE-SYDNEY, Sept. 17.

GENERAL.—The third series of sales of Foochow Teas, ex "Taiyuan," was held on the 5th, the features of which were the reluctance of the trade to bid the higher price that increased cost demanded, firmness upon that part of holders resulting in the greater bulk of the offerings being withdrawn, and the larger quantity of good Panyong kinds, sold from 5½d, to 6½d, being taken by a speculator. The position of both the markets of supply and consumption, as regards the stocks available seems to warrant the safety of the spec., irrespective of the strong advance in value of leaf since the Foochow market opened.

Much larger supplies of Indians have been available during the month, and these, owing to the heavy falling-off in supplies from Ceylon, found ready buyers at last month's rates, with an improvement in one or two choice breaks shown. Calcutta, in sympathy with its rival markets of production, has shown an advancing market during the month marked with a decided firmness at close, both in value of leaf and exchange.

The continued advance of the Colombo market has materially reduced shipments to Australian ports, and has resulted in very high prices being paid for the few small lots of true Ceylon-flavoured Teas offered. The lower qualities show no change, the falling-off in supply being no greater than that of demand.

Stock in bond on the 7th were 3,485,979 lb. as against 3,884,755 lb. at some time last year.

CEYLON.—The very high prices ruling in Colombo have checked shipments to all Australian ports; consequently for the few true-flavoured lots offered upon this market further strong advances have been paid. "Bombays," owing to the better supply of low-grade, clean liquoring Indians, have been not only without change, but the demand has fallen away as rapidly as the shipments have diminished. As usual, the bulk of the sales have been effected privately, only about 700 chests being printed, and these sold at fancy prices whenever the lot offered showed good Ceylon flavour, whether it was a Pekoe Souchong or Orange Pekoe. Prices paid were:—For Dust, 5½d to 5¾d; rough Leaf, 5½d to 5¾d; "Bombays," 5¾d to 6½d; clean Pekoe Souchongs, 7d to 7½d; good flavour, up to 8½d; Pekoes, 7½d for clean, up to 10d for good flavour; Orange Pekoes, 8½d for tippy, up to 1s 1½d for fine hill-grown. Nothing choice shown publicly, but small lots sold privately at 1s 4d to 1s 6d. Stocks in bond on the 7th were 342,384 lb.

LONDON REPORTS ON CEYLON PRODUCE.
COFFEE.

August Brazil receipts totalled 810,000 bags against 844,000 bags last year, and to date since 1st July 1,325,000 against 1,466,000 in 1894. The fact of such heavy receipts has led to the belief in some quarters that the estimates of the present crop will be exceeded. Messrs. Faria Cunha & Co., Rio, Messrs. Goetz Hayn & Co., and Messrs. James Mathew & Co., Santos, have cabled to this effect. Simultaneously favorable reports as to the 1896-97 crops have come to hand, advices stating that the weather is fine, and prospects under present conditions point to a large yield. It is certainly early to talk at all definitely as to 1896-97 crops, all we can gather is that the present conditions are favorable. These telegrams, combined with liberal receipts, have adversely affected terminal markets. In Havre prices have eased 1½ to 2 frs., in London 1s 9d to 2s. The undertone is easy, but speculation continues cautious, operators do not seem inclined to take strong views at least for the present, and a waiting market is the result. Cost and freight prices in Brazil keep remarkably steady. Buyers are reluctant, having the opinion that with heavy receipts Brazil must come to them. On the spot the public sales have been small, prices are steady, commoner kinds of Columbian only being more difficult of sale. Messrs. Dmring and Zoon's monthly figures just to hand by wire show a decrease in the European stocks of 2,850 tons, and an increase in the World's Visible Supply of 13,860 tons.—*I. A. Rucker & Bancroft's Report*, Sept. 5th.

THE
AGRICULTURAL MAGAZINE,
COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for October :—

Vol. VII.]

OCTOBER, 1895.

[No. 4.

CEYLON FIBRES.

THE following reports made by London experts on certain samples of Ceylon fibre sent from the School of Agriculture is rather disappointing in view of the frequently expressed

opinion that there is a great future in store for Ceylon in the development of its fibre resources

The following are the samples referred to :—

(1). Fibre and rope prepared from *Sansevieria zeylanica* (S. Niyanda).

(2). Rope made from the fibre of *Furcraea gigantea* (S. Gonedass), the common hedge plant generally referred was "Aloe."

(3). Floss from the pod of *Calatropis gigantea* (S. Wara).

(4). Fibre from *Sterculia balanghas* (S. Nawa).

Report No. 1 on the above specimens :—" We think that as commercial articles they are little wanted, the world's supply of fibre, generally, being already not only adequate but really beyond the actual consumption. Consequently all those special fibres, against which, the fibres you submit to us, would have to compete, are at the lowest point in record, and any new product coming into the market would not in any case find a very profitable market.

Sample No. 1. The fibre is too short, but is well cleaned : a limited market might be found at present at about £8 to £9 per ton.

Samples No. 3 and 4. We can give no opinion, it is certainly useless for the fibre (rope) trade.

Sample No. 2. No market here whatever for the rope, which is very nicely made. It could

only be sold for the commonest purposes, as scaffold cords, and as we have already mentioned other fibres are so low, that the English rope makers need not allow any foreign rope to compete with them.

We would not advise either fibre or rope to be exported to England, except in small quantities as a trial."

Report No. 2.—" In my opinion the fibre could be treated in England, but I could not possibly say until the fibre was tested in this country.

No. 3 sample. I cannot say as to this No. It is not silk ; it looks like cotton.

I beg to say the ropes, or better called lines, look very well, and would sell here as they are if shipped in coils. All these Nos. 1 and 2 are worth about £20 per ton delivered in London.

No. 1 sample larger-sized 1 in. rope.—I have tested one of the strands three-times, and this stands a breaking strain on the average of 265 lbs. test.

No. 1 sample smaller size ¾ in. rope.—I have tested one of these strands, which averages 165 lbs. test.

No. 2 sample 3 strands larger.—The larger sample tested to 280 lbs.

No. 2 sample 3 strands smaller.—Tested 22½ lbs."

OCCASIONAL NOTES.

In our last issue on page 27 instead of the heading " Vines and Line Supports" read " Vines and Live Supports."

The reports on India Agave fibre as given on another page should encourage all land owners to adopt either *A. Americana* or *A. Vivipara* to the

exclusion of all hedge plants, for boundaries, with a view to supplementing their income from tea, cocoa, and coconuts by growing these fibres, and at the same time checking cattle trespass and solving the difficulty about suppressing theft of prædial products! But some enterprising person should set up a central factory for extracting the fibre by means of the most approved machinery.

We direct attention to an interesting extract referring to Weeds taken over from the *Agricultural Gazette* of New South Wales. We have ourselves written much on the subject of utilizing weeds to the best advantage by judicious treatment, instead of completely suppressing their growth under all circumstances. We know of some planters who have been bold enough to adopt the latter alternative and that with satisfactory results, but they are few in number. We commend the article referred to, to all agriculturists, and regret that owing to the limited space at our disposal we are unable to reproduce it *in extenso*.

It is satisfactory to be able to report that the experiment in Grape Culture at the School of Agriculture bids fair to be a success. About 750 rooted vines are now thriving well, and there are about as many cuttings making healthy growth. The following are the varieties being tried:—Gordo Blanco, Lady's Finger, Black Prince, Champion Muscat, Chasselas D'Or, Gross Colman, Snow Muscat Marillion, Black Ambro, Muscat of Alexandra, Black Hanbro, and White Marillion.

It is not two months yet since the vines were planted out, and many of the Gordo Blanco variety are already in fruit.

We learn through visitors and correspondents that vines are to be found nearly in all parts of the Island. We lately had the opportunity of inspecting two splendid vines in Matala, a very wet district, and on one of these counted over a hundred full bunches. A correspondent from Haugurankette writes us that he is growing purple grapes there. In Colombo, the owner of a vine in the heart of the town reckons on his R150 worth of grapes a year. All this must make M. Zanetti very hopeful about his experiment.

A small plantation of rhea fibre has been successfully established at the Colombo School of Agriculture, and the plants have stood out well against the late long and trying drought without any special attention given to them. Some demand has sprung up for cuttings, and it is likely that a few of our lowcountry landowners will give rhea a trial on a fairly extensive scale. The great advantage about rhea cultivation is that the grower has nothing more to do than to harvest his sticks once in two or three months and strip off the bark (which can be sold in Colombo) for shipment to London, where the extraction of the valuable fibre is now facilitated by chemical treatment, which, however, is a close secret. On making enquiries as to prices in Colombo, we were informed by one firm that they were prepared to

buy rhea bark in any quantities of not less than 5 tons in pressed bales at R9 or R10 per cwt. free on board. From another source the offer came of R150 per ton, nothing being said as to baling or placing on board.

As a general rule $2\frac{1}{2}$ gallons of milk are required to produce one pound of butter. The market value of good cow's milk in Colombo is about 20 cts. per bottle of 26 oz. ("guaranteed" pure milk generally fetches 22 cents and sometimes more), so that it would take about R3 worth of milk to produce one pound of butter; but the prices of butter is about R1.50 per lb., and to cover cost of production (including labour) and leave a small profit—sufficient to give a fair interest on outlay—the separated milk should fetch at least 12 cents per bottle. And if householders are wise they should gladly pay that price for milk separated by a machine than give 15 and 16 cents for the ordinary milk vendor's stuff. But, unfortunately, separated milk has no recognised value with us yet.

THE SAFFLOWER. (*Carthamus Tinctorius*.)

There are many plants cultivated in India which yield valuable dyestuffs, but there are also others growing wild which, if taken in hand, are capable of producing useful dyes. It cannot be denied that vegetable dyes are being to a great extent replaced by the aniline dyes, the products of coal tar. This is mainly due to the cheapness of the dyes and the regularity of supply which can always be depended upon. A manufacturer who uses a particular substance is put to a deal of trouble and expenses if after a time there is any interruption in the supply of that substance. He adopts his machinery and appliances to the product which he is using. His workmen get used to the handling and

manipulation of their materials in a special way and thereby gain a sort of dexterity which is of great importance, in that work is done expeditiously. The few vegetable dyes that have been in use in India have met with no demand owing to the want of a regular supply and uniformity in quality. These two important requisites could be met only by a systematic process of cultivation and preparation. However gloomy the future may be for indigenous dyestuffs, there is some consolation in the fact, that vegetable dyes are superior in quality to any obtained artificially. The former are extremely well adapted for the purpose of dyeing costly materials and they are devoid of the poisonous properties possessed by many artificial dyes. If a systematic method of cultivation be adopted, if technical knowledge which at the present day is indispensable in every walk of life is employed in their preparation, and if the chemist's aid is called in at the proper time, there is no reason why the vegetable dyes should not hold their own and pay their way.

Carthamus tinctorius yields the carthamine dye of the English. It is called by the Germans *safran*, and by the Spanish *cartamo*. In Russia the dye is known as *polerroi* and in India *kusumba*.

There are two species of *Carthamus* known to botanists, one a wild species, the *Carthamus ovyacantha*, met with in the North-Western Provinces and the Panjab, and other *C. tinctorius* or the true Carthamin grown largely in India, Spain, Germany, Hungary, Italy and Russia, and even in South America and the Sunda Islands. The plant is also cultivated to a certain extent in China and Egypt.

Carthamus tinctorius is an annual herbaceous plant with large orange-coloured flower heads. The history of the plant is little known, as the plant is no where found in its wild state. De Candolle believes that the grave clothes of ancient Egypt were dyed with Carthamin. It is said the plant was introduced to China in the second century B.C. Indians at one time were not aware of the presence of the valuable red dye, but grew it for its evanescent yellow dye and for the oily seeds it gave.

EARTH-VELOS.

This is a preparation patented by Strawsons Limited, the well-known firm whose name has been long associated with insecticides and machines for distributing them. The preparation is in the form of a powder, and special forms of it are known as Hop-velos, Vine-velos and Tea-velos, their use being intended particularly for ground pests of whatever nature. Earth-velos is said to be suitable for all crops, requiring neither skilled labour nor expensive machinery for its use. It is sufficient to spread it evenly over the soil, and hoe or plough in at the time of ordinary cultivation. It destroys wire-worms, leather-jackets, grubs, millepedes, beetles, aphides and all insect life in the soil—preventing insects from entering the soil to hibernate or change into chrysalids and thence into grubs, and destroying those already there. For fruit gardens, the ground may be strewn over with the powder by means of a distributor such as Strawson's "Coronette" (specially designed for dealing with

insecticide powders, and costing only 30 shillings) at the rate of 1 or 2 cwts. per acre. About three dressings a year are advised. Where the roots of trees are deep and difficult of access a hole from 8 to 16 inches deep may be made with a stake and a teaspoonful of Earth-velos put in, the top of the hole being closed by means of the heel. Great success appears to have attended the use of this preparation against phyloxera in vines. The effect is in some respects like Bisulphide of carbon, but the preparation is safer and cheaper, being non-poisonous. Further, it can be kept any length of time if covered, but should be preserved dry and never mixed with water. Being combustible, however, no fire or artificial light should be brought in contact with it. Earth-velos is sold in packages of one shilling, two and six pence, and five shillings, or in large quantities at 32 shillings a cwt. or £28 per ton. We believe that the Eastern Produce and Estates Company is the agency for Messrs. Strawson, whose London address is 77, Queen Victoria Street, London, E.C.

INDIAN CORN AS HUMAN FOOD.

Indian corn—on what grounds, it is difficult to explain—is little fancied as a human food in many parts of the world where it could be cultivated with success. Probably there is a misconception as to its proper nutritive value.

In a bulletin issued by the Department of Agriculture, Brisbane, it is stated that excepting sugar cane, maize is the most important crop grown in Queensland—about one-half of all the cultivated land of the colony being devoted to it. The average yield per acre for 1894 is given as 25·8 bushels, which is higher than is obtained in the United States, the greatest of maize-growing countries. Dr. Wiley, chemist of the United States Department of Agriculture furnishes a table of analysis of leading cereal grains, which serves to show the chemical relations that maize sustains to other bread grains, and clearly indicates the value of the different foods, based upon the digestible food elements which they contain. The following is the table:—

	Hulled Oats.	Wheat.	Rye.	Barley.	Maize.
Water ...	6·93	10·27	8·67	6·53	10·04
Ash ...	2·15	1·84	2·09	2·89	1·52
Oil or Fat ...	8·14	2·16	1·94	2·68	5·20
Digestible carbohydrates ...	67·09	71·98	74·52	72·77	70·69
Crude carbohydrates ...	1·38	1·80	1·46	3·80	2·09
Albuminoids ...	14·31	11·95	11·32	11·33	10·46

[We might here add the following analysis of rice for purposes of comparison:—Water 13·0, flesh-formers 6·5, starch &c. 80·0.]

Dr. Wiley, commenting on the above table, says: "As indicated by the above analyses, maize is fully equal in value as a food to any of the cereals, making up in its contents of fat any deficiency which might be noticed in its nitrogenous matters and digestible carbohydrates. This conclusion, however, as to the food value of maize, does not rest alone upon the comparison of analytical data. The long years of use

of this article, by man and beast, has shown its high character. Whether to be used as food for producing muscle for labour, or as a means of fattening animals, it has been found to be of superior value to any of the other cereals produced in the United States."

Another reason that may be assigned for the prejudice against Indian corn as an article of human food is the fact that few know how to prepare it so as to form a palatable diet. Professor Shelton of Queensland condemns the grinding of maize into a fine powder as in the case of wheat, and states that maize flour in this condition is quickly converted by cooking into a sticky, pasty mass, which is both unpalatable and indigestible. Maize, he says, should be ground into an even and rather coarse meal—not flour—which, when cooked, gives the light granular bread and cakes seen in maize-consuming countries. He further recommends that the maize should be thoroughly kiln-dried before grinding, and the germ afterwards removed from the grain, explaining that this will give a better and more uniform meal that will keep without becoming rancid.

DAIRY PRODUCE.

The following extracts are from a valuable and exhaustive paper read by Surgeon-Captain P. W. O'Gorman before the Indian Medical Congress:—

If there be any article of diet in India that needs more than any other the earliest and most stringent regulations to be enforced against disease and adulteration, I claim them for our dairy produce—produce on which by far the largest proportion of our population, European and native, of all castes and classes—infants, children, invalids—subsist for long periods together, and these the most helpless and voiceless. Time after time is disease being specially traced to this produce: lives are being sacrificed every day, and outcries arise from every station in India against the present régime. The time is, therefore, ripe for legislation. All European countries have laws in force against adulteration of food, and the last were passed by the Senate of the United States in 1892, under the name of the "Pure Food Bill."

From the labours of Pasteur, Koch, Klein and others, much light has been thrown on the bacteriology of milk products. Schenk describes 25 pathogenic and saprophytic micro-organisms, but several others can be added. Milk may be contaminated either during milking or in the subsequent manipulation, and may exhale an odour owing to the substances so acquired (*Bacillus fetidus lactis*), or become slimy or stringy (*Bacillus lactis viscosus*), or take on a bitter or an acid (*B. dahi*. Hankin), sweetish, putrid taste (*Bacillus fetidus lactis*) or its colour may turn yellow, blue (*B. cyanogenes*), or red (*B. lactis erythrogenes*). Moreover, various pathogenic micro-organisms (parasitic) may be imparted to milk from the diseased animal furnishing it. Many dangerous organisms, however, may exist in it or in its products without exciting notice.

The following 13 diseases have been discovered to be due to milk contaminated, either directly or indirectly, by specific germs, viz:—

Tuberculosis
Typhoid or Enteric Fever
Cholera.
Diarrhœa (Enteritis)
Vomiting and Purging (ptomaine poisoning.)
Gastritis.
Dyspepsia (acidity, etc.)
Stomatitis and Aphthæ.
Diphtheria.
Scarlatina.
Foot-and-mouth disease (eczema epizotica).
Peculiar febrile symptoms.
Peculiar "milk sickness" (vomiting, collapse, etc., from cows suffering from the "trembles.")

To these may very probably be added several others, including dysentery, malarial fevers, small-pox, rinderpest, pleuro-pneumonia, actinomycosis, and anthrax due to direct contamination or adulteration with befouled water, etc. Milk may also be contaminated by inflammatory products in nearly every disease to which the cow is subject. Professor Brown cites an instance where, in a case of septic mammitis, a milker actually milked into a pail a quarter of the contents of the udder, from which came nothing but pus, under the impression that it was peculiarly rich milk.

It ought also to be specially borne in mind that "*cheap*" and "*nasty*" are convertible terms in dairy produce. I wish to emphasise this fact that it is absolutely impossible to get good, pure, wholesome dairy produce at the present prevailing rates. They ought most certainly to be raised from one-third to one-half higher.

I have now, I think, made out a very strong case for legislative interference in the interests of both natives and Europeans. The Municipal Act should be amended and strengthened, and rigid inspection and regulations enforced on all the points I have indicated. And as the country at large is not yet ripe for such measures, I beg to earnestly urge that the amended Adulteration and Dairy Produce sections of the Municipal Act or a new separate *Pure Food Act* be extended to all cantonments, large railway stations, and all municipal towns, and perhaps subdivisional headquarters of districts. All inspectors to be properly qualified, and be Europeans in large towns and cantonments. Another thing I would beg to urge on Government would be the direct encouragement, in every possible way, of *European private enterprise in Dairy farming*, in preference to any Commissariat monopoly of such, as otherwise the civil population can never hope to enjoy the untold advantages of modern dairying.

WATER MEASURES AND RINFALL.

In connection with various operations in practical farming, conservation of water, rainfall and irrigation, the following measures and quantities, given in the Agricultural Journal of Cape Colony, will be found useful:—

Water Measure.

One Imperial gallon of pure water weighs 10 lbs.
" " " " " contains 277·274 cubic in.
1 cubic ft. contains nearly 6½ Imperial galls. (6·23)
" " of water weight 62½ lbs. (62·212)
" yard contains 168½ gallons,

- 1 Imperial pint of water weighs $1\frac{1}{4}$ lbs.
 " " contains 20 fluid ounces.
 6 wine bottles are reckoned to contain one gallon
 of water, or $26\frac{3}{4}$ ounces each.
- Rainfall and Irrigation.*
- 1 inch of rain is 144 cubic inches to a square foot.
 " " 1,296 " " or $4\frac{1}{2}$ galls. to
 the sq. yard.
 " " 22,622 galls. to the acre (4,840 sq. yds.)
 " " 113 tons to the acre.
 " " $14\frac{1}{2}$ million galls. to the sq. mile.

By an inch of rain is understood as much rain as would form a sheet of water one inch deep over the surface of the ground, if none of it soaked into the soil or ran off

An inch of rain falling on a roof will be after the rate of a little more than half a gallon to the square foot. As the slope of the roof makes no difference, a house roof will, when an inch of rain falls, collect a half gallon of water for every square foot of area the house stand upon. So if a house is 40 ft. long and 30 ft. wide, the catchment area will be 1,200 square feet, and an inch of rainfall will supply to a cistern 600 gallons, allowing some 15 gallons for waste and evaporation. If there is 20 inches of rainfall during the year, then with proper spouting and cistern room, the abovementioned roof or area will furnish during the year 12,000 gallons of water.

An inch of rain over an acre of 4,840 square yards being 22,622 gallons to the acre, it is a matter of some interest to get the approximate quantity required for irrigating.

As I find that usually, even in a dry season, after 2 inches of rain have fallen, the land can be ploughed, I have suggested that 50,000 (fifty thousand) gallons be accepted as an estimate, the quantity required for irrigating an acre of land once.

Of course more or less water will be required according to the nature or staple of the soil, its dryness and powers of absorption. But still it is well to have a definite or approximate standard of measurement as to the quantity of water required, to be delivered by a pipe or furrow, or, it may be pumped for irrigation.

In Spain the regulation quantity of water for one irrigation is $2\frac{3}{4}$ inches. This would be 52,210 gallons per acre.

It has been found in practice that one good watering is much better than two or three light ones. For unless the water soaks some way into the ground, it does not enable the crop to feed on the plant food in the soil. If only a little below the surface is kept moist, the roots of the plants will be encouraged to grow near the surface and suffer from the heat and drought, instead of penetrating deep into the soil and sub-soil.

Measuring the delivery of water as to quantity supplied in a given time, has been a question of some consideration, enquiry, and experiment.

The fact or difficulty to be dealt with is that the quantity of water delivered over a weir or through a pipe or any other kind of aperture *constantly* varies with depth or pressure of the head of water whence it is derived.

For instance, the quantity of water which is delivered through a four-inch pipe with *two* feet of water above the orifice will be 354 gallons per minute, while the quantity delivered through the same pipe with a head of *one* foot of water would be only 250 gallons per minute, being a difference of 1,240 gallons per hour.

So the problem to be solved was to invent or arrange some plan by which the water should always be delivered under the same pressure which would be secured if always the same *head* or depth could be maintained.

In Italy this water measurer is called a *module*. The principle of which is, that a stone trough is filled from the canal, river or spring, in which trough or module the water is always kept at one state of fulness or level, and so maintains the same pressure and consequently delivers exactly the same quantity of water at all times and in perpetuity.

In the United States of America the law of water delivery provides for the construction of a "module."

Water is sold by the *square inch*, that is the quantity which will be delivered by each square inch of the aperture through which the water flows. An orifice one foot long and two inches high, thus delivering 24 inches.

The law provides that "water sold by the inch by any individual or corporation shall be measured as follows, to wit, every inch shall be considered equal to an inch square delivery orifice under a five-inch pressure, and the five-inch pressure shall be from the top of the orifice of the box (module) to the surface of the water." This will give a constant pressure of four inches.

A module thus constructed, and with this pressure, will deliver through *every square inch* of the orifice $7\frac{1}{2}$ gallons (Imperial) every minute, and 450 gallons per hour.

A four-inch pipe under the same pressure will deliver 94 gallons per minute.

LAWS OF CEYLON RELATING TO AGRICULTURE.

CHAPTER X.—*Miscellaneous.*

1. As it is necessary to have channels of drainage, ponds, and tanks unobstructed, plans or surveys, made under the authority of the Surveyor-General, in which encroachments shall appear, shall be considered conclusive, unless satisfactory proof to the contrary shall be established.

2. It shall be lawful for the Government Agent to order verbally or in writing, any person obstructing or encroaching upon any watercourse, pond or tank within his Province, to remove such obstruction or encroachment, or to abate it. And if the person who is so ordered shall fail to comply with the same within a reasonable time, or if there be any doubt as to who is the proper person to whom such order should be given, the Government Agent may cause such obstruction to be removed; and the Government Agent, or any person authorised by him in writing, may use all reasonable means such as may be necessary for such removal. The Government Agent may recover the costs *bona fide* incurred in effecting such removal from the party whose non-compliance with orders caused such costs, in manner provided in Chapter IX. of this Ordinance.

3. If any person by clearing or draining any land, by doing any act whatsoever on the same, shall cause any channel, watercourse, or eld used for irrigation purposes, to be blocked up, or obstructed by silt, earth, or other substance, it shall be lawful for the Government Agent of the

Province within which such land may be situate, to give order to the owner or occupant thereof, by written notice, within a reasonable time to be specified in such notice to

(a.) Remove forthwith any such silt, earth, or other substance.

(b.) Provide all such drains, pipes, and other works as may be necessary to carry off the water from such land to some point where it can be passed over or under such channel, watercourse or ela.

4. A copy of such notice shall be affixed in some conspicuous place on such land, and another copy shall be sent by registered letter through the post, addressed to such owner or occupant, and if so sent shall be deemed to have been served at the time when the letter containing the same would be delivered in the ordinary course of post.

5. In proving such service, it shall be sufficient to prove that the letter was properly addressed and registered at the Post Office.

AGAVE FIBRE.

The following is a report by Mr. Collyer, the fibre expert, on two samples of Agave fibre sent from India—one from Saharanpur, N.W. Provinces, the other from Coimbatore, Madras Presidency.

"Saharanpur fibre, length 40" to 60", fair light colour, good strength, fairly clean, rather fine flattish fibre, similar in character but rather superior to *Furcraea gigantea*, equal for some purposes to fair current Manilla hemp, but finer in fibre. Value £22 to £24 per ton.

Coimbatore fibre, length, cut ends 24" to 30," fair, yellowish colour, well cleaned cut end, good strength, good roping quality, but short. Value £20 to £22 per ton.

Agave fibre, equal in quality to either of the above samples, would sell readily in any quantity at slightly under the fair current Manilla hemp (£23 to £24), and its growth should be encouraged to the utmost."

The plant, *Agave americana*, is as a rule not grown for its fibre. In Upper India it is generally used as a hedge plant to prevent cattle trespass. It is said to grow on any soil, but that best suited is a mixture of clay and sand that may be described as a rich heavy alluvial loam. The plant grows both in the open (as along the Madras Railway Line,) as well as under shade, but best in the former position. In the Saharanpur sample the fibre was extracted immediately after cutting the leaves, by beating with a wooden mallet, washing out the pulp, and drying in the sun. In Coimbatore the fibre is generally extracted at once, but sometimes a day or two after cutting. The extraction is done by hand, either by maceration or scraping. The fibre got by scraping without washing or bleaching is very clean and free from pulp, though not very long; that by maceration is longer but not nearly so clean.

Mr. Gollan, Superintendent of Saharanpur Gardens, states that a plant of average age, or say from 6 to 8 years old, will annually produce from 12 to 15 mature leaves. The average weight of a fresh leaf of *A. americana* is $2\frac{3}{4}$ lb., in the case of *A. vivipara* $\frac{1}{2}$ lb. The fibre of the latter though shorter is considered better, and the plant superior for hedges.

The Coimbatore plant is possibly *A. americana*, but it is to be feared that this species and *A. vivipara* are often confused, and hence probably the reports of varying quality in the samples of Agave fibre submitted to experts.

Aloe fibre is also produced from *A. vivipara* in the Bombay Presidency. The plant grows wild, but is not cultivated specially for fibre. It is of slow growth, and takes about 2 years before the leaf can be cut for fibre.

The following is an extract from the report of Mr. D. Morris of Kew Gardens:—

"It is evident, however, that the plants exists in Bombay in sufficient quantity to supply several hundred tons of fibre received in this country. After a consideration of the facts noted below, it might be found advisable to cultivate this species of Agave on waste lands in Bombay entirely for the sake of its fibre or the sisal hemp plant, *Agava rigida*, var. *Sisalana*, might be introduced on a large scale. This latter yields the most valuable fibre of any desired from species of Agave, and there is little doubt it would thrive equally well in India. The important fibre industry of Yucatan, created entirely within the last twenty years, is now of the annual value of about three-quarters of a million sterling; India has, therefore, good grounds for devoting attention to an industry which so far has established itself on a moderate scale in spite of adverse circumstances.

"In order to test the quality of the fibre produced by *Agave vivipara* when cleaned by machines similar to those in use for the preparation of Sisal-hemp in Yucatan and West Indies, a few of the broken leaves about a foot to two feet in length, taken from the larger plant received at Kew, were forwarded to the Death's Fibre Machine Company, 147, Leadenhall Street, E.C."

The sample of fibre produced by passing the leaves through the Death Machine as well as that cleared by hand in Bombay were examined by Messrs. Ide & Christie; and their report showed a great difference in quality and value between the two. Mr. Morris continues:

"The value of the machine-cleaned fibre ranges, according to length, from £25 to £30 per ton. The ordinary Bombay aloe fibre, cleaned by hand, is worth from £5 to £12 per ton. These figures fully bear out the opinion offered in my letter of the 21st February, 1887, that the Bombay aloe fibre industry was capable of being greatly improved. At the present time (1890), there is in stock in this country 1,000 tons of Bombay aloe fibre, which, prepared roughly by hand, will only realise (if sold) about £8,000, a price that will probably hardly pay expenses. If this fibre had been cleaned by machinery and presented in the condition of the sample produced by the Death machine, it would realise about £27,000, or more than three times its present value. It appears possible, therefore, without any extension of the present Agave plants in Bombay, to increase, to a very appreciable extent, the returns on the shipment of Aloe fibre from that Presidency. The following is the report of Messrs. Ide & Christie on the two samples of Aloe fibre mentioned above:—

We have your favour of the 4th inst., (February 1890,) with samples of fibre extracted by Death's process from the leaves of *Agave vivipara*. This

is an excellent fibre, of fair strength, fine colour (which however, may change somewhat under continued exposure to the air); and were it *three* times as long would be worth £30 per ton today in London; if twice as long, £27; and, as it is, it may be valued at £25.

The ordinary Bombay aloë of commerce presents a very different appearance to your specimen. Its value today is good, £12; common £5 per ton.

Sir Fredrick Abel, Secretary and Director of the Imperial Institute, considers that to the process of "retting" or steeping the leaves in water may probably be due the inferior quality of fibre, as it is a well-known fact that monocotyledonous fibres will not, as a general rule, bear retting. He further writes:—

It may, therefore, be of importance to the Bombay aloë fibre trade to bring to the notice of the authorities in the Agricultural Department of the Government of Bombay the fact that a better fibre than that usually supplied to the market as Bombay aloë has been obtained from Indian-grown Agaves. This was shown in the report of a fibre expert."

POULTRY NOTES.

According to *Town and Country*, M. Bournouf recommends in *Le Belier*, a French Journal of Agriculture, the following method of preserving eggs: Dissolve in two-thirds of warm olive oil one-third of bees-wax, and cover each egg completely with a thin layer of this pomade with the end of the finger. The egg-shell by degrees absorbs the oil, and each of its pores becomes filled with the wax, which hermetically seals them. M. Bournouf affirms that he has eaten eggs kept for two years in this manner in a place not exposed to too great extremes of temperature. He thinks that the germ may also in the same manner be preserved for a considerable time.

Dr. Ropenshaw in Poultry states, on the other hand, that all plans for preserving eggs are more or less unreliable, because the eggs experimented with are, so to speak, alive, or contain a living germ, which can only last for a certain time unless developed by incubation into a higher form of life, when the egg necessarily becomes "bad." He draws attention to the facts that unfertilized eggs are after being subjected to incubation found to be perfectly fresh, while fertilized eggs in which the germ has perished are found to be putrid.

"If a poultry-keeper wants to preserve eggs," says Dr. Ropenshaw, "let him not keep a cock. The hens will lay just as well without one (in my experience better), and the eggs will keep if carefully rubbed over with fresh butter and then put in a cool place, not heaped up one on top of another, but placed side by side on a shelf previously covered with a thin layer of sawdust or dry moss (not hay, which has a strong smell; or bran, which is apt to get musty): if they are turned half round now and then they will remain perfectly good for six months, possibly longer, but I have only tested them for half a year, and cannot speak positively beyond

that I consider the buttering a much better plan than pickling or soaking in lime water, for if the butter is fresh it imparts no taste whatever to the preserved eggs, which at the expiration of six months cannot be distinguished when cooked from eggs one to three days old. But they must be unfertilized eggs to begin with, for those that contain a living germ will not keep, no matter what method is adopted to preserve them. Moreover, maiden hens lay far more eggs than mated ones, and are not nearly so frequently 'broody.'

Turkey hens are to be preferred for hatching eggs for many reasons. As their period of incubation is longer, there is more chance of constant sitting, and they make very careful and attentive mothers. They will easily cover from eighteen to twenty hen-eggs, and will continue quite useful for five or six years.

A little powdered sulphur or carbolic should be sprinkled in the nests made for hatching this will keep off vermin. In very dry weather it is advisable to sprinkle the eggs with warm water about three days before they are due to hatch out. The average time required for hatching out the eggs of the different kinds of poultry are

Ordinary fowls	...	21 days.
Ducks	...	28
Turkeys	...	26 to 29 days.
Geese	...	30

The two commonest diseases among fowl are Roup and Diarrhœa. The symptoms of roup are running at the nose and sneezing. Immediately these symptoms are observed the bird should be isolated. A tea spoonful of Epsom salts should be given immediately, and when this has acted the head and throat should be washed with diluted kerosine (two parts water to one part kerosine). Soft food only in a crumbly condition should be fed, and if the attack has been taken promptly the bird should recover within a week. Care, however, must be taken to watch for symptoms among the healthy birds, for if the disease is found to have affected several, it would be better to shift all the birds into another pen, and the infected pen should be closed and properly disinfected.

Diarrhœa is often caused by the drinking water being left in the sun, and also by feeding the soft food in a sloppy condition. If promptly attended to, a case may generally be cured by feeding a little boiled rice sprinkled with prepared chalk. If there appears a tendency amongst the birds in the pen to contract diarrhœa, a few drops of tincture of iron should be put in the drinking water, in addition to giving rice and chalk.

WEEDS.

The plants which endeavour to take possession of our fields, and are apt to choke the struggling crops (or apologies for such) are called "weeds," are despised, detested, and persecuted as "exhausters," while they really represent the means by which nature endeavours to replenish the exchequer, and to restore the productive power of the soil, of which it has been deprived by man's

inconsiderate actions. For what does he do? By ploughing, &c., he turns up the lower actively living soil, and brings it to the surface, while at the same time he turns down the dried-up dead surface soil, burying with it the dead and living vegetation, which under normal conditions is here revived, and adds to the fertility the products of last season's sun-force in the form of carbon and organically combined saline compounds (manures), which should be supplemented by fertilisers to make up for that portion removed in the form of grain, hay, fodder, &c., or washed out by rain. So far, it is all right. If the ground be sown while moist at slight depths, as is the case under cool and moist atmospheric condition (old world countries mostly), the young plants rapidly cover the surface and shelter it from the sun's rays. It then remains moist, and is thus preserved in constant vital activity, unless frozen. Then all manures, fertilisers, &c. can and do act to their full extent, being laid hold of by the natural organic and chemical forces, and made available for the higher plant life, and absorbed for man's advantage. In this way no deterioration or impoverishment follows or need follow, but instead regular improvement. In hot and dry countries like ours, other conditions prevail, but the same operations are persisted in mechanically, and result not in the same beneficial effects, but in constant deterioration proved by continually decreasing averages of our grain and vegetable crops, notwithstanding increased care, and the adoption of more or less scientific methods. We plough and fallow like our European forefathers. Moreover, before doing so, we feed off all the weeds and stubble, or rake them together and burn them, leaving the ashes and cinders to be blown away by the winds, and to be washed away by the floods, and leaving the soil as bare as a floor, and exposed to the glowing heat of the sun, which bakes the surface as hard as a rock and kills all the agents of fertility beneath, except the seeds of mischievous weeds, and the eggs of injurious insects. By fallowing in spring we loosen and bare the soil more mischievously still, under the mistaken ideas, that "it needs rest"; that weeds exhaust it; that the soil requires to be aerated, and that to make the air circulate the soil needs breaking up, and exposing to the sun, &c. The last is only necessary in soil reclaimed from morasses and swamps, when the soil, on the retreating of the water becomes compressed into a stonelike, airless, homogeneous substance by atmospheric pressure from above. There is some truth in all, but just enough to conceal the fallacies.

Acting on such fallacious ideas, we only succeed in converting our fields into deserts and blasting our future, for the causes which operated hitherto in reducing the 50 bushels per acre in early years to 5 at present, are still acting, and will reduce the 5 to less still, till not even grass or weeds will be able to exist. It is not enough to study books, or to consult "authorities" by the score, we must study nature herself. Word-knowledge is apt to prove delusive, thing-knowledge alone can guide us nearer and nearer to truth, which only he could fully gauge, who knew everything. This no man, least of all the multitude, can attain. The soil, as all other things, must not be merely considered from one aspect, but from as many as present themselves. What may be perfectly true from one point of view, or under one set of conditions

in one country, is, or may not be so under another elsewhere, nor does it matter how many experts or authorities (text-books included) entertain a belief, if it be false. We must always be ready to bring our beliefs and opinions into line with nature's laws if we desire to prosper. Look about you then for nature's facts. Do you find that the richest ground which is bare, or that which is reeking with plant life. Does the latter ever get rest? Certainly not, and yet its fertility and richness augment from year to year. Why should this be? Because the plants grown and growing there convert more and more of the purely mineral and chemical ingredients into sub-organic ones by the aid of worms, nitro-bacteria, &c., bringing out the actively fertile qualities more and more, and at the same time shelter the surface from being heated and dried up. Moreover, the growing plants and their dead remains arrest the flow of rain-water, compel it to move slowly, and conduct a very large proportion through root and worm holes to the subsoil, laying up a stock more or less in excess of their needs under ordinary circumstances. You can prove this any day for yourself. Dig in densely weedy or stubby soil, and measure the depth at which perceptible moisture is met with in summer, and you will find it at much less depth than in a large area of bare ground in constitutionally loose soil, at less than in hard-baked, nay, in the latter cases you may get through the moist soil into permanently dry lower down, a state of affairs perhaps never met with in plant-covered areas. Only such soil as had become waterlogged at some time (swamps, river-flats, &c.) when dried, needs breaking up and aerating by exposure, not naturally loose and porous soil. To render hard-baking soil loose no fallowing, &c., will permanently avail. That object can only be attained by the abundant addition of carbonaceous substances (stable manure, &c.), and lime or sand. The lime need not be quicklime, but ordinary lime stone crushed or ground, the smaller the quicker in action. Our customary farming methods, in combination with our climate, do their level best to withdraw both carbon and lime from the soil. The former is burnt up gradually by the long exposure of the bare, broken-up fields to the fierce heat of summer. The latter is washed out in the form of bicarbonate by the floods of winter, carried to sea, or into the deep porous subsoil, beyond reach of the roots of cereals, vegetables, or root crops finally. Why wonder then at the decreasing fertility? The fruitful soil has become sterile by losing the whole or a large part of two most essential constituents, is losing more still. Sand and clay, with a proportion of useless stones, and the colour remain, although even in this the black has given more or less way to the red, where carbon alone, and not manganese, deepens it.

GENERAL ITEMS.

Town and country says with reference to mulching and watering fruit trees:—A dry season is very hard on fruit trees as well as on other plants. In such a season mulching is of the greatest benefit to all kinds of plants. Any vegetable matter will do for a mulch, but of course the most nutritious grasses and fodder plants answer best. Litter of all kinds more or

less impregnated with manure is especially valuable, as it will not only help to retain the moisture in the soil, but also manure it. Weeds, so long as they do not contain too much seed, brush wood, and muck of all descriptions will answer very well as a mulch. The depth of a mulch may vary with the conditions of the soil and the quantity of material at hand. Some people spread mulch all over the surface of their land to a depth of one foot, but perhaps a depth of from three to six inches is about the average. Water may be most beneficially applied in connection with mulch. Some people apply it by simply pouring it over the top of the mulch, and letting it soak through to the soil, while others remove the mulch from around the tree, open a small trench some five or six feet from the tree, and pour in a quantity of water, permitting it to soak into the soil and replacing the mulch. By the latter method a smaller quantity of water will probably suffice to moisten the soil than if poured over the mulch, as in the latter case a considerable quantity might be lost through evaporation, but if the mulch is kept moist it will decay all the quicker, and furnish its manurial ingredients to the soil. One of the chief objects of mulching is, however, to shade the soil from the sun's rays, and keep it from cracking and drying up. It also has a powerful capillary action in drawing the subsoil water to the surface and so keeping the surface moist, thus furnishing needful water to the lateral rootlets of the plant.

—————

"Coal ashes," says the Editor of the Cape Agricultural Journal, "contain a small quantity of potash. Wood ashes vary in the quantity of potash they contain from 4 up to 10 per cent. All the sources of supply of this material should be most carefully hus-

banded and kept dry, as rain will soon wash all the potash out of ashes and under them almost valueless. Where lime is burnt with wood, the mixture of lime and ashes produced in the process will be useful for trees and crops. One of the principal sources of potash for manure is German kainit worth in London about £2 10s per ton, and containing, in the best quality, about 14 per cent of potash."

—————

The *N.S.W. Agricultural Gazette* refers to a warning that comes from America as to a much-advertised so-called fodder plant known as sacaline. This is a polygonum, and, as European and American seedsmen's catalogues reach this country, it is just as well to take time by the forelock, and warn searchers after novelty against any extensive trial of this plant. It is stated that none of the more conservative seedsmen include it in their lists, and the reason of this is probably fully explained in the following opinion of it by the head man of one of the largest seed firms in Philadelphia. He says:—"Look out! for you will be terribly disappointed if you expect to realise the hopes that the glowing descriptions from Europe would seem to warrant. In a couple of years they will make roots the thickness of a man's arm, circling and running in all directions through the ground. When once the plants are established, you may try with all your might, but you cannot destroy them; they simply laugh at you, and grow so much the stronger. Farmers, do you want to spoil and infest your land? Then plant polygonum (sacaline)."

—————

Never add lime to a manure containing nitrogen; and when lime has been applied to the land, do not use such manures until about three weeks afterwards.

DO PLANTS ABSORB NITROGEN ?

ALTHOUGH the question opened by "Student's" query in your last issue (page 231) would demand a special article dealing completely with the absorption of nitrogen by plants, a short note may be of some service.

Briefly stated, plants have access to nitrogen in two conditions—*i.e.* (1) As free uncombined nitrogen in the air; (2) In a combined state (as salts of ammonium, nitrates and organic compounds in the soil). A very large number of carefully conducted experiments have shown that the absorption and assimilation of nitrogen in a free state is confined to the lower orders of plants—mainly bacteria—and to leguminous plants among higher green vegetation. Wheat, Rye, Buckwheat, cruciferous plants, and many others not belonging to the Leguminosæ, always die of nitrogen starvation when grown in soil containing very little or no nitrogen, although they may be exposed to the air. Moreover, leguminous plants die under these conditions unless their roots are possessed of fleshy "nodules" (well seen on the roots of ordinary Broad Beans). It is from the combined forms that an ordinary green plant—Wheat, for example—obtains all the nitrogen it possesses, and this it takes up means of its root-hairs from the ground.

In the soil the plant has access to nitrogen in (1) complex organic compounds, resulting from partial decay of vegetable or animal remains; (2) ammonium compounds (*e.g.*, ammonium carbonate, sulphate; and also (3) nitrates, chiefly of sodium, potassium, magnesium, and calcium. It was formerly supposed that the ammonium compounds supplied plants with all the nitrogen necessary for growth, but definite experiments have shown that, although many green plants can be nourished by both organic compounds and pure ammonium salts, the results are in every

way inferior to those experiments where the plants are supplied with nitrates to their roots. These facts, coupled with the knowledge that both organic compounds and ammonium compounds soon give rise to nitrates in the soil, lead to the conclusion: that plants absorb or take up their nitrogen from nitrates, and seeing that nitrate of lime is most abundant in the soil it is concluded that this substance is the main source of nitrogen for plants.

"Student's" difficulty lies in the assumption, or statement, that nitrate of lime is taken into the plant as such—that is without any change. If this were true we should, as he remarks, expect to find the lime (neglecting the other bases, potash, soda, and magnesia), and nitrogen in something like the same chemically equivalent proportions as met with in nitrate of lime. This is found not to be the case. There is an excess of nitrogen and a deficiency of lime, as seen in the analysis quoted, and this has led "Student's" query and suggestion that the nitrogen must have been obtained from other sources than nitrates. The latter view has been amply refuted by most careful experiments, and the explanation of the apparent discrepancy is that the nitrate of lime is split up and decomposed at the very threshold of entry into the plant—*i.e.*, in the root-hairs and in the roots which are not included in the analyses given, which soon dry up and remain in the soil. The lime is thus separated and practically left in the soil, while the nitrogen enters into new combination, and helps to build up various more or less complex organic compounds. The ratio of the lime and other bases to the nitrogen in different plants grown even upon the same soil, and thus having equal access to nitrates, varies much.

The details of the chemical changes which nitrogen undergoes after entering the plant and where these changes take place are practically unknown yet. The changes are slow, compared, for example, with those undergone by carbonic dioxide, and difficult to follow. Different kinds of plants, growing with equal access to nitrates in the soil, show very different results as regards their method of taking up and utilising these compounds. In some cases the nitrates can be readily detected as such in all parts of the plant; in others only in the stem, or perhaps only in the root, or in no part at all.—JOHN PERCIVAL.—*Journal of Horticulture.*

COFFEE PRODUCTION IN THE MONTANA OF PERU.

Peru has been known for many years as a coffee-producing country, but the coffee grown on the coast has been absorbed by domestic consumption, and Peru's appearance as an exporter of this article is of recent date, although she is now likely to be a considerable competitor with other countries. Coffee planting began, and coffee is still cultivated near the port of Pacasmayo, with success. But although the cultivation on the coast could be somewhat extended, it must always remain restricted, as there are only certain favoured localities in which the planter can hope for a good return. The acting British Consul at Callao says that the region which Peru offers to the coffee planter unsurpassed in fertility, and almost unlimited in extent, is situated on the eastern slope of the Andes, at a height of from 6,000 to 2,000 feet above sea level, among the network of streams and rivulets that find their way into the great affluents of the Amazon. This region, known as the Montana, has hitherto been shut off from the world by lack of communications, and, above all, by the difficulty of crossing the high ridge of the Cordillera that bars it from the coast. In spite of these difficulties, coffee has been cultivated both in the south, in the gold-bearing districts of Sandia and Carabaya, and in the centre of Peru in the valleys of Chauchamayo, Vitoc, and Huanuco. It is the Chauchamayo district—for most of the coffee that passes under the name of Vitoc or Huanuco comes from Chauchamayo—which is the real coffee-planting district of Peru, and it is the production of this region that has elevated Peru to the rank of a coffee-exporting country. This is due to the completion of the Central or Oroya Railway, by the Peruvian Corporation, to its present terminus at Oroya, giving railway carriage over the crest of the Cordillera, and also to the opening up of the Perené and adjacent valleys which form its prolongation. Oroya is about 60 miles from Chauchamayo valley, and there is a fair road all the way, passing through the town of Tarma, the capital of a department with about 7,000 inhabitants. The Chauchamayo Valley, itself about 10 miles long, is now in the hands of private owners, but the rich and far more extensive valleys beyond it of the Perené, Paucartambo, and Río Colorado, have now been linked on to La Merced the last town in Chauchamayo by the extension of the Tarma-Chauchamayo road through a short but difficult defile. The output of coffee for the whole region was about 1,500 tons in 1893, but extensive planting has lately taken place and production will shortly, it is said, be trebled. It is considered that coffee can be grown at the expense of 5 Peruvian soles (sole=2s.) per quintal, or 100 lb., the yield of a tree after the third year being about 3 lb. The average cost of clearing may be taken at 65 soles (£6 10s.) a hectare, or £2 12s. an acre. The number of plants that can be planted with advantage on a hectare (2.47 acres) is about 1,700 to 1,800, or, say, 700 to the acre, although a larger number is often put into the ground. Young plants can be obtained for 10s. per 1,000.—*Journal of the Society of Arts.*

TAPPING RUBBER TREES.

Mr. D. P. Copeland, Deputy Conservator of Forests, Assam, gives the following report on the methods of tapping rubber trees adopted in Assam, and of collecting and preparing the rubber for the market:—

The mode of extracting rubber as practised by Mr. Martin of Tezpur.—Small funnel-shaped cane or bamboo baskets were prepared and coated with caoutchouc, after which the baskets were attached to the tree under the incision. The incision or cut was made diagonally and ovoid in shape, being about 3 inches across the centre and from 6 inches to a foot in length. Sometimes the cuts were made like an arrow head, thus V, the baskets being nailed with a bamboo nail just below the point. These baskets, when full, were emptied into cane receptacles coated with caoutchouc, and thus conveyed to the factory

where the milk was poured into large wooden boxes or bins 6 feet square, and partly filled with water, the caoutchouc, after a time floating on the top. The caoutchouc (being still fluid) was then taken out and boiled over a slow fire on iron pans, which are still lying in Tezpur, 4 to 6 feet in diameter and 2 to 2½ feet deep, two parts of water being added to the caoutchouc, and the whole stirred constantly. As soon as the rubber coagulated into a mass, it was taken out with iron forks and pressed, and again boiled and pressed, and then dried in the sun, and finally washed over with lime. The rubber thus prepared was shipped direct to the London market.

The Assamese and Nepalese mode of extracting rubber is as follows:—The men begin from the top of the tree working downwards, making incision with their *daos* or *khukris* from 6 inches to a foot long and about 4 inches wide along the stem of the tree. The milk collects in these cuts, and also runs down the stems, some of the overflow falling to the ground. After four or five days, the rubber thus cut is dry, and can be pulled up very easily; it is then either wound round into balls or left loose. The ball rubber fetches a smaller price than the loose rubber, as very often a stone or other impurity is hidden inside the ball to add to the weight. The tappers try and get rid of their rubber as soon after collecting as possible, as it loses in weight by drying. The traders get over this difficulty by keeping it in water in barrels and wetting it well before shipping. The rubber undergoes no preparation in Assam, and is shipped to the Calcutta market in the same state as it is received from the forests, except, of course, the wetting with water already mentioned. I am informed that a machine has been put up at Margherita in the Lakhimpur division for cleaning rubber before shipping; but as I have only heard of the process, I cannot describe it. The most favourable time for tapping is from November till April, the dry-weather months. During the rainy season from May till October, the richness of the juice diminishes. From that time till January the rain diminishes, and the milk increases in richness.

While on the subject, I beg to describe a third mode of tapping rubber which has been the cause of the total destruction of our indigenous rubber forests in Assam; this system crept in gradually, and not having been suppressed with a strong hand, has left us ruined and killed out the rubber trees. I mean root-tapping. The Assamese, being too lazy to climb, were probably the first to find out that by tapping or cutting the root, of the tree along the ground much more rubber could be got and with far less trouble. I maintain, and can prove it, that stem-tapping, however severe it may be, unless it amounts to down-right girdling the stem, cannot kill out or permanently ruin the tree; but root-tapping, as practised in Assam, kills out the tree at once. The roots of the tree are followed up for 40 or 50 feet along the ground, and every yard or so a hole is dug, and the root is cut clean through with an axe, a few large leaves being placed over the hole to prevent rain or due wetting the rubber; a week later the rubber is removed from the hole, being found in slabs from half a pound to six pounds in weight. Stem-tapping cannot be done during the wet weather, as the rain would wash off the caoutchouc from the cuts; but root-tapping with a little care, provided the trees are growing above flood-level, can be done the whole year round.—*Madras Mail.*

DIMINISHING MARGINS IN AGRICULTURE.

Where nature is prodigal, man is wasteful. Waste has been the rule in American agriculture. Accumulated mold of ages of vegetation was offered at \$1.25 per acre. Afterwards it was given away, subject to official fees for perfecting a title, both to natives and immigrants. With land free to all there was prodigality of fertility and economy of labor.

Thus in primitive agriculture, rotation, cultivation diversification were all sacrificed, and fertility w.

transmitted into net cash. Because wheat could be grown without cultivation on the broken sod, and because it was always a cash crop, little else was grown; and because there was so much of it, and so few farm animals, the straw, which is worth as much in England as the whole crop is here, was burned to get rid of it; and because of this repeating of a crop without cultivation, weeds much more than loss of fertility reduced the rate of yield; until at last, because of extension of wheat area beyond the needs of consumption, price was reduced and profits destroyed. Thus nature, which can not be trifled with safely, has been avenged, and the wheat grower is muddled in trying to lay the blame upon the currency the tariff, or anything rather than his own uneconomical and wasteful practice.

The same abandon attended early efforts in animal industry. Unimproved breeds were kept four years or more, on lush grass in summer, in the lea of a haystack in winter, fattening at one season and existing at another, favouring the production of fat and lean, in layers, to be sold at low prices to unsatisfied consumers. The first butter dairies—for instance, Pratt's in New York—required forty pounds of milk to make one pound of butter. He, by selection and care, reduced the requirement almost one half, and now some Jerseys produce a pound of butter for thirteen pounds of milk. The "hogging down" of corn in feeding cattle and hogs was another wasteful procedure in primitive farming.

It was the same with cotton. The seed was wasted, or only used for manure. Sometimes stock was killed by being gorged over a pile of seed, but systematic feeding was unknown. Now forty million of dollars, more or less, represent the oil of the seed, which was wasted if applied to the soil, and almost as much more should be got from feeding the cake, with incidental foods to constitute a suitable ration, and costing almost nothing. In this way all the valuable elements of the seed are returned to the soil, with additional manurial value of other feeding material. Pork, if not beef, can be produced in the mild climate of the south with cotton seed cake, cow peas, and other fall and winter growing forage plants, even cheaper than the central west.

In wooded sections the first and largest opportunity for waste was found in the wanton destruction of wood and timber, and it was improved until large areas have become deserts. In every rural industry, exploration has been depletion and destruction. When flax became an auxiliary or successor to wheat, a million of acres went into cultivation for seed, and the straw was thrown away, though coarse fibre worth a hundred dollars per ton has been made of the straw as it lies from the mower; while, by a slight change of method of culture and treatment, as is done in Europe, far more valuable fibre can be produced. Flax-growers will say it cannot be done because they do not know how and will not learn, but it has been done and is done successfully and uniformly in other flax-growing countries.

Reduction in prices and competition in production are lowering the margin of profit more or less, though not equally or by regular gradation year by year. The most careless are pinched fearfully, the more systematic only feel the tightening pressure of reduction, while the most skillful and scientific still find a reasonable profit in agriculture. It is well that these wastes in their primitive recklessness are no longer possible. The richest soil in the world never made an increasing yield, or retained a permanent fertility until higher values of land and greater cost of production compelled economy and improved methods. England once made smaller yields than the United States upon soils naturally less fertile. Now its average grain yield is more than double that of this country.

Thus there are compensations in reduced profit in agriculture. It is a spur to improvement, to the education of the farmer, more potent than any he has yet felt, and it is all the more valuable because its rewards go to the energetic and mentally alert, while the laggards fall behind in the race, and the slothful vegetate.—(J. R. Dodge, in *Prairie Farmer*)

THE COFFEE, CACAO, KOLA, & C. INDUSTRY IN JAMAICA.

A PRACTICAL PROPOSAL.

The Secretary read the report of the Committee appointed by the Board on Coffee, Kola, Chocolate and Pimento, which was as follows:—"The Committee reports that it has met and considered the matter referred to it and now submits the following *ad interim* report:—

Our remarks on coffee do not apply to the district of Port Royal Mountains, where the cultivation and curing of coffee is well understood and also the advantage of selling coffee in the cherry.

1. The general mode of "planting" coffee by the peasantry is as follows:—The land is cleared and burnt off; plants or "suckers" of from three to four feet high (which have been roughly uprooted) often having berries on them sometimes with diseased roots, are procured and frequently left to quail for a day or two before being replanted. As soon as the rains set in these suckers are planted among "ground provisions" without regard to regularity or distance from each other. After the "provisions" have been reaped the young coffee is often neglected and consequently when the trees arrive at maturity the yield is poor. In most cases too many large fruit trees are allowed to grow and overshadow the plants, thus depriving them of sufficient light and air;—again there is little or no attention paid to the invaluable practice of pruning, forking, &c., which is not yet understood by the peasantry.

Some years ago when the market price of coffee fell very low; in a great many instances the peasantry actually abandoned their cultivations.

2. The reasons generally given why so much apparently available land in close proximity to the dwellings of the peasantry is allowed to remain uncultivated, are, first, because the land has become impoverished by previous crops and is being left to nature to be resuscitated. Second, because they prefer to hold their own land in reserve against the time when they may not be able to rent land, and often the soil is unsuitable for coffee, such as clay.

3. The yield of coffee may be increased by better cultivation, proper pruning, and the use of manures. Cultivation and pruning are well understood by experts, but our people need to be instructed with regard to them, this we think may gradually be done by leaflets, lectures and demonstrations.

4. To practically demonstrate to our people the value of improved methods of cultivation such as planting, draining, forking, manuring, pruning, &c., it is advisable that the President's suggestion be carried out and "model grounds" be established in certain districts at the expense of the society, and we recommend that Mr. H. Cork's offer in Upper Clarendon for experimental purposes be accepted and that the Secretary in the first place be requested to visit the spot and arrange matters.

5. The inferior quality of coffee produced by the small settlers is due chiefly to the manner in which the article is prepared for the market. The primitive style (in most cases) of curing the coffee on the bare earth and in wet seasons actually resorting to the use of iron pots as a dryer, must affect the quality. Added to this the evil resulting from the reckless manner in which this article is purchased by the runner or buyer, without regard to quality certainly does not tend to improve matters. In our opinion therefore the best remedy on the state of affairs is the establishment of Central Factories for the purchase of coffee in the cherry and the proper curing by a good set of works. The advantages to be gained by these central factories should be brought to the notice of our people by leaflets and lectures.

6. We have carefully considered the subject brought to the notice of the Board of Management by the Colonial Secretary from a letter from the Collector of Taxes, for Manchester, calling attention to the poverty of the peasantry owing to the impoverishment of land in that parish, and as far as

our investigations have gone we are of opinion that assuring the existence of the state of things represented the cause and possibly a remedy may be found in the foregoing remarks.

7. We recommend the distribution of the leaflet on Cocoa published in July by the Director of Public Gardens, a large number of which have been placed at the disposal of the Secretary.

A leaflet on Kola is also being prepared which can be dealt with in the same manner.

8. The Curator of the Museum having taken up the matter of Pimento, the committee will not deal with it.

Mr. Burke moved the adoption of the report and said that it showed that the committee were doing their work well. They could not do too much for the cultivation of coffee, as recently he saw that the exportations of the article had greatly decreased, and the Society should press upon the peasants the necessity for new and improved methods.

The Chairman said he was planting about 60 acres of Liberian coffee in St. Catherine, and he would be glad to give the Secretary samples in order to supply the peasantry with them.

A resolution was passed approving of and giving effect to the recommendations of the Committee.

Mr. Burke called attention to the enormous waste of everything that could be used for manure in the Island. If some material were obtained and thrown in and the compost allowed to rot, a first rate manure would be got. The peasantry should be told that what they would thus put into manure would be returned to them from the land.—*Jamaica Agricultural Society.*

WATERING.

There is probably no one operation in the whole routine of gardening that is more thoughtlessly carried on than that of watering. The individual requirements of particular plants are little thought of, and "watering" is administered indiscriminately to each and all alike. Where there is a mixed collection to be dealt with, the difficulties in adjusting the supply to the needs of the individual are, no doubt, great, but in market establishments, where large quantities of one plant are grown, and where a house or houses are set apart for the exclusive cultivation of some particular subjects, the difficulties are materially lessened, though not overcome. In any case it is most important to gain a knowledge of the principles which govern the relations between the growing plant, the amount of water it receives, and the period at which it receives the supply.

That a plant needs water, suffers if it gets too little or too much, that it requires more at one time than at another, and that different plants vary in their requirements according to their conformation and structure, and the circumstances under which they are growing—all this, of course, is well known, though in practice it is often not remembered or acted on.

Again, the influence of excess or deficiency of water may affect not only the individual plant, but may determine variations in the productiveness of the plant, and induce variations in the number, size and vigour of the seed and its contained embryo. In reference to these matters, the *Revue Scientifique* for July 6 publishes a report of a thesis prepared by M. Edmond Gain, and presented to the Paris Faculty of Science. The general character of this thesis may be gleaned from what has already been said, but it may be of interest to add a brief summary of the conclusions at which M. Gain, a well-known author on agricultural chemistry, has arrived, as they are of great practical importance. There is, says M. Gain, an alternation in the requirements of plants for water. Continuous deprivation or continuous supply of water are alike contrary to the physiological requirements of plants. In all M. Gain's experiments these plants which were supplied with water at the two critical periods—the commencement of the unfolding of the leaves, the beginning of the flowering period—and at

no other time, did as well as those provided with a continuous supply of water during the whole period of vegetation. Further, the experiments of M. Gain showed that this influence of moisture is not felt equally by all the organs: it has a greater effect on the aerial than on the subterranean organs. The result of this differing influence is shown in the fact that plants grown in dry soil have thicker roots than plants in damp soil, though the stems may be equal in weight. This is in accordance with the well-known fact that plants of very dry countries have frequently roots which are very large in comparison with the weight and height of their aerial parts.

With regard to the influence exercised by the greater or lesser quantity of water on the propagation of the species, the researches of M. Gain have established the two following facts, relating, the former to seeds, the latter to the tubers:—

1st. The humidity of the soil favours and greatly augments the number of fruit and seeds, but drought induces the formation of larger and heavier seeds. On damp soil a plant yields smaller seeds, which consequently tend to bring about the degeneration of the species.

2nd. The number of the tubers is but little influenced by the variation in the retentive powers of the soil for water, but on damp soil the plant yields larger tubers. There is then an increase in weight; the polarity of these tubers is, however, not much marked, and they are consequently less perfect than those which have been submitted, in the heat, to relative dryness.

It may be repeated that moisture perceptibly increases the immediate yield, but tends to the formation of imperfect reproductive organs, which produce less vigorous plants. This is to the advantage of the individual, but to the detriment of the conservation of the species. The practical inferences are obvious.—*Gardeners' Chronicle.*

IMPROVED PLANTING.

THE IMPORTANCE OF LARGE PITS.—To begin with the very important work of pitting.—What is the object of providing pits for young plants? Why not simply dibble them in anyhow? Simply because the tender young rootlets must have a free loose soil to enter on all sides, or the growth of the plant will be checked and its vitality impaired. This being so, is the size of the pits usually dug sufficient for this purpose or not? Who has not remarked the check young plants receive at that period of their growth when the rootlets have reached the hard sides of the pits and are too weak to enter the hard soil beyond. By the nature of things this check occurs at a very critical moment of their existence and has a lot to say to the prevalence of "failures." The pits usually dug on the Nilgiris at any rate, and I believe in the other districts also, are so-called 18" cube circular holes. As a matter of fact the real size seldom exceeds 15", which is far short of the actual requirements of the plants.

PITS 3x2x2 JUST AS CHEAP AS 2' CUBE.—At first I made my pits 2' cube: now, as I find it entails no extra cost, I make them 3x2x2 deep. The seeming puzzle about the cost lies in the fact that in the latter pits the cooly is able to use a basket to remove the earth, while in the former he cannot. Perhaps the most uniformly successful of the older Nilgiri estates is Hillgrove, which was planted up many years ago by Mr. Riley in large 2ft and sometimes 3ft. pits, particular care being taken to remove all stones from the pits. Hillgrove is, I believe, the only estate in the district which has been planted up in this manner.

STIR UP YOUR SOIL.—As a class we planters seem to be now more appreciative of the value of what farmers at home call "tith," and of the aeration of the soil. As it is difficult, though not impossible, to do very much without serious injury to the large roots on an old plantation, let us do all in our power at the start. What is the best model to copy from? I won't take my readers further

than the nursery from which the young plants were taken. Why not try and obtain as nearly as possible the same results on the estate, though of course by different methods.

EXCELLENCE OF LARGE RENOVATION PITS.—The nearest approach I can recommend is the digging over the whole area—when the estate is first planted—with large renovation pits, commencing with every other row. Fork them a full fork's depth at the bottom, leave them open for 2–3 months, and fill them up again with the same soil. When a block is finished, pit again over the alternate rows. Thus every four plants have a pit in their centre.

Almost every square foot of the land is thus dug up in time, say in the first three years from date of planting. This gives the young coffee roots from the very first a free access to the greater proportion of the soil. The ground is well aerated and its physical condition improved. The stones of food in the ground can be easily tapped, being rendered more soluble by the free access to the soil of air and rain, saving the cost of heavy manuring. Being porous, the soil absorbs every shower in the dry weather and drains off the excess in the monsoons readily through the subsoil. In droughts the coffee-roots can obtain the moisture required well below the surface, and in the wettest of weather are not troubled by any excess. It is clear that in all ways the estate with a cultivated depth of 3 feet (for this is what the above system comes to) has an immense advantage of those estates which have their soil only partially stirred up to the depth of 15 inches or less.

RESULTS OF CAREFUL CLEARING.—There is another point I have not yet touched on, and yet in the example before me, *i.e.*, the nursery, it is a most important one,—I mean the careful removal of all roots and stones which would prevent the free growth of the tender rootlets. On estates the presence of stumps and large stones has yet another evil: it renders cultivation appreciably more expensive and a great deal less efficient. Were the surface of an estate quite clean and friable, it would be possible to do a great deal more in the way of adding fertility to the soil than is now dreamed of. For one thing huge amounts of fodder for cattle might be grown after the plants have reached their fourth or fifth year and borne their first good crop, any excess being preserved in the shape of hay, or better still, ensilage. As this would all go back as manure, the result would be a gain and not a loss. If the cultivation were carefully managed, the plants would suffer very little, and were the crop a leguminous one, the roots left in the soil would greatly enrich it in nitrogen. Instead of taking it off the land, it might be cut and dug in, or buried in pits. The change in the nature of the soil in green-manuring the estate would be simply marvellous. The effect of the humus would be far-reaching and, unlike cattle-manure, would furnish plant-food for a number of years before becoming exhausted. Some will scout at all this. Let me ask these wherein then lies the value of virgin forest and jungle soil?

THE VANITY OF LARGE AREAS.—None of these things can be done of course without some extra expense. It costs more, no doubt, *at first*, to plant up an estate carefully and thoroughly than to stumble along in the old ruts of routine. In opening up large areas, the question of first cost assumes very large proportions, but I hold that the rage for large areas has done us planters more harm than any known plant-disease or low prices. As the general rule seems to be that the larger the area, the less money ought to be spent in proportion, I hold that it is practically impossible to cultivate a large estate as well as a small one. The greed for opening land and the desire to be counted among the "large proprietors" has done an infinity of mischief. The vanity extends so far that I verily believe there are men who would rather own a third share in a three-hundred acre estate than be the sole owner of a compact 100 acre block, giving perhaps 20% more income. It has been said that a man is deserving of honour who causes

two blades of grass to spring where only one grew formerly. The burden of my remarks is that if a man is content with half the usual area, he can obtain quite double the usual yield. This, too, with a cost per acre but slightly higher than usual. There are numerous instances proving the truth of my contention to be found in every district, I believe, in South India. If this be so, what in the wide world can be called that twist of mind which compels men to open out in so many cases more than twice the land they can properly cultivate?

In agriculture all the world over the same thing is going on. In America they call it "intensive" *versus* "extensive" farming. Let us planters rank ourselves then among the intensive lot, and we may laugh at the mishaps which yearly befall the ill-regulated but arrogant extensives.—*Planting Opinion.*

A PRIMITIVE TOBACCO FACTORY.

China is nothing unless she is primitive, and although the factory which forms the subject of these remarks is not exactly situated in Chinese territory, as it is in the Portuguese settlement of Macao, it is, to all intents and purposes, a Chinese factory, for it is owned and worked by Chinese. The premises comprise several large sheds with earthen floors, and one or two better built rooms, used as storehouses. The factory gives employment to several hundred Chinese men and women. I was accompanied on my visit by Mr. A. A. Pettigrew, a son of Mr. Pettigrew, of Cardiff Castle, who is at present (May) on a tour in the East. The tobacco is not grown at Macao, but at a place called Hokshan, about forty or fifty miles to the north-west of the former town, on one of the numerous mouths of the Sikiang, or Canton River. When the plants are properly dry, they are done up into bales about 2½ feet long, 2 feet wide, and 1 foot deep, and sent down to Macao in junks. On arrival at Macao, these bales are stored in the premises of the factory until such time as they are required for the manufacture of tobacco.

The first room we entered was devoted to stripping the leaves from the stalks, these being discarded in the manufacture. Women, sitting on the floor on their haunches, were busily engaged in this operation when we entered. The sight of us did not distract the women's attention, but several young children who were present on our arrival, scampered away to distant corners like mice into a hole. The dust from the tobacco leaves got into our noses and throats, and caused us to sneeze and cough, much to the delight of our celestial onlookers, as evidenced by the loud outburst of laughter which followed our discomfort. Strange to say, we did not hear a sneeze or a cough from any of the Chinese whilst we were in the factory. After the leaves have been stripped from the stalks, they are carried into one of the sheds in large bamboo baskets by men, then spread on a wooden floor and damped with water. When sufficiently damp, they are made up into layers about 2½ feet long, 2 feet wide, and 2½ inches thick, and placed on boards. The next process is to make each layer into a solid cake. This is done in the following way:—About a dozen layers, with a board 1½ inch thick between each layer, are placed on the top of one another, and then pressure is brought to bear upon the whole lot by means of a lever of the second order, in the shape of a thick pole. One end of the lever is fixed firmly with strong ropes, and this constitutes the fulcrum; the weight of the resisting substance is the tobacco, and the power is applied at the other end of the lever by means of stout ropes, which pass round a wooden axle that is securely fastened to the ground.

When the tobacco leaves have been properly pressed, the cakes are taken out and cut crosswise into strips 4 inches wide, and the two ends cut off, as they are not sufficiently pressed. The next step is to tie half-a-dozen of these strips together by means of ropes. The next operation is to make the tobacco ready for use. This is done by means

of a plane, very similar in shape to an English carpenter's plane. The strips of tobacco are stood up on end on the ground, and kept in position by boards made for the purpose. As the strips are only about 1½ foot high, the men have to work the plane in a half-stooping position, a most uncomfortable way of working from an Englishman's point of view. However, the Chinese do not appear to mind it, as they work away contentedly from morning to night. The shavings of the tobacco leaves are the tobacco ready for smoking. Every man puts his shavings, as he takes them from the plane, into small heaps, weighing about a pound each, enclosing at the same time a ticket with the name of the firm on it in the centre of each heap. These small heaps are then put into papers, the two ends of the papers being left open. The packets are then weighed, and a little more tobacco is added or taken away according to whether the packet is too light or too heavy. When the packets are of the proper weight they are put into another paper, both ends closed up, and then packed in boxes ready to be sent away. There is a good deal of order in the way in which the factory is worked. Women are only employed in stripping off the leaves from the stalks, men do all the rest of the work. There is one lot for dampening and pressing the leaves, and another batch for cutting the pressed cakes into strips and tying them up ready for planing. The planers only make the tobacco and put it into heaps, a separate lot of men put it into the first papers ready for weighing. The men who weigh the tobacco pass it on to others, who put it into the second paper, and these finally hand it to the packers. The tobacco is of a dark brown colour, and is only used, so far as I know, by the Chinese. It has the reputation amongst them of being a particularly good brand, and the factory is said to be one of the largest in South China. It was very amusing to see the workers at 12 o'clock, as this is the time they take their mid-day meal. As soon as the clock struck twelve, everything stopped as if by machinery. In less than five minutes tables were produced from unlooked-for corners, basins of rice and other foods were placed upon them, and the men were busily engaged in emptying them by the aid of chopsticks. All the workmen took this meal in the same place as they had previously been working in.—W. T. TURNER, Botanic Garden, Hong Ko g.—*Gardeners' Chronicle*.

VANILLAS OF COMMERCE.

The following historical and descriptive account of the species yielding aromatic fruits, more or less used in commerce, has been prepared by Mr. R. A. Rolfe, A.L.S., Assistant in the Kew Herbarium.

From historical accounts we learn that vanilla was used by the Aztecs of Mexico as an ingredient in the manufacture of chocolate prior to the discovery of America by the Spaniards, who adopted its use, and Morren states that it was brought to Europe as a perfume about the year 1510 at the same time as indigo, cochineal, and cacao, and ten years before the arrival of tobacco.

The earliest botanical notice of the vanilla is by Clusius, in his *Botanicorum Libri Decem*, published in 1605. This author had received fruits from Morgan, apothecary to Queen Elizabeth in 1602, which he described as "*Lobus oblongus aromaticus*" (p. 72), without being aware of their native country or use. He describes them as 6 to 8 inches long by half an inch broad, and terete, from which it is evident that they belonged to the true Mexican *Vanilla* (*V. planifolia*).

In 1651 a figure was given by Hernandez in his *Nova Plantarum Mexicanorum Historia* (p. 38), under the name of *Araco aromatico*, which shows both the characteristic growth and fruits of the plant, the flowers not being represented. The original of this figure was one of a series of 1200 executed at great cost in Mexico, by order of the King of Spain, during the previous century. Hernandez only mentions its use as a drug and gives its native name as "*Tlilxochitl*."

Piso in his *Mantissa Aromatica*, published in 1658, appears to have first put the name *Vaynil'a* on record, and also its use as an ingredient in the manufacture of chocolate (pp. 200, 201). He describes it as the fragrant siliqua or pod of the *Araco aromatico* of Hernandez, and that it was called *Vaynilla* by the Spaniards, who added it to chocolate, not only on account of its fragrance but because of its medicinal virtues. The name is the diminutive of the Spanish *vaina*, a pod or capsule.

In 1675 Redi figured the pod and seeds, the latter as seen under the microscope (*Experientia*, p. 179). He called it *Vainiglias*.

Dampier next furnished some important information about the plant. Speaking of the coast of the Bay of Campeachy, South Mexico, under date 1676, he remarks:—"Here are great plenty of *Vinellos*," (*Joyages*, II., pt. 2., p. 123). And at Boca-toro, in Costa Rica, which he visited in 1681, he observed:—"There grow on this coast *Vinelloes* in great quantity, with much Chocolate is perfumed" (I., p. 38). At a place called Caibooca in the former locality, Dampier remarks:—"We found a small Indian village, and in it a great quantity of *Vinello's* drying in the sun. The *Vinello* is a little Cod full of small black seeds; it is 4 or 5 inches long, about the bigness of the stem of a Tobacco leaf, and when dried much resembling it: so that our Privateers at first have often thrown them away when they took any, wondering why the Spaniards should lay up Tobacco stems. This Cod grows on a small Vine, which climbs about and supports itself by the neighbouring trees; it first bears a yellow Flower, from whence the Cod afterwards proceeds. It is first green, but when ripe it turns yellow; then the Indians (whose manufacture it is, and who sell it cheap to the Spaniards) gather it, and lay it in the sun, which makes it soft; then it changes to a Chestnut colour. Then they frequently press it between their fingers, which makes it flat. If the Indians do anything to them beside, I know not, but I have seen the Spaniards sleek them with Oyl" (I., p. 234). He further remarks that the Vines grow plentifully at Boca-toro, where he had gathered and tried to cure them but without success, and that he had never met with a Spaniard who could tell him, which led him to think that the Indians had some secret. "Could we have learnt the art of it, several of us would have gone to Boca-toro yearly, at the dry season and cured them, and freighted our vessel. We there might have had Turtle enough for food and store of *Vinello's*..... They are commonly sold for 3 pence a Cod among the Spaniards in the West Indies, and are sold by the Druggist, for they are much used among Chocolate to perfume it. Some will use them among Tobacco, for it gives it a delicate scent. I never heard of any *Vinello's* but here in this Country, about Caibooca and at Boca-toro" (I., p. 235).

The preceding accounts all clearly refer to the true Mexican *Vanilla* (*V. planifolia*), but in 1796 both Plukenet and Sloane introduce confusion into the records. The former includes the above under his "*Vanillia's Piperis arbori Jamaicensis innasceus*" (*Almagest. Bot.*, p. 381), though figuring the true plant (t. 320, fig. 4). The latter, while retaining Clusius' original name, and citing the above references, records it as growing spontaneously in the woods of Jamaica about Aqua-alta (*Cat. Pl. Ins. Jam.*, p. 70). In his *Natural History of Jamaica*, published in 1707, he further observes:—"It is said by several that they grow in this island about Aqua-alta, and that before the felling of timber and clearing ground, they were common in the shady bottoms of the inland parts of this island." (I., p. 180), so that it was evidently included on hearsay evidence, and probably the indigenous *V. inodora* (*V. anaromatica*, Griseb.) was mistaken for *V. planifolia*.

The Mexican *Vanilla* was, as already observed, introduced to England very early in the seventeenth century. The second volume of Miller's *Gardeners' Dictionary* appeared in 1739. There the author remarked that he had some branches of the plant, gathered by Mr. Robert Millar at Campeachy, and

sent between papers by way of sample, and as the stems appeared fresh, though gathered at least four months, he planted them in small pots and plunged them in a hotbed of tanner's bark, where they soon put out leaves and roots. It is probable that they were soon afterwards lost.

Shortly afterwards Catesby gave a good coloured figure of *V. inodora*, including flowers and fruit, but in his remarks completely confounded it with the true economic plant.

Thus three distinct species had become confused together, and these are all included by Linnæus, in his *Species Plantarum*, in 1753, under the name of *Epidendrum Vanilla* (p. 952).

Between 1830 and 1838 Bauer and Lindley's *Illustrations of Orchidaceous Plants* appeared, and we find plates 10 and 11 of the *Genera* devoted to the structure of flowers and fruit of *Vanilla planifolia*, Andr., "drawn by Mr. Bauer in 1807." This is the first evidence of the production of fruit in Europe, and as the drawing was made in the same year as Salisbury's figure appeared, it is practically certain that it was made from the very same plant. How the flower became fertilised is not mentioned, perhaps accidentally or by some insect. Morren suggests that the fruit was drawn from a specimen of commerce, but the colour, the uniformly plump texture, and the fact that it is attached to the rachis, all show the contrary; quite apart from the fact that the vanilla of commerce was then thought to be produced by another species, *V. aromatica*, which even Morren states that he sought for in vain in the gardens of London and its environs, and at Kew, and wrongly supposes it to be the plant cultivated by Miller in 1739. Morren is also wrong in stating that the "*Vanilla planifolia* (?)" of Lindley's Herbarium is "the very same plant drawn in flower by Mr. Fraucus Bauer," for it came from a Botanic Garden near Moscow, as the ticket "ex horto Goreu-*kensi*" proves.

To Professor Charles Morren, of Liège, belongs the credit of first producing fruits in quantity, and of proving that *V. planifolia* was the source of the true vanilla of commerce. By a particular method of treatment adopted he succeeded in obtaining 54 flowers on one plant, and these he fertilised artificially, and obtained the same number of pods. The following year a crop of about 100 pods was obtained from another plant by the same method. His paper, "On the production of Vanilla in Europe," was read before the British Association at Newcastle, in 1838, and published in the following year (*Ann. Nat. Hist.*, ser. 1, III., pp. 1-9). He also succeeded in tracing his plant back to the one which originally flowered in the collection of the Right Hon. C. Greville, and also its introduction to Java, as has been already pointed out. Thus Morren first proved the necessity of artificial fertilisation, and he attributed its not bearing fruit in the East Indies to the absence of the species of insect which doubtless existed in Mexico, and there fertilised the flowers. He also suggested that vanilla might be produced in inter-tropical colonies, and also in European hothouses, by artificial fertilisation. Detiel states that artificial fertilisation was first practised by Neumann, in 1830, in the Jardin des Plantes, but Murrén makes no mention of it. In 1845 Blanco described a species of *Vanilla* from the Philippines, which he had received from his friend Azaola under the name of *V. majajensis* (*Fl. Filip.*, ed. 2, p. 593), but it has since been referred to *V. planifolia*, and thus, if the determination is correct, it may have been at some time introduced from Mexico by the Spaniards. Blanco describes the pod as not aromatic, but it may not have been mature when he received it.—*Kew Bulletin*.

THE INSECT ENEMY, "ORTHEZIA INSIGNIS."

Dr. Trimen, in his annual report on the Botanic Gardens for 1893, mentioned the occurrence in the Peradeniya Gardens of an insect pest the *Orthezia Insignis*, which had proved rather destructive to the ornamental shrubs there. It afterwards spread to

the lantana outside, but Dr. Trimen was of opinion that it was mainly a garden pest, and that it would not spread to estates. Mr. E. E. Green, of Pundaloya, contributed what appears to have been a rather sensational article on the subject to the "*Tropical Agriculturist*" for January last; and it is replied to in the "*Kew Gardens Bulletin*" for June and July, just to hand. Mr. Green stated that the pest has, forunately, as yet shown no taste for either of our two most important products tea and cocoa. Coffee, however, does not share this immunity, for trees of Liberian coffee have been observed to be infested with the insect, and we have no reason to suppose that the Arabian species will be less liable to attack." The insect was first described by Mr. J. W. Douglas—with whose name it is consequently associated—from specimens found in Kew Gardens, where, Mr. Green remarked, "it is now said to be doing an enormous amount of damage in the plant houses. . . . Originating as it does in the Peradeniya Botanical Gardens, there is little doubt that we owe the introduction of this pest to plants received from Kew." The "*Kew Gardens Bulletin*" editor replies that "Mr. Green's statement as to 'the enormous amount of damage in the plant-houses' caused by the insect is very much exaggerated, and I am unable to ascertain the authority on which it is made." The Assistant Curator was also requested to report on the subject, and he states that their Hongkong *Strobilanthes* is not much affected, but species of this plant from India and Ceylon are much subject to *Orthezia*. No appreciable harm is done to the plants, even when badly infested, and it is the least harmful of all the insects parasitical on plants at Kew, where it is "rather a curiosity than a troublesome pest." Some interesting comments follow on the question of the introduction of the pest into Ceylon and we consequently give the two concluding paragraphs of the Assistant Curator's report *in extenso* :—

The dispersion of plant diseases through the interchange of plants is undoubtedly a peril requiring careful precautions. The *Phylloxera* was introduced from England into Switzerland. The Coffee-leaf disease (*Hemileia*) has been conveyed from Ceylon on the one hand to Fiji (with tea seeds), where it practically extinguished the promising coffee industry, and to German East Africa on the other. It has always been a matter of the deepest anxiety lest by any accident it should be introduced through Kew to the New World, where it does not at present exist. It has been no less a matter of anxiety lest the coffee-leaf miner should be introduced into the Old World. Kew extends, undoubtedly, an involuntary hospitality to many strange guests, which come unbidden no one knows whence. The remarkable land Planarian, described by the late Professor Moseley as *Bupalium Kevense*, which is generally to be found in the houses, is a case in point.

It is undoubtedly possible that the *Orthezia* may have reached Ceylon by way of Kew. It is not, however, very probable, and the reverse may just as well have been the case. It exists in the public exhibitions, however, from which plants are not drawn for exportation. The plants in the propagating houses from which distribution is made are kept scrupulously clean, and every precaution is taken to send them out free from taint of any sort or kind.—Local "*Times*."

A CHAT ABOUT JAPAN TEA.

Professor Dr. Max Fesca, went to the Far East country in 1882, for three years, as he thought. He has remained there ever since, but he now thinks it probable he will not return. The Professor has been engaged in geological and agricultural surveying in Japan, and he has, naturally, seen a good deal of tea cultivation. It was concerning this that our representative waited upon Dr. Max Fesca, at the Bristol, this morning, when he found him "ready to communicate."

TEA VS. THE MULBERRY.

"The Japanese manufacture green tea almost solely," said the Professor in response to a question. "What is consumed in the country cannot be determined by accurate data; but they export from five to six million *yens* worth per annum, and this may be said to be all green tea, and almost all of it goes to America."

"Can you tell me why the amount exported is not increasing?"

"The mulberry," was the reply, "is already growing along with the tea, and silk culture and manufacture is far more profitable and attractive to the people. They export 16 million *yens* of silk, and this is a minimum estimate. Thus, I think, the export of the green tea will decrease instead of increasing; and that the extension of the mulberry will be preferred. The old famous tea districts will remain; but there will be little new land opened up in tea, and some will be changed in favour of silk production."

THE AGE AND YIELD OF TEA.

"Anything about tea interests us here, Professor; will you tell me what effect age has on the bushes?"

"These are shrubs 150 years old, and though the quantity is less the quality is better than when they were young. That is the rule in good districts where the soil is suitable. The average up to which the heavy yields continue is some 30 years, and then, as I have said, the quality rather improves. There are two seasons for plucking; in the year, the first commencing now, on a little later, with the summer monsoon. In a wet year there would be a third time of plucking; but this would be only inferior tea. Of course, bushes have a rest in the winter; but it is a striking fact that the annual yield per acre in Japan is larger than in Ceylon or Java. I have compared the yields, and so beneficial is the winter rest, apparently, for the subsequent enormous reproduction of leaves, that the months of idleness compared with plucking all the year round, represents no loss at all, but the reverse. The Japanese cut the shrubs one metre high, and only in those districts which in winter have rather much snow are they cut lower. Every year the bushes are pruned into shape."

"CONCERNING MANURING?"

the interrogator remarked.

"Oil cakes, which are expressive out there," replied the Professor, "are used on the most valuable plantations; but in the ordinary way any kind of manure is used, according as it is available. The manuring commences from the beginning, and is not only done annually but several times a year, each bush being manured. On many places it is recognised as a mistake to use forcing manure. It is better, of course, to use a gentle, strengthening kind that will benefit the shrubs themselves, rather than produce an abnormal flush."

THE DECADENCE OF GREEN TEA, AND CEYLON PROSPECTS IN AMERICA.

"I can remember the time," continued our visitor, "when we in Germany drank a good deal of green tea, and it was so in England, too, where you can remember black and green were blended. Now in Japan itself the Europeans mostly drink the black tea from China, which is less strong. The Japanese, who take tea without sugar or milk, drink their own strong beverage, and take it in small cups in consequence. I don't think it is injurious; and I have found it very refreshing, after walking a long distance and going into a tea house by the road side. The price of tea has been going down and down, and this has been disappointing to the producer; besides which, from the value of the total export which I gave you in Mexican dollars, you will see that there must be plenty of room for Ceylon tea in the United States. Japan

cannot by any means supply such increasing demands, though, of course" (in reply to a concluding question) "I am unable to say what Ceylon can do to induce Americans to drink its tea beyond the usual plan of making known what you have to offer, and showing that it is good value for the money. *Prosit.*"

"Thank you, and *bon voyage*, Professor."—*Ibid.*

VARIOUS PLANTING NOTES.

A NEW PENCIL.—The Blaisdell Paper Pencil Company, Philadelphia, U.S.A., has introduced a kind of pencil, the lead of which is seen, on examination, to be covered with many very narrow trips of paper. The pencil never needs cutting in the ordinary sense of the word, but, to expose more lead, all that is necessary is to make a small slit in the paper near the lead, thus raising a tiny flap. By gently pulling and unwinding this, working towards the point, a spiral of paper is twisted off, and a length of the lead is laid bare. This process can be repeated as required, till the pencil is too short to be used at all, and is less laborious, and is more certain in results than is cutting with a knife. The lead is excellent in quality, and keeps a good point. In appearance this pencil always resembles an ordinary cedar pencil, the "uncut" end of it being covered with red glazed paper, which increases the likeness, and is pleasant to handle.—*Gardeners' Chronicle.*

THE COTTON PLANT is losing its popularity as a "safe investment" in the very heart of the cotton-growing States of America. Time was—some forty years since—such an assertion would have been laughed at. "You cannot do without American cotton" was the article of faith set up by growers and brokers on the other side of the Atlantic; starvation in Lancashire during the cotton famine shook the belief in many minds, and alterations in spinning and weaving machinery brought under subjection cottons of short staple; planters and capitalists took up the cultivation of the plant; and to-day, Lancashire is no longer dominated by New Orleans or New York. But planters in the Southern States kept on; and in the face of a steady fall in prices, opened up all over the world a market for cotton seed, cotton oil, and cotton cake. Of course, the same products can be placed on the market wherever cotton is grown, and capital can be utilised. Should it be desired to learn where cotton is grown at the present time, the intelligence can be had from the "market" columns recording sales in any daily paper any morning in the week. And it has come to pass, that it has been determined to reduce considerably the growth of cotton in America. The result of the special investigation set on foot by the Federal Government's Agricultural Department in 720 Cotton-growing counties in the United States shows that in eighty-eight there will be little or no change in acreage as compared with 1894; five report an increase up to 10 per cent.; two, an increase of from 11 to 20 per cent.; three an increase of from 21 to 30 per cent.; and three an increase of over 30 per cent.; 127 show a decrease of 10 per cent. and less; 250 a decrease of from 11 to 20 per cent.; 158 a decrease of from 21 to 30 per cent.; forty-four a decrease of from 31 to 40 per cent.; seven a decrease of from 41 to 50; and thirty-three a decrease of more than half. This decrease in acreage is not confined to any particular locality, but covers a widespread territory, embracing almost the entire area devoted to Cotton culture. The extraordinary low price of the staple gave rise to the agitation as to the necessity for reducing the acreage in 1895; this resulted in a convention this year, and a rise in prices is hoped for. Doubtless, much may be done in improving the varieties now grown, and so placing on the market the highest class of raw material. Meanwhile, the above noted facts are surely well worth record.—*Ibid.*

THE PLANTING ENTERPRISE OF CEYLON:
IN TEA, COFFEE, CACAO, CINCHONA,
CARDAMOMS AND MINOR PRODUCTS:
EXTENT OF CULTIVATION UNDER
EACH PRODUCT IN SEPTEMBER,
1895. NUMBER OF PLANTATIONS
AND SUPERINTENDENTS, &c.

TOTAL EXTENT CULTIVATED IN PLANTATIONS 379,182 ACRES.

IN TEA 305,000 ACRES.

No tropical industry—and probably no agricultural enterprise outside the tropics—has had so much care bestowed on the compilation of substantially accurate statistics concerning its position and progress as has the Planting Enterprise of Ceylon in the products above-named, and to a lesser extent in Coconuts, other Palms and Cinnamon. The first compilation of the kind was made by a Committee of the Planters' Association led by Mr George Wall in 1856. Thirty-nine years ago it was a comparatively easy task to frame a list of the then limited number of plantations in existence, and to sum up a cultivation confined entirely to one product. This was done, as we have said, by the Planters' Association in 1856; but no further attempt was made to collate the acreage in cultivation, for thirteen years afterwards, until 1869, when the present Editor of the *T. A.* first prepared a complete review with this information. Since then at thirteen distinct periods—in 1871, 1873, 1874, 1875, 1877, 1881, 1883, at end of 1885, in the middle of 1888, of 1890, of 1891, of 1893 and now in the latter half of 1895,—the compilation has been carefully made and the position of the Planting Industry accurately gauged, our figures being adopted not only by planters and merchants, but by the Government and Civil Servants as the only available and reliable returns of an industry which must be regarded as the backbone of the prosperity of the Colony. We have, in fact, at the expense of much time and labour for twenty-six years back, been doing the work which properly appertained to the Agents of the Government, or to a special officer as Statist, and supplying information which in other Colonies and Dependencies, is only to be found in official publications. However, we have had our reward in the intimate acquaintance it has given us with all the phases of the more important industries of the country and in being enabled to follow closely each successive development of new branches of planting and agriculture generally. Especially interesting, although involving far more trouble, has been the work of collating the statistics since a variety of new products has been added to the old staple now so insignificant comparatively; and never perhaps has so much pains been taken as on the present occasion to secure accurate returns of the area planted with the all-important new king, TEA, and with minor Products, although no one can be more conscious than the compiler, of the impossibility of attaining perfect accuracy. Still for all practical purposes we believe, the results derived from our tables, may be taken as reliable statistics from which to gauge the present position of industries, the importance of which as regards the revenue, trade and general well-being of this community, cannot be over-estimated.

Taking first the total extent of the properties included in our Directory, namely 748,017 acres,—there is an increase of 23,212 acres on the return made up at the middle of 1893. This is owing chiefly to some 6,000 acres added to both the Kelani Valley and Matale East, partly through land sales and grants and partly transfers. Then there have been additions through more correct information or private purchases of about 1,000 acres to quite a number of districts, and in other districts additions are due to the revival of old properties for tea, that had fallen out of cultivation and notice. In other directions, more correct returns have slightly increased or reduced the totals for each district.

Turning to the more important figures representing the area now in cultivation with tea, coffee (Arabica and Liberica), cinchona, cacao, rubber, and the host of new and old products with which experiments are being made in different quarters, we find the grand total to be 379,182 acres, or an increase of 25,947 acres on the middle of 1893. This addition of 26,000 acres may not be considered much for the two years, more especially when it is remembered that over 4,000 acres additional have been brought into cultivation, in the Kelani Valley alone, 3,300 more in the Kalutara district and 1,700 acres in Matale East and Lagalla, in the interval; while Allagalla, Balangoda, Dikoya Lower, Dolosbage, Hewaheta Upper, Kadugannawa, Maskeliya, Matale West, and Udapussellawa, each show about 1,600 acres of cultivated increase. On the other hand, the higher districts, Dimbula and Dikoya, show scarcely any difference in their totals and Nuwara Eliya very little; but there is a distinct extension of cultivation both in Eastern and Western Uva if we take Haputale and Haputale West and the Badulla, Passara, Madulsima and Monaragala groups together. In respect of old coffee land, a revival has

come in favour of tea. In Maskeliya, a comparatively young district, our cultivated return in 1883 was lower than in 1881 by 2,000 acres, indicating how coffee had then fallen out of esteem there; but all this has now been more than recovered under tea. On the other hand, it is noteworthy that neither in Dimbula nor Dikoya had any land gone out of cultivation—and the same is true of most of the Uva districts which, with the higher and younger divisions, never showed so large an area in cultivation as at present. That the total area under cultivation—after careful checking and verification of the returns—should stand so high as about 380,000 acres (or nearly 600 square miles), notwithstanding the adverse experiences of coffee and cinchona, is matter for surprise and gratulation, and shews how widely tea has been planted and how satisfactory, so far, have been the results.

PLANTERS AND PLANTATIONS.

Considering the efflux of planters from our shores during the period of coffee depression, no one will be astonished to learn that the total number of Superintendents fell from 1,339 in February 1881 and 1,108 at the end of 1883, to 1,079 by December 1885. Since then, however, the turn of the tide has set in steadily; for we had in July 1888 as many as 1,136; increased by June 1890 to 1,211; by August 1891, to 1,258; and in August 1895 to 1,334; while now we have the full number of 1,469 Superintendents and Assistants corresponding to 1,528 estates in cultivation out of a total of 1,962 properties. It is probable that more than 300 European planters left Ceylon in the four years, between 1881 and 1885; but a considerable number afterwards returned, while a very large quota of young men "to learn tea" have been added to the number of Assistant Superintendents. Perhaps we may fairly say that our planting community diminished at the rate of sixty Superintendents or Proprietor-superintendents a year, between 1880 and 1886—and that about 400 or about 45 per annum have since been added of old colonists returned or new men from home. The total now is higher than in the height of our coffee prosperity; although it is noteworthy that the number of separate plantations is not so large in proportion, a fact explained by the aggregation of small properties into one charge under the process which has given us so many Limited Companies among "tea estates."

THE ANALYSIS OF THE CULTIVATED AREA is, however, of more practical importance than the foregoing total results. We must explain the principle on which the returns have been compiled. After giving the matter a fair trial, on a former occasion, we found it quite impossible to work out a suggestion made to us of securing returns from each estate of the number of trees (in thousands) of each product. In respect of all products, save cinchonas, we had to fall back on the old plan of acreage returns, asking for the figures representing each product whether cultivated in fields by itself or interspersed with others. We have thus obtained, as far as possible, the acreage in tea, coffee, cinchona, cacao, cardamoms, &c., planted alone; of tea or coffee intermixed, or planted with cinchona, or cacao or rubber; also of each of the minor products separately; and of tea and cinchona; cacao and rubber, &c. The total results under each head may be seen at a glance from the following:—

(September, 1895.)

	Acres.
Total extent of Tea planted by itself	296,753
Do of Coffee (Arabica) cultivated by itself	15,142
Do of Coffee (Liberica)	264
Do of Cinchona do	982
(besides 1,714,000 trees partly alone and intermixed),	
Do of Cacao by itself	13,328
Do of Coffee and Cinchona interspersed	1,611
Do of Coffee and Tea interspersed	5,038
Do of Coffee and Cacao do	5,331
Do of Tea and Cinchona do	3,596
Do of Tea and Cacao do	448
Do of Tea and Liberian Coffee do	146
Do of Cacao and Liberian Coffee do	934
Do of Cardamoms alone	4,615
Do of Rubber do	201
Do of Tobacco do	45
Do of Cotton do	109
Do of Other Products and some of the above mixed	18,385

[Some Cacao and Liberian Coffee are mixed with Annatto, Coconuts and other products.]

To arrive at a fair estimate of the total extent which may be taken to represent each product, we have, in the case of cinchona growing among coffee or tea, taken from one-third to one-fourth the acreage for the cinchona, and credited two-thirds or more to the staple. In the case of coffee and tea, or coffee and cacao, being planted together, we have divided the acreage into two equal parts. Of course this would not be a fair criterion in every case: some planters who may have their 100 acres of tea or coffee interspersed with 20,000 cinchona

trees will maintain that the tea should still be reckoned at the full 100 acres *plus* the cinchona. But knowing as we now do by experience that the cinchona, where it matures, does not benefit the other product, but the reverse, it is misleading to count the full acreage of the staple, in addition to a certain extent of new products interspersed. However we have left the figures in the Directory lists and in our tables as returned to us from the estates and agents, to speak for themselves, and it is possible that some may consider that tea and coffee area should be counted in full, even when mixed with cinchona, cacao, or rubber. We have no doubt however, that the majority will agree with us that, analyzing the above figures in the way we have pointed out, and with a moderate estimate for the average number of cinchona trees per acre,

THE POSITION OF THE CEYLON PLANTING ENTERPRISE AT THE MIDDLE OF SEPTEMBER 1895 MAY BE REPRESENTED SOMEWHAT AS FOLLOWS :—

	Aeres.
Total area of 1,962 plantations and planting properties	748,017
Do do of 1,528 plantations in cultivation with 1,469 Superintendents and Assistants	379,182
Total approximate extent under TEA	304,419
Do do COFFEE (<i>Arabica</i>)	21,634
Do do COFFEE (<i>Liberica</i>)	2,804
Do do CINCHONA [4,483,000 trees over 2 years.]	18,278
Do do CACAO	4,693
Do do CARDAMOMS	634
Do do RUBBER	82
Do do TOBACCO (on plantation)	133
Do do COTTON do	5,730
Do do GRASS (Cultivated)	16,000
Do do of Annatto, Coea, Vanilla, Pepper, Cloves, Plantains, Citronella grass, Divi-Divi, Croton, Castor-oil, Aloes, Cinnamon, (on the coffee, tea, or cacao plantations)	7,397

Of Fuel, Timber and Fruit-trees, Span, Coconuts, Areca, Nutmegs, Kapok (on the tea, coffee or cacao plantations)

We have 8,400 fewer acres under Coffee now than in the middle of 1893, and more than 2½ million trees fewer of cinchona. On the other hand we have an increase of nearly 31,500 acres in the staple (Tea) which is of chief interest. The cultivation of Cacao shows an increase of 2,000 acres which is very satisfactory as is also the extent added (366 acres) to Liberian Coffee, while the extent in Cardamoms and minor products has either been stationary or shows a decrease due to the great attention given to tea in the past two years, save in the case of timber and fuel trees of which several thousand acres have been planted in the two years. In giving 305,000 acres as the total area of tea, it must be remembered that certain proportions of clearings planted during the current south-west monsoon, are included. Nevertheless it is clear that 310,000 acres of tea will shortly be reached, and exceeded, were it only through the supersession of both coffee and cinchona where these are at present intermixed with the staple, in the proportions credited this time to the latter products. We may expect, indeed, to see the 5,038 acres at present credited to tea and coffee, altogether tea, and so with cinchona and tea, so that we are quite prepared to find our once great staple reduced from 272,000 acres (as in 1877) to 20,000 acres by the time we make up another return, unless Mr. E. E. Green shows how green-bug and other enemies can be got rid of, and Liberian Coffee takes the start it deserves; while on the other hand tea will probably be represented by 315,000 acres in full cultivation by the middle of 1896.

In the returns of 1883, the considerable number of plantations with "abandoned" opposite their names, attracted attention: altogether they aggregated 53,540 acres; at the beginning of 1886 the aggregate was 40,000; but in the middle of 1888, the total of 293 "abandoned" properties stood at 69,432 acres; in July 1891 there were entered about 293 "abandoned" properties aggregating 73,262 acres; while in 1893 through more careful returns, the total number was 324 with an area of 74,217 acres. We have now substituted the term "uncultivated" and the total of such estates is 289—or 35 less than in 1893—covering 65,727 acres; but a certain proportion of this extent—probably one-third—must still be considered reserve and untouched forest or chena land.

Of good forest reserves mentioned in many of our district returns, though not in all, the aggregate is about 57,000, but even if we add one-third of the uncultivated, making a total of 85,000 acres. We feel sure this is far below the actual extent of forest land in private hands. How, then, is the difference between the total area of 748,000 acres and the cultivated area of 379,000, namely 369,000 acres to be accounted for? Our estimate would be that of forest land fit for tea, cacao, Liberian coffee or other products, there are counting all reserves and un-

opened blocks about 120,000 acres in private hands; that 50,000 acres represents the area of land once cultivated, but abandoned within the last 30 years and now growing up in weeds and lantana, and that the balance of about 200,000 acres may be put down as representing chena and patana (a good deal of both fit for cultivation,—especially in Uva, where patana land is turning out so well in tea—should prices of produce keep up) besides swamps and other utterly waste portions.

WEATHER FALLACIES.

The weather and aught connected therewith, it is almost a truism to say, is of universal interest. And yet Meteorology has not attained the dignity of an exact science; all science is the result of experience, and scientific laws are generalisations deduced from an observation of natural phenomena and of concrete facts. That being so, Meteorology ought to have outdistanced all other branches of scientific inquiry in respect of the sum of systematised knowledge. For have not the data been apparent to man ever since he set foot on this planet, ever-present to his senses, moulding his character and determining his prosperity and comfort, more so than all other external surroundings? And what is the result? In a prominent position in the columns of our newspapers we have printed "weather forecasts," issued officially, which, like dreams usually go by "contraries" not to speak of a host of persons who style themselves "weather prophets." That is all. Hesiod, it is on record, was among the first who presumed to dogmatize upon the weather. He and his successors have much to answer for. Sunday school pic-nics, garden-parties, and out-door gatherings are postponed in consequence of predictions which usually come to pass not on the day named by the "prophet" but on that on which such events actually take place. Then the "prophet" is reviled and the Sunday school teachers make remarks which it is not advisable their pupils should hear. But people follow his counsel next year, all the same and should the "prophet" prove correct, as he cannot fail to do if he goes on long enough, the fact is advertised, his fame blazoned forth and his reputation established for another period of years. After all the "prophet" is but the quack of the Meteorological profession. The regular professors have done and are doing a great work in systematising the results of world-wide observation. And it is not of them we would speak flippantly. Some day, perhaps we shall be able to forecast with certainty what the atmospheric conditions will be. Man has now got the heels of the weather. Approaching storms, thanks to an international system of Meteorological stations connected by telegraph, are duly heralded and timely warning given. But still that nebulous personage, the Clerk of the Weather goes on in the same inscrutable, and, apparently haphazard fashion scattering his favours here and his buffets there without regard to the convenience of mortals. While in the East he may delay the monsoon, thereby giving old-stagers, periodical opportunity for declaring that the existing state of matters is "unprecedented," it is in Britain, particularly in the northern portion, that his vagaries may be seen to most advantage. There he often adds insult to injury, for a man certainly does look foolish and feels in no enviable frame of mind when, attired in winter garments, the temperature rises to "summer heat." The situation is scarcely less trying when after one has donned a summer suit there are suspicions of snow in the atmosphere!

These contradictions notwithstanding, men have seized upon certain phenomena as weather signs and it is with exposing these fallacies that the President of the Meteorological Society in his latest address—chiefly deals. The President of the Royal Meteorological Society candidly admits that research shows “how little we have ourselves advanced in some matters since the time of Hesiod, Theophrastus and Aratus.” In early times men, then as now, foretold what they desired, the wish being father to the prophecy and put down for a universal law that which was only a coincidence of totally independent events.

Mr. Inwards has no regard for St. Swithin, at least as far as the weather is concerned. According to him the saint has no more to do with the dryness or humidity of the season than has the splinx. It is not always pleasant to be disillusioned even in the interests of truth and before Mr. Inwards' criticisms many will feel cherished ideas go by the board. There are, says he:—

“Forty weather saints, among the most prominent of whom is undoubtedly St. Swithin, whose day is July 15, and the superstition is that if it should rain on that day it will rain for forty days after. This date is very near a well-known bad time in wet years, as the terms, long in use, of “St. Margaret's flood” and “Lammas flood” abundantly testify. The fact that some of these heavy rains began on July 15 has been enough material for the adage-monger, and so we have another “universal” law laid down, a law which is, however, constantly broken, as every student of the weather very well knows. The whole thing is a fallacy of the most vulgar kind, and ought speedily to be forgotten, together with all the adages which make the weather of any period depend on that of a distant day.”

Regarding the attempts which have been made to connect atmospheric changes with the movements and position of the heavenly bodies Mr. Inwards shows that nothing has been proved to show that meteorological conditions depend in any way upon such factors. In this connection he quotes an interesting letter from Herschel dated Feb. 6th, 1814:—

“I am glad of an opportunity to say that prognostications of the weather are so much *above the knowledge* of astronomers that I have taken unknown pains publicly to contradict reports of predictions that have been ascribed to me. You may therefore be assured that what you have heard as my opinion about the frost is without the smallest foundation.”

The moon, according to Lord Byron, is responsible for many things, but Mr. Inwards acquits her of any complicity in affecting the weather:—

“Even the halo round the moon has been discredited, for Mr. Lowe found that it was as often followed by fine weather as by rain, and Messrs. Marriott and Abercromby found that the lunar halo immediately preceded rain in 34 cases out of 61.”

Coming down to earth the worker deals with the fallacies connected with the behaviour of plants and animals. He says:—

“Mr. E. J. Lowe, F.R.S., has endeavoured to put some of the rules from this source to the test of definite observation. He took a number of well-known signs said to indicate change and carefully noted what happened after each sign, and although he does not say that all indications from animals, birds and plants are useless, yet certainly those he did investigate seemed utterly to break down. He took the well-known signs of bats flying about in the evening, many toads appearing at sunset, many snails about, fish rising much in lake, bees busy, many locusts, cattle restless, land-rails clamorous, flies and gnats troublesome, many insects, crows congregating and clamorous, spider-webs thickly woven on the grass, spiders hanging on their webs in the evening, and ducks and geese making more than usual noise. Mr. Lowe found that in 361 observations of the above signs, they were followed 213 times by fine, and only 148 times by wet weather; so

that even after the prognostications for rain, there was a greater preponderance of fine weather.” He called a day fine when no rain was measureable in the rain gauge. Mr. Lowe says that even swallows flying low cannot be depended on, as, especially at the close of summer and autumn, they almost invariably skim the surface of the ground, and Mr. Charles Waterton, the naturalist, decided, after careful observation, that the unusual clamour of rooks forms no trustworthy sign of rain. These must, therefore, swell the list of fallacies, although there are many other rules which have not been so carefully examined, but which may still be true. My own impression is that although it is painful to dismiss the animals from their ancient position as weather prophets, we may consider them as indicating what they feel, rather than as predicting what is to come, and that their actions before rain simply rise from the dampness, darkness or chilliness preceding wet weather, and which render these creatures uneasy, but not more so than they affect man himself.

As to cows scratching their ears, and goats uttering cries, and many other signs of bad weather, they are at least very doubtful; whilst the adage about the pig which credits him with seeing the wind, carries with it its own condemnation. The medicinal leech is still left on the list of weather prophets, though he has no doubt had his powers exaggerated.

Plants have also their advocates as weather indicators; and there is no doubt that in most cases they act in sympathy with changes in the dampness, gloominess, or chilliness of the air, and as these conditions generally precede rain, one cannot term the indications altogether fallacious. The pimpernel and the marigold close their petals before rain, because the air is getting damper, while the poplar and maple show the under surface of their leaves for a similar reason. Indeed, an artificial leaf of paper may be made to do the same thing, if constructed on the same principle as the natural one—a hard thin paper to represent the upper side of the leaf, and a thicker unsized paper for the lower side; these will, if stuck together, curl up or bend down in sympathy with the hygroscopic condition of the air. A slip of ordinary photographic paper will do the same, and will curl up at once when placed on the hand.

In 1892 attention was directed to a plant, the *Abrus precatorius*, a beautiful shrub of the mimosa kind,* which has the property of being sensitive in a high degree, so that its pinnate leaflets go through many curious movements, and it was claimed that these form a guide of unerring certainty to foreshow the coming weather. Even earthquakes were said to be predicted by this wonderful plant. If it closed its leaflets upward, after the manner of a butterfly about to settle, fair weather was shown; when the leaflets remained flat, changeable and gloomy weather was indicated; while thunder at various distances was to be foretold by the curling of the leaflets, and the nearer the thunder the greater the curl, until when the points of the leaflets crossed, the thunderstorm was indicated as being overhead. Changes of wind, hurricanes, and other phenomena were to be shown by the various curious and beautiful movements of the leaflets and stalks. These movements undoubtedly took place, but when the plant was submitted to the unprejudiced observation of Dr. F. W. Oliver and Mr. F. E. Weiss, at Kew Gardens, those gentlemen failed to find any connection between these movements and the weather, and Dr. Oliver made a report on the matter, which hits the heart of the whole subject of plant movements, by ascribing them for the most part to the agency of light and moisture. Mr. Scott, of the Meteorological Office, gave the finishing stroke to the theory by proving that the movements had no connection with either cyclones or with earthquakes, so that the sensitive plant may be considered as out of the list of weather guides, in spite of having been made the subject of an English patent.”

The discharge of cannon as a means of producing rain is also discredited and to various other ideas, generally accepted, Mr. Inwards applies

* Very common in Colombo gardens, with its pretty scarlet and black seeds.—ED. T. A.

the dictum,—‘and this too is fallacy.’ As for those who “prophesy” they are denounced as a generation of false prophets. The paper is destructive, not constructive and when the reader, driven from his strongholds of belief, asks what have we then to reply on, Mr. Inwards says:—

“I would venture to refer him to all the patient work which is being done in various countries, and by which a real Science of Meteorology is being slowly built up, while to the outdoor weather student I would offer this consoling reflection—There is still the sky.”

Some people will say, we ask for bread and these philosophers give us a stone! But this would not be fair; for in the Meteorological returns available even in Ceylon, much may be learned in working out averages, and in noting exceptional seasons as to rainfall, temperature, &c.

WHAT REMAINS OF COFFEE IN CEYLON:

HOW THE 22,000 ACRES STILL UNDER CULTIVATION ARE DISTRIBUTED.

GOOD NEWS FOR PLANTERS' FROM HAWAII: “LADY-BIRDS” THERE CLEAR-COFFEE OF BUG &c.

In 1877-78, coffee reached its maximum area of cultivation in Ceylon with the aggregate close on 280,000 acres. Six years later, and no less than 100,000 acres of this extent had either been abandoned or practically superseded by cinchona, tea or other cultivation. Six years later still, in 1890, the area under coffee was returned at no more than 54,000 acres, in 1893 it had sunk to 30,000 acres exclusive of about 2,500 acres under the Liberian variety and now (Sept. 1895) it has gone down to 22,000 acres besides 3,000 acres of Liberian coffee. So great a transformation in agricultural enterprise within a period not much exceeding half-a-generation—as such is reckoned in temperate zones—has surely never been witnessed in the world's history before.

It is of interest at this time to know over what districts in Ceylon the 22,000 acres that remain of the old staple—coffee *Arabica*—are distributed. North as well as South of Kandy, in districts that were once the stronghold of the coffee bush, scarce an acre now remains! For the Knuckles, Rangala, and Nilambe districts, for instance, no return whatever is made by a single planter,—under coffee the record is absolutely *nil*. It is no better in Ambaganuwa, Medamahanwara and Lower Dikoya; while only a very few acres appear for Kelebokka, Hunasgiriya, Dolosbage, Pussellawa, Ramboda, the Hewahetas, and Kotmale. Dumbara, Hantane, the Matales and Pundaluoya show a little more; but altogether in the Kandy districts proper, between Ramboda and Matale and Dolosbage and Medamahanwara, once the mainstay of the coffee enterprise, with perhaps 100,000 acres under cultivation, the total under coffee now does not exceed 3,500 acres!

We now come to the three higher districts between Adam's Peak and Great Western, which could—fifteen to sixteen years ago—show over 80,000 acres cultivated with coffee. Here is the return for the present day:—

Dimbula	2,109	acres	coffee
Dikoya	1,535	do	do
Maskeliya	160	do	do

Total . . . 3,804 do do

We then come to the Principality—to Uva and its allied districts—in which, for our purpose today, we include Maturata as well as Udupussellawa, and although compared with the maximum return fifteen or even ten years ago, our figures show a woeful decrease—still, it is a matter of satisfaction that so much good coffee remains, especially in Haputale, and still more that in place of every acre superseded, we have full compensation in flourishing tea or cacao. Uva could at one time boast of well-nigh 50,000 acres of coffee. Here is now the record with some extra districts:—

Haputale	6,119	acres	coffee
Haputale West	507	do	do
Badulla	2,419	do	do
Passara	1,222	do	do
Madulsima and Hewa			
Eliya	921	do	do
Monaragala	143	do	do
New Galway	114	do	do
Udupussellawa	1,449	do	do
Maturata	480	do	do

Total . . . 13,374 do do

Or let us say 13,500 acres which is equal to nearly two-thirds of the whole coffee extent in the island. Moreover, we are glad to learn that in certain parts of Uva, (as in Dumbara successful clearings with the old staple with the Liberian variety—are being established, while the greatest care is being taken of the fields that remain. Considering the continued high price of coffee and good crops recently gathered, it is scarcely to be wondered at that this should be the case; but there is a further reason now for conserving coffee in the news just received from Honolulu that lady-birds there are killing the enemies of coffee.

As regards Liberian coffee, the 3,000 acres cultivated are chiefly distributed between the Kurunegala, Kegalla and Polgahawela, Matale North and West and certain low-country districts; but there is no reason why a considerable extension should not take place. We hope to hear of further experiments being made with the Nalkanaad-Coorg and Mysore-hybrid coffees, as also with the hybrid between the Liberian and Arabian kinds reported some time ago to have been established in the Peradeniya Gardens.

INDIAN AND CEYLON TEAS.

Mr. W. D. Gibbon, homeward-bound, drops a note to us as follows:—

S.S. “Malta,” Suez Canal, Sept. 1.—“We hope to be at Port Said at 12 noon after a very uneventful journey. The “Malta” is a most comfortable boat. I understand from a London buyer of tea just returning from Calcutta that buyers there have lost money by their purchases the London market for Indian teas being dull. Indian tea was nothing like the quality it had last year. The season has been bad, but the increased area coming into bearing will keep up the quantity so far as output is concerned. My informant, who says he has *no prejudice* on the subject, maintains that the keeping quality of Indian tea is far superior to Ceylon, and that there is a salty flavour in Ceylon tea not perceptible in Indian and which he tries to account for owing to Ceylon being an Island.”

COFFEE, CACAO AND SHADE IN THE DUMBARA VALLEY.

In connection with our Handbook Planting Review, it is of special interest to learn how experiments with new or old products are proceeding and so we want to know from time to time about those in Dumbara with Coorg coffee mixed with cacao and all under shade, first begun on Kondesalle at, we believe, the instance of Mr. Hamlin and continued by Mr. Wilkinson; and also carried on by Mr. Vollar on Pallakelly. The Manager of Kondesalle has accordingly obliged us with the following very useful reports:—

Kondesalle Estate, Kandy, Sept. 21st, 1895.

DEAR SIR,—I have with the exception of one year, opened land in Arabian coffee and Foresteria cacao and shade yearly since 1888.

All the coffee planted on this estate has paid well, especially the 40 acres clearing planted in July 1892, which last year gave a crop of almost 4 cwt. per acre and this year may give quite 1½ cwt. per acre, perhaps 2 cwt. per acre. This field is shaded with dadap. My previous clearings were shaded with the Coorg fig *i.e.*, *Ficus glomerata*, which I do not believe in and am of opinion that from the experience I have had the *Ficus glomerata* does not suit coffee as well in this district as I am told it does in Coorg. It certainly does not suit cacao except in occasional patches.

Although Arabian coffee has done so well on Kondesalle and Pallakelly, I know of four instances on other estates in another district where it has even on better soil, proved a failure.

All our seed was from Coorg. A few acres lately have been put into Liberian.

C. H. T. WILKINSON.

[The following was written to us four years ago, but omitted to be sent for publication at the time.]

July 24th, 1891.

DEAR SIR,—In the issue of your paper for 21st inst. I notice you draw attention to the coffee and cacao clearings on this estate under the heading of "Coffee Planting in Dumbara." There are one or two errors which I should like to correct as they may be misleading to those intending to plant cacao and coffee together, so you may publish as much of this letter as you think fit. My first clearing—50 acres—was planted in June-July 1888. Coffee plants were put out, but the cacao was planted seed-at-stake. The next clearing—54 acres—was planted June-July and August 1889 in the same way.

The cacao holes are 3 feet deep, and are 10ft. by 12ft., and not 11ft. by 11ft. as you have it, therefore the coffee is 5ft. by 6ft.

If the land is really good I advise coffee and Caraccas cacao being planted together at 10ft. by 12ft. I am inclined to think that the Caraccas or red variety is a heavier bearer than the Forestero, although not so hardy. Forestero grows faster than the Caraccas and requires more space as it spreads; therefore I do not think 15ft. by 15ft. too wide apart, for if the soil be really good, even at this distance, the branches will meet in 3 or 4 years, especially if the land be flat.

In parts of my 50 acres clearing where the soil is really good the Forestero Cacaos have spread so freely that their branches already touch—so are crowding out the coffee.

If Coffee and Caraccas be planted I recommend them being planted the same year as these Cacaos do not grow quite so rapidly and do not spread so much; but if the Forestero is required to be planted, I recommend putting the coffee in alone (*without shade plants*) the first year and Cacao and Shade Plants the year following. The Coffee will have a better chance by having a year's start and I find where the shade trees have not come on well at first, the Coffee bushes are much more luxuriant.

Shade Trees in my clearing have been planted 10 by 12 *i.e.* one for every Cacao tree. This in my opinion is far too close and is not required I therefore recommend one shade tree to be put in for every two Cacaos thus:—

Cacao o. Coffee x. Shade y.

C. H. WILKINSON.

Mr. Vollar kindly reports as follows:—
"Coorg coffee was planted in Dumbara, and at the same time cacao plants were also put out. Upshot:—got one or two good crops of coffee which more than paid all expenses of clearing and left a fair profit, and then the cacao trees overshadowed the coffee and snuffed it out. From what I observed, I have no belief that the coffee would have lasted or gone on giving good returns, if it had had its own sweet will, but it was a splendid catch-crop. We have still a fringe of coffee along the roadsides, which gives a fair crop every other year."

DR. TRIMEN'S "FLORA OF CEYLON."

We have to acknowledge the receipt of Part III. of this valuable work accompanied by 26 coloured plates executed in Messrs. Dulau & Co.'s (the publishers') best style. Reserving an adequate notice with examples of the information of

general interest afforded, we quote for the present, the title page of the volume:—

A hand-book to the Flora of Ceylon containing descriptions of all the species of flowering plants indigenous to the island, and notes on their history, distribution, and uses by Henry Trimen, M. B. (Lond.), F.R.S., Director of the Royal Botanic Gardens, Ceylon. With an Atlas of Plates illustrating some of the more interesting species. Part III. Valerianaceæ—Balanophoraceæ with Plates Li—LXXV. Published under the authority of the Government of Ceylon. London: Dulau and Co., 37 Soho Square, W. 1895.

Among the more striking of the plates are:—
"BARLERIA ARNOTTIANA, Nees, VAR. GLABRA, Trimen"; a double page with "IPOMEA JUCUNDA," Thw.; "IXORA JUCUNDA," Thw. with its dark-green leaves, red stems and wealth of white flowers; "WRIGHTIA FLAVIDO-ROSEA," Trimen; etc

HOOLANKANDE ESTATE, KELEBOKKA.

The price paid for this property the sale of which to the Earl of Glasgow (Governor of New Zealand) was recently announced is £12,750. The acreage is 668 of which 355 in tea, 40 in timber, rubber &c.

THE TEA "RING" OR MONOPOLY IN CALIFORNIA.

We can use no other term than the above after reading the following circular letter handed to us by a Colombo merchant. No doubt San Francisco tea dealers would prefer that there should be no intrusion of a new and better article such as Indian and Ceylon teas, seeing that the inferior and oft-adulterated Japan and China teas, afford them a wider margin of profit. But it is just their monopoly that has to be fought and if the large dealers refuse to hold Ceylon and Indian teas, then it will be for the producers to go direct to the consumers with samples and advertisements and to let them know how they are kept out of a wholesome superior article—and a more economical one in the end. To stop the steady supersession now of Japan-China by Ceylon-Indian teas year by year in America (as in Europe and Australasia), is a task parallel to that of worthy Dame Partington in trying to drive back the Atlantic Ocean. We quote as follows:—

San Francisco, July 27th, 1895.—Whereas the practice of consigning Teas to this market, to Agents and Brokers, has been steadily increasing and in consequence threatens to be a menace to legitimate Importers, by causing serious demoralization in prices, and general injury to the trade. Be it therefore resolved, that we request all Tea Houses in Japan, China, India, and Ceylon who consign Teas to this market, to cease doing so, and to sell only on orders from the Importers direct, or by sample or orders from their Agents or Brokers, representing them in this market. Be it further resolved, that the respective Agents or Brokers be at once notified that these resolutions will go into effect after due time has been allowed for communication with their Principals.

THE TEA PLANTING INDUSTRY OF
CEYLON IN 1895:

THE POSITION IN RESPECT OF ALTITUDE
AND GROUPS OF DISTRICTS; INTERESTING
ANALYSES.

THE RESERVE AVAILABLE FOR TEA.

Just as we have pointed out the location of what is left to us of "Coffee," so it may be well briefly to bring under review the great divisions or centres of "Tea" cultivation in the island. We may indeed be told that tea is everywhere, or be asked where it is not, within the recognised Planting divisions of the Mountain Zone and much of our South-Western lowcountry; but by grouping certain districts together and showing the total area in these covered by the tea plant, we may get a much better idea of the importance of the several zones of cultivation. In doing so we may first give an approximative estimate of the area with tea from an altitude of about five thousand feet above sea-level and upwards; secondly between five thousand and down to about three-thousand-five-hundred feet altitude; thirdly from the latter limit to say two-thousand feet; fourthly between two and one thousand feet and fifthly under a thousand feet altitude and in the low-country proper. Premising that the aggregate area planted for Ceylon is taken according to the latest Directory returns, at 305,000 acres, plus 5,000 acres in native gardens not in our lists, our estimate of approximative areas at the different altitudes works out roughly as follows:—

	Feet.	Feet.	Acres.
Tea above (or close on)	5,000	about	30,000
"	3,500	and under	151,000
"	2,000	"	67,000
"	1,000	"	24,000
"	under	"	38,000

Total.. 310,000

Next we may attempt some grouping as respects districts. Taking first the great expanse of cultivation between Great Western and Adam's Peak and including Lower Dikoya, we get of tea planted, as follows:—

	Acres.
Dimbula—area under tea	41,001
Dikoya	26,731
Dikoya Lower	7,996
Maskeliya	18,547

Total - 95,175

Or, not far short of one-third of the total area planted in the country, and certainly by far the most valuable third. Let us by way of contrast place the Uva group of districts, going as far as Maturata and Nuwara Eliya on the one side and Balangoda—though this may seem rather beyond the Uva climate—on the other. We then get a return as follows:—

	Acres.
Haputale	11,630
West	1,197
Balangoda	3,412
New Galway	881
Udapussellawa	8,289
Maturata	5,129
Badulla	8,579
Passara	3,560
Madulsima and Hewa	
Eliya	6,609
Monaragala	245
Nuwara Eliya	3,600

Total - 53,141

Here we have over one-sixth of our total area under tea; but then it must be remembered that in this division there are also 13,400 acres of coffee and an appreciable area of cinchona against only 3,800 acres of coffee and very little cinchona in the Dimbula-Dikoya group.

It may be well next to show the area under tea in the districts North and South of Kandy respec-

tively. In the Northern, North-Western and North-Eastern divisions, we have:—

	Acres.
Matale East & Laggala—area under tea	7,439
Matale West	3,095
North	1,289
Kelebobokka	4,387
Knuckles	4,095
Nitre Cave	329
Rangala	4,595
Medamahanuwara	988
Hunasgiriya	2,859
Panwila and Wattedgama	1,913
Dumbara	60
(And let us add) Kurnnegala	1,368

Total - 32,417

Or not far off one-ninth of the whole extent under tea and less than half the acreage included in the next group. South and West of Kandy, we place:—

	Acres.
Hantane—area under tea	4,840
Hewaheta Lower	4,004
Upper	4,228
Nilambe	4,991
Pussellawa	12,211
Ramboda	3,637
Pundaluoya	3,345
Kotmale	8,198
Ambagamwa	5,992
Yakdessa	1,761
Dolosbage	14,174
Kadugannawa	3,375
Alagalla	2,453

Total - 73,209

This takes the second place, the proportion being nearly one-fourth of the whole.

Finally, we may give all that remain together as "Lowcountry," although the Rakwana, Kukulu and Morawak Korale districts are scarcely in that category:—

	Acres.
Kelani Valley—area under tea	22,322
Kegalla and Polgahawela	1,350
Kalutara	10,453
Udagama	3,970
Other Lowcountry Districts	3,749

41,844

(Considerably higher.)

Kuruwita	1,262
Rakwana	3,145
Morawak Korale	3,168
Kukulu Korale	1,053

Total - 50,472

In this total we have very nearly one-sixth of the grand aggregate for the island; but as time rolls on, if only encouragement is offered through prices keeping up, we may expect the lowcountry to show a further considerable development.

We have been asked by a Colombo merchant to state what proportion, according to our reckoning, of the reserved land in private hands may be available for planting with tea. The total extent of plantations being 748,017 acres and of cultivation 379,182 "

We get for total reserve 368,835 " Of this very large extent we should say that about 120,000 acres represent forest and other valuable land fully available for cultivation if due encouragement is offered; and unless a fall in the price of tea through large crops in India interfere, we see no reason why 60,000 acres of this reserve should not be planted during the next five or six years—apart from any Crown land that may be made available—so let Indian tea-planters beware of supposing that there is no more tea land to plant in Ceylon,

SUPPLEMENTING TEA WITH COFFEE IN N. INDIA.

First as regards the elevation required for growing coffee in the Bengal Presidency. We can start from the low country, where there is good drainage, to any fairly sheltered elevation below frost zone. There are a few coffee trees in Calcutta, but we will cite Rangoon, some 8 deg. south of it, where may be seen over an acre of coffee in their Botanical Gardens some 20 years old grown in "Native" fashion—cropping on suckers. Owing to want of method, it crops heavily every two years. There is no pampering, rather an intentional neglect to wisely prove that it thrives under difficulties. In Bengal we have the advantage of being—roughly—8 deg. north of Rangoon, where it thrives on the plains. We have a rainfall averaging 65 inches in the year, falling in the months best suited for coffee. A dry winter and spring, and showers in April, with a wet October—this last matures berry and future bearing wood. Coffee, like tea, will not do on a wet subsoil.—*Indian Planters' Gazette*, Sept. 14.

[And then follows practical advice.—Ed. T.A.]

THE PREPARATION OF CAMPHOR.

In view of the failure of Mr. Nock's persevering attempts to collect camphor from decoctions of the bark, twigs, &c., of his trees, we applied to Mr. R. Porter to try and get some of his friends of the English Presbyterian Mission in Formosa, to compile and give us the necessary information. The result is eminently satisfactory, in the paper we append written from Taiwanfu, the capital of Formosa. We give the manuscript account in full and we trust the instructions are simple and clear enough to enable Mr. Nock to utilise them in a fresh experiment; there are three little sketches—of the furnace, the style of chips, and the beaten wood—which we also have had reproduced:—

THE METHOD OF PREPARING CAMPHOR IN FORMOSA.

The method employed in Formosa for preparing camphor is very rough, and consequently not very economical.

I myself have not seen the process but have heard it described by several persons, particularly by the man who first had to do with this work in Formosa.

The apparatus and operation are as follows:—

1. A fire-place is built and a shallow iron vessel (the kind used in Formosa for boiling rice) inserted therein.

2. The walls of the fire-place are carried up a short distance and a meshed frame placed across the opening.

3. A large earthenware vessel is placed inverted over the top. It is made to fit more or less closely to prevent (as far as is safe) the escape of vapour.

4. The pieces of wood are chipped off from the tree with an adze diagonally to the grain.

5. Each piece of wood is then beaten till it splits more or less up along the grain. This is to expose the surfaces where the camphor lies. Some of the pieces of wood are about the size of one's hand, or less. The slices are not very thick.

6. Water—not too much—is put into the iron vessel.

7. The prepared pieces of wood are placed on the top of the meshed frame.

8. A wood or charcoal fire is lighted under the iron vessel. It must be a slow fire and the water must not boil violently.

[The idea seems to be like that in the making of beef-tea with steam, the water from which is generated being allowed only to simmer.]

9. The steam goes up through the grating or meshed frame and then through the pieces of wood. It gets impregnated with the camphor which is deposited in the inside of the inverted earthenware vessel.

10. The wooden chips are changed about every twelve hours, the exhausted ones being taken out and fresh ones put in.

11. The process goes on continuously for several days (nights included.) A sufficient quantity of camphor is obtained after six or seven days, but it is soft and apt to run into an oily fluid. To get a good hard quality the process should in all last about ten days.

12. When the camphor is properly ready, it is scraped off from the inside of the earthen vessel. This is the camphor of commerce, not the refined kind sold by chemists.

GEORGE EDE, E. P. Mission, Formosa.

A NEW TURBINE FOR GEEKIYANA-KANDE ESTATE.

The Colombo Commercial Company are erecting a new turbine on Geekiyanakande estate, Neboda. The turbine is of Gunther's partial injection type, and is so constructed as to suit the requirements of both the wet and dry seasons when the supply of water will vary. The horse-power is 25, but the turbine could be efficiently worked even at 3 h. p. The fall of water is 70 feet, and the machine passes 250 cubic feet of water per minute. The pit is 45 ft. deep, the excavations made through rock being at a depth of 22 feet, the upper portion—23 feet—only, being through earth. The diameter of the pit is 6 feet 8 in. and the upper part is lined with 9-inch brick lining. The vertical shaft has a revolution of 240 turns a minute. The tail-race is 2½ chains in length—the cutting of the first two chains being through solid rock. This has been the first instance in Ceylon of such a deep turbine-pit. Work is now in full swing, and will be completed shortly.

COFFEE IN THE NORTH OF QUEENSLAND.

It is an interesting fact that the Cairns district can now boast of the largest area under coffee in the whole of Australia. As a result of the enterprise of Messrs. Swallow Bros., of Hambleton Plantation, thirty-five acres of their estate have just been put under the coffee plant, there being 34,000 trees of the Arabian and 1,000 trees of the Liberian variety. It is anticipated that in from two to three years the thirty five acres will give a total of about thirty-one tons of coffee beans per annum, which at the wholesale rate of 1s. per lb., represents a gross return for the thirty-five acres of £3,500 per annum. The seed from which the young plants were grown was obtained direct from Ceylon. We always thought there was "money" in coffee culture, these facts show it. Other agriculturists north-wards should follow this example!—*Australian Tropicalist*, Sept 2.

FOREST-THINNING.

Mr. J. A. Manton, who is in charge of the forest-thinning operations in the Murray district for the New South Wales Government, reports that the total area thinned to date is 50,500 acres. The average number of trees left is about 250 to the acre, and it is assumed that at least 100 will grow to marketable timber during the next 35 years. Placing the market value at only £1 per tree there will be a return of at least £100 per acre in 35 years. The cost of the thinning operations so far has been 5s 2d per acre.—*Australasian*.

LIBERIAN COFFEE IN WYNAAD.

Kadur Dist., Sept. 19th.

Sir,—May I hope for a reply to the following queries from some of your numerous readers? About what should be considered "a good maiden crop" per acre from Liberian coffee growing at an elevation of 1,000 feet and planted 10 ft. apart—and also at what age may the first crop be expected?—ENQUIRER.

II.

Vayitri, Sept. 20th.

Sir,—As promised in my letter appearing in your issue of the 4th instant, I have now to inform "Toda," that the first shipment of Liberian coffee from this district was sold in London on the 19th ultimo and realised 84s per cwt. The consignment being a small one, the price is, I think, fairly satisfactory, and just 10s more than that secured for the coffee (grown in the lowcountry and erroneously marked Wynaad) referred to by "Toda" in his letter of the 3rd August last. It may interest "Toda" also to learn, that the outer husk or pulp, if carefully dried, finds a ready sale on the coast, and adds very materially to the value of a Liberian Crop. R. LAMB.

III.

What's all this pother about the elevation of Nellacota? There is little doubt but that "Liberica" would grow at the top of Needle Rock if it could only find a footing there. The question we would like to have settled is, as to whether the said "Liberica" would bear paying crops of coffee at 4,600 feet or so above sea-level? That the tree has borne heavily and given half a ton and more of high-priced coffee per acre at about 2,600 feet elevation in Wynaad, seems to have been conclusively proved. It would now be very interesting to know how much coffee per acre may be expected from trees growing at 4,600 feet and over, or, well, let's say in the clouds or somewhere near the frosty regions! in a locality rather foreign to the habitat of "Liberica," which loves rather the hotter and more forcing climate to be found at a comparatively low elevation. I trust, however, that the "Liberica" at Nellacota may reward the enterprise of its planters by proving highly successful and remunerative.

Manantoddy Club, 23rd Sept.

EXCELSIOR.

IV.

As the elevation at which Liberian coffee will grow and crop well is, I believe, of much interest to many, kindly allow me a word in reply to "Nilgiri Wynaad," whose letter appears in your issue of the 19th. He impugns my recorded tests by aneroid on the ground that such tests can be comparative only; but having found out by a reference to Mr. Borough Smyth's map, that the highest point of Needle Rock is there given at 4,600 feet, he takes it for granted that is the highest point of the range, and at once draws an imaginary line from thence to where he supposes "Toda's" Liberians' to be growing; and another imaginary line to Avondale Bungalow, which he supposes to be the highest point of Avondale estate. Against his imagination, I think my aneroid tests can be fairly placed. Such tests, I believe, are generally accepted as good enough for practical purposes—admitting their variations are understood, and allowed for. There is a trigonometrical survey point at either Needle Rock Peak, or Rockwood Peak. Aneroids set at sea level, I should think, would be found to agree very closely to that determined point; but I have not, though it is necessary to climb to the top of either Peak, in order to be able to rectify, possibly, a difference of a few feet. I leave that for "Nilgiri Wynaad" to do. As he says, no one will deny that Needle Rock Peak (or the highest point of the Needle, to be absolutely correct) is the highest point of the Range, he may be surprised to learn that it is not, but that Rockwood Peak is. Nor is Avondale Bungalow the highest point of Avondale Estate to which I

alluded. "Toda" has admitted to me that he ought to have written 4,000 instead of 5,000 feet, as being the elevation his Liberians are doing so well, and I understand him to be of opinion that Liberian might even be found to crop at 5000 feet. I agree with him that his Liberians are cropping at about 4,000 feet. We have the testimony of Mr. W. C. Dawson that they are doing ditto on the Bramagherries at 4,100; and it would be interesting to know whether other testimony of this variety cropping at even higher elevations could be adduced. I am inclined to the opinion of "Toda," without fixing so high a limit as 5,000 feet, but they might be found to crop well at over 4,000 feet. "Nilgiri Wynaad's" belief would probably not have found expression, had he been better posted up in local knowledge. H. SHELDUCK.

—M. Mail, Sept. 23rd.

BRITISH CENTRAL AFRICA.

We have the official *Gazettes* from Nyassaland of July 1st and 15th. The first is full of Customs regulations; but in a Supplement we get some exciting news about lions:—

It is stated that a troop of lions made a determined attack on the cow-byre at the Mission Station at Blantyre the other day, and killed three cows. The increasing boldness of those animals is extraordinary and is probably due to the extinction of the game in the more settled Districts of the Protectorate. A few days ago one of the Zanzibari policemen at the Ntondwe post on the Zomba road met a lion walking up the same road in close proximity to the post. The lion was between the man and the little fort and stood his ground, not at all inclined to give way. The Zanzibari therefore fired at and wounded the lion who however charged him and the man received him on the point of his bayonet. Nevertheless, the lion managed to free himself, and though very severely wounded made off into the bush. In the struggle the Zanzibari had one of his toes torn off by the lion's claws. Otherwise he was uninjured, but the nervous shock was so severe that for some days he was incapacitated from duty, and would not leave the fort under the belief that the lion was lying in wait for him.

Major P. W. Forbes arrived at Zomba on the 23rd June to see H.M. Commissioner in reference to the taking over of the Administration of the British South Africa Company's Territories north of the Zambezi. The transfer of the Administration from the Commissioner to Major Forbes will have been completed by the date on which this Gazette is issued.

Major Forbes proposes to start in July on a tour of inspection round the Chambezi, Tanganyika Mwera and Luapula Districts. He hopes to be back in Blantyre in about two and a half months from the date of starting. Major Forbes proposes to make his headquarters at Blantyre for some time to come, as besides the administration of the Chartered Company's sphere he is charged with the completion of the Telegraph line from Blantyre to Tanganyika. No immediate alteration in the Administration of the Company's sphere is contemplated. The latter paper has articles about Angoli Labour and Coffee and the following paragraphs:—

It is interesting to notice the attention which the more intelligent of the native chiefs are now giving to the planting of coffee &c. Coffee planting has been started in the Marimba District by some of Jumbe's old headmen. Magnificent crops of potatoes are now being raised by the chiefs and headmen in the Zomba District, and those brought in for sale are superior in size to the best that can be turned out in our European gardens at this place. All these potatoes are derived from seed distributed amongst those chiefs by Mr. Whyte, two and three years ago. Unfortunately, the experiments with wheat were marred by the locusts, and it is to be feared that the natives are rather discouraged from planting corn for some time to come,

EXPERIMENTS WITH TEA IN CEYLON 26 YEARS AGO.

[I send some notes on tea written by Mr. A. C. H. of Rangoon, formerly a planter on Mount Temple Estate, above Gampola, which it will be interesting to publish. He is a very clever and original man, but unlucky in his speculations. At present he has a rice mill, and is preparing Burma rice in the same way they prepare it in Madras, steaming it to make Caluuda rice, and is the first to introduce that system of preparing rice into Burma, which may benefit the rice growers there very much. He is very sanguine about making a fortune over it.—*Cor.*]

9th Aug. 1895.

In 1879 the following experiment was tried on five year old tea bushes by a restless spirit whose notions are out of the beaten track. A few old women were, after picking the usual flush of young leaves, set to strip every leaf off a certain number of bushes to ascertain what kind of tea could be made from the hard leaves.

About 8 trees a piece was all the old women got through, each tree producing as its total crop, over a pound weight.

The leaves were too dry to wither, roll, or ferment; the question was: what to do then?

A large-sized sausage machine being available the leaves were put through it, and cut up; they were then sprinkled with water, plenty of it, and with some trouble of attempted rolling (and palming, patting or pounding) got to adhere in the form of balls. In this state a certain amount of fermentation was set up, even to a reddish-green colour, and the tea was in due course fired, put into paper packets of 1 lb. each, and put aside for sale to natives who occasionally came for tea at 1s 6d each.

The originator of the experiment forgot it until some weeks after, a neighbour who turned up his nose at the very idea of Ceylon tea, ran out of his imported stuff and wrote over asking as a favor to be spared a few pounds of tea. By way of paying him off for the contempt he always exhibited with regard to the production of Ceylon tea, a couple of paper packets of the production in question were sent to him with a note saying that this was some rubbish sold to natives at 1s 6d a pound, and was the only tea available at the moment.

In the course of an hour or two an acknowledgment was received to the effect that the sample sent was the finest the writer had ever tasted, and he would be only too glad to buy every pound available at 1s 6d! So much for tea made from what 99 planters out of 100 consider of no value, because the remaining one has said so.

Twenty-seven days after that stripping, every bush treated threw out an abundant flush of pekoe tips or about ten times the quantity that any ordinary bush would yield under ordinary circumstances. At a rough calculation an acre of tea if stripped say twice a year would yield fully 800 lb. of tea from hard leaf. From only pekoe tips two pluckings, 50 lb. and more than its yield of average tea during the other 10 months in the year, because all the young leaves would be tender enough to manufacture if advisable.

The late Dr. Thwaites on being consulted, gave his opinion that stripping should not be resorted to "too often."

The question induced by the result of this experiment is "Does the Tea Planter under the prevailing system derive one quarter of the profit from his tea trees that they are capable of yielding?" the answer is, if you have full-grown bushes why not prove it?

A. C. H.

[We suspect that after each successive "stripping," the bush would prove less and less readily responsive and would in fact soon begin to show signs of suffering.—*Ed. T.A.*]

HOW IT STRIKES AN OLD COLONIST. MOROWAKA REVISITED; THE COMING RESURRECTION OF BURIED SOVEREIGNS.

Passing along Craven Street a few months ago, I observed a brass plate bearing the words "Morowakkorale Tea Company, Limited."

The doorway had long been familiar to old Indian and Ceylon men, mercantile, civil and military, and perhaps was more frequently and hopefully entered in the olden time when the quaint little street came to a *cul de sac* ere reaching the bank of the Thames, than now when it is an open and busier thoroughfare.

Morowaka seems better known in London than it is in Colombo. "Where on earth is Morowaka?" said a leading Estate Agent the other day and as there are doubtless many in Ceylon equally ignorant of our southern hills, a brief record of the district's history during the past 30 years may not be out of place.

The Morowakkorale proper lies wholly within the Southern Province, though several of the estates such as Hayes, Valleyfield, Panilkande, &c., are within the limits of Sabaragamuwa, about 40 miles from Matara—60 from Gallo and 112 from Colombo, by such roads as are now available and those who complain of them ought to have "seen those roads before they were made."

The railway journey to Galle from Colombo unnecessarily tedious as it unquestionably is—taking four mortal hours to cover what in my native country would be accomplished in about 1½ hour. Still it is an improvement on the old coach, though the journey may be more monotonous. We are not now and then landed in the ditch we get no nullagatawney at Bentotta. Albeit there is a considerable saving and for this we are duly thankful. In a few weeks more the line will be opened to Matara bringing us ten miles nearer our destination.

To anyone like myself who 30 years ago crept up from Akuresse through jungle paths,* the present carriage drive seems splendid, and indeed it is a very creditable trace—but passes through a very poor and sparsely peopled country. There are no valuable forests and the greenery existing such as the bracken, only serves to show the poverty of the soil. Here and there the pretty and curious pitcher plant hangs over the steep embankment indicating a very moist and warm climate. The purple variety, by the way, only supposed to be found in Borneo, is here not uncommon. A few miles before reaching Akuresse—or about 20 miles from Galle—we come upon the first tea estate, a poor jāt in a poor soil, but such is the result of 150 inches of rain per annum in a hot climate, that the flushes seem fairly good.

AKURESSA

itself, with its comfortable bungalow, its pretty clump of teak trees and its navigable river, forms the only real oasis in this lowcountry wilderness. The road thence to Deniyai—29 miles—affords little worthy of note save the welcome and very pretty Resthouse at Morowaka where one can always get an easy chair, a refreshingly long drink and see such familiar objects as a copy of the *Tropical Agriculturist* and Sandy Brown's picture hanging on the wall.

ARRIVED AT DENIYAI

where the frogs perpetually croak, the worried travellers feel only fit to follow their example. There is not much to eat, less to drink; but we bless the Government Agent whose forethought had provided such splendid beds. Deniyai though barely 1,000 feet above sea level is cooler than Kandy, and we sleep as only moderately tired men with fairly good consciences can. Feeling refreshed next morning we start for a walk of 5 miles into the heart of the old coffee district; but before we had travelled a mile we had entered upon a tea wattle of considerable extent, at the entrance into which stands a substantial stone and lime Church dedicated to St. Joseph built by the prosperous native

* Our first and only visit to Morowakkorale and across Gongalla to Rakwana was in 1872.—*Ed. T.A.*

proprietor of the wattle. The wattle of about 100 acres showing a fairly good cover of—I am sorry to say—in add—rather poor jât, making up in flower what it fails to do in flush.

THIS QUESTION OF JÂT

is by the way one of the most tender topics that a visitor can touch in Ceylon. It took the pukka planter 6 years to arrive at its immense importance and he is loath to think that any occasional interloper should so far profit by his dearly bought experience as to become in 6 weeks an authority on the mysteries of Manupuri or the so-called Singlo-hybrid. The bare possibility of any one seeing at a glance the superiority of pure indigenous, acts like wormwood on the man who has daily to look at his poor degenerate China jât and think "what it might have been had he but known."

The fact, however, seems to be that the produce of the purest and best seed-bearers deteriorates after 7 or 8 years, like most things in the tropics. Even planters themselves get musty and it would well repay proprietors to give them a change home every 8 or 10 years in order to rub off the rust.

But all this by the way. As we trudge along the 5 miles from Deniyai to Anningkande, where, after a hospitable reception, I am ready to stretch myself in the Verandah and tell all I know of

MOROWAKA AS A PLANTING DISTRICT.

It was in the very early sixties that in company with my most amiable of friends, W. Hay Wodehouse the Temple Lands Commissioner, I first visited Morowaka, viewing it from the ridge above Berlepanatra, an unbroken range of forest save where the natives had nibbled away portions for koorukan or hill-paddy, and we pictured then and there the smiling homesteads that might some day be dotted over these verdant slopes. The natives were not numerous nor very bold. "All you who have never seen white men, now's your chance" was the message that was sent through the village by tuck of tom tom, and they came 'keeking' at us very timidly with hand on mouth, lest their breath should pollute us. Alas they are not quite so respectful now!

My next visit to the neighbourhood was with the redoubtable

J. W. BIRCH

—, "poor Colonial Birch," as H. O. Russell delighted to dub him—a different type from the polished Woody—or the aristocratic Russell; but a most useful and energetic public servant, albeit his manner of treating the natives was rough and ready in the extreme.

"Koorunba!" he called out as we came panting upon a Colonna village; but thinking he was only a Rakwana planter, the owner of the wattle hesitated, when, immediately, the edict went forth that this man's garden be stripped of every green thing. "I'll teach him hospitality," said B. as his followers literally carried out his instructions.

We encamped for the night on what is now known as the Panikande flat, and early next morning as B. was bewailing the chenaing of so much fine forest, a native headman crept up salaaming and unfortunately began to complain of the inroads of a surveyor upon what he considered his inherited territory. B. was in no mood to listen to such grievances, and turning upon the arachy he exclaimed, "You think—you thief,—that because you have been permitted to look at those hills all your lazy life they belong to you," and ended by administering such a castigation as headmen had never heard of. This now brings us to the days of Surveyor John Grinlinton, whose flowery description of the ferns in these valleys caused the Government of the day to raise the upset price of the land by 100%.

But before this—(1863)—Lemarchand and Clark had discovered and slyly secured a large slice of this *Eldorado*, quickly followed by Captain Bayley, Blyth and others; but the big purchase at £0. (1.20) per acre was by J.R.H. for his Craven Street friends.

Anningkande was the first opened, and I well remember zig-zagging over from Berlepanatra to find C. G. Bury at work clearing, and who in the evening entertained me with the story of

HOW HE DID THE FISCAL IN THE CENTRAL PROVINCE.

Worried by unfortunate duns of the A. Saibo order, B. had made up his mind to seek relief by flight into the wildest and least accessible of new planting districts, but before starting determined to give his friends—the provision dealers—one more good order, and his brother planters a parting spread. Summonses to attend Court had been treated by B. as a joke. So on the eve of flight, as bad or good luck would have it, a warrant was issued and two belted peons were despatched to apprehend his body. These arrived just as dinner was announced; but the host took them aside and talked them over with such tact that they consented, nothing loath with such a prospect before them, to lay aside their belts and assist to wait at table! So lullily entering into the humour of the thing, they ate and drank as much as any dour, feeling sure all the same that they would have their man in the morning; but long ere they awoke B. was trudging up through Bogawantalawa en route for Sabaraganuwa, thence to this back o' the world called *Morowaka*.

Several more planters of the same jât followed till Morowaka became rather noted as a refuge for harassed debtors; but somehow proprietors began to discover that these were not the best type of men to develop successfully a new district and as one by one they were shunted or died off, their places were filled by the best and most trusted planters the C. P. afforded. And now we come to the time when Morowaka first had a fair chance

AS A COFFEE DISTRICT,—

when steady, faithful and practical men like S. LeCoq, A. T. Rettie, R. Morison, &c. entered upon the stage and well did they act their part. But it was of no avail. As a coffee district Morowakkorale was doomed, even before *Hemillia* put in an appearance. Those who knew the quality were well aware that (under no possible circumstances) could the life of the coffee tree be a very long one there. *Ten years* as a rule, had been its length of days as a paying product in the adjoining district of Rakwana, where any attempt to prolong its life by high cultivation only prolonged the misery. This was sufficiently exemplified under the liberal cultivation of C. Shand & Co., and King Coffee never had more loyal or generous subjects—yet so early as 1858 the sagacious Sir. H. Ward mildly reported:—"Some of the older coffee looks thin and poor." Nevertheless there were few districts in which coffee more amply repaid the planter: the first three crops—from 30 to 40 cwt, per acre—were sufficient to cover all outlay. The mistake Morowaka men made was in despising Rakwana experience and in hoping and working for a permanency. It was in vain that economy in permanent buildings was suggested. "Let us have no fears as to permanency of coffee if properly cultivated" said Craven Street,—“Look at the Hampton Court Vine, 200 years old and still bearing. If coffee fail, it is the fault of the planter whose duty it is to make the soil suitable and keep it up.” All very beautiful in theory, but to those who know all about the old vine and young coffee, it sounds a trifle ridiculous.

At this stage came leaf blight, and to no district in the island did it prove a greater blessing. Would that it had been practicable to take more immediate advantage of the opportunity!—that, as in the younger districts of the C. P., the coffee had at once been supplanted by the new product. As it is, the Morowaka korale is still a somewhat sad spectacle to those who remember it in the first flush of hope. From Anningkande I can see the remains of the old Coffee Wattle spread out like a map before me. Every foot familiar ground—from the Goshen *tergal* where clever Arnold White practised his scientific manning, to the Eastmost end where poor little Liddell did his dibbling. Right in front lies what was considered the cream of the district, where I can still see the roads so carefully traced by LeCoq, and along which I have so often wandered with that prince of practical planters. But even here no attempt has yet been made

TO GROW TEA.

The fact seems to be that the hardy new product succeeds most abundantly in lands which King Coffee despised. J. R. H. laughed his loudest when Silvakande was pointed out to him as the purchase of a neighbouring proprietor;—the representative of Craven Street *pro tem.* little dreaming that the straggling strip of forest which ran along the bottom of their estates would one day prove the veritable gold mine which would redeem their fortunes. There are in the island few finer fields of tea than this, and although there are in this district many patches equally good, it is not all Silvakandes, Campdens nor Beverleys, and much discrimination is required in the selection of suitable land. Any novice might select and successfully plant in such districts as Dimbula and Dikoya, but it requires a tropical agriculturist to discriminate here.

Immediately over the ridge lies the

KUKULU KORALE VALLEY

correctly described in the recent report of the Government Agent as "that infertile region." The valley comes in like a "gushet" twist Morawaka and Rakwana, contains about 10,000 acres and though for full five years I occasionally fossicked there in the hope of finding 100 acres of really good land, I had to give it up in despair. Yet during a wave of temporary insanity which passed over the island in 1872-3 the Government took the opportunity of seeing quite a number of blocks and there lie buried many a good sovereign. One can hardly sympathize with some of the investors who asked for advice and acted contrary to it, remarking it was "surely good enough to sell at a profit." Man naturally hopes that he can always find a greater fool than himself, but sometimes this is very difficult.

The only hope of a resurrection in Kukululu seems to be in Cardanoms. Once in a life-time a lucky man may pick up a gem, herbage for a herd of elephants might be found, and if leeches could be turned to account there is wealth there but beyond this the future of Kukululu is not hopeful.

From the ridge above Vegeria—which rises a little to the West of the grand Abbey Rock—may be seen some of the remains of good, old, hospitable

RAKWANA

through which I fain would now pass. "To those who know Rakwana," said Sir Henry Ward, "it is needless to speak of its hospitability." But, alas! King Coffee is gone, so too are the Dorays I knew of yore!

The time was when twenty bungalows would open wide their doors to welcome a wandering Visiting Agent, but shade of dear David Mitchell! now I know not whether the love of "Auld lang syne" would procure me the meagrest curry and rice. So with a sigh I once more turn my back on Rakwana and retrace my steps towards Galle.

BANANA FLOUR.

LIKELY TO DEVELOP INTO A VERY IMPORTANT INDUSTRY.

A good deal of attention has been drawn of late to the use of the banana as a source of flour or meal, and, though such an application is by no means new, or the discovery modern, it seems not at all unlikely that banana flour is an article that has a prospect of great development in the near future. Wherever the banana or plantain thrives, the fruits, when dry, are converted into meal, and used for making cakes, puddings, and for various other uses in cookery. An effort is being made to establish a factory for the manufacture of banana meal.

As to the use of banana flour for brewing purposes, Mr. Kahlke, one of the best known manufacturers of yeast in Germany, writes in this connection: "Banana flour, without doubt, from its richness in starch and its good flavor, is particularly suitable for the manufacture of yeast. This flour is easily rendered saccharine. The yeast obtained by adding banana flour to the other

ingredients has a good color, all the requisite properties of an excellent class of yeast, and moreover keeps well. The alcohol obtained from it leaves nothing to be desired, so that this flour may be introduced as an article of commerce, and employed without any special preparation. Satisfactory experiments have also been made in some breweries, where 20 per cent. of malt has been replaced by the flakes and flour of cananas. The flavor of beer was not altered, and the quantity of liquid was increased, and the malt was replaced by a less expensive substance. Experiments are being made in which the proportion of banana flour is increased."—*Fiji Times.*

DEMAND FOR LOW CLASS TEAS.

It is very satisfactory to notice, writes the *Planter*, from the proceedings of the meeting of the Calcutta Committee of the Indian Tea Association, held this month, that the result of the stoppage of the export of tea sweepings from London to Hamburg was a demand from Germany in Calcutta for low class teas and large quantities of tea dust. This proves conclusively that the tea sweepings scandal was affecting very injuriously the Indian tea trade, and that steps were not taken too soon to put a stop to it. It would be advisable to include in the arrangements on foot to push the sale of Indian tea measures for the exploitation of the German and other Continental markets. It is of no little importance to the industry to know where our low class teas and tea dust can be largely disposed of.

LIBERIAN COFFEE.

Steadily, little by little, Liberian coffee is outgrowing the prejudice with which it has for a long time had to contend. Planters in India are beginning, here and there, to pay some attention to it, and the results in nearly all cases have been a surprise. The old feeling, "why should I bother about an inferior cultivation while Arabica is doing so well," is in many places giving place to a desire to know more about the hardy Liberian plant and its prospects. In the Straits Settlements, in Sumatra and in Java, Liberian coffee has obtained a firm foothold, and in Java, the continued recurrence of the so-called "leaf-disease" in the Java coffee on lowlying lands, from which the Liberia still preserves comparative immunity, causes more confidence to be felt in the latter; and many lands which have suffered most severely from the ravages of this disease in the Arabian plant are being re-planted with Liberian.—*M. Times*, Sept. 26.

SANDAKAN NOTES.

Continual improvement in the coffee estates is reported. The Byte estate crop for August is reported to be 33 pikuls 35 katties. Part of this crop, as "husked coffee," goes to Hongkong. This coffee has been spoken well of in Singapore and Selangor. The amount of fruit in all stages of the growth to the shrubs shows no signs of diminution, and holds out every hope of monthly crops of ever-increasing bulk for some months to come. A gentleman representing a Ceylon Syndicate is in Borneo just now, looking for coffee land. He inspected the Byte estate, and is said to have expressed a high opinion of the coffee he saw there.

His Excellency the Governor visited the gambier gardens at the back of Sandakan the other day, and appeared much pleased with the progress made in that industry.

Upwards of 60,000 coconuts have been planted here during the last twelve months, and the commercial barometer is assuredly on the rise, despite the croakings of some people who look with doubt, not unmixed with cynical smiles, at the curious *modus operandi* suggested recently in the London office of the Chartered Company for the immediate enrichment of all who are either directly or indirectly connected with the country.—*S. F. Press*, Sept. 24.

SELANGOR PLANTATIONS SYNDICATE.

The first ordinary general meeting of the Selangor Plantations Syndicate, Limited, was held on Tuesday afternoon, at the office, 147, Leadenhall-street, E. C., Mr. Ludwig Huttenbach presiding.

The Secretary (Mr. James Fitzpatrick) having read the notice convening the meeting.

The Chairman said: Gentlemen, as you have just heard from the notice which has been read, this is the statutory meeting of the company. We are compelled by law to hold this meeting within four months of the registration of the company, whether we have anything to say to you or not, and this is the very last day of grace, the four months having expired today. If that had not been the case we would have preferred to hold this meeting a little later, so as to be able to lay fuller information before you. As it is, we are not in a position to say very much. This may partly be attributed to the fact that our manager, who has been temporarily in Europe, left only on August 1, and, consequently, will only have arrived out there about a week or ten days ago, and there has not been sufficient time for him to send home any regular reports. All arrangements have, however, been made, so that immediately on his arrival out there the property would be transferred to the company. As stated, we have no recent specific news; but, generally speaking, we have no reason whatever to alter the favourable opinion, which we expressed when you were invited to take shares. I may further mention that although no formal reports have reached the directors, I have seen from private advices that things on the estates are in a very satisfactory condition. Instead of going now into further particulars, let me assure you once more, in general terms, that we are satisfied in every respect with the state of affairs, and that we feel that you are interested in a good, sound, and promising concern. I wish to emphasize once more the fact on which stress was laid when the company was formed—that Selangor is under British rule, and that we have every reason to expect that we shall be treated in all cases not only with ordinary fairness and justice, but, doubtless, with special liberality and consideration, as, from the character of the officials out there, I feel convinced that, our company being almost the first of any magnitude, they will give us every possible encouragement. Knowing, as I do, the officials out there, I feel sure this is the case, but if any confirmation were wanted I may tell you that we have had indications to this effect from, not merely a very high official, but the very highest official of the Selangor Government. (Applause.) As usual, I have kept the best to the end, and that is that it gives me special pleasure to see that this whole meeting is composed of old friends. I do not say this in order to mention something which may be pleasing to you, but because this fact of our knowing each other, and dealing with old friends, makes it still more incumbent on us to do everything in our power, which can possibly be done in furtherance of your interests, so as not to forfeit the full confidence you have hitherto reposed in us, and which I can assure you is highly gratifying to us. I don't mind telling you that some people have expressed the opinion that the anticipations we have as regards this Company have been exaggerated. Of course, this may be so, as in agricultural enterprises the possibility of unforeseen contingencies always exists; but I think I may remind you that when the Sumatra Tobacco Syndicate was formed we were also ridiculed in some quarters for holding out the probability of large dividends, and yet we ultimately paid, as the result of one crop, a dividend of 180 per cent. It has been remarked to me that I personally expressed myself at the time as not satisfied with this dividend. Well, I frankly admit that this was the case, and I am equally frank in telling you now that if our anticipations as regards the Selangor Coffee Syndicate are realised to the letter I shall likewise not be satisfied. I daresay you will, but I expect something still better, and I beg to repeat that our joint efforts will be devoted to bring about a perfect success. As I have mentioned, this is the statutory meeting and there is no resolution to be proposed. It is only a formal meeting, but I think

there can be no harm in following the usual custom of inviting any gentleman present to put any question that occurs to him, and, of course, if it is in our power we shall be only too happy to answer it. (Applause.)

No questions being put, the Chairman said: The following telegram from Selangor has just come in: "The property is now in course of transfer, which will probably be completed in a few days." When that transfer takes place we shall be in full swing—in fact, I might say we are in full swing at the present time.

A vote of thanks to the Chairman terminated the meeting.—*H. and C. Mail*, Sept. 13.

PLANTING IN SOUTHERN INDIA.

One of the greatest industries of Southern India is the cultivation of tea and coffee, which thrive on the sunny and rain-swept slopes of the Nilgiris and other hills of the South, and afford continuous and well-paid labour to a large proportion of the inhabitants of the hills and of the plains beneath. A planter's life is often considered by those who have no experience of it to be a dreary and monotonous one. In reality it is anything but that. It is a life full of variety and activity; quite redeemed from any danger of monotony by the element of speculation which enters into it, and which always brings a certain excitement with it. Black care and smiling hope may be said to hover in turns round the path of the planter, which is as full of ups and downs, and as much smiled and frowned upon by fickle Fortune, as is the career of a professional speculator. Coffee-planting, in fact, may almost be described as a fine gamble. A few years ago this industry seemed to be at a low ebb, prices being low and the demand small, but a turn of Fortune's wheel has completely changed the position of affairs. Prices are now high, and all goes swimmingly with the production of the fragrant berry, which has risen enormously in the favour of the public.

In selecting the site for a coffee plantation in these hills there are a variety of things to consider. The land should be sheltered from the wind, and, if possible, lie in the line of the showers that fall in the early part of the year, and yet not be exposed to the full fury of either the S. W. or N. E. monsoons, with their accompanying damp and constant mists and fogs. Land should also be chosen that is never affected by frost, as this scorches and blights the coffee and is as fatal to it as fire. Damp at the roots is another deadly enemy, and all land on which coffee is to grow requires careful drainage. Another great essential is a stream of water which runs during the whole of the crop season: this is a necessity for the process of "pulping" which will be described later. The coffee range varies from 300 to 450 feet or even to 600 feet on the eastern slopes of the Nilgiris. The most favourable site for a plantation is a sheltered valley with a running stream. Coffee is grown from seed, in nurseries, i.e., level plots of ground carefully prepared trenches for water. In about eight months the seedlings are ready for planting, the best time for this being during showery weather, soon after the rains have set in. When the young plants have reached a height of 3½ feet to 4 feet, which takes 3½ to 1 years, time greatly depending on climate, soil, and situation, the trees require topping to prevent their growing any taller. This idea is the outcome of experience, as in Arabia, the original home of coffee, the trees are allowed to grow to a height of from 12 to 20 feet, with a number of stems, nor are the berries plucked as with us, but shaken off, when fully ripe, into mats spread underneath and dried in the sun.

A Nilgiri coffee plantation is a pretty sight, with its lovely ravines, its giant trees which shade the undergrowth of dark green laurel-like shrubs, their branches laden with berries, some green, some gradually changing colour to the bright scarlet of the ripe ones, which closely resemble cherries.

The coffee plant is a very hardy one and will survive and yield after years of neglect and repeated attacks from its many foes. These latter are numerous. Its living enemies are, besides the squirrels, monkeys, rats, and birds, who love the sweet pulpy covering of the ripe berry, the coffee-bug and the "borer," a most destructive insect. The chief diseases to which the coffee shrub is heir are leaf rot—which is caused by damp—and prevails in rainy, misty climates, and its worst foe, the dreaded leaf disease. This latter is the latest and most serious of plagues to which the long-suffering plant is subject, and it is as lasting, damaging, and incurable as the odium in the vine. This is a most serious disease, which appears to have its seat in the sap of the tree, appearing and disappearing with no apparent cause, on all soils, at every elevation. Although it has not yet made its appearance in so dangerous a form on the Nilgiris as in the lower-lying countries of the Wynaad, Coorg, Mysore, or Ceylon, no coffee planter can say that his crops have not been reduced by leaf disease.

Although the day for realizing large fortunes in tea has gone by with a fall in the price of the leaf, that has brought it within the reach of the poorest, tea cultivation yields a steady, if not a big, profit to the planter, who is willing to devote himself to it; personal supervision and even labour being of the utmost importance in tea. The task of the tea-planter is altogether a bigger one than that of the cultivator of coffee. In tea there are at least twenty "pickings" a year; it therefore requires more continual labour on the estate, as, unlike coffee, tea is prepared ready for consumption. Tea thrives best on the Southern and Eastern slopes of the Nilgiris, which get a fair share of both monsoons, and at the same time possess a warmer and more equable climate than the Western slopes. It requires sufficient moisture, and a certain richness of soil and good drainage; but the less the land on the plantation slopes, the better it is for the tea.

Like coffee, tea is raised from seed in nurseries, and while the seedlings are growing, the estate should be prepared, if necessary, by terracing and by "lining," or marking out and "pitting" cylindrical pits of 18 inches being the best size.

The quality of tea depends on the care bestowed on each of the processes it undergoes; the grade is determined by "sifting." This is performed by women or children, who do it by hand or by machinery, in sieves varying in size, the tea falling through them upon a cloth. The grades in tea are:—1. orange flower, or broken pekoe; 2. pekoe; 3. pekoe souchong; 4. souchong; 5. congou. The dust which results from all these manipulations especially from sifting, is sold by itself, and not mixed with the teas.

Labour has always been a matter of difficulty to the Nilgiri planter. Local labour, alas! is becoming scarcer with every year. It was formerly obtained chiefly from the Badegas, or "Northmen," descendants of Kanarese colonists from the Mysore country. These Badegas are a hard-working and a thrifty race, and thanks to their industrious habits they are becoming a comparatively wealthy people. Their villages are characteristic of their prosperity, and form a striking contrast to those of the other hill tribes, with their rows of neatly thatched or tiled houses, standing in fields of *korali* or *sami* and surrounded by well-stocked farm yards. Prosperity has made them very independent, and they are becoming very unsatisfactory workers, as they keep innumerable holidays, and stay away altogether on the smallest provocation. Having learnt, too, the principles of coffee-planting, and acquired a complete knowledge of its manufacture, they have lately set up as planters themselves in a small way, and quantities of coffee are grown and sold locally by the more wealthy Badegas. There are even instances of Badegas having taken over plantations on the death or retirement of the owner; and, idle and trying as they are as hirelings, they display the greatest energy on their own behalf, and will work night and day for themselves. When any district becomes congested, as Mysore did some five and twenty years ago, there is little difficulty in obtaining labour from it. On the other hand, should a country be blessed

by good seasons and consequent prosperity, or, again, should it be visited by a famine, which relieves congestion, the difficulty of obtaining labour is proportionately increased, and it becomes necessary to tap more distant districts. The southern districts of India—Trichinopoly, Madurai, and Tinnevely—are the great recruiting grounds for the planters of Ceylon, the Straits Settlements, and Mauritius. This naturally impoverishes the labour supply of the Nilgiris and other planting districts of Southern India. The labour question is the most important of all the difficulties that arise to harrass the planter, and when he has succeeded in obtaining labour his troubles are by no means at an end. Anyone who has had the slightest acquaintance with Indian life will realize some of the labour difficulties of a European employer, and will understand how constantly friction may arise between the planter and his coolies. At the head of all the labourers on the estate is the writer or overseer, who acts as a go-between between master and men, and supervises all the field labour. But in planting, as in most things, the eye of the master is of supreme importance, and only those planters who are willing to devote their whole time and attention to their estates can hope for a reasonable profit. The lowcountry coolies, who are brought often from a great distance, are housed by the planter on the estate in coolies which every planter is obliged to build for them. Some owners also have a bazaar on the estate for their coolies, which is managed by the writer, and where the labourers and their families can obtain necessaries at the usual rate. Of all the lowcountry coolies those from Mysore are the most respectable. They are also the most careful, saving, and industrious, being of higher caste than the others. The low caste or Pariah coolies, on the contrary, are reckless, extravagant, and generally in want. The lowcountry coolies work from 7 a.m. till 5 p.m., while the hill coolies, who are not housed, but go to their homes after the day's work, come at 9 a.m. and leave again at 5 p.m. A male coolie employed in ordinary field labour earns 4 as., a woman 2½ as., and a child from 2 as. and under a day. Skilled labourers employed in the manufacture of tea and coffee are paid at a higher rate, and work overtime is paid for separately. It is a matter of great regret that the Supreme Government seem but little disposed to follow the excellent example set by the Ceylon Government, in enabling planters to contract for the services of coolies for a term of years, but are rather inclined to give as little encouragement and assistance as possible to this industry in the way of legislation, even when the Madras Government, who are in a position to understand local requirements, strongly recommended the adoption of certain measures sought for by the planters of Southern India. Instances of this indifference were given in their opposition to the Breach of Contract Act and the Coffee Stealing Prevention Act, and to other measures of the same character.—*Times of India*, Sept. 21.

EXPORTS OF COTTON SEED OIL

FROM THE U. STATES.

During the last fiscal year the exports of cotton seed oil reached 21,161,728 gallons, valued at \$6,806,313. This was a gain over the exports of 1894 of 6,203,419 pounds. Of the total exports 3,463,412 gallons went to the United Kingdom; to Germany, 2,674,263 gallons; France, 2,463,994 gallons; rest of Europe, 8,922,716 gallons; Mexico, 1,720,859; Brazil, 593,295 gallons; British North America, 423,067 gallons. It seems incredible that a few years ago cotton seed oil was not known as a commercial product, and that the cotton States wasted material which now brings the country nearly \$7,000,000 in a single year. The utilization of waste products is one of the most wonderful chapters in the history of recent times.—*American Grocer*.

THE EXPORT TRADE OF INDIA FOR 1894-5.

INDIA exported "Spices" to the extent of 23 millions of pounds weight in the twelve months ending 31st March last; but "pepper" which used to be by far the most important product under this heading has fallen greatly from its old position; while the trade in "ginger" has developed in quite a wonderful way during the past three years from a total of less than 4½ million lb. in 1892-3 to more than 10½ million lb. in 1894-5. The official figures for the three years compare as follows:—

	1892-93	1893-94.	1894-95.
Spices:—	b.	lb.	l.
Cardamoms	304,527	391,010	234,493
Ginger	4,714,203	6,534,529	10,243,707
Pepper	12,257,270	8,653,371	8,135,705
Other Spices	8,825,884	7,711,279	9,395,262

Total lb. 23,101,884 23,289,189 23,009,367

In Cardamoms, it will be observed, there is a considerable decrease on the two previous years—so that all India now exports less than Ceylon which has shipped 260,000 lb. in the nine months of the current year. But then the very large home consumption in India must be remembered. SUGAR, refined or crystallized, including Sugar Candy:—

	1892-93.	1893-94.	1894-95.
To United Kingdom	cwt. 117	cwt. 106,850	cwt. 15,206
" Ceylon	23,193	26,317	31,048
" Other Countries	13,593	13,779	11,925
Total	cwt. 37,461	cwt. 146,946	cwt. 60,179

SUGAR, unrefined, viz., Molasses, and Jaggery or Gourd and other Saccharine Produce:—

	cwt.	cwt.	cwt.
To United Kingdom*	698,771	940,122	855,657
" Egypt	50,531	82,916	75
" Other Countries	44,471	127,597	102,375
Total	cwt. 798,773	cwt. 1,150,635	cwt. 958,107

Of the export and distribution of our staple "Tea" there is not much to remark except that the shipment to the United States is showing a continuous increase; but it is unsatisfactory to see the great decline in the quantity to Australia, although on the other hand, Ceylon exports are increasing. What we want is to see China teas altogether ousted and the taste fully established for India and Ceylon tea:—

	1892-93.	1893-94.	1894-95.
TEA:—	lb.	lb.	lb.
To United Kingdom	108,513,141	116,007,328	118,417,084
" United States	49,957	115,661	227,595
" Persia	1,406,625	2,497,525	3,172,806
" Australia	3,908,087	6,239,538	4,871,919
" Other Countries	844,637	1,472,423	2,409,912
Total lb.	114,722,447	126,332,475	129,099,316

The shipments of Cinchona Bark shew a slight increase, and the decrease in the export of opium is noteworthy:—

CINCHONA BARK lb.	2,813,637	1,665,647	1,737,318
OPIUM cwt.	104,658	97,910	94,645
TOBACCO:—	lb.	lb.	lb.
Unmanufactured	11,808,432	8,672,951	9,719,331
Manufactured	823,737	786,785	833,220

Next come a variety of products of more or less interest to us in Ceylon. The falling-off in Cutch ought to be of some concern to the new "Cutch" Company at Trincomalee. Of Myrobalans, Ceylon exports an appreciable quantity and a great deal more could be obtained under careful, extended supervision of our forests:—

* Jaggery to be refined.

DYEING AND TANNING MATERIALS:—

	cwt.	cwt.	cwt.
Cutch	22,316	187,115	155,032
Indigo	125,703	131,399	166,308
Myrobalans	667,549	830,529	1,123,113
Sallower	990	2,353	1,790
Turmeric	59,907	63,551	119,422
Oils:—	gallons.	gallons.	gallons.
Animal	39,695	50,352	10,325
Essential	18,261	19,035	20,174

	{ cwt. 75,338	44,616	42,810
BORAX	cwt. 7,677	7,230	7,850

The shipments of India rubber, year by year, from India, keep wonderfully steady at between 9,000 and 10,000 cwt. collected chiefly in Northern Bengal and Assam forests:—

	cwt.	cwt.	cwt.
CAOUTCHOUC, Raw:—			
To United Kingdom	7,712	7,721	6,695
" Other Countries	2,260	1,895	2,575
Total	cwt. 9,972	cwt. 9,616	cwt. 9,270

BATS!

The *Popular de Taubaté* tells of two planters who gather their coffee with the pulp already removed, this service being performed for them by bats, which eat the pulp as fast as the coffee ripens. This species of bat should be cultivated in Selangor.—*S. F. Press*

THE PINE HILL ESTATES COMPANY, LIMITED.

ANNUAL GENERAL MEETING.

The annual general meeting of this Company was, pursuant to notice, held at Mr. L. P. Fisher's office, Palace Square, Kandy, at 11.30 a.m. on Saturday last, when there were present Messrs. J. Roydon Hughes (in the chair), L. P. Fisher, R. E. Prance, H. St. B. Evans, Hunter, and Lieut. Herbert. Miss Nicol was represented by attorney, and Messrs. S. H. Dyer, A. Jemmett Brown, and F. S. Hill, and Mrs. R. E. Prance by proxy.

The notice convening the meeting, and the minutes of the last general meeting, having been read, the report of the Directors for the season ending the 30th of June, 1895, was submitted to the meeting.

Mr. HUGHES proposed, and Mr. FISHER seconded, that the report be adopted. Carried.

Lieut. HERBERT moved that a final dividend of four per cent. be declared, making with the previously declared interim dividend of five per cent., a dividend for the year of nine per cent. Mr. HUNTER seconded. Carried.

Mr. HUNTER moved, and Mr. EVANS seconded, that a further sum of Rs. 2,000 be placed to the credit of the reserve fund. Carried.

Mr. R. E. PRANCE was re-elected Director, and Mr. Guthrie was elected Auditor for the ensuing year.

A vote of thanks to the chair then terminated the proceedings.—Local "Times."

BATS AND COFFEE.—*Apropos* of your paragraph about bats and coffee is the following from Dr. Nicholls' work on *Tropical Agriculture*: "In crop time one will often see parchment coffee on the ground under the trees, this is usually called 'bat coffee' for the bats have eaten the pulp and dropped the beans enveloped in their parchment."—*Cor.*

A TEA MACHINIST'S FACTORY

I spent last week in

ABERDEEN,

where I was glad to meet several Ceylon friends. I also took the opportunity of visiting Mr. William Jackson's factory, where the models of his various inventions are prepared. Mr. Jackson showed me one of his new

PARAGON TEA DRIERS

(similar to the one which has recently been erected on Great Western estate) and explained the various improvements which it possessed over previous driers. I also saw in process of manufacture one of the new tea roll breakers which Mr. Jackson has just invented, a marked feature of which is its comparatively noiseless working. Upstairs were models of Mr. Jackson's various previous inventions; some of the latter ones, however, being absent, owing to their not having yet being returned after production in court at the recent trials of the famous law-suit. On the floor was a quantity of "withered" oaf,—not tea, but

ELDER LEAVES,

a boxful of which, after rolling and firing, stood close at hand. The leaf when hot from the firer has a smell not unlike that of tea, but this soon disappears. When Mr. Jackson first began utilizing the elder leaves thus, he noticed that his workmen, as they left of an evening, would pocket a handful of the fired leaf to carry home. He therefore asked his foreman to make inquiries as to what the men did with it; and he was amused to learn that two cupfuls of the decoction acted as

AN EMETIC!

Mr. Jackson tried one cup of the infusion himself; but it took a lot of cream and sugar to make it palatable. I was also shown a box of

TEA-DUST,

one of five which had been sent to Mr. Jackson from China with an order for a machine that would separate from the tea clay the dust that was mixed with it. (The tea dust, I should explain, was what is used for the manufacture of "brick tea"; and consumers have begun to resent having to pay for and swallow clay dust; hence the application.) The English agent of the Chinese firm was shown a machine which he thought would suit the purpose of his clients; but he would not fix on it until he had referred to them; and meanwhile he insisted on returning the boxes of dust to China. One box, however, Mr. Jackson retained as a curiosity.

TWO INGENIOUS MACHINES OF AMERICAN MANUFACTURE were shown me by Mr. Jackson. One of these was for boring holes in iron or wood, the borer being capable of being moved to any position upwards, downwards, or horizontally. The price was considerably less than that asked for an English machine of inferior capability. To the other machine

AN AMUSING STORY

was attached. One day Mr. Jackson was on the point of leaving for London, when he walked a Yankee, who asked if he would look at a machine for cutting wood, at the same time pulling from his pocket a bundle of prospectuses. Mr. Jackson replied: "I am leaving for London in ten minutes; so you had better show the papers to my foreman." "Oh, but I can show you the machine itself," said the Yankee. "Why, have you got it in your pocket?" asked Mr. Jackson. "No, but it is outside," returned our American friend; "and I can show it to you at work here within ten minutes if you wish." Mr. Jackson consented; and soon up drove a conveyance drawn by a couple of fine horses, with two men holding the machine. This was set up on the floor of Mr. Jackson's workroom; and ten minutes afterwards Mr. Jackson was on his way to the station for London, and the Yankee was away with a cheque in his pocket.

"That is how the Americans do business," added Mr. Jackson, "while the English workmen are napping." The machine, which is a very simple one, has over and over again repaid its cost to Mr. Jackson, who has never repented of his hasty bargain.

D. W. F.

NEW PRODUCTS.

An old planter writes:—"Thanks for the valuable information *re* Camphor; the tree would grow well here, there being several varieties indigenous. Another indigenous tree here might be turned to account the *Gorala* of the Sinhalese belonging to same family as the Mangosteen—and producing the *Gamboge* of commerce—what is the value of Gamboge at present?"

So far back as 1884, a consignment of Gamboge in its natural state from Ceylon fetched £44 5s per cwt. in the home market. This was from the *Garcinia morella* (the "Gokatu" or "Kana Goraka" of the Sinhalese). How collected we cannot say. In 1891 there were 17 cwt.-0-12 lb. of "Gun" exported from Ceylon, the local Customs valuation being R475. In 1893, the export was 41-cwt.-1-6 lb. valued at R1,550. The latest London quotations for Gamboge are:—Siam (pickings to good clean pipe) £6 10s to £10 5s (per cwt. we suppose).

WHOLE SOME COFFEE.

A writer in *The Lancet* laments that good, wholesome, pure coffee, free from chicory, is not brought to the notice of the public by advertisers as much as tea, cocoa, or chocolate is. As he observes, those who have travelled on the Continent know that a cup of excellent coffee can be obtained at an almost trifling cost, and know what an excellent stimulant it is. Why (it is asked) should this be? and why, on the other hand, should coffee, even in the homes of the rich in this country, be too often wholly undrinkable? That there is no difficulty about the making of good coffee is held to be proved by the fact that the best is made in the simplest apparatus—a plain earthenware jug. This, with boiling water and a reasonable amount of berries, freshly ground, is all that is required. "Both the demand and supply of coffee in this country (adds the writer) are diminishing, but a more extended knowledge of its value as a stimulant and as an article of diet would ensure its increased use and in due time its reduced price."—*Daily News*, Sept. 5.

THE CANARY ISLANDS.

Although largely and necessarily of a highly technical nature, the lengthy article in the August number of the Journal of the Royal Horticultural Society on "The Plants and Gardens of the Canary Islands," by the Assistant Director of the Royal Gardens at Kew, will be read with considerable interest not only by scientific botanists (who will find, in addition to the general discussion of the flora of the several islands of the Archipelago, a list of such Canary plants as are at present under cultivation at Kew, and a catalogue, apparently the first that has ever been given in English, of the native and introduced plants in the Botanical Garden near Orotava), but by the annually increasing number of our countrymen who direct their steps to these southern resorts to escape the severity and the uncertainties of our winter climate, and also by market-gardeners, fruit growers, and indeed by all classes of tradesmen who are in any way connected with that complicated problem—the distribution of our food supplies, whether obtained from home or foreign sources. The Canary group is composed of 13 islands, six of which are very small. They are situated almost wholly between the parallels of 28deg. and 29deg. N., but they are scattered over several degrees of longitude, so that while Fuerteventura is within 60 miles of Cape Juby on the African coast, Palma and

Hierro are about 300 miles distant. In former times they were known as the Fortunate Islands. Pliny knew of their existence. Juba, King of Mauritania, despatched a fleet to visit them, afterwards reporting them to Augustus Caesar as clothed with fire. He also sent to Rome two large dogs from the islands, and to this fact is attributed the probable origin of the name Canary. The Portuguese rediscovered the islands in the 14th century, the inhabitants being the brave Guanches. Early in the next century Fuerteventura and Lanzarote were taken possession of by the King of Castile, but it took until nearly the close of the century before the Spaniards succeeded in subjecting the gallant Guanches in all the islands. After cruel persecution at the hands of the conquerors the last of the original inhabitants had disappeared before the end of the 16th century. The islands have ever since been not a colony, but a Spanish province, and their fortune has been a very varied and capricious one. "Under the prescriptive policy of Spain," said one writer, "nothing depending on human exertion prospers, and though the Canary Islands are less exposed to its despotism than any other part of the Spanish Dominions, everything languishes." This, however, is only partially true, for, like our own West Indian Islands, the Canaries have suffered reverses through the changes which from time to time take place in the demands for various products, and the keen competition with which they have to contend. In the early days of the Spanish occupation the cultivation of the sugar-cane was the great industry of the islands, the African negro being the labourer. Vines were introduced long ago, Canary wine or sack being a famous beverage in England in the time of Shakespeare. But mildew, and not Spanish despotism, afterwards wrought sad havoc among the vineyards, and the public taste changed. Cochineal culture was introduced in 1826, and soon became an important industry, but science has discovered how to extract all the colours of the rainbow out of coal tar, and amongst the many sufferers were the Canary Islands, whose cochineal trade dwindled to a mere nothing. They have, however, entered upon another prosperous period, thanks to the indefatigable exertions of Mr. Alfred Jones, of Liverpool, who has induced the inhabitants to try other industries.

So far as invalids and holiday-makers are concerned the geographical situation of the Archipelago is all that could be desired. They are not in the Tropics, and they can hardly be described as being of the Temperate zone. But while the islands are all in about the same latitude, they present differences in aspect, climate, crops, flora, customs of the people, and so on the eastern islands being more African and the western ones more Atlantic in character, and, as Dr. Morris points out, the amount of vegetation in the several islands increases with their distance from the African mainland. At Las Palmas, in Grand Canary, the coldest month is January, but the mean temperature for this month exceeds 62deg., against less than 40deg. on the Riviera, and about 39deg. in London. July is the warmest month at the Royal Observatory, Greenwich, its mean temperature being 62½deg., so that mid-winter in Grand Canary is as warm as midsummer in London, the lowest night temperature registered at Las Palmas in five years being 51½deg. Passenger steamers frequently call at the islands, the voyage from Plymouth occupying five days, from London six,

and from Liverpool seven. The islands are almost entirely of volcanic formation—really the peaks of submerged mountains a continuation of the Atlas chain running westward from Morocco into the Atlantic. Since the close of last century there have been no volcanic outbreaks, but formerly they were rather severe, the eruption of 1704 destroying thousands of lives and a number of towns on the island of Teneriffe. To get at the volcanic mud, which is a rich fruitful soil, it is often necessary to blast the solid overlying lava, and this has to be piled up in heaps so that the country presents locally the appearance of an extensive stone quarry. Both soil and climate are favourable to widely dissimilar classes of vegetation, strictly tropical plants such as the sugar-cane, banana, the oil palm of Africa, and the coconut palm growing alongside the common oak, ash, bramble, white poplar, and other trees of our more northern latitude. The most remarkable tree in the Canaries seems to be the dragon's-blood tree, one "of the most celebrated in the annals of natural history." Strange to say, similar dragon's-blood trees are known to grow in various parts of Africa, across to Abyssinia, Somaliland, and still further east on the island of Socotra. Professor Bayley Balfour states that they are remains of an old African flora which covered the greater part of the continent when the climate was very much colder than it is now. Climatic changes had gradually driven it out and replaced it by more tropical plants.

The islands now depend for their living mainly on garden cultivation, there being no large estates or farms. All the fields are small, land being exceedingly valuable everywhere. Its letting value is from £15 to £25 per acre, and to this has to be added the cost of water, which runs to from £10 to £15 an acre. An acre of good land therefore means an initial expenditure of £40 and the cost of labour before any profit can be made. An excellent system of irrigation is, however, in operation, large tanks having been constructed to store up the winter rains for use during the dry season. The secret of the present prosperity of the Canaries is this provision to secure an abundance of moisture all the year round. Without it the land would be of very little value. As it is, the tenants are able to raise three, and even four crops a year—a fact which has been received with some incredulity by not a few English agriculturists. This prolific quality of the soil explains why the rents are so high, but with so many harvests it is not unusual for the thrifty and hard-working inhabitants to clear £30 an acre per annum—a very good profit on the large outlay. The whole of the work is done in the most primitive fashion, wooden ploughs drawn by oxen doing all the ploughing necessary. With what rapidity crops reach maturity may be gathered from the fact that a steamer leaving England with seed potatoes in the middle of November returns home with a cargo of new potatoes in the following February, the plants appearing above ground in about a week, and in another five or six weeks the tubers are dug up and shipped. England is the principal customer for the fruit and vegetables grown in the Canaries. In 1892 we received 59,508 tons out of the 63,691 tons of bananas exported from the islands; and of the 96,842 tons of vegetables 59,124 tons came to England, and 27,970 tons went to the West Indies. Most of the bananas come to us from Grand Canary and most of the tomatoes and potatoes from Teneriffe. We received in one year no less than 118,632 tons of fresh fruit from these fortunate

isles. Bananas are largely grown on Grand Canary and Teneriffe, flourishing only on well-irrigated land in warm localities near the sea. Each bunch is made up of from 150 to 250 fingers, and in 1893 Grand Canary alone exported 217,095 bunches. Canary oranges are of excellent flavour, and recall the now almost extinct St. Michael oranges. The trees unfortunately are little cared for, and they are consequently badly affected with disease. The tomato industry is quite a new one, but it has increased by leaps and bounds. Not until 1887 were any tomatoes exported, by 1893 there were 54,641 cases, and in the first half of 1894 the total was 85,000 cases. The actual cost of growing, packing, and delivering in London is estimated at 2d per lb. The potato trade is confined to the early months of the year, down to the end of May. In the first half of 1893 the number of cases shipped was 15,101, and for the corresponding period of 1894 it rose to 32,600. There is still some trade in wine cochineal, cereals, sugar, and many other fruits and vegetables, but it is evident that the inhabitants are concentrating their energies mainly on bananas, potatoes, and tomatoes, for the English markets in the first place.—*Morning Post*.

