

COMMENCED IN 1881.

"Step after step the ladder is ascended."—George Herbert, *Jacula Prudentum*.

THE TROPICAL AGRICULTURIST.

A MONTHLY RECORD OF INFORMATION FOR PLANTERS

OF

TEA, CACAO, COFFEE, CINCHONA, PALMS, SUGAR, COTTON,
TOBACCO, SPICES, CAMPHOR, RUBBER, RICE,

AND OTHER PRODUCTS SUITED FOR CULTIVATION IN THE TROPICS.

EDITED BY

J. FERGUSON,

of the "*Ceylon Observer*," &c.

"It is both the duty and interest of every owner and cultivator of the soil to study the best means of rendering that soil subservient to his own and the general wants of the community; and he who introduces, beneficially, a new and useful *Seed, Plant* or *Shrub* into his district, as a blessing and an honour to his country."—SIR J. SINCLAIR.

VOL. XV.

[Containing Numbers I. to XII. : July 1895 to June 1896.]

Colombo, Ceylon :

A. M. & J. FERGUSON.

LONDON :

JOHN HADDON & Co.: KEGAN PAUL, TRENCH, TRÜBNER & Co., LTD.; LUZAC & Co.: &c.

BOMBAY : THACKER & Co., LTD.—AUSTRALIAN COLONIES : GORDON & GOTCH.

MDCCCXCVI.

TO OUR READERS.

In closing the Fifteenth Volume of the "**Tropical Agriculturist**," we would as usual direct attention to the large amount of useful information afforded and to the great variety of topics treated in the several numbers. From month to month, we have endeavoured to embody in these pages the latest results of practical experience and scientific teaching in all that concerns tropical agriculture; and our ambition has been to make our periodical not only indispensable to the planter, but of service to business men and capitalists, never forgetting that agriculture trenches upon every department of human knowledge, besides being the basis of personal and communal wealth.

While directing our attention chiefly to the products prominently mentioned on our title-page, we have always taken care to notice minor industries likely to fit in with sub-tropical conditions: and our readers have an ample guarantee in the pages before them, that, in the future, no pains will be spared to bring together all available information both from the West and East, the same being examined in the light of the teachings of common sense as well as of prolonged tropical experience in this, the leading Crown and Planting Colony of the British Empire.

Special attention has, during the past year, been given to the extension of the fibre industry (rhea, sisal, &c.), coffee and other products in Nyassaland, British Central Africa; Liberian coffee and other products in Deli, Sumatra, the Straits Settlements; and to other new developments in coffee &c. in the Malayan Peninsula and North Borneo.

The Tea-planting Industry has sprung into so much importance in India and Ceylon, that a considerable amount of space is naturally given to this great staple; and we think it will be admitted by impartial judges that the *Tropical Agriculturist* should be filed, for ready reference, in every Tea Factory in this Island and India.

A full and accurate Index affords the means of ready reference to every subject treated in this, the fifteenth volume, which we now place in our subscribers' hands, in the full confidence that it will be received with an amount of approval, at least equal to that which has been so kindly extended to its predecessors.

We are convinced that no more suitable or useful gift can be made to the tropical planter or agriculturist, whether he be about to enter on his career, or with many years of experience behind him, than the fifteen volumes of our periodical which we have now made available. They are full of information bearing on every department and relating to nearly every product within the scope of sub-tropical industries.

In conclusion, we have to tender our thanks to readers and contributors, and our wish that all friends may continue to write instructively and to read with approval; for then, indeed, must the "**Tropical Agriculturist**" continue to do well.

J. FERGUSON.

COLOMBO, CEYLON; 1ST JULY 1896.

COLOMBO, JULY 1ST, 1895.

[No. 1.

FLOWER-FARMING IN AUSTRALIA.

WHAT AUSTRALIAN FARMERS, MANUFACTURING CHEMISTS AND HORTICULTURISTS ARE DOING IN THIS DIRECTION.—A LUCRATIVE INDUSTRY.—LITTLE OUTLAY AND QUICK RETURNS.

(By W. LODIAN, MELBOURNE.)

THE present paper is intended only as an introduction to the subject,—to afford a brief view of the art of perfumery-making. It would be impossible to do otherwise in a short 'comploté' article like this. Scent-making already has a big standard

literature and all who wish for more information, will get a surfeit of it in any public Library.

Our own people require such information on this subject. Why should we not produce our own perfumery?

'It is easier to make perfumery than make butter,' has often been written, but this fact is little known. Very trifling capital is required; the seeds or graftings are supplied free to Australian citizens by the Government experiment flower-farm at Dunolly, with printed instructions; and a lot of literature on the subject can be had on application to the Department of Agriculture, Melbourne.

A FEW PERFUMERY 'PAINTERS':

Never grow plots of flowers too close together. Reason: If you group various kinds of scent plants too close to each other—as lavender and pennyroyal next door—each one will become tainted one with the other, and the virgin aroma of each will be confused, and the distilling will not improve them. An acre of roses or jasmine, for instance, should be separated by, say, an acre of potatoes or

cabbages, or whatever you like to grow in the way of edibles.

The plants are all arranged in rows running due North and South, so as to get the greatest and longest benefit from the sunshine. On the influence of the sun, consists, in a large way, the superiority of the oil extracted.

For every perfume, a separate still is not entirely required, as by a simple dose of sulphuric or oil of vitriol (1 part to 20 of water,) the still is properly cleansed. A 20-gallon still costs £5; one of 50-gallons, £30; and one of 300 gallons, £80. To begin with, a flower grower in a small way finds a 20-gallon still ample.

What flowers does it pay best to grow? The answer is: Boronia (the native perfume plant of Australia) tube-rose, jonquil, acacia, rose, jasmine, orange-blossom, lavender and peppermint. All now command a market both at home and abroad.

As you go along, read up all the modern literature concerning perfumery.

HOW THE DISTILLING IS DONE:

The spaco below the falls bottom of the still is occupied by water, and a few pounds of salt or alum is dissolved therein to increase its boiling-point. The tank is now filled with the desired flowers, and the funnel-shaped steam-lid is held in place by being screwed down and the crevice packed round with clay just damp. A quick fire is ignited under the still, causing vapour, which, percolating through the flowers laying in the falls bottom, releases the attar; and steam and oil go jointly up the funnel and wind their way through the condensing corkscrew-shaped pipe. A stream of cold water running into the tub (or ice could be used) helps to condense the steam and oil, which flow into a glass jug or vase. The oil is seen floating on the top, and is skinned off by a spatula or black ivory paper-knife,—or sucked off the water by a pipette (glass pipe),—a crystal tube having a bulb about three inches from one extremity. The distiller places one end in his mouth and, lightly touching the little floating filaments of essential with the other, draws them into the bulb.

If the identical distilled water is employed several times over, it increases the output of oil. The temperature of the steam must not be too great, or the essential oil is liable to be injured. Time: about three hours. The falls bottom containing the stewed leaves is hoisted out and the mashed mass is used as a fertiliser.

SOME OF THE ELEMENTS OF SUCCESS:

When laying out a flower farm for the manufacture of perfumery, it must be borne in mind that one important rôle to financial success is the means to obtain low-priced labor,—such as women's and children's help, who can do the work quite as well as the higher-priced male. It would not do at all to pay 5s. to 6s. a day to men to collect roses or jasmine flowers. It is also an error to attempt to cultivate too many species of perfume flowers. Select only those which are peculiarly suited to your earth and position, and adapted to affairs climatological. A well-established truth it is that these conditions enhance considerably the value of the outputs of various flowers.

No: it won't pay in flower-farming to employ the labor of men (except in the more technical features) when boy and girl labor can be utilized and the work done just as well. One of the open secrets of the success of the Southern French is that they have always utilised the labor of the young—and even old women—in picking flowers, because they do it quicker and better and cheaper than men.

Make flower-growing serve your ends by using it as a staff,—not as a crutch. Thus,—never entirely rely upon it for a living. Run it along with something else. If you have a family of children whose work you can have, you are pretty certain to be successful.

WHAT IT DOES NOT PAY TO CULTIVATE:

The perfume-making business of the present time is not what it was like in times gone by, and this data about it in different encyclopedias is almost quite out-of-date. The progress of the science of chemistry has been so quick in recent years, that many aromas hitherto taken from flowers, are now manufactured by chemical combinations and adult rations, by manufacturing druggists. Examples: the fragrance of the simple violet, and its notable modest odor, is now gotten by chemical process. Attempts have even been made to obtain it from the urine of diabetic patients. The flower heliotrope has lost its fame as a commercial perfume plant: chemists have learned how to turn out from other sources an artificial article which is an exact substitute,—the product quite surpassing—it is given out (in quality, consistency, and likeability, to the real thing of nature)—the odor forced from the flower itself. Even the household lilac has not been permitted to retain the exclusive privilege of its aroma-breathing characteristics; for the man of the pestle and mortar obtains its chemicals,—chiefly these artificial scents are obtained, synthetically, from vetiver coal-tar. Don't be alarmed by the progress of science. Many secrets there are, which chemists cannot imitate.

PROCESSES EXTRACTION:

Besides distilling, there are four methods for extracting scents from flowers. They are: expression, maceration, absorption, and the methyl-chloride process. Expression is only adopted where the substance treated is very liberal in its native or essential oil, such as the peel of the orange or citron. By maceration is meant the placing of the flowers in fat made liquid (just warm); allowed to remain therein about three days (no need to keep it warm), and then warmed sufficiently to allow the fat to drain from the exhausted flowers, and, after squeezing out what fat remains with these, they are thrown on to the fertilising heap. Fresh flowers are added to the fat (the absorbing qualities of which are well-known), and after 8 or 9 such changes, the fat is found sufficiently perfumed. It is then treated with alcohol, and yields its perfume to that agent, which becomes the perfume article of commerce. The fat, if properly cleaned, can be used over and over again. The heat of maceration, however, is rather injurious to the delicacy of the perfume.

The absorption process (usually known by the French name of *enfleurage*) consists in the flowers being laid on frames of cold fat, which is subsequently treated as in maceration. Cotton rags soaked in olive oil are also used, then the oil squeezed out and treated. The methyl-chloride process is a chemical treatment to be best studied in text-books and considered;—the distillation process is best,—but study all the law before building a still.

ATTAR OF ROSES.

Nature has many flowers. Gold is heavy, but roses are not, yet the essential oil of roses is worth more than gold—weight for weight. Of all botanical growths, the otto (same as attar) of roses finds the readiest market. It is always in demand. Like the most precious of auriferous metals,—too much cannot be obtained. In a fairly prosperous year, 300 pounds' weight of roses will yield 1 ounce of attar, or oil, and a lot of fragrant and saleable rose-water. The petals are placed in a still, the vapor volatises the attar, and both steam and oil ascend, wind their way through the spiral condenser, and pass out of the other extremity into the receiving base.

The correct kinds of rose to grow are the centifolia, or chou, rose (rarely seen Antipodes-wards), and the rose of France,—also called rose de Grasse after the celebrated flower and perfume-producing region of France,—a place twice visited by the present writer, in 1891 and 1892. An acre of land under first-class cultivation will yield at least 1,500 pounds of rose-petals; and this will give 5 ounces of attar, worth from 35s. to 47s. each ounce; and there will also be some 100 gallons of rose-water, valued at 3s. to 4s. per gallon.

The roses are best put into the still while quite fresh and crisp—the gathering taking place in the morning after the dew has disappeared. If it is desired to keep them 24 hours before use, sprinkle them with fine salt, to retain their fragrance.

WHAT THE PERFUME STILL IS LIKE:

This is a very simple arrangement. Any intelligent person—whether a mechanic or not—can construct one with the partial aid of a blacksmith. A roughly-made, plant consists as follows: A metallic tank of about 100 gallons' capacity, the interior fixed with a holed false bottom about 9 inches from the base, and set in brickwork (although this is not absolutely necessary), with a fire-retort under. A funnel about 1 foot diam., at its greatest extent, with a river to enter and a flange to support it, is fitted like a saucepan-lid over a similar hole in the head of the tank. A pipe of 2 inches diam., a continuation of the funnel, continues like a spiral worm around the interior woodwork of a barrel filled with cold water,—the end emanating near the base, like a faucet. Thus the apparatus is complete.

Steaming or distillation of flowers is the method employed in the fabrication of neroli, rose, lavender, etc., oils; also of various other growths. The work of distilling is quite simple; and never necessitates any great degree of experience.—i.e., the fat and the oil methods,—both quite easy to learn.

But the greatest art in perfumery consists in adulteration,—the knowledge how to blend cheap with valuable essentials. It requires years of learning, and is a professional secret. Like painting, it is not easily learnt. But the grower does not need these secrets. Those are for the manufacturing chemist.

SOME RESULTS PER ACRE:

The bitter-orange blossom will yield 80 oz., of essential oil per acre, which at 15s., to £1 per oz., means £60 to £80 per acre. The acre of jasmine will bring in £20 to £30. Roses from £70 to £90 per acre (the attar is exceedingly limited, or probably the sum per acre would be higher). The oz., is worth from £2 to £3, even the prolific oil-producing true lavender, brings 60s., per pound. Peppermint yields up to 30 pounds of oil per acre, which at 30s., per pound, means a return of £45 per acre. And so on with the other essential oils, all of which are most valuable. Compare the figures, ye struggling farmers, with your present low returns for growing corn or market produce. Study the

perfume market, form rings for keeping up prices, and place your trust in—roses, the attar of which is never likely to be over-produced.

A FEW FIGURES ABOUT OTHER COUNTRIES :

Last year in France, Grasse district alone produced 2,000 tons of orange blossoms, 1,500 tons of roses, 220 tons violets (cheap labor and abundance defies chemical competition,) 200 tons jasmine, 88 tons tube-rose, 38 tons jonquil, 33 tons acacia, 22 tons mignonet. One factory there, by itself uses 50 tons acacia (buying up the flowers from neighbouring regions,) 70 tons roses, 16 tons jasmine and 10 tons tube-rose. There are 50 distillations in Grasse (a town of 11,000) some employing 200 han's in season.

A TOUR THROUGH NORTH AND SOUTH WYNAAD.

A GLORIOUS COUNTRY—ABANDONED COFFEE—HEAVY YIELD—TEA CULTIVATION—OPENING FOR CEYLON MEN—SPORTS TO BE HAD.

Probably a few notes from this glorious country will interest some of the friends I have left in your little island, which, with its many charms, cannot be compared with this luxuriantly productive land of Southern India. It seems to me extraordinary that the planters of Ceylon should emigrate to the distant Straits and even to Africa for "pastures new," owing to its over-population in the matter of planting. There, when a prolific country like this adjoins the Island!

I started from the Kasselas estate for Manantoddy (about 5 miles distant) at 5 o'clock a.m. en route to Vythery, not long ago, passing many acres of abandoned coffee-land abandoned in 1867 through the collapse of the cotton market, most of the then owners of the estate's being Bombay merchants, who were more heavily involved in "cotton" than "coffee"; consequently the latter had to give way to the former. It is a sad sight to see poor "King Coffee," planted 25 years ago, or more, struggling (yet cropping) through the heavy luxuriant overgrowth of secondary jungle and lantana. Out of the many estates that once flourished and used to yield 15 cwt. per acre (and special ones over a ton) there are only two left in Manantoddy, viz., the "Brummagherries" and the Kasselas. The former is situated on the borders of Coorg, and, from what I saw of it, it promises to keep "King Coffee" to the fore, though it suffers severely from "borer." On the Kasselas estate, which is out of the range of this terrible scourge, I saw coffee that takes one back to the good old times of '72, some of the fields even outshining those palmy days of a ton per acre. On one occasion, during a morning stroll with my wife on the Kasselas estate, I stripped a lovely coffee tree to prove what a good one could do in the matter of yield. We were both delighted and surprised at the result—a little over *six Mysore seers*!!! Taking 28 Mysore seers to a bushel, I leave it to your readers to work out the result per acre, planted 6x6, as such trees could not possibly grow closer. It may have been an exceptional one, but it had not been pruned or cultivated for years, though topped and kept free of "suckers"; it, however, grew out of the stone foundation of a set of old coolies' lines, and had been picked over once before I stripped and measured the result.

Manantoddy—which I reached about 7 a.m.—is an exceedingly nice little town, possessing a club, hospital, travellers' bungalow, post office, two churches—a charmingly laid out burial-ground, the prettiest I have seen for a long time—golf links, and a boating club, a European private medical practitioner, and shops—in fact has everything as convenient as at Nuwara Eliya. The climate also is delightful, but *one* thing it lacks (and in a worldly sense it is *very* much "the one thing needful") and that is money! Everything is almost in a stage of stagnation for want of it, and were it not for Messrs. Arbutnot & Co. of Madras, and an old resident planter, coffee in this district would be extinct. But its capabilities are second to none

in the world, as far as planting is concerned, *Anything*, I firmly believe, would grow and flourish in such a fertile district. I must not forget to say I had the pleasure, too, of shooting 18 and a half couple of snipe as I strolled along. I started the following morning for Vythery, passing through magnificent land—thousands of acres of both "virgin forest" and bamboo land, and not an acre of which, if planted with tea, could, with such excellent soil and climate, produce less than 1,200 lbs. per acre, which would fetch from 8d. to 1s. per lb. if only proper jats and decent elevations were brought into force. Before reaching the hospitable abode of Perengodda estate, the proprietor of which took me over the Belliapara estate, I saw there tea trees over 30 feet high and 4 feet in circumference. (Indigenous Assam.)

These, though utterly abandoned and struggling to grow in heavy secondary jungle, were in a most healthy and luxuriant condition, and seeding freely. I also saw a clearing of about 10 acres from the progeny of these trees, only 2 years old, which would make the heart of any Ceylon planter rejoice!

I believe Wynaad consists of about sixteen hundred square miles. I have in my time travelled from the Neilgherries, Mysore, and the Coorg Frontier through the whole of Wynaad, which consists of three distinct districts, hundreds of miles apart, viz.: *North*, which consists of Manantoddy, Dindimul, Brummagherries, and Keria. *South*,—Vythery, Cullputty, Sultan's Battery, Maypadie, Cherambody, and Terriote, (these can boast of a "Public Hall," Race Course, Post, Telegraph, Police, and Civil Offices, as well as a fine Hospital). *South East*.—Goodalur, Dava'ah, and Pundalur—not a district of which would not grow and produce far better coffee, tea, cocoa, or any other produce than "the spicy little Island" can, if run with a little capital.

The "Pelrendotty" tea estate is the only one making an apology for tea in the South, but the method adopted here, both of the cultivation and manufacture of the leaf, is so very primitive, that it cannot honestly be held as a criterion of what Wynaad *could* produce in the way of the "cup that cheers but not inebriates!" I believe the average yield of this estate is about 900 lb. per acre, but, when one takes into consideration that every acre has from 50 to 60 per cent. failures, twelve to fifteen hundred lb. per acre is honestly nearer the mark of what it should do, and this without manure, proper pruning, or plucking. The so-called "Factory" of the estate is an old cramped shed, that no one in Ceylon would dream of utilising for anything but a tool store. It has only within the last few months gone in for a "Sirocco," and three second-hand "Little Giants," and these must evidently have been the first three manufactured after the invention of the "Roller." The place is perfectly innocent of any other machinery, not even a roll-breaker. Sifting by hand, and sorting and packing, are all done in the same cramped room, and all at one and the same time as the process of rolling, fermenting, and firing are going on; and yet it seems a marvel to some people that this estate's tea only fetches 4½d. per lb.!!!

However, the Panora Company are now going in for tea in a practical manner, and it does its manager credit for the way in which he has opened and planted up about 200 acres (and still extending). This is about two years' growth, and its luxuriance is simply marvellous, and is only beaten by the Cootacovil estate belonging to the Wynaad Tea Company, where they have a field of tea of the same age. On Panora I met an old Ceylon planter who has just taken up the berth of tea-maker, and on his first entering the clearing he was so struck with its wonderful growth that he could scarcely gasp forth the expression "magnificent!" "wonderful!!" "is this not a dream?"!!! He is so charmed by what he has seen that he intends to open for himself next season what is left in the south. Land can be had both in north and south Wynaad at from R20 to R50 per acre, every inch of which surpasses the best land in Ceylon, and all sorts of climates similar to Kandapolla and other places;

and its principal advantage is that it has a winter! Besides all Wynaad's many advantages it affords "Jack" good sport and so saves his being the proverbial "dull boy" that only work might make him! It has game and fowl of all descriptions, and the "Brunnagherries" is the most charming spot in addition to its sporting advantages —A.—Local "Times"

PRODUCTS OLD AND NEW IN THE NIGER COAST, WEST AFRICA.

(By Mr. Billington, Curator, Botanic Station.)

Almost the whole country round Old Calabar could be profitably planted with coffee, and much of it with cocoa. The Liberian coffee thrives wonderfully well even with little attention. There are upwards of 200 plants in two different places in the gardens that are flourishing. Cocoa also thrives and is shipped in small quantities, and fetches a fair price on the market.

There is much original forest soil upon which the best cocoa can be grown, especially that around the springs.

The plants of both were most of them transplanted from nursery beds in July, and there have been few failures, a fact that speaks well for their future. The transplantation of cocoa in this country is generally attended with a certain amount of risk. I therefore recommend for the native culture, where rough-and-ready methods are usual, to plant two or three seeds in an 18-inch hole at 12 feet apart, in limes.

If fresh seeds are planted in May or June, one may rely on almost all germinating. The best plant is left, and the others can be either transplanted with care, or pulled up, when the remaining plant will go ahead without a check.

The same procedure does not apply to coffee, which is best to be planted in nursery beds. The ones I transplanted are now larger than those in the nursery, and amongst the 200 that were planted in permanent places, there are no vacancies.

There is, however, a point upon which these important plants may fail eventually to justify the high expectations that are required of them, namely, whether there is sufficient depth of soil above the clay strata for the plants after reaching a certain age. It is my opinion that they will thrive at every stage.

Tea (*Camellia theifera*).—There are not enough plants, nor has there been time enough for me to express any opinion as to its future, beyond that the two small specimens that are in the gardens are growing fairly at present.

Arrow-root (*Muranta arundinacea*) and *Turmeric* (*Curcuma longa*) the soil is suited for, and both thrive well with an excellent yield. The former should prove profitable.

Ginger grows fairly, with a small yield, but occasions a good deal of trouble.

Kola Nut (*Cola acuminata*), being indigenous, is naturally flourishing. I recommend its cultivation.

Rubber Trees grow well with little attention, the soil and climate being especially suited for *Ficus elastica* and *Ceara Rubber* (*Manihot Glaziovii*). Both of these will in the course of time prove profitable, although some while must necessarily elapse before they can be started in quantity. The specimens in the gardens are in fine condition.

Randolphia Vines I have not experimented with, as they are indigenous, and will not grow in the open country.

Annatto Dye Plant (*Bixa Orellana*) flourishes almost without attention. It is to be regretted that there is not a larger demand for the pulp. If cultivated on a large scale, no market would be found for it.

Henna (*Lawsonia alba*), with its sweet-smelling flowers, is doing well.

Spices and Aromatics.—Cinnamon, pimento and Melegueta pepper have all made good growth. The first named, I feel confident, will be a success, and worth cultivating on a large scale. Plants raised from seeds, planted by myself in July, are now 3 feet high.

Black Pepper (*Piper nigrum*) I am afraid, judging by the present condition of the plants, will not thrive.

Capsicums give a fair crop of large fruit-pods. A fair-sized variety is grown by the natives, which, if it were only cultivated on a large scale, should prove profitable. Many tons are exported from other parts of the coast.

Nutmegs (*Myristica fragrans*), which arrived in bad condition, died soon after being planted out. I can therefore express no opinion as to how this valuable tree would grow.

Bay Tree (*Laurus nobilis*) and *Camphor* (*Cinnamomum Camphora*) have done well from the first. The latter can be recommended.

Oil seeds, Castor Oil (*Ricinus communis*).—Some exceedingly fine specimens have been grown, having a fair yield of seed. It is cultivated in small quantities by the natives, and is well worth attention. The same applies to ground-nuts (*Arachis hypogæa*). *Jatropha Curcas*, the physic nut, that will grow almost wild, may be mentioned; and cotton-seeds might prove profitable, as well as the croton-oil plant, which, I think, would grow.

Cotton (*Gossypium* sp.), although growing robustly, has an inferior staple of fibre, and I cannot recommend its cultivation except as an oil seed.

Coco Nuts thrive, but the distance from the sea will make itself felt when it comes to the question of yield. They would be, however, worth the natives' while to cultivate on a large scale.

Fruits.—The following are growing well, many of which have been raised from seeds in the gardens:—Mango, bread fruit, orange, lime, shaddock, guava, date, loquat, cherimoyer, custard apple, sweet sop, sour sop, rose apple (*Eugenia Jambos*), Avocado pear, akee (*Blighia sapida*), durian (*Durio Zibethinus*), banana, plantain, pine-apple, papaw, granadilla, cashew.

Such products as these, though of no actual commercial value, with the exception of the pine-apple, the distance from England being too great for exportation, are of considerable use and benefit to the country itself.

Timber.—Logwood, the specimen in the Gardens, has grown 8 feet in nine months. When once it seeds, the seeds being winged and carried about by the wind, more are propagated without attention.

Fibre Plants (*Sansevieria guineensis*), which can be planted almost everywhere, promise well. Pine-apple, the leaves are long, and might be produced in any quantity. I have tried without success to obtain seeds of the Sisal hemp and China grass, both of which would grow in Old Calabar, as would many other useful fibres.

Eucalyptus.—The climate seems unsuited for. After many experiments I have only succeeded in raising a few small and struggling specimens of *E. citriodora*. It is possible that if they get past a certain stage they will improve.

(From Report on the Botany of the Ndiani, Akpajefe, and Akwa Rivers District.)

In the natural products of the whole district I am disappointed.

Rubber.—Rubber does not exist in the quantity I expected to find it, and it appears to me to be worked to its full extent, except that a more scientific method of extraction would increase the quantity. It was the exception to see any large vines that were not tapped. The district in which most vines were seen was round Okuri and Ndebiji. The natives make the unfortunate mistake of cutting down the vines, not tapping them. The result is that the vine dies. There is one species of *Carpodinus*, yielding an inferior rubber; but they do not work it. A few rubber trees (*Ficus Vogelii*) are growing in the towns, but not in sufficient quantity to be worth while collecting.

The wine palm (*Raphia vinifera*), from which the piassava fibre is obtained, is found plentifully almost throughout the whole journey, but more especially about the Akwa River, Ndegha, Ndebiji, and Ekoi Afanya. The natives do not appear to use it at all. Taking into account the large number of these palms, it is surprising to find how little palm wine there was in the different villages.

Oil-yielding Plants.—Palm oil is one of the principal articles of trade at most places, but in the Dibiyanga, Munimba, and Ituka district very few oil palms are seen. The forest is very dense in these parts, which will account for their scarcity. From Ndebiji to the Akwa River they are fairly plentiful, in fact, some nuts seen near Okorora were the finest I have ever come across.