A FICUS STRANGLING A MANGO TREE.

Our illustration, taken from a photograph kindly furnished by Mr. G. M. Woodson, College of Science, Poonah, exhibits a Mango tree growing in a grove near Lanowlee, on the Western Ghauts, India, being killed in the embraces of a Ficus. The process of destruction is well and correctly described in the following words by Mr. James Rodway in the *Guiana Forest* :—

"Woe betide the forest giant when he falls into the clutches of the Clusia or Fig. Its seeds being provided with a pulp, which is very pleasant to the taste of a great number of birds, are carried from tree to tree, and deposited on the branches. Here it germinates, the leafy stem rising upward, and the roots flowing, as it were, down the trunk until they reach the soil. At first these aerial roots are soft and delicate, with apparently no more power for evil than so many small streams of pitch, which they resemble in their slowly-flowing motion downward. Here and there they branch, especially if an obstruction is met with, when the stream either changes its course or divides to right and left. Meanwhile leafy branches have been developed, which push themselves through the canopy above, and get into the light, where their growth is enormously accelerated. As this takes place the roots have generally reached the ground, and begun to draw sustenance from below to strengthen the whole plant. Then comes a wonderful development. The hitherto soft aerial roots begin to harden and spread wider and wider, throwing out side-branches which flow into and amalgamate with each other until the whole tree-trunk is bound in a series of irregular living hoops. The strangler is now ready for its deadly work. The forest giant, like all exogens, must have room to increase in girth, and here he is bound by cords which are stronger than iron bands. Like an athlete, he tries to expand and burst his fetters, and if they were rigid he might succeed. . . . The bark bulge between every interlacing—bulges out, and even tries to overlap; but the monster has taken every precaution against this by making its bands very numerous and wide. . . . As the tree becomes weaker its leaves begin to fall, and this gives more room for its foe. Soon the strangler expands itself into a great bush almost as large as the mass of branches and foliage it has effaced. . . . If we look carefully around us we see examples of entire obliteration—a Clusia, or Fig, standing on its reticulated hollow pillar, with only a heap of brown humus at its base to show what has become of the trunk which once stood up in all its majesty on that spot."—*Gardener's Chronicle*, Sept. 21.

A FIRE RESISTING TREE.

An interesting account of a fire resisting tree is given by Mr. Robert Thomson in a Consular report on Colombia. He writes:—The thousands of square miles of natural pasturage on the plains and lower hills of Tolima assume during the rainy season the most beautiful verdure. But in the alternate season of drought the general aspect is that of a desert. These lands were originally acquired at a nominal cost. No conservation of the natural fertility of the land has ever been taken into consideration. On the contrary, the natural grasses, intermixed with scrub or brushwood, have been systematically burned from year to year, and the burnings effected during the most scorching periods of drought. The principal object attained by this process of despoliation is the reproduction of new and tender herbage or pasturage, which, with the advent of the rainy season, forthwith covers the parched surface. Vast pastoral regions—scores of thousands of square miles—in tropical America are thus maintained. Half a century, or it may be a century, of this treatment suffices to extinguish almost every trace of fertility in the soil. In Tolima alone hardly less than 2,000 square miles of savannahs and hills, ascending to some 3,000 feet, have in this way been transformed into comparatively barren wastes. And in other parts of the Republic many thousands of square miles have similarly lapsed by this devastating process.

A STRANGE SIGHT.

This persistent burning of the savannahs and hills for crops of renewed pasturage plays desperate havoc with all other vegetation, trees and brushwood. Isolated palm trees, with their intensely hard trunks and endogenous structure, together with groups of brushwood in sheltered or humid spots, sometimes withstand the fury of the flames. There is, however, one phenomenal exception to this subversive power of the fires. A humble tree with contorted and rugged trunks and branches and scabrous leaves, a tree presenting the most subdued and weird aspect conceivable; this pigmy tree not only resists the fury of the flames, but fire is actually congenial and subservient to its existence, for the tree, instigated by the conflagrations, forms itself into great plantations. The name of this tree is chaparro (*Rhopala obovata*), indigenous to Colombia and other South American countries. It attains a height of 15 to 20 feet, and its distorted trunks measure from nine to 12 inches in diameter. It is widely distributed in Colombia, for I have found it at the Sierra Nevada, of Santa Marta and dispersed inland 1,000 miles from the sea. In contact with great forest fires it maintains a precarious existence. But, as already explained, it usurps dominion in places where no other tree can grow. In Tolima it abounds on the slopes and ridges of the hills at elevations from 1,000 to 3,500 feet. In this department alone hundreds of square miles of the lower hills which have been reduced to sterility by incessant burnings are occupied by this diminutive tree, and it assumes the aspect of vast systematically formed and well-kept plantations. This is more than a triumph of the "survival of the fittest." It is very remarkable that these fire-begotten plantations are nowhere crowded to excess; on the contrary the trees are so regularly placed that their aspect vies with that of the most carefully formed plantations. There is a popular belief in Tolima where alluvial gold abounds that this tree flourishes only on those seductive lands, serving as a guide to searchers after the precious metal.—*Pioneer*.

GOVERNMENT CINCHONA PLANTATION IN BENGAL.

The result of the year's operations of the Government Cinchona Plantation and factory in Bengal was that the total number of living cinchona plants at the Government plantations in Sikkim and at Nimbong, excluding the nursery stock at the close of the year, was 3,927,501. The demand for quinine having increased owing to the success of the pice-packet system, Dr King has ordered two to three hundred acres of land to be prepared for the purpose of being planted out with new trees. The crop of the year amounted to 500,534 lb. of dry bark, of which 295,054 lb. were obtained from the trees uprooted on the Government plantation in Sikkim, and 205,480 lb. were collected from the trees uprooted at Nimbong. The bulk of the bark, with the exception of 126,603 lb. of the red sort, was of the quinine-producing kind. The outturn of bark per tree was over a pound, as compared with less than half a pound per tree in the preceding year, when the majority of the trees cropped were dwarfed and feeble. The whole crop, less 1,959 lb. sold to a medical depôt and to other purchasers, was, as usual, made over to the Cinchona Factory for disposal. The outturn of the factory was 8,318 lb. of sulphate of quinine, the produce of 393,150 lb. of yellow bark, and 4,032 lb. of cinchona febrifuge, the yield from 105,560 lb. of red bark. All these figures are decidedly satisfactory, but a precisely similar question arises in regard to the Bengal plantation and factory to that raised with reference to the Madras concern: Is it impossible for private plantations to supply Government with all the bark it requires in excess of the production of the Government plantations as they now stand? If it is, the extension of the plantations is justifiable. If, however, private enterprise is able and willing to meet the demand, than an extension of the Government plantations can only be regarded as a step in the direction of State interference with private trade. Such interference is opposed to the principles laid down by the British Government and the Government of India, and we trust that planters, and others, in Bengal will stand by planters down here in their representation to the effect that no extension of Government cinchona plantations in this country is necessary or desirable. The manufacture of quinine is quite a distinct matter from the production of cinchona-bark. Private enterprise has so far manifested no inclination to take the former in hand, so the Government is free to develop the manufacture as much as it likes.—*Madras Times.*

COFFEE PLANTING IN THE HAWAIIAN ISLANDS:

250,000 ACRES OF SUITABLE LAND

AVAILABLE:

2,500 ACRES PLANTED: 20,000 MORE
EXPECTED IN 2 OR 3 YEARS.

A REPORT has lately been made to the Executive and Advisory Council of the Republic of Hawaii by a Labour Commission relative to the Coffee Planting industry. Having in view the disasters which have happened in certain British Colonies owing to shortage of labour the authorities in Hawaii are looking ahead and are considering what steps should be taken to render impossible in their case the evils referred to. The framers of the Report are fully aware of the danger which exists in allowing the island to depend entirely upon the single industry of sugar. In reviewing the present condition of the coffee industry the report states:—

The soil and climate of several districts are admirably adapted to the cultivation of coffee, and there is no reason why this industry should not in a few years, with proper encouragement, equal in the value of its product the sugar industry. In the Kona district of Hawaii, the land suitable for coffee plant-

ing covers an area of more than 80,000 acres. The excellent growth of the coffee plants and the quality of their fruit during the last forty years, demonstrate the exceptional adaptability of this district for the purpose. Aside from wild or uncultivated plants which cover considerable areas, there are probably 400 acres which have been recently planted and will soon be in bearing. This acreage is being added to every month, while buildings are being erected, and other improvements made. Several plantations have recently been started with considerable capital, men of experience and means are engaging in the business, and the majority of the planters reside on their plantations and superintend their own work. In this district the successful production of coffee has been thoroughly demonstrated. The greatest drawback, however, to its more extended cultivation here is the inability of settlers to acquire lands, owing to the fact that vast areas are covered by leasehold interests, which bring little revenue to their owners or the Government. If arrangements could be made by legal enactment or otherwise, by which these large areas could be generally opened up to settlers, there would be in a few years an extraordinary growth of the coffee industry in this district. In the Puna and Hilo districts there has also been within two years a great development of this industry. In the Olaa section nearly 14,000 acres have been leased to proprietors who are now engaged in it. About 600 acres have been planted, while nearly 1,000 acres have been cleared at great expense, and are nearly ready for planting. In the Puna, Hilo and Hamakua districts of the island of Hawaii, there are probably 150,000 acres of land on which the coffee plant will grow to more or less advantage, and upon this land, also, fruits and vegetables may be successfully cultivated. None of the land herein referred to as suitable for coffee, is now planted with sugarcane, and most of it is unsuitable for sugar cultivation.

On the island of Maui there are a number of excellent coffee plantations. In Hamakualoa, about sixty Portuguese families have secured homesteads, and each of them has a coffee patch. The largest planter on the island is a Chinaman in the Kula district. Without attempting to give even approximate figures, it is safe to say that many thousands of acres of land on that island are suitable for this purpose. There is also a considerable acreage under cultivation on the islands of Oahu and Kanai. The opinion is expressed in the Report that coffee planting encourages a desirable class of settlers and in this connection it is mentioned:—

It is a significant fact that there are already over 200 intelligent, enterprising white men, mostly small proprietors, engaged in this industry, nearly all of whom will become permanent settlers.

Regarding the extent of land in coffee plantations stated at 2,500 acres:—

In November, 1892, a committee of the Planters' Labor & Supply Company estimated that the acreage of the cultivated coffee land on Hawaii, Maui and Molokai was 1,325. If to this is added that of Oahu and Kauai, and also the large increase during the last two years, it is safe to estimate that the total acreage is now not far from 2,500. If there should be as now proposed by the Government, a wise and satisfactory adjustment of the land tenures, there may be within a few years not less than 20,000 acres under coffee. Moreover, it is very apparent that the sugar planters are closely watching the pioneers in coffee, and if they are successful, many of the former will place large areas of land now uncultivated, under coffee, and make this industry auxiliary to that of sugar.

For facts and figures the Commissioners refer to the case of Ceylon and the report states:—

In 1875 the official returns of the Island of Ceylon showed that 204,000 acres of land were under coffee, and that 200,000 laborers were required in the cultivation; that is to say, about one laborer to the acre. With the better class of labor and improved methods in these Islands, it is believed that one man can cultivate three, or in some cases, even five acres. But in the picking season there will pro-

bably be needed about one person to the acre. Women and children would supply this need to some extent, if men with families could be induced to immigrate and settle here. If there should be within the next few years 20,000 acres of land under coffee cultivation on Hawaii alone, there would be needed in the picking season, according to the above estimate, nearly 20,000 laborers including women and children. According to returns received at the office of this Commission, the number of laborers employed on all the sugar plantations on December 31st, 1894, was between 20,000 and 21,000. Such an increase in the coffee acreage would therefore require, during part of each year, as many laborers as are now employed in the great sugar industry of the country. The demand for laborers on the coffee plantations is now readily supplied by the Japanese whose contracts with the sugar planters have expired. The demand for this labor is as yet limited, but it is evident that with the present rate of increase in acreage there must inevitably develop a competition for laborers between the sugar and coffee planters which may prove disastrous to both, or may result in the irreparable losses before referred to as experienced in Demarara and the Strait Settlements. There is no doubt that in those countries the labor question was allowed "to take care of itself," and with the most disastrous results. A similar experience here, caused by a want of laborers, might be regarded as a national disaster in more ways than one. The subject, therefore, becomes one of supreme importance to the State and community.

The Commissioners proceed to put a valuation on the coffee plantations in the following manner:—

Regarding the coffee industry as a source of Government revenue, the Commission is informed that in the island of Ceylon, the coffee plants have, when in full bearing, for some purposes, the value of one dollar a tree. It seems to the Commission that the same valuation may be justly placed on the plants here, if the planters meet with anything like the success they expect. For purposes of sale coffee land with full bearing trees upon it, would be worth \$500 per acre, allowing only 500 trees to the acre and calling the land nothing. On this basis the value of 20,000 acres with coffee trees in bearing would be \$10,000,000, and at the present tax rate of one per cent., if taxed at that value, the annual revenue to the Government would be \$100,000. This estimate is, however, only suggestive, it being most likely that the coffee plantations would be valued for purposes of taxation, at considerably lower figures. The annual product of the crop from the moderate area named, allowing 800 trees to the acre, which is less than the average, would be, at one pound to the tree, 16,000,000 pounds, which, at the price of fifteen cents per pound, would amount to \$2,400,000, or about one-third the value of the present sugar crop. This gross return of \$2,400,000 would give, if equally divided, \$1,000 each to 2,400 families, or \$500 each to 4,800 families. Estimating four persons to the family, it appears that nearly 20,000 persons could derive a comfortable living from this moderate acreage, and with more comfort than the average moderate farmer in the United States is able to get. The value of other home products is not here taken into account. Small independent proprietors would produce for their own consumption, and by their own labor, vegetables, fruits, poultry, and meats, the value of which should be added to the income from the coffee crop. The value of these products, even if not sold, is of great importance in the economy of life. This estimate, if correct, shows again the importance and value of this industry in reconstructing the social and political situation in the Islands. If twenty thousand acres of land should be successfully placed under coffee cultivation within the next two or three years, there is no reason why 30,000 or 50,000 acres more should not be put under cultivation at no distant period. No article known in the world's trade as a staple article, saleable in all markets, has been up to the present time produced in these Islands, besides sugar and rice. The production of coffee now adds another staple article.

The Report goes on to deal with the labour question in detail. It is a question of whether occidental or oriental countries are to be tapped for labour supply. Sentiment, it is stated, is against eastern labour, a fact which by no means simplifies the position.

INDIAN GOVERNMENT BOTANICAL GARDENS NEAR MUSSOOREE.

We have received a copy of the report of the progress of the Government Botanical Gardens at Saharanpur, Mussooree. The financial results are satisfactory and considerable work has been done in the way of improvement. The Garden still continues to supply the Medical Department with drugs, but the demand during the year was less than usual. The Ceylon medical stores are at present doing something in the way of preparing ointments, tinctures, &c., by which a considerable saving is no doubt being effected, and the idea of "growing" some of their own drugs might with advantage be borrowed from North-West India. We note that there is a good sale of fruit from the Gardens, as much as R1,306 having been realized during the past year. The American Dewberry is again reported to give excellent results, but we have not yet heard of the plants at the Hakgala Gardens or those with Mr. J. W. Ebert at Demetegoda, as bearing fruit. Mention is made of the introduction of the "Red Ceylon Peach" into the Gardens from Florida, which however, turns out to be no stranger to Saharanpur. The report mentions the despatch of cow pea seed to the Superintendent of the Colombo School of Agriculture, who has already reported in his "Agricultural Magazine"—see file of *Tropical Agriculturist*—of the success of his trials. Sisal Hemp is stated to be making excellent progress, growing on raised embankments. Regarding Teosinte, another fodder plant successfully introduced into Colombo by the Superintendent of the School of Agriculture, and grown at the School and a few other places, we are told "the plant yields a nutritious and excellent green forage, so it cannot be made too widely known, or be too often brought to the notice of all who require to grow forage in large quantities."

OFFICIAL IGNORANCE ON PLANTING MATTERS:

A CLEVER AND ORIGINAL SPEECH.

The following speech, which was delivered by Mr. J. W. Hocking, of Wynaad, in moving the adoption of the address to the Viceroy at the last general meeting of the U. P. A. S. I., but which was inadvertently omitted by our reporter, deserves publication as it exemplifies clearly the ignorance prevailing on planting matters:—

A great deal had been said about the necessity of educating Government to a knowledge of their position. He could give an excellent instance of how one person had been educated to a knowledge of the planter's position. His wife was brought up on "Uncle Tom's cabin" idea that all planters were slave drivers. She had lived in the midst of a large labouring population and, through continually hearing their grievances, she became an ardent Radical in regard to improving the position of the labouring classes. But she met with the same difficulty planters are met with. Planters are recommended by Government to solve all their difficulties by raising the rate of pay. Talking over this subject with a Radical friend of hers, "the village mason, the same difficulty met Mrs. Hockin. It is quite true, she said, that you ought to have more wages, but if they were raised higher than they are now who in this parish could afford to employ you? The man scratched his head and said That is so, I never thought of that. Apparently the Government of India also had never thought of that. Planters had to make two ends meet; they paid their coolies as much as they could afford which was a very large increase on

what the coolies could earn in their own villages. Although his wife had repeatedly declared she would never marry a planter, she eventually did so, and had now over ten years' experience of planters and instead of classing them with the villain Segrce or even with the well-meaning St. Clair who found himself helpless in the face of the evil system then obtaining in America, she now classes planters with the benevolent squire and farmer in England without whom every one, except the most bigoted Radical, admits the country parish could not get on. No man is a hero to his own valet and few are so to a wife with Radical ideas, but if practical experience can convert a Radical wife to think well of planters' treatment of their coolies, planters need not despair that a similar experience may have a similar effect on the Government of India and the Secretary of State. It is for that reason that planters ask that an enquiry may be made into the working of Act XIII of 1859 in Southern India. Planters have every confidence that the Collectors of Southern India will report as the Commissioner of the Tea Districts in Northern India did that the practical working of the Act is "harmless and even beneficial." Planters have been repeatedly taunted by English lawyers that the measures they demand are opposed to the principles of modern legislation. In reply they would point to the English Merchant Shipping Act passed in 1854 and amended so lately as 1880. In that Act penal punishment is provided for the breach of a civil contract, doubtless because the merchant sailor being generally, not only penniless, but under an advance from the ship before she sails, no fine can be levied. Planters claim that their case is on all fours with that of the merchant captain; their coolies are not only penniless but, like the sailor, always in debt to some one and advances are absolutely necessary to provide for the coolies families in their absence and to free them from the debt they always owe to the village landlord and trader who will not allow them to move until the debts are paid. No fine can be levied on coolies with no property but debt as it cannot be levied on a sailor in a similar case, and if the imprisonment of the English sailor for breach of civil contract is not opposed to the principles of modern legislation it is difficult to understand why the imprisonment of the coolies, for the same offence and under similar condition is.—*M. Mail.*

TEA PLANTING IN CEYLON.

Run-tom-tom, rum tom-tom, rum-tom-tom. These were the sounds that woke me up from my sleep the first morning after my arrival on the tea estate to which I had come out to learn my work as a tea planter under the premium pupil system. While I was wondering what all the noise was about, a servant knocked at my door and told me that the tom-tom was beating to summon the coolies to work, and that unless I wanted to be late I must dress quickly. It was then something after 5-30 a.m., and was just getting light. There is hardly any dawn or twilight in Ceylon. The variation of time, during the twelve months, of the sun's rising and setting is only a matter of about twenty minutes, and so practically all the year round daylight lasts from 6 a.m. to 6 p.m.

In less than no time I was dressed, for I was young and curious, and, after swallowing down a cup of tea along with some toast and a banana, away I rushed to the muster ground, to find the coolies all drawn up two deep in the form of three sides of a square, the men on one side, the women on another, and the children on the third. The "conductor," i.e., native overseer, and the "kanganies" stood in the centre, the latter vigorously chewing away at what I afterwards found to be betel leaf and tobacco. The betel leaf mixture is the regulation chew, and is as necessary to the natives as smoking is to us. The women and even the children use it. A small piece of arecanut, a betel leaf smeared with lime, a bit of dried tobacco, *et voila tout!* It is wonderful how national and individual tastes differ. I have often tried a chew, with

the only result of feeling distinctly unwell afterwards. Well, the coolies were then all sent to their respective occupations, each gang attended by one or more kanganies, the women and children to pluck the tea leaves, and the men to various other things, such as cleaning out drains, mending roads, *et hoc genus omne* of work.

I remember the first mystery I was initiated into was the plucking of tea leaves. The plucking coolies are all armed with cane baskets about 2ft. to 3ft. deep and from 1ft. to 1½ft. wide. These they tie round their waists or sling over their heads. Then each coolie is given a row of tea bushes, for the tea bush are always planted in rows about 3½ feet distant and 3½ feet from each other. When a coolie has finished her row she takes the first after the last row being plucked, and so they go on. Tea bushes are ready to be plucked every eight days or so, for by that time the new shoots have grown big enough, and if allowed to remain longer, the leaf runs away and gets too coarse. At different times of the year the shoots grow quicker or slower. The art in plucking is this. The new shoot starts with a small leaf called the fish leaf. Now, one leaf, or at all events, half a leaf, should be left above the fish leaf, and the stalk above nipped off and put into the basket, and the shoot should only have grown enough to have the spike and two leaves on the plucked stalk, thus. Of course, one cannot always get round the estate quick enough to get the leaf plucked off in this condition; during some parts of the year rushes will come on, and the leaf will run away. The result of which is a great deal of coarse leaf in the tea, which detracts much from the delicate flavour of the spike and first two leaves.

I did feel very foolish that first morning among the coolies, to hear them all jabbering round me like so many monkeys let loose out of the Zoo.; to feel instinctively that I was the subject of their conversation, and yet not to understand a single word; to wander about and try to look as if I knew all about it, when I felt most distinctly that I knew absolutely nothing. To try to climb the steep side of the hill, holding on to the tea bushes for dear life, with the only result of tumbling back myself, or sending a shower of earth and stones on to the coolies beneath me amidst the suppressed titters of all except the one who received the shower. I guess she thought the more. Oh! it was most embarrassing. I thought the morning was never going to come to an end, but at last I was informed that it was time to weigh the leaf.

Weighing the leaf is quite a business. Every coolie brings up his or her basket of leaf, which is weighed with a pocket balance. The number of lbs. plucked is marked in a check-book, and the leaf is emptied into big baskets, which are carried down to the factory by coolies. One big basket of leaf weighs about 60 lb., and this weight a man coolie will carry on his head with the greatest ease. On many estates now they run the leaf in sacks from the tops of the hills down to the factory by one or more wire shoots. This method saves a great deal of labour.

As soon as the weighing was over, I toiled back to the bungalow to enjoy the luxury of a bath. And a luxury it was, too. We then had breakfast, or what they call breakfast, for to me it seemed like an early dinner. Mulligatawny soup, a couple of *entrées*, cold beef, curried fowl, bread and cheese, the whole washed down by excellent draught beer. 1-30 p.m. saw me out again, and, after losing myself two or three times on the estate roads, I at last managed to find the plucking coolies, who had just had their leaf weighed for the second time. Then till four o'clock followed almost repetition of the morning, only I was beginning to feel quite proud of myself by this time, for I could say "Ingéva" (come hear), "Ango po" (go there), and a few other like phrases. At four o'clock the horn blew at the factory, and away we went down there for afternoon muster. The leaf was then weighed for the third time, and every coolie who had plucked a certain amount of green leaf during the day got "full name," and those that had plucked under that amount "half name." Of course, the number of pounds varies according to the

amount of "flush" on the bushes, and the first thing one should do on going into the field where the pluckers are is to tell by looking at the "flush" how much each coolie must pluck in order to get "full name." A good coolie will pluck from 20 lb to 30 lb with a fair flush. Very often a cent cash is given for every pound over 20 lb and I have known a woman to pluck 60 lb and more in one day with a good flush on. By the time the leaf has been weighed, all the other coolies from other parts of the estate had assembled, and a mark put against their names in the check roll if they had done a full day's work, and half if they had not finished their task. By 4-30 muster was over, and so finished my first day's work on a tea estate. Quite an easy one, as I afterwards found out; for during most months of the year there are various works going on which have to be supervised very carefully—clearing, planting, pruning, &c. The weeding of the estate is always given out in contracts to the kanganies at so much per acre, and one has to see that these contracts are kept clear up to date.

The most important, and probably most scientific work on an estate is in the factory in the manufacture of tea. The process of turning the leaf from its green state when plucked off the tree into the condition in which we see it at home is one of great interest; and in large factories hundreds of pounds worth of machinery are worked by turbines or steam engines. The process is, when the leaf is brought into the factory it is spread out very thinly on tatts of jute hessian cloth, stretched tightly 6 in. or so one above each other; there it is left for several hours to wither, on an average from sixteen to twenty-four. Of course the weather greatly affects the time of withering. When the leaf is sufficiently withered, it should feel, when squeezed up in the hand, something like a silk handkerchief. Then it is taken and put into a roller and rolled till all the capsules in the leaf are thoroughly broken, but the leaf itself, though rolled and pulpy, should not be chopped up. Nearly every planter has his own ideas as to the proper method of rolling, and certainly no hard and fast rule can be laid down. The planter must study the texture of his leaf, &c., and judge for himself what suits his estate best.

After rolling is over, the leaf is laid out on tables and allowed to ferment for a short time, then it is put through the firing machine, and it comes out at the other end tea, as the term is applied at home. But the process is not yet over. There are machines called sifters, and through them the bulk is sifted on wire meshes, of different sizes, the top mesh coarse, the next finer, the next finer still, and so on; and by this we get the different grades of Broken Pekoe, Pekoe, Pekoe Souchongs, &c. The tea is kept in big bins, and once a week or fortnight or month, as is necessary, the tea is packed in chests on which are stamped the grade, the name of the estate, and any other necessary information. The coolies carry it off to the storehouse on the Government road, from whence it is carried by bullock carts to the nearest station, often, as in the case of the district I was in, over sixty miles away.

The trains take the chests to the Agents in Colombo, who ship them off to the tea auctions in Mincing-lane. Only very intelligent coolies are employed in the factory, and, as a rule, they receive higher wages than the others. An ordinary coolie's pay averages from 8d to 9d per diem. The estate supplies him with rice, which is deducted from his pay, but rows of quarters called "lines" are supplied free. A coolie takes a $\frac{1}{4}$ bushel of rice a week, but he is not allowed his full quantity unless he turns up for muster five days in the week, except in cases of illness. My experience of coolies is that they are very good fellows to work, provided they are justly and firmly treated. The cost of production of tea must necessarily be very cheap in order to make any profit. In fact it should be placed in the London market for something about 6d. per lb.

A tea planter's life in Ceylon is by no means an unpleasant one; indeed, I look back upon the time

spent there as some of the happiest years of my life but the work is often hard and very monotonous, and, to those who cannot stand tropical heat, most trying. The usual way of learning one's work is under the pupil system. You pay a planter from £150 to £200 for a year, for which he boards you, and lets you learn the work on his place, and also promises to do his best to get you a billet of "sina durai," *i.e.*, under assistant, at the expiration of your year. A sina-durai's billet usually begins with 83-33Rs. per mensem, that means a nominal £100 per month; but, of course, with exchange so low, it is not actually half that sum in sterling money. When I left Ceylon nearly two years ago the island was simply swarming with young fellows, and it was difficult to get these billets, and I knew lots of young men who were only too glad to work for their board. I think it is most imprudent for any young fellow to go out to Ceylon to become a tea planter unless he has got a fairly good capital to back him. I have seen very moderate estates indeed sold for £8,000. Of course, it is cheaper to open up land yourself, but then you must wait for three years before you can expect any returns.

For anyone fond of sport there is generally plenty to be obtained in the way of deer, pigeons, &c., and in the wet months snipe. Down in the "low country" there is some big game, but nowadays elephants are getting so scarce that one has to pay a license of R100 for every one shot. I never met such thorough good fellows anywhere as the planters in Ceylon, most hospitable and generous, and I received more real kindness during my four years' residence there from people almost comparative strangers than I think I should have at home. No wonder that I entertain the happiest recollections of the years I spent in "sunny Ceylon."

VOYAGEUR.

—The Field.]

CAUCASIAN TEA.

The successful experiments made with the tea cultivation in the Caucasus have led to very sanguine expectations as to the future. M. Bataline, the director of the St. Petersburg Botanic Gardens, has visited the Caucasian shore of the Black Sea for the purpose of reporting on its cultivation. In this report he says that the resources of the country are admirable, but little has been done to use them. "Over an extent of thirty versts, from Novorossiisk to Gheledjik," says the report, "the soil and the climate are not favourable to the cultivation of fruit. The only important orchards are those in the neighbourhood of Touapse. The strip of land between Gheledjik and the Asche River is, on the other hand, highly suited to this kind of cultivation. Here are found wild the chestnut, the laurel, the samschit or Caucasian palm, and, to the South of Gaza, even the olive. At Soukhoun plants can be cultivated which were formerly not dreamed of. Fruits and grapes are not good, but rice, indigo, cotton, olives, palms, lemons, and oranges have been acclimatised, especially on the property of M. P. Tatarinow. A tree nine years old produces, on this estate, about 400 oranges a year. The tea plant also grows here. The English were the first to demonstrate that the soil of this locality exactly resembles that of those parts of China where the best kinds of tea are grown. The first person who succeeded in growing the tea plant in the Caucasus was Colonel Solovtsov, who, however, had many difficulties to contend against. At first he had to import plants from China since none can be bought in Europe; the Customs formalities greatly hampered him. The Customs House officers went so far as to disinfect these plants, believing them to be vines, and hoping to prevent the phylloxera. The Societe Economique Libre sent M. Solovtsov a telegram congratulating him on his excellent results.

"At the meeting at which M. Bataline read his report, tea grown in the Caucasus was served and its flavor was found to be satisfactory. The tea plantations of Colonel Solovtsov are situated in the arrondissement of Batoum. He began to cultivate tea nine years ago and he has had excellent results,

The first attempts to grow the tea plant in the Caucasus were made thirty years ago, but they were not successful. Professor Boutlerow intended to renew them at Soukhoum, but the project was interrupted by his death and his successors had no success. Now the cultivation of the tea plant seems to be safely introduced into the province and it is under the protection of the Government." In conclusion M. Bataline says: "The events which are now proceeding in the Far East may bring about notable changes in the tea trade. The English have long been growing tea on the slopes of the Himalayas and in Ceylon, but the Colombo tea is disagreeable in flavour. Our Caucasian tea is superior in quality and we may, perhaps, look forward in a few years to drinking Russian instead of Chinese, which now costs us annually 42,000,000 roubles, just as the Russian wines are every day expelling more and more foreign wines from our daily consumption.—*Grocers' Review*.

VARIOUS PLANTING NOTES.

TEA SHIPMENTS.—The total shipments for September from Colombo to London were 5,078,000 lb. and the estimate for October is 5½ to 6 million lb. against actual shipments of about 4,900,000 lb. in October 1894.

PEARL OYSTER CULTIVATION.—London, Sept. 6th.—A Frenchman has asked Mr. Thomas Playford, Agent-General for South Australia, for the lease of a piece of the foreshore of the Northern Territory, to be devoted to the cultivation of the pearl oyster.

GOOMERA TEA ESTATES CO.—Good news for Shareholders in this Company, comes by the mail, to Messrs. Baker & Hall, in the shape of an announcement of a dividend of 17 per cent for the year ending June, and carrying forward an amount equal to 6 per cent.

CINCHONA BARK AND QUININE—are said to be on the rise, and the *New York Drug Reporter* winds up an editorial as follows:—

The bark situation is daily growing stronger, and another year may see the alkaloid considerably higher than it is today, based solely on natural conditions.

THE CANARY ISLANDS.—We promised our readers a review of Dr. D. Morris's interesting paper on these islands, which recently reached us. We are saved the trouble by being able to take over an excellent resumé and criticism, which has appeared in the *Morning Post*, and which will be found reproduced elsewhere.

EXPORT OF CHINA TEA.—Our Special Telegram from the Far East continues to give us satisfactory news about the export of China tea to the United Kingdom, the total to date being less than that at the same date last year by 2 million lb. The China tea season is generally considered to come to a practical close in this month of October, and there is no evidence of a revival of the trade this year, as some people anticipated.

"HANDBOOK of Horticulture and Viticulture of Western Australia" by A. Despeissis, M.R.A.C., late Consulting Viticulturist, Department of Agriculture, N. S. Wales, Expert of the Bureau of Agriculture of Western Australia,—is issued by direction of the Bureau of Agriculture and a copy has just been sent us for review in our *Tropical Agriculturist*. This will be done; meantime we may mention from a glance that this volume of 338 clearly printed pages is exceedingly well put together with numerous useful engravings, a map of the South-west portion of West Australia—from Geraldton to Albany shewing the Vine and Fruit-growing divisions; and a capital index.

THE NEW SOUTH WALES LAND DEPARTMENT is now offering homestead blocks at 7s 6d per acre, capital value. This low value has been fixed for the first time in the history of the colony.

NEW LIMITED COMPANIES.—A contemporary announces that the next Ceylon Tea Company to be floated will be one to purchase and work three well-known estates in Madulsima. We hear of one or two other new Companies besides to take over adjacent estates in other districts and work them economically by saving separate factories. This is the basis on which we have always advocated the establishment of Limited Companies, and most of the shares in these cases are taken up by the proprietors and their friends. A fourth, or it may be, fifth projected Company is of a somewhat different character, as it is to take up a new lowcountry industry which has already been successfully established. Details of all of these will no doubt shortly appear.

SELANGOR PLANTATIONS SYNDICATE.—The meeting of shareholders of this four months old Company reported in another column, though purely formal in character was of a gratifying nature. Opportunity was given to the Chairman (Mr. Ludwig Huttenback) to state his belief in the future of the Syndicate. This, he did in a happy speech, remarking that the Directors had no reason to alter the favourable opinion, which was expressed by them when shares were offered to the public. In British territory under a friendly official body he had no doubt, that the Syndicate would receive every assistance. From the confident tone of the Chairman's remarks, it looks as if there were good times ahead for the Syndicate.

COTTON AND PEPPER EXPORTS FROM SOUTHERN INDIA IN 1894-95: WHY NOT PEPPER FROM CEYLON IN LARGE QUANTITIES?—The valuable return forwarded to us by Mr. Ralph Tatham for Messrs. Arbuthnott & Co., ought to excite the interest of planters and progressive native agriculturists for this reason. Here is Southern India sending away in the year 1894-95, as much as 151,439 cwt. of Pepper, valued at R2,574,463; while Ceylon with all its advantages of climate, soil, cheap labour and transport, and the fact that a hundred years ago, it was a great pepper-growing and exporting country, and has among the Kegalla Sinhalese, a lot of natives well acquainted with the pepper vine and its ways,—cannot now get up an export exceeding 143 cwt. = R35,115 (in 1894)! And yet pepper is one of the few products for which there is a good and paying demand. We are aware that the veteran Mr. W. H. Wright at Mirigama and some others are pioneering once more with pepper, and we wish them all success. Every tea planter in Kegalla, Polgahawella, Western Dolosbage, the Kelani Valley and Kalntara, ought to find a second string to his bow in "Pepper." In 1650 A.D., Ceylon pepper was the most highly valued in Europe. In A.D. 1740, Governor Van Imhoff considered pepper in Ceylon more important than coffee, and the Dutch, the year before had exported nearly half-a-million lb. of this spice. In 1843, Bennett wrote that the one district of Kalntara ought to grow more pepper than the whole island then yielded. For a long series of years the Ceylon export exceeded 100,000 lb.; now it is about 16,000 lb.! There is no reason why we should not grow and ship up to the value of one or two million of rupees,

TEA PLANTING IN CEYLON.—“Voyageur” must be credited with affording readers of *The Field*, a very lively as well as instructive account of tea planting in Ceylon, and his winding-up will be generally appreciated.

VICTORIA REGIA.—There is now growing in the Victoria Tank of the Royal Botanic Society, in the gardens in Regent’s Park, one of the finest plants of the *Victoria regia* ever seen in London. The surface covered by the plant is over four hundred square feet. There are ten gigantic leaves, each measuring over seven feet in diameter, while several beautiful flowers are open almost at once.—*Standard*, Sept. 7.

ROADS—ROADS—ROADS!—It is very likely that our next Governor’s term of administration in Ceylon may be one of the most important as regards “roads” as well as railways and tramways, of any in our record. Not only do we hope to see all the sections of road and the bridges required to serve and feed the Uva railway, taken in hand and disposed of; but the long-talked-of connection between the Southern and Sabaragamuwa provinces by road should be effected, both by way of Morawak and Colonna Korales, and towards Hambantota for the salt traffic—a triune junction would seem to be wanted, the termini being Pelmadulla, Hambantota and Matara. Then again, the Central and Sabaragamuwa provinces should have their road communication by way of Bogawantalawa and Balangoda, apart from district extensions. Tramways in Colombo should at last be inaugurated, and a light locomotive line from Nanuoya through Nuwara Eliya to Uda-pussellawa, as the pioneer of several more to follow; but, of course, still more important would be the inauguration of the metre-gauge for our Northern, and we trust Indo-Ceylon, railways. Altogether the next five or six years should witness a big step onwards in material improvement in Ceylon.

TEA SEED.—No wonder though tea planting should still be pursued so vigorously in Ceylon, seeing that considerably over half-a-million lb. weight of tea seed valued at R329,000 was imported from India during the two years 1893 and 1894:—

	lb.	R Value.
1893	324,075	— 128,502
1894	207,410 and 9 pkgs.	200,168

Up to date this year, the import is much less, the total being R35,360 as may be seen from the following statement kindly supplied by the Collector of Customs:—

Statement showing the quantity and value of Tea Seeds,

Imported from the several ports of India, from January to August, 1895.

R. REID, Principal Collector,
Colombo Customs, 19th Sept.

COCONUT PLANTING IN NORTH BORNEO.—The Governor of British North Borneo has ordered that any native planting 30 coconut trees in the year shall be exempt from poll-tax. The trees will become the property of the planters.—*S F. Press*.

JAVA Co.—The *States Gazette* contains the statute of the Agricultural Company Ngobo in this city, with a capital of fl 300,000, which has been fully subscribed. The company is to work the Ngobo estate in Java.—*L. and C. Express*.

COORG PLANTING.—The Coorg correspondent of the *Planter* states that Mr. James Chisholm’s estates have been converted into a Company: one pound shares. He believes the management remains in the same hands.—*M. Times*, Oct. 4.

PLANTAIN TREES, PRODUCERS OF ELECTRICITY!—A Saigon Journalist has, it is alleged, discovered that the juice of banana trees acting upon zinc and copper batteries, develops electricity. By connecting a number of banana trees, with piles inserted in incisions, he worked a telephone 2,500 metres long for eight months.—*M. Mail*.

FROREN LILIES FROM AUSTRALIA.—The Orient steamship “Ophir” has brought home from Sydney a bouquet of Australian lilies enclosed within a block of ice. They have been sent to the care of the Agent-General for New South Wales with the request that he will ask Her Majesty to accept them.—*London Times*, Sept. 5.

THE HAMPTON COURT VINE.—“Old Colonist” referred to this vine the other day. We read in a paper by this mail:—

That wonderful vine in the gardens at Hampton Court maintains its reputation. Though it is 127 years old, and has once this season been pruned of 2,000 bunches of fruit, it has now over 1,200 “massive clusters” in process of ripening.

ROADS IN NORTH TRAVANCORE.—The beautifully-graded elephant tracks which have for so long been the only substitute for roads in North Travancore will soon be discarded. The very punishing Sylhet Tea Company is now hard at work in finding outlets from their property direct to Cochin. This means sixteen miles of roads through the Company’s property and another twenty to the existing road and river service to Cochin.—*Planting Opinion*.

MR. M. A. LAWSON, Superintendent of the Government Gardens and Cinchona Plantation on the Nilgiris, has retired from the Madras service. He was formerly Professor of Botany at Oxford, and in charge of the exquisite garden which stretches along the bank of the Cherwell, which Macaulay described in a well-known passage. Mr. Lawson went out to India twelve years ago, at the instance of Sir Mountstuart Grant Duff.—*Colonies and India*.

THE BORNEO TOBACCO CROP.—We are indebted to Messrs. Mansfield & Co. for the following note of tobacco exported (1894 crop) during this year, the whole of which was carried to Europe by Blue Funnel steamers.

Kinabatangan	2,185 bales	against 2,175 (1893 crop)
Darvel Bay	1,058	“ 866
Total	3,243	“ 3,041
of the above 2,614 were shipped to Amsterdam,		
	629	“ Rotterdam.

—*Borneo Herald*, Sept. 1.

RHEA.—A new use has been found for the fibre of the Rhea. In making the new American yacht “Defender’s” spinaker, the material to be used will be Ramie silk. This fabric would, if properly woven, no doubt take the place of cotton, as it is 25 per cent stronger than duck when dry and about 50 per cent stronger when wet. The reason for its very limited use in this respect, writes a contemporary, is due to the fact that only the Chinese understand the art of weaving it perfectly, and as a consequence it is dear. We think that the secret, if any such existed, is now known to others besides the Chinese, and the development of the Ramie-working industry on commercial lines is not very far distant.—*Indian Engineer*.

PLANTING IN NORTH BORNEO.—The August crop from the Byte Coffee Estate was piculs 33.35. Some ripe cocoa pods were also gathered.—*North Borneo Herald*, Sept. 16.

NORTH BORNEO COTTON.—A sample of Dusun cotton was picked last month at Loong Piasow after being subject to two or three days rain when ripe; the sample was sent to Hongkong and is reported as being of "fine quality, long staple, very clean, free from seeds, and of good colour." It is valued at 18½–19 per picul as against a quotation at the same date of China cotton 17½ to 19½ and Indian at 14–16.—*Ibid.*

THE "AGRICULTURAL GAZETTE" of New South Wales Vol. VI. Part 8 for August, 1895 has for contents:—Honey: Its Composition and Adulteration—F B Guthrie; The Honey Bee—Foul Brood—R. Helms; Bee-keeping—The Inmates and Economy of the Hive—The Queen Bee—Albert Gale; Irrigation—H G McKinney; Harvesting in California—J Martin; Fruits to Export and How to Export Them—A H Benson; Comparative Experiments with Sugar Beets—G Valder; Poultry Notes—S Gray; Practical Vegetable and Flower Growing—Directions for the month of September; Orchard Notes for September; General Notes—Cure of Black Spot; Gummings in Lemon Trees; Sending Specimens to Department; Agricultural Societies' Shows, 1895.

ELECTRICITY SENT TO A DISTANCE.—Electric power transmission for a distance of 105 miles is proposed by the Kern River & Los Angeles Electric Power Co., of Los Angeles, Cal. Mr. H. Hawgood, M. Inst. C. E., is the Consulting Engineer, and he now has a party in the field selecting the most feasible route for the transmission line between Kern River and Los Angeles. The scheme contemplates the development and transmission of from 10,000 to 40,000 H.P. The plant recently installed at Folsom, Cal., generates about 6,200 H.P., and transmits 5,000 H.P. to Sacramento, a distance of 19 miles, at a tension of 11,000 volts.—*Engineering News*.

BREAKING A MONOPOLY.—With reference to the report that the Travancore Government has decided to abolish the cardamom monopoly against which the planting community has been agitating for years past, the *Western Star* states, that although the Government contemplated the abolition of the monopoly, it has been strongly advised against giving effect to its intention, as it would be practically impossible to assess each holding correctly. It would therefore be the source of regular loss to the Government, and this, our contemporary learns, has been satisfactorily explained to H. H. the Maharajah. The cardamom gardens were all surveyed last year, and a regular assessment will be fixed on each holding, which it is expected, will amount to the average income obtained by the Government from this source.—*Indian Engineer*.

THE "INDIAN FORESTER" for September, 1895 has the following contents:—Original Articles and Translations—The Chemistry and Physiology of foliage leaves by Dr. Leather; The Cause of the dripping of Water from Forest Trees; A Note on Ceroplastes Ceriferus (white insect wax), by E. Stebbing; How to get rid of blight. Correspondence—Privileges and Rights, letter from B. H. B.-P.; Seeding of the Thorny Bamboo, letter from M Kuppasawmy Chetty; Jadoo fibre: plants without earth, letter from A W Peet. Official Papers and Intelligence—Budget Estimates of the Forest Department for 1895-96; A Note on Plant Assimilation of Nitrogen, by Dr. J W Leather; Peculiarities in the distribution of certain Indian Leguminosæ, by Dr. G Watt. Reviews—Annual Forest Administration Reports of Assam and the Central Provinces, for 1893-94; Report on Revenue Administration in the Central Provinces for 1893-94; Report on the Botanical and Afforestation Department, Hongkong, for 1894; Report of the Agricultural Chemist to the Government of India for 1893-94. Extracts, Notes and Queries—Marram Grass in Australia; Wood-pulp Mosaics; Chemical Wood-pulp; Woodlands in Sussex. Timber and Produce Trade. Extracts from Official Gazettes.

THE POSSIBILITIES OF THE COW-PEA.—A planter who was aware of our interest in the subject of green-manuring has drawn our attention to the cow-pea. This plant certainly has a future before it in our coffee districts, judging from the excellent work it has accomplished elsewhere. Some years ago a few plants were casually introduced in Queensland, where its value was promptly appreciated. Now it covers the best part of that province, where it is utilized in a three-fold manner, the most important of which is manuring the heavily-taxed sugar-cane fields. It can also be used as fodder for cattle, and the seeds form a valuable food for man. It can give two crops a year. It has been cultivated between perennial plants and trees with the most satisfactory results. The yield off one acre is put down as giving almost four thousand pounds of organic matter, which again yields very nearly 65 pounds of nitrogen. We should like particulars of this plant, as its double value for forage and green-manuring makes it take a front place in the list of leguminous plants, our indigenous plants being mostly poisonous to cattle.—*Planting Opinion*.

THE TEA IN LOOL CONDURA: THE OLDEST CONTINUOUSLY CROPPED FIELDS IN CEYLON.—We are very pleased to have the following corroborative report from Mr. J. N. Campbell, Manager of the Oriental Estates Company Limited:—

23rd. Sept.—The oldest tea on Lool Condera viz. the China Jât tea planted along the road sides is now 29 years old, and the oldest field 20 acres of Assam Hybrid is 27 years old. There is also a field of 80 acres of tea now about 23 years old. The whole of this 100 acres was planted in virgin forest at an elevation of nearly 5,000 feet and it is now as healthy and vigorous as ever and continues to give a fairly good crop.

This report and that of Mr. Bommer, are of interest and value to the entire tea planting community in Ceylon. How often, in the early days have our Indian planting visitors come back to us from the Gampola and Dimbula districts with the cry:—"Oh yes, the show is fine; but it is not going to last; a dozen years or so will see these fields worked out;"—and here are fields no better than the average, still yielding well and looking vigorous after 23 to 29 years!

YARANTOTTA, 3rd Oct.—Last week brought us a spell of fine planting weather, and those with planting or supplying to do have taken due advantage. Now we are having bright mornings with wet afternoons and occasionally the Peak standing out clear and distinct. Does this mean the North-east monsoon? It cannot now I think be far-off. What I have seen of tea in the district looks very well. The oldest opened fields look as well as they have done any time for the last ten years. Of course here as on upcountry estates there are thin poor ridges which are always more or less backward and as the surrounding bushes expand they give to the casual observer the impression that the bushes on the thin ridges are falling-off. The same inequality of growth and spread of bush takes place upcountry, but the development of the more favoured bushes being slower the contrast is less pronounced. Referring to the question of weeds. It is not likely that we will ever attempt growing weeds along with the tea at least very generally; but the other day I noticed a small field of tea, on the bank of the Kelani Ganga with a complete surface of grass such as grows anywhere from here to Colombo. The tea belongs to a native and is about eight or ten years old. It had been lately pruned and looked quite healthy in spite of the grass. No doubt it would prevent wash and protect the roots from the sun. At another point on the river I saw a clearing, or rather plantation of arecaunts (grown trees) with the space between planted with tea which looked quite healthy though without much spread.—I think local Postmasters might use more despatch in receiving letters after the arrival of the mails and keep the receiving box open later before time of departure. Fancy, closing the receiving box half-an-hour before the advertised time of departure.—I notice one or two cultivators have commenced harvesting kurrakkan.

Correspondence.

To the Editor.

PLANTING AND LIFE IN NYASSALAND.

Lauderdale, British Central Africa.

July 15th, 1895.

MY DEAR SIR,—I have just received your *Tropical Agriculturist*, a valuable Magazine I have taken (with a break) almost from its commencement. I have read with a sort of pitying amusement the unfavourable account of British Central Africa by a Ceylon Planter (Mr. Thornton, I presume.) As you appeal to me, I send a few notes, on this interesting case. The Ceylon Planter made a bad start, a very bad start, seeing his fellow passengers began to "eat medicine" on the second day up the river. Perhaps this very unwholesome diet was washed down by even more hurtful potations of spirits, which flow far too freely now: the wail of the C. P. may even have its sources as far back as this.

A young engineer, not a year out from home, certainly died, I am sorry to say, but had been seriously ill for at least a fortnight. Had he been better advised and "eaten" less medicine with unwholesome accompaniments, he would probably have been still alive.

"Any man who goes there gambles with death," so writes our C.P. But I have some figures, carefully made up in 1891, which will go much further than bare assertion, one way or the other. These refer to the employes of the African Lakes Company, which was started by my brother and myself in 1878. Up to 1891 there had been engaged in all 64 men. Three however, had only served a few months each in Africa, four had been dismissed, and one had been drowned on the coast, all of whom I exclude though their aggregate service would have added several years to my figures:—

25 of the rest were either in our employ or had completed their engagements with about.. .. .	5½ years
Average service and a total of	130½ "
22 men had been a shorter time in all	38 "
5 were invalided, but two of these were consumptive, one of whom would probably have lived even a shorter time at home; the other recovered. These had an aggregate service of	22 "
4 had died, after serving	9½ "

56 men, therefore, had completed service of 200 "

There was, therefore, exactly according to these figures a death-rate of 20 per thousand per annum. But two of these died immediately in consequence of the severe and protracted exertions and anxiety, when we were fighting the Arab Slave-traders at the North end of Lake Nyassa. But for this, the deathrate would have been only half of what it was, or 10 per thousand, one per cent. But not one died in those early and hardest years of all, the first nine years, of pioneering work, of many privations, of occasional dangerous crises, and constant strenuous work. For instance in 1882-3, my first year of coffee work (my brother planted our first patch the previous season) my whole day was spent in out-door work, much of it at the coffee, while I did five nights of office work a week till 12 p.m. or 2 a.m.

But, and I think it accounts for the difference between my figures, and the impressions carried away by your Ceylon Planter, we only employed teetotallers in those early days. If a man will indulge in promiscuous drinking, he is not "gambling with death," he is selling his life at a price. We want none such.

I say no more, but shall detain this letter a few days, till I can send you my second year's meteorological record, which has an answer also to the fore-mentioned Ceylon Planter.—I remain, dear sir, yours sincerely, JOHN W. MOIR.

P. S.—29th July, 1895,—Since writing the foregoing an old Capitan or Kangany came up to see me, and volunteered the statement, "in the old time no drinking, no one died; now every one drinks and many die."

I trust you will understand my Registers. The large ones are for 3 periods of 6 months each; the smaller for the last 6 months.

Each 6 months is added and averaged, as also each 12 months.

There are some columns to enable me better to foretell the weather, such as a "Crater" and "Chiperone"—the amount of cloud in each, which you would probably leave out.—Yours,

J. W. M.

[The Meteorological returns which are elaborate in detail, will be found elsewhere.—ED. T.A.]

"QUININE" TREE AND MALARIA.

SIR,—The *Madras Mail* is responsible for the following:—

"It has been discovered, says an English contemporary, that the famous tree from the bark of which quinine is obtained furnishes no quinine except in malarial regions. It is therefore claimed that quinine is a malarial poison drawn from the soil and stored up by this wonderful tree."

It is indeed wonderful that such ignorance should be thus countenanced! The fact that the richest barks are grown in regions where malaria is unknown such as in this Naduvatum and Ootacamund district, seems to be ignored!

Quinine is a waste-product in the economy of the tree, which is incidentally formed during the process of nutrition, but not being essential to either growth or nourishment is expelled as far as possible, namely to the circumference or bark of the tree.—Yours faithfully, J. MCKENZIE.

[A fashionable London Doctor in a paper on "Influenza and its cure" in the "Nineteenth Century" first promulgated the error alluded to above, and we corrected it at the time in London.—ED. T.A.]

CAMPHOR IN SOUTHERN INDIA.

Sept. 18th, 1895.

SIR,—In former years you included camphor in your column of "Market Rates for Old and New Products," but for some time past that product has not been quoted. May I ask whether you have any objection to include camphor again in the list of monthly quotation at the end of the *Tropical Agriculturist*? It was the study of the progress of camphor as formerly quoted every month in your Market Rates for Old and New Products that induced me to procure seed all the way from Japan.

I may take this opportunity to remark that to the surprise of Mr. Hooper he obtained solid camphor from the leaves that I sent to him. Only oil of camphor is supposed to be obtained from the leaves alone.—Yours faithfully, J. MCKENZIE.

[We shall certainly resume the quotations: we were not aware it was dropped. We shall be glad to hear of Mr. Hooper's experiments: has he tried the bark? —ED. T.A.]

AN ENEMY OF TEA—THE RED "BORER" ON A LOWCOUNTRY ESTATE.

Hanwella, Salawa Estate, Sept. 21.

DEAR SIR,—I have found in the new field of this estate certain kinds of insects which are called "Parasa lepida," "*Zeuzera coffea*," "Eumeta sikimo." These insects destroy the young tea bushes, some eating the bark, some the leaves and others bore holes in the stems and eat the heart of the main stem. I learnt these names of the insects and their forms by reading the book which is called "TEA INSECTS" published by Mr. E. C. Cotes.

I am sorry I buried all the insects I found. I post to you a piece of stem in which you can see the tunnel made by the insects and how they eat. I showed all the insects to Mr. Richard Morgan and he advised me to direct them to you.—Yours truly,

CHAS. A. PIERIS.

[Salawa estate which is now included in the Kelani Valley district has 400 acres under tea; but Mr. Pieris does not tell us if the mischief is widespread, although we gather it is chiefly confined to the young tea. The enemy is the well-known red "borer" to which Nietner first gave a name and wrote:—

"This insect . . . destroys many trees, young and old, the caterpillar eating out the heart: for this purpose it generally enters the tree six or twelve inches from the ground, ascending upwards. Fortunately it is not abundant. It resembles the caterpillar of the goat-moth of England, is two inches long, and as thick as a goose-quill, nearly naked, of yellowish colour, back red, head thoracic, and anal plates blackish; when full-grown the colours are light and dirty. The sickly drooping foliage, and a heap of globules of conglomerated wood-dust at the foot of a tree soon indicate that the caterpillar is carrying on its destructive work inside. The chrysalis rests three months, and its skin half protrudes from the hole when the moth escapes, which is about February. The moth measures $1\frac{1}{2}$ " across the wings, which are white, spotted with steel blue; the upper ones, with one large spot and numerous series of small ones, placed in rows between the nerves; the lower wings are less spotted. Thorax with four spots near margin. Abdomen variegated with blue. Legs blue, second pair with white femora, third pair with white femora, and tibiae." Mr. E. E. Green adds that the presence of the insect may usually be detected by the heaps of sawdust-like excrement to be found on the ground under the bush.

With regard to remedies, cutting out infested stems is the most promising treatment that has been suggested, though the damage occasioned appears to be seldom sufficient to make this worth while. In the case of coffee bushes Dr. Bidie remarks (*Report on the ravages of the borer on coffee estates*, Madras, 1867):—"If not much injured, the external opening should be closed with a wooden peg, which causes the death of the borer, and the tree will then in all probability recover." Squirted kerosine oil into the whole or hooking the grub out with a barbed wire would also be likely to be effective in cases where the trouble was worth taking.—Ed. T.A.]

THE VALUE OF PEPPER IN CEYLON AND INDIAN CROPS.

Dartry, Gampola, Sept. 27.

DEAR SIR,—In your notice of Mr. Tatham's returns of exports from Southern India, you say that in 1894 Ceylon only exported 143 cwt. of pepper—R35,115! Surely there is something wrong here? as this works out R245.63 per cwt. or R2.21 per lb. Southern India exported 1894-95 151,439 cwt. valued at R2,574,463 works out R17 per cwt. or say 15 cents per lb. This, I take it, is more in accordance with the facts, for as a small grower of pepper I know that I had con-

siderable difficulty in disposing of this year's crop at 13 cents per lb. in Colombo. At these prices I don't think there is much inducement to grow it.—Yours faithfully,

J. A. R.

[We regret very much to find there was a misprint, the local Customs value was R3,515 or R24.50 per cwt., or not quite 22 cents per lb.; but Customs valuations when there is no duty are proverbially haphazard. The London quotation in our last "T.A." is 2½d per lb. which corresponds with the local 13 to 15 cents. We are sorry to find that our correspondent does not think this price very profitable: is he not rather too high, however, for the proper pepper-growing region of heavy crops?—Ed. T.A.]

CAMPHOR TREES AND MR. NOCK'S CAMPHOR EXPERIMENTS.

Ohiya, Sept. 28th.

DEAR SIR,—Concerning the Camphor industry, is it not possible that Mr. Nock's failure to obtain camphor, is owing to his experimenting on too young trees? From a short paragraph in the "Scientific American" for August 18th, 1894, I extract the following:—

"The Camphor is extracted from chips taken from the roots or from the stem near the root, the wood yielding about 5 per cent of Camphor, and the root a larger proportion.

*** "Plantations of young trees are also making and are well taken care of, and, although Camphor has not hitherto been extracted from trees less than *seventy* or *eighty* years old, it is expected that under the present intelligent management equally good results may be realized in *twenty-five* or *thirty* years."

From another volume of the "Scientific American", I find that Camphorated oil has been used with success in the treatment of phthisical patients, in Berlin.

This paper also states that the Camphor tree is being domesticated in the United States, and that it was thought it could be produced there in paying quantities.—Yours faithfully,

G. H. G.

[We fear Mr. Green is correct; for Mr. Nock referring to the Formosan process writes:—"It is exactly as I did it except that I allowed no steam to escape, and had a wooden condenser. Perhaps too it was boiled too fast, and I did not keep on for 10 days. I'll have an earthenware top made and try again as soon as I can find time."—Ed. T.A.]

THE KUKULU KORLE: IN DEFENCE AGAINST "HOW IT STRIKES AN OLD COLONIST."

Kukuln Korle, Rakwane, Oct. 4th.

DEAR SIR,—In the *Observer* of 30th ultimo there appears a long descriptive article headed as above, and as some of the remarks contained therein are very disparaging in the reference made to the Kukuln Korle, and "good, old, hospitable Rakwane," I cannot refrain from saying a few words in their defence.

It is much to be regretted that "O. C." "fain" though he was, could not have passed down through Rakwane, and into the much despised Kukuln Korle, to refute, with his own eyes, the erroneous statements he has made, and to dispel the gloomy picture which presented itself to his over imaginative brain.

Step down "O.C." from the lofty heights of Vegeria where you have conjured up such strange and gloomy imaginings, and accompany me, and I will guide you through old Rakwane, and shew you fields of as fine tea as you would wish to set eyes upon, and which, for general appearance and paying capabilities, may be equaled, but not surpassed, in any other district of this sunny Isle. Then having feasted your eyes on the luxuriant fields of Barra, Stubton, Hatherleigh and Rangwelteme, let me conduct you up through old "Everton," the scene of your labours "in days of yore,"—alas now so changed—and so on, into the heart of Kukulu Korale North. I will here shew you fields of tea which have given, and are still giving their 600 lb. of manufactured tea per acre. What do you think of that?

You are wrong again "O. C." when you say that the Kukulu Korale is best adapted to the cultivation of cardamoms, for they have been tried and "found wanting."

Your most correct statement concerning the Kukulu Korale is with reference to the leeches, for their wicked little ways seem to have made as lasting an impression on your mind, as they doubtless did on your body, on the occasion of your ever memorable visit to the district of gems.

Now, as to your remarks calling in question the hospitality of the present generation of Rakwane Planters,—well, all I can say is, that you do them a cruel injustice, for although the bungalows are not now so numerous as in days gone by, still in the hearts of the present occupants of the lesser number of bungalows of today, there exists the same love of shewing hospitality—be he stranger or V. A.—as ever characterised the planter of old, with his hearty welcome, and offer of good cheer. Old Rakwane has changed in many ways since the days when coffee was King, but not so its residents, for the hospitality of those of today is like that of their predecessors, proverbial.

With these few remarks, I beg to subscribe myself,
ANOTHER OLD COLONIST.

WEST HAPUTALE AND THE MINOR ROAD TO THE OHIYA RAILWAY STATION.

Callander, Ohiya, Oct. 7.

DEAR SIR,—My attention having been called to a query in a leader in the *Observer* of Oct. 3rd on the Uva roads, whether the Ohiya bridle-path has been finished, I have the pleasure of informing you that what you are pleased to designate as our "sma' mercy" has been completed and taken over by the Provincial Engineer: and I invite you next time you visit Uva, to come and have a peep at our 'right little tight little' valley and its "sma' mercy," and sniff our Highland breeze. A rickshaw could bring you down at racing speed, but corners might be inconvenient, and don't be alarmed at our mile-stones: they are made big and heavy that the wind can't blow them out!—Yours,

GEO: H. GREEN.

[We are heartily pleased to have Mr. Green's news and his cordial invitation to West Haputale which will not be overlooked; but surely neither the planters there nor the Railway Managers will long be content to have the traffic carried on coolies' heads (?), in rickshaws or single bullock carts? can a double bullock cart travel on the new road: if not, the sooner there is another vote the better, for bumper crops of leaf over an extended area must be looked for in West Haputale.—Ed. T.A.]

VARIOUS PLANTING NOTES.

SUGAR FEEDING OF CATTLE.—The results of some experiments in the use of molasses and sugar in the feeding of cattle made at the sugar factory at Libnowes, Austria, are given by Mons. Vivien in *Le Fermier*. The trials extended over 30 days. Twelve beasts had added to their usual rations, for 7 days, 2 lb. 3 oz. of molasses per day; for the following 15 days, 3 lb. 4 oz.; and for the last 8 days, 5 lb. 6 oz. The average rate of each beast before the experiment was 1,120 lb., and, after the experiment was 1,204 lb. being a gain of 84 lb. per head, or a total of 1,008 lb. This is equivalent to a daily gain per head of over 2 lb. 9 oz. Twelve other beasts were experimented upon at the same time, and fed in the same way as the former, except the molasses. In 30 days they increased 784 lb., corresponding to 65½ lb. per head, or an average of nearly 2 lb. 3 oz. per head per day. As to the profits, the net gain was calculated as equal to 3s. 8d. per head in favour of the molasses-fed animals. A further experiment is said to have demonstrated that even better results can be obtained by the use of red crystallised sugar instead of molasses.

COFFEE is, of course, largely adulterated—says the *Daily Chronicle* of September 10th:—

Of a number of samples collected in different parts of London, 43 in all, no fewer than 22 were labelled "French coffee," and nine of these "contained from 62 to 93 per cent of chicory, etc., averaging 70 per cent of other substances than coffee," and in the 43 samples the average amount of coffee was just 50 per cent. Ginger, too, is sadly adulterated. "The refuse left after the fermentation of ginger, in ginger-beer making, . . . is largely used to be mixed off with unexhausted ginger, and ground together to reduce the price." Exhausted caraways are similarly mixed with fresh. Fine oatmeal is adulterated with barely meal. Beeswax "is extensively sold in Mincing-lane containing as much as 50 to 60 per cent of paraffin wax." Pepper is adulterated with "ground rice, long pepper (which is not a pepper at all), olive stones," and other things. And there was no way of stopping the sale by public auction of 240,000 lb. of pepper-salvage from a fire, which had been soaking in Thames water for several weeks, was saturated with sewage, and had become most offensive. So it was duly ground and sold by retail, though "quite unfit for human consumption." Even candied peel is now made of peel from which the essences have been abstracted. Beetroot sugar coloured with aniline dyes is sold as Demerara sugar. But we must stop.

COTTON CAKE.—"Advanced Agriculture." Henry I. Webb, Ph. D., B. Sc. (London). Treating on oil cake as a stock-feeding product, he advises that all cakes be stored in a dry place, and packed in layers at right angles to each other, to admit the air between; this prevents them from becoming mouldy. Mouldy cakes should not be used for feeding; they are often *very dangerous*, sometimes causing blood poisoning and such diseases as anthrax. Decorticated cotton cake is a good food for mixing with others for cattle in winter and about the best concentrated food to give cattle on grass. It neutralises the purgative action of grass; it is very high in albuminoids, and contains a higher manurial value than any other food. It is also an excellent food to mix in a ration for a milking cow, but it should not be given too near her calving period, either before or after. Neither should it be given to stock under one year old, unless in very small quantities mixed with other foods of a more carbonaceous nature. The reason for this food being so unsuited to young stock seems rather difficult to explain, but it has lately been considered that its highly nitrogenous nature acts prejudicially on the liver. Many of these cakes, when badly manufactured, contain hard, indigestible lumps, and should be used with caution. Undecorticated cotton cake, possessing less feeding and manurial value, can only be recommended for cattle out at grass, though it is often used for mixing with other foods for cattle in the winter.—*Home paper*.

ECHOES OF SCIENCE:

A rubber-yielding creeper, the "milk withe" (*Eorsteronia floribunda*), has been discovered in Jamaica, through the attempts of botanists to acclimatise the india-rubber tree in that island. The climber is generally as thick as a man's wrist, and reaches the tops of the highest trees and rocks. The milky juice coagulates on exposure to the sun.

Gelsoline, the new fibre from the bark of the mulberry tree, is treated like flax, and purified with soap and water to prepare it for the weaving shed. The cloth, as now made in Italy, is ten times stronger than cotton, and only one-tenth the price of flax.

The flowers of the "mahwah" (*Bassia lotifolia*) are eaten in India. They fall at night in large number, and are gathered in the morning, then eaten raw. They are sweet, but of a sickly flavour and smell. The flowers are also dried and stored as food, especially by the Bheels.—*Globe*.

INDIAN PATENTS.

Calcutta, the 19th Sept. 1895.

Specifications of the undermentioned inventions have been filed, under the provisions of Act V. of 1888:—

For improved process and apparatus for the treatment of Rhea Grass and similar fibres.—178 of 1895.—Henry Hungerford Boyle, Chemist, of London, for improved process and apparatus for the treatment of rhea grass and similar fibres for commercial purposes. (Filed 10th September 1895.)

For improvements in and relating to machines for delinting cotton seed.—196 of 1895.—James Jones Fankner, Citizen, 94, Poplar Street, in the City of Memphis, County of Shelby, and State of Tennessee, United States of America, Machinist, for improvements in and relating to machines for delinting cotton seed. (Filed 10th September 1895.)

The fees prescribed have been paid for the continuance of exclusive privilege, in respect of the undermentioned invention, for the periods shown against each:—

For cutting and gathering leaves from off tea bushes.—246 of 1889.—John Ashington Thompson, tea planter, for cutting and gathering leaves from off tea bushes by means of specially constructed shears, scissors, knives, hooks or sickles. (From 3rd November 1895 to 2nd November 1896.)—*Indian Engineer*.

THE TIMBER FUEL OF CEYLON.

We do not remember seeing any analyses of the relative value of the woods of this island as heat-giving and steam-raising fuel. If information on this subject could be collected and published, a considerable service would be rendered to steam users especially in tea factories, and indeed in all factories for drying purposes. As the distances increase over which fuel for estates has to be transported in correspondence with the denudation of proximate sources of supply, this information will become of very considerable importance. There would be direct and large sacrifice of economy in accepting a supply of wood possessing a lower degree of heat-raising properties than could be obtained from the better descriptions. What it is desirable to know is, which woods throw out when burnt, the largest amount of heat and leave the smallest residuum of ash. It must be manifestly unwise to use those woods which offend in respect to the latter quality. We doubt whether hitherto this question has been much studied. The widening area that now has to be traversed before wood fit for fuel can be obtained must

however, soon necessitate its study. No doubt the Railway Locomotive Department and the Managers of some of our Colombo Mills have already considered it. There must also be many planters who have, by this time, gained an extensive experience of the woods most efficacious in steam-raising, and we hope that some of them will make the result of their experience generally available. And such results, if collated and published, would be useful in other ways. For instance,—most of us are aware that damp wood fuel is a thorn in the side of the fire-raiser. But perhaps few are aware of the fact mentioned to us by one who has had considerable experience with wood fuel for steam boilers, that a certain proportion of green or damp wood, largely increases the heat of a wood fire burned under draught. There is a tendency when the fuel consists wholly of dry wood to "fly" when the draught is at all strong. An admixture of green wood will not only check this, but the steam given off greatly increases the general heat and promotes that slow combustion which it is desirable to obtain. Even in the splitting of the logs there are specialities, the observance of which has useful results, and these vary both with different kinds of wood and with those that are either dry or damp. Some woods burn better sawn transversely into billets, others yield their maximum of heat when split longitudinally. At all times the best results are obtained when a small proportion of coal can be burned with the wood, the combination of gases yielded by the two fuels largely increasing the heat and promoting ready combustion. Notes on the "topic" we have started from planters or others with local experience would be readily received and utilised by us, for the general benefit.

FRUIT UP-COUNTRY:

LEMONS—AVOCADO PEARS—CHERIMOYAS.

The reproach of our hill plantations having no proper gardens or orchards, is certainly in a fair way to be removed and a few years more should witness a great change. First, we have our friend Mr. J. G. Macfarlane of Ormidale, Maskeliya, writing:—

"There has been a good deal of interesting reading lately in the *Observer* re fruit culture. I send you under separate cover four lemons grown on this estate. What do you think of them? The tree from which they were gathered I planted here about ten years ago."

The lemons sent to us are quite equal in size and flavour to those recently brought from Mildura, Australia, and higher praise we can scarcely give. An orchard of 10 or 20 acres of such lemon trees, would be a splendid addition to a residential property in our hill-country, the crop being worth packing for the old country. — From Lower Hapntale, Mr. Maartensz has sent us from the famous Macaldenia Gardens some very fine Avocado pears which though rather too rich and buttery for our taste, we can judge must be as well grown and ripened as any in their native habitat.—Next "Old Colonist" and others will be interested in learning that our latest gift which comes from Mr. H. F. Dunbar of Gampaha, Udapussellawa, namely two well-grown "Cherimoyas" are as fine and luscious as any in the Far West, we venture to say. To Mr. Nock belongs the credit of introducing this fine fruit, the Gampaha tree being grown, we believe, from his seed first put in by Mr. J. Bagra.

What has become of our Mildura friends and their proposed Lemon and Orange plantation?—We hear now of a couple of planters who are

willing to go in for a fruit-garden experiment in the Kalutara district. They have fixed on a piece of land, of no service for tea, near a village and if they get 100 acres at R10 per acre from Government, they would undertake to plant 10 acres yearly with different fruits, and so show the Sinhalese how to grow fruit properly, as well as go on with what might become an important industry. We trust this application will be favourably considered by Government when it comes before it.

PURCHASE OF ESTATES FOR A COMPANY.

An upcountry resident writes :—

“Have you not heard of the new Company? Rozel and Mottingham purchased by Thomson for some £26,700, I mean to take a few shares.” The purchase is, we presume, for a London Company of which Messrs. Whittall & Co., are the local Agents. The two properties named—one in Lower Dikoya, and one in Maskeliya—are returned as follows :—

	Total.	Tea.	Timber and Grass.
Mottingham	258	220	16
Binoya or Rozelle ..	929	441	118
	1,187	661	134

The bargain should therefore be a good one for the buyers.

THE BRITISH ASSOCIATION :
THE INAUGURAL ADDRESS.

Ipswich—Cardinal Wolsey’s town and coupled by him with Christ Church as “twins of learning”—is favored this year as the place of meeting of the British Association, an Association which has played, and continues to play, perhaps, a greater part in the growth and influence of science (natural knowledge), than almost any other in the world. The names of all our most eminent men are connected with its proceedings, and almost every important branch of industry has benefited by its labours and endowments. This year’s President is “Sir Douglas Galton, K.C.B., D.C.L., F.R.S., &c.” And no one, wishing to keep abreast of the science of the day, and of its history and conquests during the last sixty years, should fail to read his inaugural address. This address is not, as is so often the case, confined to an abstruse and technical dissertation on some particular branch of science, too learned for the appreciation and enjoyment of the general reader; but is a general survey of the gains that science has made during late years in every department, and can be read and understood by every intelligent person. It is, as usual, very long and the mere enumeration of its headings or sections would take up some space. But it is not too long, and does not contain a word too many, for those who love science for truth’s sake, as well as for the many who live by one or other of its ramifications and departments. The immense strides we have made in our general knowledge and industries are herein set forth; and only a very inadequate idea of the scope of the address can be gathered from our reference to some of its subjects. Thus, it opens with a glance at the history of the Association since its foundation in 1831, comparing, generally, the ignorance of that time with the knowledge

of today. It was at the instance of the British Association that Government undertook tidal observations at 500 stations on the coasts of Britain; “a subject necessarily of importance to England as a dominant power at sea.” It roused Government to make large-scale experiments in Ship-building and Naval Architecture. It caused Government to establish a general Registration of Births and Deaths in 1858. It instituted, long ago, an enquiry into the accuracy of Standard Weights and Measures of Length and Capacity; and “in the last session of last Parliament” a Committee of the House of Commons endorsed a recommendation of the Association to provide for a Uniformity of Weights and Measures with reference to the interests of science. In the eighteenth century English artisans were pre-eminent in the manufacture of instruments of precision, so much so, that practical Astronomy was kept mainly in the hands of British observers; “the sectors, quadrants and circles were then inimitable by continental workmen;” and “the foundation of the British Association was coincident with a rapid development of mechanical appliances in the engineer’s workshop.” Thus, “a young workman named Joseph Whitworth” realized that the basis of accuracy in “machinery was the making of a true plane,” a problem he at once proceeded to solve, followed by “an exact system of measurement generally applicable in the workshop.” Most people have heard of the Royal Observatory at Kew. In 1842 the Government gave it up, and as the Royal Society declined to take the charge, it would doubtless have lapsed had not the British Association accepted the responsibility, and after having maintained it for nearly thirty-years, at a cost of about £12,000, handed it over to the Royal Society in 1871. These facts will give some idea of the services the British Association has rendered to the country as well as to the Sciences, geographical, geological, chemical, astronomical, mechanical, and physical. Meteorology, Biology (animal and botanical), Anthropology, Bacteriology are all passed under review in this address; while sewage purification, smoke abatement, mechanical engineering (a boundless subject in itself) are all told of in the most interesting manner. Then a good deal is said about the “Influence of Intercommunication afforded by the British Association on Science Progress;” about Science in Germany; assistance to Scientific Research in Great Britain, and a general summing-up. How the British Association works is told in the following words: “Our meetings have been successful because they have maintained the true principles of scientific investigation. We have been able to secure the continued presence and concurrence of the master spirits of science. They have been willing to sacrifice their leisure and to promote the welfare of the Association, because the meetings have afforded them the means of advancing the sciences to which they are attached.” Again, “the British Association has distributed £60,000 to aid research since its foundation.” The President, in his opening remarks, rightly pays a tribute of respect to the memory of Professor Huxley, who took such a prominent part in the proceedings of the last meeting at Oxford, and, “whose energy and wealth of argument helped to win the battle of evolution, and to secure for us the right to discuss questions of religion and science without fear and without favour.”

Sir Douglas Galton concludes his address in these words :—

The various agencies for scientific education have produced numerous students admirably qualified to pursue research; and at the same time almost every

field of industry presents openings for improvement through the development of scientific methods. For instance, agricultural operations alone offer openings for research to the biologist, the chemist, the physicist, the geologist, the engineer, which have hitherto been largely overlooked. If students do not easily find employment, it is chiefly attributable to a want of appreciation for science in the nation at large. * * Every year the field of usefulness of the Association is widening. For, whether with the geologist we seek to write the history of the crust of the earth, or with the biologist to trace out the evolution of its inhabitants, or whether with the astronomer, the chemist, and the physicist we endeavour to unravel the constitution of the sun and the planets or the genesis of the nebulae and stars which make up the universe, on every side we find ourselves surrounded by mysteries which await solution. We are only at the beginning of work. I have, therefore, full confidence that the future records of the British Association will chronicle a still greater progress than that already achieved, and that the British nation will maintain its leading position amongst the nations of the world, if it will energetically continue its voluntary efforts to promote research, supplemented by that additional help from the Government which ought never to be withheld when a clear case of scientific utility has been established.

CENTRAL TRAVANCORE PLANTERS' ASSOCIATION.

CEYLON AND INDIAN TEA DUTIES.

A general meeting of this Association was held in the Bon Ami bungalow on the 28th ultimo at 10 o'clock. There were present Messrs. R. S. Inray (Chairman), H. W. Baker, J. Burrows, A. R. Cox, Jr., W. Courtney, J. Finch, R. H. Goldie, W. Graham, B. Laurie, A. E. Veale and G. I. Ackworth (Honorary Secretary); also as visitor of the Hon'ble V. B. Wilbraham. The minutes of the last meeting were taken as read.

Ceylon Import Duties on Tea.—The Honorary Secretary said:—Mr. Chairman, you will have noticed in the last leading article of the *Madras Mail* on the proceedings of the U. P. A. S. I., that my speech on this subject was referred to and the writer of the article demanded what it was the planters of Southern India required. I regret that my speech was not very accurately reported, but I am glad of this opportunity of stating again publicly, that what we want is, that the Ceylon Tea Import Duty should be placed on the same basis as that of India, so far as Indian teas are concerned. At present the Ceylon duty is about 50 per cent *ad valorem*, whilst that of India is only 5 per cent. Ceylon teas are therefore admitted into India practically free, whilst an absolutely prohibitive duty is placed on our teas in Ceylon. This is not only unjust but unstatesmanlike, as the two countries, whose interests are identically the same, ought to run hand in hand. We have no wish to relieve China of any other inferior teas, but our teas are as good as those of Ceylon, and ought to be treated on the same footing as the latter are in India.

VARIOUS PLANTING NOTES.

The COFFEE ESTATE of Messrs. Ramsey and Harrison at Singgora is said to be promising very well. Several hundreds of acres of very rich soil are under cultivation and the only difficulty the proprietors have to contend with is that of obtaining labour.—*S. F. Press.*

"TROPICAL COLONISATION."—Under this heading we give an article of fascinating interest from the *Spectator*. Special mention is made of Ceylon, in most flattering terms as to beauty of scenery, richness of vegetation, goodness of climate; but we agree with the editor rather than with Mr. Boyle as to the main question in dispute; and there is in this island, the experience of a century of British occupation and sixty years of planting settlement to point to, in support of the *Spectator's* argument.

ODDS AND ENDS.

(From an *Ex-Rangalla Planter*.)

THE TEA BOOM.

The name of Ceylon no longer stinks in the nostrils of city men and speculators, and the one thing that all and sundry long for is the possession of some shares in the big dividend-paying tea companies, such as Yatiyantota, Yutaderia, We-oya &c. &c. and now the much abused Castlereagh Company and Clunes Limited have come with a rush and intend paying handsome dividends, like the rest. Those shareholders, who, putting no faith in Mr. L. H. Kelly, sold out at R65 must feel a trifle sick when they see Castlereaghs quoted at R140, while, I can fancy, a benign smile playing around the chiselled features of L. H. K. Although rejoicing at the success of the Ceylon Planters, I would fain utter a word of warning, and would advise them strongly not to put too much faith in tea, but to keep some other irons in the fire. In Cacao for instance there is likely to be a boom since the interesting test was made recently by a French woman, who, with a view of testing the sustaining powers of chocolate, lived upon that alone for 60 days, and lost only 15 lb. in the interval. In these depressed times, to be able to live for two months on chocolate alone is a policy likely to be adopted by the thrifty, and so cocoa will be in demand. Planters, who are drawing big dividends from their tea shares, should also remember that tea can be grown in almost any country, the latest to enter the lists being Russia, where they are growing magnificent tea on the Caucasus, one planter there having received a firm offer of 20,000 roubles for his next season's crop. In New Zealand, Australia and the Cape tea grows well, the only advantage Ceylon has against these countries being cheap labor and continuous flushing, and this brings to me the subject of the

TUNDU-MANIA.

What has gone wrong with it? In the days of King coffee there was no trouble about tundas, one planter never dreamt of taking a mean advantage of another, so why do they do so now? The correspondence on this subject, which appeared in the *Observer*, was exceedingly silly, and the stupidity of it reached a climax when a "Buchan Loon" rushed into print with his experience, which he had, no doubt acquired in the Bog of Ardallie, or some other festive spot in Buchan. He modestly admits that conceit is characteristic of his native wilds; an undoubted fact, for, sometime ago, I pointed out, in these notes, that another Buchan Loon, Mr. Marr, had been lecturing, in Scotland, on Ceylon, he having spent a fortnight in your island, and his knowledge of the palm-fringed isle having been acquired amongst the Clydesdale horses of Cairnbrogie. The labour question appeared to me to have been threshed out by Mr. E. J. Young in his pamphlet on Indian labour fields: why don't the planters read that? They were willing to pay Mr. Young for going to India on their account, and yet they don't seem disposed to read what he has to say on the matter.

TEA-TONER.

—A new tablet just brought out in London is finding a place on the tea tray. It is a tea-toning lozenge, which is dropped into an infusion of tea and acts as a solvent to the tannin never absent from even the most delicately brewed of this beverage. Its component parts are gelatine and alkaline salts, and its alleged office is the neutralising of any injurious digestive effect of the cup which "cheers"—indeed at the moment of drinking, but often chides bitterly afterwards.

MODERATE CARELESSNESS.

Mr. Mackwood's allowance for moderate carelessness in the tea factory seems a peculiar idea, and would be all very well, for us home buyers of your tea, if the carelessness took the form of putting too much into the chest, and not, everlastingly, too little. Tennis has a great deal to answer for, but short weight in the tea chests is certainly a very reprehensible thing to lay to its charge.

OLD DISTRICTS.

It is cheering to read such accounts of the old districts, as appeared in a late *Observer*. Dumbera natives getting their gardens weeded, in expectation of a crop of coffee, and Rangalla natives enjoying prosperity through the tea enterprize. Fancy Rangalla with telephonic communication, cart road to Nitre cave, a Church—and no necessity for a constable at that centre of commerce, Udispattu. I hope the Dumbera natives are not trusting to the talented Mr. E. F. Wright and his cure of leaf disease. Mr. Wright is not the first man who expected to draw in the Government reward of £10,000, but their names have long ago passed into oblivion, and the reward remains in Government hands still.

COSMOPOLITE.

TROPICAL COLONISATION.

We wish we could heartily agree in the views of Mr. Frederick Boyle, but history, we fear, forbids. That gentleman, who has much and varied experience of tropical lands, argues, in the *New Review* for this month, that the English belief as to the impossibility of Europeans colonising tropical countries is a baseless, as well as an embarrassing, prejudice. We shall have to do it, he says, for the temperate regions are either getting full, or being closed to immigrants by the jealousy of their occupants; and we may therefore as well reconsider the objections to settling in the tropical or, to be more exact—for the description which includes Northern India in the tropics is a little vague—in the hotter regions of the globe. Mr. Boyle finds most of them unreal. That man as a being does not degenerate physically in the hot countries seems to him certain, and we should admit that the evidence is for the most part wholly on his side. The Bengalees may be allowing to be “a feeble folk”—though there is great exaggeration even about this—but the Arabs, the Soudanese, the Southern Chinese, and almost all negroes are remarkable for muscular strength, power of enduring fatigue, and physical energy in general. They have less perhaps of the habit of living than Northern Europeans—though half the centenarians of the world are negroes—but that probably results from special circumstances, the English from the twelfth to the eighteenth century having died at least as fast as any dark tribe. If they had not, they would have increased in number at a much quicker rate. The dark peoples are, in fact, as “strong” as Europeans; while as to courage, the Soudanese broke a British square, the West Indian negro soldiers can be entrusted anywhere, and if the daring of the South Chinaman is doubtful except when he is a pirate, no one has ever questioned that of the Malay, either in battle or in the wild adventures which led him to Madagascar and the islands of the Pacific. Nor is there much evidence of intellectual decay, for if the world owes nothing to the negro, she takes all her creeds from the men of the hotter lands, and the clearest-sighted professor in Europe is not superior in power of subtle thought to the Brahmin of Madras. If, then, man as a genus does not necessarily degenerate in the tropics, why should the white man, his most energetic species, degenerate either? As a matter of fact, there are families of Jews which, without mixing their blood, have retained all energies, in Persia, Bombay, and even Bengal, for centuries; while the people of Costa Rica, who are “nearly white,” are a singularly hardy peasantry, and we may add the Copts, who, if not white, are as nearly white as the Jews,

are still the most competent race in the valley of the Nile. Neither the Ptolemies nor their soldiers degenerated in Egypt and there are Spanish families in Mexico as strong and as able as ever their progenitors were in Old Spain. Why then, asks Mr. Boyle, should not some State try the experiment of a tropical Colony, which, if it succeeded, would open such vast regions to European immigration, nay, might even produce a race greater than any now existing, for Mr. Boyle sympathises a little with the naturalist, Mr. Bates, who, after years spent in the forests of Brazil, chiefly in the valley of the Amazon, found himself so fascinated by the vigour of Nature in the tropics that he wrote:—“The well-balanced forces of nature maintain here a land surface and a climate that seem to be typical of mundane order and beauty.....I hold to the opinion that, though humanity can reach an advanced degree of culture by battling with the inclemencies of nature in high latitudes, it is under the equator alone that the race of the future will attain to complete fruition of man's beautiful heritage, the earth.”

It is a splendid dream, because it opens up new and almost infinite possibilities for the white race now dominating, though it does not colonise, all the continents; but we fear a dream only. History is opposed to Mr. Boyle. To begin with, that must have been a powerful instinct or a most operative law which originally divided mankind, so that the white race was confined to Europe, that the black race populated Africa, and that the huge bulk of Asia, the most fertile and tempting of all the continents, was filled with yellow and brown men. A scientific theorist would certainly say that some immutable law of convenience alone could have produced that result, which, amidst all the endless mutations of history, has remained substantially unchanged. Europe and Asia have fought for ever, but the bulk of the populations have remained European and Asiatic, while the great Roman invasion of Northern Africa and the Vandal invasion which followed it, alike ended in the triumph, more or less complete, of the brown races. Historians suggest no explanation of this cardinal fact, nor is any, we think possible, except that, whatever the meaning of the mysterious law of race—and science in no way accounts even for colour—the white peoples flourish best within strictly temperate regions. They can flourish in the highlands of the tropics, but they do not reach their highest level, and tend, when attacked for ages by autochthons, to recede, as they have done in Egypt, and are doing in many parts of Spanish America. It is probably true that they can labour in the tropics, for the white mechanics of the Southern States of the Union live and work there, and possible that, as governing castes, they would in the tropics develop marvellous energy; but they almost certainly would not advance as rapidly as in Europe. Englishmen are, we think, for some unknown reason, habitually unfair to Spanish Americans, who, whether pure or crossed, have produced men of singular daring, energy, and power of endurance; who have built great cities and reclaimed great regions of the earth; and who have besides a power of absorption and attraction acknowledged by all who settle in Spanish America, Italians more especially; but it would be foolish to say that the owners of Brazil or Central America or Mexico show any symptoms of developing into the superior race of mankind. Pure or crossed, an optimist would hardly say of them that they were better than their ances-

tors in Old Spain or Portugal. A "Southern gentleman" of English blood is often a very fine man; but he is not so much nobler than an English gentleman that he can be quoted to prove the truth of Mr. Bates's dream. That the hot lands are not fatal to energy may be true; but certainly they do not, with all their natural advantages, ever tend to produce it. If they did, the most glorious of all tropical countries, Ceylon, would have produced a grand race; and it has not done it. There, with land of all altitudes, and all kinds of powers of production, amidst perpetual summer and scenes which, if the theorists are right, should have bred in them an abnormal sense of beauty, dwells a race which we have no wish to decry, but which is certainly not more distinguished than, say, the Belgian or the Swede for any high qualities whatsoever. Whether an admixture of white blood would have altered the result, as we understand Mr. Boyle to half believe—at least if he does not believe it, we do not quite comprehend the drift of his remarks on the cross-breeds—is still an unsettled question; but it is clear that in the Southern States of the Union, in Spanish America, and in India, such admixture has not developed any markedly superior race. Mr. Bates's hope is a dream.

We should say, on a review of the whole evidence, that it pointed to this result. It is probably much more possible for white men to colonise a tropical country than is imagined, especially if the colony was so organised that sanitary laws could be enforced from the very first; but the first generation would suffer terribly from unaccustomed diseases—low fever, for example—from the depressing effect of a change of climate, and from the shock involved in a violent change of daily habitudes as to diet, hours of labour, and general social life. This suffering, involving much mortality, would discourage the average colonist to such a degree that he would not remain for the time which even Mr. Boyle admits to be necessary to secure complete acclimatisation. No generation of men will devote itself in this way for the benefit of its successors, and every experiment will therefore end either in failure, or in the importation of races able to relieve the colonists of all severe or exhausting toil. The second alternative may succeed,—has, for example, succeeded in Louisiana; but that is not colonisation by white men. It is "settlement,"—a very different matter, and one which cannot be said to have been as yet fairly tried. We can quite conceive of both the world and the whites being benefited by the settlement of a tropical region, in which dark men shall labour, and white men, few comparatively in number, shall guide their labour, and, while reaping a profit out of their exertions, shall deliberately endeavour to keep up among them a high and improving standard of civilisation. A body of white colonists working as a hieratic caste, and governing in the interest of the labourers as well as their own, might produce, under favouring circumstances, such results as the world has never seen, a civilisation in which poverty, disease, and crime were almost entirely absent, and the whole community exulted in struggling forward to some lofty ideal. The experiment, however, has never been made, except by the Jesuits in Paraguay, and it is difficult to imagine how it could succeed. The guides become arbitrary or the guided rebellious, or in the end some adroit man avails himself of human foibles to seize the reins of power, and we have, as under Dr. Francia and his heir, a pure despotism which advances nothing, because in the interest of the

despotism individuality must be put down. We rather wonder, however, that the experiment has never been tried by laymen, who with a healthy African district before them, and two regiments of black freedmen from America, might achieve, for a time at least, a considerable result, and would certainly add considerably to the knowledge of mankind. A good many *phalanstères* have been started from time to time, and a philanthropic Baron Hirsch might try that one with some faint hope of success. It would, however, be a faint hope, the law of ages being clearly that Europeans and Asiatics and Africans will not, unless coerced by irresistible circumstances, work in continuous harmony together.—*Spectator*.

PLANTING AND PRODUCE.

COCOA ADULTERATION.—On this subject Messrs. Cadbury Brothers write: "It may be true, as stated by a writer in the *Times*, that many 'of the leading manufacturers and the Government in the victualing yards' add 50 per cent. of sugar and arrow-root to the cocoa they prepare, but the word 'all' is incorrect. Our firm, which clears between one-third and one-fourth of the cocoa imported into Great Britain, has resolutely set its face against all such admixtures. Our cocoa is absolutely pure, and does not contain any addition of sugar or starch, nor any of those alkaline salts added by many of the Dutch makers to produce their dark-coloured and scented cocoas. Mr. George Cadbury, a member of our firm, in giving evidence before the Foods Adulteration Commission of 1872, proposed that the exact percentage of all the ingredients used in the manufacture of any articles of food should be distinctly given on the label. To this opinion we adhere, and believe the public would soon learn its value were it carried out. The public understand chocolate to be an article containing sugar and flavouring matters, such as vanilla. Our remarks, of course, only apply to brands offered as 'cocoa,' which as a beverage need not contain any starch and sugar, still less any addition of alkaline salts."

SHADE TREES AND COFFEE PLANTING.—Mr. Robert Thomson, who was for many years at the head of the Government gardens and plantations in Jamaica, has furnished to the Foreign Office for presentation to both Houses of Parliament an interesting report on the agricultural products of Tolima, in the Sierra Nevada of Colombia. He points out that in recent years a great impetus has been given to the cultivation of coffee in Colombia through the systematic interplanting of shade trees with coffee plants. The value of the coffee exported from the territory has increased from 810,000 dols in 1877-78 to 10,000,000 dols in 1894; and it may be assumed that in the course of two or three years the value of the total output will amount to 15,000,000 dols. Mr. Thomson mentions that thousands of acres in the district in question are being gradually reduced to a desert by the practice of burning the natural grasses during the most scorching periods of drought for the purpose of obtaining new and tender pasturage, and that the soil, is only preserved from sterility by the chaparro tree, which appears to flourish in consequence of the fires and the leaves, which form new vegetable mould.—*H. and C. Mail*.

SALE OF THE MESSRS. CHAMBERLAIN'S BADULLA ESTATE.

We learn that Mahapallagalla estate, Badulla, has been sold by the Messrs. H. & W. Chamberlain (brothers of the Rt. Hon. Joseph Chamberlain, M.P.) to the Nahavilla Estates Co. for the sum of £7,000. The property includes 323 acres, of which 47 are in coffee, 200 in tea, 26 acres fuel trees and the rest patana. It ought therefore to be a bargain for the Company.

SULPHUR AS A CURE FOR RED SPIDER IN TEA.

To the Editor of the *Home and Colonial Mail*.

Sir,—I regret not having had an earlier opportunity of examining, in your issue of the 30th ult., my two letters on "Sulphur as a Cure for Red Spider," which you were good enough to publish. In the one of April, 1893, which you reprint, several slight abridgments have been made, to which I take no objection, but, on the contrary, feel obliged that you devoted so much of your valuable space to the subject. But there is one serious omission of half-a-dozen words from the seventh paragraph from the beginning of that letter, on the "process" of applying the sulphur, that I trust you will kindly permit me to call attention to.

That paragraph should commence as follows: "Our process of application is simple and inexpensive. We put the sulphur in gauze bags or cloth of open texture, and after wetting the bushes thoroughly over and under the leaves, and the branches and stems, by means of large hand garden syringes, the sulphur is dusted over the whole bush," &c.

The words omitted—whether from a defect in the copy you had or through an oversight of the printer I know not—are in italics.

Apologising for again troubling you, and thanking you in anticipation for making this most necessary correction.—I am, &c.,

GEO. W. CHRISTISON.

WHAT WILL NORTH BORNEO'S CHIEF EXPORT BE ?

TAPIOCA.—Here is a cheap article of general request that can be grown to any extent on the banks of the rivers and waterways round the Bay and from thence floated to a central manufactory, while as to the demand, tapioca stands on much the same footing as sago; produced now in large quantities any material rise in the price of wheat would entail a sufficient rise in the price of tapioca to cause a vast increase in its production in countries best adapted to its cheap growth, manufacture and transport; and what country is better adapted to these ends than North Borneo?

Last year's export from Singapore alone of the various products I have spoken of, (sugar, Manila hemp and cotton omitted as they are not grown in the districts for which Singapore is the port of shipment) are as follows:

Gambier.	Sago.	Copra.
682,000 pcls.	695,000 pcls.	841,000 pcls.
Rattans.	Tapioca.	Coffee.
271,000 pcls.	372,000 pcls.	61,000 pcls.

making a total of 2,922,000 pcls. or say 172,000 tons. All these things we can grow just as well, as cheaply, and as profitably in the Sandakan district as in the places from whence those large supplies come; while the area of land centreing upon Sandakan is large enough to grow every picul as well as sugar enough for the Hongkong refineries and cotton enough for the Japan mills; no one I presume queries this; but when are we going to begin?

Which ever products offer most inducements to the capitalist are likely to be the things that will be most largely cultivated at first and a combination of quick returns and good profits are the points likely to have large influence on the question; the following list gives the length of time within which the various plants mature:—

Cotton	commences to give crop in	8 months
Sugar Cane	"	9 or 10 "
Tapioca	"	12 "
Gambier	"	15 "
Manila Hemp	"	20 "
Coffee	"	30 "
Rattans	"	48 "
Coconuts	"	60 "
Sago	"	140 "

But various other considerations have to be taken into account; a great deal depends upon which of these products receives attention first; for trial is synonymous with success and profit, and success

and profit will mean the following up of that particular cultivation. Now the plants that are receiving most attention at the moment are in the order named coffee, sago, coconuts, gambier, Manila hemp, cotton and sugar. There is no doubt that coffee successful as it is will be followed up, but to do so on a large scale requires a good deal of capital and elaboration. Sago-palms will be planted in increasing numbers, but new plantations takes too long to crop to figure in an export sheet for years to come. Coconuts are planted in the Sandakan district at the rate of some 20,000 per annum, a rate likely to be accelerated in the future rather than reduced, but they also are a long crop: gambier is well in hand, the gardens are being increased in size, the leaves take but a short time to mature and at present prices the manufacture gives large profits where the transport bill is not too high, and gambier is the product that I expect to see exports of increase more quickly during the next few years than anything else, always remembering that it is in the power of sugar to go ahead and take a commanding lead at any time and at short notice. Manila hemp owing to the want of skilled labourers on the one hand and to the small returns it offers to the capitalist on the other will make its way but slowly, but it will give good and certain rents to the large land owner on the one hand, and a Manila hemp patch is a sort of bank that can always be drawn upon when the small occupier wants money on the other, so that although its increase will be slow it will be sure; cotton also does not promise large profits to the capitalists although it offers several attractions to the small occupier, but it may be that millowners in China and Japan may demand it and put their money in for other reasons than the profit the crop itself would pay and then it would rush ahead in a way second only to sugar. Sugar is barely started yet, but when once a start is made it will go ahead by leaps and bounds.

Demand is another factor in the matter; for sugar and cotton, the demand is practically unlimited, as also it is but on a smaller scale for coconut products, for coffee it is very big but there is a limit, for gambier the demand is smaller, but the area of production also is small and is always decreasing, for Manila hemp the demand is bounded by very well defined limits, while for rattans there is no probability of ever our producing them in such quantity as would affect prices; while tapioca and sago stand on a somewhat different footing, when wheat rises as rise it must some day the demand for these two products is capable of indefinite expansion, that the price of wheat will be over 40s per quarter twenty-five years hence is pretty certain but how much sooner?

Considering all these points therefore I am inclined to think that gambier will be the first product to go ahead largely and to hold the lead in our export list for a few years, but then I think sugar will pick it up and pass it by with coffee and coconuts third or fourth.

If I made a bet now as to the values of exports 20 years hence I should back (but should want long odds) sugar to be first, gambier second copra third, coffee fourth, cotton fifth, tapioca sixth, Manila hemp seventh, rattans eighth and sago ninth, and for a long shot at the future I should expect to see sugar always an easy first, sago second, tapioca third, cotton fourth, coffee fifth, copra sixth, Manila-hemp seventh, gambier eighth, (owing to the land for it being mostly worked out and then probably planted with tapioca) and rattans last.

Cocoa, India-rubber, tobacco, oranges and pumeloes pepper, nutmegs, arrowroot, betelnuts and various other agricultural products are likely to be exported in more or less quantities from the country; but never I think tea, cinchona or cinnamon, (always avoid anything Ceylon can really produce). If the cultivation of rice or of Indian-corn is taken in hand in the course of years, these things will very likely become large exports, and there is no knowing what else may turn up but as far as I can judge my remarks bound present probabilities.

MYNAH.

—N. B. Herald.

CENTRAL AFRICA.

(From the British Central Africa Gazette.)

(Zomba, Aug 1st.)

Mr. Stotesbury, of the Survey Department of India, and a staff of Indian assistants have arrived in this country to undertake for the Government the systematic survey of the land in the protectorate. His work in addition to that of Messrs. T. H. Lloyd and Anderson would soon bring about the authoritative survey of all estates, and greatly facilitate the land settlement. Careful attention will be given to the mapping of native reserves.

Mr. Poulett Weatherly, the well known sportsman has written us an interesting letter from Momora, in the Ulungu country, south of Tanganyika, a portion of which we propose to publish in our next issue. Mr. Weatherly has started on a ten months' exploration through the Awemba country over a district quite unknown to Europeans.

Dr. Percy Rendall writes:—"During a visit I made to 'Woodlands' (a country house near Cape Town) I was interested to note a large herd of fallow deer that were being transferred to the Zoological collection in Mr. Rhodes' grounds. As far as I can ascertain fallow deer have never been acclimatised and bred in South Africa before. In addition to these, I saw Burchell's zebra and eland in captivity in the grounds of the High Commissioner."

 JAVA QUININE.

The Java quinine-factory scheme, after many troubles, is now approaching completion. A syndicate of four gentlemen have sent out a circular saying that they have been supplied with funds for the erection of a factory which they propose to "locate" near Bandoeng. The factory will not purchase bark outright, but charge a fixed price for manufacturing—viz., 11s 8d per kilo, for quantities between 400,000 and 600,000 kilos per annum; 10s 10d per kilo for quantities between 600,000 and 900,000 kilos; and 10s for still larger parcels, calculated upon an average of 4 per cent quinine. It is thought that the Government gardens will assist the factory by sending their bark to it for extraction. The co-operation of many of the largest private planters has also been secured. The factory will commence with an annual capacity of 600,000 kilos bark. It is thought that from 15,000 to 20,000 kilos of the quinine made can be sold in Java and the neighbouring Dutch colonies. The trouble, it seems to us, will be to prevent the prepared quinine from being "slaughtered" on the European markets in the same way as the bark is now, for no provision is made to keep the manufactured product in the control of a central sale-office. On the contrary, it is to be handed back to the planter who supplied the bark, and who will, therefore, be under the same temptation to sell with regard to quinine that has been his undoing in the matter of the mother substance.—*Chemist and Druggist.*

 INDIA AND CEYLON TEAS IN AMERICA :
 STATISTICS SHOW THAT THEIR SALE
 IS ON THE INCREASE.

Under the above heading the *New York Mail and Express* publishes the following:—

"Consumption of India and Ceylon tea in the United States and Canada is rapidly on the increase. In 1890 there was a total consumption of 2,100,000 pounds. In 1894 the figures were 5,200,000 pounds. These teas are pure and machine rolled.

"To one who has seen the Celestial at work rolling the tea leaves in his hands, the best recommendation that can be given to the India and Ceylon products is that they are machine rolled. Thus all foreign substances are kept out of the machine rolled India and Ceylon teas. They are also relatively cheaper than other brands. According to the sta-

tistics of the English Chancellor of the Exchequer, three pounds of them go as far as five pounds of Chinese or Japanese teas. They find a ready sale in the markets."

The same issue contains a clever and very much up-to-date advertisement of Ceylon and Indian teas. The "Valkyrie" and "Defender," the former flying a flag with "India" and the latter a flag with "Ceylon" imprinted on it are engaged in a neck and neck race while behind lay two junks "China" and "Japan." The letterpress in connection with the illustration says:—

"'Good Thing, Push it Along.'—The above diagram shows the types of the fastest yachts afloat, as well as of the old Chinese junks. There is as much difference between "Defender" and "Valkyrie" and the old-fashioned junk as there is between the delicate, well-flavoured, machine-made India and Ceylon teas and the hand-rolled and lead-colored Japanese and Chinese article. The comparison is striking, you say! Try the teas and be assured of the statement. Insist on your grocer supplying you with Ceylon and India teas. Three pounds of India and Ceylon tea go as far as five pounds of China and Japan teas."

The *Brooklyn Daily Eagle*, which gives prominence to the same advertisement has the following:—

"MACHINE VS. HAND MADE TEAS.—Tea drinkers in the United States have discovered that teas grown in Ceylon and India, being machine rolled and not subject to objectionable treatment by the hand, are more desirable than the Chinese and Japanese teas. Furthermore, no foreign substances are used in India and Ceylon teas for coloring the product. As to price, the English Chancellor of the Exchequer says that three pounds the former is equal to five pounds of the latter. The consumption of these British teas increased in 1890 from 2,100,000 pounds to 5,200,000 pounds in 1894."

The advertisement referred to and the figures quoted also appear in the *New York Daily News*.

The above was in type yesterday. Today's Kandy post brings us a packet from the Secretary of the Planters' Association giving cover to two letters (and sample advertisement cuttings) addressed to Mr. Wm. Mackenzie by Chicago and Toronto tea dealers; but the names are not given. The former has started "the Monsoon Tea" and has apparently been subsidised with a supply of circulars and 4,000 dollars, with which we are told a great work has been done in Chicago and the Western States in making known "the Monsoon" (pure Ceylon) tea. But they now want 10,000 dollars more from "both Associations" (? Ceylon and India—5,000 each) to work the East and South—including the Atlanta Exposition (which we had thought the Commissioner and Committee of Thirty had blown out of all consideration!). Here is perhaps the most important passage in the Chicago letter:—

"I do not know whether my plan of introducing Ceylon teas is the best or not, but what can be said of it is this: that two years ago scarcely a pound of Indian or Ceylon tea was used in Chicago or the West, and now every good grocer both here and over the Western country is offering it for sale, and repeat orders are coming in daily—amounting to about 400 half chests per month of 'Monsoon' alone."

Surely the writer does not mean that all the credit of the change is due to him or his plan? He calmly ignores the International Exhibition altogether!—The other letter is a much shorter one and is apparently from a Firm exhibiting in a Canadian Food Show and mentions that thousands of cups of tea are being served out daily. The diagrams, and the ad-

vertisements of the "Mousoon tea", are certainly very striking. The Commissioner himself sends no comment on the letters (or advertisements) and these being without names, how are we to know what weight is to be attached to them? Surely it would be more business-like for the Commissioner to give a fortnightly or monthly report on what is being done, summarizing the letters of agents. But we much fear that trouble will arise through the subsidising of a few favorite firms or individuals and the neglect of others? That is a matter, however, for the Commissioner and Committee of Thirty to decide. We can only rejoice in all the evidences of advertising on a big liberal scale, brought before us, because we feel sure that this is the way to make our teas known and to lead to an extension of the demand for Ceylon teas.

—♦—

FAILURE OF FIJI AS A TEA, &C.,
GROWER.
FAREWELL DINNER TO MR. A. J.
STEPHENS.
A GREAT DEAL ABOUT THE COLONY AND ITS
PROSPECTS.

TAVIUNI, August 31.

Without the sensible and true avouch of our own eyes and ears, we might not have believed a few month's ago that there was any foundation for the rumour that it had been decided to close the Alpha Tea Estate, although we knew full well that its capable manager had been bravely fighting the fates for some time past. Now, all too well know the truth, and Mr. Stephens' friends have gathered round and have right royally done honour to one who has so manfully done honour to himself and his avocation. Too well, we all know the disadvantages at which he was placed to make the Estate the success the product deserved, for a better quality of tea is not produced here nor in any other of the tea-growing countries of the world. It was hoped up till the last that Mr. Stephens would not find it necessary to leave Fiji, but those hopes have now become blighted and we, here, paid a last tribute to him we like so well by being present at Mr. Tarte's residence on Friday evening, invited by that gentleman to a dinner given in honour of the departing pioneer. Excepting our popular medico (Mr. F. S. Finucane), who was unavoidably absent, all the leading Vuna Point planters and residents, including Mr. Stuart Black of Selia Levu, Mr. J. Guillian Scott, of the Bank of New Zealand Estates Company, and Mr. H. Monckton, S.M., of Taviuni. After doing justice to their "inner man" off a table tastefully arranged with delicacies innumerable, even for our most pronounced epicures,

Mr. J. V. TARTE, the host, asked all to charge their glasses and drink the toast of the evening, "Our Guest, Mr. A. J. Stephens." He said:—It is with mingled feelings of pain and pleasure that I rise to propose the toast of the evening, "Our Guest, Mr. A. J. Stephens." With pain to think that we are so soon to lose from our midst a pushing energetic man, a kind neighbour and a sincere friend. (Much applause.) I remember some 17 or 18 years ago being on the Levuka Beach, when a tall dashing fellow hastily passed me, with a hat which for size and stylo I won't forget in a hurry, and on my asking who that was, I was informed, "O, that is one of those Ceylon fellows, who has come down here to show us how to grow coffee and tea." Gentlemen, notwithstanding the envious sneer, he has shown us how to grow both, for well I remember the glorious sight I witnessed when on an invitation from him and his partner, the late Hon. J. E. Mason, I visited Alpha and saw the glorious prospects that were before them by the appearance of their coffee plantation—prospects, however, which were never to be realised. That fearful scourge, the coffee leaf disease, breaking out, simply annihilated

the lot. However neither he nor his partner were the men to sit down quietly and suffer defeat. No, if coffee were a failure, they would try tea, and on that, gentlemen, I need not say much as you all know the success achieved in growing it and its quality. Alpha tea is a household word in Fiji and, were it not for the labour troubles and financial difficulties of the Company he represented of late, preventing him going into it on a large scale, it would have been as well known in the outside world as Ceylon tea is. Before sitting down I have one more pleasant duty to perform in presenting him with an address signed by all his fellow planters and residents on the island, and am sure he will appreciate it all the more when I tell him it was done by a fellow-planter as a labour of love, and for beauty and artistic design it could scarcely be excelled. Gentlemen, with your permission, I will now read and present it.

ADDRESS TO ARTHUR J. STEPHENS,
late of Alpha Estate.

"We, the undersigned residents of Taviuni, understanding that you are about to leave us owing to the closing of the Alpha Estate by its owners, wish to express our sincere regret at the event. The loss the community will sustain by your departure is one which will be long felt. As a man and a friend you have always proved yourself a gentleman in whom thorough reliance could be placed and who was always ready to assist others. As a planter your energy and outspoken method of meeting all opposition to the general welfare of the community has done much to advance the colony. We deeply regret that circumstances have prevented your meeting with the success you deserved as the pioneer of coffee and tea planters of Fiji. We wish you every success in your future sphere of action and trust you will live long to enjoy it." Here followed the signatures.

The toast having been drunk with musical honours,

Mr. STEPHENS replied saying that he was deeply moved by the kindness of the Taviuni residents generally. His friends at North End had already entertained him, but he was completely taken unawares by another dinner at Vuna, and with the address presented to him—a thing he never for a moment could have either expected or deserved. He said his planting efforts here had been a failure, but through no fault of his own. He had done everything in his power to make a success of Alpha. He had first of all, with the late hon. J. E. Mason (a better man than whom never lived), introduced the Arabian coffee, cinchona, eardamons, and the Assam hybrid tea, and these adapted themselves to the climate and promised well until the unprocurableness of suitable labour, together with recent hurricanes in Fiji, weighed too heavily. He was very, very sorry to have to give up the fight, but more sorry than he could say to leave so many good and generous-hearted friends behind. He thanked them all heartily for the kind way in which they had entertained him and trusted that, wherever he went, he would find as pleasant and agreeable neighbours as he had in Taviuni.

A song by Mr. W. J. EWINS, "Remember Me," with words written specially for the occasion and dedicated to the guest and sung to the air of "You'll Remember Me," in good style, was followed by that gentleman proposing the toast of "The Government." He said in spite of the many hard things that are said of Crown colonies, we have many things to be thankful for. For instance, Queensland Sugar planters have been having an unpleasant time owing to the working man's vote, which has interfered with the coloured labour so necessary in a tropical climate. Our labour laws in this colony give us many advantages in working coolies and Polynesians that other colonies do not possess, and we are thereby enabled to get a fair amount of work from the labour.

Mr. MONCKTON, S.M., in responding, said he was given too short notice to make the reply he could have wished, but was very pleased with the views of the proposer as just delivered and he tendered thanks.

The PLANTING INTERESTS were proposed by Mr. JAS. MCCONNELL:—We are here tonight to show our respect to Mr. Stephens. He has been for a number of years a Taviuni resident. I declare that he was always

eager to advance the interests of this island. We are all patriots, but the greatest patriots of us all has been Arthur J. Stephens. I never knew him to do any act or deed that was hostile or hurtful to the interests of this Province.

There are men who I know would sell
The truth to serve the hour,
And palter with eternal God for power.

When I was in Australia lately (and here in Fiji), I always embraced every opportunity of pointing out to people with capital and sons to settle that Fiji would be in time a great colony. I have been often grieved to hear the remarks made "that much capital had been wasted in Fiji. That a Government official, who now possesses the confidence of the Colonial Office, had at one time planted 40 acres of ramie on Taviuni and there was not then (or yet) any machine to clean or prepare it for the market." Then I have been reminded that "a large area of coconuts had been planted on the Nananas, the coconuts grew, but did not bear a remunerative crop." Because Taviuni would produce a good crop of nuts, it did not follow that Viti Levu would do so. Then we have been all reminded constantly about the capital wasted on the islands of Rambi and Mango, and at Deuba. To hear of these visionary schemes having failed and to be told (as you all have been) that Fiji was not a good country, has been to me always very painful to listen to. I have generally, in reply, said:—"Dear friend, do you not know that Fiji is a Crown Colony. You only want to send your son to Fiji. What if he blunders and waste your money; the fact of having failed and lost your money and not having been a successful colonist will secure for him recognition at the Colonial Office. He will probably be made a Governor. He will be certainly qualified for, and made a Crown Colony Legislator. The chances are that he will be made a K.C.M.G., and may blossom into a Duke." (Cheers.) Gentlemen, the present is the most awful crisis that ever Fiji saw. During the past few years, the Mortgage and Agency Company, the New Zealand Loan and Mercantile Agency Company, and the Union Bank have withdrawn their capital, indicating that something must be rotten and decidedly wrong about the way that the affairs of this colony are administered, directed or managed, when financial institutions of the highest standing refuse to help the colony to develop the agricultural resources of the country. These, according to the estimate of competent men, should produce an annual return of twenty millions sterling, and just examine the beggarly show of empty boxes, and we have no parliament and a Legislative Council that is not capable (or competent) of re-arranging Colonial affairs on a solid basis. Sir, the entire colony must deplore and lament the closing up of the Alpha Tea Estate; the labour troubles have had much to do with this movement. The fact is the Government and the Legislature about this question and other matters are not in sympathy with the colony; they are only in touch with the wants of the residents at Suva and Levuka. History is only repeating itself. Western Australia, New South Wales and Natal each was for many years in its infancy directed by the Government of a Crown Colony, with a nominee Council. While so nursed the growth of each, like Fiji, was stunted and dwarfed. The first thing that the Representative Legislative Assembly of Western Australia did was to pass a law to give 1,000,000 acres of the waste lands to a syndicate to run a line of railway 300 miles into the interior, and open up the country for settlement. The policy was very beneficial and effectual; in less than six years the population has been doubled and within the last two years the revenue has risen from £400,000 to over £1,200,000. Fiji has been a Crown Colony for 20 years. I suppose, like Western Australia, the Colonial office will continue to spoon-feed and keep us in leading strings for another 20 years, unless by accident a Governor Weld or Sir Charles Mitchell be sent here, who will, do justice to the colony and explain to Downing Street that the attempt to guide the infant steps of the colony by a Nominee Council have been unfortunate and disastrous.

You all know the history of the Roman Emperor who fiddled while his city of Rome was burning. The history of Fiji shows that the Government and the Council have been very much like that Emperor. They have quietly sat (either through apathy or prejudice) and watched the tea and fruit industries being wiped out. The hill land of Taviuni is the best tea land in the world; Mr. Stephens has proved it beyond a question of doubt. The cost of labour prevents the industry being worked at a profit. The Alpha Tea Estate is closed up and abandoned; other estates for the growth of tea will not be started. The Government "native tax experiment" is responsible for the high cost of labour and its limited supply.

The fruit industry was extinguished long ago on the two most valuable islands of the group, covering half the lands of Fiji, Taviuni, and Vanua Levu. The fruit industry to be successful in Fiji should have been fostered and promoted on these two islands, the volcanic soil of which is pre-eminently well adapted for its growth. But not so; the clay subsoil along the coast of Viti Levu, the retentive nature of which holds the rainfall and causes the land to be what the farmers call sour; this generates disease in plants, the pines shipped from Suva are a miserable article, the land there will only produce one crop of bananas and they are a diseased abortion. The value of fruit for a few years after 1882 was over £10,000 shipped from Vanua Levu via Levuka. During 1893 only £281 worth; and last year there was to the value of £241 only. The centralizing policy at a distant place like Levuka on a barren islet has undoubtedly arrested the progress of Fiji. The future greatness of the colony depends upon the development and the cultivation of the soil of Taviuni and Vanua Levu.

It was during the time that Sir Charles Mitchell was here that I last brought the question of the shipping arrangements under notice of the Government. Sir Charles, having had West Indian experience, understood the question that the interests of an important island like Taviuni were not identical with that of another island at a distance of 100 miles away, and that to tranship the imports and exports of Taviuni at Levuka, Kadavu, or Norfolk Island, was not to be justified. * * *

Mr. W. J. Ewins, being called upon to respond for the Planting Interests, said Mr. McConnell had said that Viti Levu lands had no chance against such as those we possessed, but apparently the fruit and cane growers there were not of his opinion; for they were by no means beaten yet, in spite of diseases in bananas and cane, as is being evidenced by the large areas the planters were still opening up. (Applause). Speaking as a sugar-planter he felt certain, in spite of the deplorable fall in the prices of sugar, that, incredible though it may seem, by judicious economy, careful and skilful management, we could still make a profit and felt by no means. With regard to tea and coffee, it was sad to think that many who had tried these industries had not met with better success. The high cost and difficulty of procuring local labor mainly contributed to such failures. It was a pity that the Fijian was not more easily and cheaply available for such work. He spoke a short time back for the Government, but now spoke as a planter and he must say that he thought it a pity that a system of native taxation, which was based on the Dutch policy in the Malayan Archipelago, should be continued in a British colony where a similar mode to that of the Dutch is impracticable.

Hon. J. M. BORRON proposing the Commercial Interest.

Mr. J. McCONNELL, responding for the Commercial Interests * * * You know that up to the present the mineral resources of the islands are an unknown quantity. They may be of great value for aught that man can tell. We have no mining class in Fiji to provide for. No manufactory of any importance has yet been started, unless you can call the Suva Desiccated Coconut Co. one. Its success is very doubtful. Manufactories might be established, and when these are attempted it will be a good thing for Fiji, if care will be taken in selecting competent

Directors. A failure of any enterprise through want of prudence in that direction would do harm to Fiji. The wealth of Fiji is at present derived from the fruits of the soil; therefore the success of a commercial man in Fiji depends upon the prosperity of the planters and the progress that may be made in bringing under cultivation the waste lands of the colony. These waste lands amount to over 4,500,000 acres and there are only 39,000 acres under cultivation. Be assured that the Vuna Chamber of Commerce whether it had one or fifty members, will endeavour to secure for the planters of these two islands direct steam communication with the colonies, to enable the planters to grow and export fruit and save the planter double freight, and the intermediate charges now imposed by the middle man for transshipping.

PERAK MILLING AND TRADING COMPANY, LIMITED.

The prospectus of the Perak Milling and Trading Company, Limited which has a capital of \$12,000 has been forwarded to us:—

The Company is being formed for the purpose of purchasing from Messrs. Tait, Tate and Company of Perak, Engineering Contractors, the following properties:—1,300 acres of *padi* land in the District of Krian in the Protected Native State of Perak in the Malay Peninsula, and of three other pieces of land respectively situated in Tanjong Piandong, Kurau and Bagan Serai in the aforesaid District, and of purchasing *padi* from the Native producers thereof and milling the same. The cultivation of *padi* in the State of Perak has of late years been rapidly increasing, and the Government recognising the importance of the industry has recently started a new Irrigation Scheme for the District of Krian by means of which it is confidently expected that the production of *padi* in the next four or five years will be more than doubled. At present the cultivation of *padi* is exclusively carried on by natives. They produce annually about 6,000,000 gantangs of *padi* (a gantang being equivalent to a gallon in English measure) 4,000,000 of which are exported as *padi*, and 1,500,000 as rice which has been simply treated by hand mills.

The first mentioned property is held by Messrs. Tait, Tate and Company, under a Lease for 999 years from the Sultan of Perak. 100 acres of land have been planted with *padi* and another 100 acres will be cleared before the end of the year.

The Vendors are to receive \$35,000 in cash for the cost of the erection of the Mills and for the expenses incurred in opening up and cultivating the land till the end of the current year, and ten fully paid-up shares. It is proposed that the Company should open up 250 acres of land annually, thus bringing the whole estate into cultivation in five years. It is hoped that two crops a year may be produced as is the case in Ceylon.

In regard to the planting of 13,000 acres of paddy, the estimated profit per year for the first five years is \$5,000 and the estimated profit yearly after the fifth year \$16,000. The total expenditure for milling is stated at \$178,000 and the total receipts \$208,000 showing an estimated yearly profit of \$30,000 which with the average profit on the estate for the first five years shows a total profit of \$35,000.

CAMPHOR IN JOHORE.

Datu Meldrum reports:—

Scarcely such a thing as Kapur Barus—*Dryobalanops Camphora* is to be found in the territory of Johore now. To obtain it involves the destruction of the tree and before a tree reaches maturity more than a generation must elapse. The price of Barus Camphor used to be twenty times higher than Japan or Formosan manufactured Camphor, *Camphora Larus*. No attempt to plant it has been made in Johore.

THE MANUFACTURE OF INDIAN CIGARS.

A PROFITABLE UNDERTAKING.

We are (says the *Madras Mail*) glad to see that the manufacture of cigars in this country under European management gives every promise of developing into a large and profitable industry. The first annual general meeting of Messrs. G. Mengel & Co., Limited, was held at Dindigul on the 28th instant, when the balance sheet was presented which showed on the ten months' working a net profit of 12½ per cent. This is very satisfactory. There is no reason that we can see why all the cheaper brands of cigars smoked in Europe and Australia should not in course of time be obtained from Southern India. Public balance-sheets, such as Messrs. Mengel & Co.'s, conclusively show that there is money in the business, and we know that enterprise is not lacking. During the first half of this year 109,292 lb. of tobacco—nearly the whole of which was in the form of cheroots—were shipped from this port as against 77,006 lb. for the same period in 1894.

LETTERS FROM JAMAICA : BY AN OLD CEYLON PLANTER.

Blue Mountains, July 31st 1895.

ORANGE CULTIVATION.

You appear to have in a gentle way, been "hauling me over the coals", in that I have not, as your Jamaica correspondent, given you more information as to the wonderful expansion of the Orange Trade and Cultivation on the North side of the Island. I was under the impression that in my first letter from Jamaica, I had dealt fully on that subject, and stated that "Pen" keeping, and "Banana" cultivation were the most paying investments in the Island. The growth of the orange trade has certainly been very remarkable. In 1884 the total value of fruit exports was £253,019; in 1889 it was £320,323 and in 1893-94 it had risen to £527,871. Last winter there was a terrible cold wave in Florida, and it damaged not only the crop, but the trees very severely, and those of our orange growers who had oranges left made a lot of money by shipping them, and for another year or two, until the Florida trees pick up again, there ought to be good times for our orange growers. But in Jamaica we have no orange groves proper, and the attempt to grow them on that principle does not seem to have been successful. Perhaps we want some Florida planters to come and teach us grafting and other "dodges." The best Jamaica oranges seem to be those sown broadcast by the birds, these usually come up sweet oranges, but I am told that if you plant seed most of it comes up Seville orange, so that

GRAFTING IS NEEDED

to turn it out a profitable tree. I hear one or two grafters have lately been imported, so we may do better in the future—"Experientia does it." The best oranges grow at an elevation of 2,000 to 3,000 feet above the sea—Manchester is famous for them, but they grow well all over Jamaica, and if they were picked at the proper time, and sized, and shipped carefully as Mediterranean, and St. Michael's fruit is shipped, they would certainly "take the cake" in the American markets, and there is no reason why they should not do the same in London and Liverpool. I have shipped a few boxes myself on trial to London, early in the season with most satisfactory results,

AS TO BANANAS

(or plantains, as we called them in Ceylon) the edict has gone forth that the trade as regards Jamaica has passed its zenith and that competition from the Central American countries, and such places as Honduras, and Boca del Toro, Cuba, may even Colon will soon run the Jamaica exporter very hard, the more especially unless he improves the quality of his shipments, and makes them arrive at market in the "fittest condition."

OUR SETTLERS HAVE BEEN SO CARELESS

in the preparation of their products for shipment, be it Coffee, Cocoa, Bananas, Oranges, Pimento, etc. that except for mountain-grown and prepared Coffee, Jamaica obtains much lower prices for its products than would be the case, were they shipped in good order. I have seen it suggested in the papers that a law should be passed that would cause all produce to be inspected by Government officials before shipment; and that all bad and doubtful packages should be rejected and not allowed to be put on board ship. It would be a somewhat drastic measure, but it would be one to make "Quashie" sit up, and see his sins "of negligences and ignorancies." No fault can be found I believe as regards

RUM AND SUGAR,

except that if more modern machinery were universally adopted, better results would be obtained. The usine system is once more being urged upon our Sugar Proprietors, as a means of fighting Beetroot Sugar which under the subsidized system, the Cane Sugar Planter is not able to overcome. Something must ere long be done to enable our Sugar Planters all over the British Dominions to fight beet sugar and to hold their own, and it will be a most suicidal act on the part of Great Britain, if she allows her Colonies to be ruined, for the mere principle or "fad" of Free Trade. Trade to my mind is no longer *free* unless it is reciprocal, even Cobden himself were he alive would admit the present state of things is not just or equitable; and that when he started

FREE TRADE,

he believed other nations would follow England's example, and that trade would universally become *fair* trade, and not all one-sided as it is now, to the serious loss and next door to ruin of our English Farmers and Manufacturers, and our Colonial Planters and Agriculturists and Stock growers all over the Kingdom. How Ministers, whether Unionist, or Liberal, do not see the unfairness of letting subsidized articles like beet root sugar come in freely, with non-subsidized sugar, has been a puzzle to me, and proves that politics are not honest and straightforward, but simply pandering for popularity to the mob, and the rag-tag and bobtail of the constituencies. Could I become ruler of Great Britain's policy, I would have free trade with our Colonies, getting them to

PROTECT ALL BRITISH PRODUCTS

by a favourable tariff, as against foreigners. I would also only have free trade with such nations as placed no duties on British productions, and I believe if this were done, the revenue would very much increase, and the money could be devoted to the better payment of our sailors and soldiers, and to the payment of pensions to people too old to work who have lived an honest and hardworking life. This would be making really good use of the money.* We are shortly to have

* In Ceylon we have had for three years "protection" of the local rice growers, and yet our imports of rice go on increasing!—*Ed. T.A.*

A GENERAL ELECTION,

as we are to have a Member of Council for each Parish in the island, and a very sensible law has been passed to the effect that such member must be a resident in, or be a proprietor in the parish. This will keep out lawyers of whom there are already too many in the Council; and also should prevent all demagogues, and those who wish to set the black man against the white, from airing their Radical and disloyal opinions in the Council.

W. S.

P. S.—I believe you still get the *Gleaner*—I see in its columns that there is a likelihood, of Jamaica supplanting Florida and that Americans are likely to come here to start orange groves.

OLD FARMERS AND MODERN AGRICULTURE.

Prof. Wiles of the Department of Agriculture, Washington, in an address on "the chemists, the farmer and the people," drew the following amusing picture in verse of the old-fashioned farmer, moralizing over modern agricultural science:—

And the fellers from the Colloge of Agriculture, they

Wuz thick az lightning bugs in June, and had a heap to say.

There wuz one they called a chemist, and he kind a seemed to know

All that wuz in the air above and in the ground below.

He sed we needed nitergin, and showed us how the stuff

Wuz awful high and skeecree for erops, while in the air enuff

Wuz found to make us 'tarnal rich if we could only git

Some cheap and sartin projeck of hitchin' on to it.

He sed that poas and clover and other erops like them

Wuz jist the stuff to do it and store it in the stem,

And the yeerth is full of critters that eat this stuff, you see,

And change it in a twinkle into ammoniee.

Since I come back from the institoot, it really appears

That potash, nitrate, fosferas, wuz ringing in my ears.

And, William, it seems perty tuff that you and Jim and me

Hev went along so ign'rant of what we daily see.

Jist hauled manure out on the pints and plowed and hoed and mowed

And worked so hard for little pay, and never, never knowed

Thet clover, peas, and beans, and sich oz the chimist mentioned there

Hev the highly useful knaek of suckin niter from the air.

INDIAN TEA SALES.

(From *William Moran & Co.'s Market Report.*)

CALCUTTA, Sept. 17th, 1895.

TEA.—The market during the last fortnight has been strong, and of the 41,000 chests brought to auction, practically all were sold. Prices have ruled very firm for all descriptions, while common grades, especially leafy sorts, show a rise of from $\frac{1}{4}$ to $\frac{1}{2}$ an anna per pound.

Quality generally has been better, the most marked improvement being on teas from Assam, Dooars and Sylhet. This week's sale, being the last before the holidays, will be large, probably 33,000 chests. The following sale will be held on the 2nd October.

TEA IN CEYLON AND S. INDIA.

The *Madras Mail* of October 4th, commenting on the figures given by the *Observer* of probable future extensions of tea in Ceylon, offers some remarks of interest to local planters. Admitting that there are 60,000 acres which may be put under tea in Ceylon during the next five or six years, it asks:—

"When these 60,000 acres are in bearing, what, in all probability, will be the extent of land under tea in Ceylon? Will it be the present acreage (*i.e.*, 379,182 acres) plus 60,000? We venture to assert that it will be nothing like this. Admitting that these 60,000 acres are in every way suited for tea, and are, as predicted, brought under cultivation, then, if we can attach any credence to reports which have reached us they will not do very much more than replace the acres of poor soil and miserable land opened up in recent years, which will never give an adequate return, and which will naturally fall out of cultivation little by little year by year. The fact of the matter is that tea cultivation is being overdone in Ceylon, and, we hold, foolishly so, seeing what good land is available in Southern India. Travancore is fairly well-known in the island and Ceylon planters have given their attention to it; but a district which is but little known, and which is most admirably suited for tea, is the Wynaad. This district is divided into North, South, and South-East Wynaad. It is in the South and particular parts of the South-East where, in course of time, tea will be largely cultivated. That the plant will give splendid results there is evidence to prove. The soil in this district is most fertile; the land is either forest, bamboo or old coffee that has lain fallow under scrub for a decade; the climate is very suitable; and the communications are on the whole good. Owing to the gold mines, which were at work there fifteen years ago, roads have been traced all over the district, and in many places there are deserted bungalows and the foundations of old storehouses, mills, &c. Companies in Ceylon and individual planters would do well to prospect Wynaad before putting poor land under tea. So long as the present policy of pushing the product in new markets is pursued, we do not believe that the Indian and Ceylon tea-planter, with cheap labour and the best of machinery, need have any particular dread of over-production; the world still wants 200 million lb. of tea annually more than British plantations can produce. But, should over-production ever take place, or should, for other reasons, there be a fall in prices, it will then be a survival of the fittest, and the Company or the planter who has put every rubbish-heap under cultivation simply because it happens to be near his door, and who has deliberately ignored good soil, yielding 1,000 lb. and more of tea *per acre*, owing to its being at a little distance, will bitterly see his short-sighted policy. Wynaad, in a small way, has as great a future as a tea-producing country before it as either Ceylon or Travancore, and no one, we believe, would be more ready to accept this than any Ceylon tea-planter who might happen to visit that district.—Local "Times."

DRUG REPORT.

(From *Chemist and Druggist*.)

London, Sept. 19th.

ANNATTO-SEED—In good demand at rather firmer rates, 25 packages fair Madras realising from 3½d to 4d per oz.

CAFFEINE—The spot price in second-hand is 21s 6d to 22s per lb., but very little is available. Whiffen's brand for October delivery offers at 20s, Howard's for December at 18s per lb.

GAMBOGE—There has been an active demand for fine qualities of gamboge, mostly for America, and an advance of 10s has been established, good picked having realised 10l 15s per cwt. At today's auctions no demand was manifested. For Saigon and Singapore mixed, small to medium prices, partly dull ricey fracture, 9l 10s per cwt is the limit. For fair pipe and lump a bid of 8l 15s per cwt was refused.

ESSENTIAL OILS—Cinnamon-leaf oil is again dearer; 2½d per oz has been paid and 3d per oz is asked. Cinnamon-bark oil is also tending higher, a good deal of the supply

having been bought up. For a lot in sale today 1s per oz was asked. The Lemon crop outlook is said to be very unsatisfactory. Oil guaranteed to contain 7.7 25 per cent of citral offers at 3s 9d to 4s per lb., c i f prompt shipment. Citronella firm; small parcels have sold at 1s 3d per lb. For arrival there are sellers at 1s 1d per lb., c i f.

QUININE—A somewhat better tone prevails, and 20,000 oz of second-hand German bulk have changed hands at the slightly improved price of 13½d per oz on the spot. The following are the present manufacturers' quotations:—Howard's vials 1s 4d to 1s 5d; tins 1s 3d to 1s 4d. Whiffen's vials 1s 4d; tins 1s 2d. Pelletier vials 1s 5d. Fabrica Lombardi vials 1s 4d, tins 1s 2d; German tins 1s 2d per oz. In America the consuming demand for quinine is described as excellent. All the current orders go directly to the manufacturers, dealers having generally advanced their views to 25s, although jobbing orders might possibly be filled at 21½c in small lots. A parcel of 20,000 oz has just been shipped from New York to London by the "Europe."

VANILLA—A moderate supply, mostly of good quality, sold at very high prices.

FRUIT IN UVA.

(From a Correspondent.)

Re fruit culture, for which our district is remarkable and I should say the *best climate in the Island*, I am sending you by goods train a tea basket full of lemons, citrons and bitter oranges, (Seville oranges I think I have heard them called). The two latter citrons and bitter oranges grow like weeds, everywhere along the banks of streams and are gathered, and used by the natives in their diet, curries, &c. The lemons, I have grown from imparted seeds. The fruit I send you are by no means a good sample, as my soil is very poor and the cultivation spontaneous, without any manure. Besides these I have growing apples, pears, plums and peaches, all bearing fair crops on poor patana soil without manure. The local fruit trees, I also grow, and side by side, I can show you loquats, China and native guavas, mandarin and sweet oranges of varieties, mangoes, jacks, and plantains of varieties, limes, passion fruit, granadillas, grape vines, pine apples of varieties, in fact almost any indigenous fruit can be grown here, and if your Mildura friends want to live and enjoy life by fruit culture let them come to our glorious Uva climate in preference to any other place in the island or lowcountry, with its heat and malaria!

[We are obliged for the abundant sample of fruit: enough of acidity to sour even "Mark Tapley"; but Uva can produce sweet things too.—ED. C.O.]

COFFEE PLANTING BY JAVANESE.

Three lots of coffee land at Seluma, Perak, amounting in all to forty acres, have been applied for by Javanese. The headman has gone to Kluang to buy seed and returning via Penang, will bring in about a hundred followers; he has had experience in coffee planting at Klang in Selangor. If these men settle permanently, and succeed, others will soon follow; the opening up of the new ridge-path from Alor Pongsu in Krian to the Ijok river ought to help the development of this District considerably and will open up a considerable area of bending land for settlement.—*Pinnang Gazette*.

ORCHID COLLECTING IN NORTH BORNEO.

The British North Borneo authorities will issue no more orchid collecting permits for the present for Province Keppel or Kinabalu. Any person travelling or collecting orchids without a permit is liable to a fine of \$500.—*S. F. Press*.

THE LOWER PULNEYS PLANTERS' ASSOCIATION.

The following is from the Annual Report of this Association:—

Labour and Crops.—Our Labour supply is good and being chiefly local we are able to avoid the heavy outstanding advances current in many planting districts. The crops last year were good and this year, in spite of the unfortunate rains we had about the time of the opening of the blossom, and the scanty rain since, will, so far as can be judged now, be fair, though not as good as last year.—*M. Mail.*

CYPRUS: ITS PRESENT AND FUTURE.

(From the *Westminster Budget*, Aug. 23.)

A TALK WITH ITS HIGH COMMISSIONER.

As Sir Walter Sendall, K.C.M.G., High Commissioner of Cyprus, had recently arrived in London, it occurred to us that he might be willing to give some information about the one British trophy of 1878. The island has so often, lately, been described as a white elephant that information about it from one, who could speak with authority, seemed likely to be generally interesting. The High Commissioner replied very courteously to the suggestion, and so a representative of the *Westminster Budget* found himself a day or two ago in pleasant tête-à-tête with Sir Walter Sendall not very far from Hyde Park Corner. Sir Walter at once remarked on the contrast between the climate of Cyprus and England, which he felt very much, as he happened to arrive in London just after the long drought came to an end.

CYPRUS AS A HEALTH RESORT.

"And is Cyprus fairly healthy?" I asked.

"It's an extremely healthy place," said Sir Walter. "It got a bad name when we occupied it first; but for a long time it has been the healthiest station for troops on the foreign roster. There's no doubt, if we had better roads, it would be much resorted to. The few people, who have come over from Egypt, say that the change from Cairo and Alexandria is exceedingly agreeable. They come over in the summer-time, of course."

As Sir Walter has held the Governship of the Windward Isles and of Barbados, the following question naturally suggested itself to me:—"Is the climate at all like that of the West Indies?"

"It is during the hot months. Then it is like that of the tropical West Indies. But then we are, of course, north of the Tropics, and we have a really cold winter; fires all over the house, in every room."

"And the island is otherwise attractive?"

"The scenery in the mountainous part of the island is extremely beautiful. Unfortunately, the least inviting portion of the island is the part which first catches the eye of the visitor, and that is Larnaca and the road from Larnaca to Nicosia—a flat uninteresting country. The proper name of Nicosia is Lefkosia, from the white minarets of the Turkish mosques. The place itself is picturesque enough, and I reside there during the greater part of the year; but in the summer the Government moves to Troödos on the Olympus range, where the troops are stationed.

CYPRUS AS A SEAT OF WEALTH.

"In the olden time," said I, "Cyprus was wonderfully prosperous, was it not?"

"It was not only rich," said Sir Walter, "but a seat of commerce, and abounded in wealth of every description."

"And how is it that the British occupation has, so far, failed to benefit the island?"

"Well," said Sir Walter Sendall, "the main thing, of course, is want of money to develop the resources. Then, you see, it has been for 400 years under the Turks, steadily wiped out, and prevented from every kind of progress."

"The root of the whole matter is this," continued the High Commissioner, "that so large a proportion of the money raised by taxation leaves the island to make up the payment, which England is under an obligation to make to the Porte under the Convention, that it leaves the Government with the bare expenses of administration, without any surplus, which would enable them to embark upon any expenditure for improving the productiveness of the island. Cyprus is an improvable estate, but the Government have no money to spend on improvements."

AGRICULTURE 2,000 YEARS BEHIND THE TIMES.

"And as the Cypriotes are poor they must plod along as best they can?"

"Their methods of agriculture," went on the High Commissioner, "are of the most primitive description."

Here Sir Walter took down from the mantelshelf a tiny model of a Cyprus plough. "There," said he "that's what they use today. It's just what Virgil describes. They haven't changed their implements of agriculture for 2,000 years. You see, it can only scratch the ground. Here again is a model of their threshing implements. Of course, with such materials, the grain must have a lot of dirt mixed up with it. As for the threshing-floors, they are precisely what they were in Palestine in the days of Araunah the Jebusite. Every village has one or more of these."

Sir Walter Sendall declined to discuss the value of Cyprus as a place of arms, though he had no doubt whatever of its great usefulness as a sanatorium. He also considered the phrase "enchanted island" as somewhat overstrained, except as coming from a person who saw the Orient here for the first time.

TEA IN CEYLON AND SOUTHERN INDIA.—The *Madras Mail* in discussing our Planting Statistics for Ceylon has taken the opportunity to dilate on the great advantages presented by the Wynaad districts for intending tea planters. We have not a word to say against these advantages; but our contemporary goes too far in speaking at large of "acres of poor soil and miserable land" opened with tea in Ceylon. We have often said how India tea visitors so far back as 1885, declared after visiting our tea gardens that half-a-dozen years would see many of them snuffed out; but somehow these same gardens are now more prosperous than ever they were. Our contemporary makes a mistake over our statistics—not 379,000 acres are in tea, but 305,000 on plantations (the balance being coffee, cacao, &c.) besides, perhaps 5,000 in native gardens not enumerated—making 310,000 acres altogether under tea in Ceylon today. When 60,000 acres are added, before the close of the century, we shall have 370,000 acres and we see no reason why all this area should not be in full and prosperous cultivation by A. D. 1900.

COCONUT PALM ON FIRE.

Mr. Jardine writes:—"I never saw a coconut tree set on fire by lightning or meteorite, though I have seen hundreds killed by lightning."

Mr. W. H. Wright, writes:—

"I saw a tree some eight years ago take fire from a sky-rocket. The tree is situated at Colombo in Regent Street, the property belonging to Mr. W. Vanderstraaten, proctor. I may say that after a few months I saw the same tree giving a very large crop of nuts. I have taken this as a lesson; occasionally since, when I have found a tree not giving crop I set fire to it, so improving the tree and forcing it into crop.—Some time ago I witnessed a coconut tree taking fire from a flash of lightning and just before the rain came down; but I never saw any tree in a blaze during the rain, I suppose owing to the trees being wet and so the fire cannot ignite."

CLYDE TEA ESTATE CO., LD.

Incorporation of this Company with a capital of R300,000 divided into 3,000 shares of R100 each has been applied for by Messrs. Julius & Creasy. As has been reported the Company has purchased Clyde, Kaluganga and Liskillin estates in the Kalutara district.

MORE TEA COMPANIES.

The shares in the Ruanwella Tea Estate Company which is to have a capital of R260,000 have been privately subscribed more than twice over. Ruanwella belonged to Mrs. C. B. Deane, J. B. Lindsay and T. N. Christie, but has been sold by them to the promoters of the Company. There are 358 acres in tea out of a total of 576 acres.

We also learn that the Ederapolla and Ardross Estates, in the Kelani Valley, are being formed into a Company, with sterling capital. Messrs. Lyall Anderson Company, 16, Philpot Lane are to be Secretaries and Agents. The estates are to be taken over on 1st January. The vendors take a large proportion of the shares, and the balance was taken up at once, privately. Ardross belonged to Mr. Macmartin and has 212 acres in tea out of 294. Ederapolla belonged to Messrs. Jas. Bett and A. Watt with 395 acres tea out of 526 acres.

PROSPECTING IN CEYLON.

(By an Old Ceylon Planter.)

Three decades and more have passed away, since first I went "Prospecting" in the Central Province of Ceylon. For many years, as far as I remember, Government had not advertized in the *Gazette* any extensive forest lands for sale, suitable for the cultivation of the fragrant berry; but towards the end of the fifties, rather large blocks of land of virgin forest were advertized for sale in the Lagalla district, and I determined to have a look at them, with a view to purchase; true it was that evil reports had been circulated about Kandy to the effect that the whole of the Lagalla district was more or less exposed to violent and continuous gales at certain times of the year.

A JOURNEY BY COACH.

But "seeing is believing," and so a friend and I one fine breezy morning took our seats in the old coach, that trundled into Matale in those days daily at the rate of four miles to the hour. Two fat Tambys sat their shaky and unctuous figures in the coach, and looked as if they had been fed on ghee and olive oil all their days. Nevertheless they were mortals, and Moors seemed to enjoy the journey greatly, chatting in Tamil with each other and offering one another short cigars, which are generally called "Jaffnas" in Ceylon, and are found only in the native bazaars for sale.

The journey from Kandy to Matale town was a pleasant one, and in places the high road was shaded by over-hanging boughs, beaded with pearly tears soon to be dissolved by the growing morning. Before leaving Kandy town we had elected to leave our horses under the care of Jacob of ancient renown, as we did not wish to risk them in unkuown and unroaded regions.

THE MATALE RESTHOUSE

was the spot where the coach pulled up. The hotel had a most uninviting appearance for travellers—shabby without and dingy within. The landlord, a tall, rickety-looking man, graciously informed us that breakfast was on the table, and waiting for us, visions of the inevitable estew, rose up before me,—often concocted as it was then of aged buffalo beef, swimming in a mass of half-frozen or half-melted fat of an inferior quality. It was soon off the table, and our landlord informed us that it was made from elk flesh,—but certainly it had the feel to the palate of stewed sponge! Then we had curry and rice; but alas! the *kokie* had purloined the "cream of the coconut," and left us only the saffron and aromatics. It was as harsh as a rasp and indigestible as a cucumber. Having duly blessed the *kokie*, landlord and resthouse, we mounted the sorry steeds that were waiting for us outside the front gate and left the spot. You can easily believe that

RESTHOUSE QUADRUPEDS

are not high-flyers as a rule, but the gallant grey and vicious-looking tat pony, with a coat as rough as a file and as red as rust, that waited for us were the veriest bags of bones I have ever seen offered to two fat coffee planters to ride on. The grey animal seemed as if his bony body was lifted up on stilts and Bob the tat, had a mouth so hard, that nothing but an Indian bit with points all around could hold him in when he chose to have a spree! There was no use complaining, and so I mounted upon the top of the grey, and my cheerful companion strode the Indian tat. As we thumped along the ill-paved streets of Matale town, I thought of King Richard and little John, as portrayed in my school history book long ago. And then fugitive ideas crowded my brain and I wondered if the jackals would have a meal off our fleshless nags in the Lagalla jungles. Bah! it was too ridiculous altogether. At last we passed over the new iron bridge and then hobbled into the

HAMLET OF RATOTA.

By the time we topped the East Matale coffee estates there was an aggravating sun overhead, and anon G.W.'s

FAVOURITE COFFEE ESTATES

were all before us. What a surprise they were, with the primaries of the coffee trees pruned so severely that in my native country they would have been called by the factory lads, switches. "Famous estates indeed," said my genial friend; "Why, I would not exchange my little totum for one of these hungry-looking places, and I have a shrewd guess that G.W. will bury many a British sovereign in them before he has done with them." At last we managed with difficulty to reach the last estate of the district from which we could discern the

LAGALLA RANGE OF HILLS

in the distance, and made for the bungalow of the planter that was known to have two good tats, which we hoped he would let us have for the nonce. "Come in," he said, "and take pot luck. I see you have jaded brutes under you. Come in and wet your whistles. Where are you going to?" "Oh! to the jungle lots that are for sale shortly in Lagalla?" "Well, they are over yon range of hills some half dozen miles away, but with my galloways you can mount the crest of the hills before the sun goes down and reach the only shanty in the district, where you will find an old blue-jacket, and he will only be too glad to give you lodgings for the night. Then early in the morn you start for your diggings, and I will have the ponies sent for you by breakfast time." As we reached the road over the top of the hills and returned the ponies, we entered into dense forest and following a jungle path tried to find out the new clearing where the jolly sailor lived.

COLOMBO TEA SALES: DEMAND FOR AUSTRALIA AND AMERICA.

(From a City man,)

London, Oct. 4.

The Planters are getting fine prices for their teas in Colombo; for some time they have been about 1d. per lb. ahead of prices here. I am glad to see the sales in Colombo increasing so rapidly; by last mail, I noticed, that about 18 million lb. had been offered at public auction from 1st January to 12th September, or more than 1-4th of the total export. In the best of the coffee days, local sales never exceeded 1-10th of the export. It is gratifying to note the rapidly increasing exports to Australia &c., it relieves the London market and does good all round. I hear the Americans strongly favor direct imports from Ceylon.

In London, prices have again advanced and a steady advance till high Xmas seems likely.

THE LABOUR QUESTION IN CEYLON.

We direct attention to a special paper printed on "The Labour Question" in pamphlet form and which the writer has given us permission to reproduce in full. Though his name cannot be given at present, we may say that the planter responsible for the views now put forth is one who travels about a great deal and has special opportunities of judging of the condition of affairs and of the remedies so far applied. In his opinion, the proposal of the Dikoya Planters' Association to ask Government to give planters a first claim on coolies' pay for advances "requires a deal of trimming." But to turn to the paper itself, the writer is greatly impressed with the helpless condition of the average cooly as regards the burden of debt he staggers under—debt which he has often incurred himself, which has been thrust upon him, and which he has more often than not inherited. It is the heaped-up responsibilities of the cooly by this last-named iniquitous process which chiefly troubles our author, and which doubtless has troubled many conscientious planters before him. For, undoubtedly it is a circumstance that has been well known to, and understood by old planters; and the file of the *Observer* in olden days teems with suggested remedies, chief of which there has lately come into favour the only remedy insisted upon by this writer, namely, *monthly payments of wages to coolies*. In order that this rule should become universal we would have it made compulsory by law. The practice of imposing debts by inheritance is bad, and should be stopped on principle; but, perhaps, somewhat too much is made of this in the pamphlet. The chief end of most coolies has been and always is the same: somehow or other to get overhead in debt, however contracted.

In insisting upon his two points the writer uses arguments and illustrations which are forcible and true, and against which very little can be said. To break the power of the Chetty and kangani over the cooly has been the theme of many planting pens, and in some few instances there are planters who have had the courage of their convictions to brave all opposition, and to carry their theory of monthly settlements into practice. Pertinently enough the writer of this brochure speaks of the experience of "a friend of his" who has "paid his coolies every month for many years past, and has abundantly proved the blessings of this system." On the other hand we published not long ago, one or two letters from old Managers with the

deepest possible interest in their coolies, pointing out practical objections to monthly payment of coolies. One of these, a letter from Udapussilawa, excited a good deal of attention at the time. And if this question of "*cooly indebtedness and monthly settlements*" is to be threshed out, it should be done after the manner of those other planting questions, treating in detail and the discussions collected in a concise shape—together forming a little reference library—published by the *Ceylon Observer*. Let leading planters all give their opinions and experiences, and let their letters be collected into pamphlet form for distribution and comment. It is suggested to us that this could best be done by the Committee of the Planters' Association calling for reports from the different districts. In the meantime, the "paper" we give elsewhere deserves careful consideration.

(From a pamphlet by an experienced planter.)

With one or two exceptions, those who have lately written and spoken about the great "Labour Question" appear to me to have dealt with the subject almost entirely from the Proprietors' and Superintendents' point of view, while the canganios and coolies have been represented to us as being for the most part demoralized, and quite different in many important respects to what they used to be in days gone by.

They are, however, in my humble judgment entitled to a great deal of sympathy, and the present may not perhaps be an inopportune time to state their case for public consideration rather more fully than has hitherto been done.

Taking our Tamil labourers as we find them in the present day, it will be admitted, that not only are they deeply involved in debt, but speaking of them generally, they are held responsible for the repayment of monies which they have only in part received, and for liabilities which they cannot, with any show of justice, and ought not, for many obvious reasons to be called upon to meet.

Dealing first of all with the indebtedness of these people, it will, I presume, be conceded that although the Coast Advance Account as shown in the Estate books is frequently a heavy one, it probably does not represent very much more than a fraction of what they are supposed to owe to the Chetties and Bazaar-keepers, to say nothing of Afghans and other creditors, and the hundred and fifty transactions running on between themselves! With the exception of the so-called Coast Advances, all these debts carry interest, at more or less exorbitant rates, and instead of dying a natural death, as other debts frequently do, they are handed down from father to son in perpetuity. There is in fact no escape from them, and they multiply as they grow older. New coolies arriving from the Coast are taught to consider themselves part security for this accumulated debt, or bribed to do so, and children, instead of being born naked into the world, as in other parts of the globe, make their debut here with a halo of debt around them, which becomes rapidly denser as they advance in maturity.

If a Superintendent will patiently investigate the origin of any particular debt of long standing amongst his coolies, he will find in nine cases out of ten that it pertains largely to a generation of people who have long since passed away. The debt in fact has survived, while the debtors themselves have died.

In too many instances these debts had their beginning at the time of the collapse of coffee, when wages were hopelessly in arrears, and frequently not paid at all, and it is a reproach to us to be reminded that at this unfortunate period, while Europeans, Chetties, and traders were chasing each other through the Bankruptcy Courts, the canganios and coolies were practically left outside in the compound. The burden of debt, though removed from others less deserving of relief, was not raised from their shoulders, and they and their children are still held liable for responsibilities incurred at that time.

The habit of inheriting and immortalizing debt is a feature in the character of the Tamils, which though praiseworthy enough in itself, has been traded on far too largely by employers of labour in Ceylon, and it is this monstrous system of extracting, or attempting to extract, from the living, the debts which rightly belong to the dead, and is largely, if not wholly, responsible for the present unsatisfactory state of affairs.

If what is involved in the above statement is denied or questioned, I would ask how it is that Estates hitherto have lost so little by Advances? If a planter of long standing is asked to name the sum he has from time to time written off his Coast Advance Account, the reply, in the vast majority of cases, indicates either that nothing at all has been lost, or at most something very trifling.

Now what is the precise significance of this admission? and what conclusions are to be drawn from it? Either it means that the Coolies who have died in his services have departed without leaving debts behind them, or that he has contrived somehow or other (through the Canganey) to recover them from the living. We know as a matter of fact that dying Coolies are always more or less in debt, and instead of the Estate bearing the loss as it ought to do, we carry on the account from time to time, knowing that if their surviving relatives do not themselves pay the money, the sword can be held over them until the debt is liquidated from other sources. On some Estates the proportion of debt due by deceased Coolies may not amount to very much, but on others, especially in parts of the low-country, where the mortality is heavy, it represents a very large sum, and is constantly accumulating.

Of late years we have gradually come to realize that it is practically impossible to recover all outstandings from the people, who are supposed to owe the money, and it has therefore become customary and more convenient to accept payment of advances from employers of labour; but at the same time, we take very good care that the Canganies and Coolies are not relieved in any way of the responsibilities in connection therewith, and every time the debt is transferred from one estate to another, it increases in bulk, like a snow-ball, with this one distinction, that it *never* melts. Not infrequently the coolies' pay is indiscriminately and unjustly withheld, as a set-off against these outstandings, and this combined with a wicked system of irregular payment of wages due, has necessarily produced a demoralizing effect on the labour supply of the country, and one may well enquire how it could possibly be otherwise?

Sometimes, an attempt is made to draw a distinction between the kanganies and the coolies; the latter it is urged are to be sympathised with to some extent, perhaps, but as for the former, they deserve all the abuse they get, and a great deal more besides.

No doubt, many cases could be quoted to show that the kangany has defrauded his employer, especially at critical times, when opportunities have given him a chance of dictating terms; but as a general rule, it may be taken that his position is a very unhappy one. He owes far more money than he can possibly pay, and far more than he has ever received, and after all he is only a cooly, with an umbrella to protect him from the rain in place of a cumby.

The idea that Canganies are well off and that their head money is paid them in order that they may become security for advances, is quite erroneous. The head money has nothing whatever to do with advances, and the only security which the Canganey holds for debts standing in his name is the Cooly; and what is the Cooly worth? He is possessed of two things: his cumby and his labour! The latter no doubt is a good marketable asset, while it lasts, but it should not be mortgaged too heavily, and people who complain that Coolies do not work so well as they used to, should remember that they have very little incentive to do so; in fact, it is rather the other way on.

In olden days their debts were never more than could easily be repaid, and they moreover received every month the where-withal to meet them. In the present day their liabilities are in the majority of

cases beyond reasonable prospect of liquidation, and it is no wonder therefore that they work more for Rice than for Wages. The former is served to them regularly, and they barter what they do not require for other necessaries. The latter is in a great number of cases and unknown quantity, which they may, or may not receive into their own hands, but in any case it is pretty certain to be doled out at long and uncertain intervals, and grabbed at by hungry creditors when payday arrives. So regardless have coolies become in respect to their balance-wages, that it is sometimes difficult to get them to travel from the lines to the bungalow for a settlement, and instead of expressing surprise that people so burdened with liabilities should work irregularly, and with indifference as to the future, the wonder is that under all the demoralizing influences of an unjust and ever-increasing debt, the labour arrangements of the island should continue as satisfactory as they are.

The system on which we have worked our coolies for years past, and which we are always impressing upon Government is as perfect as it well can be, encourages and fosters hereditary debts, and there is no escape from the conclusion that, if it is not directly responsible for bringing our labourers into a state of hopeless insolvency, it has at all events been closely associated with this unhappy result, and it is not very creditable to us that it should be so.

The labour difficulty of the present day is summed up in the one word "Debt." It is not that the coolies have individually changed, or that there is scarcity of them in the vineyard, but that surrounding circumstances are such as to render it difficult for us to make the most of the material at our disposal, and a state of affairs has been brought about, which shews it to be desirable that the Cooly should in future be protected to a greater extent than he has hitherto been, both from himself and from others.

Seeing that the Tamil Cooly is a pauper labour, it seems only fair and right that his debt should be buried with him when he dies, and as he has practically nothing but his labour to mortgage, his debt-contracting powers should be as limited as we can make them.

At first sight it may appear almost impossible, by any means short of a miracle, to better his position as regards debt, or to bring about a more healthy state of affairs generally.

The Cooly, we know, lives in an atmosphere of debt, and likes it rather than otherwise; but while conceding all this, and a great deal more besides, there is no sufficient reason why he should be *hopelessly* in debt, and mixed up irretrievably with the debts of others, or why indeed he should be any worse off in this respect than he was twenty-five years ago. In those days Coolies were, as a rule, regularly paid, and Chetties advanced them sparingly, because the balance of wages being practically confined to one month's pay, did not represent sufficient security for a substantial loan.

If we would wish to return to these happy times, it is imperative that wages should be *promptly* and *regularly* paid, but as the debts in the country are now so overwhelming, (assumed and otherwise,) the only hope of this system being generally adopted is to make it compulsory by Legislative enactment and penal in its operation.

So long as it is optional (practically) for a Superintendent to pay his Coolies once a month, or once in three months, as the case may be, no *general* change in the direction indicated need be looked for, but once make monthly payments *compulsory* and *penal*, and the debt-contracting power of the employed will be immediately and permanently lessened, while other very beneficial results may be expected to follow as a natural consequence.

Some years ago Lord Stanmore (then Sir Arthur Gordon) strongly urged upon the planting community the importance of monthly payments, and if he had had his way, the prompt settlement of wages due would then have been made law; but it was pointed out to him, amongst other things, that as the Island was only just emerging from the dark days of depression into the light of better times, it might be well to postpone legislative measures in this direction until the Tea industry had thoroughly established itself in the

country, and placed people in a position to meet their engagements from month to month without personal embarrassment.

It will not be denied that our position in the present day is such as to enable us, without much inconvenience, to pay our Coolies regularly, and it is high time that they shared, to this meagre extent at all events, in the general prosperity of the island.

The principle involved in the prompt and regular settlement of wages due, is one which cannot for a moment be contested, and if circumstances, have arisen, which render it impossible to give effect to this principle ourselves, we should be grateful if Government can be induced to step in and remove the obstacles for us.

The arguments which one hears against monthly payments from a practical point of view, are that Canganies and Chetties are opposed to it, and that it might lead to a loss of outstanding advances, &c.

The Canganies object because it deprives them, to a great extent, of the power of recovering debts of doubtful origin, which we insist upon them paying, but they very soon reconcile themselves to the change and as for the Chetties and other moneylending sharks if regular monthly payments result in a loss of outstandings in that direction, we need not repine. Real and just debts should of course be paid if they can be proved, but not those which have been carried forward from time immemorial, with interest added and in this connection it must be remembered that as the influence possessed by Chetties over our labourers has never been exercised for good, we may welcome anything likely to weaken the chain which has hitherto linked them together.

The question of outstanding Coast Advances is no doubt a more serious one, but let us look at things as they are. On the majority of Estates, as already mentioned, debts have accumulated to such an extent, that they are no longer recoverable in their entirety from the people who are supposed to owe the money, but rather from *employers* of labour, and as the amount increases almost every time the account is transferred from one Estate to another, it stands to reason that before very long whether the Coolies are paid regularly every month or irregularly as at present, *losses must occur*. The sooner this is realized by proprietors and their representatives the better, and the sooner the atmosphere will be cleared of the impurities which have for such a length of time withheld from our Coolies the light of more prosperous days.

If in dealing with large advances it were customary to regard them as merely so much money paid away temporarily for the benefit the Estate derives from the coolies' labour without any intention of recovering it from the labourers themselves, the system would be relieved of much of the scandal with which it is now associated, but we know that in a great number of cases the Coolies' pay is kept in arrears, and frequently confiscated altogether for the purpose of meeting these outstandings, and it is here where the injustice comes in; for in the majority of cases I repeat they probably do not owe very much more than a fraction of the money.

It may be asked why monthly payments should of necessity, or be likely to, lead to loss of Advances? The reason is that while coolies have no great objection to paying off debts even though they may have had little or nothing to do with contracting them, provided they can borrow money for the purpose, it is quite a different thing when they are expected to do so out of wages paid into their own hands. It is only under such circumstances that they began to realize the value of money, and pay away such as is due but nothing more.

I hardly think we shall ever see the day when Ramasami will deliberately repudiate a just debt, nor one which there is a moderate prospect of his being able to repay within a reasonable time; indeed, the tendency is all on the opposite direction.

A plauting friend of mine of great experience, in charge of a large and important Estate, has paid his coolies every month for many years past, and has abundantly proved the blessings of this system, his only regret being that he cannot pay them once a fortnight. His experience is that the

Coolies greatly prefer it to any system of irregular and deferred payments, and the Canganies learn to appreciate it also when they get accustomed to the change. He has no Coast Advances outstanding, and his transactions with the Chetties are few and far between.

It is his suggestion that a system of compulsory monthly payments throughout the Island may the means (slowly perhaps) of restoring order where chaos now reigns, and I pass it on to the readers of this paper with every confidence that he has not overstated the benefits likely to be derived from it. Referring to the proneness of the Cooly to get into debt, he naturally enough enquires how we can expect him to keep clear of it if we withhold from him the only legitimate means of doing so?

Possibly it might be found advantageous if compulsory monthly payments became Law to avail ourselves to some extent of *Indentured Labour* under conditions which Planters and Government might mutually agree upon, but the first and most important thing is to arrange for Coolies in all parts of the Island and on every estate to receive their wages regularly, which after all, is only their just due.

In a recent Memorandum from the pen of the Chairman of the Planters' Association, reference is made to the want of touch between Coolies and their employers such as existed in older days.

No doubt this is the case to a great extent, and strange though it may seem the Medical Aid Ordinance is probably more to blame than anything else for thus alienating the Coolie from his master. Government, of course, did not contemplate such a result as this when the Ordinance was introduced; but, nevertheless, it practically had the effect of taking Coolies out of the hands of the Superintendents as regards their little ailments and so forth, and in many cases they have been left to shift pretty well for themselves ever since.

There are, however, serious responsibilities attaching to employers of labourers in a country like Ceylon, and while there may not be any very general desire to avoid these responsibilities, the tendency has been rather in that direction for some time past, and I doubt very much if the Cooly would ever have drifted into his present position if he had been properly looked after.

It has been suggested that the abolishment of the Tundu system might go some way towards solving the labour difficulties, and special legislation in respect to runaway coolies has been put forward as a possible remedy for the evil, but neither of these appear to me to touch the real seat of the disease, and the mischief associated with the former would probably disappear to a great extent if a system of regular payments applied to every estate. The Chetty would not then have the power to shift Coolies about from place to place as he has now, and even if he had the power, he would gain nothing by doing so.

I have endeavoured to shew in this paper that our Canganies and Coolies are labouring under the demoralizing influences of an unrighteous and ever-increasing debt, and that we have no right to expect any great or permanent improvement in the labour arrangements of the country until this burden has been removed from their shoulder, or, at any rate, greatly reduced in weight.

Individual planters may quote their own and other cases to prove that the conclusions which have been arrived at are wrong or overstated, but I am not dealing with individual cases. I am dealing with Coolies generally, and that their position in respect to debt is practically as I have represented it to be will not be denied. If, however, it is questioned, I would again ask how is it that Estates lose and have lost so little by advances?

Hundreds of cases might be cited to prove the great injustice of making pauper labourers of the present day pay the debts of pauper labourers who have gone before them, and it is time in our own interest, as well as on other grounds, that the immortality of these outstanding should be destroyed. Our labour system will not rest on a sound basis until this has been accomplished.

THE CEYLON IMPORT DUTY ON TEA AND SOUTH INDIAN PLANTERS.

SIR,—With reference to the enclosed circular, letter please give it attention as sent to your care carefully seeing to return to me all the accompanying papers.—I am, &c.,

A. PHILIP, Secretary.

Kandy, Oct. 19th, 1895.

(Copy.)

Colonial Secretary's Office, Colombo, July 23rd, 1895.

SIR,—I am desired by His Excellency the Governor to transmit to you the accompanying copy of a letter from the Secretary United Planters' Association of Southern India relative to the import levied on tea, and to ask your Association to be good enough to favour the Government with an expression of their views on this subject.—I am, sir, (Signed) H. L. CRAWFORD, for Colonial Secretary.

The Secretary, Planters' Association of Ceylon.
[COPY OF LETTER FROM THE SECRETARY, UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA, TO HIS EXCELLENCY THE GOVERNOR OF CEYLON.]

To His Excellency Sir ARTHUR E. HAVELOCK, G.C.M.G., Governor of Ceylon.

Your Excellency,—I have the honour to address you on behalf of this Association regarding the import duty on tea, now in force in Ceylon.

I am directed to point out that whilst the tax, which has now been in force for several years, is quite unremunerative to the revenues of Your Excellency's Government, it operates very injuriously against the interests of tea properties in Southern India.

Ceylon possesses a market for teas from which all those of Southern India are shut out owing to the existence of the import duty; and this Association ventures to urge the repeal of the Act imposing this duty, not only in the interests of the planters of Southern India, but also in those of Ceylon itself.

The Association would respectfully advance the opinion that whilst no possible injury would be inflicted on the local market by the abolition of the duty, a considerable impetus would be given to the tea industries of both countries.

It is well-known that both for the London and the Colonial markets each of the teas finds a ready sale when blended; and it would be a distinct advantage to both countries if the blending could be performed in Ceylon instead of at the various Ports of sale.

I am further directed to point out that the natural market for Southern Indian Teas is Colombo; and the larger the quantity attracted thereto, the better for Ceylon.

Ceylon is in no way benefited by the exclusion of Indian Teas, as the latter is naturally absorbed at the various Ports in any case.

In conclusion, I am to ask for Your Excellency's best consideration of the prayer of the Association, and—I have, &c. (Signed) G. L. YORK, (?) Secretary.

Kandy, Aug. 19th.

To the Hon'ble, the Colonial Secretary, Colombo.

SIR,—Having duly laid your letter of the 23rd July, and the accompanying copy of a letter from the Secretary, United Planters' Association of Southern India, relative to the import duty levied on tea, before the Committee of the Planters' Association of Ceylon at a recent meeting, I have now the honour to invite your attention to the annexed copy of the resolution passed on the subject—I am, &c., A. PHILIP, Secretary to the Planters' Association of Ceylon.

(Resolution referred to:—)

“That, in reply, it be stated that in the opinion of the Committee it would be highly detrimental to the interests of Ceylon Tea that the prayer of the petition from the United Planters' Association of Southern India be granted. That Ceylon has for many years worked hard to introduce her teas into foreign countries and to raise their credit for purity, and, now,

that some success has been achieved, it seems unwise to admit other countries on equal terms to the jeopardy of Ceylon's interests. That, regarding the question of blending, the Committee desires again to draw the attention of Government to the Resolution on the subject transmitted to Government with the Secretary's letter of the 26th January, 1894, which Resolution, and connected statement, the Committee again fully endorses.”

Colonial Secretary's Office, Colombo, 29th August, 1895.

SIR,—In acknowledging the receipt of your letter of the 19th August, 1895, relative to the Import Duty levied on tea, I am directed to inform you that the proposals contained in the resolution transmitted with your letter of the 26th January, 1894, to which you draw my attention, as offering a protection against the dangers of removing the import duty on tea, did not seem practicable for any action of the Colonial Government, under the Merchandise Marks Ordinance of Ceylon, inasmuch as its provisions apply only to any false trade description as to the place or country in which any goods were made or produced, and to the material of which any goods are composed, and has no operation at home where the fraud would be committed.

2. It would, therefore, apparently be for exporters of blended and unblended tea to adopt Trade Marks to seek protection from any fraud in blending in Ceylon by means of registration under the Imperial Act and of vigilance in the markets of Europe and elsewhere.

3. I am to say, however, that any detailed suggestions by which the local Government could apply the provisions of this Ordinance, in order to carry out the proposal effectively, will receive attentive consideration, with a view, if possible, of meeting the wishes of the United Planters' Association of Southern India, an object which the Governor believes that your Association would desire to attain.—I am, &c., (Signed) H. L. CRAWFORD, for Colonial Secy.

The Secretary Planters' Association of Ceylon, Kandy.

Sept. 23rd, 1895.

The Hon. Colonial Secretary, Colombo.

SIR,—Your letter of the 29th August to the Secretary having been forwarded to me for my perusal, I deem the matter of so much importance that I reply to it, merely stating at the same time that your letter and copy of this reply shall be laid before the next Committee meeting of the Association.

2. I have the honour to point out that while the Association in no way desires to actively injure the interests of the planters of South India, yet it in no way sees that the planters of South India have any claim for favourable consideration at the expense of Ceylon planters. The Planting Community of Ceylon and unquestionably also the Mercantile Community, are of opinion that the removal of the Import Duty on tea would be injurious to the interests of the Ceylon tea enterprise.

3. The desire of the Ceylon Planting and Mercantile Communities is that the duty may not be removed or changed in any way, because while acting as in some measure a protection against South Indian tea being re-exported as Ceylon tea it in no way hinders South Indian planters selling their produce in the Colombo market in bond. This is in fact now done, and the statement made by the United Planters' Association that their teas are shut out is therefore inaccurate.

4. As regards blending, the Association is unable to see that it is in any way conducive to the interests of Ceylon tea to facilitate further than at present the opportunities for blending. But if further facilities are given, the Association is of opinion that absolute precaution should be taken that no blended tea can possibly be exported as Ceylon tea. Unless that object can be fully attained, the Association, I feel sure, would desire that further facilities should not be given.

5. Owing to the tenor of the third paragraph of your letter under reply, I venture to hope that the Government of Ceylon will, so far as it legitimately

may, in the first place guard and protect that industry which is its chief source of prosperity, and I regret to see that apparently His Excellency has misunderstood the desire of the Association as regards the request of the United Planters' Association of South India. It was the feeling of the Committee who passed the resolutions contained in the Secretary's letter of the 19th instant, that the requests of the Indian Association should not be granted both as regards the removal of the impost and the granting of further facilities for blending unless the Ceylon Government can make such arrangements for blending as shall absolutely prohibit the risk of fraud, and unless all expenses of such arrangements be borne by importers and there be no risk of loss or damage to the Ceylon tea enterprise. In claiming this consideration I feel confident I am not claiming more than is due from any Government towards the chief industry of the country.

6.—In consideration, I would press also that the Planting Community of Ceylon have for years now been spending time, labour and money in pushing their teas as *Ceylon* teas throughout the world, South India having done nothing to push her own teas, and any admission of South Indian teas to Ceylon without absolute safeguards that such shall not be re-exported as *Ceylon* teas would be a distinct injustice and injury to the Ceylon Planting Community. I therefore trust that His Excellency will not grant the requests of the United Planters' Association of South India.—I am, &c., (Signed) A. MELVILLE WHITE, Chairman. C. P. A.

Colonial Secretary's Office, Colombo, September 30th, 1895.

Sir,—Having laid before the Governor your letter of the 23rd of September, 1895, relative to the import duty levied on tea, I am desired by His Excellency to state that the planters of Ceylon may rest assured that the Government will do everything to protect their interests. It is not, however, politic to withhold friendly and neighbourly consideration to a proposal emanating from a country from which the planters draw their labour supply, and whose competition, if fairly and properly conducted, they should not fear.—I am, &c., (Signed) H. L. CRAWFORD, for Colonial Secretary.

The Chairman, Planters' Association of Ceylon.

Relugas, Madulkelle, October 1st, 1895.

The Hon. Colonial Secretary, Colombo.

Sir,—I have the honour to acknowledge receipt of your letter of the 30th of September, and in reply desire to thank His Excellency the Governor for the assurance that the Government will do everything to protect the interest of Ceylon planters.

2. A meeting of the Committee of the Planters' Association has been called for the 11th instant, at which the correspondence will be considered, and until then, further reply on my part seems unnecessary.—I am, &c., (Signed) A. MELVILLE WHITE, Chairman, C. P. A.

KANDY, October 19th, 1895.

To the Hon. the Colonial-Secretary, Colombo.

Sir,—Having duly submitted to the Committee of the Planters' Association at a recent meeting the correspondence that has passed on the subject of the Import Duty levied on tea, I have now the honour to annex, for the information of Government, copy of the Resolution passed thereon.—I am, &c., A. PHILIP, Secretary to the Planters' Association of Ceylon.

(Resolution referred to:)

"That the Committee approves of the Chairman's letters to Government on the subject, and that a copy of this resolution be forwarded to Government."

THE LABOUR QUESTION.—An estate proprietor of long experience writes:—"I am against legislation that may tell in the wrong direction in times of adversity! However, it is a question that is in the air, and has to come forward for discussion."

ARTESIAN WELL BORING IN CEYLON; AND THE NEED OF A GEOLOGICAL SURVEY.

We are asked if the apparent total failure to obtain water by artesian boring at Mannar does not furnish strong additional proof of the necessity for a thorough geological survey of the Island. We are unaware of the data upon which it was concluded that the strata in and about Mannar island afforded prospect of success to the work undertaken and now abandoned as being fruitless. We are not disposed to cavil at the expenditure, even if it were only for the sake of experimentalizing. Mannar, like many other localities in Ceylon, has a very deficient water supply, and had the work undertaken there increased that supply, it would not only have been of local use, but would probably have afforded experience that could have been beneficially extended. Ordinarily, wherever artesian boring has been undertaken, it has been upon knowledge previously obtained as to the lay of the surrounding strata and the probability of that to be pierced, confining a supply of the precious element. We are unaware if any such previous knowledge had been obtained in the case of Mannar; but, indeed, we do not see how such knowledge could have been obtained unless it were derived from a survey of the geological features over a wide area. There has long existed a tradition—which has never been in the least degree verified—that the water of the Jaffna Peninsula is derived from the Pulney Hills in Southern India. It is upon this tradition that the extraordinary diurnal movement of the water in the celebrated well at Pootoor in that peninsula has been accounted for. Probably, it was the impossibility of assigning any local cause for such motion that gave rise to the tradition. And it must be admitted that, to a certain extent, the conjecture is not wholly colourless. The intermittence of the rise and fall of the tides in this well, which does not at all agree with the action of the tides on the adjacent coasts, seems to point to some distinct operating influence. How far similar phenomena may have been observed in the shallow wells about Mannar we have no knowledge. If such are known, and it has been ascertained that they have no correspondence with marine tides, we should hold that there were *prima facie* grounds for the hopes upon which the late artesian boring was undertaken. We should be glad to be enlightened as to this matter. Failing any such solution, we can scarcely comprehend why anticipations of success were entertained.

But certainly our querist is right in his conclusion that the failure of an experiment which, had it proved successful, might have conduced greatly towards an improved water supply in many thirsty districts of this island, affords a strong additional argument in favour of a Geological survey. Until this Survey be completed, and it be, moreover, connected with that of India, all efforts towards securing, among other things, the advantages of an extensive water supply in our driest districts, must be mere "leaps in the dark." It is not necessary that we should recapitulate our previous arguments in favour of such a survey. We content ourselves with adding this additional one to those we have on previous occasions set forth. And we hope that such a scheme may be favourably considered by our new Governor when he has sufficient acquaintance with the island to enable him to correctly estimate the value of a Geological Survey in a variety of directions, more especially in respect of our plumbago mining and gemming industries, apart from the question of artesian well boring.

VARIOUS PLANTING NOTES.

SEASON REPORTS.—The Season Reports for the past month are published in the last *Gazette*. The reports regarding paddy crops and harvest are generally fair; the Southern Province reports several districts where fever, chicken-pox, measles and dysentery prevail; hoof disease in cattle is reported to be increasing in the Eastern Province, and cattle murrain in the Anuradhapura district.

CACAO IN THE DUMBERA VALLEY.—What is this we hear from a Colombo dealer, of cacao being uprooted on a well-known Dumbera plantation in favour of tea? Tea is said to grow and flush at a marvellous rate in the old rich valley. Another authority hints that coconuts, rather than tea, are likely to supersede the chocolate plant in certain divisions. We are very sorry to think there should be any circumscribing of the area under cacao.

THE IMPORT DUTY ON TEA IN CEYLON.—The import duty on Teas in Ceylon is certainly unfair to India—says the *Madras Times*—and if it cannot be removed it should certainly be counteracted by a similar import duty in India. As Mr. Acworth says, the Ceylon duty is about 50 per cent *ad valorem*, while the Indian is only 5 per cent. In respect to tea duties, at any rate, Ceylon is considerably behind the age. Its trade is quite strong enough to dispense with a *protective* duty of 50 per cent, and if the duty is not protective, it must be useless.

COCONUTS AND LIGHTNING.—“Of course,” writes a correspondent,—“lightning, as you suggest, would be a sufficient explanation of a coconut tree on fire. Was it not witnessed in a garden near Christ Church, last year or the year before, about the time of that terrible storm on Galle Face when a horsekeeper was struck dead? But in Pondicherry a storm is not suggested. Indeed, I gather that it is its absence which suggested spontaneous combustion.”—There is such a thing as a bolt out of a blue sky; but, of course, it should be observed: what is the experience of Messrs. Lamont, Wright and Jardine?

“HOW TO SUPPLEMENT TEA WITH COFFEE”—is the title of a series of articles in the *Indian Planters' Gazette* evidently for the benefit of North Indian tea planters. We wonder if the writer ever heard of the late Mr. Charles Anderson's experience with 50 acres of coffee in Assam? If not, he had better enquire. Mr. Anderson (an old tea-planter) failing to persuade Ceylon (Dikoya and Maskeliya) planters in the late seventies to go in for “tea” (as they ought to have done and made a fortune 20 years ago), was persuaded by them rather to go in for coffee in Assam, with of course disastrous results.

CROWN LANDS SOLD.—Governor Havelock has sold a less area of Crown lands than any previous Governor of Ceylon during the past forty years. Sir Henry Ward (1855-60) sold 112,000 acres for about £200,000; Sir Chas. MacCarthy and General O'Brien (1861-65) 157,000 acres for £397,117; Sir Hercules Robinson (1866-71) 227,000 acres for £341,562; Sir Wm. Gregory (1872-77) 270,000 acres for no less than £612,000!—the maximum in extent and amount though not in average per acre; Sir James Longden (1878 to 1883) sold 149,000 acres for £375,000; Sir Arthur Gordon (1884-89) sold 115,000 acres for £218,000; while Sir Arthur Havelock sold (1890-95) 70,500 acres for £182,000—(highest average £2 11s 7½d per acre)—or if 1895 be fully added, in perhaps about 78,000 acres and £200,000. Although in the 40 years over 1,100,000 acres have realized over 2½ million pounds sterling going by the old currency throughout—or an average of over R20 an acre.

ON THE MOVE.—Mr. Maguire of Messrs. Davidson & Co., proceeds on a visit to Assam this week. His itinerary will be through the tea districts there, and he will, probably, return before the end of the year.

SALE OF AN ESTATE.—Mr. J. B. Lindsay, of Ruauwella, says a contemporary, has almost completed negotiations for the purchase of Roth's estate, Dikoya, the property of the late Mr. Arbuthnot Smith. It consists of 100 acres, of which 5 are planted in tea.

A QUININE FACTORY IN JAVA—so long talked of, is really *in fait accompli* at last. It is situated near Bandoeng, is under the control of four partners and is not at first to buy bark, but to manufacture at a fixed charge for planters. That charge is to be about 5s per lb. of quinine which ought to pay the producer very well if the quinine is worth 16s or over per lb. Further particulars will be found in another column.

TEA TO MANCHESTER.—Those responsible for the first direct cargo of Indian and Ceylon tea to Manchester are rather proud of the success attending the experiment. The tea has arrived, been discharged, and sold within fifty-eight hours. The importers congratulate themselves upon making a study of the market, for did they not send out samples in sealed bottles of the drinking water of Manchester to Calcutta and Colombo in order to see which teas were best suited to the Manchester market.

COFFEE CROP PROSPECTS IN COORG—we learn, are better than they were last year. Mr. R. Tatham writes from Tellicherry:—“We have had a good average monsoon, always a dreary time on the coast. I have gauged at our mills 111·41 inches from 1st June to date; it is all over now.” Mr. Tatham was about to start on his usual visit prior to crop. Another old Colombo resident, Mr. Noone is referred to, as well and busy.

A NEW TEA COMPANY.—The prospectus is issued of the British Darjeeling Tea Company, Limited, with a capital of £50,000 in £1 shares. The company is formed for the purpose of acquiring and working the freehold tea estates known as West Darjeeling Nigali, and Pusumbing situated in the district of Darjeeling, in the province of Bengal, India. The price to be paid for the properties is as follows: West Darjeeling and Pusumbing, R7,10,000, or £39,197 18s 4d; Nigali, £6,000 in fully paid-up shares. The present issue is of 29,000 shares and £25,000 in six per cent debentures. The directors of the company are: R. J. Boyle, Esq., chairman Moabund Tea Company, Limited; W. F. Rabau, Esq., director Moabund Tea Company, Limited; Sydney Thompson, Esq.; and Loftus R. Tottenham, Esq., late Judge of High Court Calcutta.—*H. and C. Mail.*

PLANTING between Chilaw and Puttalam is chiefly confined to coconuts, but we believe experiments are being made with cacao and Liberian coffee. The region is a rather dry one and a contemporary's correspondent only shews 1·92 inch of rain from 1st July to date; but in the Rajakadaluwa division especially, the soil is never too dry and the roots of the palms seem to find all the moisture they require not far from the surface. The rainfall return is, however, for Mr. C. A. Seton's Segersta estate 18 miles North of Chilaw, 12 North of Rajakadaluwa and 14 South of Puttalam. It is very satisfactory to find European capitalists pioneering in this fashion in remote and comparatively untouched parts of the lowcountry. Mr. Seton in the Puttalam district is balanced by Mr. Pole-Carew's enterprise in palms, cacao, &c., in the equally dry and remote district, Hambantota. May both be very successful.

NEW TEA ESTATES COMPANIES.—We learn that the valuable tea properties—Chrystler's Farm, Dimbula, and Glenorchy, New Galway—connected with the estate of the late Mr. John Martin are to be formed into a Limited Company for which Messrs. Lewis Brown & Co. will be the local agents, and Messrs. Lyall Anderson & Co. the London Agents and Secretaries. The shares will probably be taken up by the heirs and others interested. A Company with such fine properties should have a good name, let us suggest: "THE HIGHLANDS TEA ESTATES CO. OF CEYLON"!—Another first-class Company will be "THE NUWARA ELIYA DISTRICT TEA CO."—to include Tommagong and Concordia estates, both purchased by Mr. Megginson for this Company at handsome prices.—A third Company on the tapis is said to be "THE RUANWELLA ESTATES CO."

AUSTRALIAN TIMBER—It has for years been a pleasant duty to record any endeavour to popularise the use of Australian wood in this country, whether for paving or upholstering purposes. Gradually the Eucalyptus and other large timber trees have become popularly known, if not as popularly used. Today our vehicular traffic is carried on over roads constructed of wood from the Antipodes, and promise is not wanting that New Zealand and Australian timbers will soon obtain higher rank. The Manchester Ship Canal Company, we believe, are endeavouring to make a market here for the wood noticed; they have brought, and continue to bring, to Manchester what may be looked upon as pioneer cargoes for that section of the industrial world. The venture, we have been informed, has so far been successful, and there is no doubt that, when the capacity of the Eucalyptus is better known, it will enter in successful competition with most kinds of timber now on the market.—*Gardeners' Chronicle.*

LABOUR CASES IN COURT AND OUR LABOUR LAWS—are evidently going to attract a good deal of attention as an appeal case elsewhere indicates. This magistrate who succeeds Mr. Northmore in his responsible post must certainly be one well up to his work under the Labour Ordinance. In this connection we direct attention to the notice of motion given by Mr. Robinson for the next meeting of the Passara Association. We know there is a strong feeling rising all over the country and especially among Visiting Agents in favour of "monthly payments." One old planter writing on the subject says:—

"It strikes really at the power at present in the hands of the chetties and kangaries."

And there are many more thoughtful men who consider that to make monthly payments compulsory will be of the greatest benefit both to planters and coolies.

A COCONUT TREE ON FIRE.—With reference to the paragraph in a late *Observer*, a planting correspondent writes:—"Can the explanation of spontaneous combustion stand, in the case of a healthy coconut tree, with a large head and full crop of fruits, which is found to be on fire? I mean is it likely on scientific grounds. Is it not more likely that the head of the tree was set on fire by a meteorite dropping between the branches which are ensnathed in an inflammable fibrous substance? I have known healthy trees snuffed out by the decay of the unopened leaf, but maintaining their vitality until the leaves die out one by one downwards; and I have never been able to detect any disease or insect pest. But, *per contra*, I have never seen a tree aflame, though I have accepted the Sinhalese explanation of *tharuka*, or meteorite, as the cause of the insidious defunction. Is it scientific." What about lightning setting the palm on fire?

THE SAMBUR: FROM A PLANTER'S POINT OF VIEW.—If you cut a deep ditch and put a 4 ft. fence all round your garden, he will jump it. Even barbed wire will not stop him, for he will squeeze through somehow and leave some of his back hair on the barb for you to see in the morning. No young plant seems to be safe from his devastations. He treats my blue gums the same as he does my cinchonas, and he eats up the young shoots of pommeloes, citrons, mangoes and other trees when he gets a chance. Neither will we leave *Grevillea Robusta*, or coffee alone. Tea he tramples upon and breaks the branches of the plants. A young plantation is evidently his favourite playground, where high jinks appear to be carried on during the night time.—*Planting Opinion.*

HONOUR TO AN EX-CYLON PLANTER IN FIJI.—Elsewhere will be found very interesting proceedings from the *Fiji Times*, in connection with a farewell dinner to Mr. A.J. Stephens—eldest son of the Patriarch of Dolobere—and himself well and favourably known here. We take over a great deal more of the proceedings than we usually do in such cases, because the several speeches reveal to us the present condition and prospects of planting in the Fiji islands far better than even a special report would. Perhaps after-dinner speeches—*in vino veritas*—have to be credited with this result; but the whole proceedings afford very interesting reading especially to Mr. Stephens' many planting friends in Ceylon.

THE DAVIDSON-MAGUIRE TEA PACKER.—Messrs. Davidson and Co., of Belfast, have always shown enterprise in advertising, and they occupy with their announcements several additional pages in the *Home & Colonial Mail* of September 27th. In addition to this, the journal itself has a two-page illustrated article descriptive of the advantages of Davidson's Improved Patent Electric Portable (Davidson-Maguire) Tea Packer, for use in London tea warehouses. Mr. Davidson, in December last, exhibited his tea packer as then arranged, but now it has appeared in a portable form—no longer bolted to the floor of the warehouse, but capable of being easily moved all over it—and worked with an electric motor. It is considered possible that this new design will eventually supersede the present highly objectionable and destructive process of "treading in," when the refilling of chests in the London bonded warehouses is necessary. The writer describes the *modus operandi* of this crude process as follows:—

A layer of about 6 in. or 8 in. deep of tea is thrown into the chest at a time, and shaken down lightly by hand. A piece of cloth is thrown over the tea, upon which the typical dock labourer then mounts, and with his heavy hob-nailed boots crunches the tea down as hard as he can, first with one foot and then the other. Naturally the haviest man gets it crushed down soonest; but what, may we ask, are the results to the tea? Something to make any planter or estate proprietor sick at heart, after all the trouble and care that has been taken in the assortment of his teas into true unmixed grades, free from broken and dust, for this "treading in" process when applied to any well-sorted whole leaf tea so breaks it up that, if one of the chests was afterwards re-sorted, it would likely show from ten to fifteen per cent of broken leaf or dust, and for this result the tea estate proprietor (to add to his sickness of heart) has to pay 2s 6d to 3s 6d per chest according to the size of the package.

The new arrangement is considered so thorough in its working that, when the packing on the estate has been done by its means, re-bulking in London should be quite unnecessary. Consequently the suggestion is made that all the chests of machine-packed invoices should be branded in small but distinguishable letters with a hot iron (or instrument for which purpose Mr. Davidson would very likely supply along with his packets) as "Factory Bulked and Machine Packed," as on arrival in London this brand would soon be recognised amongst buyers as a "good character" mark.—*Local "Times."*

COFFEE PLANTING IN NYASSALAND :

Summary of Meteorological Observations at Lauderdale, S.W. of Mlanj.

VARIOUS PLANTING NOTES.