A tree, which is called by the natives "Inoi," which is also fairly common, yields from its seeds a very fine limpid oil that they use for anointing themselves and for food. It is doubtful if there is sufficient quantity to be worth collecting.

ARGON, NITROGEN, AND PLANTS.

The announcement that Lord Rayleigh and Professor Ramsay have succeeded in proving that there exists in the atmosphere a gas which had hitherto been unsuspected, is of great interest, not only to chemists and physicists, but also to botanists. Very soon after the discovery of argon, the question was raised, "Do plants assimilate argon?" and Professor Ramsay elaborated a series of experiments, to find out if he could throw some light on a subject which is naturally interesting to botanical workers. The first thing, of course, was to find out whether there was any argon in a nitrogenous vegetable, so Professor Ramsay set to work to see if he could discover argon in nitrogenous vegetables and animal tissues. Peas and dead mice were desiccated, and then treated by Dumas' method for extracting nitrogen. This consists of mixing the powdered mice or Peas with copper oxide and lead chromate in a heated tube, whereby all the hydrogen, oxygen, carbon, sulphur, &c., are removed, and the nitrogen is collected. This, of course, was acting on the assumption that the process which liberates nitrogen also liberates argon, and this is by no means certain; in fact, Professor Ramsay, by Dumas' method, failed—so it is understood—to discover argon either in Peas or in mice.

It may be, of course, that the method employed is at fault, and that some new arrangement will have to be employed to induce this very inert gaseous constituent of the atmosphere to show its presence, or it may be that plants are quite unable to assimilate even a particle of the argon which is to be found floating in the atmosphere.

But it is to be hoped that further experiments on this subject will be made, for the relation of the atmosphere to plant life is a very important one. Since the classic experiments of Priestly and others towards the close of the last century, many researches of a laborious character have been made to find out the percentage in the air of the gasses of which our atmosphere is composed. We do not know yet whether argon is an element, or a mixture of elements. If it is a single element, its atomic weight must be about 40, and in that case no place is ready for it in Mendeleeff's table of the elements. The simplest way out of the difficulty would be to suppose that argon is a mixture, but there is conflicting evidence as to this. Mr. Crookes, with his spectroscope, says one thing; M. Olszewski, with his low-temperature thermometer, says another.

Plants, we know, do not possess the power of absorbing, or, at least, of assimilating, the free oxygen and hydrogen gasses; in all probability, argon does not enter into their composition. But experiments might be made in growing suitable plants in an atmosphere of pure argon or argon mixed with pure oxygen, on a bed of pure sand. It will be remembered that it was with such experiments that Hellriegel and Wilfarth in Germany conclusively proved that free nitrogen was fixed by leguminous plants in symbiosis with microbes, as well as by mixtures of the lower organisms inhabiting soils, green algae, and microbes.

The chemical history of the atmosphere, from its origin to the present day, has attracted the attention of many observers. Koene and Stas in Brussels, and Dr. T. L. Phipson in England, have all brought forward theories. Briefly stated, they amount to this. The primitive atmosphere was composed of

nitrogen, the substance which has the least tendency to combine directly with others. Into this atmosphere volcanic action evolved large quantities of carbonic acid and water. There was no free oxygen in this primitive atmosphere, but it was in this primitive atmosphere of nitrogen, with more or less carbonic acid and vapour, that the first organised beings (i.e., plants) made their appearance; experiments have shown that many plants of our own day can vegetate in an atmosphere of this kind, in which animal life is quite impossible. In fact, according to these physicists, all the oxygen now existing in the earth's atmosphere is due to vegetation extending over immense periods of time. It is generally allowed that the function of nitrogen in the atmosphere is to dilute the oxygen, which would otherwise be too strong for human beings. How argon will combine with all these theories remains to be seen.—H. C. F.—*Gardeners' Chronicle*.

THE TREATMENT OF THE SOIL IN LIME PLANTATIONS.

(By F. Watts, F. I. C., Assoc. Mason College, Govt. Chemist, Antigua.)

The question of the application of manures to fruit trees is one which is sure to require consideration sooner or later in all districts where large orchards are established; and as little has been written on the subject in relation to Lime trees the following notes may prove acceptable to those interested in the Lime industry.

In considering the question of manuring this or any other crop, it is of essential importance that the mechanical condition or heart of the soil should first of all receive attention. Unfortunately this condition or heart includes a number of physical factors which do not readily admit of representation by figures, such as friability, porosity, aeration, water holding power and many others, though these points are readily recognised by the practised eye and hand. It is to the maintenance of this condition or heart that the principal operations of tillage are directed. The roots of a Lime tree like all others must be supplied with air as well as moisture; they will not penetrate badly-drained soils to any considerable depth, and under these conditions suffer from shallowness of the available soil, the impervious subsoil being of little more use to the tree than impenetrable rock. From the character of the Lime crop and its cultivation there is a decided tendency for the soil of Lime orchards to fall off in condition, particularly where the soil is of a clayey character, and this danger is increased when the orchard is made to serve also as a pasture for stock; the trampling of the animals, especially in wet weather, hardens the soil, reduces its porosity and prevents the free spreading of the roots of the Lime trees.

The necessary aeration of this soil, could be readily secured by growing some intermediate crop between the Lime trees, either with the idea of making this intermediate crop remunerative in itself, or of turning in the resulting growth as a green dressing. In the first case careful attention must be paid to the manuring in order that the removal of double crops may not unduly impoverish the soil; but if reasonable care be taken various crops may be raised and the soil left in an improved condition at the end of a given period; such crops as corn, potatoes, yams, and arrowroot lend themselves to this form of cultivation and might be grown with advantage in newly-planted Lime orchards, for the space of several years. Situated as some Lime orchards are, it is sometimes difficult to find a market for the produce grown in this manner. In such cases the cultivation of intermediate crops for green dressings commends itself, and for this purpose nothing surpasses the pigeon pea in utility. It is now well known that plants of the Bean or Pea tribe possess the remarkable power of assimilating the nitrogen of the atmosphere—a power which other plants do not possess. In consequence of this beans and peas are able to thrive in soils so poor in nitrogen that other plants could grow in them with

us if the Mangrove renews its bark readily after being shaved. Should this be the case, it would be interesting to know whether the renewed Mangrove bark would give a larger amount of tannic acid, just as renewed cinchona bark gave a much better analysis than the original bark. The advantages of shaving off the bark are manifest, for the tree will not get killed in the process, and would probably give another harvest of bark within the year, and along river banks the cutting down of large quantities of Mangroves, which keep up the bank of the river and stop denudation, might cause a considerable alteration in the course of the river.—*Ceylon Forester*

MADRAS SEASON REPORTS.

For the purpose of Weekly Season Reports the Board of Revenue has directed Collectors to adopt the following adjectives in describing the yield of crops:—20 annas=a bumper crop; 16 annas=average; 10 annas=fair; 8 annas=middling; and 4 annas=bad.

THE SEASON ON THE WEST COAST.—A correspondent writes:—The unusual manner in which the south-west monsoon is holding off this year is causing much uneasiness and apprehension, owing to the exceptional drought this year, wailing comes up from all parts of the district that water is becoming very scarce and crops are beginning to wither up. In many localities, the *modan* and *chama* dry crops have, it is said, entirely withered up, while almost a similar fate is said to be awaiting field-sown paddy, not a few cultivators even complaining that the very seed has been parched up beyond recovery. Even the outturn of coconuts is affected. In Calicut, the heat is intense; several wells have almost totally dried up, and even the Big Tank which supplies the Europeans and several others with good drinking water has gone down to a very low water level.—*Madras Mail* June 8.

VARIOUS PLANTING NOTES.

THE ACTION OF GLYCERINE ON PLANTS.—The *Revue Horticole* tells us that a German naturalist has discovered that if a plant deprived of its starch by planting, be watered with two parts of glycerine to a thousand parts of water, and exposed to light, the starch soon appears; but as this would happen in any case under exposure to light, we do not see what part the glycerine plays.—*Gardeners' Chronicle*.

OYSTER-SHELLS.—The use made of these substances in agriculture leads us to mention the analysis of the shells of various kinds of oysters made by MM. Chatin & Muntz. So far as cultivators are concerned, the principal thing to be noted is the large proportion of lime, varying from 48.4 to 53.7 per cent. of the dry matter. Phosphoric acid varies in proportion between 0.01 in the Marennes variety, and 0.90 in the Portuguese oyster. The presence of minute quantities of iodine and bromine goes towards explaining the use of oyster-shells in medicine in olden times.—*Ibid*.

A JAPANESE DOUGLAS FIR.—In the number of the *Tokyo Botanical Magazine* for Feb. 20, is a description and figure of a new species of *Pseudotsuga*, discovered in the province of Kii in Japan, at an altitude of 2000 feet, by HOMO SHIRASAWA. Mr. SHIRASAWA puts his new discovery in the genus *Tsuga* section, *Pseudotsuga*. The description which he gives (in German happily), and specially the illustrations, leave no doubt as to the correctness of Mr. SHIRASAWA's identification. The original Douglas Fir, as is well known, is a native of North West America, and so far, has been the only representative of its genus or section. That a Japanese form should occur is most interesting. It forms a parallel case to the occurrence of *Tsuga Mertensiana* and *Tsuga gigantea* in California, &c., and of *Tsuga Sieboldi*, *Thuja japonica* in Japan, and there are other cases of parallelism in the floras of the two countries known to botanists, which furnish ground for interesting speculation. The newly-discovered tree grows in association with *Tsuga Sieboldi*, *Fagus japonica*, *Mag-*

nolia hypoleuca, and others. It has an erect straight trunk, horizontal spreading branches and conical top. The height is given as 15 to 20 metres, with a circumference of 3 metres, so that in point of dimensions it is far exceeded by its American congener.—*Ibid*.

TEA SALES IN BOMBAY.—An auction sale of Indian teas took place on Saturday, at the office of Messrs. Grindlay, Groom, & Co., of this city. But as the agents were determined to hold to their reserve prices, the dealers left the room in a body. On the sale being proceeded with, only five boxes of Orange Pekoe, from the Raipur Tea Estates, were purchased by a Persian shop-keeper, at eight annas and one pie per lb., leaving four hundred and twenty-four cases unsold.—*Bombay Gazette*.

CALCUTTA TEA MARKET: SALE No. 3.—After the interval of a fortnight the third sale of the season was held on the 13th inst. The room was a fairly full one, most of the old buyers having returned, and there being a sprinkling of new faces, representing some of the large distributing houses of the world. In spite of this the auction was dull the general unattractive quality and the heavy weight of Ceylon tea now being placed on consuming markets being doubtless the reason for the want of competition at the present comparatively high range of values which tea has reached.—*Indian Planters' Gazette*.

COMMERCIAL FIBRES.—The third of a series of Cantor Lectures was delivered before the Society of Arts by Dr. D. MORRIS, M.A., F.R.S., on Monday, April 1, 1895. The following is a summary:—Continuing the review of fibres yielded by the Palm order, the lecturer drew attention to the remarkable vegetable substance, resembling whalebone in strength and elasticity, called bass, or piassava. This is extensively used for making brooms and brushes, and consists of the indurated fibre-bundles thickly investing the stems of Palms. Some are strong and bony, while others are soft and elastic, resembling horse-hair. The bass or piassava of commerce is obtained chiefly from native Palms at Para and Bahia. Latterly it has been obtained from the Wine Palm of West Africa, and still more recently from the Palmyra Palm of Ceylon. The fibres yielded by the husk of the Coco-nut were of considerable commercial importance. They afforded material for brushes, mats and matting, cords, ropes, and tow. Coco-nut refuse, on account of its wonderful properties of absorbing moisture, has been recommended for use as a backing material in the construction of men-of-war. Of all vegetable substances, the most noted substitute for horse-hair was the fibre of the Spanish Moss (*Tillandsia usneoides*). The plant grows in long hanging tresses on Cypress trees in the Southern United States. The fibre is prepared by steeping the narrow stems and leaves in hot water. The preparation of Pine wool from the leaves or needles of the Scotch Fir was mentioned as a local industry in Germany, but now extending to other countries. The supply of material for paper-making was becoming more and more dependent on woodpulp. This was imported into this country to the extent of 216,000 tons annually. It was important, however, to distinguish between mechanical woodpulp and wood-cellulose. In the latter the extraneous matters were so fully eliminated that the pulp was practically pure, and suitable for the best papers. In mechanical wood pulp no chemical purification took place, and although sometimes sufficiently white to be used in "white" papers, the stability of such papers when used in public documents and works of great historical value was open to grave doubt. Many most valuable materials for paper-making, such as the Paper-Mulberry of Japan, and the Nepal Paper Plant, were not at present in European commerce. The lecturer concluded the course by discussing in some detail problems connected with the introduction of new fibres and improvement of fibre plants by systematic selection and cultivation, and by a general review of the methods adopted, by mechanical and chemical means, for the extraction of commercial fibres.—*Gardeners' Chronicle*.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, May 23rd.

CAFFEINE has been rather quiet this week. Makers are said to have sold small lots to the export trade at 19s per lb for delivery in July and August, whilst to the home trade 10-lb lots have been booked at list-price for same deliveries, some of which have been re-sold to second-hand dealers; but, on the whole, business in the article has been limited. Makers, it would seem, are having difficulty in obtaining the raw material, and are consequently acting cautiously in their future engagements, and will not sell on this market for American account, wishing to do the business through their New York agents only.

CINCHONA—The exports of cinchona-bark from Guayaquil (Equador) are officially enumerated as follows:—

	Weight lb.	Value £
In 1893	67,500	2,025
In 1894	157,400	3,094

The exports of cinchona-bark from Porto Cabello (Colombia) in 1894 were 848 kilos only, of which 275 kilos went to Germany and 573 kilos to France.