THE INDIAN TEA CROP.—Full particulars of the original and latest Estimates for the current season's crop will be found in our *Tropical Agriculturist*. Out of a total crop of 138,135,964 lb. for 1895, it is expected that 124,000,000 lb. will be shipped to the United Kingdom. This is against 118,417,084 lb. sent thither in 1894-95.

LIMITED COMPANIES IN CEYLON.—The year 1895 is likely to be a record one in the history of Ceylon in reference to the formation of Limited Companies: here is a list of the 21 Companies registered so far in Ceylon this year, and with a total capital of R10,195,000:—

1895—NAMES OF COMPANIES.	CAPITAL. R.
Colombo Fort Land and Building Coy., Ltd.	750,000
Blackstone Estate Company, Ltd.	.. 130,000
Kandy Hotels Company, Ltd.	.. 400,000
Kelani Tea Garden Company, Ltd.	.. 300,000
Beaumont Tea Company of Ceylon, Ltd.	.. 500,000
Ottery Tea Company of Ceylon, Ltd.	.. 500,000
Udabage Company, Ltd.	.. 300,000
	Noml. Capital
Union Estates Company, Ltd.	.. 500,000
Hill Club Company, Ltd.	.. 50,000
Gallo Face Company, Ltd.	.. 500,000
Claremont Estate Company, Ltd.	.. 65,000
Estates Company of Uva	.. 750,000
Uvakellie Tea Company of Ceylon, Ltd.	.. 500,000
Nyassaland Coffee Company, Ltd.	.. 300,000
Kirklees Estate Company, Ltd.	.. 100,000
Doomoo Tea Company of Ceylon, Ltd.	.. 500,000
Ceylon Provincial Estates Company, Ltd.	1,000,000
High Forests Estates Company, Ltd.	.. 1,000,000
Clyde Tea Estates Company, Ltd.	.. 300,000
Ruanwolla Tea Company, Ltd.	.. 750,000
Ceylon Hills Tea Estates Company, Ltd.	.. 1,000,000

Total. R10,195,000

A NEW LONDON standard of Indian "type tea" comes into force next month. It is said to be about a half-penny a pound inferior to the old.—*Madras Times*.

THE SEASON'S TEA CROP.—The revised estimate of the Indian tea crop, will probably not be issued by the Tea Association for another week or so; but it is generally expected that it will show a reduction on the original estimate, which put the crop at 140,390,520 lb. or 13,262,305 lb. over the actual output of the crop of 1894. Shipments to the Colonies and other ports with local consumption were put at 14 millions, leaving about 126½ million lb. for export to Great Britain, against 115½ for 1894. Up to the 30th September, however, only 62,254,706 lb. have been shipped, against 59,509,612 lb. to same date last year.—*Indian Engineer*.

FALSE BRANDS ON TEA.—Here is what Messrs. Alfred Harvey & Co., of Melbourne and Sydney write in their Monthly Tea Circular received today:—

"Now that the Customs have commenced to prosecute traders for putting false brands upon spirits, it is to be hoped they will next give some of our shippers, importers, or dealers a turn for putting false districts or descriptions upon packages of Tea. How much preferable to printing an untruth would it be to omit the false name of the district, and sell as Orange Pekoe, Pekoe, or Pekoe Souchong. Darjeeling has an envied reputation—so has hill-grown Ceylon and neither should be bosmired."

It is evident therefore that Ceylon teas sent to Melbourne are even now fraudulently misrepresented—to go and call a low-grown tea by the name of a high district, is just as bad as anything that could happen from blending and calling the result, "pure Ceylon teas"; but in Australia as in England there are experts whom nothing of this sort can deceive."

REVIEW OF THE TRADE OF INDIA.

WHAT IS SAID OF TEA, COFFEE, &C.

We have received from the Government of India a copy of the Review of the Trade of India in 1894-95 referring to:—I, Foreign Sea-borne Trade; II, Trans-Frontier Trade; III, Coasting Trade; By J. E. O'Connor, C.I.E., Director-General of Statistics to the Government of India. It is, as usual, an able and full Report covering 72 pages. We had not realized before that Ceylon supplied sugar to India: here are the figures:—

	1890-91	1891-92	1892-93	1893-94	1894-95
	cwt.	cwt.	cwt.	cwt.	cwt.
Ceylon	1,935	1,082	4,921	17,161	7,393

Of practical value is the part devoted to imports of tea, which shows that if we cultivated proper relations and equal tariffs with Bombay we ought to supply from Ceylon nearly 5½ million lb. of tea now got from China, Straits and Java. This tea is chiefly for the Persian market, but passes through Bombay:—

TEA.—This trade maintains a high level, though the imports last year were smaller than in 1893-94. The imports are:—

	lb.	Rx.
1890-91	4,770,008	925,141
1891-92	6,353,017	443,161
1892-93	6,022,883	443,326
1893-94	7,687,757	572,006
1894-95	6,326,122	424,666

The sources of supply are China, Ceylon, the Straits and Java, from which countries the imports in the last five years have been:—

	China	Ceylon	Straits	Java
1890-91 lb.	3,940,584	167,177	543,847	97,640
1891-92 "	4,680,232	849,737	589,953	216,261
1892-93 "	4,795,473	633,596	464,518	107,100
1893-94 "	6,016,244	980,507	360,770	308,333
1894-95 "	4,630,327	901,971	413,417	362,366

The Ceylon tea is consumed in India, but the greatest part of the other imported tea is re-exported, going chiefly to the Persian market by sea, and to the Afghanistan market by land.

Next comes a notable mention of Colombo made in reference to the re-export trade from India:—

With Ceylon the trade is relatively small, not half what it is with the Straits, though being so much closer it might have been supposed that the trade would be larger. The explanation is that Colombo is so happily situated geographically that it is admirably adapted to be an entrepôt for the supply of Southern India and other neighbouring regions, and that there is no necessity for that port to receive supplies of European goods except direct from Europe.

Then we quote what is said about coffee:—

The run of high prices has continued now for three consecutive years. The world is so largely dependent on Brazil for its supply now, that Ceylon has given up coffee, and the conditions in that country are so uncertain, that speculative influences have been in successful operation for a considerable time past. The range of high prices has not, however, been effectual in increasing the supply from India materially, for coffee-planting has been beset with difficulty and disappointment and the area under the plant continues to be very restricted. In Travancore, following the example of Ceylon, coffee has been largely abandoned in favour of tea, and in British India, according to the agricultural returns, the area has substantially diminished during the last four or five years.

Next we have a long paragraph on tea:—

Tea.—The exports of the last ten years are given below:—

	lb.	Rx.
	(ooo's omitted.)	
1885-86	68,784	4,306,133
1886-87	78,703	4,727,992
1887-88	87,514	5,174,440
1888-89	97,011	5,267,315
1889-90	103,760	5,277,650

	lb.	Rx.
	(ooo's omitted.)	
1890-91	107,015	5,219,233
1891-92	120,149	5,968,129
1892-93	114,722	6,292,348
1893-94	126,332	6,585,835
1894-95	129,099	7,555,745

In 1894-95 the quantity exported greatly increased and the prices obtained were higher even than in 1892-93, which was an unusually good year. The prophecies of the planters that the closure of the mints would be the signal for the ruin of their business have happily not been fulfilled, nor are they likely to be fulfilled. The Average Prices realised at the auction sales in Calcutta during the last six years were as follow, in annas and pie per pound:—

	1889-90.	1890-91.	1891-92.
Orange (and broken orange) pekoe	11-8	11- 2½	11-1
Broken pekoe	9-9	8-10½	8-7½
Pekoe	7-5	7- 2	7-0½
Pekoe fannings	5-7	5-10	5-3½
Pekoe souchong	5-7	5- 8½	5-3½
Broken ditto	5-0	5- 8½	4-9½
Other low class	4-8	5- 2	4-2½

	1892-93.	1893-94.	1894-95.
Or. (and bro. orange) pekoe	13- 0 5-7ths	11- 1½	14-0 2-5ths
Broken pekoe	11- 3 1-3rd	9- 2 4-5ths	11-8
Pekoe	8- 9	7- 2½	9-4 4-5ths
Pek fans.	6- 7 1-5ths	5- 7 1-5ths	7-3 6-7ths
Pek sou.	6- 5½	5- 4 4-5ths	7-2 5-7ths
Broken ditto	5-10 6-7ths	4-11 5-6ths	6-8 1-5ths
Other low class	5- 0½	4- 5½	5-6

The Exports are, in pounds (ooo's omitted):—

	1889-90.	1890-91.	1891-92.
United Kingdom	98,731	100,209	111,169
Australia	3,419	5,119	5,204
Persia	1,118	1,221	2,789
Turkey in Asia	65	89	340
United States	103	79	83
Canada	85	61	102

	1892-93.	1893-94.	1894-95.
United Kingdom	108,513	116,007	118,417
Australia	3,908	6,240	4,872
Persia	1,407	2,497	3,173
Turkey in Asia	115	456	1,399
United States	50	116	228
Canada	39	113	317

The United Kingdom continues to be the great market for Indian tea, as much as 92 per cent of the exports of the year having been shipped thither. Of the small quantity not shipped to the United Kingdom, Australia takes a considerable but unfortunately not an increasing share: Indian tea seems to make no headway in the Colonies in competition with China and Ceylon tea. Persia during the last four years has been taking larger quantities. As regards the trade with Persia Her Majesty's Consul at Bushire writes in his report for 1894: "There has been a strong demand throughout the year for Indian and Batavian teas, which seem to be steadily supplanting the China teas in favour with the Persian consumer. Heavy consignments, chiefly from India, were received by native merchants who found no difficulty in disposing of them at a good profit. It was, however, at the port of Bandar-Abbas that this trade received its most vigorous impulse, the import being more than double that of the previous year." Some of the tea at any rate imported into Bandar-Abbas was destined for consumption in Russian Asiatic territory, and it seems probable that the effect of recent fiscal arrangements of the Russians will divert the transit trade to Batoum and the trans-Caspian railway. A new feature in the trade of the year is the largely increased export to Asiatic Turkey, and it is to be hoped that the exports to this country may become larger. Exports to the United States and Canada have also developed very greatly, though the aggregate is still relatively trifling.

Calcutta is now, and always will be, the great centre whence Indian tea is exported; but, in consequence of the increasing demand from Persia and Asiatic Turkey, the exports from Bombay and Karachi are increasing.

The distribution last year was as follows:—

Bengal 123,000,733 lb.; Bombay 2,828,746 lb.; Sindh 1,067,359 lb.; Madras 2,149,006 lb.; Burma 53,472 lb. Total 129,099,316 lb.

To the quantity of tea given above as exported from British India should be added about 780,000 lb. exported from Travancore and Cochin.

Then on cinchona bark:—

Cinchona bark is the only separate item of importance in the group "Drugs and Medicines," and this article has rapidly lost a great measure of its importance in recent years owing to the competition of other countries having so lowered the price of the drug, which planters once thought would be the source of untold wealth, as to make it what is commonly called "a drug in the market."

The exports would have been even smaller during the last two or three years if their volume had not been kept up by the bark sent for sale from estates whose owners got rid of their trees, root and branch, finding chinchona bark not worth the expense of cultivation. But though the bark has ceased to justify the expectations once formed of it as an article of export, and India will probably under ordinary circumstances never be a large exporter of the article, the cultivation of the tree by the Government has had a most useful effect in supplying large quantities of febrifugal alkaloids and the sulphate of quinine to the fever-stricken population of malarious regions in India.

It is of interest to quote the following in view of Mr. Crawford's local Cutch Company:—

Cutch.—This trade has not, as figures go, a flourishing aspect, the exports being:—

	Cwt.	Rx.
1890-91	156,493	236,355
1891-92	197,059	317,296
1892-93	229,316	382,484
1893-94	187,115	337,890
1894-95	155,032	292,136

The limitation of the trade is, however, ascribed by the Chief Collector of Customs in Burma, whence the bulk of the article is exported, not to absence of demand but to absence of supplies due to "the Government having further limited the issue of licenses in some of the catch-producing districts and to the period allowed for catch-boiling having been reduced from six to four months; also to the extension of forest reserves." The demand from outside markets, he says, was fairly good.

And finally there is mention made of trade across the frontiers North and North-East, as well as North-West of India which includes some tea:—

Tea:	1893-94.	1894-95.
India	Rx. 40,751	Rx. 33,727
Foreign	Rx. 59,999	Rx. 46,328

THE CONSOLIDATED ESTATES COMPANY, LIMITED.

The General Managers have the pleasure to submit their Fourth Annual Report and Balance Sheet, together with Statement of Accounts for the Crop Year ending 30th June, 1895.

The Profit and Loss Account shows a balance (including £160 8s 11d brought forward from last year) of £2 700 13s 10d after paying Interest on the Debentures, and an Interim Dividend of 4% on the Preferred Shares.

Out of this sum the General Managers propose: To pay a Balance Dividend of 4% on the Preferred Shares, which will absorb £320 0 0 To set aside for redemption of five per cent of the Debentures at 103 ... 618 0 0 To write off from the Factory Account the sum of ... 800 0 0 To pay a Dividend of 8% on the Ordinary Shares, which will require ... 800 0 0 Carrying forward the Balance, viz: 162 13 10

£2,700 13 10

The following shows the result of the year's working, viz:—

Net proceeds of Crop, viz:—	Average net Price	£	s.	d.
Tea, 300,084 lb. About (₹) 1. per lb. ...		8,622	5	11
Interest on Account		36	13	9
		8,658	19	8
Expenditure on Estates, viz:—				
Messrs. Geo. Steuart & C.'s draft ...		4,707	18	7
Postages and Telegrams		0	5	0
		4,708	3	7
Bonus remitted to Superintendent ...		185	0	0
		4,893	3	7
Net Profit on Cultivation £3,765	16	1	

It will be seen that the crop was slightly in excess of the estimate—being 300,084 lb as against estimate of 300,000—and exchange was somewhat more favorable than was anticipated; while on the other hand the average price realized for the Company's Tea was rather lower than that current when the last report was issued, although slightly above the average price obtained the previous year.

The Shareholders are aware that the Company has recently acquired four new estates on terms which the General Managers believe to be favorable, and to promise satisfactory results. For convenience of reference the following approximate particulars of all the estates now held by the Company are appended:—

Name of Estate	Ceylon District	Total Acreage	Acres Planted with Tea				Forest waste, water, etc.
			Full Bearing	Partial Bearing	Reserve Suitable for Tea		
Wattegodde	Dimbula	895	800	Nil	Nil	95	
Tallagalla	Kalutara	499	258	22	204	15	
Ellagalla	Matale	445	207	13	20	205	
Hoonocotua and Hennewille	Kotmale	713	588	20	55	50	
		2552	1853	55	279	365	

The last four Estates have been purchased as from 1st July 1895 and therefore the working of them does not appear in the Accounts now presented which are for the Crop Year ending 30th June 1895.

The following are the Estimates of the current season's crops (1895-96) of the Company's Estates:—

	EXPENDITURE, at 1/1½ per Rupee,	CROP
Wattegodde	R82,958 = £4,666 7 9	300,000 lb. Tea
Tallagalla	32,933 = 1,855 5 10	140,000 ,, ,,
Ellagalla	25,903 = 1,457 0 10	90,000 ,, ,,
Hoonocotua and Hennewille	66,344 = 3,731 17 0	240,000 ,, ,,
	R208,188 = £11,710 11 5	770,000 ,, ,,

On the basis of exchange as above and at the prices now current for Ceylon Tea the foregoing Estimates if realized would show very satisfactory results.

It is proposed to plant 70 more acres with Tea on Tallagalla and a few acres on Ellagalla and Hoonocotua during the current season. The cost of these extensions, and of a small outlay for requisite machinery and withering accommodation, is estimated at about £800. This will be charged to the Factory and Extension Account, but the General Managers propose to continue the present policy of writing off liberally from this Account out of Revenue in prosperous years.

The Preferred Shares to the nominal amount of £9,000 Nos. 801—1,700, both inclusive, and Ordinary Shares to the nominal amount of £9,000 Nos. 6,001—6,900, both inclusive, which were issued on 1st July

last, and are included in those enumerated in the annexed Balance Sheet, do not participate in the Dividends now proposed to be paid, these Dividends having been earned during the Crop Year which ended on 30th June last. For the same reason the Debentures to the nominal amount of £23,000, Nos. 121—350, will not participate in the next drawings for redemption.

ARBUTHNOT, LATHAM & Co.,
GENERAL MANAGER.

33, Great St. Helens, E.C.,
23rd September, 1895.

THE INDIAN TEA CROP.

In their circular of the 16th April last, the General Committee of the Indian Tea Association gave an estimate of the outturn of the present season's crop of Indian tea based upon the following figures, which they had been able to collect:—

ORIGINAL ESTIMATE OF CROP OF 1895.

	lb.
Assam	57,531,490
Cachar	19,405,880
Sylhet	22,272,000
Darjeeling	8,069,210
Terai	3,176,000
Dooars	19,864,240
Chittagong	842,000
Chota Nagpore	238,800
Kangra	3,000,000
Dehra Doon and Kumaon	2,000,000
Private and native gardens	4,000,000

140,390,520

From the figures which have since been obtained, a revised estimate has been prepared, based upon actual results to the 31st August, as follows:—

	Manufactured to 31st Aug. 1894.	Manufactured to 31st Aug. 1895.
	lb.	lb.
Assam	32,987,585	34,286,191
Cachar	10,783,203	10,332,442
Sylhet	10,695,213	11,967,318
Darjeeling	5,164,574	6,089,418
Terai	2,004,966	1,707,738
Dooars	8,983,916	10,802,538
Chittagong	459,257	361,759
Chota-Nagpore	91,061	131,231
	71,169,775	75,678,535

REVISED ESTIMATE OF CROP OF 1895.

	lb.
Assam	56,874,241
Cachar	17,421,950
Sylhet	22,910,208
Darjeeling	8,479,854
Terai	2,472,116
Dooars	20,044,489
Chittagong	921,746
Chota-Nagpore	202,360
Kangra	2,808,000
Dehra Doon & Kumaon (Estimate)	2,000,000
Private & native gardens do	4,000,000

138,135,964

being 2,254,556 lb. less than the original estimate of the crop. Estimating shipments to the Colonies and other ports with local consumption at 14 millions, there would remain about 124 million lb. for export to Great Britain. Actual shipments to date to Great Britain are 66,389,121 lb as against 61,908,561 lb. to same date last year.—*Madras Times*, Oct. 17.

THE DUTY ON TEA IN W. AUSTRALIA.—A gentleman writes from Perth, W. Australia, to a contemporary:—"As you are probably aware, our Government has placed tea on the free list, and the new tariff came into operation on the 1st September. The duty on tea has always been 4d. per lb., so that you will see the removal of such a heavy duty all at once has simply demoralized the market here. Teas are selling locally below cost."

CINCHONA IN INDIA.

Our Simla correspondent telegraphs us concerning a table compiled by Mr. O'Connor with respect to the cinchona industry in India. Statistics show, we are told, that there has been a steady decline in the cultivation of this product, the area under cultivation in 1886-87 and in 1894-95 being shown as follows:—

	1886-87.	1894-95.
	Acres	Acres
Madras	8,989	5,819
Bengal	3,524	2,508
Mysore	271	350
Coorg	1,707	32
	14,491	8,709

We are not in a position to question the accuracy of these figures, but the remark that the table points conclusively "to a steady decline of the cinchona industry in India would appear to be challenged so far as Madras is concerned by a Blue-Book now before us. In a statistical abstract relating to British India for 1882-83 to 1891-92—a parliamentary blue-book—we find the area under Cinchona in 1891-92 given as follows:—

Coorg	63 acres
Madras	10,799 "

so that in 1891-92 there was a larger area under Cinchona in this Presidency than there was in 1886-87 in Madras, Mysore and Coorg combined. There can, however, be no doubt that the Cinchona industry even in Madras is not what it was. For this the Government itself is partly to blame, but the main influence appears to have been the downward rush of prices that occurred a few years ago in consequence of Supply greatly exceeding Demand.—*Madras Times*.

EXTRAORDINARY SINGLE LEAVES ON THE VICTORIA REGIA.

From the measurements given in a recent issue of the *Gardeners' Chronicle* of leaves of the Victoria Regia in the Royal Botanic Society's Garden, Regent's Park, London, it would appear as though some of the leaves upon a plant of the same species growing in the Sheffield Botanic Garden are still larger. I have never seen a more vigorous plant, or one with finer leaves, than the Sheffield specimen. The tank in which the plant is growing is 28 feet in diameter, and even this width is insufficient for the leaves to develop fully, as they get damaged by being squeezed against the sides of the tank. The surface of the water is entirely covered with leaves; the flowers are large and numerous, and at the time of writing there are flower-buds in various stages of development showing above the surface of the water. Today, September 24, the largest leaf measured was 7 feet 3 3/4 inches in diameter, inside measurement, with a turned up margin 3 1/2 inches high, which gives the full measurement of 7 feet 10 1/2 inches diameter. The next largest leaf is 7 feet 2 inches. Then there are three of 7 feet 1 inch, and 2 of 7 feet; two younger leaves, each 6 1/2 feet and another 5 1/2 feet. There are also upon the plant three smaller ones. Four leaves have been cut from the plant, each of which measured upwards of 7 feet in diameter. All the above measurements were taken inside, without calculating the rims, which vary from 3 to 4 inches in depth.—*William Harrow*, in "*Gardeners' Chronicle*."

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears &c., no matter how severe or long-standing, will be sent post free.—Artificial Ear-drums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN LONDON.

INDIAN TEA SALES.

(From *William Moran & Co.'s Market Report.*)

CALCUTTA, Oct. 30th, 1895.

TEA.—The sales held since our last have comprised about 41,000 chests, all of which were sold. Prices all round have been somewhat lower, the fall being most noticeable on good to fine qualities. We hear that there has been some rain in Cachar and also in the Doors, but the weather continues cold and manufacture must be shortly closing. Owing to this it is possible that the quantity available for export to Great Britain may not reach 20,000,000 lb. Tomorrow about 21,500 chests will be offered.

TOTAL QUANTITY OF TEA PASSED THROUGH CALCUTTA FROM 1ST APRIL TO 28TH OCT.

	1895	1894	1893
Great Britain ..	80,426,934	77,584,510	72,015,580
Foreign Europe ..	192,023	182,485	231,809
America ..	830,631	346,941	90,340
Asia ..	2,771,022	2,692,344	1,752,238
Australia and New Zealand ..	3,903,449	3,185,967	3,595,197
	88,124,059	83,992,247	77,715,164

(From *Watson, Sibthorp & Co.'s Tea Report.*)

CALCUTTA, Oct. 30th, 1895.

In sympathy with London the sales held here on the 24th instant passed off without spirit; really good liquoring teas alone being much wanted and for these full prices were paid, but for all other sorts the market was lower; teas under six annas were only fractionally easier, but a decline of from 3 to 6 pie may be quoted on all grades above this price. 22,735 packages changed hands.

The average price of the 22,735 packages sold is As. 8-1 or nearly 8½d per lb. as compared with 18,763 packages sold on the 25th October 1894 at As. 9-3 or about 9½d per lb. and 25,404 packages sold on the 26th October 1893 at As. 6-9 or about 8½d per lb.

The Exports from 1st May to 26th October from here to Great Britain are 80,249,154 lb. as compared with 76,438,773 lb. at the corresponding period last season and 69,660,087 lb. in 1893.

NOTE.—Last sale's average was As. 8 or about 8½d per lb.

Exchange.—Documents bills 6 month's sight, 1s 1-15-6d.

Freight.—Steamer—£1-12-6 per ton of 50 c. ft.

HAWAIIAN TEA AND COFFEE CULTURE.

The Hawaiian Coffee and Tea Co. of North Kona have now on the market some native-grown tea from their plantation in that district. The brand is known as "Kona Tea" and each package in addition to the usual advertisements bears the following: "This package contains absolutely pure tea, prepared by machinery from the best Ceylon Hybrid." The flavor of this tea is similar to that of the well-known English Breakfast tea. The Company has about five acres which produces a very satisfactory yield. Unfortunately, however, the expense of harvesting is a great drawback at present and is another convincing proof that the government will have to direct its energies to providing for enough cheap labour to meet the demand of planters engaged in the various kinds of agriculture and fruit culture at the proper season. This country cannot compete in foreign markets against other tropical countries unless it is on an equal footing as regards labour. As soon as the tea and coffee industries begin to approach the extent of development we all look for there will have to be an abundance of labour at hand when required otherwise disastrous failure will be the result. As the coffee season only lasts a few months it will be necessary to provide employment for the labourers required during the coffee season, in the interval. To do this successfully, crops that will alternate with sugar cane and coffee must be cultivated and the sooner a start is made in this direction the better.—*Hawaiian Commercial and Maritime Report.*

DRUG REPORT.

(From *Chemist and Druggist.*)

London, Sept. 26th.

CAFFEINE—Unaltered at 21s on the spot; the forward quotation remains the same as last week.

CINNAMON—At the end of last week a parcel of 100 bales sold at 9½d per lb c i f terms, for August-October shipment.

CROTON-SEED—Very scarce, and almost unobtainable on the spot. The value of fair East Indian is now from 35s to 36s per cwt.

ESSENTIAL OIL.—Lemongrass oil, which had been somewhat neglected lately, has become firmer again, and several transactions are reported for arrival. On the spot 1½d to 2d, landed terms has been paid, and about 400 cases have found buyers at 1½d rising to 1 17-32d per oz "c i f" for September-October steamer, and 1½d per oz "c i f" for September-January steamer shipment. Citronella oil offers on the spot at 1s 3½d to 1s 4d per lb according to quantity, and for shipment there are sellers at 1s 1d c i f terms.

QUININE has been more active, and closes at an advance of about ½d on last week's rates about 30,000 oz having found buyers on Monday and Tuesday at 1s 1½d per oz for second-hand German brands in bulk. Business in second-hand, however, is somewhat hampered by the fact that there is only ½d per oz difference now between the manufacturers' price and that of second-hand holders. The market closes very firmly, with few sellers at 1s 1½d per oz.

London, October 3rd.

KOLA.—Still tending easier. Of 31 packages offered today, 8 West Indian sold at from 10d to 11d for good, and from 7d down to 4d for ordinary to very poor.

QUININE Again slightly dearer, with sales of about 5,000 oz second-hand German bulk at 13½d per oz.

ESSENTIAL OILS—Cinnamon oil was bought in at 1s per oz., but 8d per oz would be taken for fair quality. For Lemongrass 1½d per oz, c. i. f. is said to have been paid, which would be dearer. Citronella is also higher. On the spot 1s 4d per lb is reported paid; for shipment the quotation is 1s 3d per lb c i f for drums, but there are no buyers over 1s 2½d per lb.

THE CLYDE TEA ESTATES COMPANY,
LIMITED.

The prices given for the properties purchased are as follows:—

1. Clyde (including Enselwelle)...R150,000
2. LiskillinR 48,000
3. Kaluganga... ..R 43,000

The extents are:—(1) 320 acres, 241 in tea; (2) 205 acres, 137 in tea; (3) 186 acres and 130 in tea—the age of the tea has, of course, to be considered in each case.

A "CRACK" TEA ESTATE FOR SALE.

The death of Mr. K. C. MacIver has thrown his Lippakelle estate into the market and all Dimbula is watching to see if it will realize £100 sterling per acre, and so top the record for Ceylon. This price is not outrageous, if it be true that the profits for four years averaged from £15 to £16 per acre, so beating the return for any property in Ceylon. It is not settled yet whether Lippakelle may be put up to public auction: this course will be adopted if it is not sold privately.

THE BEST SOAPS FOR WARM CLIMATES
are CALVERT'S TOILET SOAP (6d. Tablets) and PRICKLY-HEAT SOAP (6d. and 1s. bars), pleasantly perfumed, for Bath or Toilet, containing 10 per cent. of Pure Carbolic. Very serviceable as preventatives of Prickly-heat and other skin-irritation. Sold at Chemists, Stores, &c.
F. C. CALVERT & CO., MANCHESTER.

THE
AGRICULTURAL MAGAZINE,
COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

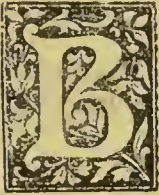

The following pages include the Contents of the *Agricultural Magazine* for November:—

Vol. VII.]

NOVEMBER, 1895.

[No. 5.

AGRICULTURAL EDUCATION.

RIEFLY stated, the object of agricultural education is to teach the most enlightened methods in the cultivation of the soil, so that the cultivator may secure the best results while the fertility of his land is maintained. As the wealth of a nation depends upon the agriculture of the country, it is but fitting that agricultural education should receive Government aid in as large a measure as any other department of education. At the same time agricultural education should be made as attractive as possible to all, for there are few persons, particularly in the Colonies, that have not a direct or indirect interest in the soil. It is a mistake to imagine, as some do, that the results of agricultural teaching can be gauged by the number of scholars, who after their training at school cultivate their own lands. If this test were applied to agricultural colleges abroad, it will be found that the majority of those who are being trained at these schools are by no means intended to be farmers. The more the individuals of a community—no matter in what capacity they are serving, whether as professional men, Government servants, or in private employ—know of agriculture, of the soil and the plant in all their bearings, the better for the community and the country to which they belong. We do not think of limiting the literary education of a boy because he may not intend to be a literary man, or what is popularly called his "scientific education," because he has not made up his mind to be a worker in science. The object of education in its widest sense is, we take it,

to expand the mind and enable men to think and act under the various circumstances in which they may be placed. It is but meet that we should make themselves acquainted with our natural surroundings—the soil, the air, plants and animals, and the various relations in which they stand to one another. Unfortunately there are some people who are proud to own their ignorance of these matters, and others who imagine or pretend that they know all about them, when in fact their ignorance is prodigious.

In this country we should greatly desire to see all minor native officials possessed of an up-to-date knowledge of agriculture, such as will equip as well as actuate them to take an active, intelligent, and honest interest in the welfare of their more ignorant and conservative brethren who are engaged in agricultural operations.

OCCASIONAL NOTES.

The fertility of soils is always a subject of interest, and we therefore direct attention to a series of papers on this subject written by Professor Edward Kinch, the well-known chemical lecturer at Cirencester, the first of which appears in our present issue.

We have been favoured with a copy of the "Memoranda of the origin, plan, and results of the field and other experiments conducted on the farm and in the laboratory of Sir John Bennett Lawes, Bart., D.C.L., LL.D., Sc.D., F.R.S., at Rothamsted, Herts." The present year is the fifty-second year of the experiments. The pam-

phlet is replete with facts and figures derived from all manner of experiments with crops, manures, food-stuffs, &c., and should prove a valuable work of reference.

Whether the operations of the Cutch Company in the Eastern Province will result in the ultimate extirpation of the mangroves that flourish in our tidal areas is more than we can say, but the protest that has been raised in Jamaica against the destruction of the mangrove in that colony and the claim put forward for this tree as a sanitary agent are undoubtedly of local interest. The mangrove is said to solidify the mud where it vegetates and to raise it. From the leaves, bark and seeds which fall from the mangrove, we are told that the mud receives an immense amount of tannin—a powerful antidote against putrefaction. By catching and solidifying the mud it keeps it from spreading, and while preventing the increase of the fixed shell-fish and the multiplication of other species, particularly the crabs—the greatest consumers of organic matter deposited on the banks. It is further stated that where the mangrove flourished, yellow fever and other disorders of an endemic character were unknown. If these statements are founded on fact, it would be well for us to take heed lest in our anxiety to encourage enterprise, we open the door to fresh evils.

Dr. George Watt suggested enquiry into the possibility of increasing the yield of Cutch by acacia catechu, by mechanical or other injuries to the plant. Dr. Leather, the agricultural chemist, remarks that it "appears to be probable that catechin can be drawn from the trees by wounding them, for it is a solid substance found in the heart-wood." The Director of the Imperial Forest School states, "if catechin were a gum obtained by exudation and chiefly from the sap-wood, no doubt wounding the trees would increase the production, but it is not a gum but a substance found in the heart-wood, and wounding could have little or no effect." In spite, however, of these opinions, Dr. Watt goes on to point out that the removal of gum or any other mechanical disturbance to the life of the plant through wounds, diseases, drought, &c. might easily enough cause a deposition of crystalline matter within the wood. He further refers to analogous cases thus: "The irritation caused by sand within the oyster shell is believed to be the exciting cause to the formation of the pearl. Barus camphor is deposited within the wood of *Dryobalanops camphora* very much after the same manner as catechin (kirsal) within that of acacia catechu. The crystals of that form of camphor are well known to occur within the heart-wood, hence it is said old trees are the most productive. In searching for trees likely to yield camphor, the natives pierce the stems to the heart-wood, thus injuring them materially; but it is said that a tree left for seven or eight years will then be found to contain deposits of camphor freely, so that the tapping process has come to be regarded as facilitating the formation of the much-prized article. The formation of Agar (a crystalline substance found within the wood of *Aquilaria agallocha*) is believed to be due to some diseased condition. The formation of the crystalline substance *tabashir*

within the bamboo has been demonstrated to be due to an insect. A native merchant (according to Mr. Peppe) tried to imitate the action of the insect, with the result that he found that by making a small perforation above a joint in half-mature bamboos the salt formed freely. This he practised systematically and made a considerable sum of money before he finally glutted the market with *tabashir*. (*Dict. Vol. I., 385.*) It is not unusual in fact in agricultural operations to check the growth of plants so as to cause the formation of reserve materials. In the production of *ganja* it is found necessary to remove the male plants since the fertilization of the female destroys the formation of the narcotic. But in some parts of the country (as in Burma) this same result is obtained by injuring the stems. Without mentioning other such examples it may fairly well be said that it remains to be demonstrated that the yield of catechin is not a matter that is capable of control. It was, however, from analogy in similar instances that the writer ventured to make the suggestion that the formation of catechin might be facilitated by mechanical agencies or other disturbances to the life of the plant. This, however, was only a suggestion, though it is one that might still be kept in view."

PRINCE KRAPOTKIN'S ARTICLE IN THE "NINETEENTH CENTURY."

Prince Krapotkin has done good service as a chronicler in almost every department of Science, and his summary of the result of the researches into the nature of the relation between the plants, the soil, and the free nitrogen of the atmosphere is a valuable contribution to the literature of the subject.

Nitrogen, in one form or another, exists both in the soil and in the atmosphere, and it is curious to note that apparently contradictory

conclusions resulted from enquiries into the relation of both these sources of nitrogen with plant life, till fresh research in a new direction altogether, helped to reconcile the apparently contradictory results.

(1.) *As regards Atmospheric Nitrogen.*—Some fifty years ago, Boussingault, as well as Lawes, Gilbert, and Pugh conclusively proved that plants do not absorb free nitrogen from the air through their leaves. And yet Ville has brought forward no less conclusive evidence to prove that in some way unknown small quantities of nitrogen always find their way from the atmosphere into a vigorous plant (irrespective of the ammonia and nitric acid that might be derived from the atmosphere).

(2.) *As regards Soil Nitrogen.*—We are told that Liebig declared that cultivable soils have quite enough of nitrogen for agricultural purposes—left by previous generations of plants—and advised that the mineral salts carried away by plants should be returned to the soil. But it was found on the contrary that plants could not do without nitrogenous manures, and that the addition of stable manure gave vigour to plants and seemed to vivify these very nitrogen compounds previously present in the soil.

Prince Krapotkin then goes on to show how experimentalists gradually came to see that chemical experiments carried on in Laboratories were insufficient to explain away the apparent contradictions referred to above, and to account for the true relationship between the plant and the nitrogen found in the soil and the air; how, while we are more and more persuaded that chemical processes that are going on within are complex and unstable compounds are the real basis of life, we have also come to know that the seat of these processes must be looked for in the infinitesimal component parts of the organism and the microscopical inhabitants of its organs.

It has been proved to conviction that the progressive increase in the percentage of nitrogen in soil left uncultivated is due to the lower fungi and micro-organisms which develop in prodigious quantities in decaying vegetable matter. Neither the nitrogen shut up in vegetable mould or in the form of insoluble ammoniacal salts so easily formed in a clayey soil is of any direct avail to plants. It is now known not only that a "living ferment" is necessary for the production of nitric acid and nitrates in the soil, but also that the process of converting ammonia into nitric acid is performed by special microbes, and that two different bacteria are required to accomplish the full process—one to decompose ammonia and transform it into water and nitrous acid, the other to further oxidise this acid and convert it into nitric acid. Without these two microbes, which are continually preparing fresh nitric acid in the soil, while the previous stocks of it are washed into the subsoil, agriculture would be in a precarious state. In the enquiry into the relation between plants and free atmospheric nitrogen, it was first discovered (by Wilfarth and Hellriegel) that the roots of papilionaceous leguminosæ—which strikingly showed an apparent independence as regards soil nitrogen—were found in fertile soils to be covered with nodules originated from agglomerations of bacteria (*B. radiculicola*) which have a sort of symbiotic association with the plants. It has been further

demonstrated (by Schlosing, jr. and Laurent) that various mosses and especially algæ (*Confervæ*, *Oscellariæ Nitroscæ*) which usually develop on the surface of the soil also absorb nitrogen from the air. But leguminosæ are not the only higher plants that can utilize atmospheric nitrogen by the aid of bacteria. *Elaeagnus angustifolia* (a garden shrub nearly allied to the laural tribe) has also been found to harbour the bacteria that utilize atmospheric nitrogen, though different from *B. radiculicola*. Indeed, it appears that each species of leguminosæ has its own bacteria especially appropriate for entering into a mutual benefit association.

These discoveries, to quote Prince Krapotkin's own words "have solved enigmas of long standing, and to the practical agriculturist they promise a new method for improving the soil by watering it with liquids containing the necessary microbes. Once inoculated into the soil the nitromonade (or *nitrosomonas*) of the soil and the *Bacteria radiculicola* in the root nodule will continue their work. . . . The fact that the nitromonade though devoid of chlorophyll is capable of making the synthesis of organic compounds out of purely mineral salts is of immense importance in the economy of nature."

It has been proved that the beech can only thrive when a mantle of mycorrhiza fungi envelope its roots, and while obtaining their nutriment from the soil yield part of it to the roots of the tree. The same has been found true in the case of the pine.

In conclusion, to quote Prince Krapotkin again, "all these are evidently but separate instances of a much more general fact, which only recently became known under the general name of symbiosis, and appears to have an immense signification in nature. Higher plants depend upon lower fungi and bacteria for the supply of that important part of their tissue, nitrogen. Lower fungi associate with unicellular algæ to form that great division of the vegetable world the lichens. More than a hundred different species of algæ are already known to live in the tissues and the cells of animals, and to render each other mutual services. And so on, associations of high and low organisms are discovered every day; and when their conditions of life are more closely examined, the whole cycle of life changes its aspect and requires a much deeper signification."

LAWS OF CEYLON RELATING TO AGRICULTURE.

CHAPTER X.—(Continued.)

6. Provided, however, that nothing in sections 3, 4 and 5 of this chapter shall apply to—

(a) Any channel, watercourse or ela which has been or may hereafter be cut, opened, or constructed for irrigation purposes within a period of not less than one year after such land or premises or portions thereof shall have been cleared and drained for cultivation, except in so far as such channel, watercourse, or ela may be so blocked or obstructed by reason of any further and additional clearing carried on, or any further and additional drains opened, on such land or premises or portions thereof after such channel, watercourse, or ela has been so cut, opened, or constructed as aforesaid; or—

(b) Any channel, watercourse, or elu which has been or may hereafter be cut, opened, or constructed for irrigation purposes through, and without payment of compensation to the owner of any land or premises not cleared and drained for cultivation.

7. (1) The owner or occupant against whom any order is made under the last preceding section shall

(a) Perform within the time specified in the order the act directed thereby; or

(b) Apply within ten days from the date of service of the said notice, by petition to the District Judge of the district in which such land or premises may be situate, for an injunction to restrain the Government Agent from enforcing such order, on the ground that the same is contrary to law. And every such petition shall be accompanied by an affidavit containing a statement of the facts on which the application is based.

(2) Upon receiving such application the District Judge shall forthwith cause copies of the said petition and affidavit to be served on the Government Agent, and shall fix an early day for enquiry into the matter and give notice thereof, both to the applicant and the Government Agent. If the District Judge after taking evidence which the parties may adduce, or he himself may require, is satisfied that the order is contrary to law, he shall issue such injunction as aforesaid, but if he is not so satisfied he shall make absolute the order of the Government Agent, and in either case he shall award such costs as he shall deem meet.

8. If such owner or occupant to whom such order shall have been given shall refuse or neglect to comply with the same, the said Government Agent shall, if no injunction as aforesaid shall have been served upon him within thirty days from the expiration of the time specified in the notice, cause the obstruction by silt, earth, or other substance to be removed, and shall provide such drains, pipes, and other works as may be necessary; and for that purpose the Government Agent shall have power, and he is hereby authorised to enter into any land or premises, and to cause to enter therein such persons with such instruments and things as may be required.

9. (1) The costs which have been *bona fide* incurred by the Government Agent under section 8 shall be certified under his hand, and shall be a first charge on such land or premises, and on any crop or produce thereof, and on any movables thereon.

(2) The Government Agent shall proceed to recover such costs by seizing and selling such land, premises, crop, produce, or movables, in manner provided in section 1 of chapter IX., and the provisions of that chapter shall *mutatis mutandis* apply to every such seizure and sale.

10. All the powers, duties, and obligations entrusted to or imposed on, the Government Agent by this Ordinance, shall and may be executed and performed by any Assistant Government Agent within the limits of this district.

MICROBES.

The term microbe is often vaguely understood, though since of late it occurs very frequently in our daily readings. Professor Crookshank, one of the leading bacteriologists of the day, has contributed a very interesting paper on this subject to the Journal of the Royal Agricultural Society of England.

Microbes are now divided into four classes: Bacteria, yeasts, moulds and protozoa. The first three classes are of vegetable origin and the last includes animal organisms.

Bacteria are such minute objects that when magnified under powerful microscopes, a thousand times, often appear as mere commas or dots in an ordinary printed page. The different classes of bacteria, vary greatly in size and appearance. Some are egg-shaped and found singly, in pairs or in the form of chains, others are rod shaped and some others spiral. From these different shapes bacteria are divided into three classes, viz., micrococci or spherical forms, bacilli or rod forms, spirilla or spiral forms. Bacteria possess the power of motion, and under the microscope they are observed to move to and fro and often turn round and round. They reproduce by division. A bacterium increases in size, constricts in the middle and is divided into two. There is another mode of reproduction where distinct spores are formed and shed from the mother bacterium. It is said that a bacterium produces two new individuals in an hour; this is a formidable process of reproduction, as at this rate a single bacterium is capable of giving rise to a crop of nearly sixteen and a half million bacteria in a day. These bacteria, however, require suitable nourishment for their growth, and when this is not found they perish. If not for this provision the multiplication of bacteria would take place to such an extent as to exclude all other living things from the surface of the earth. Bacteria must be supplied with food, they require oxygen, nitrogen, carbon, water and certain mineral salts. They cannot thrive at all temperatures—high temperatures and very low temperatures easily kill them. They produce certain changes in the mediums in which they grow, and according to these changes they are classed as pigment bacteria (producing colour stuffs), ferment bacteria (setting up fermentation), putrefactive bacteria (producing decomposition), pathogenic bacteria (causing disease).

Micrococcus prodigiosus is given as an example of a bacteria that produces colour stuffs, it produces a red colour similar in appearance to blood, and is the origin of blood-rain which we often hear. It has even been suggested that this micro-organism was responsible for one of the plagues of Egypt, for it sometimes appears as a blood-red growth covering the surface of pools and ponds in marshy districts. Instances are given of its appearance on the bread of a military bakehouse in Paris, and in some places in Italy. Even in Ceylon we hear of blood-rains. The blood milk which milkmen here sometimes complain of and attribute to "evil eye" may be traced to the presence of this organism. There is also another organism, *Bacillus syncyanus*, which spoils milk by turning it a bluish colour. There are certain bacteria which cause phosphorescence. Fish thrown up on the shores of some coasts become luminous at night owing to the growth of these bacteria,

An instance of bacteria causing fermentation may be found in the case of wines which turn into vinegar. A yeast causes the fermentation of toddy into a liquid containing alcohol, and a protozoa causes a fermentation in butter.

The class of bacteria that causes putrefaction is important in that some of them are useful and others dangerous. These bacteria hasten the disintegration of bodies, and if not for their presence we will find all dead bodies to have mummified. The mummies of Egypt have been preserved by the use of certain ingredients which prevent the attack of putrefactive bacteria. In putrefaction certain alkaloids, *ptomaines*, are found which are very poisonous substances. The poisoning as a result of taking tinned meats &c. is produced by *ptomaines*.

The other class of bacteria are those that produce disease. It may be questioned that if it is true that varieties of bacteria are found in the air, water and dust and even in myriads on our own bodies, how could it be possible to attribute the cause of a disease to any of these. But the particular disease germs are met with in the blood and tissues, and when these are artificially cultivated and introduced into the healthy animal body cause disease of the same nature as that which the original person or animal suffered from.

"Foul air is full of germs, water may come from a polluted stream, or be contaminated with sewage from leaky drains, cesspools or with soakage from cemeteries carrying the contagia of typhoid fever, diphtheria or cholera. Rags and dust bins are the hamlets of germs, meat and milk may come from animals suffering from tuberculosis or other disease and be unfit for human food. Pure air, pure water, pure food, pure surroundings and a pure life—such are the weapons with which we must oppose these invisible enemies of mankind and avert the dangers to which we are otherwise exposed."

W. A. D. S.

THREE WELL-KNOWN CEYLON GRASSES.

The introduction of *Panicum maximum*, Guinea grass (when and by whom) into Ceylon is not definitely recorded. It is known to have been growing here in 1824. The late Dr. Gardner introduced what he supposed to be a new fodder, but it eventually turned out to be identical with Guinea grass. It was introduced into Jamaica about 1744 from the coast of Guinea. Lunan in his *Hortus Jamaicensis* says that this most valuable grass is a native of Africa and was introduced into the West Indies by a mere accident. A gentleman by the name of Ellis brought over some birds from the coast of Guinea and with them some seeds for their support; the birds dying soon after, the seeds were thrown away as useless. From these seeds grew up some luxuriant grass which attracted Mr. Ellis' notice, and he had a horse and a cow brought where it was, when both greedily ate of it. It was then transplanted into a garden and gradually cultivated, till it became one of the most paying and useful plants in Jamaica.

Mauritius grass, *Panicum molle*, is erroneously so called as it is not native to that country. Its introduction into Ceylon is also obscure. The cultivation of the grass in Colombo was at one time

confined to a single firm, viz., Messrs. Wilson, Richie & Co, until their failure some years ago, when the Tamils and Sinhalese (particularly the former) began to cultivate it; and the grass now occupies every bit of lowlying land available in Colombo and the suburbs. Trinius gives Brazil as its native place, but it is said to have originally come to the Botanical Gardens at Culcutta from Sumatra about ninety years ago, and Mr. William Ferguson thought that it very likely spread from there to the various places in which it is now cultivated. Roxburgh mentions that it was Dr. Charles Campbell who brought it to Calcutta in 1804.

Cynoden dactylon is the well-known *doob* grass (also called *Huryalee* and *Arngam-pillu* by the Tamils). It is considered the most nutritious of the natural grasses for cattle, and is indigenous to the Island. Hitherto it has been described under about a dozen scientific names, and is identical with the *Panicum dactylon* of Linneus. The grass occurs over a great part of the world—in England and other parts of Europe, India, China, Thibet, Australia, South and Central America and the Cape. It is believed to be the *Agrostis* of the Greeks, and its perfect flowers considered "among the loveliest objects in the vegetable world." Its usefulness and beauty have led to its being made "sacred" to some of the Hindu deities.

NEW METHODS WITH TOBACCO.

The usual method of harvesting tobacco leaves for curing is to cut away the stalks of the plants and afterwards strip off the leaves. Another method is, however, being adopted in the Southern States of America, and the following account from the *Cultivator and Country Gentleman* shows the advantages of the new process over the old, and should be of interest to local tobacco growers:—

Under this system the routine of planting and cultivation need not differ essentially from that in general use. The first important divergence from the ordinary line of practice is made when harvesting begins. The usual way is to cut the stalk at the ground, at the time when the largest part of its leaves are ripe. Just previous to this, topping of the plant is done, when a number of the upper and immature leaves are broken off and thrown away. By the new plan, the leaves which ripe first are plucked from the stalk, leaving therest to be gathered as they mature. The bottom leaves which are thus saved, as they are the first to ripen, would otherwise decay and be lost before the other leaves of the plant are ready to be harvested. The leaves are gathered at several different times, always from the bottom, until nothing of the plant is left in the field but the stalk and its suckers. Removing the first leaves is said to hasten the maturity of the rest, so that the entire crop may be secured earlier than it could be otherwise, thus lessening the danger from frost. Finally, the top leaves, which when ripened are not without value, are saved.

Removing a part of the leaves admits the sunshine more freely to the others and also to the ground at the roots of the plant. This is regarded as essential to the perfect distillation and secretion of the subtle oil that gives the finest wrapper leaf its delicate aroma, and which is complete only in the thoroughly ripened leaf.

A great advantage claimed for this process is the complete separation of the leaf from the stalk as soon as the leaf is ripe. It is said that, if the leaves are not removed, the stalks will extract nearly two ounces of the oil of tobacco from every pound of leaves cured on them, and that when the leaves are cured separately, the tobacco is about 15 per cent. heavier than it would otherwise be.

The leaves of the tobacco plant do not all ripen at the same time, and while the upper ones are maturing, the lower leaves are becoming worthless. This fact puts the farmer in a dilemma. If he leaves the plant until some of its leaves are over-ripe, it is believed that their oil is absorbed by the stalk and their value thus impaired. If he cuts the plant while some leaves are green, these immature leaves will be of little worth. It is urged that loss in either direction may be avoided by taking off the leaves as fast as they ripen.

In practice the leaves are gathered and laid in baskets 3 feet long, 18 inches wide, and 9 inches deep, and in them conveyed to the curing-house. This building is provided with heating apparatus, usually in the basement. The leaves are strung on steel wires, 84 leaves to a "stick." As soon as a "section" of sticks is filled, it is hoisted to its place. The leaves are cured in a very short time, compared with the process of air-curing on the stalk. House-burn, or pole-sweat, is said to be entirely avoided.

It is estimated that the tobacco stalks grown on an acre of average land contain 4,000 lb. of water. When damp or rainy weather prevails, it is believed that this quantity of water in the stalks is a serious drawback to good cures in tobacco sheds, and is a probable cause of pole-sweat. When the weather is propitious, and the best results with the stalk-cure are obtained, it is argued that the leaf is more or less impregnated with a bitter flavor, gathered from the tannin contained in the stalk.

The above are, in substance, the leading arguments advanced by the advocates of the leaf-cure as against the stalk-cure. As to the merits or demerits of the former, I do not care to express a positive opinion. Intelligent growers will doubtless investigate and judge for themselves. Several patents are held in connection with the process. In the few instances in which the leaf-cure has been tried in Connecticut and Pennsylvania, the growers have seemingly concluded that its advantages over the old method are more than offset by the great additional labor and expense involved.

CRUELTY TO ANIMALS.

Animals are cruelly treated under different circumstances. Many owners only think of getting as much work or making as much money out of their animals as possible. There are others who seem to derive a sort of morbid enjoyment by illtreating their beasts &c. There is yet a third way in which animals suffer, in that they are subjected to different methods of treatment which cause them pain, with the object of doing them some good. This last form of cruelty is more or less due to ignorance, the first-mentioned to selfishness, and the second to wanton cruelty.

In any scheme for the prevention of cruelty to animals no practical good can be effected without taking into consideration the origin of the forms of cruelty. Punishment is no doubt a necessity in most cases, but before a person is punished for alleged cruelty, it is always advisable to take into consideration the motive or motives that led to the act.

Here in Ceylon the forms of cruelty we meet with are not very numerous. Lame bulls or those with sore necks are put to the yoke, or lame horses are made to trot about with heavy traps all day. Children and often grown up people in a few instances illtreat harmless creatures, but such instances are extremely rare. Branding is the form of cruelty which is perpetrated through ignorance.

A Society is useful in checking these practices, but when that Society can employ only one or two paid agents to travel about the length and breadth of the island, the advantages gained will be very small, and perhaps nothing. The evidence of the activity of the paid agent should not be gauged from the number of prosecutions entered in the Courts nor the amount of fines recovered, but from the condition of animals that are seen about. It is a noteworthy fact that we come across, almost daily, horses used in waggons and cattle used in carts that are not actually fit for the work; but these are allowed to go about unmolested, whereas a few are now and again prosecuted.

Cruelty to animals is a Penal Act in the island, and any breach of this Act should be duly noted by the guardians of the peace, and if in any way these officers neglect to do their duties, it is for the public and within the province of a Society to insist on their attention to this duty. A S.P.C.A., if it appoints paid agents at all, should do so to note the extent to which cruelty exists, and then to inform the Society not against the owner of animals but against those who neglect to perform their duties. It is a great pity that no one has yet recognized the fact that the very appointment of special agents to carry on the work of prosecuting those committing cruelty to animals is in itself the most damaging to the cause they have at heart; for by that means they imply that either an act of cruelty and a breach of the law in that respect is not of much importance, and the officers of Government who are specially appointed to see the laws of the Island carried out do not take a serious view of such acts, or that the cruelty exists only in the eyes of a band of persons who are joined together to form a Society for P.C.A.

The legitimate duties of a S.P.C.A. should be, if the aims of the Society are actually to benefit the animals and ensure their better treatment, to instruct the people in humanity, and to show them an example by providing suitable institutions for treating animals when ill or otherwise disabled. They may if they find their resources ample also devote some of them in seeing that the duly authorized guardians of the law do not neglect their duties in respect of paying due attention to cases of cruelty.

W. A. D. S.

CUTCH.

The *Agricultural Ledger* No. 1 of 1895 is devoted to an exhaustive account of Acacia Catechu and its products. The three important

products of the tree are "dark catechu" or the commercial *Cutch*, "pale cutch" or *Katti* (identical with the "kaipoo" used by the Sinhalese to chew with betel, lime, tobacco, and areca), and kirsal or khersul, a resinous product of great value found imbedded in the wood. The following is an account of the method of preparing "dark catechu" or the commercial *Cutch*, the valuable tan in India and Burmah. (Query? Have the Cutch Company the "Rat-Kihiri" trees among those to be operated on?)

The trees that yield this substance are regarded as mature when about a foot in diameter. They are then felled and cut up into blocks two or three feet long. In some parts of the country the Natives ascertain whether it will pay to cut the trees, by making a small notch into the heart-wood. Trees between twenty-five and thirty years old are regarded as best suited and are said to yield more or less according to the number of white lines perceived in the heart-wood. The bark and the outer sap wood are generally removed and rejected.

The red heart-wood is then cut into small chips. In certain districts the branches are not utilized in the preparation of the extract, in others they are so used. The chips are then boiled in water in earthen pots for twelve hours. When the water is reduced by one-half, the chips are taken out and the liquid placed in large iron pans or cauldrons and again boiled and stirred till it attains the consistence of syrup. The cauldrons are then taken off the fire and the stirring of the liquid continued till the mass is cool enough to be moulded, when it is taken out and spread on leaves arranged within a frame or mould and left for the night. In the morning the *Cutch* is dry and then exists as brick-like masses that each weigh 36 to 44 lb. These are broken up into pieces ready for the market. The process of boiling and preparation of the dry extract varies considerably all over the region where the article is made, but the principle is the same as that given above, which may be said to be the Pegu system. Occasionally the chips are boiled a second time with the production of a small amount of inferior stuff. In other cases the red liquid is poured over fresh chips and again boiled.

From the widespread conviction of the necessity for stirring or beating the concentrated solution (on its being removed from the fire), it might almost be inferred that some chemical change was thereby effected similar to the oxidation produced by beating the indigo-vat solution. Thus for example, in Baroda the decoction is strained through a blanket. For this purpose the blanket is dipped into the fluid, stirred about and then wrung out, while the blanket is being held at as great a height as possible. By this process the liquid falls through the air in a greatly divided stream or shower, and this is continued for an hour or so, the liquid being repeatedly wrung through the blanket, the trough is then covered over with a lid of split bamboos and the sediment allowed to subside. The water is then poured off and the extract cut into small cakes and allowed to dry. In Bariya (Guzerat) the thick decoction is poured into pits, five or six feet deep, in the bottom of which baskets are placed. The liquid drains off, the chips are

retained in the baskets and the solid extract formed on the floor of the pits. This is removed and dried on leaves while exposed to the sun.

Speaking of the Pegu system, it is admitted that much difference of opinion prevails as to the value and extent necessary of the heating process. One writer says it is more of a "beating up" than "stirring," but I have never been able to ascertain what the object or effect of the process is. Cooks differ, to, in the amount of beating up that is desirable, some being satisfied with half an hour's application. It will be seen below in connection with the subject of *Kath* that a peculiar system of encouraging crystallization (which may be analogous to the beating) is considered essential.

In Pegu the manufacture of this article extends from June to March, but the months of December to March are regarded as the best. In April and May scarcity of water is supposed to stop the works, while in the rainy season the difficulty of transport checks the industry.

As to the amount of *Cutch* yielded by heart-wood, it had been stated that from 3 to 10 per cent. in weight would be a good average. In other words, one ton of timber in the round might be taken as yielding 250 to 300 lb. of *Cutch*.

The *Cutch* trade appears in several forms. The Pegu variety occurs in masses with layers of leaves between the successive preparations. But *Cutch* is also met with in cubes of various sizes which often show the markings of leaves used in the moulds, or it occurs in sharply-defined cubes or blocks from having been cut up by a string or wire run through the still plastic mass. In other cases it is sold in rounded balls or flattened cakes made in the hand.

In colour it is externally of a rusty brown, internally a dirty orange to dark liver-colour, and in some cases almost black or port-wine coloured. It is inodorous, but has an astringent bitter taste, followed by a sense of sweetness. It is brittle and breaks with a more or less resinous shining fracture.

THE FERTILITY OF SOILS.

(PROFESSOR KINCH.)

The fertility of a soil is partly dependent on its chemical composition, but also partly on its mechanical and physical condition. Its productiveness is influenced very largely by its environments of climate and weather. Upon the size of the prevailing particles in a soil its physical properties, and therefore its fertility, largely depends; the actual total number of particles amount to many millions, or even hundreds of millions, per grain weight of soil. When the size of the particles is large, good crops can only be grown with the copious addition of manures, especially those containing organic matter, or by means of irrigation. Grass grows well in soils with very fine particles. The coarser particles of the soil, including sand, have little cohesion, and little power of holding water. A gravelly or sandy soil is therefore easy to work with a plough, as its tenacity is low; it is dry, as it holds little water, and that is readily evaporated; it is, under most conditions, warmer than a clayey soil; it has some advantages for market gardening. Soils containing very fine particles and clay are tenacious, and, as such, stiff; they retain much more water than sandy soils, and do not dry so readily; their capillary power is greater; they are colder than sandy soils. Soils having very much the same ultimate chemical composition might be in either of these categories, according to the fineness of their particles. Both sandy and clayey soils are improved by the addition of humus, the decaying organic matter of the soil. In sandy soils it holds together or cements the soil particles; it increases their power of holding water and their power of absorbing water from the air, and so renders them less liable to be burnt up in dry weather. Organic matter added to clay diminishes its coherence, and makes it more easily worked; the

ameliorating effects of long dung on heavy clay are well known. Humus has a greater power even than clay of absorbing water. Humus not only exerts important effects of a physical nature, but it is important from a chemical point of view as a storehouse of the most valuable constituent of plant food. The good properties, and, therefore, the fertility of a soil, are increased by the presence in it of easily decomposable compound silicates, which exert an influence on its absorptive powers for some of the important ingredients of plant food.

Sometimes it is necessary to distinguish between what may be called the inherent and, to some extent, permanent fertility of the soil, and its temporary fertility or high agricultural "condition"—which latter has been brought about by the care, skill, and capital of the cultivator, and which he can to a large extent remove in his crops. The inherent fertility is much more difficult to remove, and only very slowly disappears under adverse circumstances; upon it the amount of the rent of land depends to a considerable extent.

CHEMICAL CONDITIONS OF FERTILITY.

Plants obtain from the soil all the ash constituents they contain, and most plants obtain thence, also, the nitrogen they require for their growth. It follows that if the most important chemical constituents of a soil are nitrogen, phosphoric acid, potash, and lime, the soil to be fertile must not only contain these constituents, amongst others, in a good proportion, but they must be in a form in which they are available to the plant as food. If they are locked up in a totally insoluble form, they might be present in the soil in large amounts and yet the soil be absolutely sterile. A soil to be fertile must also be free from poisonous and injurious matter—such as decomposable sulphides, excess of ferrous salts, excess of saline matter, especially of common salt, and even from too large a quantity of acid organic matter. But the actual fertility of a soil, as far as it can be measured by chemical means, is dependent mainly on the amount and the conditions of the four ingredients—nitrogen, phosphoric acid, potash, and lime.

It has been seen for many years that of any one factor making up the fertility of a soil the nitrogen is the most important. The nitrogen of a soil is almost entirely contained in the organic matter or humus, which consists of the residues of previous races of plants which have grown in the soil and decayed there. Sir John Lawes has pointed out more than once that "fertility is due to the organic residue of previous generations of plants, mixed with certain mineral substances, the most important of which are phosphoric acid and potash." Lawes and Gilbert, in a paper read to the Chemical Society in 1885, also state that "not only the facts adduced in this and former papers, but the history of agriculture throughout the world, so far as it is known, clearly shows that, pre-eminently so far as the nitrogen is concerned, a fertile soil is one which has accumulated within it the residue of ages of natural vegetation, and that it becomes infertile as this residue is exhausted." A soil rich in humus is rich in nitrogen, though the one is not an exact measure of the other, as the percentage of nitrogen in humus is somewhat variable. Also, this nitrogen is not all equally valuable to the plant. Some of it may be in a form in which it soon becomes assimilable,

whilst part of the organic matter strongly resists the processes of oxidation and decay in the soil, and so the nitrogen in it remains for a long time in a locked-up form, in which the plant can make no use of it. This, indeed, is a very advantageous provision, as if the nitrogen all became available and soluble in a short time it would certainly be largely wasted by being washed out of the soil ere plants could utilise it. The chemical analysis of a soil is a matter requiring a good deal of time and a good deal of skill, and when it is done it may not tell us all we want to know. We can find out the total amount of nitrogen, phosphoric acid, potash, &c., in the soil, or the amount soluble in strong hydrochloric acid, or, with greater difficulty, the amount soluble in water; but none of these represents the amount of plant food which the plant itself is capable of attacking in, and absorbing from, the soil. Moreover, different plants have different powers of taking up the various plant food. All plants, however, can undoubtedly take up from soils matter which is not soluble in water, and this they no doubt accomplish by means of the acid sap in their rootlets or root hairs.

(To be continued.)

THE MANUFACTURE OF RHEA FIBRE.

So much of a contradictory character has recently been published regarding the Rhea fibre and the rival methods of preparing it, that the ordinary reader has learned to treat the subject as only in the experimental stage and of doubtful practical value. Our readers will therefore be interested in the following particulars of rhea in connection with the Gomess process of preparation. Only recently we have had an opportunity to see and examine samples of the rhea fibre in every stage of manufacture, including the finished and dyed article in the form of yarns, cords, and cloth, as prepared under the Gomess patents. The plant itself grows wild in many parts of India, and is already cultivated in several districts. Its productiveness may be shown by the following figures. From Mr. Favier's book on "Textile Nettles" it appears that Mr. Montgomery cultivated rhea in the Kangra Valley, and produced 1,900 lb. of rhea ribbons or bark per acre for twelve successive years. Mr. Gustav Mann, Conservator of the Assam Forests, produced 1,800 lb. per acre. The Indian Husbandry Co., at present working in Bengal, report their production to be over one ton per acre, and Mr. Manuel, of Lucknow, in his report gives the average production of dried rhea ribbons in well-manured and moist ground to be one ton per acre per annum; while Mr. Fredrick Pincott has contracted to supply the London Rhea Fibre Treatment Co., Ltd., 15,000 tons of rhea ribbon from India at £7 or R130 per ton f.o.b.

The ribbons after being separated from the natural gum by the Gomess process become *filasse* within twenty-four hours, with a loss of 30 per cent. on the original weight. There is thus 14 cwts. of *filasse* left, which, it is said, will find a ready market in England at £112 per ton. The product of an acre when washed is thus equal to £77 per ton. The present market value of rhea ribbon is from R120 to R140 per ton, but it is highly probable that more extended cultivation will bring it down to a price ranging from R80 to R100 per ton, or R60 to R65 per acre as the cost

of cultivation. Thus the cultivation of rhea will be much more profitable than that of cotton.

Considering the enormous cotton production of the United States it is a noteworthy fact that the Senate at Washington has just passed a Bill with a view to encourage the cultivation of the rhea plant, offering Government subsidies to successful cultivators in three of the southern states of the Union. From a practical point of view the strength of the rhea fibre is its chief physical quality. According to Dr. Forbes Royle, who tested it as an expert, its strength is equal to two and a half times that of Russian hemp. According to Trautwine, the best hemp ropes require 15,000 lb. strain per square inch of section to break them, while leather of the best quality gives way at 5,000 lb. We have thus the comparative breaking strength as follows:—

Hemp	15,000 lb. per sq. inch
Leather	5,000 " "
Rhea	37,500 " "

Rhea is thus naturally designed for all purposes in which the utmost strength is required in cordage or cloth. The next physical property of the fibre is its fineness, which allows it to be mixed with all the finest animal and vegetable fibres known, and to be spun into the finest of yarns up to 300's. When prepared for spinning it is of the purest white colour, with a silky lustre, and it readily takes dye of every shade. The samples exhibited by Mr. Wookerjee, who has acquired all the rights of the Gomess Patents for British India, consist of the green plant; the raw ribbons as they come from the plant; dried ribbons freed from gum (*filasse*); *filasse* silver; rhea yarns plain and dyed from 10's to 60's; rhea cord, white and dyed; rhea tatted shawl dyed magenta; corded cloth of rhea and silk mixed; and figured cloth of rhea dyed. The beauty of these samples and the remarkable strength of the yarns cannot fail to impress all judges of textile materials or products. A small factory is at present being organized in Bombay where the Gomess process of removing the gum from the ribbon will be shown at work on a commercial scale, with apparatus of full size, and all persons interested in the use of goods made from rhea or in the manufacture of rhea will be invited to see this factory at work. In addition, apparatus will be prepared for carrying out comparative trials of strength of rhea and other cordage and yarns, by breaking them with deadweights. In this manner the value of rhea for main driving ropes in mills, driving cords and banding, belting, tent and heel ropes, traces, harness and reins, cordage for shipping, twines and threads, sailcloth and canvas for tents, and fishing lines and nets will be recognised. In many of the above instances the saving of weight is of great importance, as, for instance, in tent ropes and canvas, and the saving in cost for cordage or material of a given strength is illustrated in the case of belting, which is sold by weight.

Assuming Dr. Royle's experiments to be correct, the breaking strength of a rhea belt a little over $3\frac{1}{2}$ of an inch in thickness would be equal to that of first-class leather $\frac{1}{4}$ of an inch thick. Such a belt would not bear forked guides, but the difference in cost would pay for friction clutches, which, even for belt driving, will eventually supersede the clumsy and destructive fork. The experimental factory now being established and the operations that are to be shown therein will be of the highest

interest to all who are concerned in textile manufacture or business in India, and they will doubtless find that such a practical demonstration as is to be given will be more readily appreciated than any printed description.

One fact interesting to the cotton mill-owner has been published in the prospectus, *viz.*, that the existing cotton machinery can be adapted, with certain modifications and at a reasonable cost, for the manufacture of the rhea fibre, though the well-known firm of Messrs. Greenwood and Batley, of Leeds, have gone the length of designing special machinery for producing yarn and manufactured goods from the rhea fibre *filasse*. A parent company for India has been founded in Bombay, which has the right of forming sub-companies in different parts of the country, and in the meantime Mr. Cowasji Wookerjee has been empowered to grant licences for the manufacture of rhea according to the Gomess patent process. It is claimed for this process that it is the only invention of its kind which has been granted patents in Germany and the United States of America, besides other European countries and India. The subject, on the whole, deserves the careful attention and study on the part of the investing public, considering the wide field of utility the rhea fibre has before it. The shares of the London Company have been reported to be at a premium, and we hope the Indian companies will meet with the same success.—*The India Textile Journal*.

GENERAL ITEMS.

One of the most universally distributed orange scale is the *Aspidiotus aurantii* which is commonly found sticking on to the rind of the fruits, giving it a very unsightly appearance. Repeated applications of kerosine emulsion are most effectual for this as for all other scales.

A writer in an Exchange gives his experience of preserving orange: The plan I adopt is to leave the oranges on the trees till well ripened, carefully gathering in baskets and on no account allowing any that drop from trees to get into baskets, as the slightest bruise will rot an orange. I always had large packing cases in an outbuilding in which they were packed. I first put a layer of dry river sand, then one of oranges, which must not touch each other, and so on till the box is full. Oranges were gathered about the end of July and boxes opened for consumption in midsummer. The sand must of course be clean and perfectly dry.

In view of the extension of grape cultivation in Ceylon, the following from the *N. S. W. Agricultural Gazette* should prove of interest:—Mr. E. Herborn, of Minto, reports the successful treatment of black spot of the grape with sulphate of iron and sulphuric acid. He writes: "My vineyard had suffered considerably the previous season, and I determined to try the following (last) winter this remedy. I treated about half the vineyard only with one application only. As the spring advanced and foliage and fruit developed, the most unpractised eye would at once be struck with the remarkable difference in the appearance of the two halves of the vineyard. The one exhibited vigorous, healthy foliage,

with a good show of fruit; the other, scanty yellowish foliage, and shrivelled berries, or none at all. Had the whole vineyard been similarly treated the proof of the efficacy of the remedy would not have been so clear, as an improvement in the vineyard, as compared with the previous season, might have been attributable to other causes. Under the circumstances I have narrated, however, cause and effect were in unmistakable evidence. I shall not fail to treat my vines several times this winter. I use $\frac{1}{2}$ per cent. sulphuric acid in a saturated solution of sulphate of iron, any time before the buds burst, following up with Bordeaux mixture, which latter is, I believe, also a specific for *Oidium*."

The black sooty appearance common on orange trees is due to the presence of the mycelium of a fungus, *Capnodium citri*, which grows on the sugary secretions of scale insects. It injures the tree by blocking up the stomata of the leaves. The true cause of the trouble being the scale insect, the tree should be treated persistently with kerosone emulsion.

An ointment, says the Editor of the Cape Colony *Agricultural Journal*, made of equal parts of flowers of sulphur and grease, laid on in a streak as broad as your hand all down the backs of horses and cattle will rid them of ticks. The diffusive qualities of sulphur are something not well understood, but may be easily tested.

The *Adelaide Observer* states that in making Bordeaux mixture it is of the greatest importance that air-slaked lime should be rejected. The lime must be strong and fresh from the kiln. The bluestone must be the best. This is the latest way to make Bordeaux mixture:—Dissolve 6 lb. of best sulphate of copper in 6 gallons of boiling water in one vessel large enough to hold 22 gallons. In another vessel place 4 lb. of fresh lime; pour on a little water, but not enough to cover the lumps; when that is taken up add a little more water; after a little add enough to make 4 gallons. Strain the lime water through a branbag or fine sieve into the vessel of bluestone water, and make up to 22 gallons by the addition of more water. Use the mixture without much delay, as it spoils by being kept for more than a few hours.

Leg weakness in poultry may arise from muscular weakness or from a deficiency of bony matter, and the symptoms usually manifest themselves between the ages of three and six months. The free use of bone dust is a preventative of this affection, but a cure is not difficult by using the following prescription:—Sulphate of iron 1 grain, strychnine $\frac{1}{2}$ grain, Phosphate of lime 5 grains, and sulphate of quinine $\frac{1}{2}$ grain. Make a small pill and administer three times daily—morning, noon and night.

Writing to the *Australasian*, "Grazier" says:—I have found the following a very easy and efficacious way of getting rid of worms:—Tie the horse up in the stable and starve him for at least 12 hours, and then give him about a quart of new milk quite warm from the cow. This will rid the horse of all the worms.

COLOMBO, DEC. 2ND, 1895.

[No. 6.]

PLANTING AND AGRICULTURE IN COLOMBIA, SOUTH AMERICA.

(Special Report to the Foreign Office from
W. Robt. Thomson.)

TOLIMA: ITS AGRICULTURAL PRODUCTIONS.

HIS department is situated in the southern part of the great Valley of the Magdalena, extending from 2° to 6° north latitude. And the department is embraced within the two great chains of the Colombian Andes, the Eastern and Central Cordilleras, which continue nearly parallel from latitude 2° 5' to 5°. Within these bifurcations of the Andes is also comprehended a large portion of the department of Caudinamarca, thus including the lofty and extensive savannah on which the city of Bogota (8,600 feet above sea-level) is situated. The average height of the Eastern Cordillera is from 12,000 to 13,000 feet above sea-level, whilst the highest ridges of the Central Cordillera are covered with perpetual snow, the culminating peak, Tolima, from which the department derives its name, being upwards of 18,000 feet, and the highest peak of the Andes north of the Equator. The River Magdalena, from its source, flows through the department some 400 miles to the river-port town Honda, which is the terminus of steamboat navigation with the coast, distant 600 miles. At Honda rapids in the river preclude continuous navigation higher up, but immediately above these rapids the river is again navigable for steamers for 100 miles, and for native craft 300 miles. The area of Tolima is 18,434 square miles, and the population 230,000. The department comprises a small area as compared with the total area of the Republic, namely, 513,845 square miles.

The plains and lower hills extending from the River Magdalena occupy an area of several thousand square miles, and the climatic conditions up to an altitude of from 3,000 to 4,000 feet are purely tropical, *tierra*

caliente. Within this zone nearly all the inhabitants of the department are settled. The chief industrial pursuit, in common with the rest of the Republic, is cattle farming.

A distinctly more temperate zone prevails between 4,000 and 6,000 feet above sea-level, *tierra templada*. This region consists of numerous ramifications of mountains, which are to a large extent covered with forest. Here the cultivation of coffee is becoming an important industry, a subject dealt with later on.

A still higher zone, designated *tierra fria*, extends from 6,000 feet up to the coldest climate in which European grains and vegetables can be grown. Potatoes and wheat are grown in patches at elevations ranging from 6,000 to 9,000 feet, and barley and oats thrive up to 12,000 feet.

The agricultural and planting prospects of Tolima, like those of the Republic in general, are only beginning to emerge into the domain of commerce. Up to a dozen years ago, for example, the value of the exportation of quinine-yielding barks, cinchona, and cuprea, obtained from the forest, was for many years far in excess of the value of the exportation of all other vegetable products combined. This bark business attained its maximum development in 1881-82, when the value of the article exported amounted to some 30,000,000 dol. Since then this trade in Colombia, notwithstanding that the trees abound in the forests, has completely collapsed, owing to the extensive cultivations of cinchona in the east.

As I have already said, the greatest industry of Tolima is cattle farming. The area of land appropriated to pastoral purposes practically occupies the whole of the zone which I have in the foregoing designated *tierra caliente*—several thousand square miles. Official statistics give the total number of horned cattle, horses, mules, and asses in Tolima at 390,000, the total number throughout the Republic being 3,465,000. There are also in the Republic goats, sheep, and swine, 3,487,000. Great cattle farms ("haciendas"), each containing from 1,000 to 4,000 cattle, abound throughout the department. To the favourable positions of Tolima, *i.e.*, in proximity

to the most densely populated and richest community in the Republic, the community inhabiting the elevated savannah of Bogota, must be attributed its dominant position in regard to cattle rearing. Thus a lucrative market is assured for many thousands of cattle annually. These lowland cattle, though very inferior both in point of size and quality to those on the cold savannah, are reached under conditions calculated to assure their production at a minimum cost, that is to say, at a much cheaper rate than is practicable in the cold regions.

The thousands of square miles of natural pasturage on the plains and lower hills of Tolima assume during the rainy seasons the most beautiful verdure. But in the alternate season of drought the general aspect is that of a desert. These lands were originally acquired at a nominal cost. No conservation of the natural fertility of the land has ever been taken into consideration. On the contrary, the natural grasses, intermixed with scrub or brushwood, have been systematically burned from year to year, and the burnings effected during the most scorching periods of drought. The principal object attained by this process of despoliation is the reproduction of new and tender herbage or pasturage, which, with the advent of the rainy season, forthwith covers the parched surface. Vast pastoral regions—scores of thousands of square miles—in tropical America are thus maintained. Half a century, or it may be a century, of this treatment suffices to extinguish almost every trace of fertility in the soil. In Tolima alone hardly less than 2,000 square miles of savannahs and hills, ascending to some 3,000 feet, have in this way been transformed into comparatively barren wastes. And in other parts of the Republic many thousands of square miles have similarly lapsed by this devastating process.

This persistent burning of the savannahs and hills for crops of renewed pasturage plays desperate havoc with all other vegetation, trees and brushwood. Isolated palm trees, with their intensely hard trunks and endogenous structure, together with groups of brushwood in sheltered or humid spots, sometimes withstand the fury of the flames. There is, however, one phenomenal exception to this subversive power of the fires. A humble tree with contorted and rugged trunks and branches and scabrous leaves, a tree presenting the most subdued and weird aspect conceivable; this pigny tree not only resists the fury of the flames, but fire is actually congenial and subservient to its existence, for the tree, instigated by the conflagrations, forms itself into great plantations. The name of this tree is chaparro (*Rhopala abovata*), indigenous to Colombia and other South American countries. It attains a height of 15 to 20 feet, and its distorted trunks measure from 9 to 12 inches in diameter. It is widely distributed in Colombia, for I have found it at the Sierra Nevada of Santa Marta, and dispersed inland 1,000 miles from the sea. In contact with the great forest it maintains a precarious existence. But as already explained, it usurps dominion in places where no other tree can grow. In Tolima it abounds on the slopes and ridges of the hills at elevations from 1,000 to 3,500 feet. In this department alone hundreds of square miles of the lower hills which have been reduced to sterility by incessant burnings are occupied by this diminutive tree, and it assumes the aspect of vast systematically formed and well-kept plantations. This is more than a triumph of the "survival of the fittest."

It is very remarkable that these fire-begotten plantations are nowhere crowded to excess; on the contrary, the trees are so regularly placed that their aspect vies with that of the most carefully formed plantations. There is a popular belief in Tolima, where alluvial gold abounds, that this tree flourishes only on those seductive lands, serving as a guide to searchers after the precious metal. The bark of the tree is peculiarly constituted. It consists of a congeries of integuments or semi-detached layers. The outer portion, about half-an-inch thick, performs no organic function, and this portion of the bark, in conjunction with its peculiar compositions, protects the inner vital integuments from injury by fire.

The form and structure of the tree may have originated from the severe ordeal through which it has survived. For instance, according to the theory of natural selection, some animals when they migrate into a colder climate become covered with thicker fur. As we have seen with regard to this plant, the powers of nature have been encroached upon, *i.e.* the plant having emerged from a state of nature it has made for itself a law of its own, for it has triumphed over the most disastrous element to all organic life. The hundreds of square miles of worn-out land covered by this beneficent tree in Tolima alone are undergoing a slow process of amelioration which, moreover, could be easily accelerated by the interposition of a few simple devices.

It is noteworthy that the chaparro prefers the slopes and ridges of the hills to the flat savannahs, on which it is seldom found in any considerable quantity, though widely dispersed. Fire ranges with far greater fury on the slopes and ridges of the hills than on the plains. I, however, attribute this preference of the plant for the hill-sides to the pernicious influence of the accumulations of water on the plains during the rainy season.

The illustrious Humboldt, during his travels in South America, noted the dispersal of this plant on the vast llanos stretching from the Orinoco, &c. These llanos are, for the most part destitute of vegetation other than *Gramineae*. The only trees that were found on many parts of these dreary wastes were specimens of chaparro and in more humid spots a palm. Thus, retreating to the llanos which he traversed, he says, "For many square miles not a tree to be seen, but where a few solitary trees are found they are, in humid districts, the *Mauritia* palm, and in arid spots the *Rhopala complicata*."

Vast deserts and semi-deserts abound throughout the tropical world many hundreds of thousands of square miles. It may be that the chaparro is destined to play an important part in the reclamation of these illimitable wastes for the decomposed leaves gradually form a crust of vegetable mould.*

COFFEE.

In recent years a great impetus has been given to this Coffee cultivation in Colombia. The most reliable statistics show the following export returns:—

Year.	Value.
	Dollars.
1877-78	810,000
1890	7,500,000
1891	10,000,000

It may be safely estimated, in view of the continual large extension of this cultivation, that in the course of 2 or 3 years the total output will have augmented to 15,000,000 dol.; no less than 37,000 tons.

I am unable to state the proportion of coffee which Tolima contributes, but it may be estimated at about 300,000 dol., a return greatly in excess of the production half-a-dozen years ago. The districts of Tolima in which this cultivation is chiefly carried on are distant inland from Honda from 100 to 200 miles. Thus, bearing in mind that coffee is cultivated at from 700 to 900 miles from the seaport Savanilla, credit is due to the enterprising planters. The River Magdalena, with several of its tributaries, afford to a large extent the means of transport to Honda. The produce is carried by mules from the mountain slopes to the river, thence in rafts down the current to Honda, from 3 to 5 days' journey. From Honda, whence also is shipped the produce from the great coffee-growing province of Cundinamarca, the coffee is conveyed by steamers, and two short railway routes, to the sea—600 miles. Independently of the Upper Magdalena and its tributaries, many thousands of mule-loads of coffee are annually brought to Honda, partly from Tolima, but chiefly from Cundinamarca, thus from 3 to 5 days' journey to Honda only. The cost of transport from the plantations to the coast amounts in English money from 1*d.* to 1½*d.*, thus respectively 9*l.* 6*s.* 8*d.*

* An extract from a letter of mine to the Director of Kow Gardens relative to chaparro was published some years ago.

and 14l. per ton, a very heavy item. In this connection it may also be mentioned that from several of the large growing coffee provinces of the Republic the cost of transport is still higher.

Notwithstanding the great difficulties appertaining to distance from the sea, and the consequent cost of transport, the Tolima planters are quite able to compete with planters in far more favorably situated countries, countries which are in a position to transport coffee to their seaports at a comparatively trifling cost. Magnificent land abounds on the colossal Andes most admirably adapted for the cultivation. Well cultivated plantations on these Cordilleras are unsurpassed by those of any other country, and this observation applies not only to the quality of the produce, but also to the quantity. Land is obtainable, in general, at a nominal cost; and it is available to a large extent, though it may be mentioned, in the adjoining department of Cundinamarca, where great enthusiasm prevails relative to coffee cultivation, and where it is being much more extensively planted than in Tolima, the price of the more conveniently located sites for plantations has augmented very materially; indeed, as much as 40 and 50 dol. (paper currency), say 2l. 13s. to 3l. 7s. at exchange now ruling of 15 dol. to 1l. per hectare (2½ acres) is now paid.

The extension of this cultivation in Tolima, and this applies to the whole country, is in general confined to districts accessible to settlements or villages. More remotely removed from populated districts widely extending mountain slopes, eminently fitted for coffee, remain in a state of nature. It may also be noted that the quality of the labour itself is satisfactory, for it is on the whole industrious and intelligent. 80 c. (about 1s.) per day Colombian currency, are the average wages for peons, and for women about 50 c. (about 8d.).

As regards the productive capabilities of these Cordilleras, coupled with the labour resources, *i.e.*, where it is sufficiently abundant, it may be stated that the cost of coffee production at the plantation ranges from 30 to 35 dol. per mule-load of 250 lb., or from 12 to 14 dol., Colombian currency, per 100 lb. With the rate of exchange which has prevailed during several years (1 dol. ruling rather less than 2s.), this shows that planters are acquiring enormous profits. With money at par the nominal cost of production would be about the same, although in reality the price measured in gold would have much more than doubled. It should, therefore, be remembered that to the depreciation of Colombian currency must be attributed in great measure the rapid expansion of the coffee industry. At the same time exceptionally high prices for the article have ruled during recent years, a result partly due to the abolition of slavery, in coffee-growing countries, and partly to the revolutionary movements in Brazil, where coffee is grown on a gigantic scale. Now that coffee has become a staple industry of Colombia there can be no doubt that the country is able to maintain a prominent position among all rivals.

The number of coffee trees planted per hectare (2½ acres) in Colombia averages about 1,500. The general averages yield per tree per annum on well-kept plantations is 1½ lb., or 2,250 lb. per hectare—900 lb. per acre. On many other plantations the average yearly crop does not exceed 1 lb. per tree—600 lb. per acre. Thus the number of trees planted per acre in this country strikingly contrasts with the number planted in British Colonies, where twice as many are planted per acre, notwithstanding heavier crops are secured in Colombia. In the palmy days of coffee cultivation in Ceylon the average production was 5 ewt. per acre.

One of the chief elements of success appertaining to this cultivation in Colombia must be assigned to the systematic inter-planting of shade-trees with the coffee. At altitudes ranging from 3,000 to 5,000 feet more densely-foliaged shade-trees are employed than is the case at plantations between 5,000 and 6,000 feet, where a slender shade is afforded by a species of *Cassia*. The shade-trees utilised at plantations situated between 3,000 and 5,000 feet are a species of *Erythrina*, and another leguminous tree, a species of *Inga*, which latter is becoming very generally

adopted by planters. I would strongly recommend this *Inga* for adoption by British colonial coffee planters, as it is most admirably adapted for the purpose. It grows rapidly, and the large compound leaves fall abundantly at the season in which the plantation requires the least degree of shade, whilst the abundance of fallen leaves from this tree check in a very marked manner the irrepressible growth of weeds. Moreover, the general result of the beneficial influence of this congenial shade reduces to a minimum all cultural expenses; indeed, it may be safely computed that the good offices of this tree curtail the cost of actual cultivation to the extent of some 50 per cent. as compared with coffee devoid of shade. It is a remarkable fact that British colonial coffee planters have in the main ignored the application of shade to the coffee tree. Without shade the tree certainly flourishes, but its full exposure to the sun, at any rate as the sun is wont to shine here, is detrimental in the long run to its most congenial state of productiveness. However, near the upper limit of this cultivation, namely, from 5,000 to 6,000 feet, shade is not to be recommended.

From the foregoing it will be seen that Colombia is making rapid strides in coffee cultivation, and the strides are so remarkable that it already produces about two-thirds as much coffee as all British colonies and possessions combined, and doubtless it will very soon overtake the total aggregate production of these colonies and possessions. When the vast productive tropical resources of the empire are borne in mind this seems anomalous. For example, the "Times," in a recent editorial, says with regard to the expansion of three of the great groups of colonies, not referring to the Eastern Empire:—"What is most remarkable about that growth is that it has already reached a point at which each of the groups exhibits the most extraordinary variety of climate, of produce, and of the conditions under which life may be lived." It is true that the production of this article in Ceylon has dwindled, owing to the fatal leaf disease, from 50,000 tons in 1871-75, to 3,750 tons in 1891. Though this disease has so seriously affected Ceylon and India, England possesses other eligible colonies exempt from the disease. For instance, in the New World, Jamaica may be mentioned as being capable of growing coffee on a very much larger scale than it does at present. There, however, during scores of years this product has remained almost stationary. Even compared with the neighbouring Republic of Hayti, the inhabitants of which are usually denounced for their aversion to progress, Jamaica comes out unfavourably, for Hayti, in spite, too, of revolutions, exports seven times more coffee than Jamaica.

As I am well acquainted with the productive resources of Jamaica, England's tropical American colony par excellence for coffee, it may not be amiss to give the following particulars touching coffee cultivation in that colony in comparison with the cultivation in Colombia. The total coffee production in Jamaica, about 10,000,000 lb., represents what is cultivated on an area of 11,000 acres in Colombia, but in Jamaica 22,476 acres are under cultivation. Thus, were the Jamaica plantations yielding to the same extent as those of Colombia the value of the output would be increased from 336,840l. to double that amount yearly. Moreover, the general average quality of the Colombian article is superior to that of Jamaica, though that island contains several plantations at high altitudes the produce of which is the finest in the world. There can be no doubt that the coffee industry of Jamaica would be greatly benefited by the adoption of the more advanced practical methods pursued in Colombia.

In a recent number of the "Kew Bulletin" reference is made to the slow development of the coffee enterprise in Jamaica and other British colonies. What that paper suggests in order to encourage the enterprise in Jamaica is the opening up of roads to facilitate transport, but Jamaica is already well provided with splendid roads; besides, the most eligible sites for plantations are nowhere situated more than some 20 miles from the sea, and seaports surround the island. I have already described how

remarkably different are the conditions of transport in Colombia, and how this, the most important commercial plant of tropical America, can be turned to better account in the colonies,

A glance at the following figures, which I have culled from the "*Ceylon Tropical Agriculturist*," &c., shows the relative position of the exports of the three great rival products—coffee, tea, and cacao, in the Old World and the New:—

Articles.	Quantity.	
	Tropical America Tons.	Old World Tons.
Coffee	640,000	105,000
Tea	Partially nil	216,000
Cacao	42,000	1,600
Total	682,000	322,600

To the foregoing Old World returns China and Japan contribute to the extent of fully 100,000 tons of tea, so that the total exports from the British Eastern Empire, together with Java, &c., amount to but little more than 200,000 tons of coffee, tea, and cacao, whereas the total output of coffee and cacao from tropical America amounts to 682,000 tons, and the value of this is 50,000,000/.

Touching the cultural requirements of these three products, cacao, though from an alimentary point of view by far the most important, is placed at a great disadvantage, inasmuch as this plant is exclusively adapted to hot and humid tropical zones, conditions which have undoubtedly restricted its cultural extension. Tea is an extra tropical product, though it is cultivated with great success on the mountains of the tropics. The coffee plant, like cacao, is essentially tropical, but it is constitutionally adapted to a far wider range of climatic conditions, for it grows in the hottest valleys, up to the genial temperature experienced at elevations between 4,000 and 6,000 feet above sea-level. As to cacao, it may be assumed that if this tree were susceptible of cultivation over the wide climatal expanse on which tea grows, instead of being confined to purely tropical climes, its cultivation would have long since attained greatly enhanced proportions.

CACAO.

This is a favourite article of cultivation among the natives, cacao and the beverage is very largely consumed throughout the Republic. In most parts it is used, probably, to the same extent as tea is in England. Anyhow, it may be safely computed that its consumption by the 4,000,000 inhabitants of the country amounts to not less than 3 lb. per capita per annum; thus a gross annual production of 12,000,000 lb. The number of trees requisite to yield this quantity may be estimated at about 12,000,000, *i.e.*, 1 lb per tree. And it may be mentioned that the number of trees thus indicated is considerably less than is under cultivation in the island of Trinidad. From a few districts of the Republic some hundreds of bales are exported, but it is notorious that, in spite of the illimitable resources of the country for the cultivation of this indigenous tree, the production falls short of the actual wants of domestic consumption. Were the plant more largely cultivated the internal consumption would be greatly increased, consequent on reduced prices, which are usually higher here than in Europe. Moreover, only recently several shipments of cacao have been imported from England, shipments transported at great cost to the interior of the country.

The explanation as to the abnormal position of this cultivation may be best indicated from the following extract of a letter of mine addressed to the President of the Republic, and published in the "*Diario Oficial*" of November 8, 1893:—

"I place this in the first class of the products which deserve the attention of the Government. The plant is indigenous here, and the article is one of general consumption in the Republic. Further, as an article intended for exportation, it is, in my opinion, more important than coffee. "Unfortunately, in many parts of the country the cultivation of it is found in

a most lamentably degenerate condition. In a note on this, and other similar matters, published in the '*Diario Oficial*' of November 7, 1887, I referred to an insidious disease which affected the cacao tree in various parts of the country. Many plants in other countries have been attacked from time to time by some disease, but without loss of time an investigation of the causes has been made. Here this industry is allowed to decay, and the country to suffer a loss of many thousands of dollars each year. In the document itself I pointed out as a likely means of combatting the evil the following:—"In all probability the most systematic and efficacious remedy which could be adopted would be the renovation of all the plants by selecting foreign seeds, thus making impossible the reproduction of plants proceeding from diseased trees. Another effective remedy might be found in having recourse to the system of grafting healthy branches into the wild species of the cacao."

In continuation of this subject I made the following remarks in my former report, published by the Foreign Office in March, 1891:—"In two reports of mine, published by the Colombian Government, I strongly advocated the introduction of cacao seeds from Trinidad, with the view of ameliorating the degenerated plantations of the interior. The result of my excursion to the Sierra Nevada, as reviewed in this report, completely nullifies my former impressions as to the advisability of importing these seeds; now the conditions are reversed, the wild cacao being, par excellence, the kind for cultivation throughout the Republic. In those countries in which this product has become a staple the yield per tree hardly averages 1½ lb. With our wild cacao I feel sure that under careful cultivation that average can be doubled, though in making an estimate of returns I prefer to curtail this prospective average. The cacao planters of Tolima, where millions of pounds are cropped, annually obtain an average of little more than ½ lb. per tree. Hence the replanting of the degenerated fields of the interior, as well as the extension of this cultivation, with seeds from the Sierra Nevada, is a measure the importance of which cannot be overrated. Arrangements could be made for the acquisition of these seeds on a large scale."

In that report I also referred to the favourable conditions under which cacao flourishes in Trinidad, where this product is an important staple, and in making a comparison with these conditions, I summoned up—"How infinitely superior are the innumerable sites for plantations at the foot of the Sierra Nevada, sites which nature has disclosed." In this connection it should be mentioned that these favourable conditions are by no means confined to the district surrounding the Sierra Nevada (a system of mountains distinct from that of the Andes), that is to say, equally eligible lands abound in the great valleys at the feet of the Cordilleras of the Colombian Andes. Here thousands of square miles are most admirably adapted for the plant.

The disease affecting this cultivation is confined, as far as I am aware, to two provinces, namely to certain districts of Tolima and of Antioquias. Fortunately, though the disease is widely extended in Tolima, the southern confines of the department are in a great measure exempt from it. Yet attacks by parasitical insects are frequent sources of concern to the planter. In all probability the diseases to which this plant is subjected have been instigated by the injurious system of close planting resorted to, combined with the excessive shade imparted by an overgrowth of trees planted for shading the cacao.

In the south of Tolima, it is interesting to note, this cultivation is pursued on a considerable scale and with great success, under the influence of irrigation. The region in question is characterised by prolonged droughts, and the application of irrigation has thus proved most advantageous. Cacao thus produced has become quite an important industry. Planters in British colonies will be glad to learn that the plant is amenable to systematic irrigation, a condition that assures the extensive cultivation of the plant in comparatively dry regions, for excessively humid conditions of climate have been deemed indispensably requisite for the plant.

TOBACCO.

This is a very important industry in Tolima, and it affords employment to many thousands of the peasantry, for the cultivation of the article entails incessant care and attention, and its subsequent manipulation, from the preparation of the crude product to the manufacture of cigars involves exceptional conditions of labour. Women and children are largely employed in the manufacture of cigars. The best cigars are sent to Bogota and other large towns. The price of these averages from 2 to 5 c. each (Colombian currency). There is comparatively little difference in the quality and aroma among these cigars. The higher priced kinds are the produce of the most carefully cured and best formed leaves. In point of quality, it is worthy of remark, there is a much wider range in this respect than is the case in the Jamaica cigars, which are no doubt superior, and this is a new industry in that colony. Among the common classes of people in Tolima a very inferior ill-made cigar is extensively smoked. These are sold in the districts in which tobacco is cultivated at the rate of some 30 for 1 real (about 2d.).

This cultivation in Tolima formerly occupied a much more important position than it now does. The great falling-off in cultivation is the result of a disastrous disease which attacked the plant about a score years ago. The cause of this disease has been attributed to the unintermitted reproduction of the article on the same land. The plant is now generally cultivated in small patches, so that the effects of the disease is neutralised.

Anterior to the appearance of the disease, Tolima was the chief tobacco-producing centre of the Republic, now the quantity exported from Tolima is insignificant. At present the principal seat of this industry is occupied by the Department of Bolivar, which furnishes 50 per cent. of the total exportation from the country.

20 years ago the total quantity of tobacco exported from the country was somewhat higher than at present, then it was about 4,000 tons, valued at 2,500,000 dol. In 1891 it was 3,840 tons, valued at 1,480,000 dol.

Agriculture in general in the tropics is carried on in a rough and primitive fashion, weeding the fields constitutes the one dominant element inseparable from the cultivation of most products, that is to say, weeds grow apace in such a way that agriculturists unacquainted with the tropics are total unable to form the slightest conception of their rapid and irrepressible growth. Moreover, the system of weeding pursued is commonly performed in a most perfunctory manner. The conditions of climate are, of course, not conducive to painstaking efforts on the part of the peasantry. This is the kind of treatment usually accorded to most agricultural products in tropical America. These is, however, one notable exception to this rule; I refer to the cultivation of tobacco. It is a delicate plant, and easily overpowered with weeds and with insects, so that careful cultivation is indispensable. A tobacco plantation is, therefore, cultivated like a garden. Peasantry employed in this cultivation necessarily become trained to superior methods of cultivation. There can, therefore, be little doubt that a Government that fosters tobacco cultivation in tropical America fosters a genuine predilection for improved husbandry on the part of the agricultural labourer,

CINCHONA.

There is but little interest nowadays attaching to cinchona cultivation, but the following brief remarks may prove interesting:—

Several species are indigenous to this department, and prior to the great reduction in the price of quinine—a reduction from about 10s. per oz. to 8d.—large quantities of bark of excellent quality were exported from this department.

Cultivation was started in various parts of Tolima over a dozen years ago, when barks still fetched a high price, but coincident with the marked decline

in prices the plantations were abandoned. The largest and most important was established under my superintendence; some 400,000 trees, comprising the best species, were thus established at an elevation of from 6,000 to 8,000 feet above sea-level. Though abandoned for several years, a large proportion of the trees are growing, and as they assume larger dimensions will be turned to account some day. Seeds of the more important species grown in the east were obtained and planted to a considerable extent, thus, *C. succirubra*, *C. Calisaya*, var. *Ledgeriana*, and *C. officinalis*. These species flourished here, but, after half-a-dozen years of cultivation, one of them, viz., *C. officinalis*, began to show symptoms of what is denominated "canker," an insidious disease, and large numbers have since succumbed. This is exactly what occurred with regard to this species in the Jamaica cinchona plantations, which I also inaugurated.

Besides the above-mentioned species, several indigenous species were planted on a large scale, and these proved the most important, as will be seen from the analysis given below, which analysis was made by Mr. David Howard, of the well-known firm of quinine manufacturers.

A detailed account of the Colombian species was given at a meeting of the Pharmaceutical Society, in London, in April, 1892, by Mr. Holmes, the curator, and it may be here added that gentleman then stated in regard to one of these varieties, viz., *Tuna*, "Probably the richest known in the percentage of quinine." The result of the analysis shows remarkable average richness:—

	Quinine Sulphate.	Quinine.	Cinchonidine.	Cinchonine.	Quinidine.	Amorphous.
Thomsoniana ...	5.91	4.45	0.27	0.82	0.26	0.74
Ledger, verde ...	4.90	3.68	..	0.01	0.20	0.44
Negra ...	7.30	5.48	..	0.10	Trace	0.78
Morada ...	3.06	2.30	..	0.04	0.50	0.38
Tuna ...	9.04	6.78	0.40	0.38	0.18	0.42
Pombiana ..	5.88	4.41	0.34	0.02	Trace	0.22
Officinalis ..	6.32	4.47	1.23	0.10	0.07	0.46
Succirubra ..	5.93	4.45	2.77	0.12	0.02	0.32
Hybrid ..	3.32	2.49	1.92	0.04	Trace	0.56

INDIA-RUBBER.

A very important species of rubber is indigenous and I am inclined to think peculiar to Tolima. Unlike other important kinds of rubber, it grows at high elevations, viz., at from 6,000 to 8,000 feet above sea-level. Some thousands of bates of it were exported a dozen years ago. But as the tree was only locally distributed, the source of supply was soon exhausted. The authorities at Kew have named this plant *Saprum biglandulosum*, a species which is also said to be found in British Guiana, where, however, it seems to be of no value as a rubber producer.

In connection with the cinchona plantations above referred to, a plantation of this rubber was made about 10 years ago. The tress grew with remarkable rapidity, with trunks a foot in diameter in six years; but this plantation shared the same fate as the cinchona, that is, it was abandoned years ago because the cinchona was abandoned. With renewed attention, however, this plantation may still be made important.

A few years ago I directed the attention of the Secretary of State for India to the advisability of cultivating this plant on a large scale in that country. My letter was referred to the Government of India. I think, however, that no progress has been made. This valuable plant could be cultivated over a wide range of latitude in India, thus extending from the elevated mountainous regions of Southern India to the low-lying valleys of the Himalaya as far as 26° north latitude. And this is a great advantage as compared with the limited zone in which the other important tropical American species of rubber introduced to India can be cultivated.

DEEP DIGGING FOR COFFEE.

A Correspondent in South Coorg writes to a Madras paper: The change that is worked in a sick piece of coffee by a deep digging is little short of marvellous; in a couple of weeks' time one would hardly know it for the same piece of coffee. Any one has only to try it to be convinced of the fact. It seems strange under the circumstances that the important work of digging should in any case be neglected; and yet I have heard of its discontinuance being advocated, and of this being put partially into practice in several places. The argument used in favour of discontinuing digging is that it was very seldom done in the Spicy Isle, and yet crops used to be large. It would be well to call to mind, when using argument of this description, that almost all the coffee in that delectable land has gone out. It has also got to be remembered that soils differ and that work suited to one description of soil would be quite unsuited to another. In Coorg, for instance, digging is not generally so necessary in the open friable forest soils as it is in the Bamboo; although even there it would have been beneficial in all cases where the slope of the land admitted of its being carried out without the risk of loss of soil through wash. The result of stopping digging for a couple of seasons in the Bamboo or the Santikoppa District would cause such a rough awakening that I am sure it would never be attempted again; the lesson learned would be too severe to be easily forgotten. I may mention that the increase in borer alone would be startling; although it is as likely as not to be attributed to this cause. The following brief extract from Professor Johnston, although referring more particularly to the plough, is equally applicable to the fork, will afford some reasons as to why digging should naturally be beneficial. "By the use of the plough the parts of the land are more minutely divided—the air gets access to every particle—it is rendered lighter, more open, more permeable to the roots. The vegetable matter it contains decomposes more rapidly by a constant turning of the soil, so that whatever the fibres of the roots penetrate they find organic food provided for them, and an abundant supply of oxygen of the atmosphere to aid in preparing it. All soils contain, likewise, an admixture of fragments of the minerals of which they are formed, and which, by their decay, yield new supplies of inorganic food to the growing plant. The more frequently they are exposed to the air, the more rapidly do these fragments crumble away and decompose. There are few soils so stubborn as not to show themselves grateful in proportion to the amount of this kind of labour that may be bestowed on them. I might make many quotations from other authorities in support of the beneficial action of digging, but the above ought to suffice to convince any sceptic. In the case of the estates above referred to, it is the practice to place the manure on the surface of the hard ground near the stems of the trees, the idea being that it all sinks into the ground and that none of it is lost. This may look very well in theory, but in practice a two-fold loss is entailed on the manure, one by the wash and the other by the escape of the organic part as gas into the air, and I am sure that if the quantity of manure used were not large, the results would be very evenescent. One bad result of putting down manure in this way is that the stems of the trees throw roots into it above the surface of the ground, and these become exposed if any part of the manure is washed away; or they are injured if a coolie is careless with his manooty in scraping weeds or digging; so that here also, as far as the trees are concerned, there is a further waste of manure. When the roots are injured they are deprived of the only means of taking in the manure just when they had begun to do so, Dr. Voelcker had said that it does harm to go upon the land when it is wet evidently because this tends to make it hard and compact. But how is going upon the land when it is wet to be avoided? The seasonable performance of the different works entails going upon the land often when it is very wet. The only way to coun-

teract the bad effects of this is to fork and stir the soil several times if feasible. But here the planter is exercised by the fear that this would cause too much root disturbance. So long as the roots are not turned up and exposed, I believe no harm results. The fork should be inserted deeply near the big trees and the soil be prised up. Even if some tearing of roots results, the injury is slight and is more than compensated for. This cannot be done in the case of young plants as they are apt to be lifted. In this connection the following will be of interest. Thus Mr. Phillips in "Principles of (Tropical) Agriculture":—"Mr. Mills is known as the grower of some of the finest pines ever seen, and the secret of his method is thus characterised in the *Gardeners' Chronicle*:—"The foundation of his success is common sense. He keeps his soil perfectly open and well drained; his roots are preserved by this means in a healthy condition; he does not cramp them. These are his great rules of conduct. They apply to other plants as well as pines."—*Indian Agriculturist*.

THE CEDAR OF CENTRAL AFRICA.

In Commissioner Johnston's report of the first three year's administration of the eastern portion of British Central Africa there is a sketch-map showing the agricultural condition of this country and the extent of such forests as yet remain. Mr. Johnston says:—"The dense forests are now mainly confined to certain hilly regions, where local circumstances protect them to some extent from destruction by bush-fires. They are always associated also with either an unusual rain-supply or the presence of underground springs. Slightly stagnant or surface water appears to contain too many salts in solution to be favourable to the growth of forest, and such forests as are usually found growing near swampy districts are palm thickets. There is one magnificent forest of raphia palms—one of the grandest sights I have ever seen in the vegetable world—near Jumbé's town, Kota-Kota, in the valley of a sluggish stream flowing into the Bua. As a remarkable feature peculiar to British Central Africa should be noted the splendid cedar forests on the upper plateau of Mlanje. Under the explorations of Mr. Alexander Whyte, the naturalist attached to my administration, it was not known that any conifer existed in Central Africa, south of Abyssinia, and north of the Drakensberg, with the exception of a few small juniper bushes discovered by Mr. Thompson growing on Mount Kenia and one or two other heights in Equatorial Africa. The existence of conifers on the top of Mlanje was first reported by the Rev. Robert Clelland, a missionary belonging to the Church of Scotland Mission. Not much heed was given, however, to this news, because no specimens were sent home for identification. But, undoubtedly, Mr. Clelland's information put us on the scent, and one of the first things I attempted on arriving here in 1891 was to have the upper plateau of Mlanje explored. As a consequence, Mr. Whyte discovered the grand conifer, of the genus *Widdringtonia*, to which his name was given. An account of this tree and the circumstances of finding it were given in an earlier report of mine printed by the Foreign Office. This *Widdringtonia* would appear to be nearest allied to the cypresses, as it unquestionably is by the shape of its seed vessels, and the nature of its foliage; at the same time, it is widely different to the cypresses in shape and size, and far more resembles the cedar, both in appearance and in the fragrant smell of its timber. It would seem now as though there were two different species of *Widdringtonia* growing on Mlanje, one a very lofty tree, reaching fully to 130 ft. in height, and the other scarcely exceeding 30 or 40 ft., and growing in a very straggling habit. There is a slight difference in the foliage of the two species. We have not yet been able to get the dwarf species identified, but hope to do so before long. In regard to this *Widdringtonia*, I might mention that Mr. Whyte has spared no efforts to introduce, or let us say, re-introduce its growth into all parts of the Shire highlands above

3,000 ft. in altitude. The tree would appear to flourish at a relatively low altitude, inasmuch as those planted in the grounds at Zomba, below the Residency, at an altitude not exceeding 2,900 ft. above the sea, leave nothing to be desired as regards their vigour of growth, some of the young seedlings having attained a height of 5 ft. in two years. Mr. Sharpe believes that he has seen a *Widdringtonia* growing on one or two of the more inaccessible peaks of Zomba, and, judging from what I could see through a field-glass, I think he is right in his opinion. Nowhere else, however, throughout British Central Africa, or in the adjoining regions, has any one reported the existence of this conifer. Barou von Eltz has made an active search over the lofty Livingstonia Mountains, at the north end of the lake, but has failed to find anything of the kind.

As an example of the rapid application to practical usefulness to which we have put this discovery of Mr. Whyte's, I may mention that, whereas the definite existence of the tree was only first made known in October 1891, in June 1893, Captain Johnson, commanding the Indian troops at Mlanje, was having the dead trees sawn up into logs, which were being sold to advantage in Blantyre, and later on, in the autumn of 1893, enough cedarwood was supplied from Mlanje to re-roof the whole of the Residency and its attendant buildings at Zomba, besides which a great many useful articles of furniture have been made of the wood.—*Timber Trades Journal*.

PRODUCTS OF BOLIVIA.

This mountainous country has great natural wealth. It is rich in the precious metals and has large stores of copper and tin. Lack of transportation facilities prevents free export of the natural products, other than high-grade minerals and cocoa.

The torrid region extends from the low tropical plains and valleys of eastern Bolivia to an altitude of approximately 6,500 feet above the sea. It abounds in every variety of tropical fruits, including granadillas, pepinos, paltas, pacaes, a fruit of the genus *Inga*, consisting of thick pods about six inches long filled with a sweet, refreshing, white pulp; chirimoyas, a species of *anona*, one of the most highly prized of the Bolivian fruits; pine-apples, those of the province of Yungas being especially rich and fragrant; sugar cane, coffee, rice, a superior quality of white and yellow cotton, cocoa (*erythroxyton coca*), the dried leaves of which are a highly stimulating narcotic and are chewed by the Bolivian and Peruvian Indians, by travelers in the Upper Andes, and by the Bolivian soldiers, when in the field, just as betel is used by the inhabitants of the East Indies, cacao or chocolate tree, a species of *theobroma*, found also in the West Indies, which bears a pulpy fruit from the seeds of which chocolate is made. One of the peculiar productions of this zone is the guayacu tree from which is gathered a fruit containing a rich aromatic flour or powder neatly inclosed in a strong box-shaped cover or shell and esteemed more for its rich perfume than for food. It is known only by the name given it by the Aymara Indians, viz, *haku guayacca haku* in the Aymara tongue, meaning flour and *guayacca*, box; hence 'flour box' or 'box of flour.' The guayacca is perhaps the tallest tree of Bolivia, growing to the height of about 125 feet, with dense foliage and wide-spreading branches, thus making it one of the most delightful shade trees known to the montana. This region also abounds in forest of ebony, mahogany, rosewood, satin wood, cedar, wax, and cork trees, palms, rubber trees (*caoutchouc*), and other varieties of wood of great beauty and value rarely met with in other countries, including a species of mulberry from the bark of which are made the curious shirts worn by certain tribes of the Bolivian Indians. Among the medicinal and other plants are cinchona, jalap, matico, sarsaparilla, copaiba, tamarind, palma-Christi, ipecacuanha, camphor, gum arabic, balsams, valerian, cinnamon and vanilla.—*American Grocer*.

SOME QUEER FOODS.

There is an old proverb to the effect that what is food to one man is poison to another, and the proverb is well illustrated at the department of agriculture at Washington, by an odd sort of exhibit of queer foods eaten by out-of-the-way people. Among the articles in the exhibit is a loaf of bread made from the leaves of a plant that is allied to the century plant, as also another kind of bread from a dough of juniper berries. These are relished by some kinds of Indians, while others make cakes out of different kinds of bulbs. The prairie Indians like a dish of wild turnips, and the "screw beans," which grow on mosquito bushes, are utilized by Indians for food. Soap berries furnish an agreeable diet for some tribes.

The Digger Indians in California do not disdain the seeds of salt grass, and the seeds of gourds are consumed in the shape of a mush by Indians in Arizona. The exhibit in question includes a jar of pulverised crickets, which are eaten in that form by Indians of Oregon. They are roasted, as are also grasshoppers. These delicacies are cooked in a pit, being arranged in alternate layers with hot stones. After being thus prepared they are dried and ground to powder. They are mixed with pounded acorns or berries, the flour made in this way being kneaded into cakes and dried in the sun.—*Rio News*.

A RETROSPECT.

We suppose it will be at least an orthodox, if not an interesting proceeding, if, in this our first number, we devote a small space to looking behind us, and trying to recall from out the fast receding years, a few facts as to the beginnings of the planting industry in the days when B. C. A., as we now know it, was still a vision of the future.

We need not here go over the story of the discovery of this part of the world by Livingstone in 1855 and it will be sufficient to note that it was in 1875 that the late Henry Henderson fixed on the site of the Blantyre Mission, a selection showing a judgment and knowledge, which has not since been equalled. It was one year later before the first mission party arrived among them Mr. John Buchanan. In 1878 Mr. Jonathan Duncan arrived bringing the now historic coffee-plant and in the same year Messrs. John and Fred Moir established themselves at Mandala. At the end of three years the maiden crop of the first coffee-plants was sown and the plants distributed, part being planted out at Blantyre, part sold to the A. L. C. and planted at Mandala, and part being sent to Zomba. The second year's crop was also sown and distributed and thus a beginning was made in coffee-planting.

In 1881 Mr. Buchanan started for himself at Mlungusi (below the Zomba Mission site) and put the question to a practical test as to whether coffee-planting would be a commercial success. Although many years, with varying vicissitudes, have passed since then we do not suppose. Mr. Buchanan would now materially alter the opinions he then formed and enunciated in his book "The Shire Highlands." In the light of present day experiences it is interesting to reread the verdict passed on the first sample of coffee from East Central Africa (Zomba district) placed before a London broker

"The following is the report of Messrs. Patry and Pasteur, coffee-brokers, London:—

"The coffee particularly is remarkable for the depth and brightness of its colour, which gives to it a value probably much greater as a fancy coffee suitable for certain foreign markets, than it would possess merely from its strength when roasted; and it compares favourably, for appearance, with the products of European plantations in British India, Ceylon, and Java. It is, however, a rather soft coffee, and not likely to keep its fine colour very long.

"Indeed some of the berries are already getting a little faded, which, if it made further progress, would soon detract a good deal from its value in its present state. In all other respects the coffee is as

well prepared as possible; it is large, well picked, and very clean-looking, smooth and even, and of bright, deep blush-green colour, and worth in this market about 85s. per cwt. in bond."

In connection with the preparation of the above sample, I am, in justice to it, entitled to state, that I had had no experience whatever in preparing coffee prior to my sending away the sample."

As this is merely an outline we are not able to go into the details of Mr. Buchanan's efforts in sugar planting in which he was ably seconded by his brother David Buchanan, who joined him in 1883, nor to relate how he made a wooden cane crushing mill and afterwards a wooden waterwheel, but we note that in 1885 he was able to write as follows:—

"There are now growing in the Blantyre garden orange, lemon, fig, pomegranate, peach, loquat, guava, apricot, nectarine, custard-apple, granadillas, and several others."

From 1885 onward was the period of the Arab war and Portuguese complications and the records of these years are chiefly in the archives of the Foreign Office. In 1887 it was, we think, that Mr. Sharpe came into the country elephant-hunting, which however had to be exchanged for the more serious business of fighting the Arabs, a work in which the late Mr. L. M. Fotheringham had his full share. In 1888 the *Blantyre Mission Supplement* was first published and a few stray notes here and there help us to follow the progress of events. It was in the same year that the present writer came into the country. At that time one could almost count the Europeans engaged in planting or trade on the fingers of one's hand and the chief stations were Blantyre and Mandala, Chirazulo, Zomba and Domasi. Mr. Robert Buchanan, who came out in 1885, was at that time in charge of Zomba.

In 1888 both Messrs. Lindsay and Smilie had been sometime in the country and Mr. Simpson was on the lower river. In March on the same year we read that "the Brothers Pettitt are still holding their own in the country. Mr. Pettitt and Mr. Marshall are on their road to Quilimane in the course of their trade" and in May we hear of Mr. Steblecki's arrival.

In December the *Supplement* reports Mr. Sharrer as "being on his way up" and having brought his steamer as far as Katunga's filled with his trade goods and two months later a note is made of the purchase of the site of his present head-quarters from Kapeni.

In April 1889 the following paragraph marks the progress of the Mission agriculture:—

"The Mission tea bushes are doing extremely well; the gums have seeded, and we have now plants from them; Mocha coffee is sown and springing oranges are maturing, and there has been a supply of vegetables for some time past."

With regard to "outsiders" we read:—

"Coffee seems to be doing well this year. The Mission patch shows some light berry in one small part but not so wide spread as last year. The acres of the Buchanan Bros. in the Michiru valley are perfect; level symmetry, lovely green and laden shoots have transformed the rough bush into a fairy land. The plants are all young and of the same age, so there is neither lightness in berry, borer in stem, nor irregularity in the rows."

Mandala coffee, much older and of course more tried, is doing well."

In October 1889 our present Commissioner passed up to the North End (of Nyasa) on his mission of peace and shortly after the country was declared a British Protectorate.

In 1889-90 the late Mr. Robert Cleland was frequently at Mlanje arranging for the opening of his station there and we well remember with what enthusiasm he spoke of the soil, the forest, the rainfall, and the general suitability of the place for coffee. During one of his visits he made a determined attempt to reach the highest point of Mlanje but failed, and he was the first to discover the well known Mlanje pine.

Mr. Duncan started his present estate at Upper Mudi early in 1890 and in July of the same year we read of a great storm of hail passing over

Blantyre. "The hail was worse than we have ever seen here before. It lay for days after and the natives gathered it in basketfuls."

In 1891 there are several arrivals. Mr. Bradshaw passed up the river and settled at Mlanje where Mr. Brown of Ceylon had preceded him. Mr. Brown opened up for the A. L. C. what is now Mr. Moir's Lauderdale Estate. Mr. Hastings also arrived and took up land at Chirazulo while numerous other purchases were completed and ratified. Mr. Adamson, now at Cholo, arrived shortly after Mr. Hastings.

The *Supplement* has a doleful note in April of that year—"Coffee is being planted in all directions. Coffee plants have been unable hitherto to hold out above four or five years." The same note is struck in September 1892, at the time of Dr. Johnston's visit, but we notice that these views are contradicted in their issue for June of the present year where despondent planters are told to take a "little heartening" seeing that the pioneer patch of coffee in the Mission garden, which is fourteen years old, is "as flourishing as ever"

In August 1891 it records the aim of "The Buchanan Bros." to reach the number of 1,000,000 coffee plants that season.

"This sounds well and is no empty sound, for even the empty berry foe seems to be succumbing to treatment, as did the borer and leaf-scale. The highest price quoted is we believe this very Shire Highland coffee—we want some good name for it—the quotation being 112s.

"Mr. Sharrer's plantation's are said to have laid more ground, than any one else, under cultivation."

But it is time to stop as we are now, so to speak, on the very borders of the present regime, seeing that our Commissioner arrived in July 1891 by the Chinde mouth, and the history of the last four years must be tolerably familiar to most of us and if not, is it not written in the recently issued *Blue-book?* to which we refer those desirous of acquiring the latest information.—*Central African Planter.*

COTTON, COFFEE, AND VANILLA CULTURE IN TAHITI.
—Referring to the cultural industries of Tahiti, the British Consul states that Cotton has always been the favourite culture of the native population, but owing to the extremely low prices that have latterly ruled, both locally and in Europe, its cultivation is being gradually abandoned. Tahiti Cotton no longer pays to produce, and it would be an excellent thing for the island and for some of its dependencies if the natives could be induced to undertake in its place the culture of Coffee, which grows in the island under the most favourable circumstances. The quality has been declared by European and American experts in Liverpool and New York respectively to equal West Central American in aroma and in general quality. Coffee would be the ideal culture for the natives, but so far only a few of them have been induced to set out small patches, for the reason that as they only live for to-day, they cannot as yet be persuaded to undertake an enterprise from which a return can only be expected after the first three years. The one attempt made by any foreigner in this direction—a small plantation of seven acres, planted some three years ago—shows conclusively that this enterprise could be made to pay. The annual production of Coffee is at present 3 to 4 tons only. The cultivation and curing of Vanilla in Tahiti is being neglected in consequence of the inferior quality as compared with that of Mexico, Bourbon, and Seychelles, and the corresponding low price that it commands. A hope, however, is current in the island that the market value may be increased by the adoption of a more efficient method of curing the bean than that at present in use. The annual export of Vanilla is about 15 tons.—*Gardeners' Chronicle.*

THE LABOUR QUESTION.

We direct attention to two letters elsewhere from men of planting experience and long residence, writing the one from a Kandy, and the other an Uva, district. Both deprecate any appeal to Government for legislation to render monthly payments compulsory, and we think the parent Association will be very slow to accept a proposal of the kind until they see a good deal further into its working and consequences. These "consequences" are depicted by a contemporary after a graver fashion than is attempted even by the planters themselves, and we quote the following for the purpose of asking how far actual experience bears out the several anticipations of evil results all round:—

If the cooly's wages are paid into his own hand at the end of every month, it will be a good thing for him, but probably his creditors will see very little of this same pay, and either the debtor must go through the bankruptcy court and get a clean slate to begin again with, or else his creditors, including the estate proprietor, must face the loss of large sums of money in the shape of bad debts written off. This arrangement would, no doubt, be a splendid thing for the gangany, who, in spite of what is said about him, is often a distinct genus from the ordinary cooly, having inherited the gang that works under him, with his father's possessions and liabilities, and being a somewhat important personage in his way, more intelligent and unscrupulous than the cooly-gangany who has worked all his life in the field and has been merely promoted by the favour of his master. The former receives large sums of money from time to time, which are spent in other methods than advances to the humble cooly on the coast, and are often utilized for money-lending purposes and in the purchase of real estate. If the gangany is to get a release from these debts, simply because the coolies under him are unable to bear the burden of their indebtedness to the gangany, the latter will undoubtedly score all round, and we do not see how distinctions are to be made between one class of debts and another, or how the debt which has been rightly incurred is to be separated from that for which the debtor is not really responsible, and which he has never benefitted by in the slightest degree.

Now, while the writer of the pamphlet only makes mention of one friend who has for a considerable time practised "monthly payments" with the utmost satisfaction, there must surely be several other planters throughout the planting districts, who have had experience of the system. At the time when Sir Arthur Gordon wished very much to legislate in this direction, he had—if we remember rightly—a leading Dimbula planter and a well-known group of estates in Matale to refer to, in support of the case for "monthly payments." Now, in a matter of this kind, a single fact is worth a bushel of theories. Will the gentlemen who have actually carried on "monthly payments" for it may be half-a-dozen years, tell us exactly their experience. How have their Ganganies got on about the old debts; how about security for Coast advances; how about hereditary claims? We do not say that even if the answers should be satisfactory, the time is ripe for compulsory legislation. The case is one to which *Festina lente* pre-eminently applies. But if we have all the advantages, as realised in actual practice, related to us by those who are making monthly payments, and perhaps the drawbacks noted by observing neighbours who have watched the working of the new system, we are far more likely to arrive at safe conclusions than if we go merely speculating about consequences, without taking note of actual experience.

THE ELK HILL COFFEE ESTATES COMPANY.

The Elk Hill Coffee Estates and Land Exploration Company, Ltd., of which we published the prospectus a few days ago, is a company formed with a capital of £100,000 in shares of £1 each to take over as a going concern the coffee estates and business of Mr. James Chisholm, a well-known and successful coffee planter in Mysore. The prospectus states that the books of the firm covering a period of ten years have been submitted to a prominent firm of chartered accountants in London, and the result of their examination shows an annual average profit of £7,703. On the Board of the Company are two late Commissioners, Colonel Henderson, C.S.I., and General Cole, who are well acquainted with the district and have visited it in their official capacity. The profits of the concern on the basis of ten years' working would be equal to the payment of 6 per cent. interest on the intended issue of £32,000 of cumulative preference share, and 10 per cent. on £50,000 of ordinary shares. The Indian Agents of the Company are the firm of Messrs. Pierce, Leslie and Co., well-known in Southern India, and the vendor and his friends take payment of a large portion of the purchase money in ordinary shares. The prospectus provides for the way in which intending subscribers in India should apply. The bulk of the Indian tea companies' capital on the Bengal side has been subscribed in England, and this seems to be an effort to apply the same principle to coffee, giving Indian subscribers an opportunity of investments also.—*Times of India*.

BENGAL CINCHONA PLANTATIONS.

Dr. King's report on the Bengal Cinchona plantations for the past year is, as usually, a most satisfactory record. The scope of operations was much extended owing to the purchase of the Lebong plantation from the Bhutan Cinchona Association, from which 203,000 trees (all quinine yielders) were cut down. Altogether 295,500 trees were uprooted for their bark, in addition to those from the Lebong plantation; the greater number of which were, however, feeble plants. The year's cropping reduced the number of trees to 3,277,000, but as there are still 650,000 trees growing on the Lebong property, the total number of living trees belonging to the Bengal Government at the end of the official year was 3,927,501 in permanent plantations and 20,000 in nursery beds. It is satisfactory to note that the demand for quinine, owing to the success of the pice-packet system, has increased. It is therefore intended, in view of a further increase in the demand, to plant out during each year an area in excess of that uprooted during the previous one. The year's crop yielded over 500,000 pounds of bark, the bulk of which was of the quinine-producing kind. The whole crop, with the exception of about 2,000 pounds sold independently, was made over to the Government Cinchona Factory. There was a slight falling off in the issue of cinchona febrifuge as compared with 1893-94, due mostly to a decrease in indents from the Government Medical Depôts at Calcutta and Mian Meer. Considering the low rate to which the price of quinine has fallen during recent years, and the still lower level to which the prices of cinchonidine and cinchonine have been reduced, says Dr. King, a diminution in the demand for cinchona febrifuge was inevitable. The diminution has, however, been more gradual than was anticipated,

and the fact that during the past year the cash sales were reduced by only 37 pounds, Dr. King regards as a most satisfactory evidence of the public belief in the efficacy of this drug as a cure for fever. He notes that both cinchonine and cinchonine have during the past year been pressed on Indian buyers at very low rates by European quinine makers who, obliged by the tests of the pharmacopœia, to remove these alkaloids from their quinine, can find no market for them in Europe. The expenditure on the plantations and factory during the year amounted to R1,23,805, including the instalment of R50,000 paid towards the purchase of the Lebong plantation. The net result of the year's working was a surplus of R7,705, which, however, can hardly be regarded in the light of a profit, as the plantation from which a certain number of trees has been taken has not been increased by a corresponding number. Dr. King pays a high tribute of praise to the work done by Mr. J. A. Gammie who was in executive charge of both the plantation and the factory. Messrs. Pantling, Parkes and Hartless, the three assistants, are also favourably mentioned.—*Indian Daily News*.

TEA REPORT FROM NATAL.

Mr. G. W. Drummond, Kearsney Estates, writes us:—It seems likely that the new tea season will commence about the 23rd inst. The tremendously long drought we have had has, of course, had its effect on the backwardness of the young shoots. Our estimate for the Stranger district is 830,000 lb., out of which we hope to make at this factory 540,000 lb. and the total crop of the colony should be about 950,000 lb. If we get the favourable weather we got last year the estimate will be reached without a doubt, and probably exceeded. I have found that many people, most people in fact, who make Natal tea, give it exactly the same time to infuse as Indian or Ceylon tea. This is a mistake. Many a cup of Natal tea is spoiled by this mistake. Natal tea should be allowed to stand in fresh water, first boil, for fully three minutes longer than Indian tea, and two minutes longer than Ceylon tea. It is a tea that can be drunk by itself (pure)—no mixing—and has not the astringency of Indian tea, nor does it contain the same amount of tannic acid, which last is not wanted, and should not be allowed to find its way into the cup. Indian tea, 5 minutes; Ceylon, 6 minutes; Natal, 8 minutes.—*Natal Mercury*, Sept. 27.

TALIPOT PALM.

There is a fine talipot palm in flower above Mirigama on the right side of line from Colombo coming up.—*Cor.*

THE RUANWELLE TEA CO., LTD.

Application has been made by Messrs. F. J. and R. F. de Saram, Proctors, for the incorporation of the above Company with a nominal capital of R750,000 divided into 7,500 shares of R100 each. The subscribers to the Memorandum and Articles of Association are Messrs. A. Melville White, T. J. Anderson, G. W. Carlyon, C. E. H. Symons, G. H. Alston, C. J. Donald, and C. A. Leechman; the first Directors being Messrs. A. Melville White, Eric S. Anderson and G. W. Carlyon, and the Agents and Secretaries, Messrs. Whittall & Co.

RETURN FROM TEA.—With reference to an advertisement of Kitulgaha estate in Maskeliya, it is remarked to us that "a return of R3,000 a year off 40 acres tea is not bad, seeing the leaf is sold." Very good we should say.

ELECTRICAL DEVELOPMENTS.

THE new "Non-polarising Electric Battery" :—otherwise, "the new Voltaic Battery," are names which do not convey much to the minds of the ordinary reader not familiar with the details of up-to-date electrical science, with its barbarous nomenclature of "Volts, Webers, Ohms, Ampires," &c. But when told what work the new battery will do, at what cost, and in how convenient a manner, —provided these shew a great advance—all can understand that another great discovery has been made, affording "Light" and even "Power" from a cheap and simple source. In writing on the possible achievements of science, a short while ago, we ventured to say that a time would come when all the potentialities contained in a small lump of coal would be made available in some new form of battery. Well, recent discoveries, apparently, go very near to the realization of our prognostications. If we could accept all that is mentioned in the paper before us, the new battery for lighting purposes, seems to afford facilities unobtainable hitherto. For a sum of about £50—we are informed—an installation can be had for any factory or residence, which will run for 200 consecutive hours, against a hitherto possible maximum of 10 hours by any other battery doing the same work, at the same cost. No engines, dynamos, or accumulators are required—only a floor space of 4 ft. by 21 inches and 3 ft. in height. As a motor, it is stated that it will not be found to be of much use until it can be made to develop more power.

Unfortunately, at the same time, we are told independently by a Colombo householder, for whom a friend at home has been interesting himself in this "Non-Polarising Battery" that it has by no means been fully and practically developed yet. He has been watching it since February last, but so far without being able to recommend it.—Still another circular placed before us has reference to the "Boron Carbon Battery" mentioned in the *Chemical News* which says:—

"The conclusion of the all-too-brief description states that the new cells are unrivalled as a lighting agent for lamps and give off no fumes, whilst one usually suices to drive a motor, and three for the entire electro-chemical work of a large laboratory."

Verily, in the variety of candidates for further favour, there is a difficulty of choice. We must just allow the rivals to shew what they can do in the old country before trying them out here. But we are doubtless on the threshold of further discoveries which will afford us cheaper and greater "power" as well as more brilliant "light," and by the same safe, easy and inexpensive means.

Since writing the above, there comes from a correspondent, the latest story in lighting:—

"The Municipal Council of Paris has lately invited the Administration to study the practical means of lighting with 'Acetylene.' A mixture of 4 oz. of marble lime and 2½ oz. of coal of sugar submitted during 20 minutes to a heat of 3,500 to 4,000° celsius, gives 4 oz. of black crystals of 'carbure of Calcium.' Put in contact with water this decomposes immediately in giving gas bubbles, the 'acetylene,' which has a lighting power twelve times greater than gas. 2 kilos. 85 of carbure of calcium in 40 kilos. of water produce one cubic metro of acetylene. A manufacturer of aluminium of spray (North Carolina U.S.A.) is said to produce the carbure of calcium at £3 per ton of 908 kilos. At that price, taking into account its greater lighting power, acetylene will be ten to twelve times cheaper than ordinary gas. One may

foresee that lamps will be made in the recipient of which, in place of oil, a lump of acetylene will be placed in the water; this would be the downfall of kerosene and gas, as well as of electric light?"

SOME RECOLLECTIONS OF EARLY DAYS IN CEYLON.

[BY MR. R. E. LEWIS—A PIONEER PLANTER IN
THE EARLY "FORTIES" AND AFTERWARDS
COLOMBO MERCHANT.]

The writer's recollections commence in

THE YEAR, 1841,

when Sir Colin Campbell was Governor of Ceylon. It was then ceasing to be merely a military dependency of the British Crown, but was becoming a Colony, while Mercantile and Planting enterprise were beginning to develop. It is not intended to give a history of the enterprises, but something may be said as to the causes for this change. In a word, it was the abolition of differential duties on coffee, which had been imposed on the produce of Foreign Countries and even on that of our own possessions in favor of the West Indies.

In these days, when few middle-class families have not some friend or relation connected with the Island, it may sound strange, that Ceylon in the "Forties" was very often confounded with Sierra Leone, and intending voyagers were sympathised with as going out to one of the most unhealthy countries in the world.

As early as 1837—perhaps earlier—some few plantations had been commenced; the Governor Sir Edward Barnes had himself opened land near Peradeniya, rendered possible by the opening of the road to Kandy under his energetic rule.

PLANTING

was very experimental in those days, and much capital was wasted, by planting in unsuitable situations. The great rush for land however began in 1841 and land was then readily sold by the Government at 5s an acre, as a reference to the *Government Gazette* for that year will show. Unhappily much land was bought and planting commenced by Civil Servants and Military men and much disaster followed leading to regulations which have lately been revised prohibiting such investments. Experience in cultivation and finance had to be acquired, wanting which many proprietors were ruined and by the year 1847 few estates remained in the hands of the original owners. Experience at last came,—not a little assisted by the local press, through which every improvement became common property, producing valuable discussion. We've after wave of alternate prosperity and depression have characterised the Enterprise up to the time when Coffee had to give place to Tea.

In those early days, the

SOCIETY

outside the Civil and Military officers was very limited. A few merchants had offices in the Fort where their assistants mostly lived to protect the hard cash in the strong room; no Bank having been established until 1841, when the "Bank of Ceylon" was opened. There was no decent hotel in those times; the Colombo Resthouse would now be a disgrace to an outstation; but there was much hospitality to strangers, and Captains of ships were always entertained by the merchants, to whom their vessels were consigned. Admission to the use of the Library with the privilege of attending the dances every fortnight, was by ballot. There were then two Regiments of Royal Troops besides the Ceylon Rifles, Artillery and Gun Lascars. Not long before there had been

FOUR REGIMENTS,

stationed in the island. With the influx of new people, houses and furniture were wanted and except old Dutch furniture in the houses of Burghers,—often very handsome and made of valuable woods,—there was little to be had, except a few articles manufactured outside and brought in for sale on pingoes chiefly,

It was not an uncommon thing for somebody to say to another about to leave the island:—"I am sorry you are going away,

HAVE YOU ANY FURNITURE TO SELL?"

Not only furniture but gentlemen's and ladies' clothing articles were difficult to obtain, beyond plain things which could be made by local tailors and needlewomen. The writer not knowing what head covering might be worn, brought out with him a silk hat costing 6s 8d which was admired by all beholders: many were the enquiries "Where did you get your hat?" At that time the Colonial Secretary was wearing a beaver, the color of a fox's brush. Soon after, things changed by a curious circumstance. A new Chief Justice came out and in his train a Scotch gentleman, who practised as a notary afterwards and later on as a magistrate at an outstation. His wife, with an eye to the main chance, brought with her an invoice of ladies' goods which were sold off at once. This lady saw at a glance the nakedness of the land and having a brother in the drapery trade, communicated her views to him, which resulted in the establishment of

A GENERAL STORE

of high character and which celebrated its jubilee only lately. Retail business by Europeans has since progressed largely in all its branches. One of the most pressing wants at that time was

ROADS IN THE INTERIOR.

The Kandy, the Kurnegalle, the Galle, the Gampola, the Negombo, the Putlam and the Matale roads alone existed. Estates which did not adjoin these roads were reached at best by bridlepaths, but most often by a mere track through jungle over rock and river which caused those clever and sure-footed Pegu ponies to be in great request,—rice and stores reaching the estates by coolies and tavelam bullocks. The facilities for locomotion now enjoyed independently of railways, are chiefly due to the late Major Skinner and his able assistant Capt. Evatt and his subordinates. There were then mail coaches (so-called) on the Kandy and Galle roads which started daily at morning gun-fire. Our merchants were few; the business of coffee curing and shipping had not then come into existence; nor had the trade in piece goods and European articles been developed by the circulation of money on the plantations. A merchant leaving for Europe would be always accompanied to the Wharf by his brother merchants. Intercourse with Europeans was then almost entirely by

SAILING SHIPS;

merchandise and produce coming and going in the same way. Mr. Wm. Tindall of London and Scarborough was the owner of nearly all the vessels which traded with Ceylon; their Commanders being well-known men well received everywhere. Any one who wished to use the Overland Route organised by Waghorn, would go up to Bombay by our little multi-steamer, "Seaforth" going on by Indian Navy steamer to Suez, and thence in a very rough way across the desert to Cairo and to Alexandria and onwards. Our Overland Mails came in and went out once a month. During the moosoon they were brought down by Dak from Bombay. In the North-East monsoon they came by the Colonial steamer "Seaforth" from Bombay. The arrival of the

ENGLISH MAIL

was a very exciting thing: for it happened mostly, that the outward mail had to be despatched in a matter of hours after. Perhaps there is no European now living in Ceylon who remembers the arrival of the mail announcing the birth of H. R. H. the Prince of Wales and the Breach promotion in 1841. On that occasion after the steamer was signalled, Civilians, Military and Mercantile men were at the Wharf awaiting the Captain of the steamer to land. When he came, he announced to the recipients themselves their new honours. That gentleman after a prosperous career as a merchant in Colombo is now at a good old age, living near London. The passage of the mail was then about a month—possibly more—for when Capt. Ingledew the Pioneer of the P. & O. Company, brought letters to Galle in the

steamer "India" in 30 days, it was considered a great feat. Since that time the large and powerful steamers of the P. & O. and British India Company, besides many other modern lines, with the opening of the Suez Canal, have reduced the time occupied in transit and expenses of travelling to about half of what they were up to as late as 1871. Postal facilities of all kinds now exist which were undreamed of in the 40's 50's and 60's. The early planters had among other difficulties, that of

FETCHING THEIR MONEY

in hard cash up to the estates which generally required a personal visit every month to Kandy. The provision of this money was by Government notes cashed at the Kandy Kachcheri. Considering the temptation to highway robbery and the facilities for it in lonely corners, it speaks well for the natives, that the number of these crimes might have been counted on the fingers of one hand. A greater trial to the planter was

THE LABOUR QUESTION

especially for clearing jungles for which Sinhaleso villagers are specially adapted; those were not the days of contractors for felling and burning, and the immigration of Tamils for all the after operations had not been systematised.

AMUSEMENTS

were few, Governor's Balls, Race Balls and dinner parties in Colombo were about all. In the Planting districts perhaps the monthly visit to Kandy where the pioneer enjoyed himself very much like Jack ashoro, was a beneficial change which the circumstances of his life required. It might then have been said.

"The sound of the church-going bell
These valleys and rocks never heard."

There were Chaplaincies in Colombo, Kandy, Galle and Trincomalie; Missionaries both Church, Presbyterians and Non-Conformists at several stations with Churches and Chapels in Colombo and Kandy, but the privileges of public worship which dwellers in the jungle now enjoy, though these might be improved and extended, did not exist. The most important improvement, and cause of the great contrast between the present and the earlier times has been the introduction of

RAILWAYS.

The facile communication between the Plains and the Hills is a boon to the health of Europeans, whilst its is an enormous advantage to the Planting Interest, on the prosperity of which, as seen by its ups and downs in sixty years, the well-being of the island depends.

R.E.L.

JAPANESE CIVILISATION.

BATHING. Cleanliness is one of the few original items of Japanese civilisation. Almost all other Japanese institutions have their root in China, but not tubs. Their hot baths—for they almost all bathe in very hot water of about 110° Fahrenheit—also help to keep them warm in winter. For though moderately hot water gives a chilly reaction, this is not the case when the water is extremely hot, neither is there then any fear of catching cold. There are some eight hundred public baths in the city of Tokyo, in which it is calculated that three hundred thousand persons bathe daily, at a cost of 1 *sen 3 rin* (about a halfpenny of English money) per head. A reduction of 3 *rin* is made for children. In addition to this, every respectable private house has its own bath-room.

HOW TEA IS DRUNK IN JAPAN.

The tea drunk in respectable Japanese households generally costs about 25 cents a pound, while from 50 cents to \$1 will be paid for a better quality, fit to set before an honoured guest. The most expensive Uji tea costs \$6 per pound. At the opposite end of the scale stands the so-called *bancha*, the tea of the lower classes, 5 cents a pound made out of chopped leaves, stalks, and bits of wood taken from the trimmings of the tea-plant; for this beverage is tea, after all, little as its flavour has in common with that of

Bohea or of Uji. Other tea-like infusions sometimes to be met with are *Kosen*, made by pouring hot water on a mixture of various fragrant substances, such as orange-pool, the seeds of the xanthoxylon, etc; *Sakurayu*, an infusion of salted cherry-blossoms; *Mugiyu*, an infusion of parched barley; *Mane-cha*, a similar preparation of beans. *Fuku-ja*, or "luck tea," is made of salted plums, sea-weed, and xanthoxylon seeds, and is partaken of in every Japanese household on the last night of the year. Japanese tea, unlike Chinese, must not be made with boiling water, or it will give an intolerably bitter decoction; and the finer the quality of the tea, the less hot must be the water employed. The Japanese tea equipage actually includes a small open jug called the "water-cooler" (*yu-zanashi*), to which the hot water is, if necessary, transferred before being poured on the tea-leaves. Even so, the first brew is often thrown away as too bitter to drink. The consequence of this is that Japanese servants, when they first come to an English house, always have to be taught how to treat our Chinese or Indian tea, and generally begin by giving practical proof of their incredulity on the subject of the indispensable virtue of boiling water.—B. H. Chamberlain.

THE OPENING UP OF NORTH TRAVANCORE.

INTERESTING EXPERIENCES OF MR. BENZIE.—Mr. Geo. Benzie, the well-known surveyor, gave us some interesting information yesterday on the subject of the big work he is now carrying on in Travancore. with Mr. Chas. Gordon, in connection with the cart-road to be made through the western side of the Sylhet Tea Company's new property, to provide an outlet for it in the direction of Cochin. The new road will only go to the boundary of the Sylhet Company's land, and between that point and the present termination of the Cochin road there is an interval through which it is hoped the Travancore Government will eventually make a road, so as to establish complete communication. In the meanwhile the Sylhet Company are pushing on with their road at all speed, the contract being in the hands of Mr. Benzie, assisted by Mr. Gordon.

Talking about his recent trip to Travancore, Mr. Benzie said:—"I was over there for six weeks this time, and, when I left, the first eight miles of roadway were completed, and the work was going on under the supervision of Mr. Gordon. How long the road will ultimately be I cannot say, but I should think to the boundary of the Sylhet Company's land it must be from 30 to 35 miles. I spent the bulk of my time this last visit in exploring the country and looking for ways and means of cutting the road, for that part is nearly all jungle. It is a very wild country to have to travel through, and, in parts where I went, natives even had never been. The natives of this particular part of Travancore are a nomadic class. They put up grass huts and stay in them for a time, cultivating *kurakkan*, like our natives do here, one year, but the following year they may be 40 or 50 miles away. They are called *Mathuvars*, or back-carriers—that is to say, they carry everything on their backs. They are splendid jungle men and handle their jungle—knives well, and they work willingly enough, but unfortunately their numbers are few. They are Tamils, of course, but as compared with the Tamil coolies you see in Ceylon they are a civilised race. They are much the same as the coolies in regard to build and physical appearance, but their manner is more independent; they don't come up to you in the cringing way that a Tamil cooly does, and they are a heap pluckier than the coolies.

THE HOME OF THE ELEPHANT.—"The whole place swarms with elephants. On the Cardanum Hills, which belong to the Rajah of Travancore, and which abut on the Sylhet lands, it is estimated that there are fully 6,000 elephants, and you cannot leave a house or a tent of a night without a watchman and big fires without running a very great risk of its disappearing before the morning.

CAMPING OUT.—"Yes, I camp out the whole time sometimes sleeping in the open and sometimes under cover of a tent. The elevation is about 5,000 feet, and in February and March it freezes there of a morning, but at other times it is much drier than similar elevations in Ceylon, and it is not nearly so hot during the day as in Ceylon. And it is grand soil; very fine indeed. The very patana land even is better soil than a lot of the forest-land in Ceylon. On the Cardamom hills, as you know, cardamoms are indigenous; they are not cultivated in any way. The part of the Sylhet lands where I am working, as I have told you, is mostly jungle. You ask if it is not risky for the Company to make this road before getting a definite answer from the Travancore Government that will continue it. Other people have asked me the same question, and my reply has always been that the road is necessary for the development of that side of the Sylhet lands. Whether it be continued or not the road must be made. It is through the finest part of the Sylhet land."

A NEW SANITARIUM.—"The part of Travancore where I am working is in the same range as, and probably within 15 miles of, Kodi Kanal, which is said to possess the finest climate in India, and which has been fixed on now as the site for the chief Observatory in India. It is already largely used as a sanitarium, and there are many boarding houses there, the people who visit the place coming chiefly from Madras, Trichinopoly, and Madras, and they prefer it to Ooty. One gets there every English comfort, and plenty of pastime, such as good tennis, billiards, shooting &c. I could recommend it to Ceylon folk requiring a hill-change, the bugbear for Ceylon people being, however, the steamer trip between here and Tuticorin. Still, once at Tuticorin, one can get to it pretty easily and cheaply. One has to go by railway from Tuticorin and from the point where you leave the railway there is a journey of over 30 miles of cart-road, and then one of eight miles in saddle or in chairs. Steamer fare from Ceylon to Tuticorin is R21; railway fare from Tuti to the nearest station (120 miles) is R9; cost of conveyance over rest of the country R4; total R34 for the single journey, and (of course) less for the return trip. You can leave Tuticorin at 2 o'clock today and arrive at Kodi Kanal in time for breakfast tomorrow morning. I don't suppose the Nuwara Eliya people will thank me for saying all this, but it really is a very delightful sanitarium. I am off on Monday or Tuesday again for Travancore, and I shall be away there several months at all events."

"LADY BIRDS" IN CALIFORNIA.

DEATH OF THE ENTOMOLOGIST WHO
INTRODUCED THEM.

Professor Charles Valentine Riley, whose death resulted from a fractured skull caused by a fall from a bicycle, was the leading agricultural entomologist of the United States. Born at Walton-Thames in 1843, he passed his early years there and at Chelsea. He was educated in France and Germany, where he acquired not only a knowledge of the languages, but became very skilled in the use of the pencil, an accomplishment that proved of great use to him as his love of entomology developed itself. In 1869 he crossed the Atlantic and settled on a farm in Illinois, where he devoted himself to agriculture and natural history pursuits. In 1864 he took part in the civil war in the ranks of an Illinois regiment of Volunteers. Four years later he was appointed State Entomologist of Missouri, and during his tenure of office he prepared a remarkable series of illustrated monographs. In 1877 he became the leader of a commission appointed to inquire into the ravages of the Rocky Mountain locust, and in the following year the office of Government Entomologist of the

United States was conferred upon him, a post from which he retired only a year ago. He published a large number of memoirs upon the Hessian fly, army worm, cotton worm, chinch bug, phylloxera, and other insect pests. One of his most brilliant exploits was the suppression of a scale insect which threatened to destroy the orange groves of California; this he did by introducing and acclimatizing from Australia an insect—allied to the English ladybird—which preyed upon the scale insect. Whilst at Washington he organized the Entomological Museum and started the periodical *Insect Life*, now in its seventh year. He lectured at different times at various Universities and colleges, and in 1889 the entire charge of the agricultural section of the United States display at the Paris Exhibition was intrusted to him. He had already received a gold medal from the French Government in recognition of his researches into the life history of phylloxera, and in 1889 the cross of the Legion of Honour was bestowed upon him. He was a frequent visitor to his native land, and was here as recently as last year, when he attended the Oxford meeting of the British Association.

THE NEW DIMBULA COMPANY, LIMITED.

REPORT, SEASON 1894-95.

In presenting their tenth Annual Report the Directors are enabled to recommend the payment in full of all arrears of dividend on the "B" shares and at the same time to commence payment of dividend on the "C" shares, which hitherto have not participated in the profits of the Company. The estimated yield of Tea for the past year has been exceeded, but prices have been lower than in the preceding year.

The estate is reported in good order; considerable additions have been made to the factory accommodation in the past year, and larger additions have been sanctioned for the present year to meet the increasing yield from the larger acreage now in bearing, and to provide as far as possible for the efficient treatment of the Tea. The full area of cultivated land (2,193 acres) will come into bearing during the present year.

The accounts now presented show a surplus of £16,270 3s. after writing off the balance of Tea Extension Account, viz., £69 8s 4d. and the balance £1,750 16s 11d. of the "Factory and Machinery Account." The Directors propose a dividend of 8 per cent. per annum on "A" shares for the year ended 30th June last, 4 per cent. of which was paid in March. The Directors also propose the payment in full of all arrears of dividend on the "B" shares amounting to 8 per cent, 4 per cent. of which was paid in March last, and a dividend of 8 per cent. for the year ending June 30th last, and the payment of 6 per cent. on the "C" shares. The Directors further propose an additional dividend of 2 per cent. on all shares, and the placing of £3,000 to a Reserve Fund.

The Directors have much pleasure in recording their appreciation of the General Management in Ceylon, and feel that special credit is due to the Resident Manager.—By order of the Board, A. CRABBE,
Secretary.

JAPANESE AND CHINESE FOR THE STRAITS.

The well known politician, Mr. Oi Keutarō, is now staying at Singapore, where he is believed to be engaged in business. In a recent letter to a friend at home, he speaks with admiration of the influence exercised by the Chinese population there, and of the general truthfulness of Chinese merchants. Another surprise to him has been that the summer is more endurable at Singapore than in

Tokyo, and a third cause of astonishment is the cheapness of house rent. He suggests that it might be profitable to organize a society for the emigration of carpenters, plasterers, and other artisans from Japan.

TEA PROSPECTS IN INDIA.

A Correspondent writes to the *Englishman*:—
“My advices from the tea-producing districts are anything but cheerful. There is now a complaint of want of rain, and the nights are too cold. The consequence is that the prospects for October (generally a favourable month) are very poor, and all circumstances point to an early, and I should say, for producers, a disastrous close to the season. The point I wish to dwell on forcibly is that the total crop of tea for 1895 will of a certainty be much less than that anticipated by the Indian Tea Association. This is no alarmist's prediction. I have no ulterior reason to induce my writing on so important a subject, and I give you my name as a guarantee of good faith. I am a large producer myself, and my only hope is that better prices will compensate in some degree for a short crop.”

THE PREPARATION OF CAMPHOR

In answer to his enquiry on our behalf, Mr. R. Porter has received the following second reply from friends in China:—

Your enquiry about the manufacture of Camphor, I was totally unable to answer till the other day, when I met a very good fellow from Formosa. I give his information, in case it may be of use. The Camphor trees grow in the hills, none on the plains. They are more abundant in the northern portion of Formosa. Some of the trees are very large, 5 to 6 feet in girth, and proportionately tall. The larger trees give a better yield of Camphor. The Camphor is obtained as follows:—The roots of the trees are exposed, and with a kind of axe pieces about the size of a man's hand (sometimes twice that size) are cut from the external layers of the root. Some of the pieces may be an inch thick, some half an inch, all include bark, and a thin slice of the woody matter. The pieces of Camphor root are put into a large, somewhat shallow iron pot. The pot is covered with a jar, a little water is put along with the wood. Fire is applied, and the camphor distils, being caught on the sides of the jar. The workmen live in camps, and for each set of camps there is a central stove. The management of the manufacture is all in the hands of foreigners. Formerly the Mandarins tried to manage it, and send the camphor to the foreigners, but this plan did not succeed. The number of trees is very large; they are not planted, but purely self-sown. The trees already sliced, generally, but not always, die.”

TEA FOR TIBET.

Mr. A. de Rosthorn's pamphlet on the Tea Cultivation in Western Ssuchuan and the Tea Trade with Tibet via Tschienlu is very interesting and instructive, and in the compass of 40 pages gives much practical and valuable information about the Tea trade between China and Tibet. The information has been acquired by Mr. de Rosthorn partly by personal observation and enquiry and partly from official records. Mr. de Rosthorn shews, what some of us knew already, that of the so-called Tea, exported from China via Tschienlu into Tibet, a large proportion—about 65 per cent—is not tea but the leaves of wild trees, “brushwood.” He gives an account of the manufacture of this “tea,” tells us how much is exported, gives the revenue derived from it, the cost when laid down in Tibet, and other particulars interesting to the Indian tea-grower. We have also a very suggestive reference to the political question which may be involved in the treatment of the Tea trade with Tibet by the Chinese Government.—*Luzac's Oriental List*,

TEA BULKING ON ESTATES.

As is well-known, it has for years past been the practice to bulk Indian and Ceylon teas at the gardens before they are despatched to the markets, or to bulk them in London if it has not been done at the gardens. This has been done to secure regular and uniform quality. Serious complaints have reached us, however, that some importers are neglecting this practice. They are bringing teas on to the English market which are not bulked, and are taking the risk of being detected. When the irregular character of the tea in the chests is discovered, and a claim is made, it is quietly allowed, and the matter treated as accidental. If the non-bulking is not detected, then the cost of the process is saved and goes into the pockets of the importer. The omission, however, if persisted in, must lower the confidence in Indian and Ceylon teas—a confidence which has naturally tended to enhance their popularity, and has contributed to the growth in consumption which has been such a marked feature of the tea trade for some years past. Such a policy, moreover, is dangerous. The greed of the Chinese men, which led to the deterioration of Chinese tea, and the consequent falling off in the demand, ought to be remembered by all—but the most indifferent or careless among the importers. There is little doubt that similar conduct on the part of those interested in Indian and Ceylon imports will lead to a like result. Once let the confidence of the trade and the public be shaken it will not be easily reinstated, and the continuance of these non-bulking tricks will do an amount of damage to the trade which cannot be readily estimated. At present the evil has not grown strong, but, unless checked, and that speedily, disaster is not far off. We hope the London Wholesale Tea-dealers' Association, which has rendered such practical service in the past, will take this matter up, and use its great influence to put a stop to it before our immense and still-growing trade in Indian and Ceylon teas is seriously damaged.—*London Grocer*.

PARTNER WANTED FOR LIBERIAN COFFEE.

An advertiser in our advertising columns, hailing from Sumatra, who has £5,000 of his own, seeks for a practical coffee-planting partner willing to furnish £2,500 with the right of participating in one-third the returns. The notice is a thoroughly genuine one.

“LADY BIRDS.”

Our London Correspondent suggests that instead of making further trial of the importation of these little insects from California, a direct endeavour should be made to obtain some of the Australian variety. The success attained by the late Professor Riley in his introduction of this insect in relieving the fruit-growers of California from a great pest which threatened the distinction of their orange-groves, should induce us to persevere in the same direction. That victory has been described as the “most brilliant” achieved by the Professor during his career. We have in this a special encouragement to further effort in the same direction. We fear the death of the “lady-birds” during their journey onward to Ceylon that we previously reported, is not to be accounted for by the fact that all air was excluded from them. We are ourselves aware of the tenacity of insect life under such exclusion to which a recent correspondence bore testimony. Its vitality under circumstances even more likely to produce death, has been repeatedly evidenced, and we believe the cause of failure must be sought in some

other directions. It seems difficult to imagine that an insect that delights in the sun heat of a Californian summer would succumb to even the heat of the Red Sea while in transit. But there may be some other climatic influence unfavourable to the life of the "lady-birds" which caused their death in the long transit across America as well as Europe. It is certainly wise to make a fresh attempt with the allied form of Australian beetle, to which reference has been made. As this was successfully transported to and acclimatized in California, there can be little doubt, we should say, that it would bear the transfer to Ceylon; and our correspondent and others interested in England will be glad to hear that already steps have been taken by a Ceylon planter to endeavour to get a supply of the little enemy of the coffee as well as orange "coccus" (bug) from Queensland.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, October 10.

CINCHONA—A parcel of 20 serous fine cultivated Bolivian Calisaya (MC brand) has just arrived, and will shortly be offered for sale. The holders expect to get about 2s 3d per lb for it. The bulk of the supply of cultivated Calisaya in flat pieces which was offered at the last drug sales has been sold privately at firm prices.

COCA-LEAVES—Fine qualities have been rather scarce lately, but this week there have been a few new arrivals, including good bright South American Huanaco, for which holders expect to be able to get 1s 4d per lb. For fair but somewhat broken Truxillo 1s per lb is asked privately. There has also been an arrival of 22 boxes of very fine coca leaves from Ceylon, said to be the finest ever placed on the market from that island. This lot is held for 1s 6d per lb.

ESSENTIAL OILS—Lemongrass oil has been dealt in at 2d per oz on the spot for fair native brands. There are no quotations to arrive at present, as it is said that all available oil has been shipped. Citronella oil is still quoted at 1s 4d per lb for tins and drums on the spot. The quotations for arrival are more or less nominal—viz 1s 2½d per lb for tins and 1s 2¼d for drums c i f. Cassia oil is firmly held at 7s 6d to 8s 6d per lb for 70-per-cent to 80-per-cent quality on the spot. The quotations for shipment are practically worthless, because no oil is offered above 4s per cent cinnamic aldehyde, and this quality is too low to engage attention.

VANILLA—Mauritius report that the market is very firm, while vanilla of good quality is wanting. The probable yield of the next crop is estimated at about 7,800 lb. The following figures show the exports of vanilla from Mauritius in the last three years:—

	1892	1893	1894
Weight	17,100	6,990	4,136
	£	£	£
Value	174,074	33,895	32,720

QUININE—At the end of last week a considerable business was done at slightly higher prices, 5,000 oz second-hand German in bulk on the spot selling at 1s 1½d and 20,000 oz ditto for January delivery at 1½d per oz. One of the manufacturers also reported a sale 20,000 oz deliverable at the end of January at the full quotation of 1s 2d per oz. During the early part of the present week there has also been a good demand, with sales on the spot at from 1s 1½d to 1s 1¾d, and January at 1s 1½d. The market closes slightly weaker, with spot sellers at 1s 1d per oz. Some excitement has been caused by the sale a couple of days ago to a firm of brokers of a parcel of Brunswick quinine for April delivery at 1s 2½d per oz. The sale was made by the agent of the manufacturer, but as that gentleman also carries on business on his own account it is difficult to say whether it ought to be classed as the second-hand or first-hand transaction. If the latter, it would be, according to the other manufacturers, a breach of the spirit of the agreement which exists between the makers and which is understood to provide that they shall not sell further ahead than sixty days. A considerable business has been done lately by most of the manufacturers especially for export to the States

London, Oct. 17th.

KOLA—The first hand supply of kola nuts in London is mostly in the hands of one firm, who are inclined to ask much higher prices, on account, they say, of the reduction in the supply. In September the arrivals were

only about 20 packages, and since then only one important consignment has come to hand in Liverpool. It consists of 21 packages, of which 15 are nuts in a fresh state. For best quality 1s 2d per lb is asked privately, which would show an advance of 4d per lb. Of 40 packages offered today only about 6 found buyers very little interest being manifested in the article, fair, partly broken, washed West Indian sold at 11d. dull mouldy at 5½d to 7d, wormy at 6d per lb. For fine washed kola 1s 3d per lb was suggested as the price.

ESSENTIAL OILS—Oils of Citronella and Lemongrass remain firm at the last spot quotations of 1s 4d per lb for the former in tins and drums, and 2d per oz for the last-named Lemongrass and Citronella keep firm. Two cases oil of Cinnamon-bark sold today at 6d per oz; for a 4 case parcel of Cinnamon oil a bid of 3d per oz is to be submitted.

QUININE—No business is reported this week, and the market price is more or less nominal; 1s 1½d per oz would probably be the nearest quotation for second-hand German brands. At auction today 5,000 oz of Brunswick quinine in bulk were bought in at 1s 1½d per oz. No bids were made for the parcel. The manufacturers' prices remain as follows:—Howards in vials 1s 4d to 1s 5d, in tins 1s 3d to 1s 4d; Whiffen in vials 1s 4d, in tins 1s 2d; Pelletier in vials 1s 5d; Fabrica Lombarda in vials 1s 4d, in tins 1s 2d; all the German factories, in tins 1s 2d per oz.

VANILLA—A considerable business has been done in vanilla of all kinds since the last auction at extremely high prices. This article is now very dear, especially for the better grades; while vanilla suitable for essence-manufacturers, which not so long ago could be had at about 3s 6d, now easily realises from 12s to 12s 6d per lb. The stocks in first hands in London is said to be very low indeed. At auction today 81 tins were offered almost the whole of which sold with excellent competition at an advance of from 2s to 4s per lb. Fine slightly crystallised 8 to 8½ inch; Bourbon beans bought from 30s 6d to 31s; medium chocolate 5½ inches to 7 inches, 22s 6d to 23s; ordinary brownish, 4½ inches to 6½ inches, 15s to 18s; common foxy from 4s 3d down to 3s per lb. Reports from Bourbon indicate that prices are likely to be higher for the new crop.

ARBORICULTURAL TRAINING AT EDINBURGH UNIVERSITY.

Mr. Long, President of the Board of Agriculture, received in Edinburgh on Oct. 23 a deputation from the Arboricultural Society with reference to a forestry in Scotland, and the limited facilities for obtaining forestry education in Scotland as compared with Germany and other countries. Mr. Long expressed himself as favourable to the appointment of an arboricultural correspondent in Edinburgh, in preference to a sub-office in connection with agriculture.—*O. Mail*.

COFFEE LAND IN THE STRAITS.

Two blocks of land lying opposite the Port Diokson Coffee Co.'s concession, of 500 acres each, have been applied for by Messrs. Burt and Sharpe of Mincing Lane, London.—*S. F. Press*.

NEW PRODUCTS.—It has been most interesting to us to learn from an experienced planter like Mr. A. J. Thomas, the great success which, in his opinion, is attending the cultivation of Liberian coffee and cacao as well as tea on the well-known Morankande property in the Madawalatenne district. It is quite cheering to hear of the "Liberian" flourishing as it does, while "catch" crops of "Nalknaad" coffee are arranged for, between both the Liberian and the Cacao.—Mr. Thomas was one of the few planters who gave truly effective evidence before the Prædial Products Commission; for, he and his neighbours have been and still are very much troubled with thieves. The Commission, unfortunately, has not resulted in much comfort for them.

THEFTS OF PRÆDIAL PRODUCTS.

One would not be justified in inferring, either from the tenor of the Report of the Commission appointed to advise on the theft of prædial products, or from our approval of the conclusions arrived at by the Commissioners, that there was no occasion for their appointment. Not only did the prevalence of thefts, especially of cacao pods from fields, justify the inquiry that was set on foot by the Government; but the inquiry itself has been useful in many ways. From the official point of view, there has been this great advantage, that the Government has by its action cleared itself from the charge, which had begun to be prepared against it, of being indifferent to the losses sustained by industries which are the mainstay of the prosperity of the Island, while the outcome of the inquiry has, to a great extent, justified its attitude, which too had exposed it to some reproach, of unwillingness to place further special legislation on the statute book. From the planters' standpoint, there is ground for satisfaction in the evidence that their complaints have not passed unheeded, and that the labours of the Commission cannot fail to make the official world better acquainted with the difficulties and the needs of the agriculturist than it had been before. At first sight it may appear that the planters failed to make out their case and that the inquiry was fruitless; and already such familiar expressions as much ado about nothing, love's labour lost, the mountain in labour, much cry and little wool, have been current; but we do not regret the appointment of the Commission. The Report should open the eyes of planters—their own brethren being witnesses—to the fact that they do not always take as great care of their goods as they should; and the lack of due watchfulness, it must be remembered, not only results in loss, but is also an encouragement to wrong-doing to people who have hazy ideas of *meum* and *tuum*, and who think the harm comes in, not so much in appropriating what does not belong to themselves, as in being so stupid as to be caught doing it. This caution is specially necessary in view of the circumstance that the labourers resident on estates are themselves not above suspicion, and that as often as not, if they are not the thieves, they are in league with them, or have knowledge of their doings. The value that the employer places on his products, as evidenced by reasonable precautions against their being stolen, is often their best protection; but if master takes scanty precautions against pilfering in the factory or in the store, or even in the field, Ramaswamy and Appu Sinho think nothing of helping themselves to what is so lightly valued. On the other hand, though the Government may not be able to protect the employer against his own employees on a large plantation, it is bound to afford every tax-payer the protection and justice which it is the function of civilized States to provide. By care in the choice of men for the rank and file of the regular and rural Police, by the provision of adequate detective machinery, by ensuring the due supervision of subordinates, by the appointment of qualified Magistrates, and by rendering the punishment of offenders deterrent, it can do much to prevent thieving and to protect the agriculturist. We use the word agriculturist in its widest sense; for it is not only the owner of large estates who suffers from the prevalence of thefts, but the humblest villager as well, to whom the loss of his garden produce is often a direct discouragement to industry.

These truths, we say, have been brought out by the labours of the Commissioners, not as discoveries, but as factors to be reckoned with in the agricultural enterprise of the Island. If special legislation cannot be justified on the evidence placed before the Commissioners, it is because that evidence, while proving that thefts were much more frequent and serious some time ago, established the efficacy of severe sentences by experienced magistrates, and rigorous prison discipline under a new *regime* in lessening thefts. The Report admits the latter cause, which implies the existence of the former; for without magistrates fully appreciating the gravity of thefts of prædial products, the jails would not have the materials on which to exercise their rigour. Another cause which is specially mentioned is deserving of attention—the employment of villagers on estates. It would be well, even at some inconvenience to show indulgence to the irregularity which is too often a distinguishing feature of village labour, not only as a matter of benevolence to neighbours, but also as a protection against thefts. The thieves of a village are generally the idlers, and there is no little merit in weaning people from dishonesty, while weaning them from idleness. But in order that a fair measure of success should attend such employment, the village headmen must be warned, both by the superior headmen, and by the revenue officers, that they should have an eye on the bad characters who may find employment on estates, and also rigorously prosecute those who have no ostensible means of livelihood.

These are general considerations, and we can lay no claim to originality on their behalf; but the remedies, though old-fashioned and slow, are likely to be permanently efficacious if persisted in. If education, into which morality enters, is the best means of arresting the spread of crime generally, industry should be the first step in that education. We content ourselves today with these general observations, and may touch on some special features of the Report in another issue.

VARIOUS PLANTING NOTES.

"PLANTING OPINION" understands that Government will shortly abolish the post of Quinologist, and that the Botanical Department will be quite separated from the Cinchona Department, the former having its headquarters in Madras. A former planter on the Nilgiris, lately in the Jail Department, will probably be offered the post of superintendent of the Cinchona gardens.—*Madras Times*.

A MAMMOTH POTATO.—America has broken the record with a "mammoth" potato, which is 28 inches long, 14 inches in diameter, and weighs 86 lb. 10 oz. This is equivalent in weight to over a bushel of ordinary potatoes. It was grown by Mr. J. B. Swan, of Loveland, Colorado, who raised 430 bushels of potatoes on a single acre last season. The mammoth potato is to be used for seed, it being "too big to eat."—*Globe*.

TRADE WITH AUSTRALIA.—A leading Australian house has sent a representative to Colombo to endeavour to establish between Victoria and Ceylon, trade relations in the following lines:—"Fresh fruit, fruit preserve—jam, &c., biscuits, cordials, candles, soaps (toilet and household), beef and mutton tallow, general produce of Australia." Taking so much of our tea as Australia does, it is very desirable we should become customers in turn, as far as this Colony possibly can use up the products referred to.

DEATH OF TREES BY SUNSTROKE.

At a time when local coconut planters are discussing the apparent "spontaneous combustion" of coconut palms due to the fall of meteorites, it is of interest to read the following in the latest *Gardeners' Chronicle*:—

During the late extraordinary warm spell, the writer of this paragraph was called upon to see a large Sugar Maple tree that was supposed to have been destroyed by a leak of the city gas-main at the root; but on examination showed that the tree died, literally, from sunstroke. It is strange that close observers of trees are unable to see when anything is out of the common run of things, and consequently note that something is going wrong. This Sugar Maple had been planted on the street probably a quarter of a century ago, and was about 4 feet in circumference; but the trunk was almost triangular, and yet this peculiarity seemed to attract no attention. The tree was simply triangular because on three sides of the tree the bark and wood had evidently been destroyed years ago, while the outer bark still continued to cover up the injury, and the only live wood was on the angles of the trunk. Only about one-third of the trunk was practically alive. When the exceedingly warm spell came, it was impossible for these limited ducts to supply the moisture required for such a large surface of foliage, and the tree, therefore, literally died from inability to furnish the moisture required for transpiration. It may be always taken for granted, that when the trunk of a tree naturally cylindrical, takes an angular form, there is something wrong beneath the bark, and an examination should at once be made. The flatter portions will usually be found dead. In this case, the bark should wholly be cut away from the dead portion, and the denuded part painted, in order to check rotting away. In time, the healthy wood may grow over the wound or lifeless part, and the life of the tree be eventually saved.

THE EAST INDIA TEA COMPANY

has been registered with a capital of £200,000, of which amount there will be a first issue of £170,000 in £10 shares. £85,000 of this amount will consist of preference shares at 6 per cent. The object of the Company is stated to be the amalgamation and taking over as going concern certain estates in India and Ceylon.

The estates to be dealt with in the manner indicated are those of the Doolabherra, Mookhamcherra and Mahaousa Tea Companies, besides the gardens known as the Blackwater, Hapugastenne, and Waladowa. The properties altogether include about 12,660 acres, of which about 3,629 acres are already planted with tea. The prospectus states the properties in Ceylon include about 5,000 acres that will be available for the extension of cultivation in the island, and in view of the refusal of your Government to put up fresh land for sale for this, this available acreage will possess an exceptional value. A good deal of the land now cultivated is said not yet to be in full bearing, but the average profits for the past three years are stated to have been £9,875, while those for the past years were £12,586. The price to be paid for the four estates now yielding profits will be £158,000, and for the other two estates £7,000, the vendors taking as part of the purchase money 2,750 preference and 2,750 ordinary shares. The list for public subscription will close today. Enclosed with this I forward to you copy of the advertisement made, which includes the prospectus of the new Company.—London Cor.

THE EAST INDIA AND CEYLON TEA

COMPANY, LIMITED.

CAPITAL £200,000,

Divided into 10,000 six per cent. Cumulative Preference Shares of £10 each, and 10,00 Ordinary Shares of £10 each.

The Preference Shares are entitled to a cumulative preferential dividend of 6 per cent per annum and a preference in return of capital.

Issue of £170,000, in 8,500 Preference Shares and 8,500 Ordinary Shares.

DIRECTORS:—P. R. Buchanan, Esq., 45, Leadenhall-street, E. C. (Chairman), Director of the North and South Sylhet Tea Companies, Limited; S. Boulnois, Esq., 3, Love-lane, E.C., Director of the Mahaousa Tea Company, Limited; C. T. Richardson, Esq., 31, Binswood-avenue, Leamington, Director of the Mookhamcherra Tea Company, Limited; A. Bryans, Esq., 45, Leadenhall-street, E.C., Director of the Chergola Tea Association, Limited; L. Davidson, Esq., Superintendent of the Gikyankande Tea Estate, Ceylon (Resident Director in Ceylon).

Particulars of the properties to be acquired by the company will be found in the statement—accompanying this Prospectus. They comprise about 12,660 acres of land, of which about 3,629 acres are already planted with tea. (See our London letter).

The exceptionally large area of land available for cultivation in Ceylon, amounting to about 5,000 acres, is a special feature of the undertaking, and should greatly add to its value. There is ample factory accommodation on the estates for all present requirements and the factories are supplied with all necessary machinery. Labour is plentiful, and an experienced staff of managers and assistants is in charge of the properties. Although a considerable area of cultivated land was either too young to yield crop, or only in a partial bearing, the average profits for the past three years from the Estates under cultivation, as will be seen from the Auditor's certificate set forth below, amounted to £9,874 19s 5d. It will also be seen that the profits for the past year were £12,586 7s 6d, and on this basis there would be sufficient to pay 6 per cent on the Preference Shares, and 9½ per cent on the Ordinary Shares now being issued in respect of the four Estates under cultivation.

The prospects of the current season are good, and there was, on the 30th September last, an increase of 126,148 lb of tea over the crop at the same date last year; as the new planting comes into bearing the crop should be considerably increased, and larger profits in consequence realised. The Directors of the Company are all connected with the tea industry, and most of them have a practical knowledge of planting. The Company takes over the existing arrangements of the Vendor Companies, with their several officials and staff of employees, and the business will thus be carried on without break of any kind. The financial arrangements for working the estates now in force will also be continued by the Managing Agents in London, India and Ceylon. Provision of further working capital is thus unnecessary, except for the development of the uncultivated lands, which is provided for as stated below. The properties are taken over as from the following dates, viz.:—Those of the Doolabherra and Mookhamcherra Companies from the 30th November, 1894; those of the Mahaousa Company from the 31st December, 1894, and the Blackwater Tea Estate from the 30th June, 1895. The several Vendors will receive interest at 6 per cent upon their purchase-money from these dates until the same is paid. It is proposed for the future to close accounts on the 30th November in each year. The price to be paid by the Company for the four yielding properties is £158,000. The price to be paid for the Hapugastenne and Waladowa Estates is £7,000, the remaining £5,000 of capital now issued being reserved for the opening out of same. The £30,000 of unissued shares will be available for the further development of these estates, or the purchase of other properties, as may be deemed desirable by the Directors.

VANILLA.—A report from Seychelles states that an abundant flowering of the vanilla vines is shown in all parts of the Archipelago, and the crop for 1896 is expected to be exceptionally good.—*Colonies and India*, Oct. 12.

PLANTING AND PRODUCE.

TEA IN DAMP CLIMATES.—Mr. T. Christy recently made the suggestion that for the purpose of exportation to moist climates tea should be put up at the garden in what are now the familiar self-opening tins, in sizes of about twenty-five pounds each. The *Grocer*, supporting this view, he says: "It is well known that these tins are easily opened and closed, and that when properly made they keep their contents air-tight. The consumer using one of these tins would be able to take out tea sufficient for immediate requirements during the dry part of the day, and then close the package so that the leaf would keep fresh and sweet to the very last. It is important that care should be taken that tea at all times should be kept as free from any contamination as possible. It is so delicate in its nature—and the rapid modern methods of its preparation intensify this—that every precaution must be made to keep it fresh; and this simple and practical suggestion ought not to be overlooked by those interested in promoting this produce from Ceylon."

THE NATAL TEA INDUSTRY.—The development of the tea growing industry goes on apace in Natal. From very small beginnings—in 1885 the total crop was only 28,000 lb—the output has increased until about 1,000,000 lb of Natal tea is now produced chiefly for the South African market. We hear that extended cultivation is contemplated.

A PLANT WITH A LAW OF ITS OWN.—A valuable official report is that by Mr. Robert Thomson, formerly head of the Government plantations in Jamaica, upon the products of the department of Tolima in Colombia. It is the custom there to set the grasses and brushwood on fire in the dry season to prepare the ground for renewed pasturage. The effect of these fires, however, is very destructive, and many once-fruitful places are now barren deserts. But one plant flourishes, not only in spite of, but because of, the fiery ordeal through which it passes. This is the Chaparro, or *Rhopala obovata*, a dwarf tree, which "not only resists the fury of the flames, but fire is actually congenial and subservient to its existence." Its bark is peculiar. It consists of "a congeries of integuments or semi-detached layers. The outer portion, about half an inch thick, performs no organic function, and this portion of the bark, in conjunction with its peculiar composition, protects the inner vital integuments from injury by fire." Mr. Thomson points out that the plant has "made for itself a law of its own, for it has triumphed over the most disastrous element to all organic life."

BANANA CULTIVATION.—The cultivation of the banana is making rapid strides in the West Indies, where, now that the means of exporting fruit have so much improved, its cultivation is found to be more profitable than that of the sugar cane. There is a banana plantation in Cuba covering an area of fifty square miles, containing on an average 2,500,000 trees and keeping in constant employment 3,500 persons. A fleet of twenty-six steamers is required to transport the fruit to the United States.—*H. & C. Mail*, Oct. 18.

TEA IN MAURITIUS.

A few months ago Mr. J. T. Hawke was in Mauritius, and he says that Ceylon need fear no tea-planting rivalry in that part of the world, for there were only some 250 to 300 acres planted up, and the largest estate (one of 125 acres) belonged to the Assets Company. The tea was good—Indian jât,—and in the experimental gardens at Onipeep there were 20 acres of tea planted, bearing 600 lb. to the acre, at an elevation of 1,800 feet, with a temperature equal to that of Nuwara Eliya. But tea is not likely to be cultivated largely in Mauritius; the French are too conservative and keep fondly to planting sugar, and to a small extent vanilla. On the other hand, Mr. Hawke says that the remarkable rise in the export of Ceylon tea to Mauritius is easily explained. The French Creoles like Ceylon tea, and are shewing a marked preference to it over the China article; while, over

and above all, to use Mr. Hawkes' own words, "They are at last beginning to realise what is very true, and that is that coffee is not the drink for a tropical climate, and they are taking to tea instead."

In three weeks Mr. Hawkes hopes to leave for the Seychelles. He is going there to plant coffee to a small extent, as he has seen coffee growing there and bearing remarkably well, and he does not see why it should not be done on a large scale. He will, however, begin with only 50 acres. He expects to start in a fortnight or three weeks, and will probably remain in the Seychelles for a twelvemonth.—Local "Times."

A CINCHONA ANNIVERSARY.

October 20th will be a notable anniversary-day in the annals of the drug-trade, for it is twenty-five years ago next Sunday that the first public sales of Java cinchona-bark were held at Amsterdam. For eighteen years previous to 1870 cinchona-plants had been grown in the island with more or less success, but few, if any, of those connected with their propagation foresaw the gigantic dimensions which the industry was destined to take. It was, in fact, chiefly in order to stop the mouths of inconvenient questioners in the Dutch Parliament, who, yearly, on the occasion of the debate on the Dutch-Indian Estimates, worried the Government about their alleged waste of 1,500*l* to 2,000*l* a year on the cinchona-gardens, that the Indian authorities decided to send home a consignment of cinchona that the critics might be convinced that there was something to show for the expenditure. This consignment, weighing 933 half-kilos. (about 1,026 lbs.), consisting entirely of *Calisaya javanica* and *C. Pahudiana*, left Java in 1869, but it does not appear to have been sold until the autumn of the following year, along with further shipments. At any rate, the first public sale of Government bark (private plantations had not as yet come into bearing) was held on the date aforesaid. For size, compared to the Amsterdam cinchona-auctions of the present day, it was as the acorn to the oak, for it amounted to no more than 876 kilos, the loss in weight from the time of shipment to the day of sale having been no less than 13 per cent. The net proceeds of the sale were 1,935 florins (about 161*l*), or nearly 2*s* per lb. The result of the sale, and the determination of the Government to encourage the culture of cinchona with more energy than before, gave a strong impetus to the industry. Private planters, who had hitherto looked askance at cinchona (before 1870 only two estate-owners, in addition to the Government, had laid down experimental plantations), started up all over the island, and literally sowed the seed of the over-production from which they are now suffering. In 1875 the first bark-crop from private plantations was exported. It amounted to 3,125 half-kilos. Last year the Javan Government exported 654,851, and private planters 8,266,741 half-kilos.

Ceylon, now an extinct volcano so far as cinchona-production is concerned, only preceded Java by a very short time as a producer. The first experiments in the island were made by Dr. Thwaites, the late Director of the Botanic Gardens at Peradeniya, in 1860; but for several years the coffee-planters looked upon his attempts as an amiable craze out of which nothing financially valuable could come forth. Up to 1867 the doctor had positively to beg coffee-growers to accept cinchona-plants for nothing, or to give them a trial on their estates. Several of these gentlemen put down succubras around their bungalows as ornamental plants, but only one, Mr. R. J. Corbett, set a few acres apart for the culture—a venture which paid him handsomely in after years. In 1866 the first samples of Ceylon-grown bark had been sent to England for analysis, and in 1868 Messrs. Keir, Dundas & Co. sent a ton of *Officinalis* bark, grown on their estate at Loolecondra, for sale to London. This parcel was auctioned at No. 6 Mincing Lane in April, 1868, and realised such high prices that the consignees immediately made ar-

rangements for the planting of 250,000 *Olecinalis* trees, while other planters rushed into the culture in an access of the same "cinchona-fever" which broke out in Java two years later. In 1869 there were about 100 acres of land under cinchona in Ceylon, in 1873 there were 1,500, and in 1883 the industry reached its maximum, with an area under cultivation of 64,000 acres, each acre being supposed to carry an average of 1,000 trees.—*Chemist and Druggist.*

TEA ADULTERATION IN AMERICA.

The New York *Freeman's Journal* says:—
The importance of tea as a healthful, refreshing and invigorating beverage is so generally recognized that it is estimated the United States consumes 90 million pounds annually. While probably 60 per cent. of this possesses the qualities mentioned, the greater portion of the remainder is unfit for consumption and deleterious to health, acting as a slow poison, instead of a healthful beverage. The trade is so enormous that there is a great incentive to unscrupulous dealers to deal in cheaper sorts in order to increase profits. They either supply inferior grades, increase the weight by an ingenious treatment with plain blue mud, or furnish refuse leaves that have already been used in the kitchens of the Chinese families, redyed and colored with Prussian blue and soapstone. To such an extent were these deccits practiced that in 1833 the United States Government appointed tea inspectors for the protection of tea importers. These inspectors examine samples of every cargo that reaches this country and certify to its quality before it is landed. This precaution caused a decided improvement in most of the tea consumed here, but far more important results have been accomplished by the efforts of the planters and importers of Ceylon and India teas. The advantages of these grades are now so well understood that Great Britain uses several times as much of them as of the qualities grown in China and Japan, while thirty years ago 90 per cent. of the tea used there came from China.

NEWS FROM FIJI.

(From our Correspondent.)

Sept. 29th 1895.

The new Sigatoka Tobacco Company have experienced great difficulty this season owing to the number of caterpillars which have retarded their planting, and spoiled a part of their crop. The native labourers have also been giving trouble. The tobacco I hear is now being harvested and the experts say that tobacco as good as that of Sumatra can be grown. It is sincerely to be hoped for the Colony's sake that this will turn out to be true.

A large Banana Company has been formed. The Nadroga natives have agreed to plant up 500 plants each, about 1½ acre. Over 400 have already signed contracts to this effect and 200 more are expected to do so. The Company agree to buy all approved bunches of 8 hands and over at 7d. a bunch, if the natives carry out their part of the agreement satisfactorily. The Company will swamp the markets with Fiji fruit and should be able to under-sell the Queensland and New Hebridles planters. I think the Company will experience great difficulty in keeping the natives up to the mark. Two Sugar Mills owing to the low prices will be closed at the end of the present season.

The Alpha Tea Estate owing to hurricanes and high price of labour, has been closed.

We have had a cold winter season; up at the Sanatorium the thermometer went down to 43°. I shall most probably be leaving for Ceylon shortly.—A. J. S.

RAINFALL IN LAGALLA, MATALE NORTH-EAST.

I am enclosing memo. of rainfall for October from a group of estates adjoining one another, yet with very different results in daily and month's totals. I believe they are all record figures for this district for the month of October, which is always considered a S. W. month—with the exception of a few days about the 20th, all the rest were regular N. E. rains; Although our neighbours have beaten us by inches we are not jealous!

COFFEE IN TAIPING, STRAITS SETTLEMENTS.

(From Mr. Bowen's Monthly Report, 5th Oct. 1895.)

Two more applications by Javanese for coffee land were received during the month. While on a visit to Ulu Selama during the latter part of the month I went to see the Arabian coffee gardens of Inche Karrim and Haji Abdul Rahman. This coffee is looking well and the older plants are bearing heavily; Malays, however, will not recognise the fact that to grow coffee successfully the ground must be kept quite free from weeds, etc.

A NEW COFFEE COMPANY.—The Port Dickson Coffee Company (Limited) has been registered by Sanderson and Co., 40, Queen Victoria-street, E.C., with a capital of £20,000 in £1 shares. Object, to acquire a certain tract of forest land of about 2,000 acres, situate in the State of Sungei Ujong, in the Straits Settlements, in accordance with an agreement expressed to be made between D. M. Lumsden of the one part, and this company of the other part, and to carry on the business of coffee (and other products) planters in all its branches. The directors are D. M. Lumsden, R. J. Boyle, A. J. M. McLaughlan, and R. B. Major Qualification, £500 shares. Remuneration to be fixed by the Company.—*L. and C. Express.*

PRÆDIAL PRODUCTS.

THE COMMISSION'S "SCHEME" TO PREVENT THEFTS.

The sound common-sense which the Prædial Products Thefts Commission have exhibited, both in the conclusions at which they arrived and the reasons by which those conclusions are supported, is equally to be seen in the 'Scheme'—which they propound as worthy of adoption, should circumstances call for special protective measures. Although they felt themselves unable to recommend special legislation on the evidence before them, past experience and future possibilities suggested to them the need of being prepared for a contingency which could scarcely be considered remote. If the conditions which obviated the necessity for special measures just now were the prompt and vigorous punishment of offenders, the fall in value of the products most easily misappropriated and greater facilities for earning an honest living, any of these causes may cease to operate at any time, and there would then be a recrudescence of thefts. It is far more satisfactory to consider what should be done in that event now, when a calm and unbiassed judgment can be brought to bear on preventive proposals, than when the public mind is excited by losses arising from impudent and daring thefts. Then, the acuteness of the disorder suggests violent remedies to the sufferers, while the recklessness of some of the proposals inspires in the Government distrust of the suppliants for aid. Here, further, were brought together a body of Officials and Unofficials, whose experience and moderation might not be forthcoming at some future time; and it was very advisable therefore that a scheme, formulated by one of their own number, should be considered and revised by the Commission already appointed. The necessity for another Commission, with the delays inevitable in appointing one and receiving and considering their Report, will not now arise. The Government will have in the scheme which has been put forth the materials on which to proceed if special measures are again demanded; and the thoroughly judicial way in which the *pros* and *cons* of special legislation are stated in dealing with the scheme, should be a further aid to the Government.

The scheme briefly is that all lands or gardens on which cacao or coffee is grown—these being the only two products whose protection cannot be accomplished by ordinary means—should be registered in the Provincial Kacheheri, with full particulars of the land, its estimated produce for the year, and the name of the proprietor or manager. The produce of registered lands can be removed only on permits, books of which in triplicate will be issued by the Government Agent. One of the permits (which will be numbered consecutively) will be given to the carrier; the duplicate will be sent to the Kacheheri for registration; while the original will be kept by the landowner or his representative, but only till such time as a second book is necessary, when the originals of the book previously issued must be sent into the Kacheheri. While the annual estimate of produce, which the Government Agent has power to have revised when necessary, will prevent the squatter from increasing the yield of his patch by appropriation from his neighbours,—the calling-in of old permit books before issuing new ones will prevent the dishonest manipulation of old forms. The inspection of Registers by any one on payment of a small fee; and the power of the Government Agent to inspect produce in transit, and

hold inquiries when irregularities occur and prosecute for frauds—are all useful provisions to check undue acquisitiveness in small landowners. But dealers, too, want looking after—perhaps, more so than growers;—and they are to be licensed to buy and sell in specified places, where they are to keep records of their transactions. To them, too, the Government Agent will issue permit books in triplicate, different in form from those issued to growers, but for similar use; and without these permits no produce can be removed from a dealer's premises. As a corollary, no one may receive produce from a grower or dealer without a permit, and thus an effectual check will be provided against the class but for whose ready acceptance of stolen goods, the risks incidental to thieving would be greatly enhanced. As soon as the produce is received, the receiver must forward the permit with his endorsement to the Kacheheri. The dealer is guilty of an offence who has more or less produce than the permit warrants.

These are briefly the main provisions—avoiding details and exceptions—of the scheme; and there can be little doubt of their stringency, and even of their efficacy to reduce, if not to remove, the temptation to steal and to deal in stolen produce. But we must not lose sight of the obstacles they must present to legitimate trade in the case of the ignorant and lowly—those who cannot read or write, and who will have to pay for the smallest service which the sharper can render. The drawbacks have, however, not been overlooked by the Commissioners, who, after admitting that there must be "considerable interference with the ordinary course of trade," proceed to describe the scheme in these terms:—

It will mean registration of all lands cultivated with cacao or coffee, and the annual correction of registers with reference to producible quantities of crop, and frequent corrections with reference to change of ownership.

It will require the filling-in of a somewhat elaborate printed form whenever any produce is disposed of, and this, in the case of a poorly educated peasantry, must necessarily involve some hardship.

In crop time, when protection is most required, the checks provided will be difficult to enforce. So long as a grower has not sold the whole of the estimated produce of his garden, he will have a margin on which he can dispose of stolen produce; and if a man be both a dealer and a grower, he can remove produce on either a dealer's or a grower's permit as suits him best, and in such instances the checks provided may not prove sufficiently effective.

25. To render the scheme effective it will probably be necessary to largely restrict the number of licensed dealers.

It will be difficult to supervise or examine produce in transit, while the large number of permits and of permit books generally in use will open a door to fraud.

It will thus be seen that only under exceptional circumstances would the promulgation of the scheme be justified. Meanwhile, by the establishment of a special Police, in what may be called infected Districts, on the application of two-thirds of the owners, a handy means of relief will be provided—the Government contributing a moiety of the cost of the Police. This remedy, for the application of which means already exist in the Ordinance 16 of 1865, with certain modifications suggested in the Report, should be adopted promptly when thefts become frequent in any District. Meantime, let the suggested amendments of the Police Ordinance be asked for by the Planters' Association or the Planting representative, from Government.

‘ CEYLON HANDBOOK AND DIRECTORY
FOR 1895-6.’

In directing attention to our Directory *Supplement*, we have to thank upcountry subscribers to this volume for their forbearance in respect of the delay attending its delivery. The last touches have now been given and the printer's work closes to-day—so that regular delivery from the binders to outstation subscribers in the order of the register will commence next week; and we trust before the end of the month, “the big book”—for we regret in some respects to say it is the biggest volume ever issued from our press—will be in everybody's hands. The mere addition of all the new TEA COMPANIES with their Boards, &c., added considerably to our pages; while the DIRECTORIES altogether are much fuller than ever before. In GENERAL INFORMATION, too, we have never given so much. Of many friends (and perhaps some will become critics of the bulk), each wants some one new thing given and the total result of additions, in the endeavour to be generally useful, is, of course, very great. One wants the Franking Minute in full; another Patent Rules and still another the Labour Laws; while as regards “facts and figures” woe betide us if everything possible, is not available! The PLANTING AND AGRICULTURAL REVIEW has been thoroughly revised and brought up to date. The MAP OF CEYLON in pocket form, adds to the bulk of the volume; and as our collotype portraits of H. E. Sir West Ridgeway have only just arrived, we have decided to add them to the Book as a frontispiece, just as Sir Arthur Havelock's portrait appeared in the edition of 1890-91.—The very first copy of the volume put together (without the final revise) was given to the Governor before his departure, and today we have received an appreciative acknowledgment from Mr. Ogilvy, Private Secretary.

Those who have a proper idea of the labour involved in compiling, arranging and printing, a volume of this kind with its 1,500 to 1,600 pages, will believe us when we say that the limited edition which after all a field like Ceylon can take off, does little more than cover the actual outlay. We should be in pocket probably if we had never touched this year's edition; but we should have known far less about the island, its condition and wants; and done far less to serve the public and to discharge a duty which, undertaken by the present Compiler, since 1863, is expected of us and which we are only too glad to be able to discharge. This, however, is probably the last of our very large volumes. We shall take steps to compress, leave out and reduce certain sections before another issue is called for.

The handy “GENERAL ADDRESS DIRECTORY” for the island will be ready about 1st December.

A STREET AND HOUSE-TO-HOUSE DIRECTORY FOR COLOMBO (by special request) is in course of preparation, most of the information being already in the printer's hand.

CEYLON AND HER PLANTING
ENTERPRISE.

TO THE EDITOR OF THE LONDON “TIMES.”

Sir,— At intervals during the past 30 years I have, at the cost of much time and trouble, compiled statistics of the planting enterprise of this colony, and have periodically sent you the results for publication. No agricultural industry in the world probably has a fuller or more reliable record than is obtained through the inquiry thus conducted. My last report was dated August, 1893, so that two full years have

elapsed, and all interested in the first of Crown Colonies and its most notable Industry will be glad to have the following figures:—

POSITION OF THE CEYLON PLANTING ENTERPRISE
AT THE END OF AUGUST, 1895.

	Acres.
Total area of 1,962 plantations and planting properties	748,017
Total area of 1,523 plantations in cultivation with 1,469 superintendents and assistants—	379,182
Total approximate extent under—	
Tea	304,419
Coffee (Arabica)	21,634
Coffee (Liberica)	2,804
Cinchona 4,483,000 trees)	
Cacao	18,278
Cardamoms	4,693
Rubber	634
Tobacco (on plantations)	82
Cotton (on plantations)	133
Grass (cultivated)	5,330
Total approximate extent of annatto, coca, vanilla, pepper, cloves, plantains, citronella grass, divi-divi, croton, castor-oil, aloes, cinnamon (on the coffee, tea, or cacao plantations)—	7,397
Of fuel, timber, and fruit trees, sapan, coconuts, arecas, nutmegs, kapok (on the tea, coffee or cacao plantations)	16,000

Without entering into any elaborate comparison, I may mention that in the two years 26,000 acres have been added to the total area under cultivation; but the increased extent under “tea” in the same period is over 31,000 acres, the difference being obtained by a further supersession of coffee (Arabica)—due to the persistency of its fungus enemy, and of cinchona (no longer a profitable product). While there are 8,500 acres fewer under ordinary coffee, the cultivation of the hardier Liberian species has slightly increased; and if an experiment now being made by a planter (Mr. E. E. Green) to import lady-bird beetles from California to clear off the bug (coccus) which is troubling coffee in our richest districts, be successful, it is possible that there may be a fresh departure with our old staple. At any rate, it is satisfactory to know that our export of coffee this year is likely to be very much larger than during any of the previous three years, the comparison so far being as follows:—

COFFEE EXPORTS, JANUARY 1 TO SEPTEMBER 16,
1892-1895.

Total exports	Plantation.	Native.	Total.
from Jan. 1 to Sept. 16, 1895 ..	52,388	3,607	55,995
Ditto ditto 1894 ..	22,201	587	22,788
Ditto ditto 1893 ..	43,652	1,808	45,460
Ditto ditto 1892 ..	34,967	2,030	36,997

The area under cacao (chocolate plant) is also, I am glad to say, slowly but surely increasing, about 2,000 acres having been added in the past two years. So also with the cultivation of rubber trees, a considerable advance has been made and interest taken in the culture by planters in several districts.

I am thus particular in specifying certain minor industries, before touching on the present overshadowing staple—tea—because it has been my constant endeavour in writing for the planters in our daily Press, as well as in the monthly *Tropical Agriculturist*, to impress upon them the great advantage, wherever possible, of having two or more strings to their bow, and my hope is to see the cultivation of Liberian (and perhaps as well Arabian) coffee, rubber, useful and ornamental timber trees freely extended during the next few years in the Ceylon planting districts.

Nevertheless, I am bound to confess that so far tea is the most encouraging as well as most profitable culture. Although we have now got beyond the *maximum* area ever planted with coffee (280,000 acres coffee in 1878-79, against 304,000 acres in tea in 1895), yet the tea plant is everywhere healthy and vigorous, and crops satisfactory. Nowhere, apparently, can tea be grown more economically than in the favoured divisions of Ceylon, and the enemies of tea can be much more easily fought and conquered than those of coffee. Shortness of the labour supply is occasionally in some parts a difficulty; but if the Indo-Ceylon railway now projected from Colombo to Madura were constructed, this difficulty would be at an end. There is room for a further expansion of the tea area, through private re-

serves of forest land being utilized. The Crown for the present sells very little land. But it may be of interest to mention that, during the administration of Sir Arthur Gordon (now Lord Stanmore), 1883-90, the area planted with tea rose from 32,000 to 220,000 acres, while 81,000 acres have been added in the time of Governor Sir Arthur Havelock, who is just leaving us. The export of Ceylon tea, which was only about 1½ million lb. in 1883, will, for this year, probably exceed 90 million lb.; and I see no reason why this should not be maintained and exceeded for many years to come.

I will not touch on the danger of "over-production" and consequently of prices falling below a paying level; because at present Indian and Ceylon planters are busy trying to conquer new markets for their staple in America and Russia as well as Australasia, where much progress has been made. At the same time I may mention that the ranks of Ceylon planters are very full at present and that there is little room for additions in young men who hope for a career here; although our plantations continue, in my opinion, to be the best tropical agricultural school for young men who are prepared after their training to pioneer (with coffee, cacao, &c.) in the Malayau Peninsula, Sumatra, North Borneo, or Nyassaland, in Central Africa.

A word or two may be permitted as to the more purely native agricultural industry in Ceylon. I calculate that there are some 50 millions of coco-palms growing in regular plantations or small native gardens in Ceylon, covering some 650,000 acres, and yielding an annual harvest nearly equal in value to that gathered from the 300,000 acres of our tea plant. A certain proportion of the "harvest" is exported,—in coconut oil, up to 500,000 cwt.; "copra" and "poonac" (the dried kernels), up to 200,000 cwt.; coir fibre, rope, and yarn up to 170,000 cwt.; in coconuts (10,000,000), as pulled or with the husk off; and in a new and fast-expanding industry in "desiccated coconut," six to seven million lb.—but a large, perhaps the larger, proportion is consumed for food and domestic use otherwise by the people of the island, apart from the large and unfortunately growing quantity of arrack (the whisky or brandy of Ceylon) prepared from the sap of a large number of palms set apart for that purpose. Of other palms (Palmyra, Kitul, and Areca chiefly) and fruit trees in great variety, I count the Sinhalese and Tamils of Ceylon have over 300,000 acres planted, and most yielding crops, as additions to the food supply and, in some cases, exports. Of our famous ancient spice—cinamon (which was carried from Ceylon and sold in Rome in the time of Augustus Cæsar for the equivalent of £8 sterling per lb.)—there are still about 35,000 acres planted in Ceylon, the annual exports of the quills and chips keeping in excess of 2½ million lb. This industry is in Ceylonese (chiefly Sinhalese) hands. Cardamoms, pepper, cloves, nutmegs, and some other spices claim more attention from the European planters; but the cultivation of citronella and other grass for essential oils is solely done by the natives, as also, of course, the great paddy, or rice-growing industry in Ceylon. Since the abolition of paddy rents from January 1, 1893, this industry is now "protected" (the Cobden Club Committee consenting) to the extent of a Customs duty of 29 cents per bushel on all rice imported from India; but the result so far has not affected our imports (*), which are as follows:—

RICE IMPORTS, 1892-94.

	Bushels.
1892.. Imported from India ..	7,282,411
1893.. " " ..	7,447,376
1894.. " " ..	7,556,505

Finally, I may mention that the trade in our only mineral of commercial importance, plumbago, is not very prosperous, though we continue to export between 300,000 to 400,000 cwt. of it, largely if not chiefly, to the United States, London coming next, while France and Germany have begun to take increasing quantities

* If it should be said that the imports are for immigrant coolies, it must be answered that the total consumption by them cannot exceed 2½ million bushels, while local and imported rice competes in every bazaar in the towns and throughout the island.

indirect shipments: Ceylon has from time immemorial been famous for its precious stones—rubies, sapphires, cats'-eyes, and moon-stones—and these continue to be freely found, the digging and selling being in native hands and the proceeds largely carried away by visitors or despatched in registered postal packets.

May I wind up by saying that the two notable material facts in the history of Ceylon during the past 15 years are—(1) the rise of the tea-growing industry from 9,000 acres planted in 1880 to over 300,000 acres in 1895; (2) the immense growth and ever-increasing expansion in the tonnage and trade of the capital, Colombo. The total tonnage of the port in 1880 was 1,300,000; while last year the aggregate (inwards and outwards as before) had reached 5,328,000 tons. If, in place of being shackled with a long list of Customs burdens and restrictions, Colombo were to get some of the fiscal advantages of Singapore, or even Bombay, it would more and more rapidly become the great port of Southern Asia, and such increase of prosperity for the port and city would be further confirmed and extended if it were directly connected by an Indo-Ceylon metre-gauge railway with Southern India, as originally projected by the late Duke of Buckingham and Sir William Gregory.

I am, Sir, yours respectfully,
J. FERGUSON, of the *Ceylon Observer* and
Tropical Agriculturist.

Colombo, Ceylon, Sept. 19.

INDIAN PATENTS.

CALCUTTA, OCT. 24TH.

"For Improvements in Stoves or Apparatus for heating Air".—No. 321 of 1895.—Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, Merchant, for improvements in stoves or apparatus for heating air.

Specifications of the undermentioned inventions have been filed, under the provisions of Act V. of 1888:

"For Improvements in Apparatus for Rolling Tea Leaf and the Like".—No. 238 of 1895.—William Jackson, of Thorn Grove, Mannofield, Aberdeen, North Britain, Engineer for improvements in apparatus for rolling tea leaf and the like. (Filed 11th October 1895.)

"For Improvements in Apparatus for subjecting Materials to the Action of hot Air".—No. 257 of 1895.—William Jackson, of Thorn Grove, Mannofield, Aberdeen, Scotland, Engineer, for improvements in apparatus for subjecting materials to the action of hot air more especially intended for use in drying tea leaves and other produce—(Filed 11th October 1895.)—*Indian and Eastern Engineer*, Nov. 2.

MARVELLOUS VICISSITUDES OF AN ISLAND.

TRY AND TRY AGAIN.

Away to the South of Asia and almost attached to the great empire of Hindustan, lies the ancient isle of Lanka.

Thousands of years ago,—aye, thousands of years,—perhaps before our British ancestors in paints and hides attired, unsuccessfully resisted the Roman invaders, this island had intercourse with the Chinese in the Far East, and the Arabians in the West. 'Tis hard to name a date so far remote that some of the arts, say pottery and architecture, were unknown to its people.

The Americans, who are the heirs of the ages, are not really the inventors of many things which their skill and intelligence have greatly improved, cheapened and utilized. The Chinese, who may have been as advanced five thousand years before the beginning of history as they are to-day, and if left to themselves would be five thousand years hence, were acquainted with the compass and the cantilever, with powder and printing centuries before Columbus was born.

The ancient capital of Lanka, whose gigantic ruins are now being uncovered in almost impenetrable jungle, was founded and with it the Buddhist religion in the island some five hundred

years before our Christian era. The ruins of its vast temples attest the skill of its ancient builders.

A sacred tree brought over there from India when a small plant, is still growing, and its history has been regularly recorded for nearly two thousand five hundred years, by the devoted priests of a Temple dedicated to it. It is now the oldest historical tree in the world.

But Lanka was known and its products utilized at an earlier age when a still more famous temple was built. I mean that of Solomon.

———"That uxorious King,
Who beguiled by fair idolatresses,
Fell to idols foul."

If in the recently discovered African mines we have found the source of Solomon's immense stores of gold, in Lanka we recognize the source of his ivory. So skilful, too, were the dentists of those early years, that the ivory trunks were extracted from the live elephant; and so effectually were the molar roots drawn, that unlike the elephant of African India, Lanka's greatest beast has never since developed a large tusk, but has to be content with a small protruding stump, which like Monbodda's tail in man, merely indicates what has been.

Passing over two thousand years or so, a short time in the life of those eastern countries, during which Lanka was ruled by its native King, or by Invaders from the adjacent continent, and while its Gigantic irrigation works, now mere monuments, were being constructed, we find the Portugese ruling the island during the 16th and 17th centuries. Then came the Dutch; until about the beginning of the 19th century, the English gained possession. The descendants of the Portugese and Dutch are still numerous in the land.

About 1825, while Lanka had few Englishmen besides the Civil and Military Servants, an enterprising soldier introduced the cultivation of coffee. His example was soon followed by his brother officers, and within the next ten years a large tract of land carried the fragrant bean.

The success of the young Englishman attracted capital to the island, and hundreds of coffee gardens were planted during the following thirty years. The island's seaport became a place of great importance, and the planters a numerous and influential body. Roads were opened up, branching between ranges of lofty mountains into all the lovely and fertile valleys on whose slopes the grand primeval jungle gave way to the coffee tree.

Soon the railroad took the place of the road with its thousands of bullock carts.

Between 1865 and 1875 the exports of coffee ran from 750,000 to 1,000,000 cwt.; giving employment to a quarter of a million of coolies (native labourers), or with their families perhaps finding sustenance for seven hundred thousand people.

About 1868 or 1870 a curious looking powder was observed on the leaves of the coffee plant in many parts of the island. At first little notice was taken of it; then it became a curiosity, and in time the attention of a famous scientific authority—the Conservator of the island's beautiful botanical garden—was attracted to the phenomenon. After close observation the oracle spoke, and his utterances were a grave warning; the stranger was pronounced to be a dangerous and insinuating parasite, which penetrated into the cells of the leaves and prematurely destroyed them while their functions in assisting the trees to mature their fruit were still unperformed.

At first little heed was given to the sage's opinion. Manuring was resorted to and under the influence of good prices, hope, and faith, with an occasional note of distrust, which when expressed was immediately hooted down, ruled until about 1876-78. By this time it was evident to many that the weaker portions of their gardens were succumbing to the attacks of the parasite. Manuring no longer produced its old results; crops estimated to be good in their early stage gradually dwindled during the two months while the berries should have been maturing, until actual out-turn grievously disappointed the poor planter.

Years before this, one gentleman of a botanical turn and a rare gift of foresight, had introduced the cinchona and other tree into Lanka. He planted fields of those, and soon found they were well adapted to the soil and climate and could be cultivated most profitably.

His example was generally followed so far as cinchona was concerned. Hundreds of millions of those trees were put out between 1870 and 1880. Those who planted them first reaped a splendid harvest, as the bark from which quinine was extracted sold readily at from three shillings to ten shillings per pound. Great fortunes were anticipated by hundreds of planters—single trees of the best qualities being valued at thousands of pounds, as seed bearers.

The exports of bark went up by heaps and bounds, until supply exceeded demand, when prices fell badly. Quinine fell from eighteen shillings per ounce to two shillings, and even to ten pence. Bark from a five shilling average per pound to five pence, and soon after became almost unsaleable. Thus another grievous disappointment befell the poor struggling planter. With household bills unsettled, and labourers' wages in arrear, the interest of an ever swelling mortgage became due with ruthless regularity every six months. Ruin and sequestration were the fate of many, while others strove bravely by hard work and strictest economy to stave off the evil day.

Meantime, attention was directed to that other plant which our far-seeing friend had introduced. Experimentally by many, and boldly and extensively by a few, its cultivation was attempted. Early in the eighties it was recognized as a useful friend which might help many whose properties lay in the Zone, to which alone it was then thought to be adapted. Gradually, with fear and trembling rather than faith, it was tried higher up in the mountains and further down the vallies—and still its capabilities did not fail.

By 1885 it was known that those who had planted it during the seventies were surprised at their success; and it gradually dawned upon all that from the sea level near the equator to winter snow about thirty degrees north, and seven thousand five hundred feet elevation, one variety or another of this Heaven-sent plant would grow, flourish, and pay handsomely. The moist climate of Lanka was found to be particularly suited for it. Cheap labour helped greatly and rapidly; falling exchange was a God-send to a country with a silver currency.

Other countries slow to grasp improvements, wedded to old customs, and not over cleanly habits, had been growing this plant and exporting products for centuries. Among them it was a family industry, as weaving of woolen and linen garments was last century in England and Ireland. The children plucked the leaves. The elders rolled them by hand and dried them over charcoal, as, and when, other household matters permitted.

In Lanka it was speedily recognised that machinery supplied the most economical and only cleanly way of manufacturing the article. It was universally adopted, both for rolling the leaf and firing the product.

In 1893 Lanka exported 1,000,000 pounds and in 1895 it will export 94,000,000 pounds of this useful, refreshing and grateful household need.

Great Britain now uses the machine-made product of Lanka and the adjoining continent of India almost exclusively whereas a few years ago the hand-made article had complete possession of every household. Other countries, chiefly Australia, Russia, and America including Canada, which took only four and one half million pounds from Lanka in 1891, will this year take seventeen, perhaps eighteen, million pounds.

Cleanliness is a factor in favour of the machine-made product, as is also economy in time and money. A cup can be made in half the time and with half the quantity of raw material required when the hand-made article is used.

Lanka is the ancient name of Ceylon, and the other plant of the far-seeing planter is the tea tree, from the young succulent leaves of which the now famous and almost universally drunk Ceylon tea is manufac-

tured. We would prescribe a soothing cup of its extract to all whose brains are wearied by business troubles and to the many whose digestion has been weakened by the too stimulating extract of coffee's fragrant bean.

W. MCK.

LABOUR CONTRACTORS IN MADRAS.

We have before us the Draft of an Act which it is proposed to pass in the Madras Council, to provide for the licensing and registration of contractors who supply labourers to estates in the Southern Presidency. One of them is the Bill as prepared by the Advocate-General; the second embraces the alterations which the United Planters' Association of Southern India suggests should be incorporated in the Government measure. We are not sure if these alterations are "amendments" in the strict acceptance of the term; but it would not be wise to decide hastily on that point, without knowing something of the origin of the measure, and the reasons which have weighed with the planters in suggesting the alterations. Has the Bill been prepared at the instance of the planters, for the protection of their own interests, or has it been devised by the Government for the protection of the labouring classes from Recruiting Agents, whether of their own nationality, or strangers to the country? The superiority of one Bill over the other must depend on local circumstances on which we cannot pretend to be fully informed; but speaking generally, and subject to correction, we should say that the provision made by the Advocate-General for the registration of licensees, which the revised Draft omits, is a wise one. It is scarcely business-like to issue licenses without keeping some record of them; and if a Register is to be kept, it would be obviously useful that it should have legal recognition, both for purposes of reference, and as a means of verifying the license in the event of suspicion attaching to it, either as a whole or in respect of alterations in it. The chief difference between the two Drafts lies in the provision for a Register, and in the absence of such provision.

The Preamble sets forth the expediency of licensing [and registering], contractors who hire labourers for service on tea, coffee, and cinchona estates, and of preventing unlicensed persons being employed in supplying gangs to work on estates. The interpretation clause is very full and precise, and defines such terms as 'planter' (to include owner and manager), 'estate', 'gang', 'contractor', and not least 'advance' which means "any money or thing given to any contractor, as a prepayment, in whole or part, on the consideration for his contracting to supply gang labourers, and includes any release of a balance due on a previous contract, when such release is by mutual consent treated as an advance." That strikes us as a very satisfactory definition, and one which might with advantage be incorporated into our local Labour Law, to guide the Courts in dealing with the indebtedness of coolies to estates and *vice versa*. Indeed, it may be a question whether we should not have a similar Act here, whereby the Kangany might be licensed and registered as a means of increasing his usefulness and limiting his readiness, sometimes, to flit from one estate to another. That however is a matter on which we should like large employers of labour to have their say, through the Press or in District Associations, so that the Parent Association might decide whether to approach the Government or not with a view to legislation.

Probably, the reason of the disinclination which Planters show to enter into written contracts with labourers, may also militate against the forging of any shackles for the Kangany, lest his conservative mind should rebel against the change. And, to 'leave well alone' is a motto which has much to recommend it in this age of unrest and revolution.

But to proceed, the Bills we are noticing contemplate the restriction of the recruiting of labour for estates to persons duly licensed. The license is to be obtained from the Sub-Magistrate within whose jurisdiction the applicant resides; but we prefer the "may be granted" of the original Bill, to the "shall be granted" of the revised, because that would imply some discretion in the granting of licenses; and the withholding of a license by the Magistrate from an applicant of known bad character would be an advantage, rather than the reverse, both to the labourer and the estate. Any person acting as a labour-contractor without a license would expose himself to a fine of R5 for every day he so acts, and any planter who enters into a contract with an unlicensed person would similarly incur a like penalty for every day he so employs the man. Each license is to run for 12 months, but may be renewed, the renewal being recorded on the license under the signature and seal of the renewing officer; and it must contain a correct abstract, according to a prescribed form, of every contract entered into by the licensee. The abstract is required to be both in English and in the Vernacular which the Maistry understands, to be signed by both planter and contractor, and to contain particulars of estate, district, number engaged, duration of contract or specification of work, amount payable and how, and amount of advances. The license restricts the contractor to work within the jurisdiction of the licensing Magistrate, but if the coolies he engaged to work on an estate outside that jurisdiction, the contractor is bound within a week (a month in the revised Draft) to produce the license before the Sub-Magistrate, within whose jurisdiction the estate is situated, to have his signature and seal to the abstract. So with regard to all alterations and modifications of the contract. The Bill strikes us as both well-conceived and carefully prepared; and if a trustworthy class of contractors come to be licensed, there should be no reason why we (in Ceylon) should not ask for such an alteration of the law as might enable such licensees to recruit labour for our estates too, on terms and conditions to be hereafter arranged. Whether this be thought advisable or not, the connection between ourselves and Southern India is intimate enough to explain our interest in the proposed legislation.

TEA DRINKING IN CHINA.—In a paper on "Work in Heathen Homes," by Miss Horne and Miss Miller of Amoy, read at one of the L. M. S. Centenary meetings in London recently the writer says:—

Again, a rule of Chinese courtesy is that a guest must be offered tea, or a concoction of hot water poured over a Chinese fruit mis-called "tea." The lady worker inwardly groans as she hears the order given by the mistress of the house to prepare tea; in vain does she say there is no need to make tea, she has lately eaten, she would rather they sat down and listened. Their duty of politeness is to offer her tea, and to she *shall* have. (Laughter.) So she has to endure the fumes of wood smoke, and then to politely taste the syrupy beverage, after which the household can spare a little attention to listen to the "doctrines."

TEA PIONEERS IN ENGLAND:

A FAMOUS FENCHURCH-STREET FIRM.

(Abridged from the London "City Press.")

From what was gathered at an interview the other day with the head of the well-known firm of tea merchants, Messrs. Davison, Newman, and Co., of Fenchurch-street, the question whether we drink good tea (writes a representative of the *City Press*) is open to much discussion. A cheap article nowadays sells, says the head of the firm, and thereby becomes popular. But whether the policy pursued by the community is one to be commended is open to grave doubts. Competition is the propelling agent of the age of merchandise, and to a large extent it is responsible for the many inferior kinds of goods that now glut the markets. The responsibility always rests with consumers, for the supply is made according to their demand.

The tea house of Messrs. Davison, Newman, and Co. is the oldest-established in this country. It was founded in 1650, when tea was "worth its weight in gold," by Daniel Rawlinson, the father of Alderman Sir Thomas Rawlinson, who was Sheriff of London in 1687, and Lord Mayor 1706. The "Annual Register" gives the following particulars of the founder of the firm: "Daniel Rawlinson, merchant, baptized 1614, died 1679." There is a fine portrait of him in the Hawks-head School. He rebuilt the latter in 1675. A monument is erected to his memory in St. Dionis Backchurch, Fenchurch-street. Samuel Pepys and Daniel Rawlinson (founder of the firm) were friends, and seeing how near to one another they lived the fact is not surprising. The diarist frequently refers to "Dan Rawlinson." Mr. Battersby (*vide* Pepys' Diary, p. 308, August 6th, 1666) informs Pepys that "after all this sickness, and himself (Rawlinson) spending all the last year in the country, one of his (Rawlinson's) men is dead of the plague, and his wife, and one of his maids sick and himself shut up." Whereat Pepys says that he was "mightily troubled." On August 9th, three days later, we learn from the same source of the death of Mrs. Rawlinson, the continued illness of the maid, and the fact that Mr. Rawlinson had been forced to quit his house. On September 8th, 1667, Mr. Pepys relates how he met Mr. Rawlinson in Fenchurch-street, the latter having been looking over the ruins of his premises destroyed by the Great Fire of the previous year.

The firm, which carries on business today almost on the same lines as it did in the days of that much-maligned monarch Charles II., is justly entitled to the term famous, for it is one of the first historic houses of business in the City. The business was commenced in Fenchurch-street 250 years ago, and was conducted at the same old place until 1890, when the successor was perforce obliged to remove. From No. 44 they migrated to No. 57, but deep was the regret of the firm, and perhaps quite as deep was the regret of their old customers, and everybody else, at the removal of such a grand old landmark. But it was compulsory owing to City improvements. The establishment is split up through it, however, for, while the retail business is carried on at the new address, the wholesale business is done at the large five-storey warehouse in Creechurch-buildings, Leadenhall-street. In 1763 the firm was known as Rawlinson, Davison, and Newman. In 1777 the style Davison, Newman & Co. was adopted, and is retained to the present day. In 1777 Monkhouse Davison and Abraham Newman admitted into partnership three of the clerks, who put various small sums into the business, no amount, however, exceeding £500; a Mr. Thwaytes invested £500. These small sums of money qualifying for partnership in a well-established firm whose capital was £80,000 seems ridiculous, but the fact is nevertheless, true. In 1792 the capital increased to £196,000. Our representative was privileged to inspect the original books and documents and many other interesting data of the old firm. In the "Annual Register" for 1799 we read the following: "Died this year, in Fenchurch-street, Abraham Newman, Esq. He was one of the richest citizens of London. . . . He acquired £600,000. . . . So forcible was his habit that he went every day to the shop and tea

his mutton chop at two o'clock . . . with his successors. To each of his daughters he left one hundred thousand pounds." He retired some years before he died. Monkhouse Davison died in 1793. The two partners were buried in one vault. The memorial tablet still exists in the church of St. Olave, Hart-street. Time eventually carried off all the original partners and also the two clerks, leaving Mr. Thwaytes the master of the whole concern. He realized an enormous fortune, for, after providing pretty comfortably for those who knew him best, he bequeathed £40,000 to the Clothworker's Company. The interest on £20,000 of that sum we understand, is now paid annually to the blind by that company. The following extract is taken from a book called "The History of Signboards":—"At 44, Fenchurch-street, a very old-established grocery firm still carries on business under the sign of the "Three Sugar Loaves." The house presents much the same appearance it had in the last century, with the gilt sugar loaves above the doorway, and is one of the few places of business in London conducted in the ancient style. The small, old-fashioned window-panes, the complete absence of all show and decoration, the cleanliness of the interior, and the quiet order of the assistants in their long white apron betoken the respectable old tea warehouse, and impress the passer-by with a complete conviction as to the genuineness of its articles." This description, of course, referred to the old premises. Over the new premises, 57, Fenchurch-street, the identical old shop sign is still to be in the shape of a crown supporting three gilt sugar-loaves.

The connexion enjoyed today by Messrs. Davison, Newman, and Co. is of a nature fully commensurate with the honorable records of a prosperous commercial career of nearly two and a-half centuries. Their mercantile relations are of the most influential order, many of their customers having dealt with them for generations. This reflection (continues our representative) brings us back to the abstract question—tea. The late Sir Andrew Clark was no friend of the teas hailing from any plantations but those of China, our representative was told. In his lecture to the students at the London Hospital, the late *doyen* of the medical profession said:—"If you want to have, either for yourselves or your patients tea which will not injure and which will refresh, get black China tea."* It is the opinion of the principal that the tea which comes from fields not Chinese, and for which there is now such an enormous public demand, is not the best friend of the tea-drinker. Tea "critics" say that it is too pungent, and what money is saved in buying it for home consumption is lost in another way, for, by all accounts, the drinker of such tea can seldom make sure of retaining a healthy nervous system. Unfortunately the people are so wedded to cheap and strong teas other than Chinese that they do not relish the more delicate importations from the Flowery Land. India and Ceylon send over good tea as well as indifferent tea, but tea specialists, like the successors of the City's earliest firm of tea merchants, would never recommend the choicest products of those places in preference to those of China.* Pure tea, pure coffee, and pure sugar are necessary to health and happiness. Among the working classes of the community it is generally believed that cheap, and thereby impure, stuff is only sold for them, and that the higher-priced foods belong to the world which is not theirs, the world of the "upper ten." But will it surprise them when they hear that many of the nobility today insist upon having tea at less than 1s 6d per pound? Will it surprise the readers of the *City Press* to hear that while it is possible to get at this establishment fine old-fashioned China tea at 2s 4d per pound, many of the best country families will not buy it, preferring the cheap Ceylon instead?† The finest tea that is imported into this

* Sir Andrew Clark recanted this opinion afterwards and pronounced good Ceylon tea the best he ever tasted.—ED. T.A.

† This just shows how behind the age the Firm's views are.—ED. T.A.

country is the pure Souchong—Sir Andrew Clark's favourite.*

It is a "tradition" that it was this old historic house which exported to America those celebrated chests of tea, which, being sunk in Boston Harbour, gave rise to the war of American Independence—hence our previously unexplained heading.

THE DARJEELING-HIMALAYAN AND OTHER MOUNTAIN RAILWAYS.

The Report of the Directors of the Darjeeling Railway for the half-year ending 30th June 1895 shows that the revenue of the line continues to increase, and with the expansion of the tea industry the receipts must go on improving, says the *Pioneer*, which takes a rather different view of the situation from Mr. Waring. For one thing, the Government gets the half of any profits above 5 per cent. Our contemporary continues:—

As mountain lines to Simla and Mussoorie have already been projected, and others are in contemplation, it may be well to consider the causes to which the success of the Darjeeling Railway is attributable, as the experience gained in that concern should be a valuable guide in forming a judgment as to the feasibility of other schemes of a similar nature. The total length of the Darjeeling Railway from Siliguri to Darjeeling is 51 miles, of which 7 miles in the Terai are practically level, and the remainder comprises the mountain section. The gradients of this latter vary considerably from 1 in 23, which is the steepest, to 1 in 30, or more; and the sharpest curve is about 60 feet radius. The total rise from Siliguri to Ghoom station (3½ miles from Darjeeling) is some 7,006 feet, and the actual length of the ascent from the foot of the hills is 40 miles. From Ghoom there is a fall of some 200 feet into Darjeeling. The cart-road, which is utilised as far as possible, is a good metal road 25 feet wide, and had the lower section of it been as well laid out as the upper, there would have been considerable saving in the cost of the construction of the Railway. * * * It may be as well to consider here if any direct advantages accrue to Government from conceding the use of an important mountain road for the purposes of a railway. In the case of the Darjeeling line the agreement between Government and the Company is, we understand, as follows:—The upkeep of the road is to be paid for by Government and the surplus earnings of the Railway over 5 per cent are to be divided equally between the two parties. Hence we find in the accounts under notice a sum of R30,365 entered as the Government share of the excess profits. This may be reckoned as a pure gain to the State. Instead, therefore, of discouraging the construction of railways on mountain roads, it would appear the Government policy should be to make it a condition that such roads should be utilised where possible. Whether a railway is made along them or not, such roads must be kept up at the public expense, but if it becomes profitable to utilise them for a line of railway, the State is both a direct and indirect gainer. It is argued that a good road may thus be converted into a bad railway, but such is not the experience of the Darjeeling route. It is true the road is hampered to a certain extent by the existence of the Railway, but as the rates of carriage on the latter are less than half of that by bullock-cart, while the speed is five or six times greater, it follows as

* The utter ignorance shown in speaking of pure "Souchongs"—a common China tea brand—as the "finest," can only make real authorities on tea smile.—ED. T.A.

a natural consequence that the road traffic becomes insignificant and the necessity for a first-class road thus disappears.

The success of the Darjeeling line, both on account of its public utility and the profitable returns it gives to the shareholders (and it may be said to Government), should result in more attention being directed to the feasibility of other schemes of a similar nature. In the Dooars, where the tea industry is expanding so marvellously, there is a great opening for light railways: and the Bengal-Dooars line, which has so recently been opened, is already showing signs of becoming a highly remunerative enterprise. A mountain line up the Teesta Valley is discussed as a possible scheme of the immediate future, and as a good metalled road exists we believe to Kalimpong in Sikkim there should be little difficulty in promoting a scheme of this kind. There is a large tea area to be served; besides which the Tibetan trade follows this route. In other directions there are promising schemes to which promoters of light railways might well direct their attention. In the vicinity of Murree there are 12 or 13 depots in which British troops are located for 8 months in the year, and the cost of carriage for provisioning them alone must be a considerable item. A light railway from Rawalpindi to Murree would serve these depôts, and would afford Government the means of transporting troops rapidly to the plains in an emergency. Simla and Mussoorie must also sooner or later be provided with railway facilities. If the same concessions were given as in the case of the Darjeeling line, doubtless companies could easily be formed to carry out the schemes. It is imperative that the public roads should be utilised for all these mountain lines, as in no case will it probably be found possible to build a railway on a separate alignment except at a prohibitive outlay.

TREE-PLANTING IN SOUTH AFRICA.

The regulations for a tree-planting prize competition are as under:—Three prizes of amounts not exceeding £500, £300, and £200, for first, second, and third prizes respectively, are offered by the Government for the best plantation of forest trees. The award will be made in May, 1901. Persons intending to compete should give notice in writing of their intention to the Secretary for Agriculture not later than May 1st, 1896. The plantation, excluding roads, fire-paths water-courses, rocks, and other ground unsuitable for planting, shall contain not less than 100,000 forest timber trees planted or sown in one block, which, however, must be subdivided into compartments by fire-belts; if the block be shaped as a band or shelter belt, its narrowest part shall be not less than 100 yards. The trees shall be spaced at an average distance of not less than 3 ft. by 3 ft. (equal 4,840 per acre), not more than 6 ft. by 7 ft. (equal 1,037 per acre). Trees planted sparser than 1,000 per acre, when inspected by the judge, will be excluded from the competition. The plantation must be clean and regular, the trees evenly distributed, and efficiently protected against danger by fire or grazing.—*Home paper.*

BRITISH CENTRAL AFRICA.—The *Gazette* of Sept. 1st is to hand by the French mail, but there is not much in it of outside interest, save that lions are prowling close to the capital, Blantyre, and alarming the residents with their nightly howling. Here is a paragraph referring to a proposed railway:—

Mr. Grieve Macrone reports very satisfactorily on the progress he is making with his railway survey. He hopes to have his work completed before the rains set in, and we shall then for the first time be able to judge of the feasibility of a line to be brought up from Chimomo to Blantyre along the Cholo plateau.

VARIOUS PLANTING NOTES.

PLANTING AND LIFE IN NYASSALAND.—We direct special attention to the letter of Mr. J. W. Moir of Lauderdale estate, answering certain criticisms directed to us by a Ceylon visitor to British Central Africa in the early part of this year. As we said at the time, experience on the coast and up the river is very different from that of the resident at Blantyre and in the coffee hill region. Mr. Moir's life statistics are eminently satisfactory; and so are his rainfall and temperature tables,—given on pp. 353-354—as to the suitability of the hill country for coffee growing.

TEA CULTIVATION AND THE OLDEST TEA IN CEYLON.—It may surprise a good many to find that whereas in 1892-93, only 23,000 acres were added to the total in tea in Ceylon, in the past two years (1894-95) the total of land planted with the staple is 32,000 acres.—We are accustomed for each new edition of our Handbook to get a report on the oldest field on Loolecondura (now in its 27th year). Mr. Bonner, the present manager is good enough to respond to our request as follows:—

Loolecondura, Sept. 21.

To the Editor, *Ceylon Observer*.

DEAR SIR,—In reply to your letter *re* the Oldest Tea field on Loolecondura. This field is still very vigorous though one or two patches on the ridges are decidedly poor. The yield 1st January to 31st August is at the rate of 382 lb. per acre and though not so good as 1893, this may in a great measure be accounted for by its being only recently pruned.—Yours faithfully,
C. E. BONNER.

LADY BIRDS AND COFFEE IN HAWAII.—We take the following important paragraph—important to Ceylon Planters with coffee—from the *Hawaiian Commercial Journal*, Augt. 13th:—

What has given the Kona people more encouragement than anything else is the rapid disappearance of the blight, which in the early part of the season threatened to destroy the whole crop. The ladybird recently introduced in the district did not begin operations on the coffee trees until about six weeks ago, confining themselves at first to the guava bushes. They lay dormant all winter and when the warm weather set in, appeared in small numbers on the guava trees. When they first appeared the planters feared they would not spread to the coffee trees but a few weeks later when the warmer weather set in myriads of the bright-winged strangers swarmed the coffee trees clearing them completely of all blight. The result will be that whereas the whole crop was threatened with total destruction more than half a crop will now be saved with the prospects for future seasons exceedingly bright.

RUBBER CULTURE.—Not alone in coffee—and Liberian coffee especially—are our Straits neighbours leading the way; but also it seems in respect of the cultivation of rubber. We have had a call from the proprietor of a plantation in Lower Perak on alluvial riverside soil, where there are either planted, or about to be planted, some 500 acres of Para rubber. The climate and soil ought to be as good for Para, as its native Amazonian region, and we look forward with much interest to hearing from Mr. Baker of the progress of his clearing and his eventual harvests of rubber.—There has, however, in the past two years been a good deal done in Para rubber in Ceylon, especially in the Kalutara and other lowcountry districts. The Conservator of Forests does not tell us much of his Sabaragamuwa plantations, but they appear to be growing all right. Perhaps 1,000 acres altogether are planted with rubber trees in Ceylon.

MEM FOR PLANTERS.—Never add lime to a manure containing nitrogen; and when lime has been applied to the land, do not use such manures until about three weeks afterwards.—*The Agricultural Magazine*.

PLANTING ENTERPRISE IN NORTH TRAVANCORE.—The following is from the *Madras Mail*:—

WE PUBLISH FROM THE *Ceylon Observer* AN interesting account of the lands which have been bought in the Kanan Devan District by Messrs. Finlay, Muir & Co. from the North Travancore Company. We understand that it is the present intention of the proprietors to put 10,000 acres under tea within the next four years. Mr. H. M. Knight is the General Manager, and the property will be opened out under him in a thoroughly practical manner. We should like to see as vigorous a spurt in other planting districts.—*M. Mail*.

HYDRAULIC MORTAR.—May be obtained by mixing brick dust with quicklime. Blocks of such mortar half an inch in thickness, after immersion in water for four months, bore without crushing, crumbling or splitting, a pressure of 1,500 lb per square inch. It is asserted that the use of mortar of this composition largely prevails in Spain, and that it is found here to be superior to much artificial cement in the construction of drains, tanks, or cisterns. The proportions used are one of brick dust, one of lime, and two of sand, mixed together dry, and tempered with water in the usual way. There must be many occasions in which you would find this new mixture useful. It is not known to me if it will absolutely set under water, but probably a somewhat larger proportion of brick dust might ensure this. It seems reasonable to think so, for we know that artificial cements are made almost entirely of burnt clay and lime. Very little experimenting would be able to decide your local architects and engineers on this point. It may well be recommended to your Director of Public Works to make some trials in the direction mentioned.—*London Cor.*

THE EXPORT OF CEYLON TEAS.—The figures given in the Chamber of Commerce Price Current this week, relating to the exports of Ceylon tea to all parts of the world, are more than usually interesting, and show a most gratifying increase in the output of our staple (to 26th Sept). The American shipments have risen from 163,410 lb. to 272,290 lb. The export to Australia exceeds that of last year by 1,487,284 lb. But by far the most interesting increase is shown in the figures relating to the Russian market. The importance of that country as an outlet for our teas has long been recognised, and an energetic campaign has been carried on there against merchants' and dealers' prejudices in favour of China tea. From January to September, 1893, the direct shipments of Ceylon tea to Russia were 15,410 lb. From January to September, 1894, there were 33,328 lb. The shipments up to September 26th this year, however have been 206,895 lb., an increase of 650 per cent! This is a noteworthy rise, and one we are heartily glad to see. For it we owe thanks undoubtedly in a very great measure to M. Rogivue, who has done good work on behalf of our staple; but to Mr. Lampard, the latest addition to the ranks of our local tea-buyers, credit is also due, for since his arrival in Colombo he has been helping to develop foreign markets, and in regard to Russia we hear that he is now sending off something like fifty tons of our tea a month. 27 tons were shipped by him in the "Vindebona" the other day, and his shipments to Russia this month will be fully up to fifty tons. This is good news for our planting community, and we are glad to draw attention to it and hope to see the increase maintained.—*Local "Times."*

[Mr. Lampard is as strong as other large tea-buyers here in the belief that the trade direct with Russia, Australia, America, etc. could be increased manifold were the absurd Customs restrictions which keep Colombo in swaddling clothes removed.—*Ed. T.A.*]

"COCONUT BUTTER."—Mr. John Hughes' letter on this subject given elsewhere will be read with general interest: the new industry even if confined to America ought to lead to a large and growing demand for coconut oil, so benefiting Ceylon producers.

NEW PRODUCTS.—We attract attention to the useful and interesting letter of R. M. T.; we are very pleased to have the information he gives about greater attention being paid to new products. There is plenty of room for them in Ceylon without going to India.

LADY BIRDS FOR COFFEE BUG, &C.—We are glad to learn that Mr. G. H. Green of West Hapntale is likely to supplement his brother's attempt at importing "lady birds" from California, by trying whether a supply can be got from Queensland. We heartily trust both these spirited ventures may be highly successful.

INDIAN TEA COMPANIES.—Mr. George Seton has published in tabular form the results of the 1894 season's working of 40 Indian tea companies registered in London, says the *Financial Times*:—The total share capital involved is £3,734,620 and on this sum an average dividend of 9 per cent. was paid, £335,970 being distributed out of total receipts amounting to £1,687,767. The 40 Companies have reserves and balances in hand equal to 9½ per cent. of their entire capitals, the Jorehaut (which pays 20 per cent.) showing 41.82 per cent. of its capital in this form. Only one Company paid no dividend; 27 paid 7 per cent. and over, while 22 paid 10 per cent. or over; and three paid 20 per cent. Few groups of industrial investments can show such consistently excellent results.

THE SCOTTISH TRUST AND LOAN Co. OF CEYLON, LD.,—whose annual Report will be found elsewhere—is one of the few Companies that began operations in the days of coffee, and would probably have come to utter grief when coffee collapsed, were it not for the pluck and perseverance of Mr. Thomas Dickson, senr., well supported by the local Agents, Messrs. Cumberbatch & Co. They never lost faith in the Company's properties although the returns dwindled woefully for some years; and then in the tea era came the reward of their faith and courage; for, now, all is prosperity with the "Scottish Trust," though the Directors are still in the process, it will be observed, of developing fresh property. For the year ending the 31st August last, the shareholders have divided 10 per cent in dividend and bonus. Altogether we congratulate the Company, its Officers and Managers on so satisfactory a Report.

GOOD NEWS FOR CEYLON TEA PLANTERS.—We are well pleased to learn that an influential Russian tea-buyer who has been on a visit to the island, has left so well satisfied with all he has seen and learned that he is likely to establish an Agency here next year and indeed that he has already withdrawn from his Agencies in Canton and Foochow. This gentleman was especially loud in praise of our high-grown teas. While the guest of Mr. E. S. Anderson in Dikoya (as well as in Colombo) he had the opportunity of testing a great many samples; and he thinks there can be no doubt of such teas going very largely into consumption in Russia in supersession of China teas. Already M. Popoff's house uses more and more of Ceylon teas in their blends, and while the delicate high-grown are in demand for the well-to-do classes, lowcountry Ceylons suit for the cheaper blends. To get a hold of the Russian market through buying Agencies in Colombo will be a great gain to the producer.

SCORPION STINGS.—A correspondent writes:—"A paragraph in a recent issue of your paper on scorpions prompts me to write and say that I have found phenyle an infallible and instant cure for stings from scorpions, bees, wasps and hornets. A little pure phenyle rubbed on to the wounded part will give immediate relief and effectually prevent inflammation. I have tried this simple remedy in dozen of cases, and it has never failed. Publicity of the fact will perhaps be the means of giving relief to many.—*Proucer*."

TEA AND TIGERS AT UPPER BURMAH.—"I hope next week to go up to Tamanthi to look at some native tea gardens, which do a fair trade in pickled tea (let-pet), and in exportation of tea-seed to Assam. The actual cultivation is very poor, and I don't think they have ever succeeded in getting more than 300 lb. of green leaf per acre per annum off any garden. A very big tiger was shot in this district the other day by Sepoys at a post named Yebami, on the Uru river. I have the skull, a splendid one, but the skin was mangy. I measured the skin and it was exactly 10 feet from tip of nose to end of tail, so I suppose the tiger measured, when alive, about 8 feet 10 inches. The curious thing about the latter was that it only killed fowls, eating 54 in three days. The Sepoys fired 106 rounds at the beast, and only four bullets hit it!"—*Ibid*.

TEA SPECULATION.—The *H. and C. Mail* of Oct. 11th devotes most of its "planting and produce" paragraphs to the consideration of our "note of warning" about not allowing speculations in tea shares to go too far, and the need of "putting on the drag." Our contemporary introduces his review as follows:—

THEY THINK So.—The idea has taken a firm hold in some quarters at home that the tea-planting industry is "wallowing" in wealth just now, and that to be a tea planter is the next best thing to possessing a gold mine or occupying the proud position of a leading jockey. Perhaps the grocer may have helped to spread the notion that the tea planter is steeped in wealth, because in his playful way he sometimes tells his customers, when he is asked to explain how he can possibly sell such beautiful tea at such low prices, that the grower makes all the profit, and he, the retailer, in his abject despair at the prospect before him, wishes to heaven he had taken to growing tea instead of selling it over the counter. Then tea has been talked about almost as much as if it were a new beauty or the latest scandal. An article of produce is not a subject for conversation outside commercial circles as a rule, but tea is the exception. It is supposed to be grown under romantic conditions, and the tea planter is believed to be the most enviable of mortals living in an atmosphere of tropical horticulture tempered with polo and cooling drinks. Perhaps these pleasing fictions have helped to strengthen the general impression that to be connected with tea, especially the planting of it, is a blissful and remunerative association. The success of the past year's workings and the references of late in the financial papers all help to foster the notion, and it would be quite useless for a tea planter at the present moment to plead poverty in any form. Already, if we may judge by a note of warning in the *Ceylon Observer*, the planter in Ceylon is beginning to possess some lofty notions of his own as to the value of his product and the estates on which it grows. Had it not been that the minds of the company-mongering fraternity at home are engrossed over the goldfields of South Africa and West Australia, and their yearnings after the welfare of humanity consequently confined for the present to those spheres of usefulness, there certainly would have been some attempt to create a financial boom in tea. Something of the kind may happen even now, but tea estates are not quite on all fours with gold mines, and there are difficulties in the way. For all that, the public believe in tea, and they are convinced that tea proprietors who can snap their fingers at the low rate of exchange are more likely to revive the glories of the ancient order of Nabobs than any of their Anglo-Indian contemporaries.

A FOURTH CROP of Strawberries has just been gathered near Penzance. Chestnut-trees are in new leaf and bloom in north London. At Kendal damsons sold for a farthing a pound, and apples at less than a half-penny. A marrow weighing 32 lb. was displayed at the harvest festival in Eastbourne Wesleyan Church.—*Christian World*.

DEATH OF MR. ANDREW JAMIESON.—The *New Bulletin* for September announces the death at the General Hospital, Madras, on August 17, of Mr. Andrew Jamieson, Curator of the gardens and parks at Ootacamund, Nilgiris. Mr. Jamieson was fifty-three years of age, and had been connected with the Ootacamund Gardens for nearly twenty-seven years. He was formerly a member of the gardening staff at Kew, and was appointed to Ootacamund in September, 1868, being in sole charge of the gardens on the Nilgiris for many years, until they were placed under the control of the present Director, Mr. M. A. Lawson, who spoke most highly of Mr. Jamieson's skill and perseverance in all his duties.—*Gardeners' Chronicle*.

BRICK-MAKING IN CEYLON.—There is a report current that an effort is to be made at Nuwara Eliya to make bricks according to European methods in place of those hitherto in vogue. We wish the project all success, but we would point out that the demand for bricks in Nuwara Eliya cannot be large, while past efforts to improve the system of brick-making in Ceylon have not been very successful. During recent years two companies were projected at different times to start brick-making in Colombo, according to the most approved methods, with European machinery and under European supervision, but they never got beyond the stage of projection; for some reason or other, the difficulty in one case being the personality of one of the projectors, which was objected to by the general public when they were asked to invest. An effort was also made, if we remember aright, by Government to make their own bricks when the new Post Office taken in hand, and some machinery was erected at the General Factory, but this scheme also fell through, although it was responsible to a great extent for the decided improvement in native-made bricks that has been observable during the last two or three years. And yet there are said to be large profits made in brick-making as at present carried on, and it has been urged that, were machinery imported and European methods adopted, instead of the primitive ways at present in vogue, still larger gains might be looked for, although, in our opinion, this does not necessarily follow, as experience of other enterprises—laundry work for instance—has convinced us that in some operations, especially where a large degree of skill is not required, the hand labour of the native can hold its own with the more expensive and complicated machine-work of the European, without taking into account the opposition of vested interests.

A PLACE WORTH OCCUPYING.—Sir Theodore Bent describes the only spot on the Arabian littoral which seems to be worth while annexing. This he describes under the title of the "Land of Frankincense and Myrrh":—

Dhofar is 640 miles from Muscat on the one side and 800 miles from Aden on the other, so it is situated about as far as possible from any civilised centre. Nominally it is under the Sultan of Oman: virtually it is ruled over autocratically by one Wali Suleiman, who was sent out there about eighteen years ago as Governor, at the request of the feud-torn inhabitants, by Sultan Tourki of Muscat. If ever this tract of country comes into the hands of a civilised nation, it will be capable of great and useful development. Supposing the harbour restored to receive ships of modern size, the Gara hills, rich in grass and vegetation, with an ample supply of water and regular rains, and, further-more, with a most delicious and health-giving air, might be of inestimable value as a granary and a health resort for the inhabitants of the burnt-up centres of Arabian commerce, Aden and Muscat. It is, as I have said, about half-way between them, and it is the only fertile stretch of coast-line along that arid frontage of the Arabian Peninsula on to the Indian Ocean.

JAPANESE MATTING.—The demand for Japanese matting, probably made from the culms of *Lepironia mucronata*, appears, from a recent report from Hirgo and Osaka to be still increasing. The progress made in the manufacture of this article is more and more noticeable each year, the export for 1894 amounting to over 277,000 rolls of 10 yards each, against 227,000 in 1893. The chief demand comes from New York, and the quantity carried to that port by sailing vessels alone amounted to over 170,000 rolls, being an average of over 12,000 rolls per vessel, which shows what an important factor as regards freight this industry has assumed. New designs of matting are constantly being invented by the Japanese, while the workmen are very ready to execute orders based on patterns received from foreign countries, so that the number of styles now available to the exporter are almost unlimited. The crop of Rush from which the matting is made was particularly good and abundant during the year, and the result has been that the trade proves capable of great expansion without any important change in prices, to the considerable advantage of both the Japanese and foreigners engaged in it. To all appearance, the demand for floor matting is likely to increase in the future.—*Gardeners' Chronicle*.

SHEET-LIGHTNING.—An interesting paper was read at a recent meeting of the Scottish Meteorological Society by Mr. C. Michie Smith, Government Astronomer, Madras, on the thunderstorms of Madras. Almost every night, he said, sheet-lightning could be seen on the horizon, and he attributed this not to the reflection from distant flashes, as was commonly and erroneously supposed, but to the meeting of land winds and sea winds. The first would be heavily charged with dust, while the latter would be free from impurity. He had frequently noticed that when sheet-lightning occurred the clouds were double, and he suggested that these two columns of sea and land clouds might be negative and positive to one another, and thus discharge is brought about between them. The succession of flashes was sometimes so frequent that three hundred could be counted in a minute, and this would go on for as long as an hour and a half. The Indian Government had decided to build an observatory at a height of 7,700 feet, at Kodaikanal, and although it was primarily intended for the study of solar physics, a certain amount of meteorological work would be done. Associated with this Observatory would be another building 7,000 feet below it, and at a distance of three or four miles. The foundation stone of the former was successfully laid this morning.

THE PROSPECTS OF QUININE will certainly improve greatly if war breaks out in South-Eastern Europe. Meantime the *New York Drug Reporter* has the following editorial remarks:—

The attempt to secure co-operation among the Java planters, with a view to restricting production, appears to have failed, but the statistics prove that, at any rate, individuals have been willing to try to obtain better prices for their output. One feature must not be overlooked, and that is that the supply of bark is gradually failing, the indications pointing to a repetition of what has occurred in Ceylon. Manufacturers of quinine would be perfectly willing to pay higher prices for their bark, as they could easily obtain a relatively much higher price for the alkaloid, without the consumption being affected in the slightest degree.

The quinine makers do not appear to be worried by the prospect of an early establishment of a factory in Java for the manufacture of the alkaloid. As a foreign contemporary says: "The trouble will be to prevent the prepared quinine from being slaughtered on the European markets in the same way as the bark is now, for no provision is made to keep the manufactured product in the control of a central sale office. On the contrary, it is to be handed back to the planter who supplies the bark, and who will, therefore, be under the same temptation to sell with regard to quinine that has been his undoing in the matter of the mother substance."

"HANDBOOK TO THE FLORA OF CEYLON."—Dr. Trimen's most useful handbook makes steady progress. The plates by which it is illustrated now number seventy-five. *Barleria Arnottiana*, with large tabular blue flowers would be a desirable introduction to our stoves. The text of the third volume has now reached the *Balanophoraceæ*. The terse descriptive paragraphs admitting ready comparison are in marked contrast to the diffuse dissertations admitting of comparison with difficulty if at all, which are employed by the laboratory school of botanists.—*Gardeners' Chronicle*.

THE NEW PUBLIC-GARDENS SUPERINTENDENT AT NAGPUR.—We learn that Mr. John Horne Stephen, formerly of Kew, and lately curator of the Lal Bagh Botanic Gardens at Bangalore, Mysore, has been appointed Superintendent of the Public Gardens at Nagpur, Central Provinces of India, in succession to the late Mr. J. R. Ward. Mr. Ward died in January last from smallpox complicated with other maladies. He had only held his post since 1893, but had already won general regard; his untimely death has cut short a career of promise.—*Kew Bulletin*, September, 1895.

A NEW GUINEA CORRESPONDENT WRITES.—"The well-known German traveller, Mr. Otto Ehlers, has started on his trip through New Guinea. With 45 carriers, he intends to follow the Francisco river inland, and to cross the mountains so as to meet the Heath river in the English territory. The direct distance from shore to shore is not much more than 90 miles, but nothing whatever is known of the country to be traversed, if it is inhabited or not, if the inhabitants are friendly or hostile, if food is to be procured or not and therefore the results are still doubtful.—*M. Mail*.

THE POSSIBILITIES OF COLONISATION IN THE TROPICS are discussed in the articles of Mr. Frederick Boyle in the *New Review*, and Captain Lugard and Mr. A. Silva White in the *Nineteenth Century* for September:—

Mr. Boyle revives and gives personal support to the opinion of Mr. H. W. Bates (the "Naturalist on the Amazon") that, "though humanity can reach an advanced degree of culture only by battling with the inclemencies of nature in high latitudes, it is under the equator alone that the race of the future will attain to complete fruition of man's beautiful heritage, the earth." Captain Lugard, eschewing transcendentalisms, continues his search after "New British Markets," this time in tropical Africa, and winds up with the enthusiastic prophecy that the "great policy" of Colonial development announced in the speech of August 22nd, but "first formulated in 1893," "will be identified in English history as Mr. Chamberlain's." Captain Lugard may learn some day, in company with more eminent persons, that it is not quite as easy to lead the Colonial Secretary by the nose as it appears to be.

THE PLANTING AND AGRICULTURAL ENTERPRISE OF CEYLON AND THE LONDON "TIMES." Very opportunely on the day we are publishing our "Directory" *Supplement*, the German steamer has brought us a copy of the London *Times* of Oct. 21st—three days later than our last mail—which, among other things, contains the long letter we ventured to address to the Editor on Sept. 19th on first arriving at a clear idea of the position of our Planting Enterprise. We reproduce the letter in full elsewhere and it will be observed that it refers to native Agricultural industry as well as to our Rice Imports, Customs Taxation, and the marvellous increase in the Shipping Trade of Colombo. Appearing at a time when Sir Arthur Havelock is about to hand over the reins in person to a new Governor, Sir West Ridgeway, this letter in leaded type in *The Times* cannot fail, we think, to attract a good deal of official and general attention in the mother country, and thereby to prove a good advertisement for Ceylon.

TAKE NOTICE.—The *Ceylon Observer* by the way issues a warning to Indian tea planters in italics and it only requires the accompaniment of slow music to render it melodramatic. Our contemporary says: "We have been asked by a Colombo merchant to state what proportion, according to our reckoning, of the reserved land in private hands may be available for planting with tea. The total extent of plantations being 748,017 acres, and of cultivation 379,182 acres, we get for total reserve 368,835 acres. Of this very large extent we should say that about 120,000 acres represent forest and other valuable land fully available for cultivation if due encouragement is offered; and unless a fall in the price of tea through large crops in India interfere we see no reason why 60,000 acres of this reserve should not be planted during the next five or six years—apart from any Crown land that may be made available—so let Indian tea planters beware of supposing that there is no more tea land to plant in Ceylon." The italics are copied from the *Observer*.—*H. & C. Mail*,

THE INDIAN TEA CROP.—A writer in the *Indian Planters' Gazette* says of the current crop:—

If the profit last year per lb. was estimated at 2d per lb. we would be inclined to think that all over it might be cut in two this year, as Assams, which principally keep up the high average price of Indian teas up to date, with a few, aye—very few—notable exceptions, have proved a "lame duck", and only contributed to lowering the average. 'Tis true that lately a few of the sales have been exceptionally good, but this by no means represents the general bulk, and there can be little doubt this is entirely due to the atmosphere, as all cannot have lost the "cunning of their hand." In the beginning of this season a leading broker stated his opinion that the poorness of the Indian crop was entirely due to atmospheric causes, and planters must find it a great advantage to be informed by competent authority that the fault does not lie in the system of manufacture pursued, but in the air so to speak. At one time, the 1895 crop was talked about with "bated breath," but the wind has again been tempered for the shorn lamb, and season 1896 will be upon us ere we know what we are about, and there will be probably speculation as to the enormous increase again!

WHAT HAS BEEN DONE AND WHAT IS TO COME—formed the occurrence of a striking passage in the British Association President's address:—

Who, at the foundation of the Association, would have believed some far-seeing philosopher if he had foretold that the spectroscope would analyse the constituents of the sun and measure the motions of the stars; that we should liquefy air and utilise temperatures approaching to the absolute zero for experimental research; that, like the magician in the "Arabian Nights," we should annihilate distance by means of the electric telegraph and the telephone; that we should illuminate our largest buildings instantaneously, with the clearness of day, by means of the electric current; that by the electric transmission of power, we should be able to utilise the Falls of Niagara to work factories at distant places; that we should extract metals from the crust of the earth by the same electrical agency to which, in some cases their deposition has been attributed? * * But what will our successors bring discussion sixty years hence? How little do we yet know of the vibration which communicate light and heat! Far as we have advanced in the application of electricity to the uses of life, we know but little even yet of its real nature. We are only on the threshold of the knowledge of molecular action, or of the constitution of the all-pervading æther. * * It is only within the last few years that we have begun to realise that electricity is closely connected with the vibrations which cause heat and light, and which seem to pervade all space—vibrations which may be termed the voice of the Creator calling to each atom and to each cell of protoplasm to fall into its ordained position, each, as it were, a musical note in the harmonious symphony which we call the universe.

"SABAI" GRASS FOR PAPER.—Experiments are being made in the Deccan for improving the growth of the *sabai* grass, which is fast taking the place of the failing esparto in the manufacture of paper. The Deccan Paper Mill Company has obtained a free grant for five years of 50 acres of land for the cultivation of the *sabai* grass.—A small beginning was made in 1893-94 in the export of printing and writing paper from Bengal to Ceylon, Java, the Straits, and even to Australia when the export value was only Rx. 3,827. In 1894-95 it had increased to Rx. 8,036, and from all accounts there is a distinct probability of the export trade of India in paper taking a prominent position in the next yearly Trade returns.—*S. and E. Engineer.*

"CENTRAL AFRICAN PLANTER."—We have received a copy of the first number of this little periodical (12 pages) published at Zomba, dated September and edited by R. S. Hynde, F.R.S.G.S. We quote from the introduction as follows:—

We have already a paper devoted to Mission interests, a general Magazine, and a Government *Gazette*, but no organ devoted to the planting interests of the community—the interest, we venture to state, on which the commercial prosperity of B.C.A. depends. It will thus be seen that we are attempting to fill a place which has hitherto been vacant and that we have neither the wish, nor the intention, to trench upon the fields already taken up. Such is our apology and now a few words as to our plans. We propose to run the paper somewhat on the lines of the "*Tropical Agriculturist*" of Ceylon—a paper which, as most of us think, may be fitly styled the Prince of Planters' Papers. We will endeavour to put before our readers the latest information on Tropical Agriculture at our command and we also hope to publish, from time to time, original articles from residents in the country dealing with planting questions.

We appreciate the compliment to ourselves. The most important article is entitled a "Retrospect" as to coffee planting in Central Africa which we reproduce elsewhere. We wish the "Central African Planter" a successful career.

SUNSPOTS AND RAINFALL IN INDIA AND CEYLON.—The *Pioneer* has the following deliverance on this subject:—

Once upon a time everyone who aspired to do his duty at an Indian dinner table had to know something about the theory of sunspots. But now that Sir W. W. Hunter is gone, and the weather on the whole remains much the same, the interest of the subject in general conversation has rather waned. There is in fact only one region in India where it has been shown that a general agreement exists between the changes in the solar photosphere and the amount of rainfall. This region is the Carnatic, where the rainfall shows a very fairly regular increase and decrease which approximates in a very remarkable manner to the course of the sunspot variation. This is the more remarkable as the total rainfall of India affords no evidence of a similar eleven year variation, and the rainfall of the present autumn in Madras will hence be carefully watched by those who are interested in establishing a relationship between the progress of solar changes and terrestrial meteorology. A slight maximum of sunspots occurred in the beginning of 1884, and that year was one of heavy rainfall in Madras. The present year 1895 is also one of maximum spots, hence according to the theory heavy rains should be received over the Carnatic and Southern India generally during the prevalence of the present North-East Monsoon. So far this anticipation has been amply fulfilled, as during the past fortnight, *i.e.*, since the setting in of the monsoon, the rainfall has been abnormally heavy over the whole of the peninsula region. Thus Colombo has received 22 inches instead of 8 inches; Madras 8 inches instead of 6 inches; Masulipatam 8 inches instead of 5 inches; and Cochin 12 inches instead of 7 inches, a result which will be equally acceptable to the Southern India ryot as to the believer in direct solar action on terrestrial weather.

DAYS OF OLD : MR. R. E. LEWIS.—We are much pleased to have a long and interesting communication—to appear in an early issue—on "Days of Old" from this gentleman who pioneered coffee here in the early "forties"; and afterwards became Editor and author and merchant—joining the firm of Messrs. Darley, Butler & Co. Mr. Lewis was one of the very first to write the history of coffee-planting in Ceylon. He must now be over 75 years and yet it is interesting to learn that although Mrs. Lewis and himself "suffered from influenza—critically at the time—we are both well and I have regained my active habits."

CINCHONA.—Mr. O'Connor says that in 8 years the area under cinchona in India has fallen from 14,491 to 8,709 acres; but the Madras figures do not quite agree with this result. In Ceylon, however, in 8 years we have gone from 40,000 down to 5,000 acres!—Speaking of cinchona, we may here give figures—the latest available—supplied to us by Mr. Morey for the importation of bark and quinine into the United States:—

	Quantity.	Value.
Cinchona Bark	lb. 3,423,941	\$299,998'00
Cinchoniada	oz. 11,483	1,586'00
Quinia [Sulph of]	oz. 2,686,677	542,440'00
All other Salts of Cinchona	oz. 156,442	22,366'00
	oz. 2,854,602	\$866,390'00

TEA AND FINANCE.—We are not infrequently asked to express an opinion as to the merits of certain tea companies as investments, and whether the new projects launched from time to time are worth attention. We leave to those who make a special study of the stock and share markets the task of acting as financial advisers in these matters. We have continuously pointed out that the shares in sound and well managed tea gardens are well worth attention, and as we give ample information about all that concerns these gardens week by week it is not a very difficult task for the intelligent investor to ascertain for himself the prospect before him. That tea planting is on a sound basis is quite certain. It will have its ups and downs, but in the case of well-managed properties it offers much that cannot be found elsewhere. The preference shares in some of the leading companies—the Jokai Company is an instance—are valued as highly by investors as Colonial Government securities, and this is evidence of the solidity of the tea industry from the investors' point of view. That every new tea concern whose prospectus is issued is necessarily a good thing by no means follows.

INDIAN AND CEYLON TEA IN AMERICA.—We understand that Mr. Mackenzie, special commissioner of Ceylon, is expected at Liverpool tomorrow (Saturday) by the ss. "Etruria." His report on the outlook for British-grown teas in America will be awaited with much interest. It is stated that the 304,000 acres of tea at present under cultivation in Ceylon will yield, this season, some 90,000,000 lb. of tea, and the revised estimate of the Indian crop is 140,000,000 lb., so that there will be no lack of tea to supply our American cousins. Mr. Blechynden's proposed scheme of operations is at present receiving the attention of the American and Foreign Tea Committee of the Indian Tea Association. His programme is, we believe, based in a great measure on co-operation with Ceylon, both in respect of demonstrations in Food Shows and in subsidising firms already engaged in the business of advertising and selling Indian tea. The scheme also contemplates enlisting the interests of newspaper men, and thus securing valuable notices. Mr. Blechynden's operations also include the services of six talented saleswomen, who discourse on the merits of Indian tea to select gatherings of the sex, in addition to which, as we stated last week, the agency of the Salvation Army has been enlisted in the joint service of India and Ceylon.

LABOUR LAWS IN INDIA.—The Bengal Chamber of Commerce has addressed a strong protest to the Bengal Government against “the attempts made by a section of British manufacturing interests to retard the industrial development of India by forcing on this country, under the sanction of Parliament, labour laws wholly unsuited to the conditions under which labour has to be performed in India.”

HANDBOOK OF THE FLORA OF CEYLON.—The third volume, or third part, as it is designated, of this admirable work has just appeared. It contains the orders *Valerianaceæ* to *Balanophoraceæ*. With it are issued plates 51 to 75. These are of quarto size, and represent interesting or critical species. Dr. Trimen, who is now on leave in this country, is to be congratulated on the rapid progress of his undertaking. For further particulars see *Kew Bulletin*, 1894, p. 34 and p. 227.—*Kew Bulletin*.

CEYLON INVESTMENTS IN JAVA.—From what we hear of the results of the investment of Ceylon capital in coffee in Java, the capitalists who have cried out against the local Government for withholding sales of Crown land and so forcing capital to find an outlet elsewhere have not much cause for complaint. Two and a half year old coffee giving 4½ cwts. an acre is equal to anything in Ceylon in the old coffee days, and a coffee estate in Java must be a finer property than the best tea estate in this island at present prices asked for estates or for jungle. There seems to be no difficulty about getting land in Java, and, with the splendid soil there, and facilities for working, the wisdom of planters having a second string to their bow instead of overdoing the tea output and swamping the market ought to be apparent to everybody.—Local “Times.” [And so our contemporary appears to rejoice in the development of Java with skill and capital from Ceylon, rather than in the extension of enterprise locally. This is certainly a new form of patriotism !—ED. T.A.]

ADVERTISING TEA IN AMERICA.—Another packet of Chicago, Brooklyn and New York papers shew that Mr. Mackenzie and Mr. Blechyn-den are not idle—for they seem to have joined forces in advertising, and wisely so, we think. The *American Grocer* has a really striking half-page which is headed,—“The Rise of Indian and Ceylon Tea and the Eclipse of China Tea”; but which ends:—“Insist on your grocer supplying you with the pure Ceylon Teas,” so this must be a Ceylon advertisement only.—In this connection we may notice that Mr. Elwood May send us a neat little pamphlet called “Tea Secrets” issued by his “Ceylon Planters’ Tea Co.” which ought to make a good advertisement of his tea and coffee brands.—In one advertisement, our Commissioner seems to show for the United States alone (?) a consumption of Indian and Ceylon teas in 1893 and 1894 equal to 2,500,000 and 3,300,000 lb. respectively. This is far above what our statistics for London, Colombo and Calcutta shipments prove, and we suspect though headed “U.S.,” that Canada is included. Mr. R. V. Webster has been telling our contemporaries that the imports for the present year are bound to be 40 per cent above those of 1894. That would bring us up—on our statistics—as follows:—

United States and Canada 1894	=	2,633,426 lb
40 per cent increase	=	1,453,368 „

U.S. & Canada in 1895	=	5,086,804 lb.
-----------------------	---	---------------

Of course, the bulk of this is sent from London.

TEA CULTURE IN ASSAM.—We have to acknowledge with thanks the receipt of a Blue Book on this industry for 1894 sent to us by Mr. J. Braine, of Joonkballie Tea Company, Limited. We are much obliged; we had already got the statistics and embodied them in our “Handbook and Directory.” There is a small map of Assam showing divisions, stations Railways and droas.

THE NEW ZEALAND TARIFF.—We are much obliged to an ex-Ceylon Colonist who sends us a copy of the new Tariff for New Zealand from which we quote as follows:—

CLASS 1—FOODS AND ARTICLES FOR HUMAN CONSUMPTION.

CLASS 4—NON-ALCOHOLIC BEVERAGES.

Name of Article.	Former Duty.	Present Duty.
Tea	6d lb.	4d lb.
Coffee, raw	3d lb.	2½ lb.
Coffee essence	15 p.c.	20 p.c.

TEA AND COFFEE IN BRITISH DELHI AND LANGKAT.—The report of the British Delhi and Langkat Tobacco Company for the year ended December 31st, 1894, states:—Tea and Coffee.—Fair progress has been made in carrying out the estimated extensions of these new cultures. The exact particulars cannot be given, owing to the prolonged illness of the manager, Mr. Inch. His opinion, as an experienced Ceylon planter, completely bears out the estimate already formed of the entire suitability of the climate and soil for raising these products.—*London and China Express*, Oct. 18.

CEYLON AND THE PLANTING ENTERPRISE.—In a long letter to the *Times*, Mr. Ferguson, of the *Ceylon Observer*, points out the position and prospects of the planting enterprise of Ceylon, and supplements his letter with some interesting statistics. *** Mr. Ferguson winds up his letter by saying “that the two notable material facts in the history of Ceylon during the past fifteen years are—(1) the rise of the tea-growing industry from 9,000 acres planted in 1880 to over 300,000 acres in 1895; (2) the immense growth and ever-increasing expansion in the tonnage and trade of the capital, Colombo.” Oct. 25.

CEYLON TEA IN AMERICA.—The following report on tea in the *American Grocer*, of Sept. 25th, received today, shows that increasing attention is given to our product:—

Ceylons have been selling freely and at unusually low rates. The Ceylon Planters’ Commissioner has again been in this city and a good deal of advertising done, evidently with the view of attracting the consumer. Unquestionably it will bear its fruit and the demand for teas from this island become even more general. A rather unusual feature was this year observable in London at the opening of the season, viz.: Ceylons advanced in price while Indias gave way. The rapidity with which the output increased is remarkable—to say that a few years ago they exported 1,000,000 pounds, while this year the export will exceed 90,000,000 pounds. The quality of recent shipments shows improvement, and some good trade are offering.

Quotations are as follows:—Indias.—Pekoe souchong 16 to 19c; pekoo, style and cup, 21 to 22c; pekoo, extra, 22 to 23c; orange pekoes, 23 to 25c; orange sylhet, fancy style and cup, 26 to 28c. Ceylons.—Pekoe souchong, 15 to 17c; pekoe, ordinary 17 to 18c; pekoe, extra 18 to 21c; orange, pekoes 22 to 25c; B.O. pekoe, extra 28 to 35c; fancy orange, 45 to 50c. Darjeeing.—Pekoe souchong, good cup 25 to 32c; orango pekoe 40 to 55c; B.O. pekoe 55 to 65c.

Today at noon the Montgomery Auction and Commission Company will sell 3,652 packages of teas, viz.: 938 half-chests Moyune, including a “crack” chop; 1,264 half-chests and boxes Pingsuey, new season’s; 426 half-chests congou, new crop, including desirable pekoes; 67 packages India, Java and Ceylon; 229 half-chests and boxes Amoy; 225 half-chests Foochow; 503 half-chests and boxes Formosa.

Correspondence.

To the Editor.

GUTTA PERCHA TREES: EXPERIMENTS SUGGESTED.

Oct. 2nd.

SIR,—Your paper (the *Observer*) has such a wide circulation and letters have the advantage of appearing in the *Tropical Agriculturist*, which touches specially planters in foreign countries, that I would suggest to some of those interested to try the following experiment. I have very good grounds for stating that it can be successfully carried out and has been so.

Where the gutta percha tree exists, if the leaves are allowed to fall ripe and are then collected and withered, then rotted and time allowed for them to decay, and if the matter is then collected and ground up finely and treated with bisulphate of carbon a very superior gutta percha is produced. I have lately seen cakes of this gutta percha drawn out as thin and fine as rubber.

Naturally it will occur to anyone who is interested in this subject that by this plan the trees can easily be deprived of their leaves and twigs without in any way deteriorating the parent stem. Surely some gutta percha trees can be found in Ceylon and this experiment tried and reported upon in your paper.

It is only fair, however, to say that this matter does not originate from me, and that good work is being done and excellent gutta percha collected.

I am sending out to Africa by this mail information on this subject with the view of inducing some of the growers of *Landolphia* to try the experiment where a good supply of leaves can be produced. These species of *Landolphia* (four or five of which I have obtained) I find the greatest difficulty in growing and Mr. Horace Billington informs me that he experienced great difficulty in getting up a stock of these rubber-yielding plants.

Some of your readers will remember that I urged the collection of rubber and gutta from trees some years since by extraction and boiling of the fresh foliage, but, from all I can hear, this has not yielded a satisfactory result except in the boiling of the twigs and stems of the *Landolphia*.—Yours truly,

THOS. CHRISTY.

[Ceylon being a very paradise for leafage, would be the place for experiments. Planters with rubber trees should make a trial.—ED. T.A.]

VEGETABLE BUTTER.

London, E.C., Oct. 10.

DEAR SIR,—I enclose a cutting from *The Standard* of the 7th October in reference to the preparation of Coconut Butter which is made from a vegetable oil as opposed to Margarine which is made from animal fat. It might therefore be termed vegetable butter, and as such would be much appreciated by those who, either by education or inclination are opposed to the consumption of oil or fat of animal origin:—

“Some time ago it was reported that butter had been made successfully from coconuts, but it was supposed that the cheapness of margarine had prevented the discovery from assuming commercial importance. Now, however, an American dairy paper reports the establishment of an extensive factory for the manufacture of coconut butter, which is already being made at the rate of 10,000lb. a day. The crude coconut oil it is stated, is received from Cochin in terees of 2,000lb. each. This oil is almost colourless and tasteless. After passing through two processes, which are kept secret, it emerges white and granular, and afterwards it is churned with skim milk or butter-milk to give it a butter flavour. At present most of the commodity is sent out in its natural white colour, for the use of confectioners and cooks in

restaurants, but that which is sold for table use is coloured to resemble butter, and for the best quality it is intended to add a little cream before churning. The so-called butter is said to possess a clean, sweet flavour, and to keep remarkably well. The oil from which it is chiefly made is declared cheaper and better than “neutral lard,” emulsifying more easily with skim milk, and being more difficult to detect when mixed with real butter.”

Some few years back I exerted myself to bring to the notice of an old Ceylon firm a project for the manufacture of this particular butter from coconut oil; but at that time the firm in question could not see their way to take up the matter; and now the ever enterprising Americans have perfected the process in a practical manner.—Yours faithfully,

JOHN HUGHES.

A USEFUL GRASS.

DEAR SIR,—In last *Kew Bulletin* (Sept. 1895) reference is made to a very useful grass *Andropogon pertusus* known in the West Indies as “sour grass” and in Bengal as *palava*. Can you or any of your correspondents say if it is to be found in Ceylon and what is its local name.—Yours, &c.,

HAY.

[Mr. Nock will at once be able to tell us if we have this grass.—ED. T.A.]

MR. ROBERT THOMSON'S REPORT ON COLOMBIA, S. AMERICA.

Sydenham, Oct. 18.

DEAR SIR,—I have the pleasure to forward by book post today a copy of my last Report on Colombia. I was very pleased to see you had reproduced in your valuable work my previous Report. I think this was in the July (1894) number of the *Tropical Agriculturist*. One error slipped into the introductory part of that report, an error on your part, viz., you mentioned “Joseph” Thomson instead of Robert.—I am, your obedient servant,

ROBERT THOMSON.

[The Report referred to, gives us much useful and novel information and extracts will be found quoted elsewhere.—ED. T.A.]

“ANDROPOGON PERTUSUS.”

DEAR SIR,—*Andropogon pertusus*, Willd. Sp. Pl., Rox. Fl. Ind. 1. p. 238, Thw. Ew. p. 437. A very common grass from the sea coast up to 3,000 feet elevation. Plentiful about Colombo. It is an excellent fodder grass, either in a green or dry state and cattle are very fond of it. It can easily be distinguished from the other species of this genus by a remarkable pit on the back of the calyx of the hermaphrodite flower. It creeps a little, but the culms rise from one to two feet with three to twelve digitate spikes of flowers. It is not known by any native name.

J. A.

No. II.

DEAR SIR,—This grass is indigenous to Ceylon, but it apparently has no distinctive native name. W. Ferguson in his Notes on Ceylon Grasses says it is very common from the sea coast to 2,000 and 3,000 feet, and speaks of it as an excellent fodder grass either in a green or dry state. The following is his description of the grass: “It creeps near the root but has culms from one to two feet high and three to twelve digitate spikes of flowers. It can at once be distinguished from the other species of this genus by a remarkable pit on the back of the calyx of the hermaphrodite flower.” Baron von Mueller states that in Australia it is regarded as one of the best grasses

to withstand long droughts, while it will bear any amount of feeding. There it is known as "Pitted bluegrass." The *Australian Gazette* for February 1893 contains a description with plate of this grass which it recommends as a lawn-grass especially in dry districts. Dr. Watt in his Dictionary quotes Dr. Stewart as saying that it is an "excellent fodder for bullocks, &c., and for horses when green."

AGRICULTURIST.

WANTED—THE EXPERIENCE OF PLANTERS WHO PAY THEIR COOLIES MONTHLY.

Glencairn, Oct. 23.

DEAR SIR,—*Re* the present discussion on the labour question,—there must be many Planters in the Island who pay their coolies monthly; will they kindly come forward and give their opinion *pro bono publico*. By monthly payments is meant, I presume, paying for October say on the 30th November. If such be the case, I think a large majority of estates do this already.—Yours faithfully,

"TEA."

THE PAMPHLET UPON "THE LABOUR QUESTION."

DEAR SIR,—The writer on "The Labour Question" begins by a complaint that the writers and speakers upon the question have hitherto taken the views only of Proprietors and Superintendents, and represented the labourers as having become demoralized and different to what they used to be. Almost the whole of his paper confirms this great difference, and in one part he actually traces a cause of it, as far as the Government action in imposing a medical ordinance and altering relations between employers and employed. It does seem preposterous that a writer who virtually condemns Government action and interference in one direction should seek for more of it in another. He is equally inconsistent when he says that individual planters may quote their own and other cases to prove his conclusions incorrect, but that he is *not dealing with individual cases*. Yet his whole argument for monthly payment is supported by his reference to his *one* "friend of great experience." He must have more faith than is visible, if he supposes that the advance system stops at the estate, and does not enter into the Bazaar. It would be extremely interesting to know how his one friend's coolies shifted off their original and "immortal" debts, and what monthly payments enable them to do it.

It appears to me that the reckless issue of advances by young and inexperienced Europeans in new districts in former times, as well as now, somehow left the entanglement and embarrassment, if it be such, to the present Proprietors, and that as far as I can judge, Ramasamy is the only one who has increased in independence and not the Proprietors nor the Superintendents.

He makes far too much of the point of inherited debt. To whom are the orphans liable for the debts of dead parents? Do they inherit any rights or advantages as well as obligations? and how is the temporary proprietor to step in and control relations between kanganyes and coolies when everyone knows it is an affair of their own ancient custom and selection.

He says, however, that it has of late years been found impracticable to recover the money from those who are supposed to owe it, but the debt is passed from estate to estate. Where, then, is the hardship? The cooly is absolutely free. He passes on where he wishes; increases his debts by the further mortgage of his security,

but *doesn't pay it off*, so the writer says, on account of his inherited woes. Why, surely, the orphan's inheritance of debt has enabled him to recover twice its amount ere this! At least on the writer's showing. For the kangany also, the writer expresses great sympathy—for he is said to have neither money nor security (only an umbrella). Now really it becomes an interesting question: the kangani has nothing, the cooly only debts, and the orphans an incubus of responsibility enough to bring tears to one's eyes, if only one wasn't wondering again about the money itself! Who got it? Where is it? All consumed by those dead coolies. At this point I thought I had solved the problem in the manner desired by the author, but alas! he says "in olden days their debts were never more than could easily be repaid." So now, indeed, the writer on the "Labour question" has complicated matters and certainly cleared up no mystery.

Formerly the system was one of "Coast Advances"; it underwent changes by reason of the needs of new districts and inexperienced planters and it became simply advances, and the wily and "able financier," the Tamil kangany, financed his cash to his native village and his debit balance and obligations to his foreign occupation, and therefore, according to the sentimental author, the poor orphan didn't pay his debts but only increased them, and therefore he should be relieved of them altogether!

SIC.

NO. II.

October 23rd.

SIR,—Surely the present Labour Ordinance binds Planters down enough without asking Government for further legislation. Superintendents can now pay their coolies monthly or fortnightly if they think it is for the benefit of the estate.

It seems that the cry for a new Ordinance, comes principally from men who have only been working labour since tea took the place of coffee, and who are not in touch with their coolies and cannot manage them; these men must have some excuse for a short labour force and so they call for a new Ordinance to make coolies' monthly pay compulsory, fearing their labour might go to another estate when coolies are paid every other month.

Look at the scheme in another way; if a Superintendent likes, he can find out exactly how much each cooly owes for Coast Advances to his Kangany, and each payday could hand over a proportion of his pay, taking the balance for his monthly expenses; a cooly can easily live on R5 a month and pay for his rice out of this.

If the coolies are paid every month and there is nothing owing them, who is to be responsible for the Coast Advances, is each cooly to have a separate stamped advance account? The Kangany now keeps the coolies in a gang and sees that they are not cramped; why should he do this, or bring coolies, if he does not derive any benefit? Another item to be considered is the Tamil custom of hereditary debts, always practised on the Coast, would it be advisable for Ceylon to alter this; why not India first?—Yours faithfully,

"TAKE CARE."

LIBERIAN COFFEE AND COCOA,
RUBBER &c.

Dedana Etta, Oct. 25.

DEAR SIR,—It is an incredible statement appearing in one of the Madras papers, that Ceylon planters dissatisfied with the profits of tea planting, were running all over Southern India to select land to plant their old love, Arabian Coffee. Not ten

per cent. of the original coffee planters (proprietors) of the period when the decade began are alive or resident here. What is being planted in Ceylon is Liberian Coffee, and that timidly and quietly by those with little or no experience, and none of these care to run over to India for the purpose, as there is much land available for this product in districts where Arabian Coffee in its best days would not yield very profitable returns. The cultivation of tea seems best to thrive in the hands of Limited Companies, and the gradual sinking in value of the article will not alarm the shareholders even if the dividends per annum are only five per cent. Individual proprietors of medium-sized estates would prefer products giving larger returns, and Cocoa and Liberian Coffee estates are what we expect to see in numbers in a few years. The price of cocoa has fallen, but not yet to its former *normal* price, and its present average value has been maintained, since its fall, from the unaccountable and most certainly, unexpected prices obtained a year ago. Liberian Coffee promises not only to maintain its present very paying price, but there is every probability of the price for bulk increasing.

The cultivation of these products is slower than tea, and has hence been overlooked. There has been much planted out this year, and the present weather has enabled the filling in of vacancies to be successfully carried out. At this season of the year small plants are preferred, as they take root sooner and stand the drought that follows much better than larger plants. These latter do well generally in the South-West season. In low districts dalap cuttings or seedlings should now be grown as shade. By January, when by then they are well rooted, they grow vigorously during the drought that follows, seeking moisture from below. Some time back Mr. Munton drew attention to the Castilloa rubber, used as a shade tree in South America. These trees grow very tall, afford excellent shade, as they do not shed their leaves during the hot months and at the end of eight or ten years yield profits. The planting of Liberian Coffee this season is an advantage, as the plants are generally free from disease and take a good start, fitting them, for an attack in June—July. A nursery for the South-East is best started in March—the end of the ripening season. R. T. M.

COOLIES AND LABOUR LAWS:
IMPORTANT TESTIMONY.

Oct. 27.

SIR,—I was glad to see your correspondent "*Aberdonensis's*" letter in the *Observer* of 25th inst. My experience - and it has been a pretty large one—coincides entirely with his. To take the matter of "inherited debt," during the last few months I have been asked to take on a good number of coolies in small gangs of two or three, who had been paid off by me a year or two previously. In every case their debts had increased from R10 to R15 per head to from R40 to R60. The explanation of this is simple. The coolie knowing his value demanded from his Kanganey further advances under the threat of leaving unless he got them; that money he has simply squandered to the benefit of the proprietors of Arrack Taverns and Boutiques. As an instance of this, I may quote a case which I know to be true. On the recent Tee Vali, an Arrack Tavern renter in this district, who supplies arrack at the most to a group of not more than ten estates, acknowledged that he had sold arrack to the value of over R2,000 in three days

Some impulsive people have now jumped to the conclusion, that monthly payments will prove a panacea for all our troubles. A friend of mine, than whom no better or more practical planter exists tried them on taking up a large charge in another district, but was obliged to revert to his old system of three monthly payments as he found his labour force was becoming very unsettled. Heaven help us if Government are now to be asked to step in and compel us to pay monthly. Surely there has been enough legislation in recent years regarding our coolies, and does anyone for a moment suppose that were such a law passed, it would be anything but a dead letter in a number of cases. I have no doubt the same gentlemen who advocate the passing of the above law will shortly be clamouring for indentured labour, with all the necessary regulations and interference by Government.

The only way out of our present difficulties is to stop the system of bidding against each other for labour now in the country, and to endeavour to get more from India; but I must confess I see little chance of this happy consummation unless we Planters can be brought to one mind in the matter, and judging from past experience. I fear that will be a difficult matter.—I am, etc., M.

THE LABOUR QUESTION AND COOLY
PAYMENTS.

Gammadua, Oct. 27.

DEAR SIR,—One of the recommendations of the Joint Committee of the Ceylon Chamber of Commerce and the Planters' Association appointed to consider the Question of Coast Advances, was the adoption of "a system of monthly payment of coolies wages within say 35 to 40 days, and in any event to make payments every two months." As I had the honour of serving on that Committee and supporting the recommendation my experience in the paying of coolies monthly may now be of interest to "Tea" and your readers and be useful in discussing the Labour Question.

My first experience of paying coolies monthly dates back five years, the first payment of a single month's balance paid to all my coolies was in September, 1890, when the July balance of pay was handed them and since then I have had a pay-day monthly with the exception of the following months:—

April, August and December	..	1891
February, September and November	..	1892
March and September	..	1893
November	..	1894
September	..	1895

By special request of the kanganies the balance of pay then due, was held over till the following month and two months' balances were then paid together. To show that the monthly system of payment is favourable to the recovery of Coast Advances, I submit an abstract of the advances of three estates belonging to one group:—

During	Advanced.		Recovered.	
	R	c.	R	c.
1889	1,414	71	637	30
1890	977	81	1,271	15
1891	1,797	00	1,685	78
1892	1,715	25	1,679	41
1893	1,570	00	2,073	83
1894	1,897	50	1,809	46
½ of 1895	2,531	00	1,846	13
4 mons. "	1,417	25	690	53
	13,320	52	11,693	59

The average *daily out-turn* of coolies at 31st December 1888 was (taking 31 days in the month) 127 coolies. The average days for September 30th 1895 was 257 without weeding contractors' coolies.

Other three estates in my charge have no coast advance account and trifling sums advanced to the kanganies going or sending coolies to the Coast annually to recruit, are generally so small they are debited in the checkroll, and recovered in a month or two.

At first the kanganyes were rather opposed to the coolies being paid monthly, as they were afraid they would be unable to recover the debts due by the coolies, and they would not be able to repay their coast advances, and the system had to be introduced gradually. Experience has now proved that the coolies are not more inclined to leave the estate (or in other words bolt) than when the quarterly payment system was in force. For many reasons the coolies prefer the monthly payment of their balance and as a rule many of them know exactly how much they have to get; but about a "peranal" time they like having a little extra cash, and hence the request that two months' balances be paid together. According to the law as it is at present one runs a risk of losing his coolies by withholding the balance of pay due to them for a longer period than sixty days.

I do not think it would be advisable to ask Government to make monthly payments compulsory, that it might be beneficial to the coolies I admit; but it might also be very inconvenient some months both for proprietor and coolies were the system enforced by law; but so many planters are finding out for themselves the advantages of the monthly payment system that it will probably ere long be almost universal without the interference of Government. I understand that there are Managers of estates who pay their coolies monthly balances the following month, and find it beneficial to do so; but my reason for holding one clear month's balance in hand is, that should a cooly be in debt to the check-roll that month, the debt is recovered from the previous balance about to be paid, and tell him this has been done. While the coolies are being paid those who admit being in debt to their kanganyes, have by mutual agreement set aside from their pay, a sum towards the payment of the debt, and as a record of this payment is kept in the check roll, it can be referred to, should any dispute arise as to the amount recovered for the kangany. It is very seldom this has to be referred to, and as all recoveries of debt as a rule are made at the pay table, it is also seldom there is any squabbling over their debts at the lines. These recoveries made from the coolies, plus what can be recovered from the kangany's pay, go towards his Coast advance debt should that individual be in debt.

As to the debts due by the coolies to the kanganyes, let any planter attempt to bring a gang of coolies from the Coast through a paid Agent other than a kangani, and he will very soon find how coolies' debts mount up. It is not only the advances on the Coast, feeding and transport, but after their arrival on the estate there is the cumbly, cloths, chattypans and curry stuffs all go towards his debt before a day's work is done. Should he arrive in wet weather or at a feverish season he may be bowled over with fever, or if a lazy fellow, he may sham sickness and loaf in the lines for days and refuse to do any work. Rice has to be given him or he will soon be in a state he could not work. Or he may clear out within 10 days of his arrival, taking three or four of his companions with him, necessitating a further outlay of more rupees and coolies to search for, and when caught, bring them back to the estate. Being new coolies they are cautioned, that if they bolt a second time there is a method of punishing coolies in Kandy, which is graphically described; but even this has not always the effect of keeping them on the estate. Another attempt is made and getting clear away, more rupees are again dealt out and more coolies put on their track with instructions to go and find them. Ultimately they are discovered and brought back, and as they can give no satisfactory reason, if any, for running away, the master is compelled to make an example of them and to Court they are sent and receive the sentence of one month's rigorous imprisonment.

Under the presentable Administration of the Prisons and the system adopted for punishing offenders, not many coolies are likely to runaway a second time after they have had only one month's rigorous imprisonment.

Though it may appear that the services of a cooly doing his month in Kandy are lost to the estate they are not so, if at the expiry of the month the coolies are brought back to the estate; their experience

of prison life is related in all the lines before they have been 24 hours on the estate, and for a time at least it has a very restraining effect and induces a more contented feeling amongst the others.

If Superintendents would take the trouble to send crimps, and men found loitering on their estates, to be dealt with by the Court, and succeed in getting them one month, there would be less dissatisfaction, amongst the coolies, less bolting, more work done and less debt.

While this is being done, Managers or employers of Tamil labour should send their advances direct to the coast as far as possible and discourage their Kanganyes from taking on coolies with tundus. That there are occasions when it may be advisable to give money to pay up a debt due by relatives of one's coolies working on another estate, is admitted; but as a rule it is the readiness of the Kangany, backed by the Superintendent to pay up the debts as shown in these tundus that have been the means of adding to the debts and the curse of the cooly.

Break up, by discouraging, this system, and the cooly will settle down to his work and in most cases gradually pay off what he owes.—Yours faithfully,
JAMES WESTLAND.

COMPULSORY MONTHLY PAYMENTS.

Kandy.

Sir,—The *Observer* of 17th inst. contains a Report of the proceedings of the Dikoya Planters' Association which includes the result of a discussion on the Labour Question, which must be of great interest and importance to the whole Planting community, and it is very much to be regretted that the arguments adduced in favour of the resolutions carried are not published.

It seems to me that there is an obvious intention to carry, if possible, the set of resolutions in each District Association and that then, backed up by such a weight of authority, the 'set' of resolutions should be brought before the Parent body and, as full reports of discussions at the District Associations are very rarely, if ever, reported and published, those of the planters who do not attend District meetings (very many of course) will have no opportunity of hearing any arguments for or against the proposals. No harm, therefore, can be done by discussing the matter.

Two resolutions were passed by the Dikoya Association (A) claiming that the cooly shall not be allowed to quit service until his advances are paid off, and that advances shall be a first claim over his wages. (B) That monthly payment of wages shall be compulsory. Now, really, sir, can the District Association lend itself to such an inference as the first resolution involves. Can anybody assert that it is the practice for coolies to quit service without paying off their Advances? I don't mean to say it is never done. But out of our community say of 2,000 planters do you believe 50 can come forward at the P.A. meetings or admit that their coolies have quitted service without in some way or another paying their debts? As a "practice," is not the inference from the resolution wholly and entirely wrong?

As regards making Advances a first claim against wages, or up to a certain limit, I am not prepared to raise any objection. It would be a perfectly fair claim considering the advantages already held by the cooly for the recovery of his wages against the estate and other privileges he enjoys if payment of wages is long delayed and I should urge that advances whatever the amount should be recoverable by means of the Court of Requests as is the case with actions taken by coolies for recovery of wages. But this very fair and righteous claim is so manifestly just in itself that it might well be urged on its own merits and not tacked on to a set of resolutions. Our Planting Representative in the Legislative Council might well direct his and our attention to it when the amended Court of Requests Ordinance comes up shortly in Council.

Now the second resolution (13) regarding compulsory monthly payments, calls for unpleasant comment in its singular position.

If it had stood honestly (though mistakenly) alone, it could have been dealt with by itself, but from the way the "set" of resolutions is worded it reads as if the Hon. G. F. Walker thought he was making a concession to somebody. Which is it the Government or the cooly? and that in return for the Government granting the demand of the first resolution, be implied approval of compulsory monthly payments proposed in the second, now there is here. Something very wrong, for the 1st claim is not founded on the general practice among coolies and his 2nd claim if a just one should be granted without any *quid pro quo*. Why should any (supposed) concession be made. Moreover what is conceded?

Every planter in Ceylon may at this moment if he chooses pay his coolies monthly. Yet, it is no exaggeration to say that not 7 per cent of planters do it. Why not? Because, now, as in the past, it is found to have no advantage whatever; none to the manager for he has more trouble and recovers less of his advances at a time, and the same disadvantage meets the kangani also for same reason and on this account he is *compelled* to issue more advances for weekly requirement to his coolies, and also it is a disadvantage to the coolie because he gets less pay in his hand at a time. Mr. Giles Walker and others who agree with him will say the cooly is wrong and that it must be to his advantage and if he can't see it, he must be taught and made to see it by legislation. Curious how legislation, medical legislation, hopelessly failed in these directions years ago and, the cooly can't see it even yet!

Let the champions of monthly payments state the reasons for their belief—of several who have adopted the system, not one gives assurance that either he or his coolies are any better for the change.

The neighbouring coolies do not rush off in crowds to the gentleman who pays monthly to seize the advantages he is supposed to thrust on them. He is not better off than his neighbours, his advances don't seem to be less than his neighbour or better secured. But that is his own affair, let him pay monthly as every planter can if he wishes to. What I want to know is why should monthly payments of coolies be *compulsory*. Not long ago the leading planter in East Matale mentioned that his coolies had begged him to postpone paying one month and pay two so that for Tee Vali they might have more in hand. That gentleman, I believe, is also a great champion of monthly payments. It is presumed that he pocketed his principles and accommodated his coolies, but does this gentleman want legislation to prevent his meeting the wishes of his coolies and strengthen the backbone of such principles. Monthly payments, I advocate for all who wish, weekly even if they please, but not compulsory. I myself was requested by Sinhalese villagers a few months ago to keep 2 month's pay, yet there were people who once were paid every week.

J. M.

TEA FREE OF DUTY IN WESTERN AUSTRALIA.

Colombo, Oct. 28.

SIR,—I beg to inform you, that I have received advices from Western Australia, that there is now no duty on tea entering that part of the Australian Continent.—Yours faithfully,

E. B. CREASY.

[Well done, the youngest Gold Colony!—ED. T. A.]

THE LABOUR QUESTION.

Kotmalie, Oct. 31st.

DEAR SIR,—It is difficult to understand what "Well-known Planter" would have us do unless it be to destroy our advance notes, write off all outstanding advances and give the cooly a fresh start with a clean sheet and compulsory

monthly payments. A very drastic remedy most planters will admit and worthy of the strongest of rank Socialists.

How long might I ask "Well-known Planter" would such a happy state exist were each cooly and kangany relieved of his indebtedness to the estate? What would be the consequence of such action. I venture to say that the advance question would be in a far worse case six months afterwards than it is at the present time. Favourite estates would be overstocked with labour, while estates with new clearing work or long and unwieldy transport of tea chests, be deprived of the requisite labour and again have to resort to advances or if advances were illegal, offer increased wages which would be still more damaging the tea industry.

Coast Advances, we must give if we are to continue drawing on India for our labour supply. We must therefore have kanganies to recruit and pay out our advances.

The Coast cooly demands, and rightly so I think, an advance of money to leave with relatives who have been depending upon him for support, and this probably accounts to a great extent for the many inherited debts which we hear of among our coolies.

The "tundu" system is almost solely to blame for any difficulties we have with our labour force. We did very well without it twenty-five years ago. It is however an excellent thing in itself; but is in every instance abused both by planters and coolies, both using it at times as a threat when any difference, serious or trifling, arises.

It is this indiscriminate and thoughtless giving of tundus that has increased the indebtedness of our coolies, and the evil becomes worse each year as the busy plucking season comes round, and I see no hope of a better state of affairs till some combined action is introduced in regard to the issuing of tundus. Only the other day two gangs each of six coolies were engaged on tundus for R380 and R355 respectively for an estate in this district.

My experience of the cooly is that he prefers having his pay every two months. I have tried monthly payments and never found them satisfactory. On one occasion the money was in the bungalow to pay for one month and I was asked by the coolies at muster to return it to the Chetty and wait till they could be paid for two months.

Monthly, or even weekly payments will not keep Ramasamy out of debt. The greater his indebtedness, the more important a person he considers himself. Were he paid every Saturday, the whole in most cases would go on Sunday and after the manner of the English miner he would live on credit till the next payday.

A. F. S.

CEYLON TEA IN AMERICA.

DEAR SIR,—It was with great interest, I read Mr. MacKenzie's letter appearing in your columns of the 5th inst., regarding advertising in the journals, etc., in the United States.

I think that in your leader, you have sounded the key-note of success. Popular Lectures on the subject of Ceylon and Ceylon Teas, will, without doubt, be one of the best means of attaining the end in view. It is a well-known fact that lectures are very much appreciated by Americans of all classes.

I know of no more interesting series of lectures than the following would be:—

First—Ceylon, The Spicy Isle, Illustrated by Limé Light Views,

Second—The Products and Resources of Ceylon, Illustrated.

Third—The Rise and Progress of The Ceylon Tea Industry.

Fourth—The manufacture of Tea in Ceylon, compared with that in China, Illustrated by Line Light Views and Diagrams.

Fifth. The value of Tea as a Dietetic, and the superiority of Ceylon Teas over China as such, owing to difference in Chemical composition.

Such a series of lectures could be adapted to suit all classes of Society from the most scientific, to babes and sucklings; yet all the while most interesting.

One important point about lectures is that you could give your audience, samples of the articles which you were pushing either in the form of a really good cup of Ceylon's finest tea to wash down the substance of the lecture, or in the shape of a small packet with which they could prepare an afternoon cup for themselves after being instructed by the lecturer as to the proper method of preparing same. Pamphlets could also be distributed bearing the names and addresses of dealers in Ceylon teas in each town where the lectures were delivered. Many would willingly take up the job to stump the States in the interests of Ceylon; in fact I would not mind the job myself for even less than is quoted by Mr. McKenzie for advertising in one of the American Journals, provided travelling and other expenses were paid, and I think I could make some impression on the Yankees, and get them to turn from their "evilways" of green tea drinking to the more healthful Ceylon Broken Pekoe or Pekoe, I am etc.

EXPERIMENTUM CRUCIS.

[We should favour rather, one good lecture in each town. Americans are too busy a people to go in for a course by the same lecturer.—Ed. T.A.]

VARIOUS PLANTING NOTES.

TEA EXPORTS.—It is an interesting fact that if China keeps this season to a little less than her usual tea export of recent years, her total exports will almost exactly correspond with those of India and Ceylon. Thus the revised estimate for India gives 138 million (instead of 140½) of which it is estimated 124 million will go to the United Kingdom. The Ceylon exports are not likely to fall below 92 million and although all the Indian may not be shipped, the aggregate for the two countries cannot fall far below 230 million lb. Now this is very near what we estimate for China Exports:—

Russia say	90	million
U. Kingdom	45	„
N. America (besides 45 million Japan's)	55	„
Thibet and Central Asia (Brick tea, etc.)	15	„
Australasia and Cape... ..	14	„
Other places... ..	11	„

230 „ lb.

India 138 million + Ceylon 92 million = 230 „ lb.

TEA is the most encouraging and most profitable culture in Ceylon, writes a Ceylon journalist, who, though his name is Ferguson, which suggests North Britain, does what is generally supposed to be purely an Irish practice—to wit, he perpetrates a "bull," for he includes precious stones and plumbago under planting enterprises. With respect to plumbago, which is the only Ceylon metal (mineral rather) of commercial importance, the trade therein is not very prosperous, though between 300,000 cwt. and 400,000 cwt. thereof are shipped annually. Most of it goes to the United States, London coming next, while France and Germany have begun to take increasing quantities in direct shipments. Ceylon has been long famous for its precious stones—rubies, sapphires, cat's eyes, and moonstones—and these continue to be freely found. The digging and selling are in native hands, and the output is largely carried away by visitors or dispatched in registered postal packets. Mr. Ferguson, omits to mention that the natives are in the habit of selling inferior stones at fancy prices to travellers who know nothing of the value of gems, and think they

are getting bargains. This fact possibly justifies the inclusion of the trade in stones among the "planting" industries of the island.—*Financial Post*, Oct. 22.

INDIAN TEAS FOR THE COLOMBO MARKET AND THE CEYLON IMPORT DUTY.—It is a little comical to read the letters on our back page in the light of actual facts:—(1) is it, or is it not the fact, that Ceylon produces some of the very worst, as well as some of the best teas under the sun? [To blend our good teas even with China or Java, much less Indian, teas would not be so bad as with some of the stuff occasionally sold in the Colombo market and twice rejected as unfit for human food at Melbourne.] (2) Do not the Ceylon tea planters live, to a great extent, by the blending trade? What are all the great tea sellers in London and the Colonies but blenders? How is our tea getting into Russia but by blending? Actually, Ceylon and China teas are at present sent to London, blended there and then sent back to Australia! Can it be said that the North Indian planters have not worked hard to make their teas known with their Calcutta and London Tea associations? and yet why are they not afraid to leave Calcutta an open port, although several million lb of China teas enter there for blending. Finally, it is absurd to suppose that the grand Port of Colombo, is to be shut off from its legitimate trade, as the port for Southern India and as the distributing port for Australasia. We are told that one solution of the difficulty is for Government to build large Bonded Stores for blending purposes. If so, the sooner they are built the better.

THE CEYLON FORESTER for October is a useful number albeit mainly taken up with a review of Mr. Brown's Forest Report for last year. It would be well if the Department's experience so far, of the four or five best timber trees to cultivate at different elevations, were put briefly and clearly before our planting and agricultural community. In reference to the Sessional Paper called for on the Department, by Mr. Coomaraswamy, Tamil M.L.C., we have the following satisfactory criticism:—

This return, as at present compiled, shews a loss of R67,833.70 for the 5 years, but, as the Conservator points out, this is not the true state of the case. In his remarks we notice, however, that the Conservator has not credited the department with the increased value of timber in depôt from January 1890 to December 1894, which amounts to R62,901.61, nor does he mention under the head of capital, stores, &c., as we believe this includes the sawmill at Batticaloa, which cost about R10,000, we think this item might also be included in capital expenditure.

The figures are as follows:—

Total Expenditure	R2,199,635 37
Deduct Capital Account	200,826 74
	<hr/>
	R1,998,808 63

Total Revenue	R2,131,801 67
Free Grant	42,005 18
Value of Timber in depôt on Jan. 1st, 1890	} R196,732 00
Value of Timber in depot on Dec. 31st, 1894	
Increased value of Timber	62,901 61
	<hr/>
	R2,246,708 46

In favor of Department.. R247,899 83

The above figures shew that so far from the Forest Department not paying, the yearly average revenue derived is equal to R49,579.96 for the last five years, which, considering the increased protection given to our forests should be considered a satisfactory result.

Notes on Ceylon Birds are continued,

THE NATIVE HOME OF COFFEE.

When we are enjoying a fragrant cup of coffee. It is pleasant to reflect that there is one country, though one only, where the coffee plant grows and flourishes without cultivation. This country—according to an Italian traveller—is Kaffa, in South Africa,* from which town, it is surmised, the plant took its name. “I affirm what I have seen,” says this traveller, “namely, that Kaffa is the only country in the world where coffee grows spontaneously, comes to maturity, and produces perfect fruit without any cultivation at all.”† At the present day, he continues, there is not a house in Kaffa which does not possess a piece of ground planted with coffee, and he himself, during his two years’ stay in the place, had about three thousand plants in the ground, but that which grows spontaneously in the woods, producing without artificial means, was always esteemed the best. And, in fact, rich people, in order to have good and fresh coffee every morning, keep a piece of ground apart in their farms planted thickly with the forest trees, beneath which the plant thrives and bears better and more aromatic fruit than when in the open. Here the berries are gathered daily for the family consumption. Another advantage mentioned with regard to forest-grown coffee is that it is never subject to any malady, whereas the other suffers from a variety of diseases. Again, the wild plant germinates in a fortnight, while the domestic one does so after several months only. It is usually believed that there are various species of the coffee plant. Our informant, however, is of the opinion that there exists but one plant, which, nevertheless, according to the different methods of cultivation, undergoes a certain change. As, for example, in the wild and domestic plant; and, again, in that which is favoured by climate and soil, and that which is not. Much also depends upon the cultivator. The same species growing wild produces small berries, which become double the size when cultivated. It is also impossible, we are reminded, that one harvest can produce nothing but fine full berries; consequently the bad and the good are mixed together for sale, or sold separately at different prices by the coffee merchants. The small unripe grains have neither taste, nor smell, nor form. An apparent variety in coffee is likewise produced, according to the time employed in and the manner of gathering the grains at harvest time. Coffee requires several months to come to maturity; in Kaffa ripe berries begin to appear in September, and are fit for gathering in November. Any small or unripe berries remaining are equally gathered and given to the servants or sent away for sale. The Arabians are reported to be the best coffee cultivators, because they know how to gather the grains at the most favourable moment, and take great care in sifting and cleansing them to send them in good condition to the markets.‡ Consequently, our traveller maintains that the good reputation that Moka coffee has maintained is due solely to the care referred to, inasmuch as the products of this country do not differ in the least from that which is sown and cultivated in other parts.

What a pity it seems, then, that in a country where coffee comes to perfection in a wild state

there should be neither roads nor means of transport for converting it into an article of commerce. These necessary aids to business are, however, wanting in Kaffa, it is said. Neither do they exist even for the interior of the African towns, or for the regions of the Oriental coast. Consequently the production is a source of little or no profit to the country, whereas it might be one of great gain to the inhabitants. The only purpose for which it is utilised is for domestic use, as everyone is accustomed to this beverage. If by chance the provision should not suffice for one family, it is easily made up for by a neighbour, in return for a measure of corn. The great ivory, musk, and slave merchants purchase a certain quantity, but only sufficient for their journey, or for presents to their hosts *en route*, or to obtain a free passage over one of the frontiers, never for selling. Less important vendors, who pass through the country selling wax, coriander, and other small wares, buy it for selling again, but in such limited quantities that no one in Kaffa cultivates and gathers in the berries in the hope of gaining anything by such transactions. And if, in time of war, even these small itinerant merchants fail to pass, the cultivators, not knowing what to do with so much coffee in the house, do not trouble to gather the grains when ripe. Another authority on this subject, M. Massaja, confirms the above statements, and, basing his opinion on the traditions of the Kaffas and the Arabs of Moka and Jemen, says that this plant, which the greater part of botanists assert to be a native of Arabia, comes instead from Kaffa, whence it takes its name. “And this,” he continues, “appears to me probable, as Kaffa and the adjacent territory are, as far as I know, the only places where the coffee grows so spontaneously, and with such force of vegetation in the woods. And the plants which vegetate under the shade of the great forests are, according to the natives, of excellent quality, and not subject to any of the diseases which generally attack those which grow in the open country. How far the assertion of the Kaffas is true, says this writer, I cannot venture to say; it is a fact, however, that rich proprietors, in cultivating this shrub near their dwellings, always select the most shady spot; and if trees are scarce, they have them planted in a manner so as to form small forests.

There is not a house in Kaffa which is not surrounded by coffee woods or plantations, the products of which always surpass the quantity necessary for the family’s consumption. When the coffee is fresh, the natives eat it fried with salt and butter, or make an infusion of it, as we do. The plant is propagated in two ways in Kaffa—by transplanting and sowing. In the former case, they generally wait for the rainy season. Then, proceeding to the forest, such plants as have taken growth in others half fallen to the ground, vegetating to the detriment of the larger shrub by robbing it of its nourishment, are taken up. Care is however taken not to loosen the earth adhering to the young roots, which are replanted in a free spot, in holes about twelve inches deep, so that not more than nine inches of the plant remain above ground, and in a slightly slanting position. The sowing of coffee takes place, as soon as the ripe fruit is harvested, in ground freshly ploughed and well manured. After one or two years, the young plants are transported to a spot where they will remain till the time of production is finished. A little while after the transplanting or sowing, the Arabs take care to exterminate all weeds and useless growths. The Kaffas, however, do not trouble themselves about

* No—rather North-East Africa or Abyssinia.—Ed. T.A.

† So long ago as the early “thirties” a Mission from Bombay to the Court of Abyssinia described part of their journey from the Coast as being under wild coffee bushes laden with berries.—Ed. T.A.

‡ This is absurd.—Ed. T.A.

any weeds, except for the plants near their habitations, the result being that the weeds and parasites, increasing with all the force belonging to intertropical vegetation, often finish by suffocating the whole plantation. In Kaffa, as we are told, the coffee shrub reaches a height of from three to five yards. It begins to bear fruit, as in Arabia, about a year or two after transplanting, and three or four weeks after sowing. In the fifth or sixth year it attains to the maximum of production, and becomes sterile in the sixteenth or seventeenth year. In the Antilles or in Venezuela the plant bears fruit till the thirtieth or fortieth year. It is probable, however, says our informant, that if the plants were pruned at the base they would bear fruit in Kaffa for another five or six years. Contrary to the former authority, already quoted, Mons. Massaja says that the berries of the wild plant are somewhat larger than those of the cultivated ones; sometimes the pod contains but one grain, which, being free to develop itself at pleasure, takes a form almost round, and is called Moka by the coast merchants from the resemblance it bears to the coffee of Jemen. In Kaffa and the adjacent country the coffee selected for the consumption of the great dignitaries and the Court is preserved for two or three years in a dry place, because the older it is the more coffee develops its aroma and strength. That which is destined for commerce is sold before it is quite dry.—*London "Standard,"* Sept. 20.

THE PUTUPAULA TEA ESTATE CO. LTD.

At the annual general meeting held by the shareholders today, a dividend at the rate of 10 per cent per annum was declared:—

(From Directors' Report.)

Tea in bearing	391	Acres
" " partial bearing	30	"
Liberian Coffee	10	"
Forest	90	"
Grass &c.	25	"

Grand Total 546 Acres

The Crop amounted to 132,389 lb. Tea (against an Estimate of 110,000 lb.) and 77½ bns. Liberian Coffee. The nett average sale price of the former was 47.36 cents per lb.:—The latter realised R482.65. The net profit for the year amounted to R22,635 16, and the Directors recommend a dividend of 10 per cent for the year, carrying forward the balance R2,635.16 to the current year's accounts. A sum of R1,567.01 was spent in manuring a portion of the Estate, the benefit of which will be felt for a year or two, but the Directors decided to include the entire amount in the season's expenditure.

A small Down-draft Sirocco was purchased during the year, the cost of which, R3,520.65, was added to Capital Account. A further sum of R1,278.66 was spent in putting the existing Machinery in good order, and therefore it is not thought necessary to write off anything for depreciation this year, the property being worth more than the amount standing at the debit of Machinery account.

A sum of R1,500, has been allowed for improvements and repairs to the Superintendent's bungalow, and debited to capital account.

The estimated crop for 1895-1896 is 140,000 lb. Tea, on an estimated outlay on working account of R32,390. In addition to this expenditure, a further sum estimated at R9,110, will be spent in extensions, buildings, and manuring.

VARIOUS PLANTING NOTES.

TEA BULKING ON ESTATES.—With reference to the remarks of the *Grocer* on this subject, — see elsewhere—would it not be possible for our London contemporary to get the information and publish the marks of offenders? The fact of a

threat of this kind would lead to greater care and it might be found that repacking in Colombo (after a local sale) was to blame.

THE NEW DIMBULA COMPANY, LIMITED.—The Shareholders in this Company may well be congratulated on the Report which the Directors present, as given elsewhere. It is particularly satisfactory to see the "C" shares coming in for a good dividend after a long period of waiting. The Company has undoubtedly got a valuable property and it is admirably managed.

THE OLD DUMBARA VALLEY will yet be a grand coconut planting district, a correspondent thinks. He has seen "over 1,000 acres in coconuts, on one property—a very wise planting. We'll live to see all the Valley a coconut grove yet—though cacao may still go on for a number of years, but the lack of moisture is against it and so can't compete with Trinidad if prices are to rule the same."

COOLIES IN COORG.—A writer in *Planting Opinion* says:—It is estimated that Coorg gives employment to at least 30,000 Canarese coolies in addition to the local labour and the labour from the coast. Of these Messrs. Matheson & Co., on their 7,000 acres in the Bamboo, employ 5,000 or thereabouts from six to eight months of the year. The 30,000 coolies, with their maistries, draw some 12 to 15 lakhs per annum in wages very nearly the whole of which eventually reaches Mysore either in payment of grain &c., or as surplus income which the coolies annually take with them to their country. The prosperity of Mysore is thus largely contributed to by the province of Coorg.—*M. Standard.*

THE NEW RUBBER TREE (*Sapium biglandulosum*) which Mr. Robert Thomson found to be indigenous in Colombia, South America, at elevations of from 6,000 to 8,000 feet, is one about which we should like to hear some more and to see the seeds made locally available through Hakgalla as soon as possible. We are quoting Mr. Thomson's interesting Report on coffee, cacao, cinnamon &c., as well as rubber in full into our monthly periodical; but meantime may mention that thousands of bales of the rubber have been exported from Colombia, but Mr. Thomson does not give the prize realized. He states however, that in a plantation formed of this rubber tree, the trees grew rapidly—trunks a foot in diameter in 6 years. It should just be the tree to try high up in Ceylon. Respecting the genus, we may quote from the "Treasury of Botany" as follows:—

SAPIUM—A genus containing about a score of trees or shrubs of the order *Euphorbiaceae*, found in the tropics of both hemispheres, and all of them yielding a milky juice, which in some is very acrid and oven poisonous. The leaves resemble those of the willow, the poplar, or the laurel, and at their point of union with the stalk are furnished with two round glands; while the small greenish flowers are disposed in terminal spikes, the lower portion bearing the fertile, the upper the sterile flowers.

S. indicum, a widely distributed eastern species, is known under the name of Boroo in Borneo, where, according to Mr. Motley, the leaves are largely used for dyeing and staining rotang of a dark colour. The acrid milky juice produces a burning sensation like that from a capsicum. The young fruit is acid and eaten as a condiment, while at the same time the fruit is one of the ingredients used for poisoning alligators. The ripe fruits are woody trilobed capsules, about an inch across, with three cells, and one oily seed in each.

The Milkwood of Jamaica *S. laurifolium*, receives its name from the milky juice which abounds in the stem, and is a source of annoyance to sawyers and others when the wood is green. *S. salicifolium* affords in Paraguay a bark which is used instead of that of oak for tanning. Most moderate authors unite this genus with *Stillingia*, from which there are no reliable characters to distinguish it. [A.A.B.]

CEYLON SOILS AND MANURES.

In the year 1877, under an arrangement with the Ceylon Planters' Association, Mr. John Hughes, F.C.S., the Analytical Chemist visited Ceylon, and after touring through all the most important districts, undertook the work—lasting over three months in Colombo—of analysing the country's soils and the more usual manures, the permanent outcome of which labours was a goodly little guide-book of 150 pages.* We have recently been looking over this book, and we find that although it was written in the interests of coffee before the era of tea, it must, in the nature of things, be quite as valuable for the tea planter as it was for the coffee planter. Not that we ever heard of any sustained interest following its publication in coffee days: but that was not the fault of the book, but rather of the despair and losses which leaf disease caused to develop and fall upon all so rapidly after that date, everywhere in Ceylon. But now times are changed. In place of advancing despair, we have the strong forward march of prosperity and confidence; in place of a decaying staple over a limited area, we have a paying product spreading over an unlimited area of production, which cannot be all alike rich and fertile. It, therefore, seems to us that this book by MR. HUGHES ON SOILS AND MANURES will be found to be more valuable to the tea planter than, under adverse circumstances, it ever proved to be to the coffee planter. For it treats not only of the soils of many districts and well-known estates, but of the manurial values of all the available fertilizers ordinarily used. Such, for instance, as castor cakes, and other miscellaneous cakes, linseed, coconut, cotton-seed, bones, fish and compost. It teaches the use of lime and instructs all about limestone, calcareous sand, granitic limestone, gas lime, wood ashes and cattle manure and pigs and oxen, and how to feed them.

The fact that tea flourishes wherever coffee grew, as well as in places where coffee would not grow, is sufficient proof that all that was good for coffee must be good for tea, and any tea planter of a practical turn desiring a trustworthy guide in scientific cultivation cannot, we think, afford to be without a copy of this important little work (along with Mr. Cochran's Manual) bearing exclusively as it does upon Ceylon estates, soil, and climates. In his general remarks Mr. Hughes says:—"Bones, cake, and superior kinds of fish-manure are the materials which are best calculated to be economically used as fertilizers; also composts whenever the estates are sufficiently near a railway to allow of the application at a moderate cost." This broad rule applies equally to tea; for the cost of carriage to the estate, and distribution over the fields of the estate, must ever be the first items to consider after the cost of the article itself. How to discriminate in the selection of suitable fertilizers is a very important part of a planter's duty. Doubtless cattle, stable and line manures will still be the planters' best friends, but on a large estate they go such a little way that other fertilizers must be thought of, and no better guide in their selection than Mr. Hughes' book—supplemented by Mr. Cochran's Manual—can be got. We may add a couple of passages illustrating the usefulness of Mr. Hughes'

little book. On the use of "Lime," which in some localities is available for plantations and which can always be obtained on railway trucks from the sea-side as burnt coral, Mr. Hughes writes on page 30:—

THE USE OF LIME.—During my tour, I was very much astonished at the small value apparently attached to the use of burnt lime, prepared either from coral or from some of the numerous local deposits of magnesian limestone, which very fortunately occur in irregular masses interspersed among the prevailing granite formations of the Island. At home the value of lime upon all arable soils is so fully recognised by practical agriculturists that it would be unnecessary to enter at any length into a discussion of its merits. At the request of the Planters' Association I addressed a short note upon the use of lime in some form as a desirable manure for coffee, and I have reason to believe that it will in future be much more extensively employed.

Lime is a necessary constituent of all permanently fertile soils, for it is a requisite element of the ashes of plants. It assists in rendering both the organic and inorganic portions of soils available as plant food. On all flat land rich in organic vegetable remains, lime will be found especially valuable for improving the physical as well as the chemical condition of the soil. Sir Samuel Baker in his book ("The Rifle and Hound in Ceylon") mentions in reference to Nuwera Eliya, that "an absence of lime in the soil, and the cost of applying it artificially prohibit the cultivation of all grain, and restrict the produce of the land to potatoes and other vegetables." The analyses of upwards of 50 samples of Ceylon coffee soils drawn from different estates, would incline me to think that the great huntsman need not have limited his remarks to the neighbourhood of Nuwera Eliya, when speaking of the poverty of the soil as regards lime.

The difficulty of applying lime artificially is one which is fast disappearing under the annual extension and improvement in the means of transit; good roads, railway extension, and plentiful labour supply, will soon enable the planter to obtain burnt lime at a moderate cost, say 1s. per bushel, delivered on the estate.

I am told that ordinary burnt lime applied at low elevations (by which I assume anything under 2,000 feet) has been found too stimulating. This fact should rather be taken as a positive proof of its quickening efficacy at once indicating the powerful action upon the previously dormant qualities of the soil. With the alternations of heavy rainfall, followed by tropical heat, the effect of burnt lime, naturally is very powerful, so that caution must be used, and a far smaller dose applied than would be considered sufficient according to English modes of application.

Also on "Cattle Manure," the other nearly universal fertilizer, albeit not always in sufficient quantity Mr. Hughes on page 90 has the following:—

CATTLE MANURE.—It is quite unnecessary if not superfluous to say anything in favour of this manure, its merits as a general fertiliser for all crops has been long since determined, but there are one or two points connected with its production and subsequent use, upon which a few remarks may be made. Ferguson's Directory, 1878, contains a very able article upon "The true way to keep Cattle for Food and for Manure." The writer, who is evidently an experienced planter, states that "Ceylon is perhaps the only country where manure is the sole end and object of stock-keeping, and Ceylon is a most fortunate country if the operation will pay, even when coffee is above 100/ per cwt." The author adds: "there seems to me but one solution of all these complications, and that is, to make the stock pay for their food in beef, and have the manure over and above." Certainly this is the way to make manure profitably; but can it be done? and if it cannot, then does it pay to keep cattle? Doubtless this question has been seriously and anxiously considered over and over again by planters, who have at length come to the conclusion, namely, that of the two alternatives, it is decidedly the better.

* Special Report to the Ceylon Planters' Association by John Hughes, F.C.S., Fellow of the Institute of Chemistry of Great Britain and Ireland—to be got at "Observer" Office book-store, price v.p.p. R1.50 post free.

Unfortunately, however, in too many instances, such manure, which has entailed a large outlay to make, is allowed to remain several months before being applied. Large sums of money have been spent by proprietors in the erection of expensive cattle-sheds, in the purchase of cattle and cake; and yet, when the manure has been made, it is left rotting in a heap, sometimes entirely exposed to the combined action of sun and rain, and nearly always liable to depreciation by drainage. I regret to state it, but frequently during my tour did I notice a dark stream wending its way from the manure heap to the nearest watercourse. It is unnecessary to point out that such dark fluid contains most valuable fertilising constituents. Voelcker, in his capital paper on "Farm-yard Manure," mentions that the drainings of dung-heaps are more valuable than the urine of domestic animals, such as the cow, horse, pig, &c. Coolies probably dislike carrying manure for many reasons, and it requires considerable energy on the part of the resident Superintendent to carry out this application of cattle manure at regular and frequent intervals.

TEA IN AMERICA.

NEW YORK, Oct. 9.

There is no improvement in the demand for invoices. New crop Moyune Greens are here and show very good cup quality, but in style of leaf are a trifle deficient. They bring very high prices, owing to small supply. Low grade Japans are very firmly held; also low grade Blacks particularly Formosas. On everything else it is a buyer's market. India and Ceylon tea is growing in favour. The aggressiveness and persistency of the campaign to introduce these teas is bearing fruit in an enlarged demand. One cannot help but admire the pluck and courage of Ceylon and Indian planters in pushing for a market in this country.

Today at noon the Montgomery Auction and Commission Company will sell 8,219 packages of teas, viz:—817 half-chests Moyune, new season's 3,508 boxes Pingsney, new season's; 83 half-chests Japan, new season's; 489 half-chests Congou, including new season's; 79 packages India, Java and Ceylon; 510 half-chests and boxes Amoy; 625 half-chests Foochow; 2,108 half-chests and boxes Formosa, including "Fancy" invoice, seasons 1895-96.—*American Grocer.*

TEA AND ROADS IN THE WYNAAD.

CALICUT-GUDALUR ROAD.—Extract from letter from the Honorary Secretary, Wynaad Planters' Association, to the Chief Secretary to Government dated 24th September 1895 to which no answer has as yet been received.

With regard to para 6, the Executive Engineer states:—"With regard to the coffee industry I believe that many of the estates have been abandoned and that the traffic along these roads is small and light compared to that anticipated when the improvements to these roads was first commenced." I am again instructed to question the accuracy of this statement. As a matter of fact the great abandonment of coffee estates occurred before 1885 when very low prices for their produce prevented planters from coping with leaf disease. In 1885 the price began to rise again and since then we doubt if there has been any falling off in the Coffee trade (except yearly fluctuations) and at the present moment the abandoned coffee estates are gradually being planted up with tea (as has been done so successfully in Ceylon) and prosperity is fast returning to the district.

In para 7 of the Executive Engineer's report he says:—"I do not think they would have much difficulty in maintaining these roads, now that they have been thoroughly made in an efficient state for light traffic." We would point out that the Executive Engineer speaks only of light traffic and he makes no mention of the very large timber trade which has sprung up since the road was constructed from the foot of the ghant [28th milestone] into Calicut which can certainly not be termed light traffic.

We venture therefore to submit that the statement of the case by the Executive Engineer, West Coast Division, is not verified by facts and we further venture to state that the circumstances in existence when the road was commenced are inexistence now, and that the traffic along the road has not diminished during the last few years and will now steadily increase owing to the tea trade.

ECHOES OF SCIENCE.

The American "snow plant of the Sierras" (*Sarcodes sanguinea*), which rears its thick subtropical spike of red flowers out of the snows of the mountains is, according to Mr. Meehan, an American physiologist, who has specially studied it, not a parasite (like the *Balanophores*, which it resembles), but a saprophyte: that is to say, it is nourished by dead organic matters. It is an annual, germinating on the radicles of conifers, but afterwards drawing its food from the ground, into which it thrusts very deeply.

Ladybirds are sometimes killed by persons ignorant that they are a good friend to the gardener, because they eat small vermin. The dragon-fly, or "needle case," is another useful insect, which is killed in some districts under the belief that it has a sting. He is an enemy of house and other flies.

Mr. Walter Hough recommends the following composition for preserving specimens of natural history from the attacks of insects:—570 grains of a saturated solution of arsenic acid, 570 grains of essence of petroleum, 140 grains of alcohol at 95° of proof, 1 grain of phenic acid, and 1 grain of a 10 per cent. solution of strychnine.—*Globe.*

Dr. Backhaus's artificial human milk is cow milk carefully and cleanly collected, then fermented by rennet. The serum produced is sterilised and cream added according to the quality of "human" milk required. Dr. Backhaus strongly recommends dairies to sterilise their milk before sending it out to customers. To show the importance of cleanliness in preparing milk, Herr Backhaus states that the inhabitants of Berlin consume 300 cwt of cow-dung with their milk every day.

Some of the shade trees in American cities are being killed by electricity. American electricians are far from being as tidy and scientific in their operations as British or Continental ones, and it is common enough for them to run wires through the trees. The result is that in wet weather the electricity escapes from the wire and destroys the tree. On the other hand, weeds are now killed on American railway tracks by watering them and giving them a powerful shock of electricity.

THE MERGUI PEARL FISHERIES.

As a result of the report made by the Queensland expert on the Pearl Fisheries in Mergui, a batch of thirty Japanese pearl fishers have been engaged by the Burma Government for employment there. The revenue during the past year from this service was R29,247.—*S. P. Press.*

TEA IN WYNAAD.

Some correspondence has been taking place in *Planting Opinion* concerning the cost of production and the yield per acre of coffee and tea. A gentleman, writing over the *nom-de-plume* of "Wynaad," stated that in that district planters get 600 lb. per acre and can put the tea on the London market at 4d per lb. "Not quite a Novice" now writes, in a doubting spirit:—If this is so, Wynaad planters

"would do well to go in for some advertising, if they want to boom their district. The figures given by 'Wynaad' are until now unheard of in the history of tea." Our contemporary also observes that the figures are astounding. Be this as it may, we know on reliable authority that "Wynaad's" figures are well within the truth. By the way, *Planting Opinion* evidently does not possess a copy of Mr. Standen's excellent essay on "Tea Cultivation in the Wynaad," otherwise it would never have appended the foot-note it did. Our Coonoor fortnightly contemporary is doing excellent work for the planting industry of Southern India in collating planters' views on different subjects, but before it expresses opinions on the capabilities of any district it should make itself *au courant* with the latest information on the subject. In South Wynaad there are fields of tea which have given 1,200 lb. to 1,500 lb. per acre, a fact which has been stated in these columns more than once. The only reason why the Wynaad is not for its acreage one of the biggest tea-producing districts of the day is that it is unknown. Let it be boomed and a change will come o'er the spirit of the dream.—*M. Mail.*

DRUG REPORT.

(From *Chemist and Druggist.*)

London, October 24th.

CAFFEINE—The market remains firm. Sales were made by second-hand holders at 20s per lb, spot terms, in the course of this week. The manufacturers have booked orders for the total of their capacity up to December. Some short time ago they were still selling at 18s per lb for November delivery, but at that quotation no orders could probably be executed at present. For December delivery also the makers will only sell small quantities.

KOLA-NUTS—Fair West Indian nuts sold this week by auction at 10d per lb. Privately about 1d advance is asked on the recent rates.

QUININE tending somewhat easier. Several small sales of German bulk, B and S or Brunswick brands, are reported from second hands at 1s 1½d per oz. A parcel of 5,000 oz *Fabbrica Lombarda* in bulk has been sold at 1s 1d per oz. The market closes rather dull, with sellers of the usual brands at 1s 1½d, but no buyers.

VANILLA Mail reports from Port Louis, Mauritius, dated end of September, state that the market is bare of cured vanilla. No business has been transacted during the month. It is stated that the coming crop of Mauritius vanilla will be no less than 60 tons smaller than the last. A considerable business has been done privately in the last few days. Fine beans are very scarce, and high prices are asked. Good Mauritius, 6 to 7 inches, have been sold at 28s per lb. A parcel of Australian vanilla showing long but rather foxy shrivelled beans, which was bought in at the last auctions, has since been disposed of at 21s 6d per lb. Mexican vanilla, a variety not very often seen on our market, was bought in at the last sale at 40s per lb, which, however, must be regarded as a nominal price.

TEA BLIGHT, AND LEGUMINOUS PLANTS.

Dr. Watt announces a discovery which may possibly prove of importance to the tea industry. He found that tea gardens over which *Sa* (*Albizia stipulata*) trees had been planted suffered far less from insects and mites than gardens where this was not the case. He writes:—"It soon had demonstrated to me that, far from this comparative immunity from blights being due to the shade afforded by these trees, the quality of the tea was distinctly lowered, though the volume afforded was increased. The *Sa* tree belongs to the group of Leguminosæ that according to the researches of investigators in Europe, should not produce the beneficial root tubercles discussed in the appended pamphlet. I was for a time puzzled to account for the facts narrated until through the kindness of Mr. Buckingham, I was permitted to have a young tree dug up so that I might examine its roots. To my no small delight I found that these were covered with multitudes of the tubercles, and further that under the microscope these were actually found to contain the

nitrogen-feeding bacilli. I extended my researches in this direction, and found that in Assam very nearly the whole of the members of the *Mimosæ* (the sub-order to which the *Sa* belongs) also produce root tubercles. I shall thus have to amend the review of the literature of that subject (as given in the pamphlet), and the *Mimosæ* to the *Papilionaceæ* as forming beneficial tubercles on their roots. But I was led to the practical consideration, and one that I now regard as almost of supreme moment to the tea industry that the cultivation of a herbaceous-leguminous plant to be hoed in as green manure would secure the strength to resist many blights without entailing the disadvantage of the shade given by the *Sa*. I accordingly recommended the Assam planters to sow in October and hoe in about February a crop of *Matti Kalai* or some other of the numerous pulse crops common to the neighbourhood. Many of my Assam friends have given practical effect to this suggestion (Mr. J. A. Thompson of Ligri Pukri more particularly) by examining all the wild or cultivated plants of the kind indicated in order to discover a quick-growing species with a copious production of root tubercles. I need only add in conclusion that the principle involved in this recommendation is identical with the time immemorial experience in the value of Clover in the agricultural rotation of crops pursued in Europe. By growing a herbaceous leguminous crops for a few months on the soil, some attempt is made to combat the evil effects of a perennial cultivation of the same plant on the same soil."—*Pioneer.*

PROSPECTING IN THE 'FIFTIES.'

NORTH OF KANDY: PART II.

(By an Old Planter.)

The

SHADES OF EVENING

were fast closing around us and steady rain began to fall as we hurried along the jungle bridle-path, which led up to the new clearing, and soon a disc of light was visible in the distance, and then we alighted at the middle of a little coffee plantation; but it was not roaded, and we did not know which way to go. Peering into the distance before us we espied something big and high and white, and climbing over the trunks of forest giants prostrate on the ground discovered to our dismay that it was only

A GREY-COATED AND PRODIGIOUS BOULDER

and which we had fondly hoped was a cottage with white-washed sides. What was to be done? Here we were in a sad fix,—not a human voice to be heard, nor a building of any kind to be discovered, and we knew not which way to proceed, so we wandered on and on over planted clearings, till at last I fancied I heard the sound of a Tamil chant and then the thud of the rice-pounder, and it was so, and soon we reached a long set of

THATCHED LINES

and found Minatchy and Ramaswamy happy and lively and contented even in this lone and unroaded region, and guided by one of our dusky Tamil friends, we reached the gable end of another set of lines where resided our nautical host. "Who visits my cabin at this time of night, I wonder—friend or foe?" in a cheery tone he enquired. "Come in and get shelter from the rain." Light glad were we for his

HOSPITABLE INVITATION;

and then he gave us a brew of genuine Congou—all he had to give—we smoked the pipe of peace and listened to sailors' yarns, redolent of sea waves and white squalls and typhoons. Early next morning we started for

THE JUNGLE LOIS

some 2 or 3 miles away, and as we travelled over the new clearings I was delighted to see how sturdy and healthy the young coffee trees looked, springing up from a rich fertile loam, soft and springy beneath our tramp. As we proceeded, I noticed the *Lagalla* district—most of it, at any rate, had an unbroken and ominous descent, as far as the eye could

pierce, and right down to the Mineriyawa Lake—which as an inland sea—shone like a burnished silver disc in the very far distance. Soon we reached our destination, and duly inspected the lots for sale. It reminds me of

ONE FINE LOT

especially, with a splendid outlook, gentle slope, covered with forest trees of say 2 or 3 hundred years' growth. What a temptation it was to a poor, but industrious coffee planter in those long-ago days! But I remembered the warning I had given me: "Take care, it may be wind-blown," and I thought of the rapid and unbroken descent from the top of the Lagalla hills to the flat and outlying lowcountry. I enquired of our guide, if the district pleased him, and what were

ITS FUTURE PROSPECTS

as a coffee district. A shrewd sort of expression came over his face and he said only in a whisper. "Howling winds, three months on bud, trees stripped of leaves; berries size of an ordinary pea; hungry wolves howl around my wigwam for 6 or 8 weeks at a certain time of the year; rain, yes, torrents of it. The coffee tree may stand: but persistent gales of wind are death-blows to the tropical coffee planter's prospects." On our

RETURN JOURNEY

with a broiling sun overhead, I noticed as we neared Ratotta that the plant yielding

GINGELLY OIL

called in Tamil by coolies Nalyenna, was grown in native gardens, and onwards at places most of the way I think to Matala; and I was pleased to see the coffee shrubs grow well on the new clearings along the river's bank, as we crossed over it. As we arrived at

RATOTTA

which consisted then of a tiny Resthouse, Post Office, and store, kept by a Mr. Bone, if memory serves me right, we were lucky enough to get seats on Her Majesty's Royal mail-cart—a coffin-like vehicle—made to imitate, I suppose, the gay scarlet and gilded mail carts that used to start from St. Martin's-le-Grande, years ago, and a very poor model it was. Anyway, we were right glad to get rid of our stumbling ponies, and get a lift on the Ratotta mail-car to the Matala Resthouse. In the evening we met a few friends, the Government Surveyor and one or two others, unlucky proprietors of Lagalla lands; and afterwards I was assured that from Lagalla right down to Nitre Cave, persistent and cruel winds had mined many promising young coffee estates, in fact almost snuffed out the coffee enterprise in those storm-swept regions; which with good soil, could only be expected to grow root crops, such as ginger, arrowroot, &c.

PLANTING AND PRODUCE.

A GOLD MEDAL FOR INDIAN TEA.—In connection with the Empire of India Exhibition it is gratifying to hear that a diploma for a gold medal has been awarded for the exhibition of Indian teas made by the Indian Tea Association under the direction of Mr. E. F. Langdale. The diploma, which is in course of preparation, will be delivered at an early date.

A NATION OF TEA DRINKERS.—"The extent to which Ceylon and India on a small scale packet tea is pushed," writes a correspondent, "is remarkable. In remote villages in Cornwall and in small inland hamlets all over England you will find some form of Ceylon or Indian packet tea. The cottager when he can afford it takes his tea with regularity, and the village alchouse must suffer, I should imagine, for good or evil we have become a nation of tea drinkers." We agreed with our correspondent. Certainly the representatives of Ceylon and India have worked hard and well to push their products.

THEN AND NOW.—Those who object to the tea drinking ways which now prevail would no doubt have appreciated the customs of the Restoration period. In a new volume of "Seventeenth Century England" just published, we find that people then

had a "morning drought" of ale, with bread, butter, and radishes for breakfast. Dinner was at 1 o'clock, and so early were the hours kept that the debauch often began then. There were plenty of drinks available. More than 12,000,000 barrels of beer were brewed in 1688; the one spirit in common use was brandy; of Spanish wines, canary, sack, malaga, and sherry were common, as were claret, burgundy, and Rhenish wines. Water was scarcely ever drunk, even children drinking small beer. In town, coffee was usual, tea rarer. Pepys's wife was informed by the "potticary" that tea was "good for her cold and fluxions." Merchants went to work at six a.m., and in summer the majority of folk were in bed at sunset.

GRATIFYING EVIDENCE.—The tabulated statement of the results of the working of Indian tea companies compiled by Mr. George Seton and published in our columns has called forth many favourable comments in the newspapers on the position and prospects of Indian tea. The *Grocer* says, referring to Mr. Seton's tables: "Both financially and commercially the British industry in tea affords very gratifying evidence of its growth and prosperity, as nearly all the companies have been doing well, and the rates of dividend in some cases have been exceptionally high. In this respect the Assam, the Brahmapootra, and the Jorehaut with their payments of 20 per cent. take the lead, followed by the Chandpore, the Lebong, and the Moabund concerns with their 15 per cent dividends. Next to these were the tea-growing districts of the Dooars, the Leesh River, the Attaree Khat, the Doom Dooma, the Doloo, the Allynugger, the Borjuli, the Chubwa, the Dapoota, the Jhanzie, the Jokai, the Lungla, the Mazdehee, the Moran, the Sephinjuri Bheel, and the Shumshernugger, where the dividends earned and paid have ranged between 10 per cent. and 12½ per cent. Other tea companies have distributed in this way rates varying from 5 per cent to 8 per cent., and in this group may be included the Baraora, the Borokai, the British Indian, the Cachar, the Chargola, the Darjeeling, the Dejee, the Endogram, the Indian of Cachar, the Land Mortgage Bank, the Majuli, the Mookhamcherra, the Noakacharee, and the Scottish Assam estates. A few gardens pay only from 2½ per cent to 4 per cent profit, and in one instance there was simply nothing to hand over to the proprietors. As regards the several crops, the aggregate weight of tea raised by the forty companies enumerated was 39,612,815 lb for the season 1894, and among the largest contributors to this grand result were the planters representing the Assam Company, the Jokai, the Dooars, the Assam Frontier, the Land Mortgage Bank, the Brahmapootra, the Borjuli, the Jorehaut, the Doom Dooma, the Chargola and the Upper Assam interests, producing a yield of from 1,213,458 lb to 3,251,127 lb each. The plantation yielding not more than from about 300,000 lb to 900,000 lb of tea apiece, though not necessarily associated with the least prosperous of their class were the Allynugger, the Attaree Khat, the Baraora, the Borelli, the Borokai, the British Indian, the Cachar, the Chandpore, the Chubwa, the Dapoota, the Darjeeling, the Dejee, the Doloo, the Eastern Assam, the Endogram, the Indian of Cachar, the Jhanzie, the Lebong, Leesh River, Lungla, Majuli, Moabund, Mookhamcherra, Moran, Noakacharee, the Scottish Assam, Sephinjuri Bheel and the Shumshernugger. The smallest crop grown—185,090 lb—was in the district of the Mazdehee Company, but such a drawback if it may be so termed did not prevent the cultivators from earning a dividend of 10 per cent and instances of this nature could be easily multiplied."—*H. & C. Mail*.

ROYAL GARDENS, KEW.—Bulletin of Miscellaneous Information for October has for contents:—New Rubber Industry in Lagos; Diagnoses Africana; VIII.; Citrus Fruits in Sicily; Miscellaneous Notes; Weather and Attendance of Visitors in September; Botanical Magazine; Queensland Cherry; Dried Plants from British North Borneo; Fruit of Sararanga; Hortus Fluminensis; Liberian Coffee.

PERAK PLANTERS' ASSOCIATION.

A meeting was held at Taipeng on Nov. 2nd, Mr. H. A. W. Aylesbury in the chair.

The following bye-law was proposed by Mr. Gibson, and seconded by Mr. Stephens:—

"That no coffee plants or seeds tendered for sale by natives shall be purchased by any member of the Association unless the seller can produce written proof that the same are his *bona fide* property, or that he has been duly authorized by the owner to offer such plants or seeds for sale. Breach of this bye-law to involve a fine of \$50, to be paid into the funds of the Association by the offenders."

A discussion took place in regard to a proposal, which originally emanated from the Selangor Planters' Association, for a Central Association, or amalgamation of all the planters' Associations in the Native States and Province Wellesley. The meeting was unanimously in favour of this, and the Honorary Secretary was asked to communicate with the Selangor Planters' Association with a view to bringing about this much desired object.—*S. P. Press.*

A VETERAN PLANTER'S VISIT.

Mr. J. E. Todd, Meleny Estate, Assam, one of the pioneer tea planters in that country is at present on a visit to Ceylon, his second since 1861. Mr. Todd who was a passenger by the M. M. Co.'s ss. "Oxus," left for upcountry on Sunday morning on a visit to Mr. Ansthruther of Tillicoultry. He will then proceed to Nuwara Eliya and revisit the places with which he is familiar in that district. Mr. Todd will make a sojourn of from 8 to 10 days, remaining in the Island till the arrival of the "Clan Matheson," on board of which he will meet Sir John Muir, head of the firm of Messrs. Finlay, Muir & Co. with whom he will travel to Calcutta.

SELANGOR PLANTERS' ASSOCIATION.

Minutes of a general meeting, held at the Selangor Club, on Saturday, 26th October, 1895. Present: Messrs E. V. Carey, (Chairman), C. Meikle, E. B. Skinner, R. Meikle, R. Kindersley, R. C. Tollemache, L. Dougal, H. Rowe, M. Stonor, C. Glassford, B. Nissen, F. A. Hurth, H. M. Darby, H. Hüttenbach, C. Jackson, and Tom Gibson (Hon. Secretary).

Mr. Forsyth, having expressed his wish to retire from the Committee as he no longer intended to reside in Selangor, Mr. H. Hüttenbach was elected in his place.

Correspondence with the Perak Planters' Association, re the proposed Central Planters' Association, having been read, the Chairman explained to the meeting that, taking advantage of the presence of Mr. T. H. Hill (Chairman of the S. U. P. A.) in Kuala Lumpur, the Committee had invited him to meet them on the 15th October, and it was then resolved that the Hon. Secretary should write to the S. U. P. A. and arrange a convenient date for representatives of the two Associations to meet in Kuala Lumpur and that notices be sent to planters in Johore and Perak.

GERMANY IN AFRICA.

Under this heading a home contemporary gives interesting information regarding German East Africa. The colony of Togoland which has only 73 white inhabitants, is made up of 19 officials, 22 missionaries, and 32 traders, who include six Frenchmen and four Englishmen. The value of the imports amounted in 1893-94 to £127,937, and of the exports, which consisted of palm nuts, palm oil, gum, ivory, skins and hides, ground nuts, and coffee, to £160,571.

In the Cameroons the white population numbers 231. The imports for the official year 1893-94 amounted to £232,131, and the exports to £238,707, the exports being similar to those from Togoland, with the addition of indiarubber, ebony, and cocoa. Reference is made to the official report on German East Africa. It is stated that in German East Africa the white population numbers 215. The exports of ivory rose from 242-449 lb. in 1893-94 to 317,777 lb. (14,692 tusks) in 1894-95. The fear expressed in the official report a year ago that the amount of ivory exported through German East Africa would diminish in quantity in consequence of the competition of the Independent State, and of British Central Africa, Uganda, and British East Africa, "which are all striving to attract the ivory trade to their own export markets," does not therefore, as yet, appear to be well founded.

INDIAN AND CEYLON TEAS.

LONDON CONDITIONS OF SALE.

An alteration which comes into force today (Nov. 1st) has been made in one of the clauses for regulating the sale of Indian and Ceylon tea by public auction. We give below the Clause (4) as it formerly stood and as now amended:—

OLD CLAUSE.

These teas will be ready for delivery on the day of sale (excepting packages requiring cooping, which will be completed without delay), and three clear working days from that date are to be allowed for delivery of weight notes. The buyer to have the option of refusing to accept any lot or lots for which he cannot obtain the weight notes by 6 p.m. on the third day, by giving a written notice to that effect to the selling broker on the following morning. Missing packages, if equal to bulk, and not more than 5 per cent., are exempted from this condition, and are to be taken by the buyer at the original price and prompt if tendered within fourteen working days from date of contract.

NEW CLAUSE.

These teas have been weighed, inspected, bulked (if necessary) and tared, and will be re-weighed, papered, and leaded down by the evening of the day after the day of sale. All packages will be nailed down within six days. Delivery will be given on the day after the day of sale, and up to the delivery of weight notes, on notice being given (in writing) the day before it is required to the selling broker and warehousekeeper. The buyer to have the option of refusing any packages as to which the above conditions have not been compiled with. Three clear working days are to be allowed for delivery of weight notes. The buyer to have the option of refusing to accept any lot or lots for which weight notes have not been delivered by the evening of the third day, by giving a written notice to that effect to the selling broker on the following morning, if, on application, he cannot then obtain them. Missing packages, if equal to bulk and not more than 5 per cent., are exempted from this condition, and are to be taken by the buyer at the original price and prompt if tendered within fourteen working days from date of contract.

—*London Paper.*

HOW TO RENOVATE BROWN BOOTS.—First give the boots a tight treecing up either with trees or soft paper (the former method is the best), then give them a good wash with soap and lukewarm water, but do not sodden them. This can be done with a sponge or very soft brush. Do not brush too much in one place, but only till the dirt is all off. When this is done, put them under a tap, or give them another wash with warm, clean water without soap. It would be best now to give them a wash with some scouring fluid, but in either case, when quite dry, give them a good creaming. It is always wise to treat brown leather as above before it gets too dirty, as continual creaming with the dust on helps to impoverish and wear away the grain and beauty of such leather, and so causes them to crack and show dirty lines when creamed.—*From "Work" for September.*

THE AGRICULTURAL SCHOOL:—IN
DEFENCE.

If the Unofficial Members of Council have not been very successful in their legislative battles, they have sometimes done good service in drawing the attention of the Government to what they believe to be errors of policy on the part of the Executive and thereby have brought the light of criticism to bear upon defects where they are alleged to exist. As we have already stated, we are rather at a loss to assign a motive for the vigorous attack which the Tamil Member made on the Agricultural School, particularly when we recall the fact that his zeal for the security of our finances seemed to forsake him during the debate on the Arrack Rent Sales. Mr. Coomaraswamy's plea for the suppression of the School was supported by two arguments, first, that the expenditure on the institution was excessive, and secondly that the School itself was a failure. In support of his first argument the Tamil Member quoted figures from the Blue Books to the effect that the net expenditure on the Agricultural School for the past three years was as follows:—

In 1892 ..	R12,007·41
„ 1893 ..	R12,728·11
„ 1894 ..	R12,370·75

Now we find on reference to our Blue Books for three years that included in the above is a sum of R5,000 paid to the Colonial Veterinary Surgeon during each year. Why this sum should be included in the expenditure on the Agricultural School it is difficult to say. We should be sorry to think that the work of the Government Veterinary Surgeon was confined to the Agricultural School; and indeed if this be so, so large an expenditure on the salary of a teacher would not be warranted. We know, however, that this office of Veterinary Surgeon is for the whole colony, and that the Surgeon's special work lies in the study of large questions concerned with the stock of the country—especially with reference to the suppression of cattle disease. We presume that the Veterinary Surgeon besides, conducts a class in the Agricultural School; but it is nevertheless most unreasonable to debit the School with the whole salary of R5,000, when the salaries of the Superintendent and his staff of three Assistants aggregates not much more than R5,000! We should have thought that it would have been more consistent to attach the Government Veterinary officer, as a "Colonial Surgeon," to the Medical Department, where he ought to prove more useful under an able administrator like Dr. Kynsey. Indeed, it appears quite anomalous that a Colonial Veterinary Surgeon should have the Director of Public Instruction as his chief. If the change we advocate is made the veterinary class in the Agricultural School could still be taken by the Colonial Veterinary Surgeon or even by the Government veterinary scholar who had such a brilliant career at the Bombay College, and who we believe is already on the staff of teachers. Taking away the salary at least of the Government Veterinary Surgeon (for there may be other expenses for which he is responsible) from the cost of working the Agricultural School, we find the figures quoted by Mr. Coomaraswamy reduced to the following:—

1892 ..	7,007·41
1893 ..	7,728·11
1894 ..	7,370·78

The Veterinary Surgeon's salary, therefore, forms 40 per cent of the expenditure on the School and as it should come under another head altogether, the above would be fairer figures for the Tamil

and Mercantile members to take in reckoning the cost per student and in comparing the total cost with that of the Technical School or Royal College. Mr. Coomaraswamy's assumption that the expenditure per year for the last 11 years was over R12,000 is quite unwarranted. Even if he, through an oversight, included R5,000 in 1892, 1893 and 1894, he should have remembered that there was no Veterinary Surgeon before 1892, and that the Superintendent, Mr. Driberg, joined the staff only in 1889. The real expenditure for the 11 years is thus nowhere near R140,000 or R150,000, but more like R60,000 or R70,000. It is very surprising to us that there was no official—not even the Treasurer or the Government Agent of the Province—sufficiently up in the subject to correct the unofficial speakers! If the paid members of the Executive and Legislative Councils do not study the annual Blue Books, who can we expect to do so?

There is another point to which we may direct attention and that is that the Training School and Practising School are bracketed under the head of Agricultural School, though the expenses of the three are given separately. From this it would appear that the Principal of the Agricultural School is Superintendent as well of two other Schools. If so, then surely the salary of this officer should be divided proportionately in estimating the expenditure on these three establishments? We are further reminded of the existence of the Government Dairy—a separate institution from the School—against which in all reasonableness a large slice of Mr. Driberg's salary should be debited. If not, the alternative must be that the proceeds of the Dairy should go to swell the receipts from the soil. The Director of Public Instruction in his Administration Report for 1894 speaks of a number of students being refused admittance into the Agricultural School; this would indicate that only a limited number is taken on, and if so the small numbers are not due to lack of applicants for admission. It would appear from the total receipts that the fees charged at the School are unduly low, and indeed the Superintendent in his Report for 1894 recommends that they should be raised. If this suggestion be acted on, we may hope to see the net expenditure on the school still further decreased.

Let us now refer to the second argument put forward, namely, that the School is a failure. But how has Mr. Coomaraswamy set about gauging the success or failure of the institution? It would seem from the character of the return called for, that the hon. member looks upon the School as an institution for training Agricultural Instructors and nothing more. It is true that the School was started on a very small scale at first and that Mr. H. W. Green, who was its initiator, tried the experiment of sending out a few Agricultural Instructors to certain districts. Whether this experiment was a success, is doubtful. We have heard of a few of these Instructors doing good work under the immediate supervision of progressive revenue officers, and we have also heard of some making no headway at all—left to themselves receiving no help from village authorities, *sans* funds, *sans* labour, *sans* land, *sans* everything that is necessary for establishing anything like an agricultural station. Indeed we believe that the attempt to disseminate agricultural education through Instructors has been a half-hearted one, owing (1) to the withholding of the expenditure that must necessarily be involved in carrying the system forward with any effect, (2) to the lack of support from village and district authorities, (3) to the opposition of conserva-

tive natives, and (4) the ill-considered rationale of the work of the Instructors themselves. The prime error in connection with this last cause of failure was the idea that the mission of the Agricultural Instructor was to force an English-made plough on the native paddy cultivator—to act indeed as an agent for Howards of Bedford—and that the central School in Colombo had concern only in this mission and took no heed of the unlimited sphere of usefulness indicated in the terse but significant motto of the Royal Agricultural Society of England:—“Practice with Science.” We understand that of late since the number of Agricultural Instructors has been reduced, it has been decided to appoint Instructors only on the demand of revenue officers, who see an opportunity for fruitful results and who are prepared to take a personal interest in the work of the officers placed under their control. We have the further assurance that the interest and industry of these Instructors will, in future, be more closely enquired into by the provision—announced at the Agricultural School last prize-day—that the Superintendent has been appointed to inspect their work.

But we hasten further to say that the value of Agricultural Education is not, in our opinion, to be estimated by the success or failure of some half-dozen young men sent out as pioneers in a discouraging though meritorious enterprise; and we would further quote a passage—from Mr. Driberg's Report, published some two years ago—which we commend to the notice of the Hon. Tamil Member who in his speech last Wednesday remarked with the complacent satisfaction of the rabid as well as ignorant conservative:—“We have got on well heretofore, and we wish to go on as before”:

In a paper on “Technical and Agricultural Education in the Colonies,” read before the Royal Colonial Institute, the writer observes that “he would be a bold man who in the last decade of the nineteenth century would in the slightest degree undervalue what science can and does so largely give to agriculture; or who would argue that because yonder farmer has been a successful man, and yet could neither read nor write, he owes that success to the absence of education. In these days, education (not only in the principles which underlie his art but in the workings of the markets of the world) is so largely used against the farmer, that for the latter to neglect it would be the height of foolishness.” He then goes on to show that as with the lawyer or medical man, soldier or sailor, a knowledge of the principles of his art is necessary to the Agriculturist. John Chalmers Morton, one of the leaders in the agricultural world, said when speaking before the Society of Arts:—“The sound preliminary education for which I am to argue, is not only the foundation-stone of a future building—it is the seed of a future life, with influence and guidance in it, as well as mere security and strength. And the agriculturist, whatever the distinctive features of his occupation may be, will, I believe, quite as much as any other busy man, benefit by an education which may open his eyes a little wider than they are at present to matters which really concern himself, though they may seem outside the limits of his day's work. Such are the opinions of those who have made a study of this subject; and such opinions are the securities for the benefits of agricultural education: I do not give them by way of apology for the instruction imparted here.

There can be no manner of doubt in the mind of any man of enlightenment that Ceylon, like every other country and colony, is all the better for the existence of a central School of Agriculture just as it is in having a Botanical Department, an Archaeological Commission and a Museum; to keep us in touch with the changing

times; to diffuse—it may be but slowly—knowledge of the great principles of scientific agriculture, of the natural laws which control and regulate plant-life, and to use the knowledge of both for local ends; to be able to note and if possible, utilise the results of recent research; and to be a means of communication with the Agricultural world around us. When we consider the large scope of Agricultural Education and the pettiness of the questions raised (such as that referring to local experiments with Agricultural Instructors) we cannot but decide that to give up the School would, as we have stated before, be “a backward step indeed and one not to be thought of.”

One thing strikes us as very comical, namely the persistency, with which Unofficial Members, apparently encouraged by the Government, seek for objects of attack and possible Retrenchment (?) *outside the scope of the Retrenchment Committee's Report*. Surely their first duty is to insist on the recommendations in that Report being attended to and to hammer away at them, in season and out of season, until something is done. It is an uncommonly weak if not miserable thing, to seek out a struggling young institution with poor funds to back it in the interests of the native community—for the Agricultural School is purely for the benefit of the Ceylonese—and to strike a blow at such a School; while big officials and extravagant institutions are left unnoticed, and encouragement is given to throw away at one stroke some R250,000 of Arrack revenue—enough, by the way, to pay for the Agricultural School, for more than a quarter of a century. And yet there was no one in the Legislative Council to remind the Tamil Member of this fact!

THE CEYLON HANDBOOK AND DIRECTORY.

An old resident and good judge of such work writes:—

I write hurriedly, but can only say how pleased I am with the Directory—its outward appearance, and its very full and varied contents, so far as a glance has enabled me to judge,—and how thankful to have received an early copy. I have always, even before I took to planting, been impressed with the general and special utility of two publications, both issuing from the *Observer Press*—the Directory and the *Tropical Agriculturist*. My admiration of them and appreciation of their value have not diminished by closer acquaintance; they have rather increased; but a new feeling has possessed me this year—wonder at the marvellous industry and perseverance which could put so big a volume through the Press, with all the cares of a daily paper on your shoulders. More strength to your hand and elbow!

BRIQUETTES OF COFFEE HUSKS.—The *Soerabaia Handelsblad* says, that at the last meeting of the Malang Coffee Planters' Association it was resolved to offer a prize for the discovery of a universally practicable and cheap binding substance for the preparation of briquettes of coffee husks. On account of the gradually increasing scarcity of firewood on the estates it is very necessary to look out for a substitute; and upon some estates coffee husks in a dry state are used for fuel. They burn up too quickly, however; and at the same time cause risk of fire through the quantity of sparks.

THE LANKA PLANTATIONS COMPANY,
LIMITED.

DIRECTORS—George Allen, Esq., Chairman, William Anstin, Esq., Henry Bois, Esq., and Edward Pettit, Esq.

AGENTS IN COLOMBO—Messrs. J M Robertson & Co.
SECRETARY—Mr. Charles M Robertson.

Authorised Capital, £200,000, in 15,000 ordinary shares of £10 each and 5,000 preference shares of £10 each, of which only 1,470 have been issued.

REPORT to be presented at the fifteenth ordinary general meeting of the Lanka Plantations Company, Limited, to be held at the office of the Company, on Wednesday, the 13th November, 1895, at 12 o'clock noon.

1. The Directors now submit their Report for the twelve months ending 30th June last, together with the Balance Sheet and Accounts of the Company made up to that date and duly audited.

2. The Coffee Crop shipped to London was cwts. 1,371, against cwts. 789 last year, and realized £6,561 6s 2d net. The acreage under Coffee alone was 210 acres, and the trees after maturing a good crop are reported to be in excellent heart and condition. Patches of Coffee scattered about the fields of Tea added considerably to the total yield this year, but so large a crop can hardly be expected again.

3. The total crop of Cocoa gathered on Yattawatte amounted to cwt. 1,214, against cwt. 979 last year, and realized £3,038 10s 11d. There was a further drop in the market during the year, but even the very low rates now ruling leave a good margin of profit. During the season a further acreage has been planted, and 42 acres of available land adjoining the estate purchased. The cost of the new planting and the land have been charged to Capital Account.

4. The Tea received from the Company's estates amounted to 523,048 lb., and has been sold at an average of 8d per lb. net, realizing £17,507 3s 2d. Last year the Company received 518,136 lb., which was sold at an average of 7½d net, and realized £15,873 5s 5d. The total acreage under Tea now stands at 2,161 acres.

5. The following Statement shows the acreage and state of cultivation of the Company's Estates on the 30th June last:—

Estate	Coffee		Tea	Cocoa	Grass	Chestnut and Patana	Forest and Timber Trees	Total
	Acres	Plants						
Ampitiyakande	50	414	-	-	4	167	70	705
Arnhall	-	225	-	-	-	12	-	237
Fordyce, Garbon Gongalla and Paramatta	-	767*	-	-	34	-	135	936
Rappahannock	23	302*	-	-	31	30½	87	473½
Rillanulle	-	232	-	-	-	6	20	258
Thotulagalla	137	221*	-	-	4	109	84	555
Yattawatte	-	-	620	95	169	105	989	
	210	2161	620	168	493	501	4153½	

* Partly in Coffee.

6. The net Profits for the past year amounted to £11,378 13s. 4d., to which must be added the sum £458 17s. 6d., the balance brought forward from the year 1893-94, making together £11,837 10s. 10d.

7. The Directors propose to take advantage of the unexpected increase in the net proceeds of the coffee crop to write off from the suspense account the sum of £3,714—being not only the one-tenth usually written off, but also the sums of £799 and £1,021 which, from circumstances, the Board was unable to write off in the years 1888 and 1889. This will enable the Directors, at the end of the current year, to strike out of the suspense account the sum of £4,544 5s. 7d., charged in the year ending 30th June, 1885, which by these payments will have been entirely paid off.

8. Having already paid a half-year's interim dividend on the Six per Cent. Preference Shares to the 31st December, 1894, amounting, less property tax, to £426 6s., the Directors recommend the payment of

the dividend on these Shares to the 30th June last, requiring, less property tax, a similar amount and they further propose a dividend of 8s per Share, free of income tax (being 4 per cent. per annum), on the Ordinary Shares, amounting to £6,000, carrying forward a balance of £1,270 18s 10d to the next account.

VARIOUS PLANTING NOTES.

A NEW PLANTATION Co.—The Poonagalla Co. formed to take over Sir George Pilkington's properties is announced by this mail. The price paid for the four properties with about 1,200 acres in cultivation and as much more in reserve, cannot be considered dear at £27,050. In fact it ought to be quite a bargain for the Company and good dividends ought to result. Sir George will continue to be the chief shareholder himself, and the Company could not have a better Manager than Mr. James Bisset.

THE LANKA PLANTATIONS Co., LD., is one of the oldest connected with our planting industry and has always deserved well in the estimation of colonists. It suffered in the coffee-disease days; but we are glad to see how far prosperity has been renewed—though dividends still are small—and the very satisfactory prospect there is now before the shareholders. We congratulate Mr. Geo. Allen and his brother directors as well as the local Agents, Messrs. Murray, Robertson & Co. on this good result. The Lanka Company has still large interests in coffee (its crop for 1894-5 realizing nearly £7,000) and also in cacao (its cocoa selling for over £3,000) apart from tea. Gum seed was sold in Ceylon for £10 3s 6d; and "Leaf" (what "leaf"?) for £109 0s 6d. This must be tea leaf from an estate where there is no Factory?

THE CHINA TEA SEASON OF 1895—having now virtually closed, it may be well to give the total export figures. It will be observed there is a comparative decrease on 1894 to the United Kingdom of nearly 3½ million lb.; but to Odessa (Russia) an increase of nearly 4½ million lb. To North America the export of China is about the same, but from Japan there is an increase this year of over 4 million lb.:—

THE NEW DIMBULA COMPANY, LIMITED.

Report of Proceedings at Eleventh Ordinary General Meeting, held at No. 52, Gracechurch Street, London, on Wednesday, 23rd October, 1895. H. Brooks, Esq., in the Chair.

The Secretary having read the notice convening the meeting, and the minutes of the last meeting, held on October 24th, 1894.

The CHAIRMAN said:—I have now to move that the report, balance sheet and accounts as presented by the Directors be received and adopted. I think you all have copies of the report and accounts which are in their usual form, and I hope are intelligible to the Shareholders. Your Directors have much pleasure in meeting you again with such a satisfactory report of the operations of the Company for the past year. The Statement of Accounts you will see shows that in spite of receding prices for tea during the past year, profits do not show any material falling-off from those earned in the previous twelve months; a result which is due, to some extent, to the prevalence of a favourable rate of exchange, but largely, I may say, to the fact that expenses in Ceylon have been kept down to a very low level, and to an increased yield. That, I think, is evidence of the careful management by our Resident Manager in Ceylon. I do not know that there are any items in the account to which I should call your attention. You will notice from the closing of the present Accounts for tea-extension and machinery and building, that the outlay on these items has now all been written off, and that the cost of all the new tea acreage has been provided for out of the profits, as well as the building and the machinery. I may now, perhaps, gentlemen, be permitted to congratulate the holders of the B Shares upon their receiving all arrears of dividends upon this class of Shares, and the holders of the C Shares upon their now participating for the first time in the division of the profits of the Company. And as this in a way marks an epoch in the history of the Company, it may not be out of place here to recapitulate the results of the Company from its formation, and it is perhaps with some pardonable pride that your Board may point out that not only has the conversion of the estate from coffee to tea been fully carried out, but that we now have a factory and plant in the highest state of efficiency, and equal if not superior to any other establishment for tea making in the Island, and that we have paid the Debenture holders of the old coffee company interest upon their money at 8 per cent. up to the present time. The Company has paid out of profits over £32,000 on tea extension, buildings and machinery, and has paid to the shareholders during the same period, no less a sum than £64,000 in about ten years. And I think, I may say you have now a property worth very much more than the amount at which it stands in the books of the Company. With regard to the future, we are hopeful that we may continue our successful career, but we are not unmindful that the possibility exists that the low rate of exchange which has helped us so much in the past season now under review, may not always remain in a condition so helpful to the successful operations of this Company. If there is anything in these accounts upon which any proprietor wishes to have any further information, I shall be pleased to give it if it is in my power. I now beg to move that the Report, Balance-Sheet and Accounts, as presented by the Directors be received and adopted.

General HARRIS having seconded the motion; Mr. JAMES ANDERSON asked what was the quantity of tea obtained from the estate, and what the cost per lb. free on board, and whether there was any intention of increasing the acreage in tea, and remarked that it appeared to him an unnecessary precaution to have a reserve fund.

General HARRIS having dissented from this view, the Chairman stated that 837,116 lb. Tea had been obtained, costing 3.26d per lb. free on board, and that the question of tea extension was under consideration. He also contended that it was desirable to have a reserve fund. The resolution was put to the meeting and carried unanimously.

The CHAIRMAN:—I have now to move the following resolution:—“That a dividend be declared on the A shares at the rate of 8 per cent. per annum; that a dividend be declared on the B shares at the rate of 16 per cent., viz., 8 per cent. for year ending June 30th, 1894, 8 per cent. for year ending June 30th 1895; that a dividend be declared on the C shares at the rate of 6 per cent per annum; and that an additional dividend of 2 per cent be declared on all shares; that the same be paid on October 24th, less the interim dividends on the A and B shares, paid in March last; and that £3,000 be placed to a Reserve Fund.

Sir A.N. BIRCH, K.C.M.G., seconded the motion, which was carried unanimously.

The CHAIRMAN: The next business on the Agenda is to notify that there is a vacancy on the Board through one of the Directors retiring in rotation. Mr. W. S. Beuett is the Director who now retires, and I have very great pleasure in proposing that he be re-elected as a Director of the Company, and I think from the amount of good work he has done for the Company, you should be very pleased to support him.—Mr. W. HERBERT ANDERSON seconded the re-election of Mr. Bennett. The resolution was carried unanimously.—Mr. BENNETT:—I thank you very much, gentlemen. I have been connected with this Company since its earlier troubles began, and I am glad to see it has merged from them in such triumph, and I hope it will continue to prosper.

Mr. JAMES ANDERSON:—I have much pleasure in proposing that Mr. George Sneath be re-elected Auditor for the ensuing year, and that his fee be 20 guineas. Mr. J. K. MORRISON:—I have pleasure in seconding that resolution. The resolution was carried.

The CHAIRMAN:—Before separating, I should like to move that a vote of thanks be tendered to the Resident Manager in Ceylon. You will see from what I have said, how much we attribute our success to the way our affairs are managed in the island, and I think we can do no less than express our feeling of satisfaction at the way in which things are done. I have therefore much pleasure in moving that a vote of thanks be accorded to the Resident Manager and Staff in Ceylon.

Mr. BENNETT; I shall have the greatest pleasure in seconding that, knowing Mr. Dick Lander and also his indefatigable work, and his knowledge of engineering and all other matters which help him in his work. Mr. C. J. SCOTT: May I say that I visited the estate last December, and I have very great pleasure in supporting that resolution. Everything was in perfect order, and the prospects of the Company look excellent. (Hear, hear.) The resolution was carried unanimously.

Mr. JAMES ANDERSON moved a vote of thanks to the Chairman and Directors for the way in which they had conducted the affairs of the Company, not only during the past year, but during the whole history of the Company. General HARRIS seconded the motion which was carried unanimously. The CHAIRMAN acknowledged the vote of thanks, and the proceedings terminated.

POONAGALLA VALLEY CEYLON COMPANY, LIMITED.

Capital £50,000, in 5,000 shares of £10 each.

Dividends will be payable as from 1st January, 1896, according to the amount for the time being paid or credited as paid upon the shares.

The estates were inspected and valued by Mr. Alexander T. Rettie, the well-known Manager of the Spring Valley Estates, in June last, with a view to the sale to the Company, and the following figures are taken from his Report:—

DIRECTORS.—Sir George Augustus Pilkington, Southport, Chairman (the Vendor to the Company). Robert Colvill Bowie (Portmore Estate, Ceylon), Ravensby House, Carnoustie. N.B. George Gray Anderson (Lyall, Anderson & Co.), 16 Philpot Lane, E.C.

Secretaries and Office.—LYALL ANDERSON & Co., 16 Philpot Lane, E. C.

PROSPECTUS.—This Company has been formed to purchase from Sir George A. Pilkington the properties of Lunugalla, Udahena, Cabragalla, and Poonagalla, situated in the Kandapolla, or Eastern division of the district of Haputale, Ceylon.

The estates consist approximately of 2,554 acres in all, viz:—

LUNUGALLA.—Altitude, 2,500 to 4,500 ft. above sea level—228 acres tea in full bearing; 54 acres tea planted 1893 in coffee; 28 acres tea planted 1894-95 in coffee; 35 acres drained and roaded for planting; 35 acres fuel trees; 50 acres coffee; 358 acres Patna forest, waste &c. Total 788 acres.

UDAHENA.—Altitude, 3,000 ft. to 5,000 ft. above sea level—140 acres tea in bearing; 30 acres tea and coffee; 45 acres tea planted in 1893; 18 acres tea planted in 1894; 10 acres coffee; 80 acres cleared and drained for planting; 5 acres fuel trees; 325 acres ravines. Chena, Patna, Waste, &c. Total 653 acres.

CABRAGALLA.—Altitude, 3,000 to 4,500 ft. above sea level—100 acres tea in full bearing; 30 acres tea planted in coffee 4 and 5 years old; 20 acres tea planted in 1893; 18 acres tea planted in 1894; 30 acres coffee; 10 acres Fuel Trees; 17 acres Patna Ravines and Waste; Total 225 acres.

POONAGALLA.—Altitude, 2,800 to 4,000 ft. above sea level—116 acres tea over 3 years old; 35 acres tea over 2 years old; 52 acres tea planted in 1894; 20 acres tea planted under coffee 1894; 80 acres coffee; 6 acres Liberian Coffee (all drained); 2 acres fuel planted 1894; 577 acres forest, patna, waste &c. Total 888 acres.

The estates were valued by Mr. Rettie at an aggregate of £27,050 sterling, and the price to the Company has been fixed at that figure. The Company will also pay the amount of any capital outlay on the estates by the Vendor between 20th June last, the date of the valuation, and the 1st of January, 1896. Mr. Rettie's Report and Valuation is open to inspection at the Office of the Company. The properties will be taken over as from 1st January, 1896.

Sir George A. Pilkington has agreed to accept payment as follows:—

£10,000 in fully-paid Shares; 8,500 in 6 per cent Debentures; 8,550 in Cash; £27,050.

FACTORIES.—Mr. Rettie reports that at Lunugalla the factory is a substantial building of three flats, 96 feet by 36 feet, with a 15-foot verandah on ground floor for machinery, which is in good order and sufficient for next two years; and that at Poonagalla there is a very nice compact factory of 60 feet by 40 feet, a ground floor and two upper floors, and ample supply of water, and the machinery all new, in excellent order and sufficient for some time to come. There are no factories at Udahena and Cabragalla, the tea from the former being made at Lunugalla, and from the latter at Poonagalla.

EXTENSION OF CULTIVATION.—In Mr. Rettie's opinion, on Lunugalla of the 358 acres of Forest, Patna, &c., 225 acres might be made available for Tea and most of the remaining 133 acres would grow fuel. On Udahena about 150 acres of Chena Patna, &c., could be planted with Tea and much of the balance could grow fuel. On Poonagalla about 200 acres of the 577 forest would probably grow Tea profitably and much of the remaining 377 acres would no doubt grow fuel.

COFFEE.—There are 50 acres of excellent Coffee on Lunugalla in good heart, on Cabragalla 30 acres very fine, and on Poonagalla 40 acres in good heart.

THE VINE GROWING EXPERIMENT AT THE AGRICULTURAL COLLEGE.

With regard to the vine growing experiment at the Agricultural College, instituted by and carried out under the Supervision of Mr. Zanetti, Mr. Drieberg the Principal of the College is now in a position to report as to the first season of culture. As stated there are 800 plants, one or two years old, trained to a height of about 3½ feet. The plants are now beginning to show signs of "wintering" as they would naturally have done at this season had they been allowed to remain in Australian soil. Planted

four months ago, the vines came out in blossom two months after being put into the ground and shortly afterwards fruit formed on the two year old plants. There were fifteen bunches in all and the grapes forming these though inferior in size and appearance to the grape of Europe or to the hot-house grape of Britain, have an excellent flavour, very different from that of the Ceylon variety. So far as it has gone Mr. Zanetti is satisfied with the experiment and with the appearance and growth of the vines. Little importance is attached to the crop which has been produced as it is supposed to be due to the fact that the vines, having been two months out of the ground when they came from Australia, matured it when they were planted at the Agricultural College. The vines have been pruned down after the continental method and Mr. Zanetti is hopeful that when they again shoot up there will be indications of an improved crop. It is expected that there will be another blossom on the vines before the end of the year. The heavy rains recently experienced, it is satisfactory to note, have done little damage to the plants, as a matter of fact they do not seem to have been effected in any way special precaution being taken in the matter of providing for the water running away.

SALE OF AN ESTATE.

Mr. T. C. Anderson has sold Kitulgalla estate, Kelani Valley, to Mr. J. B. Lindsay for £1,750 sterling cash. The property covers 172 acres—40 acres tea in full bearing, 40 acres heavy forest and 92 acres chena.

THE GREAT WESTERN TEA COMPANY OF CEYLON, LIMITED.

The half-yearly general meeting of the Company was held at 12-30 p.m. on Nov. 1st, at the office of Messrs. J. M. Robertson & Co. Mr. J. C. Dmbar presided, and the others present were:—Messrs. J. F. Headrick, D. R. Marshall, R. L. M. Brown, Thos. Mackie, Geo. Vanderspar, Henry Bois and W. Moir (Secretary).

The SECRETARY read the notice convening the meeting and the minutes of the last general meeting which were confirmed.

The CHAIRMAN then said that the meeting had been called merely for the purpose of declaring an *ad interim* dividend. The Report was satisfactory and the Directors were highly pleased at the state of things. The quantity of crop for the half-year was considerably in excess of that for the same period during the previous season. Having gone carefully through the accounts, the Directors thought they were safe in recommending an *ad interim* dividend of 8 per cent. for the half-year.

Mr. D. R. MARSHALL thereupon proposed and Mr. R. L. M. BROWN seconded that an *ad interim* dividend of 8 per cent. be declared.—Carried *nem con.*

Mr. VANDERSPAR inquired how much the crop for the half-year was.

The CHAIRMAN said it was 189,640 lb.—54,000 lb. in excess of the quantity secured during the same period last year.

Mr. VANDERSPAR then inquired if the first or second half of the year was usually the better for crop.

The CHAIRMAN remarked that it was the second half of the year.

The business then concluded with a vote of thanks to the Chair.

OUR MONSOON AND "THE ELEVEN YEARS' CYCLE."

Our readers will remember certain interesting papers on the above subject written by Professor Archibald during his visit to Ceylon early in 1893, and some may recall his prophecy for the advent of the South-west monsoon of that year. It was not realized according to the date registered at the Master Attendant's Office; but Captain Donnan, like ourselves, would be free to admit that, in fixing an exact date for both the little and big monsoons, a certain amount of arbitrariness or guesswork must inevitably be applied in view of the means available at our Port for judging of the conditions. So much we readily grant to Professor Archibald who sends us from up-country another interesting letter on the subject. It is a pity notwithstanding all that is done through the Surveyor-General's and Public Works' Departments, that our Meteorological Returns should be so inferior evidently to those of India. In India, of course, there is a separate Meteorological Department, and a specially qualified head in Mr. Eliot, giving all his time and thought to the subject; and it is a pity we think, that in respect both of Meteorology and—if we may add—of a Geological Survey, Ceylon should not be identified with India, and worked as one. In respect of Meteorology, there can be no doubt that the observations and reports which Mr. Eliot would initiate in Ceylon, could not fail to have a very important bearing on the deductions which are regularly made from the Indian Meteorological Observations. We could not have a better Governor to approach on such a subject than Sir West Ridgeway in view of his special Indian experience, and we trust to see some improvement and assimilation in Meteorological work attempted in Ceylon during his term of Government, as also a Geological Survey commenced if not completed.

"THE CEYLON HANDBOOK AND DIRECTORY FOR 1895-6."

(By an old Resident.)

I have to thank you Sir, for an early copy of the big "book"—as I see you call it in your editorial notice of its issue at last. This is a name often given, with a different meaning, to the Bible, and without irreverence we may call your Directory for 1895-6 the Ceylon Book of Books, or the Big Book of Ceylon. Lying before me is also a copy of your "Hand Book" for 1863. It is worth while to stay for a moment to compare the two. The book for 1863, while being also an 8 vo. is only one inch thick, including the covers, and weighs only 1½ lb. with 460 pages. Your new Directory just issued for this year, has a thickness of about three and half inches, and weighs 5 lbs., with over 1,500 pages. Now, as it would trouble anyone wanting a scrap of blank paper, for a note, or memorandum, to find a spare clear square-inch between the two covers, it follows that every inch of the surfaces of nearly 1,600 pages is covered with printed matter of use and value. But to continue the comparison between the books of 1863 and of 1895. These years indicate a period of 32 years, so that, in order to bring your Big Book "up-to-date" it has grown, or increased in size and contents, nearly four-fold, and by over 1,000 pages, in that time; or at the rate of 30 pages every year, on an average. But some years have been more prolific of new matter than others, and notably has this been the case with this new volume, for it is by one inch thicker than that of last

year; to go beyond the dimensions of which it was then thought almost impossible. It follows, therefore, that the present Directory contains over 200 more pages of matter than any of its ponderous predecessors. How such a little island-country can furnish material for so huge a Year-Book is a puzzle, until we sit down to a careful and patient study of its contents. Naturally, as we should suspect, it is pretty exhaustive of the useful information about everything Ceylonese from its INDUSTRIES past, present, and those possible in the future, to its LAWS, TRADE, INHABITANTS, MANNERS, and CUSTOMS, CLIMATES (and there are many) STATISTICS of all kinds, particulars of all PLACES, TOWNS, VILLAGES, DISTRICTS, PROVINCES, ROADS, RAILWAYS, RIVERS a CALENDAR, chokefull of useful information of many kinds; all useful Ordinances, full Military and Naval notes, and a thousand and one other details which only an exhaustive Index can show; and the Index of this Directory fills 32 pages of double columns.

The full and complete Directory contains the names of everybody who is anybody, and is brought up to the date of publication by nearly a dozen pages of "Errata and Addenda," necessitated by the nature of the case, for somebody is shifting his quarters, coming, going, or alas! dying every day of our lives. The details of each district, and of every estate in the island, are particularly valuable and complete, having been corrected up to the latest possible date, and I see that the old antiquated word "abandoned," opposite valuable properties not yet brought under suitable cultivation, is here for the first time itself abandoned in favor of the more appropriate and correct word "uncultivated." A year or two ago before the Japs had asserted themselves, I happened to be at the Mount Lavinia Hotel when a dozen of these Islanders called here as passengers *en route* to Europe. I noticed them well. They were in European clothes, and for the most part spoke English. One of their number sat poring over good Mr. Link's copy of your big Directory for that year. Pretty dry reading, I thought, for tourists, till the gentleman jumped up, book in hand, searched out the manager, and declared he "must have one of these books," and offered to buy, and did buy and pay for that copy on the nail. Japanese, we have since learnt to know, are discriminative and appreciative, and good imitators, so that I should not be surprised to hear that your Directory has suggested one for Japan. It will take the Japs a good many years to get up such a book as this, but I suppose they will begin in a small way as you did over thirty years ago. It seems now, after nearly half-a-century, that it is scarcely possible to think of a single question to which a reference to the index will not direct you, amongst the subjects crowding these 1500 pages, to an answer. The man who does not possess a copy of this Directory is himself as a stranger in the land.

I must not forget the latest exceedingly valuable addition to this marvellous R16 worth of necessary knowledge, viz., the Map of Ceylon in a pocket in the cover. It was a happy as well as a liberal thought to present this along with the Book to subscribers; and I also see as frontispiece the presentment of our new Governor.

COFFEE IN THE STRAITS.—Considerable interest is being shewn in coffee planting in the Gopeng division, as the people are beginning to appreciate the value of the existing plantations around Gopeng and at the foreign settlement at Lentgat.—*Kinta September Report.*

BORER IN TEA.

On Sept. 19.—Messrs. Macneill & Co. wrote to the Association enclosing copy of a letter received from Mr. H. A. Hole Manager of their Doodputlee Garden Cachar, regarding damage done to an indigenous bush by a borer. The enclosure was in the following terms:—

I am today sending you by parcel post the shoot of an indigenous bush killed by a borer. There are two grubs within the shoot; I shall much like to know what they are. I never before saw any boring insect that attacked tea. Here it is comparatively common, as you will perceive, attacking the strongest and healthiest shoots of indigenous bushes, causing the shoot to wither and eventually rot off just where the bore commences. The grubs live on the pith of the shoot. The borer does not commence from the ground. The shoot I enclose rotted across about 2 feet from the ground, the pith of the lower portion being intact. I think many cases that are put down to white-ants are really the work of this borer.

The above correspondence and the shoot were forwarded to Dr. Watt requesting that he would kindly favour the Association with his opinion. In replying if Dr. Watt says:—

I have the honour to acknowledge receipt of your No. 326 O dated 9th instant, on the subject of a Borer caterpillar in a sample of Assam indigenous tea sent to the Association by the Manager of a Tea Garden in Cachar. I regret to say that the worm in question had so shrivelled up or possibly been so attacked by ants on transit that it was unrecognizable. From the appearance of its operations I should however presume it to have been the Red Borer, *Zeuzera Coffea*, an insect that I have repeatedly found doing much harm in certain gardens. You will find a figure both of the caterpillar and moth in Mr. Cote's "Account of the Insects and Mites which Attack the Tea Plant," p. 8.

2. I would invite you to kindly ask the Manager to cut off a few more twigs containing the borer, and to place these in a wide-mouthed bottle with spirits of wine sufficient to at least half fill the bottle. In this way the insect can be conveyed to me in a state that will admit of its final determination.

3. I would also desire you to be so good as to ask that certain observations be recorded regarding the insect. We do not know (assuming that it is *Zeuzera Coffea*) how many generations of that insect there are during the year. This could be best ascertained by completely enclosing an affected bush with wire gauze and allowing the insect to have its way with that particular plant. The number of times moths emerge should be carefully recorded. Some writers say that the moths emerge from the cocoons in February, others that there are more than one generation, while other species of the same family of insects are known to live for two or three years in the larval stage before they produce cocoons and perfect insects.

4. It would obviously be unwise to recommend any treatment till we discover the full life history of the insect. During my tour through Assam I urged on the attention of planters the necessity of their co-operation. We are not likely to advance the question of how to cope with the pests of the tea-plant till we possess more trustworthy particulars than we at present have regarding each blight and pest. Were each planter to give even five minutes every alternate day or so to the study of one out of the many insect pests we very soon would possess the desired particulars. The borers would be best studied in the way I have indicated. A few of the insects that escape should be collected, killed as carefully as possible, so as not to rub off all the plumage by which alone they are recognised. The others left to couple and lay their eggs. Cocoons, caterpillars and if possible eggs as well as perfect insects are necessary for a final determination. The preserved moths should be placed in a small box along with camphor. The date of emergence should be recorded, and the experiment extended for, say, two years in order to see how many times a year moths are produced.