COCAINE is firmer for the Hydrochlorate. The quantities of the crude both here and in Hamburg seem to have been bought up, and higher prices are therefore probable.

QUININE—A good business has been done up to 12½d for immediate delivery, and 12½d is now asked for German bulk; 12½d paid for July delivery, and 1s 1d for October for German brands. The second-hand stock is gradually being absorbed, and that in an improving market.

London, May 30th.

ANNATTO—Holders firm, 4½d per lb being asked for good.

CAFFEINE—Only retail transactions from second-hands. July delivery 20s, spot 27s. Our last advices from America show a similar retail trade in the article, but at high prices.

COCA-LEAVES—11d per lb is asked for fair green Truxillo, but there was no inquiry at the auctions.

COCAINE—Contrary to expectation, the price of the Hydrochlorate was reduced again yesterday a further 1s 6d per oz, quotations being now 16s 6d to 16s, according to quantity.

KOLA-NUTS—About 40 packages were offered, one case of fair bold Grenada selling at 1s 7d per lb, the bulk, however, was withdrawn at prices from 1s 3d to 1s 6d.

ESSENTIAL OILS—Cinnamon oil, 8 cases of low quality, sold without reserve, at 5½d to 7d; Lemon-grass oil sold at 1½d today.

QUININE—Quiet, but firm; 12½d nearest price for best German brands in bulk. A sale of 5,000 oz October delivery is reported at 1s 1½d.

VANILLA—The finer qualities sold well at full to dearer prices today.

AMSTERDAM DRUG MARKET.

May 30th.

Our correspondent writing on Wednesday, reports that Cubebs are neglected. Of second Padang Cassia vera there was a good deal offered (200 packages), but there were no buyers, and the same has to be said regarding the prime quality stuff, and as for the medium, 102 packages, amounting to 5,900 kilos were offered, 11½c per half-kilo being named as the price. At the Genu copal auctions, on May 31st, 168 tons of hard and half-hard resin will be offered, and 118 tons of softer varieties. Prince Batavian Genu Damar has been sold at 43½c to 44c. There has been more inquiry for Cajeput oil, and 1,250 bottles have sold at 115c per bottle.

WATTLE BARK INDUSTRY.

We (*Natal Witness*) are given to understand that our German cousins in the Noodsberg District have started a wattle bark mill on their own account. A correspondent writes:—"Good luck to them, but I wonder how long it will last. Since the starting of the above new venture, it seems strange that the wagons of bark roll into town in larger number, even although the price has dropped to zero (3s. 6d). I hear on very good authority that storage is small, and cash, not paper, is wanting. At the same time, it would be wise on the part of Maritzburg buyers

of bark not to let the price fall too low. There is a feeling at present among the growers that a 'circle' is being formed. I hope there is no foundation for the rumour."

THE FUTURE OF TEA IN CHINA.

An authority writing on the future of tea in China says:—"I am informed that one early result to the awaking of China which is certain to follow the declaration of peace, will be the taking of steps to improve the manufacture of tea." Our London correspondent has had a long conversation upon this topic with a gentleman having lengthy experience as an importer of Chinese teas. From him he learned that it was possible that those interested like himself would initiate steps to induce the owners of Chinese "Hong" to import the machinery and obtain the assistance required to introduce such an innovation. But at the same time great doubt was expressed if, even after the severe lesson of late received, it would be possible to stir the strong conservatism of the Chinese sufficiently to compel the required action. We do not ourselves think that it will be possible to do so. Even if it should prove possible to effect this, we do not think the conditions of tea-growing in China would readily yield themselves to the adoption of Western methods in the preparation of the leaf. It would certainly be possible to establish central factories in the midst of a number of gardens, the produce of which might be sufficient to keep the machinery going. But opposed to this there must remain the difficulty of transport to centres of this character. Good roads scarcely as yet exist in any of the Chinese provinces, and we venture to think that it must be a long day before the peasants of that country could be induced to carry the green leaf from their huts, where preparation now goes on, to a central point. For ages past the buyer has visited each small grower and has taken over the tea direct and in readiness for packing. The labour must be greatly increased had the green leaf to be first collected and transported for preparation. No doubt the tea would be much improved if it could be properly treated; but the difficulties in the way seem to us to be almost insuperable. Altogether there is little reason for Ceylon planters to fear that the hope of the home dealers in China tea will be realised. But under any circumstances this article has now become so displaced in the London market by British-grown teas, that we feel sure no efforts of the kind described could suffice to replace it.

NATAL TEA.

THE SEASON'S OUT-TURN.

Mr. G. W. Drummond, of Kearsney Estate, reports as follows:—"We are now drawing to the close of the current tea season, and I am glad to be able to say from our own results so far, and from news of our neighbours and the district in general, that it has been the most satisfactory season for the last five years at least. The rains in April gave a splendid fillip to the plants for the end of the season. There are some very large swarms of locusts here still, but they have not touched the tea as yet. Loquats, bananas, and pineapples, however, have suffered a great deal. We should not be surprised, however, if the total out-turn for Natal reached 850,000 lb. of tea, especially as May is promising to be an excellent month, and one million for next season is not only possible, but probably. *Natal Mercury*, May 17.

PLANTATIONS IN CEYLON AND LABOUR SUPPLY.

It was a decided relief to read the two very sensible letters from the Chairman of the Planters' Association and Mr. Charles Young (see page 17). They offer a strong contrast to the theoretical, and, in our opinion, impracticable schemes advanced from two or three quarters during the past few months. Mr. Melville White at once separates the Planters' Association from any Cooly Agency Scheme and fully justifies the attitude we assumed on this point. He indicates moreover, after a very practical fashion, some of the risks incidental to any private Agency Scheme, which will no doubt be duly considered by planters. At the same time, there is no intention officially, to interfere with any such Agency—only, it would be well to give existing means a full trial before going to the expense of establishing new Agencies.

In this connection, we cannot help drawing special attention to the letter signed "Planter" which appeared in our issue of Tuesday last; because though dated from a Coconut district, it gives the opinions of a gentleman who, more than any other in Ceylon, is entitled to be listened to with respect on any point affecting Cooly Immigration. We almost wish that "Planter" had given his name, to carry home his counsel more forcibly to his brother-planters. He advises a careful study of Mr. Edward Young's Report; and he expresses the belief that the old established Firm of Messrs. Adamson, Mactaggart & Co. at Negapatam can do better for Ceylon planters than any new Agency. He would have them established a branch Agency at Salem—to tap the districts of Tanjore, Arcot, and Salem—and this, we have no doubt, the said Firm would be prepared to do, if they get sufficient encouragement from individual proprietors or managers in Ceylon. We would, therefore, recommend any of those short of labour and unable to trust their kanganies to recruit—after such experience as "a Central Province Planter" gives today—to communicate with Messrs. Adamson, Mactaggart & Co. It has been stated that the partial failure of the operations of this Firm in the past, has been due to the want of a trustworthy leader, guide or kangani to keep the coolies together until they reached their future employer or the estate. But this does not seem at all an insuperable difficulty, especially where one employer is prepared to indent for a considerable number of coolies, so making it worth while to give a responsible leader to the gang.

In reference to immigration generally, can there be any doubt as to the great value which through Railway communication would afford, after the picture given to us of the hardships and extortion to which coolies are exposed in travelling any distance at present? "When the Railway is made to Paumben"—writes "Planter"—and he knows Paumben and Southern India almost as well as Ceylon—"and from Manaar on the Ceylon side," (still more with the viaduct and through unbroken carriage!), "labour difficulties will vanish." Surely then, the practical work which the planters of Ceylon ought to take up through their influential, representative Association is that for which Mr. E. J. Young has given them so good a lead—the urging on of THE INDO-CEYLON RAILWAY. No other work can have so great and beneficial an effect in increasing our supply of coolies from Southern India.

ORCHIDS IN DARJILING.

A Darjiling paper says that the Deputy Commissioner has passed an order to the effect that Orchid dealers are not in future to sell ferns or Orchids in Darjiling, on the ground that the surrounding forests are being denuded of them.—*Pioneer*, May 4.

THE CASE OF MR. CHARLES LEDGER.

The *Handelsblad* of Amsterdam, one of the leading daily papers in Holland, has taken up our appeal on behalf of Mr. Charles Ledger, the cinchona-pioneer. In an editorial article in its issue of April 13th, the *Handelsblad* takes for its text our assertion that "scintiment counts for something in the government of the world," and bases upon it an appeal to the Dutch Government to allow Mr. Ledger a pension of £100 a year. We shall be agreeably surprised if this appeal should be responded to. To agree to it would certainly be an act of generosity on the part of the Dutch Government, which would put our India Office to shame, and a mark of broad-mindedness such as few nations show in the case of individuals not connected with ruling families. In presenting its case for Mr. Ledger, the *Handelsblad* gives a short account of cinchona-cultivation in Java, and expresses the belief that a proposal, on behalf of the Ministry of the Colonies, to give Mr. Ledger £100 a year would be accepted by the Dutch parliament.—*Chemist and Druggist*.

CINCHONA AND QUININE.

The following translation and figures from a Report on cinchona and quinine of the well-known Dresden Firm, Messrs. Gehe & Co., is of much interest: it will be observed that stocks of bark (as also quinine) are low in London, but large in Amsterdam:—

The *Planter* notices an uncommon occurrence reported from Ranchi. A mango tree, on which some fruit had set and grown to about one quarter of the full size, has sent out flowers on the branches which did not flower before. This is the only tree among the group which bears flowers and fruit together.—*M. Times*, May 12.

OIL GAS ENGINE.

THE CASTLETON TEA ESTATE, Darjeeling, has put down an oil-gas engine 15 h.p. and a new Blackman drier.—*Planter*.

TEA IN INDIA.

(From the *Planter*, April 13.)

Sylhet has every promise of a good season, if they only escape hail. Manufacture has now commenced on most gardens, although this district is genevally pretty late at commencing.

An invoice of seventy chests from the Central Terai gardens is one of the first arrivals of the new season's tea in Calcutta.

Our Dehra Dun correspondent writes:—"I have been told that several gardens have suspended plucking for the time being, as the bushes are hanging back so much on account of the sudden fall in the temperature that they appear to be at a perfect standstill."

Our Ranchee correspondent writes:—"The thermometer has been up to 94°. This was on the 5th April, and on that day the wet and dry thermometers showed a difference of 26 degrees. During March rain threatened several times, but it did not come down in useful quantities. Altogether it looks doubtful whether this will be a good season for quantity, and as there was a severe drought up to the end of May last year, another drought may be serious and do some harm to tea bushes. Since 1890 each alternate year has had short rainfall up to the end of May. In 1891 and 1893 heavy rain fell early in the year, but the rule seems to be changed now."

CACAO PLANTS IN DOMINICA.

The following letter received from the Lasoye district of Dominica may be of interest to intending cacao planters.

Melville Hall, Dominica, 25th October, 1894.

Dear Mr. Barber,—I send herewith the measurements of the cacao planted by myself on this estate, the rapid growth of which will, I feel sure, be of interest to you.

The height of stem from ground to fork is 2 feet 1 inch; length of main branches 2 feet 6 inches; length of first laterals 1 foot 2 inches; stem circumference, at base, 3½ inches, near fork 3 inches; length of longest leaf 13 inches.

The seed from which this tree was grown was obtained from the Botanical Station on October 4th of last year and planted by myself a week later. It is the nearest approach to the Criollo variety growing at the Station, the pod being similar but seed rather larger. Originally grown in a bamboo pot it was planted out five months later.

Many trees of the same lot are taller, and with the fork; but the one of which I send measurements is the most forward.

Trusting this may be of interest and with kind regards,—Yours faithfully, H. W. GRAY HUTTON.

This is a case of very rapid growth, and from the measurements a very healthy and well shaped tree. It is of interest to note that there are many parts on the windward coast of Dominica where cacao would grow excellently, provided that ordinary precautions were taken to shield the plants from blasts of wind down or up the valleys and the steady sea breeze. There is practically no cacao grown along the coast from Hampstead to the neighbourhood of Boetia. Many of the valleys which are now out of cultivation could easily be placed under cacao, provided that advantage were taken of the protected portions and additional tree-belts placed where necessary. No shade trees of any kind are needed in Dominica excepting for very young cacao plants.

Many plantations in the neighbourhood of Vieille Case are unprotected from wind. The effect of this is seen in the blasted appearance of the outer trees which on the other hand form a hedge for those within.

As to the kind of cacao for Dominica there can be no doubt that, if properly tended, there is none to equal a good Forastero. This kind has been persistently sold by the Botanical Station during the last three years. The plants sent out, with the solitary exception of the tree bearing the variety mentioned in Mr. Hutton's letter, are of one kind, being obtained from a singularly successful and uniform plantation in Montserrat.

Up to the middle of last year there had been distributed from the Botanical Station 1615 plants in pots, and 47,070 seeds of this one variety. The object of this has been to try and improve the quality of the Dominica product, at the same time giving it uniformity of sample.

The great quantity of cacao now shipped is settlers' cacao of the Calabacillo kind. The trees are very hardy and bear well. They thrive with little care and bear profusely. The beans are however very flat, dark and bitter, and it is almost impossible to prepare a good sample. It rests with the planters of Dominica whether they will go on improving the general sample of the Island by continued planting of a good hardy kind, or allow the cultivation to sink back to its level of settlers' cacao by planting the old local variety. —*Agricultural Journal.*

THE KITTUL PALM.

The Wine Palm or Kittul Palm attains a height of 50 or 60 feet, and is remarkable for the peculiar form of the leaflets, which have been compared to those of our common Maiden Hair Fern. The leaves themselves are from 18 to 20 feet long. It is a native of Ceylon and India, growing in forests in the hilly districts where teak and the wild mango abound.