5. For most of the larger insect pests of the tea plant I believe as effectual a method as any to battle with them would be to train a few children to catch the moths in ordinary insect-collecting nets. I have seen as many as 8 or 10 maunds of the common brown caterpillar (*Andraka trilochoides*) gathered daily in one garden. A few weeks later thousands of the harmless looking moths were, however, allowed to flutter about all over the garden, and deposit thousands upon thousands of eggs. I do not say the planters should stop collecting the caterpillar; by no means, but if it pays them to do so why not complete the process by catching the moths as well. The first step toward any such wholesale warfare against the larger insect pests is, 1st, to know both the caterpillar and the moth; 2nd, to know the months of the year when these should be looked for. In the case of borers it is obviously the more rational course to catch the moths, since the collection of the caterpillar very often means the destruction of the bush. The presence of the borer may at once be detected by the saw-dust like powder seen escaping from holes on the stem or branches, or accumulated around the base of the stem, and by the leaves of the tree all turning brown simultaneously and withering up along one branch or set of branches that spring from a distinct portion of the bush. These should be instantly cut off, and burned, as they can do no good, and may become the nursery for hundreds more of the same enemy

TEA BLIGHTS.

We (*Indian Planters' Gazette*) have to acknowledge receipt of the following correspondence which will be of interest to our readers:—

From—Messrs. Macneill & Co. Calcutta, Sept. 7.

In a letter which we have received from the Manager of our Kalline Garden in Cachar he writes us as follows:—

"In *Englishman* of 28th August a letter from Dr. Watt, read at Assam Branch of Tea Association, contains very valuable information under the heading of 'An Enemy of Pure Jhat Teas,' and solves a matter that has puzzled me for two years. Part of our very best tea has had the appearance, he mentions it had a close resemblance to red spider but you could not find the red-spider on the leaves as on hybrid. I am fairly sure it is the parasitic mite he writes of. These bushes have to a large extent recovered, but I should say, 10 per cent of them have given little or no tea for 2 years. I would feel much obliged if you could get me any further details or particulars of Dr. Watt's experiments or discoveries, and also if, when on this subject, you could get me a pamphlet or leaflet of his on the subject of introducing nitrogenous microbes into our soils by means of leguminous plants (a late German discovery). Mr. J. S. Hulbert, of the Assam Company, had been in communication with him about it."

We shall be much obliged if you can put us in the way of getting from Dr. Watt the further information which our Manager asks for.

Following upon this communication the Secretary of the Indian Tea Association communicated with Dr. Watt, Reporter on Economic Products to the Government of India.

Dr. Watt replied as follows:—

In reply to your No. 310—O., dated 10th inst., by which you forward to me an extract from a letter received by you from Messrs. Macneill & Co. on the subject of a blight observed at Kalline in Cachar, I have the honour to say that the blight in question is, doubtless, the new disease to which I have drawn attention.

The report on my explorations in Assam (at least in a preliminary form) I trust may appear very shortly, and will afford full particulars of the kind desired. In that report I am to recommend that the bushes should be syringed in March and April with either a decoction of *Adhatoda Visica* or kerosine emulsion. From my experiments I believe the simple insecticide we possess, in the wild plant *Adhatoda*, will very possibly be found completely

effectual. It is certainly killed the mite when applied to it under the microscope and was effectual also in the few practical experiments I was able to conduct during my rapid tour through Assam. But I am of opinion that unless applied with determination during the early stages of blights no insecticide is ever likely to be found a practicable remedy for any of the more serious maladies of the tea plant. Once they got fairly distributed over an area, say of 500 acres (which I calculate might possess 1,000,000 bushes), it seems to me that springing with insecticides is carried beyond the field of practicable operations.

Your further enquiry in which you ask to be supplied with a copy of my pamphlet on the Assimilation of Nitrogen through the Agency of the Root Tubercles in certain Leguminous Plants, I have much pleasure in enclosing two copies. I would add that while in Assam I made a discovery that I think of no small importance. The chemistry of most tea soils is admittedly deficient in nitrogen. You are aware that some years ago a hotly-contested controversy was conducted on the value of *Sa* (*Albizia stipulata*) trees being grown in tea gardens. The Hon'ble Mr. J. Buckingham was one of the very first advocates of this recommendation I found that tea gardens over which *Sa* trees had been planted suffered far less from blights, and from the mite alluded to above more particularly, than gardens where *Sa* trees were not grown.

[The remainder of Dr. Watt's reply we published in our issue of 16th inst. under the heading of "Tea Blights and Leguminous Plants."—Ed. T.A.]

A NEW CURE FOR SNAKE-BITE.

To allay, and cure, the intolerable pain following stings by scorpions, centipedes, hornets and their kind, which so often seek to share with us the shelter and comforts of our houses and couches in India, we have seen it stated that "*phenyle*" applied to the wounds has no equal as a remedy, and never fails. Be that as it may, we have now to consider a kindred subject of very much the greater importance as death after short agony is worse than pain however acute. We know from the statistics that a certain number of lives are lost every year from snake-bites; and although generally a marvellous immunity from such accidents is enjoyed by Europeans, still, so long as we live in a tropical country we are all liable to fall victims to lurking reptiles, while for the hospitals the subject is of vital importance. The world scarcely yet knows how tremendous is the debt of gratitude it owes to the great Frenchman, Dr. Pasteur, who has just passed away. He is even said to have 'put Lister on the path of his Antiseptic spray in Surgery'; and in France he saved the silk industry by curing the diseases of silkworms; he also cheapened the manufacture of beer by his pure yeast; he cured "Anthrax" in cattle, and following up this last discovery he was led to that still more important study the prevention and cure of hydrophobia. He saved hundreds of lives, and his system is now being followed all over the world. But these successes by no means exhaust the benefits conferred on mankind by this truly great man. Though he does not appear to have worked at the subject himself, it was he who again pointed the way, and it was at his institute that Calmette has conducted his researches for a "rational cure for snake-bite."

The principle is Pasteur's "immunised serum" possessing antitoxic powers. Pasteur's discoveries were directed against bacteria and bacterial infections, whereas the labors of Ehrlich, Behring, Kitasato, Calmette and Fraser have been to extend the same principle of serum-immunisation to other, *i.e.* non-bacterial, poisons. Not to weary the reader by following too closely the technical account of

these labours as we read of them in "*Nature*," we may quote, first, as follows:—"It had been demonstrated by several observers that, by means of oft-repeated injections of small sub-lethal doses of snake poison (rattlesnake, cobra, or viper venom), the resistance of an animal against the poison may gradually be increased considerably, it may be rendered 'giftfest' to borrow a German expression. In fact, all the methods used for inducing a tolerance against tetanus poison can be shown to work in the case of cobra poison." The next step was, that Calmette showed that, "on mixing cobra venom with small quantities of serum obtained from an immunised rabbit, the deadly effect of the venom disappears, a fact at once confirmed by independent observations by Phisalix and Bertrand." Lastly, we read that "recently these French observations have received entire confirmation in their leading points by Prof. Fraser of Edinburgh." We, therefore, see that we are within a measurable distance of having a reliable cure for snake-bite at last. Of course it still remains to be perfected; but soon every hospital and every doctor will have a ready means of saving the lives of persons bitten by snakes, as well, it would seem of immunizing anyone who may be willing from all danger from a chance bite.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, October 31.

ANNATTO—A few lots of fair seed from Madras realised 4½d per lb.

CAFFEINE—One of the manufacturers asks 19s per lb. for December delivery; the second one would probably accept 18s for the same position.

KOLA—There has been a good demand privately, sound but rather dull West African kolas having been sold at 8½d per lb. At auction today there was a good demand, fine qualities being held for very high rates. Other kinds were slightly dearer. Ten packages, out of the 41 offered, sold as follows:—West Indian, dull to good, but mouldy 6d to 9d; good 11½d to 12d per lb.

ESSENTIAL OILS—Lemongrass and Citronella oils unchanged. Cinnamon oil at 1s per oz.

QUININE—Few Transactions are reported this week. There would probably be buyers of second-hand German bulk at 1s 1¼d, but no sellers can be found at that figure. Perhaps 1s 1¼d might be accepted. The parcel of Italian (Fabbrica Lombarda) quinine to which we referred last week, had been lying in a warehouse for many years, and was out of condition. The price of 1s 1d per oz. obtained for this lot is therefore not a fair criterion to its general value. At auction today 6,000 oz. Brunswick quinine (landed weights), 188s import, sold at 1s 1d per oz.

VANILLA.—At today's auctions the fairly heavy supply of 202 packages, weighing in the aggregate about 2,900 lb., was offered for sale. Competition was exceedingly brisk, and the prices realised showed an irregular but all-round advance upon the last auction rates. Practically the entire supply was sold at the following rates:—Mauritius and Seychelles: fine, 7 to 8½ inches, 28s 6d; crystallised, 6 to 7½ inches, 27s to 28s 6d; medium to good fresh chocolate, 6½ to 7½ inches, 22s 6d to 27s; brownish to fair, 4 to 5 inches, 17s to 20s; fair crystallised, 4½ to 5 inches, 21s to 22s 6d; ditto, 5 to 6½ inches, 25s to 26s; common reddish, 12s to 17s per lb. Dull foxy Ceylon beans realised 10s to 10s 6d per lb.: ditto Java, 4½ to 6½ inches, 8s 3d to 9s 3d per lb.

TEA CULTURE AND BLIGHT.—We call attention to the discovery of Dr. Watt given elsewhere in favour of the planting of *Albizia stipulata* trees amongst tea, although the shade is not considered too favourable. As a substitute Dr. Watt recommends to the Assam tea planters the sowing of a crop of pulse and the digging in of the same; but the conditions in the Ceylon tea districts do not favour such an experiment, unless over a limited area.

ROEBERRY TEA COMPANY OF CEYLON,
LIMITED.

Incorporation of this Company with a capital of R500,000 divided into 500 shares of R100-00 each has been applied for by Messrs. F. J. and R. F. de Saram. The Company is purchasing we understand the two estates Roeberry and Dehegalle both in Madulseeema. A contemporary states:—

The former property consists of 633 acres, 300 acres of which are planted in tea, and 20 acres with grevilleas; and the rest is forest, chena, and patana. The other estate is 400 acres in extent, 242 acres being in tea; 58 acres coffee; 40 available jungle; and 60 scrub and jungle. The estates are being sold by the trustees of the estate of the late Mr. George Alston and the Blackwood Coffee Company respectively for £8,500 and £5,200. This is equivalent to about R237,000; and the cost of the factory now being erected, viz., R35,000, is to be paid by the Company. Three thousand R100 shares are to form the present issue; and the provisional directors are Messrs. Geo. Alston, W. H. Figg, and Percy Bois.

“FERGUSON'S CEYLON HANDBOOK AND
DIRECTORY 1895-96.”

(By an “Official.”)

A new edition is before us literally bulging with information, and though not overflowing, very full indeed. It is a compendium of information—the experience of years of unwearied industry, of dauntless labour, of unselfish love and study of the Editor's tropical home—not the scourgings of a bird of passage. Mr. Ferguson has given Ceylon more than any European has ever taken or can ever take away from it. No Dependency of the Queen has ever been served as he has served it, and may his shadow never grow less. The chapter on the rise and progress of the planting enterprise has been written down to the present year. As regards plantation coffee, it is satisfactory to find that the estimate for 1895 is 57,000 cwt. as against an export of 29,629 cwt. in 1894; and as regards native coffee an export estimate for 1895 of 4,000 cwt., as against an export of only 1,568 cwt. in 1894. These are encouraging indications that the decadence of the coffee plant has been arrested and that a slow but steady increase of the output of coffee may fairly be looked forward to. At present we have 305,000 acres of tea under cultivation. The export of tea has risen from 23 lb. in 1873, value R58, to 85,376.322 lb., value R16,103,214 in 1894. The imports of tea in 1873 were 69,494 lb., and in 1891, 242 lb. In 1878 10 cwt. of cocoa were exported; the estimated export for 1895 is 28,000 cwt. The export of cinnamon in 1893 amounted to 1,160,754 lb., value R580,370. The estimated export for 1894 is 2,784,754 lb., value R1,113,902. The area of land under coconut cultivation is 854,221 acres yielding 1,436,219,635 nuts at an average of 1,680 nuts per acre. The approximate estimate of area cultivated with the coconut palm in the world is 2,780,000 acres. The cultivation is also being extended in Northern Australia with success. To what extent the ever-increasing cultivation of coconut will in the future affect the question of price, can at the present time be only a matter of mere speculation.

It is impossible for want of space to touch upon the exhaustive treatment of all our products—cardamoms, cocoa, palms, cinchona, rubber, &c. One can only peruse with ever-increasing interest and wonder the various exhaustive articles on these subjects. The total area of land cultivated in Ceylon is estimated at 3,387,000 acres, with a probable eventual extension to 4,860,000 acres. The valuation of agricultural property in Ceylon is estimated at £40,510,500. I have thus very lightly indeed touched on the first part of the Directory. Part II is entitled “Calendar and Useful Information.” The useful information is very comprehensive and minute—abbreviations used in connection with commerce—common chemical terms and their scientific equivalents—foreign patents, notes on boilers, table

of constant multipliers for finding weight of metals, a most exhaustive chronological table of events in Ceylon, a resume of the principal Ordinances, &c., &c., &c. The comparative statement of revenue and expenditure in 1892 and 1893 (and further on, 1894) is most interesting, as also the chapter on Ceylon Railways. There is a very full and interesting chapter on the Colombo Harbour Works. The Directories are very full, as also the Estate Directories. But I must stop. It is utterly impossible to convey any fair conception or any conception at all of the vast and varied amount of most useful information this “Handbook and Directory” contains. At the end of the book there is a pocket and in it we have an excellent map of the island. So that between the boards we have the island and all it contains. The labour involved in gathering and arranging the information must have been stupendous. The result is worthy of the builder and worthy of the subject. If the Government Record Room, and the Kacheheri Record Rooms in the island, were burnt to ashes tomorrow, “FERGUSON'S CEYLON HANDBOOK AND DIRECTORY” would supply all that they contained and a trifle more!

THE CHINESE TEA TRADE AND
RUSSIA.

The following is an important extract from the letter of the St. Petersburg Correspondent of *The Daily Telegraph*:—

At a sitting of the Siberian Railway Committee, presided over by the Heir-Apparent, now the reigning Czar, on Oct. 31, 1893, it was resolved that the Government be urgently requested to take energetic measures to induce the Chinese authorities to allow the Russian railway to run through Chinese territory in two directions, viz., from the Transbaikal to the Gulf of Liaotung on the one hand, and through Mongolia to the Central Provinces of China on the other. The reasons alleged were reasonable enough—from a Russian point of view; viz., the necessity of winning the Chinese markets, and in this way of paying the expenses of the railway. The memorandum on this commercial aspect of the case is instructive. It set forth that the chief exports from China are costly—viz., silk and tea, amounting to about 68 per cent. of all exports from the Celestial Kingdom; that about two thirds of these pass through English hands, and that over and above, England is ruining the tea trade* by her own plantations in Ceylon and India; that China, left to her own resources, is powerless to break down this competition; but that Russia, with the tea trade in her hands, could enable China to hold her own. The chief imports also could be supplied by Russia with advantage to both countries, viz., cotton &c., amounting to 41, and metal manufactures and woollen wares amounting to 10 per cent. of all China's imports.

Unless this be done, it was urged, the Siberian railway will prove ruinous to the country. The report wound up by affirming that in all that part of north-eastern Asia, the most important district for Russia, from an economical and strategical point of view, would be the contiguous territory of Manchuria, comprising the basin of the Sungaree, with the cities of Sansin, Ningoota, Tsitsikar, and Girin, the actual population of which is about twelve times that of all Ussuria. This territory must be brought under the control of Russia.

And this is precisely the land through which it has just been reported Russia is authorised to construct two lines: to be called the Nertsinsk-Tsitsihar-Vladivostok Railway and the Tsitsihar Port Arthur Railway respectively, besides which she has received the right of anchorage in Port Arthur.

The plan existed, as I have shown, at a time when China and Russia stood face to face as irreconcilable enemies. That it will be realised now that they have become fast friends cannot for a moment be

* From 1886 to 1890 the export of tea from China fell from 90 to 67 million pounds.

doubted. The news may be premature. That it is absolutely false, no person acquainted with Russia's style of policy in the Far East can for a moment believe. Most of the reasons are obvious.

THE FUTURE SUPPLY OF INDIA RUBBER.

*An English View of the Situation. **

Some twenty years ago sinister rumors as to the depletion of the rubber forests of South America caused a new departure in economic botany, namely, the systematic planting of rubber trees, and the results may be considered satisfactory as far as the possibilities are concerned, although the garden product, as we may term it, has not yet entered into serious competition with that from untended nature. The question now arises as to whether all the time and trouble has been expended needlessly or not. From what has appeared recently in the American technical press, this would appear to be the case, and it seems of some interest to briefly recapitulate those criticisms on what is almost entirely an English enterprise. Attention is drawn to the fact that vast forests of rubber trees exist untapped, and that any fear of curtailment of supply is illusory. This statement is supported by the fact that the market price of rubber remains practically stationary, while the demand has largely increased of recent years. A critic remarks that there is no good in doing what nature has already done so well for us; and another practical man, when asked why he did not support the rubber plantations, made answer by the query, "Why do I not go in for the cultivation of coal?" These and similar remarks go to show that in America there is no fear as to the supply running out, and that, therefore, any precautionary measures which prudence might dictate are unnecessary and uncalled for. The American business man cannot see any pressing need for the movement under consideration, and he is unwilling to embark his capital in an affair the benefits of which to him at any rate, are so problematical. With regard to this point of unlimited supply, it may be noted that recent travellers in the upper parts of Brazil report that there is a large unworked area of rubber forests in the watershed of the Orinoco, and even where the forests are worked it is only in rare instances that more than the borders of the stream have been tapped, no trouble being taken to get spoil from the higher regions. Further than this there is a constant succession of trees arising from seeds. Count de Berthier has expressed the opinion that the Venezuelan forests could be made to yield 1,000 tons of the best rubber per annum if carefully worked, and he is supported in his optimistic tone by what the Baron de Marajó has written in a recent number of the *New York India Rubber World*. In Africa, although the supply is abundant, the want of navigable rivers has acted prejudicially against the due expansion of the trade, as under the conditions of portage at present obtaining in many localities the natives find it unprofitable to carry rubber any distance to the coast when the item of paying tribute to the various tribes encountered *en route* has to figure in the profit and loss account. While on this matter of Africa's addition to our supply, we should like to take the opportunity of referring to the statement of M. Chapel that if the African rubbers were collected and prepared for market by the more enlightened methods in vogue in South America, the resulting product would be equal to the best Pará rubber. We confess to a mild feeling of surprise at this statement, and consider it a bold assertion which is not supported by the facts of the case, though as it must be remembered that some kinds of African rubber are much superior to others, the author quoted may have had in his mind the best of the African sorts. As regards the bulk of the rubber, that from the *Landolphias*, or the species of *Ficus* found on the west coast, we think the day is very far distant which will see them improved to the standard of Pará rubber,

though we certainly do not doubt that some amount of improvement is possible, and indeed, to our own knowledge, this has been effected of recent years in the case of the Lagos rubber, which, though at first practically worthless, now fetches a fair price in the market. However, we are rather wandering away from the lines of this article, and to return to the critics of the rubber plantations, it may be noted that they prognosticate great difficulty in obtaining labor if the plantations are carried out on anything like a large scale. The Indian, it is asserted, will not change the whole course of their lives and submit to the entire revolution of their methods of work, while it has been amply demonstrated that Europeans or Asiatics are incapable of sustained work in the climate. Other objections have been urged, but in face of the chief one, viz., unlimited supply, there seems but little use drawing attention to them. The case then seems a tolerably clear one for those who argue that rubber plantations are not warranted by the facts of the case. In passing judgment, however, on those who, in the light of recent discoveries, may seem to have acted somewhat precipitately, and without the exercise of due foresight, we should, of course, bear in mind that the common facts of today were not the common facts of 10 or 20 years ago. The discovery of these rubber forests is of recent date, and it cannot, therefore, be pointed at as an overlooked factor in the original consideration of the matter. It will be remembered by those interested that the representations made to our Kew authorities as to the depletion of the rubber forests, were couched in distinctly alarmist language, and therefore they quite merited the measures taken by the India Office. Of course it was possible for our government to have undertaken such explorations as have recently been made by private individuals, and this would probably have resulted in the alarmist rumors being somewhat discounted, as we may presume that the forests of today existed in much the same condition 20 or 30 years ago. However, it is easy to be wise after the event, and we shall certainly not be found in the ranks of those who seek to throw ridicule on the whole movement, because, whether the expense and trouble which our Kew authorities have been put to seem warranted or not at the present time, it has certainly been shown that rubber trees can be successfully acclimatized and grown in India and other districts far remote from their original habitat, and occasion may yet arise when the information thus gained may prove of much value to the India-rubber industry.

COMMENT BY AN AMERICAN IMPORTER.

A gentleman thoroughly familiar with the conditions of trade and industry in Central and South America entertained somewhat different views from the above. "While," said he, "it is true that not much capital, American or foreign is invested in rubber plantations, the question is certainly in the air, and before long the vague notions and ideas on the subject will assume practical shape. The rubber countries are poor and naturally anxious to attract capital from outside to develop their industries and resources. On the other hand, it is beginning to be felt that some measures have to be taken to insure the future supply of the ever-increasing demand for rubber. As population grows, and as new applications or extensions of old applications of rubber in industry, are made, the demand for rubber increases, and it is a short-sighted policy to depend on existing rubber forests, which surely cannot last forever and access to which must become more and more difficult and expensive. Not only will rubber plantations be needed, but there will be more profit in them than in going to the inaccessible forests for the supply. The business world is not entirely ripe for it, but the subject is in the air, and you may expect to see the starting of a great many enterprises in that direction before many years go by. It is, however, to American capital that we have to look for this. Foreign capital will not go into anything the price of which is controlled by this country. We consume two-thirds of the rubber product of the world, and hence control prices. In twenty years our consumption has risen from less

* From London *Engineering*.

than ten millions to not far from forty millions. The rubber countries look to us for capital. The natives in South and Central America have already begun the planting of rubber trees, and a traveler will meet here and there plantations of considerable importance. But American capital will do the real work when the time is ripe. There is, however, one serious drawback,—the lack of labor. There is no civilized population in the rubber districts, and the Indians cannot be depended on for regular, systematic, and continuous application. They are not accustomed to order and discipline, and they will work in their own way, getting drunk or loafing whenever it suits them.—*India Rubber World*.

VARIOUS PLANTING NOTES.

WOOD ASHES, fresh and unbleached, are of great value as a manure for fruit trees generally and also for strawberries, but the bare advice often given that they be "stored for use" should be accompanied by instructions regarding the proper method of storing. If wood ashes are once wetted they will have lost much of their manurial value; therefore they should be stored as soon as made. They should be kept quite dry at all times; but better still would be the adoption of a system of applying them to the soil while fresh.—*Indian Agriculturist*.

THE NEW DUMBULA CO., LD.—We attract attention to the proceedings at the annual meeting of this Company in London as given in another column. They reveal a specially satisfactory state of affairs and it is no wonder though the shares in this Company are strongly held in view of the dividends paid, and the fact that 837,116 lb. of tea last season were placed on board ship at the very low rate of 3.26d per lb. Altogether, the vote of thanks to the Ceylon Manager was exceptionally well deserved.

THE "AGRICULTURAL GAZETTE" of New South Wales, Vol. VI., part 9, September 1895.—Contents:—Notes of a Trip to the North Central Coast Forests of New South Wales, J. H. Maiden; The Cultivation of Lucerne (*Medicago sativa*.) J. L. Thompson; Broom Corn or Broom Millet (*Sorghum vulgare*, Pers.) G. Valder; Comparative Test of Sorghums, G. Valder; Sugar-cane at the Experimental Farm, Wollongbar, Richmond River, G. M. McKeown; The Honey Bee—On the Relationship of all Bee-races, with suggestions for their Improvement, R. Helms; Bee-keeping—The Inmates and Economy of the Hive—The Queen Bee (*continued*) Albert Gale; Practical Vegetable and Flower Growing, Directions for the month of October; Orchard Notes for Oct., General Notes; Growing Flax; Table showing the Districts in which the under mentioned Timbers are obtainable; Wild Oats; Yorkshire Fog, Agricultural Societies' Shows. 1895-6.

COFFEE IN GERMAN EAST AFRICA.—The *Deutsches Kolonialblatt* says:—

The firm of A. Zuntzel, Wve., has given the following report respecting a sample of coffee sent by the station Kilossa in German East Africa:—"The coffee resembles the increasingly scarcer fine Ceylon coffee. The bean is not yet fully developed; the roasted beans also appear somewhat shriveled; but probably the product could be brought to develop well by means of practical cultivation and rational treatment. The flavour of the roasted beans is good and resembles that of Ceylon coffee. The price of the raw coffee I should estimate at 85 to 90 pf. per $\frac{1}{2}$ kilo, without duties. The price of good Ceylon coffee, or of its superseder, namely 'West Indian cured,' varies from 90 to 105 pf. per $\frac{1}{2}$ kilo without duties. If I place the price of the sample sent lower, it is because it is still somewhat light and not so full of flavour as the kinds resembling it in the market." From the above it appears however that a regular cultivation of the coffee referred to would in process of time pay, and should thus well be recommended.

LEEDS AND ITS TEA TRADE.—The "gift" system applied to the sale of tea is popular, we should imagine, in Yorkshire. In Leeds the generosity of the tea retailers knows no bounds. Furniture, upholstery, in fact almost anything from a child's cot to a bootjack is included in the items given away with a pound or more of tea. Indeed, a large purchaser of tea who was about to start house furnishing might stock himself with tea and fittings upon reasonable terms, and upholster his residence from the kitchen to the roof, including the crockery and the carpets.—*H. & C. Mail*.

VICTORIA REGIA PLANTS.—Read the following letter from Mr. W. Nock, Acting Director, Royal Botanic Gardens, Peradeniya, dated 3rd September, 1895:—

"You will be sorry to learn that all the plants of the *Victoria Regia*, that you were good enough to send, have died. On the other hand you will be pleased to learn that 11 of the seeds have germinated and are doing well and I hope in a few weeks time they will be large enough to plant out. The only thing that has troubled them yet is a water slug which feeds on the small tender leaves. I am having these carefully hand picked and I trust all will now go well. I had much pleasure in despatching by post to your address on 22nd ultimo, 36 packets of Palm seeds which I trust have reached you safely and that they will prove acceptable. I very much regret that, at present, we have but a very few of the plants named in your list of desiderata, but I have instructed my assistant to propagate as soon as possible as many plants of those you ask for and they will be forwarded as soon as they are ready."—*Agri-Horticultural Society, Madras*.

THE LABOUR QUESTION—like the poor—is always with us and there are signs as the letter of "A.F.S." shows that scarcity of supply and pressing needs are likely to lead to multiplication of sharp practices. We fear the Government cannot take action in the way pointed out, more especially in respect of private land; but certainly the matter should be brought under the notice of the Planters' Association.—A much larger question is opened up after a very interesting fashion by our correspondent "Egomet." He begins by having a hit at the objectors to indentured labour, and then proceeds to point out to those whose averseness to this system appears to be based upon the regulations that obtain in Assam, that an organization yielding very desirable results, which he enumerates, exists on the Diamond Fields of South Africa and is very well worthy the consideration of our planters. In the concluding part of his letter he emphasizes the necessity for reform whether initiated by the Government or by the planters. On this point our opinion is that the matter is not ripe for legislation, at all events at present. "Egomet's" proposal is nothing less than a revolution in the present system of dealing with the planting labour force in Ceylon. The sketch given of what has been done on the Diamond Fields is most enticing, more especially the substitution of arbitration Boards or officials for the Law Courts, the regulation of the supply of liquor, and the guarantee of a regular supply of docile labour. We fear in the case of Ceylon that the formation and working of a similar organization so as to cover the whole of our planting districts would be expensive. But the members of the Planters' Association would do well to invite "Egomet" to lay the scheme before them in full detail.—In the minutes of the Udappussellawa P. A. we notice that a very sensible resolution has been passed recommending co-operation between the planters and the Chamber of Commerce as to making a suitable alteration with regard to paying coolies.

Correspondence.

To the Editor.

PROFESSOR ARCHIBALD ON THE MONSOONS AND THE "ELEVEN YEARS" CYCLE."

Nov. 19.

SIR,—As I happen to be again passing through this earthly Paradise and may not have another opportunity of following up the question *in situ* I shall be glad if you will allow me a little space to refer to the "eleven year" cycle of the dates of arrival of the big monsoon at Colombo which I placed before your readers in 1893 and to advert to its apparent and exceptional failure during 1893, 4, and 5. From the averages for the cycle from the past dates since 1854 given in the list furnished by the Master Attendant, the arrival of the big monsoon ought to have been 2, 10 and 4 days early in 1893, 1894 and 1895 respectively, whereas it was 19, 16 and 30 days late—differences not only exceptionally large, but entirely opposite to those which occurred in the corresponding individual nine years of three preceding cycles covering a period of thirty years.

Of course the popular verdict will be that the theory has failed, and so I frankly admit that it has in these three years; but it would certainly be hasty to infer either that its existence is mythical or that it may not turn out to have a practical as well as scientific value in the future and I venture to put forward my reasons in support of this claim.

In the first place it was discovered by the remarkable unison that was found to be displayed by the arrival dates at Colombo and the yearly rainfall anomalies of the Carnatic, the cases in which early dates at Colombo and heavy rainfalls in the Carnatic and late arrivals and light rainfalls agreed, being no less than eighteen out of 22 with only one distinctly negative case. Such a parallelism itself argues the presence of law and even granting that three cases in which the parallelism fails, have now to be added, they only make the ratio of favourable to unfavourable eighteen to four instead of eighteen to one. Moreover, since the concurrent fluctuation in the Carnatic rainfall and the sunspots has been maintained all through, notably in the present year as referred to in the *Pioneer* of Nov. 5th, the exceptional feature seems to lie entirely with the Ceylon dates of arrival.

Now as the Master Attendant may be assumed to have only a small personal equation, we must evidently look either to some local peculiarity or to some general cause which without sensibly altering the supply of rain to the Carnatic or Ceylon has exercised some peculiar effect upon the conventional date of the arrival of the big monsoon at Colombo.

It is certainly a fact which has been officially admitted by Mr. Elliot, the head of the Meteorological Service of India, with whom I have been working during the past two years, that ever since the beginning of 1893, some extraordinary and abnormal set of conditions has prevailed, not only over India, but over the entire Indian ocean, as far as data are available. The monsoons of 1893 and 1894 were abnormal in respect both of quantity and distribution, and it was only the other day as he was leaving for a tour of inspection in Persia that Mr. Elliot asked me to investigate the possibility of these conditions being connected in some way with an unusual quantity of floating ice in the Southern Ocean, of whose presence an Orient steamer had a vivid proof the other day by receiving 70 tons of it on board without any manifest after colliding with a berg. It will surely be admitted that the presence of such a widespread abnormality as that which caused the monsoon of 1893 to stand out in contrast with all its predecessors, as the *wettest ever known*, and that of 1894

as the *second wettest in India* may be allowed to upset temporarily a law which depends on a regularly recurring and small variation of sun-heat. As soon as these abnormal conditions subside, the normal laws may be expected to act, and the cyclical law which I firmly believe exists, will resume its operations.

Before concluding, I should like to point out that the rainfall of Ceylon judging from Colombo unlike that of the Carnatic does not seem to be directly dependent upon the early or late advent of the S.-W. monsoon as estimated by the Port officer.

For example in 1893 when it was 19 days late according to his method, the rainfall of May at Colombo was no less than 20.39 inches or nearly double its average (11.34) for this month while the total for the year was 2 inches above the average. Some people would be inclined to fancy such a rainfall with a S.-W wind would of itself constitute a monsoon, but I suppose the Port officer has his own opinion about what constitutes a burst. Again in 1872 when the burst was assumed to occur on May 1st which was 18 days earlier than usual the rainfall of May was 1 inch below the normal, and the total for the year 25 inches below the mean for 25 years, and nearly the lowest on record.

It would almost seem therefore from these instances that an early arrival of the big monsoon betokened a scanty rainfall and *vice versa*. I have therefore examined this point with the following results.

First I have taken exceptional years and then all cases of early and late arrivals. The results are given in a tabular form below:—

Table I.—Extreme monthly falls, arrival of big monsoon.

		inches	
Wettest May	1888	28.78	one day early*
Driest May	1882	2.62	normal date.
Wettest November	1870	36.23	9 days early.
Driest November	1872	2.82	18 days early.

Table II.—Big monsoon exceptional arrivals.

(1) Early	years	average	rainfall	anomaly		
		date	May	Oct.	year	
1872 } 1874 } 1883 } 1887 }		May 6th	in.	in.	in.	
		(13 days early)	0	-1	-8	
	(2) Late	1876 }	June 5th	in.	in.	in.
		1885 }	(17 days late)	+2	+1	-3
1893 }						
1894 }						

Total annual fall anomaly

	in.
All early years (11)	+0.8
All late years (12)	+2.0

The balance is thus in favour of late years though the amount is not enough to be practically important. The general result appears to be that so far as Colombo is concerned the monthly and annual falls are not directly dependent on the early or late arrival of the south-west monsoon, but is due to certain secondary and probably local influences which mask any regular periodicity; but that in general the rainfall at Colombo both monthly and annual is greatest in those years when the arrival of the monsoon according to the port officer's definition is latest. An examination of the rainfalls at other places in the island is required before any deductions can be drawn for districts other than the neighbourhood of Colombo. I hope some one may be tempted to undertake it and send the results to the Indian Meteorological Office, which is studying the general conditions that affect the monsoons of the Indian ocean.—I am sir, yours faithfully,

DOUGLAS ARCHIBALD,

Fellow of the Royal Meteorological Society of London.

* The average date for the arrival of the big monsoon is taken to be 19th May.

BRIQUETTES (BRICKS) OF COFFEE HUSK FOR FIRING PURPOSES.

November 20.

DEAR SIR,—In the *Observer* of the 19th inst. I note that at the last meeting of the Malang Planters' Association it was resolved to offer a prize for the discovery of a cheap binding substance for the preparation of briquettes of coffee husk, etc., etc., and as I think I could throw some light on the subject, I would be glad if you could put me into communication with your Soerabaya friends.

For several years past I have been experimenting—off and on—with coir fibre dust mixed with a cheap, adhesive and inflammable substance, pressed into briquettes, the size and shape of a Scotch peat, which makes a good fuel, but has insufficient heat generating power, as only 19 lb. of steam could be got out of it although I stoked all I knew.

Had I got another 6 or 8 lb., it would have done my purpose, but unless some other cheap substance can be found, I must confess to being defeated, as have done many better men before me, who have tried their hand at it but the substance used with the coir-fibre dust would amalgamate with coffee husk equally well and would I know solve the Malang Planters' difficulty, as the coffee husk has in itself sufficient heat generating power for any ordinary steam pressure.—Yours faithfully,

ENGINEER AND PLANTER.

[This letter is sure to attract attention in Java (Malang and Soerabaya) and we shall be ready to give our correspondent's address when applied to. Meantime he might write to the Secretary of the Planters' Association referred to.—ED. T. A.]

THE CEYLON LABOUR QUESTION.

Nov. 20.

SIR,—Indentured Labour to Planters would appear to be pretty much what Pork is to Jews. Why it should be so is a little hard to understand. Indentured Labour is of all sorts, is indeed just what you choose to make it. Its sole essential feature, the point in which it differs from free labour is this, that in the contract of service the employed is either represented by, or else has conjoined with him some responsible party, generally a Government Department or a Labour Bureau, which stands *in loco parentis*. All else, the obligations of the employer to the bureau and of the bureau to the employer, are as may have been arranged between the authorities and the representatives of the industries concerned.

When a Ceylon Planter grows inflamed over Indentured Labour he has in mind, I am told, the regulations which obtain in Assam; whereby, he declares, the Planter is converted into a sort of milch cow for his coolies, and the coolies into "fat and greasy citizens" who do a turn of plucking or weeding now and again just to keep them in health and appetite. However this may be (and the description strikes one as a trifle embroidered), I am not concerned to defend the Indian system; my purpose is to emphasise the fact that the Indian system is not the only one.

What is wanted in Ceylon, if I am correctly informed, is an organization which shall secure (1) to the Planter a sufficient and steady supply of labour, and this without recourse to recruiting agents or advances; (2) to the coolie, fair wages and treatment and protection from caprice and inexperience on the part of the employer; (3) to the Government the two desiderata of steady employment for the labouring classes, and the abolition of those incentives to drink, debt, and petty crime which are inevitable where the coloured labourer is treated, quâ labourer,

otherwise than as a legal minor. To which may be added, (for the solicitude of Government may surely be expected to extend thus far), the promotion of the interests of industrial Capital in so far as they hinge on Labour.

An organization yielding these results now exists on the Diamond Fields (not yet on the Gold Fields) of South Africa: outcome of twenty years experiment and discussion, not without noise and heat. It occurs to me that the Planting Community of Ceylon, in preparation for the revision of its labour arrangements which the accompanying of the tea industry now in progress will render necessary, might find it profitable to investigate the methods of regularising labour which obtain elsewhere, and this method in particular. A system which in disputes between master and servant, substitutes for the tedious untrustworthy processes of law the summary arbitration of skilled labour officials;—which safeguards employer and employed alike from the crimp and the pettifogging lawyer;—which makes it an indictable offence to serve liquor to a registered labourer without his master's written permit;—which treats a registered labourer who should leave the estate without a written permit as a vagrant, and any person who should enter the estate without a written permit as a trespasser;—which guarantees a steady supply of docile labour.—such a system is surely worthy study. For the substantial benefits aforesaid the employer in his turn is under sundry obligations which he may not shirk; but they are obligations which no man, fair-minded and possessed of the gift of working labour—and it is as much a gift as writing poetry—will consider vexatious.

And now what like is the system in operation here in Ceylon? "Just perfect!" exclaims the orthodox Planter in reply. But one has not gone far in search of the perfection before one finds that like the joys of Paradise it is ineffable; no tongue can tell it. One hears how you catch your cooly, and how you keep him, and the way you pay him, and what happens when you and he fall out and invoke the aid of the law; but at the end of the story what appears is not the perfection of the system, but the patience of the Planter. In the light of the famous Labour pamphlet—I hear the unhappy author is hiding in the high jungle until the storm he raised is over—and the subsequent Correspondence, the Ceylon system would seem to have at its root—one might even say as its root—the habitual and hereditary insolvency of the cooly; gathered up and made available for the purposes of the Planter in the person of the kangani, and recorded in the *Tundu*: primarily a caveat emptor addressed to whomsoever the cooly seeking other employ, may address himself. Now the *tundu* is hardly a document to take into a Court of law, and an Auditor, a London Auditor, would treat it with scant courtesy. Its value is as a string round the coolie's leg; and it is this only, so long as the planters hang together and discourage the mobility of Labour.

The *tundu*, indeed the whole system, is the outcome of the Arcadian phase of the industry, when estates were all in the hands of private owners, and native cultivation had not begun. The planting community was then, and in no sentimental sense, a brotherhood from which any man who should play "dirty tricks," crimping his neighbours' coolies for example, was promptly banished. Camaraderie secured mutual fair-dealing. But private owners are now rapidly giving place to public Companies with neither bowels nor conscience, exercising no more rectitude in their dealings than the Law demands, and as much less as possible. And with the Companies is coming into existence a body of native planters who also will show small respect for the 10th commandment in the articles of manservant and maidservant. All this would not matter were the supply of labour in excess; but it is not in excess; it is, I am told, barely adequate. With demand unscrupulous and supply deficient, a state of things is inevitable, has indeed already begun within a few miles of where I am writing, which will issue disastrously to the employer or not, according as he takes the initiative in reform or leaves the initiative to Government.—Yours etc.,

EGONET.

MR. J. H. RENTON ON CEYLON TEA
IN AMERICA.

Relugas, Madulkelle, Nov. 24th.

STR,—Although enclosed is a private letter, I think the information contained is sufficiently interesting, coming from an independent source, to warrant its publication.—Yours truly,
A. MELVILLE WHITE.

New York, Oct. 25th.

My Dear White,—I have been some six or seven weeks in the United States and Canada, making myself personally acquainted with the conditions of the tea trade and write to you to say how very pleased I am with all that MacKenzie is doing for us. He is doing his very best with the small funds at his disposal. Six thousand pounds go a very little way in this country, but the lines he has adopted are the right ones, and I do most sincerely hope that for the sake of Ceylon he will continue to act as our delegate for another year or two. He has got in touch with the men, and now that he knows the ropes it will be a great pity if he were to leave and some new man take his place.

I think, however, that the Ceylon Planters might do more themselves to help the introduction of their teas into this market. First, by placing much more on the Colombo market. The American buyer would prefer to buy direct. He does not like the idea of playing second fiddle to London. He buys direct in China and Japan and does not see why he should not do the same in Ceylon; but as long as the London market remains at a penny a pound below the Ceylon market, he does not see the force of sending out any direct orders, and the general complaint is, that direct orders are not executed, owing to the lack of supplies of the proper kinds of tea for this market. The only advantage which the American buyer receives by buying direct at present, is that he gets his packages in good order. I have been into several warehouses and am perfectly ashamed at the condition in which the Ceylon packages arrive from London. 90 per cent are broken and tied up with bits of rope and hoop-ironed all over. This is the result of the teas being re-bulked in London.

Second.—What the Americans want are well-made, well-twisted leaf, light in cup, thin liquor and flavour. I know that it is difficult to make Pekoes and Pekoe Souchongs of this description for America, while the Broken Pekoes must be made differently for London and other markets; for Broken Pekoes are almost unsaleable here. The teas most suitable are Pekoes and Orange Pekoes.

Third.—I hear great complaints about our packages. Our chests are too bulky and clumsy for inland transport. The American prefers the Japan packages and there is a great deal in this complaint, when you consider the immense distances that they have to travel in the States. The Japan packages are made of Momi wood and run as a rule, 23 inches long by 15 broad by 19 deep. These are covered with matting. Now, as we import an immense number of Japan packages, is there any reason why we should not import packages of a size suitable for this market? We can import the same wood as what the Japanese use, viz. 3-8ths inch and the matting to cover packages of this reduced thickness. I think that if we could give them 1st, more teas; second, teas of the quality they want; and third, in the packages they want; there can be no doubt, we should do a much bigger business in Ceylon teas with America.—Yours very truly,
J. H. RENTON.

A. MELVILLE WHITE, Esq., Chairman, Planters' Association.

A DAY AMONG THE COCO-PALMS.

And such palms! We can well say after wandering among the classic groves of Mirigama that "the half was not told us." "Classic" in the sense of being almost historic as well as most interesting ground in connection with Ceylon planting; for who has not heard of "the Squire of Mirigama" and his famous work among the coconut palms?

After being a successful coffee planter in Dumbara so far back as the "thirties"—('twas sixty years ago!)—Mr. Wright took charge of Peradeniya and there opened up field after field with coffee, and qualified as well as horticulturist in the forties and early fifties. Thence he went as pioneer coffee planter to East Haputale in the fifties, sixties and seventies; and then we find Mr. Wright, after some years' residence in town, renewing his youth and showing both young and old coconut planters "how to do it," by opening and cultivating this model plantation of 250 acres in the vicinity of Mirigama. Its name "KANDANGOMUWA" means the place where the trunk of a beheaded man was buried—beheaded and buried no doubt "by order of the King" of Kandy. Not far away is the beheading place itself, and the locality being near the Kegalla frontier where there was often fighting between the Kandyan forces and their enemies, it is not unlikely that the punishment of both traitors and prisoners was more common here than in other parts of the country.

The slaughter, however, which has taken place on and around Kandangomuwa, during the past ten years has been of the enemies of the coconut palm. These are principally in the shape of beetles and against them and especially the kandapanwa or red beetle, Mr. Wright has waged deadly war, not simply on his own plantation, but also throughout the country-side around his plantation. The reason for this is very obvious when one remembers the terrible foe this beetle proves to young coco palms and the difficulty of knowing that they have found a lodgement, until their work is almost fatally done. It is generally too, the most luxuriant and promising, because tender and succulent palm that the red beetle pounces upon, and only after he has burrowed down to the heart and utilised the life-blood for his offspring, do the signs of the attack become externally visible. Occasionally the mischief is perceived before the plant is vitally affected, and if the beetle is got at and dug out at once and the tree properly treated, recovery is possible. But where the beetle has had time to make his deposit and rear his family, it is of the utmost importance that the tree should be cut down and utterly burnt before the swarm of beetles gets away. A single tree neglected, in what is too often the native fashion, until it becomes a perfect nursery of the kandapanuwa, is enough to affect a whole district of plantations. In our walk through Kandangomuwa, we saw but one palm affected by red beetle and it was being promptly and effectually dealt with. But what would be the use of Mr. Wright's watching carefully over his 250 acres, or some 17,000 palms, if in the native gardens all round him, no care were taken to deal with trees affected by the beetle. Perhaps there is no more striking illustration in all the history of agriculture than this of how a careless owner may damage his neighbour's property. In Australia, a Thistle Act was passed to enable careful cultivators to clear up neighbouring properties of a wilderness of thistles, if such were neglected by the owner, at his expense, and in Ceylon in the old coffee days, a

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears &c., no matter how severe or long-standing, will be sent post free.—Artificial Ear-drums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN LONDON.

similar Ordinance was often threatened in reference to white weed. But certainly, still more important should it be to have a measure to compel attention to the chief enemy of the coconut palm. The plan adopted by Mr. Wright is, however, an effectual one and very pleasing to his native neighbours. For, as soon as he hears of a palm attacked by red-beetle in his neighbourhood, though outside his own property, he hurries off with kangani and cooly, and pays the owner 50 cents for the privilege of being allowed to cut down and burn it out. At first, of course, this practice kept him busy enough; but now he has his reward in affected trees being few and far between, in the neighbourhood.

We have, however, run too far ahead in discussing one branch of the planter's work, suggested by the name of the estate. Kandangonwa is about three miles from Mirigama station which is fast becoming a busy centre of traffic. The thriving continuous village along the road-side and a great extension of cultivation in plantations, fruit and vegetable gardens owe very much to the establishment of this railway station, some years after the line was opened to Kandy. The experiment has been a highly successful one and it suggests the question as to whether one or more stations with equally good results might not be established at other points on the line. That is a matter for the General Manager and Government Agents to decide. Mr. Wright had undoubtedly very favourable land on which to plant at Kandangonwa. It is of that slightly undulating character in which the palm planter delights; while the soil—much of it a sandy loam—is such as palms luxuriate in.

(To be continued.)

PLANTING AND PRODUCE.

INVESTORS AND TEA SHARES.—There is one point in connection with investment in tea shares that should be noted. At one time the lists of shareholders in tea companies were composed mainly of people having some connection with Anglo-India and the planting interest. Now the general public are investing in tea shares, attracted by the stability of the industry. Both for Indian and Ceylon shares of the better class there is a steady inquiry, and there is no reason why tea shares should not increase in public favour. Investors require some reasonable security, with a probability of steady dividends. Mines and ventures of the lightning-change sort suit speculators, but the investor likes something that does not disturb his rest. Four or five per cent with comparative safety is a boon to the small capitalist, who wearies equally of the small returns upon consols and "gilt-edged" securities and the risks he has to accept if he trusts his money in the ordinary joint-stock project. Under these circumstances tea shares are attractive. In this connection we may mention that Messrs. Gow, Wilson, and Stanton, who devote special attention to the purchase and sale of tea shares, issue a useful list of prices and other particulars, and a quotation from this list will be found in another column.

INDIAN TEA AND THE SOCIETY OF ARTS.—We understand that arrangements are being made by the Indian Tea Association, in consultation with the Society of Arts (Indian Section), to have a very interesting paper read at the commencement of the session in January next on the practical side of Indian tea planting, dealing particularly with the improved methods of manufacture since the introduction of machinery, the increased attention paid to sanitation, and care taken of the labour force in supplying them with good water, food, &c., the advantage of railway communication, illustrated by numerous slides showing the gardens build-

ings, and various other details of an interesting nature. The reader of the paper will be Mr. G. W. Christison, who has practically devoted the whole of his life to this subject. We hope to give further details later on when the date of the lecture is fixed.

A NEW USE FOR TEA.—While experiments are about to be made in England in the direction of tobacco growing, there is a remote prospect that the new woman may use tea in a manner scarcely contemplated by tea planters. "At the house of a well-known lady where I visit," so a West-end physician has informed the representative of a weekly journal, "green tea cigarettes are invariably handed round after dinner; and I know three actresses of celebrity who give 'tea-smoking' parties twice a week, and a coterie of literary ladies in Kensington have formed a small club for the same baleful indulgence." As the supply of green tea in this country is not large, dealers must keep their eyes on this new development. The *Lancet* and the *British Medical Journal* will no doubt be ready with some suitable thunderbolts for the occasion. Meantime, if a lay opinion be of any value, we should say that green-tea cigarettes smoked at short intervals would produce an effect rivalling delirium tremens in variety of sensation and in the number of reptiles to be seen at a single glance.

DR. MARSHALL WARD.

At a meeting of the electors to the Professorship of Botany at Cambridge, held on November 2nd, Dr. Harry Marshall Ward, Sc.D., F.R.S., of Christ's College, Professor of Botany at the Indian Engineering College, Cooper's Hill, was chosen to succeed the late Professor Cardale Babington. Dr. Ward graduated B.A. as a member of Christ's College, obtaining a first-class in the Natural Sciences Tripos, 1879, with distinction in botany. In 1883 he was elected to a Fellowship, and in 1888 was elected a Fellow of the Royal Society.—*O. Mail*.

The new Cambridge Professor of Botany, Dr. Marshall Ward, may be briefly described as a plant physician. At the invitation of the Ceylon Government, he was successful in tracing the fungus which caused the coffee disease whereby the plantations of the island were devastated, and he followed up this brilliant beginning by studying the diseases of the salmon and the potato, the lily and the bean. His acquaintance with the parasitic plant is more intimate than that of any other botanist in the world, and it was owing to this special knowledge of his that he was invited to take charge of his special subject in the forestry department at Cooper's-hill. His presence in Cambridge will make a great change, because hitherto undue attention has perhaps been given in that university to the mere classification of plants.—*Star*, Nov. 5.

CEYLON TEA IN AMERICA.—It is indeed very gratifying to learn from the letter of the ex-Chairman of our Chamber of Commerce which has been placed at our disposal by the Chairman of the Planters' Association, that our Tea Delegate in America has proceeded to work on the right lines in endeavouring to popularise Ceylon Tea in the great Western Continent, and that, in the opinion of so shrewd and capable a business-man as Mr. Renton, the very best possible use is being made by Mr. Mackenzie of the limited sum placed at his disposal. Coming from an independent source, as Mr. White says, this information is not only interesting but extremely satisfactory, and amply justifies the appointment and continuance in office of Mr. Mackenzie. The American dealers wish to trade direct with Ceylon, and the points which Mr. Renton mentions (about better packages and suitable teas) in this connection will no doubt receive the careful consideration of all concerned. Altogether, Mr. Renton's is a very useful letter.

ELK HUNTING IN CEYLON.

It was a perfect scenting morning, the hoar frost hung thick on the long grass in the deep hollows, and the rhododendrom leaves were silvery with rime. There was hardly light enough to pick our way across a swamp or two we had to cross, and it was not until we reached the jungle edge that the pink tints in the eastern sky gave way to the dull grey of actual day. I had selected an isolated piece of forest for the morning's "draw," and expected to find an old and very large stag which had beaten me more than once. I had a strong pack out, about seven couples of foxhounds and four and a half couples of long-dogs and half-breds, including my grand old seizer, Zulu.

Posting three of my kangaroo hounds at the back of the jungle, so as to cover all the open patana lying between it and the main forest, I took the pack up the hill to the jungle side. I had posted Zulu near the river below me, with orders to the dog-boy to bring him to me on hearing a single note on the horn. June, who had been feathering on what seemed a very good line on the grass, opened at one just inside the jungle. Her first note was followed immediately by a savage "bay." Standing close by the jungle edge, I heard the growling of what I thought was an old stag—a sound I have heard many a time when I have run up against a stag in his lair in thick forest. Then suddenly I heard the unmistakable grunts of a boar. The bay lasted but a few seconds, and as one of the hounds howled in pain the boar rushed past within 10ft. of me, but hidden by the bramble thicket he had "stood" in. He then made a wide circle deep into the jungle. I called for Zulu, and with three coolies followed the pack; my other seizers were quite out of hearing I knew, so I had to do the best I could with what I had got.

After going about 200 yards through very thick "nillu" jungle I reached a clear spot about 20 ft. in diameter, where the undergrowth had been trodden down by deer and pigs. In the middle of this stood two small trees growing close together, and whilst waiting near these, listening to the "tongue" of the hounds as they approached me, I heard the thud of hoofs on my right. Glancing in that direction without moving I saw the boar trotting down a gentle incline in a direction that would take him past me about four yards distant, and the other side of the two trees. Having no weapon with me but my hunting knife, I took, for further security, one cautious step forward and sideways so as to place the two saplings between the boar and myself. I could see his wicked little eyes glistening as he stood and listened for the approaching pack, now, some 500 to 600 yards behind him. The movement I made, though very slight, did not escape his notice. He turned and raised his head, looking straight at me, and, quicker than thought, he was past the trees and upon me. My knife was in my belt, and I was absolutely powerless. Indeed, it was the feeling of my own impotence to deal with such a massive brute that struck me more than anything else.

Past the trees he reared himself upon his hind legs, and to the best of my belief, he had all four feet off the ground as he sprang upon me. I felt the rough bristles of his chest on my face as I fell to his charge. By the most extraordinary good fortune he passed on over me as I lay and rushed straight at two of my coolies who were standing some 10ft. behind me, one of them holding Zulu in slips. I picked myself up as quickly as I could, in time to see both the coolies on their backs and old Zulu's four feet in the air. About 10ft. beyond stood the boar, in thick "nillu," contemplating, as I believe, a fresh attack. But Zulu, having escaped from the hold of the dazed dog-boy, with slips and all, rushed furiously at the boar. In a second he was alongside of him, and in another had him by the ear. By this time the whole pack had come full cry on his line in a regular crash of music all round me. It was frantically exciting, for I could not tell how long the good old dog would hang on. The boar was ploughing his way through the dense undergrowth, dragging

Zulu with him, and I feared every moment the slips would catch in the bushes and choke him off. I seized the spear that the dog-boy always carries to meet emergencies of this kind, and rushed down with the pack. Twenty yards or so down the slope I caught the boar up, going slowly, with the whole pack baying at him. Not a hound would touch him though, most of them having had a severe lesson taught them at previous encounters with *Sus indicus*. It did not take me as long as it takes me to write this to get the spear into the brute's side. Then jamming it well home, I gave the butt end to one of my men to hold, and my knife soon did the rest.

As quickly as possible I got my hounds together, and examined all carefully. Zulu had four skin wounds over his ribs, inflicted, I imagine, when the boar first knocked him over. Rip, one of my Colchester lurchers, I found badly hurt, a large double or treble gash in the thigh cutting through the large tendons and down to the bone. He was the hound I had heard howling at the first bay, and had crawled out on to the patana, where I found him lying. He never recovered, and had to be shot some months afterwards. Hector, a strong, plucky, half-bred dog, had two deep cuts in his hind quarters; Juno, a foxhound, had a deep wound in her chest; and two or three others had a slight skin wound. I had no means of weighing the boar in camp, but he was one of the heaviest I have ever killed, and stood over 32 in. at the withers. His tusks are wonderfully perfect and sharp, and measure just under 9 in.

On looking over the pack I found three of my best foxhounds were missing. This was a shock to me for I naturally feared more damage had been done, and I was just going into the jungle again to look for them when I heard in the distance the familiar note of good old Lifter. Far away on the patana I could see three white objects flashing across to the nearest jungle. Giving the disabled hounds in charge of my coolies I ran my best speed across to where Bountiful, Gossamer, and Lifter were throwing there tongues to a merry tune. I laid on the rest of the pack and soon there was a grand chorus in the big jungle under Sudugalla. I now sent for my three long dogs, and by the time they arrived I heard a "running bay" about a quarter of a mile in, and felt sure then that hounds were running a good stag. The baying of the hounds now began to approach the patana, and getting forward Smiler, my fastest seizer, I was just in time to see a fine stag, some 300 yards off, trotting across the open towards the nearest jungle. Taking advantage of a slight ridge on the patana which lay between me and the stag, I got Smiler well forward, and as soon as I was sure he had viewed him he was slipped. It was a pretty course, but not room enough for the dog to reach him before he dashed into the jungle at full gallop. I could see he had a grand head, the points of his well polished antlers flashing white in the bright morning sun. In a few minutes the leading hounds were racing across the patana on his line, and with a few touches on the horn I hurried up the laggards. I could now guess fairly well his "point," especially as I was sure he was the stag that had beaten me before, and running all I knew to where I supposed he would again face the open and cross the river I saw his galloping slots on the grassy bank of the stream, and at the same moment heard hounds going hard on my right some 300 feet above me.

Getting over the ridge where I had last heard tongue, I again heard a "bay" about half a mile off. The country here was rather broken, sharp spurs running down from the main ridge and forming deep ravines with very steep sides. The jungle on the main ridge being too dense to allow of any pace, I had to take the broken country, thus giving more time than I liked for the stag to get his wind. As I climbed the last hill to the bay, I could hear every now and then the heavy strokes of his fore feet as he pounded at the more venturesome hounds around him. Within three yards of him, I could see his head just above the undergrowth. I gave the order to slip the seizers, but he either winded me or heard me, for away he dashed once more, crashing the "nillu" like a young elephant.

He now made a fresh point, which I more or less anticipated, and, making my best pace, I was just in time to hear the pack topping a distant ridge of forest, about a mile from where the last bay had occurred. Getting down the hill to cross the stream below me I heard, to my astonishment, the baying of hounds quite close to me. I soon found out the cause was a sambur hind, which some of the tail hounds and a couple of the seizers had charged on to in their last burst after the stag broke bay. She was fighting gamely, but I wanted every hound for the hunted stage, so, jumping into the water by her side, I got my knife well home behind her shoulder and dropped her in her tracks. Without waiting a moment, and, the few hounds whipped to me, I hurried on, and over the next ridge, some 300 ft. high, I once more was rejoiced to hear a grand bay in some very dense forest. Feeling sure the stag would not face the open again, nor take water in the adjacent river, I forced my way through one of the most awful thickets of thorns and bamboo I was ever in. The baying of the hounds was getting more and more savage, and, as I got nearer, the noise was almost deafening. The whole pack, barring the seizers which had somehow failed to keep with me, were pressing him close, and each time as I got within a few yards of them the stag broke bay again and again. Once more I think he wined me, for he made another bold bid for freedom by a straight run of about half a mile, but hounds would not be denied, and again they made him stand. He had been fighting hard the whole time, and I heard over and over again the heavy thud of his hoofs as he dashed at, and fortunately missed, some forward hound. At last I got up to him once more, and as I was trying to make out the direction of his head from the points of his antlers, which I could just see over the undergrowth, he rushed straight at me, knocking me over with one of his brow antlers. As I fell I gave him one behind the shoulder with my knife. This failed to stop him, and for another ten minutes or so it was the grandest fight I have ever seen. He charged the hounds right and left, wounding two or three of them with hoofs and horns, but they were now mad with fury, and pressed him harder than ever. Once more he broke away, and stood again near a small tree. Behind this I crept to within less than three feet of him, and then made a quick dash at his shoulder with my knife. The next thing I knew was that I had received two violent blows on my arm and shoulder, and I was lying on the ground with hounds running over me. My knife had gone home, though, this time, and it was his last kick, and a pretty bad one it was for me. He travelled about fifty yards after that and fell dead. He was an enormous stag, carrying a very symmetrical head, and for a Ceylon sambur a large one. The spread of his horns I measured 30½ in., and the length of beam along the outside curve was 29 in. His weight must have been considerably over thirty stone clean, and he stood more than 13 hands at the withers. I had no means of ascertaining the weight exactly, but I have weighed smaller stags that I have killed which have turned the scale at thirty-two stone clean.

It is only fair to mention to the credit of Zulu that he was thrown out after the first bay I slipped him at, being too heavily built a dog to keep up with racing foxhounds. Had he been with me the fight would have been over much sooner. The run lasted two-and-a-half hours. T. FARR.
—Field.

**SMOKERS SHOULD USE
CALVERT'S DENTO-PHENOLENE,
A FRAGRANT LIQUID DENTIFRICE AND
MOUTH-WASH.**

Editor of *Health* says:—"The most effective preparation for ridding the month of the aroma of tobacco, and leaving a pleasant taste."
Sold in 1s. 6d., 2s. 6d., and 1 lb. 7s. 6d. bottles,
by Chemists, &c.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, November 7th.

COCA-LEAVES—Fine Truxillo leaves are reported to be scarce, and held for more money.

VANILLA remains quite firm. It is said that in Mauritius there is nothing left in stock.

ESSENTIAL OIL—Citronella oil: Native brands quoted on the spot at 1s 4½d to 1s 5d per lb. A fair amount of business has been done for November-December shipment, with Chemical guarantee of purity, at the rate of 1s 3½d per lb, c i f terms for oil packed in drums, and at 1s 2d per lb, c i f terms without guarantee, for November-January steamer shipment.

QUININE—The market is a trifle easier, 20,000 oz second hand German bulk (B & S or Brunswick) having been sold in the course of the week at 13½d to 13¾d per oz. There are sellers today at the last-named figure. The following are the London statistics of quinine:—

	Oz.
Imported in October 1895	17,000
Delivered in October 1895	40,072
Stock on October 31st, 1895	2,069,904
do do 1894	2,896,368

At today's cinchona auctions in Amsterdam (almost the largest ever held in that city) about 4,500 packages Java cinchona—rather over three-fourths of the quantity offered—sold steadily at an average unit of 2½c per half-kilo, showing no alteration compared with the last Amsterdam public sales.

INDIAN TEA SALES.

(From *William Moran & Co's Market Report*.)

CALCUTTA, 27th Nov. 1895.

On the 21st instant, 17,672 chests were offered and 17,605 sold. Prices for all good quality teas were very firm and occasionally marked a rise; common sorts were again slightly lower. Tomorrow 18,000 chests will be offered.

TOTAL QUANTITY OF TEA PASSED THROUGH CALCUTTA
FROM 1ST APRIL TO 25TH NOV.

	1895.	1894.	1893.
Great Britain	96,941,284	90,838,733	87,690,370
Foreign Europe	223,988	204,635	257,314
America	881,558	430,537	210,976
Asia	3,227,913	3,044,128	1,135,849
Anstralia	5,259,049	3,661,952	4,502,279
	106,533,792	98,179,985	93,796,788

(From *Watson, Sibthorp & Co's Tea Report*.)

CALCUTTA, 27th Nov. 1895.

17,550 packages changed hands in the sales held on the 21st instant. Good liquoring teas were again in demand and sold at full prices, but other sorts were more or less neglected and found buyers only at a further decline of from 2 to 4 pie per lb. There was a fair amount of business done for the Colonies, Bombay and other places.

The average price of the 17,550 packages sold is As. 7-1 or about 7¾d per lb. as compared with 19,767 packages sold on the 22nd November 1894 at As. 9-8 or nearly 10d per lb. and 16,185 packages sold on the 23rd November 1893 at As. 6-11 or about 8½d per lb.

The Exports from 1st May to 25th November from here to Great Britain are 96,809,667 lb. as compared with 91,159,735 lb at the corresponding period last season and 88,143,613 lb. in 1893.

NOTE—Last Sale's average was As. 7-3 or nearly 8d per lb.

EXCHANGE—Document bills, 6 month's sight 1s 1-13-16d.

FREIGHT—Steamer—£1-11-3 per ton of 50 c. ft.

VIOLET PERFUME.—In a *Tour Round my Garden*, by Alphonse Karr, translated by Rev. J. G. Wood, the reader is told that "the Violet alone refuses to separate its odour from itself; it is to be met with nowhere but in its own corolla. Perfumers are obliged to make, with the root of the Florentine Iris, a certain false and acrid Violet odour, of which every returning spring compels us to acknowledge the insufficiency." I would like to know if this is still the case, or if the difficulty has been overcome? *William Cuthbertson, Rothsay.*

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce).

Colombo, Dec. 2, 1895.

* The TROPICAL AGRICULTURIST *

◇ MONTHLY. ◇

Vol. XV.]

COLOMBO, JAN. 1ST, 1896,

[No. 7.]

THE LATENT VITALITY OF SEEDS.

CASIMIR de Candolle has lately published an interesting paper entitled *La Vie Latente des Graines* (Archives des Sc. Phys. et Nat.; Bibl. Univers., 1895), in which he comes to the conclusion that if the external conditions necessary for the vital activities of seeds be absent for a long time they may be totally arrested, but yet the seeds may be alive and re-enter an active course of existence after, perhaps, an indefinite period. His experiments were conducted in a cold room of a meat refrigerator, having made a preliminary one as follows:—Three lots of Peas and Haricot Beans were placed (1) in free air; (2) in a tube of air, but sealed; (3) in pure carbonic acid. After two years (1) had increased in weight, and nearly all germinated; (2) had lost weight while a smaller proportion germinated; air now containing 11.4 per cent. of oxygen, and 3.8 per cent. of carbonic acid; (3) none came up. He asks the question whether the enfeebled vital activities had ceased before the end of the experiment, so that respiration and assimilation had completely stopped; if so, the protoplasm must become quite inert. He believes that to be the case. He now experimented with an intensely cold temperature, having previously determined that Peas, Haricots, and Fennel seed would germinate after an exposure of four days to a temperature of 148° F. He wrapped up some Wheat, Oats, seeds of Fennel, of the Sensitive plant, and of Lobelia Erinus in tin foil. All were well packed in a cylindrical iron box of 3½ cubic feet capacity; the lid being hermetically sealed. This was placed in an open wooden box for protection. The whole was subjected to an intermittent steam of intensely cold air coming direct from the refrigerator, from May to September, 1894, or 118 days.

The cold air was continued from eight to twenty hours per day; the average time being fourteen hours. On the greatest number of occasions (sixty-eight times), the cold was prolonged for twenty hours.

The lowest temperature reached was—65° F., and the highest—36° F.

In the intermediate periods the warming was very slow, for the temperature scarcely passed freezing-point at the end of two to three hours, after stopping the machine. Conversely, the cooling of the box was very rapid, as it was directly exposed to the current of cold air.

M. De Candolle asks the question whether the box could check the cooling. As an experiment in this direction, he completely filled a box with corn. The lid, being hermetically sealed, was then pierced to allow the bulb of a thermometer to pass through it, and the hole was then plugged with cotton-wool. He then observed the thermometer outside a window. The rate of cooling varied much according to the initial temperatures, and in proportion as the exterior air was calm or agitated. Thus, in a strong north-east wind, the temperature of the room being 18° Fahr., and 17.5° Fahr. outside, it took twenty-six minutes to ascend to 21° Fahr. On a calm day when it was 53.6° Fahr. in the room and at freezing point outside, it took one hour and eight minutes to descend to freezing point.

But, as M. De Candolle observes, this experiment does not bear much, if any, analogy to the cooling by the air from a refrigerator, for the box was placed in the direct current from it. Moreover the seeds were surrounded by a metallic paper, greatly facilitating the conductivity of the box. He thinks, therefore, that not more than a quarter of an hour would be required to put the temperature of the box in equilibrium with that of the cold air. On taking out the seeds, they were at once sown. Nearly all the Wheat, some of the Oats, and some Fennel seeds quickly appeared. Of sixty-six seeds of the Sensitive plant, thirteen only came up; while of numerous Lobelia seeds, only ten germinated.

The failure of the seeds of the Sensitive plant was not solely due to the cold, as many failed to germinate, while many Lobelia plants grew in a control experiment. The conclusion the author arrived at was that life, as expressed by vital functions, was completely arrested for a time; the protoplasm was inert, and could not either respire or assimilate.

The cause of some being killed was that their protoplasm had not yet become completely inert.

If this result be true, then, one would expect that seeds could be maintained with impunity in a medium unsuitable for respiration, provided there was nothing which could exert a deteriorating effect upon the internal chemical processes, as does carbonic acid.

He, therefore, tried the effect of plunging seeds in mercury; thus, 8 grains of Wheat were placed below 2.5 cm. of mercury for one month (October 19 to November 19). Of these four only germinated. Of 5 grains of Wheat under 13 cm. of mercury, from November 27 to December 28, four grew. Of 5 grains of Wheat under 5 cm. of mercury, from February 5 to May 5, all grew. Similarly 13 grains of Cress, under 5 cm. of mercury, for two months, all germinated.

This experiment, therefore, as that with a low temperature, shows that seeds can exist in a state of complete vital inertia; and that the internal changes of metabolism can be arrested, as long as the necessary external conditions of temperature, moisture, &c., are withheld.

M. De Candolle thinks that this state of chemical and vital inertia may last, perhaps, indefinitely. He then gives the following cases in illustration:—M. A. P. De Candolle mentions a case where grains of the Sensitive plant germinated very well after upwards of sixty years repose (*Physiologie*, p. 621). Girardin has seen Haricot Beans germinating which were taken from the herbarium of Tournefort, where they had lain for a century. In 1850 Robert Brown sowed, for curiosity, some seeds from the collection of Sir Hans Sloane, 150 years old, several germinated, as for example, one of *Nelumbium speciosum*, of which the plant is still preserved in the Natural History Museum. He refers to the popular notion of "Mummy Wheat" having germinated, only to refute it, adding, that it appears that the grains were sterilised before being placed in the tomb—but he does not give the proof of this. The present writer finds the starch grains to be perfectly sound, and to colour readily with iodine; so that the grains could not at least have been boiled. The most extraordinary case to which he refers was observed by Prof. De Heldreich (*Garten Flora*, 1873, p. 323), the Director of the Botanic Garden at Athens. In botanising about the mines of Laurium he discovered in 1873 a new species of *Glaucium*, *G. Serpieri*. It made its appearance from under a thick layer of volcanic scoria, to which he would assign a date of 1500 years. He concludes with a reference to the investigations of M. Peter, who took soil from the interior of forests; and, after taking every precaution, found that soil from ancient forests gave rise to woodland species only; but soil from recent forests supplied species of open plains and fields, according as the forest had replaced these respectively. Admitting that his experiments did not decide the question, M. Peter thinks it would be safe to allow at least fifty years of duration of arrest of vital activity in the seeds buried in the soil of forests.—*Gardeners' Chronicle*.

COMMERCIAL FIBRES.

By D. MORRIS, C.M.G., M.A., D.SC., F.L.S.,
Assistant-Director of the Royal Gardens, Kew.

PLANTAIN AND BANANA FIBRES.

Besides Manila hemp, produced by *Musa textilis*, other species produce fibre useful for cordage purposes, for mats, and for making coarse paper. The plantain, in Jamaica (*Musa sapientum*, var. *paradisica*), produces a white, glossy fibre at the rate of 1.81 per cent. of the gross weight. The price of the best plantain and banana fibres is, however, seldom above £12 per ton, and they would only fetch this price when there is a high demand for white-rope fibres, and a short supply of Manila and Sisal hemp. In spite of this, it is worthy of consideration, whether the immense number of banana stems cut down every year in the West Indies (estimated at 50,000,000) could not be utilised for their fibre. It is evidently not sufficiently good to compete with first-class rope fibre, but it might possibly be used for making

coarse paper, as a packing material, or even for the manufacture of *papier maché*. The Abyssinian banana, *Musa Ensete* yields a somewhat weak and dull-looking fibre. *Musa Bajoo* s grown in Southern Japan for its fibre, which is woven into cloth of an exceedingly durable character. *Musa sumatrana*, forming an impenetrable jungle in the Malay Peninsula may eventually prove a useful fibre plant. A banana, native of the Solomon Islands, yields fibre which is woven into ornamental garments, bags, and sleeping mats.

PINE-APPLE FIBRE.

The common pine-apple (*Ananas sativa*) has a rosette of 30 to 50 narrow, strap-shaped leaves, from 3 to 5 feet long. These contain an abundance of fibre which, though somewhat difficult to extract, is possessed of great merit. It is finer and stronger than that yielded by almost any other plant except China grass. In the East Indies it is manufactured into a beautiful fabric known as "piña" cloth. In the Straits Settlements, Sierra Leone, and some other localities in the Old World, this tropical American plant has become thoroughly naturalised. The leaves in these semi-wild plants are more highly devoted than in plants cultivated for the fruit, and hence are better suited for fibre purposes. In the Philippines it is also customary to pluck the fruit before it matures: this is said to cause a considerable extra development of the leaves.

Pine apple plants are grown in every tropical country and their cultural treatment is well known. They are easily propagated by means of offsets from the base. The leaves are fully developed in about 12 to 18 months, and each plant could yield at least 10 to 20 leaves every year. For piña cloth the fibre is extracted by scraping by hand, then washed and laid out to bleach in the sun. The steeping, washing, and drying are repeated until the fibres are considered to be properly bleached. The fibre bundles are very fine, transparent, strong, and supple. The ultimate cells are from 2 to 5 mm. long, fine, uniform in diameter throughout, solid and glossy.

A sample of pine apple fibre of excellent and extraordinary length (6 feet), grown at Malacca, was brought to this country by Mr. Derry in 1893. It was stated, in the "Kew Bulletin," 1893, p. 368, that one manufacturer was hopeful of using 1,000 tons a year or more of this fibre at the price of £30 per ton, delivered in London. "Pine-apple hemp" is a regular article of export from Formosa to Swatow, where it is made into fine "grass cloth," esteemed for its coolness as a summer wear.

CARAGUATA FIBRE.

Caraguata (*Bromelia argentina*).—The best fibre of Paraguay is "Caraguata iberá." It is described as long and silky. There is frequent mention of it in works of travel, and five specimens were shown in the Paraguay Court at the Exposition Universelle, held at Paris in 1889. Specimens of the plant, abundant in a wild state, were received at Kew in 1890 and it was found to be a new species of *Bromeliaceae*, allied to the pine-apple, which it resembles both in habit and character of the leaves. In a report furnished to the Foreign-office by Mr. Arthur Herbert (No. 1,006, 1892), it is stated "the iberá is a sort of caraguata, and its fibre is of a finer quality than that of its congener, but neither of them has obtained any importance in commerce owing to the cost of cleaning and separating the fibre from the leaves. Several attempts have been made but so far without any great success. From the interest that has been awakened in this product in European markets it would seem to deserve a more serious study, and the opinion seems to prevail that with improved machinery and more skilful administration more profitable results might be obtained." Any machinery that could successfully extract pine-apple fibre could also clean the caraguata fibre. It is anticipated by those acquainted with the local circumstances that caraguata fibre will some day form an important article of export from Paraguay.

OTHER BROMELIA FIBRES.

According to the "Kew Bulletin," 1887, April, p. 8:—

"There are several samples of a wild pine-apple (*Bromelia sylvestris*, Willd.) from the West Indies

and Central America at Kew, but there is no record of their commercial value. A sample supposed to be from this plant was lately sent from Trinidad, upon which the brokers reported as follows:—"Not yet in commercial use, but destined, we think, to a successful future; fine, soft, supple fibre, strong and good colour, ample length; say £30 per ton and upwards."

"The fibre of the Jamaica Pinguin (*Bromelia Pinguin* L.) would appear not to be of high value. The plant covers hundreds of acres in the plains and lowlands of Jamaica, and an effort was made some time ago to prepare the fibre for commercial purposes. The report of brokers upon a sample of 90 lb. was as follows:—"A long, towzelled, weak fibre, of bad colour, coarse, no strength, and only fit for brooking up. Similar to St. Helena hemp tow, but not so good. We should think £12 to £10 per ton to the utmost value." Several samples of this Pinguin fibre from Jamaica and elsewhere, cleaned both by hand and by machine, are to be seen in the Kew Museum, No. II."

Another bromeliad (*Karatas Plumieri*) with leaves 8 to 10 feet long, armed with distant, incurved teeth, is common in Tropical America. It is a well-known and valuable fibre plant. It is said to be used by Indians in making the finest hammocks in Central America, Guiana, and Brazil.

BOWSTRING HEMPS.

The species of *Sansevieria* yielding Bowstring hems have creeping rhizomes and a rosette of leaves of a fleshy character, sometimes flat, concave, round, or spear-shaped. The flowers are in spikes or clusters, white or green. The leaves are dark green, more or less succulent, and banded or mottled with white or black markings. They abound in a very valuable fibre, remarkable alike for fineness, elasticity, and strength. The *Sansevierias* are chiefly of African origin, but one at least may be Indian. Some of the species are already widely distributed in tropical countries. They are capable of being propagated very readily. Usually the rhizomes are divided and planted; plants may, however, be raised from seed, or, better still, from the leaves, which, if cut into pieces about two or three inches long, readily take root in moist situations. Plants may be put out at 3 or 4 feet apart. The first leaves for cutting may be produced in three to four years. In India, with *Sansevieria roxburghiana*, 1 lb. of fibre was extracted from 40 lb. of small green leaves. It was calculated that "one acre would yield 1,613 lb. of clean fibre at a gathering, two of which may be reckoned on yearly." So far *Sansevieria* fibre is not in commerce. It is, however, used largely in India—where it first received the name of bowstring hemp—in Ceylon, and on the West Coast of Africa for twine and cordage, and is regarded as most valuable. The fibre of *Sansevieria cylindrica*, known in Angola as "Ifé," is said to be the best fitted for deep sea sounding of any fibre known. The special merits of the fibre yielded by each species will be mentioned below.

Konje Hemp (*Sansevieria guineensis*).—One of the oldest and best known species. The mottled leaves are somewhat flat and leathery, about 3 to four feet long, 3 inches broad in the middle. On the Zambesi it yields "a valuable fibre similar to Manila hemp." It grows "in great abundance in many places, keeping to the shade of woods." In Mauritius, Jamaica, Cuba, and Trinidad it is semi-wild and yields excellent fibre. In Jamaica the return, under favourable conditions, is estimated at $1\frac{1}{2}$ tons of dry fibre per acre, of the gross value of £45. Samples received in this country from Trinidad, in 1886, were valued at £20 per ton, but the colour and strength were not normal. Good machine-cleaned fibre from Cuba is said to have realised £50 per ton.

Sansevieria longiflora.—This plant is a native of equatorial Africa. The leaves are like those of *S. guineensis*, but usually larger or flatter, and not invariably blotched with green. The best distinction is the individual flower, which is $3\frac{1}{2}$ to 4 inches long, while in *S. guineensis* it is only 2 inches long. Fibre from *S. longiflora*, grown at Kew, was described in 1887 as "very bright, clean, and strong; in every

way a most desirable commercial article. It would compete with the best Sisal hemp for rope-making purposes. Value £30 per ton."

Pangane Hemp (*Sansevieria Kirkii*).—The leaf is very horny in texture, with a brown edge, much mottled on both sides. This species was discovered by Sir John Kirk, who states, "It grows abundantly near Pangane on the mainland opposite the island of Zanzibar. . . . It is used by the natives and yields a long and useful fibre." The robust habit and large size of the leaf of this plant render it very valuable for fibre purposes. Under exceptional circumstances a single leaf will attain the height of 9 feet. Fibre from a plant grown at Kew was valued in 1887 at £27 per ton.

Neyanda (*Sansevieria zeylanica*).—This has long been cultivated in Ceylon. The leaves are semi-circular in transverse section, 1 to 2 feet long, dull green with a red margin, and copiously banded with white. The Singhalese use the fibre in numerous ways for string, ropes, mats, and a coarse kind of cloth. Generally the fibre is prepared by retting or by simple beating and washing. The small size of the leaves, and the difficulty of handling them in large quantities, would render this species of less value commercially than any of the preceding.

Ifé Hemp (*Sansevieria cylindrica*).—This is a most distinct and curious-looking plant. The leaves are quite cylindrical and solid, about 3 to 4 feet long, and about an inch in diameter at the base. When growing they look like a cluster of sharp-pointed stems. The species extends across South Africa from Zanzibar to Angola. The fibre, as already stated, is very valuable. Specimens prepared from plants grown at Kew were valued at £28 per ton. *S. sulcata* is very similar, but the leaves are more slender, with rather deeper vertical grooves. The fibre is slightly weaker, and valued at £26 per ton.

SISAL HEMP.

Sisal hemp, Henequen, or Yucatan hemp, is produced by a species of *Agave*, native of Mexico, of which the common "American aloe" is the type. There are two, if not more, varieties cultivated for fibre. The chief one is the "Sacqui" (*Agave rigida*, var. *longifolia*). Plants were received at Kew in 1879, and again in 1890. The other is the "Yaxqui" (*Agave rigida*, var. *sisalana*). The former has leaves with side teeth, and a strong terminal spine; the latter has the terminal spine only; the edges of the leaves are smooth.

Cultivation.—These *Agave* plants are propagated either by suckers from the base of the stem, by seed, or by bulbils (called "pole" plants) produced on the flowering branches. The latter appear in the axils below the flower, and number many thousands. They remain in the parent plant until they are about four to six inches long, and sometimes much longer.

The land suited for the cultivation of Sisal hemp is entirely different from that required for Manila hemp. The best fibre districts in Yucatan possess an arid climate, with gravelly, stony, or rocky soils; they are only a few feet above the level of the sea; the summer heat is intense. It is claimed that the fibre is stronger and more abundant in dry, hot soils than in rich, deep soils. The plantations are formed with young plants about 18 to 20 inches high. These are put out in rows, at distances varying from 6 to 12 feet apart, equal to about 600 to 1,000 to the acre. Broad lanes are left here and there for the purpose of making roads or tramways, all converging on the factory, where the leaves are cleaned. A plantation begins to yield in three to five years, depending of the size of the plants when first put in, and the nature of the soil and cultivation.

Harvesting.—When the leaves are fit to cut 10 to 20 are taken from each plant, beginning from below. The cutting may be repeated two or three times a year according to the vigour of the plants. As soon as a plant shows signs of "piling" it is regarded as useless for fibre purposes. The pole is cut out and the remaining leaves are harvested soon after. To provide for the continuance of the plantation "it is the custom to place at the foot of each plant (when about three-fourths of its life are spent) a small plant which replaces the old plant when the

latter is removed." The period of the life of a plant may extend from five to ten years or more. Cutting the leaves too severely will accelerate the poling of the plant and thus destroy its usefulness.

Extracting the Fibre.—The leaf-cutters are paid at the rate of 25 cents per day for 200 leaves. The leaves are conveyed from the fields to the factory either on mule back or by means of light tramways. Each mule carries 200 leaves each trip; a task of 10,000 leaves requires ten trips, with five mules each. On the tramway a mule can draw a waggon with 3,000 leaves and make five trips a day. Most of the large fibre estates in Yucatan are provided with light portable railways on the French Decauville system. The more common machine used for extracting the fibre is the "raspador." It is a rude piece of machinery consisting simply of a wheel like a four-foot pulley with a six-inch face. Across the latter are fitted pieces of brass an inch square and six inches long, running across the face about a foot apart. This wheel runs in a heavy wooden frame and makes about 110 revolutions per minute. The leaf is put in at one end of the machine and held by a strong clamp while exposed to the beaters. The pulp is soon crushed out of it, leaving only the fibre. The leaf is then reversed and the other end cleaned in the same way. The average work of one machine, requiring $1\frac{1}{2}$ horse-power, is 7,000 to 9,000 leaves per day with two men feeding. It is estimated that 1,000 ordinary leaves will yield 50 pounds of dry fibre. Exceptionally they will yield 100 pounds, but from strong plants from five to seven years old 75 pounds would be a good yield. After the fibre is cleaned it is spread out in the sun to dry. It is afterwards pressed into bales by lever or screw presses or by hydraulic pressure. The latter method is becoming general. The bales vary from 350 to 400 pounds, with a cubic measurement of 22 feet. It is calculated that the total cost of growing and cleaning the fibre and of delivering it at Progreso, the port of shipment, is about $3\frac{1}{2}$ cents to 4 cents per pound Mexican money (about $1\frac{1}{4}$ d. to $1\frac{1}{2}$ d. English money).

Position of the Industry.—The fibre plantations in Yucatan are estimated to cover about 24,000 acres. The total yield in 189 was 350,000 bales of 375 lb. each giving a total weight of 131,250,000 lb. For the whole country, this would be at the rate of 760 lb. per acre. The actual return is probably a good deal more, as the total area under cultivation is not all yielding fibre. The estimated yield of the Yucatan plantations in 1895 was 400,000 bales. A State duty of 20 cents per 100 lb. is levied on hemp exported from Progreso. A detailed account of the fibre industry in Yucatan is given in the "Kew Bulletin," 1892, pp. 272-277, and 1893, pp. 212-218. The latter was prepared by her Majesty's Vice-Consul at Progreso. A general account of Sisal hemp plants, and efforts to start industries in various countries is given in the "Kew Bulletin," 1892, pp. 21-40. Attached to this is a return of the average price per ton (spot value) obtained for Sisal hemp in this country for each month from January, 1879, to December, 1891. The following is a brief summary, based on this return, brought down to September, 1895:—

Year.	Highest.		Lowest.		Average for the Year.	
	£	s.	£	s.	£	s.
1879.....	32	10	21	0	24	0
1883.....	29	0	24	0	27	0
1889.....	56	10	45	0	50	0
1894.....	20	0	15	0	17	10
1895.....	17	0	13	0	14	7
Jan. to Sept. ↓						

The fall in prices, so marked in the United Kingdom since 1889, was equally prevalent in the United States. This will appear from the following:—

Price per lb. in.	1892.	1893.	1894.	1895. to Sept.
New York.	Cents.	Cents.	Cents.	Cents.
	6 to 6 $\frac{1}{2}$	3 $\frac{1}{2}$ to 3 $\frac{1}{4}$	2 $\frac{1}{2}$ to 2 $\frac{3}{4}$	2 $\frac{1}{2}$ to 4 $\frac{1}{2}$

Note added.—The monthly report on Sisal on the 15th September, 1895, showed a more favourable tendency. The spot value was £16 to £17 per ton.

BOMBAY ALOE FIBRE.

Bombay Aloe (*Agave vivipara*).—The plant is a native of tropical America, but widely spread in the East Indies. It is extensively used as a hedge plant in India, in Bhubar, and the North-West Provinces. The leaves are very long, narrow, and concave, with rather distant, brown teeth, and a terminal spine. Numerous bulbils are produced on the flower spike, hence the specific name. When white-rope fibres were in high demand, the fibre from *Agave vivipara* was prepared rudely by hand, and shipped from Bombay. It was, from the first, practically unsaleable. In 1890 the stock in this country had accumulated to over 1,000 tons. The prices quoted were from £5 to £12 per ton. As pointed out in the "Kew Bulletin," 1890, pp. 50-51, well cleaned fibre from this species was really worth at that time from £25 to £30 per ton. The difference in price was entirely due to the character of the cleaning.

A very similar fibre to Bombay aloe fibre was imported this year from Natal under the name of South African hemp. It was probably yielded by *Agave americana*. It was of bad colour, not well cleaned, and almost unsaleable. It is useless to ship fibre of this character from any British possession.

MANILA ALOE FIBRE.

Manila Aloe (*Agave vivipara*).—The plant known locally as "Magney" is the same as that yielding the Bombay fibre mentioned above. It is also cleaned by hand. The value of the Manila fibre has always been slightly higher than the Bombay fibre, owing to its being presented in a cleaner condition. In March, 1893, Manila aloe fibre was quoted at 17s. per cwt., while Bombay aloe fibre was dull at 8s. to 13s. per cwt. It was only possible to produce the former when the price of white-rope fibres was exceptionally high. Of late years it has almost disappeared from commerce. In the Philippines the aloe fibre is used for making strings for violins. It is important to distinguish between this fibre and Manila hemp. The latter is yielded by *Musa textilis*.

MAURITIUS HEMP.

The Green or Poetid Aloe yielding Mauritius hemp (*Furcraea gigantea*) was introduced as a garden plant from South America, about 1790. It is known amongst the French as *Moss vert*. In 1837 it had established itself spontaneously in many localities in the island. About 1872, the quantity of plants growing on abandoned sugar estates suggested their utilisation for fibre purposes. The first exports were 214 tons, of the value of £4,934. Since that time, with some fluctuations, due to the ebb and flow of demand, the Mauritius hemp industry has steadily advanced. The value of the exports is now about £50,000 annually. The plant has much the habit of an "Aloe," but the leaves are bright green in colour, and with no teeth or terminal spine. The leaves are often 4 to 7 feet long, and 5 to 8 inches broad in the middle. The flowers are greenish white, on a branched peduncle or "pole" 10 to 20 feet high. Bulbils are produced as in some species of *Agave*. The plant is chiefly propagated by means of these. Regular plantations are established on the same plan as those described under Sisal hemp. Plants that have "poled," are replaced by strong young plants from nurseries. The life of a plant is about seven to ten years. They are, therefore, cut for about four or five years before they pole. Overcutting the leaves tends to cause the plant to flower and die prematurely.

Fibre Machines.—The hemp industry in Mauritius was greatly advanced by the invention of local machines, called *grattes*. They cost about £20 each, and are worked by steam or water power. The *grattes* are on the same principle as the *raspador* of Yucatan, and consist of a drum, with bladed blades, which revolves at a great speed in front of a feed table, on which the leaves are placed. One *gratte* is served by two men, who work alternately; one of them must be left-handed. The out-turn of wet fibre for each machine is, on an average, about 94 lb. per hour; the out-turn of dry fibre per day of eight hours for each machine is 214 lb. The average cost of producing a ton of fibre ready for shipment in 1890 is 225 rupees. A full account of the Mauritius

fibre machine is given in the "Kew Bulletin," pp. 98-101.

Mauritius hemp is not largely used for cordage purposes. It has special applications on account of its fineness and lustre, and is much used for ornamental purposes. The prices have been well maintained, in spite of the depressed condition of most fibrous substances during the last two years. In March, 1895, the quotations were:—"Good white, 21s. to 24s. per cwt.; fair, 17s. to 18s.; common, 14s." The imports in 1893 were 1,373 tons; in 1891, 681 tons.

Furcraea gigantea has been largely planted at the island of Anguilla in the Leeward Islands, under the direction of Sir William Haynes Smith, K.C.M.G. The plantation is about 350 acres in extent, and the first crop of leaves will be shortly harvested. Should the price of Mauritius hemp be maintained, the Anguilla plantation is likely to be very successful.

SILK GRASS.

Although this term is sometimes applied to some species of *Bromelia*, it is more generally applied to *Furcraea cubensis*, one of the "green aloes," very similar in appearance to the plant yielding Mauritius hemp. It is a native of tropical America, and is cultivated in Jamaica and Tobago as a fibre plant. The leaves are 5 to 6 feet long, usually armed with strong prickles, but sometimes unarmed (as in the variety *inermis*), or with few prickles. The yield of fibre is at the rate of 2.5 to 3.15 per cent. Samples of silk grass fibre from Jamaica, in 1884, at £27 per ton, and reported to be superior to Sisal. Another species, *Furcraea seloua*, with leaves 3 to 5 feet long, armed with brown horny teeth, is plentiful in Ceylon, but apparently scarce elsewhere. The fibre yielded by it is very similar to that of *F. cubensis*. Unlike the latter, however, it has no unarmed variety, and is therefore not likely to be widely cultivated for fibre purposes.

NEW ZEALAND PHORMIUM FIBRE.

The plant yielding this interesting fibre (*Phormium tenax*) is very variable. It belongs to the liliaceous order, and has very long, sword-like leaves, growing in opposite rows, and clasping each other at the base. There are two well-marked varieties. One has leaves 5 to 10 feet long, bright green above, glaucous beneath, with the flowers red; the other has shorter leaves, with the flowers yellow. The flowering stem is large, and alternately branched. It rises out of the centre of the leaves, reaching a height of 12 to 16 feet. The fruit is a three-valved capsule, containing two rows of small, flattened black seeds.

The Maoris are said to recognise about 55 sorts of the Phormium plant to which distinct names are given. The accepted number amongst Europeans is much less. Each shoot has five leaves, and about ten shoots go to a clump; there are therefore about 50 leaves in a clump. Exceptionally the leaves may be 10 feet high, but usually they are from 5 feet to 7 feet high. So far the Phormium plant is not regularly cultivated. The fibre is prepared wholly from wild or semi-wild plants. It is recommended to start plantations under favourable conditions, and make Phormium one of the established crops of the country. By such means it is anticipated that the leaves will be more uniform in character, and capable of yielding a better class of fibre.

Phormium has been the subject of extensive investigation in New Zealand for many years. Numerous experiments have been undertaken with the view of improving the methods of preparation, and extending the application of the fibre. The results have not been successful. The subject is still occupying the serious attention of the New Zealand Government. In 1893 the following premiums were offered:— (1) £1,750 for improvements in machinery which will materially reduce the cost of production of commercial fibre; (2) £250 for a process for utilising the waste products of the industry. The results of the trials in connection with these premiums have not yet been published. It is probable that experiments carried on in this country with fresh leaves would be more successful. It is to be expected that the conditions in New Zealand, in a comparatively new community,

devoted chiefly to agricultural pursuits, are not so favourable for inventions as in the large manufacturing centres of England. A suggestion on this point is offered later.

It may be mentioned that the fibre of *Phormium* is neither a flax nor a hemp in the usual acceptation. It would be more correct to call it simply "Phormium fibre." It is one of the oldest exports of New Zealand. Between 1823 and 1832, although New Zealand was then visited only by whalers and a few traders, no less than £50,000 worth was shipped to Sydney alone. At that time the Maori hand-dressed fibre fetched a high price in the English market, under the name of "New Zealand flax." The Maoris were careful in the selection of the leaves, taking only those in which the fibre was properly ripened, instead of cutting over the whole plant indiscriminately and at all seasons. Machine-dressed fibre did not come into commerce until 1861, and then only to supply the deficiency in Manilla for ropemaking. It is estimated that an acre will yield about ten tons of sun-dried leaves, and that the usual yield of fibre is at the rate of 12 cwt. per acre. Phormium is pre-eminent for its high yield of fibre; this is at the rate of 15 to 20 per cent. of green leaves. The old Maori fibre was so well prepared that it was capable of being made into damask and towelling equal to fairly good linen. Specimens of these are in the Kew Museum. The machine-dressed fibre is defective in many respects, and is only fit for the manufacture of twine for the use of binding machines. It is felt that the full value of the fibre can only be obtained by the use of a combined scraping and chemical process applied to carefully selected and properly matured leaves. This is well brought out in the following extract from the "New Zealand Official Year Book" for 1894:—

"The greatest improvement of the present system will be effected by the cultivation and careful selection of the leaves, and by the substitution of a chemical retting process for the prolonged owashing and sun-bleaching which at present obtain. . . . The sodic-sulphate process suggested by Mr. Cross appears to be the most promising. The advantage of this process over any other is the very high yield of fibre it achieves, which exceeds one-fourth of the weight of the green leaf, no other process having yielded more than one-sixth. The quality of the fibre produced resembles the native-made fibre in lustre and strength. For the future, if the phormium plant is to become a source of fibre supply for the world's market, its cultivation must be established in favourable situations. The natural supply is now difficult to collect, and still more difficult to renew and perpetuate."

The shipments of Phormium are variable. Owing to the improved demand for fibres generally, the number of Phormium mills in New Zealand increased from 30 in 1886, to 177 in 1891. The approximate value of the industry during the same period increased from £13,094 to 234,266.

The exports of Phormium for 1881, and for the years 1885-93, showing the quantities and values, were as follows:—

Year	Tons	£
1881.....	1,308	26,285
1888.....	4,042	75,269
1889.....	17,084	361,182
1890.....	21,158	381,789
1891.....	15,809	281,514
1892.....	12,793	214,542
1893.....	12,587	219,875

The figures since 1893 have shown a remarkable falling off in exports both to this country and America. The latter imported only 7,000 bales in 1894, as against 70,945 in 1893.

A careful investigation of Phormium fibre was undertaken by Mr. Cross in 1886. The results are published in the Reports of the Royal Commission of the Colonial and Indian Exhibition, 1887, pp. 373-376. As compared with Irish flax Phormium fibre contains a lower per-centage of cellulose, the actual figures being, Irish flax 80.2 per cent., Phormium 65.7 per cent. This cellulose in Phormium is also

shown to possess a lesser stability than in flax. It is pointed out there is a very close structural resemblance between Phormium fibre and Manila fibre, so that in case Phormium may not be so useful as flax for the higher textiles it may be brought into more active competition than at present with Manila hemp as a white-rope fibre. The structural resemblance between Phormium and Manila hemp above noticed is corroborated by what takes place in commerce, "Phormium," writes one authority, "mixes well with Manila. When the demand in the States for binder twine runs on Manila then New Zealand Phormium is in such demand for mixing that it may go above Sisal in price."

The outlook in this direction is, however not very promising. The supply of Manila, as well as Sisal hemp, could be considerably increased if prices went up, as there are large tracts of land still available for cultivation, and the labour supply is both cheap and abundant. Further, the question of freight has to be considered. Freight on New Zealand Phormium to the United States in 1892 was £4 10s. per ton, while on Sisal it was only £1. Again, by sailing vessel to the United States the freight on Manila was only £1 12s. 3d. per ton. By way of England it is more. The best opening for Phormium is evidently in the direction of supplying a good fibre for textile purposes, and here the field, at present at least, is not so fully occupied.

The prospects of the Phormium industry are very fully discussed in a paper presented to the Houses of General Assembly in New Zealand (H. 22, 1892), containing correspondence with the Agent-General in London. The latter states:—

"There are a number of skilled persons who, if they had sufficient inducement and full and proper opportunity [in this country] for ascertaining the nature of *Phormium tenax*, would direct their attention to the discovery of a means whereby the plant could be effectually and economically cleaned, so as to enable it to compete with Manila and Sisal."

He then offers the following suggestion:—

"It appears to me that what is wanted is the cultivation of the plant itself in this country to such an extent as would provide sufficient materials for the purpose of supplying those whose skill and attention would be directed, on sufficient inducement being offered, to the discovery of proper machinery for preparing the fibre for the market."

It may be added that the plant grows very freely in the South of England, the South of Ireland, and many localities with a warm climate south of the isothermal line of 51° Fahr. A plot of about five acres in extent would be amply sufficient to supply leaves for experimental purposes. The importance of the interests concerned would fully justify the New Zealand Government to act upon the suggestion here given.

PALM-LEAF FIBRES.

Several species of palms with feather-winged or pinnate leaves, are utilised for the fine fibre contained in the leaflets. This fibre is fine and hair-like, very soft, and, when unbleached, closely resembles flax. It is composed of the fine fibro-vascular bundles running through the substance of the leaflet. It is deftly extracted by hand in the young state before it is hardened by exposure to the sun. The process is slow and tedious, but the value of the fibre is undoubted. It is remarkable for great strength and durability.

Oil-palm Fibre (*Elveis guineensis*).—The oil-palm is the most valuable plant in West Africa. It is distributed in a wild state over the greater part of tropical Africa. The yield in palm oil and palm kernels is of the annual value of about £2,000,000 sterling. The fibre from the leaflets of the oil-palm has long been known in West Africa. Only small samples have occasionally reached this country. A very clear and graphic account of the method of extracting the fibre is given in the "Kew Bulletin," 1892, pp. 62-67 (with wood-cuts). The young leaflet is, first of all, deprived of the mid-rib for a short distance below the apex, and it is then split horizontally so as to expose the fibre-vascular bundles. These are taken up one by one, and usually twisted,

at once into a thin cord. If not so twisted, they are kept in small tufts, and eventually made up into a bundle. The threads are "as fine and tenacious as human hair." It is a hard day's work to prepare six ounces of this fibre from 36 lb. of the raw material. It is estimated that the actual cost of this hand-made fibre cannot be less than about £75 per ton. It is almost exclusively used for making fishing lines and fine cord. A sample submitted to Messrs. Ide and Christie, in June, 1891, was described as of "great strength and fineness, and, if really spinnable, worth £50 to £60 per ton." This must be regarded as one of the most valuable and lasting of tropical fibres.

Gri-gri Fibre (*Astrocaryum* spp).—In the West Indies, at St. Vincent, and on the Atlantic slopes of Central America the Caribs extract a fibre from the young leaflets of the Gri-gri and other palms identical in character with that of the oil-palm. Demonstrations in extracting fibre were given by the Caribs sent from St. Vincent to the Jamaica Exhibition, 1891. It is evident that the process is widely known amongst native races. Everywhere the fibre is regarded as most costly and durable. A fine fibre is extracted also from the leaflets of *Astrocaryum Tucuma* in tropical South America. This is knitted by hand into a compact web of so fine a texture as to occupy two persons three or four months in its completion. The handsome hammocks afterwards made from the web sell for £3 each, or even double that amount.

PALMYRA FIBRE.

A fibre very similar to West African bass, and nearly of the same character as Para and Bahia piassava, is obtained from the Palmyra palm, called by the Portuguese, *par excellence*, "palmeira," or "the palm tree" (*Borassus flabellifer*). In West Africa it is known as the Black Run palm. It is very tall, sometimes, but very rarely, branched, with large, fan-shaped leaves with spinous petioles. The fruit is nearly as large as a coconut, with one to three seeds. The Palmyra palm is widely distributed in India and Ceylon, but generally in a cultivated state. It is, however, truly wild in tropical Africa. In the East, it is a toddy or sugar palm. The young germinating nuts are cooked and eaten as a vegetable. The leaves are made into books, which contain the classics of the Pali and Singhalese languages. The timber is hard, and very durable; it is used for umbrella handles and walking-sticks. From the base of the petioles, or the sheathing leaf-stalks, is obtained a stiff, wiry fibre. This was at first called "bassine," to distinguish it from bass and piassava fibres. It came into notice as a commercial article in 1891, when the high prices of piassava induced the production of substitutes. At that time even split rattan, stained black, was requisitioned as a brush fibre. Palmyra fibre has steadily increased in quantity, and, contrary to what was at first anticipated, it has also risen in value. "The chief objection to Palmyra," wrote Messrs. Ide and Christie in 1892, "is that it lacks straightness, but experiments are being made in this country to overcome this defect, and should they prove successful it is claimed by importers and dressers that Palmyra should, for wear, be found equal to the best Para." These anticipations have, to some extent, been realised. Palmyra now has practically taken the place of West African bass. The latter, on the 16th Sept., 1895, was "dull, business small, £14 to £23 per ton." Palmyra fibre, on the other hand, was "good, £26 to £34; medium, £22 to £25; common, £15 to £19 per ton."

The natives in Ceylon and India are evidently copying the worst practices of the Indians of Brazil in sending consignments of Palmyra fibre to this country in a damp condition. The result is that as one firm complains, "the bales, on opening, are found wet, and the fibre to a large extent perished and powdery." Should the practice continue, the industry will be seriously injured. The bales are press-packed, and iron bound; they weigh 1 to 3 cwts., and measure 10 to 30 cubic feet.

KITTOOL FIBRE.

The Kittool or Kittul palm of India and Ceylon (*Caryota urens*) is a stout handsome plant with a

smooth annulated stem, 30 to 40 feet high. It has broad leaves, with the leaflets obliquely cuneate. The fruit is small and reddish. It is a toddy and sugar palm, and also yields sago.

Mr. J. R. Jackson, A.L.S., in "Commercial Botany," gives the following excellent account of the fibre yielded at the bases of the leaves of this plant:—"Kittool fibre," he says, "has been known in this country for some 30 or 40 years, but it is within the last 10 years that it has become a regular commercial article. When first imported, the finer fibres were used for mixing with horse-hair for stuffing cushions. As the fibre is imported, it is of a dusky-brown colour; but after it arrives here it is cleaned, combed, and arranged in long straight fibres, after which it is steeped in linseed oil to make it more pliable; this also has the effect of darkening it, and it becomes, indeed, almost black. It is softer and more pliable than piassava, and can consequently be used either alone or mixed with bristles in making soft, long-handled brooms, which are extremely durable, and can be sold at about a third the price of ordinary hair brooms."

The use of Kittool fibre is said to be spreading not only in this country, but also on the Continent. During 1895, Kittool fibre has not been much in demand. The values on the 16th September were quoted as follows:—"Long, 10d. to 10½d.; No. 1, 7d. to 7½d.; No. 2, 2d. to 2½d.; No. 3, 1d. to 1½d. per lb."

COCONUT FIBRES.

The Coconut palm (*Cocos nucifera*) is extensively cultivated in nearly all tropical countries. It exists in immense groves in Southern India, Ceylon, the Islands of the Eastern Archipelago, and Polynesia. Its cultivation is extending in the West Indies, and on the East and West Coasts of tropical Africa. The coconut palm is one of the first objects to be seen along the beach, and soon becomes one of the most familiar objects to travellers in the tropics. It is a valuable food plant for man and animals, and provides besides materials for the construction of houses, and numerous utensils in daily use. It has a cylindrical stem, usually gracefully curved, and attaining a height of 40 to 100 feet, surmounted with a crown of large feathery leaves. The plant is propagated by means of seed-nuts (the fruit); these germinate, if kept moist, in 3 to 5 months. The young plants are put out in their permanent places, when about 8 to 15 months old, at distances varying from 27 to 33 feet apart. The coconut begins to bear in 5 to 8 years. Usually, the nuts take from 8 to 10 months to mature before they fall from the parent plant. Each coconut palm bears from 30 to 60, and, very exceptionally, when well watered and manured, up to 100 nuts a year.

As shown above, the coir of commerce is yielded by the thick pericarp or outer fibrous covering of the fruit of the coconut palm. The word "coir" is said to come from the Malay *Kāyar*, a twisted product. *Kayar* is also the Tamil for a rope. Although coir was known in Europe in the 16th century, it was not until about 1842 that it was brought prominently into notice. St. George's-hall, Windsor, in that year was laid with coconut matting on the occasion of the baptism of the Prince of Wales. Later a great impetus was given to coir manufacture by the Great International Exhibition of 1851.

Coconut fibre is tough, elastic, easily manipulated within certain limits, and eminently suitable for manufactures where lightness, cleanliness, and great indestructibility are required. It is understood that coconut fibre will not bear bleaching. Various shades of colour are, however, obtainable by using different descriptions of natural unbleached fibre. In an ornamental mat in the Kew Museum the various shades are obtained by using dark Fiji coir, medium coloured Ceylon coir, and very light Cochin coir.

Besides being made into rough cordage, coir is used in combination with wool to give richness and effect to hearth-rugs and carpeting. It is also used for brushes and brooms for household and stable purposes, matting for sheep-folds, pheasantries and poultry yards, church cushions and hassocks, hammocks, clothes-lines, cordage of all sorts, string for nurserymen, nosebags for horses, mats and bags for seed-crushers, oil pressers, and candle manufacturers.

Coir is one of the best materials for cables, on account of its lightness, elasticity, and strength. It is durable, and little affected by salt water. Of coir and coir-made rope, about 9,000,000 to 10,000,000 lb. are annually shipped from India; much is prepared in Ceylon; but Cochin is noted as the port of shipment for the best quality of yarns.

Certain varieties or cultivated forms of the coconut are better suited than others for the production of coir. Cochin (a small native state on the Malabar coast) produces a bright, light-coloured coir, which fetches the best price. On the other hand, a good deal depends on the age at which the nuts are gathered, and the time which elapses before they are husked and cleaned.

In the process of separating the fibre, the following commercial qualities are produced:—The mat, or long fibres, used for spinning purposes: the shorter, or more stubborn fibres (bristles), for brooms or brushes; the tow or curled fibre for stuffing cushions; and the dust or refuse for gardening purposes. When dyed black, the tow has been used as a substitute for horse-hair. A singular use was proposed a short time ago for coconut dust or refuse. Taken before it is quite dry, and subjected to great pressure, it is capable of forming plates of varying thickness, like millboard, only much more brittle. These boards, if used as backing for steel plates or ironclads, swell up on being punctured below the water-line, and soon close the orifice. If really effective, such plates could be produced at a trifling cost, for thousands of tons of coconut refuse float away annually down the rivers in India and elsewhere.

The first step in the preparation of coir is the removal of the husk from the hard interior shell. This is usually done by striking the nut on a pointed instrument stuck in the ground. A man can husk about 1,000 a day. The husks are then soaked in water. This is variously conducted. The water may be either salt, brackish, or fresh; in this the husks are kept for a lengthened period. The more recent method is to place them in tanks of water made warm with steam. The latter heats the softening process, and improves the colour and quality of the fibre. Where machinery is used, the husks, when sufficiently soaked, are passed through a crushing mill, which flattens and crushes them ready for the extractor, or breaking-down machine. In the latter the fibres are completely disintegrated, and are then passed through a "willowing" machine, to free them from dust and refuse. It is calculated that, when treated in this country, 10,000 husks will produce 45 to 50 cwt. of "spinning fibre," and 9 to 13 cwt. of "brush fibre."

In Ceylon, 40 coconuts are said to yield 6 lb. of coir; in Madras, 3 large coast nuts yield 1 lb. of coir; in the Laccadives it requires 10 small nuts to yield a pound of coir, measuring, when made into yarn, 35 fathoms. In 1889, an attempt was made to export coir from Lagos. A bale of loose coir, weighing 42 lb., was prepared from 400 nuts. No attempt had been made to separate the "bristle" and "mat" fibres. Good Ceylon bristle fibre was then worth £30 per ton, and Ceylon mat fibre £10. The Lagos fibre, when separated, was valued at £15 and £9 to £10 respectively ("Kew Bulletin," 1889, pp. 122-132). The average annual value of coir goods exported from Ceylon is put down at £60,000. The quantity exported in 1884 was as follows:—Coir rope, 10,419 cwt.; coir yarn, 81,057 cwt.; coir fibre, 12,732 cwt.; total, 107,208 cwt.

The principal exports of coir from India are from the Madras Presidency. For the five years ending 1880-81 they were 271,934 cwt., valued at R2,179,767 while for the year 1881-82 the value was R2,354,202. The exports from the Malabar coast alone amounted to R2,343,000. "From these figures an idea may be obtained of the immense importance of Malabar and the Laccadives as the chief seats of the Indian coir industry."

The approximate market value per ton of coir goods in London on the 16th September, 1895, were as follows:—

Coir yarn: Cochin, common to good, roping, £11 10s. to £14, weaving, fair to good, £20 to £25; Ceylon, fair to good, ballots and bales, £17 to £21.

Coir fibre: Cochin, fair to good, £11 to £20; Ceylon, clean, £8 to £9 10s.

Coir rope: 4½ to 6 inch, 2½ to 3½ inch, and 1½ to 1¾ inch, £11 to £14.

Bristle fibre: Medium, £18 to £21; good, £20 to £30.—*Journal of the Society of Arts.*

SWAMP PLANTING.

EUCALYPTUS GLOBULUS AND OTHER EUCALYPTS.

Much has been written from time to time on the special antimalarial properties possessed by an Australian tree known as *Eucalyptus globulus* and such writings cause no inconsiderable number of enquiries at the Botanical Establishments of West Indian Colonies for plants of this species. It has been stated that the planting of this tree has lessened the amount of fever prevailing in the neighbourhood of the city of Rome and in other places, and it is therefore regarded as a suitable plant for any swampy district, and in this way, it has become a somewhat popular idea that *Eucalyptus globulus* should be planted in all malarial districts. I am conversant with what has been written on the subject by Baron Von Mueller and various other Botanists—but without controverting one word of what they have said, I must point out that in our case the circumstances and climate are so different, that I am sure that even Von Mueller himself would at once tell an applicant for information that it would be useless to plant under such conditions of climate as prevail in the lowlands of the West Indian Islands. During my twelve years in Jamaica I planted on plain and hill, and distributed year after year many hundreds of plants to others. Those on the hills succeeded, those on the plains invariably failed, and to plant in a swamp or near swampy ground was found to kill them at once. The tree in the hills grew rapidly and Von Mueller, quoting from the records of the Department, states that trees had grown 60 feet high in seven years, and having been personally in charge of them for a period of six years I can fully confirm the statement. *Eucalyptus globulus* is a native of the Southern parts of Australia, where at times the temperature falls below freezing point, as in Victoria and Tasmania, so that it is not, in reality, a native of tropical regions, but requires, as do most plants coming from temperate climes, a season of rest or winter to enable it to thrive, and this our climate of the plains is unable to afford. The fact is, *Eucalyptus globulus* will not grow in the West Indian plains, and if planted it will not survive for more than a few months, and the reputation it has somehow or other obtained for being suitable for tropical growth is certainly nothing more than a popular fallacy. If we examine the reason given for its reputed anti-malarial properties, we shall find it stated. (Von Mueller, p. 151), "Eucalyptus leaves generate ozone largely for the purification of the air; and the volatile oil is very antiseptic." Not only is this true of *Eucalyptus globulus* but of many other plants of the genus, and also of some of our own West Indian plants, and where therefore *Eucalyptus globulus* is proved to fail, we should seek out other trees of a suitable character. If, however, *Eucalyptus globulus* will not grow with us, there are others of the genus that will thrive, among which we have *E. tereticornis*, and *E. citriodora* and others. Of the first, we have a tree in the Trinidad Gardens giving four feet in diameter of the stem at three feet above ground, and reproducing itself freely from seed, which of itself is a fair test of its acclimatization, but although *Eucalyptus globulus* has been continuously planted for years, not a single tree has thriven. Besides being ozone givers the Eucalyptii are rank feeders and absorbents of moisture, and it is highly probable that the tree acts in this way as a malarial antidote, far more than in giving off or dispersing an almost magic influence from its leaves, and that many West Indian or exotic trees of similar character would answer as well and serve the same

purpose. We may mention as suitable the Swamp Palm *Raphia to digera*, the Ivory Nut Palm *Phytelephas macrocarpa*, the *Casuarinas*, the Saman Guango or Rain Tree, *Pithecolobium*, Saman and the *Pterocarpus* of our own swamps. *Phytelephas* gives the ivory nut or "corossos" of commerce. *Casuarinas* in India have cost £1 to £10 per acre to raise, returning in eight years £13 to £32, (Von Mueller); and they are suitable for saline soils, and "thrive much better than *Eucalyptus globulus* in Lower Egypt," (Dr. Schweinfurth). The wood is admirable for fuel, and the tree has been proved to do well and grow rapidly on the Trinidad Lowlands. The Saman is well known for its beautiful wood and fast growing properties and the *Pterocarpus* give the Dragon's blood of commerce: but even such trees as these if planted directly into a swamp, will probably fail for many reasons; but if planted on small hillocks in or near such places, they will thrive and do well and ultimately take possession of it. Some may dispute the fact that *Eucalyptus globulus* will not grow in the districts indicated, and reference may be made to plants existing.

In such case I would recommend the cultivator to make sure of the species he has growing; for it may be safely assumed that it is not the plant supposed, but a species of the genus more suited to our climate. The species of Eucalyptii most suitable for cultivation here are those coming from the hottest and most tropical portions of Australia, such as the districts in the vicinity of Port Darwin or the most northern portion of the territory, and not those coming from the southern or more temperate regions.

VARIOUS PLANTING NOTES.

THE DANGER OF WEED KILLERS.—We would draw the attention of all who handle weed-killers to the exceedingly poisonous elements sometimes included in such preparations. Messrs. Spiers & Pond were recently sold £5 and £5 5s. costs for selling what was alleged to be a preparation of arsenic, without entering the signature and address of the purchaser. The preparation was sold as a weed-killer, and it said to have contained 75 per cent. of arsenic, and 25 per cent. of caustic soda, in all 2 lb. 13 oz. or sufficient to kill 6000 persons. Apart from the danger which might result to those buying such mixtures without due knowledge of their contents, there is no small risk involved if such violent poisons are left lying about in positions easily accessible to children and others ignorant of their nature or contents.—*Gardeners' Chronicle.*

"JOURNAL OF THE KEW GUILD."—We have already alluded to the recent publication of the number of May, 1895, and may now give some indication for its contents. It opens with a portrait and brief memoir of Sir William Hooker, the first Director. What he did, how great was his courtesy, and how potent his aid to young gardeners and students, is held in grateful remembrance by the older generation, and it is well that the new-comers should be made acquainted with the facts also. The main purpose of the guild, that of linking the Kew gardeners of the past with those of the present, seems to have been well accomplished, and no doubt the circulation of the present number will still further promote that co-operation and good fellowship which are so desirable. The items of Kew news have mostly been published already in the gardening papers, but it is very useful to have them collected in so convenient a form. The notes from far off members in all quarters of the globe are most interesting, and constitute a feature which we would fain hope may be much extended. Some notices of old Kewites who have passed away will be of interest to many who still hold their memory dear. There are some omissions which will probably be made good in subsequent issues. The list of old Kew men will prove very serviceable. We congratulate the promoters on the progress of the guild, and most heartily wish it all attainable success.—*Ibid.*

THE HILL-COUNTRY OF CEYLON: THE BEST OF CLIMATES AND SCENIC ATTRACTIVEIONS.

To see ourselves as others see us may occasionally shock our vanity, but it not infrequently produces precisely the reverse effect, and acts as a powerful antidote to the normal tendency of human beings to undervalue what is familiar to them. We are all aware of the floral and scenic beauty of our island. Every passing stranger sings its praises in our ears, and yet so immersed are we in the race for wealth that we scarcely have time to look about us and realise the marvellous gifts of climate as well as scenery with which nature has endowed this favoured isle. A pamphlet in manuscript lies before us by one who, as a recognised Meteorologist of high repute both in Europe and Asia, and a resident in many climes, is qualified to judge and speak with authority upon the merits of our hill Sanitaria. The author, Mr. Douglas Archibald, a former member of the Bengal Educational Service, has good reason to dread the deadly Bengal climate, which after four years, sent him home in 1878, seriously invalided and no one than he can better judge of the superiority of even our sea-level climate over those of the Indian main land; and though he has recently returned to the scene of his former labours and been engaged in important meteorological work for the Government of India—amongst which a Monograph on the Climate of Calcutta is conspicuous,—he has wisely resided in the Himalayan Sanitaria, and is thus able to compare them from personal knowledge with our own Highlands.

Amongst the points which seem to have struck Mr. Archibald's imagination most forcibly are the accessibility of our hill resorts as compared with those of India. The journey to Simla for example, involves eight hours' weary jolting in an antiquated tonga, which occasionally, as he has told us happened to himself, breaks down and deposits its human freight in the road. This after 48 hours' railway journey in a May sun is enough to finish off the traveller altogether. To compare this with the delightful journey to Kandy, Hatton, and Nuwara Eliya, or Bandarawela seated in the refreshment car, eating iced bananas, qualling cool liquors, and gazing at our gorgeous scenery is like comparing barbarism with civilization! Another point is the relative cost of reaching our Sanataria from say Calcutta. The journey to Simla from either Calcutta or Bombay including tonga is at least R120 or R130, and return about R160 or R170.

This spread over three days is R50 a day, whereas from Calcutta to Colombo, it is R180, return fare by P. & O. steamers spread over 10 days, or at the rate of R18 a day including feeding. In the other case the feeding by the way is all extra. Moreover, the sea-journey itself is incomparably pleasanter and alone one of the best of health tonics.

A further advantage upon which the author lays great stress is the vast superiority of our hotels right through to Bandarawela over the corresponding houses which adopt the title in India. We are not in the habit of considering ours altogether perfect but it is consoling to find that they are far ahead of most of those on the mainland, and though our prices may seem somewhat high, we at all events appear to get our moneys' worth.

The Eulogium pronounced by Mr. Archibald on Nuwara Eliya is to a great extent deserved especially in regard to the beauty of its scenery,

the facilities it affords for recreation of all sorts, and the absolute purity of its atmosphere and in these respects it deserves, as the author points out, to be better known and advertised. We are, so blessed with beautiful uplands that we are apt to underrate their supreme merits and forget that the enormous territory of Northern India has only one line of refuges from the heat at all of which the monsoon rainfall is far more disagreeable than at Nuwara Eliya. It must always be remembered that the rainy season in the districts of which Hatton is the centre is always declared by the resident planters to be about the healthiest, due to the equableness of the temperature, so that visitors should put this to the credit side even in the few months when the weather may seem to be against them. The "perfection of climate as we have frequently pointed out, is in the uplands of Uva, and the author fully recognises the remarkable feature of the climate of this district represented by Bandarawela in affording a complete shelter from the rains of the S.-W. monsoon while at the same time it has a mean temperature of only 3 degrees above the ideal of perfection viz. 65°. This means of escaping from the South-west monsoon rains is as Mr. Archibald points out a unique feature of Ceylon due to its insular position and is with a few exceptions such as Kashmir unattainable in India, and he draws attention to the peculiar advantages possessed by Bandarawela as a resort during June, July and August—or, indeed, from June till October.

TIN-PLATE TEA CHESTS.

Mr. Frank Randell, of Llanelly, has written to the *Ironmonger* on the above subject, which is at present being largely discussed in Swansea tin-plate circles. He says:—"I will at once say that having had over twenty years' experience in the tea trade, the new style is, in my opinion, a very distinct improvement upon wood chests lined with lead, and I am convinced that it is the tea-chest of the future, now that I have seen the actual thing and the several advantages in its favour. I notice that there is a marked gain with regard to the weight of the chests or tare—viz., 10 lb. in every 100-lb. chest—and, therefore, in a cargo of, say, 10,000 chests, there is a saving of freightage of 100,000 lb., and a further gain of 1 to 2 inches cubic space per chest—two most important items in cost of transit. The tin-plate chest being hermetically sealed is a positive safeguard against any damage by water, either by sea or rail, and it is, moreover, proof against the possibilities of contamination by microbes or other germs of disease, to say nothing of a vast amount of tea being secured from running out through the cracked timber and other crevices often found in the wood chests, it being a well-known fact that several thousand pounds of tea are lost annually in this way during transit and handling from one warehouse to another. The use of tin chests further prevents the damp air getting into the tea, thus retaining its aroma and full flavour until wanted for use."

In view of an alleged scarcity of timber he holds that in cost the tin-plate chest will compare favourably with the wooden article. Commenting on the latter the *Ironmonger* says:—"It will be interesting to note whether the tin-plate manufacturers try to make a proper use of the opportunity. They seem to have a great chance of creating an enormous demand, and as China has lost her supremacy in tea, they have a magnificent chance of gaining converts in Ceylon, Assam, Japan, and other tea-growing countries. The Chinese may possibly adhere to the old chests, but elsewhere the tea-growers are progressive men, and if it can be shown that the tin-plate chests can be had at nearly the same prices at the wooden ones, they will almost certainly be adopted. Who amongst the tin-plate makers will take the matter up in an intelligent, level-headed, enterprising manner?"

INDIAN AND CEYLON TEA IN AMERICA.

Mr. Mackenzie, the special commissioner for Ceylon, who is now in London, has sent us the following particulars referring to the campaign for pushing Indian and Ceylon tea in America:—"It is difficult to say anything about what is being done to push Ceylon and Indian tea in America without trenching on other people's business. And about that I have so often been asked to be discreet, that I think it well to say nothing. "But, vaguely and generally, I may say that I found much more interest is now taken in British-grown teas than was the case early this year. The vigorous efforts a few strong London firms have made to push their packet teas appear to have convinced American dealers that 'contemptuous indifference' is not the best attitude to assume towards the teas (Ceylon and Indian) chiefly contained in those packets

"The advertising schemes which Mr. Blechynden and I propose to carry out were somewhat delayed by the uncertainty as to the amount of support we might expect from Calcutta. But beginning from December (next month), short pithy advertisements are to appear in twenty-seven periodicals of the weekly and monthly order, which concern themselves chiefly with ladies and household matters.

"Besides these, we advertise in the principal trade journals and in several New York and Brooklyn Saturday evening papers. We have also been assisting at food shows and in many other ways. Half-hearted measures are of no use, and are merely a grievous waste of time and money. We should strike strongly and at once. But unfortunately our Indian allies are, in my opinion, too niggardly with their funds. They are rich enough and strong enough to furnish *twice* and much as Ceylon does. Yet it is with difficulty that *half* as much can be extracted from them.

"Several good firms have begun to handle our teas, chiefly because they have heard we are to assist largely in pushing them. It would be a pity were they to be disheartened because of failure on our part to do what they expect of us. Our opportunity is to be in 1896, and all our strength should be put forth during that year."—*H. & C. Mail.*

PRESERVATION OF BOOKS IN THE TROPICS.

In the *Kew Bulletin*, 1894, pp. 217, 218, an extract was given from *Indian Museum Notes*, Vol. iii. No. 3, on the best means for preserving books from the ravages of insects in the tropics. On this subject the following letter has been received from Surgeon-General George Bidie, C.B.E., formerly in charge of the Government Central Museum, Madras:—

Berry View, Paignton, South Devon, 19th March 1895.
 Sir,—In the *Kew Bulletin* for 1894, p. 217, there is a memorandum on the "Preservation of Books in the Tropics," and I now write to mention that so far as their protection from insect enemies is concerned, the subject was investigated by me years ago, when in charge of the Government Central Museum, Madras, and the practical outcome of the experiments recorded in the Museum Annual Reports for 1881 (p. 6) and for 1883 (p. 4). Indeed, it may be affirmed that the application of corrosive sublimate for the protection of books from tropical insects was first devised by the staff of the Madras Museum, and thereafter regularly used for the books in the scientific and large public libraries which it contains. Before bringing it into use it was carefully tested by placing books and papers poisoned with it in the nests of white ants, the most formidable of all the enemies of literature, and it was invariably found that the articles thus exposed came out of the ordeal uninjured. The composition of the Madras preservative was as follows:—

Corrosive sublimate	1 oz.
Carbolic acid (Calvert's)	1 oz.
(or Thymol, $\frac{1}{2}$ oz.)		
Mothylated spirits	2 pints.

This mixture was carefully and freely applied with a soft brush about the bindings and amongst

the leaves of the books, the eyes of the operator being protected with close fitting goggles. It dried quickly and was perfectly safe, as I have never seen or experienced any disagreeable effects from handling books poisoned with it.

My impression is that the value of this preservative was made known to all public departments by Government circulars, but apparently these never penetrated so far as Calcutta.—I am, &c.,

(Signed) G. BIDIE.

W. T. Thiselton Dyer, Esq., C.M.G., &c.,
 Director, Royal Gardens, Kew.

COLOMBIAN INDIA-RUBBER.

Through H. M. representative at Bogota (Mr. G. Jenner), Mr. Robert Thompson (who was for many years at the head of the Government Gardens and Plantations in Jamaica), has sent home a report on the agricultural productions of the département of Tolima (Colombia). The following is a reference of interest to our readers:—"A very important species of Rubber is indigenous, and, I am inclined to think, peculiar to Tolima. Unlike other important kinds of Rubber, it grows at high elevation, viz., at from 6,000 to 8,800 feet above the sea-level. Some thousands of bales of it were exported a dozen years ago. But as the tree was only locally distributed, the source of supply was soon exhausted. The authorities at Kew have named this plant *Sapium biglandulosum*, a species which is also said to be found in British Guiana, where, however, it seems to be of no value as a Rubber-producer.

"In connection with the cinchona plantations above referred to, a plantation of this Rubber was made about 10 years ago. The trees grew with remarkable rapidity with trunks a foot in diameter in six years; but this plantation shared the same fate as the cinchona, that is, it was abandoned years ago because the cinchona was abandoned. With renewed attention, however, this plantation may still be made important. "A few years ago I directed the attention of the Secretary of State for India to the advisability of cultivating this plant on a large scale in that country. My letter was referred to the Government of India. I think, however, that no progress has been made. This valuable plant, could be cultivated over a wide range of latitude in India, thus extending from the elevated mountainous regions of Southern India to the low-lying valleys of the Himalaya as far as 26° north latitude. And this is a great advantage as compared with the limited zone in which the other important tropical American species of Rubber introduced to India can be cultivated."—*India Rubber Journal.*

THE SEASON IN MADRAS.

Yesterday the Board of Revenue telegraphed to the Government of India for the week ending the 23rd Nov. as follows:—"Heavy rainfall along the East Coast and South of Nellore and moderate falls in the remainder of the southern half of the Presidency; showers elsewhere. Agricultural operations are progressing. Standing crops are generally good. Harvest is going on with a fair outturn. Pasture and fodder are sufficient. Cattle is in good condition. Prices are falling especially in the Deccan, Southern and West Coast Districts."—*M. Mail.*

VEYANGODA DESICCATING COCONUT MILLS

were never so busy as at present, working night and day and disposing of nearly 50,000 nuts a day, or the equivalent of the produce of over 10,000 acres per annum. The mills are most popular with the estate proprietors and villagers on account of the fair prices they give for the crops of nuts. Nearly 200 natives too, find profitable employment in these mills, an immense boon to the surrounding district. Native capitalists are trying their hands at mills on the Kelani and at Negombo.

COPRA IN FIJI.

Attention is drawn in our advertising columns to an ordinance passed in Wallis Island for the purpose of improving the quality of the copra made on the island of Wallis and Futuna. The natives are forbidden to climb the trees except to obtain nuts for drinking or domestic use, and only nuts naturally fallen from the trees are to be used for copra making. Traders are liable to fines for buying bad copra, so that it is evident that the Government intends to improve the standard of thier exports.

The native tax copra has been coming in very fast during the last month or two and has every prospect of continuing. It is expected that the yield will be quite equal to that of last year, so that there will be no diminution in the revenue of native taxes as was anticipated shortly after the hurricane of January last. A most unwelcome feature has however cropped up in connection with the product this season. Several cargoes brought to Suva have been rejected and sent back to the districts, owing to the copra being damaged by salt water. This has been caused principally by leaky vessels and faulty tarpaulins, while in one case at least the produce was spoiled by the ballast being taken out and the vessel completely filled with copra which was thereby damaged with the bilge water. The damage has occurred, not only on native boats, but also on European-owned vessels. Fully fifty tons have been rejected on this account, and a certain portion of this will be complete loss.—*Fiji Times*.

A DAY ON A LIBERIAN COFFEE ESTATE IN THE MALAY PENINSULA.

"SUDA PUKOL LIMA, TUAN" (5 o'clock, sir!). With these words am I awakened one morning by my Chinese boy. Though intensely sleepy, I have no further chance of rest, as my "boss," no gong being handy, begins to drum violently with a boot on the wooden partition of his room. So I slip out of bed and, after washing my face and hands, get hastily into my clothes, a costume consisting of a cotton vest, khaki trousers and button-up coat, merino socks and canvas boots. By this time it is half-past five, and the first streaks of dawn have been appearing for the last few minutes in the East, the mist is lifting, and the birds are already giving notice that a new day has begun. I shiver as I turn from the window, and am truly glad when my boy reappears to announce, "Te suda siap, tuan" (tea is ready sir).

I am soon at work on hot tea and the inevitable poached egg in the dining-room, into which both bed-rooms of the bungalow open. These three principal rooms form the main portion of the building, and stand on piles raised four feet from the ground. From the back of each bed-room, steps lead to the bath-room below; here also are two smaller rooms used respectively for stores and medicines, and the bungalow opens on to a verandah in front.

By the time my meal is finished it is quite light, so, putting out the lamp and whistling to the dogs, the manager and I start out. After some five minutes' walk we came to the coolie lines. Here are drawn up two long rows of coolies, Tamils from various districts of Madras, the men separate from the women and children. The manager then produces his small muster-book, and calls out from it the names of the coolies; opposite the names of those who are present he puts a dot, against those of the absent a cross. Muster being finished, he proceeds to tell off his coolies to their various works, so many to holing, so many to filling, so many to weeding, so many to pruning, two or three men to the nursery, and, lastly, some men to plant. The manager then goes back to the bungalow, saying he has some work to do, and that he will give out medicine to any coolies who are sick, and thus save me the trouble of returning to the bungalow for what is, as a rule, part of my duty.

I start off to the weeders. Weeds in this tropical climate ripen and seed wonderfully quickly, so quickly that we find it necessary to weed every portion of the

estate every three weeks. One weed in particular, called *vaalkie* by the Tamils, a kind of chick-weed, is the bane of every plantation; it roots very deeply, and if any portion of the root or head be left on the ground, it will revive as though it had never been touched. For this reason, all weeds are collected in sacks, and, after work is over, either burnt or buried. Each weeder is supplied with one small sack, and with a small pointed stick to loosen the soil at the weeds' roots. I give each coolie so many rows to weed, and am careful to notice whether the number of workers arrived at the spot corresponds with the number despatched from muster.

My way now lies through jungle, to the new clearing, and as I take the path all is shade, though in the open the sun has already begun to give its fierce heat. My dogs thoroughly enjoy themselves ranging on either side of the track in search of game. Squirrels of several kinds run up the trees for refuge, shaking off great drops of dew which fall on my pith hat with a thud. Trees rise up on all sides, ranging from the slender sapling to great giants of a hundred and fifty feet high, interlaced in many places with beautiful vines. The undergrowth is dense: nowhere can one see further than five yards, one close mass of creepers, palms and wild ginger leaves. Here, in the shadow of the trees, is none of that gorgeous colouring, or life, so much written about as existing in the forests of Brazil. It is true that from the open clearing, at certain times of the year, one does see the leafy tops of trees here and there glorified by tints that would shame an English autumn, but in the shade where I walk, the general impression is of a great green mass, relieved from monotony by one of the graceful rattan tribe. Save for the occasional scolding of a squirrel, or the chattering and shrieking of various sorts of monkeys, disturbed by the approach of man, the silence is wonderful. The birds seem to be ashamed of themselves. One rarely sees them; but on this path, wherever a gleam of sunshine manages to force its way, colour is supplied by hundreds of butterflies, some of striking brilliancy and beauty.

Suddenly my reverie is rudely disturbed by a great yelping of the dogs, who, seeming to scent something, keep rustling to and fro in the undergrowth, as they now find, now lose, the scent. It may be a wild pig! And I am cursing my ill luck in not having a gun with me, when a small form, no doubt the innocent cause of all the commotion, creeps suddenly out of the jungle some twenty yards away, looks round with frightened eyes, and then hops slowly across the bath, back into the jungle. This is a mouse-deer, the smallest of all deer, perfectly proportioned though but a foot high. The dogs soon give up the chase, and come back to my side just as I emerge into the new clearing. Here is what would seem to the uninitiated a scene of wildest confusion, trees lying about in all directions, some heaped on top of others, and all more or less charred by the fire that was applied to them a month ago. Now, in reality, everything is quite in order: if one looks closely, one can see pegs placed in line at a space of ten feet apart, this being the distance at which holes for the coffee plants are to be cut. Wherever a bough would have been in the way, it has been lopped off. The explanation of the seeming disorder is that, in this country, timber is never removed from a felled clearing. By its shade, it keeps the earth from drying too fast, and, decaying so rapidly as it does, it forms a valuable top-dressing for the soil.

My first business in the new clearing is to inspect the work done by the holers. Each of these is armed with a heavy hoe and a sort of iron scoop into which is fitted a long handle. The hoe is used instead of spade for digging, the other implement to trim the sides of the hole, and remove earth where the hoe cannot reach. I have first to set the coolies their task, then to see that they are doing their work properly, that the earth which they remove is neatly piled in one or two heaps. We do not allow more, as the "filling coolie," whose duty it will be to refill these holes with top soil, would have to hard a task had he first to remove the earth left all round the hole by a careless "holing coolie."

A quarter of an hour or so I spend with the holers, then after checking their numbers I pass on to the fillers, whose task I set, and whose work I proceed to inspect. They must refill the holes with soil scraped from the top of the ground, which soil has to be carefully freed from roots before being put in. It is then stamped down, and more is added until the soil of the hole is raised three or four inches above the surrounding level, thus allowing any subsequent subsidence caused by rain.

The planters next claim my attention. They have just started work on the field, the small plants being brought from the nursery, which is handy, and given to a certain chosen few who understand the work. They, making a hole with a wooden peg in the earth of the hole itself place in this the tap-root of the plant, taking great care not to bend it, and completing the operation by pressing down the soil round the root with their fingers. After each of these planter coolies there comes another coolie, whose duty it is to shade the young plants with palm-leaves, which he places east and west of them, thus shielding them from the sun, but allowing a current of air to pass through from north to south. I watch the planters for some time. Coolies are very apt to bend the tap-roots; for this reason we never take the planting coolie, so he can never give the excuse of having been in a hurry. I glance at a young nursery, where two or three men are employed in watering the seed put in a few days before; then, on looking at my watch, find it is time to be off. So I turn homewards, only halting on my way for a few minutes' inspection of the pruner's work in an old clearing, and arrive at the bungalow again about eleven, very hungry and thirsty.

My boss, who is lying in a long chair, is apparently in the same plight, as he calls out to me to hurry up and change. This accordingly I prepare to do. But first I must have my bath. The bath, one cannot call it bath, is a much more frequent and important occurrence in the East than in the old country, so it seems worthy of description. In one corner of the bath-room, which I enter by means of steps from my room above, stands a big earthenware jar full of water. This jar is, in my case, about three feet high, and rather more than a foot in diameter at the mouth broader below. Near it is placed a tin bailer, and with the help of this one is expected to throw water from the jar over oneself until refreshed. This, in such a hot climate, is a somewhat lengthy operation, but, oh! the relief of it. The pleasant feeling of that cool steam trickling from one's buzzing head, down one's hot spine! It is much more refreshing than the ordinary bath, but I well remember that when I first came out to this country I was much preplexed by this mysterious jar. I stepped boldly into it. But, alas! when my legs were in, there was no room to get at the water.

Eventually I was forced to appeal to my boss for advice. He roared with laughter at the idea of my getting into the jar, but after putting me right, he was obliged to admit that he himself had done the very same thing, when he first came out!

Dressing after my bath was not a work of much time, as in a bachelor establishment one does not trouble oneself with too many clothes. A vest, the sort of skirt called a "sarong" that is worn by all Malays, and a pair of grass slippers complete my toilet. We shent to the boys for food, which soon arrives, and consists of four courses—fish, mince, stewed chicken (chickens appear constantly under various disguises), and curry. I do not touch the last dish, as I find it makes me so sleepy that turning out again into the heat is distinctly objectionable. Our drink is whisky, beer being too bilious for ordinary occasions, though we sometimes do indulge in it by way of a treat on Sundays. When our food is over we enjoy a little interval of idleness, lying in our long chairs on the verandah and smoking. But at half-past one the work of the day begins again; we resume our outdoor clothes; the manager goes off to see after the pruners, remarking that he has not much confidence in my skill in that line, and wants to see for himself what they are doing; while I start on my morning's round over again.

The coolies had been tasked, so that, if fairly industrious, they should be able to finish work between the hours of one and half-past two, at which time a horn is blown as a signal for all untasked, such as nurserymen to leave the field, while those of the tasked who have not then done their allotted portions have to remain to complete it.

As I have started out at half-past one, I expect to find that most of the coolies have finished, and on my way to the weeders, I do meet several from each of the works, who have evidently done what they had to do, and are hurrying back to the lines to wash themselves. When I reach the weeding party, ten men have finished and gone, and the others remaining have only a few yards to complete. Their work seems clean, so I go on to the new clearing. No holers! I ask the headman who has been looking after them where they are, whereupon he answers that they have all finished, except one who has gone sick.

It never does to trust any of these men too implicitly, so I proceed to count every fifth row, and find that though the correct number of holes has been cut, many are not of the proper size. As the headman possesses a gauge with which to measure the holes, he has no excuse to offer, especially as he has been warned only yesterday. So I dock two days' pay, firmness being the only method that answers with coolies, leniency they regard as weakness to be taken as much advantage of as possible. The fillers' work is satisfactory. And now all the coolies have finished, as the nurserymen and planters went off some ten minutes ago, at the blowing of the horn.

I have nothing more to do, and telling the headman to have the coolies ready for muster at four, I go back to the house. When 4 o'clock arrives, off I set to the lines, and put down the working coolies' names in the small muster-book. Then I have to check the different totals given me by the headman, and see that they, when totted up, agree with the grand total in the muster-book. This takes some time today, as the man who looked after the holer gives me one too many in his total, entirely forgetting to deduct the coolie "gone sick." After puzzling a bit, I find out his mistake, and am able at last to get back for a much-needed bath and change, while the coolies begin to cook the rice for their evening meal.

After tea there is some book-work to be done: I must enter the coolie's names from the small muster book into a big one; then the manager calls to me to take copies in the letterpress book of some business letters which he is writing. So I am well employed until dinner-time, half-past seven. Dinner does not differ materially from tiffin, except that soup always begins it, and curry is dispensed with. As our rising hour is an early one, we turn in about half-past eight, after smoking one pipe.

My day's experience may be taken as a pretty accurate example of work on most estates. If picking had been going on, of course we would have had also to measure the crop picked during that day, in the afternoon. To a man who becomes interested in the coffee, its growth, and cultivation, such work as I have described is not irksome; the morning's walk is always a pleasure; and though I must say that occasionally going out after tiffin into a burning sun is distinctly against the grain, still that is often the result of over-eating.

As to the amount of capital required to open a coffee estate in the Peninsula, £20 per acre is generally considered sufficient to bring the coffee into bearing. This should include all cost of buildings, &c.; of course, as one can easily see, the expenditure on a place of 100 acres will be greater in proportion than that on a place of two hundred, since a good manager would have to be paid quite as large a salary on the one as on the other, the store and bungalow would cost nearly the same, and so on with a good many items. For this reason it is better that no estate should be started with less capital than £1,000: this should allow for the opening of 200 acres.

I do not mean, by my account of a day's life on a coffee estate, to make out that the planter's lot is all work and no play. On the contrary, on Saturday and sometimes another day as well, we drive

into the nearest town and play either cricket or football. I see my reader shudder at the idea of football in 85 deg., in the shade—about the temperature at 5 p.m., when we begin to play—but I can assure him that not only is there no particular fatigue (except after the first try or two, when one is in no sort of training), but also I, for one, am certain that the exertion is of distinct benefit to the health of the many who, in towns, lead a life of too much liquor and too little exercise.

After football and a change, one repairs to the club, where there are to be met all the *elite* of the place, and where one can get a game of billiards. After a pleasant hour there, the cart is called, and in brilliant moonlight we drive home to our estate in time for the welcome dinner at half-past eight.

ABEL.

—Field.

TRADE AND INDUSTRY OF DUTCH GUIANA.

Unlike British Guiana, Surinam has been at a standstill as far as her population is concerned. According to a statement in the Demarara "Argosy," the number of inhabitants in 1805 was 64,602; in 1811 59,453; in 1831 61,511; and in 1893 only 58,866, notwithstanding that several thousand coolies have been imported in late years. Yet the capital shows a considerable increase, but this is hardly a favourable sign as it means so many the less employed in agriculture. In 1847 Paramaribo contained only 13,266 inhabitants; today the town's-people number nearly 30,000.

The exports of produce from Surinam show the same vicissitudes as in Demerara. Coffee was at one time the main crop, and in 1817, eight and a half million Dutch pounds were exported. It never went entirely out of cultivation as in British Guiana, but in 1890 the amount had sunk to 437 lb. However, it is creeping up again, and in 1893, 30,514 lb. were exported. Cotton has gone out of cultivation entirely. In 1823, two and a half million pounds were produced, but in 1835 that amount had dwindled to 3,533 lb., and now it is *nil*. Sugar was of less consequence when cotton and coffee were to the fore, but when they fell, it assumed a greater importance. In 1816 the amount was eleven and a half million pounds, after which it increased, until in 1835 it reached thirty-seven and three-quarter millions, but in 1893 only fourteen and a half millions (say, 7,250 tons) were produced. This seems absurdly small, and, as may be supposed, the sugar industry might be eliminated without ruining the colony.

What then are the principal products of the colony? First of all comes cocoa. In 1817 it was exported the amount of 113,454 lb—in 1893 it reached to *nearly seven millions*. Several districts are entirely wanting in sugar estates, *e.g.*, the Upper Cottica, which produced in 1893, 23,419 kilos. cocoa, 4,545 coffee, 10,275 corn, 7,450 ground provisions, and 17,368 bunches of plantains. Balata is an article of some importance, the exports in 1892 reaching 241,359 lb; and in 1893, although much smaller, the total was yet 65,092 lb. With regard to the Surinam gold industry, there are four gold-bearing districts, *viz.*: Upper Surinam, Upper Saramacca, Upper Marowynne and Lawa district. The output of the last ten years has not increased to any great extent, and it is almost impossible to say what has actually been collected, as the royalty (or export duty) is only paid when the gold is sent away. The consequence is that although in 1893 there appears to have been about the value in round numbers 1,200,000 guilders collected, the export amounted to nearly 1,600,000. This last sum is higher than the total of any former year, but, as may be seen, it only amounts to 640,000 dollars, as against about two millions and a half dollars in British Guiana. During the previous ten years the annual collections amounted to an average of about a million guilders per annum, and this seems to be fairly stationary. Of the districts the Upper Surinam produces more than half; then came the Lawa and the Saramacca, about equal, and

finally the Marowynne. The number of persons engaged in the industry is put down as 3,382, this total including every one interested, whether at the diggings or in the town. The village system appears never to have been introduced into Surinam. The abolition of slavery in 1863, when 37,000 people were emancipated, made a great impression, but was not so ruinous as the same change in the British Colonies. The output of sugar, coffee and cotton fell at once to half, and these products have not yet recovered, nor are they likely to do so. Possibly coffee may be replanted, but it is in cocoa that the hopes of the colony lie. This did not participate in the downfall of the other products, but advanced with rapid strides, rising to double in the 10 years from 1860 to 1870.

AN ENGLISH COLONIAL EXPERIENCE.

THE CULTURE OF TEA IN CEYLON.

By Our Special Correspondent in the Far East.

(Translated from the *Journal Des Débats*.)

On board the "Salazie," Oct. 7th, 1895.

I profit by the clemency of the sea in the Strait of Malacca to send you some notes that I have been able to gather on my passage to Colombo on the culture of tea in Ceylon. The chance—I ought to say the good fortune—of life on shipboard has already put me *en rapport* since leaving Marseilles, with Mr. C——, a planter of importance in the North of India. I will recount to you anon his experiences. They are not without interest to our colonists present and future. They appear to me to be the same which has been followed for fifteen years in "the Great Island of the Indian Ocean" (Ceylon) of which the area, it should not be forgotten almost equals that of Ireland.

I will spare you my sensations of Colombo. All has been said elsewhere of the stupour of delight with which we were filled at the first revelation of tropical nature. One feels himself overwhelmed by the splendid luxuriance of plants and flowers. And yet I had only had a few hours of it when a grey sky burst in a waterspout of warm rain. I should not have regretted it much elsewhere. This drawback was sufficiently prolonged to help to accentuate the *bizarre* sensation of the extraordinary power of vegetation of this privileged island.

I had been recommended to go and see the Editor of the *Ceylon Observer*, Mr. Ferguson, who has resided in the island for 30 years and whose name is an authority in matters of tropical agriculture. He put himself with perfect willingness at my disposal. It is thanks to him, to the documents he was good enough to furnish me with, and notably to his book "Ceylon in 1893," that I am enabled, aided also by the recollection of my conversation with Mr. C——, to send you these remarks, a little unconnected it may be, on one of the most curious economic developments of these latter years.

Two groups of figures suffice to describe it. In 1873 Ceylon exported 23 lb. of tea to England. This year it has exported 92,000,000 lb. and the planters count on *two hundred millions of pounds* in 1897. The first exportation having seriously begun in 1884 (two million pounds) one can say that it has almost increased a hundred-fold in 10 years.

As to how long tea will last in Ceylon opinions are very different. My Indian planter who, I beg pardon of him from afar, is not perhaps altogether impartial, holds, that the soil of the island is in course of being impoverished, by the series of diverse and intense experiments to which it has been subjected during a period of thirty years. Old Ceylonese (I speak of European colonists) are on the contrary very confident. They say that they form an experimental corps which certain blights have rendered prudent. Their plantations are situated in a climate healthy and very supportable for the European. They have prepared numerous and rapid means of communication and no one is situated more than a day's journey from Colombo which is a port admirably served by international navigation,

The planters have in the Tamils from the South Coast of India, who immigrate to the island by thousands, an excellent supply of labour. Their number is estimated at 150,000 on the tea plantations alone. The Planters of tea in Ceylon believe that their product, stronger but very much more pure and less adulterated than China tea, is beginning to be more and more appreciated not only in England, but in all the English Colonies. Regarded from this point of view the proximity to the Australian market will be without doubt more and more profitable to them.

They avoid devoting themselves exclusively to tea and reserve a certain place for coffee, cacao, cinchona &c. This tends to reduce the risks a little.

I hasten to return to the history of Mr. C. He is a fine example of what can be accomplished on the initiative of individual energy and it is because of that reason that I present myself to cite it.

Thirteen or fourteen years ago he joined with some friends and they subscribed a capital of about £30,000 (750,000 fr). They bought from the Government of India some thousands of acres in a district situated on the North frontier near to one of the Independent States—between the Peninsula and Thibet.

This district which is about 600 square miles, was thirteen years ago, an immense forest without a single tenant, habited by the elephant, the tiger &c., and where 300 or 400 savages vegetated. They have cleared it at their own expense. They have now a tea plantation of about 2,000 acres where they employ more than 2,000 workers, men, women and children, under the direction of four Europeans. I will not state the figure of interest which the undertaking brings to them. But one will have an idea if one reflects that generally, in "the case of a good yield," they count on a net profit of from £10 to £15 per acre, that is to say at least about 600 to 1,000 fr. per hectare. This district has actually a population of about half a million souls. This population has come liberally from the one and peopled districts of Bengal. The planters have always paid the passage of the workers that they engage, the others come at their own charge. Very many of these first have saved enough at the end of three or four years to buy lands from Government and to become small proprietors. The cultivation of rice, millet, and coffee is multiplying. All this population has naturally brought in its train representatives of all the trades necessary for the life of the community. In short a veritable little State is created in the space of a few years, thanks to the intelligence, to the enterprising spirit and to the capital of several men.

All this is done without the least interference of Government. When it was decided to make roads and a railway in the new territory opened to civilisation Mr. C— and his friends decided for the first time to make an appeal to its aid. They asked Government to aid them in the construction, or at least, to guarantee a minimum dividend for the railway. For different reasons the Indian Government has refused this collaboration even under the latter form. Our four planters have taken their part in the enterprise. They have constructed themselves 56 miles (90 kilometres) of railway at their own expense. Today it returns to them 5 to 6 per cent and they are going to extend it.

But this abstention of the Government has had a happy counter effect and it is perhaps the most astonishing part of my authentic narrative, upon which we would do well to carefully meditate. For instead of multiplying officials the Viceroy "in his Council," following the legal formula, has given a sort of delegation of the principal administrative and judicial offices to certain planters designated by him.

Government have found profit in this affair. Here is a country which, in its primitive state cost dear enough. It was necessary to keep in it a Resident with his assistants over and above a staff of forest keepers. And now, thanks to the sale and the leasing of lands to the taxes which begin to come in, this district, is supporting itself without costing a cent.

On the other hand, the planters are satisfied that a population, menaced by famine in these districts in their original state, have found here remunerative work which has been a benefit to everybody.

PLANTING AND PRODUCE.

COFFEE GROWING AT HOME.—The depressed state of agriculture at home leads to various speculative suggestions as to the possibility of growing plants hitherto associated with tropical climates. One day tobacco is talked of, another day it is coffee. Saturday's meeting of the Royal Botanic Society of London foreshadowed the cultivation of the latter tree. In the greenhouses are a number of coffee trees which have this season been remarkably fruitful. Mr. Sowerby, the secretary, had gathered some of the beans, which he had carefully roasted, ground, and decocted into coffee. This brew was submitted for the opinion of certain of the members known to be connoisseurs of the beverage, and their opinions agreed that it was excellent in every respect.

METAL TEA CHESTS.—Opinions are divided in the trade about metal chests for tea, but on the whole there is no prejudice against their use which may not be overcome, although the trade insist that lead lining must be used. At a recent meeting of Cardiff grocers the following letter on the subject was read from Mr. Randell, of the firm of Messrs. Randell and Sons, merchants, of Llanelly: "I have recently received a consignment of Indian tea, packed in 100 chests, direct from India, the same being of tinfoil instead of wood, and lead lined, and I see in them very many advantages over the old mode of packing tea. As the use of tinplates is a very important question now for South Wales and Monmouthshire, I venture to ask you to bring the matter forward at the opening of the Exchange, with a request that the members will be good enough to co-operate in any movement which may be started in South Wales to induce tea brokers, merchants, and planters to use tin plates for the purposes of tea packing, especially when it clearly shows several advantages over the wood chests now in use. What is wanted is the co-operation of the grocers and tea dealers of South Wales and Monmouthshire to give it effect." This gave rise to a general argument upon the subject of tea packing. One speaker said "tinplates would not be at all suitable for packing tea. Could they be prepared in the right way no doubt it would be a good thing, but ordinary would not do. It would have to be lined with lead." The Chairman: "Or washed with lead." The first speaker: "Yes, some other mode of packing is certainly desirable; at present the Indian teas are disgracefully packed. It would be a great boon to the retail trade if tea were sold in uniform packages of 50, 60, 80, or 100 lb. If the tinplates were lined with lead and hermetically sealed the thing could be done, but, of course, the retail grocers would have to be provided with appliances for opening the chests." The chairman said "they were all agreed, he took it, that the present system of packing tea was unsatisfactory to the retailer, but what could they do in the matter?" Ultimately a resolution expressing their approval of Mr. Randell's idea and suggesting that he should bring the matter before the Grocers' Federation was carried.—*H. and C. Mail.*

NEW TEA MACHINERY FOR CEYLON.

Messrs. Davidson, the well-known makers of tea machinery, will shortly introduce into the Island several new types of machinery used in the preparation of tea. The machinery we understand, will include an automatic tea-dryer of a new invention. This machine is designed on the endless web principle and is fitted with an improved make of cast iron stove. A new withering machine and a Davidson steam engine for use in tea factories, both of new design, will also be placed on the market, we understand, early next year.

THE UNEQUALLED CLIMATE OF THE HILL-COUNTRY OF CEYLON.

When dealing more in detail with the climatic elements in the latter part of Mr. Douglas Archibald's pamphlet, attention is drawn by the writer to many features which only the microscopic eye of the Scientist, who never overlooks details, would have discerned. For example, our hill-stations are cooler than those of India at the same elevation although we are nearer the equator. In the Himalaya the rate of decrease with the ascent is one degree Fahrenheit for every 450 feet elevation. With us the rate is one degree for every 340 feet between Colombo and Kandy and one degree in every 260 feet between Kandy and Nuwara Eliya. Whatever may be the cause, and for practical purposes we may leave this alone, the result is decidedly in our favour, since we are not obliged to go so high or breathe so rare an atmosphere to cool ourselves as our less fortunate Anglo-Indian brothers.

Another feature peculiar to Ceylon from its propinquity to the equator is the small range of its monthly temperature during the year. Any one can easily see that on the Northern tropic where the sun has to travel 46 degrees from the Southern in order to reach verticality, there must be a greater range than near the equator when it never travels more than 23 degrees on either side of the Zenith; and this difference is exaggerated as we travel either poleward or inland where the presence of a solid surface accentuates temperature changes by its small capacity for heat and its great capacity for exhibiting heat or cold in the form of temperatures. Our small annual range in Ceylon applies to hills as well as plains and this, again, is a great advantage since it means that at Nuwara Eliya, for example, no month is excessively cold or hot as occurs at the best Himalayan sanatoria. To counteract the possible enervation produced by such a small annual change there is as Mr. Archibald points out, a remarkable compensation in the fact that the diurnal range of temperature is always greater than it is farther north or south, and even on an island like Ceylon when it should be less than on a continent in the same latitude, it is greater than at many Indian stations. This also means cool nights when the maxima during the day as with us are never very large, and even Colombo shows this when in July instead of a stuffy 80 at night after 83 in the day we have a comparatively cool 77. At Kandy and Nuwara Eliya the effect is still more marked; the mean daily minima at Kandy all through the hot weather never being greater than 70°, and at Nuwara Eliya, where the range is providentially smaller, never less than 50°. In other words, while an agreeable change during the day is experienced our hill stations are never too hot and never too cold. Of course, this in a great measure is due to the fact that owing to the double march of the sun over us in the year our hill stations experience in reality two summers and two winters of only half the normal dimensions of those outside the tropics.

The question of rainfall is another point on which the author throws some new light, since he points out the mistake of judging the average raininess of a place merely by inches or annual totals. The inches may fall in sudden puffs, as is shown by a comparison of rainy days at Hatton 207 with 203 at Nuwara Eliya, while at the former the annual fall is 158 against 94 at the latter, and the falls may be pretty uniformly spread over the year and not as in India be

confined to the season of the S.-W. monsoon. By a judicious series of transportations, the visitor may almost escape both monsoons, and in any case meet with nothing worse than what is called a "Scotch mist" at Nuwara Eliya if he avoids certain months.

It is curious to find that we embrace in Ceylon almost all the most desirable climates in the world. New Zealand is represented by Nuwara Eliya; South Queensland or the Cape by Bandarawela; Sydney by Hatton with a few inches of rain off; Cairo with its hot summer expunged by Kandy, and that while this latter station has a summer heat no greater than Rome or Madrid; the winter *cold* of Nuwara Eliya is no greater than the summer heat of Edinburgh.

What are we to say after all this? Have we made as much of our blessings as we might or advertised them as much as they deserve? We think not and while undoubtedly the best advertisement such places can get is the reports that visitors carry away with them of the air they have breathed and the comforts they have enjoyed, we quite agree with Mr. Douglas Archibald that a supplement might be added to the caution to strangers on landing against the dangers of sunstroke, so as to make it read as follows:—
"Beware of sunstroke and go to our Hill-country."

THE LANKA PLANTATIONS COMPANY, LIMITED.

The fifteenth ordinary general meeting of the shareholders of this company was held at the offices of the company, 12, Fenchurch Street, E.C., on 13th November.

The chair was occupied by Mr. George Allen, chairman of the directors, and the shareholders present were Messrs. F. Bois, E. F. North, A. Collinge, J. Hall, J. E. Dawson, J. Smith, J. Lee, and W. H. Haslam.

The secretary Mr. C. Robertson, having read the notice convening the meeting, and the minutes of the previous meeting having been read and confirmed, he chairman in moving the adoption of the report and accounts said:

Gentlemen, you will all agree with me that the duties before us today are pleasant and by no means difficult. I will deal first with the report which you have all received and are no doubt familiar with. You will notice that the coffee shipped to London was 1,371 cwt. against 789 cwt. last year, and realised £6,564. The acreage under coffee alone was 210 acres, and the trees, according to the latest reports, after maturing a good crop, were reported to be in excellent heart and condition; and as the superintendent is confident of his estimate, we may hope for fair profits for 1896. The total crop of cocoa gathered on Yattawatte amounted to 1,214 cwt., against 979 cwt. last year, and realised £3,038, and in spite of the very low rates now prevailing there was a good margin of profit left. During the season a further acreage has been planted, and forty-two acres of available land adjoining the estate have been purchased, the cost of the new planting and land having been charged to capital account. The estate is improving year by year, and the manager reports that there is every indication of a good crop for 1896. With regard to tea, there has been an increase of nearly 10,000 lb., which has realised an increase in cash of £1,600. As our teas are nearly all high-class teas, it naturally follows that we benefit by high prices. Mr. Bois reports that the estates are in good order, and everything points to a satisfactory result for the current year. Since the death (if I may term it so) of coffee we have spent £20,206 out of revenue in substituting cinchona for coffee, and then tea for cinchona. The directors propose to take advantage of the unexpected increase in the net proceeds of the coffee, to write off from the suspense account the

sum of £3,714, being not only the one-tenth usually written off, but also the sums of £799 and £1,021, which from circumstances beyond our control we were unable to write off in the years 1888 and 1889. This will enable us at the end of the current year to strike out of the suspense account the sum of £4,544 5s 7d charged in the year 30th June 1885, which by ten annual payments will have been entirely paid off. We are now able to declare a dividend of 4 per cent on the ordinary shares, leaving £1,270 to be carried forward. This is not only highly satisfactory to the original shareholders, but to those who have since bought shares in the company. I may mention that latterly there have been inquiries for shares at £6 per share. With reference to the loan of £12,000 in the last balance sheet, we paid off £3,000 with some money we had on deposit, and desiring to reduce the interest we applied to our old bankers for a loan of £9,000, but the request was refused; it was, however, willingly granted by the London and Westminster Bank, which paid off the balance, and we have thereby saved about £450 in interest. The most interesting subject to persons engaged in this industry is, of course, tea, and Ceylon tea is now so good that it *must* make its own way. I will give a few extracts from some of the leading brokers' circulars, which go to prove the truth of this. Messrs. Wilson, Smithett & Co., in their circular of a recent date, say: "Several Russian orders were in the market, and again comparatively few were executed, as they were generally for teas of exceptional character which certain home buyers were determined to have at almost any cost, but they had the effect of stimulating the competition and securing full prices, and leaving at the same time the reasonable hope of renewed orders at higher limits in the future. For the nine months the imports mark an increase of 5,800,000 lb, whilst home consumption has expanded to the extent of 2,000,000 lb and exports of 1,600,000." Messrs. George White and Co., in their circular of November 4th, report that "deliveries were 1½ million lb above the imports, so that the stock has been reduced by that amount since September 30th. For the four months from July 1st the quantity taken from the warehouses was more than 3¼ million pounds over that received, indicating a very healthy condition of trade." Messrs. Gow, Wilson and Stanton, who take a great interest in these matters, report under date November 1st: "From North America reports are very encouraging, and there is every reason to believe that British-grown tea has now taken sufficient hold on the public taste, both in the United States and Canada to ensure a permanent and increasing demand for it, if only the work of the Indian and Ceylon Commissioners can be effectually and steadily carried on." I am not acquainted with the details of the work now being carried on in America, but this I may say, that when I was there recently a gentleman greatly interested in Ceylon tea complained to me that the tea was not made up to suit the tastes of the consumers. Another complaint was that the Ceylon Planters' Association is associated with the agent of the Indian Planters, and I understand that they occupy the same office. I may also say that I saw an advertisement consisting of a large block in which the quantities of Indian and Ceylon sold during the past year was marked, and of course the number of pounds of Indian tea sold looked much larger than those of Ceylon, putting Ceylon in an unfair position. I have sent this advertisement to our planting member of Council in Ceylon, pointing this out, but up to the present have received no reply. In conclusion I may say that I still continue to have a sanguine hope of the prosperity of the company, and that subject to climatic influences and other matters over which we have no control (for after all we are "tropical agriculturists" in the same position as farmers), the merits of Ceylon tea must come to the front. That small amount of tannin is in its favour, and I think it may safely be said that we are on the high road to prosperity.

Mr. Ford North stated that he wished to make a few remarks in a friendly spirit with regard to the

difference in the accounts of this company and others. With regard to the suspense account, it was very satisfactory to see that £3,700 had been paid off, but he was sorry to see that it had been taken off with one hand and with the other hand £1,256 had been added to the suspense account for machinery, buildings, &c. Most companies, he maintained, objected to a suspense account and charged all to revenue account. He would have liked to have seen this item not carried to the suspense account.

The Chairman, in reply, remarked that the directors courted rather than depreciated criticism on the part of shareholders. The new machinery and buildings were not likely to rust or wear out in a short time, as Mr. Ford North seemed to think, and he considered that what had been done had been done wisely. The price per acre of their cocoa land was £8 17s, and he had considered that the cocoa estate was one of their very best properties. He did not think that prudent men could have done better. They had paid 4 per cent., and had they wished to divide all their profits they might have paid a great deal more.

Mr. W. Austin remarked that he took a hopeful view of the prospects of the company. When the shares were very low he continually bought them, so that no one could say he took a gloomy view. He was the latest director who had been appointed, and he was extremely gratified at the way in which the business of the company was conducted. He had heard Mr. Ford North's remarks with great pleasure. The companies to which he, Mr. Ford North, had alluded had, however, great latitude, and if the suggestions he had made with regard to the accounts were carried out it would make the company appear to have earned a smaller profit than they had actually done. It would be a pity to issue new shares, as they would be at a discount. He considered that the Chairman had done a grand piece of financing in getting money at a low rate as he had done. The affairs of the Company were thoroughly well managed, and every £1 that was spent was severely criticised by the directors.

The following resolutions were put to the meeting and carried unanimously:—

Proposed by the Chairman and seconded by Mr. Pettit, "That the report and accounts be received and adopted."

Proposed by Mr. Austin and seconded by Mr. Pettit, "That the payment of a dividend on the 6 per cent. Preference shares for the six months ending December 31, 1894, be confirmed, and that for the six months ending June 30, 1895, be paid forthwith."

Proposed by Mr. Austin and seconded by Mr. Pettit, "That a dividend on the ordinary shares for the year ending June 30, 1895, at the rate of 8s per share, free of income tax, be paid forthwith."

Proposed by Mr. Ford North and seconded by Mr. Collinge, "That Mr. Allen, a director who retires on this occasion, be re-elected."

Proposed by Mr. Smith and seconded by Mr. Collinge, "That Mr. Edward Pettit, a director who retires on this occasion, be re-elected."

Proposed by Mr. Collinge and seconded by Mr. Haslum, "That Mr. John Smith be re-elected auditor of the company for the ensuing year at a remuneration of £21."

Mr. Ford North proposed a very cordial vote of thanks to the directors and also the managers of the estates in Ceylon, and the chairman having briefly responded the proceedings terminated.—*H. & C. Mail.*

ENGLISH AGRICULTURE.

Norfolk, Nov. 4.

Farmers have indeed been having a bad time of it. Many farmers have been let out of cultivation, and others only kept in cultivation by foregoing all rent. However it is to be hoped, that things have at last touched bottom and that an improvement may be looked for during the coming year. No Government can guarantee good harvests, but a strong one, such as the present, can do much to help the struggling tiller of the soil.

BUILDINGS ON ESTATES :

BALLARDIE'S AND OWEN'S PRIZE ESSAYS.

Does any planter want to build either a factory, cattle-shed, bungalow (large or small) or a set of lines, or to alter, or reconstruct anyone or all of these? If an experienced man, he at once prides himself on being what every good planter ought to be, and claims to be in his capacity of jack-of-all trades: a practical builder. In old coffee days, to engage the services of an architect was almost universally considered a needless waste of money. True, as regards coffee stores, very little variety was indulged in, the "stores" nearly everywhere having been designed and built on one unvarying plan. This was a custom that had more than one advantage: the cost was easily ascertained from the experience of others, and the native contractors became experts in constructing almost identical buildings wherever they went. The pulping-houses, however, demanded more variety of plan, and in constructing these the planter found his ingenuity considerably taxed. So, too, in the case of bungalows, every planter was free to follow his own taste and requirements,—if he did not—as at first nearly everybody did, early in the planting—era, run up a rectangular shed divided into three rooms with a long verandah in front. Those which were substantially built remain to this day, but often so transformed by "taking in the verandah" here, adding a wing there, that the original simple design is not easy to be distinguished. Well, all honour to the memory of the old planters, sturdy and independent as they were, and if mistakes were made and money wasted, why coffee could afford it, as it afforded many other items of expenditure that would surprise the economy enforced by strict Visiting Agents in these later days.

And it cannot be denied that a Tea Factory demands a greater practical knowledge of buildings than sufficed for the simpler coffee store. So, too, the greater number of married planters now have created a demand for more up-to-date homes and bungalows, while even the coolies are better housed. The old thatched roof on posts ten feet apart, open to all the winds that blow, will not do now-a-days for cattle, especially where manure is the object of their being, while also a vast number of valuable cattle are now kept for dairy purposes and for profits derivable therefrom. All these modern conditions call for greater care in the construction of buildings on estates for all these purposes, besides such subsidiary structures as lime-kilns, &c.

In 1879 Messrs. J. de Caynoth Ballardie and T. C. Owen wrote "prize essays" published together in a handy book on such estate "Buildings"; but like other works it came just too late to be of much service to the planter harassed by leaf-disease, loss and debt. But has not the time come round again when such a book ought to be one of the companions of every practical planter? How to design every conceivable building in an infinite variety of plans, is here given in detail graphically and textually, and even the old and expert builder will find valuable information in this book of designs and estimates. We can confidently recommend it to all in charge of tea and cacao estates and estates of every other produce as a reliable guide in designing and constructing and giving out contracts for every sort of building likely to be required in such places. This may be judged from the

following list of the plans "to scale" embodied in the volume to which we have been referring:—

- (1) BRICK KILN.—Section of kiln—plan of kiln—trough and section—yoke—drying shed and section.
- (2) LIME KILN.—(1) To burn 150 cubic feet per diem—(2) to burn 250 cubic feet per diem.
- (3) BRICKWORK MASONRY.—English bond and Flemish bond.
- (4) WALLS' ROOFING CLIP.
- (5) KING POST ROOF.—King post—queen post—struts—tie beam—principal—ridge piece—purlins—common rafter—pole or roof plates—wall plates.
- (6) QUEEN POST ROOF.—Queen posts—struts—tie beams—principal—ridge piece—purlins—straining beam—common rafter—pole of roof plate—wall plates.
- (7) HERRING-BONE STRUTS: 2 in. square.
- (8) JOINTS OR SCARFS.
- (9) BEAMS AND PILLARS.

LINES.—Twelve-room set of Lines—wooden roof, wattle and daub walls—kanganies' row.

BUNGALOWS.—Door and window frames—wooden plank ceilings—wainscoting—verandahs—chimneys—small bungalows—large bungalows.

PULPING HOUSE AND STORE.—Receiving pulping house and store (combined)—sections of pulpers—Walker's Gearless Pulper—Store Receiving House—Section of field Receiving House—Coffee spouting—waterbox—covered spout to carry water to outside hopper—Self-acting measuring boxes—Tube well—Cherry Discharge, Dams (composite and earthen, and wooden and iron doors) anicuts, weirs and spouts.

CATTLESHED AND PIGGERY.—Store for fodder—air passage—stone walls with permanent stalls—brick walls with moveable stalls—pillars—roadside cattle and pig shed.

ESTATE CARTROADS.

Eight plans illustrating buildings referred to in Mr. T. C. OWEN'S ESSAY, viz., Store and Pulping House—Cattle shed—big cattle shed—big store—pulping house—bungalow.

SCIENTIFIC INQUIRY INTO TEA CULTIVATION.

From the Secretary, Indian Tea Association, to the Secretary to the Government of India, Department of Revenue and Agriculture, dated Calcutta, 11th November, 1895.

Sir,—Referring to your letter No. 352-13, of 7th March, in which it was stated that, pending the appointment of a successor to Mr. Cotes, who had resigned his appointment in the Indian Museum, the Government of India regretted they were unable to make any arrangement for the investigation of tea blights in Assam, I am now directed by the General Committee to submit for the consideration and orders of the Government of India a memorandum drawn up by Mr. J. Buckingham, C.I.E., Chairman of the Assam Branch of the Association, containing suggestions for the appointment of a scientific officer for the tea districts.

2. I am to state that this memorandum has received the approval not only of the General Committee, but of the branches of the Association and also of the Planters' Association in Darjeeling, the Terai, the Dooars, and the Kangra Valley, who are all agreed that the appointment of such an officer as suggested in Mr. Buckingham's memorandum would be a very great benefit to the tea industry, and, as a natural consequence, to the trade of the country.

3. The General Committee feel that they can add but little to the suggestions contained in Mr. Buckingham's memorandum, but they desire to take this opportunity of tendering their best thanks to Government for having deputed Dr. George Watt, Reporter on Economic Products to Government, to prosecute investigations in the Assam province, which latter will, without doubt, when his report has been published, prove of the greatest value to tea planters and the industry generally. The Committee are awaiting with much interest the publication of this report, and in the meantime they would commend Mr. Buckingham's proposal to

the most careful consideration of Government.—
I have etc.,

S. E. J. CLARKE.

Secretary, Indian Tea Association.

[Memorandum re appointment of Scientific Officer for the Tea Districts, to be submitted hereafter to the Government of India.]

The tea industry having for some years past felt the necessity for a thorough scientific investigation into the chemistry of the tea plant and its cultivation and manufacture, desires to bring the matter before the Government of India for consideration and such co-operation as may be found possible.

2. It is understood that in a kindred subject *viz.* investigation connected with silk, such co-operation and even pecuniary support has actually been rendered by the Governments of India and Bengal. It is accordingly felt that the support not only of the Government of India, but also of Local Governments where tea cultivation is pursued, might reasonably be extended to an industry of such magnitude and importance.

3. The Tea Association fully appreciates the assistance which the Government of India have rendered, and are still rendering in the deputation of Dr. Watt, the Reporter of Economic Products, to investigate into the subjects of tea blights. Without anticipating the report which Dr. Watt is likely to publish, it may be said that he has convinced the planters in the districts visited that there is as much to be learnt on the subject of proper cultivation of the plant, as in that of the remedy of actual blights. But this involves a scientific investigation mainly of a chemical nature, which the planting industry unaided is unable to accomplish, not so much financially, as in the proper control and supervision of the operations of a scientific officer.

4. It is contemplated that a chemist of established reputation should be brought out to this country, or a fixed term of years (say five), to receive such alary as would ensure his devoting his entire energy to this enquiry, but on the distinct understanding that the result of his investigations should be the property of the Association. The selection of such an officer, it is felt, the Government of India would be better qualified to make than the Association.

5. The direct assistance which the Government of India, it is believed, could render, would be in the equipment of a laboratory, since the apparatus required might be utilized by Government in its chemical laboratories at the close of the contemplated investigation. It is also suggested that the major portion of the apparatus and chemicals might even be lent for the purpose here indicated.

6. In venturing to suggest direct aid, the Association considers that supervision of chemical inquiries is of the greatest importance, and for this purpose the chemical officer might be associated with one of the scientific departments of the Government of India.

This Association believes that the desired aim of the investigation might be frustrated through a scientific officer not being supervised, there being the liability of his attention being diverted from the main points at issue. But, in venturing to make this suggestion, the Tea Association desires mainly to obtain an expression of opinion from the Government of India, and the final scheme may be matured hereafter.

J. BUCKINGHAM,

Chairman, Assam Branch, Tea Association.

—Indian Planters' Gazette.

SALE OF AN ESTATE.

It is reported that Gangwarily Estate, West Dolosbage, has been sold by Mr. John Drummond to Mr. W. Blackett.

SALE OF COCONUT ESTATES.

The price paid Mr. Jacob de Mell by the Ceylon Tea Plantations Company for the coconut estates Siringapatha and Tursina is R325,000. Mr. de Mell purchased these estates about 15 months ago from Messrs. Akbar Brothers for R280,000.

GALATA GROUP.

Mr. Tunnicliffe has, we learn, sold these estates for R100,000 to Messrs. Cresswell and Elwes.

DRUG REPORT.

(From *Chemist and Druggist.*)

London, November 14.

ANNATTO—Five bags of dull dark Madras sold at the low price of 1½d per lb

CAFFEINE—Quiet. Some business has been done this week at 19s per lb on the spot.

CROTON-SEED—At today's auctions a parcel of 15 bags of seed from Colombo, not quite so nice as what offered at the preceding sale, was well competed for and again realised an advance of a few shillings, the whole lot being sold for 50s per cwt.

CUBEBS remain quite neglected. There was a fairly plentiful supply at auction, but no berries were sold; privately 32s 6d per cwt would be accepted for fair slightly stalky quality. At auction a bid of 27s was rejected for some berries of fair quality, slightly stalky. Seven bags cubeb stalks and berries sold without reserve subject to paying charges at 5s per cwt.

GAMBOGE was in very good demand today, medium qualities being steady. Of 40 packages, 22 realised £10 7s 6d for good pipe, partly blocky, of bright fracture, and from £9 7s 6d down to £9 for partly drossy and blocky pipe ricey mixed to fair blocky pickings.

KOLA—Holders are disposed to ask more money, viz, 1s 3d per lb for good bold washed and 1s per lb for small washed. It is doubtful, however, whether those prices given can as yet be made. At auctions today 28 packages were all bought in, bids of 10d being rejected for good washed quality. We understand privately that 11d per lb has been paid for fair washed from Africa.

NUX VOMICA—One hundred and sixty-six packages of small to fair pale quality from Bombay were all bought in today at 5s 6d per cwt.

ESSENTIAL OILS—Cajuput oil 10 cases were bought in. Cinnamon oil sold, subject to approval, at 4½d per oz. Citronella oil is again dearer, 1s 5d per lb being now asked on the spot, while offers of 1s 3½d per lb c i f for oil in drums have been refused this week by Ceylon exporters, who say that there is no more oil to be had. Lemongrass oil is also very firm on the spot at 2d to 2½d per oz, without further arrivals in sight. The market in Cochin is said to have been cleared.

QUININE—At the end of last week there was a sale of 20,000 oz German bulk (B & S or Brunswick) at the price of 1s 1d per oz, showing a further decline of fully one-eighth. Since then the market has become slightly firmer again and buyers offered at 1s 1½d, which has not, however, been accepted. For second-hand German bulk on the spot 1s 1½d has been refused this week. Offer of 1s 1d per oz for Fabricca Lombarda quinine have also been refused, and the market is, upon the whole fairly steady.

VANILLA—The supply at today's auctions was fairly large—viz 266 tins—but almost the entire quantity was made up of arrivals from France, the principal portion consisting of stocks which had been held back by large French holders. Good quality was well represented, but buyers were not such keen purchasers as at the last auctions, and the prices today ruled very irregular, and were on the average about 1s to 1s 6d per lb lower. The total quantity offered weighed about 4,200 lb, and was nearly all disposed of.

THE UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.

Following up the acknowledgment which we made of a copy of the proceedings of this Association for the year we would mention that the volume which is of a very convenient size, consists of 191 pages including the appendix. The main part of the record is a report of the proceedings at the second annual general meeting held in August last, and the variety of subjects then discussed shows how very important the organization is. We trust that it will long continue to keep a strict watch over all matters connected with the planting industry. After the report comes the accounts showing a balance on hand of R819, then correspondence, and lastly the appendix in which we notice is incorporated a copy of the Ceylon Labour Ordinance.

MEXICAN COFFEE LANDS.

A former Ceylon planter, with large experience in the coffee countries of the world, has studied the possibilities of Mexico as a coffee-growing country. In an interview printed in the *Chicago Inter-Ocean* he says:

"I journeyed to Mexico to inspect the Mexican lands suitable for coffee from a business stand point. With hardly an exception, I found chaos reigning supreme, as far as cultivation was concerned, little or no attempt having been made to do anything but pick the crop. After thoroughly inspecting some of the newer districts, with which the older districts cannot be compared for a moment, it surprised me that these older districts had ever been taken up at all for coffee, the proximity to the railway being the only valid excuse, as neither in climate nor soil can these older districts stand their own.

"In choosing coffee lands what should be looked for first and principally is a suitable climate. Coffee wants a regular temperature of say, from 60 to 80 degrees Fahrenheit all the year round, with a rainfall of from 100 to 120 inches, the latter preferred; in fact, a warm humid atmosphere; when you can get that it matters little about the latitude or elevation. It is true that the high elevation bean is generally the most delicate in flavour, but the difference in price is so little that it will not nearly compensate for the difference in crop, and the planter, if he is wise, will confine himself to what will fill his pockets the quickest.

"Two districts specially caught my fancy, the one on the Tonto River, partly in the State of Oaxaca and partly in the State of Vera Cruz. I saw thousands of acres of magnificent rich loam covered with heavy forest which could be converted into most successful plantations. These districts are par-excellence, the home of the sugar cane. The district, however, on which my choice rested, and which in every way filled my bean ideal of the coffee district, was on the Gulf of Mexico side of the Isthmus of Tehuantepec, inclosed between the two rivers, Uspanapa and Coatzacoalcos, and intersected by others. Most of these rivers have deep water and are navigable far into the interior. Within this tract of country there is a large per cent of the finest coffee lands I ever saw in my life. I was thoroughly surprised with the rich, black soil and its uniformity; he nice, easy lay of the land, with its good drainage; its plentiful supply of live mountain streams, its fine navigable rivers, within easy reach of the seaports, where goods can be shipped to all parts of the world; its plentiful supply of fine, robust natives, willing and ready to work; its production in a wild and semi-wild state of coffee, sugar, vanilla, cacao, rubber, fruits of all kinds, corn and other products, and lastly, and a very important thing to the shelter, its fine, healthy climate. The residents of this district claimed for it a temperature and rainfall exactly in accordance with my views of what was perfect for coffee and my first glance at the vegetation verified their claim.

"The climate as regards health being one of the principal things to thoroughly investigate, this I did, and I found, first, that the death rate in Minitlan, the largest and most important town in this district—being also a shipping port—and seemingly in the most unhealthy part of it, is only 8.7 persons, in the 1,000 per year, while the death rate of Chicago averages about 18.2. The old residence Americans and foreigners speak highly of it in that respect.

"All over Mexico coffee is handled, almost without exception, in the most slovenly manner, being neither cultivated nor prepared for market properly." [Nevertheless some of the finest coffee seen in this market has been of Mexican growth.—Ed.] "If the old districts give handsome results with the present system, I venture to say that in the district referred to, on the isthmus, under judicious management, being essentially a coffee district, which most of others are not, the results, I think, could safely be multiplied by 10.

"There is any amount of valuable timber which can be made to pay handsomely, as well as growing

corn between the rows of coffee, which forms a good shade for the young coffee plant, and yields from sixty to eighty bushels per acre, and at least two crops at that rate per year. This, at the local rate for corn—about \$1.25 silver, or about 60 cents American—would, I think, almost, if not altogether, clear expenses of cultivation. The outlet to this district is Coatzacoalcos, where at present two steamers per week arrive and go on to Minitlan, load up and return to Vera Cruz, where they tranship their produce into the large New York and European steamers. This is necessary on account of a bar at Coatzacoalcos, preventing any steamer drawing more than fourteen feet of water coming in."—*American Grocer*.

THE FUTURE OF PETROLEUM AS A FUEL.

In an article contributed to the *Colliery Guardian*, Mr. R. Nelson Boyd, M. Inst., C.E., discusses the possibilities of petroleum replacing coal as a fuel for general purposes in this country. After referring to the numerous experiments and trials that have been made with liquid fuel, including those of Mr. Holden, on the Great Eastern Railway, where several locomotives are at present running, and have been for a number of years, with liquid fuel, he goes on to observe that the adoption of petroleum as a fuel to any practical extent has been limited to South Russia up to the present time, and it appears that its general use is a matter for the very distant future, except under special local circumstances.

The necessary elements for the economic use of petroleum are quantity and cheapness, and these are only to be found in South Russia—at any rate up to the present time. The production of crude oil in the South Russian field is about thirty millions of barrels, giving say, three to four millions of barrels of residuum, or so called "astatki," equal to about half a million tons, which represent in heating power one million tons of coal. This is, of course, a large and a sufficient supply for local purposes, including the steamers on the Caspian Sea and the locomotives and as there is no other use for the astatki, it is obtained at a low cost. But this is the only petroleum-producing field in the world where circumstances so favourable to the use of liquid fuel exist. The Russian oil is of such a character that in the process of distillation it leaves a large percentage of residuum, whereas in other fields almost all, if not all the distillates from the crude oil are applied to commercial purposes, and sold at prices which preclude their use as fuel except for special purposes, such, for instance, as heating where space and cleanliness, rapidity of lighting and extinguishing the fire are dominant over the question of cost. But these special applications cover only a small field of consumption, and in reality, as a competitor with coal as a fuel, petroleum is not in the market, at any rate in the country. In addition to the high cost comes the question of supply. The quantity of petroleum produced is certainly considerable, but when compared with the amount of coal raised in the world the figure sinks into insignificance—that is, from the point of view as fuel.

It would be difficult to estimate with exactitude the total production of petroleum in the world owing to the want of correct data. In the United States the returns show over 2,000 millions of gallons raised in 1894; in Russia, about 1,200 millions of gallons; and in Galicia, Austria, 50 millions of gallons; but the statistics of other countries are very uncertain. It may, however, be roughly estimated that the world's production will amount to between 4,000 and 5,000 millions of gallons. A very large production has sprung up in recent years in the far East, the statistics of which are not easily obtainable; but, taking the total production at 5,000 millions of gallons—say, 20 millions of tons, equal in calorific heat to 40 millions of tons of coal—we arrive at a figure which represents but a very small percentage of the world's production of coal. This is assuming the entire production of crude oil to be used as fuel, whereas only the small production of Russia

astatki is available for the purpose, if we eliminate the refined oils, burnt in so-called petroleum stoves, which are practically lamps, the cost of which is too high to enter into competition with coal for industrial purposes. The demand for illuminating and lubricating oils, as well as for other distillates of crude oil, is equal to the supply at present but is increasing day by day, and the produce of the new discoveries is being absorbed by the growing demand for the various petroleum products. Among the uses of these distillates must be remembered the oils used for enriching gas, and in petroleum engines, which though not applied directly as fuel, replace a certain, but a comparatively small, amount of coal.

Under these circumstances, it seems futile to look upon petroleum as a competitor of coal as a fuel, at any rate for the present or the near future. It is somewhat curious to note how slowly the already known petroleum fields are opened out in the face of a large demand and a lucrative trade. It is really only in the United States and in South Russia that the deposits are worked to any great extent. Crude oil has been known to exist in abundance in Peru for many years, yet the production does not seem to increase. The same may be said of the deposits of Japan, Java, Sumatra, and other fields in the far East which have been left in abeyance until quite recently. In Mexico and other South American States very good indications, to say the least, have been discovered, but they have not been practically followed up by the expenditure of any capital. The European fields, other than South Russia, are being opened out with much reserve, as if an opinion prevailed among capitalists that petroleum was but an ephemeral product, with not much present and no future profitable life. Yet the United States raise 2,000 millions of gallons of crude oil, and dispose of it all to advantage.

So long as this reticence of speculation in petroleum development prevails, the production will not become formidable, and oil will not be extensively applied to industrial purposes.—*Indian and Eastern Engineer.*

CEYLON PRODUCE.

COCONUT OIL.—The market is very treacherous, leaving the brokers in the "high seas." Even our old friend, "Peruma" is staggered at the present status of the market. Very conflicting reports come from all quarters re coconut crops and the battalion of millers and dealers take them for what they are worth—often swallowing an occasional "pill". A few days ago, the market was steady at R337.50 per ton f. o. b., and after gradually showing a tendency to an increase, reached the climax of R340—but only to fall back immediately in two ranges to R335.

COPRA.—The arrivals are few; and the quality is not much to be admired. For some weeks, hardly anything has come for the manufacture of white oil. Prices range from R38.50 to R47.

POONAC.—What a fall, compared with the prices fetched sometime ago! Good mill can now be had for from R15 to 47.50 per ton f. o. b.

COFFEE.—Plantation, new season's crop is quoted at R84.85; but a parcel changed hands last week at R82 per cwt. f. o. b. In Native firm offers are given at R72 and R71; but this is all moonshine as at those prices no mortal with a spoonful of braing can operate upon. R68 is nearer the mark.

COCOA.—The season is in full swing, and since the middle of last month hundreds or hundred-weights are almost daily brought down to houses of Europeans, Sinhalese and Tamils. The latter two have representatives upcountry, who are buying largely for them. Prices locally range from R32 to 45 per cwt. A fine parcel from "Woodsley" changed hands yesterday at R43; while "Gangoruwa" and beans from other well known estates are in the hands of brokers.

CARDAMOMS.—The season's crop has not been a success, and this is due it is believed to the circumstance that, off and on during the whole year, there

have been pickings. There is a very great demand for Malabar from Bombay and the Borah and Parsee merchants have run up prices from R1.06 to R1.28 to 30 per lb. The European market supply will almost be nil in "Malabar." It is only recent by that Bombay has taken a fancy to Malabar. In the past its pet was the well bleached, white bold Mysore.—Local "Examiner."

PENGERANG PLANTING CO.

The ordinary general meeting of the Pengerang Planting Co. was held in the Exchange Rooms today at noon, the Hon'ble G. S. Murray (chairman) residing. There was also present Messrs. W. Hutton and E. J. Nanson, directors, and Messrs. A. P. Adams, McBain, Dittmar, Eckhardt, W. W. Bailey, Manager, and Mr. A. J. Gunn, Secretary.

The Chairman said in adopting the report they would at the same time adopt the propositions that were put forward in it, that was, a dividend for nine months at the rate of 20 per cent per annum, absorbing a sum of \$10,500, and that the amount passed to rest account should be \$4,000, which would leave a balance of \$14,052.94 to be carried forward to new account. He hoped that the shareholders would look upon that report as a satisfactory one. The Company had now, he trusted got to such a stage that they might hope to continue to prosper. It had not in the past been a very prosperous concern, and there were many reasons why in the early days of their enterprise they paid no dividends at all. They made many mistakes as a pioneer company in these parts, and they had other difficulties to contend with which he need not enter upon at that meeting. He hoped they were in smooth waters now. The only thing which occurred to him as at all likely to mar their progress, and it was certainly a very important one, was whether the price of coffee was to be maintained. That was a point which everybody interested in a coffee venture should keep clearly in mind. At present the price of coffee ruled very high: some were of opinion that the price would still improve, others held a contrary view. He was not prepared to say much with regard to the views which had been expressed as regards the cultivation of coffee in other parts of the world falling off, as no definite and reliable information could be got. They had to accept the good things as they came, and hope for the best in the future. He did not think it was necessary in the meantime that they should start any account for the depreciation of the estate. As a matter of fact the property was improving in value every day. No one knew the life of a Liberian coffee estate, and it seemed to him that so long as they kept on adding to the area under cultivation the estate was in a thoroughly sound financial position. It was carried, that the report and accounts as submitted should be approved and adopted.—*S. F. Press.*

NORTH BORNEO NEWS.

The Government is advertising free grants of land up to 500 acres in extent for the cultivation of Tapioca.

A very large extent of land, flat and of fertile soil has lately been discovered between the range in Ulu Lingkabau, (a tributary of the Sugut) which has Makatol hill at the northern and Mount Talin at the southern end—and the Bongon River above Timbang Batu. The locality is blank on the latest map. The land in question would appear to be accessible without much difficulty from Marudu Bay, the most easy road being up the Benkoka river to where a walk of half an hour brings one to the Tinandukan Nilampan Hill at the edge of the flat, which takes over four hours to walk across. Pangeran Mahomet of Sembali will act as guide to any one wishing to prospect.

The wet weather, succeeded by a spell of sunshine has benefitted the Tobacco crop to a large extent.—*British North Borneo Herald, Nov. 26.*

VARIOUS OILS.

(From Semi-Annual Report of Schimmel & Co.,
Fritzsche Brothers.)

Leipzig and New-York, Oct., 1895.

CINNAMON OIL, CEYLON.—In conformity with the opinion which we expressed in our Report of April last, an enormous change has come over the market-values of this important article in the course of the past few months. The quotations for cinnamon-bark of the "usual assortment," (which is the ordinary condition of sale of cinnamon in wholesale quantities for shipment,) have risen from 8d to 11d per lb., those for cinnamon-chips, the raw material for the distillation of the oil, from 2d to 2½d per lb., or about 30 per cent. As the existing cheap stocks have been disposed of, the finer grades of cinnamon oil have in turn followed the upward course of the market, and it is therefore probable that this long neglected and unreasonably depreciated article will again acquire its proper position shortly. The cultivation of cinnamon has been just as unprofitable in Ceylon as the manufacture of cinnamon oil. Many planters have given up the culture and it is therefore impossible to deny that the present movement in the price of bark and oil rests upon a solid foundation.

In order to place ourselves in a position to form an opinion of the quality of the cinnamon oils of the London market, we caused to be sent to us a number of original bottles containing oil imported from Ceylon. The examination of these samples convinced us that there was not a single genuine oil among the lot, but that they were all largely mixed with cinnamon leaf oil. The following brands were examined:—

1. Cinnamon bark oil. N. G. de Silva. 2. Kaderana genuine Cinnamon oil. First quality. Distilled in Ceylon. 3. Genuine cinnamon oil. First quality. Distilled at Ekelle. T. A. Jayasekera. Colombo, Ceylon. 4. Charles Mendis Kaderana. Purest Plantation cinnamon oil. Colombo, Ceylon. These figures clearly show that none of these oils contained less than 50 per cent of cinnamon leaf oil. We do not allege, however, that this has been added to the cinnamon oil on purpose; in fact, it is more probable that in Ceylon the leaves and bark of the plant are distilled together, and that this is the cause of the inferior quality of the oil.

CITRONELLA OIL.—The price of this article, after having remained at the lowest level for several years, commenced to advance gradually in January of the present year and lately reached the highest point of recent times with a quotation, in Colombo, equaling 1/3d, or \$0.30 per lb.

The statistics, which show a very large export prove that the cause of the advance does not lie in a scarcity of supplies at the point of production, consequent upon a failure in the crop, but that it must simply be attributed to the constantly increasing use of this popular perfume. In particular it is said that a large English soap factory has recently commenced to use citronella oil, and has entered into contracts for large quantities with British wholesale drug-houses. It is added that the latter experienced some difficulties in fulfilling their engagements with respect to the delivery of the oil, and that, as they had accepted all risks, trusting to the long-established stability of the quotations they found themselves compelled to pay high prices, and not only to buy up everything available in England, but also to secure supplies from America.

At any rate it is certain that the speculators have received a wholesome lesson.

Vigorously supported by our New York house, which had purchased very large quantities of citronella oil before the commencement of the rise, we have been able to fill the requirements of our clients without stint and at moderate quotations. Careful investigation enables us to state that no reduction of price is at all to be expected in the near future. Moreover, considering the increasing consumption of the article, which is strikingly shown by the export-statistics reproduced below, it seems to us impossible that the price of the oil should again fall to the former bottom-figure.

Citronella oil is now generally tested in Ceylon according to the method published by us. That process has come to be considered authoritative in cases of dispute. It was certainly published just at the right moment for closing the door to further demoralisation of the trade in the article.

In an experimental investigation recently made by us for a leading importer of citronella oil, only one out of four samples stood our test; the other three being adulterated. It is true that the latter gave a clear solution with from 3 to 5 parts of 80 per cent alcohol, but they turned cloudy upon the addition of further alcohol, and caused a precipitate of a foreign substance at the bottom of the flask. This deposit did not consist of petroleum, but probably of East-Indian Gurjun-balsam or wood oil. An exact identification of the adulterant was prevented by the smallness of the samples.

CAMPHOR.—The advance in price in this indispensable article is due to the speculative tactics of a London capitalist and is therefore, at any rate in the extent it has assumed, without a solid basis. The question whether it is likely to be prolonged much further cannot be answered. At any rate there is very little spirit of enterprise shown for the article at its current market-rates, and businesses in the drug are restricted within the narrowest limits.

The question whether the island of Formosa will pass entirely into the possession of the Japanese is only of secondary importance. If that should be the case, however, the Japanese will hold the monopoly of the production of the article, and, with their notorious astuteness, they will then in all probability succeed in discovering a means of preventing direct shipments from Formosa, thereby maintaining prices, if not at their present level, but at a figure which will secure them a handsome profit.

The average price of Formosa camphor during the last thirteen months has been as follows:—

1894 September per cwt. 67s., 1895 August per cwt. 160.

Crude Japanese camphor reached its highest point (up to the present) in the middle of September, when 210/ per cwt. was quoted for it.

It scarcely requires mentioning that under the prevailing conditions no binding quotations for refined camphor can be given.

JOHORE COFFEE ESTATES.

The local coffee estates are looking well and good pickings are expected next month. On Theobroma the new clearings are looking very well, especially the swamp. Another swamp of about 50 acres is now being cleared and should this be as successful as the present one, it is hoped the future will be brighter than it hitherto has been. Mr. Abrams, the proprietor, is to be admired for his perseverance, as Theobroma is the only estate out of five originally opened up in the Pantei District still working. Mr. J. M. Crichton, an old Mysore coffee planter of over 15 years experience, has taken over the management of the Pulau Layang estate. A new clearing of over 40 acres on this estate, commenced by the former manager, has been discontinued.—*S. P. Press.*

EDRAPOLLA TEA COMPANY OF CEYLON,
LIMITED.

Mr. Porter, who represents this new Company in Ceylon, has, we understand, received a telegram from London informing him that the Company has been registered.

A NEW INSECTICIDE.—A gentleman in Calcutta, "who has made a special study of the subject, and has an extensive knowledge of the virtues of Indian plants," has, it appears, discovered a "perfect" insecticide and destroyer of mites and blights. His insecticide has the merits of simplicity, economy, and efficiency, while it has the great advantage of being non-poisonous to human beings, horses, dogs, etc. The new insecticide is as yet a secret, the discoverer holding back until he can make suitable terms for its disposal.—*Madras Times*, Nov. 28.

PLANTING AND PRODUCE.

TEA IN THE UNITED STATES.—At the Food Exposition held at the Madison Square Garden, New York, the Indian and Ceylon Tea Court is a prominent feature. It is hung with rugs, and decorated with photographs showing the tea plantations of India and Ceylon, scenes in the tea fields, and the different processes of manufacture. The various interests have combined, waiving their own speciality, and united in a campaign to popularise Indian and Ceylon tea. A different blend or brand of tea is served to visitors each day by lady attendants, who set forth the virtues of Indian or Ceylon tea. The New York correspondent of the *Grocer* says apropos: "One cannot help admiring the tenacity with which the advocates of India and Ceylon tea have clung to the American field. They are determined to win, and their very aggressiveness and persistency have won the admiration of the people and traders, and secured for Indian and Ceylon tea recognition of its claims, as against Japan and China tea. Progress is being made, and in the right direction. With many consumers Indian and Ceylon tea will never be popular, they not liking the heavy liquor and sweetish taste. In each section of the United States a different sort of tea is in favour. Thus in New England and the Middle States the black tea of China is most popular, notably Formosa Oolong, although Philadelphia takes more kindly to Foochow. A great deal of mixed tea is sold, but these mixtures are not scientifically made, nor is the American grocer given to the use of machinery for sifting or blending; ten chances to one he will mix at random two or three sorts in the scale, while the customer watches the operation. The art of blending is very imperfectly understood here, which makes your correspondent think there is a field which English blenders might work with profit. Such tea does not encounter the strong prejudice which is shown towards straight teas of the Indian type. Japan tea is largely consumed in the more recently settled States, which also take the ranker sorts of coffee, while the older States prefer the milder sorts. It is incomprehensible to many why Japan tea, with its astringent, rank flavour, is so popular. I recently met a chemist who claims that flavouring Oolong tea with vanilla makes a delicious drink, and one which would please the American palate. The putting of a vanilla bean into a lot of tea for a short time is all that is needed. I have never tasted tea so prepared, but think that there is enough promise of success to warrant the experiment even in England. Those qualities which enable John Bull to open markets all over the world will be victorious in time in giving him a good market in America for Indian and Ceylon tea."

THE EFFECT OF TEA ON THE DIGESTION.—We are so used to the unmitigated abuse of tea that its condemnation with faint praise is quite a relief. Dr. McKechnie,* of Colombo, has been making experiments with tea, with a view to ascertaining whether that popular decoction has the effect on the digestive organs ascribed to it. As the result of his investigations, Dr. McKechnie is of opinion that the tannic acid in the tea is not the injurious agent, but that the undoubted injury which arises is caused by some of the less soluble extractive matters. He is inclined, says the *Lancet*, to think that the action of tea is not so injurious as some writers think it to be. It greatly depends on the method of infusing whether its action is injurious or not. Long-infused teas seem to extract some substance, possibly an alkaloid, that has an inhibitory action on the nerves of the stomach. Dr. McKechnie also states that an infusion of tea of twenty minutes with the tannic acid precipitated has a similar bitter taste as the same tea with the tannic acid present, so that the bitterness in long-infused tea seems not to be due to the tannic acid, but to some other ingredient. Moral: Let the consumer know that tea should not be boiled in the same copper with the family washing, and that even twenty minutes' stewing does not improve it. Avoid long-infused tea unless you

* Really "Dr. P. Mackechnie Short."

wish to extract the "some other ingredient" here referred to, because otherwise you may become a martyr to science without discovering what that "other ingredient" really is.

COCONUT BUTTER.—According to an American paper an extensive factory has been established for the manufacture of coconut butter, which is already being made at the rate of 10,000 lb. a day. The crude coconut oil, it is stated, is received from Cochin in tierces of 2,000 lb. each. This oil is almost colourless and tasteless. After passing through two processes, which are kept secret, it emerges white and granular, and afterwards it is churned with skim milk or butter milk to give it a butter flavour. At present most of the commodity is sent out in its natural white colour for the use of confectioners and cooks in restaurants, but that which is sold for table use is coloured to resemble butter, and for the best quality it is intended to add a little cream before churning. The so-called butter is said to possess a clean, sweet flavour, and to keep remarkably well. The oil from which it is chiefly made is declared cheaper and better than "neutral lard," emulsifying more easily with skim milk, and being more difficult to detect when mixed with real butter.—*H. & C. Mail.*

DOMINICA FOR PLANTERS:

HIS HONOR P. A. TEMPLER.

We are indebted to a correspondent for the following extract from a letter of His Honor P. A. Templer (such is his official designation) dated the 2nd August last which he supposes "may be of general interest especially at the present time when Plantation Companies seem to be all the rage." Since it was written Mr. Templer has had practical experience of anything but a pleasant nature, that Dominica is not quite as healthy as he believed. He describes the heat in August as equal to that of Colombo in April." Mr. Templer writes:—"Dominica is very healthy and if we could only get some money into it and a few Ceylon planters to open it up, it might do great things. It has as rich a soil as any place in the world, abundant rainfall, and *in the hills* a perfect climate. Some 80,000 or 90,000 acres of virgin forest full of fine timber are just waiting for men with capital to come and cultivate them with anything they like to grow. I saw a neglected patch of Liberian coffee away in the forest the other day, which was a little over two years old, bearing well and utterly unmindful of the fact that no one ever came near it or looked after it from the day it was planted. Any one can have the land for one pound an acre."

CEYLON INVESTMENTS IN JAVA.

From what we hear of the results of the investment of Ceylon capital in coffee in Java the capitalists who have cried out against the local Government for withholding sales of Crown land and so forcing capital to find an outlet elsewhere have not much cause for complaint. Two and a half year old coffeees giving 4½ cwt. an acre is equal to anything in Ceylon in the old coffee days, and a coffee estate in Java must be a finer property than the best tea estate in this island at present prices asked for estates or for jungle. There seems to be no difficulty about getting land in Java, and with the splendid soil there, and facilities for working the wisdom of planters having a second string to their bow instead of overdoing the tea output and swamping the market ought to be apparent to everybody.—*The Indian and Eastern Engineer.*

THE AUSTRALIAN LADY-BIRDS RECEIVE KIND NOTICE IN HAWAII.

SUCCESS ON COFFEE.

Mr. J. Marsden, Commissioner of Agriculture in Honolulu, writing to us on October 28th, reports :—

I mail you under separate cover the August number of the *Planters' Monthly*, in which you will find an account of the good work done by the *Cryptalaemus* Lady-bird on the Coffee blight in Kona, Hawaii. We are the more eager to see lady-birds at work in Ceylon.—The extract referred to is as follows :—

Kailua, North Kona, Hawaii, Aug. 8, 1895.

EDITOR "PLANTERS' MONTHLY":—

Some eight months ago I wrote to you concerning the lady-bird which had been introduced to prey upon our coffee blight, expressing doubt, as to its utility, and until May of the present year, my remarks seemed to hold good, as, up to that time, very few specimens in any stage could be found, and the increase of *Pulvinaria* was simply terrible.

In his reply to the resolutions adopted by the local Associations on April 5th, Mr. Marsden informed us of the habit of *Cryptalaemus*? taking a winter rest, and some weeks afterwards an increase of the lady-bird was apparent on guavas growing in the vicinity of coffee, on which the original colonies had been liberated, but principally at a point about three miles on the Thurston road at an elevation of about 1,000 feet. Spreading from this place they have travelled in all direction, and are now to be found from the beach up to 2,000 feet on the mountain side, their distribution having been materially aided by large quantities of pupæ having been collected and carried to various parts of the district. So far they seem to breed more rapidly at low elevations and show a preference for blight upon any tree but the coffee. It is, however, gratifying to note that, having cleared out the blight on other vegetation, they take to the coffee, as a last resort, and keep on until that too is clean.

The work of *Vedalia Cardinalis* on the cottony cushion scale in California has hitherto been regarded as an exceptional instance of the complete extermination of an insect pest by a predaceous enemy; and, in a recent letter from the Washington Department, a doubt is expressed as to the wisdom of relying too much in that direction. The work of *Cryptalaemus* *Monstrosus* in the *Pulvinaria psidei* will, however, so far as present indications show, be just as remarkable as that of *Vedalia* in California, if it remains as industrious as it is at present.

Now that the dreaded White Aphis has been completely exterminated by *Rileyii*, the hopes that *Cryptalaemus* will inflict a similar fate upon *Pulvinaria* is making our Kona coffee planters jubilant and Prof. Koebele, as well as Mr. Marsden, will occupy a warm corner in their hearts.—Yours faithfully,

WILLIAM G. WAIT.

THE NEW QUININE FACTORY.

The opening of the new English quinine-work at Stamford Hill, which we announced in our issue of last week, is not likely to have a serious effect upon the market-position of the drug. It is true that the entire output of the factory for the present month is said to have been sold already, but the works are described as only of "moderate capacity." The chief point of interest in the situation is that the new factory is the only one in Europe not bound by the "agreement," "convention," or "understanding"—call it what you will—which has existed for more than a year among the older makers, and has given a healthy tone to the quinine-market. The Imperial Quinine-works may set out on their career with the best possible intention against price-cutting, but theirs is an unknown brand, and they will naturally have to pay for their comparative obscurity as a manufacturing concern by accepting a lower price for their article than better-known makers. We have no reason to doubt the accuracy of the statements that were publicly made last week with regard to the excellence of the new

quinine, but it takes a long time to convince the average consumer, especially a British one, who is proverbially loath to leave his time-honoured sources of supply. Now, the fact that the new company, in spite of the alien origin of its leading promoters and its chemist, appeal specially to consumers of English quinine, will probably render it necessary for them slightly to undersell their rivals for a long time in order to establish a sure footing. If the makers already in possession of the market refrain from retaliating, things may settle down without much trouble into a condition in which the new English brand will assume a market position analogous to that taken by a certain quinine among German brands. But should the older makers be so ill-advised as to declare war upon the new comer, we may possibly again return to the price-cutting days of 1892, when quinine was purchasable below 10d. per oz., and, possibly, to a renewal of the system of unrestricted selling for forward delivery at competitive prices, which was responsible for the accumulation of such an enormous stock of second-hand quinine in the hands of speculators.

The new factory starts at a time when the older manufacturers were believed to be contemplating an all round advance in their quotations early in the coming year. From the quinine-makers' point of view the market has been mending for some time, notwithstanding the fact that there has been no improvement worth speaking of in the second-hand quotations, and that the makers' prices have remained unaltered for months. The second-hand stock of quinine in London has been reduced to manageable proportions, the cinchona bark supply in this country is too small to place any serious impediment in the way of a rise, and at least one of the large German quinine works has been deliberately kept closed all through the summer months. Only the Java producers remain hopelessly disunited. Their exports of cinchona bark last month reached the enormous total of over 1,200,000 lb. (1,100,000 Amsterdam lb.), and in their present disorganised condition they are almost at the mercy of the quinine-makers, so far as the price of their produce is concerned. At the present time the quinine manufacturers pay for the quinine in the bark only about one-fourth of the price at which they quote their finished product, and if only the second-hand stock of quinine were smaller than it is, they would not be at all badly off. For the sake of the stability of the industry it is to be hoped that they will admit the new firm into their comity with as little friction as possible. On the other hand, the brokers who at present act for the new factory are too experienced in questions relating to cinchona bark and quinine to be likely to provoke a contest of price-cutting.—*Chemist and Druggist*.

LIBERIAN COFFEE AND COCOA PRICES.

Dolosbage, Dec. 8.

The last London market reports contain the announcement that 86 bags Liberian (Ceylon) fine yellow fetched 90s 6d and brown at 86s. These prices for small consignments are excellent, seeing that the average for Arabian, realizing from 94s to 110s, at the same sale, was only 99s. Besides, small consignments of any product generally go "for a song." When Liberian coffee growing was first attempted, much was said about the markets for it. It will only sell at New York and low continental markets &c. That was fourteen years ago. It is important to note the colour of the coffee that fetched most. Bluish-grey and pale green were the tints for Arabian coffee years ago.

Cocoa has been reported as selling at 65s. for several months past, but the Ceylon mediums, though not reported, have fetched from 67s to 69s, and best qualities up to 77s. The last report states that there has been a steady decrease of stock. Prices will, of course, improve. It will be remembered by a few that the price of coffee rose

in '73 from R6 to R11 per bushel in the local market, notwithstanding increased shipments from Ceylon and elsewhere. In or about 1881 the price with diminished exports, decreased to R8 per bushel! Cocoa at 50s. only in the London market won't deter those desiring a plantation, that is never abandoned or renewed "for nearly a century" as Sir James Longden remarked when he visited certain cocoa properties with a view to giving an impetus to its cultivation. He spoke from his knowledge and experience of plantations in Trinidad as well as in Jamaica. J. D.

VARIOUS PLANTING NOTES.

VARIOUS OILS.—Elsewhere we quote extracts from the semi-annual report of Schimmel & Co., Fritzsche Bros. of Leipzig and New York regarding the market for cinnamon and citronella oils of which a very hopeful account is given.

COFFEE IN MEXICO.—What a former Ceylon Planter has to say about the prospects of coffee-growing in Mexico will be found quoted elsewhere. He speaks particularly of two districts capable of being converted into most successful plantations.

PETROLEUM AS A FUEL.—An interesting article on this subject is quoted in another column. It contains the views of Mr. B. Nelson Boyd, M.I.C.E., who expresses the opinion that the general adoption of petroleum as a fuel is a matter for the very distant future.

THE SHEVAROY PLANTERS' ASSOCIATION.—We (*Madras Mail*) publish in the annual Report of the Shevaroy Planters' Association. It is stated that there is a scarcity of labour on the plantations on these hills, but considering how favourably they are situated in regard to the railway, no difficulty ought to be experienced in getting as many coolies as are wanted if only planters would combine and organise.

LADIES AND TEA have become inseparably associated, thanks to those charming afternoon gatherings with which everybody is familiar. There is a new guise in which the association appears, to which a correspondent directs our attention:—

"There is in London a firm of lady tea merchants who have an estate in Ceylon, and who employ members of their own sex exclusively as tasters, blenders, packers and agents."

SALE OF AN ESTATE IN THE KELANI VALLEY.—Mr. J. M. Brace has purchased from Mr. C. S. Warren, Mapitagama estate, Ruanwella, the price paid for the estate, which is one of the best small covers of tea in the K. V., being R57,500. The estate consist of 148½ acres, of which 100 acres are planted in tea.—*Cor.*

A QUININE FACTORY IN LONDON.—A new quinine factory has been established in England—at Stamford Hill, in the North of London. It contains brand-new machinery of the latest description, and has no connection with any previous English manufacturer of quinine. Its institution caused quite a stir among the London druggists, and is expected to effect prices greatly. [A full report is given elsewhere.—*Ed. C. O.*]

COLOMBO TEA MARKET AND THE CESS TAX.—Mr. Arthur Lampard certainly gives us a thoroughly original suggestion for the disposal of the Tea Cess in his letter elsewhere:—distribute it among producers supporting the local market! There is more in Mr. Lampard's letter than appears at first sight. Colombo will never be a great tea-market until it is better supported and freed from absurd Customs shackles, and the more tea sold here, the sooner will we drive China's and Japan's out of America, Russia, and Australia.

SALE OF LAND AT BATTICALOA.—We hear that some Dikoya planters are going to bid for the lands, suitable for coconut cultivation, to be put up on the 19th instant, at the Batticaloa kachcheri, and that prices are likely to go high. This interest of Europeans in coconut cultivation is a good sign, especially when it leads to fresh land being opened up.

SIR JOHN MUIR'S MOVEMENTS.—Mr. W. Milne from the Sylhet Company's Travancore property, met Sir John Muir at Madras as arranged, but the latter decided to go on with his family to Calcutta, and returned in February to visit Travancore. The weather will then be less rainy, and the surveying and other work more advanced. Mr. Milne came down to Colombo, where he is now. He leaves for South India for good next week.

THE QUININE FACTORY which has just been opened at Stamford Hill is the subject of an article which we quote in another column from the *Chemist and Druggist* dealing with the effect which its existence is likely to have upon the market-position of the drug. Our contemporary does not think that the effect will be at all serious.

CARDAMOM CULTIVATION IN BANGALORE.—We understand that the reports of the Deputy Commissioner of Hassan and Kadur have been forwarded to the Superintendent of Mysore Revenue Survey on the subject of the reduction of assessments on estates cultivated with cardamoms in exposed situations of excessive rainfall with certain instructions for reclassifying and reassessing all such estates in the situations unfit for coffee owing to either excessive rainfall or exposure, with a request that definite proposals may be submitted so as to enable the Government to sanction the revised settlement being brought into effect during the current year.—*Daily Post.*

GROWTH OF TREES.—The following interesting results of experiments relating to the growth of trees at different times of the day have been sent to us by Mr. E. H. Thompson, the Government entomologist of Tasmania. Measurements were taken as far as possible every three hours, with the following results:—From 6 a.m. to 9 a.m., 8½ per cent. of growth; from 9 a.m. to noon, 1½ per cent. of growth; from noon to 3 p.m., no growth; from 3 p.m. to 6 p.m., no growth; from 6 p.m. to 9 p.m., 1½ per cent. of growth; from 9 p.m. to 12 p.m., 3¾ per cent. of growth; from 12 p.m. to 6 a.m., 85 per cent. of growth. The greatest growths in twenty-four hours were banksia rose, 6½ inches; geranium, 5¾ inches; wattle, 4½ inches; apple, 2½ inches; pear, 1½ inch.—*Public Opinion.*

THE CEYLON COOLIE.—An experienced planter in Ceylon, writing to a local paper on the much vexed labour question, thus sums up Ramasamy: "Monthly, or even weekly payments will not keep Ramasamy out of debt. The greater his indebtedness, the more important a person he considers himself. Where he paid every Saturday, the whole in most cases would go on Sunday, and, after the manner of the English miner, he would live on credit till the next pay day." And perhaps Ramasamy is not altogether wrong, for there can be little doubt that the money-lending Chetty takes a lively and continuous interest in the coolie who is ever on his books, and out of whom he makes a steady income, and the Chetty is an influential man.—*Pioneer.*

SCIENTIFIC ENQUIRY INTO TEA CULTIVATION.—Elsewhere we quote from the *Indian Planters' Gazette* the full text of correspondence between the Secretary of the Indian Tea Association and the Government of India on this important subject. It is pleaded that as Government had rendered assistance in investigations connected with silk it might similarly give support to an industry of such magnitude and importance as tea by equipping a laboratory for the use of a chemist of established reputation who should be engaged for a period of five years' say.

Correspondence

To the Editor.

VINE-GROWING NEAR COLOMBO.

Lenawatte, Padukka, 22nd Nov.

SIR,—I see in the *Observer* of the 20th instant that something is said about my vine-growing experiment; if you can spare a little more space of your valuable columns I would like to add something on my own account.

A vine requires four years before coming to its regular stage of bearing. Out of ninety two-year old plants, though a good few had been in blossom twenty days after being planted at the School of Agriculture, about fifteen bore fruit; I do not give much importance to this crop, as I must take into consideration the substances contained in the plants, and absorbed during their two years' origination in the other grape-producing country; but as one with a little experience in this culture, I must say, that the change of soil, climate and abnormal moisture to which these plants have undergone, have in no way affected their natural course of growth. Neither the quantity of fruit, would have been larger, nor the quality better, if left where originated "Gardo Blanco," the only two-year old vines I have, and the one that has been bringing this little fruit, is a Muscat. Anybody who knows this variety of grape, cannot say much about the appearance of its clusters and berries, but certainly must speak the highest about its flavour. The grape I had the satisfaction to taste from the School of Agriculture's Vineyard is just as good in appearance, and as delicious in taste as the Muscat grown in any other part of the world (the hot-house grape of Britain included). I have asked Mr. Driberg to let you be persuaded of these facts by providing you with a specimen.

I have been pruning the vines at their very first signs of wintering so as to bring their next bearing, if any at all, in dry season. Mr. Driberg, to whom we must be thankful if these experiments will prove successful, will carefully watch and keep me informed with all stages of growth in the plants. The pruning being done, our next attention will have to be paid to the "disbudding" a very important operation in order to secure healthy crop. I hope in a few more months to add some good and positive news *re* this experiment, while I remain, sir, yours faithfully,
C. ZENETTI

PATENT TEA-PACKING.

Rambukana, Dec. 1.

DEAR SIR,—A contemporary of yours a few days ago mentioned that Mr. P. M. Short of Dimbula had commented very favourably on a patent tea-packing paper brought out by Mr. Anderson. Perhaps you have also seen the paper and will be able to tell, after comparing it with the sample sent, made for me by a large manufacturing firm in England, which is the better. I have not seen Mr. Anderson's paper but from a description given of it I think mine would be more serviceable. I shall be glad to give any further information and samples to anyone caring to try the paper. In the meantime I may state it is easily glued together, is perfectly air and water tight, is much stronger and lighter than lead and only *one-third* the price.—Yours truly,
F. C. THEOBALD.

[Is Mr. Theobald sure there is no infringement of patent? The packing sent to us seems very serviceable.—ED, T.A.]

"TEA-MAKING A LOST ART."

DEAR SIR,—Under the above heading you print a letter in the *Observer* of Dec. 7, which consists, I take it, of an attack by a Planter upon Colombo Brokers, and as I represent neither of these interests I may possibly be better able to reply to it. The letter is a little rambling, but on dissection I imagine there are the following questions requiring a reply:—

The reason for Brokers' adverse comments upon the make of tea.

The reason for Brokers' adverse comments upon the liquor of tea.

The reason of the decline in price, and the policy of encouraging local sales.

The remark in the letter under review attributing to Brokers' ulterior motives in making their reports is one I regret was not expunged from an anonymously written letter prior to publication*, as I feel sure it is perfectly unjustified and has no foundation in fact, and I am endeavouring to reply to this letter, only because many planters may be interested in this subject, which otherwise I would not attempt to do, for the benefit of up-country. Regarding the make of teas sold in the Colombo Market, I consider that speaking generally the Brokers are studying the planting interest in its truest sense in pointing out what is an admitted fact as regards the great bulk of the tea; and as one who has spent a good many years in the London market, I can state that in regard to this, the teas sold here are more roughly and coarsely made than Indians, Chinas or even Javas; and as this defect is a great handicap in Colonial and Foreign markets, comments drawing planters' attention to it can only be good in the interests of the industry. The reason for brokers' adverse comments upon liquor is because it is a fact, but the marked falling-off in this particular is a thing which the recent heavy rains are accountable for, and therefore beyond all human control. In common tea I admit the decline in prices; but it is owing to the fact that the whole of India's increased output consists of this grade of tea—which competes with low grown Ceylons—the two being practically an interchangeable article—buyers taking whichever appears the cheaper. The market in London for such grades of rough-leaved, sweet-liquoring teas is from 4½ to 5½d with a sick feeling and a tendency to lower rates.

Regarding good, well-made, teas, with Ceylon flavor, the market locally for these grades, of which far too few are sold in Colombo, has been an extremely good one during August, September, October; teas with stand-out point were realizing locally at least 1½d per lb. above London prices. The difference between this market and London is not now so marked, but is still in favour of Colombo.

* The remark was as follows:—

"Nobody is taken in with it, except that the credit and motives of those who indulge in it are questioned. Selling brokers in Colombo are also buying brokers; and when a systematic attempt is made to call down the teas at local sale, the suspicion arises that there is something behind all this. If the market is bad and the teas fair, why not say his?—But in these days it is only the teas that are bad, and are steadily getting worse."

Now, in our opinion it is far better in the interests of Brokers and all concerned that such talk or suspicions as the above, should come out in black and white and be answered, than that they should become the common talk in upcountry bungalows without the chance of the other side being heard. Had we suppressed the sentence, what would "Upcountry" and his fellow-planters infer? Why that the Press had joined in a conspiracy of silence with their Colombo neighbours.—ED, T.A.

Regarding the policy of encouraging local sales, I think the planting interest as a whole, by the efforts they have made and are still making, realize the importance of opening up fresh markets to deal with the increased supply the island will be producing in the near future, and thus prevent prices declining to an unremunerative point. I claim to be in a position to give an opinion upon this point, the result of personal experience, and I am convinced there is one way and one way only of doing this and that is by making Colombo a real representative market where colonial and foreign buyers may feel assured of having their orders properly executed. No real expense may be looked for in the foreign development, however much money the Planters' Association may spend, until this is done; for buyers abroad will not realize the advantage of buying Ceylon tea in London, plus 1½d per lb. Freight, Dock and landing charges when they can import direct and satisfactorily both China and Japan teas, without any such import. I trust I may be forgiven for saying that I feel sure, the wiser method of employing the Cess-tax would be to distribute it amongst planters selling locally; for, in this way it would do some good and planters sharing it, would, in addition, obtain, year in and year out distinctly better prices than London rates and do more than anything yet done to open up the World's Market for Ceylon Tea.—Yours faithfully,

ARTHUR LAMPARD.

THE LOST ART OF TEA MAKING; A REPLY TO "UPCOUNTRY."

December 8th, 1895.

SIR,—In reply to Upcountry, who by-the-by might have given us his name, it would be interesting to read some of the reports of "A Lost Art" that he has in his possession. As regards tea-tasting, I maintain we never had better men in Colombo than at present. I don't allude only to Brokers, but to the Trade generally. "Upcountry" is quite wrong when he asserts that "since the home markets got weak" the Colombo Brokers have developed "a keenness of vision" etc., etc. Local teas and reports are based on local prices and demand, and have now-a-days, very little to do with the home market. If a man requires a report for London he gets it and to the best of our ability; but it is no more possible for the local Broker to value, not report, teas sold five weeks hence in London than it would be for the London Broker to value, say, for Australia or Russia. It *can* only be done approximately, and quite near enough for advances against shipment. Certain marks, both here and in London, have their *own* supporters and will always upset any calculations as to value. My experience of late has been that the teas, both high and low grown, are in many instances quite as good, and some better and the market only *not the teas*, must be blamed for results. Another point I should like to draw attention to, "Upcountry" says "Selling Brokers in Colombo are also buying Brokers." Well, of course they are. God help them if they were not, at times, but so are *all the leading selling Brokers in the Lane* from the king (W. J. & Hy. T.) downwards. Surely a man must be very dense if he does not see or understand the "*pull*" his teas get, protected by good orders. His Brokers will always "find out" his own teas first and fill up his orders from his own catalogue where suitable, and failing that he goes on to his brother

Brokers and there will always be far less "taken out." There is no "blue funk" about. Only since August, with the advent of one or two new buyers, some tall orders from places outside the "little village," and a low exchange local prices have been about 1d-2d over London, and now when orders are filled for the *moment* and buyers are thrown back on home rates, the usual wail comes and Brokers are told they don't know *their* business!!!—Yours truly,

A. H. THOMPSON.

THE LOST ART—"TEA MAKING;" AND THE WORK OF BROKERS.

SIR,—When teas deteriorate, *some one* must be blamed, and 'Upcountry' vents his rage on the Colombo Broker—the man whose personal interest it is to keep prices up, to keep the market up and to satisfy as far as he is able his constituent, the seller.

He infers that we, tea-tasters, report on an invoice as inferior to the previous one in make. liquor &c., when we find the market is weak. This of course he says in ignorance, but as every tea-taster who has had a practical education in Mincing Lane, knows as a rule *prices fall when teas deteriorate*.

For instance a buyer purchases a tea this week at a certain price and in a fortnight's time the same estate's tea is offered which he tastes with a view to "following" his previous purchase. He finds it 1d per lb. inferior, and what does he do? He either leaves it alone or bids 1d less than the price he paid before. The Planter who has made the tea, possibly thinks the invoice equal to the last and assures his agent that it cannot be worse, because he has not altered his manufacture in any respect, forgetting perhaps a change in the weather and ignoring the various, though perhaps trivial matters which cause differences in quality and character of teas, and which the "all-seeing" eye can and does detect, but which slight though important change may not be apparent to an unprofessional taster. But no!—it is the Colombo Broker's fault! The climate, the tea, the Superintendent are in no way to blame!!

If your correspondent will look at the local tea circulars published in August last, he will find such remarks as these "the quality of teas generally shows improvement;" "a large proportion of good teas were offered" &c; and in many tea reports he will find the same. But to say now that the invoices offered last week were generally better than those sold 5 weeks ago would be incorrect and misleading, though doubtless it would please the eye of illused "Up-country." His unprovoked assault on the commercial morality of Colombo brokers is unworthy of a reply. The auctions are public, and every one interested, can see and judge for himself if he suspects his teas are "called down" or that they do not receive fair and open competition.—Yours truly,
TEA-TASTER.

[Teas made after pruning and during very wet weather must necessarily be inferior.—
ED. T.A.]

DOMINICA AS A FIELD FOR CAPITAL.

The Grove, 9th Dec.

DEAR SIR,—Referring to Mr. Philip Templer's letter about Dominica as a field for Ceylon Planters I now enclose a cutting from the *Financial News* of 25th September last [quoted on page 464.—ED. T.A.] forwarded to me by my Agents

Messrs. Harvey Bros. on the same subject. The computation "that 20 hands will be sufficient to work a cacao plantation of 300 acres in full bearing, including picking and curing crop" written by Mr. Morris, certainly beats our experience. The hands must be either of very different activity, energy and skill from those of the Tamil labourer; or the mode of upkeep and cultivation must be materially different. It would be instructive to know more about this. Perhaps the weeding in Dominica is like the weeding of native coconut plantations in Ceylon and a saving is effected in that way.

The average yield also of from 80 to 100 pods per tree is a crop that we may well be satisfied with—if with such little cultivation such a crop can be got—and there can be no great reason for clean weeding if the saving is in the weeding. Your correspondent may I dare say be willing to obtain for us this information from the West Indies. Or Mr. Templer may most likely be glad to show us Ceylon men more economical modes of cultivation.—Yours truly,

JAS. H. BARBER.

VARIOUS PLANTING NOTES.

PROPOSED FORMATION OF A COMPANY IN COLOMBO TO PURCHASE COCONUT ESTATES.—We learn that a Company is in course of formation amongst some Europeans in Ceylon to purchase a group of coconut estates in various districts, and that a well-known broker is negotiating the sale on behalf of the owners of the properties. We stated a few days ago that a Syndicate was being formed in England with a large capital to purchase coconut estates in Ceylon. The properties were appraised, but negotiations have been going on for the last four months or so without any practical result, and the matter is still pending. In the meantime, we understand that one or two Colombo firms, in conjunction with up-country planters, have resolved to start a Company and buy up the same properties. The capital to be raised is, we understand, a very large one, but, as the properties are expected to yield very remunerative returns, it is expected that the shares will all be taken up readily.

ADVERTISING CEYLON TEA IN CANADA.—We have to acknowledge receipt from Mr. A. Melville White of a copy of the *Canadian Grocer*, a journal which, in point of excellence in artistic advertising, would be hard to beat. In its columns a large measure of space is devoted to advertising Ceylon tea, and we are sure no better medium could have been selected for bringing it under the notice of the trade. The advertisements themselves are smart, and cleverly got up. An article in the paper deals with the "Buying, Handling and Selling of Teas" by Mr. W. J. Forman, Ingersoll; and in it much valuable information is given to retailers as regards sampling, blending, advertising, &c. And then again the *Canadian Grocer* gives prominence to "W. M'K's" article, "The Marvellous Vicissitudes of an Island" which has appeared in our columns. Mr. White also sends us a number of cuttings from American and Canadian papers containing advertisements, paragraphs and articles regarding our staple product. It is of interest to note from these that the Salvation Army have vigorously taken up the work of pushing Indian and Ceylon tea. They have issued handbills in their own characteristic style narrating the advantages of the article and assuring customers that "every cent of profit is devoted to extending the spiritual work of the army." A good stroke of business which Messrs. M'Kenzie and Blechynden have accomplished has been to secure the right of

advertising on the margin of the Salvation Army's note paper. In this connection it is stated by Mr. M'Kenzie that the Salvation Army's is the third largest mail that comes into New York. This should be a valuable adjunct to the work of advertising. From the papers which Mr. White has been good enough to send us we are pleased to observe that the campaign is being carried on vigorously.

THE GLENCOE ESTATES COMPANY, LIMITED.—This Company, with a nominal capital of R500,000, has been formed to take over Mr. John Clark's properties, Glencoe estate in Maskeliya, and Woodland estate in Lower Dikoya. Glencoe is well-known, and consists of 202 acres, of which 200 acres are in tea in full bearing; and Woodlands is also a good property, consisting of 110 acres of tea and 10 acres of tea and cinchona. The estates were valued at R220,000 and a purchase price has been fixed at R180,000, half of this being taken in shares, and half in cash, Mr. Clark continuing in charge. The Company is practically a private one, and the capital now to be issued, viz., R180,000, in R100 shares, has been subscribed, although applications are still coming in. The estimated return on the capital is 14 per cent. The first directors are Messrs. G F Truill, F R Williams (of Minna estate, Maskeliya), and E Booth, Mr. Clark joining the board after allotment. The agents and secretaries are Messrs. Bosanquet & Co. — *Local Times*.

PAPER MILLS IN INDIA:—From a Blue Book recently issued we take the following:—

There are nine paper mills—four in the Bombay Presidency, three in Bengal, one at Lucknow, and one at Gwalior. Another is under construction in Bengal. Of the nine, three are private concerns in the Bombay presidency, one of which has not been at work for many years. The others have an aggregate nominal capital of Rs. 492,200. The fibrous materials used for making paper are chiefly rags, babui and moonj grasses, straw, jute and hemp cuttings, and old jute bags and cloth. The quality of the papers made has much improved in recent years, and they have a large and increasing sale. Most of the white and blue foolscap and much of the blotting paper, note paper, and envelopes, used in the Government offices, is now obtained from the Indian mills. The total quantity of paper made in 1893 was about 29½ million lb. The number of persons employed is 3,157. There are a number of small paper works, for the manufacture of what is known as country paper, scattered through most provinces, but of these petty industries no statistical information is available.

"A STRONG MARKET FOR COCONUT OIL"—is the subject of an article in the *Oil Paint and Drug Reporter* dealing with the completion of a transaction in New York involving the sale of 500 tons of Ceylon oil which had formed the unsold portion of the stock of a local dealer who had made an assignment some months previously. It is explained that though the oil had not actually been retired as a competing factor in the market, it had passed into very strong hands and it was conceded that there was no probability of any of it finding its way into consumptive or other channels except at full and inflexible prices. The effect of the announcement of this deal was to immediately cause an advance on both varieties of oil, and the feeling of confidence which has thus been inspired is intensified by the knowledge that the supplies yet to be forwarded this year from the primary markets are comparatively light. Of Ceylon oil the next shipment is 550 tons expected in New York in the beginning of December. It is stated that the demand for coconut oil is slowly improving despite the fact that very many of the heaviest consumers are carrying rather full supplies.

INDIAN GOVERNMENT CINCHONA PLANTATIONS.—From the Revised Estimate for 1895-96 we notice (says the *Madras Mail*) that the Government Cinchona Plantations will show a profit on the current year's working of R17,700, receipts being set down at one lakh and expenditure at R82,300. It is possible that when the accounts for the year are made up, the profits will be even larger, owing to the constant daily increasing demand for quinine and febrifuge. The Budget Estimate for 1896-97 provides for a profit of over R12,500, that is if the sales continue stationary. In view of this considerable profit, Government should at once reconsider its decision to plant up new acreage. These increased sales of quinine are satisfactory, but if they go on and Government runs its factory on commercial principles, it must expect to hear shortly from the trade on the subject.

FRUIT-GROWING IN AMERICA.—Some idea may be gained of the scale on which fruit-farming is carried on in America—says the *London Echo*—from the operations of one establishment alone, the Hale Orchard Company, which, in 1891, planted 100,000 Peach trees in Georgia:—

During April and May this year 50 men were occupied all day in removing excess fruits in order to allow the rest to have room to develop. They began to come to maturity in June, and from the 20th of that month 350 men, aided by 50 mules, were engaged every day gathering and carting away, filling 4,000 baskets in the 24 hours. Imperfect, bruised and scratched fruits, separated from that in prime condition, amounted to 300 bushels a day. It took from 525 to 600 baskets to fill a railway refrigerator van, and each van load represented a value, including coast of gathering, packing, and transport of £100. From this single orchard 80 van-loads were sent away this year. In Houston County the cultivation of the Peach alone gives employment to 3,000 people.

COCONUT PLANTING IN FIJI.—The Editor of the *Fiji Times* is a strong believer in the coconut palm and urges his depressed fellow-colonists as follows:—

To owners, who possess land lying idle, situated other than on Viti Levu, where from some unexplainable cause the coconut does not thrive to the same degree as in other islands of the group, we would suggest the planting of such lands with coconuts. As they stand at present they are comparatively valueless, but once planted with the coconut palm, from the mere fact of their being so planted, their increment for the succeeding ten years at least would be an increasing one year by year, and so by some such practical means our waste lands would regain their wonted value once again, and with something on boot. Once in full bearing the produce from an acre of coconuts should be worth two pounds sterling, plus 10s for reducing the nuts into copra. At this estimate it will readily be seen, at a five per cent interest on capital—the days of 10 per cent have gone for ever—the value of an acre of coconuts would be worth about thirty pounds. As a warranty for so planting we have only to turn to Ceylon, where, for the past two years, quite a revival in coconut planting has set in, and is being pushed ahead with some vigor. We would like to see our unoccupied lands which are suitable for the production of the palm, put to a like use, and the ordinance lately passed to facilitate contracts being entered into between Europeans and natives will largely assist to this end, as no European oversight will be necessary, beyond what is specified in the contract. The native, at any rate will now be capable of planting and tending the nut for the first year or so, after which it may be left to take care of itself, and the owner of so much planted land will know that his possessions are increasing in value, for while he is sleeping his nuts will be growing. We hope, therefore, that some attention will be given to this suggestion by a large number of owners and agents of unproductive areas.

"THE LOST ART: TEAMAKING".—As we expected, "Upcountry" has drawn forth a prompt reply, and he as well as others of the planters will be pleased to see such recognised authorities as Mr. A. H. Thompson (Broker) and Mr. Lampard (Buyer) giving the needful explanations called for by that letter. Now, in the face of such answering letters as we publish, it will surely be admitted that we acted very wisely in allowing "Upcountry" to have his growl (even including his insinuations) fully out. Far better that any uncomfortable feelings or suspicions entertained in upcountry factories should be brought into the light of day, and so be met, and dispelled, rather than that they should be denied publication, and so allowed to pass from one district to another and gather more and more force as they became common talk. Mr. Lampard must remember that many planters lead a lonely life, they cannot meet on 'change, or find a businessman among their accessible neighbours to explain Colombo matters that they do not understand, and therefore we feel a certain latitude should wisely be allowed, when those competent to clear away unfounded suspicions are available. So again, in respect of "anonymously letters." Many Estate Managers do not feel at liberty to sign their names without the permission of absent proprietors, and yet it is often in the interests of such that they feel bound to criticize Colombo businessmen. It is now for "Upcountry" to say how far he is satisfied with the letters of Messrs. Thompson and Lampard and whether he thinks any further explanations necessary? To our mind, the information given is satisfactory, if not conclusive.

VEGETABLE PRODUCERS IN PORTO RICO.—Besides sugar and coffee, both of which are intimately associated with Porto Rico, tobacco also holds an important position, but though already cultivated to a very large extent, it is stated that its growth might be extended almost indefinitely if it were not for the old question of excessive taxation. The soil is of the very best for tobacco growing, and quite equal to the best of the Cuban plantations, but as a rule, there is some carelessness in the process of curing. Good tobacco requires no great labour in its cultivation, but considerable care and attention, especially as regards insect pests, and when the leaf is stripped, selected and dried. In all these matters the native of Porto Rico is exceedingly careless, and this it is that prevents so good a final product being obtained as in Havana. Still, a considerable quantity of Porto Rico cigars find their way to the States, Spain, France, and England; but the tobacco trade is one which ought to be largely extended, if only proper facilities were given by the Government. Large quantities of tobacco-leaf are exported to Cuba, to be made up there into the world-famed Havana cigars. On the subject of fruits, it is said that, though the plantain, banana, &c., are grown everywhere, and are much used as fruit in the country, the export trade is not large nor yet of the pine-apple, which grows to perfection when any care is taken of it. It is remarkable that the pine-apple is not exported in larger quantities than is actually the case, seeing that it is a fruit that could easily be shipped and carried the short distance to the United States, where it can command good prices. The coconut grows in immense quantities all around the coasts of the island, and to a considerable distance inland, but little or no use is made of it, and exports are few and far between. The contents of the green nut are much used as a beverage, but the great bulk of the crop, which has a continuous growth, is allowed to go to waste. The mango, covered with its green and golden fruit, is common everywhere, and lines the roadsides in many parts for miles and miles. The Seville, or Bitter orange, grows wild in the woods, but none of the fruit is exported, and by far the greater part goes to absolute waste.—*The Gardeners' Chronicle*.

THE "AGRICULTURAL GAZETTE" of New South Wales, Published by the Department of Agriculture. Volume VI. Part 10. October, 1895. Contents:—Stinworth (*Inula gravecolens*, Desf.) J. H. Maiden; The Weeds of New South Wales (Supplementary Notes, No. 1) J. H. Maiden; Botanical Notes—Mr. Charles Ledger of Cinchona and Alpaca faine, Note on Sassafras timber in the Bega District, Beech or White Beech, Additional notes on Colonial or Moreton Bay Pine, J. H. Maiden; The Cause of Gummings in Sugar-cane, N. A. Cobb; The Phylloxera in Europe.—Annual Report of the Chief Andres Blavia, of the Central Government Station of Viticulture in Spain, at Cette, Translated by H. Cambridge; Beekeeping.—Chapter II: The inmates and economy of the Hive, the Drone, Albert Gale; The Dairy Industry in Denmark, F. E. H. W. Krichauff; The Devon Breed of Cattle, J. L. Thomson; Chemical Notes, Beeswax, Testing Babcock's Flasks, Fowl Manure, Notices of some recent Text-books, F. B. Guthrie; Ticks on Cattle; Poultry Notes.—Cramming Fowls, Freezing Poultry for Export, S. Gray; Practical Vegetable and Flower Growing, Directions for the month of November; Orchard Notes for November; General Notes—A new Fruit-dryer, Remedy for Potato Scab; Agricultural Societies' Shows, 1895-6.

POISONOUS EFFECTS OF BORAX.—The extensive use of compounds containing borax, which under various names are sold for preserving foods, lends a special interest to some observations of Dr. Ch. Féré of Paris, who has used borax in the treatment of intractable cases of epilepsy, and with success in certain cases. It is true that for this purpose it was necessary to give large doses for long periods, but in the course of the trial he met with a considerable number of persons who were peculiarly susceptible to borax. In them, loss of appetite was succeeded by burning pain in the pit of the stomach, dryness of the mouth, and eventually by nausea and vomiting. Borax produces also a remarkable dryness of the skin, which is found to favour, if not to cause, various skin diseases, especially eczema. The hair also becomes dry and may fall out, causing complete baldness. The most dangerous result of the use of borax, however, is its power of producing kidney disease, or of converting a slight disorder of the kidneys into a fatal malady.—*British Medical Journal*.

COFFEE, COTTON AND A SPECIES OF "TEA" IN SOUTHERN ABYSSINIA.—The following extracts from an official Report are of general interest—more especially that part which indicates the existence of a shrub in Abyssinia which serves the people as a substitute for "tea" and is similar to the maté of Brazil and Paraguay:—

"But few people are more desirous or more capable of trading than the natives of Africa; and the facility with which factories can be formed is sufficiently proved by the reception heretofore experienced in various parts of the continent. Abundance of land now unoccupied could be purchased or, rented at a mere nominal rate, in positions where the permanent residence of the white man would be hailed with universal joy, as contributing to the repose of tribes long harassed and persecuted. The serf would seek honest employment in the field, and the chiefs of slave-dealing states, gladly entering into any arrangement for the introduction of wealth and finery, would, after the establishment of agriculture, no longer find their interest in the flood of human victims, which is now annually poured through the Highlands of Abyssinia. No quarter of the globe abounds to a greater extent in vegetable and mineral productions than tropical Africa; and in the populous, fertile, and salubrious portions lying immediately north of the equator, the very highest capabilities are presented for the employment of capital, and the development of British industry. Cotton of a

quality unrivalled in the whole world is everywhere a weed, and might be cultivated to any requisite extent. The coffee which is sold in Arabia as the produce of Mocha is chiefly of wild African growth; and that species of the tea-plant which is used by the lower orders of the Chinese flourishes so widely and with so little care, that the climate to which it is indigenous would doubtless be found well adapted for the highest-flavoured and more delicate species so prized for foreign exportation.

"Chaai is a shrub very extensively cultivated both in Shoa and in the countries adjacent. It is in general use among the inhabitants as a substitute for tea, which, in all its properties and qualities, it closely resembles. The plant is said to have been brought originally from the western mountains, of which the elevation being from five to eight thousand feet, agrees with that of the Chinese tea districts, whilst the average temperature does not exceed 60° Fahrenheit. In a light gravelly soil it attains the height of twelve feet; and the leaves being plucked during the dry season, and well dried in the sun, fetch from one penny to two-pence the pound. They are either chewed or boiled in milk, or infused in water; and by the addition of honey a pleasant beverage is produced, which, being bitter and stimulative, dispels sleep if used to excess. The virtues of the chaai are equally to be appreciated with those of the yerba mate, recently introduced into England from Brazil and Paraguay."

THE NEW CURE FOR SNAKE-BITE.—In our recent article we showed that the world really owed this suggestion, amongst so many other boons, to the great Frenchman, Pasteur. Since then, an article contributed by Profs. Geddes and Thompson to the *Contemporary* confirms this, in these words: "to the Chemist he has given a new theory of fermentation; to the physician many a suggestive lesson in the etiology of diseases; and a series of bold experiments in preventive and curative inoculation, of which Roux's treatment of diphtheria, and Prof. Frazer's new remedy for snake-bites, are examples at present before the public; to the surgeon a stable foundation, as Lister acknowledged, for antiseptic treatment." But besides its greatest men, the world contains many quiet, and sometimes obscure, workers, who often contribute very important help and make valuable original suggestions towards the elucidation of great discoveries. Apparently we have such an one (though by no means an "obscure" worker) in "DINSHAH ARDESHIR TALEYASKHAN," (who is "assisted by the Medical Staff of the Maharaja of Baroda") and who in January 1891 published a "Note on the probable discovery of snake-bite and cholera cure," which had a limited circulation in "Europe and America only." "At that time", he says, the task of discovering effective remedies was all but hopeless, and despaired of." D. A. T. in November 1895, publishes another "Note" in which he says: "To Prof. Frazer of Edinburgh, and Dr. Haffkine of Paris is now due the whole credit of ransacking on the lines laid down in the Note of 1891." ANTIVENINE is the name given by Dr. Frazer to his snake-bite cure. We have not space to go into details, but having read D. A. T.'s Note of 1891 we think the claim he makes in his Note of 1895 not without some justification. But in these matters the man who by his labour and science demonstrates the proof is always the true discoverer.

TURPENTINE.

Capital lying idle in India for want of investments that will yield something less exiguous than the rate of interest on Government Paper, need not go far in search of employment. To judge from the account given by the Conservator of the School Circle of the United Provinces, the manufacture of turpentine is an industry which promises to pay well those who engage in it. The operations carried on at the Forest School for the distillation of the product from the fine resin collected in the Jaunsar forests have proved that the industry can be made profitable. At present of course, it is carried on departmentally under conditions that keep it, for all practical purposes, in an experimental stage. But in the large towns of the submontane tracks there is a market for a much larger quantity of turpentine than the Forest School can supply. It is therefore reasonable to suppose that, if private enterprise were to take up the manufacture energetically, it would find its reward. No limit need be assigned to the area of operations, and the Kumaon forests may just as well be tapped for the resin of the conifers as those of Jaunsar. The matter is, we think, worth the attention of those who seek new openings for the employment of their capital.—*Indian Agriculturist.*

DOMINICA AS A FIELD FOR CAPITAL.

It has for some time past been apparent that the West Indies must rely less on the old staple industry of sugar planting, and turn their attention more to the cultivation of the many and valuable fruits and vegetable products for which their situation and climate render them so eminently suitable. In no island can the experiment be made with a greater chance of success than Dominica, and few islands have a finer prospect before them. Trinidad and Jamaica are first in the field; but, in proportion to her acreage, Sunday Island should soon assume a high rank in the vanguard of the movement. The necessity for new capital is now recognised by those who have visited the islands, and already syndicates and companies are being projected which promise to return to their promoters and shareholders a high return. Dominica is 29 miles long by 16 miles broad, and has an area of 291 square miles, or 186,000 acres, of which about 20,000 acres only are under cultivation. In the official catalogue of the Colonial and Indian Exhibition of 1886 the following account of the Island of Dominica is interesting and important: "Its mountains are next in height to those of Jamaica; but right away to the top they are densely clothed with foliage. From peak to shore the island is a mass of virgin soil and an unopened forest, while from the heights can be seen sparkling streams and brooks which appear as fresh as those of Yorkshire. The finest lime groves in the West Indies may even now"—that is nearly ten years ago—"be seen there. A certain amount of cacao is already established. Of fruit in all kinds there is plenty. No place in the West Indies is better adapted for cacao or for fruit of all kinds. Cinchona will flourish there as well as in Jamaica. In short, whatever can be grown in the tropics will grow in Dominica." No island has such capacities for irrigation; nowhere can water-power be obtained so easily. The rivers and streams, which never run dry, number nearly 30; and, as the coast line does not exceed 90 miles, three rivers in every mile pour down past the estates to the sea. There is excellent steamship communication, not only between the islands themselves, but America, Canada, and the United Kingdom, and the trading world generally. There is an abundant rainfall, averaging about 82 in. per annum. The mean temperature is about 79 deg. Fahr.; the maximum 83 deg. 93 min. and the minimum 74 deg. 83 min.; so in respect to climate Dominica is vastly superior to Trinidad and other islands. The severe droughts of 1869 and 1873 in Trinidad were fatal to the lime trees throughout that island.

The most important of the vegetable products of Dominica are, no doubt, cacao and limes. Mr. Morris, in his work on "Cacao; How to Grow and How to

Cure it," says that "a good cacao tree, in good soil, yields from 50 to several hundred pods per annum. The average for well-cultivated trees at seven years old should be between 80 and 100 pods per annum. As it generally takes about 11 pods to yield 1 lb. of cured cacao, the above would indicate that a good mature cacao tree, under favourable circumstances, might yield, on an average not less than 7 lb. of cured cacao. The average yield per tree at all stages on an estate of, say, 300 acres would probably not exceed some 2 lb. or 3 lb. per tree, or, taking 230 trees per acre, a return of 4 cwt. to 6 cwt. of cured cacao per acre. Under ordinary circumstances the actual working expenses on an estate in Trinidad are estimated at about 16s per cwt. At the sixth and on to the ninth year cacao trees should be in fair bearing, but they seldom reach their prime before their twelfth or fifteenth year, after this period, where the trees have been carefully established and well cultivated, a cacao estate is a comparatively permanent investment, and it may be expected to continue in bearing and yield remunerative returns for some fifty, eighty, or one hundred years. It is computed that 20 hands will be sufficient to work a cacao plantation of 300 acres in full bearing, including picking and curing crop. Land in Trinidad planted with a cacao fetches £50 and upwards per acre. The cost in Dominica of lands in forest is 10s. to £1 per acre, and under certain conditions the Government gives free grants. The following statement will give an idea of the expenses and profits connected with cacao planting in Dominica for the first six years. Afterwards, as we have already stated, the estates will yield far larger and heavier profits:—

100 acres of forest land to fell, clear, plant cacao; houses for manager, labourers, &c., stock, &c., complete, £20 per acre to sixth year	£2,000
Interest on £2,000 at five per cent for six years	600
Contingencies (say)	400
	<hr/>
	£3,000

Returns, sixth year—

5 cwt. per acre at 60s=£15	£1,500
Working expenses, at 25s per cwt.	625

	£875

Another industry which promises well is the growth of limes and the manufacture of lime juice. There is no difficulty in the cultivation of the lime; indeed, as soon as it has begun to yield it looks after itself. The fruit is crushed by the same machinery employed to crush the sugar cane, and the juice is distilled by mechanical process. It is then boiled and run off into barrels to cool, when it is ready for exportation and sale. It is estimated that a lime estate should yield a profit of about £10 an acre. All the world knows of the lime juice of Montserrat, an island about one degree north of Dominica; but the climate and rainfall of the latter are even more suitable to the cultivation of the lime than Montserrat itself. Cacao and limes would doubtless, be the chief staple of a Dominica estate; but there is also a successful future open to the cultivator of oranges and bananas. The working expenses of an orange plantation are almost nominal. Prune the rotten branches, thin the fruit in its early stage, and manure the trees occasionally, and you have done all. The great germ of success in orange culture in Dominica lies in the fact that the fruit ripens some two months before the Florida crop; latter, moreover, is subject to severe and disastrous frosts. It is a fact that Florida orange-growers go to Dominica in the early fall to buy such oranges as they can obtain, to sell in the States prior to the ripening of their own crops. A crop of 1,000 orange trees should after the eighth year realise a net profit of not less than 10s per tree, or £500 a year. Dominica oranges have been sold in London this last winter at 2s a dozen. In November and December England and Scotland have no oranges, except some immature fruit from Spain and the States. Florida oranges ripen earlier, and so, at present, meet with no competition for practically two months. The

oranges which ripen in Dominica in September should supply this competition. The banana is another product which has money in it. The tree is raised from a sucker, and fifteen months after planting produces its first bunch of fruit. It is also useful in acting as a shade tree for the young cacao plant; but it will grow in any out-of-the-way part of the estate. Mr. Morris refers also to this plant in his work on cacao, and shows to what proportions the trade in this and other fruit has reached in Jamaica. The annual profits on banana cultivation are estimated, he says, at £15 per acre, but as much as £20 or £30 per acre are realised in suitable districts. The banana is a perishable fruit, and requires a rapid transit to foreign markets; but it appears from a pamphlet published in 1890 by Dr. Nicholls that the Government of Dominica has made arrangements with the Quebec Steamship Company for making Dominica the last port of call on the line from the West Indies to New York. Dominica thus appears eminently suited to take a decided lead in the new commercial activity which will undoubtedly, in a few years, prevail throughout our West Indian possessions. If once she can show how to respond to an inflow of home capital there will be no lack of money forthcoming, and though the old West Indian nabob can never be resuscitated, and it is hardly expedient that he should be there is no reason why these new and valuable industries should not bring in their wake a fresh era of prosperity to the islands and a race of moderately wealthy and comfortable planters.—*Financial News*.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, November 21st.

CAFFEINE.—Steady. The general quotation is 19s per lb., but for 100-lb lots 18s, it is said, would be accepted. It is very doubtful, however, whether the last-named figure applies to "spot" stuff. For December-January 18s is quoted.

QUININE.—There has been no business of any importance this week. Second-hand German bulk quinine offers at 1s 1½d per oz.

ESSENTIAL OILS.—Lemongrass Oil is firmly held at 2s per oz on the spot. Oil of citronella is again dearer, 1s 5d per lb having been paid on the spot for tin oil, and holders being now disposed to ask 1s 6d for that variety. The last business for shipment was at the rate of 1s 4d per lb c i f, and it is believed there are now buyers at 1s 5d per lb for drums, but no sellers.

TEA IN MAURITIUS: GOOD NEWS FOR TEA PLANTERS.

There is nothing like living under a good maternal Government, for the enjoyment of protection to industry and encouragement in production. The Tea Farm having proved a great success, and tea cultivation being likely to prove a source of profit to the country, it was not to be expected that the Financial Authorities would miss an opportunity to fritter away a little public money, and prove to the World at large, and to such of our planters in particular who have been unwise enough to invest their money in Tea Planting, how good and patriotic a thing it is, to endeavour to increase the resources of the Colony by any new enterprize. Open competition, no doubt, like open confession, is good for the soul, and is the very breath of Trade, and when Government happens to be one of the competitors, and, with the true instincts of maternity, chooses to supply the naughty little heathen Chinese, who won't buy nasty rum, with nice tea at a good deal below cost price, it is a capital thing for the Colony and of course helps out the Auditor General in the budget which we are given to understand he is preparing.

Mr. Mayer, Government Vendue Master, has, we are informed, sold today by public auction, by instructions from the Storekeeper General, about 2000 lb. of the Farm Tea at 0.80 per lb. We hope that the public will appreciate the fact, and be duly grateful to a Government which provides them with the cup which cheers but not inebriates, at such a

moderate price, and at a sacrifice of so little common sense. If they get the benefits—for it is rumoured that the whole lot found a ready purchaser in an astute 'revendedor' who finds no difficulty in passing it on at R1.50. The Farm Committee are naturally delighted—some are asleep—the Chairman is on a journey, and as when they are asked for their opinion, and give it, it is naturally never taken, they have ceased to be a necessary factor in the matter at all.

There will soon be another sale, and it is to be hoped that the price realized will encourage an export trade.—*Merchants and Planters' Gazette*, Nov. 6.

BOILER INSPECTION IN CEYLON: AN EXPERT'S VIEWS.

Connected with the controversy on the inspection of machinery and closely allied to it is a point, which, in our opinion, has been to some extent overlooked, viz:—the inspection of steam boilers. Speakers at the recent Chamber of Commerce meeting and elsewhere have shown that, beyond the danger inherent in the case of all machinery in motion and which no legislation can avert, in tea factories, the safety of those employed is in no way jeopardised. But in the case of steam boilers lies a source of danger, in the generality of cases, unapparent to those in charge and which under unskilled direction might be the cause of a terrible disaster. With a view of determining how far this danger exists our representative considered the best means of throwing light on the subject was to call on Mr. Lamont of Messrs. Walker and Co., than whom, probably, no one in the island is better qualified to express an opinion. Mr. Lamont very courteously expressed his willingness to submit to the process of being interviewed.

A FACTORY ACT SUPERFLUOUS.

You want to know what I think of the Ordinance for the inspection of machinery? he said. Well in my opinion a Factory Act for Ceylon is quite unnecessary.

In the case of tea factories only?

No, I should say all round.

What about textile factories and other places in which women and children may be employed?

We have only one textile factory and in it, so far as I am aware, there has not been a single accident. We have several coconut desiccating mills but, as I have never been inside, I am unable to say what arrangements are made for fencing machinery. In tea factories least of all, do I consider there is any necessity for Government interference. Tea-making machinery, generally speaking, involves a minimum of danger to the persons employed. They may become careless, indeed they do, often laying aside the brush which is supplied for sweeping in the leaves and using their hands. The loss of a finger or a hand may be the result. Such accidents, however, must be of comparatively infrequent occurrence, as one never hears of them. No legislation can put a stop to that. I don't see what further precautions you can take than to fence machinery in tea factories.

BOILER INSPECTION: LEGISLATION NECESSARY.

But what I want chiefly to know is—what about the steam boilers in use in tea factories?

Ah! that is a different matter. I am strongly of opinion that we should have an Ordinance rendering the inspection of boilers compulsory. All boilers, in my opinion, ought to be inspected at least once a year, either by a properly qualified inspector or by some other competent person.

You consider that the policy of *laissez faire* is conducive to danger?

Yes, I do. While I cannot recall any serious accident. I have seen boilers which *ought to have burst*. Why they did not I don't know. These I may say were in European hands.

Is there any particular type of boiler in use in tea factories, and is that particular type adapted for running for a considerable period without an overhaul?

The boiler most in use is of the locomotive type, ranging on an average from 12 to 14 nominal horse-power. With that particular type of boiler little inspection is required but, to my mind, that is an argument in favour of compulsory inspection. In this country the water used is comparatively free from lime and consequently the formation of "scale" is less than in other countries. Steam boilers, so far as tea factories are concerned, date only some ten years back. As time goes on these boilers will suffer from wear and tear and the danger will become greater. There is a strong temptation, especially when a boiler is in native hands, of putting off repairs and it is in all such cases that an Ordinance is required. In many tea factories the working of engines and boilers devolves on natives, and the Superintendent or the S. D. may supervise but, from the very nature of their training, they cannot be expected to detect any flaw which might arise.

A SYSTEM OF INSPECTION.

But is there no system of periodical inspection at present such as is carried out by the boiler insurance companies at home?

Oh yes. Some Companies employ a competent European engineer who is well qualified to inspect the boiler under his charge. This firm undertakes the work of boiler inspection. Once a quarter an inspector makes a round of estates in the Kelani Valley and inspects the boilers in use, for which a certain fee is charged. There is his book and here is an entry — Estate "safety valve leaking slightly; otherwise, boiler in good order; engine not so clean as it might be." a copy of the report is sent to the Superintendent and if a third copy is required for the proprietor it can also be had. Superintendents can thus keep the men in charge up to the mark, and the responsibility of having repairs done lies with them. Our Kandy firm do similar work Upcountry, and so, I understand, do Messrs. Brown & Co. of Hatton and other firms.

Then is this sort of inspection at all general?

Yes, I should say that most of the estates upcountry are visited by engineers.

WHERE THE DANGER LIES.

Then why render compulsory what is already done voluntarily?

For those who do not have their boilers inspected. It is in these cases that the danger lies.

In what manner would you propose to legislate?

I would render it compulsory to have all boilers inspected at least once a year, either by a Government inspector or by a competent engineer. I am in favour of the latter method because it does not entail the appointment of another official and because the owners of boilers would much prefer an engineer of their own choosing to come about their premises rather than a Government official. This would cause no hardship or inconvenience because, as I have said, most of them are in possession of certificates of efficiency for their boilers. To such as were in possession of these certificate a license might be given by Government. However, as regards the licensing of boilers that is a matter of opinion. I do think all the same that the certificate of a

competent engineer whether official or unofficial, should be insisted on by Ordinance.

"A COMPETENT ENGINEER."

In the case of an unofficial inspector how would you define a "competent engineer."

By a "competent engineer" I mean a person who has served an apprenticeship to engineering and holds a responsible position in an engineering firm.

Is once a year often enough to inspect a boiler?

I think it is. Of course, once in six months would be more likely to ensure absolute safety but it might be a cause of complaint, as an inspection would entail cessation of work. I may mention that under Lloyd's Rules a steamship's boilers are inspected once in four years only. Yes, once a year is quite often enough.

One more question. How will the new Ordinance affect your firm?

Not very much. An inspector coming poking about might bother us a little, but if he did come, though I say it myself, he could not show us very much that required to be done.—Good Morning.

TEA LEAD PAPER.

With reference to the enquiry by a correspondent the other day in regard to Tea Lead Paper we wrote to Mr. T. C. Anderson, Cartmore for the favour of his opinion. Mr. Anderson has been good enough to reply sending us also another sample for comparison, and from his letter we quote as follows:—

"My opinion is unfavourable. I and others have tried it, (or similar paper, a sample of which I send you) and the report from the Lane was that the teas had gone off, and this within two months. My patent lead paper is infinitely superior and has the following advantages as stated in the specification. It strengthens the lead and makes it more air-tight, thus enabling thinner and cheaper lead to be used, and the paper being *inside*, it prevents the contact of the tea with the lead, which is injurious to the tea. The only disadvantage it has, is that it is slightly dearer, but against this is the fact that the teas are better preserved. I have shipped teas to South Africa in this lead, and in the usual lead packets, and the former is preferred, and to South America. I use no other. The Colombo Commercial Company imported a consignment on trial some years ago, but it had been packed in London in a damp condition and the lot was unsaleable.

VARIOUS PLANTING NOTES.

THE NAHAVILLA ESTATES COMPANY.—The Report of this Company for the past year will be found in another column. It shows that a good deal of progress has been made both in tea and coffee cultivation, and that while the profit for the past year has been such as to permit of a dividend at the rate of 20 per cent—32½ per cent was the exact return; the prospects for the ensuing year are also very satisfactory. We congratulate the shareholders,—especially Mr. R. P. Macfarlane (who is ere long to take a well-earned holiday)—upon this fortunate state of matters and trust that the Company may long continue to be prosperous.

"DOMINICA AS A FIELD FOR CAPITAL."—We direct attention to the article on this subject which we quote elsewhere from the *Financial News* and to Mr. J. H. Barber's letter in criticism thereof. Both will be read with a good deal of interest here, and we trust that we may hear more on the subject from either Dr. Morris, or Dr. Trimen who is at present in England.

DIMBULA FELIX AND ITS TEA.

DIMBULA FELIX is unquestionably a prince amongst Tea districts: much more so than ever it could have been in Coffee.

After passing along the damp valley of Ambegambuwa and through the dismal dripping tunnel, the prospect on emerging, is very cheering. At first the estates retain just a little taint of the mouldiness we had been passing through; but presto! all is changed, and by the time we skirt Chrystlers Farm we breathe a more stimulating air. The patriarch, alas! has gone since we last visited the locality; but his handy-work remains, and no planter ever did his work more neatly and methodically. Albeit, John Martin did not for years believe in tea. Compared with coffee, he said it was "— rubbish!" And he was not alone in this opinion; nearly all the crack planters said the same if less forcibly. Old R.B.T. often declared that "tea planting was only fit for creatures in comboys." Yet, here we are, in the midst of a general prosperity which the coffee era never brought us; for, it was only in exceptional cases that coffee paid the poor proprietors:—not altogether the fault of the coffee, much less that of the planter—but there was always too great a leakage in coffee,—too much Agency. What a change now in Colombo! Twenty years ago when a planter went to see his agent he approached the great man's office hat in hand. Now forsooth, he throws himself into a lounge at his hotel and sends a message for the fellow to come to him!

Dimbula is seen at her best as we approach the heart of the district. The broad belt of land stretching due South-west from the Great Western towards Adam's Peak is probably the pleasantest planting ground in the island, the soil so uniformly good, or fairly good, the climate so mild and even,—that any novice might plant with success and live as long and healthy a life as he could anywhere in the tropical world.

One is glad to observe a marked improvement in the general appearance of estates during the past two years. It is a relief to find that the experimental stage is past, and that the cultivation and preparation of the leaf has now been reduced to an approved system. No longer do we hear wild guesses at 600 to 1,000 lb. per acre; they are content to estimate an average return of 400 lb. No longer do we, here and there, see the unfortunate tree cut down to within an inch or two of the ground, the leafless stubble struggling between life and death. A more natural and rational system of pruning has been uniformly adopted. The cultivation and manufacture of tea has, in short, been fully grasped and without any reasonable doubt the industry has come to stay in Dimbula Felix.

EXOTIC TREES.

Nor is the general improvement confined to the tea plants: the beautiful belts of exotic trees interspersed throughout the district not only give a pleasanter aspect to the landscape, but they afford the tea a better chance of escaping blight than ever poor coffee had. It is all very well in temperate or cold latitudes to plant up wide expanses with the same product; but, in the tropics, plants are not so sociable and the greater the mixture the more natural and healthy is the vegetation. And yet some discrimination is necessary; for, all trees are not friendly to the tea plant, which after all must be our chief consideration. Many of the *Acacias* for instance are poison to tea; the *Sapu* is a sworn enemy—while the *Bamboo* is a beast that will tolerate nothing else to feed in its neighbourhood. Cinchona, like coffee, is a dead horse, and its place is well filled by more beautiful if less profitable substitutes, among which *Grevillea* is the chief favourite, so much so that it too threatens to be over-done; but I am glad to see many others cropping up. The rapid-growing *Eucalypti* adorn many a swamp and odd corner; but for rapid growth, shelter and harmless shade the *Albizzia* is the best I have seen,—the timber not so useful as that of the *Inga*; but the tree is more kindly to the products growing under it. Of all the recent introductions, however, commend me to the

*Bucklandia** a large leaved variety of poplar habit, well-suited for wind belts—and being closely allied to the *Liquidambar* of Formosa—chiefly used for making tea chests, the wood will doubtless one day come in useful.

GOVERNMENT RESERVES NOT REQUIRED.

With such a beautifully mixed cultivation it may well be asked what earthly necessity is there for large Government reserves? Let every estate proprietor be bound to cultivate, say 50 forest trees per acre, and dispense with the foresters and their antiquated notions regarding the cause of rainfall and water supply. The classic grounds of Abbotsford are a case in point, an example of what may be done by a mixed cultivation. Twenty-five years ago, men laughed at the seemingly haphazard way in which trees all and sundry were pitchforked into this property; but see them now, after judicious thinning out, and you will laugh with the other side of the mouth.

There is only one thing that cannot now be helped in Dimbula, and that is a considerable proportion of poor jāt. What a contrast some of the fields show in this respect? And it is curious to note how much there seems to be after all in sheer luck. It isn't foresight, it isn't brains. "Brains," said the late James S. Martin, "are often a positive encumbrance to a planter," a crumb of comfort of which I was forcibly reminded in crossing a certain boundary the other day. On the one side the pure and beautiful broad and tender-leaved *manupuri*. On the other a nondescript jāt with little leathery leaves,

Yet to think of the owners of these two adjoining properties a dozen years ago! The one with a gigantic intellect and with unique means of gaining information and supplies of every green thing obtainable. With the other, alas! nature had been very niggardly. Yet, look at the tea he planted. By mere good luck he simply stumbled upon the very finest jāt, and now the estate he left is worth £20 an acre more than some of the neighbouring properties. Planters of the present day have indeed an immense advantage over their predecessors; profiting as they do by past experience. Yes, it was worth waiting. The advantage of good jāt being now so palpable that it would be culpable folly to plant inferior stuff. The real difficulty is now however, where to plant. This reserve policy of a demented Government is really an outrage on common sense without a particle of reasonable argument in its favour while the loss to the Colony is incalculable. Again, I say, look at the mixed cultivation on these beautiful high-land estates. Could any forester suggest a better cover?

There are few prettier rural scenes in the Highlands of Ceylon than can be seen from the verandah of Abbotsford bungalow, a picture so often and so beautifully painted by an Old Master, that he would be a bold amateur who would now touch it, and I only approach the subject to record how much the year prospect has improved by the rapid growth of the many ornamental trees, particularly the *Coryppha Australis* which thrives so much better here than in its own native land. I cannot however refrain from bewailing one little bit of vandalism by a neighbouring proprietor who has planted up portions of the pretty patana—Mount Pisgah to wit—in stiffly

* We (Ed.) quote as follows from the "Treasury of Botany":—"Bucklandia. The name of a genus belonging to the order of witch Hazels, having stamens and pistils in the same flower, or in different flowers on the same plant; or some plants have stamens only, while others have only pistils. The calyx is almost bell-shaped, adherent below to the seed-vessel; the anthers are supported on awl-shaped filaments. The flowers are in head-like groups, each subdivision of which consists of eight flowers. The name *Bucklandia*, which has also been employed to designate certain fossil species of plants, was given in honour of the late Dr. Buckland, well known as a geologist. The only species is an Indian tree with the general aspect of a poplar; its leaves are alternate, stalked, and variable in outline. [G. D.]"

straight lines, a dreadful eye-sore. Why could he not have been content or induced, to follow nature in graceful curves, instead of that sickening irritating bee-line which disfigures the scene,—enough of itself to disturb the peaceful slumbers of him who so often and so fondly looked upon this prospect.

THE NAHAVILLA ESTATES COMPANY, LIMITED.

A meeting of the Nahavilla Estates Co., Ltd., was held at the office of the Agents—Messrs. Geo. Steuart & Co., at 3 o'clock on 14th Dec. There were present:—Messrs. E S Grigson, Chairman, and A Orehard, Directors; Messrs. J Paterson, J Anderson, J Abel, J F Headrick, and Gordon Pyper; and *by proxy* Mrs. Catharine Margary, Messrs. T S Grigson, W Anderson and J L Gordon, Mrs H H Grigson, Messrs. Chas. Gordon, R C Wright, A F Souter, R J Drummond and R P MacFarlane.

The Report of the Directors dated 5th December was taken as read and unanimously adopted.

The following proposals were carried unanimously:—

1.—“That a final dividend at the rate of 10 per cent for the last half-year, making 20 per cent for the year, be paid forthwith.”

2.—“That Mr. R. C. Wright of Deaculla, Matutale, be elected Director in place of Mr. R. P. MacFarlane who retires by rotation.”

3.—“That Mr. John Guthrie be appointed Auditor for the year ending 30th September, 1896, on a remuneration of R100.”

The CHAIRMAN then made some remarks on the position of the Company and the results of the year's working, which, he thought, might be regarded as highly satisfactory. The recent acquisition of Mahapalagalla was alluded to, and the Directors hoped that it would prove a satisfactory addition to the other properties of the Company.

The following is the

ANNUAL REPORT.

The Directors have the pleasure to submit their Second Annual Report together with a Statement of Accounts for the year ended 30th September, 1895.

The accounts shew that a sum of R44,619 26 has been expended on the purchase of sundry allotments of land, in building and equipping the Factory on Ury with machinery, in planting and cultivating the area not in bearing, and this amount has been added to the cost of landed property.

The Directors therefore deemed it advisable to call up the remainder of the Capital to recoup the expenditure (*vide* Circular of 10th October, last).

The profits for the year including a small balance of R201 57 brought forward from last year, and after paying preliminary expenses in connection with the purchase of Ury Estate have been R67,515 94, equal to a return of about 32½ per cent. on the paid-up Capital of the Company.

An interim dividend for the half year of 10 per cent was paid, absorbing the sum of R20,800, and the Directors recommended the balance (R46,715 94) being disposed of as follows:—

	R	e.
Final Dividend for the Season of 10		
per cent, making 20 per cent in all	20,800	00
Directors' Fees	1,500	00
Secretariat and Office Rent	1,000	00
Reserve	23,415	94
	46,715	94

During the year under review about 160 acres of new land have been acquired in the neighbourhood of Ury, 100 acres of which are now being planted with tea; and on Nahavilla further 23 acres of coffee land have been brought under this cultivation.

The definition of the two estates as at present constituted is as follows:—

Tea in full bearing	175	181
„ „ partial „	66	—
„ not in „ (includes land in course of planting)	93	127
Coffee	120	117
Forest	44	66
Cinchona, Patna, Serub, Chena, &c.	103	158	
Total	..	601	652 acres.

The Factory on Ury is in working order, and the prices realized for the teas have so far been satisfactory.

The coffee crops secured for the year exceeded expectations very considerably, and although prospects for 1895-96 do not point to so large a return from this source, still there is a fair crop on the tress, which together with the proceeds from the tea, should enable the Directors to present a fairly satisfactory report again next year.

The Directors have just concluded the purchase of Mahapahagalla Estate for the Company at a cost of £7,000, the acreage of which is as follows:—

Tea in full bearing	170
„ not in „	47
Coffee	35
Patna, Forest and Fuel trees	71
Total	323 acres

Mr. R. P. MacFarlane retires by rotation from the Board of Directors, and as he is shortly proceeding to England, it will be necessary to elect another qualified shareholder in his place.

NEW TEA COMPANIES.

THE VOGAN TEA COMPANY OF CEYLON, LIMITED.

The memorandum and articles of Association of “The Vogan Tea Company of Ceylon, Limited,” are published in the *Gazette*. The main objects for which the Company is established are:—To purchase or otherwise acquire the Vogan and Iddagodde estates in Kalutara, and the Stamford Hills, and Barkindale estates in Dikoya; to prepare, manufacture, treat, and make marketable, tea, and (or) other crops or produce, and to sell, ship, and dispose of such tea crops and produce, either raw or manufactured, at such times and places, and in such manner as shall be deemed expedient. The nominal capital of the Company is one million rupees, divided into ten thousand shares of one hundred rupees each (of which seventy-two thousand rupees are now called up), with power to increase or reduce the capital. The following have signed the memorandum:—W W Mitchell, M Finlay, C S V Morrison, F Liesching, V A Julius, W Moir, and Henry Bois.

THE KANDYAN HILLS COMPANY, LIMITED.

The memorandum and articles of Association of “The Kandyan Hills Company, Limited,” are published in the last *Gazette*. Among the objects for which the Company has been established is:—To acquire the Pansalatenne estate, situated in the Matale district, or cultivate tea, and (or) any other products or trees, plants, or crops which may hereafter be approved, and either on the said estates or elsewhere within or beyond the limits of Ceylon, and to prepare, manufacture, treat, or make marketable the produce of any such farming or cultivation, or any like produce, and to sell, ship, and dispose of such produce, either raw or manufactured, at such times and places and in such manner as shall be deemed expedient. The capital of this Company is R300,000, divided into three thousand shares of R100 each, with power to increase or reduce the capital. The following have signed the memorandum and articles:—George J Jameson, Flowerdew Macindoe, E R Waldoek, Frank Duploek, E Benham, John Wilson, and F Liesching.

THE VALUE OF TEA PLANTATIONS AND FORESTLAND

ought to rise still further if it be correct that the responsible head of a Planting Firm, whom we welcome back to the island, has been stating that, in his opinion, first-class forestland at a high elevation suitable for tea is worth £35 sterling per acre, and that he is prepared to buy at that rate. And yet with the standard of value already set for tea estate property in Upper Dimbula, the Agras, in Udapussellawa and around Nuwara Eliya, of £70 sterling and upwards per acre, who dare say that half that amount is too much for first-class forestland?

In any case, it seems to us that it behoves the Ceylon Government to take advantage of the present full tide of prosperity to have a certain proportion of its waste land between Dimbula and Haputale utilised for cultivation. It is perfectly absurd to have a first-class line of railway running for twenty miles through country that as yet does not yield a single ton of traffic! Over four millions of rupees may be said to be spent on the line between the last tea-field in Dimbula and the first encountered in Uva; and are we to be told that no traffic is to be drawn from the scores if not hundreds of square miles of Crown lands at present lying unutilised in this region? The idea is indefensible; and so is the old-fashioned notion that it is necessary to leave these higher forests untouched on account of rainfall or for the protection of the head-springs of our rivers. Let the Government enforce rules to conserve forest on each side of streams as they please; but far better in these days when the value of quick-growing timber and fuel trees is so fully realised, to lay down regulations for the planting up of a certain area in each lot sold with exotic trees which, indeed, would be done in any case for the shelter and benefit of the tea. There are besides, patana lands near Ambewella and below Horton Plains admirably adapted for tea; and much of the Obcoya Valley ought to be utilised, to the benefit of the Railway, of the General Revenue and for the General Prosperity of the Colony.

BEAUMONT TEA COMPANY OF CEYLON.

An extraordinary meeting of the shareholders of the Beaumont Tea Company of Ceylon, Ltd., was held in the offices of the Secretaries and Agents—the Eastern Estates and Produce Company Limited., on Dec. 16th. Mr. F. H. Wiggin presided, and there were present: Messrs. D. Michie, F. Liesching, F. S. Rashleigh, B. G. L. Bremner, and (by proxy) Mr. John Guthrie.

The CHAIRMAN explained that the meeting had been called:—

1. To consider the advisability of purchasing additional estates and allotments of land.
2. To confirm such purchases as shall have been made by the Directors.
3. To consider and pass (if approved) the following resolutions or either of them (namely):—

(1) That the capital of the Company be increased by creating 5,000 new shares of R100 each and that the Directors be empowered to issue and allot the same, or any of them, in such manner, and at such time, or times, as they may think expedient, and at any premium, and generally on such terms and conditions in all respects as the Directors may determine.

(2) That the Directors be authorised to borrow money for the Company on mortgage debentures, and to that end to issue debenture bonds bearing interest at 6 per cent per annum for such amounts

as may be required for the purpose of the Company, but not exceeding in the aggregate at any time half the then issued capital of the Company.

4. To transact any other business that may be brought before the meeting.

The CHAIRMAN explained that the power to purchase additional estates and allotments of land was practically already conferred by the Articles of Association, but they wished to put the matter beyond all doubt.

Mr. RASHLEIGH moved and Mr. BREMNER seconded the adoption of the motion.—Agreed.

The CHAIRMAN stated that the Directors, exercising what they believed to be their powers, had arranged to purchase Delta Estate at a price which he had every reason to think would prove a satisfactory bargain for the Company. He therefore moved that the arrangement for the purchase of Delta estate be confirmed.—Agreed.

On the motion of Mr. RASHLEIGH seconded by Mr. BREMNER the other resolutions before the meeting were passed and that without comment.

Mr. RASHLEIGH asked whether, for the information of the shareholders, the price and other arrangements connected with the purchase of Delta Estate should not be made public.

The CHAIRMAN considered such a course inadvisable and intimated that a valuation of the estate can be seen by the shareholders at the office of the Company.

The proceedings then terminated with a vote of thanks to the Chairman.

COCONUT PLANTING AT MIRIGAMA: A MODEL PLANTATION: No. II.

We have too long delayed to dispose of our further reference to the model coconut plantation of the Mirigama district, if not of the whole island. We have mentioned the exceptionally good soil and favourable undulating lay of land on which Mr. Wright had to work. Everything in these respects, was just what an experienced coconut planter would desire to have, and in the matter of ready access and easy means of communication, Kandangomuwa was also desirable; while the surrounding Sinhalese villagers soon prized the regular employment and prompt payment for work afforded them on the new estate. But all these advantages of soil, situation and command of labour would have been of little avail, if the utmost pains had not been taken in the selection of seed nuts, and in the various operations for nursery, holing, planting and care of the young plants. As to nuts, Mr. Wright proposed to pay a specially increased price in order to be sure of the very best possible article. He was allowed to select his own trees on various estates—famous for their fine nuts—and to put a mark on the same to shew that the coming crop was not to be harvested for him, of course, paying in proportion for the privilege. The largest and ripest of nuts were thus secured, and none was passed for the nursery without such testing as eye, ear and hands could afford. We need not enter into the further planting operations, but may hasten on to the present condition of the property after six and seven years of growth has covered the soil with an umbrageous grove of palms, at the rate of only 66 tree to the acre—so giving an unusual area to each; and yet their branches already nearly meet over the intervals. The absolutely methodical, systematic style of management is shewn by the whole estate being marked off in different blocks, each of which is indicated by a small wooden sign board painted white with the number of tree-

in black figures—so that at a glance the Superintendent can see how far his weeding, clearing, manuring or harvesting work has progressed, as he walks or rides over the property. This is quite an original idea of Mr. Wright's, adopted so far as we know on no other property, and yet it has been admired for its usefulness and simplicity by all old planters who have visited Kandangomuwa. In the centre of his property, on a commanding position, Mr. Wright has erected a commodious bungalow and all the needful offices and stores; while all who know of his past career as a successful amateur Horticulturist, may be sure that he has not forgotten his cunning or tastes over the garden. Such splendid, well-cultivated as well as carefully selected mangosteens and other foreign fruit trees are nowhere else to be seen in the island—he has Singapore mangosteens, blood oranges from Aden, durians, chestnuts, Brazilian nuts, rambutans, and mangoes, &c. Mr. Wright's latest hobby—for he cannot possibly be idle in this direction—is Orchids, of which he has a delightful collection including some very beautiful specimens.

Mr. Wright is a great believer in manuring coconuts; and we feel sure that he is ready to subscribe to the opinion of that other veteran, Mr. W. B. Lamont, that no man ever spent up to a rupee per tree per annum in manuring his coco-palms, without pocketing 100 per cent on his outlay. The use of a stock of cattle is not neglected on Kandangomuwa; but Mr. Wright has more faith in sheep manure; and he began by introducing a valuable breed from Australia—a ram and three ewes about six years ago, and now he has raised a flock of close on a hundred sheep, a cross with native ewes; while he is determined to get the number up to 1,000 of a flock before he considers his property properly stocked. This is a new departure in stock-breeding of the utmost importance to the Colony at large, and for which Mr. Wright deserves very great credit and official thanks.

Mr. Wright is also a believer in the Veyangoda Coconut Desiccating Mills. He and other neighbouring proprietors are entirely satisfied with the liberal way in which their crops are purchased at this establishment. So far, it has been the day of comparatively small things with Kandagomuwa in its crops of nuts, rising from 1,784 nuts in 1889 to close on 40,000 this year. But, henceforward, the return going on at a geometrical ratio may be expected very soon to reach eight-hundred-thousand nuts. So mote it be—with a continuance for a century of cropping at the same rate to the benefit of Mr. Wright, his children and grand-children.

A few lines of "Reminiscences" of early years, will conclude our notice of Mr. Wright's work.

PLANTING AND PRODUCE.

THE FEAR OF OVER PRODUCTION.—If the tea planting industry is overdone it will not be because of the absence of warning on the subject. At home and on the spot tea growers are told that if they will persist in increasing the outturn they must look out for all kinds of trouble in the future. The temptation just now is very great no doubt to "open out" in tea, and there is every chance that the temptation will not be resisted while the demand is brisk. That the friendly warnings issued for some time past will, as in the case of warnings generally, be utterly neglected we do not doubt, but it is the duty of all well regulated minds to persist in uttering them all the same. We notice that a Calcutta prophet says that ere long we

—the planters—"shall have to face hard times." Well, we imagine that is precisely what will happen unless there is moderation in the outturn. New markets are very important, but they are necessary to relieve the British market of some of the present supply. Unless people discover some new virtue in tea the demand after all is limited.

THE NEW MARKETS.—There is no doubt that the demand for Indian and Ceylon tea is increasing outside the United Kingdom. Australia is steadily adding to the quantity annually consumed, and appears to be following the example of the United Kingdom in the gradual displacement of China tea by Indian and Ceylon. In Russia the use of Ceylon tea has lately received considerable impetus, and that market is now a very important outlet. South Africa, however, should not be overlooked, as recent advices from Cape Town state that the quantity of China teas shipped to Natal, although tea planting is carried on to a small extent there, has lately been on an increased scale.

A TEA GARDEN DISPUTE.—It is not often that a dispute about an Assam tea garden is heard in the Law Courts at home. In the Queen's Bench Division last week, Mr. Justice Mathew, sitting to try commercial cases, had before him the case of MacLaughlin v. Bardley, which was an action brought by Dr. A. J. MacLaughlin to recover a balance on account of the purchase of a plantation in Assam from Mr. William Mackenzie Bardley, of The Elms, Exmouth. Dr. Blake Odgers, Q.C. (with him Mr. Rose Innes), in opening the case, explained the purchase was admitted, defendant having from time to time made payments on account. The action related to the purchase of an estate, and defendant agreed to pay eight rupees an acre for land suitable for planting tea and one rupee for land not suited for that purpose. The dispute was in respect of the acreage of the estate, and there was a question as to survey made at the request of the defendant in order to avoid a difficulty with the Government. The property subsequently went into the hands of a Company, of which the defendant was chairman of the directors. The plaintiff was called in support of the claim, and was cross-examined by Mr. Turton, who represented the defendant. In the course of the evidence the counsel engaged in the case saw his lordship in his private room. On their return into Court Dr. Odgers asked his lordship to give judgment for plaintiff for £300 and costs, the settlement to cover and include all matters in dispute, and to be a final discharge of the settlement. Mr. Turton thanked his lordship for his interposition, and said it should be clearly understood that the settlement included all matters of difference arising out of this transaction. His lordship agreed, and gave judgment accordingly.

FACTS AND FIGURES.—*Financial News*, as will be seen from the following extract, throws doubt upon the statistics regarding the increased consumption of Indian and Ceylon tea abroad. It says: "some rather absurd statistics have got into circulation regarding the increased consumption abroad of Indian and Ceylon tea, one writer representing that up to the end of September the deliveries abroad were 35,000,000 lb., against 28,000,000 lb. for the whole of 1894. That the re-exports of Indian and Ceylon tea are growing fast is true, but these figures are far in excess of the truth. The Board of Trade returns for October show that in ten months the total re-exports of tea were 25,294,881 lb. of which three-fifths was Chinese. The re-exports of Indian tea rose from 2,832,838 lb. for ten months in 1894 to 3,192,288 lb. for the same period this year; while the increase in Ceylon tea was from 4,402,014 lb. to 6,073,288 lb. Of course, some countries take their Indian tea direct; but the London market is still the best criterion of the course of this rising trade." Messrs. Gow, Wilson, and Stanton's letter, which the *Financial News* prints today, is a complete answer to its own comments. This letter is as follows: "In your article upon the increased consumption of Indian and Ceylon tea abroad you have drawn attention to a matter which is of vital importance to the

British-grown tea industry; for it is upon the opening up of new markets for Indian and Ceylon tea that the prosperity of that industry now mainly depends. So generally is this fact admitted by the proprietors of tea estates that, in response to a petition from planters, the Ceylon Government imposed an export tax upon tea for the purpose of raising a fund to open up new markets, while Indian planters have raised a voluntary levy among themselves for the same purpose, the two funds annually reaching somewhere about £10,000. You comment upon a report having obtained circulation which erroneously states that 'up to the end of September the deliveries abroad were 35,000,000 lb, against 28,000,000 lb for the whole of 1894.' The total quantity of Indian and Ceylon tea used abroad for the first nine months of 1895 was about 27,000,000 lb, against about 20,000,000 for the same period in 1894. Of this quantity only 8,000,000 lb were re-exported from the United Kingdom in 1895, and 6,000,000 lb. during the same period in 1894, the remainder going direct from the countries of production. The total quantity of Indian and Ceylon tea used outside the United Kingdom during the whole of 1894 did amount to 28,000,000 lb., as stated in your article, and if the increase which has taken place during the first nine months of 1895 should continue in the same proportion to the end of the year the use of British-grown tea outside the United Kingdom should reach nearly 40,000,000 lb.—a quantity sufficient to materially affect the welfare of the enterprise. This matter is of such importance to one of our great national industries that we feel sure you will consent to give it publicity."—*H. & C. Mail.*

TEA DEALERS IN COUNCIL

The annual meeting of the London Wholesale Tea Dealers' association is always interesting to the growers and importers as a reflection of the views of the tea trade. Mr. Francis Peck presided over the meeting held last week, and the annual report was as follows: "Your Committee have delayed the issue of their report until now, as they were anxious to complete the negotiations respecting an amendment to Clause 4 of the Public Sale Conditions. These negotiations were only concluded at the end of Oct., and the clause as hereinafter referred to came into operation on the 1st. The subject of robbery of tea returns for sampling has again engaged the attention of your committee, and a special fund was raised, which assisted in the prosecution of another receiver and sampler. The case on being tried at the court resulted in conviction, the receiver being sentenced to eighteen months' imprisonment with hard labour, and the youth to three months. An account of the receipts and expenditure in connection with this fund is printed with this report, and shews a balance in hand to be used in future cases. In connection with this subject, the warehouse proprietors have a plan for abolishing the system of using returns for sampling still under their consideration, and your committee will favourably entertain any well-devised scheme which may not be opposed to the interests of wholesale dealers. A case was reported of some tea sweepings being exported, and after being subjected to a particular treatment re-imported, and, although then of an objectionable character, passed by the Customs authorities. Steps were promptly taken to effectually prevent such rubbish being used for home consumption. A further representation was made to the Customs authorities respecting tea collected in what are commonly known as damaged heles in some bonded warehouses, and an assurance was given that such tea should in future be destroyed. Complaints have been received of teas being put up for sale without any indication whether the teas were bulked here or abroad, also of the bulking operations being in some cases imperfectly performed, and steps have been taken to prevent such irregularities. A measure was drafted during the last Parliament, entitled the 'Warehousemen's Certificates Bill' and as it appeared to facilitate advances upon warrants without enquiry, and thus render fraud easy, your

committee considered it most objectionable, and will continue to oppose it if further steps are taken to introduce it in the House of Commons. With reference to the subject of Clause 4 Public Sale Conditions referred to in the first paragraph of this report, your committee have very carefully considered the matter, and after several interviews with the brokers' committee and the warehouse proprietors, have agreed to an amendment, which came into operation on November 1st. The original clause simply stated that the teas would be ready for delivery on the day of sale, but there was no penalty for any infringement of this undertaking, and in practice it was found that frequently delivery could not be obtained, and, moreover, that packages were often allowed to be left open for a long time, and the teas seriously affected thereby; whereas, by the amended clause, the operations to be completed on the day of sale are clearly stated, all packages nailed down within six days, and delivery given on the day after the day of sale, on a notice being given. This will not prevent any packages which are urgently required being in ordinary cases delivered on the day of sale, but, what is more important, gives the buyer the option of refusing any packages as to which the conditions have not been complied with. In some catalogues the words 'To be taken without allowance for any irregularity in quality' have been used, much against the interest of the buyer, and your committee are glad to report that upon the injustice of the condition being brought under the notice of the Brokers' Association an assurance was given that the objectionable words should be omitted in future."

The Chairman said, with regard to the amendment of Clause 4 the Public Sale Conditions, he supposed every one of them knew what an important matter that was. They had had to have a very great number of interviews with both importers and also with the brokers until they could get it satisfactorily settled. The negotiations were only concluded at the end of October, and the clause came into operation on the first of the month. He hoped it would be a great improvement on the last. Two or three members of their committee had taken a great deal of interest in that matter. As to the question of robbery of tea returns for sampling, he was afraid they had not got to the end of that yet, but at all events their action had had some effect. He did not think they would really stop it until they got a fresh system of sampling, but that at present seemed as far as ever. There was a balance of £34 on the fund raised for that prosecution. The cost did not reach the sum subscribed, and so it was decided to carry the balance to a prosecution fund in the event of a similar case being taken up. With regard to the paragraph as to the warehouse proprietors' plan for abolishing the system of using returns for sampling, the only difficulty was that the more they came to think over the different proposals the more difficult it was to arrive at any really satisfactory substitute for that which they now had. They would probably all know to what the next subject referred—that of tea sweepings being treated and re-imported. The sweepings of warehouses, mixed with dirt and every else, were sent to Holland, ground up, and reimported as good tea. The Customs passed it—how or why he had never been able to make out. He was in correspondence with the customs personally, and so were also the committee, but someone let the teas go through—they were very white, and he supposed the people thought they were Pekoe tips. They proposed to add one paragraph to the report on a matter which had been engaging the attention of the committee as follows: "The subject of dust teas being imported in packages not canvassed or otherwise protected has been under the consideration of the committee, and they urge on importers the desirability of having such packages properly packed." He supposed everyone knew there were a considerable number of complaints in respect to dust teas, that when they arrived at their destination they were short weight. The general feeling was that both in the interests of the importers and themselves such teas should be canvassed at the

port of departure. He would move that the report be adopted.

This was seconded and the motion carried.
—*H. & C. Mail.*

CINCHONA IN INDIA.

From the Revised Estimate for 1895-96 we notice that the Government Cinchona plantations will show a profit on the current year's working of R17,700, receipts being set down at one lakh and expenditure at R32,300. It is possible that when the accounts for the year are made up, the profits will be even larger, owing to the constant daily increasing demand for quinine and febrifuge. The Budget Estimate for 1896-97 provides for a profit of over R12,500, that is if the sales continue stationary. In view of this considerable profit, Government should at once reconsider its decision to plant up new acreage. These increased sales of quinine are satisfactory, but if they go on and Government runs its factory on commercial principles, it must expect to hear shortly from the trade on the subject.—*Times of India.*

TEA-GROWING AT THE CAPE.

It has been a standing anomaly for many years that England has been almost alone in appreciating the superiority of Indian and Ceylon tea to the Chinese article. Many were the attempts made to find markets in other countries, but until quite recently, it seemed as if our planters would have to be content with British custom alone. A great change, however, has latterly occurred; during the first nine months of the present year the quantity of Indian and Ceylon teas sent out of the United Kingdom exceeded by 7,000,000 lb. the amount thus exported during the whole of 1874. At the same time the United States, Anstralia, and even Russia have considerably increased their direct imports of the British-grown herb, and it may be pretty safely assumed that, as the knowledge of its superiority spreads in these and other countries, the demand will continuously increase. The one exception is, oddly enough, South Africa, which still remains faithful to Chinese tea. Why this should be the case among people not particularly given to sticking to ancient ways remains to be explained. But for many years the goahead Australians displayed the same strange preference, in spite of the most determined efforts to convince them that they would benefit by following the example of the mother country. Perhaps the "Capers" are merely making shift with their old source of supply until they can produce tea for themselves. It is already experimentally grown in some parts of Cape Colony, and experts predict that, before the end of the century, tea-growing will become an established and highly profitable industry in that marvellous land.—*Globe*, Nov. 20.

AGRICULTURAL COMPANY OF MAURITIUS.

The twenty-second ordinary meeting of the Agricultural Company of Mauritius, Limited, was held yesterday at Winchester House, under the presidency of Lord Stanmore. Mr. Alf. G. Dick (manager and secretary) read the notice convening the meeting.

The Chairman, in moving the adoption of the report and accounts, said that when he addressed the shareholders last year he had a very pleasing duty to perform, inasmuch as he was able to tell them that the estates had produced a net profit of over £12,000, and that the directors were prepared to pay a dividend. He was sorry to say that this year he could not do the same. Of course, in such an industry as that in which they were engaged, there must be fluctuations. Last year they considered that the hurricane of 1894 was a slight one; it had not apparently done much harm; but when the crop came to be cut it was found that it had done a great

deal more harm than was supposed, and had damaged exceedingly both the quantity and quality of the canes. Then, again, there was a great amount of disease in the canes, and altogether the result was far from encouraging. Prices were bad, the produce was indifferent, and naturally the anxiety of the directors was great. Under the circumstances the directors conceived that it was their duty, while content with the management of the company's affairs in the colony, to make the strictest and closest inquiries into every detail of management on the several estates, and to exercise every economy in their power, in order to assist the recuperative process which they hoped in more favourable years to undergo. He was very glad that they did make that investigation, and that they had consequently delayed meeting the shareholders, because the result was much more satisfactory than some of them at first sight were prepared to expect. They found that their business was essentially in a sound position. They were clearing off debts running over several years, which were due to causes entirely beyond their control, and they were also largely diminishing the debenture debt, and the interest payable on account of it. There was every reason, he thought, to expect that, unless they had more bad luck than usually fell to the lot of men, they would be able next year to present a report as flourishing as the one submitted last year. He did not for a moment deny that if they were overcome by such an extraordinary concurrence of bad luck as to have hurricane upon hurricane, disease upon disease, and prices still going lower and lower, they would be in a serious position, but he did not think they had any reason to expect that such an extraordinary run of bad luck would continue. The last report received from the colony was decidedly encouraging. It was to the effect that the crop was satisfactory, and that prices had improved. Referring to the accounts, the shareholders would see that the amount of the share capital that was called up in March last was £4 a share. The calls so far had been fairly met, although not so well as the directors could have wished, and step had been taken to get in all arrears. The debenture debt had been reduced to £145,950, and since the making up of the balance-sheet to £132,630, showing a very substantial decrease as compared with last year. Altogether the liabilities had decreased by £29,460. The adverse balance carried forward was £19,900. Under the circumstances the Board had felt it their duty to exercise the strictest economy, and to reduce the expenses as far as possible without impairing efficiency. The office expenses had accordingly been reduced by 25 per cent., and the directors themselves had reduced their fees by a similar amount, although they had been reduced on a former occasion. The great reduction in the production of sugar all over the world, which amounted to something like 1,000,000 tons, must have its effect in raising the price of sugar, and he was quite satisfied that there was no occasion to think despairingly of the future of the company.

Mr. W. J. Tanner seconded the motion.

Mr. Haigh said the directors had collected from the shareholders over £80,000, and they had only reduced the debenture debt by £71,900. On the other hand the debts in Mauritius had been increased by £46,000. He complained also of the fact that the directors had paid an interim dividend although no profit had been earned. ("No, no.")

Mr. Tanner replied that the directors had only had £55,000 in the present balance-sheet with which to reduce their indebtedness, and not £80,000.

The Chairman also stated that the additional liabilities in Mauritius were incurred with the full approval and knowledge of the shareholders last year. The inquiry was instituted for the purpose of seeing whether the estates in Mauritius were likely to be worked at a profit or at a loss in the future, and, as the result had shown, the directors had every confidence that they could be worked at a profit.

The Secretary added that the company had called up altogether £90,000, including the 12s call made in June. £19,000 were outstanding, which left £71,000, and they had paid off £72,000 worth of debentures up to date.

After some further discussion, the report and accounts were adopted, and the other formal business transacted.—*Financial Times*.

COCO-NUT OR COCOA-NUT.

Once again we call special attention to the following editorial note from the *Pharmaceutical Journal* of London. We have for several years back with the concurrence and approval of the highest authority in the island (the Director of the Royal Botanic Gardens) adopted "coconut" in all our publications. Emerson Tennent, the greater Historian of Ceylon, did the same. The difficulty usually is to get people at home to aid in a change of the kind, but now that the step has been taken by so good an authority in England, we trust all writers, printers and publishers out here will follow suit and do what they can to make the convenient and indubitable form of "coconut" universal. We would especially appeal to our contemporaries, to the Department of Public Instruction (and Agriculture?), and last not least, to the Government Printer to adopt what is so clearly and scientifically shewn to be the correct form. If we could only convince "Mincing Lane" we should like next to see "cacao" adopted for the produce as well as the tree; but this is more difficult, "cocoa" as pronounced being a universal household as well as "market" word for this food product and drink, in England. Still if "coco" is kept for the nut, there will be much less risk of "cocoa" beans, nibs, or paste being supposed to come from the palmtree. Here is the paragraph:—

"COCO-NUT OR COCOA-NUT.—A discussion as to whether this should be spelled c-o-c-o or c-o-c-o-a has recently been published. The palm yielding the coconut and the tree which furnishes the substance used as a beverage and called cocoa, are known by botanists, and hence by pharmacists, to have no connection. Nevertheless, many persons outside that intelligent circle have an idea that both are products of the same trees, or are connected in some way, and even botanists do not agree as to the correct spelling of the word coco in coconut. The evidence on the subject is briefly this:—In early botanical works and books of travel coco-nuts are mentioned, the word "coco" being derived from an Indian word coc or cocus, used to indicate the fruit of *Cocos nucifera*, on account of a fancied resemblance of the base of the endocarp, with the three circular impressions, to the face of a monkey whose conversational powers were limited to uttering a sound like coco or cocus. According to another authority the word "coco" in Portuguese means anything which frightens children, the monkey-like expression on the endocarp being perhaps used for that purpose. Linnæus in forming the genus *Cocos* probably founded the name on these variations, and how it came to be known as cocoa (c-o-c-o-a) nut is not quite clear, but there is nothing to warrant such a method of spelling. Now that the leaves of *Erythroxylon Coca* are also articles of commerce and known as coca (c-o-ca), it becomes a matter of much importance to discriminate carefully between the three substances of similar names but widely different nature."

THE LANTANA.

(Abstract of report on Forestry from the *Planters' Monthly*.)

The lantana of which mention has been made in former reports of this committee, continues to spread with vigor in almost all districts of this country; Puna, as Mr. Rycroft believes, and Kula, Maui, according to Mr. von Tempsky, being happily free from the invasion. Where it attacks cultivated ground, or intrudes into land already wooded, its lead eradication is no doubt desirable. Mr. Lowry and Messrs. Gay and Robinson, for our 1888 report, described the process adopted by them in meeting the difficulty. The young plants lightly rooted are without difficulty pulled up; the older plants are cut off near the ground, and a few drops of kerosene oil are poured on to the exposed wood of the remaining trunk, after which the roots perish. Mr. R. W. Meyer and Mr. Colville clear their arable and pasture lands of lantana twice a year. As the committee suggested in 1888, the lantana is probably not without economic use, if it can be restricted to valueless or only slightly valuable land; but this restriction is of course the difficulty which presents itself; and no remedy seems to exist except the careful clearing of young plants where they can be reached. Moreover, where lantana is not interfering with any other growth, it is as Mr. McBryde points out, providing the seeds of mischief elsewhere. This gentleman writes that some landowners do not clear their lands at all, or do it so little that it amounts to nothing, giving as reasons that the clearing would cost more than the land is worth; whilst others after constantly and diligently clearing, find themselves constantly injured by the proximity of what are in effect nurseries for propagating the plant.

Of some economic service rendered by the lantana Colonel Spalding speaks as follows, in a very interesting letter with which he has favored the committee: "I think no one will dispute the right of the lantana to be regarded as in the front rank of 'noxious plants,' and yet I am by no means sure that this interesting individual has not been maligned. Having had over 12 years' experience with the lantana on Kealia, I am not prepared to say that it has been altogether an evil. The dying out of the kukui trees, some years ago (a circumstance I cannot attribute altogether to the cattle) left our middle lands on foot hills bare and exposed. In many places the soil was soon washed from the surface, and these lands became unfit even for pasturage. The lantana came and stayed. Naturally it has been kept out of the cane fields, and only allowed to extend itself over these middle lands that had been denuded and rendered almost worthless. It has continued to grow maula, to some extent, but our best pastures on the upper lands are comparatively free from it. Now I find that the lands where the lantana has had its home for years had gained in strength of soil, and the cattle find good grass wherever they can push through the bushes. I attribute this to the fact that the thick bushes prevent the hot rays of the sun from drying up the ground, and serve to retain the moisture which causes decomposition of fallen leaves, and vegetable matter, adding to the strength and richness of the soil. I expect to see the lantana die out in the near future, and leave these lands in much better condition than if it had never grown."

Granting that the plant in question is to a certain extent useful, it seems likely that it will establish and take care of itself where it is wanted; and too great efforts cannot be made to keep in check; for in a balance of advantages and disadvantages the latter will be found in most districts to predominate.

[The Lantana, though regarded by many in Queensland as a pest, has its friends and these are increasing. When well grown it is easily uprooted by bullock teams. Colonel Spalding's views will find many adherents in this country.—Ed. T.A.]

PALMETTO FIBRE.

The experiments made by Dr. Silas L. Loomis, of Fernandina, show clearly that the palmetto fibre is of great value commercially and that the plant, which not long ago was considered not only worthless, but a burden to the land, will in the future be of great importance. It will almost, if not, quite, equal cotton for varied uses and as a source of wealth. Dr. Loomis divides the possible application of the palmetto fibre into articles made of raw material and manufactured articles.

Of the raw material are the following:

1st. Roof covering and thatching for the sides of building.

2nd. Brooms such as are in use wherever the palmetto grows.

3rd. For scrubbing and other rough uses brushes are also made by binding leaves together, and are very cheap, easily made and useful.

4th. Hats and Baskets.—When the young leaves of different grades of fineness are split and bleached one has an article which, when braided in different styles, can be made into hats, baskets and bonnets which vary in price from 10 cents to \$3 and even \$20 according to quality and decoration.

5th. Food.—The bud of cabbage palmetto from which the plant derives its common name is edible both raw and cooked. Its taste is not unlike the cabbage.

6th. Piles.—Trunks of the cabbage palmetto show a wonderful durability as piles in under-water building. Piles in the wharves of Havana of this material are said to have been in use for more than one hundred and fifty years, and are still in a good condition. The foundation of Fort Moultrie was also built of palmetto.

7th. Potash.—Ashes of the palmetto lixivated and steamed yield a good quantity of potash.

ARTICLES MADE FROM THE SAP.

1st. Tanning.—Tannic acid is made from the roots, the trunk and leaves. The common progress of tanning with oak or hemlock barks always adds to the weight of the leather. As yet no method has been discovered by which, in tanning, an increase of weight can be avoided except by the use of tannic acid.

2nd. Medical Uses.—A certain preparation of the oak gives a medicine which has a happy effect when used for the throat and breathing organs.

3rd. Coloring Matter.—Through simply steaming the clarified sap a known dye is obtained which dyes a pretty brown.

ARTICLES MADE FROM THE FIBRE.

1st. Brushes.—The rough, stiff fibres at the point of the leaf stalk made into brushes through a special process.

2nd. Mattresses.—The leaf is split to a requisite fineness, curled, then ran through a peculiar machine, pressed into bales and sent to the mattress manufactory.

3rd. Upholstery.—The durability of the fibre as compared with other materials, recommends it for upholstering purposes. The long tough fibre holds its place until the furniture has become unusable.

4th. Cordage.—The long tough fibre seems very suitable for certain grades of cordage.

5th. Paper-making.—The different grades of fineness which we have in this fibre make it a valuable addition to the article to be selected from in manufacturing paper. It is suitable for all qualities of paper, from the roughest roof paper to the finest sort of bank note and bonds.

6th. Wood Pulp.—The great solidity of palmetto wood pulp makes it of more value than any other wood pulp. It is to be recommended to manufacturers for the making of pails, tubs, casks, globes, scrolls, wheels, etc.

7th. Felt.—The finer fibres felt very easily and can be put to many uses, viz., in the place of wool felt in ship-building, and for the polishing of quartz and other stones. With a mixture of 48 to 60 per cent. of wool it can compare with all other felts.

8th. Stuffs and Carpets.—There seems to be no reason why the fine fibres cannot be spun and woven into stuffs and carpets of different qualities.

9th. Underground wires which are covered with chemically prepared palmetto fibre, have stood unusual tests without injury. For protecting single or small wires this fibre is perhaps the best covering that has yet been discovered.

Many of the methods for using the palmetto described above have borne the test of actual experiment. The number of these uses grows continually larger. The products have already become valuable articles of commerce. So soon as the achievements of Dr. Loomis, of Fernandina, have become known, capitalists in many of the favorable points of Florida will hasten to build factories for converting the palmetto into useful and ornamental articles of commerce. Then the hitherto neglected and worthless palmetto lands will become of high value to the country.—St. Augustine News.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, November 28th.

CAFFEINE.—The market remains firm at last week's quotation—viz. 18s to 19s per lb according to quantity and position. The manufacturers are very busy, and do not much care to sell for some months ahead. They seem both to be of opinion that, if any change is made, it will be towards higher rates. It is said in the Ceylon papers that there has of late been a very strong demand for tea-leaf, red leaf, and tea-sweepings on the part of dyers, who have found a profitable use for these articles in their industry.

CARDAMOMS.—At today's sales the supply was small. It consisted of 163 packages, of which 78 sold at steady prices—viz: Ceylon-Mysore, medium to bold round pale 2s 2d to 2s 3d per lb; smaller size, but good appearance 1s 8d; small to medium, fair pale to brownish 1s 4d to 1s 6d per lb. Seed realised from 2s to 2s 2d per lb.

CINCHONA.—At today's drug-sales several parcels of South American and other cinchona-barks were offered; The most interesting lot was one of 12 serons, recently arrived from Payta (Peru), which sold, with good competition at 10½d per lb for fair Loxa quill 7½d for mixed Huanoco, and from 2½d to 6½d per lb for damaged Huanoco. Sixteen bales of Maracibo bark realised from 7½d to 9d for sound and 8d per lb for damaged. Of the other lots offered, very little was sold.

VANILLA.—About 2,000 lb offered today and sold, with good competition, at steady rates, especially for short beans.

ESSENTIAL OILS.—Of Lemongrass oil 2 cases of Winter's brand were taken out, while 5 cases of Winter's Citronella were also bought in at 2½d per oz. Citronella oil is again much dearer; 1s 6d per lb has been paid for drums on the spot, and 1s 7d per lb for small parcels in drums. It is said that there are now no further sellers below 1s 8d per lb. Lemongrass oil is also firmer; 2d per oz has been paid on the spot, but 2 1-16ths d is asked. For shipment 2d per oz c i f, January-March, is reported paid.

QUININE.—Tending lower. No business is reported this week, but there are sellers of second-hand German bulk quinine at 1s 1d per oz.

COCA-LEAVES.—8 bales of damaged but otherwise fair thin Truxillo leaves sold without reserve at 10d per lb to 11½d per lb today. Sound quality was bought in at 1s 2d per lb, and good Huanoco character at 1s 6d per lb.

KOLA.—About 1d per lb dearer, with a fair demand. Of 39 packages, 5 sold at 1s to 1s 1d for fair to good West Indian, and at 7d per lb for ordinary Malta gitto.

FLOWER SEEDS AS A PAINT.—A South of India correspondent writes:—

"I believe we have made a discovery that in the hands of a clever person might lead to a new industry. A Miss———had gathered a few seeds of that flame-coloured spiked flower—I forget the name that grows in several Nuwara Eliya gardens (like a sceptre) and put them in a little wooden box 7 or 8 months ago. Today on opening the box she found they had all melted into a thick shiny tarry substance. I tried to stick two sheets of the *Observer* together with it, but it is not so much like glue as a sort of paint. I have polished my boots and shoes with it and they look beautiful. Also I have painted the little white wooden box with it and it looks as if it had been done with black enamel paint. We are puzzled to know whether our correspondent means a *Lobelia* or "red hot poker"; the seed of the latter, however, we have not observed as at all conspicuous. Mr. Nock will be able to decide,

OUR MODEL COCONUT PLANTATION:
ITS PLANTER AND OWNER:—A VETERAN
PIONEER.

We have already referred to the early career of Mr. W. H. Wright, an example in so many ways, especially in his energy and ingenuity, to the rising youth of the island. Mr. Wright is now in his 75th year, but is wiry and muscular enough to warrant the expectation of another ten years of work with almost unabated vigour. His education as a boy in Colombo had not many advantages—he never entered Academy or College—but he got a fair grounding in the three “P’s” at the Orphan Asylum and it may have been his own fault that he did not go further; for in his very early years, he showed a greater interest in everything outside, than in the school-work. In every species of manual work he was certainly interested and in this way became a jack-of-all-trades—acquiring what proved invaluable accomplishments to him afterwards in his jungle-work, when he could, on an emergency, act tailor, shoemaker, carpenter, mason, doctor, or farrier as the case called for. Mr. Wright’s first engagement was under the Hon’ble Geo. Turner and David Baird Lindsay on Rajawella estate as Assistant on £2 10s (30 dollars) a month, of which—he it noted by the youth of the island—the young lad remitted £1 monthly to his mother. He worked so hard here, that Dr. Ferdinands who came the way, remarked to his Peria Durai: “Why you will kill this lad.” He, however, left soon after with good health and the best of certificates and next got a place in Kandy under Major Badly, R.E. From there Mr. Wright went to Peradeniya estate and by 1842-3 (when 21 years old) he had, practically, full charge of, and opened the coffee plantation of this extensive property—Messrs. Viscardi and Vallance, the chief Superintendents directing their attention more to the Sugar. From Peradeniya, a little later, Mr. Wright was accustomed (an evidence of his active habits) to drive to Colombo 72 miles after work on Saturday and be back for his duties by Monday morning. He won the full confidence of Mr. Christian and other members of the firm of Messrs. J. M. Robertson & Co., and whenever any member of the firm upcountry, wanted cash after the Kandy banks were closed, Mr. Wright could get them any amount of money up to a thousand pounds from De Soysa’s private bank without even a chit, only giving an order on the Colombo firm: such was the confidence placed in him alike by Europeans and natives.—While he was at Rajawella there was a terrible outbreak of cholera and coolies were dying, five and six a day, on other places round, but Mr. Wright was able to keep his coolies in health by a simple means: every morning at muster he had a supply of powdered charcoal (burnt coconut shell) near him and as each man answered to his name he had to come up and swallow a teaspoonful from the master’s hand, followed by a drink of water.

Mr. Wright’s first venture in planting on his own account was in the Weyakelle estate, Dolosbage, on which he spent R15,000 in 15 months and then sold it for R30,000 to Dr. Slipton. In the closing years of the “fifties” his attention was directed to Haputale and he bought several blocks of land from Government. Koslande was the only one that he retained eventually, and after about two years of work he bought from his partner Mr. John Hamilton, the veterinary surgeon of

Kandy, the half share of this property for £2,200. While living there he purchased Mr. Corbet’s two rifles and two of Mr. Jack Tyndall’s for £100, and after killing his forty elephants he sold the battery for the price which he originally paid for it. He saved Mr. Tyndall when attacked by hornets on a notable occasion. Mr. Wright was one of the pioneers in the South-eastern division of Haputale where we first met him in 1865. He did exceedingly good work there as a planter, while he was always ready to advise or oblige a neighbour or indeed passing visitors—as Sir Hercules Robinson found, when in journeying from Hambantota to Nuwara Eliya, His Excellency was indebted to Mr. Wright for supplying his suite at a pinch with the services of some 50 coolies to carry baggage from Wellawaya to the Sanatorium. Eventually Mr. Wright sold his Koslande property to Messrs. Pineo and Bennett for £24,000. The history of this transaction is worth recording. Mr. Pineo asked: “Would Mr. Wright listen to any offer for the place?”—“Yes,” he replied, “if a fancy price were given.” “How much would you say?” “£24,000—that is £8,000 down and for the balance £2,000 every two years and interest at 8 per cent.” Mr. Wright was asked for a written statement of the offer, but he said: “No, I give you my word as a gentleman and expect you to take it as a gentleman. I give you one month to decide and at the end of the time I am free to sell elsewhere.” Next day another gentleman came and offered Mr. Wright £2,000 down as a bonus if he would sell to him on the same terms, but he refused and lost the £2,000 sooner than break his word. After selling, Mr. Wright returned to Colombo, where his enterprise in house-building and in gardening was much admired. Later he parted with his residence—“Wilhelmshöhe,” Turret Road—and went to Mirigama to open Kandangomuwa coconut plantation.

Mr. Wright’s reminiscences go back to the days of Governor Sir Edward Barnes whose face and form he recalls, as also those of a long succession of British Governors, many of whom took notice of the enterprising Horticulturist by reason of his displays of new products at Agri-Horticultural Exhibitions in Colombo and Kandy. In this way, Sir Henry Ward took special pains to have Mr. Wright’s vanilla—then a rare product worth its weight in gold—sent to Europe for a French Exhibition. [Some of the vanilla that he cultivated at Peradeniya was sent home to Baring Bros. and fetched 5 guineas a pound.] Still more interesting is it to hear the veteran subject of our notice speak of Geo. Bird—the “father” of Ceylon coffee planting—whose stalwart form was only equalled by that of the brothers Reid of Rajawella, “Stumps” and others of the early planting pioneers. Long may the Chief of Ceylonese Coconut Planters survive to tell the tales of his early days and still more to point—with honest, justifiable pride—to the work of his brain and hands in what is, in our opinion, the model Coconut Plantation and Planters’ Fruit Garden of the island of Ceylon.

To exemplify still further Mr. Wright’s “pluck,” we may mention that should he sell “Kandangomuwa” for a fancy price, which may be learned on application, his determination is to get another block of waste land and open again in coconuts. This speaks well for a veteran of 75 with 60 years of work behind him and who has never been out of Ceylon, his only sea voyage being in a brig he chartered to carry rice from Colombo to Hambantota, to save his own and neighbourhood coolies in Haputale from starvation!

UVA: PLANTING NOTES BY AN "OLD HAND."

Bandarawella, Dec. 17th.

Lovely weather for the past week, but the hot sunshine is rough on young plants. The seed and plant market somehow or another is always a lively one, and sunny Uva's young tea fields will require much supplying.

Crumbs of comfort for cacao planters are to be found in the following newspaper's paragraph. "There is no cheek to the revival of trade in America which has been such a feature of the situation in recent months. Phenomenal grain crops have been harvested and there is every sign that during the year the circle of business activity will continue to widen and expand." The McKinlay Bill and depression in America were the causes of our losing good prices for our cacao, but now that the last is absent, let us hope that the Americans will give such prices for our cacao that prosperity will again be our cacao planter's portion.

LABOUR.—This difficulty will again be a newspaper topic in April of 1896. Coolies have not come in from the Coast. The cultivation of tea is extending and, as the tea bushes grow older, the bearing increases. What do you say to the following? "As a matter of fact labour creates and employs capital and the labourer makes the advance to the capitalist. Labour in ninety-nine cases out of a hundred is performed before the wages are paid—and the wages are paid out of the product of labour, not out of capital." We have been all calling out for capital to come into the country and made no provision for the labour. The Ceylon Government will be very blind to its interests and to those of its subjects, if they don't quickly take the initiative in getting coolies from pastures new.

Bandarawella Hotel is most excellently managed. The food is plentiful and well cooked. Tourists and lowcountry people have only to stay a day or two at this comfortable Hotel to wish to repeat their visit and recommend it to others.

Trains are running well to time.
Pate's coach is well horsed.

CINNAMON:

THE PRICES AT THE LAST QUARTERLY SALE.

THE particulars which have come to hand by the last mail of the Quarterly Auction sale of Cinnamon held on the 25th ultimo, confirm the view we expressed on the previous sale of August last. The prices recorded at that sale, we felt, could not be maintained, if indeed some of them were not fictitious, or represented bids by speculators, who would be found wanting on settling day. This fictitious or doubtful advance had reference chiefly, if not solely, to common sorts of spice and medium marks. The advance in the price of the leading marks, such as Golna Pokuna and Wester Seaton, though substantial, was not phenomenal, and indicated about 2d to 3d per lb. Part of this advance has been lost, the prices for the finest spice having receded from 1d to 2d per lb. The drop cannot be said to have been wholly unexpected, as the good brands had shared to some, though to a small, extent the benefit of the inflation. As compared with May sales, the rates must be pronounced satisfactory.—A. S. G. P. (Golna Pokuna) and D. S. W. S. (Wester Seaton) having realized from 7d. to 1s. 4d. according to quality.

J. D. S. R. (Rajapakse Mudaliyar, we suppose) took scarcely second place, having regard to quantity, with prices ranging from 9d to 1s 3d. Indeed, it looks as if his average must be quite equal to, if not higher than, those of the two brands we have named first. The drop in prices has been most marked, as was to be expected, with the brands which were run up extravagantly last August—as much as 100 to 150 per cent over previous averages, as against the 15 to 20 per cent. of the finest spice. Thus O. R. in diamond whose Seconds had sold at 1s. 7d., or 1d. to 2d ahead of the Firsts of the premier brands, and A. S. (whose Fourths were knocked down at 1s. 4d., while its Thirds fetched 10d. in August last) were nowhere at last month's sales. Then C. H. De S. Kurawitte, an Estate belonging to the De Soysa family, had its spice run up at the sale before the last to 1s. 7d. per lb. for its Firsts, or about 100 per cent; while in November it ran down to 10d.—a price somewhat higher than its ruling average for years past. It would be interesting to know whether the Proprietors of the medium and common marks obtained the prices noted in the August catalogues on settling day.

What is satisfactory is that, though there was a collapse in the inflation attempted four months ago, and though the prices receded somewhat for the marks whose spice had a *bona fide* sale, the prices which ruled last month were in every way reasonable and compared favourably with the averages which had ruled just before the fictitious and forced advance, and indeed with the averages for some considerable time past. It may be that prices were kept up by the speculators of August last, who stood to lose heavily if there was a sudden and serious drop; but more probably the prices which ruled represent the actual value of the spice at the present time, having regard to new uses and a consequently steady demand. This view is supported by the fact that more than two-thirds of the exceptionally large quantity catalogued found buyers at the last auctions, or immediately after, while the demand since, both here and in London, has not slackened. But for a genuine inquiry for the spice, the effect of rushing a large quantity into the market under the influence of the fictitious and speculative operations of August, would have been a serious fall in prices. That there was no such fall in the value of the brands which found *bona fide* buyers in August, is a healthy sign and promises well for Cinnamon Proprietors. The activity of the local inquiry for the spice just now, is confirmatory of our view, that new uses are creating a steady demand—though this inquiry is doubtless stimulated just now by the delay in harvesting operations. The exceptionally wet weather of October caused almost a general suspension of peeling; and since then a heavy leaf bud has rendered harvesting operations next to impossible. As a consequence, very little Cinnamon can be got ready to be shipped in time to reach London for the next sale on 24th February. Peeling is said to have only just commenced in a few places, but the sticks do not part with their bark easily; and if operations are not to be suspended, they will be necessarily slow. Meanwhile we learn that there are buyers for the ordinary assortment of quills at from 60 to 65 cents per lb.

This is what a leading London firm in the trade reports of the last sale:—

Cinnamon.—The closing sales of the year were held on the 25th inst., 2,817 bales Ceylon being catalogued, against 667 bales at the August auctions, an

and 2,516 bales at this period last year. On this occasion there was no speculative movement, and, as anticipated, values gave way, but a genuine trade demand prevailed and about 2,050 bales were disposed of in the room and immediately after the auctions, at decidedly easier prices when compared with August rates. As against May sales, regular rates, the prices now obtained must be considered favorable on the whole. In view of the inflated prices at the August sales, it is difficult to compare the rates now realized.

The fine and good brands sold from 7d to 1/4 per lb. for fourths to superior, and common to medium grades ranged from 7 1/2d to 11 1/2d per lb. for fourths to first.

793 bags chips &c., were offered and sold at 3d to 3 1/2d per lb. quillings, clippings, and broken 7 1/2d to 9d per lb.

Stock of Ceylon 5,716 bales against 1894, 3,567; 1895, 3,788; and 1896, 3,742; bales.

The next sales are fixed for the 24th February 1896. London, 27th Nov. 1895.

FORBES, FORBES & Co., Limited.

THE SALE OF ESTATES IN NUWARA ELIYA.

Regarding the sale of estates in the Nuwara Eliya district which we reported in our last issue, our evening contemporary says:—

Acting on behalf of a sterling London concern, the Nuwara Eliya Estates Company, Limited, Mr. W. Megginson of Carolina has just completed arrangements for the purchase of Portswode estate, Nuwara Eliya, from the Hon. Sir J. J. Grinlinton. The price paid is about £94 per acre. The adjoining estate, Kenmare, has also been purchased by him for the same company, and now we hear that the next estate, Tommagong, the property of Mr. J. MacLaren, and Lover's Leap adjoining, have also been acquired for the company referred to. The pick of the basket, however, is Pedro—the well-known property belonging to Captain Bayley—which, we understand, is also included in the sale, though the price paid has not yet transpired. Rumour, however, fixes it at considerably over £90 an acre. Besides these, Concordia has passed into the same hands—another valuable property in the vicinity. The properties thus acquired by Mr. Megginson form some of the finest and most remunerative estates in Ceylon.

From our Directory we take the following figures showing the acreage of the estates:—

	Total.	Cultd.	Tea.
Kenmare ..	230	170	170
Lover's Leap ..	150	139	139
Tommagong ..	248	259	180
Pedro ..	373	275	275
Portswode ..	502	256	210
Concordia ..	185	188	106
	1,691	1,268	1,110

Our contemporary adds:—

Besides these estates, an attempt has been made to acquire two well-known Dimbala properties, but without success, for we hear that Messrs. Cross and Ballardie refused to part, even after £100 sterling an acre had been offered them! This certainly beats the record, and should have an important influence upon all tea estates property before long.

THE GOVERNMENT OF MADRAS, it is said, will shortly abolish the post of Quinologist, lately held by Mr. David Hooper, and separate the Botanical Department from the Cinchona Department, the headquarters of the former being transferred to Madras. An old Nilgiri planter lately connected with the Prison Department will probably be offered the post of superintendent of the cinchona gardens.—E. Mail.

COLOMBO TEA SALES.

Wednesday's sale closed the series for the year, and Messrs. Forbes & Walker show that the totals for the year (up to Dec. 11) are 415,697 packages = 25,431,523 lb. offered, of which were sold 237,728 packages = 19,122,336 lb. as compared with 255,722 packages = 20,281,265 lb. offered of which 193,343 packages = 15,279,141 lb. were sold to same date in 1894. We append a table with offerings, sales, and prices for the 12 months as compared with 1894. The highest average was 56 cents on the 2nd Oct.; and the lowest 40 cents on Dec. 18th; the biggest sale 600,718 lb. was on Jan. 16; and the smallest 178,254 lb. on Nov. 6. The average for the year is 48 cents as compared with 44 cents in 1894. The tables are as follows:—

THE NUWARA ELIYA TEA ESTATES COMPANY, LIMITED.

This is the title of the London Company which has just purchased the Pedro, Portswood, Lover's Leap, Kenmare, Tommagong, and Concordia estates in the Nuwara Eliya district. The Company has a capital of £150,000, and the directors are Messrs. C. A. W. Cameron (Messrs. Frith, Sands & Co.), Winchester House, Old Broad St., London; Charles R. Robson, Batchacre Hall, Newport, Salop; and H. J. St. J. Oscar Thompson, (Messrs. W., J. and H. Thompson, Mincing Lane). The bankers are the National Bank of India; the solicitors Messrs. Freshfield and Williams, 5 Bank Buildings; the secretaries and managing agents in London, Messrs. Frith, Sands & Co., Winchester House, Old Broad Street; Ceylon agents, Messrs. Leelman & Co.; and General Manager of estates in Ceylon, Mr. W. Megginson. The first issue of shares has already been subscribed and allotted, while the second issue has been fully applied for, and there are no shares available for subscription in Ceylon. There has been a good deal of exaggeration in the reports that have gained currency as to the sum paid for the properties, and we are able to state authoritatively that the price paid is £83 10s. per acre of tea all round. With regard to the offer for Edinburgh and Inverness estates, while we are not in a position to give the exact figures, we are assured on authority that the price is considerably less per acre than that paid for the six above-mentioned estates.

During the past few years, the cultivation of tea in Natal has made rapid strides, the acreage now reaching four figures and the output six. These figures, at first glance, will not appear very formidable to Indian planters, for an area of but 2,000 acres, and a production amounting to something like 600,000 lb., represent but a bagatelle when compared with our local figures. Where the interest for the Eastern producer comes in, however, is in the fact that the Natalian infant, under the healthful influences of congenial climate, careful sustenance, and attentive nursing, is annually verging towards robust youth, and gives promise of developing into an exceedingly healthy and powerful adult. Last season's crop was an advance of about twenty per cent upon the production of the preceding year—a progress of most appreciable dimensions, and the present conditions of the trade indicate still more rapid advances year by year. The cultivation of coffee has practically given way to the sister industry, and even sugar—Natal's premier product—is experiencing the slight of defection on the part of some of its erstwhile adherents in favour of tea. Advocates of the tea industry in Natal claim as one of its chief advantages over the growth of coffee the comparatively small risk of destruction by hail; whereas tea is continually manured and gathered, the whole crop of coffee must stand, till it is ripe for the pluckers, a probable victim to a single heavy hailstorm, and the Colony knows only too well how it can hail periodically. A tea garden attacked by a hailstorm would present, it is reasoned, but one *flush* to the destroyer, representing but a portion of the crop, and this would not necessarily be devastated. In the case of coffee, the elements would enjoy an unrestricted walk over, wreaking, not only incalculable damage on the sticks, but perhaps wrecking the heart of the victimized planter. Then, as regards its merits over sugarcane cultivation, it is pointed out that there is no risk from fire, and cane fires—accidents sometimes but most often the act of a revengeful or discharged coolie—are the nightmares of the sugar planter. Again, it is claimed that, whereas coffee has suffered from the borer, *Hemileia vastatrix*, and short rainfall, and sugar by excessive expenditure for machinery and other drawbacks, tea has experienced immunity from pest or serious disease, and cheap female and juvenile coolie labour can be utilized in its production. The yield per acre, too, in the Colony is estimated to be considerably in excess of that of India, and equal to the best Ceylon gardens. Coolie labour there is, of course dearer than on its native soil, but only about half the number of hands are found necessary, and the market returns so far have afforded ample recommendation to planters to prosecute the industry. The rainfall, an average of about 39 inches, though necessarily less than the humidity of more tropical climates, is steady and gradual, and perhaps more effectual than torrential downpours, and for comfort in working in the gardens Natal claims favourable comparison. It will thus be seen that, from the Colonial cultivator's point of view, the industry offers much encouragement, and one is not astonished, therefore, at the leaps and bounds by which the production is progressing.

The principal tea district is situated a few miles to the north of Durban on the coast, close to the village of Stanger, on the main road to Zululand, about 29 degrees south, but at intervals all along the coast small areas are under cultivation, and at all these gardens convincing proof has been afforded of the suitability of climate and soil for the plant, specimens of which close upon forty years old, can now be seen enjoying a perennial youth. South coast planters have also lately been pushing forward, and extending their operations in the cultivation of tea, and already several limited liability companies have been established in the country for a more widespread prosecution of the industry. "Natal tea" is used pretty extensively locally, and commands a considerable trade in the Cape, Transvaal, and other States of South Africa, and now that railway extension in that continent has been pushed forward to limits hitherto only

reached by ox-wagon, a greater market has naturally become open to cultivators, and a greater stimulus has necessarily been given to the enterprise. One firm, not only employ an experienced traveller throughout South Africa, but periodically ship parcels of their produce to England. Natal tea has a decidedly characteristic taste, but it is said—and this is worthy of note—that, like Transvaal tobacco, the taste is an easy and pleasant one to acquire, and, when once acquired it is not readily relinquished. The Colonial planters depend entirely upon coolies for their labour, and this class of Indian subjects has long since become indispensable to our friends on the other side of the ocean, for a successful development of many of their outdoor industries. In this connection it may not be inappropriate to mention here that one enterprising planter lately put a hundred acres under rice, and the result attained was said to be very satisfactory. This was, we understand, an initial experiment, but probably more will be heard of rice cultivation in Natal ere long. Sufficient interest for the present attaches, for us, to the tea industry, and our Colonial cousins advance in this direction will probably be eagerly watched from this side. It may be mentioned that the plucking season in Natal commences in September and closes in June, so they are now in the middle of their operations. The official statistics of the output at the close of the season will be interesting.—*Capital*.

TODDY AND TREE TAPPERS.

"Habit is everything." The profound wisdom of the old saw struck me very forcibly as I took my early morning ride through the almost boundless palmyrah topes which stretch away inland to the hills, on which the great blue-grey monsoon clouds are resting prior to a northern journey, and on the other side away to the calm warm sea.

In and out between the slender trunks of these lofty giants jogged the toddy drawer, pole over shoulder and with his "goods and chattels" suspended therefrom. In the left hand a wooden crutch. Hurrying from one tree to another to gather into their plaited baskets the night's yieldings. The average height of the trees roundabout was full 35 feet; while some conspicuous 50 foot wallahs reared their rustling fan-shaped leaves in all the dignity of their riper years.

I watched one drawer. He deposited his pole and slung baskets at the tree foot and placed his crutch against the trunk. From a hanging side basket (from which protruded a forest of brush and knife handles) he withdrew a heavy bladed weapon. It was like the "kookrie," without a point to it, and heavier. A murderous weapon. This he sharpened on the pole of the crutch and replaced in his basket. Then he put on his climbing "irons" which consisted of a small circle of plaited palmyrah leaf!

The crutch gave him his first foothold, and then embracing the tapering trunk, up he went at a rapid pace. Up till he reached for the strong fibrous shiny "mattais" (the stalk of the leaves) and swung himself into the rustling leaves. Then leaning over here and there, supporting himself with his knee-pits, he emptied the small chatties into a division of side basket—trimming afresh each spathe before adjusting the chattle, with his heavy sharp knife, and coating each pot with lime from another division of his basket. A few rapid movements executed in the dizzy heights, and he was as rapidly descending the tree. Emptying the toddy into one of the larger slung baskets he shoulders his pole, reaches for his crutch and off for the next tree. He is not really drawing "toddy" but "pathani," which is boiled down into jaggery, for which he need take out no license. But the toddy drawer is doing exactly the same without liming the pots, for that process prevents fermentation.

There is toddy *and* toddy. The article freshly drawn, sweet and cool is excellent, but the foul smelling fermented sour liquid which stands in the big chatties in the reeking toddy shops is as unlike; it is a decomposed corpse to a young baby. The smell of a much frequented toddy shop is sufficient to intoxicate anyone but a confirmed drunkard or a Tamil

fisherman. But it was not the "habit" of *drinking* toddy which caused the old saw abovementioned to flash across me. It was the "habit" of *drawing* toddy. For months on and the toddy drawer is engaged, sometimes both at dawn and at eve at other places only once during the day, in scaling these tall trees one after the other. A man will go up twenty trees in an hour or so, and then walk his six or eight miles to deposit the toddy in a licensed shop! I do not know what this would pan out into in raising foot-pounds per second, but it seems to me that the result would be fairly "tall." But habit comes into the equation, and how much are we to allow for that? Not quite "everything," but a good deal.

The drawers down in these parts are, for the most part, well set up; broad chested, deep and muscular; points developed doubtless by continuous generations of toddy drawing. Physical development secured at the cost of the mental deterioration of the drinking community.

Stern and terrible are the threats held out by the Great Sirkar against those who infringe the laws regulating the import, export, transport, &c., of intoxicating liquor—up to one thousand rupees—six months or both! And yet many are the ways and means by which the crafty law-breaker evades the meshes of the law, small as they are. Tapping the silent trees at night and holding a revel by moonlight in the tope is a favourite amusement, and now and then the merry party are disturbed by a watchful Abkari officer with his band of men, and a rare game of hide and seek goes on in and out of the old trees ending, perhaps in the offenders planking down their five-rupee fine on the Magistrate's judgment, and returning to their unlawful pleasures "ek-dum."

The toddy shops about here are remarkably uniform. Usually situated on the outskirts of the village, they are conspicuous. A regulation T. S. consists of an inner room and outside three walls of palmyrah leaves and a roof and a few leaves for a carpet. Along one wall stands two or more toddy chatties—and the shop keeper during the day is usually asleep inside! There, with his license ready in a tin case for any questioning Revenue official, he remains doling out at the rate of 2 or 3 annas a gallon toddy to the thirsty souls. And when the sun gets low the little shop is quite animated as the workers of the day bring in their pice and sit round discussing the questions of the hour. These are the mofussil shops. The town shops are less pleasant. They smell evilly, and instead of the happy village folk we find the saturated arrack smelling gaol bird and harpies of the lowest type. The scum and the dregs of the dirtiest of dirty municipalities, and some of the most unfortunate of our fellow creatures. There they squat and drink the sour rotten liquid until night falls, and they reel out into the darkening streets to sleep off the fumes against the morrow. Those are the two types I have met down here. I should like to see the one shut up and the other more frequent. But that savours of "Utopia."—*T. Pioneer*.

KOSHENA COCONUT ESTATE COMPANY, LIMITED.

The first statutory general meeting of the shareholders of the above Company was held this afternoon at the office of Mr C. E. H. Symons. There were present: Messrs. John Clovis De Silva, C. Malingan, R. L. R. R. Itanamalaga Chetty, and Mr. R. M. Colenda Vlan Chetty and Mr. C. E. H. Symons. Mr. J. Clovis De Silva proposed and Mr. R. L. R. R. Itanamalaga Chetty seconded the following resolution:—That the following gentlemen be appointed Directors for the year 1896: Messrs. Symons, J. W. C. De Soysa, C. Ramalingan and Bastian Fernando.—Carried. Mr. J. Clovis De Silva also proposed, that the Secretary do visit the estate and report to the Directors at least twice a year, on a fee to be fixed by the Directors. Mr. R. M. Colenda Vlan Chetty seconded.—Carried. A vote of thanks to the chair closed the meeting.

THE COCONUT-GROWING REGION BETWEEN CHILAW AND PUTTALAM.

SINCE the middle of 1888, we have made the journey from Colombo to the Rajakadaluwa district, north of the Deduruoya, half-a-dozen times at irregular intervals; and on each successive occasion, we have been more and more impressed by the need of that fuller, speedier and altogether more adequate means of transport which a Railway alone can afford. There are no wealthier native districts in the island than the maritime divisions of Negombo and Chilaw. The Marawila district is, we suppose, unequalled for its rich, continuous coconut groves and well-to-do population. Indeed for 50 miles north of the capital there is the same succession of villages, huts and gardens that marks the more familiar coast line towards Kalutara and Galle; but with evidences of much more prosperity and trading and travelling enterprise. Coaches and steamers as far as Negombo have full occupation, and very frequently native passengers wishing to be picked up on the roadside have to be left behind. Coaches and many other vehicles, north of Negombo, by no means suffice to meet the public needs. One thousand rupees per acre can scarcely purchase coconuts in full bearing in the neighbourhood of Negombo or Marawila; while, although we get into a drier region farther north—where tobacco gardens around Chilaw have to be regularly watered and where there is evidence of the palmyra palm finding a congenial home—still we have in the Madampe region some of the finest of Ceylon's coconut plantations as well as paddy fields; while there are also prosperous palm groves right up to the river.

It is, however, of the region north of Chilaw and the Deduru-oya that we have more particularly to speak. Rajakadaluwa is 56 miles north of Colombo, rendered readily accessible now by the fine iron bridge some 567 feet long with 8 pairs of iron screw piles, opened a couple of months ago and which bears the name of Governor Havelock and of Mr. W. C. Simmons, District Engineer. This officer of the P. W. D. has done excellent service not only in the successful erection of an important bridge, but on irrigation works in the remoter, and feverish divisions of Sabaragamuwa. What is now wanted to serve the Puttalam district (which we enter on crossing the Deduruoya) is a similar but less costly bridge across the Battuluoya (ten miles farther north) the neighbourhood of which is also the scene of active planting enterprise in coconuts, by Messrs. Seton, Baur and others. Indeed, all the way from the new bridge to Puttalam town, the land has been freely taken up for planting purposes, and ere many years elapse, the continuous expanse of jungle which, in the early "eighties," marked this road for well-nigh 30 miles, will be replaced by a continuous grove of palms with the inevitable multiplication of wayside bontiques, village settlements, labourers' lines, carters' sheds, &c., &c. Already the road—which we remember as undisturbed during a long afternoon over a good many miles, save by the one bullock cart, and a passing cheetah, which stood and gazed at the unusual intruders,—wears quite a lively appearance with native traders, villagers, carters, Chetties and Moormen and even horsemen and dogcarts. The development every year will be very rapid, both in cultivation and population; and the cry will be for more land which, we are glad to learn, is likely to be made accessible over a large division of the district, between the sea and a backwater which is expected to equal

the far-famed Kalpitiya (Calpentyu) peninsula in its suitability for coconuts.

Native capitalists do not require urging where land suited to the palm is offered for sale; but many of our readers will be glad to see what can be said for coconut planting in the Puttalam district. Nearly eight years ago, an energetic Assistant Government Agent addressed us on the subject of the development of his district and the need of better communication with the capital. The facts and figures adduced by Mr. Lushington convinced us of two things:—(1) the need and great advantage of constructing a railway from Colombo to Puttalam (and indeed as Mr. Lushington then stated, that the line to Jaffna should come via Chilaw, Puttalam and Anuradhapura); and (2) the wisdom of planting coconuts beyond the Deduru-oya. To take the latter topic first, we may give an extract from the old letter of March 1888 now before us:—

I can assure you that in parts of this district the crops with little or cultivation are enormous. In the Puttalam district as it *now* stands, *i.e.*, since the recent division the average throughout is 36 nuts per tree. 75 trees to the acre = 2,700 nuts per acre, and we calculate the price at 2½ cents per nut which gives a yield of R67.50 per acre—but the average here is much reduced by some of the old badly planted gardens of Akkarai Pattu. At Chena Kudirippu and Arachchivillu (suburbs of Puttalam) the average yield is 60 nuts per tree *i.e.* 4,500 per acre, and the same applies to the well-planted lands of Abharai Pattu and a few gardens near Kalpitiya and Karaitivu. This makes the yield equal to R112.50, but as most of the owners of gardens have numerous dependents who work in return for food they convert the nuts into copperah getting thereby 50 per cent increase in their returns. The average (good and bad together) throughout the Pitigal Korale South is calculated at 60 nuts per tree, while in the villages along the road from Madampe via Marawila to Vennappuwa and Nainamadam the yield is as high as 100 nuts per tree and in some gardens even higher. This brings the yield to 7,500 nuts per acre and the value R187.50.

Of course, we knew well that all the Puttalam district was not like Pitigal Korale South; but we also judged that if native gardens without cultivation or proper attention gave 36 nuts per tree per annum, there was great room for encouragement North of the Deduru-oya. At that time only one European planter had settled at Rajakadaluwa. We commissioned him to buy an adjacent block at the forestland sale for relatives; and, at the same time, the Messrs. De Mel and soon afterwards Mr. Baur and some others became neighbouring proprietors. A market was found for a good deal of the heavy timber cleared from the land; every care was taken in opening and planting; but unfortunately against our opinion and advice, the one Manager of nearly all the clearings would follow the native example of taking crops of plantains off the land while the coconuts were growing. The argument was that the plantains opened the soil—a superfluous work, as the good soil in these parts is specially open and friable—and sheltered the young palms while growing. Such experienced planters as Messrs. Jardine, Wright and Nicholas are dead against the use of plantains in such a case; while some of them think a crop or two of casava kept at a proper distance from the palm—far less if at all injurious and useful in shading the newly-cleared soil. Be that as it may, a stop was put to the plantain-growing as soon as possible, more especially as the native contractor for the fruit (huge boatloads are brought 50 to 60 miles to the Colombo market from this district as from Kegalla and elsewhere) bolted

with the proceeds to the tune of some 1,000 to 1,500 rupees!

Seven years ago, we took Mr. Jardine to visit Rajakadaluwa: it was a new district to him. He was struck with the growth of the young palms and with the fact that, although a dry district, much of the land lying low had water within easy reach in the subsoil which would probably sustain the trees in time of drought. But Mr. Jardine did not quite approve of the soil—a mixture of sand and light loam—and doubted its “staying” power, considering that it would have to be early and continuously supported by manure to ensure paying crops. Meantime, the palms grew and they had to battle with one year of nearly entire neglect through the illness of the Manager and our absence in England. This entailed extra expense later on, and a disadvantage through the advent of troublesome weeds in some parts scarcely got over to this day, although special credit is due to the great improvement effected under careful supervision. However, the fields are now 6½ and 7 years old, and while unable to get Mr. Jardine again to visit the scene and perhaps revise his report of December 1888 in the face of a flourishing growth, we were fortunate in securing the presence of Mr. W. H. Wright with his unequalled experience of soils and cultivation in so many parts of the island. Mr. Wright had previously reported on plantations south of the Deduruoya; but he had never visited Rajakadaluwa. From the time we crossed the new bridge, during our four miles journey onwards, our companion was eagerly on the *qui vive* to note the peculiarities of the country, the vegetation, soil &c.; and he saw much which evidently did not please him. Indeed by the time we reached our destination, Toynbee, Mr. Wright had anything but a cheerful aspect. He, however, at once started off on a walk of inspection by himself and the result was eminently satisfactory. He found none of the dreaded burnt clay (“karameti”) which he feared from what he saw along and near the main road at several points; he tested the soil by the cuttings, diggings, anthills, &c. became across; but above all, he was completely satisfied by the actual growth and appearance of the palms and the number and size of nuts on those coming into bearing. Mr. Wright had a good deal of criticism to advance, of course. He utterly condemned, for one thing, sapanwood fences—judging from his own experience at Mirigama where he had to cut them down—as specially interfering with the adjacent rows of palms; and he had many hints to give in regard to improved cultivation. But on the all-important matters as to the suitability of soil for coconuts, he had a strongly favourable opinion. It was impossible to foretell what twenty years might bring forth; but finer or more vigorous trees of their age, he had never seen even in the Mahaoya Valley and he saw no reason why, with due cultivation and such economic manuring as he was using on his own young plantation in the application of ashes and sheep manure, the fields should not yield successive liberal crops of nuts for a long period to come. Of course, there was a great advantage in seeing an estate after seven years, as compared with six months, in judging of the capabilities of its soil and of its future. At the same time, it is evident that between the Deduruoya and Puttalam, as indeed in the Rajakadaluwa division itself, there are great differences in the soil, even within comparatively short distances. The stiff clay found in some parts has to be carefully avoided by the coconut planters; though no doubt “liming” and “tillage”

could do much to improve even such a soil. Mr. Wright is a great believer in the judicious application of wood ashes to palms at almost all stages. He would have all timber burnt and the ashes carefully gathered for application, rather than allow twigs and branches to gradually decay. The burning, too, is a preventive of malaria. All swamps and lowly parts he would have carefully drained, squares raised and planted on. Of course, this is a common practice of good planters, though all may not have the means to do the works in the thorough systematic way which Mr. Wright has inaugurated near Mirigama. An estate Superintendent must cut his coat according to his cloth. Meantime we tender to the estate proprietors in Rajakadaluwa and beyond towards Puttalam, all the encouragement the veteran’s opinion should bring to them;—only to profit by it, they must carefully cultivate their palms, weed regularly, cut down and bury all plantains, keep up a steady fight with the beetle enemies. It was pitiable to notice some fields of palms choked with weeds, or impoverished by plantains, or yellow and withered for want of drainage. Far better such should never have been planted; and even wealthy capitalists among our native friends are sometimes sinners in this respect—in not doing justice to themselves or their properties. However, visitors to a district should judge by the results due to proper planting and cultivation.

To turn now to the Railway: if its need was made plain to Mr. Lushington in 1888, we feel sure the encouragement and necessity have greatly grown since then and must go on growing every year. But a far greater importance is given to such a project when it is connected with an Indo-Ceylon Line. A metre-gauge Railway from Colombo due north through Negombo, Marawila, Chilaw, Rajakadaluwa, and Puttalam will pay splendidly on its own account and then when connected at Manaar with the South Indian lines, and extended thence or from Puttalam into Amradhapura and Jaffna, we should have by far the most economical and advantageous system that can, at this time, be desired and introduced.

There is much on the journey to and from Chilaw to interest the traveller by coach and one has now the felicity of crossing the Kelaniganga by the grand new Victoria Bridge—longer and bigger, more costly and showy, but not more useful than the sister bridge over the Deduruoya. All along the route we noticed a prosperous well-to-do people and a country eminently in need of communication by railway. Meantime both steamers (to Negombo) and coaches there and beyond serve their useful purpose. We heard of the Chilaw coach being fined for want of punctuality by the Postmaster-General; but, in our experience, the longest delays by far were caused by the Post Offices along the route. “Waiting for the mails” was the rule at nearly every wayside post. This ought not to be the case; and if there are to be fines, let them be imposed on those really responsible.

THE UNITED PLANTERS’ ASSOCIATION OF SOUTHERN INDIA.

We have received a copy of a circular containing correspondence with regard to affiliation with the London Chamber of Commerce, and requesting that each Association will, at an early date, send in the name of a Planter, either now resident in England or shortly proceeding there, who it would propose to nominate to represent the United Planters’ Association of Southern India on the London Chamber of Commerce,

COFFEE LAND IN BRITISH CENTRAL AFRICA.

An advertisement shows that land in the Shire Lands suitable for coffee cultivation is being offered for sale in large and small blocks. In "The Central African Planter" to hand by the German mail we notice an article by Mr. J. Buchanan, C.M.G., on the position and prospects of coffee in which he mentions that roughly speaking there are at present 6,000 acres under coffee in Nyassaland spread over something like 100 plantations. Of these the greater number are in their first and second year, so that 1897 is looked forward to with considerable satisfaction, it being very probable that the export of coffee in parchment for that year will reach an aggregate of 24,000 cwt. Land, he says, is yet available in quantity. Notwithstanding a very marked increase in value within the last few years there is yet good coffee land obtainable at from 5s to 20s per acre.

NEWS FROM BRITISH CENTRAL AFRICA.

On pages 483-84 will be found some interesting and, alas! some very sad news from this quarter of Africa, so closely connected with Ceylon now, by planting and other ties. Pioneering as planters in a new country is, and must always be, a trying business and it is not surprising therefore, to learn of sickness and even deaths. Among the rest, Mr. J. P. Owen who left Ceylon some months ago in the service of the Nyassaland Coffee Co. has had a bad attack of fever, and has left Blantyre on his return to Ceylon; but we trust Mr. G. M. Crabbe will be able to persevere and get acclimatised like Mr. Buchanan, Mr. Moir, and Mr. Henry Brown (an old Ceylon planter). In the monthly "Central African Planter" for October, it is interesting to note the register of arrivals and departures from the infant Colony for a month as follows:—

ARRIVALS:—Mr. Jenkins arrived with Mr. Brown at Mlanje to assist in carrying on business under "Brown and Jenkins." Mr. and Mrs. Thomson for F. C. Mission Nyasa.

Per "James Stevenson"—Mr. G. M. Brable, for Nyassaland Coffee Co., Ltd. Captain Bradshaw, of 35th Sikhs on furlough from India, to hunt, Mr. and Mrs. Armstrong, Mr. Lovell, Mr. Burnet, Mr. Steblecki (a younger brother of Messrs. K. S. Steblecki), Mr. Donaldson, Mr. L. A. Wallace and Mr. Clifton for Chirono; Mr. Lindsay and Mr. Fleet of Baptist Mission of Scotland.

Per "Henry Henderson"—Miss Bell for Church of Scotland Mission.

DEPARTURES:—Mr. J. P. Owen for Ceylon, Mr. and Mrs. Thomson for Nyassa.

This monthly—conducted on much the same lines as the *Tropical Agriculturist*—has an article on "Coffee: its position and prospects" by John Buchanan, Esq., C.M.G., the pioneer planter, which we shall transfer to the pages of our periodical. The one chief drawback to coffee-planting, the writer says, is want of proper means of transport; but several schemes are on the tapis to remedy this. An article on Mr. Moir's Landerdale estate is also of interest: it was originally opened by Mr. Henry Brown; but the energetic proprietor has since done much for it and Mrs. Moir is evidently the right consort for a pioneer tropical planter, introducing fruit trees from Algiers, &c. Mr. Moir has cacao as well as coffee and is also interested in cattle and other stock. A third article from this journal as well as current notes we give on our

back page today as of special interest to Ceylon planters.—The return of Mr. H. Brown shews he has faith in the future of Nyassaland. The total coffee crop of this year is expected to equal 3,000 cwt., the average yield so far 3 to 4 cwt. per acre. A Chamber of Agriculture and Commerce had been formed, rates being regulated by acreage of land planted or closed, or by number of European Assistants employed! The office-bearers elected for the year, are:—

President, Mr. John Buchanan; Committee, Messrs. R. S. Hunter, Mackinon, T. M. Hastings, John Gibbs, Jonathan Duncan, and Robert Buchanan; Secretary Mr. W. J. Dow.

VARIOUS PLANTING NOTES.

COFFEE GROWING AT HOME.—We notice that at a recent meeting of the Royal Botanic Society something was said about the possibility of coffee cultivation in England. Mr. Sowerby, the Secretary, had gathered some of the beans grown by the Society under glass, which he had carefully roasted, ground, and made into coffee. This decoction was submitted for the opinion of certain of the members reported to be connoisseurs of the beverage, and their opinions agreed that it was "excellent in every respect." A reference was made to the cultivation of a plant which "may ultimately help in some degree to cheer and brighten the existing depressed state of agriculture." Possibly this was meant for poetry. We feel sorry for the poor agriculturist in England who thinks he can cultivate coffee successfully. The Ceylon planters could give some useful information on the subject.—*H. and C. Mail*, Dec. 6.

PUSSELLAWA PLANTERS' ASSOCIATION.—The minutes of committee and general meetings which we publish elsewhere show that the affairs of the district are being very closely looked after by the Association. The business transacted had reference to roads, bridges, tolls, hospital accommodation, and postal and telegraphic communication. It is to be hoped that the P.C.M.O. will see his way to accede to the request of the Association in respect of a conveniently-situated and suitable building as an hospital. The resolution of the Dikoya Association with regard to the labour question was disapproved, and we think there will be very general concurrence in the opinion of the Association that any further interference on the part of Government in this matter is undesirable. The estimated tea crop for 1896 is 5,849,000 lb which, deducting the crop of three estates not included last year, is an increase of 348,250 lb.

CEYLON NOTES FROM NYASSALAND.—Coffee appears to be doing well in Nyassaland, and crops have so far come up to expectations. I note of late several men have come into the country, though more so for the purpose of prospecting for gold than for planting coffee, Mr. Henry Brown, formerly of Ceylon, has lately arrived, having been home for the purpose of floating a large company in Portuguese territory. Mr. Percy Owen, whom doubtless your readers will remember as having left Ceylon of late has, I am sorry to record, been exceedingly ill with black water fever, and, in consequence, had to leave the country to recoup his health, and has, I believe, gone South. Black-water fever seems prevalent throughout this part of Africa, Mr. Potheringham, the manager of the African Lakes Company, and another gentleman in similar employ, having died from it lately; also Mr. Miller, late of the Agras. Mr. Lloyd, formerly of Ceylon, and now Surveyor-General to the Administration, is, I hear, leaving shortly for England for a trip. Mr. Mortimer Crabbe has just arrived from Ceylon to take up the appointment as manager of the Nyassaland Coffee Company, and starts for Milange almost immediately.—*Cor.*

CEYLON AND NYASALAND.

Since the arrival of Mr. Brown, but perhaps more especially since Mr. Carson's visit, Ceylon has been, to judge from its newspapers, greatly exercised over the planting possibilities of Nyasaland. Reports, more or less accurate, have been published and extravagant statements duly commented upon while every little straw has been regarded as a weather-cock. On the whole, however, opinion seems to be favourable as regards our coffee enterprise seeing that a Ceylon Company has been formed to develop the land which Mr. Carson purchased at Mlanje.

In a leading article in the *Ceylon Observer* the subjects of coffee-planting and health are discussed with special reference to our Commissioner's last Blue-book from which large quotations are made. It appears that H. M. Commissioner asserts that coffee bushes here bear only on their primary branches, that secondaries for some reason or other do not develop, and that after a time the bushes have to be cut down. This official diotum has naturally somewhat nonplussed our Ceylon friends and they refer to these "authoritative utterances" as "rather perplexing references" and note that it "is passing strange to us, now we have gone into the matter, that we can find no reference to the absence or failure of the second crop, or to the non-appearance of secondaries, in any other writings from Nyasaland."

It would, on the other hand, be passing strange to us if they had met with such references, for, with all due deference to our Commissioner's opinions, his statements are entirely misleading.

Undoubtedly the primaries have a tendency to bear too heavily as is the case in all hot, dry latitudes, and owing to ignorance have occasionally been allowed to bear such a crop as to kill themselves, but such phenomena are well known in most coffee countries. Undoubtedly, too, the old practice of allowing the trees to grow six feet high before topping has produced long bare trees with most of the green wood at the top, but such a practice is now exceptional. On the other hand secondaries not only grow but bear crops and tertiaries too as may be seen on any average coffee estate in the country. In fact the growth and development of the coffee tree in this country are quite normal, only with our small rainfall it requires very careful handling.

For like reasons some of the bushes have had to be cut down on the oldest estates, one instance in particular being due to overforcing the maiden crop. The cutting down of bushes is however not the practice and we hope never will be. At Zomba and Blantyre there is coffee of over eight years of age still bearing and if such is the case in our two driest districts and with pioneer methods, the chances are that, with our improved methods of cultivation (especially in the wetter districts), the results will be eminently satisfactory.

A Ceylon planter who lately visited this country has given us an exceptionally bad character as regards health. He really believes the death-rate is as high as 20 per cent! and calls Nyasaland a country of "sudden death." On the subject of health we are at one with H. M. Commissioner in the summing up as given in his Blue-book in which he points out, "that the only malady to be really dreaded is Black-water fever." Even in the case of Black-water we believe that if all the cases could be at once put into the hands of a competent Doctor the mortality would be much less. In the cases which have had proper treatment and in which the termination has been fatal (very few) it has usually been so because the constitution of the patient had been abnormally run down either by a too prolonged residence, or, by over-exposure and exertion with insufficient nutrition. This is a subject on which Dr. Robertson might give us the benefit of his experience, meantime we would only remark that it is self-evident that, in a new country like ours, no one should come here who has not a sound constitution and who is unwilling to take due care of his health. In passing we may further remark that we were informed by an ex-Ceylon planter that the fevers

here are not nearly so severe as those of the Ceylon low-country, and that the heat at about 2,000 feet elevation here is as nothing compared with the heat at the same elevation in Ceylon. In fine, past experience has shewn that there is nothing in the climate of B. C. A. to deter planters from taking up land as freely here as in other tropical lands. As the Commissioner remarked to an interviewer when he was at home—if a man who has a good constitution, takes care of his health, and avoids alcohol there is every chance of his standing the country.

The chief difficulty which a Ceylon planter will encounter is the unsatisfactory state of the labour. Accustomed to coolies under long contracts he will be naturally somewhat non-plussed when he finds that the longest term for which he can contract labour is one year and that the usual term for which labourers contract is six months. So far as the drudgery of estate work is concerned this difficulty could be borne with, but, when it comes to the operations of pruning and handling and such work requiring skill, the full force of the evil will be felt. This is a hindrance which we trust our Commissioner will remove and one on which an expression of opinion by planters is desirable. It must be evident that, unless the difficulty is removed, the coffee industry will be severely crippled.

Another point, in which the conditions here are different from those in Ceylon, is the great isolation of estates and the want of what are called the amenities of civilized life, to which may be added one of the necessities of life anywhere, *viz.*, a good cook.

These however are difficulties which are disappearing with the development of the country. With the extension of the cultivated area, a railway, and a greater influx of capital, the conditions of life here will greatly improve. By careful study of our meteorological records, by well directed experiment, and by adopting the best methods of cultivation, it ought to be possible so to master the conditions of coffee planting here as to place it on a permanent basis.—*Central African Planter.*

THE UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.

The following is the Report of the Deputation of the United Planters' Association of Southern India on the matter of the address that they presented to the Viceroy while at Madras:—

"The Deputation had a gracious reception from His Excellency, and from the tenour of his reply we do not consider that any further action need be taken.

As regards advances His Excellency, in his reply, referred to the correspondence that has lately taken place in connection with this subject in the Public Press, and alluded to the fact that there seemed to be some divergence of opinion as regards the necessity of advancing. We, as representatives of the United Planters' Association of Southern India, consider that some form of advance is absolutely necessary, and we cannot but regret that an irresponsible correspondence should have attracted the attention of His Excellency to the detriment of the interests of our community.

His Excellency did not allude to the subject of Extradition, but we infer that this matter is to be dealt with by the Committee of Inquiry which he proposes to institute.

With regard to coffee-stealing, His Excellency deprecated the idea that the Government of India had any sympathy with thieves, and at the same time alluded to the fact that his Government had not fully appreciated that we merely wished to protect what was in fact a product in its transition state between the producer and consumer, and was not in reality an article of consumption.—*Madras Times*, Dec. 19.

TEA CULTIVATION IN ASSAM.—At the end of last year the number of waste-land grants taken up in Assam for the purpose of tea cultivation was 9,169, of which the total area was 1,013,756 acres.—*M. Mail.*

NYASSA: PLANTING AND PERSONAL NEWS.

Mr. Hunter of Cholo hopes to have 200 acres under coffee before the end of the rains. Mr. Mitchell is opening up at the Namiwawa stream near the Namadzi.—The A. L. C. are starting a cattle station at the north end of Chiradzulu. Mr. Lloyd intends going home soon. Mr. R. R. Stark leaves for home immediately.—Mr. D. J. Morkel is opening up an estate at Chiradzulu. It is called the Fort Roberts Estate and consists of about 600 acres. He intends rearing stock and growing wheat, barley, etc. Mr. J. P. Owen has left for Ceylon; after his severe illness he considers this a "no white man's country." We regret the death of Mr. J. G. Innes, of the A. L. Corporation, Ltd., who died at Mandala on the 6th September. He was only a few months in the country, and what makes his death the sadder was his parents' unwillingness that he should come to this part of Africa. Capt. Cavendish and Mr. Gordon Cumming have returned to Zomba; Corp. W. Fletcher has gone to carry on the further making of the road.—Capt. C. F. Beeching has left Mikolongo and arrived at Blantyre; he is we understand, superintending the construction of another new road, running from Sharrer's road towards Cholo.—The A. L. C. are now issuing English money from their Banking and General Departments; the natives are rather dubious about accepting half-crowns, or other large coins, but will no doubt learn in time, as they had to do with the rupee.—We are sorry to learn that Mr. W. A. Morman of the A.L.C. plantation Rivi-Rivi has had an attack of Black-Water Fever, assistance was immediately sent to him.—Sir John Kirk, whose name is so closely connected with this country, has been deputed to enquire into the recent troubles with the Brass natives.—Coffee is said by Captain Williams to grow almost wild at Uganda and on the islands of the Lake Victoria Nyasa.—Fowls cost eighteen-pence each and eggs two-pence each.—The A.L. Corporation's oil-press at Karonga's is now in working order. The yield at present is about three buckets *per diem*.—Mr. Hasting's crop amounted to ten tons. Mr. Steblecki's to four tons, and Mr. McPherson's to five tons. Mrs. Watson of Mandala lately performed the journey from Mandala to the Mlanje Mission Station in nine and a quarter hours actual travelling with two relays of machila men.—*Central African Planter*.

PLANTING AND PRODUCE.

BROKEN AND DUST TEAS.—The following circular has been issued by the Indian Tea Association (London): "With reference to the packing of broken and dust teas, it is pointed out for the information of members that it is desirable, owing to the weight of these descriptions of teas, to pack them in half-chests either of metal or of well-made and iron-hooped strong wooden packages. The use of canvas coverings is objectionable. They not only serve to hide the condition of the packages, but probably less care is taken in handling them in transit, besides which any tea which might escape into the canvas would soon become unfit for use."

INDIAN TEA IN AMERICA.—Messrs. Reid, Murdoch & Co., of Chicago, who are well known for their enterprise in pushing Indian tea in America, have had an interesting exhibit of tea at a large industrial exhibition held at Milwaukee. We observe that the *Sentinel*, a Sunday paper published at Milwaukee, contains an illustration of the exhibit, and mention is made in the letterpress of the famous World's Fair Indian Teas—viz., "Light of Asia," "Star of India," and "Lalla Rookh," of which Messrs. Reid, Murdoch & Co. have exclusive control.

TEA CHESTS AND THE TIN PLATE TRADE.—The Welsh tea dealers and grocers are very interested in securing a more extensive use for tin plates in the manufacture of tea chests, and thus benefiting their local industries. At a special meeting of the Swansea Grocers' Association held last week the president said, as though it had quite hurt his feelings, he had recently received a consignment of chests, and he was greatly surprised to find that they were made of steel which was neither manufactured nor coated

in the neighbourhood. The movement, which had recently been initiated for utilising tin in the manufacture of chests for tea, was one which might result in a great increase in the trade of the town, and he hoped it would be enthusiastically taken up. Another speaker, who felt that the tin plate trade of the district was suffering from neglect in the matter, said that for a number of years he had been agitating for the use of tin in the packing of tea, because he believed it would create an immense demand for tin plates, which would mean increased trade to the neighbourhood in a number of directions. He thought the subject was one of special importance to the grocers of Swansea, for it was to their interest to get a chest that would preserve the tea and give little trouble. This result was secured by the chests which had recently been supplied to Mr. James Jones, Mr. Gale, and Mr. Iles. He had seen the chests, and, as a practical assorter, he knew at once that the roughly-coated plates out of which they were made were not manufactured in Wales. He had also seen and obtained some information from one of the directors of the company who supplied the chests. Feeling that the matter was one of importance to South Wales, Mr. Thomas Phillips, of the 'Tinplate Workers' Union, and himself paid a visit to the works at Glasgow last week, and ascertained from the inventor, who was also the manager of the concern, that the coated steel which formed the sides of the chest was in the first instance supplied as black plate from Coatbridge, and coated by the inventor himself, but that arrangements were subsequently made for obtaining the sheets from Belgium and coating them at Worcester. It was most unnecessary for him to make further comment, for it must be clear to everyone, from what he had already stated, that for the want of a little enterprise the trade which should be their own was presented to a foreign firm. He felt that this was the more to be regretted, for there should be no difficulty in producing a better and cheaper sheet in the vicinity of Swansea. But this was not all. They found the chest company preparing to do their own coating, a Welsh patent not having been already set up. It had occurred to Mr. Phillips and himself that if at Glasgow tin plate was successfully coated and used up, with coals cheap and a plentiful supply of steel, this might be the beginning of a competition between Wales and Scotland which might prove more disastrous to the Welsh tin-plate trade than American competition. He was, therefore, glad to attend that meeting of the grocers of Swansea in order to call early attention to the matter. In concluding, he expressed the hope that Swansea people would take the matter up with the view of inducing the chest company to construct the works they were contemplating at Swansea, which ought, he thought, to be its natural location.—*H. and C. Mail*, Dec. 6.

COMPARATIVE HEIGHTS OF DIFFERENT ESTATES IN B. C. AFRICA.

The iwriter of this note, having during the course of business to visit various estates, has jotted down the different heights of the places named as given by a pocket aneroid. In the following list the Residency, Zomba, is taken as a standard and denoted by the amount of rise being denoted by plus, and the amount of fall by —, before the figures. By combining these figures with 2,968 the height of the Residency, a rough idea of the actual height of any of the places named may be obtained. Needless to say the figures given are only approximations and differences of weather and temperature have not been accurately discounted for.

The Limbi Estate plus 550; Upper Mudi Estate plus 550; Chipande Estate plus 300; Blantyre Estate plus 250; Nkawa (Cholo) plus 100; Mwalundzhe (Cholo) plus 50; Lunzu Estate plus 50; Zoa 0; Namadzi Crossing 0; Mlanje Mission — 250; Midima Resthouse — 400; [Mlanje Road]—Mr. Simpson's Ho.— 450; Mombesi Crossing — 550; [Mlanje Road]—Songani Estate — 600; Mr. Bradshaw's Ho. — 650; Mr. Moir's House — 650; Mr. Bradshaw's Estate [lowest] — 950; Mr. Simpson's Estate [lowest] — 1000; Mr. Moir's Estate [lowest] — 1000.—*Central African Planter*.

A NEW CEYLON TEA COMPANY.

The Ederapolla Tea Company of Ceylon, Limited, has been registered, with a capital of £50,000 in 5,000 shares of £10 each. The company has been formed to purchase from Messrs. Bett and Watt, Ederapolla Estate, and from Mr. MacMartin, Ardross Estate, both properties being situate in the Kelani Valley District, Ceylon. The directors are Messrs. James Bett, Ederapolla Estate, Ceylon (vendor); J. M. MacMartin, Ardross Estate, Ceylon (vendor); G. W. Paine, Chairman of the Kelani Valley Tea Association, Limited; and R. Porter, Maskeliya, Ceylon, managing director of the Kelani Tea Association, Limited. The secretaries are Messrs. Lyall, Anderson & Co., of 16, Philpot Lane, E.C.—*H. & C. Mail*, Dec. 6.

A MONSTROUS PAPAYA.

At the last meeting of the Asiatic Society of Bengal, Dr. D. Prain exhibited a monstrous papaya, which, he explained, was an excellent example of a fruit within a fruit. Of this condition there may be two explanations. An adventitious fruit may occur within the ovary so as to occupy the position usually occupied by a seed. This is by no means an uncommon occurrence. But here was a different phenomenon. Inside the perfectly normal looking fruit has a second, about half its length, quite unconnected with the carpels of the ordinary pistil, and arising from the axis of the flower within the normal ovary, and therefore above the point of attachment of its parts. The edges of the carpellary leaves of this second ovary were more or less free, except at the base; through the interstices could be seen a third ovary proportionately smaller but rather more approaching the normal ovary in appearance and structure, owing to its component carpels being united, except at their tips. This third ovary was as free from the second as the second from the first. It occupied apparently the very extremity of the axis of the flower.—*M. Mail*.

INDIAN TEA IN AMERICA.

MR. BLECHYNDEN'S OPERATIONS.

The following are extracts from a letter dated New York, 13th October 1895, from Mr. R. Blechynden to the Secretary of the Indian Tea Association:—

On page 3 of my letter of the 29th July, under the head "in the week ending 13th July," I referred to an arrangement I was trying to make with grocers to use their cards for distribution through Mrs. Tipton in the course of her work, and getting them to give a reduction on the tea purchased within fixed dates by those presenting the cards. This arrangement was carried out with several men.

In all some 54 stores covering New York, Brooklyn and a few in Jersey city. The cards were used chiefly in connection with the *Tribune* (newspaper) fund for Fresh Air Excursions, referred to in my previous letter on this subject. The excursions went out regularly during the summer, and Mrs. Tipton accompanied the greater number of them.

I enclose a cutting from the *Tribune* summarising the operations of the season. In addition to the *Tribune* excursions some of the others were served, as for instance the 1st of August, the people's Tabernacle excursion, when, 1,272 souls were on board, including 503 women, of whom some 300 were served. There was also a coloured people's excursion, when I gave Mrs. Tipton the assistance of some coloured girls, and she superintended the serving. This was on the 9th August.

On the 8th August there was a convention of Total Abstinents held in the Empire Hotel, a great demonstration, including a parade through the city. Delegates attended from distant parts of the country. By some arrangement, permission was obtained to serve tea to the women delegates in their Committee room; it would have been impossible to serve the general meeting. Some 76 of these influential ladies were served, and also the men who were transacting business with them, and samples of the tea given

to all present in the sample tin boxes over from the World's Fair.

As stated in a previous letter, I took advantage of a special opportunity which occurred to send a demonstrator to a country fair of some local importance at Newburgh. A firm of wholesale grocers at Newburgh, doing business all through that section of the country, applied to the Indian and Ceylon Tea Cos. for assistance to demonstrate teas at the Fair. They were referred to us, and as Mr. Mackenzie agreed to pay half the cost, I sent one of the ladies we have trained there, and the tea was supplied in packets by the India-Ceylon Company. The demonstrations proved successful enough to lead the firm in question to send an order for another 400 pounds, but the order was neglected, and I cannot say what the result will be. The Firm whom Mr. Mackenzie and I had an interview with when we went to the Fair, said that they intended pushing the tea through their travellers and looked to getting a good trade in it. The Fair was visited by thousands of people, and was quite a large affair. Regular buildings were put up for the accommodation of the exhibits, and our friends occupied an entire building.—*Indian Planters' Gazette*, Dec. 14.

VARIOUS PLANTING NOTES.

COFFEE.—The National Bank together with Messrs. L. Behrens Sons, in Hamburg, have purchased coffee plantations in Guatemala, the last year's crop of which amounted to 18,000 quintals. The purchase sum is reported at 4½ million marks. It is stated that the fifth part of the coffee plantations in Guatemala are now owned by Hamburg parties, and about one-half of the Guatemala crop comes to the Hamburg market.—*Planters' Gazette*, Dec. 1.

PRECIOUS STONES IN CEYLON.—It is news to us to learn from Mr. Siedle (who has long been an expert in respect of Ceylon gems) that the country in which our moonstones (an attractive form of adularia) are now found, is between Matale or Ukuwala and Teldeniya in the Dumbara Valley. The natives often tunnel considerable distances and, in their blasting, sometimes break up valuable pieces; for, the moonstones that are in request now, are pieces large enough to be cut and engraved in cameo-fashion. One such piece found on Crystal Hill estate, Matale, was of considerable value. The tiny stones are at present plentiful and cheap, a brisk demand from America some time ago having been over-supplied. The moonstone is really a very pretty stone, though not to be compared for a moment in value with our rubies, sapphires, cat's-eyes, or alexandrite. Ceylon rubies, however, are going out of fashion, being eclipsed in colour by those from Burma and Siam. But in sapphires much business in a quiet way is still done, and Mr. Siedle is able to tell us of really valuable finds by the natives in Sabaragamuwa—single stones up to R1,000 R1,250, and R1,500 in local value. Alexandrite, again, usually found in the Matara District and near Weligama, is much in request and a good many natives are keenly after it. Altogether, the mining and trade in Ceylon gems is by no means played out; but is as active as ever though there is no great show about it.—Mr. Siedle is, with justice, looking forward to the opening up of the Bambarabotuwa division of Sabaragamuwa as likely to bring more valuable gems into the market. In early days, this was a favourite scene for gemming; but natives do not care to work in dense forest. There is also a report of successful gemming having been lately begun near Hanwella, 20 miles from Colombo.

"THE TREATMENT OF TEA IN THE LONDON WAREHOUSE."—Under this heading we publish elsewhere a letter from Messrs. Davidson & Co. which contains good news for planters in regard to the treatment of their tea in re-packing in the London Warehouse. The example has been set by Messrs. Wrightson & Co. of the Trinity Bonded Tea Warehouses of securing a complete outfit of Messrs. Davidson's Tea-packers to do all their re-packing work, and we have no doubt that other firms will soon follow, so that, as the letter remarks, "there is every prospect of the objectionable 'treading in' process being entirely abolished in the near future."

CEYLON TEA IN AMERICA.—Our Tea Commissioner to America in the course of a letter to us remarks:—"I see you lately said I was subsidising favorite firms. You are right, but not as you mean it: favorite, because willing, in consideration of a little assistance to handle our teas, and use their organization to push them." We meant the term in no other sense: certain firms had got at the Commissioner or he had got at them. There are, no doubt, scores more in the United States willing to do the same, who never got the chance or heard of the arrangement. The fair thing all round is to advertise in the interests of all, and we were much struck the other day with the remark of a Colombo merchant (Mr. A. Forsyth) as the result of his observation during a recent visit to America, namely that the one thing to do in the United States for Ceylon tea is—to advertise. This bears out our own advice from the very beginning, and we are glad to recognise how much Mr. Mackenzie has done and is doing in this direction.

INDIAN PEASANT SETTLEMENTS.—We are in receipt of a memorandum containing the brief outline of a scheme which "General" Booth proposes to launch during his approaching visit to India. He proposes to ask Government and the Native States for say 50,000 acres of land in suitable blocks free of taxes for five years. On this land it is calculated that 10,000 families (or 50,000 people including children) can be settled, but it is proposed to begin with only half that number. The capital expenditure required for commencing operations, breaking up the land, sinking wells, building houses, buying cattle and settling first colonists is estimated to be about £50,000 which it is proposed to raise in donations, in loans from private sources and bearing interest at 3 per cent and repayable within a given term of years, and in loans from Government under the Takkari or agricultural loan law. Connected with each colony there will be an agency for acquiring waste land near the over-populated towns and villages. These tracts, it is said, will be cultivated by means of the labour of the adjoining villagers, thus saving all preliminary outlay for houses, wells, support of colonists, &c. It is also proposed to establish an agency for making loans on easy terms as the go-between for Government in obtaining loans for the depressed classes under the Takkari law, as the agents for banks and others desirous of investing in this way at a fair rate of interest, and on the co-operative village loan system. Another proposal to establish agricultural schools in course of time. This, in brief, is the scheme which the "General" proposes to launch upon us. It looks well on paper and has, we believe, been "generally approved" by leading English officials and others, but our own opinion is that the Salvation Army have not qualified to undertake Indian Administration in this way or to do better for the people than the Government does.

INDIAN TEA IN AMERICA.—The *Indian Planters' Gazette* publishes extracts (which we will reproduce later on) from a letter by Mr. Blechynden to the Secretary of the Indian Tea Association in which he mentions the success which had attended an arrangement he had tried to make with grocers to use cards for distribution and getting them to give a reduction on the tea purchased within fixed dates by those presenting the cards. The arrangement was carried out with several men—in all some 54 stores covering New York, Brooklyn, and a few in Jersey City. He also refers to co-operation between Mr. Mackenzie and himself.

THE KELANI VALLEY TEA ESTIMATE.—Mr. Coles, the Honorary Secretary of the Kelani Valley Planters' Association, has kindly supplied us with the following corrected figures of the estimated crop for 1896 as compared with 1895:—

	Yield.	Acreage.
1895 ..	9,942,000 lb.	23,188
1896 ..	11,715,000 „	26,606

Increase .. 1,773,000 lb. 3,418

Yield per acre is 530 lb.

The District shows an addition of 3,400 acres of tea for 1896.

PLANTING IN UVA.—This has been a very bad season for planting in Uva to judge by the following from a Haputale planter:—

"Your correspondent from Bandarawela was about right the other day when he said that a good deal of this season's planting would have to be replanted again. October planting—those who were lucky enough to get their planting done then will be all right. Plantings since then have been most disappointing—a couple of showery days and then ten scorching hot ones. Christmas usually can be depended upon for some rain. Today has blown a hot, dry, strong wind all day, and no indication of the much-needed rain. Truly we are in one of the late R.B.T.'s dry cycles."

DR. MORRIS, C.M.G., OF KEW.—This mail brings us a letter from Dr. Morris in which he mentions:—"I am just off for a winter trip to the Bahamas, to look up things there." We are sure to have an interesting paper on these islands as the result of this trip, similar to that written about the Canary Islands. Dr. Morris, in asking for some missing numbers of this journal is good enough to say:—

"I find on looking over my file of the *Tropical Agriculturist* that I am wanting the monthly parts for July and August 1895. As I have a complete set of this interesting and valuable work from the beginning I would esteem it a great favour if you would kindly send me the parts above mentioned." In the *Gardeners' Chronicle* we find the following notice of Dr. Morris' last course of papers now published as a volume:—

VEGETABLE FIBRES.—Dr. Morris's lectures on this subject before the Society of Arts have now been republished in a complete form, and may be had from the Society of Arts, Adelphi, London. They present within small compass a readable account of the nature, properties and source of vegetable fibres generally. On looking through this excellent summary, the reader will be struck with the small number of species which have, up to the present time, been utilised. This is the more astonishing, as the great majority of plants yield fibre in some form or another. Is there not here an opportunity for our botanical stations to institute, on a far larger scale than they have hitherto done, comparative trials of various fibre-producing plants, in order to ascertain which are of the most commercial importance. In the mean time we commend the present publication to the notice of all concerned.

Ceylon is a paradise for fibrous plants, and much could be done in developing trade and in cultivating the best kinds, if "tea," "cacao" and "palms" did not absorb capital and enterprise so completely.

Correspondence

To the Editor.

A PRACTICAL QUESTION ABOUT TEA SEED: ITS GERMINATION AND GROWTH.

Dec. 12.

DEAR SIR,—I would be much obliged if you or some of your readers would inform me how it is that a large percentage of seeds which turn out sound in Colombo, and even on the estate when tested in water, never come to any thing; many of the seeds turn mouldy on the outside after being in the germinating beds a few days.

Is this due to any defect in the *mode* of germinating or not? And would a greater percentage turn out good if the seeds were spread out *each* on the ground and covered with light earth, in preference to the general method of germinating layer above layer with earth between? The above applies largely to Indian tea seed.—Yours faithfully,

‘ENQUIRER.’

[We shall hope to have the opinion of the Acting Director of the Botanic Gardens and of some old planters on the question raised?—ED. T.A.]