The Kittul fibre of commerce is prepared from the sheathing leaf-stalk; it is used as a substitute for bristles for making brushes, baskets, etc. The value is from 3d. to 10d per lb. It is said that in Ceylon ropes made from the fibre are used for tying elephants. Roxburgh says it is highly valuable to the natives of the countries where it grows. "It yields during the hot season an immense quantity of toddy, or palm-wine. I have been informed that the best trees will yield at the rate of one hundred pints in the 24 hours. The pith or farinaceous part of the trunk of old trees is said to be equal to the best sago; the natives make it into bread, and boil it into thick gruel; these form a great part of the diet of the people, and during a famine they suffered little while the trees lasted. I have reason to believe this substance to be highly nutritious."

The Wine Palm ends its existence by flowering. The first flower stalk appears at the top of the tree, as soon as that has done flowering, another appears lower down, and so on, till the last one blossoms at the foot of the trunk, proclaiming that the death of the tree is near at hand. These flower-spikes hang down in large bunches, producing quantities of round, reddish berries. The wood is strong and durable, used for agricultural purposes, water conduits and buckets.—*Indian Agriculturist*, May 1st.

PIONEERING AND TEA PLANTING AND MISSION WORK IN ASSAM FRONTIER.

From the letter of the Rev. J. A. Graham of the Scottish Missionary, dated Naya Sylee Tea Estate, Dooars, we quote as follows from "Guild Life and Work":—

For the first time I have been on the Assam frontier, and so touched our most eastern boundary. There would not have been much object in going there before this year, for then one would have found nothing save huge grass jungle land. But a few months have changed all. Now, on the banks of the Sankos, which is the dividing river, is a young Scotchman—Mr. Craig, known to East Kilbride Guildsmen—and with him a band of Nepali, Mechi, Nagpuri, and Santhali coolies, all busy converting the haunt of the tiger, the elephant, the leopard, the rhinoceros, the wild cow and buffalo, the deer and the pea-fowl, into a prosperous tea-garden, to supply you folks at home with the cup that cheers. I am staying with Mr. Craig's neighbour, Mr Murray (brother of the Minister of Greyfriars, Aberdeen). They two have charge of many thousands of acres of fine virgin soil for your Glasgow firm of Duncan Brothers. It gives a fine example of British enterprise and pluck to see a fellow-countryman go out with his tent into the forest and begin to carve out of the wilderness a smiling tea-garden. Rough, hard work it is to begin, but in three years he probably has the pleasure of

seeing his own substantial bungalow and great factory in the midst of 1,000 or 1,500 acres of tea. And as we rode the last part of the way on Mr. Murray's elephant, one could not but marvel too at the power of man over the wild beasts around; for there was that huge animal, who but a few years ago would be roaming at will over those very plains, now controlled with the utmost precision by a single man. During the last two years over 300 elephants have been caught by Government in the Dooars part of our district. All along the foot of the hills I have met occasional members of our Church. At Rangamuth, about 30 miles west of the Sankos, is stationed Jitman, the evangelist of the Foreign Mission to Bhutan, supported by the native Christians themselves. We have also a school, and I had the pleasure of baptizing there a woman and two children. Two days ago Naiman, the Dooars catechist for the Nagpuris, met me at Piskor, where there are nearly thirty Nagpuri Christians, and after a delightful service we baptized three persons who had been a year on probation. In the earlier part of the journey Dilbir, the Nepali Dooars catechist, accompanied me, and we had some baptisms. Every night we have a magic-lantern exhibition for the coolies of the garden where we happen to be staying; and on Sundays we have services for the planters. At yesterday's service in Mr. Oliver's (Nagrakata) fifteen of us met together. Not the least pleasant part of such a tour as this is the meeting with so many planters in their own homes. In every bungalow one finds a hearty welcome—for a planter's hospitality is proverbial—and in all districts are Scotsmen! Not, indeed, that they surpass in hospitality those who hail from south of the Tweed or across the Jaldacca River, through Bhutan, to visit Donghu's people at Tode, and to baptize some others of his household. A planter friend is to accompany me for three days on foot.

Mr. Graham seems to be the right man in the right place.

TEA MERCHANTS.

These tea merchants seem to have their day the same as with other trades. Formerly it was John Rose and Co. Then for a time we heard of nothing but Horniman, followed by Cooper, Cooper and Co., and then "Mazawatte." Twenty years ago the name of Lipton was not even known, and now he tops the lot. The others, we have no doubt, are all flourishing, but we do not hear so much of them.—*London Paper.*

WOOD FOR TEA-BOXES.

A large quantity of "shooks" are imported from Japan: they belong to some coniferous wood, probably *Cryptomeria japonica*, and though they cost rather more than Simul at the outset, nevertheless, as they are thoroughly seasoned and ready for dove-tailing, they can all be utilised without any loss. Consignments of what is known in the trade as "spruce" are received from Vancouver's Island, and some redwood, probably a kind of *Dipterocarpus*, comes from Burma. At first sight it may seem strange that with her large forest area Assam should have to depend for the tea-box woods from distant countries, but it is essential among other conditions that for a wood to come into practical use on a large scale the tree which yields it must be gregarious; it will never pay to employ a wood which is only found scattered here and there. Thus, though there are in the Delira Dun forests several trees adapted for tea-boxes, it is probable that the planters of that district will eventually use either spruce or silver fir from the neighbouring Himalayan forests, as soon as their available supply of mango trees has been exhausted. —*Timber Trades Journal*, April 20.

* Started in 1894.

The following prophetic forecast by Mr. Swettenham in the Selangor Administration Report for 1887 may be of interest:—"The Klang District, however, bids fair to lead the State in matters agricultural, and it is a subject for congratulation that the principal port of Selangor and the terminus of the railway should possess such solid attractions for capitalists and peasants."

It is true the capitalist and peasant have flocked to the Kuala Lumpur District, but Klang easily leads the rest of the State as an agricultural district.

Klang has become a regular home to the Javanese, their numbers here steadily increasing year by year. Quiet, steady, frugal, hardworking people, they offer a pleasing contrast to the casual Malay in the way they clear, drain, plant and weed their coffee gardens. Even the Chinamen who have embarked in coffee keep their land weeded, even if they do plant kladi between the young plants for the first year or two. But as for the Malay, he has no thought for the morrow, and calmly allows his young plants to grow up amongstalang because he is too lazy to work.

To report on the progress of cultivation is simply to say that Europeans, Javanese, Chinese and Malays who hold land in the Klang District are planting it up with coffee as fast as their means will allow them.

No new pepper has been planted, owing to the low price of pepper, which has been steadily going down in the market for the last five years, until pepper estate proprietors seem on the verge of ruin.

To sum up the position of Klang as a field for coffee planting, we find 2,710 acres of land in the Klang Mukim have been taken up by Europeans during the year. Twelve blocks of virgin forest land amounting in all to 3,810½ acres have been surveyed and will be offered for sale by public auction at an early date. The area of customary native holdings has increased from 3,516 acres in 1893 to 4,570 acres in 1894, and there are three demarcators now in the field with enough work to last them for a year. The Selangor Coffee

and Trading Company has established itself here to buy up and prepare the coffee berry for the market, and is already reported to be working at a profit. Coffee is the King of Klang.

TEA AND OVER-PRODUCTION.

A correspondent of the *Englishman* has taken up the parable of the tea planter and the limited market which has been so earnestly preached of late in Ceylon, and urges the absolute necessity there is for India to extend her market for tea if the industry is to prosper. From this it would appear that the over-production scare has spread to this country, and it is just as well perhaps that it has, for there can be little doubt that Indian planters have been too long content to let their produce push itself. With the keen competition there now is, India must be up and doing with the rest, and if the "scare" has the effect of rousing the country out of its lethargy well and good.—*Madras Times*.

THE RAILWAY TO INDIA.—In the *Contemporary Review* for April, Mr. C. E. D. Blacklaw revives the project of a Railway from the Mediterranean to India. He proposes to connect Port Said and Kurrachee through Syria, Persia and Beluchistan on the Indian broad gauge, 2,300 miles at £5,000 a mile or £12,000,000 in all—with £3,000,000 for rolling stock, or 15 million sterling in all. We have not the slightest doubt that this, or some other project, will ere-long be taken in hand. We are entering on a new era of "Railway Construction" more especially to serve the interests of the British Empire, and before the new century is very old it will be possible to travel from Colombo to Port Said all the way by rail.

75 acres coffee, and 35 acres pepper. † Felling and draining in hand. ‡ Coffee 182 acres, arecanut 70 acres, coconut 25 acres, fruit trees 76 acres. § Coffee 96 acres, fruit trees 8 acres. ¶ Coffee 30 acres, arecanut 15 acres, fruit trees 5 acres. †† Coffee 15 acres, pepper 17 acres. ** Coffee 25 acres, pepper 37 acres. ††† Coffee 45 acres, pepper 40 acres.

ROLLING TEA.

TO THE EDITOR OF "THE PLANTER."

Sir,—As economy will be the chief feature of tea-making in the future, it is not too soon to enquire whether the present rolling machines are all that can be desired. The "Rapid" roller has proved to be the favourite, as well as the latest evolution in rolling machines, but it takes its time, and it takes plenty of power. You can't get much of a roll on leaf under 30 minutes rolling whether done once or twice, and I have an idea that some of the old bag machines would work more quickly, although perhaps they will not put the same twist on to the leaf. It would be interesting to get statements of the relative power of bag machines and box machines. In mashing the leaf up to a certain stage, because I think it highly probable that the bag machines would prove more economical up to a certain point.

It is doubtful, and extremely improbable, that the former can ever supersede the latter, but it may prove to be a very valuable help in preparing leaf for rolling, as well as for finishing off the coarser leaf separated by sieves after the first roll. The packing of the leaf into bags would form a convenient means of transporting in to the rollers, and five minutes mashing would possibly bring the leaf into as forward a stage as ten minutes in a box machine.

I know that the first idea on reading this will be that bag machines are sufficiently proved to impair the quality of the tea, and I have no doubt myself that for the whole operation the box machines turn out a tea of superior quality, but I urge the point solely on the score of economy, and I believe that the very slight (if any) deterioration of quality entailed by a few minutes pounding in a bag, would not be noticed by present-day brokers and that it would not reduce prices by the smallest fraction.

To any small estate which contemplates increasing the number of its rolling machines I think that it would prove economical to purchase a bag machine. 1874.

BRITISH NEW GUINEA AS A PLANTATION COLONY.

BY SIR W. MACGREGOR, K.C.M.G., M.D.

(Extracts from Address in the Town Hall, Manchester, March 8th, 1895.)

When I was invited to read a paper before this Society it was intimated to me that it would be desirable that it should touch chiefly the commercial aspects of British New Guinea, while at the same time the more purely scientific questions connected with that place should not be altogether forgotten. In trying to comply with this, we shall therefore, consider briefly the country and its surroundings, its people, its present exports, and its potential productions.

Speaking roughly, the island of New Guinea, with its attached small groups, extends from the 129° to the 155° of East Longitude, and from the equator to the 12° of South Latitude. Only something more than a quarter of the great island belongs to the British Empire, but even this fraction is larger than the island on which we now stand.

The latitude of the colony, it is worth while to remember, is from 5° to 12° South—in other words, it is as far from the equator as it is possible for it to be without entering the hurricane zone, a position which, from an economic point of view, must be considered the best possible for a tropical colony.

Beginning at the east end of the Possession, on the mainland, a lofty range of mountains, running towards the north-west, goes from practically one end to the other, presenting many heights of 5,000 to 10,000ft., and attaining in Mount Victoria, the highest point of the grand and majestic Owen Stanley Range, an altitude of 13,000ft. This great mountain system is wooded, is generally steep, and is to a large extent uninhabitable. On account of their height, their great extent from east to west, and their dense covering of vegetation, they are generally cloud-capped some part of the day in all

seasons, and collect an immense amount of rain, which sends down rivers that are numerous and great out of proportion to the area of the country.

The broadest part of the island of New Guinea is near the longitude of the British-Dutch boundary. Naturally, therefore, our largest rivers occupy that end of the colony. These are the Fly and the Purari. The Fly opens into the sea some 130 miles east from the Dutch boundary, but it trends towards the north-west, and brings down a large amount of water from Dutch and German New Guinea. It is navigable to a steam launch for nearly 500 miles. Gold is found in its sands as soon as those are met with, after an ascent of over 400 miles. There may be some land fifty to eighty miles from its mouth fit for cultivation by Europeans, but this would require special examination. The Purari like the Fly, is not very inviting to the land seeker, though it is hoped that from it we may obtain good serviceable coal, as it traverses a great sandstone district in which specimens of excellent coal have been found. But good land for growing sugar cane, corn, or any similar crop: also good sites on low wooded hills for coffee, tea, and products of that kind are obtainable on several of the gulf rivers, with good water carriage to the spot. In connection with these sago manufactories could be established on some of the rivers, for there are extensive tracts of sago trees that are not required or used by any natives, and that, in fact, having no owner become Crown property and could be sold or let to any suitable company.

Further east there are many small rivers and salt-water inlets, affording water carriage, and often with good alluvial and hilly land which would be convenient for the planter, and which could be obtained without encroaching on the native or alienating their goodwill in any way.

The north-east coast has three fine rivers, on two of which there is a large amount of sago available for the manufacturer, and the country near the hills is in every way extremely pleasant. The islands would supply some very good places for coconut plantations, but they would for other products probably be inferior to the mainland. Generally it may be said that the interior of the country is mountainous; that in front of the mountains in the western quarter the country is low and swampy, and that elsewhere, between the mountains and the sea, there are practically all kinds of soils and positions.