A CACAO PLANTATION YIELDING 19½ CWT. OF CROP PER ACRE IN FERNANDO PO.

Dec. 13.

DEAR SIR,—It may interest Mr. James H. Barber whose letter I notice in the *Observer* of 11th to know that I have seen in the island of Fernando Po (W. coast of Africa) a cocoa plantation of nearly 200 acres giving 19½ (nineteen and half)* cwt. an acre. To ascertain this, I have surveyed the plantation and examined the books.

This plantation, like several others, was on the seaside and had no shade, the Forestero trees being from 5 to 8 years of age and at about 9 feet apart. The weeding of young fields, or rather a kind of sickling, was done about 4 times a year with *machetes*, light straight knives about 2 feet long, the cocoa plants receiving an extra hand-weeding of about 3 feet diameter.

The fields, from three years, had such a dense foliage that it was only necessary to cut down twice a year the scanty sheddy.

May I suggest that it might be interesting to Planters and give a fair idea of the profits to be derived from the cultivation of the main products, if in your yearly Table of Exports you added the approximate acreage in bearing and the average Colombo price. Of course account would have to be taken in the computation of the acreage, of the small holdings not mentioned in the district tables of estates of your valuable Directory.—Yours truly,

A. V. D. P.

THE COLOMBO AND LONDON TEA MARKETS:—HOW THEY ACT AND RE-ACT ON EACH OTHER.

Callander Estate, Dec. 13, 1895.

SIR,—Having read Mr. A. H. Thompson's reply to "Upcountry," I wish to ask him two questions. I have no intention of referring to the subject

* Why not 20 cwt. at once, most planters will remark; but let it be observed that our correspondent verified the return.—ED. T.A.

raised by "Upcountry," which is invidious, and I suspect only half believed by himself. Mr. Thompson says: "Local teas and reports are based now-a-days on local prices and demand, and have now-a-days very little to do with the home market."

This is one of the chief arguments used by all Colombo brokers to induce proprietors or their agents to sell in Colombo. But I would ask Mr. Thompson and his brother-brokers,

1st.—How is it that the local market rises or falls with the London market? "Market up" or "market down" in the weekly report from the Lane, is the almost sure signal for a sympathetic rise or fall in the Colombo market.

2nd.—What does Mr. Thompson say to this? About two months ago (when the first severe drop occurred in Colombo) valuations were received by wire, by certain buyers, of samples of teas (my own amongst them) sent home for that purpose, which led them to believe that they had been given too high a price for them. The immediate consequence was a fall of from 1d to 2d per pound for high grown teas. I by no means attribute the whole fall since then to that, as I am painfully aware that the late weather has not been conducive to good manufacture, but that was the cause of the first fall (acknowledged by brokers), and I do know this, that this was in my case on teas valued by my brokers as highly as those which fetched 3d per lb. higher average the month previous.

If local prices have so little to do with Mincing Lane, what reason had those buyers in sending samples of certain teas to London for valuations, and why was the adverse report followed so immediately by a drop in prices?

I acknowledge that the arrival of a large order from Australia gives a temporary lift to local prices, and that these may even be for some period ½d a lb. higher than in London; but experience proves that the Colombo market is ruled very considerably by the reports from the Lane. If it is not affected by the Lane and if it is usually higher (as asserted), how is it that there are so many speculators on our market, who buy to resell in the London market? I have not heard that any of them have gone "stony broke" yet.

Apologizing for the length of this letter,—Yours faithfully,

GEO. H. GREEN.

REPLY TO "ENQUIRER" RE TEA SEED: ITS GERMINATION AND GROWTH: NO. I.

SIR,—I have this year germinated and planted out 12 mannds of tea seed with not more than 2 per cent failures. The seed was germinated in the usual way between layers of *river sand* in a dark room, and planted out when about an inch spring. Mouldiness is the result of the death of the germ, probably caused by the drying up of the essential oil. Water is no sure test of good fresh seed. A seed may sink and yet be defunct, may float and yet grow. "Seed spread out on the ground and covered with light earth" ought to germinate all right, but river sand is preferable to earth.—Yours, &c., S.

No. II.—RE INDIAN TEA SEED: THE TESTING OF SEED IN ANSWER TO "ENQUIRER."

DEAR SIR,—The water test in itself is not a safe one to be guided by in determining the percentage of good or bad seed, as perfectly rotten seed will sink.

Several hundred seeds should be broken and carefully examined as even when the kernel seems sound enough though somewhat "cheesy," if the germ looks sloughy, it is in all probability dead, and the seed should not be classed as in good condition.

Doubtful seed stands a better chance of germinating if spread thinly in damp sand or charcoal dust two or three layers deep only, than if placed in deep pits or boxes, as fermentation then sets in rapidly and the seed rots.

"Enquirer"'s seed had very likely suffered from over-fermentation already on its way down from Calcutta.—Yours truly, OLD TEA HAND.

THE COLOMBO AND LONDON TEA MARKETS.

Dec. 18th.

DEAR SIR,—Mr. Thompson's little anecdote of the returned buyer is interesting and instructive, and I doubt not that he has already taken advantage of the 3d drop since that Wanderer's departure from the atmosphere of fog and smoke. True, I ought not to have used the word "ruled"; I only meant "affected" as throughout the letter. Well, if Mr. Thompson's contention is right and the Colombo market is not affected by London advices, then those adverse valuations quoted in my letter should not have been followed by a drop here; the Colombo buyers should have nobly and generously shut their eyes to such a trifle as a London report. But they did not, there's the rub: something wrong there! I will not deny Mr. Thompson's allegation there is an advantage in selling locally, for by doing so myself I own to the fact. Money is turned over quicker for one thing, and there *are* booms when large orders with high limits arrive from the cities of the world, but such do not flow in steadily all the year round; I wish they did.—Yours faithfully, GEO. H. GREEN.

THE PACKING OF TEA FOR THE LONDON MARKET.

Kandy, 18th December 1895.

SIR,—At the request of the Committee, I enclose for publication for the information of the Planting Community, copy of letters received from the Ceylon Association in London. I am, sir, yours faithfully, A. PHILIP, Secy.

Copy.

4, Mincing Lane, London, 11th October 1895.

A. Philip, Esq., Secretary, Planters' Association, Kandy, Ceylon.

DEAR SIR,—I am instructed by the Tea and Produce Committee of this Association to forward to you for the information of all concerned in Ceylon a copy of letter dated 8th instant from the Secretary of the London Wholesale Tea Dealers' Association, and to say that the Committee agrees in the opinion that 170 lb. is too great a weight for a chest of Tea. I am also to call your attention to the reports that continue to come in from the London and India Docks Joint Committee of Packages of Tea arriving in London, the chests externally sound, but the weights of tea deficient. I annex particulars of reports that have lately reached me.

30	May	Norwood, ex Nubi	1 chest,	30	lb. short
22	June	do	chest ex P. & O. steamer	16	" "
6	July	Bittorne	do	6	" "
		do	do	4	" "
10	"	Damblagalla	do	12	" "
		do	do	15	" "
11	"	Mariawatta	do	6	" "
		do	do	8	" "
1	Oct.	Lagalla ex Glenesk	do	10	" "
		do	do	12	" "
7	"	Dinegama, Senator	chest loss	not	given.

All these are reported as apparently, "country plundered" and in most cases "canister cut." It is to be noted too that all deficient packages contain either Pekoe or Orange Pekoe.—I am, dear sir, yours faithfully, (Sgd.) WM. MARTIN LEAKE.

Copy.

London Wholesale Tea Dealers' Association, October 8th, 1895.

Wm. Martin Leake, Esq., Secy., Ceylon Association.

DEAR SIR,—Messrs. Appleton, Martin and Smiles bought recently 8 chests Ceylon dust and find by the weight notes that they were 170 lb. net.

They consider a package containing so much dust as this is very likely to leak when sent by rail; and as the weight is unusually large for chests, they wish me to draw your attention to the circumstance with the view of preventing a recurrence.—Yours faithfully, (Signed) R. SEDGWICK.

Copy.

4, Mincing Lane, London E.C. Nov. 22nd, 1895.

A. Philip, Esq., Secretary, Planters' Association, Kandy, Ceylon.

DEAR SIR,—I am requested by the London Tea Brokers and Wholesale Tea Dealers' Association to ask you to be good enough to draw the attention of those packing Tea for the London Market to the serious loss and inconvenience which arise from dust Teas being sent in packages not properly protected against leakage and to suggest in the mutual interest of both seller and buyer in London that it is desirable that such packages should be canvassed or otherwise protected before being shipped.—I am, dear, sir your faithfully, (Signed) WM. MARTIN LEAKE, Secretary.

THE TREATMENT OF TEA IN THE LONDON WAREHOUSE.

"Sirocco" Machinery Depot,
Colombo, 28th Dec. 1895.

SIR,—Those of your readers who are interested in Tea will be glad to learn that there is every prospect of the objectionable "treading in" process of repacking Tea in the London Warehouses being entirely abolished in the near future. Our head office advises us by wire that they have received instructions from Messrs Wrightson & Co. of Trinity Bonded Tea Warehouses, Coopers' Row, London, to supply at once a complete outfit of our Patent Tea-packers to do the entire re-packing work in their Warehouses.

This is a much-needed reformation. Teas that have been carefully packed in the Factory will now reach the Home Market in perfect condition, without being subjected to the "tramping down" treatment in the London Warehouse with its concomitant crushing and breakage of the leaf and "greying" of the Tea.—We are, sir, yours respectfully,

DAVIDSON & CO., H. M. HARRIS, Manager.

DRUG MARKET.

QUININE.—The demand has continued of fair proportions and manufacturers are in a position to meet it. There has been considerable inquiry for speculative purposes, and 25c. was freely bid, but makers declined to sell, and no further lots of outside stock were secured. A portion of the recent speculative purchases of 60,000 ounces for foreign account has been exported by the St. Louis to London this week. The lot amounted to 21 cases, containing 13,000 ounces. The bark shipments from Java during October are reported as 1,100,000 lb. The London stock Nov. 1 was 2,069,901 ounces, against 2,896,368 ounces on the same date last year. The imports into New York have increased enormously during the past two months.—*Oil Paint and Drug Reporter.*

A CINCHONA AND CARDAMOM CENSUS.

Our Ceylon contemporary, the *Tropical Agriculturist*, has just taken its periodical census of the area cultivated in Ceylon with produce for exportation, and publishes some interesting comments upon the results of its investigations. Concerning cinchona, it is stated that in September of this year there were only 982 acres of land under cinchona alone left in the colony, but besides the trees growing on this surface there were 1,714,000 cinchona trees growing in coffee and tea gardens, the area of mixed land of this character being 5,207 acres. This latter estimate is arrived at by crediting one-third of the mixed area to cinchona. The total number of cinchona trees over two years old in the island is estimated at 4,483,000, a decrease of 2,500,000 within twenty-seven months. The coffee area, by the way, has decreased in the same time from 30,000 to 21,634 acres, while the acreage under tea, the all-devouring crop of the moment, has risen from 273,000 to 304,419 acres. There are 4,693 acres under cultivated cardamoms, slight falling-off, which is attributed mainly to the absorption of planting energy by tea-growing, which accounts for a decrease in the cultivation of many of the lesser products. Ceylon also contain 7,397 acres of land partly under coffee, tea, and cocoa, but interspersed with annatto, coca, vanilla, croton, pepper, cloves, citronella, castor oil, and aloes. The *T.A.* is naturally proud of its census, and observes with justice that "No tropical industry—and probably no agricultural enterprise outside the tropics—has had so much care bestowed on the compilation of substantially accurate statistics concerning its position and progress as the planting enterprise of Ceylon."—*Chemist & Druggist*, Dec. 7th.

THE DUTCH PLANTERS AND COFFEE
IN JAVA.

The First Chamber discussed last week the Java Budget, and it was principally Mr. Pynacker Hordyk, the former Governor-General, who criticised the policy of the present Colonial Minister. In many instances there was a considerable delay, and those reforms which were introduced had long since been prepared by the former Governor-General. Mr. Muller found that the price of fl.15 per picul paid for the Government coffee was too low, considering that fl.60 per picul was made for it, and he advised that fl.20 should be paid to the natives in future. However, Mr. Hordyk observed that if fl.15 was an injustice, fl.20 would be equally unjust, and thus there would be no other way left than to abolish the Government coffee cultivation, the consequences of which would be so ruinous to the Treasury that plans for useful works, such as irrigation and construction of railways, by which the population is benefited, would be laid aside. In addition to this the Minister stated that in Menado the price had been increased from fl.20 to fl.25 per picul but since then not a single tree more had been planted. With regard to decentralisation, he said that no body desired it, and why should he thus make proposals in this respect? The Chamber did not enter into any further debate, and the Budget passed unanimously. According to a telegram from Governor-General of Netherlands India the Government coffee crop in Java for this year is at present estimated, at 335,700 piculs.—*London and China Express*.

AN INDIAN VIEW OF TEA COMPANIES
IN CEYLON.

What the effect of this wholesale swallowing up of estates by the Company mania will ultimately be on the planting enterprise in Ceylon remains to be seen; but there can hardly be any doubt that it sounds the death-knell of the good old days, when

the position of the Ceylon planter was analagous to that of a country gentleman living on his property. It cannot but be that, with the disappearance of the resident proprietor, planting in the colony will lose much of its *prestige*, and become more and more a purely commercial enterprise, and that the change will be regretted in many ways and for many reasons. The change may be gradual, but it will be inevitable if the present state of things continues.—*Madras Times*.

TEA CULTIVATION BY THE SHANS,
BURMAH.

Mr. H. A. Johnson, of Maskeliya, has an interesting story to tell of his recent trip to Burmah, whence he returned this week in the ss. "Cheshire." His visit to Upper Burmah was taken to see his brother, Lieut. G. W. Johnson, of the 3rd Punjaub Cavalry, who is in command of the Upper Chindwin Battalion of the Military Police, his headquarters being at Kindat, 390 miles above Mandalay. For this out-of-the-way spot Mr. Johnson started last April, and in the course of his visit he went out several times on circuit with his brother, his travels furnishing him with a number of most interesting experiences and some fine sport. He described the country as most picturesque—all jungle, but the scenery he has not seen surpassed anywhere. Having joined his brother at Kindat he stayed with him a short time, and then, acting on his advice, he paid a visit to the district in which tea is grown; his brother accompanying him there. They reached the first tea gardens at Koiya, but did not stay anywhere till they reached Maungkan, a pretty little place on the banks of the Chindwin river. They travelled thither in a Government boat, and Mr. Johnson says he was well repaid for his visit. Maungkan is where tea is grown in the largest quantity, and having become acquainted with a headman, he was shown over the nurseries and the gardens—all of which, by the way, are cultivated by Shans. The tea grown is pretty much the same *jat* as that cultivated in Ceylon—Assam Hybrid.—and is not indigenous to the Upper Chindwin, though it has been grown there for 200 years, when it was first imported from the Northern Shan States. The planters do not go in for clearings as here; all their tea is grown in the jungle under shade. From these plants the Shans take leaf and seed, all their bushes being allowed to become seed-bearers. They pluck coarse, taking even the very largest leaves, and nearly all the leaf is converted into a pickle which they call *letpet*. This pickle is dark-red, and is by no means a bad condiment at the lunch table. How it is made Mr. Johnson says he does not know; but the pickle comes out a rich dark colour; the tea resembles ordinary tea leaf after infusion, except that it is larger than what we see here; and the leaf loses all flavour of tea. The pickle has a large sale in Rangoon, and the seed is all exported. Some of the tea bushes Mr. Johnson saw were from 20 to 25 feet high. He brought away some of the bushes and planted them in his brother's garden at Kindat. The soil in the Maungkan district is perfect in his opinion for both tea and coffee growing. Later Mr. Johnson spent a long time on the river Uru, a tributary of the Chindwin, 400 miles inland from the mouth of the river, going as far up as Haungpa, which is very near the jade mines worked by the Chinese. Here he had some good fishing and splendid shooting—elephants, tigers, bison (and the Burmah bison is the largest in the East), sambur, leopards, bears, and deer being very plentiful, while one requires no license for shooting elephants or other big game. He had his first experience of big-game shooting from elephant-back in the course of his trip. Birds of all sorts are very numerous, and he had some fine snipe, quail, and teal shooting. Naturally he had some interesting experiences with the tribes on the Naga Hills and elsewhere—the head hunters and men of that sort—and he has brought back with him a number of Naga weapons. On the whole he put in a very enjoyable holiday in a country about which very little is yet known.—*Local "Times"*.

PLANTING AND PRODUCE.

INDIAN TEA AND THE LONDON MARKET.—The position and prospects of Indian tea, from the grocer's point of view, cannot fail to interest the grower. We therefore reproduce the comments of the *Grocer* on the subject: "From whatever standpoint it is regarded—whether from the extent of its supply, the expansion of its deliveries here, or the quantity held in bond—this description of tea," says our contemporary, "undeniably occupies the leading position in the London market, and every year it takes a fresh stride towards a higher state of prosperity than before. Despite the dulness which has been reported in the market from time to time, the deliveries of Indian tea at this port during November progressed at an encouraging rate, and reached 12,146,450 lb., as opposed to 11,932,700 lb. in the corresponding period of last year, and 11,123,600 lb. in 1893, a total which excepting that of 14,492,000 lb. in May, 1890, when the new fourpenny duty first came into operation, is reputed to be the largest on record for a single month. Thus the aggregate delivery for the past eleven months is brought up to nearly 105,160,000 lb., or considerably more than that in 1893 to the present date, the amount in 1894 having fallen temporarily below the average. The imports have also been on a proportionately increased scale, embracing 102,500,400 lb. in the eleven months, against 101,515,200 lb. in the preceding year, and 94,386,200 lb. in 1893; and the stock remaining on hand on the 30th ult. comprised 45,270,950 lb., which was 1,827,950 lb. above that in 1894, and 4,481,600 lb. more than in the other year."

ENLARGED DELIVERIES DUE TO REDUCED PRICES.— "There can be no doubt that the enlarged deliveries of Indian tea now witnessed are ascribable to the reduced prices which have been current within the last two months, as it has been during that interval that the commoner qualities of tea have formed so great a proportion of the supplies at public sales, and the almost forced selling of these kinds has sent much heavier quantities direct into consumption. A more convincing proof of the salutary effects of cheapness in the freer use of an article of prime necessity could hardly be produced; for it was in the spring months of the year, when Indian tea was relatively dear, that the clearances for home consumption fell off perceptibly, and now that the article has become pence cheaper the deliveries have swelled again. It is, therefore, reasonable to expect that the improvement now set in will be fairly maintained, that what is still lost ground in relation to the deliveries in 1894 will soon be recovered, and that the trade throughout will work itself into a healthier and more active condition."

THE NEW CROP.—With reference to the new crop for 1895-96, it may be mentioned that the original official estimate was for a total of 140,000,000 lb., leaving about 126,000,000 lb. available for exportation to this country, and the revised estimate, prepared on the basis of outturn to August 31st, was 138,000,000 lb. of which it was calculated that, after providing for shipments to the colonies and local consumption, between 123,000,000 lb. and 124,000,000 lb. would remain for export to Great Britain. Since then, however, it has been understood that, owing to the unfavourable weather that has prevailed in the tea districts, the later estimate will not be realised, and it is expected by some authorities that the total shipments to the United Kingdom for the whole season will not exceed from 118,000,000 lb. to 120,000,000 lb., though there are firms in receipt of telegrams from private and unofficial sources who still put the probable total exportation at 123,000,000 lb., as compared with one of 115,000,000 lb. in 1894-5; so that it is not at all improbable that the boon of cheap tea to the consumer will continue to be enjoyed.

TEA IN FRANCE.—Dijon is suffering just now from an outbreak of typhoid fever. A special allowance of tea has been ordered for the soldiers, because in France it is a popular belief that tea has curative effects in cases of fever of all kinds.

CEYLON AND THE IMPORT DUTY ON TEA.—In Ceylon the question of the import duty on tea is the subject of discussion. Though the Ceylon Planters' Association and the Colombo Chamber of Commerce have protested strongly against a movement for its abolition which has been started, some authorities in Ceylon maintain that the duty is distinctly inimical to the Ceylon tea industry and trade. The arguments on this side of the question are put as follows by a Colombo paper: "1. Is it, or is it not, the fact that Ceylon produces some of the very worst, as well as some of the best, teas under the sun? (To blend our good teas even with China or Java, much less Indian, teas would not be so bad as with some of the stuff occasionally sold in the Colombo market, and twice rejected as unfit for human food at Melbourne.) 2. Do not the Ceylon tea planters live to a great extent by the blending trade? What are all the great tea-sellers in London and the colonies but blenders? How is our tea getting into Russia but by blending? Actually, Ceylon and China teas are at present sent to London, blended there, and then sent back to Australia! Can it be said that the North Indian planters have not worked hard to make their teas known with their Calcutta and London Tea Associations? And yet, why are they not afraid to leave Calcutta an open port, although several million pounds of China teas enter there for blending? Finally, it is absurd to suppose that the grand port of Colombo is to be shut off from its legitimate trade as the port of Southern India, and as the distributing port for Australia. We are told that one solution of the difficulty is for Government to build large bonded stores for blending purposes. If so, the sooner they are built the better."

TEA CHESTS AND TIN PLATES.—The representatives of the tin-plate industry are making strenuous efforts to push their wares into use for tea chests. A paper was recently read by a Llanely grocer before the Llanely Chamber of Commerce on the subject. The opinions of various members of the tea trade were quoted in support of tin plates for tea packing.

THE SISAL INDUSTRY OF THE BAHAMAS.—Dr. D. Morris, C.M.G., the Assistant Director of the Royal garden at Kew, who lately visited the Canary Islands in connection with the sisal industry, sailed last week for New York, on his way to the Bahamas. There he proposes looking into the position of the sisal industry in these islands, and, as he has done in the case of other colonies, suggesting various other plants which might be profitably cultivated in a place like the Bahamas. As there is some affinity between the Canary Islands and the Bahamas, no doubt many of the plants which are profitably cultivated in the Canaries could be tried with advantage in the West Indian group.

A RAMIE PLANTING COMPANY.—The Anglo-Dutch Ramie Fibre and Paper Company, Limited, has been registered with a capital of £150,000 divided into 150,000 shares of £1 each, 100,000 of which are ten per cent. cumulative preference.

COCONUT BUTTER.—A company has just been formed in Paris to make butter out of the coconut. It has a plant calculated to produce over 4,000 lb. a day of this butter, and will soon be able to produce twice as much. The butter will be called by its name. The nuts will be supplied from the French possessions of Africa. —*H. and C. Mail*, Dec. 13.

VARIOUS PLANTING NOTES.

TRAVANCORE AND THE AMERICAN TEA FUND.—As will be seen from the letter which we publish in another column, the Travancore Planters' Association has contributed R1,472 towards the American Tea Fund.

THE FIBRE INDUSTRY.—So far as the cocconut palm is concerned, there are several Fibre Factories at work now. A new one is about to be erected at a convenient point on the Negombo road for ex-Inspector Harrison who is very active in developing fresh industries.

The Monthly Averages are as follows:—
 Jan. 8 1/4; Feb. 9 1/2; March 8 1/4; April 8 1/4; May 8 1/4;
 June 7 3/4; July 7 3/4; August 8 1/4; Sept. 8 7/8;
 Oct. 9 1/4; Nov. 9 1/4; Dec. 9d. Yearly Average 8 1/2d,
 as compared with 8 1/4d also in 1894.

OUR TEA CROP FOR 1896.

Time was, not so very long ago, when we were very abundantly sneered at, our contemporary of the "Times" as usual leading the way, for anticipating an export of a hundred million lb. of Tea in one year from Ceylon; but now we have the same contemporary prophesying that the total export for next year is likely to be nearer 105 than 100 million lb. ! No doubt the district estimates will shew an aggregate equal to this quantity; but we would suggest caution about the total estimate, and for this reason:—True, for the present year, the total exports are likely to be between 94 and 95 million lb., or 4 1/2 million, say, in excess of the official estimates. But it must be remembered how 1894 (following on the large export of 1893) shewed little or no increase. To some extent, may not the experience be repeated, especially if India has a prosperous year in 1896 (as is fully anticipated to make up for the past bad season) and so forces many Ceylon planters to go in for fine plucking to make up

for lower prices? We would not, therefore, estimate anything above 100 million lb. of tea for Ceylon's total export in 1896; and of this quantity we should hope not more than 85 to 85 million lb. need go to the United Kingdom direct.

TEA SEED FOR CEYLON AND LOCAL PRODUCE FOR LONDON.

The ss "Simla" from Calcutta brought on the 30th Dec. 1895 230 packages of tea seed and takes away from Colombo 600 tons tea, and 50 tons cinnamon, catechu, &c.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, December 5th.

VANILLA.—The London stock at the beginning of this month was only 370 tins.

CAFFEINE has been practically a dead letter this week. The quotations remain as given in our last report.

COCOA-BUTTER. At the monthly auctions 500 2-cwt cases of Cadbury's brand sold at a decline of about 2d per lb—viz., from 13 3/4d down to 1s 1d per lb.

ESSENTIAL OILS. A considerable quantity of Citronella oil said to be 15 tons has been sold for shipment over four months at 1s 6d per lb, c i f in drums. The spot quotation also shows a fresh advance, the market having been cleared at 1s 8d per lb; second-hand quotes 1s 9d per lb. Oil of cinnamon leaf has become scarce and is higher, the price running from 3 1/2d to 4d per oz.

QUININE is again lower. At the end of last week 5,000 oz. of second-hand German bulk were sold at 12 1/2d per oz. and another 5,000 oz lot, of old import at 12 3/4d per oz; but the quotations today are easier, a parcel being offered without guarantee of age at 12 1/2d, while recently-made quinine is quoted 12 3/4d per oz. The imports during November were 24,588 oz, and the deliveries 54,178 oz leaving a stock, on November 30th, of 2,040,298 oz against 2,840,816 oz on November 30th 1894. It is said that the lot offering at the low price mentioned above is part of a somewhat considerable quantity left behind by a deceased speculator, who paid about 1s 6d per oz for it. Bids of 12 1/2d per oz were solicited for it today.

THE AMSTERDAM DRUG-MARKET.

Our Amsterdam correspondent writes on Dec. 4:—The exports of Cinchona bark from Java during the month of November (according to a cablegram just to hand) were again very heavy—viz. 1,264,000 Amst. lb (about 1,390,000 lb English). The total exports from the island during the eleven months from January 1st to November 30th have been:—

Years	1895	1894	1893	1892
Amst. lb.	8,193,700	8,386,700	6,951,000	5,552,000

The public sale on December 12th will consist of 5,472 bales and 210 cases Java cinchona, weighing 528,935 kilos and containing 27,685 kilos of sulphate of quinine of which about 421 kilos are contained in the 17,020 kilos of pharmaceutical bark, and 27,264 kilos (average 5.31 per cent) in the 511,915 kilos of manufacturing-bark. Exclusive of the bark to be offered at these auctions, the first-hand Amsterdam stock now consists of about 10,000 packages of manufacturing-bark. At auction on Tuesday 80 tons of Van Houten's Cocoa-butter sold at an average price of 73.53c per half-kilo. The tone of the market was irregular and generally quiet—*Chemist and Druggist*.

PURCHASE OF A WYNAAD ESTATE BY CEYLON PLANTERS.

We hear that the sale of a tea estate in the Wynaad has been effected, Messrs. Parry and Co. having disposed of Perrindotty Estate for a good price to Messrs. de Fonblanque and Beachcroft, well-known tea planters in Ceylon. There is, we are glad to say, considerable further enquiry in that island for land in the Wynaad for the cultivation of tea.—*M. Mail*.

NORTH BORNEO NEWS OF 1ST DEC.

Mr. E. Walker, who lately went to prospect the land in North Borneo, has taken up land in Marnda Bay and has been engaged to trace the road from Little Brighton towards the tobacco estates.

Progress is being made by our old Ceylon friend, Mr. H. Walker, Commissioner of Land, with a new road he is making in Province Dent. It is now rideable for 18 miles. British North Borneo is prepared to give the grants of lands for tapioea up to 500 acres.

UVA: PLANTING NOTES BY AN "OLD HAND."

The P.W.D. seems to have abandoned the cart road between the Ginigatna Gap and Kitulgalhina Resthouse. If some of the money likely to be wasted on costly improvements to this resthouse was spent on the upkeep of the road, possessors of valuable horses would feel in better temper with this department. How much depends on the Provincial head of a department! The roads in the Central Province are so much better looked after than those in the North-Western.

TEA.—The minds of the Editors of the *Observer* and "Times" seem now to be exercised at the prospects of increasing exports, now that the 100,000,000 lb. of tea are likely to be reached. Some of us remember the fuss that was made about the 1,000,000 cwt. of coffee. Curiously enough after that figure was reached the annual exports began to tumble down. *Absit omen.*

If manuring tea was carried out extensively, I believe in 3 years our exports would run to 30 per cent more than at present.

There can be no gainsaying the fact that 1895 has been an exceedingly good year for the Ceylon tea farmer. His Indian brother has not been so fortunate.

VALUING ESTATES.—8 years' purchase seems now to be the ruling figure for good lowcountry, and 10 years for good upcountry estates. Does it ever strike the buyer at these figures whether the estate he purchases will be worth the same amount of money at the end of that period?

LABOUR.—It seems to be taken for granted that the Tamil labourer of today is not the man, woman, or child he or she was some 15 years ago—and the writer of the "Paper on the Labour Question" printed at the *Observer* Office, has, in some arguments he advances, like "Homocœa" touched the spots.

LARGE COAST ADVANCES.—Withholding of monthly payments, no doubt at the instigation of interested kanganies, and the habit our assistants have got into of putting their labourers ½ day instead of remaining in the field and making the labourers do their work—this last pernicious habit reduces the balance due to coolies on pay-day, and, as the writer of the pamphlet says, "the coolies have become regardless in respect to their balance wages."

THE COFFEE TRADE.

The coffee market has developed several features of interest during this month. The Brazilians, who for months—I might say years—have shown unflinching firmness, have at last changed this attitude, and have accepted reductions in the cost and freight price of good average Santos, amounting to 5s. per cwt. Operators in the "Term" markets, who for months have been content to look on, are beginning to move by cautiously putting out a few "bears." The weather for the next crop has been all that could be desired, and the combined

receipts at Rio and Santos from the present crop during the first three weeks of the month have come fully up to those for the same time last year.

I now propose to examine briefly the position of coffee in Brazil, in Europe, and in the United States. In Brazil the great feature is the immense crop to be expected next season. The trees are loaded as they never have been loaded before, but I think it is utterly impossible to find labour sufficient to cure and prepare this abundance for market. This applies specially to the province of Rio de Janeiro. In Sao Paulo, however, I believe that planters may be able to handle and deal with 5 million bags. The districts tributary to Victoria and Bahia likewise promise an exceptionally large crop. That a good deal of coffee will from various causes be wasted is unavoidable; but this, or even a short spell of unfavourable weather cannot now prevent Brazil from producing next season far away the largest crop she ever has raised. There can now be no question of disappointments, such as we have seen before. The favourable weather which has continued throughout November is a guarantee against that.

This splendid crop outlook is the cause of the changed attitude of the Brazilians. It has induced them to make concessions, and the extremely low rate of exchange (95-16d per milreis) has given them some compensation in the currency price they have received for their coffee. That they will have to make further concessions in cost and freight prices seems unavoidable, if they do not want to see stocks accumulate, and such will no doubt be made. But I do not believe that they will stop there. The Brazilians are a shrewd people, and I shall not be surprised if we shortly hear of them as large sellers of "Futures" in the "Term" markets, principally in New York and in Havre, for the purpose of protecting coffee they hold, and what they expect to raise.

In Europe the position of coffee is an easy one. The stocks at the loading ports make a respectable total, and when the heavy shipments on the way (brought about by the concessions) arrive, it will become still easier, leaving large stocks not only at the ports, but also with dealers in the interior. In fact, quite a respectable invisible supply is being gradually created, which will leave distributors in the interior in quite an independent position, and enable them to watch the progress of events. Many operators who for months have practically abstained from business in the "Term" markets will now resume business, and some may seriously consider whether it might not be policy to anticipate the action likely to be adopted by the Brazilians.

In the United States, the war of rates which has been going on between the leading roasters of New York and Chicago has had the effect of stocking up the retail dealers in most of the Western States. It has occurred to me that the large New York roaster, by initiating this campaign, has seen his way to accomplish two ends—one to damage his opponents, the other to force off large stocks of roasted coffee before the important decline takes place which he scarcely could help anticipating. The visible supply of coffee for America is large, the stocks which form part of it being about 100,000 bags larger than last year. Altogether, the position of coffee in the United States is also an easy one. Local operators have up to now shown little disposition to take sides, but I think that we must be prepared to see a change in this respect ere long.

The prospects of the market are distinctly in favour of a decline in the value of coffee. Whether this will take place slowly, or proceed at a rapid pace, the future will show.

A price will, after a time, be reached when merchants will stock up. What that price may be will be the subject of great difference of opinion. For my part, I believe that we must first see a reduction of cents per pound from the present price of Rio coffee No. 7.

ANTON HUISTENDAHN.

—*Statist*, Nov. 30.

THE BEAUMONT TEA COMPANY OF CEYLON, LIMITED.

At a meeting of shareholders in this Company today (Jan. 6), the following resolutions were confirmed:—

(1) That the capital of the Company be increased by creating 5,000 new shares of £100 each and that the Directors be empowered to issue and allot the same, or any of them, in such manner, and at such time, or times, as they may think expedient, and at any premium, and generally on such terms and conditions in all respects as the Directors may determine.

(2) That the Directors be authorised to borrow money for the Company on mortgage debentures, and to that end to issue debenture bonds bearing interest at 6 per cent per annum for such amounts as may be required for the purpose of the Company, but not exceeding in the aggregate at any time half the then issued capital of the Company.

GREATEST AREAS OF FOREST.

According to the *Revue Horticole*, the greatest areas of forest country in the World are the following: In North America, north of the river St. Lawrence, covering large districts of the provinces of Quebec and Ontario. The length of this forest which stretches to the Hudson on one side and to Labrador on the other is 1,800 miles, and its breadth 1,070 miles. In South America the tropical and semi-tropical forests of the Amazon Valley and High Peru have a length of 2,200 and a breadth of 1,800 miles. The most extensive of the African forests, stretching from the valley of the Congo to the sources of the Nile and Zambesi, is still unpenetrated; its length is unknown, but its breadth falls little short of 3,200 miles. Southern Siberia contains probably the most enormous forests in the world. From the river Obi in the West to the valley of the Indigirka almost the entire area is covered with timber—a stretch of 3,200 miles. The breadth of this huge belt of wood cannot be much less than 1,800 miles.—*C. World.*

PLANTING IN THE NIGER PROTECTORATE.

Every effort is being made to plant out portions of the Niger Coast Protectorate as market gardens and orchards. A report just received by Lord Salisbury from Sir C. MacDonald, states that good progress has been made, and the Curator of the Botanical Gardens, Old Calabar, considers the condition of the gardens as satisfactory in most particulars. He continues:—The experimental part has been considerably extended, and there are now about twelve acres planted up, nearly all with economic plants. The former nursery being quite insufficient, an additional one of two acres has been taken in adjoining the gardens. Most of this is at the present time occupied with seeds and young plants, principally coffee seed for distributing the young plants to the natives. The large piece of bush that adjoined the gardens, between it and the barracks, has all been cut down and the roots grubbed up for the purpose of forming a coffee plantation. A portion of this, comprising about twenty-two acres, has been fenced in with a good wire fence. There are now planted out in it 2,100 coffee trees, which were mostly raised from seeds by myself in April, 1893, and planted out in August last year. The condition of most of these trees is very good. Some have already flowered, and many will produce seeds during the next year. The remaining portion of the enclosure will be planted as soon as the nursery plants are fit for removal.

I consider this a most important and valuable addition to the gardens—continues the Curator—as it enables the natives to see properly how a plantation should be made, and the pointing out to them its commercial value will act as an impetus to them to follow out its example. As some plants have already been supplied to natives, and others have made applications, it shows the object is beginning to be appreciated by them. The growth that the

coffee plants first planted in the gardens have made has been excellent. These trees, that are only twenty-seven months old from the time of putting in the seed, average a little over six feet high, with a fine and well-formed head, have all flowered, and would have borne a fair crop had they been allowed to do so. It is, however, better to remove the first crop of berries. For experiment I left one of the Arabian coffee trees to seed, and have just lately gathered a few berries. Another large undertaking in connection with the department has been the laying out of an orchard to the extent of about ten acres. This is situated facing the river between the barracks and Queen's Beach, and has planted in it 500 tropical fruit trees of the following varieties:—Orange, lime, bananas (Canary variety) (*Musa Chinensis*), Avocado pear, Akee, sour-sop (*Anona muricata*), papaw, and about 100 pineapple plants. It is now in a promising condition, though a good deal of trouble has been caused by the inroads of sheep and cattle. An avenue of mangoes has been planted along the road leading from the Government employes' quarters to the barracks, and another one along the straight path from the Botanical Gardens to the Consulate Hill. These plants, though small at present, will in the course of two or three years given an excellent appearance and shade to the roads.—*Planters' Gazette*, Dec. 1.

ANOTHER CEYLON TEA COMPANY.

Under the title of the Nuwara Eliya Estates Company, Limited, a Company has been registered with a capital of £150,000 in £10 shares to adopt and carry into effect an agreement, made November 28, between W. Megginson of the first part, Frith, Sands & Co., of the second part, Leechman & Co., of the third part, and C. R. Speed, on behalf of this Company, of the fourth part; generally, to acquire certain tea and other gardens in Ceylon, and to carry on the business of tea planters, merchants, brokers, and shippers. These signatories, who take one share each, are J. Sands, 50, Old Broad Street, E.C.; C. A. W. Cameron, 50, Old Broad Street, E.C.; C. R. Speed, 50, Old Broad Street, E.C.; S. H. Smith, 50 Old Broad Street, E.C.; W. R. Sand, 50 Old Broad Street, E.C.; H. St. J. O. Thompson, 38, Mining Lane, E.C.; P. Williams, 33, Hyde Park Gardens, W. The first directors, of whom there shall not be less than three nor more than five, are H. St. J. O. Thompson, C. A. W. Cameron, and C. R. Robson. Qualification, £250. Remuneration £50 each per annum when the subscribed capital does not exceed £33,000, £100 when it is between £33,000 and £100,000, and £150 each when it exceeds £100,000.—*H. & C. Mail.*

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, December 12th.

NUX VOMICA remains very low in price. A few odd packages of ordinary quality sold today at from 4s to 5s per cwt.

ESSENTIAL OILS.—The principal feature in the essential oil market this week is the continued advance in Lemongrass oil. It is said that as much as 1s 11d per lb has been paid for this article on the spot, while for delivery business has been done at 1s 6s 16th d. per lb e i f (drums) for June and at 1s 6s 16th d. per lb e i f (drums) for April shipment. Lemongrass oil is quoted at 2½d per oz the spot. Cinnamon-leaf oil has been in strong demand. Sales have been made at 4d and 4½d per oz, and as much as 5d per oz is now required. Four cases of fair Cinnamon oil sold at auction today at 10½d to 11½d per oz.

COCAINE.—Unaltered. A fair demand is reported at the previous quotations of 14s per oz for 100-oz lots.

ARECA.—Ten bags of fair quality sold today at 12s per cwt.

VANILLA.—At auction today 256 tins (about 1,800 lb) of vanilla met with less competition, and sold at lower rates for long beans, part of the supply being bought in. Fine crystallised 7½ to 8 inches, realised 28s 6d to 31s; good, 7 to 7½ inches, 27s 6d to 28s 6d; 6 to 6½ inches, 24s 6d to 26s; 5 to 6½ inches, 22s 6d to 23s 6d; 4½ to 5 inches 22s to 23s; dull and grey from 16s 6d down to 6s 6d per lb.

LAND IN SELANGOR.

In the *Selangor Gazette*, Mr Holmes writes from Kuala Selangor:—I received, during the month, 16 applications for land from Europeans and others for blocks varying in area from 320 to 1,000 acres, each applicant proposing to plant coffee. The Resident has since given instructions to the Chief Surveyor to have 20 blocks laid out in accessible parts of the district, and these will be put to auction at an early date. I have every reason to believe that the district will prove to be a planting one, and the fact of its having a port and its proximity to Penang should be in its favour.

Mr. Skeat, on the same subject, in his report on Klang, says:—The land demarcated during October comprised 101 lots, aggregating 315 acres. The balance of land undemarcated has now been reduced to 1,885 acres. Mr. E. V. Carey took up 500 acres on the Sungei Binjai Road, and an application for 320 acres was also received on behalf Mr T. Fairhurst for land adjoining Mr Carey's application. The land in the vicinity has been very favourably reported upon by all who have seen it, the soil lying nearer to the surface and being less fibrous than some of the land on this side of the river. The Sungei Binjai Road, if carried through to Ijoh, should have as bright a future before it as either the Langkat Road or the Jalan Kabun; applications were also received from Mr Cropley for 50 acres and from Yap Ah Boon for 25 acres, of mining land at Bukit Kamuning.

PROTECTION OF INSECT-EATING BIRDS.

The following letter has been addressed to the editor of *The Argus*:—

Sir,—I have read with much interest the letters from Mr. C. French and Mr. F. R. Godfrey in your columns pleading for the Artemidae, or wood-swallows. Are those gentlemen aware that the birds in question are among the worst pests the bee-keeper has to contend against? They are now in very great numbers in this district and may be seen flying about the orchards and gardens feeding upon bees.

My attention was drawn to this fact some years ago by a neighbour, who had a large number of hives, shooting the birds. On my remonstrating with him, I was shown a bird just shot with no less than 17 bees inside it. I watched the birds for some considerable time in my own orchard and saw them feeding on the bees, often flying within a couple of feet of a hive to seize a weary homeward-bound worker, evidently preferring those well laden with honey. I shot several and always found them full of bees.

This year the birds are far more numerous, consequently the apiarist suffers to a greater extent. I am well aware of the fact that these birds also destroy noxious insects in very great numbers, but when an apiarist finds his hives becoming weaker and weaker, and at last discovers the wood-swallow to be the cause, can it be wondered at if he protects himself by destroying them? I should much like to learn if apiarists in other districts have suffered in a similar manner.—I am, &c.,

EDWARD A. L. VIEUSSEUX.

Grammar School, Berwick.

INDIAN TEA FIGURES FOR 1895.

The extraordinary fluctuations in the figures of Indian tea as published monthly surely require some explanation. Various reasons are given for these fluctuations, but we have been unable to get a sensible explanation, and we do not pretend in this to solve the difficulty nor to attempt it, but merely wish to draw more attention to the subject as it is bound to have an unsettling effect on the markets. Having before us the Brokers' circulars, we quote from them the following figures dated 2nd October. Exports from Calcutta, to Great Britain to date, from beginning of the season.

(As per Customs passes.)

1895-96.	1894-95.	1893-94.
62,870,708lb	62,036,103lb	56,738,723
Landings in London during September.		
1895.	1894.	
11,600,000	18,802,000	
DELIVERIES.		
1895.	1894.	
9,100,000	8,931,000	
STOCK.		
1895.	1894.	
33,941,000	31,435,000	
Then going on, the same circular gives for four months, 1st June to 30th September—		
IMPORTS.		
1895.	1894.	
38,732,036	36,940,000	
and deliveries		
1895.	1894.	
33,623,906	33,981,000	

During the period any one will observe that the deliveries this year are slightly under those of 1894: the imports have increased by about one million and three-quarters whilst the landings in September were about 2½ million less than in 1894.

Take October again, the exports by Customs passes, were 81,560,480 lb. against 78,300,415 lb. the landings in London 19,000,000 against 17,724,000 lb. in 1894 Imports were 57,741,000 against 54,665,000 in 1894. And Stock on 1st November stood at 41,500,000 for 1895 and in 1894 37,638,000.

Can anyone reconcile these figures? Please note the landings in September were 2½ million lb. less than in 1894; the deliveries were practically the same, still the stock increased. Again, for November London Imports were for 1895, 15,800,000 lb. for 1894, 17,688,036 lb. deliveries 12,100,000 lb. against 11,932,701. Stock, 45,274,000 lb. against 43,443,024.

During the period, the exports from Calcutta from an increase of less than a million jumped to close on five million lb. the figures being as under on 2nd October—1895—62,870,708 lb. 1894, 62,036,103 6th December 101,175,256 lb., 96,704,720. and Stock stands very much as before. We are well aware that all this increase cannot be shown, but the leaps and bounds, which the crop takes every now and then, show that the present system of checking figures is wrong somewhere or else that figures and teas as well are suppressed for some ulterior reason. Taking the figures of the Indian Tea Association, the amount available for export is established at 124 million. Putting this into the manufacturing months, say 8, would give an average output of 15 millions monthly. Now September, was a notoriously bad month, and, the presumption, judging from a list of gardens in front of us, is there was less tea made in September this year than last. And October was not by any means extra favourable in the early part; although, undoubtedly, the weather was more genial towards the end, yet these hardly could have been manufactured during that time, say a fortnight. This gives an increase of 30 odd per cent; and the conclusion that must occur to any one is, that teas were held with a view to forcing the market, if not for what other reason? Had this occurred in the early part of the season, one could have found plenty of reasonable excuses, but when the season for floods and storms had long passed, the matter assumes quite a different phase, and we should be glad of some reasonable explanation.—*Indian Planters' Gazette*, Dec. 28.

CLOSETS, Urinals, Night Commodes, Stables, Kennels, &c. should be lightly dredged (after cleansing) with CALVERT'S 15 per cent. CARBOLIC POWDER, to destroy bad odours and to kill or keep away insects. The most effective preparation.—In 4lb., 1lb. and 2lb. dredgers, at 6d., 1s., & 1s. 6d. each, from Chemists and Stores.

F. C. CALVERT & Co., Manchester.

THE COCONUT OIL SITUATION.

In the *Reporter* of October 28th we pointed out editorially some features in connection with the position of coconut oils which seemed to warrant the conclusion that the market for both kinds would continue favorable to sellers during the balance of the year, if not longer, and since then the course of events has fully confirmed that view. As regards Ceylon oil, the situation, as explained in our previous article, has not materially changed, but recent developments in the market for Cochin oil have been decidedly interesting and important.

It has come to light that within the past ten days practically all the Cochin oil on the spot has passed under the control of two strong local houses. Small stocks are still held by two other concerns, but the quantity is comparatively insignificant and cannot possibly become a disturbing factor, even if the parties were disposed to release their holdings at prices below current quotations. But they are not so inclined, particularly as the oil is in demand and saleable at full figures, and the immediate outlook, at least, is a promising one. The negotiations which culminated in the acquisition of the supplies of Cochin oil, as stated, were conducted so quietly that few in the trade were aware of what was being done until the purpose aimed at had been accomplished. In making these purchases, the houses in question were guided by what they deemed a favorable opportunity to make a safe investment, and since the deal was consummated the market has responded by an advance, supplemented by increased firmness. The quantity that changed hands and the price paid for the goods have not been disclosed, though several hundred tons are said to be involved, and it is surmised that five and a half cents was the figure agreed upon. What lends special interest and significance to these transactions is the fact that virtually all of the Cochin oil due here this season has already arrived and passed either into consumption or under the control of the three or four operators alluded to, leaving the market at present with only a moderate supply. Furthermore, the offerings from primary markets are very limited, and prices there are gradually hardening. According to cables received this week from London, stocks there are considerably reduced, and it costs all of six and a quarter cents to buy there and lay down Cochin oil here. Mail advices show that the stock of coconut oils, all kinds, held in London on the 1st of November was 770 tons, against 968 tons on the 1st of October and 1,107 tons on the 1st of September, thus indicating a steady demand with diminishing receipts. The inquiry for coconut oils, particularly Cochin, has recently improved, and most of those dealers who are usually well equipped to meet all requirements have latterly been inconvenienced by curtailed supplies of Cochin oil. While this has not been true, to the same extent, of Ceylon coconut oil, the market has been seasonably active, and as stocks are under firm control prices continue steady and the general situation in that oil is characterized by a healthy tone.

The higher quotations now ruling for Cochin oil on the spot, are therefore due partly to a better consumptive demand, combined with increasing strength abroad, and partly to the fact that local supplies have been concentrated in strong hands. Present holders contend that existing conditions justify still further additions to current values, and there are reasons for believing that by degrees the price will be raised to a

point more in harmony with the import cost. In doing this the trade will, of course, bear in mind that, while even partial relief to the market cannot immediately be expected by direct shipments from Cochin, holders in London are in a position to spare moderate quantities, provided they can obtain satisfactory prices. It follows, therefore, that should the movement here continue in an upward direction, the limit will have been reached when values touch or closely approximate the cost to land the oil from London. At that centre the imports of coconut oil for the first ten months of this year were 3,105 tons, compared with 2,430 tons for the corresponding period in 1894; 2,464 tons in 1893, 2,705 tons in 1892, 5,078 tons in 1891 and 3,345 tons in 1890. The returns do not indicate what proportion of this is Cochin or Ceylon oil.—*New York Drug Reporter*, Nov. 25.

WYNAAD PLANTERS' ASSOCIATION.

Proceedings of a general meeting held at Poothacoolie Bungalow, on Wednesday, 18th December, 1895. Deputation to the Viceroy.—A circular from the Secretary of the V. P. A. S. I. giving the Viceroy's answer to the deputation was laid on the table. The Honorary Secretary stated that after the deputation to the Viceroy, Messrs. Acworth, Hamilton, Sprott and himself had met and passed resolutions to the following effect:—1. That in the opinion of the deputation, the answer given by the Viceroy was so far satisfactory that no further action need be taken until His Excellency had returned to Calcutta and had sent in a definite reply. 2. That inasmuch as His Excellency the Viceroy had stated that he believed that there were many weighty opinions against the necessity of giving advances at all, we, as representatives of the community, put it on record that in our unanimous opinion the giving of some amount of advance when making contracts for labor was an absolute necessity. 3. Proposed by the chairman, seconded by Mr. C. A. Mackenzie and carried unanimously that this Association endorses the action taken by the Honorary Secretary and records its opinion that the giving of some form of advance is necessary.

TEA AND COFFEE GROWING IN FIJI.

AN UNSUCCESSFUL EXPERIMENT.

The *Fiji Times* quotes a reference which appeared in our columns regarding a farewell dinner to Mr. Stephens, eldest son of the Patriarch of Dolosbage, on the occasion of his leaving Fiji. Our South Sea contemporary says:

Mr. Stephens will leave Fiji in the R.M.S. "Warimoo" on 3rd proximo on his return to Ceylon, a disappointed man. That he should be so, is only natural, considering that he has spent about fifteen of the best years of his life in this colony in the endeavour to grow tea and coffee at a profit. He has finally abandoned all hope of being able to bring the enterprise to a successful issue, labour troubles being the chief difficulty. We in common with the many well-wishers of the colony deplore his departure exceedingly. We understand that he has been offered an appointment in his first home, Ceylon.

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Ear-prints and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN, LONDON.

INDIAN TEA SALES.

(From Watson, Sibthorp & Co.'s Tea Report.)

CALCUTTA, 24th Dec. 1895.

There was a good general demand in the sales held on the 20th instant. Prices for all kinds ruled rather irregularly, but without quotable change, the tendency being slightly in favour of buyers. 16,986 packages changed hands.

The average price of the 16,986 packages sold is As. 7-0 or nearly 7½d per lb. as compared with 15,552 packages sold on the 20th December 1894 at As. 9-10 or nearly 10d per lb. and 10,859 packages sold on the 21st December 1893 at As. 6-10 or about 8½d per lb.

The Exports from 1st May to 21st December from here to Great Britain are 106,362,937 lb. as compared with 101,035,102 lb. at the corresponding period last season and 99,178,598 lb. in 1893.

NOTE—Last Sale's average was As. 7-7 or nearly 8½d per lb.

EXCHANGE—Document bills, 6 month's sight 1s 2-1-32d.

FREIGHT—Steamer—£1-11-3 per ton of 50 c. ft.

(From William Moran & Co.'s Market Report.)

CALCUTTA, 24th Dec. 1895.

TEA.—The last tea auctions for 1895 were held on Friday, the 20th instant, when 17,528 packages were offered, of which 17,062 packages were sold.

The sale comprised a large quantity of brown and common descriptions, which were rather easier in tone; finest were also in rather less demand, while medium kinds remained unaltered.

The next auctions are fixed for the 3rd prox.

TOTAL QUANTITY OF TEA PASSED THROUGH CALCUTTA FROM 1ST APRIL TO 21ST DEC.

INDIAN PATENTS.

Calcutta, the 28th November, 1895.

Applications in respect of the undermentioned inventions have been filed, during the week ending 23rd November 1895, under the provisions of Act V of 1888:—

FOR IMPROVEMENTS IN TEA LEAF ROLLING MACHINES.—No. 361 of 1895.—Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, Merchant, for improvements in tea leaf rolling machines.

Specifications of the undermentioned inventions have been filed, under the provisions of Act V of 1888:—

FOR IMPROVEMENTS IN APPARATUS FOR WITHERING TEA LEAF.—No. 145 of 1895.—Robert Thomson, of Kinning Park Engine Works, Kinning Park, in the County of Renfrew, Scotland, Engineer and Tea Planter, for improvements in apparatus for withering tea leaf. (Filed 1st November 1895.)—*Indian and Eastern Engineer.*

THE IMPERIAL CEYLON TEA ESTATES, LD.

We learn that Inverness and Edinburgh estates have been acquired by Mr. Megginson on behalf of this Company, the agents of which are Messrs. J. Whittall & Co. in London and Messrs. Whittall & Co. in Colombo. The estates which this Company have now arranged to purchase are as follows:—

	Total Culti- acreage, vated.	Price.
Inverness and Edinburgh	432 392	£33,600

Binoya	929	441	£25,703	
Mottingham	258	229		
Nonpareil	549	402	£8,000	
					(coffee & tea)	
					2,168 1,455	£67,703

The subscribers to the Company are:—

J. H. M. Shaw, 9, Fenchurch-avenue, E.C.; C. S. Lott., 9, Fenchurch-avenue, E.C.; S. Gray, 9, Tre-gothman-road, Clapham; C. R. Shaw, 92, Wimpole-street, W.; A. Thomson, 9, Fenchurch-avenue, E.C.; F. R. Cave 23, Clarendon-gardens, Maida Vale; J. Stevens, Loch Goil, Romford.

VARIOUS PLANTING NOTES.

THE CREOLE (RED) RICE OF LOUISIANA is pronounced by the Government chemist at Washington to be the richest of all rice in nutrient properties. This is no new thing, for its merits have been fully appreciated for a century past in the Southwest. In that locality it is given preference over white rice, and in view of the fact above noted and of its cheapness, ought to command a greatly extended patronage in the North and West.—*American Grocer*, Dec. 4.

ROYAL GARDENS, KEW.—The Bulletin of Miscellaneous Information for November has the following contents:—Ai Camphor; Botanical Nomenclature; New Orchids, 15; Begonia Disease; Rafia from West Africa (continued); Diagnoses Africanæ, IX; Sumach; Liberian Coffee; Miscellaneous Notes:—Funeral of M. Pasteur, Botanical Magazine, Index Kewensis, Kew System of Greenhouse Construction, Rosa wichuraiana, West Indian Frog at Kew, Spot Disease of Orchids, Arabian Objects for Museum, Pictures of the Lake, Select Extra-tropical Plants, Cape Herbarium, Camphor, Shade Tree for Coffee, and Crop of Cider Apples.

THE COFFEE INDUSTRY ON HAWAII, says the *Planters' Monthly*, is being pushed forward by as energetic and intelligent a class of men as ever engaged in pioneer work. They, however, labor under drawbacks of various kinds, which only time and perseverance can overcome. This industry requires five years to bring it into a paying condition: and to succeed, the pioneers need not only perseverance, but ample means to carry along their load, until the crops begin to come in freely, when brighter prospects will follow. No better coffee is anywhere raised than Hawaiian, and this fact alone should give firm assurance as to the ultimate result. All who have used it, both here and in other countries—some many years—are unanimous in the opinion that for delicious flavor and for permanent health-growing qualities, there is no equal to the pure Hawaiian coffee. Still, the amount for export this year will be small, as none of the new plantations are yet five years old; but in 1896, better returns may be expected.

GUMMING IN FRUIT TREES.—In Mr. Iggulden's very interesting remarks on Peach tree failures he says, "French experts think gumming is caused by the sun." While I think it may do so in France, I think cold may be one great cause of gumming in England, as we generally find a great deal more after severe winters, and I think the bursting of the cells, while the sap is freezing, has more to do with it than is generally supposed. The chief cause in Peach houses, as Mr. Iggulden says, is bursting the cells by injury from wares, or knocking the bark off by tools; but in each case the cells are burst, and the gum exudes out, and if this gum is left on the bark it injures it to such an extent that it has the appearance of canker, and if it drops on to a sound branch it injures the bark there, if the shoot is a young one with thin bark. I am quite aware that gumming is supposed to be caused by the *Coryneum* fungus. But is this fungus the first cause of gumming? or does it breed spontaneously in the sap after it has exuded? If so, the dropping of the gum (with the fungus in it) on to another branch would cause gumming there by rooting into the bark and into the sap. I find Plum trees on a north wall that have had no sun aro badly affected.—J.L.—*Journal of Horticulture and Cottage Gardener.*

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce).

Colombo, Jan. 6, 1896.

GRAPE CULTIVATION IN COLOMBO.

ZANETTI'S letter which appeared in the morning issue of the *Ceylon Observer* of the 22nd November takes a very hopeful view of the ultimate result of the experiment in vine-culture which is being

carried on at the School of Agriculture. The ability of the vines to withstand the effects of a copious rainfall—generally supposed to be hurtful to the grape—was put to a severe test by the abnormally heavy rains of October, and it would appear that the plants did not suffer on that account. We recollect when the proposal to grow grapes in Colombo was under consideration, that M. Zanetti stated that in his experience no ill-effects were to be apprehended from a wet climate, provided a proper site was chosen—one in which the soil was porous and did not become water-logged. We understand that in Australia the vine thrives in wet districts where the physical properties of the soil are favourable to its growth. In a previous issue reference was made to the vines grown by Father Assauw of the Roman Catholic Mission at Wahakotte. These did very well for a time, but are reported to have been ultimately killed out by an excessively wet season. After the late experience at the School of Agriculture, we are inclined to think that it was the tenacious nature of the soil that made it impossible for these vines to make any growth during the abnormally wet season they experienced, for it is well known that the grape cannot thrive in cold and stiff soils that are practically impermeable to water. The Jaffna peninsula is generally spoken of as the most suitable district for vine-culture, but it is questionable whether this has been proved to satisfaction. It is time that there are a number of prolific vines flourishing in the North, but there the enterprising householders would seem to

concentrate much of their energy on one or two vines grown on trellises (so to speak, under their very noses), giving them as much attention as any hothouse grapes in England. We have heard that the main difficulty which the Jaffna grape-grower has to face is a water supply for the vines, which for the most part of the year have to be liberally treated with water owing to the extremely dry and arid climate which characterizes the north of the Island. The test as to whether grape cultivation can be made a successful industry in the Jaffna district would be to establish a vineyard of say a thousand plants and see whether anything will come of the experiment. Under the circumstances in which grapes are at present raised there, it would be unreasonable to infer that viticulture as an industry will be a success in Jaffna. There are many trees that we can grow well and force into fruit in our gardens by special attention, though we know that it would be absurd to attempt to cultivate them on a large scale and expect remunerative results. Let us take the case of so common a tree as the orange, which is perhaps more frequently found in gardens than any other fruit-tree. With special attention it can be made to thrive almost anywhere and fruit excellently, but there are only a few situations in which one would be bold enough to attempt orange culture. It would seem that the good folk of Jaffna had their attention specially directed to grape growing (as also to the operation of grafting) by an enterprising official ruler with a strong predilection for agriculture, who by the force of his philanthropic nature no less than by the weight of his official influence, persuaded many of his subjects ready to follow his advice and example. (Would that we had more like him!) Indeed, we have heard it said that it is "the fashion for every householder in Jaffna to have a grape vine in his compound." So much the more credit for the Jaffna householder for the taste he displays.

We do not, however, mean to affirm that it is our conviction that Colombo is the best place for vine-growing, or even to assert that vine-growing

is bound to be a success in Colombo. Indeed, we have not had sufficient data to go upon to arrive at such conclusions. We can only state that as far as the experiment in vine-growing has gone, the varieties of Australian grapes—some ten in number—which have been planted in the grounds of the School of Agriculture have done remarkably well. We have yet to see whether they will continue to thrive as they have done, and whether the severe pruning which M. Zanetti has given them, in accordance with the system practised in Australia, will suit the vines in their present situation.

We are glad of one result of this experiment, and that is, that many enterprising gentlemen have secured cuttings of the excellent varieties of grapes which M. Zanetti has introduced into Ceylon. Some of these cuttings have gone to Chilaw and Puttalam, which have always been spoken of as suitable places for grape growing. The system of cultivation in connection with the experiment at the School of Agriculture has been to limit the spread of the vine to the accommodation afforded by a standard some 3½ feet high. It will thus have to be seen further whether this system will suit our conditions of soil and climate, in place of training the vines on trellises, the common method in Ceylon. What we should greatly desire is to see some of the best-flavoured varieties of the grape put into the skillful hands of the Jaffna vine-dressers instead of the "wild grape" which is hardly worth the energy which they spend upon its cultivation. This is a matter which the Government Agent of the Northern Province might interest himself in. With the knowledge of the process of grafting which the people of Jaffna possess, some of the introduced varieties of grapes might successfully be grafted on the vigorous stocks to be found in the North.

OCCASIONAL NOTES.

Writing at the end of 1895 we wish all our readers "A Happy New Year," and trust that 1896 has prosperous seasons in store for agriculturists in Ceylon and abroad, and that it will prove to be a year of plenty. For ourselves, we shall make the "fresh resolution" to do all we can, in our own little way, to further the interests of Agriculture in the Island through the coming year.

In less than a month after the pruning of the Vines—referred to in the article on Grape Cultivation—they have again made rapid growth, and, this time a fairly large number have put out blossom, which, if it set, should give a nice little crop early next year.

The "Model Farm"—now only so in name—is after a long period of neglect again beginning to look a bit trim. To keep such parts as are not under Mauritian grass in this condition is no easy matter, considering that it has been overrun by that most troublesome of weeds, the Sensitive plant. The new manager, Mr. Samaranyaka, has, however, made a good beginning in clearing away brushwood and cleaning the land, and while gradually extending the cultivated areas, improving such parts as are available for pasture. The extent of the farm is over two hundred acres. There are at present 25 head of

cattle from the Government Dairy at grass there. The only objection to the Model Farm—which is otherwise a most desirable site, and indeed a very picturesque spot,—is that a good part of it is liable to go under water at certain seasons of the year, but we will hope that before very long the working out of the flood outlets scheme will remove this defect.

We draw attention to the first part of a paper written by Mr. Mollison, on the management of Dairy Cattle. The writer who rendered such invaluable help at the inception of the Ceylon Government Dairy is admitted to be the best authority on stock in India. We commend Mr. Mollison's paper to the careful attention of all those who have anything to do with milch cattle.

Agricultural science will be much the poorer for the loss of Professor Hellriegel, whose name is so familiar to students of Agriculture, particularly in connection with the subject of the relation of the free nitrogen of the air to plant life.

THE FEEDING OF ANIMALS.

"It is obvious that so long as a country is sparsely populated and the needs of the people are amply supplied under a comparative rude system of agriculture, in which extended area precludes the necessity for improved methods, there would be little either of scope or of inducement to study economy in the feeding of animals, or systematic practice in regard to it. But as population increases in proportion to area, there arises the necessity for increased production over a given area."—(Lawes & Gilbert.)

The condition of native agriculture in Ceylon has been such that the needs of the people have hitherto been amply supplied by a comparative rude system of rural economy. But it is clear that as the population increases and the area under cultivation becomes limited, such a happy state of affairs cannot continue, and unless attempts are made to grow a greater variety of crops, and some attention is given to the such important questions as the manuring of land and the supply of "artificial" food for animals, the lot of the peasant farmer must before long become a very wretched one.

The rude system of managing land and stock at present in vogue will have to be gradually improved, if such a result is to be prevented. To the feeding of animals we are aware that the native cultivator pays little if any attention, allowing the stock under his care to roam about in search of natural pasture and forage for themselves as best they can. But the area under natural pasture is becoming diminished, and even the grass that is found in such land as is yet available has a tendency to become deteriorated. And, indeed, the results of these changes are before us. Years ago, there were many districts in the Island which raised a strong and healthy breed of cattle and buffaloes, and where the cows yielded a fair supply of milk. Any of the older inhabitants of these once-favoured districts will bear testimony to the degeneration that has taken place. Strong healthy bulls and buffaloes are now rarely met with, having been replaced by an unthrifty, undersized breed. The milch cattle now hardly supply sufficient milk to make it worth one's while to draw it. The native cultivator, as is well known, does not recognize the value of cattle manure, and though unable to ascribe a cause, he sees his lands getting poorer day by day. As it is beyond his power to account for this change for the worse, he will alternately blame the seasons and the weather, but it often happens that he is so resigned to his fate that he makes no attempt to discover any cause for the disappointing results of his operations. In some cases, he becomes so despondent, that he loses all energy, and considering it hopeless to attempt to bring about a better condition of things, he disposes of the few cattle he possesses and abandons his bit of land. Now, it is clear that the native cultivator must be made to recognize the necessity for increased production over a given area for the introduction of a variety of crops so as to supply food for man and beast. But it is only gradually that his mind can be trained to think in this way, by instilling into him the principles of the art which he professes to practise. Take the case of the feeding of stock, which is so important a matter, since the success of the agriculturist,

particularly in the East, depends so much on the condition and capabilities of his animals. It should be recognised that animals have to be fed differently for the different functions they are expected to perform, whether for the production of meat or milk or manure, or for the exercise of force.

Certain foods are characterised by the presence of some of the essential ingredients greatly in excess of others, so that from an economical point of view and also for producing the best effects of feeding, mixed diets are necessary; and in order to mix foods properly, the composition and cost of various foods should be taken into consideration. But before deciding upon certain mixtures we should keep in view what is expected of the animal, whether milk, meat or energy, and with a full knowledge of the capabilities of the various foods to help in producing these, we should mix accordingly.

(To be continued.)

NOTES FROM THE POONA FARM.

I trust the following notes culled on my late visit to the Poona Farm will interest your readers. The Superintendent, Mr. Mollison, so well-known in Ceylon by name, is considered an authority on Agriculture in India.

Of the Improved Ploughs Mr. Mollison prefers the Turnwrest to all the others for general use in India. It is interesting to watch how this plough is worked at the Farm. Two pairs of good strong Gir bulls yoked one pair behind the other are used for drawing it. The ploughing being begun at one end of the field, after each furrow is made the animals are turned short and the next furrow is taken just beside the former one without leaving any space between them, so that the furrow slice from each regularly covers the preceding furrow. Of course at each turn the mould-board and share are turned to the furrow side. The ploughing thus begun at one side of the field is finished right at the other without any unploughed strip of land being left in the middle; and the headlands are ploughed last of all.

2. The Gir bulls used in the plough are the ones kept for breeding purposes. They are worked in the morning and evening and allowed to rest during the middle of the day when the sun is powerful. The animals are all the better for the moderate exercise they get in this way, and are thereby better fitted to do their work as stud bulls than they would be when allowed to remain idle. Besides, when four animals are yoked together, the draught is so well divided among them that the strain on each individual animal is but slight.

3. It must be noted that it is not every breed of bulls that can thus be used uncastrated for draught work especially in the plough. The spirited kinds such as the Mysore and Decanee are too mischievous to be so used without being converted into bullocks; but bulls of the Gir, Aden and Sind breeds, which are naturally docile and intended for slow work, can be used uncastrated. The Krishna Valley, Malwa and Coimbatore breeds are also noted as plough cattle.

4. The majority of animals in the dairy farm are buffaloes which are preferred, as they yield richer milk than neat cattle, and are therefore

more profitable for making butter. But a good number of Sind cows are kept on the farm, and these are held in great repute as they are by far the best milkers in Western India.

5. The points of a good milker are:—a mild temper, a clean cut head, forequarters light but allowing sufficient room for the heart and lungs, a large belly, well-sprung back ribs, and strong massive hind quarters, thus giving the animal a wedge-shaped appearance when viewed lengthwise from the front. The best signs of milking qualities are, however, to be found in the udder and the milk vein. The latter should be prominent, *i.e.*, easily noticeable all along the abdomen until it disappears at the brisket. The larger the capacity of the udder the better, provided it is not fleshy. It should extend well forward on to the abdomen and come well back between the thighs. The teats should be large enough to permit the milker to take a good hold of them. They should be squarely set in the udder, be of equal size and not grouped together in a cluster but be wide apart. Most of these points are found in Sind cows, but the only defect in the shape of the udder noticeable in many of them is that it is too pendulous. This, however, is not positive.

6. All the green fodder and hay required for the dairy animals are grown and prepared on the farm itself, only the concentrated food such as oilcake, cotton seed, grains and pulses being purchased. The chief fodder crops raised there are Guinea grass, Maize, different varieties of "Jowari" such as *Sorghum vulgare*, *Sorghum saccharatum*, "Bajiri," *Penicillaria spicata*, Lucerne and other papilionaceous crops such as *Dolichos uniflorus*.

7. Of these, Guinea grass and Lucerne are the most important, as they are permanent or perennial crops, and are each the best of their own kind as fodder. Guinea grass grows equally well under the shade of big trees such as the mango and banyan as in the open. It also does well in damp situations if there is no stagnant water. If well manured and regularly watered it can be cut ten or twelve times in the year, the mowing being always done as close to the crown of the root as possible. A Guinea grass plantation has to be renewed once in every three years, because the tufts get overgrown in that time.

8. Lucerne ranks first of the leguminous family of fodder crops. If free from disease and properly attended to as regards weeding, manuring, &c., a lucerne field will last for four or more years, and can be cut ten or twelve times in the year. Its worst enemy is a fungoid disease which affects the roots. No remedy is known for this: but prevention must be sought in the selection of land, method of sowing and general care of the crop. It is best grown in a deep friable lime soil on ridges two feet apart, 10 lbs. of seed being used for an acre. It is said that when Guinea grass and Lucerne are grown as a mixed crop, the latter is less subject to fungoid disease.

9. When such cereal crops as Maize and Sorghum are grown solely for fodder, the seed is sown much thicker than when they are intended as grain crops. The quality of the fodder is thereby improved because the stalks grow thinner and more delicate; and further, the outturn per acre is increased. The best time to cut the crops

is when they are beginning to flower, as the nutritive properties of the plant are then well distributed throughout the whole plant. Later on the nutrition is more or less centred in the grain and the stems become coarse and woody. When fed on fodder cut before flowering, cattle are apt to get hoven as the crop are too green and watery at the time. Maize grown as fodder is cut when the male flowers appear.

10. Any extra amount of green fodder grown on the farm during favourable seasons is preserved for after use in the form of hay. Guinea grass makes the best hay and next come the Sorghums and Millets. Lucerne is not suited for this purpose because the leaves get very brittle as the crop dries and a large proportion of them falls off and is lost. In hay-making the grass should not be allowed to get quite dry. If a little of the sap is retained a slight amount of beneficial fermentation occurs in the stack, a sweet flavour and fine aroma are developed, and the hay is thus rendered more agreeable to the taste and smell. Care should at the same time be taken that the hay is not stored too moist; for then the centre of the stack will be overheated by excessive fermentation, whilst near the outside the hay will get musty. Hay should be stored under suitable cover and in the Poona farm there is a spacious shed built for the purpose.

E. T. HOOLE.

2nd November, 1895.

THE FERTILITY OF SOILS. (PROFESSOR KINCH.)

In most published analyses of soils the total amount of nitrogen and the amount of various mineral matters dissolved by strong hydrochloric acid is stated. Such analyses are useful for some purposes, and in some cases are sufficient to indicate a deficiency of some particular form of plant food, but they by no means indicate the amount of available plant food in the soil. A few analyses have been made by extracting the soil with water charged with carbonic acid gas, and a few in which dilute acetic acid was the solvent used, these being thought to more nearly represent the action of the living plant on the soil. Recently an important advance towards determining the amount of available mineral plant food in a soil has been made by Dr. Bernard Dyer. He examined the juice or sap of the roots of about one hundred different plants, belonging to twenty different natural orders, as far as their total acidity went. No attempt was made to determine the actual acid present in each case, but only the actual acidity of the root sap. This itself is by no means an easy task, and any method used is liable to errors. However, he found that taking the average of the whole number of plants tried the total acidity of the sap came to rather less than that which would be produced by dissolving crystallised citric acid in water to a strength of 1 per cent. of weight of the acid. Some plants of the rose order—*viz.*, *Geum* and strawberry, also evening primrose and thrift, *Armeria*, had a root sap with a higher acidity than this, whilst the root of leeks, some mangels, and some grasses were much less acid. Leguminous plants, white clover, red clover, and beans seemed to develop a much less acid root sap when grown in pots than

when grown in the field; possibly they had less necessity for the acid when in the probably richer soil of the pots. However, Dr. Dyer determined to try the effect of a 1 per cent. citric acid solution on soils of known composition and history to see if this would really act in the same way as the acid sap of the roots on the phosphoric acid and potash of the soil, and so be in some degree, at all events a measurer of the available mineral plant food of the soil.

Soils suitable for testing this point could only be obtained from one place in the world—viz., Rothamsted. Here alone have soils been under exact experiment and observation for a sufficient length of time for their agricultural capabilities to be accurately known. From Rothamsted then, with the kind assistance of Sir John Lawes, were obtained samples of soil from twenty-two of the barley plots in Hoos Field which have grown barley for forty years in succession under various treatments as to manure, and the exact amount of the produce from which each year is known, as well as in many cases the chemical composition of the produce. The weight of the fine soil of the plots, calculated to a depth of 9 inches per acre, varied from about 2 to $2\frac{1}{2}$ million lb. In these soil samples were determined the amounts of phosphoric acid and of potash soluble in strong hydrochloric acid, much as in an ordinary soil analysis, and also the amounts of phosphoric acid and of potash soluble in a 1 per cent. solution of citric acid, which solution was allowed to act for seven days on the soil. The results obtained were very interesting and instructive. Calculating them into lbs. per acre of the soil to the depth of 9 inches, they showed that the plots which were unmanured or received no phosphatic manure contained from 2,500 to 3,000 lb. of phosphoric acid per acre, of which from 140 to 280 lb. were soluble in the dilute solution of citric acid. The soil of plots which had received phosphates in manure contained from about 4,200 to 5,400 lb. of phosphoric acid, of which generally from 1,000 to 1,500 lb. was soluble in citric acid solution. A plot which had received farmyard manure for twenty years, and then been unmanured for eighteen years, contained 512 lb. of phosphoric acid soluble in citric acid per acre in 9 inches of soil; and a plot receiving farmyard manure for the whole thirty-eight years contained 932 lb. of such soluble phosphoric acid per acre. The amount of potash soluble in hydrochloric acid in the soil of unmanured plots, or those receiving no potash in the manure, averaged nearly 3,000 lb. per acre: where potash had been given in the manure it averaged about 6,750 lb. per acre to a depth of 9 inches. But with citric acid solution the comparative results were far different, the potash soluble in a one per cent. solution of citric acid from the soil of plots receiving no potash was almost always under 100 lb. per acre, whilst from the soil of plots receiving potash in the manure it averaged over 800 lb., and was sometimes over 1,000 lb. per acre. The citric acid soluble potash in the farmyard manure plot to which the dung had not been applied for eighteen years was 336 lb. per acre, that in the continuously dunged plot was 669 lb. per acre. Now there is nearly six times as much phosphoric acid dissolved by dilute citric acid solution from the soil of the plots receiving phosphates as from those not receiving phosphates, and nearly nine times as much potash

from the potash receiving plots as from those which had received no potash for forty years. If these results of soil analyses are compared with the actual crops of grain and straw obtained during thirty-eight years, it is most clearly brought out that those soils in which citric acid soluble phosphoric acid is low are those suffering from deficiency of available phosphoric acid, and likewise when the potash soluble in citric acid solution falls below a certain limit that the soil and the crops upon it are suffering from deficiency of potash. Thus a plot not receiving phosphates and with 152 lb. of phosphoric acid soluble in one per cent. citric gave a yield in 1889 of $22\frac{1}{2}$ bushels of barley, a plot treated in the same way except that it had $3\frac{1}{2}$ cwt. superphosphate per acre annually in addition, yielded 1,073 lb. of phosphoric acid to the citric acid solution, and gave $35\frac{1}{4}$ bushels of grain in 1889. Such cases might be repeated many times. In the case of the phosphoric acid it is found that the amount dissolved of citric acid is roughly proportional to, and approximately one half, the amount calculated to be left in the soil from applications of phosphates and not recorded in increase of crop.

From a careful consideration of the whole results, Dr. Dyer concludes "that it would not be unreasonable to suggest that when a soil is found to contain as little as .01 per cent. of phosphoric acid, soluble in a 1 per cent. solution of citric acid, it would be justifiable to assume that it stands in need of phosphatic manure." This amount would be equal to about 250 lb. per acre to a depth of 9 inches. Again, as regards potash, it is "more difficult than in the case of phosphoric acid to draw from the figures any fairly plausible suggestion as to what percentage limit of citric acid soluble potash should be regarded as marking the non-necessity of special potash applications. *Probably this limit lies below .005 per cent.*" That is about 125 lb. per acre to a depth of 9 inches. This plan of treatment of soils with dilute solution of citric acid does undoubtedly give valuable indications as to the condition of some of the important mineral plant foods in the soil, and is a decided step in advance in the matter of soil analysis. We are very glad to know that Dr. Dyer is extending his observations to the soils of the celebrated wheat field (Broadhalt) of Rothamsted, where wheat has now grown continuously for more than half a century.

THE MANAGEMENT OF DAIRY CATTLE.

BY MR. JAMES MOLLISON,

Superintendent of Farms, Bombay Presidency.

The constitutions of milch kine at time of parturition are delicate. Indian cows and buffaloes, although in a sense hardier than other milk breeds, are no exception to the general rule. Special care should at this time be exercised in providing suitable food and other comforts. If a cow or buffalo gives birth either during the monsoon or in the cold season, the animal must be protected from inclemency of weather. Experienced breeders will provide comfortable shelter during the wet days of the rainy season or the chill nights of the cold weather. A cool shady place will also be found for a newly-calved cow in the hot season. A recently-calved cow should not be turned out to pasture in the blazing sun and high day temperature of March, April and May. This practice must be deprecated even in the cooler parts of India. During the time a pregnant milch animal is "dry," which unfortunately (specially as regards the buffalo) is rather a lengthy period, the cow should be kept in good, but not high condition. A good pasture, well supplied with pure drinking water and shady trees, will ordinarily maintain in-calf cows in good condition. But when the natural pasturage fails, supplementary food of nutritive quality must be given. A full yield of milk during the next period of lactation need not be expected if the precaution referred to has been neglected. Beyond this a fairly liberal allowance of concentrated food must be allowed for at least six weeks just before calving. There is a very great variety of foods suitable and available for Indian milk cows. In the Deccan, kadbi (*i.e.*, Jowari, *Sorghum vulgare*, straw) or hay of fair nutritive value are the usual dry fodders; whilst various oil-cakes, cotton seed, dāl (*Cajanus Indicus*) husk (chuni) and wheat bran are the more common concentrated foods. Sesamum cake is perhaps the

best procurable oil-cake. *Khurdsni* or niger-see cake, though rather objectionable in appearance, is considered a safe and nutritive food. Safflower or *kusumbi* cake, although rather indigestible owing to the presence of a considerable percentage of fibrous husk has an advantage over other cakes, in that it can be bought at a season when it is cheap and thereafter safely stored. It neither moulds nor turns rancid on keeping. Cattle have to get accustomed to it, however, before they eat it greedily. Four to 6 lbs. per day of equal weights of oil-cake and bran, in addition to a fair allowance of dry fodder for the six weeks before calving, will keep a dry buffalo thriving. Less will suffice for a cow. A fortnight before calving, the quantity of concentrated food may, with advantage, be increased to 8 lbs. per day. The object is to supply the pregnant animal with concentrated food of a character which will not only exercise a slight laxative effect but will also improve the condition, so that free lactation may be expected soon after parturition. If in good condition, a full yield of milk forced by extra feeding will not debilitate the animal as would be the case if lean, when due to calve. For a week after calving, the feeding of the cow should receive close attention. The food should be of a laxative character and should not be too rich. Cotton seed, oil-cake and *chuni* (husk of *Cajanus Indicus*) should be at this time eschewed. There is no better food for a newly-calved buffalo cow than a mash consisting of boiled *bājri* (*Pennisetum typhoideum*) to which has been added an equivalent weight of bran whilst the cooked *bājri* was still hot. Five pounds each of *bājri* and bran will, with the ordinary allowance of dry fodder, provide sufficient ration for a day. Two oz. of salt added to the mash will make it all the more palatable. Good fresh green hay is at this time preferable to *kadbi* (*Jowari*, *Sorghum vulgare*, straw) and if a limited allowance of green fodder, say 15 lbs. per day, can be given, the ration will be improved. Thus the ration for a day of a newly-calved buffalo would consist of—

8 to 12 lbs. of good hay.		
15 lbs. of green grass or other green fodder.		
5 lbs. bran	} as a	
5 lbs. <i>bājri</i> (<i>Pennisetum typhoideum</i>)		hot
2 oz. salt		mash.

A cow should receive about $\frac{2}{3}$ rds of this ration.

Immediately after calving, a hot drink made up of a thin gruel or *kāuji* of ground *bājri* and bran with a handful of salt tends to cause the after-birth to come away quickly.

In Europe, deep milking cows are liable to milk fever which is most prevalent among heavy milking cows producing their 2nd or 3rd calf. As a preventive, should there be any risk of milk fever, the cow is drenched with linseed oil and Epsom salts repeatedly during the week before calving. The practice, which does not seem to be necessary with Indian cattle, simply because they are generally poor milkers, is effective, because the laxative medicine keeps the bowels open and prevents any undue secretion of milk. Under the most favourable conditions an Indian cow or buffalo will not yield the full quantity of milk for a week or 10 days after giving birth. Then the full yield may be expected and ordinary food may be given. A buffalo in full yield requires to be specially well fed. I do not think, however, that any quantity beyond 18 lbs. per

day of concentrated food will increase the milk yield appreciably. A moderate-sized buffalo giving over 30 lbs. of milk per day (a quantity sufficient to make 3 lbs. of butter) need not get a larger ration. Any extra quantity of food would be wasted. A large framed Jáfferabad buffalo requires a larger ration than the smaller sized Surat buffalo; and moreover the former in the Deccan are less profitable, because they require a greater quantity of concentrated food and fodder to produce a given quantity of milk. Similarly a Gir cow, because usually of large size, requires to be more liberally fed than the smaller sized Aden. The latter I have found to give an equal yield of milk to larger breeds on such less food. It is clear that no hard and fast lines can be laid down regarding the feeding of cows and buffaloes in milk. An experienced stock owner will very soon determine the quantity of food that can advantageously be given to any one of his cows or buffaloes. With good management either a good cow or a good buffalo will, in India, milk up to the full capacity for four or five months after calving, and during this period there should be little or no change in the daily ration. A milch animal has a palate, however, and occasional variety in the food is often desirable. If milk cows are fed from month to month with precisely the same food they sooner or later may reject it altogether or eat it with less greed and relish. An occasional change in the ration is, therefore, expedient. For this purpose dál (*Cajanus indicus*) husks (chuni), if not regularly given, can with advantage be substituted twice a week for part of the other food and occasionally crushed linseed $\frac{3}{4}$ lb. per animal, per day, may be similarly given.

A milk register will, if carefully kept, show at once when the milk yield begins to diminish. A daily record of the milk yield of each animal furnishes useful data. A glance at the figures will show when there has been any irregularity or disturbing cause to re-act on the milk yield. Moreover, if carefully kept, it is a true guide as to the value of different animals. One cow may milk well to begin with, but the yield rapidly diminish. Another cow may yield steadily for a long time and be much the more valuable and profitable animal of the two, although producing at no time an abnormally high yield. The milk register will also indicate whether the management of the cows has been good, and moreover furnish data which will enable the farmer to discard one cow whilst he retains another because the latter has been proved to be the more profitable.

When the period of lactation has somewhat advanced and there is evidence of a lessening milk yield, the ration should also be diminished. It may be necessary to change the food at least once a month. The change will be regulated to some extent by the size and condition of the animal, but the main consideration is how much milk did the cow give during the previous month. An average buffalo giving 18 lbs. of milk per day and suckling her calf should have the ration noted below. I have found it both good and liberal:—

Dry fodder	15 to 20 lbs.
Cotton seed	4 "
Bran	4 "
Oil-cake	3 "
Chuni (husk of <i>Cajanus indicus</i>)	3 "
Salt	2 oz.

The cotton seed, *chuni* (husk of *Cajanus indicus*) and bran with salt added should be moistened. The oil-cake, broken into pieces, at most an inch in diameter, may be placed on the top of the moistened mass but not mixed through it. The concentrated food should be given in two meals and at milking times. This is perhaps a bad practice which, however, cannot be avoided. Indian buffaloes and cows have been so accustomed to get the food whilst being milked that without it they refuse to let the milk down. The enjoyment of eating doubtless induces a placidity of disposition at the time which permits the *gavh* (milkman) to milk rapidly and extract more milk than he otherwise would, especially from those animals which are unusually irritable and fractious. Two-thirds of the dry fodder should be given at night, the remainder in the forenoon. The cows should be milked at regular stated hours, and there should be no deviation therefrom under any circumstances: 6 a.m. and 5 p.m. are suitable hours. The concentrated food is usually given in two equal meals at these times. The cows should have free access to pure water three times a day. Buffaloes should be bathed or washed at least once a day. During the period that good grazing is available the dry fodder may be reduced to 6 to 8 lbs. given at night and the concentrated food reduced by $\frac{1}{3}$ or if green food is available in reasonable quantity all the year round, it may be soiled to stall-fed cattle. A large buffalo may be allowed up to 40 lbs. per day of green food, and 6 or 8 lbs. of hay in addition, together with the concentrated food ration already noted. Usually 15 or 20 lbs. of green fodder per day is all that can be allowed. This quantity may be substituted for 8 or 10 lbs. of hay.

AILMENTS AND DISEASES OF THE HORSE.

BOG SPAVIN.—This disease resembles a wind-gall in its character, and is situated inside the hock joint. For practical work it is of no great consequence; it is, however, an unsightly sign of local weakness that pulls down a horse's value.

CAPPED HOCK.—Capped hock is due to kicking in the stable or in harness, or from standing and slipping in badly-paved stables. *Treatment.*—Cold water and friction; hobble the hind legs if a kicker.

SANDCRACK.—This is generally a crack from the coronet down the hoof. *Treatment.*—Pare out the crack and cut off the crack above and below, by searing with a hot iron; rest, and keep the crack clean with antiseptic lotion.

SEEDY TOE.—This is a parting of the crust of the coronet from the soft horn at the 'toe of' the foot. *Treatment.*—Send for a good farrier or vet.

NAVICULAR DISEASE.—Navicular disease of the foot is very serious, and is ulceration of the interior of the hoof. The symptoms are great lameness. There is always likelihood of recurrence when the horse is worked. *Cause.*—Blows or bruises on the sole; concussion; heredity. *Treatment.*—Hot baths for the feet; hot swabs; perfect rest for some months and a cooling diet.

LAMINITIS.—Laminitis, or fever in the feet, may come on suddenly after a hard day on hard

ground. The symptoms are great pain in the fore feet, and a continual endeavour to get the weight off the fore feet, which are thrust forward. *Cause*.—Concussion; galloping on a hard road.—*Treatment*.—Sling the horse, if possible, to stable beams with ropes to take the weight off the fore feet, placing a ring under the body; or use a pair of cart shafts. Remove shoes by soaking its feet in hot water; and if necessary send for a vet.

SCOUR.—This disease is very common in foals, and serious if it lasts more than a few days. If scour continues, attend to the feeding of the mare with care, and give the foal two tablespoonfuls, from time to time, of 2 oz. of camphor dissolved in 2 oz. of spirits of wine diluted in about half a pint of water. With this simple remedy I have saved the life of a foal almost reduced to its last gasp.

BROKEN KNEES.—*Treatment*.—Keep the wound clean, and bathe constantly every hour with arnica lotion. If badly broken, send for a vet.

SORE WITHERS AND BACK.—*Treatment*.—Complete rest till quite healed and sound is the only way. When there is an abscess or fistulous tendency, send for a vet.

BRUSHING BEHIND.—This is generally due to weakness. Young horses very often grow out of it. *Treatment*.—On the first symptoms, before the skin on the fetlocks is injured, put on a cloth boot tied about the joint so that it falls over the joint, and see that the hind shoes are slightly within the hoof on the inside, so that they cannot cut.

BRUSHING IN FRONT OR SPEEDY CUT.—*Treatment*.—If a habit, sell as soon as possible.

THRUSH.—The symptoms of common thrush are soft or rotten condition of the frog, with a fetid discharge from the cleft, which cleft is absent, or nearly so, in the healthy foot. *Cause*.—Due to contracted feet, or standing on rotten litter. *Treatment*.—Careful shoeing and paring of rotten parts; constant washing and attention to litter; and a temporary introduction of Stockholm tow and tar into the cleft, with or without one part to ten of sulphate of copper. The cleft which appears with thrush will extend if neglected. To avoid thrush, the litter in the stable should be kept dry and clean. If it is desirable to save straw, great economy may be practised by the use of sawdust, which can generally be obtained at a nominal price. When this is spread thickly, all droppings removed daily, and the sawdust raked over every morning, it forms a clean, wholesome, and cheap substitute for straw, and does not require renewing for weeks. Sawdust manure is good for all soils on arable lands and can be applied conveniently for top-dressing, or ploughed in with any crop, so that farmers who require their straw may use sawdust without hesitation. Tan and sawdust mixed also make an excellent bed.

ACUTE THRUSH.—*Cause*.—"Stopping" the feet with cowdung, clay, and other beastliness, is often the cause of thrush. *Treatment*.—Fomentations, poultices, antiseptic lotions, mashes, green food, constant washing of the feet.

SPLINTS.—*Cause*.—Bony deposits that come from or are the results of blows, accidents, or concussion on the foreleg below the knee, also hereditary in tendency; and are the cause of lameness or not, according to their situation. If situated near a tendon or the knee joint, a splint may be serious. A small splint often gives more

pain while growing than when formed. *Treatment*.—Rest and cold water. If there is heat and inflammation, fomentations and poultices. If the splint does not yield to this treatment, blister. In bad cases the splint can be removed by a surgical operation.

RINGBONE AND SIDEBONE.—The following are the symptoms of this disease:—A filling or rising of the hoof; inability to flex the pastern joint. *Cause*.—Heredity. *Treatment*.—Poultice: rub in iodide of lead ointment.

A. E. PEASE.

ASTRINGENT BARKS.

We publish below a statement, which may be found of use to many readers, of barks used in tanning, analysed by the Madras Government Quinologist, Mr. David Hooper. Some mentioned in the list are now used, and others not at present used have been tested with a view to their probable future application. A tan bark should have two natural properties. In the first place it should contain a tannic acid, or modification of that substance, giving a greenish coloration or precipitate with salts of iron; and to make it commercially valuable it should contain a large quantity of tannic acid. The Australian acacias and eucalypti are said to afford barks containing a large percentage of tannic extract, and are consequently greatly esteemed by tanners. The barks of the Indian acacias are also largely used for tanning purposes, and a few cassia barks are also used similarly, while a few have a reputation for dyeing. The investigation of other astringent substances shows that India is not limited to a few drugs of their description, and the list given below might easily be extended.

The best bark is that of the *Anogeissus latifolia*, which is closely followed by the guava bark and the hill guava bark. The eugenias and the guavas belong to the same natural order, and their barks compare very favourably with the eucalyptus barks. The table appended gives the amount of pure tannin in each bark, the amount of extract obtained by exhausting the powder with hot water and evaporating to dryness, the amount of ash or mineral matter left on incineration, and the color reaction the decoctions of the barks afford with iron salts. The bark of the *Anogeissus latifolia* has hitherto been supposed to be one of the most astringent; but recently there has been found a bark much richer in tannin and obtained from the *Bridelia montana*, which belongs to the Euphorbiaceæ order, and is common on the ghâts of the Nilgiris and also in other parts of India. It is well known as a most valuable astringent in Western India and is used by the Goanese in certain diseases.

It seems strange that the tanners of this country do not seek drugs very rich in tannin, for they principally use the bark of the *Cassia auriculata*, which contains only eleven per cent of tannin. The bark of the Casuarina is used in Madras both for dyeing and tanning purposes, and the Myrica Nagi bark is used by Muhomedans and Hindoos in medicines where astringents are required. The Australian acacias or wattle, introduced many years ago on the Nilgiris, have firmly established themselves and are a source of annoyance in the towns. Yet nothing is done to

collect the bark as a commercial article. The common forms of wattle (*A. melanocorydon* and *A. dealbata*) are more plentiful on the Nilgiris than the species *A. decurrens* and *A. pycnantha*, which yield rich tanning barks; but wherever the better species have been planted they have grown vigorously and well, and the bark is equally rich in tannin as that from trees growing in Australia. A sample of bark from *A. decurrens* grown on the Nilgiris was forwarded to London, and it was

stated that the sample was in good condition and rich in tannin. Mr. Hooper also made extracts or "Tannage" from these wattle bark preparations which hold the virtues in a concentrated form, and is much better than the crude bark for exporting. There is a good market in Europe for well-prepared wattle bark extract, and the demand has been on the increase during the last few years. The following are the tables referred to:—

(We have slightly curtailed the statement appended to the above which is taken from the *Indian Agriculturist*, and instead of the common English and Hindustani names give the vernacular names by which they are known in Ceylon).

		Tannin.	Water.	Ash.	Colour with Iron Salts.

* The common name of this is given as the "Manilla Tamarind" and the botanical synonym as *Inga dulcis*, commonly known in Ceylon as the "Madras Thorn," which is evidently the tree meant and not the sensitive plant (*Mimosa pudica*).

PREVENTION OF PLANT DISEASES.

In all civilized countries the respective Governments have thought it fit to enact laws to prevent the introduction or spread of animal diseases, particularly epizooties. There is no doubt that these acts and laws are based at least in their principle on laws regulating the preservation of the health of man. The necessity for the introduction of laws for protecting animals from

disease has been greater than exists in the case of man, since man is able to act for himself, and where he recognises danger he usually takes the first opportunity to avoid it. In the case of animals, there is little doubt that if they are allowed to have their own way their instinct would guide them and (as far as that is possible) to protect themselves from the ravages of epizootie.

But they are domesticated and have to live in limited areas provided for them by their owners housed and fed according to "artificial" laws. Hence the laws that have been enacted to protect animals from infectious diseases whenever they occur, have in all cases resulted in much good to the animals and have reduced their mortality to a great extent.

But we are aware that plants too are liable to various forms of diseases, some caused by deadly fungi, others resulting on the attack of different kinds of insects. Many of these spread far and wide and destroy not only whole crops but even devastate large areas of land.

The fact that plants are stationary places them at the mercy of their enemies, and according to the degree of their helplessness, the means for protecting them should be increased. But in this respect the vegetable kingdom has been to a great extent neglected. Here in Ceylon we have had a sad example of the ravages of plant diseases in the history of Coffee cultivation. Our paddy-fields are in some districts attacked by the fly or bug and destroyed wholesale. Insects of various kinds prevent the successful raising of Cotton, and pests are beginning to interfere to some extent with tea. The coconut beetle has become a thorn in the path of the owners of palm plantations. If proper measures are taken to prevent the introduction and spread of the agents that do damage to plant-life, the revenue from agricultural pursuits should be more than doubled, while every agriculturist, and particularly the poorer class of cultivators should have great cause for thankfulness. The Australian Colonies have indeed passed acts and made orders and regulations to prevent the introduction and spread of plant pests. Under these acts the introduction of plants from other countries is regulated, and measures are enforced to control the spread of any pest which may break out in the Colony. An orchard or garden found to be infested is proclaimed an infected area, as it would be done here, if cholera or cattle plague was prevailing in a particular area. The owner of such a garden has to clear his land of such parts of trees, dry twigs, &c. as would harbour the particular pest and to keep the premises free of weeds &c. Besides, every owner is bound to report the occurrence of disease and to follow the instructions for their suppression as ordered by the inspectors appointed by Government. The importance of this subject is so great, though it appears slight at first sight, that it is not too early to adopt some such precautionary measures in this country, particularly so as almost all our chief products are subject to attack by some form of plant pest.

W. A. D. S.

NOTES ON RECENT RESEARCH ON THE FEEDING OF ANIMALS.

A maintenance diet for oxen at rest—that is a ration on which oxen at rest are able to live but are not able to put on fat—has been found by Dr. Gustav Kühn of the famous German Experimental Station at Möckeru, to consist of 7 lb. of digestible albuminoids or protein matter, and 6.6 lbs. of digestible non-nitrogenous matter per 1,000 lbs. live weight. This closely agrees with

Henneberg and Stohman's maintenance diet, viz., 6 of protein and 7 lb. of digestible non-nitrogenous matter. Dr. Kühn found that when this ration was exceeded by less than 5 lb. of digestible protein the animal laid on fat and flesh.

With regard to the influence exerted by the different nutrients (nitrogenous and non-nitrogenous respectively), it was found that when the protein of the ration was increased by the addition of gluten or other nitrogenous nutrients, no more albuminoids were stored in the body than when an equal amount of organic matter containing only a small percentage of protein was used. That is to say, the putting on of flesh depends more on the amount of non-nitrogenous nutrients in the food than on the amount of nitrogenous nutrients. This is doubtless to be explained by the well-known fact that carbohydrates—that is, non-nitrogenous nutrients—act as "albuminoid conservers." They prevent the albuminoids from being used up, and thus permit them to be utilised in their specially characteristic function as "flesh-formers." It was further found that every increase of the nutrients above maintenance diet was followed by the production of fat in the body, and that for this production it made no difference whether the excess of nutrients over the maintenance diet consisted of nitrogenous or non-nitrogenous nutrients.

Among the other points brought out by these important researches, is the fact that no storage in the body can take place except when the food contains more nutritive material than is required for the maintenance of the animal. This fundamental principle of feeding is, of course, well known, but it is pleasing to find it corroborated by these careful experiments. They also bring out the fact, previously known, that, where animals are fed with an excess above the maintenance diet, no exact constant relation between the excess of nutrients and the storage of fat can be expected. This is on account of the individuality of the animals. Making due allowance for this variability, due to individuality, Dr. Kühn's results, on an average, may be said to show that for every one pound of excess over maintenance diet of digestible organic matter, 2.4 lb. of an increase of fat should be obtained. Thus, 1 lb. of starch meal in excess of maintenance diet yielded on an average .2 lb. of fat. How much of this was directly formed from the starch, and how much was the result of its conserving action, cannot be stated, but the experiments seem to bear out that carbohydrates can go to form fat.

Changes of the food of cattle should always be gradual. Another point to be remembered in the feeding of animals is to take care that the food is not affected by mould which so commonly happens in tropical countries in wet weather. Dr. Ostermann records a case where three cows became ill, two of them afterwards dying, on a farm where about 1½ lb. of cotton seed meal were fed per head per day to the stock. The disease was characterised by the presence of very great weakness. Externally, the cotton seed meal seemed all right, but on analysis it was found to contain highly poisonous putrefaction production (ptomines.) Dr. Siebert records a

similar case in which very mouldy rape-cake was fed to horses. The symptoms were unnatural redness of the lining of the mouth, hurried breathing and pulse. At this time the rape-cake had only been fed for two days. The animals recovered when the food was changed, without any further treatment. It is clear, therefore, that artificials should only be fed when they are sweet and free from mould, and should be stored with great care. Where there is the least ground for suspicion in cases of the kind, steaming should be resorted to.

GENERAL ITEMS.

The following remedy is recommended for the riddance of the guava cocoon pest which produces a blackened condition of the leaves and twigs. It is said to be even more effectual than paraffine emulsion:—

Resin	20 lbs.
Caustic soda (98 %)	4 "
Fish oil	3 "
Water	80 galls (imp.)

Place the materials in a kettle, cover with water and bring to a boil, stirring the mixture occasionally until a solution is formed, and adding hot water when there is a tendency to stop over. Boil for three hours, gradually adding hot water until half of the whole quantity or 40 gallons is in the kettle. Then remove from fire and strain. This may now be diluted to 80 gallons with cold water for use, but while the wash is

being boiled, cold water should never be added for fear of precipitating the resin. The wash should be warm when applied to the trees. Four pounds of soft soap may be used instead of the fish oil.

"Flame trees" is the popular name given to trees with brilliant flowers which in most cases appear before the leaves, and when seen at a distance have the appearance of being on fire. The principal trees of this nature are *amherstia nobilis*, *bombax malabaricum*, *butea frondosa* and *superba*, *cœsalpinia pulcherrima*, *cœchelospermum gossypium*, *lagerstroemia hos-regina*, *poinciana regia*, *pterospermum acrifolium*, *rhododendron arboreum*.

According to a French paper a substitute for gutta-percha can be prepared as follows:—Tar, 1 part; paraffine, 10 parts; dissolve together at 120 degrees and then add caoutchouc, 2 parts. Keep at this temperature until a homogenous mass results.

According to Prof. Church in 100 parts of cleaned rice there are of water, 12·8; albuminoids, 7·3; starch, 70·3; oil, 6; fibre, 4; and ash, 5. Of this ash, the potash forms no more than 0·65 % of the rice, phosphoric acid 28·4.

Ceylon moss (*Gracilaria lichenoides*): s examined by O'Shaughnessy, yielded vegetable jelly 54·5 per cent, cellulose 13%, gum 4%, and inorganic salts 7·5%.

COFFEE IN SOUTHERN ABYSSINIA.

IN the Cotton and Coffee tree of Southern Abyssinia tradition assigns to the countries of Enarea and Caffa the indigenous residence of the Coffee plant. In Shoa Proper the cultivation and consumption are strictly interdicted, as savouring too strongly of the abhorred Mohammedan; but the plant in proper situations grows strong and healthy and in all the bordering districts subject to Sohela Selassie, where the restriction is not enforced, there the plantations are numerous and thriving.

Planted before the rains, the seed soon appears above the ground, and when six months old the offspring is transferred to take the place of some worn-out tree.

Water and the manure of the sheep are plentifully supplied, and the crop, which from a full-bearing adult is generally from thirty to forty pounds, is gathered in March and April. Averaging from eight to ten feet in height, with dark shining foliage, and branches loaded with fruit, it grows luxuriantly in the valleys in any sheltered situation, delighting especially in the soil produced by a decomposition of trap rock, which has been washed down from the adjacent heights; and although taking six years to arrive at maturity, it yields a slight return on the second season of its transplantation. The berries are in the first instance of a dark green hue which before pulling is suffered to turn red, a white milky-looking pulp called gullaboo meanwhile filling up the space between the cuticle and the seed. Having been shaken and gathered from the branches, the crop is spread in the sun until the pulp becomes sufficiently dry to admit of its removal, which, by continual free ventilation out of doors, is usually the case in one month. The seeds intended for the plantation are not divested of the husk, but sown by the handful in a small plot, which is carefully manured and watered, and the gullaboo, sold separately from the bean, is employed as a beverage with

the decoction of the choat. For the better security of his own monopoly at the ports of Vyayla and Berbera, the Emir of Hurrur opposes the importation of Coffee into his own dominions, both from Shoa and from the country of the Galla. The plant is extensively and successfully cultivated; but the price given at Hurrur is high in comparison with that paid in Abyssinia; and the average demanded on the coast by the merchants of the former principality, varying from five pence to seven pence a pound, would seem to be in unison with that customary at Massowah in the Red Sea.

The difficulties attending the tedious road to the coast; the lazy indifferent character of the Danakil camel owners, who, regardless of the value of time, spend months upon the journey; and the fitful caprice evinced by the various chieftains through whose territories the caravan must pass—all form great obstacles to the conveyance of the cheaper produce from Abyssinia, although they might doubtless be overcome within a reasonable period by the well-directed efforts of British perseverance. In Caffa and Enarea, coffee grows wild like a weed over the rich surface of the country. The beverage is in universal use among the inhabitants; the price paid is almost nominal; and the convenience of water carriage is alone wanting towards the transportation of the product in unlimited quantities to every portion of the globe. Cotton of two kinds grows in the sequestered nooks of the eastern face of the mountains of Shoa, and in the valleys at the extreme foot of the range; but from the superior luxuriance of the plant, and the amount of crop produced in the lower situations the natural climate would appear to exist in those sheltered spots which in atmosphere much resemble the more favoured parts of Western India. The Efat shrub varies according to the locality and supply of water, from three feet in height to upwards of seven, and usually assuming the form of a pyramid, extends its lower branches to a width equal to the stature; the size of the leaves, and the soft and yielding nature of the stem, imparting a strong external resemblance to the Bourbon cotton. Eight and nine inches in circumference are not infrequently attained; and the advantages of a very pro-

ductive crop twice in each year, the existence of the plant during five seasons, and the heavy return of the particularly fine wool during the very first, award to the species a most deserving pre-eminence.* The indigenous plant of Efat is not, however, so much esteemed as that from Gondar, which instead of rising tall and straight from the ground, assumes a spreading dwarfy appearance.† The wool is considered superior, and the cloth produced is softer and more elastic, but the existence enjoyed by the exotic is limited to three years. Both are planted indiscriminately in the same field, although, when gathered, the crops are preserved unmixed; and after the fifth year the Efat shrub is cut over close to the ground, which is then ploughed up, and sown with wheat and other grain, when, on the removal of the harvest, the young cotton shoots are well above the ground, and will yield during two further seasons. The seed having been placed for some time in wood ashes, is well rubbed with red earth before planting; and, wherever the locality is favourable to irrigation, water is not spared. The pod, when ripe, is cut with a knife, the husk removed, and the wool deposited in a bag with the utmost care to exclude extraneous matter. One full-bearing bush produces twice during the twelve months between four and five pounds of raw stuff.

Coffea arabica (Boon) grows wild in many of the warmer provinces, but is diligently plucked out by the Christian population, who consider the use of the berry to be as foreign to salvation as the doctrine of the false prophet. Where his followers abide in greater numbers, or uncontrolled, as in Giddem and in the countries of the Ittoo and Aroosi Galla, the Coffee-tree grows unmolested, no care, however, being taken of it; but its proper home seems to be far to the west and south, in the kingdoms of Caffa and Enarea, where a donkey's load is sold for the twentieth part of a dollar. Two kinds of jessamine grace, with their fragrant flowers, the hedges and groves. *Olea spec.* (Woird) is, with the juniper and yew, the principal forest tree of Show; sixty to eighty feet in height and four in diameter are its common dimensions. The wood of the wild olive-tree affords excellent fuel and timber; but no use is made of the fruit, which attains the size of a large pea.—*From a Traveller's Book.*

THE DORMANT PERIOD IN PLANTS.

A fruitful cause of failure in the cultivation of exotic plants is due to ignorance of the climatal conditions under which the plants grow in the land of their origin, and especially the proper season for resting. In temperate climes, where the winter and summer are pretty clearly defined, deciduous plants discard their foliage as the year's temperature declines, and appear during the winter either as leafless objects or inconspicuous collections of dormant buds more or less hidden by the soil. Evergreen plants, on the other hand, retain their foliage till the spring, but only, as it were, on sufferance, active growth ceasing almost entirely, and the verdure only persisting by its own inherent toughness. This is easily seen by our familiar Christmas decorations, where the Holly, Ivy, Laurels, &c., last green for weeks unless placed in hot, dry rooms, where they perish by desiccation.

The resting period in these cases is clear enough, but it is another matter altogether when we import plants from tropical and sub-tropical regions, where the difference between the seasons may be very small indeed as regards range of temperature, and altogether dependent upon widely varying conditions of drought and moisture, so that instead of having a warm and

cold season, with a fairly evenly distributed rainfall throughout the year, we have a wet and dry season, with a constant high temperature. Under such conditions, we naturally find indigenous plants to be very differently constituted to ours, being fitted at once to withstand excessive drought and heat during their resting period, and to assume active development at short notice immediately the rains begin.

Now, these periods of drought and moisture vary considerably on different parts of the earth's surface, and the native plants adapt themselves in conformity to it. Nor is this merely a case of latitude and longitude; for, if it were, the matter would be comparatively simple, and the native country of a plant would determine its needs within certain fairly-defined limits. Elevation above the sea-level is, however, a most potent factor to be dealt with, and if ignored, leads to many mistakes being made in the methods of cultivation pursued. In the tropics we may by ascending the loftiest mountains, pass through every grade of climate from the hot plains of the sea-level, with an average mean temperature of 80° or so, to the region of perpetual snow where only the hardest alpinists survive. Yet, despite this obvious fact, many a plant has been collected, and safely transmitted from high, cool regions in the tropics, only to die in a warm stove, where they have been placed because they came from the tropics, where a high temperature has been presumed to be universal. In several cases, presumably dead plants of this category have been thrown to the rubbish-heap, only to astonish their owner by braving the elements, and obtaining a new lease by their accidental exposure to conditions more congenial to their needs.

A curious feature in this connection is the great fastidiousness of some plants, which will only thrive if their natural condition be very closely imitated, and the cosmopolitan tastes of others which will stand most diverse treatment with impunity. Our native *Asplenium marinum*, for instance, which thrives on our western coasts, where it must occasionally be subjected to some frosts, revels in a hothouse treatment, and becomes a huge and much robust plant. Such wide adaptability is, however, the exception, hence it is of great importance to the gardener to know something of the native natural conditions of growth, temperature, and humidity, and above all, when and how the plant assumes its dormant state, and for how long it maintains it. With plants which are to be forced into flower it is essential to withdraw them from all disturbing influences, and knowing when the dormant period is due, to lead up to it by reducing heat or moisture as the case may be, and maintaining them under such conditions until it is desired to start them into growth. Then the application of heat and moisture will be followed by a healthy vigorous growth, accompanied by an immunity from vermin, the presence of which is only too often an indication of a previous too short sleep and consequent weakness.

The period of rest seems, as we have indicated, to be determined mainly by the nature of the seasonal changes to which the plants are subjected in their native habitats, but in some cases it appears to be independent of this. The bulbs of Hyacinths, Tulips, and other spring-flowering plants are busy during the winter in forming their roots and even their leaves whenever not actually frozen up, and quite early in the year, little later indeed than many other plants that are beginning active growth, and long before the sun has attained very great power, they have flowered and formed new bulbs, their foliage has died down, and they lie in the dormant state for many months, only awakening when winter has again set in. This seems a very strange provision of nature that a bulb should resist all the vivifying influences of summer sun and shower, and wake up into active life when the soil is at or below freezing-point, and the great bulk of vegetation dead or asleep. It would be interesting to know how these bulbs would behave if shipped direct to the Antipodes in the spring. In those cases where the cycle of life has been fully completed, and the whole vitality of the flower is compressed within the rootless bulb, it seems feasible that if they could be at once sub-

* *Gossypium Efatense* seeds completely covered with a close down. Cotton white; capsules 3-celled, 3-valved; flowers small, with a red fundus, leaves 3 to 5 lobed; lobes acuminate.

† *Gossypium Gondarense* seeds sprinkled with short hairs. Cotton white, capsules 3-celled, 3-valved; flowers large, yellow, 3 to 5 lobed; lobes commonly obtuse.

jected to their normal growing conditions, they could hardly be weakened by losing their rest; though, on the other hand, it must be assumed that some subtle recuperative process is going on in resting plants akin to that which renews animal vigour during sleep, or otherwise the shortening of the period of rest could hardly be so detrimental as it is, even when favourable conditions for growth accompany the re-awakening.

With regard to Antipodean plants which have long been introduced into this country, such as the New Zealand *Todeas superba* and *pellucida*, they have fully adapted themselves to our climate, and rise in our early spring at precisely the time when at home their growth would be ceasing. How long, however, such a change takes to establish, we do not know. Amongst our native Ferns we have noted a certain obstinacy in retaining the home periods of awakening deciduous *Athyria* found in Scotland, starting into growth a week or two later than southern finds even after years of culture under like conditions. *Polypodium vulgare*, especially in its varietal forms, demands, curiously enough, a much longer period of rest, or rather starts into growth under glass very much later than normal plants in native habitats. They often, indeed, show no trace of starting under glass until July or even August, and this with perfectly cold culture, so that the lateness of their starting is not to be attributed to growth unnaturally maintained by warmth long after the normal dormant period should begin. This ease is unique in our experience, culture under glass inducing, as a rule, and as one would expect, a somewhat earlier development than out-of-doors. Seedlings, as a rule, are more precocious in their growth than old plants, and quite deciduous Ferns, like *Athyria*, with very little warmth indeed, will the first year retain their fronds right through the winter, though later nothing will prevent them dying down in the normal way in autumn. We have found, however, that even in a few generations, it is possible, by selective culture under glass, to considerably lengthen the growing period of *Athyriums*, shortening the dormant period in equal measure. Most of the plumose *superbum* section of this species remain quite green for fully a month after all their immediate progenitors in the same house have withered entirely down. One form, indeed (*A.f.f. plumosum*, Drury), is perfectly green at the time of writing (end of November), and has been so at Christmas; while, on the other hand, without any stimulus beyond its own inherent robustness, it rises into active growth a full month before its fellows. One year, indeed, a robust growth started on Dec. 2, before the old fronds had even turned colour, but frost immediately after stopped its progress.

It would almost seem by this ease that further selections might eliminate at one and the same time the deciduous nature of the species, and the dormant period also; this latter being decidedly reduced one-half in two generations, and nearly as much in one, since its parent is not far behind it in the long retention of its verdure, while the grandparent growing by their side, dies down as early and as thoroughly as any *Athyrium* we are acquainted with.

How long the actual dormant period is, as compared with the apparent, is an open question, as well as that of the recuperative or strengthening processes which undoubtedly accompany them. The roots certainly commence to be active long before there is any sign of life in the crown. Hyacinth bulbs grown in glasses are a familiar exemplification of this; and as regards Ferns, even in the depth of winter the crowns will be seen to be fattening up, implying great root activity and preparation for the coming rapid growth in the spring. It is highly probable, therefore, that in most, if not in all cases, much of the dormancy is more apparent than real, and that a good deal of secret and subtle work is being done, of which we know little or nothing, but the need for which is evidenced by the weakness subsequently shown when the dormant period is unduly curtailed, and these processes are interfered with.—*Chas. T. Drury, F.L.S.*—in *Gardeners' Chronicle*.

GAS-LIME AS A MANURE.

I note with some interest what Mr. John Lambert states in reference to the use of gas-lime as an antidote for club in Cabbages, and for the extirpation of wireworm. In lecturing to cottages and allotment-holders, many complaints are made as to the ravages of the wireworm, and the occurrence of clubbing in Cabbages and Cauliflowers. If I understand Mr. Lambert rightly, he recommends the use of gas-lime in a crude state, just as it comes from the gasworks. It is true that he recommends its application in very small proportions, but I have met with allotment-holders who have applied it to their land just in the form in which it is received from the works, and then found it very difficult to grow anything on the land for a year or two. It is no doubt a useful agent, destructive to insect-life when used as recommended by Mr. Lambert; but my fear is, lest some might put too large a construction upon his words, and apply it unwisely, and with unfortunate effects. Mr. W. G. Watson, in his admirable paper on "Manures and their Uses," tells us that gas-lime "is a mixture of calcium hydrate and calcium carbonate, with sulphite of lime. The two latter compounds are in themselves poisonous to plant-life, but they are both converted into gypsum or sulphate of lime (a plant-food), by exposing the gas-lime to the action of the atmosphere." It may and, I fear, does happen, that when gas-lime is applied in a crude state as received from the gasworks, the two compounds, poisonous to plant-life, are present in undue proportions in the interests of safety, hence the unfortunate results which I have heard allotment-holders deplore. Mr. Watson further states:—"To prepare fresh gas-lime for use in the garden, it may be spread out on a layer of pondmud, night-soil, or coarse vegetable refuse, and exposed to rain and air." This I hold to be sound and necessary advice. If put on cleared land in the autumn, it can be laid upon the surface at the rate of 40 lb. or so per rod, but it should lie on the surface for several weeks before being forked in, taking care that it is distributed equally through the soil. It is undoubtedly a powerful remedial agent in clearing land of insect life, but needs to be applied with caution.—R. D. [It is doubtless safest to use gas-lime after some weeks' exposure in the open for surface-dressing, or when applying it to land dug to one spit in depth; but in the case of dressing the bottom soil in trenching and incorporating with the top spit, which is usually thrown into the bottom of the trenches in the small quantities recommended by Mr. Lambert, no harm, but rather good, would result from the use of gas-lime in the fresh state. Ed.]—*Gardeners' Chronicle*.

NOTES ON THE FUNCTIONS, COMPOSITION AND VALUATION OF MANURES.

By DOUGLAS A. GILCHRIST, B.Sc.

Briefly stated, the following are the functions of manures:—(a) In many cases manures improve the physical and mechanical condition and the texture of the soils to which they are applied. Thus lime, when applied to sour land decomposes, and therefore renders harmless the sour organic acids, whose presence in the soil is the cause of the sour or acid condition of the land. When farmyard manure is applied to land, the texture and physical condition of the soil is much improved by the organic matter of which this manure is largely composed. (b) In many cases manures act on plant food already present in the soil, and convert this plant food into such a condition that it can be absorbed by the roots of plants. The manurial value of lime is due principally to the action of this manure on the food of plants already present in the soil. (c) The most important function of manures is to supply plant food necessary for the growth of crops, which is deficient in the soil.

The necessary constituents of plant food that are generally deficient in soils are nitrogen, phosphoric acid, and potash.

Nitrogen occurs in manures as:—(a) Nitrates, *e.g.*, nitrate of soda. (b) Ammonia salts, *e.g.*, sulphate of ammonia. (c) Organic nitrogen, *e.g.*, dried blood.

Nitrogen as nitrates is immediately available as plant food

Nitrogen as ammonia salt soon becomes available.

Nitrogen as organic nitrogen is much more slowly available.

Phosphoric acid, combined with lime, is generally present in manures as:—(a) Insoluble phosphate of lime, *e.g.*, bone meal and basic slag. (b) Soluble phosphate of lime, *e.g.*, superphosphates and dissolved bones.

Insoluble phosphate of lime is converted into soluble or superphosphate by treating it with sulphuric acid.

Soluble phosphates are generally more active than insoluble phosphates in promoting plant growth.

Potash is the valuable ingredient in kainit and muriate of potash. Potash has generally a better effect on light than on heavy soils.

Superphosphate and nitrate of soda should not be mixed, or, if mixed, must be sown immediately. This also applies to the mixing of basic slag and sulphate of ammonia.

Artificial manures should be purchased on a guaranteed analysis, and the source from which the fertilizing ingredients of the manure are derived should be stated. This precaution is especially necessary in purchasing bone or mixed manures. The percentage of nitrogen in a manure should be stated in its equivalent of ammonia, that of insoluble phosphoric acid as phosphate of lime, soluble phosphoric acid as phosphate of lime, and that of potash salts in their equivalent of potash.

Artificial manures are valued according to the quantities of nitrogen, soluble phosphate of lime, insoluble phosphate of lime, and potash they contain, and are generally valued on the unit system. The amount of a unit is taken to be one per cent. of a ton. Thus one ton of nitrate of soda containing nitrogen equal to 19 per cent. of ammonia is said to contain 19 units of ammonia.

Farmyard manure contains all the ingredients of plant food. This manure is exceedingly variable in quality, as the quality varies with the nature of the food given to the animal, the nature and amount of the litter used, the method by which the manure is produced, and its treatment from the time of production until it is applied to the land.

AMOUNT OF MANURIAL INGREDIENTS GENERALLY PRESENT IN THE MORE IMPORTANT MANURES.

	Nitrogen equal to Ammonia.	AMOUNT PER CENT. OF		
		Soluble.	Insoluble.	Potash Salts equal to Potash
Nitrate of soda (95 per cent. purity)	19
Sulphate of ammonia (97 ..)	24
Nitrate of potash (85 ..)	14	40
Dried blood ..	15

Bone meal ..	4-5	..	14-55	..
Steamed bone flour	1-2	..	56-65	..
Dissolved bones	3-5	16-20	19-14	..
Superphosphate (high class)	..	35-40
Superphosphate (low class)	..	26-28
Basic slag (best quality)	37-42	..
Kainit	12
Muriate of potash (80 per cent.)	30
Sulphate of potash (50 ..)	27-5
Peruvian guano (low class)	..	3-5	30-50	1-3
Ichaboe guano	..	10-16	18-30	2
Fish guano	..	7-12	17-35	..

The manures mentioned in the above table can always be purchased at a much cheaper rate than special manures, such as "grass manures," "cereal manure," "turnip manure," &c. Nitrate of soda should not be applied to any crop until that crop has reached an active stage of growth. Sulphate of ammonia is generally applied along with the seed of any crop. The phosphatic manures, bones, superphosphate, basic slag, &c., are not like nitrogenous manures liable to be lost from the soil, hence they may be applied for some time before the growth of a crop. As a rule, basic slag should be applied to

soils rich in organic matter and poor in lime. Superphosphate generally gives a better result on harder land. In the case of basic slag it is a distinct advantage to apply it in the autumn or early winter for a crop to be grown during the following season. The qualities of this manure, which contains phosphoric acid equal to 37 per cent. or more of phosphate of lime, give the best results, and this manure should be ground fine enough to allow 85 per cent. of it to pass through a No. 100 wire mesh. Superphosphate should always be in a dry powdery condition, and not pasty, as, if so, it is impossible to distribute it evenly in the soil. It is probably desirable to apply potash manures in the autumn or early winter. When artificial manures are applied some time before the growth of a crop, care must be taken that they are not buried too deeply.—*Mark Lane Express.*

NOTE.—The above was printed as an extract in the *Agricultural Journal* of the Department of Agriculture, Cape Colony, but it will doubtless be found of interest to agriculturists in general.—*J. H. H.—Trinidad Bulletin.*

COCONUTS ON THE EAST COAST OF FLORIDA.

A West Palm Beach correspondent of the *Citizen* writes:—

Although the fact that a vast number of coconut trees is to be seen along the east bank of Lake Worth has been told many times, yet few have been informed of the origin of these trees. Their being planted in rows and forming shaded walks from the lake to the Atlantic ocean and almost in a straight line from the Dimick place to Cragin's a distance of three miles, plainly shows that they were planted by hand, and with great care.

The story of their origin as related by Captain W. M. Laihart recently, is as follows:—

"Some time in the middle of January, in 1878, I happened to be upon the beach one afternoon and saw a ship, which afterward proved to be the Spanish bark "Providencia" carrying a crew of thirteen men, none of whom could speak a word of English except the mate and he only a few words. The vessel acted suspiciously, and I concluded to watch her. I waited until she was hid in the darkness, when I went home, resolved to come again the next day, I was upon the beach at day break, and saw that the vessel had been run ashore. With the assistance of H. F. Hammond, I soon had her stripped of the rigging, which we piled upon the beach

"The vessel had about 20,000 coconuts aboard, which soon began to wash ashore. These we piled up along the beach and divided them among the various settlers, who set them out upon their homesteads, and they have since grown luxuriously.

"The coconuts which had their husks on them, came from Baracoa, in southeastern Cuba. The cargo was bound for Barcelona. From what I could learn from the mate, who was the only one I could understand, the vessel had been out only a few days from Baracoa. All of the men were drunk. They had plenty of provisions and liquor, and remained on the beach here for three or four days. They were present while we were stripping the vessel, and paid little attention to the boat as they had left her. In fact, it was my impression that the captain ran her upon the shore for the express purpose of getting the insurance.

"I was much sought for by all the members of the crew, from the captain down. They made me remain with them all night for fear of wild animals, Indians, etc., and, in fact, it was impossible for me to get away. I remember the second night more distinctly, it was very cold and disagreeable. I was forced to stay with them, and I had made up my mind to get home at all hazards. Finally, when the last one of them had dropped off to sleep, I slipped away and went home, returning at daybreak the next day without their realizing that I had gone. I was indeed glad when a ship

hove in sight, which I signalled and they were all but on board."

From the 14,000 or more coconuts secured at that time their number has increased with each year. Captain Lainhart states that a few were growing there before that time, but where they came from he has never learned. About 6,000 of those that came from the wreck were washed ashore all along the coast, and have made stately trees that are now looked upon with much interest by all those who travel in this direction.—*Florida Agriculturist*.

THE LAUDERDALE ESTATE, SOUTH-WEST MLANJE.

One of the best known of the original pioneers of B. C. A, whether to natives or Europeans, is Mr. John W. Moir the original of the name Mandala. In passing we may note that Professor Drummond uses Mandala in his recently published Lowell lectures on "The Ascent of Man" as an instance of the savage habit of generalising unconsciously from single terms. He gives the instance thus:—

"Mr. John Moir, one of the earliest white men to settle in East Central Africa, was at once named by the natives *Mandala*, which means "a reflection in still water," because he wore on his eyes what looked to them a *still water* (spectacles). Afterwards they came to call not only Mr. Moir by that name, but spectacles, and finally—when it entered the country—glass itself."

The Professor might have gone on to show how it was also applied to the house in which he dwelt and finally to the community over which at that time he presided. Although not now resident at Mandala, Mr. Moir's home at Mlanje is well known even to most of the new arrivals, and there are few visitors to that district who do not take away a pleasing reminiscence of the open handed hospitality of the modest bungalow over which Mrs. Moir presides. Mr. Moir has gone into coffee planting with his usual enthusiasm and his place is furnished with every modern requisite for the carrying on of the planting business. Unlike some of us who move, so to speak, warily, as feeling our way, Mr. Moir has an implicit belief in the coffee-planting industry. He has now some two hundred acres under coffee and intends going in for further extensions as he has several other tracts of land some of which he purchased during the last year. The Lauderdale Estate was first opened up by Mr. Brown of Ceylon for the African Lakes Company and some three years afterwards was transferred to Mr. Moir. Mr. Brown who is a relative of Alexander Brown of Ceylon, the writer of the original Ceylon "Coffee-planter's Manual", and who is now established at Danraven some three or four hours south from Mr. Moir's place, seems to have opened the estate on the most approved Ceylon methods. Unfortunately he did not allow for the violence of the Mlanje winds and hence the estate is somewhat wind-blown on exposed parts. Mr. Moir is however doing what he can to remedy this oversight and by means of bananas, trees of the *figus* family and others, is endeavouring to shelter and shade his estate while on his new clearings he is judiciously leaving up shelter belts of the original forest.

The elevation of the estate is somewhat low, varying from about 2,000 feet to 2,500, but on the other hand its rainfall is about the largest recorded in the Protectorate. In 1893-4 it amounted to 91.18 inches and in 1894-5 to 127.70 with an average of 200 rainy days during each yearly period.

The crop in 1894 amounted to about one-and-a-half tons while this year about six tons (hulled) were gathered. The coffee is pulped by Gordon's cylinder pulpers driven by an iron overshot water-wheel, fourteen feet in diameter. There is also a hulling and separating machine and a circular saw driven by the wheel. Mr. Moir is the first to introduce an iron water-wheel the only other water-wheel in the country hitherto having been Mr. Buchanan's wooden wheel at Zomba which is now dismantled.

We were much interested in a cocoa plant, the only one in the country so far as we are aware, which seems to be doing well and is tended and watched most carefully. Besides the ordinary fruit trees we noticed also several mangoes which are making good progress. While on this subject it is interesting to call to mind that to Mr. Moir is due the honour of introducing the loquat into B. C. A. she having brought the seeds from Algiers, to which country she paid a visit some years ago. Besides coffee and fruit trees Mr. Moir has been experimenting with wheat and ginger and is also trying mustard as a green manure to be dug in amongst the coffee.

Mr. Moir's energies are not all directed to tropical agriculture, however, as may be seen from the young shorthorn bull and cows which adorn his herd of cattle. The young bull is pure bred from the sire which was introduced by Mr. Moir sometime ago and which unfortunately died last year. It is to be hoped that Mr. Moir's efforts in this and other directions will be crowned with success. It is by the efforts of such men as he that a country is benefited for each solution of a problem, whether positive or negative, is a distinct gain to the community.—*Central African Planter*.

ROSES.

HOW ROSES OUGHT TO BE PLANTED.—Whenever it is possible, Roses should be given a bed to themselves, in an open spot, away from trees, and not planted among other flowers. A bed 3 feet wide will hold two rows of plants, and one 4 feet 6 inches wide three rows. The distance between the plants for dwarfs should be about 18 inches, and for standards about 2 feet 6 inches. The beds having been made ready, and the position of the Roses in them marked out, the next thing, and the most important of all, is to see that they are properly planted. Some of the plants should be carefully removed from the trench where they had been "heeled in," and brought to the side of the bed they are intended to occupy. A mat should always be thrown over them, to keep their roots from drying by exposure to sun or wind. A hole should then be dug about a foot square, and of sufficient depth, in the case of dwarf (or "bush") Roses, to allow the junction of the stock and scion to be about an inch below the surface of the bed when the operation is completed. In the case of standards the hole should be 6 inches deep. A plant should then be taken from beneath the mat, sprinkled with water, and held with the left hand in the centre of the hole, while with the right the roots are spread out horizontally and evenly in it, taking care that the roots cross each other as little as possible. Some of the finest soil available should next be sprinkled over the roots so as just to cover them. Over this light covering place 3 inches more soil, which may then be trodden in and the hole filled up. Tread the soil firmly round the plant when this has been done. Firm planting is very necessary for the future well-being of Roses.

In the case of heavy soils, or where the ground remains for any length of time is too wet a condition for the planting of Roses to be satisfactorily carried out, it is an excellent plan to secure some light gritty soil, such as the clippings obtained from the sides of roads when the grass-edges are being cut. A spadeful of this material may then with advantage be placed both above and beneath the roots instead of the natural soil. Soil of this character may be firmly trodden without caking together, and the grit in it encourages the early formation of roots. When planting Roses singly on lawns or elsewhere, the same method should be followed as when inserting them in beds. Where Roses are planted in the spring the shoots should be pruned before planting.

SINGLE PLANTS ON LAWNS OR IN BORDERS.

Previous to planting Roses singly on lawns or in borders a hole should be dug for each, 18 inches square and 18 inches deep. The soil removed from the holes should be well mixed with one-fourth of its quantity of well-decayed manure, before being

restored to them. If the soil be found poor and unsuitable, better soil from another part of the garden or some truly loam should be substituted. No grass should be allowed to grow within at least 6 inches of the stem of Standard Roses planted on lawns.

CLIMBING OR PILLAR ROSES.

For Climbing and other Roses of very vigorous growth the whole prepared for their reception should be 2 feet square and 2 feet deep, and care be taken that the soil be of a suitable character and well enriched with manure. For it must be borne in mind that such Roses require much more root-room than those which are pruned back every year, and in most cases are intended to occupy the same positions for many years to come. Therefore, any extra care and attention bestowed on the planting of strong-growing Roses, like those referred to, will, sooner or later, will be repaid.

STAKING STANDARD ROSES.

As the planting proceeds, each plant should be secured to a firm stake of some kind. In order to avoid damaging any of the roots, the stakes should be driven firmly into the holes prepared for the reception of the plants before planting them. Dwarf or bush-plants do not need staking; but, to prevent injury from high winds, all long growths should be shortened previous to planting.

THE LABELLING OF ROSES.

Where there is only one plant of any variety, a permanent label, with the name of the Rose either written or printed upon it, should be attached to a small stake placed near it, and not to any part of the plant itself; but when several plants of the same variety are grouped together, or follow one another, labels will only be necessary at the beginning of each such group or row.—*Gardeners' Chronicle*.

A SO-CALLED "QUININE-BARK."

In our Trade Reports on page 838 of the issue for December 7 last, under the head of "Interesting Drugs," we referred to a small consignment of bark from the West Coast of South America from trees "growing in the same forests which yield the red cinchona-bark of commerce." The bark was further said to be used medicinally amongst the natives, and it was supposed to contain quinine. That the bark in question was rubiaceous there was but little doubt, but it could not be further identified at the time. Some new light, however, has since been shed upon it, though it by no means clears up its specific or even generic identity—indeed, to some extent, it is further mystified; but as the history of a bark which, if not identical, is very closely allied to it, may be interesting, and which may lead to its accurate nomenclature, we give the following, which we have been at some pains to trace. Referring, in the first place, to Guibourt's "Histoire Naturelle des Drogues Simples," published in 1850, we find amongst the *Rubiaceae* a bark described under the head of *Quinquina bicolor*, which agrees in its structure, colour, and taste with the bark recently received in the London market. The tree, however, is said to be a native of Guadeloupe, where it is known as *Bois jaune*. Guibourt gives it as his opinion that this tree is identical with that described by De Candolle under the name of *Stenostomum acutatum*. The fact of this tree being a native of Guadeloupe, and the bark recently seen in the London market coming from the "West Coast of South America," would seem to be fatal to the chances of their having any affinity; but proceeding further in the search for more information on the subject of *Stenostomum* bark we find a reference in vol. xi. of the *Pharmaceutical Journal* for 1851, page 168, where in some remarks on *Cinchona Pitayo*, or pitayo bark, by Mr. B. W. Bull, reprinted from the *New York Register of Medicine and Pharmacy* for February, 1850, we read that the writer was shown by Professor Guibourt at the *École de Pharmacie* at Paris a specimen of Pitayo bark which Guibourt was of opinion contained either quinine or cinchonine;

but the writer says he is "confident that it contains no alkaline principle whatever, and its tonic properties, if it possesses any, must be traced to other sources than to the presence of the principles which have hitherto been attributed to it." An editorial remark on this paper draws attention to the fact that the name Pitayo has been given to two entirely different barks, one of which is the *Quinquina bicolor* of Guibourt, and is the produce of *Stenostomum acutatum* DC., and the other a *Cinchona* bark, to which Professor Guibourt assigned the name of *Quinquina Pitayo*, is the produce of Colombia, and somewhat resembles Calisaya bark, and is probably yielded by *Cinchona aculemica* of Guibourt, which really equals *Cinchona officinalis* of Linnæus.

The next reference to the bark of *Stenostomum* we find in a notice by T. C. Archer in vol. xiii., page 312, of the *Pharmaceutical Journal* for 1854, "on a few articles imported into Liverpool in 1853." It is said to come from Valparaiso and to have been introduced under the name of Peruvian bark, and is thus described:—In respect to size and general appearance this bark is not unlike the coarser sticks of cassia, for though evidently the external bark of a tree, it is remarkably smooth and neatly rolled into thin quills about 2 feet 6 inches in length. In thickness it is about that of a shilling, externally of a very light drab colour, rather darker inside the quills, but internally the colour is cinnamon red. Mr Archer further says that a sample was forwarded to London, where it was named *Stenostomum acutatum*, but he thought probably in mistake, in consequence of that plant being a native of Guadeloupe, and the bark coming from Valparaiso. He also suggests the probability of its being a species of *Guettarda*, and perhaps *G. cordata*. He bases this suggestion on the fact of the *Guettardas* being excellent febrifuges, and being used by the natives as such.

We have had an opportunity of examining a portion of the actual sample which came into Mr. Archer's hands in 1853, and comparing with it the fresh sample recently received in London, and, though there are points of difference, the similarity is very great. In the fresh sample the exterior is of a greenish colour, and not drab; the inside, however, is very like it, and identical in striation. In fracture the colour shows rather more yellow than in the old sample, but sections as seen under a lens are so much alike as to be scarcely distinguishable the one from the other. In taste, too, they are alike. The old bark is distinctly quilled, and somewhat thicker than the new, which is more flattened. The conclusions, then, to be arrived at are that the bark recently received in London is, if not produced by the same tree as that which made its appearance in Liverpool in 1853, the produce of a very closely-allied plant, but what the generic name of that plant or plants is it is still impossible to say in the face of the two coming from places so far apart. The suggestion as to its being a species of *Guettarda* we do not agree with, as in all the species of that genus we have had the opportunity of examining the barks are totally different and without the slightest trace of colour.

In conclusion, it may be well to say that the genus *Stenostomum* is now sunk in that of *Antirrhoea*, and that De Candolle's *S. acutatum* is now known as *Antirrhoea aristata*, Bth. and Hook. f.—*Chemist and Druggist*.

THE TREATMENT OF CASUARINA ON SAND-DUNES.

M. B. McA. Moir's interesting remarks on the treatment of sand-dunes in France in the *Indian Forester* for the month of June, and especially his remarks in connection with the growth of the small pines near the sea-shore though entirely "sheltered from wind" being stunted, as compared with those half a mile distant exposed to the "full force of the western gales," instigated me to record a few notes on the Casuarina under somewhat similar circum-

stances on the sea-shore near Bulsar in the Surat District.

Efforts have been made to establish the *Casuarina equisetifolia* on the sea-shore at this spot for some time past, and last year I managed to raise at least 25,000 transplants at a nursery established for the purpose in the vicinity. Unfortunately, just about the time when the final planting operations were to take place I was transferred to another Division. But nevertheless, I gained sufficient experience from the existing plants to justify the presumption that without some special method of treatment it would be impossible to rear the plant successfully. While trees at a distance of half a mile inland on private property were doing well, those on the sea-shore itself were stunted and unhealthy even when fairly well sheltered from the strong sea breeze. I came to precisely the same conclusion as to the cause of this as did Mr. Moir in the case of the pines on the coast of France; but whereas he seems to express some doubt, there is no occasion to entertain any, so far as the *Casuarina* are concerned. The sand deposit on the minute needles and on the bark and twigs was easily perceptible to the naked eye, and could be rubbed off with the finger. Under a powerful magnifying glass the appearance of the deposit was appalling and quite sufficient to suspend the physiological functions of any plant. These microscopic particles of sand, moreover, appear to travel with considerable force, penetrating the cortical depressions and irregularities and filling up the stomata of the leaf system. The dunes I refer to are partially covered by that valuable creeper the *Iponomea biloba*, and in treating the *Casuarina* for this evil two courses seem to be open to us—(1) to greatly add to the quantity of this or any other creeper, a grass that may be induced to grow, thereby reducing the surface area of sand exposed to the wind, and (2) to occasionally wipe or syringe the plants free of the deposit that forms on them. The second course might, at first sight, strike one as being impracticable, but as the formation of this deposit is very gradual plants need not be subjected to such treatment very often. I cannot help wondering how the Madras Officers have got over this difficulty, for surely they cannot have been free of it, and I think it would be of considerable interest if one of them were to give us his experience in the *Indian Forester*.—W. A. WALLINGER, Godhra, Panchmahals.—*Indian Forester*.

CLIMATIC INFLUENCE OF FORESTS.

This influence, says M. Charles Marsillon, in *Cosmos* (August 10) has long been recognized, but has been studied scientifically only since 1867. The results of this study show that the mean temperature of wooded regions is slightly less than that of open country, the difference being about one degree Fahrenheit near the ground and a little less at the tops of the trees. In general, it is cooler by day and warmer by night in the woods than in the open country. Thus forests are regulators of temperature, and have an important influence on the climate, and hence on the agriculture, of neighbouring regions.

The soil of forests also is slightly cooler than that of the open regions—a fact especially advantageous to agriculture in warm climates. In Wurtemberg the difference of maximum temperature between forest soil and that of the open country has reached 8 centigrade. The mean annual humidity of forest air exceeds by $3\frac{1}{2}$ per cent that of the open country. This excess is in some cases as high as 14 per cent. Besides, the temperature of the tree themselves is lower than that of the surrounding air, whence that air, coming in contact with the trees, has its temperature lowered to a point nearer to saturation. If the air of the open country, already saturated with moisture, blows through the trees, and is thereby lowered in temperature, its moisture will, of course, condense and fall as rain; thus a wood may act as a veritable rainmaker. It is in fact generally recognized that rain is more frequent in the vicinity of vast forest regions than elsewhere. In parts of

the steppes of Russia where trees have been planted and forests have grown up in the past fifty years rain has notably increased. Forests also prevent floods. The forest soil is soft and spongy, retaining the rain-water and letting it out slowly into the streams. The absence of such a sponge, together with greater ease of evaporation, make destructive torrents much more frequent in barren than in wooded regions. Forests have an important hygienic influence. In warm countries, when a forest is cleared away, fever always makes its appearance, while if in insalubrious districts trees are planted in quantity, sickness disappears. Thus the Roman campagna and the Tuscan marshes, where luxuriant forests are now growing, have almost lost their traditional unhealthfulness. Another important hygienic factor of the forest is the fact that ozone exists in unusually large quantities in their neighbourhood. This fact, lately established by Fernow, has been held by him to show that a forest constitutes an important barrier against the approach of epidemics and infectious diseases.—*Indian Agriculturist*.

COFFEE: ITS POSITION AND PROSPECTS.

BY J. BUCHANAN Esq., C.M.G.

How great is the satisfaction of being able to sit down pen in hand and chronicle the march of progress in Nyasaland. Twenty years in the world's history is but a moment, and yet how much men may accomplish by steady perseverance and a determination to leave the world better than they found it even in so short a time.

The discoveries of the immortal Livingstone in Central Africa roused the civilised world to a sense of duty, and the great man's death by the shores of Bangweolo caused the hearts of thousands of his countrymen to throb with a desire to do something in answer to his prayer, "to heal the open sore of the world," the result by practical form in 1875, a handful of Missionaries take their lives in their hand and enter the Dark Continent. A year later follow more Missionaries, the Merchant, the Planter, the man of Literature and of Art.

Great are the difficulties to be overcome; dogged perseverance and British pluck soon tell. A footing is obtained on the shores of Nyasa, and later the Shire Highlands are taken possession of. From a commercial point of view one could not easily see great prospects of immediate trade, but there lay the country in its length and breadth, its hills and valleys, mountains and lakes, and the eye of the planter was keen to perceive a land full of promise, possessing great capabilities, ready to respond to the cultivator's magic wand, and to reward the husbandman with fruits rare and precious. Years pass on, experiments of all kinds are tried. Commercial Companies enter upon the field. There are wars and rumours of war; nations vie with each other in their effort to possess the coveted prize. The justice, however, of Britain's claim is recognised, and in 1889 Her Majesty's subjects had the satisfaction of seeing Nyasaland placed under British protection. For years previous to this coffee had been cultivated at Blantyre and Zomba, and the Messrs Buchanan Bros had staked their little all in it, while it was yet doubtful to whom Nyasaland would finally belong. Many were the forebodings they with others shared, but with the declaration of a British Protectorate difficulties disappeared, and from that day the coffee industry has gone forward with leaps and bounds.

It is not the writer's intention at present to enter upon a detailed account of the coffee industry of the country nor to write the history of progress made. A medium is now being offered for the free discussion of matters which primarily concern planters, and it behoves all interested in planting to freely avail themselves of this means of obtaining and disseminating information regarding the industry which of all others is likely to prove the salvation of Central Africa.

The kindly interest taken in Nyasaland by people in almost every part of the world demands that the true position of the coffee industry and its probable

future be made known. Roughly speaking there are at this moment 6,000 acres under coffee in Nyasaland spread over something like 100 plantations. Of these the greater number are in their first and second year, so that the year '97 is looked forward to with considerable satisfaction, it being very probable that the export of coffee in parchment for that year will reach an aggregate of 24,000 cwt.

Very varied have been the returns per acre. In the early days on one occasion 17 cwt per acre was gathered. Time after time a maiden crop of 8 cwt has been reaped, far too much, but taking the plantations all over an average crop of from three to four cwt may be reasonably looked for. The general method of cultivation adopted, though not in every particular identical with the system in vogue in Ceylon and India, may be said to be practically the same, the first planters having obtained their knowledge chiefly from the well-known works of Indian and Ceylon men. At the same time considerable latitude has been allowed, local and climatic circumstances rendering it unwise to adhere slavishly to the methods followed in other countries, no matter how suitable for those particular countries such methods may be. For instance, in the clearing, for several years planters trusted chiefly to local labour which failed them just at the critical time with the result that great clearings, felled and burnt off during the dry season, ran the risk of reverting to bush and grass for want of labour when the rains fell, and much clearing and holing had to be done at the end of the wet season. Again the plantations were unavoidably allowed to become foul with weeds, and doubtless the early plantations sustained great injury in consequence.

It must be remembered that the country at that date was in a very unsettled state, and the natives would not be persuaded to leave their home for a journey of 40 miles, much less 300 miles, as is the case now, returning six months or twelve months after. The African Lakes' Coy. had succeeded in bringing Atonga by steamer from Lake Nyasa as far back as 85 to do their transport work, but the passage was costly, and it was not until '91 that the Atonga agreed to leave their home and accept work on Buchanan Bros.' plantation at Zomba. The position today therefore is totally changed. The local native being satiated with cloth and other goods does little or no work, their place, however, during the dry season is taken by Angoni who come from the table land to the west of the Shire, while the Atonga from further North are available for the wet season; thus it is that the planter today, notwithstanding the enormous increase of labour demand, is in a better position than was his pioneer brother. The Atonga labour supply has been rendered available to every planter in Nyasaland by the action of H. M. Commissioner in reducing to order several Yao chiefs on the west of Lake Nyasa who, up till then, would not allow gangs of Atonga to pass through their country. Let us hope that a year hence we may see the remaining Yao chiefs of the East of the Lake silenced and thus another vast labour supply rendered accessible.

One cannot prophesy as to the future of the labour supply, as many contingencies may arise. The discovery of gold, for instance, might seriously interfere with the planters' labour supply, but, taking no pessimistic view of the case, and all things being equal, there is really no reason why the supply should not go on increasing. There are yet vast fields of labour untapped, and as we advance and close in on the old order of things in Africa the natural corollary is that tribes come to learn that the new state is better than the old. Taking the Angoni as a case in point it seems like but yesterday since the writer saw villages burning, people flying for refuge, armies of Angoni raiding and pillaging. Now we have in the Shire Highlands year after year thousands upon thousands of those same Angoni who have exchanged the spear and shield for the hoe, and who prove themselves as capable labourers as they were warriors to be feared.

The rate of wages at the present time varies from 1 to 6/ per month for the ordinary plantation hand.

The more skilled labourer obtaining 10 or more rupees. Wages are yet to a large extent paid in barter goods such as calico, beads, brass wire, handkerchiefs etc. but a money currency, namely, the Indian rupee and the English coinage, is fast becoming general. Land is yet available in quantity. Notwithstanding a very marked increase in value within the last few years there is yet good coffee land obtainable at from 5/ to 20 per acre. It is calculated that a plantation of 200 acres including, say 1000 acres more or less of land, may be brought into bearing in its third year for about £2000, though £2500 would be a safer estimate. The coffee in this country has a marked tendency to bear heavily in its first year. The writer has known coffee, not forced in any way, to bear a maiden crop of 8 cwt. per acre within 3 years of the date of placing the seed in the soil. The result of this is ruinous, and so weakens the trees that, in many instances, little more crop is obtained. Hence it would be well not to expect a maiden crop until the fourth year. As to how long the trees may go on bearing it is at present impossible to foretell. There are trees in the writer's possession now in their eighth year which have borne five continuous crops; while, on the other hand, trees that have borne heavily in their initial stage have had to be cut down and renewed.

The great drawback coffee has to contend with is the want of transport. One dreads to think of what may be the position two years hence, unless by that time we have a railway from Chiromo to Blantyre, if indeed it be not from the sea coast. The present transport arrangements are utterly inadequate to deal with the export of 2000 tons of coffee in a period not extending over three months. There are railway and tramway schemes in the air, both good enough in their way, but what is wanted is a thoroughly good railway 3' 6" gauge starting best of all at the sea coast, failing this at Port Herald or Chiromo and tapping all the coffee districts in its way to Blantyre. As yet the fatal leaf disease of Ceylon is unknown in this country, and stringent measures are in force to debar its entrance. There are here, however, several ills that coffee seems heir to in every country. The borer, for instance, we have ever with us; we have suffered also from blight and bug which every intending planter must be prepared to reckon with. The bug we have to dread most however, is an insect not unlike the lady-bird beetle in appearance though considerably smaller in size. At one time this insect was regarded rather as a friend than a foe. The mischief resultant upon its visitations is often serious, empty berry, diseased bean, and in some cases, no crop at all. Steps are, however, being taken to combat this enemy and we hope to publish the results in this magazine at an early date.

Summing up the position and prospects of coffee in Nyasaland there is every reason to regard coffee planting in the light of a staple industry. H. M. Commissioner Mr. Johnston, has all along recognised the importance of the coffee industry, and we would believe that future legislation will more than ever tend to aid the planter. Nyasaland planters are not slow to take advantage of accessory aid. They are loyal to those in power and alive to their own interests, and with the many advantages this country possesses, and the general intelligence of the planting community, we feel warranted in concluding that coffee planting has a bright future before it.—*Central African Planter.*

THE CACAO CROP.—A planter in the course of a letter to us says:—"No two persons can agree upon the cacao crop this year. Some say it is short and others that it is up to estimate. It is in my opinion rather shorter than otherwise generally. The Caracas in many places has a crop with an interval, or rather a crop for the old year and one for the new, separated from each other by an interval of some weeks, while the Forastero is spinning along with ripe and green and blossom again. As regards prices they are keeping up to previous figures in England. But there is no knowing what the Yankee and Armenian troubles may do to affect prices."

THE RE-EXPORTS OF CEYLON AND INDIAN TEAS.

One of the most striking features of the reports periodically furnished by Messrs. Gow, Wilson & Stanton on the statistics of the tea trade is the statement given therein as to the re-exports of teas from the United Kingdom. The Report before us gives the figure for the re-export between the 1st June and 30th November for the years 1892, '93, '94 and '95. Briefly abstracted, this statement shows that since 1892 the re-export of China tea has fallen from sixteen million pounds to nine million pounds; that of Indian teas has risen from 1,638,451 lb. to 1,992,095 lb.; while the increase in the case of Ceylon tea is represented by a rise from 1,818,154 lb. to 3,780,377 lb.! Roughly speaking, while China has fallen seven million pounds, only some two and-a-quarter million of Indian and Ceylon have been sent from the United Kingdom towards redressing this falling-off. We presume this difference—or rather this discrepancy—has been made up by increase in the direct exports from China to foreign countries. This, however, is not the point that most directly strikes us with respect to the statistics above quoted. The question we should desire to see answered is: "Why has Ceylon so far outstripped India in this re-export of teas to foreign markets?" While India during the term reviewed has added but 300,000 lb. or so to her re-export, Ceylon has added not greatly under two million lb. Certainly this difference is a very striking one. How can it be accounted for? We can hardly assign as a reason that Ceylon agencies may have been more active in their respective fields of work than those of India. After all, such fields have been mainly confined to America and Russia. In the first of them the two tea-growing countries have been working simultaneously, and, to a great extent, in sympathy with each other. In Russia, it is true, M. Rogivue has succeeded in creating a considerable demand for Ceylon tea, but we believe Indian tea has not been without representation there. Australia may be left out of comparison, because she imports most of her tea direct from the producing countries. Failing effort to account for the difference mentioned on the lines above sketched, nothing remains but to assume that there exists a preferential taste for Ceylon over Indian teas in the outside markets of the world. We do not assert that this is so, but we can hardly suggest any other probable or possible cause for the relatively rapid progress made by Ceylon teas in this matter of their re-export from the United Kingdom.

THE GOVERNOR OF THE STRAITS AND THE SELANGOR PLANTERS' ASSOCIATION.

TO HIS EXCELLENCY SIR CHARLES BULLEN HUGH MITCHELL, G.C.M.G., GOVERNOR AND COMMANDER-IN-CHIEF OF THE STRAITS SETTLEMENTS AND ITS DEPENDENCIES:

YOUR EXCELLENCY,—We, the undersigned members of the Committee of the Selangor Planters' Association, desire on behalf of our Association to offer to Your Excellency and Lady Mitchell on this the occasion of your third visit to Selangor, our most hearty and cordial welcome.

We feel sure that Your Excellency cannot but be struck by the great change in the aspect of the country, which has resulted from the rapid advance-

ment of the coffee enterprise. We desire to tender to you our sincere thanks for the vigorous steps you have taken to forward the cause of free labour, and we trust that Your Excellency's appeal to the Madras Government to send over Delegates with a view to ascertaining the exact conditions under which the Tamil immigrant lives in this country, will result in the Malay Peninsula being thrown open to unrestricted emigration from India.

We recognise and appreciate Your Excellency's wise determination to so foster and encourage agriculture that the State may in the future derive a large proportion of its revenue for this source and not, as in the past, be entirely depended on tin.

We trust that Your Excellency will permit us, as a body of practical men, to draw your attention to various points in the policy of the Government which affect labour and the planting enterprise—points upon which we believe Your Excellency will agree with us that our opinions, as coming from those most nearly interested in the question, are not unworthy of Your Excellency's close consideration.

LABOUR.—It is felt to be a great hardship that labourers can leave the service of their employers at a month's notice without settling their liabilities, unless bound by written contracts of service. It is true that employers have their civil remedy, but as, in the majority of cases, coolies' assets are nil, it is useless for employers to try to recover advances through the Civil Court. We submit that there can be no injustice in making it compulsory for coolies to either pay or work off their advances (taking, say, \$15 as a maximum indebtedness for each coolie) before leaving their employer's service.

It is claimed that written contracts obviate this difficulty, but we are of opinion that such contracts are utterly opposed to the spirit of free operations as binding the labourer to work for a fixed period exceeding a month, and we know that they are exceedingly unpalatable to the coolies themselves. We would have our labourers free to leave us at a month's notice if they choose and if we cannot so identify our interests with theirs as to make it to their obvious advantage to stay with us; but we ask that this freedom with regard to their movements should be contingent upon the proper settlement of their just liabilities, and we quote the instance of Ceylon where this principle is most strongly insisted upon by planters and recognised as equitable by the Ceylon Government. We sincerely trust that Your Excellency will see fit to meet our views in this connection before the new Labour Code becomes law.

AUCTION SALE OF FOREST OR "WASTE" LAND.—Your Excellency has inaugurated the system of selling forest or "waste" land in districts which appear best adapted to the cultivation of coffee, by auction sale; the size of blocks so sold has been limited to 320 acres approximately, and the usual clause providing for the cultivation of one fourth of the whole area within a period of five years has been inserted in all grants. Your Excellency has stated in a recent despatch to the Secretary of State for the Colonies that your object in introducing these innovations has been primarily the exclusion of the speculator in land. As *bonâ fide* planters ourselves we would record our entire approval of any measures which will achieve such a desirable result, but we are of opinion that the cultivation clause in itself is sufficient for this purpose, and moreover that the practical utility of this clause would be considerably enhanced by the issue of larger grants, inasmuch as the holder of a block of, say, 1,000 acres would find it a much more difficult matter to dispose of his land in the third or fourth year after purchase, with 250 acres to be brought under cultivation during the time that remained before the Government had the right of re-entry, than the holder of, say, three blocks of 320 acres each, who could very possibly place his land in three different quarters with the obligation attached to each of only opening 80 acres in from one to two years.

We also consider that blocks of 320 acres are insufficient in area to admit of economical working, and that the general effect of sales by auction is to put the trained planter who has selected his blocks, and spends time and money in doing so, at a serious disadvantage when

the sales come off. The land speculator attends the auction quite content to buy land that he knows must be worth acquiring, inasmuch as it is auctioned at the instance of the man of experience, and he can afford to bid higher than the other as he has incurred no preliminary outlay.

Again, if a planter desires to buy three contiguous blocks, the speculator may purchase the central one at a prohibitive figure and compel the planter eventually to buy him out at a price which leaves a substantial margin of profit for himself. Such abuses are inevitable in connection with sales by auction.

We would further ask that the delay in surveying blocks in the Kuala Lumpur District within the radius gazetted as subject to auction sales be rectified, and that blocks applied for in the above and other districts should be attended to and put up for sale with the same despatch as they are in Klang and Kuala Selangor. We would point out to Your Excellency that competition of these sales means the disappointment of at least one party, and that unless there is abundant land on offer, which there has not been hitherto, the result is one settler the less in the State.

We believe that general satisfaction would be given to the public if the Government would

- (1) Construct rough service paths, of a width of six feet or so to commence with, through rich districts;
- (2) Cut up and survey blocks of 500 and 1,000 acres *in advance of applications*;
- (3) Price this land at a rate which the demand at the time being and completed sales would seem to warrant; and
- (4) Dispose of the blocks to applicants in order as they come forward.

If such measures were adopted an intending settler would be able to make his selection, buy his land and commence operations at once, and there can be no doubt that the wide circulation of this fact would tend to bring numbers of investors into the country who are now holding off owing to the at present existing uncertainty connected with the acquisition of land.

It is of course of the highest importance that no such attempt to open up a district on the lines suggested above should be made without the soundest expert advice upon the suitability of the soil and locality for growing coffee.

Our Association hopes that the time is not far distant when your Excellency will concede to the planter the prior right to mine his own land himself, or to make arrangements for its being mined, as we are of opinion that it is an essential point that the holder of a lease in perpetuity should neither be deprived of any of the land comprising that lease, nor of the power to exercise control over such miners as, by virtue of the mineral rights retained by H. H. The Sultan, might at any period be empowered by the Government to prosecute the mining industry in the planter's land.

In cases of resumption of land by the Government for public purposes, we would again point out to Your Excellency that the existing terms of settlement by arbitration are, if not inequitable, at any rate not at all calculated to give satisfaction to proprietors. We maintain that the Court of final reference should in all cases of arbitration be composed of adjudicators without any interest whatever in the question at issue.

We do not at the present juncture desire to again urge upon Your Excellency the necessity for permitting lawyers to practise in the Law Courts, but we hope that the Administration of Justice in Selangor will be one of the first points which will engage the attention of the Resident-General of the amalgamated Native States. We commend the foregoing suggestions and recommendations to Your Excellency's notice, feeling assured that Your Excellency will honour the views which we have advanced, and which we claim to be representative, with your kind consideration.

We beg to subscribe ourselves, Your Excellency's obedient humble servants,—E. V. Carey, Tom Gibson, C. Meikle, E. B. Skinner, H. Huttenbach, Committee, S. P. A., December, 1895,

PLANTING AND PRODUCE.

THE PROGRESS OF BRITISH GROWN TEA.—In our last week's issue we quoted a circular from Messrs. Gow, Wilson, and Stafton, in which figures were given or data supplied by Her Majesty's Customs, showing the growth of the tea trade, and how British-grown tea is gradually, but surely, pushing Chinese leaf out of the home market. The eclipse of China tea has continued steadily, as the following figures for the past six months testify :

	1892.	1895.
India ..	52,476,000 .51 p.c.	58,285,000 .51 p.c.
Ceylon ..	34,795,000 .33 p.c.	41,125,000 .36 p.c.
China ..	16,627,000 .16 p.c.	14,493,000 .13 p.c.

In 1877—not twenty years ago—China shipped 123 million pounds to the United Kingdom, India 28 million pounds, and Ceylon nil, a total of 151 million pounds. A reference to the figures given in our last issue will show the strides made since then.

DUST TEA AND PEROE FANNINGS.—Messrs. Stenning, Inskipp & Co. in their Report state:—"Complaints have come to our notice of heavy loss in weight arising from the broken condition of the leads and packages and the subsequent leakage; we would recommend that half-chests, either of strong wood, iron hooped, or of metal, be used for such descriptions."

"PLANT MANY THINGS."—The cultivation of tea and other products will no doubt be tried, at any rate experimentally, in countries in which until recently sugar-growing has been the leading industry. In his paper, read at the Royal Colonial Institute, on "The Future of our Sugar-Producing Colonies," to which we referred last week, Mr. Justice Condé Williams made reference to the possibility of further developments of tea-growing experiments. He urged upon the colonial planters the necessity of turning attention to the cultivation of tea and other products suitable to the soil. Of Mauritius he said, speaking of the difficulties attending sugar planting: "But where, as in this interesting and beautiful island, there remains to a community the possession, in addition to great natural resources, of a fund of unexhausted intelligence, pluck and spirit, as was abundantly manifested after the terrific hurricane in the island of 1891, and the fire of the following year, there is no room for absolute despair of the future. And Mauritius possesses certain resources which are still largely undeveloped. Not the mineral resources of British Guiana and Queensland, which add to the prosperity of a colony by leaps and bounds, but such as consist in new and varied species of agricultural production—vanilla, tobacco, fibre, and tea—suited to development by small cultivators, such as are found among the rapidly increasing body of Indian 'ryots' of the island, who, so far, have devoted their energies mainly to the production of vegetables for the insular market, and of sugar canes." Referring to Natal, Mr. Justice Williams said: "Natal, in past days was called the Colony of Samples.' And if that were scarcely a respectful title to confer upon this plucky and salubrious little colony of South Africa, still less would it behoove us, in view of today's three principal staple exports of Natal, to pronounce her the Old Lady's Colony of the future. Yet tea, sugar, and coal are first-class essentials of the first order. And of tea, the latest annual output in Natal is said to be of 700,000 lb. from 2,500 acres under cultivation.' Planters everywhere are learning the lesson which Mr. D. Morris, of Kew, has tried to teach—viz., that 'the history of all essentially agricultural communities teaches us that there is safety only when we plant many things; or, in plain words, in agricultural as well as in commercial enterprise, it is not well to place all our eggs in one basket.'"

AGRICULTURE AND CURRENCY.—A paper was read at the Imperial Institute last week by Mr. W. E. Bear on "Agriculture and Currency." The reading of the paper was to show the advantages at present enjoyed by the Argentine over India and other countries in the production of wheat. The paper pointed out that the fall in prices since silver was demonetised in certain important countries was too well known. A

strong opponent of bimetalism, Sir R. Giffen had estimated the market value of the agricultural products of 1891 at £76,000,000 less than they would have been worth at the prices of 1871, and there had been a great further fall in most of the commodities since 1891. It was stated that the value of products sold off the land in 1891 was less than that of those products in 1871 by £38,000,000. No other commodity illustrated the effect of the artificial fall in prices so strikingly as wheat, which had been steadily going out of cultivation in the United Kingdom. The circumstances which caused a depreciation in currency to stimulate exportation were the maintenance, or partial maintenance, of the purchasing power of the depreciated currency in the exporting country in relation to the expenditure of the producers of the goods exported, and the ability of shippers to pay prices in currency high enough to yield satisfactory profits to the producers. The price of wheat in Europe had been so extremely low that export from India had been barely profitable, even with the advantage given by the fall in the gold value of the rupee. The Argentine Republic, with much greater currency advantages to exporters, had taken up the position recently held by India as third among the great wheat-exporting countries of the world. Previous to 1887 Argentina had never exported as much as half a million quarters of wheat in a year, and it was not till 1890, when 100 dollars in gold were worth 261 dollars in paper, that the period of extensive exporting began. Then the exports continued to expand till in 1894 they reached 7,648,000 quarters, including flour. The expansion was attributed to the high gold premium which had existed for the last eight years, and particularly the last four. The actual price of growing the grain, purchasing bags, and delivering it at the railway had been sent down at about 9s a quarter in a productive year, with gold at 350; that was when the gold premium was at 250 and 100 dols of gold exchanged for 350 of paper. Railway and ocean freights and other charges might bring the cost of landing wheat in England to 10s a quarter, and the balance of any price in excess of that sum was the profit to be divided between the owner of the land and the grower. It was only for a few weeks in 1894 that the price of wheat in England was under 20s. When Mr. Gastrell, the British Vice-Consul at Buenos Ayres, wrote his report in August, 1894, the price had not fallen below 13s on rail in Argentina, while the exchange value of 100 gold dollars was over 350 dols in paper; therefore the growers were getting 45s 6d a quarter in their paper currency. Can producers stand up against such a tremendous handicap as that? With the advantages existing, the Argentine grower would be able to undersell the rest of the farmers of the whole world.—*H. & C. Mail*, Dec. 20.

THE WYNAAD

(Communicated)

The little book of 63 pages (Gemy Svo) by Francis Ford is a concise and admirably written description of Wynaad and the Planting Industry of Southern India; giving exactly the information intending investors require without any unnecessary padding. Investors there are, not a few, unfortunately, being now driven from this island by the utterly mistaken policy of the Ceylon Government in reserving lands, hundreds of thousands of acres of which might safely be made available for cultivation; and a considerable portion of which lies alongside the rail, way to Uva, the very existence of this land, indeed, being one of the chief recommendations for undertaking the important and costly extension. The land, as it is, is valueless, and answers no earthly purpose. Sold to the planter, it would realize from R150 to R200 per acre, and soon be clothed with a vegetation closer and more verdant than in its primitive state, greatly adding to our chief industry and con-

verting a non-paying into a highly remunerative railway. The only effect the present prohibition of land sales has had is to enhance for a time the value of existing estates, which, for no other reason, have 'boomed' up to figures unprecedented in the history of either tea or coffee; and, secondly to turn away intending investors to search for other lands by which they hope to compete successfully with the Ceylon planting industry.

For this purpose, there is not a more convenient and promising field than the *Wynaad*, which, as we are here reminded, is "A Hill district in the Madras Presidency, to the West." Its general elevation is from 2,000 ft. to 4,000 ft. It enjoys a good climate; its fertility is unsurpassed and its scenery wonderful. To the east rise the Nilgiri Hills or Blue Mountains as the name implies. This range has an altitude of 6,000 feet with peaks running up to 8,000, while to the north-west the chain of ghats stretches away into the rugged little province of Coorg, famed for its coffee; area about 1,020 square miles; rainfall from 50 up to 200 inches. We might, perhaps, be inclined to demur a little to the statement that "Wynaad is admittedly as favourable as Ceylon in respect to climate and far superior to both that island and Assam as regards a cheap labour supply," but, as to the suitability of the land for tea, there does not seem to be any room for doubt; and we suspect that if the present deplorable policy of our local Government continues, it can only be a question of a very few years when Southern India will outstrip Ceylon in the yield of all her pet products.

Coffee seems again to be profitably cultivated in these bamboo lands of which we have nothing analogous in Ceylon:—

"Experience has proved that there are localities in the Wynaad, notably Sultan's Battery and Nellacotta, where coffee flourishes excellently.

..... Shade and manure are essential to success; by means of them the planter is able nowadays to hold his dire enemy *Hemileia vastatrix* at bay. An official statement of profits, on a block of estates, lately published, shows that the owner has made in ten years a net profit of £77,000 off 992 acres. In one season alone (1892) the net profit was no less than £18,000."

But it is to tea that the present race of crushed-out planters in Ceylon will most naturally turn, and here we have a descriptive report backed up by authorities and figures which seem to us unimpeachable.

"Tea is a product," says Mr. Ford, "which has been grown with such excellent results that the Wynaad promises to be one of the most paying districts in the East. 1,500 lb. per acre has been made on an estate in South Wynaad;—and he quotes from the report of our own Wm. Taylor—than whom we have few better authorities—that "the nature of the soil is a sandy loam with some laterite; well suited for the growth of tea as proved by the size and vigorous appearance of the bushes—the lay of the land is mostly easy and undulating, and I may say that, as far as soil, lay of land and climate are concerned, this part of Wynaad would compare favourably with the bulk of the tea districts in Ceylon." Mr. Taylor, who, by the way, has just called upon us while writing this, remarks; "Yes; quite true; but they will have to go in for a better jât. Of all the rubbishy jât I have ever seen, the Wynaad can show the worst, and yet they get crops—marvellous flushes—but what might they not get with a better jât and better planting?" The author backs Mr. Taylor's opinion up by that of Mr. W. M. Standen, a

thoroughly practical tea planter enjoying a high reputation, who gained the prize for an essay on tea cultivation, in which he states that the few acres of tea planted in different parts of Wynaad are "showing such a vigour of growth as could hardly be excelled either in Assam or Ceylon."

The localities in Wynaad, where tea can be cultivated with the greatest success, we are informed, are: Vayitri and Meppadi in South Wynaad, Cherambadi, Pudalar and Devala in South-East Wynaad. "There is forest land still available, and whenever the cultivation of the tea bush is vigorously prosecuted, prosperity awaits Wynaad."

And yet the planter is not allowed to suppose that he has found a perfect paradise. As in Ceylon, the anxious planter will always have cares and troubles enough with labour. "As the law now stands," we are told, "protection is given to the scoundrel and fraudulent contractor: the planter has no redress." Much is expected from the coming Governor—Sir Arthur Havelock—to redress grievances and place the planter in a better position than he has hitherto held in Southern India. "This able statesman," says Mr. Ford, "has for the last five years been Governor of Ceylon, so he comes to the Presidency with the full knowledge of the value of the industry. One of the first things that will probably strike him when he arrives in Madras is that, whereas planting in the island he left was the backbone of the State, in the peninsula it is but one of many interests. But he will have realised in Ceylon what private enterprise is capable of achieving." Altogether, although we regret the necessity that has arisen, we think young aspiring planters in need of more elbow room may do worse than follow in the wake of Governor Havelock.

The author gives some very pithy and excellent advice to the young planter. "The qualities most needed on an estate," he is told, "are keen observation, untiring industry and consummate patience. After the newness of the life has worn off, the daily routine grows monotonous, the close inspection becomes a drudgery; but, if a man gives way to his feelings, the sooner he throws up the life the better for him. Patience, consummate patience, is needed in dealing with coolies, and he who cannot control and manage his labour will never be a good planter."

We have thus glanced over and indicated the contents of a very useful and interesting little volume, which let those looking out for pastures new buy and read for themselves: it is published at the *Madras Mail* press and only costs R1. We have now only to repeat our regret that there is no more scope for investment of capital in this island, but we venture to predict that, before many years are over, our Government will regret its present policy. We were amongst the first to suggest and agitate for railway extension; though assuredly, had we known that the extensive tract of available forest through which the line passes to Haputale was destined for ever to remain a wilderness, we should have been no party to the advocacy of a railway by that route.

PLANTING IN MATALE.

We were in error in stating elsewhere that Elkaduwa Group had given 800 lb. per acre all round over 300 acres; it should have been an estate in the Elkaduwa District. We are glad to hear however that some fields on the Elkaduwa Group have

also given close on 800 lb. per acre, but not to such an extent as 300 acres. Two well-known estates not 100 miles from Matale, have given 750 and 800 lb. per acre from 300 and 200 acres respectively. Not so bad for good old Matale, the once much pitied district.

PLANTING—PATENTS.

The following Grants of Exclusive Privilege have been granted under the Inventions Ordinance during the half-year ended December 31, 1895:—

No. 419.—To William Jackson, of Thorngrove, Manofield, Aberdeen, North Britain, engineer, for improvements in or connected with stoves or apparatus for drying tea leaf, coffee, grain, or other produce.—July 7, 1895.

No. 458.—To Clive Meares, of Wangi-oya estate, Talawakele, and James Brown, of Hatton, engineer, for improvements in machinery or apparatus for improvement in wire-shoot runners.—July 7, 1895.

No. 471.—To William Alfred Gibbs, of Gilwell Park, Sewardstone, in the county of Essex, England, for improvements in or connected with furnaces for the production of hot air for drying or other purposes.—July 21, 1895.

No. 466.—To Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, for improvements in apparatus for withering tea leaf or exposing chemical or other material to hot or cold air or a mixture of air and vapour or gases, also for drying yarns, cloths, and other substances.—July 21, 1895.

No. 459.—To Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, for improvements in centrifugal fans, and in apparatus connected therewith.—July 21, 1895.

No. 470.—To Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, for improvements in apparatus for withering or limping tea leaf in the course of its manufacture into black tea, or for the finishing or facing of green tea preparatory to its being packed into chests.—July 21, 1895.

No. 429.—To C. J. R. Le Mesurier, for invention for compressed fuel.—August 15, 1895.

No. 461.—To Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, merchant, for improvements in apparatus for exposing tea, coffee, cacao, grain, and other substances to the drying or other action of air, vapour, or gases.—September 16, 1895.

No. 476.—To Robert Thomson, of Kenning Park Engine Works, Kenning Park, in the county of Renfrew, Scotland, engineer and tea planter, for improvements in apparatus for withering tea leaf.—September 16, 1895.

No. 473.—To Augusto Ferreira Ramos, Civil Engineer, of San Paulo, in the State of San Paulo, Republic of Brazil, for improvements relating to the drying of coffee, grain, fruit, and to other materials, and to apparatus therefor.—October 7, 1895.

No. 480.—To Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, merchant, for improvements in smoke-consuming furnaces for boilers and for air heating stoves.—November 11, 1895.

No. 465.—To Samuel Cleland Davidson, of Sirocco Engineering Works, Belfast, Ireland, merchant, for improvements in steam engines and in means for driving high speed shafts therefrom.—November 11, 1895.

No. 468.—To Dr. A. S. Lethbridge, Indian Medical Service, now of Calcutta, for invention for making glazed tea.

No. 472.—George Robson, Manager, Fairfield Ironworks, of Slave Island, Colombo, for invention for willowing or cleansing fibre and freeing it from dust and other extraneous matter.—December 4, 1895.

No. 474.—To Alfred Horatio Bell Sharpe, of 32, Charlesworth terrace, Foss Bank, Lincoln, in the county of Lincoln, engineer, but now residing at Spence's Hotel, Calcutta, for improvements in machinery or apparatus for drying leaves of the tea plant, the same being applicable for drying analogous substances.—December 4, 1895.—*Government Gazette*, Jan. 10,

GEMMING IN CEYLON.

We take the following from the London letter of an evening contemporary:—

Doubtless such a welcome will be given to a new undertaking, that more will be heard of very shortly in connection with gemming and gold finding. Four undertakings of a similar nature have now been commenced in your island, and all have, I believe, ceased operations upon the grounds of the difficulty, not of finding gems, but of getting them brought in by the natives employed in finding them. I think it was Mr. Gow, of Gow, Wilson, and Stanton, who said "Gemming will never be successfully carried on in Ceylon until a means is found, or a machine invented, to prevent the native hands from picking and stealing." Undoubtedly, in mining for gem stones, the chief difficulty has been to actually secure the gems which pass from the washing machines to the picking tables. The lack of success of so many gem-mining ventures of late is mainly attributable to failure to detect gems on the picking tables, and actual theft of really valuable stones. The new company I speak of hope to change all that. A machine, the Automatic Gem Separator (Lockhart's Patent), takes the place of the picking tables, and, thus eliminating the greatest cause of loss, renders mining in such countries as Burma, Siam, India, Ceylon, and Australia practicable. After being dug from the mine or pit the gem-bearing ground passes, without handling or the possibility of being tampered with, through the washing plant to classifiers of special construction which size it and pass each size to the separator. Each separator selects its gems automatically and deposits them in a locked receptacle, rejecting the worthless gravel and allowing it to pass off as tailings. The process is essentially a continuous one, and, as there is absolutely no wear on the separators, their action when once regulated remains constant. Water is the only agent employed in the separation. It can be used over and over again, and, as the head required for effective work does not exceed ten feet, only very moderate pumping power is necessary to serve a large plant where a constant supply is not available. These separators are capable of greatly reducing the heavy concentrates from the machinery at present employed; and for alluvial gravels such as are found containing gem stones in Burma, Ceylon, and other parts of the world, the reduction ranges as high as over 95 per cent. I have this week had an interview with the inventor, and, from my two and a half years' residence in the district, Rakwana, where operations are, I think I gathered, already commenced or commencing, I was able to supply him with some information which was interesting to him. Already 25 acres of good ground have been secured, which provides a pretty good area for gemming. I was shown a very nice selection of stones—sapphires, amethysts, rubies, and others. Also a piece of gold which was found by simple washing, and a small nugget that had been extracted without difficulty. If this new operator could only show that gold in paying quantities is to be found in Ceylon, what a lift it would give to the colony. At least 50 tons of soil can be treated daily, and, if each ton produces, on a moderate estimate, 10s per ton (Mr. E. G. Harding, I hear, considers that estimate within the mark), the new undertaking, the capital of which is not heavy, should have a successful future.

This afternoon I have had the opportunity of seeing at the premises of Mr. W. S. Lockhart,

M.I.C.E., at Great Suffolk Street, Boro', the gem-separating machine. It seems certainly a most ample yet ingenious invention, and is very simply worked. The soil is put by a cooly into a receptacle. All is worked by water. This receptacle enables the large stones, roots, and grass to be got rid of. Thence the residue is carried by the force of water into a receiver, which again separates the soil and smaller stones. What is then left is only gravel and gems. Into half a bucket of gravel, which had come from Ceylon and was largely mixed with iron stone, 32 different gems were mixed. This was then placed in the separator. By virtue of the slight difference of the specific gravity, the gravel was separated from the gems, the lighter gravel floating upwards by the force of the water, and falling into the tailings heap, and the heavier gems falling into the locked receptacle below. Not one was missing, the whole 32 came through, but there were also a few iron-stones which were perhaps exceptionally heavy. This was a fault on the right side. The proportion of gravel was about $99\frac{3}{4}$ to $\frac{1}{4}$, or perhaps much less, of gems, and the machine most accurately rejected the stuff without value, and preserved the gems. Another operation, showing how small gold pieces could be washed, was shewn. A small nugget, the size of a pea, came out of a machine almost by itself out of half a bucket of heavy Indian gravel, half composed of garnets. The machine could be set to separate garnets from gravel, as I saw had been done. Then a tiny piece of alluvial gold and 12 minute shot were put in to demonstrate soil washing, and separated as accurately. No constant attendance is required. The machines will go on from 1st January to 31st December; water only is wanted to work it, and without breaking it no cooly can get at a single stone. I think Mr. Lockhart, who is a thoroughly practical man has got what is required. So far it has not been a case of stealing the gems, but taking them. If, now, all that are found are secured, gemming may not be so entirely in the hands of the natives as it is at present.

Talking of gemming, there was one spot I always thought might yield a splendid harvest of gems, and that was the ground around and running away from the store at Nahaveena, Rakwana. It lies at the bottom of a lay of land, all natives used to assert, famed for gems. Goodness knows to what depth operations might be carried, and possibly enough lies beneath that waste piece to pay for the value of the estate, even at the price Mr. Layard purchased, a good many times over.

INDIAN PATENTS.

Calcutta, Dec 27th, 1895.

For a new process of tea manufacture.—No. 411 of 1895.—August Schulte, im Hofe, Ph. D. of Freiburg University, in Germany, temporarily living at 1, Vansittart Row, Calcutta.

For a combined wood and cast iron plate sleeper for metre gauge railways.—No. 155 of 1895 James Connor of Yalgivi, in British India, Permanent Way Inspector, Southern Mahratta Railway. (Filed 14th December 1895.)

For an improved tea, coffee or hot water boiler.—No. 201 of 1895.—Gopal Mahadeo Vidwans, draftsman, Sanitary Engineer's Office, Bombay, Presidency, Poona. (Filed 16th December 1895.)

For improved method of and apparatus for removing sand and like bars or banks in rivers and tideways, and for deepening the same.—No. 147 of 1890.—M. J. M. B. Baker's invention. (Specification filed 16th September 1891.)

For a new or improved method of treating and preparing $\frac{1}{2}$ and blending the same for infusion,

together with tea, coffee, cocoa, and other substances for which such prepared hops are applicable—No. 20 of 1891—Mr H. A. Snelling's invention (Specification filed 18th September 1891.) *Indian & Eastern Engineer*, Jan. 4th

BRITISH CENTRAL AFRICA.

(From the *British Central Africa Gazette*, Zomba, Oct. 15th, 1895.)

It is matter of considerable satisfaction to know that since the return of Mr. Robert Buchanan to British Central Africa, by the improvements in method of preparing tobacco which he has introduced, Messrs. Buchanan Brothers have now been able to place on the market a supply of native grown tobacco as good as any average kind imported from abroad. Smokers pronounce the samples submitted to them to be excellent, and a large sale is already springing up. Mr. Whyte has examined this tobacco, and has furnished us with the details on which this note is founded.

Since at the present time we are almost wholly dependent on coffee as our main export, the action performed by Mr. Buchanan Brothers, in showing that really first class tobacco can be grown in this Protectorate, is a matter of something more than local importance. This enterprising firm deserves the thanks of the community for adding an important and prosperous industry to the few other inducements which tempt Europeans to invest their capital in this Protectorate.

Showers of rain—some of them very heavy—have been falling in the Mlanje and Zomba Districts, and possibly elsewhere in the Protectorate during the month of September, a very unusual occurrence for the time of year. On the 1st of October, a great deal of rain fell at Zomba, and we understand that as much as two inches were registered on the same date at Fort Lister. In consequence of this unusually moist "dry" season, very few bush fires have taken place, and although bush fires are not really beneficial to the country under ordinary circumstances, they are actually much needed at the present time for the destruction of the locusts. This plague is certainly diminished in intensity. Mr. Marshall reports that the Tanganyika District is now almost free of locusts and they are little heard of on Lake Nyasa. They continue to swarm on the top of Zomba mountain on the upper plateaus of Mlanje in the vicinity of Fort Lister, on Mount Cholo, and on the hills in Matipwiri's country. It would almost seem as though locusts were beginning to prefer the elevated regions to the plains. They have up to the present done little or no damage to gardens or crops. Nevertheless, for the last week they have visited regularly every day the Residency grounds, but the firing of guns, shouting of men, and beating of drums have been up to the present effectual in dispersing them.

AUSTRALIAN FLOWERS.

"There is nothing," we are told, "that astonishes the stranger visiting Australia for the first time so much as the variety and beauty of its flowers." Australia is, indeed, a land of floral loveliness, and nowhere has Nature been more lavish in her gifts of bud and blossom than in New South Wales, where, at almost every point, the landscape is an endless panorama of surpassing beauty. There is a plethora of colour in the flowers that everywhere meet the gaze. "They are not placed here and there only, to give one the impression of limit; they cover mountains and valleys in all kinds of form and shades of

beauty. Climbers, rich in crimson, and interspersed with every other colour, are multiplied by millions, and scattered with a prodigal hand that knows no stint nor bound, save that of immensity itself, until every shrub and plant and bush, robed in splendour, makes the country gay with blue and gold, and many coloured dyes." The gorgeous colouring of the Australian floral kingdom is hardly to be excelled elsewhere. Among the favourite native flowers is the stately Waratah, or Native Tulip, as it is sometimes incorrectly designated. It grows to the height of four or five feet, the slender stem being surmounted by a large dahlia-shaped flower of the deepest crimson. It is sometimes grown as a garden flower, but thrives best in the bush. The Native Rose, which has no resemblance, save in its delicate pink tint, to the favourite garden flower, is exceedingly plentiful. The blossom is small and modest, but wonderfully enduring, and forms a charming addition to an Australian bouquet. The Rock Lily, of which a beautiful specimen, embedded in ice, was lately sent to the Queen, is so called from its being most abundant in rocky country, where its masses of yellowish-white blossoms stand out in picturesque relief from the dense background of dark green foliage. The Gigantic Lily is, perhaps, the most magnificent of Australian native flowers. From a cluster of gracefully bending leaves, rises a stalk to a height of from ten to fifteen feet, crowned with about a dozen crimson flowers, forming a kind of natural bouquet, about a foot in diameter. The *Magnolia grandiflora* is found in parts of the mountain regions, its large white flowers and delicious fragrance rivalling those of the cultured plant. The wild *Lobelia* is sometimes found as abundant as buttercups in an English meadow, but its presence is much disliked by pastoralists, as cattle will not eat it. The red flowers of the Trumpet Jasmine are very beautiful, as are also the pale-yellow flowers of the wild Honeysuckle, while the rich masses of Golden Wattle-bloom are among the loveliest attractions of an Australian landscape. The Christmas Bush is, perhaps, the most popular of all Australian flowers. It takes the place of English holly as a Christmas decoration, the flowers being small and of a reddish tint. Large quantities of the flowers are sold in Sydney at Christmas time. There are many other flowers no less beautiful, such as the Flannel Flower and Native Fuchsia, but the foregoing will serve to illustrate the rare and unsurpassed beauty of the floral wealth which has made Australia a botanical paradise.—*Colonies and India*, Dec. 21.

WILD COFFEE.

On his recent journey to the Mlanje District, H. M. Commissioner made an interesting discovery. In the valley of the little Nyungwi stream which flows direct into the Ruo about ten miles west of the confluence of the Likubala and the Ruo, and close to the place where the Nyungwi is crossed by the main road to Fort Anderson, the Commissioner found growing a species of wild coffee apparently identical with that which is met with in the interior of Mozambique, on the Zambesi, and at Inhambane. By a happy chance this wild coffee was not only in blossom, but bore the ripe berries at the same time. In growth the tree was very straggling, and somewhat resembled the original cultivated coffee tree in the Blantyre Mission grounds. This wild coffee was found growing for several hundred yards along the banks of the stream. The Commissioner collected a large number of the berries, some of which were ripe, and these will be planted in the gardens at Zomba. Specimens were also collected of the leaves, flowers and fruit for transmission to Kew for identification.

It has generally been stated by the Commissioner himself amongst others, that there is no wild coffee indigenous to Nyasaland, and certainly up to the present discovery, it was believed that no specimens of the wild coffee had been found by any one. The Commissioner searched diligently in almost all the other stream valleys that he crossed in the Mlanje District for other specimens of the wild coffee, but was not able to find any.

It is just possible that these trees found on the Nyungwi stream close to the Portuguese border might have had their origin in seeds of the wild Zambezi coffee accidentally conveyed there. At the same time, seeing that coffee is indigenous to tropical Africa and is found in almost all the warm parts of the continent which are not absolute deserts, it is very extraordinary that a fertile region like Nyasaland should almost alone possess no form of indigenous coffee. The Commissioner therefore desires us to publish this discovery for the information of planters and others who, by careful investigations, may succeed in discovering a wild indigenous coffee in the British Protectorate. Meantime he has no objection to the berries of the wild coffee growing on the Nyungwi stream (which is on Crown land) being gathered by any persons who may like to try the experiment of planting this wild coffee.—*British Central Africa Gazette*, Oct. 15.

PRESERVING FRUIT WITH BORAX.

One is inclined to think, judging from the successful experiments that have recently been made in preserving fruit with borax, that it should be well worth the while of the proprietors in the West Indies to send a few experimental shipments of limes, mangoes, and other fruit to London. I was told in Covent Garden that the London market prefers the small limes. Although it is perfectly true that the want of good roads, quays, and other shipping arrangements would be severely felt in some of the islands, for fruit requires most careful picking, packing, handling, even more so than eggs—and on these points, too, Mr. Meaden lays great stress—yet, considering the enormous quantity of limes and other fruit that could be grown per acre, the low price of borax, and by no means heavy rates of freight, I do not see why it should not pay to ship hand picked and carefully packed fruit to London and the Continent. I should like to see the Botanical Gardens Department of Trinidad leading the way by taking up the question, and making a few experimental shipments with a view to ascertaining which fruit stood the voyage best. I also note that Mr. George Christie, of New York, encourages the idea of a fruit trade from Trinidad, as he, too, believes that a profitable trade is to be done if growers would ship their produce in the right way and at the right time of year.—*Colonies and India*.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, December 19.

VANILLA.—A Seychelles correspondent writes: "Our vanilla industry has experienced great disappointments lately; we have had two wretched crops in succession, so that our vanilla planters have made no profits whatever for over two years. However, when I left Seychelles at the beginning of October the vanilla-flowers were everywhere showing up well (in vanilla-planting to get a flower is half the battle won), and the Seychellois were rejoicing accordingly. The exports of vanilla from Mauritius during the last three years have been:

	1892	1893	1891
Kilos	17,100	6,900	4,126

PATCHOULI.—Fifteen bales very stinky leaves of raw flavour were offered at the last sales, and 5 of these sold at 6½d per lb.

ESSENTIAL OILS.—Lemongrass oil remain very firm: 2½d has been paid on the spot, and a bid of 2½d c i f has been rejected. Cinnamon leaf oil has remained exceedingly firm, nothing being now to be had below 5d per oz; it is even said that that figure has actually been paid. Citronella oil is again dearer, 2s being asked on the spot. A considerable business is said to have been done for arrival, and further transactions are expected.

CINNAMON.

TO THE EDITOR "CHEMIST AND DRUGGIST."

Sir,—I read recently of a conviction for selling cinnamon which the analyst certified to be cassia, and on testing my stock get the following results:—

Pulv. cinnamomi: a decoction cooled, and a solution of iodine added, gave a blue colour.

Pulv. cinnamomi mixed with water (cold), and a solution of iodine added, gave a slaty blue.

Cortex cinnamomi, bruised in a mortar, boiled in water and the decoction cooled, gave a blue colour with a solution of iodine.

The B. P. says a decoction when cooled is not coloured by iodine.

Yours truly,

Liverpool. GEO. M. SLEGGS.

(The Pharmacopœia is wrong, for cinnamon-decoction does give a blue colour with excess of tincture of iodine. If the tincture is added drop by drop, the first drops do not give a permanent colour, probably because the essential oil absorbs the iodine; after that the colour remains. Flückiger and Hanbury fully worked out this point more than twenty years ago, and we presume that the retention of the sentence referred to in the B. P. is an oversight.—ED. C. & D.)

COFFEE PLANTING IN KUALA SELANGOR.

(From the *District Officer's Report*.)

During October applications were received for land from Europeans and others for blocks varying in area from 320 to 1,000 acres, each applicant proposing to plant coffee. The Resident has since given instructions to the Chief Surveyor to have 20 blocks laid out in accessible parts of the district, and these will be put up to auction at an early date. The land demarcated during October comprised 101 lots, aggregating 515 acres. The balance of land undemarcated has now been reduced to 1,885 acres. Mr E. V. Carey took up 500 acres on the Sangei Bingei Road, and an application for 320 acres was also received on behalf of Mr T. Fairhurst for land adjoining Mr Carey's application. The land in the vicinity has been very favourably reported upon. Applications were also received from Mr Cropley for 50 acres, and from Yap Ah Bohn for 25 acres, of mining land at Bukit Kamuning.—*Straits Budget*, Dec. 31.

THE AMSTERDAM DRUG-MARKET.

London, December 19.

Our Amsterdam correspondent writing after last Thursday's cinchona sales states that a very firm feeling prevailed at those auctions, and that it seemed apparent that the quinine manufacturers were anxious to have the unit quoted higher than in the November sale and therefore competed briskly at prices ranging up to 3c per unit. Of the 5,682 packages offered 5,249 found buyers, the quantity bought in representing the equivalent of 1,638 kilos of sulphate of quinine. It is expected that at the forthcoming January sale a further small advance in price will be established. The richest lot at auction consisted of 10 bales of crushed Ledgeriana bark analysing 10.70 per cent. It sold at 42c per half-kilo, while a parcel of 11 bales from the same plantation analysing only 10.40 per cent realised 42½c per half-kilo. The difference between the officially published analyses and those made privately by the manufacturers seems to have been larger than usual. A few lots of bark even realised above 4c per unit, but others sold as low as 2½c. Druggists' barks in quill were quite neglected and only a few lots sold. The average quality offering however was very unsatisfactory. Since the Java cinchona bark sale of December 12th, 41 bales containing about 152 kilos of sulphate of quinine and 61 cases of quill bark which were bought in at the auctions, have been sold privately at very satisfactory prices. A sale of fully 300 packages of Java bark which had not been offered in public auction at all, has also been made. No details are known, but it is said that the unit paid was fully 3c. The reports from the Continental quinine factories indicate a brisk demand for the manufactured article.—*Chemist and Druggist*.

TEA IN AMERICA.

New York, Dec. 11, 1895.

This market seems to be surfeited with trash, which sells all the way from 6@11c a pound, while low-grade teas, from 12@25c, are in great supply. Recently a line of choice Formosa sold at 62c. This class of teas, however, has a limited sale, whereas, were the American public educated to appreciate flavor and to drink tea on its merits rather than from habit, we would have the bulk of the importations high instead of low-grade. The general drift of the market is in buyers' favor. Formosa Oolongs are well held, but country Greens continue weak, as do low-grade Blacks. Dealers report a growing demand for Ceylon and India sorts. A line of fine Congous was sold at 55c.

Today at noon the Montgomery Auction and Commission Company will sell 9,226 packages, viz.: 1,611 half-chests Moyune, including some very attractive Chops; 4,001 boxes Pingsuey, new season's 227 half-chests Japan, new season's; 51 half-chests Japan, basket-fired and sun-dried, new season's; 209 half-chests and boxes Congou, new crop; 25 boxes Capers, new crop; 28 packages India, Java and Pekoe; 664 half-chest and boxes Amoy, new season's; 370 half-chests Foochow; 2,010 half-chests and boxes Formosa, new season's, and including an invoice of the well-known "Black Bear" Chop.—*American Grocer.*

PLANTING AND PRODUCE.

THE SUPPLY OF TEA AND THE MARKET.—Now that public sales of Indian and Ceylon tea have ceased for the year, the last auctions previous to January 2 having been held on 19th Dec. it will be seen that the quantities brought forward were large; but the demand was good, nevertheless, and prices were not affected by the unusually big supplies. From the beginning of June to date the increase in the quantity of Indian tea offered in London has been 58,864 packages, and of Ceylon 54,287 packages, the shipments from Calcutta during the same period having been 7,640,000 lb. greater than in the corresponding portion of 1894.

THE NEW FASHION.—As we mentioned some weeks since, a singular fashion is becoming popular in England. It is the habit of smoking cigarettes composed of tea in place of tobacco. Some ladies have conceived a passion for this new luxury. There are already in London special shops where tea cigarettes are sold, and there is talk of a club, the members of which are leaders of fashion, and who smoke nothing but these tea cigarettes.

INDIAN TEA IN AMERICA.—The following advertisement is taken from the *War Cry* of December 14, 1895, published in New York: "There is no doubt whatever that India and Ceylon teas are the best in the world. The difficulty in this country has always been the prices. Hitherto it has been almost impossible to get a pound of good India and Ceylon mixture under 1 dol. Many, therefore, have had to buy the cheaper and commoner teas, owing to their inability to pay the price asked. Now, however, guaranteed pure India and Ceylon mixtures can be bought from us at prices within the reach of everybody. Read the following extract from a letter just received: 'I have compared your India and Ceylon mixtures with those of seven other wholesale firms with whom I have been dealing, and must, without hesitation, give yours the palm. It is more pungent, and has that rich flavour only to be seen in the finest teas of these particular grades. I am ordering 100 lb. and you can look for larger orders in the future.' Auxiliary Blend, 60c. This is a mixture of India and Ceylon teas of the choicest and best of grades. Memorial Mixture, 50 cents. A mixture of same teas, unrivalled for quality and cheapness combined. In one pound or half-pound packages. These teas can be bought through our officers all over the United States. If you have any difficulty in procuring them, write to Trade Secretary, 120 to 124, W. Fourteenth Street, New York."

MOCHA MAINTAINS ITS REPUTATION.—It having been alleged that Mocha coffee is not all that poets and coffee drinkers have painted it, and that it is sometimes mixed with Java and Singapore descriptions at Aden, there has been some stir on the subject in the latter port. The Aden Chamber of Commerce issued a circular denying the accuracy of the reports. It appears that in the course of the present year 1790 bags of coffee have been received at Aden from Bombay, Singapore, Java, and the Malabar coast. A detailed statement of these imports is given in the circular, on the authority of the Assistant Political Resident at Aden, Lieutenant-Colonel W. B. Ferris, in which it is shown that 1,209 bags have been exported and 581 bags still remain in bond. Thus the whole of the imports are accounted for. Colonel Ferris adds that as the imported coffee is kept under lock and key by the Customs Department, and is exported under the eyes of the Customs officers, it is "hardly possible" that any of it can have been used for admixture with the superior Mocha or Harrar. Official statistics, furnished by the Assistant Resident and appended to the circular, indicate that the imported bean is sent to Zanzibar, Mokalla, Muscat and other minor neighbouring ports, where it is understood to be used for local consumption, its relative cheapness being regarded as sufficient compensation for its inferior quality.

PLANTING ON THE NIGER COAST.—A report presented to the Government from Sir C. MacDonald refers to experiments made in the Botanical Gardens, Old Calabar, including the cultivation of the tea plant. The curator says: "The growth that the coffee plants first planted in the gardens have made has been excellent. These trees, that are only twentyseven months old from the time of putting in the seed, average a little over 6 feet high, with a fine and well-formed head, have all flowered, and would have borne a fair crop had they been allowed to do so. For experiment I left one of the Arabian coffee trees to seed, and have just lately gathered a few berries. Another large undertaking in connection with the Department has been the laying out of an orchard to the extent of about ten acres. There are at present over 300 varieties of plants under cultivation in the gardens, and a number of varieties of useful seeds have recently been planted, including mahogany (*Swietenia mahoganii*) and sisal hemp (*Agave rigida*). Also I brought one with me from England a valuable consignment of economic and ornamental plants, most of them arriving in good condition. Among these are nutmegs, Para rubber, tea, and cascarilla (*Croton cascarilla*)—introductions that, in my opinion, will in time prove of value to the country."—*H. & C. Mail*, Dec. 27.

TEA IN AN OLD COFFEE DISTRICT.—It is quite cheering to hear, from an experienced planting visitor to the district, so satisfactory an account of tea on a great number of old Matala East coffee estates. What will former residents like Mr. Stewart Jolly and "Old Colonist" say to Midlands, for instance, being quite a picture in tea, and Nicholoya, Cottaratenne, Dangkande, &c., being equally vigorous—not to go farther afield? But there is room for improvement in communications: when we hear of the waste of labour, delay in transport, of a V.A. having to swim a river in order to get on, and all for the want of a bridge estimated to cost a few hundred rupees! What are the proprietors about, if the District Committee and "Peter Donaldson" of Matala name cannot be got at? We should say that a week's loss to the estates concerned in wet weather would pay for the bridge, so it better be put up forthwith and if a pattern is wanted, there is poor C. G. Burnett's bridge on the Maragalla side, of which he used to be so proud ten years ago, and we suppose still a memento of his engineering skill?

THE COMMERCE OF CEYLON IN 1895.

Following up the brief notice we have already given of the Commerce of Ceylon during the past year, the following review from a business point of view with which we have been favoured will be read with interest:—

IMPORTS.

RICE.—The annually increasing quantities imported indicate the presence of a large immigrant population in connexion with agricultural operations, as well as prosperity throughout the island. The figures for 1895 are the largest on record, viz. 7,356,778 bushels against 6,476,592 in 1894.

COTTON GOODS.—As a result of cheap cotton in 1894, and in the early part of 1895, our market was over-supplied with cotton goods from Europe, and a state of glut has almost become chronic, whilst prices that are obtained are, for the most part, unremunerative. The number of packages of greys imported was 2,888 and of coloured woven goods 1,009. During the latter half of 1895 imports have shown a tendency to fall off to an extent more in keeping with requirements.

METALS.—A large business has been done in metals and hardware and tea requisites, during the past year. A considerable portion of the goods coming under this head and many varieties of shop goods are now obtained from foreign manufacturers, chiefly because of their more suitable appearance and cheapness, compared with the same articles of British manufacture.

The Secretary of State for the Colonies seems anxious that such trade should be secured for Great Britain, but unless the manufacturers there can adapt their wares and their prices to suit the requirements of buyers, the tendency will be for trade with foreign manufacturers to increase.

KEROSENE OIL.—The importation in bulk and the working of the tank system seems to be answering the purpose well, but the consumer does not seem to derive much benefit as far as price is concerned, whilst the importation of kerosene oil has been largely curtailed if not extinguished. The heavy rate of duty extorted operates against the extended use of oil engines, and it is to be hoped that the efforts being made to procure a reduction of it will ultimately be successful.

EXPORTS.

TEA.—The quantities exported in the last two years are as follows:—

	1895. lb.	1894. lb.
To United Kingdom	85,753,339	75,348,644
„ Continent	786,741	298,595
„ Australia	91,379,561	7,446,782
„ America	393,527	216,422
„ India	831,070	874,205
„ Other Countries	795,633	407,066
	97,939,871	84,591,714

The increase in 1895 over the previous year is thus nearly 13½ million lb. a larger output than was expected but the weather has been favourable for flushing, and most estimates have been exceeded.

There is no land procurable, for planting in the higher elevations in Ceylon; but a good many clearings, mostly small, have been made in the low-country, and in 1896, 100 million lb. or over may be counted upon. The shipments to Australia and the Continent of Europe generally show, on the whole, a satisfactory increase, but to Russia there has actually been a falling off, significantly showing that renewed efforts will have to be made if access is to be gained to the large tea consumers of that country.

COFFEE shows some recovery in 1895, the export having been 63,920 cwt. against 32,205 cwt. in the previous year. Prices have been well maintained, but supplies of Brazil are reported to be very large and may cause depression in the current year.

COCOA.—The crop has been a fair one, amounting to 27,420 cwt., but prices have ruled very low and do not at the moment show signs of recovery.

CINNAMON.—The export in 1895 has been large, 2,169,527 lb. against 1,969,905 in 1894. The shipment has been largely stimulated by the high prices that have ruled during the latter half of the year, due to the operations of a syndicate in London where a "corner" was created in August-September, the effects of which have not yet passed away. To take advantage of high prices, the bushes have been cut very close, and supplies must be short until they have had time to grow again, probably till about April-May.

COCONUT OIL.—The total exports in the last two years have been as follows.

1895	1894
381,140 cwt.	487,571 cwt.

About 4,500 tons less have been sent to the United Kingdom than in the previous year, but America has taken 1,000 tons more. Prices have been depressed all through the year owing to the enormous supplies of tallow reaching England, and which can hardly be said to show any signs of falling off. The Indian import duty continues to restrict the quantity taken by that country. The present rupee price, Rs32.50 per ton, is a good deal in excess of the equivalent in London.

COPRA.—The trade has been of about the same dimensions as in the previous year, and, like coconut oil, it will probably continue depressed so long as Tallow is so abundant.

PLUMBAGO.—The quantity exported in 1895 was 334,921 cwt. against 339,521 cwt. in 1894—with a falling off to the United Kingdom of 1,400 tons, and an increase to the United States of about 2,300 tons. Owing to the slow revival of trade in America, enquiry has been kept within comparatively small limits. Supplies have been sufficient for the restricted demand, but it is feared these may be curtailed through the operation of legislation being enacted for the regulation of mines.

FIBRES.—In coir yarn and fibre a steady trade has been done of average extent, whilst palmira shows an increase of 4,300 cwt.

ESSENTIAL OILS.—A gradual annual increase has been shown in citronella oil, but cinnamon oil exhibits a slight falling off.

DESICCATED COCONUT shows 8,551,073 cwt. to have been exported in 1895 against 5,722,202 cwt. in 1894, and the demand for this article of our industry seems to be steadily growing.

THE NEW TEA ROOM AT MESSRS. LIBERTY'S.

As a concession to the comfort and convenience of their lady customers, Messrs. Liberty & Co. have recently opened a tea room at East India House. This is a desirable acquisition in any establishment, more especially in one like Messrs. Liberty's, where the choice of goods is so bewildering, that a shopping expedition there involves a stay of some hours. The scheme of decoration here is quite different from most of the tea rooms in London, it is approached by a wide staircase, carpeted with sage-green felt, and the walls, like those of the room itself, are covered with a tapestry paper, copied from one at Haddon Hall! The light is subdued and restful, coming through old windows, which have the appearance of the old bottle glass, only that they are tinted with varying shades of amber and yellow. They might have been taken from some old Flemish house; indeed, the whole room is a judicious blending of early Dutch and early English. The tables are tiled, and have oak rims and legs; they are in three shapes—oblong, squares, and octagonal; and are either old blue, green, or terra-cotta. The chairs are replicas of old Dutch studio ones; they are of oak, covered with interlaced leather and studded with fancy nails. The electric light and some bright draperies complete the furnishing of this comfortable apartment. The tea served is a blending of Indian and Ceylon, which Messrs. Liberty import direct.—*Queen.*

COFFEE AND CAUTION.

The way that the receipts at Rio and Santos are maintained must be very discouraging to those continental operators who, on the basis of the early estimates of this season's crop, initiated a "bull" campaign, and many must begin to question very much whether the predictions of a five million bags crop for Brazil are not likely to prove somewhat wide of the mark. Up to the beginning of last month the position looked fairly encouraging for the "bull" party, the receipts in Rio being on a comparatively small scale, while those at Santos were only of moderate extent. The total receipts at the two ports were then 2,715,000 bags, as compared with 3,071,000 bags in the previous season, and fair channel Rio for December delivery touched 69s, while May delivery stood at 68s. The world's visible supply also marked a decrease of 600 tons for whereas stocks in Europe had increased by some 1,800 tons, those in America had fallen away to the extent of 3,000 tons. But, from this time, circumstances seemed to have conspired to defeat the ends of the wicked conspirators, and their position is not now an altogether enviable one.

In the first place, the Brazilian receipts have increased in an astonishing manner, and in place of a widening gap in the totals of this and the previous season's arrivals at ports of shipment, a narrowing down of the difference to about 255,000 bags has occurred. This materially alters the prospect of a five million bags crop, 3,456,000 bags having already been received at Rio and Santos in the space of scarcely five months and a-half, leaving little more than another million and a-half bags to come to hand during the intervening period to the end of June next, if the before-mentioned estimate is to be verified. Therefore, a sharp falling away of receipts will be necessary, but up to the present there is no sign of this occurring, for although the crop movement has been somewhat smaller during the last week or so, it is still greatly in excess of that of last season at Rio, while at Santos it is also somewhat heavier.

Secondly, the trade demand has of late been very disappointing, the financial difficulties caused by the collapse of the mining "boom" and the generally disturbed condition of the political situation no doubt, to some extent, accounting for this. Consequently with supplies exceeding expectations and deliveries on a smaller scale than looked for, stocks have augmented, and visible supplies, during last month, increased to the extent of 2,940 tons, being now, according to Messrs J. R. Rouse & Co., 196,040 tons compared with 162,910 tons a year ago. Last month's deliveries were especially disappointing, falling short of that of the corresponding month by nearly 10,000 tons, but as the imports were more than 13,000 tons smaller European stocks did not increase to so large an extent as they did in November last year. Still compared with a year ago, there is shown to be over 26,700 tons more coffee in store now than then.

In the third place we have to take into consideration the prospect of the growing Brazil crop and the extent of supplies likely to be received from other sources. The blossoming of the plant throughout Brazil was accomplished under favourable conditions, and although subsequently reports were received that the Santos crop had been damaged by excessive rains no revision of the estimates accompanied them. Certainly we have not lately heard of predictions of a yield of ten million bags, but conservative and trustworthy houses have not hesitated to estimate that should everything continue favourable we may have a crop of 3,500,000 bags next season from the Rio and Santos districts. Of course much may happen between this next June to occasion a revision of the estimates. The appearance of frost during the second flowering, for instance, would cause considerable damage and greatly shorten the yield of Café das Agnas, but the fruit of the first crop having set well, we are, under any circumstances, likely to see a larger crop gathered next season than during the present one. Reports from other producing countries, however, do not point to crops in all cases being as large as last year, when it is esti-

mated 256,000 tons was growing. But considering that the plantations are being extended and new districts are continually being opened up, it would be somewhat rash to at once jump to the conclusion that supplies from other countries than Brazil will be much, if any smaller, because somewhat reduced estimates have been received from the better known sources of supply.

One thing is certain, and that is, that while of late years the supply of fine growths has been continually decreasing the proportion of common grades has steadily increased, and therefore the quantity of coffee, such as is taken for the Continent, gradually becomes larger. These grades come into competition with Brazil coffees, and tend to diminish the rise of the latter, more especially when prices are artificially maintained, as is at present the case. The deduction is that, should the "bull" manipulation be continued, the commoner grades of other descriptions will be consumed instead of Brazil kinds, and arrivals of the latter will have to be taken up by the "bull" clique, which will in time find its holding grow to such unwieldy proportions as to become unbearable.—*Journal of Finance*, Dec. 18.

BURMA AS A MARKET FOR TEA.

Dipping into a book containing the early annals of the English in Bengal, lately published (of which more shortly), we came across the statement that about two hundred years ago tea was drunk all over India. It would be imagined that a conservative people like the inhabitants of India, who through centuries have retained their customs and habits without change, would not have lost, during the comparatively short period of two hundred years, their taste for the cup that cheers so completely as they have. The bulk of the Indian people at the present time are not tea-drinkers, nor would they appear to take kindly to the fragrant Bohea even when tempted to stray from the paths of water-drinking by the, to the Indian, almost irresistible inducement of *free* tea. Those interested in the Indian tea trade, while making heroic efforts to exploit foreign markets, bethought themselves suddenly one day of the profitable market which lay at their very doors if the 300 millions in India could only be induced to buy their tea. Small packets were made up and distributed free in their thousands, throughout the land. The people took them; some tried a cup of tea, but rejected the unaccustomed beverage, while the greater portion used the packages of tea as paperweights or for any other purpose than what they were intended for. The attempt to lead the people back to their ancient habit of tea-drinking was given up. If, however, Indian tea planters had looked a little further they would have found in Burma a few million people who might have been induced to drink their teas, as they are, for the most part, very partial to the mild stimulant. All the Mongolian races are tea-drinkers. It may be hard at first to get the people in Burma to take to Indian tea. China has been before us for a considerable time now, and the taste of the people has been long accustomed to the light teas of China. The China tea which is consumed by the bulk of the people is, also, cheap, so the Indian tea introduced here must be of a low price. Indian teas of a thin, light liquor should first be tried as a compromise between the two teas, and when the people become accustomed to the taste it will be a very short step to discarding China tea altogether in favour of the Indian article. We would seriously advise Indian planters to look into the matter. A representative might be sent over here to study the subject on the spot, and the knowledge and information acquired would be well worth the money spent on the undertaking. In a previous issue we had some remarks in favour of the cultivation of tea in Burma: the fact of a market for Burma tea being at hand in the very country should be a large inducement to speculators in this direction. We would much rather that the market in Burma was supplied with tea grown in the country, but if

this is not practicable: then, in preference to Chinese merchants being enriched, we would certainly prefer that the profit made out of the tea trade in Burma went into the pockets of the Indian planter.—*Rangoon Times*.

INDIAN TEA AND COFFEE STATISTICS.

CALCUTTA, January 10th.—Mr. O'Connor has collected some very interesting statistics on tea and coffee cultivation in India.

The tea area at the end of 1894 was 422,551 acres, viz., 154,000 in Assam, 114,000 in Cachar and Sylhet, 121,000 in Bengal, and the rest in the N. W. P. the Punjab, and the South of India. From 1885 the increase in the area has been 48 per cent., and in the production over 88 per cent. The number of persons employed is reckoned at 333,000 permanently, and 156,000 temporarily.

Coffee at the end of 1894 showed 289,000 acres under cultivation, all being, except 37,000 acres in Burma, in the South of the Madras Presidency. Mysore claims 136,000 acres, Coorg 71,000, and the Nilgiris and Malabar 45,000 acres. The yield fluctuates largely, and Mr. O'Connor remarks that the attention of local authorities might with advantage be drawn to defects which seem to exist in the statistics. About 155,000 persons are engaged in the industry.—*M. Times*.

TEA PLANTING IN INDIA.

JOREHAUT, JAN. 1.—Pruning is well in hand on many gardens. We are having superb weather, grand shooting, too, snipe being abundant this season.

DARJEELING.—Now that the Christmas and New Year festivities are over, the work of getting ready for the ensuing season has been taken seriously in hand. Matters of labour, pruning general, clearing up, and the usual cold weather operations are now well in hand in most gardens.

DAM DIM, Dec. 31, 1895.—Weather has been very cold and chilly at nights of late and a good deal of sickness is hanging about. Plucking is now over and pruning is in hand. Outturns, on the whole, have been fairly good. Recruiting reports so far are favourable, and already a few good coolies are on the way up. Some of the old gardens here are extending next season.

SILIGURI Jan. 2, 1896.—The season has entirely closed here, and as soon as the seasonable distractions are over, we shall be hard at it pruning again.—*Indian Planters' Gazette*, Jan. 4.

TEA IN BURMA.

A contemporary asks why the cultivation of tea should not be added to the industries of Burma and be a paying undertaking also. When it is remembered, says the journal in question, that year by year in India large incomes are realized from tea estates, it seems a pity that such a source of wealth should be closed to Burma merely from want of enterprise. The rapid strides which tea-growing has made in Assam, a neighbouring province, may be perceived from the fact that tea alone accounts for nearly 500 lakhs out of a total value of exports of 680 lakhs of rupees during the year 1894-5. Burma possesses one advantage, and an important one, over many parts of India in which the tea plant now flourishes: the tea plant is indigenous to this country, while it had to be acclimatized and reared at much expense and trouble in India. There are, as a fact, flourishing estates in India which owe their origin to tea seed imported from some Shan plateau. The tea produced in Burma is of a coarse quality, unsuitable for liquoring and reaches the markets only as a pickled preparation. In fact, the natives do not understand the science of tea cultivation; we say science for it is now acknowledged everywhere that, in the future, scientific methods of tea cultivation will

be alone admissible if the industry is to remain profitable to those who undertake it. As mentioned above, the tea planter in Burma starts with the great advantage that the plant is indigenous to the country. There is another advantage, and one perhaps as important. All the knowledge which Indian and Ceylon planters have gained through years of toil at enormous expense, all the results of most recent scientific experiments in manures, blights, and other questions of vital importance in tea cultivation are at the disposal, at the cost of a few rupees, of the tea planter in Burma. He will not be grouping in the dark as many of his Indian *confères* have done, and through there is much still to be learned in connection with tea cultivation the planter in this country need fear no losses or failure if he goes with his eyes open.

We do not, on the other hand, blind ourselves to the difficulties to be contended with. The chief difficulty is the want of labour, although a greater one may exist in a reluctance on the part of the Government to lease land on favourable conditions. The latter obstacle would, of course, place the subject out of consideration altogether. The scarcity of labour would not be an insurmountable difficulty. Almost without exception imported labour is utilised in the Indian tea districts and we see no reason why coolies who go readily to Assam and Cachar should not come to Burma. At the worst the question of importing Chinese labour might be considered and it would be a novel undertaking to make use of her own people in the competition which is now going on with China in the tea trade.

No time could be better than the present for the production of Burma tea. Indian and Ceylon combined, through Messrs. Blechynden and Mackenzie, the Commissioners of their respective Tea Associations, are exploiting the American market in the interest of British tea, and in Australia and South Africa the taste for Indian and Ceylon teas is growing rapidly. China, which formerly possessed the monopoly of the world's market, is gradually falling behind, and when she is extinguished, as she no doubt will, the demand for British tea will be enormous and unless the cultivation is increased, beyond the supply. A start is required, and in a very short time Burma will be in the field as a tea supplier.—*Indian Planters' Gazette*, Jan. 4.

THE IVORY TRADE OF ANTWERP.

THE BRITISH CONSUL'S REPORT.

The ivory industry which, of late, has sprung into new life at Antwerp is one of considerable antiquity. In old commercial Annals of the Town it is stated that in the year 1546 a Spanish vessel, the "Santa de Maria de Victoria," was captured off the coast of Spain by English privateers. This vessel, according to the old chronicle referred to, was proceeding from the African coast to Antwerp, laden with sugar, spice, oil, and ivory, the latter commodity consisted of 340 elephants' tusks (weighing altogether about 6½ tons), and was the property of a Spanish merchant named Rodrigo de Llanos, who resided in this city. The seized merchandise was taken to London and there sold. It may be surmised that the ivory trade of Antwerp was of some importance in the 16th century, as we have evidence that skilled artisans at that time occupied themselves exclusively in ivory working. As an instance of this, the will of one Hans Van Utrecht, an ivory turner, who died at Antwerp in 1580, contains an inventory of his effects, which comprised lathes, ivory saws and tools of all kinds, rare woods, ivory, buffalo horns, and manufactured articles, such as ivory boxes, combs, seals, etc. After the termination of the Spanish dominion in the Netherlands, however, it would seem that the ivory trade languished and finally disappeared altogether. No attempt appears to have been made to revive the trade until 1887, when, in view of the rapid growth of the Belgian interests in the Congo, and in order to make Antwerp the outlet for the natural products of that country, a company was formed named the Upper

Congo Company, which interested itself largely in ivory, and succeeded in re-establishing the trade at Antwerp on a firm basis, and this town now bids fair to become the first ivory market of Europe. It is said to have already out-distanced Liverpool and to rival London in importance.

It will thus be observed that the ivory trade owes its revival almost entirely to the Congo, a fact which is proved by noting how insignificant are the importations of ivory into Antwerp from all sources except from that territory. Moreover, the markets of London and Liverpool, which formerly monopolised the ivory trade of Europe, could not have found a formidable rival in Antwerp had it not been for the regular communications between Belgium and the African coast, which were established in consequence of the intimate relations existing between this country and the Free State.

The following are the returns of ivory imports since 1888, the year in which the trade in that commodity commenced to assume importance:—

Year.	Quantity.
1888	6,400 Kilos.
1889	46,900 "
1890	77,500 "
1891	59,500 "
1892	118,000 "
1893	221,000 "
1894	264,500 "

or a total of 796,500 kilos., or 786½ tons for the seven years, representing a value of 18,000,000 francs, or say, £720,000 sterling.

During the first eight months of the current year the figures representing the ivory imports have shown a notable increase, namely, 514,482 kilos., against 264,500 kilos, for the entire year of 1894.

With regard to the total sales of ivory in the United Kingdom and at Antwerp, the following returns may be thought of interest:—

In 1894, 376 tons, of which 295 tons were fresh imports, and the remainder the residue of the stock of 1893, were sold at London, 60 tons at Liverpool, and 180 tons at Antwerp.

During 1895, 219 tons, of which 130 tons were fresh importations, have been sold at London, 43 tons at Liverpool, and 203 tons at Antwerp.

The sales of ivory during the present year took place at Antwerp on three separate occasions, and the prices ranged between 5 francs and 30 francs per kilo. (2½ lb.), according to quality.

THE TINTS OF PEARL.

We have been taught to believe that the beautiful iridescence of pearls and mother-of-pearl is caused by striations or fine grooves on the surface of the naure, just as the iris of a dove's neck is due to the striations of the plumage; but according to Mr. C. E. Benham, although a little of the colour is produced in this way, most of it is caused by interference of the rays of light by reflection from the outer and inner surfaces of the thin layers of naure forming the substance of the pearl. The colours of a pearl have therefore a similar origin to those of a soap bubble, or the iridescence of ancient glass which has been sealed by time.—*Public Opinion*, Dec. 27.

BRITISH NORTH BORNEO

(From the *British North Borneo Herald*, Dec. 16th.)

H. E. the Governor returned from a visit to Labuan on the 7th per. ss. "Teresa," having left this on 18th November.

Captain Pinson has begun cutting billian at Dravel Bay thus tapping a new source of supply of this valuable timber.

It is satisfactory to note that good tobacco land has been found on the East Coast in a locality as yet untried by foreign enterprise. We understand that a grant has been applied for.

We are glad to hear that planting enterprise is on the increase. The agent of some gentlemen

at home is putting in hemp on the south side of Sandakan Bay and they appear to meditate an extensive trial.

A firm of good position at one of the South China Treaty Ports is offering to supply coolies of the class so greatly in favour with planters at a cost of \$25 per head f.o.b. As the additional cost of passage money should not exceed \$8 or 10, the proposition may be worth attention. Further particulars can be learned on application to the Editor.

Dr. Seelhorst reports on Nov. 23rd that he had arrived at the river Bole and was able to say that there is a very large area of auriferous gravel on both sides of the river. He is located a little above the junction with the Tnak. A few days later he found the auriferous limestone and amphiolite and thinks so highly of the country that he is desirous of opening a better road to it at once.

We are glad to note that a large number of residents are keeping their eyes open for possible mineralogical finds. Some dozen or more specimens have been sent to the Museum or Dr. Seelhorst during the past month, one of which—*asbestos*—may prove of value should the commercial article be found underlying the rough outcrop from which the first specimens were obtained. Enquiries on such matters are constantly made by natives from the Hon. Curator of the Museum.

Collecting specimens of natural history seems to have "caught on" amongst our limited community some eight or nine ladies and gentlemen being interested in butterflies, insects, shells, &c., &c. As British North Borneo has a plentiful fauna and, probably, specimens new to science, we shall doubtless hear before long of a few discoveries. In one house over forty species of moth were captured in a single evening between 7 and 10 p.m.

Mr. G. Mac D. Ennis arrived by the "Banjermassin" on the 13th Nov. to take up his duties as Acting Resident, and has with the Resident made a tour round the tobacco and coffee estates.

PLANTING NOTES

BYTE.—Plenty of rain, coffee cropping feely parchment pls. 83.60 for month. Doing up roads and paths supplying and erecting a drying chamber. More pickers arrived on estate including a gang of Japanese. Coffee blossoming almost continually; question if it sets owing to the continuous rain. Cocoanuts, two of the smaller kind showing fruit spaths, planted October 1893, 26 months of age. Cocoa very promising. Application for a further 180 acres of land.

KABELI.—Much rain, coffee difficult to dry; crop for month parchment, pls. 16.67.

LOONG PIASOW.—Crop parchment pls. 2.88, heavy flush of blossom.

The heavy rains are naturally interfering with the cotton crop, although the trees at the Park Reserve and Race-course are in good bearing. Meanwhile the present backwardness will be atoned for by the larger yield which may be expected when the rainy season is over.

TEA-PEST INVESTIGATIONS.

The promised revelations by Dr. Geo. Watt, C.I.E., with regard to the different pests affecting the tea bush in Assam appear to have suddenly come to a dead stop, and it seems rather niggardly on the part of Government to step in at the eleventh hour and prevent their publication after whetting the lips of expectant tea planters for months. So far we are told a few generalisms, which makes no addition to our

present knowledge on the subject. Had the embargo come before time and money had been spent over the investigation, one would not have so much wondered at it, but now that Dr. Watt's time has been spent, and there is no recall, surely it seems a little ungracious on the part of a paternal Government to step in and say, "no further—the tea industry must pay for its information." What would the term be that would be applied were any Calcutta firm to conduct business on this principle? We fancy "Black-mail." To say the least, it would have carried more reason with it had Government, at the first start, put down its foot and said to the tea magnate world of Calcutta: "No, you are in a sufficiently flourishing condition to employ a chemist to make your own investigations, and we do not see our way to help you. But of this there was no mention, and we wonder to whom the inspiration occurred to put forward as an excuse for not publishing Dr. Watt's researches—the wealth of the tea industry! A few years back it suddenly occurred to some one in the Commissariat Department that the box was by far the most important item with regard to Indian black tea, as it could, after being emptied of its contents, be used as an almirah to keep uniforms for the Reserve, and, in accordance with this brilliant flash of economy, all attention has been paid to the outside of the platter, and the contents rank as nothing. It is far more important to examine the box and see it is properly polished, and not one screw too many or too few put in to spoil the symmetry of the lid. Can it be the same thing with regard to Dr. Watt's investigations that they really are not sufficiently far carried out to warrant their publication, and that a further period of investigation is necessary before publishing what knowledge he has gained? If this is the case, would it not be much more above board to say so, and insist upon the tea industry, furnishing any further pecuniary assistance to carry out the investigation, although we by no means advocate this course, as we consider it a duty devolving upon Government to assist all industries that are in or are likely to be in difficulties, and our own colonies set us an example in the matter, not to speak of foreign countries? Surely, the condition of Assam providing for many thousands of coolies from the other congested districts of India, aye, and continually crying out for more than are obtainable, should not be forgotten by our Governors; and should any sudden disaster, in the shape of preventable disease, attack the plant and deprive the thousands of their bread, upon whom would the greater burden fall? It is all very well for some people elated with last year's success (one which probably never will occur again) to argue that the tea industry can well afford to do all this work for itself, but the time will probably be changed when the year's results are published, and what of 1893 and many other years we could refer to? Many business men say tea is not worth investing in, unless it gives a steady ten per cent, and we doubt very much if any going concern can boast of such a record, and in consequence we deprecate the tendency to boom tea on the results of one good season.—*Indian Agriculturist*, Jan. 1.

SCOTSMEN AS TEA PLANTERS.

The London correspondent of the *Indian Planters' Gazette* writing on 13th December says:—The following recently took my eye in a local newspaper here:—

"An Indian tea planter writes:—I have been a planter for one year only. When I came out to India I had hardly the faintest idea what I was coming to, in the way of work, climate and play, but the inducement of an outdoor existence proved too much for me.

"I find that tea planting is a profession which is by no means overstocked. On the other hand, young Europeans with health and strength are greatly sought after, both by tea agents and managers here. The men required are Scotsmen; those of good education—that is to say, gentlemen—and engineers.

Practical gardeners also will never want employment in the tea districts of India.

"When making preparation to come out, I should have given anything to have met a man who could have told me all about my new life and how it would affect my leaving Scotland. *An old planter's advice is worse than useless* as he looks on things from quite a different standpoint. Especially his description of the life and chances of getting on is misleading as he may be a successful or unsuccessful man. Then his *advice as to outfit, etc., is generally absurd*. At least I found I had made fearful mistakes through listening to the words of retired planters."

This is rather flattering to Scotsmen, but not so very complimentary to retired planters. Of course a Scotsman, whatever he might think, would be too generous to write this to any newspaper. Perhaps some of your readers of experience, competent to give an opinion will favor us with their views. I have but rarely heard an opinion expressed as to what nationalities are the best for tea planters. I once recollect a Scotch Manager of long experience being charged by a sagacious friend of mine with his partiality for Scotch Assistants, when he enumerated all the appointments made by him for over twenty years, and proved that only seven out of fifteen Europeans he had selected were Scotsmen, but stated that though he had exercised his patronage in that way, in order to be strictly impartial, judging from his experience and observation he considered Scotsmen, upon the whole the most suitable. From what I know of all the tea districts I am inclined to think that the majority of good planters have hailed from Scotland and the north of Ireland. I am not able to recall many really competent managers from the south of the Humber. Doubtless the Midland and South County or London Englishmen have very many superior qualifications, accomplishments, though they do not all go to make a successful planter. This may be felt by some to be rather a delicate subject, but still I think it ought to be discussed with the best of good feeling and taste, otherwise I would not have alluded to it.

THE LATEST FROM MR. BLECHYNDEN.

The following extract from a letter, dated New York, 18th November 1895, from Mr. R. Blechynden has been placed at our disposal:—

Since my last Report the Food Show at the Madison Square Garden has been brought to a close. In my previous letters I dwelt from time to time on the importance of our taking part in this show, and the attendance and general character of it has borne out all I said on the subject.

The most important matter in connection with this, as with all other forms of advertising, was to arrange some plan whereby those whom we influenced to buy tea, would be able to obtain the same quality hereafter. On this occasion we adopted a new plan of getting this result.

THE FOOD SHOW.

I have hitherto distributed a list of grocers from whom our teas may be obtained, but as we were now to exhibit both Indian and Ceylon teas and there was no list of grocers supplying Ceylon tea available, we agreed to try and interest the firms packing tea in packets, and obtaining their co-operation to reach distributors. A letter on the lines of the draft I sent to you in my letter of the 27th August last was accordingly addressed to the various firms here, setting forth the advantages to be gained by taking part in the show, the probability of good attendance, the system on which the show was organized and the new plan of "High Teas." The firms were invited to participate in a joint show in one booth, where India and Ceylon teas could be displayed and where each of the participants would have his day in turn. To meet the cost of the booth and the general expenses, the firms agreeing to join in the scheme were to pay \$50 each by way of contribution, the entire balance of all expenses to be borne by the two Associations. This letter was sent to all the firms and agencies for packet teas of any consequence in

this city. The terms were accepted by the agent for Messrs. Tetley & Co., the agent for Appleton, Machin and Smiles, by "The Ceylon Tea Co.," owners of the "Siva" brand, and by Mr. E. M. Payne, owner of the "Daruma" brand—four in all.

THE TEA BOOTH.

The show opened on the evening of the 2nd October and as the building was opened for the erection of booths, on the morning of the 1st we had to work very hard to get all in readiness, which we eventually did. We had harder work than most people having no contractor, as I looked after the work myself, and as our booth is always one of some pretensions to style, and is made well and strongly to admit of seating people who lean back against it and so on. I will have the pleasure of sending you a photograph of the booth, which, as you will see, is on the same lines as we have always adopted, the doors and windows following the style of Indian architecture. Seats ran round the four sides and the door stood at one angle and the counter, where tea was made, at the other, giving the booth a novel appearance. The whole was draped with Indian goods, and hung inside and out with photos of tea manufacture, as well as the different ornamental signs of the firms whose teas we exhibited and the charts of the rise of British-grown teas in the London Market. Within the booth in the centre stood a large square table 4' by 4' upon which a round table with revolving top was placed and the whole piled up with packets of the different teas. Over the windows, inside, ran shelves, on which also the teas were displayed, and over the counter there was a bracket, from which the name of the tea being exhibited was hung and changed daily.

THE ATTENDANTS.

The staff in the booth consisted of two sales-ladies and two coloured girls. The latter stood behind the counter and made the tea, which was handed by the sales-ladies. We had in addition for the latter half of the show a young man dressed in the turban and scarlet *chapkan* of our *khitmatgars*, who stood at the door and invited people to enter and try the tea. After the first few days, when the crowded period began, his duties were more to try and keep undesirable people out, and put up the cords at the door when the place was full, regulate the number coming in to the seats available, etc. The salesmen of the different firms we had interested were in attendance each evening in turn to try and catch grocers, take orders, etc.

Visitors on being admitted were seated, the sales-ladies supplied them with tea, gave them the printed matter sent down for distribution by each firm, of which I send samples, and then tried to tell them about the qualities of tea, sell them packets and, failing that, samples. Each firm sent a supply of samples, Tetley and Appleton using well-made tin boxes enamelled in colours with their trade marks and the other two firms, being new to the business, used small baskets from China, miniature tea-pots, etc., more expensive and less effective than the others. Visitors desirous of booking orders through grocers could do so, and these were handed to the salesmen, or were sent up to the offices next day.

In the early part of the show, when the management got nervous that it would not be such a great success as they had expected it to be, I was able to arrange to be allowed to issue invitation cards and secured the unusual privilege of these cards being accepted at the gate in lieu of the regular tickets of admission. We issued 1,000 of these cards, each admitting two persons and sent them mainly to tea importers and jobbers.

"HIGH TEAS."

At this show an enterprising lady organised what she called "High Teas" and succeeded in interesting a number of charitable and other societies in the matter. A large hall within the building, separate from the immense Exhibition hall, was set apart for this purpose; the room was handsomely decorated by a number of the firms dealing in art furniture by way of advertisement and some of the leading caterers of the city lent their names, and in some instances, actually supplied the tables, serving what was in

reality a *table d'hote* dinner, for which a charge of one dollar a plate was made. The ticket for the dinner gave admission to the room, which was nicely laid out in the manner of a good class restaurant. The *menu* included certain brands of coffee and of tea put in by way of advertisement.

I put up a booth, reaching the roof of the room, some 20 feet high, 15 feet long and 4 feet deep, in the most commanding place in the room. It was hung with Indian goods, which I had to buy from Tetley & Co., but got them at wholesale prices. The booth looked well and I had one American and one coloured girl here dressed in native costume.

HELP FROM THE SOCIAL PURITANS.

When there was some doubt of our taking part in the show, I had arranged with Mrs. Grannies, the head of the National Social Purity Organisation, to supply her at a booth she had with sample packets of Indian teas, which she was to sell for her society's benefit. This arrangement I carried out. I was able in addition to assist Mrs. Grannies in various ways and have made a firm ally, on whom I count for assistance in the future.

I should have said above that we had our cards and the tea displayed in the refreshment room attached to the show in return for the tea we provided the caterer.

We were only able to secure one day at the Cooking lectures, which are great features of these shows, when we served tea and where Mrs. Tipton gave a short talk to the ladies, who are practically the only ones who attend there.

CARTOONS.

During the show certain special advertising was done by Mr. Mackenzie in the newspapers, copies of which were sent you at the time. One of them, it will be remembered, was in allusion to the tea booth at the Exhibition and as they were "display" advertisements with cartoons, they could not fail to attract attention. The majority of these advertisements were topical allusions to subjects of the day—Mayor Strong and the Tammany Tiger; The race between *Valkyrie* and *Defender*, with Junks in the background; Crocker and Platt (Tammany leaders) drinking China tea and coffee, disturbed by Roosevelt and Public opinion with Indian and Ceylon teas. These cartoons appeared regularly every Saturday during the time the show lasted, and in my further reports I will allude to the form in which they have subsequently appeared.

In this report, as it is already so long, I will confine myself to the Food Show and write of other matters separately. The Indian Tea Association's share of the whole expenses apart from the advertising, for which separate arrangements were made between Ceylon and ourselves, will be approximately \$250, for which small sum we have had a most excellent advertisement, and done more good, both directly and indirectly, than we could, so far as I can see, have done by any other means with double the sum. In calculating our share of the expenses I deduct the amount paid by the tea packers to the joint fund. —*Indian Tea Planters' Gazette*, Jan. 4.

THE "CEYLON FORESTER" for November and December has reached us. The contents of the November number are as follows:—Forest Conservancy; Extracts, Notes and Queries; Botanical Notes on Trees; Notes on Trees and Plants used for Drugs, Dyes, Oils, &c. in the N.C.P.; Ceylon Woods; Dimensions of a Banyan Tree at Admiralty House, Trincomalee; Acknowledgments; The Relative Price of Timber and other Minor Produce in the Different Provinces; Rates Paid for Timber &c. in the Sabaragamuwa Province; Notes on Ceylon Birds; Government Gazette Notifications; and Result of Auction Sale of Ebony held at the Central Timber Depot on 7th November 1895. The contents of the December number are as follows:—Estimates for 1896; The Working of the Forest Department; Botanical Notes on Trees; Schlich's Manual of Forestry; Notes on Trees and Plants used for Drugs, Dyes, Oils, &c. in the N.C.P.; Weight of Handmills; The Mammals of Ceylon; Shikar; Notes on Ceylon Birds; Acknowledgments; and Government Notifications.

VARIOUS PLANTING NOTES.

THE PROGRESS OF INDIAN TEA CULTIVATION.—A very valuable statement by Mr. J. E. O'Connor, Director-General of Statistics to the Government of India, has just been published showing the development of the Indian tea industry. We reproduce it from a Madras contemporary in another column.

WYNAAD TEA.—The first shipment of tea from the Erramaculla Estate, one of the new tea plantations that have recently been opened in the Wynaad, has been sold in Mincing Lane at the average price of 9d per lb. This is very satisfactory, seeing that an average of 6d per lb. is remunerative. It will be noticed that it is the same average as Ceylon tea sold on garden account for the week ending 2nd instant.—*M. Mail*, Jan. 7.

The fruit of the India-rubber tree is somewhat similar to that of the *Ricinus communis*, the castor-oil plant, though somewhat larger. The seeds have a not disagreeable taste, and yield a purplish oil. It is a fairly good substitute for linseed oil, though it dries less readily. Mixed with copal blue, and turpentine, it makes a good varnish. The oil may be also used in the manufacture of soaps and lithographic inks. The seeds are somewhat like tiny chestnuts, although darker in colour. The Indian girls are fond of wearing bracelets and necklets made of them.—*India Rubber Journal*, Dec. 12.

TEA AND COCONUTS IN THE DUMBARA VALLEY are to be the next great successes: Mr. Robert Brown (who in April is likely to go home) has already proved the former on Rajawella, getting very handsome returns from the pioneer field, the night dew in Dumbara being sufficient to give a flush; while he has also gone in freely for the palm. The fact is coffee was found no longer to give satisfactory returns, while something had gone wrong with cacao—so on Rajawella, and, we believe, Pallekelle, tea and coconuts are likely to become the ruling products.

DIMENSIONS OF A BANYAN TREE AT ADMIRALTY HOUSE, TRINCOMALEE.—By the courtesy of Admiral Drummond we are enabled to give the dimensions of the above tree, which in height and circumference of foliage exceeds the one mentioned a few months ago in the *Indian Forester*.

	ft.	in.
Height (estimated by sextant angles)	66	6
Girth of central trunk at 3ft from ground	19	6
do do 5ft do	21	10
Supernumerary trunks and roots which have taken root No. 58		
Spread of tree in S.E. and N.W. direction	165	6
do N.E. and S.W. do	174	0
Circumference of foliage	541	0

Above dimensions were taken by Lieut. (N.) I. Take of H.M.S. "Boadicea" on 31st January 1894.—*Ceylon Forester*.

MR ROBERT CROSS ON CACAO.—In our correspondence column we give another valuable letter from Mr. Robert Cross on the subject of the large-growing variety of cacao and its cultivation in Ceylon. The information it contains will be read with interest by cacao planters; though it will be seen that Mr. Cross is not very sanguine as to the successful introduction of this variety into our island, unless someone goes to South America specially to select the young plants. Even then, if an attempt were made to procure plants of the large-growing prolific cacao tree from a Spanish plantation in South America, the thing would have to be gone about quietly; for, although there is now no law in those Republics to prevent the exportation of these plants, yet the natives have become extremely suspicious, owing to India and our colonies having absorbed so much of their commercial exports. Mr. Cross's hopeful words regarding the tea industry are also valuable, coming from such an experienced critic.

THE IMPERIAL TEA ESTATE COMPANY.—In "Notes from London" our evening contemporary reports the formation of this Company with a capital of £100,000 and a present issue of £27,500 for the Binoya and Mottingham estates; but in one or two respects the paragraph in which this announcement is made is misleading. In the first place the Company has been brought out, not by Messrs. Whittall & Co. of Colombo as might be inferred, but by Messrs. J. Whittall & Co., London,—a quite separate firm; and we are assured that there never was any question of a local rupee Company taking over the estates, and that the sellers were not in any way responsible for the formation of the Company. At the present market quotations of shares in a Company owning estates adjoining Mottingham the value per acre of tea is £70 stg.; while the price paid for the estates just sold is only equal to £40 an acre of tea in bearing. According to our Directory Mottingham has an acreage of 220 in tea and Binoya 441.

THE IMPORTS OF TEA INTO AMERICA.—The total imports of tea for the first nine months of 1895, compared with the same time in 1894, were according to the *American Grocer* of the 27th instant, as follows:—

	1895.	1894.
	Pounds.	Pounds.
From China	32,540,574	36,323,149
From Japan	27,811,747	28,749,097
From United Kingdom	2,942,273	2,852,039
From Asia and Oceania	1,145,961	211,730
From British North America	535,177	733,985
From East Indies	436,649	380,022
From other countries	23,774	8,460
Total imports	64,436,155	69,253,482

We note growing imports of India and Ceylon tea, but not in a volume to cause much consternation among Chinese and Japanese producers that the American market is slipping away from them. The average cost of 1895 imports, as declared at port of shipment, was 13·8 cents per pound. That is not very flattering to the tastes of consumers, nor does it show much of an appreciation of the world's most famous leaf. There is wide room for improvement in the demand for fine tea.

MR. BIERACH'S TEA ADVERTISING.—Mr. S. Bierach has written from New York stating that he had just finished a Ceylon Tea Exhibit at the Philadelphia Food Exposition which had proved very successful. No fewer than 600 free cups of tea were served each day of the Exhibition, and hundreds of ladies had impressed on them the virtues of Ceylon tea. The brands on sale were those specially "run" by Mr. Bierach—the "Aryan," "Singha" and "Vihara" brands. Newspaper cuttings which have been brought under our notice corroborate the success of the Exhibit which was purely a Ceylon one. Mr. Bierach writes that if he cannot be employed by the Planters' Association to push the sale of Ceylon tea an exception should be made in his case and support and a grant of tea allowed him. Mr. Bierach adds:—"One thing I wish to impress upon you, is this: Ceylon should stand alone. India teas are too astringent, Ceylons are the favourites in America. Americans want good tea and will pay the price, and when the time comes your planters will be happy with better prices ruling. America has used rubbish long enough. The people are learning that what they want is a pure tea and they are quite willing to pay for a good article so you will see the importance of presenting the best."

TEA ESTATES BETTER THAN FIVE YEARS AGO!—Mr. Tom Gray, the veteran Ceylon planter, has returned to Colombo after a fortnight up-country; and reports that the tea in Dimbula, Dikoya and Maskeliya looks five years younger than when he last saw it! He thinks it sheer madness for any proprietor to sell his estate (unless forced to do so) at less than £100 the acre.

SEASON REPORTS.—The abstract of Season Reports for the month of November, 1895, published in the *Gazette*, shows that the paddy crops and prospects are generally fair, though in some parts, the recent rains damaged the crops to some extent. The general health of the people is good. Hambantota however, reports that fever prevails in some villages of the interior. Cattle hoof and throat disease is reported from Galle, Nuwara Eliya and Anuradhapura. The abstract of season reports for the month of December, 1895, has also been published in the *Gazette*. Paddy crops and prospects are generally fair. With regard to the health of the people, Mannar reports:—fever prevails to a great extent; Mullaitivu:—fever and cold, very prevalent; Badulla:—fever, sore-eyes and dysentery prevalent; chicken-pox and measles prevail in parts of the Kegalle district; Galle reports cases of dysentery and chicken-pox in Wellaboda-pattu.

FROZEN FLOWERS FROM AUSTRALIA.—It is stated in the *Westminster Gazette* of November 28, that a fine collection of blue and white Water Lilies (*Nymphæa gigantea*) has been sent by a leading florist in Sydney, N.S.W., through Sir Saul Samuel, the Agent-General, for presentation to her Majesty the Queen. The Lilies were frozen in ice, and received as long ago as August last by the Colonial Consignment and Distributing Company, Limited, being stored at Nelson's Wharf, until Wednesday, November 27, when they were delivered at Windsor. In spite of the length of time, the flowers were in perfect condition, and, seen through the transparent ice, were very attractive.

SHADE TREE FOR COFFEE.—A tree that is highly esteemed as a shade for coffee in the Republic of Colombia is described in the following extract from an interesting letter addressed to Kew by Mr. R. B. White, dated Palmira, August 6th, 1895. The tree has been identified as *Pithecolobium polycephalum*, Benth., *Hooker's London Journal of Botany*, lii. (1844), p. 219. It extends to tropical Brazil, and was collected near Rio Janeiro by Miers. Mr. White writes:—"I enclose some seeds of a tree which is being used most successfully here as a shade for coffee. It has flowers in small white balls just the size of those of the Sensitive plant, pods long, flat, compressed, with 15 to 20 seeds. Pods do not open, being held together by strong marginal veins; they simply break up when rotten. No one here knows the name of this tree. I have referred it to Mr. Lehmann, and he does not know it. It is a native only of Antioquia, and grows in a mean temperature of 75° Fahr. It is fond of stony poor soil. A tree 18 months old will cover 14 square yards of ground (12 × 12) It goes to sleep at night, allowing the dew and cool air to reach the coffee. When young the wood is soft, but on ageing it gradually gets a red heart and becomes hard and durable. The seed I send has been bathed in sulphate of copper solution, and I believe it to be good, as you can try a few seeds in Kew by way of curiosity and send the rest to one of our tropical establishments to be reported on. When full-grown this tree may be 50 feet high with a spread of at least 50 feet on all sides. Nothing can be better as a shade tree. It is a poor liver and does not exhaust the soil. It spreads out horizontally; it gives a good shade, not too dense, and during the night allows the dew to refresh the plants beneath. The leaflets do not litter the plantation and are too small to harbour fungi and moulds. It is easily trimmed and brought to shape. The umbrella ants will attack it, but they can only get hold of one little sub-pinna at a time. They cannot get a good bite and eat out a real imposing umbrella and so they do not care to draw much on this tree when once they have balanced up working expenses and output. This is an advantage."—*Kew Bulletin*, Nov. 1895.

THE TRADE OF THE PORT.—A merchant sends us the following complaint today:—"There is a serious dead-lock at the wharf, steamers delayed, warehouses blocked, no carts and coolies to be had, &c." This should stir up those responsible: holidays even may not stop Export and Import trade!

"THE AGRICULTURAL MAGAZINE" for January, 1896 has the following contents:—Grape Cultivation in Colombo; Occasional Notes; Rainfall at the School of Agriculture during November; Rainfall taken at the School of Agriculture during the Month of December 1895; The Feeding of Animals; Notes from the Poona Farm; The Fertility of Soils; Ceylon Woods; The Management of Dairy Cattle; Ailments and Diseases of the Horse; Astringent Barks; Prevention of Plant Diseases; Notes on Recent Research on the Feeding of Animals; General Items.

THE AGE OF TREES.—According to Herr Gericke, the German forester, trees in Germany have certainly lived to the age of 570 years. Pines in Bohemia, Norway, and Sweden also live to this age. The silver fir in Bohemia lives to the age of 400 years; the larch in Bavaria reaches 275 years. The evergreen oak of Aschaffenburg was 410 years old. A red beech at the same place was 245 years old. Ashes of 170 years, birches of 200, aspens of 220, maples of 225, elms of 130, and red alders of 145 years are also known.—*Globe*.

FROST IN THE NILGIRIS.—"The cold weather has set in with a vengeance and frost has been common for many night's past; but last night it visited us with unusual severity. The thermometer exposed outside my bungalow verandah registered 24° at half past 6 this morning. I have no record of what the minimum was, but I found ice a quarter of an inch thick in a tub outside my bedroom and icicles over 2 feet long were hanging from a raised sluice near the bungalow. As for my garden, the flowers have all gone. I believe it is many years since we were visited by so severe a frost."—*M. Mail*.

THE MILDURA PRODUCERS have apparently done well this last season. The official returns give the yield of raisins at 1,787,744 lb.; of currants, 10,960 lb.; apricots and peaches, 182,040 lb.; fresh fruit generally, 640,000 lb.; and of jams and canned fruits, at 81,288 lb.; The almond crop is put at 6,300 lb. Although no wine appears to have been exported, the quantity made is put at 75,000 gallons. Altogether the produce raised is valued at 40,000l. As this is only the "beginning" of what can be done on the irrigation principle, it is clear that the Mildura cultivators may be congratulated on the progress that they have thus far achieved.—*M. Mail*.

TEA AND COFFEE IN SOUTHERN INDIA.—Dealing with a correspondence relative to irresponsible scribblers in the press with regard to planting matters the *Madras Mail* says:—

We have already said that there is ample room for a special planting organ in this Presidency, and it seemed as if the little fortnightly journal issued at Coonoor was to meet this want. It may still do so, but it will have to considerably modify or alter its views. In its last issue it states that it thinks the coffee industry is not permanent, and as for tea it is doomed. "The margin of profit in Upper India," it writes, "is steadily vanishing and may in a very few years disappear altogether." And this though, according to the *Economist*, the forty Northern India tea estates, registered in London, paid in 1894 an average dividend of 9 per cent., and the financial papers during the past few weeks have more than once mentioned how much greater attention English investors are paying just now to tea-shares on account of the steadiness of their returns. Never in the history of coffee cultivation in Southern India has the permanence of the industry been more fully assured than at the present, and as for tea, though there are elements of weakness in its position, yet the vigorous manner in which demand is being developed in new countries, and the rise of prices attendant on this development, are very favourable signs of its continued prosperity.

PROGRESS OF INDIAN TEA CULTIVATION.

Mr. J. E. O'Connor, Director-General of Statistics to the Government of India, has drawn up the following statement:—

The area under tea in India at the end of 1894 extended over 422,551 acres, a little less than two-thirds of this area (nearly 61 per cent.) being in the valleys of the Brahmaputra and Surma, which contain as much as 268,796 acres, 154,281 in Assam (the Brahmaputra Valley) and 114,512 in Cachar and Sylhet (the Surma Valley). In extent of cultivation Bengal comes next, though the acreage is much smaller than in either of the divisions of Assam, the area under tea being 121,121 acres, or about 29 per cent. of the whole.

The cultivation of tea is, therefore, to the extent of between 92 and 93 per cent. of the whole area, limited to the two provinces of Assam and Bengal.

The relatively small extent of the remaining acreage is divided tolerably equally between Northern and Southern India, thus:—

NORTHERN INDIA.

	Acres.
North-Western Provinces	- 7,652
Punjab	- 8,921
Total	- 16,573

IN SOUTHERN INDIA.

Madras	- 6,102
Travancore and Cochin	- 9,079
Total	- 15,181

There is besides a small area of 880 acres in Burma. Examining the localities a little more closely, we find tea cultivation thus distributed in the different provinces:—

IN ASSAM.

	Acres.
Surma Valley :	
Cachar	59,586
Sylhet	54,926
Brahmaputra Valley :	
Sibsagar	59,925
Lakhimpur	44,477
Darrang	33,101
Nowgong	11,837
Kamruk	4,534

IN BENGAL.

Darjiling	70,038
Jalpāiguri	43,133
Chittagong	4,501
Lohardaga and Hazaribagh	3,349

IN THE NORTH-WESTERN PROVINCES.

Kumaun	3,140
Dehra Dnn	4,512

IN THE PUNJAB.

Kangra	8,826
----------------	-------

SOUTHERN INDIA.

Nilgiris	5,697
Travancore	9,022

In Burma the cultivation, which is quite trifling, is carried on in the Upper Chindwin and Katha Districts. There are a few small areas also in Goalpara and the Khasi and Jaintia hills, in the Chittagong hill tracts, in Simla, Malabar, and Cochin. Where the acreage is largest, there also is the yield of leaf to the acre the largest. It is evident that tea cultivation in India has been mainly concentrated in those places where a heavy rainfall and a humid and equable climate permit of repeated pluckings and flashings. In the valleys of the Brahmaputra and Surma the yield averages about 420 pounds to the acre, and in Bengal about 330 pounds, the yield in Jalpaiguri (the Duars) being exceptionally large. In Dehra Dun and in Travancore the yield is about the same as in Bengal, while elsewhere it is much lower. The area under tea has expanded from year to year without a pause during the decade comprised in these tables. In 1885 the area was 283,925 acres; in 1894 it had increased to 422,551 acres, the increase being in the ratio of 48·8 per cent.

The number of acres added to the tea-growing area each year was:—

	Acres.		Acres.
1886	14,294	1891	17,610
1887	14,581	1892	12,432
1888	11,525	1893	20,970
1889	9,374	1894	26,712
1890	11,126		

The average of the acreage added in the last five years was very much larger (17,770 acres) than the average increase (12,444 acres) in the four preceding years. The largest increase of all, it may be observed in passing, was in the two years 1893 and 1894, the former of these being the year in which the Mints were closed, an event which was regarded by some as the herald of disaster to the tea-planting industry.

PRODUCTION.

The quantity of tea produced has increased in the decade in much greater ratio than the area under cultivation for, while the area has increased by less than 49 per cent, the increase in production has been over 88 per cent. Taking the area and production in 1885 as being in both cases represented by 100, the subjoined table shows the ratio of increase in each compared with that year. The figures of the actual increase of production each year over the production of the preceding year are also added:—

	Area.	Quantity produced.	Actual increase annually in lb.
1885	.. 106	100
1886	.. 105	115	10,899,835
1887	.. 110	129	9,826,270
1888	.. 114	139	7,540,462
1889	.. 117	149	7,250,331
1890	.. 121	156	4,993,531
1891	.. 127	173	11,831,496
1892	.. 132	170	—1,873,628
1893	.. 139	184	10,253,626
1894	.. 149	188	2,465,144

In 1892 the production in Assam and Cachar declined, the decline in Cachar and Sylhet especially being so considerable as to affect the general results, though there was a large increase in Bengal and elsewhere. In 1894 there was again a decline, but a smaller one, in Cachar and Sylhet, and in Bengal there was but a small increase.

PERSONS EMPLOYED.

The number of persons employed in the tea industry in 1894 is returned at 383,505 (permanently and 156,120 (temporarily), or altogether a little over half a million people (539,625), which would work out to about 1·28 persons to the acre. The accuracy of the figures is, however, open to question.

EXPORTS AND CONSUMPTION.

The tea produced in India is exported mainly to the United Kingdom, to the extent of about 96 per cent on the average production. The subjoined figures give approximately the quantity of tea consumed in India, the figures representing the average of the last five years:—

		lb.
Indian Tea	{ Produced ..	124,971,905
	{ Exported ..	120,439,095
	{ Left in India ..	4,532,810
Foreign Tea	{ Imported ..	6,789,337
	{ Re-exported ..	4,341,044
	{ Left in India ..	2,448,293

Thus the average consumption of all tea in India seems to be about seven million pounds, of which 4½ million are Indian and 2½ million are foreign. It may be added that Ceylon provides India with nearly a million pounds of the foreign tea imported.

This consumption comes to only 0·024lb. per head of the population according to the census of 1891, or say one-fortieth of a pound, a quantity which contrasts strongly with a consumption in the United Kingdom of from 5½ to 5½lb. per head. Broadly, it may be said that the Indian consumption of tea per head is exceeded by the United Kingdom more than two hundred times. Indeed, such as it is, the consumption of tea in India is to a substantial extent due to the European population, for more than one million pounds are

taken by the Commissariat for the British Army, and at least an equal quantity must be consumed by the European civil population. However, the consumption is increasing among the population of the larger towns, especially the Mahomedans; there is room for great expansion in this direction.

PRICES.

The prices of tea in Calcutta have fluctuated greatly since 1873. Taking the price in March, 1873, to be represented by 100, it appears that until 1884 the level was well above that point, varying from 110 to 148. Coincidentally with the great fall in exchange and in general prices in 1885, the level fell to 90, and though in 1886 it rose to 96, a low level was maintained in the following years until 1894. In 1895 the level rose to 97. These figures all represent the course of prices of Fine Pekoe in January of each year as given by the Bengal Chamber of Commerce.

In the Statistical Bureau the average prices of the various descriptions of tea sold at the public sales held in Calcutta during the tea season have been computed of some years past, and the results are regularly published in the review of the trade of India. From these returns of prices the figures below are taken, being the prices per pound of the three descriptions which form the largest proportion of the tea sold:—

Season.	Broken		Pekoc.		Pekoe		Pekoe.	
	As.	Pie.	As.	Pie.	As.	Pie.	As.	Pie.
1889	.. 9		9	7	5		5	7
1890	.. 8		10½	7	2		5	8½
1891	.. 8		7½	7	0½		5	3½
1892	.. 11		3½	8	9		6	5½
1893	.. 9		2 4-5th	7	2½		5	4 4-5th
1894	.. 11		8	9	4 4-5th	7	2	5 7-8th

PROSPECTS OF BRITISH NORTH BORNEO.

Mr. R. S. Duff Tytler writes:—"I received the enclosed, which may interest you and others seeking 'light' on Borneo." The enclosure is the following letter from Mr. Henry Walker:—

Dec. 19th.

My dear Tytler,—I have just come across your note introducing — to me, and it just occurs to me that you would be glad to hear what he has done.

He was very pleased with all the coffee he saw in North Borneo. I happened to meet him at Labuan where I was a bit seedy and was taking a change to Sandakan so we travelled together. I advised him to go straight on to Sandakan and see the Governor first before doing anything. At Sandakan he saw Pryer's coffee which is very promising and beginning to crop well—planted in 1892 (about 180 acres). That induced him to see the Governor and he got a free grant of 500 acres subject to its being planted and then he went back in the same steamer with me to Kudat, and saw my plantings, also about 180 but we only opened 27 acres early in 1892 and gradually opened; the last 32 now being planted.

Our soil is better than the East Coast, besides we have some labour, not much but still it is a help. — stayed at Toritipan our place and the adjoining 4 tobacco estates and finally took up land on the Bay to the North of Toritipan, about 2 hours by boat. I had told him he would find good soil, but he must make sure of the water and he says he has both with a big village near. I hear he has felled 70 acres partly for Liberian coffee and partly for coconuts.

I think that coffee in North Borneo is the coming K. but I should like to see Arabian coffee grown. It grows and fruits well in many villages on the West coast and no leaf disease, but we shall get leaf disease so I do not lay any particular stress on that. My belief is we always had it in Ceylon.

Our hills begin at the sea-side and continue for 180 miles 7,000, 8,000, 14,000 feet high in the interior, behind the coast range, there are open plains and a lovely climate. I asked the Government in

1892 to make a road through the hills and pointed out a gorge which I thought would do, but the "powers" were against it and when it was said my road scheme was impossible they said 'we thought so.' However in 1894 a change was made in the Directorate and Roads were wanted. My letters were found and I got orders to make the Roads, and I have done 20 miles since March and shall finish 35 miles, I hope, in the 12 months—Bridle track.

The gorge slips in between hills of 3,400 feet up to a plain at 600 feet which rises steadily and extends North and South for 20 and 15 miles, Hills all round—and bad soil. The rainfall resembles Uva, about 70 in. well divided, and since March I have seen the sun every day. A fruit country and the jungle is full of wonderful blossoms, each in its season. I believe, it is a grand coffee country. This is the centre of our chief population. And there is any amount of yams. The directors now propose to run a railway up the gorge and if they do it will make this country go-ahead.

I was in Sandakan two months and then returned here so that I have had a lot of rough work this year, and I shall be glad to get back to Sandakan.

I hope to go to England in March or April and I should like to see the Ceylon men on my way. They ought to come here. We have our troubles but they can be overcome, only we want men with money—it's no use coming here for a job. My road will be a capital means of prospecting from sea-level gradually up through hilly land and valleys until the hills are 3,400 feet which in point of temp. means 1,000 feet more than in Ceylon.—With kind regards, yours sincerely,

HENRY WALKER.

BORNEO CHIT-CHAT.

Jan. 16th.

OIL MOTOR LAUNCHES for passenger and goods traffic in the bays and rivers of North Borneo are advocated by the *North Borneo Herald* of December. The amount of petroleum required is exceedingly small, a pint keeping the engine going for a considerable time.

GOOD BILIAN TIMBER LAND has been found on the east coast in a locality hitherto untouched. Coals are now being exported from Labuan weekly to the value of \$11,000.

A NEW COFFEE COMPANY (Sandakan Coffee Estate Company, Limited) has been registered and incorporated in London, £25,000.

TOBACCO.—North Borneo tobacco has been sold in Holland in 1894 value \$588,000, average price 37½ Am. cents per Am. lb. Sumatra tobacco has been sold in Holland in 1894 value \$14,000,000, average price 43½ Am. cents per am. lb.—*Cor.*

TEA LAND IN SOUTHERN INDIA.

We learn that Mr. W. S. Shaw, senior partner of Messrs. Parry & Co. of Madras, and President of the Board of Directors of the Bank of Madras, will arrive in Colombo per ss. "Goorkha" on the 23rd inst. Mr. Shaw's firm are at present offering suitable blocks of land in the Wynad for tea *vide* (advertisement). The demand for the land, we hear, is very keen, and intending purchasers should make up their minds at once.

TEA IN AMERICA.

New York, Dec. 18th.

The pressure to sell Greens has stopped and the result is a steady market for Pinguneys. High grade Formosas are in light supply and firm, with low grades steady and buyers holding off, believing they must go lower. Japaus unchanged. The general market is quiet and dull; the only activity is on the

part of the agents of the Ceylon and India tea planters, whose pluck, perseverance and aggressiveness command admiration. They are advertising liberally, and have succeeded in getting their teas into scores of the best stores—in short, they are making progress. The campaign never looked as well nor promised such good results as at present, and this is due in a large measure to the industry, intelligence and admirable way in which the representatives of the Indian and Ceylon tea interests have worked. Today at noon the Montgomery Auction and Commission Company will sell 3,820 packages, viz.: 647 half-chests Moyune, new season's including the "Qui Hong" Chop; 1,563 boxes Pingsuey, new crop; 157 half-chests Japan, new crop including fancy assorted 1-lb baskets; 154 half-chests Japan, baskets-fired and sun-dried, including fancy assorted 1-lb baskets; 305 half-chests and boxes Congou, new crop; 48 boxes Capers, new crop; 144 packages India, Java Pekoe and Ceylon; 19 half-chests and boxes Amoy; 483 half-chests Foochow; 300 half-chests and boxes Formosa, new season's.—*American Grocer.*

DRUG REPORT.

(From the *Chemist and Druggist.*)

London, December 24th.

There is very little news in the drug and chemical markets since our last report, business transactions being practically at an end for the remainder of the year.

Essential oils remain steady, at 10s to 10s 3d for star-anise, 1s 11d to 2s nominally for citronella, and 2½d to 2½d per oz for lemongrass oil.

Good East Indian annatto-seed has lately been sold privately in small quantities at 6d per lb.

In spices scarcely any business is passing. Zanzibar cloves remain fairly steady, with sellers for January-March delivery at 21-32nd d. per lb.

MISTLETOE AND MISTLE THRUSH.

The mysteries which have gathered round the mistletoe plant, the *Viscum album* of botanists, have struck their roots deep in the romance of folk-lore, in the evolution of cults and superstitious ceremonial, far beyond even the deep woodland ritual of the Druid priest. Even the most learned of philologists of the present day are not agreed as to the origin of the word. It fills, too, no inconsiderable space in realms of poetry. Our great Elizabethan dramatists have employed it and its imaginary properties and parasitical ways to point their morals. Under its boughs, at the merry Christmastide, many a life's romance, many human comedies and even tragedies, have received their first meaningless or passionate note of inspiration. In this article we must not be tempted, beyond this casual allusion, into a consideration of the mistletoe in any of these fascinating fields of speculation. Our purpose is to point out certain purely scientific phenomena in connection with the plant and the mistle thrush (*Turdus viscivorus*) about which much controversy has been waged, and in connection with which considerable ignorance still prevails, even among botanists and ornithologists. For instance, in one of the standard German works on silviculture ("The Waldschütz of Kauschinger," by Hermann Fürst), the statement is made that the mistletoe plant "probably" owes its wide extension and reproduction to thrushes, which eagerly consume its berries, and "in cleansing their beaks from the sticky flesh of the fruit, leave a portion of it on the bark of the tree along with some of the seeds contained in it." That is not so, as we shall show, and the elements of science and romance are interwoven with this very theory of seed propaganda and of specific *modus operandi*. Curiously enough, the ancient theory which

found favour with Aristotle, Pliny, Ælian, Phile, and others, and which the poets followed blindly and enlarged upon in metaphor form, was rudely assailed by Lord Bacon in his "Sylva Sylvarum" (1635), and even more vigorously ridiculed by the very sceptical Sir Thomas Browne in his "Pseudoxia Epidemica" (1672), but is now established as true beyond the shadow of a doubt. The truth has been revealed by the labours of field naturalists and observant botanists working on the very inductive lines of reasoning that Lord Bacon is popularly credited with having "founded," and which undoubtedly were successfully employed by Sir Thomas Browne in exposing many "Vulgar Errors." Lord Bacon ventures upon reasons for discarding the ancient theory, which are altogether fallacious. The passage will be found on pages 139 to 142 of the edition referred to, the old spelling and punctuation and use of capital letters being followed.

"We finde no Super-plant that is a Formed Plant, but Misseltoe. They have an idle Tradition, that there is a Bird, called a Missel-Bird, that feedeth upon a Seed, which many times shee cannot digest, and so expeleth the whole with her Excrement which falling upon a Bough of a Tree, that hath some Rift, putteth forth the Misseltoe. But this is a Fable: For it is not probable, that Birds should feed upon that they cannot digest. But allow that yet it cannot be for other Reasons: For First it is found upon certaine Trees: And those Trees beare no such Fruit, as may allure that Bird to sit, and feed upon them. It may be that Bird feedeth upon the Misseltoe-Berries, and so is often found there: Which may have given occasion to the Tale, But that which maketh an End of the Question, is, that Misseltoe hath beene found to put forth under the Boughes, and not [onely] above the Boughes: So it cannot be any Thing that falleth upon the Bough. Misseltoe groweth chiefly upon Crab-Trees, Apple-Trees, sometimes upon Hasles; And rarely upon Oakes; the Misseltoe whereof is counted verie Medicinall. It is ever greene, Winter and Summer; And beareth a White Glistening Berry: And it is a Plant, utterly differing from the Plant, upon which it groweth. Two things therefore may be certainly set down. First that Super-fetation must be by Abundance of Sap, in Bough that putteth it forth: Secondly, that that Sap must be such, as the Tree doth exerce, and cannot assimilate. For else it would goe into a Bough; And besides, it seemeth to be more Fat and Unctuous, than the Ordinary Sap of the Tree, both by the Berry which is Claumie; And by that it continueth greene, Winter and Summer which the Tree doth not.".....

The theories of Dr. Prior, Bosworth, and others who traced the word to the old English mistiltan, "from 'mistal,' different, and 'tan,' a twig, being so unlike the tree it grows on," must be abandoned. It is possibly derived from the Scandinavian "mist," meaning dirt, or obscurity. But be that as it may, we have endeavoured to show that in the realm of pure science there are associations of mystery and romance quite as interesting as the associate ideas of Druidic ceremonial and cult, and almost as fascinating as the legendary significance kissing under the mistletoe, with all its far-reaching or, it may be, quite ephemeral consequences. Then the bird itself has been the object of much study and an infinity of "fine writing." The habits are now well known, and have been frequently described. To our mind, its piercing, but sweet, strain

of music, poured forth in the pauses of a wild February or March storm, possess the additional charm of mystery because, like the music of the robin or the wren, we cannot reconcile such voluntary bursts with the theory of sexual rivalry as the origin of avian song.—*Graham W. Murdoch*, in *Knowledge*.

INDIGESTIBILITY OF FRUIT SKINS OR RINDS.

That the rind or "skin" of all fruit is more or less indigestible is a fact that should not be forgotten. We say *all* fruit, and the statement must be understood to include the pellicle of kernels and nuts of all kinds. The edible part of fruit is peculiarly delicate and liable to rapid decomposition if exposed to the atmosphere; it is therefore a wise provision of Nature to place a strong and impervious coating over it as a protection against accident, and to prevent insect enemies from destroying the seed within.

The skin of plums is wonderfully strong compared with its thickness, and resists the action of water and many solvents in a remarkable manner. If not thoroughly masticated before taken into the stomach this skin is rarely, if ever, dissolved by the gastric juice. In some cases pieces of it adhere to the coats of the stomach, as wet paper clings to bodies, causing more or less disturbance or inconvenience. Raisins and dried currants are particularly troublesome in this way, and, if not chopped up before cooking, should be thoroughly chewed before swallowing. If a dried currant passes into the stomach whole it is never digested at all.

In the feeding of domestic animals this fact should be kept in mind. If grain and leguminous seeds are not crushed or ground, much of the food is often swallowed whole, and the husk or pellicle resists the solvents of the stomach, causing a considerable loss of nutrition. Thus every horsekeeper should possess a corn-crushing machine for feeding purposes. Birds, being destitute of teeth, are provided with a special apparatus for grinding their seed, namely, the gizzard. The indigestibility of certain nuts is partially due to the brown skins. Blanched almonds on this account are more digestible than those which have not been so treated.—*Market Gardener*, Dec. 4.

CENTRAL TRAVANCORE PLANTERS' ASSOCIATION.

The annual general meeting of this Association we see from the *Madras Mail* was held on the 4th Jan. The Hon. Sec. read the Annual Report, in the course of which he said:—

I myself, though I have taken some pains to make enquiries, have never met a planter of any experience who has not looked on advances as a matter of absolute necessity, and I am therefore led to believe that the assertions as to their inutility emanated from the younger portion of our community.

Another step forward this year was the re-institution after a lapse of nearly twenty years of public sales of waste lands, and it is much to be hoped that these will be continued there being unbounded room in Travancore for the expansion of the tea and coffee industries.

With unanimous consent Messrs. J. Grieve & Co. were appointed sole agents for the Association. These gentlemen have done much in exposing local traders making use of fraudulent marks and selling thereunder spurious teas purporting to be the produce of this District. I trust that the arrangements now made will go far to check this trade.

INDIAN AMERICAN TEA FUND.—Members are to be most heartily congratulated on their response to the appeal made to them for this Fund. Every estate and almost every Superintendent subscribed, and the Association, which remitted the very substantial sum of Rs. 1,500, has again received the special thanks of the Indian Tea Association. The past year has seen an average decline of fully 1d. per lb.

in the tea market, and I would warn members that a recovery in the coming season is unlikely. The estimates for the year have not yet appeared, but there can be little doubt that, given favourable weather, there will be an increased yield both from India and Ceylon. For this annually increasing production an outlet must be found. Mr. Blechynden, our representative is doing admirable work for us in America and his efforts are beginning to bear fruit, but to continue the campaign the sinews of war must be forthcoming, and I would therefore urge members by every means in their power to respond as liberally in the present season to the appeal that is certain to be made for funds as they have done in the past. It is practically a Life Insurance Fund, for on the success of the American campaign in a large measure depends our own prosperity, and, after all, the sum asked for from each individual estate is infinitesimal as compared with the interests at stake. It is satisfactory to note that coffee cultivation is again springing up in the District, and this too with every prospect of success. I heartily congratulate the enterprising gentlemen, who have extended their operations in this direction.

The result of the ballot for office-bearers was as follows:—Chairman.—Mr. F. M. Parker.—Committee.—Messrs. S. M. Dighton, R. H. Goldie and R. S. Imray, Honorary Secretary.—Mr. G. L. Acworth.

Proposed by Mr. Imray seconded by Mr. Goldie:—"That this Association endorses the Resolution passed by the Wynaad Planters' Association and considers some form of advance as necessary to the existence of our industry." Carried *nem. con.*

THE INSURANCE ON TEA FACTORIES.—The Honorary Secretary drew the attention of the meeting to the fact that the principal Insurance Companies in London had raised the rates of premium in South India to what he himself could not but think an unjustifiable extent, a well equipped factory now costing some Rs. 1-4 to Rs. 1-6 per cent. per annum.

There was considerable discussion on the subject, which, on the motion of Mr. Imray, it was eventually agreed to refer to the Committee, who should have full power of action.

BLACKSTONE ESTATE COMPANY, LIMITED.

STATUTORY MEETING.

The statutory general meeting of the Blackstone Estate Company, Limited, was held on Jan. 18th at No. 21 Baillie Street—the offices of Messrs. Carson & Co., Agents and Secretaries. Mr. J. N. Campbell presided, and the others present were Messrs. G. J. Jameson, H. Creasy, J. Guthrie and E. R. Waldoek.

The SECRETARY having read the notice convening the meeting,

The CHAIRMAN said the Company was incorporated on the 25th of January 1895, and therefore it was necessary to call a general meeting within twelve months from that time. He explained that the present meeting was simply to re-elect Directors. The three Directors who retired, he stated, were eligible for re-election and offered themselves for such.

Mr. J. GUTHRIE moved, and Mr. E. R. WALDOEK seconded that Messrs. J. N. Campbell, H. Creasy and G. J. Jameson be re-elected Directors for the present year.—Carried *nem. con.*

The CHAIRMAN said that there was no more business before that meeting, which was to be adjourned to lay the accounts before the shareholders, notice of such adjournment being given to the shareholders, whereupon

Mr. G. J. JAMESON proposed and Mr. J. GUTHRIE seconded that the meeting be adjourned to the 8th prox.—Carried *nem. con.*

The meeting closed with a vote of thanks the Chair proposed by Mr. J. Guthrie.

WEEDS.

A remarkable illustration of the ill-results that may and do attend the introduction and spread of weeds has been recently afforded. Australia seems to be more troubled by these and animal pests than any other country we have heard mentioned in such a connection. Simultaneously with a renewed outcry for the more systematic destruction of rabbits, we hear of a strong agitation proceeding for the adoption of measures calculated to keep down certain weeds, the growth of which is stated to have so extended as to seriously threaten the prosperity of the most important branch of Australian production, namely wool. It appears that a great falling-off in prices obtained for this at home of late has been due to the quantity of seeds of certain weeds contained in the fleeces. This reduction has amounted to something like two-pence per pound, as very considerable cost has to be incurred to free the wool from these seeds before it can be submitted to treatment. Although our productions in this colony are not likely to suffer in the same manner as this, we think the lesson should not be lost sight of by our planters. For, once allow weeds to gain head, and it is impossible to foresee what the result may be. Many of us recollect the time when that imported plant, the lantana, spread in most baneful luxuriance over the whole face of our coffee estates. The experience gained from the effect of that scourge has not been without its benefits, and it is the rule that our present generation of the planters are careful to eradicate all similarly useless and possibly pestilential growths. But immunity from direct consequences, when long-continued, often tends to engender carelessness and laxity. It is as well, therefore, that the lesson afforded by this newest Australian experience should be emphasized. The evil in Australia we believe to be comparatively one wholly unanticipated. The sheep farmers there have been mainly occupied by endeavours to combat the rabbit plague—endeavours that would seem by the light of very recent complaints to have been far from entirely successful. But, quite unsuspected, an evil, almost if not quite as great as that of the animal pest, has been progressing upon their pasturage grounds, until the result has shown itself in a very material loss upon the staple production. What has thus been insidiously working to the detriment of the Australian sheep farmer may be as insidiously working among ourselves unless all and everyone of our estates are kept scrupulously free from weed growth. For the presence of a single estate in a district upon which negligence in this respect is permitted may infect, so to speak, the whole of the area of that district. The forces of nature are ever working around us, and in no case with greater insidiousness or rapidity than in the instance of waste and valueless growths. If the effect of that particular force is to be met and overcome, it can only be by unanimous effort and unremitting watchfulness and care. Had these qualities been operating in the case of the Australian sheep-runs, their proprietors would not now be face to face with a loss that may mean ruin to many of them.

THE HAPUGAHALANDE TEA COMPANY.

DECLARATION OF DIVIDEND.

The Directors of the Hapugahalande Tea Co. have declared an interim dividend of 10 per cent for the current season 1895-96.

MORE WRINKLES FROM AN OLD COCONUT PLANTER.

HOW TO CLEAR AN ESTATE OF PORCUPINES AND PIGS.

Begin by digging a trench 18 inches deep, 12 feet long and 2½ feet wide at the opening, but the sides must gradually converge to a very narrow slit. Feed the porcupines well a little way off from the trench and induce to come and eat again and again. They are fond of green pineapples and coconut oil seeds; these grow plentifully in and about Kandy and indeed the oil, extracted from the seeds is what natives usually use for their lamps. Gradually begin scattering food close around and then *in* the trench, but be careful not to tramp the soil or the wary creatures will not come near; bring the food nearer and then after the middle has been reached, put the food quite up at the end, they will eagerly wedge themselves in forward and others follow behind, but when they wish to turn and get away they find themselves fixed and fairly caught, their quills being their worst enemies.

Sometimes porcupines live in armadillo holes or caves and must be caught by another means. In this case, arm yourself with a long pole or stick to the end of which three dynamites are tied with a long fuse. Insert it into the cave as far as it will go and set a light to it.

Another way of getting rid of these destructive creatures is to drill small holes into 50 or 60 coconuts and put a little arsenic into each hole; sprinkle these about their feeding places, and there will be dead porcupines lying about everywhere.

PIGS.—Get ½ cwt. of poonae put in three different tubs 40 or 50 fathoms apart forming a triangle. Refill these each day and gradually place them nearer. When the pigs are accustomed to feeding there, concentrate all in one tub and mix a good dose of arsenic with the food—and the pigs will be found next morning lying about never more to rise.

FOWLS.—Are you troubled with sickness among the fowls? Try the following: 1 measure boiled rice, ½ m. bazaar salt, ¼ m. chalk, ¼ m. anthill clay; put all into a mortar and pound and make into a ball which keep in your fowl house. Also give the fowls iron water to drink, that is put some rusted iron into their water chatty.

A CEYLON PLANTER IN AMERICA.

Mr. A. E. Scovell, Strathellie, Nawalapitiya, has just returned to Ceylon after an extended period of leave. Mr. Scovell, has travelled round the world and those who know him will readily understand that what he didn't see and mentally digest in the places he visited wasn't worth seeing! He left on 22nd November last, but before setting out on his journey to New York he was fortunate enough to meet Mr. Wm. McKenzie, our Commissioner, who was good enough to give him introductions to the principal tea men in America and especially to Mr. Blechynden, the Indian Tea Commissioner, and to Mr. Robertson, who is acting Agent for the North and South Syhlet Companies, a gentleman who handles over one million lb. of tea per annum. Mr. Scovell is well satisfied with the tea propaganda in America. With regard to the food show at Philadelphia, Mr. Scovell thinks it a thousand pities that Ceylon was not officially represented, and he corroborates Mr. Bierach's letters regarding the success of his show. It is gratifying to think

that Ceylon has a charmed sound in the ears of our, at present, bellicose cousins, Ceylon tea. Mr Scovell stating as the result of his experience, being much oftener spoken of than Indian tea. The feeling that the Chicago big show had not commensurate results was, he thinks, due to the hope of reaping too soon what was sown. Very often in America he had Yankees say to him "Ah! I remember the tea I had at Chicago." Canada, he thinks, will prove a better outlet than the States. In San Francisco where they go in for afternoon teas "same as the English do," there is a growing demand. The fruit-growing district in California was visited by Mr. Scovell. Oranges and lemons seemed to pay and for their cultivation land was in demand in the Lake Tulare district. Prunes, apricots and other kinds of fruits were less profitable; and from the fact that gardens could be acquired at seven years' purchase, there did not seem to be much confidence in their future. From San Francisco, Mr. Scovell went on to Yokohama after a twenty days passage, protracted three days' beyond its normal extent by heavy weather. He visited the tea plantations at Uji, where is grown the most highly flavoured tea in Japan at the best a poor article, China tea of the worst jat. The methods of cultivation are the most primitive, and as far as tea-making is concerned, charcoal stoves and hand-rolling and sorting are resorted to. At Yokohama he saw in operation the "faking" process for giving the leaf that appearance which American *connoisseurs* delight in. Space forbids us publishing more of the information gathered by Mr Scovell in the course of his tour. We welcome him back to Ceylon!

SUGAR-CANE CULTIVATION.

Our Galle correspondent writes:—I think there is a great deal to be said in favor of Mr James Dixon's contention that Sugar-cane can be successfully cultivated in the lowcountry. Of late years several Sinhalese land-owners in Gangaboda Pattu have gone in for this cultivation and have established mills for sugar manufacture. E. A. Jayasinha Mudaliyar has 120 acres fully planted at Nagoda with a factory and all modern appliances for sugar refining. His sugars are well-known in the markets. In addition to this and Messrs. Winter's estates there are a good many gardens with mills, whose proprietors appear to do a thriving business. When Sir Arthur Havelock visited Baddegama the return trip was made in the Nagoda Mudaliyar's boat to Wakwella; and His Excellency was much pleased to view the large acreage under cane cultivation. Mr. Dixon's interesting letter is deserving of attention on the part of agriculturists and others seeking new investments for their capital.

PLANTING AND PRODUCE.

TEA PACKING IN TIN PLATE.—The controversy on this subject is carried on with considerable vigour in Swansea, and the local and trade papers discuss the subject. A grocer in Swansea raises an objection to the packing of tea in tin plates. "It will never do," says he. "You know that hay when stacked often causes sufficient heat to cause a blaze. Well, unless some outlet for the damp contained in tea is provided it will all go wrong. Of course the air cannot get to it to give it sufficient oxygen for a fire, but the result with air-tight tin boxes will be that the tea will get heated, then mildewed, and spoilt. Under the present arrangement the lead foil lining of the wooden boxes, not being hermetically sealed, allows the hot air to get away through the wood, and the tea arrives here quite sound and wholesome. It is my firm belief that it would not do so were it to

be packed in sealed tin boxes. Then, again, there is an extensive lead industry in China, and the people there will be sure to protest against the discontinuance of the use of lead foil." In an interview which a Llanelly correspondent has had with Mr. Frank Randell in reference to the question of tea packing in tin plate, and the objection thus raised, that gentleman said that if experts decided against the box being hermetically sealed the chests could be so made as to provide the required ventilation. The objection was no objection at all. As to China protesting against the change in the interests of the Chinese lead industry, he admitted that China would not come within the scope of the change until the advantages of the new packing had been made abundantly manifest. As to the suitability of the packing, this was conclusively proved by the enormously increased demand for metal chests for tea packing. In point of fact the tea even in the inside lead cases of the chests now chiefly in vogue was hermetically sealed up; but, for himself, he held an open mind. The objection raised, however, was completely answered by the fact that the tin plate chest could be easily ventilated as a wooden box. In the whole of his experience he had not found that the tea grew mildewed through the box having been hermetically sealed. In his opinion such conditions of packing were a safe guarantee against mildew. It was an admitted fact that the 2 per cent of the metal chests in which tea was now brought over was approved of by the planters and traders, and there was no reason why, in the interest of the South Wales tin plate trade, they should not endeavour to capture the remaining 98 per cent. An official of the Government Railways in Ceylon waited upon Mr. W. H. Ludford, the district manager of the Great Western Railway, at Llanelly a day or two ago, and asked to be supplied with full particulars of the new method of tea packing. He is reported to have said that as the industry of tea planting was so rapidly growing in Ceylon, the matter of adopting new methods of packing was of first importance, especially in view of the fact that the present wooden boxes were open to so grave an objection through being smashed in transit. He considered therefore that there was a great future for metal chests.

COFFEE IN MEXICO.—According to Mr. J. L. Pernet, of Orizaba, a well-known authority on coffee estimates, Mexico's crop this year will be only 300,000 centals, or fully 50,000 centals less than last year. The shortage is said to be due to the severity of last winter, to the lateness of the rainy season, and to the over-crowding of trees. It is still asserted, however, that, with little more experience, coffee planters in Mexico will become serious competitors with Brazil.—*H. and C. Mail*, Jan. 3.

THE TEA DUTY IN AUSTRALIA.

Referring to the discursive debates on the new tariff in the assembly at Victoria and the resolution to retain the duty on tea, the *Sydney Herald* contrasts the policy of the Victorians on this matter as compared with New South Wales. It says: "During the debates in the Assembly a motion had been tabled for reducing the duty from 3d per lb as at present, to 25 per cent ad valorem, the intention being to reduce the cost to the consumer of low qualities of tea. The proposer withdrew his motion when it was reached, but another member was ready to champion a more drastic reduction still, and invited the committee to include tea amongst the articles altogether exempted from payment of duty. He based his proposition upon the too familiar claim of 'a free breakfast table,' and Mr. Best, in replying for the Ministry, admitted that he had some sympathy with the policy of reducing the taxation upon an article in such general use. But the state of the finances did not encourage him at present to surrender a revenue of about £100,000 yearly. Should the public accounts present a favourable aspect later in the financial year, he might be willing to consider how a reduction could be made, but he asked the House to reflect on what the effect would be in England

if it were announced that so great an item of revenue was given up while the surplus was so small. The debate was postponed, and when the discussion was resumed nothing substantial was added, but the House decisively rejected not only the proposal for completely freeing tea from a duty, but also several suggested reductions of the existing duty.

"It is interesting to contrast this action with what has taken place in New South Wales. When early in 1892, the Customs Duties Bill of the Dibbs Government was submitted to the Legislative Assembly, the second clause contained a provision for wholly removing the duty then charged on tea, 3d per lb. Apparently, nothing but antipathy to anything like a purely revenue-producing duty animated the Ministry in this proposal. In England the duty is 4d, and even the staunchest free-traders approve of the tax. In the nature of the case it can have no protectionist incidence, and it produces a large return in taxation without being unjust or burdensome. At the time when the ad-valorem proposal was adding 10 per cent to the cost of every imported article say only those subject to higher specific duties, the protectionist Government remitted a Customs charge which had been in force for many years, had caused no dissatisfaction, and had given the Treasury an average return of £100,000 a year, and at the time Mr. See remitted it was yielding £125,000. The Treasurer had nothing more to say about the remission than that it would benefit the working-man, and might be set off against the new duties on agricultural produce. In such a light frame of mind did the Gibbs Government surrender revenue. The majority which that Administration had managed to get together was equally ready to remit a taxation which was hardly felt and to impose other duties which have been complained of ever since. Thus the tea duty disappeared. The Treasury lost a source of steady revenue which not even the English tariff seeks to dispense with. The loss was an argument the more for the mischievous ad-valorem duties. The consumer was not benefited, for it is not found that the public at once and wholly reaped the benefit of the remission of duty. The import trade was stimulated, and a salutary check upon the introduction of inferior teas was removed, with the result that we are frequently hearing complaints that the refuse of other colonies finds a safe market in Sydney, and at the present time we have the City Health Officer condemning perished teas sought to be landed and vendd here. In such ways this community has to pay for the reckless policy of Sir George Dibbs and his Treasurer. The Victorian authorities are wiser. They know that to remit a tax is easier than to reimpose it—that it is impolitic to surrender a duty which is easy to collect and which the public hardly feels, and especially impolitic when in the nature of the case other taxation must recoup the Treasury, and that in the interests of the community a small Customs duty is beneficial as serving the purpose of a check upon 'lie tea.'

"There hardly is available to a Treasurer another article of consumption which if so fitted according to the canons of taxation to bear a duty as tea. It is nearly universal in consumption; therefore almost every person in the community bears the burden in proportion to his use of the commodity. Consequently also, a small tax is immediately and steadily productive. The article in itself is not, like alcohol, an object of conscientious scruples, nor, in spite of the opinion of doctors that the Australians drink too much tea, is it believed that the taxation raised in this way represents an evil done to the moral welfare of the people. Next, in practice the duty incidentally checks the importation of the inferior qualities of tea by loading them with a Customs charge which is heavy in proportion to their low intrinsic value. A further advantage is that the duty is as easy of collection as it is lightly felt by the consumer. Having no protective incidence, it does not interfere with industry, and does not eodde a parasitic local interest at the expense of the community. The article is wholly imported, and from one or two places; therefore the collection of Customs is facilitated, and the bulk and specific value are deterrents to smuggling. It is in

all these points of view an ideal subject for taxation, and it becomes clear that the duty never ought to have been sacrificed; or, having been given up, ought to have been reimposed by some wiser administration."—*H. and C. Mail*, Jan. 3.

COFFEE CULTIVATION IN INDIA.

Mr. J. E. O'Connor, Director-General of Statistics to the Government of India, has drawn up the following statement:—

At the end of 1894 there were 289,080 acres of land under coffee in India, all of it, with the exception of 10,746 acres in Burma, being in Southern India. The cultivation of coffee is in fact restricted for the most part to a limited zone in Mysore, Coorg, and the Madras Districts of Malabar and the Nilgiris. In Mysore there are 136,052 acres, in Coorg 71,181 acres, and in the Nilgiris and Malabar 45,652.

If to these are added 6,587 acres in Travancore and Cochin, we find about 90 per cent of the coffee-bearing area of India concentrated in the hilly region above the south-western coast where the rainfall is heavy and the climate generally approximates to that of the coffee-bearing area of Ceylon. In the Madras Presidency coffee is not grown to any extent except in the two districts already mentioned and in Salem and Madura. The only other province in which coffee is grown is Burma, mostly in Toungoo, and the industry there is of recent origin. In the decade under review the area in the Madras Districts has fluctuated, remaining in 1894 at but little above the level of 1895. In Coorg there has been a sudden and large increase in 1894, in Mysore there has been a steady and considerable increase, while in Travancore and Cochin there has been no advance: in Travancore indeed many coffee-growers have abandoned that industry for the less precarious cultivation of tea. The yield has fluctuated greatly; in 1894 it was about 35½ million pounds, which was but little larger than in 1885, notwithstanding the increased acreage. Taking the figure 100 to represent both area and production in 1885, the ratio of yearly increase or decrease is shown in the subjoined table:—

	Area.	Production.		Area.	Production.
1885	.. 100	100	1890	.. 114	63
1886	.. 97	90	1891	.. 111	113
1887	.. 103	109	1892	.. 110	97
1888	.. 104	76	1893	.. 116	118
1889	.. 110	85	1894	.. 122	101

In 1894 the yield varied enormously in the different localities, the returns giving 472 lb. an acre in Toungoo; 354 lb. in the Nilgiris; 157 lb. in Mysore; 104 lb. in Coorg; 76 lb. in Malabar. A noticeable feature in the returns is the record of a yield of 1,511 lb. an acre in Cochin in 1893 followed by a yield of 175 lb. in 1894. The brief explanation given by the local authorities is "that it appears that the crop in the previous year was good, and that a good crop is almost invariably followed by a poor one." It is not explained, however, why in Cochin in 1893 the yield should have been as large as 15,111 lb to the acre when in the adjacent region of Travancore in the same year the yield was only 170 lb and in Malabar only 70 lb. There would seem to be defects in the statistics, to which the attention of the local authorities might with advantage be directed.

According to the returns there were, in 1894, 37,903 persons permanently and 118,014 temporarily employed on the coffee estates, making a total of 155,917 persons, which is equal to about one person (1.07) to two acres, while in tea estates the average is over 2½ persons to two acres. The difference is explained by the much greater labour required in the repeated plucking of tea and in the subsequent processes of preparing the leaf for the market.

The following figures are the average of the five years ending 1894-95:—

		lb.
Indian Coffee	.. Production	.. 34,444,087
Do.	.. Exports	.. 31,595,514
Do.	.. Left in India	.. 2,848,573
Foreign Coffee	.. Imports	.. 1,820,426
Do.	.. Re-exports	.. 585,245
Do.	.. Left in India	.. 1,235,181

It appears therefore that nearly 92 per cent of the production is exported, and that of the coffee consumed in India foreign coffee represents less than half the quantity of Indian coffee. The rate of consumption is little more than half that of tea, amounting to only 0.014 lb. per head of the population. It is said to be rather freely drunk by the native population in Southern India, but that is certainly not so in Northern India.

There is no trustworthy or complete record of the prices in India of Indian coffee; and in answer to enquiries I am informed that there are no materials for the preparation of a record of prices, and that the prices in fact depend upon and follow the fluctuations of prices in London of Ceylon plantation coffee, the price on Indian coffee being about 5s less than the price of Ceylon coffee. This being so, the prices in London, in February of each year of the last twenty years of Ceylon coffee (plantation) are here subjoined:—

Per cwt.		Per cwt.	
s.	d.	s.	d.
1876	89 0	1886	56 0
1877	85 3	1887	77 0
1878	80 0	1888	72 0
1879	61 0	1889	90 0
1880	68 6	1890	99 0
1881	59 0	1891	104 6
1882	64 0	1892	105 0
1883	74 0	1893	108 0
1884	69 0	1894	100 0
1885	54 6	1895	104 0

Ten years, from 1879 to 1888, of depressed prices, combined with the havoc wrought by the borer and the leaf disease, greatly discouraged coffee planting in India and Ceylon, and the prospects of the industry seemed so forlorn that both in Ceylon and India much coffee land was placed under tea. In 1889, however, there was a sharp rise in prices, and the level has ranged high since that year under the operation of speculative corners, political troubles in Brazil whence the main supplies of the world are derived, and other circumstances. The maintenance of prices at their present comparatively high level has given to the Indian coffee planter a stimulus and an encouragement which were greatly needed.—*M. Mail*, Jan. 16.

DINING FROM BOUQUETS.

Although it is well known that many kinds of flowers are used in medicine, the fact may not be known to many that the blossoms of certain plants are employed as articles of food. In many parts of India the flowers of a sapotaceous tree (*Bassia latifolia* or *mahrah*) form a really important article of food. These blossoms, which are succulent and very numerous, fall at night in large quantities from the tree, and are gathered early in the morning and eaten raw. They have a sweet but sickly taste and odor. They are likewise dried in the sun and sold in the bazaars. The Bheels dry them and store them as a staple article of food, and so important are they considered for this purpose that when in expeditions for the punishment or subjection of these tribes, when unruly, a threat is made by the invading force to cut down their *Bassia* trees, the menace most commonly insures their submission. An ardent spirit like whiskey is distilled from these flowers, and is consumed in large quantities by the natives of Guzerat, etc. The Parses and hill people eat the flowers both raw and cooked, and often with the addition of grain, and also make sweetmeats of them. A single tree will afford from two to four hundred pounds of the flowers.

The blossoms of another species (*B. longifolia*) are employed in a similar manner by the natives of Malabar and Mysore, where it abounds. They are either dried and roasted and then eaten, or are bruised and boiled to a jelly and made into small balls, which are sold or exchanged for fish, rice and

various sorts of small grain. The flowers of the Judas tree (*Cercis Siliquastrum*) of Europe have an agreeable acid taste, and are sometimes mixed with salads or made into fritters with batter, and the flower buds are pickled in vinegar. The flowers of the American species (*C. Canadensis*), the red bud, are used by the French Canadians in salads and pickles. The flowers of the *Abutilon esculentum* (*Bengal de deos*) are used in Brazil as a boiled vegetable. The flowers of *Moringa pterygosperme* (the horse-radish tree) are eaten by the natives of India in their curries.

The large and showy flowers of *Tropaeolum majus* (the Indian cress or nasturtium) are frequently used along with the young leaves as a salad. They have a warm taste, not unlike that of the common cress, and it is from the circumstance that the plant has obtained the name of nasturtium. The young calices of *Dillenia scabrella* and *D. speciosa*, which are swollen and fleshy, have a pleasantly acid taste, and are used by the inhabitants of Chittagong and Bengal in their curries and also for making jelly.

The flowers of *Rhododendron arboreum* are eaten by the hill people of India, and are made into a jelly by the European visitors. Yet poisonous properties are usually ascribed to the species of this genus, and it has been said that the *R. Ponticum* was the plant from whose flowers the bees of Pontus collected the honey that produced the extraordinary symptoms of poisoning described as having attacked the Greek soldiers in the famous retreat of the ten thousand. The flower buds of *Zygophyllum Fabaqo* are used as a substitute for capers, and the flowers of *Melianthus major*, a plant of the same order, are so full of honey that the natives of Good Hope, where the plant grows wild, obtain it for food by shaking the branches, when it falls in a heavy shower. *Coccoloba urifera* is remarkable from the peculiarity of the calyx, which becomes pulpy and of a violet color, whence the plant is called the seaside grape. This pulpy calyx has an agreeable acid flavor and is edible. The flower stalks of *Hovenia dulcis* become extremely large and succulent, and are used in China as a fruit. It is said that in flavor they resemble a ripe pear. The flowers of the pumpkin were cooked and eaten by some of the tribes of the American Indians, especially by the Aztecs, by whom they were highly esteemed. The cauliflower, which has been known from remote antiquity, differs in a remarkable manner from all the other varieties of the cabbage tribe, whose leaves and stalks alone are used for culinary purposes. Instead of the latter being used, the flower buds and fleshy flower stalks, which form themselves into a firm cluster or head varying from four to eight or more inches in diameter, here become the edible portion and one of the greatest of vegetable delicacies. The flower buds of *Capparis spinosa*, a plant which grows on walls, etc., in the south of Europe, are pickled in vinegar in Italy and form what are commonly known as capers. These are chiefly imported from Sicily, though the plant is largely cultivated in some parts of France. The cloves of commerce are the unexpanded flower buds of *Caryophyllus aromaticus* (*Myrtaceae*), a small evergreen, native of the Moluccas, but cultivated in several parts of the East and West Indies. Before the expansion of the flowers, which are produced in branched panicles at the extremity of the branches and are of a delicate peach color, the buds are collected by hand, or else sheets and mats are spread under the tree and the buds brought down beating it with sticks. They are cleaned and then dried in the sun. A uniform brown color is imparted by slightly smoking them over a wood fire. The flower buds of *Calyptanthus aromaticus*, another plant of the same order, may be advantageously substituted. The flower buds and the berries of the myrtle (*Myrtus communis*) were eaten as spices by the ancients, and are still used in Tuscany instead of pepper. Long pepper is furnished by the immature spikes of flowers of *Chavica Roxburghii*, which are gathered and dried in the sun. In chemical and composition qualities it resembles ordinary black pepper and contains piperine.—*Scientific American*, Dec. 11.

To the Editor.

SUGAR CULTIVATION IN CEYLON.

Fiji, Nov. 1895.

SIR,—For about eight of the ten years I have been in the sugar industry, the question has been constantly in my mind, "Why are there no sugar-mills in Ceylon?" As I became better acquainted with the different varieties of the sugarcane, their habits and their needs, I wondered more and more, remembering, as I do, the soil, climate, and extent of your alluvial flats.

I know—in a vague way—that much money was spent, a great many years ago, in the attempt to grow cane and make sugar in Ceylon, and that failure was the result.

Precisely the same failure was made here between twenty and thirty years ago, when the site of the present capital of Fiji was all planted with cane and a large factory built. The whole of the money spent was lost, though sugar was then five times the price it is now, and the cost of labour seventy-five per cent less than at present.

In those days really nothing—comparatively speaking—was known of cane-growing and sugar-making. The price of sugar was so high that those tropical countries which stumbled into more or less right ways of doing things made huge fortunes, in spite of the now well-known fact that they only extracted about one-third of the sugar from their cane. Even so late as ten years ago, sugar planters were, for the most part, ridiculing the idea of chemical assistance in the factory! And at the present day the majority of cane-sugar-mills in the world are without chemists. In Fiji the sole survivors have employed chemists from the start, and do still; while those Companies who did not do so have all gone into liquidation.

But what was the cause of the failure with you? It was not the climate, that is quite certain, for the climate of your low-country is that of Demerara, than which there is no better for sugar in the world. There are canes which thrive in semi-tropical lands better than they do in tropical, and vice versa. There are canes for swamps, canes for dry lands, canes for wet climates, canes for dry climates. In the state of our knowledge of 20 years ago, there were any number of unknown reasons for the failure of sugar in any particular place. But tell a modern scientific sugar planter that sugar cannot be grown to pay in your climate on your alluvial flats, and he will laugh at you. Your latitude is the same as that of Demerara, and your labour is fully 50 per cent cheaper; moreover you pay in silver and sell for gold.

The history of sugarcane-growing in Fiji is a curious one. First there was the *fiasco* mentioned above, then, a few years later, a small Company started on the Rewa river, and made sugar in a crude way for some years, and paid fairly well. Then the Colonial Sugar Refining Co. came down, in 1879-1880, and put up a large mill on the Rewa. At the same time a number of small Companies erected factories in various parts of the group, all of which have since failed but one, the Fiji Sugar Co., Ltd. The C. S. R. Co. have now two other mills in addition to that on the Rewa; the latter, owing to the absence of the very conditions which you possess, viz.: bright skies and great heat has only paid about one per cent; but the Ba river mill—when the rainfall is only from 60 to 80 inches and which is favoured with bright skies and great heat has been an unqualified success from the start; though the cost of buildings, is double what it is in Ceylon, and labourers cost 100 % more than with you.

This is a very moderate estimate for wages at 1s added to cost of introduction and losses by death, &c., bring the cost of a day's labour to 1s 8d.

There is nothing whatever—it is impossible that there *could* be—to prevent the successful cultivation of cane and manufacture of sugar on any or all of

your alluvial lands. Much has been said of the wonderful soil in Fiji; but chemical analyses and practical experience has proved this to be nonsense. Our soil is deficient in lime, nitrogen, potash and phosphates, and these we have to supply artificially and have been doing so for years. I should much like to have the analyses of some samples of your alluvial and compare the two. I would risk a good deal that yours is infinitely the better of the two.

Ceylon is still, I have no doubt, one of the most go-ahead countries in the world, and full of plucky and enterprising men. It has a climate—I speak of the lowcountry—which is a sugar planter's ideal: the cheapness and abundance of labourers coupled with the advantage of your currency, is equal to a bounty of several pounds per ton of sugar made. To think that all these advantages are unused because 30 years ago—more or less—some scores or hundreds of thousands sterling were lost in a futile endeavour to make sugar is at once ridiculous and exasperating. Ceylon and Southern India together could supply the world with sugar, and do it much cheaper than it is done now, and when they make a fair start, this and other sugar countries in which labour is scarce and dear will have to close their shutters.

Some of your readers may perhaps remember me. I was in Ceylon from 1875 to 1878, and most of the time on Kelvin estate, Dolosbage. To any old friends who see this letter I offer my salaams, and to any of your readers who may take an interest in the sugar question I shall at all times be happy to give any information in my power, being only too glad to help to find the way to the gold mine which I believe lies at your doors.—Yours faithfully,

JAMES D. DIXON.

CEYLON TEA IN CALIFORNIA.

San Francisco, California, U.S.A., Nov. 18, 1895.

MY DEAR "OBSERVER,"—As the present year of grace will have about run its course by the time a letter can reach you in Ceylon, I must write to wish you all in Ceylon a Merry Christmas and a Happy New Year; I hope 1896 will be a very prosperous year, and that with the advent of your new Governor several very necessary works, advantageous to the general community will be undertaken. I am glad to see prices for most products keep fairly high, especially those for Tea and Coffee. The old district of Madulsima keeps in the front with the formation of good companies, all of which will, I am sure, pay well: with good jāt, fair soil, careful management, salubrious climate and cheap transport, this favourite district has still to see its best days: *but* (there is always a "but") roads, roads, roads, are wanted very much for the out-lying sections of this scattered district, and I am sure even Government and P.W.D. will admit that the treatment meted out to long-suffering Moneragalla has been in the matter of roads, simply shameful.

Your "Overland" issue reaches me with wonderful punctuality, and, if delivered within 30 days from date, does not lose much time on the way. It is in great demand by several tea men, and last week I was asked for a few back numbers by a banker, who wished to read them! I have selected a few for him, containing the account of the opening of the Legislative Council, Galle Face Hotel meeting, Governor's Speech, etc., etc. The weather is usually cool about Galle Face, but there must have been a "hot wave" on the afternoon of that meeting.

"Pooh-Pooh" was certainly very severe on the bright little, right little, tight little island. Of course, Ceylon is absurdly *over-governed*, considering its size and population: no one for a moment will seriously contend the opposite. Can you give us the relative percentage per capita of the cost of governing—say Madras and Ceylon,—*everything* included, military, judicial, prisons and police, irrigation, education, etc., etc.? I think the figures will be interesting and surprising reading.

The other day I paid a visit to that fine iron ship the "Thomaseria MacLellan" of Glasgow, on the second voyage of which I was a passenger to New

Zealand nearly twenty years ago; she was then quite a show vessel, being the largest iron sailing vessel, afloat. I remember while we stayed in Rio de Janeiro for five or six weeks crowds of people used to visit and be shown over her. I noted the several changes in the fittings of the saloon, but the fine roomy cabins were still there. She can still do her 350 knots a day, and pass most sailers going. The present crew have been on board for over two years, which speaks well for the captain and officers.

I had the pleasure of meeting in a tea brokers' office last week Mr. W. D. Perry of Dublin. We talked tea, told stories, and found we had a mutual friend in Geo Kent Deaker, Passara, to whom he wished to be remembered. I gave Mr. Perry satisfactory news about our good friend, with which he was much pleased and delighted.

Your delegate is once more in London. I hear pretty regularly from Mr. Bierach, who is still hammering away at Ceylon Tea. It must be somewhat discouraging, however, to him, with no support or recognition from Ceylon for the good honest work he is doing: I presume you have heard *he*, and he alone, represents Ceylon, with a Ceylon Court at the great Pure Food Show at Philadelphia!! He has had a large amount of advertising of Ceylon and her teas in numerous papers, *gratis*, and a man who can do this in America is worth something, for your delegate's accounts will doubtless show that advertising rates are pretty stiff here. I have one before me from the *Evening Post*, New York, said to cost some £16 each insertion! I hope India pays half of this; the "cut" is in the usual rough style,—I am perhaps hypercritical, but it is an extraordinary circumstance that the three ladies therein depicted should be left-handed. I call it the "left-handed ad.," but perhaps these ladies are "ambidexterous." The "Eclipse" advertisement for America is a mistake. In this country, to quote Shakespeare!—"they don't care what kinds or quantities of tea are consumed in Great Britain." There are very many "lovely" Americans, who like and admire the English, but there is no use blinking the *fact*, that amongst the middle-class both upper and lower (amongst whom our customers are to be found in the future) there is a very strong prejudice against the British and anything British. This dictum applies to the great majority of the people, those who have no time for reading anything but the newspapers, from which source they derive their information (very frequently misleading) and form their conclusions and deductions (necessarily as frequently wrong and unjust).

This dressing-up of an ordinary woman as an Indian Princess and parading her about the New York Food Show is a mistake, a bad mistake (as a general rule mistakes are bad, but this is more so than usual): it savours too much of the Midway Plaisance, and Fake style of business, and does more harm than good eventually. You will hear of nothing like that at the Philadelphia Food Show. The Ceylon Importing Co. of Iowa also applied for a concession, but were informed that Mr. Bierach was the party who was most acceptable and best known to the management.

What a great pity a few natives were not sent out early to Mr. Bierach; he writes me he could do so much more if he had had a few Tamils and Sinhalese.

Doubtless you will have reports and figures when the time comes, direct from Mr. Bierach or through the "30 Committee," but you can judge of the good work being done through Mr. Bierach's personality solely, when 500 ceps of tea are being given away free daily, at no cost to Ceylon up to the present. No doubt his application to your worthy delegate for some assistance to help to defray the heavy expense he has been put to, will be promptly attended to as it deserves to be, and as I am sure the Planters and "30 Committee" would wish.

To overcome single-handed many obstacles, in the absence of any tangible support or recognition even, perhaps almost ignored though having valuable experience in his own line of business, and to carry through to success, in spite of all that must have been disheartening, this Ceylon Court at the Pure Food Show at Philadelphia, is, I consider, an achievement of which Mr. Bierach or anyone else, might be

proud, and one that will merit and will gain the approval of Ceylon men, or I am very much mistaken.

It does seem most extraordinary to me that at a Japan Tea Stand in New York Food Shows the Planters' Association pamphlets (of Ceylon) should be distributed. This is entirely wrong; there is great ignorance about *Geography* as well as of Tea in this country, and people receiving these pamphlets from a Japan Tea Exhibit will naturally think "it is just some new kind of *Japan Tea*," and will, in most cases, continue to ask for Japan Tea.

I am awaiting papers with descriptions of the Ceylon Court at Philadelphia, which is much admired and is a great favourite. You will, along with most of your readers, have forgotten the name of Mrs. Rorer, the first authority upon cookery in America, who at the great World's Fair, Chicago, received a salary of \$1,000 (£200 sterling) a month for lecturing upon cookery and making demonstrations. Our Court in the Woman's Building was a great favourite of hers, and I can see her now, coming in there "for a cup of your delicious pure tea," followed by a number of leading ladies. She holds the same position at Philadelphia, and is a strong, personal friend of Mr. Bierach's; it is doubtless owing to her knowledge of him in a great measure that he has been enabled to secure for Ceylon so many advantages. She condemns all teas but Ceylons, and never will endorse *China or Japan teas*; she is official lecturer on cookery, but presided the other day at a 5 o'clock tea in the Ceylon Court, she would not do this for any other exhibitor, nor will she speak during her lectures in favour of the products represented by the several firms and companies at the Show. Her lectures are on cooking and she does not use them for advertising purposes: yet it greatly surprises exhibitors, that Mr. Bierach and his Ceylon Court are so much favoured by her; as each day at the close of her lecture she says: "Now we will adjourn to the Tea Room." From the description given me I imagine this Ceylon Court is all it should be, and very attractive. Mr. Bierach has wonderfully good taste, there is a handsome carpet and beautiful standard onyx banquet lamps, with pink silk shades, eastern draperies, Ceylon photos nicely framed in coconut wood, baskets, mats, some brass ware, satinwood teapots, lace, fans, &c., &c.

I have just received this moment a short hurried letter in pencil from Mr. Bierach. I think I may quote the following:—"Well, I am catching on, am solid with the management. In next week's programme, I am to have a *big ad.*; also in all the Sunday papers a send-off FREE, *no cost to Ceylon*. Last evening I had a call from the Associate Editor of the *Grocery World*, will have a free notice in that journal. And my article on Ceylon is to be published in *Household News*. All this for Ceylon." I respectfully and earnestly draw the attention of the "30 Committee" and the planting community to the above information, and I am sure, with their usual fairness, suitable recognition and appreciation will not be longer denied Mr. Bierach. I only speak of him as I know him and as I found him, he is suited to the requirements of Ceylon here, and the "glad hand" and *not* the "marble heart" should be extended to him.

I hope he will "come out even" if nothing more, though it seems such a result would be impossible when everything is *free to all*.

The weather is simply magnificent here for this time of the year, and I am inclined to agree with Californians when they say reverently and with deep conviction, "This is God's country."

I had the pleasure of being conducted by the proprietors over the new Cliff House now rapidly approaching completion, in the place of the old historic house, burnt down last Christmas: the house is over 100 feet high, and I must have walked miles and miles in the building; it was pretty hard work as the elevators are not yet running. This will be a favourite resort, and I know of no finer marine view, as members of ships and steamers pass in and out of the world-famous Golden Gate. There are 10 dining-rooms, magnificent restaurant dining-rooms to seat over 100 guests at a time billiard and smoking-rooms, 15-foot verandahs all

round the five storeys closed in with glass, stabling for 100 buggies and horses. The driveway from town through the famous Golden Gate Park, about 5 miles in length, is being lighted by electricity, and on moonlight evenings *thousands* of bicycles, Bloomers both male and female, go out to the famous place.

The old familiar names begin to drop off: I noticed that of good old G. H. Hall, an amusing and good fellow. I hope R. P. M. of Tonacombe will soon be fit once more: I will send him the information required in a few days.

The demand for Ceylons does not improve here as rapidly as one would like, some of the large people say "We have no use for Ceylons, we cannot make as much out of them as we do on Japans and Chinas, and why should we bother with them." Others are again openly hostile to these teas, but they will in time be bound to hold them in stock. The leading buyers of Japans and Chinas told me the other day "that I would have to unlearn all I knew about Ceylon tea to do any business here"; but I took the opposite view of the case entirely, and politely hinted that they would soon find it advantageous to have a specialist in Ceylon teas on the staff of each house on this coast, and it will come to that in time.

Some Ceylon teas received recently have not been quite so good as they should have been, the quality and appearance must be kept up, for I see frequently some magnificent "Formosas," tippy and beautifully made, and those are our severest competitors.

I was asked on Wednesday last if I had been out to visit the Memorial Museum at Golden Gate Park recently. I replied I had not. I was told, "You should go out; there are some lovely things there now, just brought from Europe, wonderful mummies from Egypt, all tied and wrapped up, *dead ones of course!*" This is a fact.

Now I have wandered on without thinking, and if the *dead* mummy brings a laugh to some countenance about Christmas, my reward will be ample.

With all good wishes for 1896,—Yours truly,

T. A. C.

P. S.—19th Nov.—Just received 2 letters from Bierach. He had seen A. G. Scovell, who was much pleased with the Ceylon Court at Philadelphia; he has my address, so I hope to see him soon. Bierach has had a letter from your worthy Delegate from London, who says—"I have left matters connected with the Philadelphia Exhibition in Blechynden's hands." This is rather amusing, as Mr. Blechynden has no more to do with the Exhibit than the man in the moon. Ceylon must stand by herself. Bierach is offered space *free* for a Ceylon Court at a pure food show at Wilmington, Delaware; another show is to be held in Washington. Mrs. Roror is to be there, and Bierach can make *good arrangements there also*, but he cannot undertake all these without assistance from Ceylon.

An average of 500 free cups are being given away free daily, and for 2½ hours Mr. Bierach "talked tea" the other evening to a large audience of ladies, Mrs. Roror being present. Numbers of free advertisements appear weekly for Ceylon's benefit, so I hope to hear soon that full advantage is being taken of his valuable services. Just going to call upon Mr. Hulbert, late of Ceylon. In haste,

T. A. C.

THE LARGE-GROWING VARIETY OF CACAO.

Victor Park, Corstorphine, near Edinburgh,

Dec. 12, 1895.

SIR,—Respecting the suggestions contained in your kind editorial remarks on my letter of August 21st in the "*Ceylon Observer*" regarding the large-growing variety of cacao tree, I may state that the ordinary mode of "exchanges" in vogue between colonial and home botanic gardens might perhaps be tried in order to obtain some plants. The island of Trinidad, reported to have a very complete collection of economic plants, may possibly possess some trees of this large-growing sort of cacao. Purdie, a collector who travelled in the low-lying regions of Colombia

where this large-growing sort has in places been planted,—and was afterwards Curator of the Gardens of Trinidad,—is reported to have taken great interest in the cacao plantations of the island. I know not if he had any knowledge of the sort referred to; but it is possible that seeds or plants from this source might be procured. I fear, however, that plants would have to be relied on, as the germinating power of the seeds is said to vanish when dried. In planting in South America the fresh undried beans are always resorted to; and these are planted in the prepared sites at once where the trees are to remain permanently. But honestly I may state that I would have no strong expectations of the success of plants obtained through the medium of exchanges. This, because it is quite possible that the plants sent would be the same as those already growing in Ceylon; besides which there are other causes that might lead to failure. Undoubtedly it would be better for someone possessing the necessary knowledge to proceed specially to South America and make a collection of plants and convey them direct to Ceylon.

Geographically I may remark that Ceylon, together with a piece of Southern India, occupies, in point of latitude, the same identical position as the centre of the wild cacao region of South America. As regards suitability of soil, I may say that the most esteemed sites where cacao planting is carried on are the rich deep deposits usually met with on the banks of streams or rivers. Other comparatively level situations almost equally as good occur at the foot of the Cordilleras or in deep flat-bottomed valleys. These remarks apply more to the requirements essential for the large-growing prolific cacao tree; for the dwarf and hardier sort thrives under very varied conditions, growing from the level of the sea up to 3,000 feet in every variety of aspect, occasionally on bare hill-sides or in deep ravines, and with great diversity of soil, sometimes a clayey loam, or sand and gravel deposit, or quick-running sands all of which usually possess facilities for irrigation.

For shade a wide-spreading sparse-foliaged leguminous tree admitting plenty of light is preferred; and although the tender growths and leaves of various of the cacao trees are as the natives say "toasted", yet no serious injury appears to result therefrom. After a number of years when the trees begin to yield diminished crops and the beans become small they are coppiced. When the growths from the stocks are one year old they are removed with the exception of one; and the result is that trees treated in this way soon become equal and sometimes superior to newly-planted ones. When removing the young shoots some care is exercised in leaving only the stoutest, most straight, and seemingly best adapted to grow up to form a tree.

In the drying of cacao in South America considerable injury is frequently done to it through carelessness, inattention or slovenly and protracted method of working by which means the proper natural reddish colour of the beans is changed and the price consequently lowered. The preliminary course adopted by some of fermentation previous to drying is in my opinion likewise injurious. Ceylon cacao which often holds a prominent position in the European market appears to be more carefully managed; although as in the West Indies planters seem to "pick" and "size" the beans, a thing never thought of by those who plant in a big way in South America. In conclusion I may state that I have some confidence that suitable localities will be found for the cultivation of the large-growing prolific trees in Ceylon. The flat, more or less wooded region stretching from the coast inland including the debouch of ravines together with the banks of streams or rivers should possess a number of appropriate sites.

Some years ago when in Southern India at Nilambur I travelled over about 14 miles of wooded lands bordering the river there where I observed various tracts with forest growth equally as well suited for cacao planting as the best land I have anywhere seen in South America. Similar sites I have no doubt exist in Ceylon. I may remark that those expressions of opinion are the result of ex-

periences after having travelled in South America over nearly 2,000 miles in which wild cacao trees and plantations abounded. Of course I refer to those river-side localities as being specially adapted for the growth of the large-growing prolific variety, which I may add possesses several most valuable and important characteristics for cultivation to which I have not as yet made any allusion. Some of your readers may not be aware that cacao planting in South America is not always as it might be a pleasurable and profitable occupation. I have seen the leader of a *guerrilla* going with a number of men to the *hacienda* of a plantation and carrying away all the cacao found therein without, of course, paying anything for it. This sort of thing is spoken of as "taking donations for the *causa* of liberty." Yet in spite of such disasters I have never yet seen a cacao plantation forsaken. On one occasion in Colombia after a protracted revolution I went from the head of the Magdalena Valley down to the sea a distance of over 700 miles with cacao plantations some large and some small on each side of the river all the way. I took special notice that while I saw many plantations of coffee and other cultivated products "run to bush" or deserted I did not find a single cacao plantation abandoned. Finally I may add it gives me great pleasure to address the remarks herein contained regarding the large prolific cacao tree to the "*Ceylon Observer*," the first journal, if I mistake not, to have taken up the cultivation of the commercial products of the tropics. In thus advocating an extension of cacao cultivation, tea planters need not be alarmed that such a course would affect the tea industry. On the contrary the consumption of tea is *growing*; and in many of the towns and cities of South America there is a wide field, only at present it is difficult on account of custom and other duties to recommend a popular system of agencies for the introduction of Indian and Ceylon teas.—I am, sir, yours most obediently,

ROBERT CROSS.

RUBBER CULTIVATION IN CEYLON.

2 Powis Place, Queen Sq., W.C., London, 19 Dec. 1895.

DEAR SIR,—Some years back I obtained a copy of your book on Rubber (2nd edition), but I see very little now about Sinhalese Rubber in the trade papers. I am very much interested in the subject and have been asked by a Foreign Government to advise on acclimatisation of rubber trees. Would it be troubling you too much to ask you to send me a postcard with half-a-dozen words to say whether it has succeeded in Ceylon, or how much you exported last year and the price? Did you get any *profitable* help from Kew? Apologising for troubling you, I beg to remain, yours faithfully,

C. PURCELL TAYLOR, D.Sc.

[We have thought it best to give the above letter publicity in our columns. Rubber has, so far, not been the success that it might and ought to be in Ceylon. The causes of this are various; but the chief one is the unwillingness or inability of our planters to wait for the slow return of their money which rubber gives. The subject is dealt with in the Planting Review prefixed to our new Handbook. The export of rubber from Ceylon in 1894 was of the value of Rs. 440.—ED. T.A.]

TRAVANCORE AND THE AMERICAN TEA FUND.

Braemore Estate, Dec. 23, 1895.

DEAR SIR,—I beg to enclose the subscription list for American Tea Fund from this Association and would feel obliged if you would kindly find room for it in your paper. Yours faithfully,

R. ROSS, Hon. Secretary,
Travancore Planters' Association.

THE COLOMBO TEA MARKET.

Central Province, Jan. 9th

DEAR SIR,—I consider the Colombo tea market at this time to be a veritable treasure trove to the fortunate buyers. London average is reported to be the same by wire-9d.—with good demand, and yet you find the following averages for estates in the following districts:—*Agras*, Colombo average 54c. equal to a

	Gross	London av. of 9d
Maskeliya	- 42c.	do 7½d
Nuwara Eliya	- 50c.	do 8½d
Rakwana	- 36c.	do 6½d
Kelani Valley	- 38c.	do 6½d

Some of your broker friends may throw light on this rot in the Colombo market.—Yours truly,
TEA FARMER.

WANTED : A WEED DESTROYER.

Colombo, Jan. 10th, 1896.

DEAR SIR,—Can any of your readers advise me as to how weeds, grass &c. can be destroyed on an unused barbeque in Colombo? The roots are well down between the bricks, and it is quite impossible to get properly at them to dig them out. Is there any preparation or solution that would reach the roots and kill them off? I should be grateful for any information.—Yours faithfully,

PLANTING IN MATALE.

Jan. 12

DEAR SIR,—In the *Observer* of 10th inst. under the heading of "Planting in Matale" you state that an estate has yielded 800 lb. of made tea per acre over 300 acres giving a profit of R250.00 per acre. It is not quite clear whether you mean for the year or only at that rate for the month of December?

If the former, it is very fine, but it means that the tea netted 50 cents per lb. and cost only 20 cents or a profit of 30 cents per lb. It is possible, but doubtful, especially on old land. At 8 years' purchase (the accepted figures for low-lying estates) this would work out about £120 sterling per acre!! This is "one better" than Nuwara Eliya.—Yours, &c., J. A. R.

[A corrected para appeared in the next issue of the *Observer*. The rate is for December.—Ed. T.A.]

ARECANUT AS A VERMIFUGE FOR DOGS.

Tunisgala, Rangala, Jan. 16.

DEAR SIR,—As the letter in your Directory for 1896 headed "Areca nut as a Vermifuge for Dogs" has been the means of killing the best beagle bitch I ever had, I think it only right that others should profit by my experience and be warned against taking the advice given in the letter.

Unless our dogs have insides similar to Capt. Vetrico's, it is impossible for them to live after having taken but one-half of the *smallest* dose recommended by A.W. At least so I have been told since; and I unfortunately proved it in one case at any rate.

I prepared the powder myself, and it was all carefully sifted through a piece of ceiling-cloth. So the dog's death was not due to carelessness on my part.

From one-half to one teaspoonful is the correct dose, I am told; but it will be some time before I try even that except on a pariah.—Yours faithfully, J. HALL BROWN.

[We greatly regret that we should have been the indirect means of causing the death of our correspondent's dog. The information in our Handbook was supplied by a former well-known Ceylon resident of much experience with regard to animals. It first appeared over ten years ago, and has been reprinted in each of our Handbooks since; but we do not remember to have had its accuracy called in question before. We shall be glad of the opinion of other correspondents on the subject. From Dr. Geo. Watt's "Dictionary of the Economic Products of India" we quote as follows regarding areca nut:—

"Is very useful as a vermifuge in dogs. I have given half a nut powdered, mixed with butter, to terriers with remarkable effect." (*Surgeon K. D. Ghose, Khulna.*) "The powdered young bark is anthelmintic, used for tape-worm; useful in animals; supposed to be the principal ingredient in Naldire's worm tablets." (*Surgeon W. D. Stewart, Cuttack.*) "It is a good anthelmintic, and expels thread-worms. I have often given half a nut to a dog mixed up in butter with very good effect. The worms are expelled after one or two doses" (*Surgeon K. D. Ghose, Bankura, Bengal.*) "Is a good vermifuge for dogs in 1 oz. doses (powdered)." (*Surgeon-Major J. Byers Thomas, Waltair, Vizagapatam.*) "Nut cut small and soaked in milk is a good vermifuge for dogs." (*Surgeon-Major P. N. Mukerji, Cuttack, Orissa.*) "Very useful in worms in dogs and other domestic animals." (*Surgeon H. D. Masani, Kurrachee.*) "Is a valuable vermifuge for dogs, especially for round-worms." (*Surgeon George Cumberland Ross, Delhi.*)

—ED. T.A.]

VERMIFUGE FOR DOGS.

North Cove, Jan. 20th.

DEAR SIR,—In the *Observer* of the 17th I see a letter having reference to the Vermifuge for Dogs as given in your Handbook. Over leaf I send you the prescription I have always used for my dogs and have always found it effective and safe. It is always prescribed thus in "Answers to Correspondents" in the *Field*.—Yours &c., THOS. FARR.

Vermifuge—taken from *The Field*.—For a dog up to 10 or 12 lb. in weight:—

20 grains freshly ground areca nut and 2 grains of santonine followed in 2 hours by a table-spoonful of buckthorn and castor oil.

If the dog be more than 12 lb. in weight increase the areca nut at the rate of 2 grains for each lb. in excess.

THE WANARAJAH TEA CO., OF CEYLON, LD.

Jan. 20.

DEAR SIR,—We beg to inform you that the Directors of the above Company have declared an interim dividend of R40 per share for the half-year ending 31st December 1895, equal to 8 per cent on the capital of the Company.—Yours faithfully, BAKER & HALL, Agents and Secretaries.

PLANTING IN NYASSALAND.

Jan. 22.

DEAR SIR,—Enclosed we beg to hand you copy of a letter from our Superintendent in Nyassaland in which you may find something to interest the general public.—Yours faithfully,

P. pro. CARSON & Co.,
E. R. WALDOCK,
Agents and Secretaries,
Nyassaland Coffee Co., Limited.

Nyassaland Coffee Co., Milange, Oct. 15th, 1895.

Messrs. Carson & Co., Colombo.

Dear Sirs,—I arrived on the Company's land on the 10th and although far from being settled down I take the opportunity of sending you a few lines. I left Chinde on the 2nd September, but after 5 days on the river we had to return owing to the engine pumps breaking down. I again left on the 8th in another steamer, but owing to the river being very low, navigation was very difficult. I only reached Blantyre on the 1st October. I had to wait at the latter place 3 days for my luggage. I called on the Manager of the African Lakes Co. and made all arrangements with regard to banking, etc. Owing to labor being very scarce at present they were only able to give me 13 men to remain with me, beside sufficient labor to carry my goods, but I reached Milange on the 6th and had to stay two days with Mr. Bradshaw, as none of my boxes had turned up. I spent Saturday night at a village on the way as it is 55 miles from Blantyre to the Company's land; and as none of my boxes arrived, I had to be content with nigger grub (Indian corn and potatoes). I stayed one night at Lauderdale, but unfortunately Mr. Moir was away. At present I am camping out, and am busy building a temporary house.

EUROPEAN ASSISTANT.—While in Blantyre I tried to get an European assistant. Although I tried in several places I was unsuccessful. I found there was a big demand for Europeans and such a thing was not to be had. I then tried to get an English-speaking nigger. I also failed to get that, so I started off not knowing a word of the language, and with only 13 men. Since then I have picked up a good deal of the language which is not at all difficult. There is not the slightest doubt that a European assistant will be necessary to enable me to open up a large clearing next year, and as it seems impossible to get a man out here, it will be necessary to get a man from

Ceylon. It must be borne in mind that the labour here is very different to the Tamils in Ceylon, they are an ignorant lot, and it is a case of sheer necessity to stand by them all day, otherwise they will not work. The language is easily learnt, but the very fact of a European in the field keeps the niggers at work, to that an assistant would be useful immediately he arrived here. There is no experienced labor out here; they come for a short time and then go, hence the great necessity for an assistant. If I might suggest either of the following gentlemen both of whom expressed their desire to come out here, and at the same time, both have had a certain amount of experience with coffee, and certainly could show good testimonials, viz., Mr. G. C. Morris of Mahadawa, Madulsima, or Mr. Ch. Pinches, Naybeddy, Bandarawela. Mr. Morris I have known for some time,—he is a thoroughly conscientious and hard-working man and would be well adapted for this life. I mention this as it would be useless to send a man out here, unless he is prepared to lead a very lonely life, and at the same time great patience is required to work the niggers successfully, and the latter is of great importance as you are aware opening up land is any thing but healthy work and in consequence it would be advisable to let him have furlough at the end of four years. Living out here is, I find, very expensive, the prices charged by the African Lakes Co. for tin things are exorbitant, and unfortunately they are the chief food, so I would suggest to start him on £150 with a £25 rise for each succeeding year. I might mention that the lowest paid man in the African Lakes Company gets £100 a year and his food found by the Company. Coffee, judging from the appearance of the coffee I have seen at Milange, has excellent prospect; the trees are healthy, and have lots of strong wood about them and yield well. I have as yet been unable to gather many statistics with regards to Milange coffee, but Mr. Buchanan of Blantyre told me a field of his 6 years old gave 7 cwt. an acre last year. I saw the field, and from appearances it could not be compared to Milange coffee. I noticed that what few fields have been carefully planted are doing considerably better than the majority of fields which have been hurriedly done. In most cases the coffee has been topped too high and the maiden crops (which are generally very heavy) have taken too much out of the trees. A considerable amount of empty berry is found in the Blantyre coffee but not in Milange, where the soil is undoubtedly better.

COMPANY'S LAND.—Although I have not been able to go over much of the land, yet what I have seen is undoubtedly very good, and ought to grow splendid coffee. The land is very undulating and is thickly wooded, but there is not much virgin forest. In places the land is indifferent and is not good enough to plant, but taking it all round there is a large percentage of very good land. The soil is of a dark chocolate colour, and is very free; there is, however, an absence of rock or stone. From what I can gather the rainfall averages about 60 to 70 inches and the elevation about 2,000 feet.

ARTIZANS.—There are very few trained native artizans in Blantyre, and they are all engaged, so in the meantime I have engaged an European carpenter to assist in building a house at a salary of £7 a month. He is new to the country and is unable to speak the language, so is not of much use. It would undoubtedly be a saving to the Company if they sent out an artizan for a year or so—a man who understands masonry as well as carpenter's work, for in addition to building a permanent bungalow, a pulping-house and cisterns will be necessary, bricks can be made in the property, but lime is very expensive. In my opinion a Malay would be the best man to send out. If an artizan does come it would be advisable for him to bring a good supply of rice, as it is very expensive here.

BUILDINGS.—I am at present putting up a small thatched hut which will do for a few months, but a permanent bungalow will be necessary next year, in the meantime I will try and train some men as sawyers. Owing to the exorbitant charges out here it would be advisable to send all necessary articles such as nails, screws, tools, etc., from Ceylon. I enclose list of articles necessary. I find the prismatic

compass has not been sent. I will require one to survey the blocks of land with.

FURNITURE.—Beyond a small camp table and a chair, I have no furniture, and so I would be obliged if the Company would send out some. It can be obtained far cheaper in Colombo than out here including freight. Following are the necessary articles required:—1 almirah, 1 dining-room table, 4 chairs with arms, 1 office table, 1 sideboard, 2 beds, 2 washhand stands and any other articles the boy may think necessary. The furniture can be taken to pieces and packed in long cases and I can put it together out here.

LABOR.—At present labor is very scarce; there has lately been a war close to Milange, and in consequence local labor is very scarce; there is also very little labor coming down from the lakes at present owing to the country being in an unsettled state about these. An expedition has already been sent off to quell a disturbance. However, there is not the slightest doubt that as soon as the country is more settled, labor will find its way here in large quantities, and that, I am told, will be soon. The men, as I have before mentioned, are very ignorant and have to be looked after like a lot of cattle. They are a lazy lot and the only way to get work done is to stick by them the whole day, hence the great necessity for an European assistant. Labor is almost entirely paid by calico and I think it would be a considerable saving, if the Company imported their calico direct from England in the future. On this subject I will write more fully in my next report. In the meantime I can get all I require from the African Lakes Company.

CLEARING AND NURSERIES.—The rains, I am told, do not commence till the middle of November so as soon as I complete my hut I intend starting a clearing, also to open up large nurseries. I have written to the Manager of the African Lakes Company, asking him to send me some more labor, and if I can possibly manage it I will open 20 acres this year; in any case I will start it. I have made arrangements about buying plants. I have also booked 500 lb. of seed from Mr. Buchanan, but he says he cannot guarantee it, although he thinks it will come up well. This will be sufficient to start, and later on I will get more. If you have received advice about the Brazil seed I would be glad if you would let me know as soon as possible to enable me get nurseries made for it. It is, of course, impossible for me to say what average I will be able to open next year, as so much depends on labour, but with the aid of an assistant I think I could manage to open up 150 acres well. I will start clearing early in the year, so the sooner an assistant is sent out the better.

STATIONERY.—I would be obliged if the Company would send out a case of stationery with the Company's address printed on the paper. I have bought sufficient in Blantyre for the meantime; I will also require a copying book and press (see list).

GENERAL.—Chiromo is the nearest port on the river to Milange, it is about 80 miles distant, so that all goods will have to come that way. When you send out an assistant advise him to stop at Chiromo and he can send a messenger across advising me of his arrival and I will then send down men to bring his boxes up. He ought also to be advised to stick by all his luggage, as the African Lakes Company are very careless, and if a box is left behind it will probably not be seen for months. All cases ought to be labelled Chiromo, B.C.A., and carefully numbered, I might add that I have got all my tools with me, but I omitted to bring a list of them from Ceylon, so would be obliged if you would ask Messrs. Walker, Sons & Co., to forward one on, to enable me to see if they are correct. I regret Mr. Owen's necessity to leave the country, I presume another man from Ceylon will be sent out in his place. If I can be of any assistance to him, I will gladly do so. I enclose an order for some goods on Messrs. Cargill & Co., and would consider it a great favor if the Company would settle the account in the meantime and on receipt of the amount, I will forward a draft through the African Lakes Co. The goods might be brought out by the assistant.—I am, dear sir, yours faithfully,

(Signed) G. MORTIMER CRABBE,

A CUP OF TEA.

DEAR, SIR,—Although Ceylon and Indian teas contain possibly (?) more tannin than those of China, the taste for them is rapidly increasing, and it is to our interest to purchase the productions of our English planters rather than from the Chinese.

As tannin is a natural product of the tea-leaf, whether grown in China or Ceylon, and varies in quantity with the age of the leaf itself (as I am told by those who have grown it in Ceylon) we shall find its presence, even in the purest and best of teas. Moreover, people *will* drink tea, and many will not give a high price for it, nor make it with due care. They can, however, obviate all difficulties and dangers by making use of the Tanocea tea-toning tablets—a simple, useful, and perfectly harmless addition to their tea, the qualities and virtues of which I cannot write highly enough about. We have used these tablets for one and a-half years, and I cannot drink my tea now without them. Even the purest tea is denied to me without them, for they prevent the tannin from entering the infusion—it remains in the pot with the leaves.—Yours truly, B. J. MATTHEWS.
—*Temperance Chronicle*, Dec. 27.

COFFEE PLANTING IN CENTRAL AFRICA.

PARTICULARS OF THE ENTERPRISE BY A FORMER
CEYLON PLANTER.

Mr. R. S. Hunter, who is now engaged in coffee planting in Central Africa, and who has been in the island for the past few weeks visiting the local coffee districts and a few old friends that he knew when he was a planter in Ceylon, has been interviewed by a contemporary, who reports:—

“Do you show more in the neighbourhood of Blantyre yet?”

“Well, we have got something like 6,000 or 7,000 acres there in cultivation by this time,” was the reply, “and that is not bad for two or three years’ work. The place is beginning to look like business now. There are not a great number of Ceylon men in the neighbourhood of Blantyre. A dozen? No not so many! perhaps eight; but then there are several white men up from South Africa, though some of these don’t know much about coffee; and there are other men from other parts of the world who have been engaged in coffee planting elsewhere, and have been attracted to invest. I should say that within a fair radius of Blantyre, there are now 300 white men; not all planters, of course, but planters, storekeepers, &c. Touching coffee, there is no certainty about the planting, but, as far as we have got, the first crops seem to be very good and come on pretty fast and big, besides which it is much cheaper working there than here.”

THE LABOUR QUESTION.

The labour is very much cheaper than it is in Ceylon. We pay there in cloth—so much cloth per month calculated at sterling rates—and the average pay is from two shillings to half-a-crown a month. There have been tribal rows, but the Commissioner (Sir Henry Hamilton Johnson) has now dealt with the leading spirits in those disturbances, and the labour is now not much interfered with. The natives are fine, big, healthy men, who would each make three Tamil coolies, and they work very well provided they are properly supervised, but they require a vision and pushing on with the work. Kept at it, we get as much from our natives as you do from Tamils, and their women and children all work also. No; we don’t find them lonesome; they provide places for themselves, for the most part sleeping in grass-huts. Europeans are starting to put up decent bungalows, and the place is getting on; but the chief difficulty at present is

THE DIFFICULTY OF TRANSPORT.

We are at present unfortunate in the way of roads and railways; but a railway has now been sanctioned from Chiromo to Fort Johnson at the bottom of lake Nyanza, and another railway is in contemplation from Quilimanc in the coast to Chiromo, where

it would join the line to Fort Johnson, and so we should get communication right up from the coast. That is what we hope for.

Already we may mention that Mr. Hunter urges that the Government should proceed with these works speedily, arguing that the planters are the backbone of the country. At present all the coffee grown is shipped to Chinde, where ocean steamers call, but Mr. Hunter says that this outlet will not be sufficient soon with the acreage now in bearing.

CEYLON MEN IN THE DISTRICT.

Not all Ceylon men that go over to Blantyre succeed, and according to Mr. Hunter some men have been the very reverse of successes there. He instanced one planter who got frightened at a dose of fever, and cleared at once, barely staying in the place a month. Personally speaking, Mr. Hunter says he finds the climate agrees with him. Fever is encountered with in clearing, as in Ceylon, but otherwise the district is healthy. On the other hand, he refers to Mr. Crabbe of Badulla, who went out to join the Nyassaland Company as a man who has made a very good start indeed, and one who seems to be the right man for the country. European planters, he says, now have little or no differences with the natives in those parts, and are not hindered by any warlike spirit displayed by the people there.

SUPERINTENDENTS AND MASONS WANTED.

On this same subject we append some further information kindly given us by Mr. G. J. Jameson of the firm of Messrs. Carson & Co., who have just received from Mr. Crabbe interesting news as to his work in Nyassaland. Mr. Crabbe reports that everything is very encouraging indeed; but further supervision is required, and Mr. Jameson is trying now to get hold of a couple of good men in Ceylon to send down to Mr. Crabbe to assist him, as Mr. Crabbe has a large area to work upon. “If we can get the men to go,” said Mr. Jameson, Mr. Crabbe will proceed with opening-up operations to a large extent. We are going to have a meeting of the Directors of the Company next week to decide what is to be done. Mr. Crabbe cannot do anything on a large scale till he gets more assistance; but, given that, in the course of a year he would probably open up from 100 to 150 acres more. We also want to get some native artisans, Malays if possible—men who can do carpentering and masonry work. There is a good opening there for such men.”

We may add that Mr. Hunter said on this point that some masons got down from India by Sir Henry Johnson did not turn out very satisfactorily, as the climate seemed to get hold of them more than it did the Europeans.

WOOD PRESERVING IN SWITZERLAND.—A simple, effective and cheap way of preserving wood from decay is practised in Switzerland in the preparation of posts for the telegraph service. A square tank, having a capacity of some 200 gal., is supported at a height of 20 ft. or 25 ft. above the ground by means of a light skeleton tower built of wood. A pipe drops from the bottom of the tank to within 30 in. of the ground, where it is connected with a cluster of flexible branches, each ending with a cap having an orifice in the centre. Each cap is clamped on to the larger end of a pole in such a manner that no liquid can escape from the pipe except by passing into the wood. The poles are arranged parallel with one another, sloping downwards, and troughs run under both ends to catch drippings. When all is ready, a solution of sulphate of copper, which has been prepared in the tank, is allowed to descend the pipe. The pressure produced by the fall is sufficient to drive the solution, gradually, of course, right through the poles from end to end. When the operation is ended, and the posts dried, the whole of the fibre of the wood remains permeated with the preserving chemical.—*Work* for December.

VARIOUS PLANTING NOTES.

TOBACCO AT TRINCOMALEE.—We take the following from the "Jaffna Catholic Guardian":—"A fine species of tobacco much prized by Jaffna traders for its strength and aroma is grown at Nilavelly in the Trincomalee district, where it is now reported that the plants in gardens and nurseries have been destroyed by excessive rains."

PLANTING IN MATALE.—The Matale correspondent of a contemporary writes:—Heavy cocoa crops are now being gathered throughout the district; the estates north of Matale are doing especially well. Liberian Coffee planting also making considerable strides. Messrs. Storey and Brockman are putting in 100 acres of Liberian alone on their new West Matale estate, and interplanting with cocoa is much in favour.

THE FIBRE INDUSTRY.—A correspondent of the "Jaffna Catholic Guardian" writes:—"The trade in Palmirah fibre which was reported by a contemporary as 'gone,' has again revived. The fact is, there was for sometime a rapid decline, not a total extension of it, owing to the fall in the London Market, which made it an unremunerative business to all concerned. With the rise in the price in London, the industry has begun to revive; but fibre cannot now be got as largely as formerly for love or money, owing to the very great havoc already made on palmirah plantations in every part of the province."

NATIVE COFFEE PLANTERS IN INDIA AND IN JAMAICA.—It is, says a contemporary, the intelligence and imitative faculty of the Indian peasantry that make them so valuable a factor in the labour market abroad. The want of these qualities are a drawback to industrial development. The most noticeable instance of this latter remark comes from Jamaica, where the cultivation of special products like coffee, cacao, kola, &c. have been carried on for a period sufficiently long to have been taken up by the indigenous population, if that population possessed these qualities to any appreciable extent. But we find a committee of horticulturists and planters, only now, proposing to improve indigenous industry in these directions, by lectures and the dissemination of leaflets containing instructions on new and improved methods. The native Jamaican coffee planter understands neither how to plant coffee, how to cultivate it, nor how to harvest it. Each of the processes is thoroughly understood by every coffee planting native of India, and some of the estates owned by them are models of up-to-date methods that will compare favourably with the properties of Europeans, whose practices they have imitated only too closely. No Indian coffee planter ever thinks of putting down a three-year-old coffee plant with berries upon it haphazard which the Jamaica native will not abandon, with the result that, at maturity, the tree is sickly, stunted and unprofitable. Nor will he allow his coffee to be over-shadowed or to remain unpruned and unweeded. He sees the benefits of these operations upon the estates of his European neighbours or of his erstwhile employers, and follows them so closely as oftentimes to make him a not contemptible competitor. In the matter of curing too, where self-interest, we should imagine, would dictate more rational methods, the Jamaican tries to dry his crop on the bare earth, in the wet season, actually resorting to the use of iron posts, as driers. Thus his coffee goes into the market defectively prepared, mildewed and in a condition that causes it to realize low prices. In this respect the Indian native coffee planter is immeasurably his superior, and although the latter's crop is not so presentable as that of the European, it turns it close. The committee to which allusion has been made above, talk of central factories in Jamaica for the purchase of coffee in the cherry, in order that it may be cured by a proper set of machinery. Something of the sort will have to be done if coffee planting is to be continued in the island. By latest statistics the exports are shown to have greatly decreased and to be gradually falling off. *Indian and Eastern Engineer*, Dec. 7.

TEA IN INDIA.—Remarking on tea cultivation in Northern India, the *Madras Mail* says that the margin of profit has for the last four years been generally on the increase. The Jorehant Company of Assam, for instance, has paid a steadily increasing dividend—in 1892, 10 per cent; in 1893, 12½ per cent; in 1894, 15 per cent; and in 1895, 20 per cent with the result that its shares which in 1892 only reached a maximum value of £34, have this year touched £52 and have never fallen below £44. The prices by the way for 1895 are taken from the November *Investor's Monthly Manual* so they are not quite complete for the year; but they show what we have already drawn attention to, viz. the greater demand that there has been for tea shares during the year. Referring to Southern India, our contemporary remarks that Travancore has gradually raised over the ruins of her coffee industry a splendid tea enterprise, giving once more an example of what optimism, backed by brains, can do in the face of actual disaster. Only last year Messrs. Finlay, Muir & Co. made a large purchase of land in this State for expressed purpose of tea cultivation, and not only are they opening out this tract of land as quickly as possible, but they are developing the whole country side; constructing roads and performing work which in any other country the Government would have gladly undertaken. On the Nilgiris tea has been cultivated for many years past, but so far as we are aware there has been no great extension within recent years. Reference is then made to the attention which is now being paid to the Wynaad.

SUGAR CULTIVATION IN CEYLON.—A former Ceylon planter, Mr. James D. Dixon, writes from Fiji (his letter is given on page 543) expressing the utmost confidence that—past failures notwithstanding—the cultivation of the sugarcane in Ceylon for the production of sugar can be made to pay, and pay handsomely. It will be seen that Mr. Dixon states his disbelief in our climate's having anything to do with the failures of former years; but on this point we have the support of experienced planters when we say that we fear it has everything to do with it. It has been proved by sad experience that locally-grown sugarcane contains too much water for its sugar to crystallize properly. However, if any capitalist is willing to risk his money in an attempt to produce cane sugar profitably in Ceylon, we have no doubt that Mr. Dixon will be willing to undertake the management of the enterprise. In the Planting Review prefixed to our Handbook we give a succinct account of past attempts at sugar cultivation in Ceylon,—Mr. Winter, the first editor of the *Colombo Observer*, being the pioneer of the industry in British times. From that Review we quote as follows:—

Mr. L. Wray of Perak writing to the *Tropical Agriculturist* (on page 493 vol. 1884-5) expresses confidence that Ceylon might become a great sugar-producing country if land were judiciously selected and all modern improvements in cultivation and preparation, utilized; and we had about seven years ago (July 1888) an enquiry from a European at Nagpore who wished to try new machinery in manufacturing sugar in Ceylon; while one of the first questions asked by H.E. Sir A. E. Havelock after assuming the Government (May 1890) was, why sugar was not grown in Ceylon with its cheap labour supply. It will be seen from the above that Mr. Dixon is not singular in his belief regarding sugar cultivation in Ceylon being made to pay. It must not be forgotten, that among the natives sugarcane would have to compete with the palm sugar (jaggery) so largely used.

A FORMER CEYLON PLANTER IN BRITISH COLUMBIA.

We have received a letter from Mr. E. W. Harris, formerly a planter in Ceylon, and for some little time in charge of the fish-curing yard at Kalpitiya. Mr. Harris writes from Victoria, B.C., on Dec. 14 last:--

"How is Uva doing? Do you know if Mr. Crowther who worked on Blackett's estates (Kenakelly) is still in the island? There is a large field for the sale of Ceylon teas both in Canada and the Pacific coast of the U. S. Can I be of any help in the matter? I pay 25c (equal to 50c of Ceylon money) for $\frac{1}{2}$ a lb. of Ceylon tea here. I have been 8 years on this coast. Great things are being expected from the gold mines of Rooteney, but a lot of capital is required to develop the quartz in which it is found."

THE INTRODUCTION OF "LADYBIRD" BEETLES INTO CEYLON.

Mr. E. Ernest Green writes to us from England:--

The failure of our first attempt to introduce "ladybird" beetles must not discourage us from trying again. The experiment seems to have been most successful in the Sandwich Islands, where the same kind of beetles that were despatched to Ceylon have increased rapidly and are doing good service against a scale-bug closely allied to our *Lecanium viride*. I have written to my friend Mr. Albert Koebele, who is responsible for the experiment in the Sandwich Islands, asking him to send us a supply direct from there. They would be consigned to care of my brother Mr. G. H. Green. I also propose to get another supply from California, to be sent to me here in England. I shall endeavour to propagate and establish them here in a greenhouse where I find a plentiful supply of a scale insect (*Lecanium alienum*). I can then choose my time and send out consecutive consignments to Ceylon. The initial difficulty will be to get the insects over to England. For I am surprised to find the same lack of convenience for interchange of parcels between this country and America as exists between the latter and Ceylon.

THE PHILADELPHIA COMMERCIAL MUSEUM.

OFFICERS OF THE BOARD.

Wm. Pepper, M.D., LL.D., President; Charles H. Cramp, Vice-President; Clarence H. Clark, Treasurer; Wm. P. Wilson, Sc. D., Sec. pro tem, and Director of the Museum.

PLAN AND PURPOSE OF THE PHILADELPHIA COMMERCIAL MUSEUM.

The Philadelphia Economic and Commercial Museum is a municipal institution established by the City of Philadelphia.

The Museum consists of collections of natural products from all the countries of the world which have already entered our markets, or which may be made available for them, together with samples and cases of manufactured products from foreign countries, which may serve as aids to our manufacturers.

THE OBJECTS OF THE INSTITUTION.

1st. To bring before our manufacturers, dealers and consumers all the varied products of the world, that they may make the best selection for their own special interests.

2d. To publish all possible scientific and useful information concerning these products which may aid the manufacturer and consumer in his choice.

3d. To place on exhibition manufactured articles and samples, with full information from all markets which we ought to enter or control, and to furnish useful information concerning opportunities in foreign lands to our merchants and manufacturers.

The most important parts of the exhibits from Mexico Central and South America, Australia, South Africa, and many Asiatic countries at the World's Columbian Exposition, were, at its close, removed to Philadelphia. Similar products from all other countries have been secured, and are being rapidly added to the collections.

DIVISION OF EXHIBITS AND DEPARTMENTS.

I.

EXHIBITS ACCORDING TO COUNTRIES.

Under the classification a visitor may study the resources and commercial features of any particular country; can see the extent and variety of its products; investigate the character of its industries, climate and soil, means of transportation and manner of communication with the commercial world, and thereby be enabled to derive from the exhibits, maps, charts and other data collected, valuable information necessary in the conduct of his business.

II.

EXHIBITS ACCORDING TO KINDS OF PRODUCTS.

Under this classification the manufacturer, merchant or consumer interested in any particular commodity may here find systematically arranged and displayed samples of the various products which interest him, collected from all sections of the globe, with all obtainable data possible, whereby he may judge of their commercial value. For instance, the manufacturer of wood will have displayed for his benefit thousands of samples, embracing nearly all the woods of the world, in sufficient size and quantity, and with data necessary for him to determine their value in his particular industry. Likewise the textile manufacturer may here find samples of the wools, silks, cottons, vegetable fibres, etc., from every foreign country, comprising the most varied and complete collection of its kind in existence. The collection of hides, skins, leather, tanning materials, dyestuffs, food products, oils, medicinal drugs and herbs, minerals, etc., are intended to enable the dealer in these products to keep fully posted upon the constantly changing conditions of the markets of the world. These collections will be renewed or augmented as necessity may require.

III.

SAMPLES OF FOREIGN MANUFACTURES.

This will be a collection of samples of merchandise required in foreign countries, especially in the new markets of Spanish America, Australia, South Africa and other countries, the object being to show to the American manufacturer what his European competitor is doing in the foreign trade of these countries, and suggest to him new lines of goods which he may produce and sell with profit. Novelties and improvements made in European manufactures in standard goods and staples will be promptly reported. Detailed information as to the source, cost of production, selling prices, import duties, manner of packing, patent rights, etc., etc., will be furnished.

IV.

BUREAU OF INFORMATION.

Arrangements have been made with the Department of State at Washington for special reports on these subjects from consular officers in all parts of the world. The Museum will have correspondents in all foreign countries, men of experience, familiar with the conditions, and peculiarities of their markets, who will forward regular reports concerning commercial possibilities and the conditions of trade of their particular localities, thus enabling the manufacturer and merchant to keep in close touch with the markets of the world.

Business directories and copies of important periodicals will be kept on file; also books of reference in all languages, statistical reports from all countries, and other publications bearing upon the question of trade.

Detailed information will be furnished manufacturers, upon inquiry, concerning commercial opportunities and the demand for specified products in any locality, together with the reports upon prices, duties, credits, etc.

Special efforts will be made to procure early and complete information concerning the plans and spe-

* Yes,—manager of the Kellie Co.'s estates.—E.D. T.A.

cifications of proposed public improvements and private enterprises that may be open to contract.

V.

A SCIENTIFIC AND EXPERIMENTAL DEPARTMENT.

In this department a careful study of the scientific and economic value of all products collected will be made. As for instance, tan barks will be carefully examined; woods will be studied; gums and resins will be tested. Many new vegetable fibres will be investigated with reference to new applications, and in general new articles will be subject to scientific investigation for the purpose of determining their commercial and practical value. Through the publications of this department, the institution will co-operate and exchange with all other scientific and educational museums of the world.

INDIAN TEA ASSOCIATION.

CALCUTTA, Dec. 16, 1895.

Abstract of Proceedings of a Meeting of the General Committee held this day.

Read letter of 2nd Oct. from Mr. E. C. Ringler Thomson, British Vice-Consul for Khorassan, and Sistan, Meshed, in reply to the Committee's letter dated 10th September, on the subject of inferior Indian tea exported to and sold in Persia. Mr. Thomson forwarded four samples of tea, with his letter in support of his previous official statement, and three of these on being valued were found to be absolutely worthless; the value of the fourth being estimated at not more than 7 annas per lb, although selling in Persia at R1-4, this being the one only one of the four samples sent, which was fit for consumption.

Mr. Thomson's letter is printed as an appendix to the minutes for general information and the Committee had since been in correspondence with the Kangra Valley Planters' Association on the subject. A reply had been received from this Association, but was too late to receive consideration at the meeting and the Committee are now endeavouring to find out the best means to prevent the export of such deleterious rubbish under the name of Indian teas.

Dated Meshed, the 2nd October. 1895.

From, E. C. Ringler Thomson, Esq.,

British Vice-Consul for Khorassan and Sistan.

To, The Secretary, Indian Tea Association Calcutta.

I have the honor to acknowledge the receipt of your letter No. 311 O, dated 10th September 1895, stating that certain remarks in my recent Trade Report are likely to do considerable damage to the Indian Tea Trade and asking me for samples and particulars of the tea sold in Khorassan.

In reply I send you four samples of tea which sell at about Re. 0-10-0, 0-12-0, 1-4-0 and 1-10-0 per pound respectively. The two former are the qualities drunk by the mass of the people, and the two latter by the richer classes. Persian gentlemen have often complained to me that the after-effects of even the best of these teas is bad, and I agree with them. Really good Indian Tea is not procurable in the town at any price: but fair Chinese tea called here always "Russian Tea" can be obtained at a high price. Thus the people of Central Asia have come to believe that India cannot produce good tea. The Indian tea is brought here from Bombay via Bundar Abbas. The worst is packed in bags, sewn up in skins; and the better sort in boxes, also sewn up in skins. The parcels do not as a rule exceed 90 lb in weight, as camels are not always available at Bundar Abbas for transport, and donkeys are therefore generally employed. The bad tea I believe comes chiefly from Kangra. And I have only recently heard from a planter there that "200,000 lb of rubbish are going from this to Bombay this year consigned by native growers. It is sent to sell at 5 annas per lb or under and is about as bad as tea can be." This tea I imagine was intended for the Meshed market and seems to correspond with the cheaper samples I am sending you. I hope you will now allow that my remarks were justified. They were not dictated by a desire to damage, but to improve the Indian Tea

Trade and to remedy an evil by giving it publicity. The people here are now so accustomed to rank tea sweetened excessively that ordinary good tea at first appears to them flavourless. I have, however, found that it takes a very short time to teach them to prefer the latter. The green tea sent here from India seems to be much on a par with the black tea and comes from the same direction. I know by experiment also that a sample of Indian green tea specially manufactured by a planter at Kumaon was preferred by a native of Central Asia to that from China. The duty on good Indian green tea would probably be the same as Chinese green tea.

I am obliged to you for pointing out my error about the selling price of black tea in London and I am sorry I made it. I learnt my mistake three months ago, but too late to alter it this year.—*Indian Planters' Gazette*, Jan. 11.

LAND RECORDS AND AGRICULTURE IN MADRAS.

We have had before us for some weeks, awaiting a convenient season for review, the Report on the operations of the Department of Land Records and Agriculture in the Madras Presidency, for the official year 1894-95. There is not much in it of local interest, but a cursory notice of it may suggest some points worthy of local adaptation, if not adoption. The document we are noticing emanates from the Board of Revenue and is a review of the operations of the Land Department. It is followed by the "Order" of the Presidency Government, approving or disapproving the suggestions and comments of the Board. The matters dealt with are very varied and comprehensive and embrace (1) The Organization and Maintenance of Village Records, (2) An Analysis of Districts, (3) The Collection of Revenue in Precarious Tracts, (4) Measures of Protection, (5) Agricultural Experiments, (6) Cattle Breeding and Veterinary Establishments, and (7) Miscellaneous.

The oversight of the Organization and Maintenance of Village Records devolves on the Director of Land Records and his Deputy who are aided by Revenue Inspectors. The year's work includes the re-settlement of villages in which the settlement had expired, the training in survey of *karnams*, or village accountants, who are employed in replacing boundary stones, subdividing survey fields, and generally aiding the permanent District Surveyors who are responsible for maintenance and correction of village maps and survey records. When the immense tracts of land to be dealt with in the Southern Presidency are considered, and also the constant subdivision of holdings, the importance of a subordinate staff can be readily understood; and the Superintendent of Survey has found it necessary to make arrangements for holding "annual survey schools," lasting for 10 or 15 days in each taluk, to prevent the *karnams* from forgetting what they have been taught, and to keep them in practice. In these schools the knowledge and work of the *karnams* are regularly tested by Survey Officers, to each of whom a certain number of schools are apportioned for inspection and report. The work of survey and re-survey done under this system is considerable. The area to be re-surveyed in four of the districts was found to be 9,889 square miles—or considerably over one-third of Ceylon—of which 8,101 square miles had been surveyed up to date—2,327 square miles having been completed within the year.

The second head—Analysis of Districts—has reference to statistical registers, showing the con-

dition of each village, of which a continuous record is thus available; bearing on irrigation, cultivable extent, waste land, variations in holdings, the number and condition of flocks and herds. As, however, these particulars are available from other sources and reports, it has been recommended that the economic reports are of no practical value and should be discontinued; but the Government has reserved its decision on the point. In regard to the Collection of Revenue in precarious tracts the greatest consideration seems to be shown to the ryots, with the result that no difficulty has been experienced in the collection of revenue in any part of the Presidency. We remember complaints here, before the abolition of the Paddy Rent, that the rent was made payable before the crops were reaped; and opportunity was thus afforded to the wily headman to acquire the land or the crops under a forced sale, or the cultivator was driven to borrow at usurious rates—literally cent per cent, by undertaking to deliver to the lender paddy twice the value of the loan. On the adjacent continent, we find the time for the payment of revenue in instalments revised, so as to enable the ryots to sell their produce before being called upon to pay the Government dues. Further modifications have been recommended for the relief of the ryot, but they remain to be adopted. Had similar consideration been shown here, the Paddy Rent may have been saved; but rigid exaction did its work.

Under Measures of Protection are included the extension of communications, advances to agriculturists, and irrigation. Under the first head we note the completion of the East Coast Railway as far as Berhampur, 400 miles, and Surveys for Railways aggregating 458 miles—surely a goodly record for the year. Among the latter we find 102 miles of Madura-Pamban track, which we hope is destined some day to help to connect our little Island with its big neighbour. The advances to agriculturists represent a benevolent, and to a great extent, successful, attempt to combat the great evil of usury, on which we had occasion to write recently with reference to contemplated legislation. The loans during the year amounted to R279,591, a falling off as compared with the previous year when R450,921 found their way into the hands of needy agriculturists; but in the year before, the sum was as large as R2,275,159. It would be difficult to estimate the extent of relief which these enormous sums afforded to hundreds and thousands of families. We should think that state loans of this description are a far more efficient corrective of usury than direct legislation. The diminution in the sums lent the two last years is explained, partly by the magnitude of the previous loan, but mainly by the improvement in the seasons since the distress of 1892. Loans, however, are only a temporary expedient, and can only lighten distress. To avert famine, railways and irrigation works are needed, and both these are receiving attention year by year—the latter to help to increase the food supply, the former to transport food into the famine districts in emergencies, and generally to aid in the development of the resources of the country. On the Rushikulya works in Ganjam, the expenditure during the year was R3.11 lakhs, raising the total up to date to R36.80 lakhs, while on the Periyar project (with which the name of Colonel Penny-enick is honourably connected) R9.60 lakhs were spent during the year, or R73.56 lakhs up to date. The expenditure of these enormous

sums,—and they by no means represent all that was spent last year—if it proves the greatness of the needs of a teeming population, establishes also the solicitude with which the Government labours for the welfare of those under its rule, and may be regarded as one of the grand characteristics of British rule.

Agricultural Education does not seem to have proved a success, for we find the re-organization of the Agricultural College has been necessary, while as a means of increasing the number of students, the holder of an Agricultural Diploma is to be placed on a level with graduates, so far as employment in the public service is concerned. The College Farm continues to be managed as a Dairy Farm—the milk produced finding a ready local sale; and the development of the farm at Saidapet is contemplated so that, like our own Government Dairy, it should supply milk to the hospitals, and also to the troops in Madras. There is not much that is definite on experimental crops, and the inquiry into the cultivation of cotton and indigo which was begun two years ago has not been completed. As here, the difficulty of having iron ploughs repaired has stood in the way of their extended use. We do not read that objection was raised to the weight of the plough, but the cattle in India are of a larger and stronger breed than ours. The paragraphs on cattle-breeding and veterinary establishments are of interest, and suggest the need of some organized experiments here under Government auspices. We may revert to this subject again.

ARECANUT AS A VERMIFUGE.

It is well known fact that the arecanut contain a fluid and volatile alkaloid, Arecolin, closely allied to Pelletierin, the alkaloid contained in the bark of the pomegranate root, but much more poisonous than the latter. The arecanut has been introduced into veterinary practice in Germany over 12 years ago; but I am sorry I am unable to give you the doses used. No doubt they are carefully proportioned to the weight of the animal to be treated. I find that it has also been used in the human subject to expel tape worm, in doses from 60 to 90 grains for an adult. I do not however recommend its use, as it is highly poisonous, causing some peculiar and disagreeable symptoms, such as increased action of the bowels and violent diarrhoea, salivation and bronchitis, contraction of the pupils and a very irritable condition of the heart.

Death results from an overdose, as in the case of Mr. Brown's dog.
M. DJ

TEA AND CAMPHOR IN FORMOSA.

In the *Scottish Geographical Magazine* for Nov. 1895 is an article on Formosa by John Dodd, being the abstract of a paper read at the meeting of the British Association, 1895. From it we make the following extracts:—

I may as well describe here how the Hakkas and others manufacture camphor. Small shanties are scattered over the hills where the camphor-trees grow, and in all directions the clearing of the woods is going on at a rapid rate. Some trees are cut up for camphor-making, others are sawn into planks and knees for the building of junks and boats of all descriptions. Fine specimens of camphor wood, ten feet and more in width and several inches thick, are sent down to the coast, though to facilitate transport they are often cut down considerably before they arrive at the port of shipment. Other timber is also exported, such as the *siao lam*, a beautiful wood nearly as light as maple, and suitable for furniture. There are also hard woods and black wood as

heavy as metal: at least seventy species of timber have been collected. On the hillsides are built distilleries consisting of oblong-shaped structures principally of mud bricks, and about ten or twelve feet long, six feet broad and four high. On each side are five to ten fire-holes about a foot apart and the same distance above the ground. On each fire-hole is placed an earthen pot full of water, and above it a cylindrical tube, about a foot in diameter and two feet high, passes up through the structure and appears above it. The tube is capped by a large inverted jar, with a packing of damp hemp between the jar and cylinder to prevent the escape of steam. The cylinder is filled with chips of wood about the size of the little finger, which rest on a perforated lid covering the jar of water, so that when the steam rises it passes up to the inverted jar, or condenser, absorbing certain resinous matter from the wood on its way. Whilst distillation is going on, an essential oil is produced, and is found mixed with the water on the inside of the jar. When the jar is removed the beady drops solidify, crystallisation commences, and camphor in a crude form, looking like newly-formed snow, is detached by the hand, placed in baskets lined with plantain leaves, and hurried off to the nearest border town for sale.

Tea is now by far the most important article of export, though camphor is still in demand. Other articles, such as coal, pith paper, skins, rattans, hemp, sugar, and indigo find their way to the mainland, and a good deal of timber, camphor and hardwood is also exported.

Coal is the principal export of Kelung. The trade has had many ups and downs, caused by the obstructions placed by the authorities in the way of foreign trade. The coal seams in the neighbourhood of Kelung and in the northern hills as far as the centre of the island are practically inexhaustible. There are also less important imports, such as kerosene oil, wood for tea-chests, and pigs of lead to line them, and, when the Japanese have put things in order and the country has been more thoroughly explored, no doubt many other articles adapted for export will be found. With regard to camphor, as in other commercial matters, the Chinese Government has acted very foolishly. For over thirty years to my knowledge there has been a constant demand for camphor, and yet the administration has done nothing to prevent the reckless waste of the forests and taken no steps to provide for the re-forestation of uninhabited tracts useless for cultivation. True, as far as I have explored the mountains of the interior, camphor-trees seem to be exceedingly numerous, and there is at present no fear that the supply will run short for many years to come. But the increased demand for camphor in these days of smokeless powder may hasten the destruction of the trees, and therefore it is to be hoped that the Japanese will assure the supply in the future by planting saplings on waste lands. I planted a lot in my garden in 1869, and when I left in 1890 they were trees thirty to forty feet high and upwards. From this experiment I conclude that trees fifty years old would be large enough for all ordinary purposes to which the timber is applied. As for camphor, it may be extracted from leaves and twigs, so that comparatively young forests will yield material for the industry.

While exploring the camphor districts in 1865, I came across cinnamon and wild tea plants, the latter being ten or twelve feet high. I got down a fair amount of cinnamon to the coast, but found that the expense of sorting the outer and inner barks and packing them for shipment to England was too great. With tea I was more successful. On making inquiries I found that between Kelung and Banka, and to the south-west of the latter town, small patches of tea were cultivated in the gardens of farmers, but that it was grown principally for home consumption. All the tea I could get I bought up, and finding that it fetched a good price in Macao, I at once made loans to the farmers, through my *compradore*, for the purpose of extending the cultivation, and also imported slips of the tea plants from Amoy. I then started firing on a small scale at Banka, and afterwards took larger premises at Twa-tu-tia. In the

course of three or four years, Formosan teas acquired a reputation in America, and before the end of the sixties I had dispatched in one year two sailing vessels to America, one with a full cargo and the other nearly full. Others followed my example, and the exports increased by bounds year after year. The Amoy and Fuchow merchants were not at first in favour of Tamsui becoming a tea-port, but before long they began to join in the Formosan tea-trade, and now nearly all the tea is sent to Amoy for sale, and the merchants there have done much to enlarge the yield by heavy advances to the planters. I have no statistics showing what is the present quantity of tea exported from Tamsui, but I should say that it is certainly not less than 500,000 chests, equal to about 20,000,000 pounds. The hills and soil of North Formosa are excellently adapted for tea-growing, and, indeed, for almost any crop.

INDIAN PATENTS.

For a method of rendering tea leaf pliable for purposes of rolling or twisting without resort to natural or artificial withering.—No. 8 of 1891.—Horace Drummond Deane, of Kintyre estate, Maskeliya, Ceylon, planter, and John Thomson Race, of Hatton, Ceylon Engineer, and thus preventing all fermentation and oxidization by the application of steam to freshly plucked tea leaf, and of an apparatus for applying steam to freshly plucked tea leaf. (From 5th January 1896 to 4th January 1897.)—*Indian and Eastern Engineer*, Jan. 18.

DRUG REPORT.

(From the *Chemist and Druggist*.)

London, January 2nd.

NIX VOMICA.—The new crop of this drug is now arriving at the Indian shipping ports. It is said that it is so wet as to be unfit for shipment at present.

ESSENTIAL OILS.—Without material alteration. For Citronella oil it is reported that is 10d per lb, c i f terms, is asked for present shipment while is 8d per lb, c i f is quoted for shipment end of May. On the spot the price is 2s per lb. Lemon-grass oil, 2½d to 2½d per lb on the spot.

QUININE.—Has been extremely quiet this week, and no wholesale transactions have become known. Second-hand German in bulk is quoted at 13½d per oz. at which figure here would be sellers.

THE NUWARA ELIYA TEA ESTATES COMPANY.

The formation and operations of the Nuwara Eliya Tea Estates Co. mark a new departure in the history of Ceylon Plantation Companies and an important era in the Tea-planting Enterprise of the Colony. A good many years ago, Mr. Arthur Thompson, of the well-known Mining Lane Firm, while visiting Ceylon, made it clear that the tea estates in and around Nuwara Eliya, at an elevation of 6,000 feet and upwards above sea-level, stood on a basis of their own, apart, it might be said, from all other plantations in the island. Their teas were peculiarly *sui generis* for delicacy and flavour, and Mr. Thompson could only compare them with the fine "Darjilings" which always top the Indian tea market and of which the quantity producible is, and always must be, very limited. The same is absolutely true in the case of Ceylon in regard to the quantity that can ever be sent into the market of the specially delicate-flavoured teas of the Sanatorium and Kandapola. For, even if the Ceylon Government were permitted to utilize some of the Crown land over 5,000 feet for tea gardens, the area over 6,000 feet that could possibly be alienated for cultivation would be extremely limited; and it may be said there never can be such another stretch of tea in Ceylon at a similar

elevation as that below the Pidurutalagala range from Lover's Leap and Pedro eastwards and on the outlying spur of the Sanatarium. This being the case it will be readily understood that the Nuwara Eliya Tea Estates Co., in securing 1,520 acres of the very tea fields we are describing and in a continuous, almost unbroken area, has secured a uniquely valuable tea plantation property—unequaled perhaps, acre for acre, if quality as well as quantity produced is taken into account, anywhere else in India or Ceylon. For, it must be remembered, that not only is the climate of the Sanatarium and neighbourhood favourable to the production of the finest, most delicate teas, but the soil—deep black, friable loam—and the lay of the land, undulating easy slopes or flat plateaux can nowhere else be paralleled at least in this island. We suppose Pedro (sold to the Company by Capt. Bayley) is, acre for acre, certainly the richest tea garden in Ceylon when its producing capabilities up to 600 lb. per acre as well as quality of tea are considered, and Pedro as well as several other properties purchased have the immense advantage of lying under the Pidurutalagala range or spurs, a large portion under cliffs from which a perennial supply of fresh soil, equal to the best and most enduring manure, must trickle down, season by season, on to the slopes and flats below. Then in careful opening of the land, selection of jât, planting and cultivation, the tea properties purchased by the Company will compare with any that we know of, in our best cultivated districts. We need say nothing of the special salubrity of the district both for Europeans and coolies very near as it is to one of the finest climates in the world. Nor is the district behind in its popularity with coolies who develop bigness and strength unknown lower down, and who are specially proud of their vegetable garden privileges when these are made available. In transport facilities too, the district is specially favoured with a first-class road to the first-class railway at Nanuoya and the prospect of the first mountain road tramway in Ceylon being constructed from Nanuoya to Kandapola, passing right through the Company's estates. But these and several other advantages of a similar kind are not to be mentioned in the same breath with the superiority of the teas produced, the wonderfully heavy crops considering the standard of flavour and the fact that it is physically impossible—so far as we can judge—in either India or Ceylon to produce a superabundance of such teas. The demand rather must continue in excess of the supply, always ensuring a high standard of value for Nuwara Eliya and Kandapola teas.

Is it any wonder then that the capable London promoters and Directors of the Company which has secured the name of the Sanatarium, acting on the advice of a planter of the exceptional shrewdness of Mr. Megginson and an agency house with the long and varied experience of Messrs. Lechman & Co., should have determined to secure the group of continuous properties above referred to, even at prices hitherto unknown in the island? Allowing a fair value for the very fine land that is to be opened for tea forthwith and for the brickfields, bazaars &c., the price paid for the area planted with tea, averages £85 per acre. We think that everyone who realizes the unique position and value of the estates will consider this price most reasonable. Should the fine fuel reserves become exhausted after many years there will always be the large Crown reserves which border on all the proper-

ties to fall back on and this is an advantage of considerable importance for the future. We may be sure that the shrewd men of business here and at home, working for the Company, have well considered all the bearings and contingencies of the case; and we can only, for ourselves, congratulate the shareholders on securing the very finest selection of tea estates in Ceylon—unequaled too, as we omitted to say above, for the means of economical working, through their contiguity, easy lay of land and the fact of the main road running right through them. No matter what the future of the tea market generally may be, we truly believe that the Nuwara Eliya Estates Company will be one of the most solidly and permanently successful Companies connected with tea either here or in India—paying, it may be, not phenomenal dividends, but a steady good rate for a long series of years to come—indeed as long as a tea tree produces profitably anywhere in the island.

It only remains for us now to place on record an authentic statement of the Company's Estates purchased up to date with their names, cultivated and total acreage as follows:—

	Tea. land available for Tea.	Heavy Forest-serve and Patana.	Forest Reserve and Patana.	Total Acres.
Park ..	237	—	12	249
Concordia ..	180	—	8	188
Pedro ..	305	45	24	374
Portswood ..	300	70	92	512
Lover's Leap ..	138	5	7	150
Kennare ..	170	30	32	232
Naseby ..	100	—	13	113
	1,430	200	188	1,818
8 years' lease of Fairyland and Hazelwood ..	90	—	20	110
	1,520	200	208	1,928

Besides those for the superintendents there are excellent residential bungalows on Pedro and Portswood. Brick-making is carried on very profitably on the patana swamps of three of the estates. There are a few bazaars and there is demand for many more on the miles of Government road running through the properties. The total purchase price including the leases amounts to £129,800. We learn that last year's yield from the whole of the tea in full bearing was 460 lb. tea per acre which is a yield far above the average of the Island. The called up capital of the Company is £115,000 in ordinary shares and £23,000 of 6 per cent debentures and provides for opening up the reserve land and furnishing the factories to take in the increased crops expected. The Company is hopeful of obtaining a stock exchange quotation which would add greatly to the value of the shares as an investment. Nonpareil in West Haputale purchased with Pedro, we may mention, is to be handed over to another Company—so that the Nuwara Eliya Tea Estates Company will be true to its name. Long may it maintain the reputation of Ceylon for fine, delicate high-priced teas always so much in demand.

THE COCCIDÆ OF CEYLON.

BY E. ERNEST GREEN, F.E.S.

We have received a prospectus of the above-named work, which is described as follows:—

A Descriptive Catalogue of all the Species of Scale Insects at present recognised in Ceylon, including several New Genera and numerous New Species, illustrated by about 120 plates, chromolithographed in the finest style by P. W. M. Trap

of Leiden, from drawings made by the Author direct from nature.

To be published in Four Parts, each, containing Thirty Coloured Plates and about Sixty Pages of Letterpress (octavo).

The subscription price for the complete work is Five Pounds (£5), payable in advance, in one sum, or by 4 instalments of £1 5s each.

From a specimen plate, and page of letterpress, issued with this prospectus, we judge that it will be a work of much value as well as interest, Mr. Green being a careful observer and a facile artist. With the prospectus is circulated the following letter:—

To Messrs. Dulau & Co.—Having been informed that you are contemplating the publication of a work on *The Coccida of Ceylon*, by Mr. F. E. Green, we desire to point out that what is known of the distribution of this cosmopolitan group justifies the belief that many of the new species from Ceylon described by Mr. Green will prove, as inquiry advances, to be world-wide. The literature connected with this important group of insects is at present of a very scattered and fragmentary nature, and the creatures are not easily recognised from descriptions.

Having regard to this—to the economic interest of Mr. Green's investigation—to the fact that wherever possible he has recorded the leading stages in the life-history of the creatures, and that in all cases his delineations and descriptions are from materials studied in life—we have much pleasure in recommending the work to the consideration of subscribers, believing that a treatise like this, in which a great variety of forms will be figured with very numerous details, will be of great assistance to gardeners and to naturalists generally, and of considerable value to those engaged in economic entomology or in the management of plantations in any part of the world, as well as to systematic entomologists and morphologists.

R. McLachlan, F.R.S.; R. Meldola, F.R.S., F.E.S.; Newstead, F.E.S.; D. Sharp, M.D., F.R.S.; C. Swinhoe, B.A., F.E.S.; Walsingham, M.A., LL.D., F.R.S.; G. B. Howes, Sec. L.S.

London, Dec. 1895.

From a private letter of Mr. Green's to us we venture to extract as follows:—

I have received most kind encouragement from some of the leading English Entomologists to whom I have submitted my drawings and notes. A few of them were good enough to form themselves into a committee to support and push the publication of the work. With this view they have allowed me to circulate the letter which I enclose with the prospectus. They also very kindly applied for a grant from the British Association at its meeting at Ipswich in September last; but earlier and more important claims absorbed the funds at their disposal. Another application is to be made at the next session this year.

My work will consist of a natural history of all the scale insects (coccida) of Ceylon; describing and figuring not only those species that have made themselves conspicuous as specially injurious insects, but every member of the family—many of them at present of no economic importance, though under special circumstances liable at any time to increase and multiply as suddenly as did the "green scale-bug" on coffee.

It is interesting to note how widely distributed many of these insects are. My list will include some species that have been recorded from America, Europe, India, Japan, Australia and New Zealand. In walking through the plant houses at Kew last week I noticed two species—attacking Bamboo and Kintl Palm (*Caryota urens*) respectively—which are identical with species found on the same plants in Ceylon. To show how easily scale insects may be imported from one country to another I may mention that I have found upon Tasmanian apples sold in Colombo living specimens of the "mussel-shaped scale"

(*Mytilaspis pomonum*). And more recently, upon oranges brought in a village shop in England, I have found living and breeding specimens of an important American pest (*Parlatoria perquandii*).

The demand for specialized work of this kind is so limited and the cost of production so great that I am compelled to put a high price upon the book. But when you take into consideration the fact that it will contain between 120 and 150 chromolithographed plates the cost will not appear excessive. I am bringing out an edition of 250 copies only; but I am warned that I cannot hope to dispose of more than half that number. My publishers estimate the total cost of production at £1,000; so I am bound to drop money over the business unless I receive assistance from the Ceylon Government.

We certainly hope that such assistance will be given by our Government; and we think the Planters' Association might also give a grant in aid of Mr. Green's work, which cannot fail to be of use to the Planters of Ceylon.

TEA IN RUSSIA.

You will be interested in the following quotation of a paragraph appearing in the leading journal. The subject is one with which we may expect Mr. Rogivue will feel much concern, as it is evidently in contemplation to extend the cultivation of tea in Russia on a large scale. It may be concluded from the information given that Russia is desirous of making herself independent of any foreign supplies of tea. We do not recollect to have heard of the expedition which is said to have studied the subject of tea culture abroad included Ceylon among the countries visited. It seems going rather far afield to have studied the system of tea planting pursued in California, where the enterprise cannot but be as yet in its infancy.

TEA CULTURE IN THE TRANS-CAUCASUS.—The Consular report on the agriculture of the district of Batum, just issued, contains some interesting remarks concerning the cultivation of tea along the south-eastern corner of the Black Sea littoral. The experiments made during the last few years appear to have disclosed certain conditions which promise a great future for the industry. The soil, more especially in the hilly country round Batum, and the climate are said to be eminently suitable. A number of proprietors have acquired land for planting, among them the Imperial Domains Department, which has in addition sent a special expedition of inquiry to tea-growing countries. This expedition has already completed its tour through India, China, and Japan. In China it procured seeds and plants and machinery, as well as staying an entire month in a village near Shanghai to study the preparation of tea. In Japan, likewise, the expedition collected samples of tea plants and seedlings; and it is intended to engage Japanese labourers. Some of the members of the expedition are studying the American system of culture near San Francisco. The report concludes this part of its observations with the remark that, if tea is ever cultivated in the Trans-Caucasus in quantities which would enable Russia to profitably compete with China and other countries for the supply of her home markets, the bulk of such tea would have to be grown in the district of Batum.—*London Cor.*

TEA IN AMERICA.

NEW YORK, Dec. 25, 1895.

It has been a very slow week with tea dealers. The market is unchanged in any particular. Buyers have the advantage on everything but Formosa. No auction sale this week, which emphasises the dull condition of the market.—*American Grocer* Dec. 25.

PLANTING AND PRODUCE.