During the period from November to May winds are unsteady and northerly; the temperature is then highest and thunderstorms are of daily recurrence. From June to November a fresh south-east wind blows in from the ocean. The great masses of rock forming the central chain of mountains are so protected by their dense covering of vegetation that they do not become heated by the sun's rays, and they always produce cool currents of air at night. The heat is thus not great for the latitude of the country, probably hardly ever over 90° Fah. in the shade, usually about five to ten degrees below that. Probably white men could hardly work continuously in the sun, but the hardy diggers toil on all day in the Louisiade group, being, however, generally protected from the sun by the forest in which they work. The natives have to do a good deal of labour in some places in order to live, but they do not work steadily, and naturally do not feel ill-effects from the climate.

The principal form of sickness is fever, which is of a more tractable and less severe type than tropical fevers generally are. If reasonable care is exercised it would not interfere to any serious extent with planting operations, whilst dysentery, ophthalmia, venereal diseases, and other contagious maladies would cause neither loss nor trouble, unless these maladies are introduced from beyond the colony. It is only reasonable to suppose that it could hardly be a favourable place for white children, and probably it is not, speaking generally, a country in which European families should be reared. It is more a country for outdoor labour by coloured men under white supervision. But under cover a European can work at anything without detriment.

PRODUCTS.

The total value of the exports entered at the Custom House in the year ending 30th June, 1894, was, in round numbers, £15,000. To this should probably be added £8,000 or £10,000, representing the value of the pearls not declared outwards. One of the first items to notice is trepang. Its value was £1,714. It may be pointed out at once that the boundary of Queensland as at present fixed extends across the straits to within a hundred and fifty yards of New Guinea, and thus cuts off the fishing ground on the west that should naturally belong to the Possession. In addition to the economic unfairness of this distribution, it gives rise to the awkward fact that officers of the New Colony cannot visit the western part of the Possession without entering Queensland jurisdiction. The Queensland boundary was fixed before the annexation of British New Guinea, and Queensland is now prepared to rectify it. This will add something to the value of the fisheries in the west. The reefs have been fished for years for trepang, and it will in any case only remain as a small industry and not capable of much expansion. Copra was exported to near the value of £3,000. This should, in time to come, be an export of great dimensions. The coconut tree is in all countries most at home near to the sea, and it happens that the Possession has an enormous sea frontage, reaching according to the estimate made in the office of the Surveyor General of Queensland, something over 3,500 miles. This, of course, includes the sea frontage of both the mainland and the islands. There is no part of the colony in which this tree does not seem to thrive. It certainly bears well up to an altitude of over 3,000 ft. It has been planted from time immemorial by the natives, but only on a very small scale in most places. Various reasons have tended to keep the groves small. A weak tribe would only have excited the cupidity and hostility of stronger tribes by growing large quantities. On the other hand, several powerful tribes have valuable plantations. In other places they were cut down as acts of war, a manifestation of power not quite unknown to white men in dealing with natives. In certain districts, again, a man's coconut trees were cut down as a mark of grief when he died, or of joy on the birth of his firstborn. To a large extent these destructive practices have been checked, and all that is possible is being done to urge the natives to extend their plantations. A native regulation has been introduced into operation in the more settled districts to make compulsory the planting of a minimum number of coconuts.

A few Europeans are also forming plantations. Some of the trees planted at the Government station in the Mekeo district were flowering before they were quite three years old, but it would not be safe to count on a crop under six or eight years. There is practically unlimited land available for this cultivation, which might be entered into on a large or small scale.

It has already been pointed out that the colony lies just outside the hurricane zone. The advantage that this affords in coconut planting, for example, over such places as Fiji, Samoa, and Tonga is enormous. A large coconut plantation in British New Guinea when once in bearing would provide one with a perennial source of income. In no country are the trees more prolific; perhaps no other colony we possess offers equally good and extensive opportunities for conducting this industry to high figures. It is a cultivation that could be advantageously carried on by men of even limited capital, though it should not be taken up by a moneyless man. A person who could earn money by fishing or trading part of the year, while devoting his spare time to planting, could in a few years work himself into a coconut plantation if he had ordinary good fortune and a small capital to start with.

Gold to the value of £3,900 was entered outward. This was sent from the islands of Misima and Tagula in the Louisiades. Of course the amount entered at the custom house does not truly represent the quantity actually obtained, but the work carried on is only on a very small scale. The gold has been found by laboriously washing the sand and gravel in the numerous creeks that meander in the forest and those

have been nearly washed out. There is some reason to expect that gold-bearing reefs may be discovered. Several good veins of auriferous quartz are known, but they are thin and have not, so far as tested, appeared to gain in thickness with depth. On Misima the diggers employ natives to work at sluicing at so much a day, but on Tagula the natives have been setting up on their own account, and wash out gold for themselves.

The search for gold is extremely difficult, owing to the denseness of the forest and the rough and rugged nature of the hills. Strong traces of gold are found on the upper Fly; they are also met with on the Purari, Lakekamu, Angabunga, Goldie, Vanapa, and Maubare rivers. In the east end it has been seen at Yela or Rossel Island, at Duan and Goodenough Islands, and also at some other places. It is an arduous and difficult journey to ascend the strong-running rivers to the hill districts in which this gold is most generally met with, and it will be a long period before the Possession can be even roughly prospected.

In a country that would be trying for the wives and children of white men the gold industry would not be of so much advantage as in a country like Australia or New Zealand, which are from their geographical position the permanent homes of the white race. Still it could not fail to be of some use to even British New Guinea, although it would not probably add very much to permanent settlement. The Government has had good reason to be satisfied with the treatment of the natives by the diggers from Australia, who are a law-abiding, hard-working set of men, taking them as a whole. The only regret is that the extremely limited means of the Government renders it impossible to offer them any special facilities. It is at best only a fugitive industry in New Guinea, and if the Government had any money to devote to the encouragement of any industries, those of a permanent nature, like agriculture, would deserve a preference. Now that the search for gold has been taken up by the native on his own account, the finding of gold on a small scale will probably never die out, but the native may very likely, sooner or later, lead us on to more extensive deposits. Pearl shell was procured to the value of £3,366. This article is found over a great area of fishing ground in the eastern waters, but unfortunately the sea is often from twenty to thirty fathoms deep where the best shell is found. Several attempts have been made to improve the diving gear, so as to make it safe for picking up shell at those depths, and if this could only be done the pearl shell fishery of the colony would be a valuable one. The waters of the Possession would seem to be well adapted for farming the shell.

The pearls have generally been found in shallow water shells, mostly in the Kiriwina group, not so much in the ordinary pearl shell although found there also. They are obtained by natives, who will soon exhaust the fishery as the shell is easily reached. Probably this shell would be the best one procurable for the cultivation of pearls, as its home is in a small depth of water and it produces many pearls.

Of sandal wood 321 tons, valued at £1,896, left the colony. The market for this article appears to be limited—less than Western Australia alone could supply. It is found in the Possession near shipping ports, and labour is cheap, so that with average prices it can be worked on a small scale at a profit. The supply there, as in all other sandal wood countries, is easily exhaustible, but it will remain a small industry for some time, and will no doubt be taken up by the natives on their own behalf.

The value of imports was £28,500, making a total trade for the year of £43,500.

The principal items imported were: Food stuffs, £7,181; drapery, £2,687; tobacco and cigars, £3,985; hardware, £3,162; beverages, £1,760; and building materials, £2,889.

Food stuffs consist chiefly of rice, meat, and biscuits, imported from Australia.

Drapery is beginning to be used by the natives in certain districts, but it will be many years before they

all take to the shirt or loin cloth; those who can afford it take kindly to a jacket and trousers.

They are very fond of tobacco, and in all districts where it is known they prefer the imported American trade article to the home-grown variety, which is simply dried in single leaves, and is not nearly so powerful as the manufactured trade tobacco. No doubt this will for a long time to come continue to be a growing import as we approach new tribes.

The use of hardware is steadily extending, but there are probably hundreds of tribes in the interior who do not yet know the use of iron, but who will use it in a few years.

The native has only a small share in the beverages and building materials imported.

POTENTIAL CAPABILITIES.

To you, perhaps the most interesting, because the most practical, question is, What are the potential capabilities of the country? Can capital be advantageously laid out there?

I believe that money could be employed there to the benefit of the capitalist and to the advantage of the people.

In the fishery this could probably best be done by combining the ordinary diving operations for pearl shell with the farming of leased areas of sea bottom for the cultivation of sponges, pearl shell, and the pearl-bearing shell of Kiriwina. The ordinary fishing grounds have not been prospected with any care, but there certainly are many places where these cultivations could be favourably carried on. The Sponge used by the natives of Yela Island in the Louisiades for washing the face is a good one, and there is a great lagoon there for the location of sites for cultivation. The men engaged in looking after these establishments could be employed also in the ordinary pearl shell fishery when not required at the stations. The Government would be prepared to lease areas for this purpose on very easy terms.

The search for gold is a matter that each person must decide for himself. The probabilities are that there are other districts than Misima and Tagula that would yield payable gold, but it is at best an uncertain and usually short-lived industry, best worked by those having local experience. Capital should be put into it only on the deliberate advice of men thoroughly competent to express an opinion in each given case.

The search for gutta-percha and allied products seems to show that a profitable industry could be opened up in that line. Some examples that have been tested have been pronounced of superior quality. These articles are obtained from a number of different trees that are found over a widely extended area. The great want hitherto has been the presence of skilled labour to start the industry. A few hands would have to be brought from some country where this work is already established. Alluvial land could be obtained that would be suitable for the cultivation of rubber trees. The introduced variety is thriving splendidly at Port Moresby.

A cultivation that could in all probability be advantageously cultivated there would be sisal hemp. For three or four years efforts had been made to obtain this plant from the Bahamas; but this could not be done, as that colony apparently wished to retain a monopoly of this cultivation. The Government of Queensland has, however, recently succeeded in obtaining a large number of the plants, from which New Guinea is being supplied. Plants very nearly related to this one, if they are not indeed identical, already flourish at Port Moresby. With rich soil, land at two shillings and six pence an acre, and with cheap local labour, this cultivation could be made profitable in the colony, if it can be made so anywhere. It is not likely that it could be advantageously grown in Australia, unless there is a great fall of wages there. It would seem to be well adapted, however, in every way for British New Guinea.

As already mentioned, there is great scope for the cultivation of the coconut. It is one of the slowest, but one of the surest form of tropical cultivation, provided that it is in a country which,

like British New Guinea, is outside the hurricane zone. No doubt the most profitable way of working copra will be by direct shipment to Europe. Hitherto it has been sent to Australia, to be carried thence to Europe by reshipment, usually by steamer. But the quantity obtainable will soon be sufficient to allow of direct shipment by sailing vessel, which would greatly reduce expenses connected with freight. The copra trade of the Solomon Islands could probably be brought by way of Samarai for the same direct transport. There are a few unoccupied islands in the east end which are adapted for small plantations of this kind, and land suited for it is obtainable at many places on the other islands and on the mainland. Very favourable sites could be had for converting the coconut into oil, butter, and coir yarn. There is undoubtedly in this industry a good field for the investment of capital. It is a cultivation that can be well combined with others.

For growing tea and coffee, land in large quantity is procurable at any altitude that may be desired, and on almost any kind of soil. Tea and coffee, both of Arabian and Liberian kinds, are already in bearing in the Possession, and both free of coffee leaf disease. The introduction of further coffee seeds and plants has been prohibited by law in order to prevent the importation of disease. Healthy seeds and plants can be obtained by the planter on the spot.

Vanilla grows luxuriantly, and suitable land can be had for its cultivation in abundance.

Few things would seem to offer a more inviting outlet than the cultivation of tobacco in New Guinea. The plant that has long been domesticated is, though small, perhaps one of the finest that can be grown. It has probably come from the Malayan archipelago, as it has certainly reached the very heart of the island, from 5° of South Latitude on the Fly River to as far east as the Owen Stanley Range; but it is still unknown to the north-east coast, and was, until quite lately, not grown on the islands. Very high rates have been offered in the market for the unmanufactured leaf. Like the coconut, it is a cultivation well known to the great majority of the natives, and it is a healthy and long established production of the country. It presents a very favourable opening for enterprise.

Rice has been grown by the Sacred Heart Mission on a small scale, but sufficient to show that it thrives and bears admirably. For swamp rice, or for any other wet growing crop, there is a great field in the colony, for it contains more than enough of swampy land of all kinds.

It seems very probable that sago could be manufactured profitably by establishments erected on the Lukekamu, Mambare, and Kumusi, and perhaps at other places. Native-made sago would not be suitable for refining, because it is often prepared with brackish water, and is never rewashed. Sago-making apparatus would have to be erected as far up the river as possible, on account of the supply of fresh water. This also would be an industry that would be readily understood by natives.

Land suitable for growing sugar-cane on a large scale could certainly be had at several places. As a very great variety of sugar-canes has been cultivated from time immemorial by the natives, all over the Possession, this plant is thoroughly at home there, and clearly grows to perfection. As the country is not troubled by hurricanes the chief danger to guard against would be from floods, a contingency that should be borne in mind in selecting land. No doubt a considerable amount of local labour could be obtained for growing cane and manufacturing sugar, but probably it would be advantageous to have a permanent nucleus of more skilled labour in such an establishment, from India or elsewhere. There are strong racial and economic reasons against the introduction of those peoples into Australia, but these do not apply to British New Guinea, which is not, and never can be, a white man's colony in the same sense as Australia.

It is said, however, that the sugar to be grown in Australasia this or next year will suffice for Australasia wants. If this is so a further extension of the sugar-cane industry in that part of the world seems

sitates looking for a European or American market. British New Guinea, free from hurricanes, with land for next to nothing, with local labour and convenient access to shipping, should be able to compete successfully on even terms with any other place, either for the Australasian or other market. It seems to be more a question between cane and beet sugar than between New Guinea and other colonies that grow sugar-cane.

The central district would seem to be specially suited for growing cotton. It is a dry place, the rainfall probably varying from 40 to 60 inches, and cotton seems to thrive well there. It would be tedious, and quite unnecessary, to pursue further all the different kinds of cultivation that could be followed in the colony. Practically, anything that can be grown in a tropical country could be grown there, so great is the diversity of soil, elevation, and rainfall.

It may be stated, shortly, that there are traders enough in the country already for all the present products. What is wanted now is the man who will raise new products, or extend the range of those already existing.

To facilitate this the labour law has been made as little onerous as possible. The natives would probably expect from 4. to 6d. a day with food and lodging. No forced labour or levy of labour can be granted by the Government, the policy of which is to leave labour matters as free as is practicable in the present condition of the native; but, as already mentioned, every reasonable encouragement would be given towards employing the men in their own country, it being clearly advantageous for them on social, political, and economical considerations that this should be done. The colony has no preferential trading relations—is, in fact, debarred from having such; and it has not granted, and probably would not grant, any monopoly or exclusive privileges to any individual or Company.

The tariff of customs dues is comparatively light. Machinery and building materials are free, and the same may be said of shipping gear. Necessary articles of food are free or are very lightly taxed, like rice, for example, at 10s. a ton, sugar at 2s. 4d. a cwt., and tea at 2d. a lb. Much trade tobacco is used in paying native labour, and the duty on that article is 1s. a lb. On hardware and drapery the duty is at the rate of 10 per centum ad valorem.

Of the rainfall it may be said that in the central district, near the coast, it is the lightest, apparently from about 40 to 80 inches; while in the east and west it rises to 120 inches, or more in some places.

Land can be bought only from those already holding it by Crown grant, or from the Crown direct. If sold subject to reasonable improvement conditions the price need not exceed 2s 6d an acre. If alienated by the Crown without conditions, the minimum price per acre is: For agricultural land, 10s; for pastoral land, 2s; for trading or fishing purposes, £5; for cocoanuts, 5s.

It is advised that any person or company contemplating taking up any industry in British New Guinea should begin by first of all visiting the country, or sending some person there to do so, in order that a competent and thorough examination should be made on the spot before money is sunk in any undertaking.

The Government certainly cannot in any way indemnify any person who may suffer from any enterprise he may enter into there. In a new country like British New Guinea it would be a real calamity if private enterprise should turn out unfortunately. The fitness of the place for any particular industry should, therefore, from all points of view, be well determined beforehand by a competent independent authority. The best plan would probably be to send an experienced planter to examine and select land, and to consider all other matters carefully on the spot before commencing any active operations. If such a person is sent there, and really means business, the probabilities are strong that he will obtain what he wants, and that, too, in districts where life and property would be as safe as it is in this city.

LIPTON AND TEA IN AMERICA AND CALCUTTA.

Mr. Lipton's principal tea-buyer in Calcutta having been detached to America to push the new tea selling business commenced there, a telegram has come from London intimating that it is indispensable Mr. Duplock should attend the opening tea sales of the season in Calcutta. Mr. Duplock leaves on Wednesday next and will be away six weeks, perhaps.

PROSECUTION FOR SELLING IMPURE COFFEE.

At the Bradford West Riding Court, on Monday, Christopher R. Hill, grocer, Briggate, Shipley, was summoned for having sold coffee that was not of the nature demanded. Inspector Randerson, one of the West Riding County Council officials, stated that on March 15th he received instructions to visit the defendant's shop and purchase various articles. He did so, and bought, amongst other articles, a pound of coffee, for which he paid 1s 8d. When he had received the goods he told the defendant's wife, who had supplied him with them, that they were for analysis. She then said, "I did not know they were for analysis, or I should have given you pure coffee." The witness found no label to indicate that what he had bought was a mixture. The coffee was weighed for him. Mr. Peel: You did not say pure coffee—you simply asked for one pound of coffee? Inspector Randerson: Yes. The witness added that he did not see the canister, and did not see what words were on it. Inspector Quinlan stated that on March 15th he asked Inspector Randerson to go into the defendant's shop and make some purchases. As soon as the transaction was completed he entered the shop, and the defendant's wife was told that the mixture was required for analysis. It was not then denied that what had been bought was a mixture of coffee and chicory. The analysis showed that the mixture consisted of 50 per cent. of coffee and 50 per cent. of chicory. The defendant, in answer to the charge, said he bought the business in November last, having had no previous experience of the grocery trade. When he took the shop over the valuation included a small quantity of coffee, between three and four pounds and the coffee that was supplied to the inspector was taken from this. He did not know that the mixture had been sold to him as impure coffee; it was sold to him in the valuation as coffee, and the canister containing it was marked "coffee." He sometimes attended to the shop, but generally his wife looked after it. He did not think she knew that the article supplied was impure coffee. The chief business done at the shop was in groceries and provisions. He sold a quantity of tea, but practically no coffee. In answer to the bench, Inspector Quinlan said the shop was a very old-established one, and was situated in the main street of Shipley. It was a busy shop, and one of the finest in that particular district. The defendant, however, said that where one person passed along the side of the street where his shop was situated a thousand passed on the other side. The shop, including a house, was rented at only £19 10s. Mr. Peel: It cannot be very large for that. In reply to further questions Inspector Quinlan said that the cost of chicory was from 6d to 8d per lb. at the outside. The price which he had paid for the coffee—1s 8d—was a very good price. The defendant was ordered to pay a fine of 10s and costs, the alternative being ten days' imprisonment.—*H. & C. Mail*, May 3rd.

Correspondence.

To the Editor.

CEYLON PLANTATIONS AND THE LABOUR QUESTION: THE VIEWS OF THE CHAIRMAN OF THE PLANTERS' ASSOCIATION.—No. 1.

Relugas, Madulkelle, Ceylon, May 11th.

SIR,—A time when every planter is as busy as he can be, and when every one has as much as, or more than, he can do to keep up with his flush, seems a very unfavorable moment, to open a discussion on the labour question. If coolies are as scarce all over the country, and coast advances universally as high, as some of your correspondents indicate, the question is, certainly one of the greatest importance to the planting community. Nevertheless I submit that its consideration by the P. A. should be delayed a short time until members have a little leisure to consider it.

It is all very well to come down with a cut and dried scheme to bring fresh coolies into the country for those who want them; but the N.D.P.A.'s scheme has been launched without any attempt in the first place to justify its existence—in other words to prove the preamble; and it entirely overlooks the two points which are in reality the *crux* of the whole question. These are (1) How is a planter who has imported, say 100 coolies, through the agency to ward off the attacks of his neighbours' kanganyies on his new force? and (2) How are coast advances to be reduced in amount?

Coolies can be got, and are now being got, from the coast by many and at fairly reasonable rates of advances—at all events cheaper than as a rule they can be had from other estates although of course they are not procured so speedily. The difficulty is to keep them. Coast advances in many cases, to my own knowledge, are reasonable and I think the cases of excessive advances, are in the minority. If the Dimbula Association succeeds in getting reliable information on this point a valuable addition to the facts will be gained.

The gravity of the question may not perhaps be disputed, and I wish merely, at the present time, to indicate that reliable evidence of the cause of the evil, and specially of its extent, should first be obtained, and that the past history of the action of the Planters' Association in connection with coast advances and the matter of crimping should be recalled.

The scheme emanating from the N. D. P. A., or rather the rough draft of it now before the public, seems to me to be in keeping with one of the growing tendencies of the time, viz., to get some public body (usually the Government) to do what the individual should do for himself, and I can scarcely believe that the Chairmen and Secretaries of the Central and District Associations would undertake and carry through the onerous duties which that scheme would unquestionably entail. The question is by no means so simple as the extraordinary rapidity of production of a scheme to solve it would indicate. No amount of recruiting will bring coolies in quantity except at certain seasons (unless with an enormous expenditure in advances). The planter (call him ignorant of coolie customs, or what you will) who (by the scheme) should send his order through the agency in January so that he may have plenty of coolies in March, April, May, would, as at present, find that he could not get them and would cry out as loud as before. But if by some chance he did get them, he would probably want to pay them off again in July, August and September or be reduced to working three days a week.

I reluctantly come therefore to the conclusion that the importing of new coolies from the coast is best left to the individual or group of individuals short of labour, while past efforts of the Association scarcely augur well for the putting down of crimping and the moderating of coast advances. Still, there is no need to be hopeless and a little more light thrown on the problem may show a solution of the question.—I am, &c., A. MELVILLE WHITE.

MR. CHAS. YOUNG'S OPINION.—No. II.

Nuwara Eliya, May 11.

DEAR SIR.—I see that the labour question and that of advances are once more agitating the Planting Community; but the S.-W. monsoon will soon be on, and the rush of leaf over, and the excitement will ease *for a time*, leaving the planters sadder and poorer, the coolies a few hundred thousand rupees more in debt, (which most of them have no intention of paying by honest work), and the kaddie-keepers so much the richer and more jubilant; and I can see no hope for any improvement as long as the present wholesale system of crimping goes on.

Now that the Tea enterprise has reached that stage that we can pretty well gauge our future production, and therefore our labour requirements, I do not think that there is much fear of any serious scarcity of labour in the Island, for I think we have nearly enough resident coolies for our general requirements, and this force is being annually increased by births, so that we are not nearly so much at the mercy of a yearly influx of Coast coolies as we were in days of old; but the cooly of the present day won't work and you may fume and rage and see all your fine flush being wasted on the trees, but you cannot get $\frac{3}{4}$ of your labour force out to work, in many cases not more than $\frac{1}{2}$. What cares Ramasamy for the angry Dorie or lost leaf? He has just secured a fresh advance out of his helpless master and so renewed his bazaar credit, and he is now going to take his ease, till the next rush of leaf is on, when a further advance or his tundu will be calmly asked for; and if his Dorie won't give way any longer to this squeezing, Ramasamy will go to his next door neighbour and *get the money!* Now, sir, it is in my opinion not so much the scarcity of labour, but the idle ways of the present cooly that is our great trouble, and I do not think that matters will mend until the present wholesale system of crimping is stopt.

In my younger days when labour was far and away scarcer than now and most planters annually lost crop from want of coolies, one would as soon have thought of picking his neighbour's pocket as attempting to crimp his labourers; it was a generally understood thing throughout the Island, that you were not to take on other estate coolies without finding out from their employer that all was fair and square about their leaving. Why can't the planters of today act by each other as they did in days gone by? There is no greater scarcity of labour now than there was then. No doubt the country bred cooly of today is very different from his brother of old, but this only makes it the *more necessary for Planters to stick to and be true to each other*, and they will find their lives much pleasanter than the present most unsatisfactory state of affairs; for if they will not help themselves, no one else can help them.

The Planters' Association and the Chamber of Commerce, as has already been proved, can do nothing; they can only advise. The planters of each district should combine among themselves not to crimp each other's coolies, and although some may not agree, that should not for a moment debar the majority from joining together and registering the names of the estates that join, and if there is any disagreement let two planters be appointed to arbitrate.

What are the District Associations doing in this all important matter? They are all constantly meeting and passing unanimous votes to press Government to give them a Railway, a Road, or an Hospital, and quite right too, but why cannot they meet and pass equally unanimous resolutions in a serious matter like this, the worry of which I am sure goes home with them daily and spoils the very night's rest of many of them.

Another way to help in the matter I think would be for each estate to start a bazaar of its own and the superintendent to see that the coolies get all their requirements on the spot at a moderate price, and keep them as much as possible out of the hands of outside harpies, in the shape of Chetties and kaddie-keepers.

In conclusion I do not for a moment recommend any check to recruiting from India. Most certainly this should be attended to, but I believe the real trouble is at home and at our own doors, and it can only be put an end to in my opinion by the planters themselves—Yours faithfully, CHAS. YOUNG

CEYLON PLANTATIONS AND THEIR
LABOUR SUPPLY.—No. III.

No. VI.

Gampola, May 14th.

SIR.—I see some of your contemporaries keep up the good old rule of "going one better" than the old *Observer*. It is a sporting way of looking at matters; but I prefer, myself, to see things judged upon their merits; and when I see half columns of editorial wisdom expended on the above-named subject, and all laboriously proving that the country has developed since Sandy Brown's time, and that the *Observer* is "out of date" because he "dwells" on what planters of that time thought about this cooly question, I really do not think the matter is being judged upon its merits. The point wanted to be settled surely is not whether the country has developed (even the benighted *Observer* can be brought to admit that, although, of course, he has been an enemy of development with his handbooks, &c.); but whether our dear friend Ramasamy, on the point in question, has developed. It is all very well to despise the wisdom of our dead Sandy Browns; but there may be some of his practical stamp living, and it may be that they will despise this irresponsible nonsense about "development." The "Times" would do well to think a little before it tackles this labour question. When it has done so, it will probably conclude with me that the foundation upon which Ceylon plantation labour supply rests is the same as of old. It is, namely, that kangani system which, with all its faults (and some of them may be remediable) has outlived all other systems, agencies, and all, and is today the only means of cooly immigration. On that point Ramasamy has not developed one iota, and will not. To find remedies for the evils of the system, to open up new fields to smooth his path upon his own lines must be our task; but let us get rid of the "development" theory, for, in all points essential to enticing him on to our tea estates, Ramasamy, to all practical ends, must be taken as the same yesterday, today and for ever. And a good thing for us that it is so!—Yours, &c.,

"OUT OF DATE."

No. IV.

May 12.

DEAR SIR,—With reference to the correspondence which has recently been appearing in your columns, I think the experience of any planter who has appreciably increased his labour force during recent years, through sending money to the coast by a kangany, would be highly interesting.

So far as I can judge this system is now reduced to a farce, and the sooner the fact is recognised by planters the better. After having squeezed what money he can out of a superintendent a kangany departs for the coast full of promises. When it suits himself, he returns with a few relatives and dependents, but in all probability without a single *bona fide* new coolie.

What then remains for a superintendent to do but take on local labour at a high rate. Although the policy is a suicidal one in the long run he at least gets something for his money in the meantime.—I am, &c., A CENTRAL PROVINCE PLANTER.

No. V.

May 14th.

SIR.—Mr. Charles Young deserves the thanks of the whole planting community for his admirable letter. The present position of matters could not be more accurately portrayed. His diagnosis is as perfect as, I have no doubt, his remedy would be effectual. Planters have only themselves to thank for the present state of things, and if they would all agree not to employ nor to allow to be employed on contract, work a single coolie who could not show his writ en discharge from his last employer the labour difficulty would disappear in three months, and the coolies would be taught that they are no longer masters of the situation as they certainly are at present.—Yours faithfully,]

CUSTOS.

DEAR SIR,—May I again add my humble item in *re* the "Labor Difficulty." If agencies are to be appointed you advocate agencies carried on by Companies, such as the "British India Company" and Maetaggart & Co., established in Tuticorin; and throwing cold water on agents generally, cite failures of years ago; others eliminate the kangani system from the question; and two agents are already in the field offering their services on commission "per capitem": The Northern Districts Planters' Association propose an agent paid Rs. 3,000 a year plus commission "per capitem", also ignore the presence of a kangani by advocating "the appointment of one of the gang to act as kangani and be put in charge of the consignment for which he would receive commission &c." Now the above are the very causes of the failure of the agency system. The agent *must not reside* at Tuticorin; he must be located centrally in the Coolie Districts and personally superintend the recruiting of coolies, the recruiting to be instituted by private enterprise and the agent appointed and instructed by a "Labor Intelligence Committee" formed by members of such private Company of Planters, with or without the support and recognition of the Planters' Association. *No commission "per capitem" must be paid.* This would only lead to recruiting promiscuously and hurriedly. The agent must be an experienced Planter who has an interest in the recruiting of suitable coolies, and whose work shall reflect credit on himself. It is very easy for a Company or agent and sub-agents to collect from the "highway and byeways" gangs of coolies and send them across to Ceylon on commission "per capitem," who, on their arrival on the Estate for which they are consigned, find that their relations and friends are stationed on other Estates, and by dribbles drift away to their friends leaving the kangani to mourn the loss as sole representative of, and security for, the advances. The coolies must be recruited by a kangani belonging to the estate which finds the advances, in those villages, in which the friends and relations of the coolies already on the estate reside; supervised personally by the agent. Without the tie of relationship cooly advances and recruiting are a farce and *must fail*.

By all means try further north into fresh fields and obtain an entirely new connection which may or may not prove a success, but certainly the "devil one knows is better than he whom one knows not."

C. W. T.

No. VII.

May 15.

DEAR MR. EDITOR,—I see letters appearing again in your paper on the subject of labour. I am afraid all the writing in the world will have no effect. I am just going to give you an instance of the way some planters in Ceylon manage the labour question. I had occasion some time ago to pay off a head kangani of mine. A few months afterwards I saw him about and cautioned my kangani about him, and that he was on the crimp. A short time elapsed when a kangani of mine came and wanted to be paid off as he said his men wanted to go to the coast. But I told him that that was a lie, but that as I always paid a man off at once if he wished to leave to come at 4 o'clock and I would settle his account. This I did and gave him a paid off toondoo, believing he was being crimped by my old head kangani. I wrote on the paid-off toondoo "If this kangani should present this to the Superintendent of such and such an estate (naming the estate) would the Superintendent communicate with me?" never dreaming for one moment that any planter would take on any labour without seeing his paid off toondoo. But anyway, in this case—these crimped coolies (about 20) of mine were given work, and the paid-off toondoo never asked for. This is the cause of the labour question. If men will act in this way, well, coolies will get like their masters. No planter should take on any coolies without a proper paid-off toondoo, and if you wish to make any remark about the Kangani write it on the

toondoo, and then whoever takes these coolies on, does so at his own risk. By working thus we should soon get rid of those scoundrels who go round getting high advances. I heard a case the other day which certainly opened my eyes. I made a remark about the dreadful state of things the advance system was coming to, and a reply was made to me:—"Yes, and it will get worse. Why fancy so and so actually likes to have his coolies with large debts, for he thinks this keeps a hold over them." This I am sure is true and if men act so, nothing will ever put a stop to this wholesale crimping and large advances.

As for the Planters' Association it is very good in its own way, I daresay, and would be more so if some fresh blood was allowed to enter in; but under the present mode of working, it would take fifty years to get over the first preliminary points—to much talky-talky.—Yours, &c. X. Y. Z.

No. VIII.

DEAR SIR.—I believe that the Ceylon Planters want a number of Indian coolies for their Estates. Would you kindly place me in communication with them and oblige.—Yours faithfully,

ALEX. M. TRUTER.

No. IX.

SIR,—At this time when the "authorities" are taking up the sticks upon this all-important subject, I would venture to suggest that you should reproduce Mr. Wilson-Wood's letter on the subject which appeared either in *Observer* or "Times" or both (about September?) last year. It is a deliverance very much to the point, and should, *inter alia*, be duly considered, for the simple reason that no point can be of more importance in this puzzle than the point as to the financial basis upon which the Advance System rests.

If Mr. Wilson-Wood's theory is sound, coolly immigration carries with it its own guarantee of stability, and, as Mr. Chas. Young more than suggests, the chief drawback, so far as planters are concerned, that the system suffers from, is the suicidal policy of "beggar my neighbour" which so many, in these latter days, regard as wisdom!—Yours, &c.,

AWAY WITH THE CRIMP.

No. X.

May 15.

DEAR SIR,—Your correspondent from Dambadeniya shows a full and practical knowledge of the coolie districts, but he makes a mistake when he refers to the number of resident coolies. *Resident* in my sense of the word, does not include those who journey to and from their villages. 1. It would not surprise me to find in the records of the Immigration Department that so few of the incoming coolies had been in Ceylon before. My words were "These know not the country of their fathers." I must further disagree with "Planter" when he says that it is a bad sign to find so few entering Ceylon who had been there before. That proves that many remain never to return.

In continuation of my former letter I would wish to narrate another successful importation of outside coolies—not into Ceylon but into Mysore. The labour in Mysore is chiefly composed of Eastern (Moodlars) and Ghaut (Naad) Canarese. But on the estate which I was first in charge of, two men from the Shevaroy Hills (Salem) had brought, some years before, a large number of Tamil coolies. My former instance was Canarese brought amongst Tamils. This instance is Tamils brought among Canarese. These Tamils, when their Doraias were burnt out and compelled to leave, chose to stay; and there they were when I was there. Many of them took trips all the way to Salem and Arcot and brought other coolies back with them every year. Besides this there is the whole Telugu country untouched. This is not a case for the Planters' Association. The Chairman has too great a fondness for forgetting the dignity of his position and writing to the Press. It is not a case for any special appointment of a General Agent. Let some of our big Companies send and recruit in the North and their requirements will soon be supplied. There is much in what Mr. Young

and others say when they deprecate the cry of insufficient labourers in the country. Short time during the greater part of the year and a squeeze for two months. How is that to be met? I should say by pruning to avoid having an unduly large area in full flushing trim in the months of April and May. Now I come to a very different story indeed. The P. A. comes in here and serious steps should be taken. Mr. Young, one of our chief V. A.'s and a prominent Planter, formulates a terrible charge against his brother planters in his letter of May 11th. I cannot say I have found crimping to be so rampant. I have known Chetties and Kaddie-keepers put pressure on gangs in order that the Kangany should again put pressure on the Dorai for more money—falling receipt of which the Kangany demands his tundu and refuses to stop. If the tundu is once issued the writer of the tundu cannot complain if another planter in his sore need and trouble hails the arrival of the tundu-bearer as a heaven-sent messenger. We cannot cry out if the wretched harassed recipient joyfully pays the amount of the tundu and *something more besides*. That is not crimping. We must halt and examine the meaning of the word. Mr. Young may have come across, as he seems to have done, numerous instances of crimping. He should show the men up. In Mr. Young's younger days (no pun meant!) which he refers to in his letter, he had no "tundu" system in vogue. Gangs were held together by the cohesive force of blood-relationship and village-ties, rather than, as at present, by the wretched bondage and slavery of Chetties' extortionate agreements. Thus coolies owed allegiance to but one master and he was a fair Britisher, instead of, as now, a host of greedy remorseless extortioners. The remarkable rareness of Tamils repudiating their advances speaks well for the natural honour of the race; and I think it would be better that such cases, as that of Mr. Sinclair, never reached the Courts; because they simply open the eyes of the kanganies to the weak points and flaws of our laws. If we kept our checkrolls here as they do in Mysore all danger of undergoing Mr. Sinclair's experience would be at an end. The checkroll would be ruled like this:—

Total debt from last month.	Amount pay this month.	Total amount of rice and cash advances	Balance debt.
-----------------------------	------------------------	--	---------------

Thus except to a few coolies, there would be no pay-day. You could start by ascertaining and settling each coolie's indebtedness to the kangany, each sub-kangany's indebtedness to the head kangany, and all the debts could be put against either the pay list or weeding contracts. Then mooteries could be signed beginning with the head kangany downwards. Then every month fresh advances would be issued and carried on, and by this means, except in a few instances, there would never be a pay-day, never any pay-due, no extortion by the kanganies and perfect safety from the uncertain humours and conflicting judgments of our Supreme Court Judges.

ABERDONENSIS.

No. XI.

SIR,—I quite agree with "Custos," that Mr. Charles Young deserves the thanks of the whole planting community for his letter.

The want of combination amongst us seems to be the great cause of the rise in the rate of coast advances. If districts, or groups of estates even, combined, and engaged not to take on coolies from each other, without thorough enquiry from the last employer, the power of the kanganies to raise advances would be checked. I do not think any one can help noticing how many tundus are to be seen, just before a busy month, such as April. It is certain that the planter does not give these tundus of his own free will, but the kanganies give notice, because they can get better terms elsewhere, and the employer is obliged to give a tundu to save his advances.

The kanganies with large advances are not blind to their own interests, and do not want to bring fresh labour from the coast, and for my own part I would never advance money to send to the coast, to a kangany who was heavily indebted to me.—Yours faithfully, 20 YEARS' EXPERIENCE,

No. XII.

Talawakela, May 17th.

DEAR MR. EDITOR.—I have just read your very emphatic article in your issue of the 16th and must say, I feel you are still uninformed, on the great vital question—our life and blood—the Labour Supply of Ceylon. I have more extensive knowledge than you and all your correspondents, if past experience can count for anything. I have opened more acres of Ceylon in coffee and I am inclined to think, even in tea than all your correspondents. Forty years experience should entitle a man to have an opinion of his own.

Scarcity of labour has from time to time, for these 40 years occurred periodically, but the receding wave has returned the following year and more than made up for the great vacant sand beach, covering it over with a surplus till most estates could only give 4 days work a week. An occasional famine in India has often filled our ranks to overflowing and will again (although I pray not). Mortgagees ill-treated coolies, in the dark days. Many had to go home unpaid and the stream of immigration, was stayed and has never been perennial since.

As our wants have increased, so has our morality decreased, the "tundu" system has come in. A more vile and corrupt practice, never existed among honest men in any country. It originated in the dark days of coffee depression when planters desired to get rid of their indebted surplus labour and has grown and magnified, until every rascally nefarious kangani considers himself grievously wronged if you happen to offend him. Should you refuse his request, he demands it as a right, let his indebtedness be ever so great. Chetties and usurers are deeply involved in this species of blackmailing, which flows and ebbs, according to needs and wants. Just now it is decided, and persistent. I know a case, where a tundu kangani demanded R50 a head for his gang besides I know there is a system come in professionally; where lazy scoundrels wander about and offer 3 or 4 coolies at R20 a head, needy men give it. They work as little as they can for a couple of weeks, or so and bolt to a distant part of the country and dupe some other needy man. The Chetty does not get his interest "in" on Ramasany's big debt, because master has not paid or is not farther squeezable. So says the Chetty.—"Get a tundu, I can put you in the way of getting the needful plus my interest." so on, and so on. We get deeper into trouble, when labour is scarce. Demoralization, vileness, cupidity and all manner of abominations are creeping into our system!

Now say you. "Give us your Panacea for all the ills you mention"?

Here it is: "let not another tundu be written" by any planter in Ceylon. let Chetties suffer, let Kanganies "squirm" in their own vileness, till they again become honest men, who trust to their own, and coolies' industry to work off their debts.

Let the law say:—every honestly paid advance, to kanganies and coolies shall be honestly wrought off in honest labour, for which it was in all good faith given, or repaid in sterling money, not however obtained on the "tundu" system. In a few years as in olden times we would be surrounded by honest kanganies, not "restless vagabonds" but permanent good servants, as of 30 years ago.

Let every planter look to India as his field for recruiting. Any planter having to pay off a gang, give them a writing to the effect he has done so, and let them look for employment, as all honest workmen have to do. Ten years ago I wrote to a leading planter (F. W. L.) asking him to bring the "tundu" system before the C. P. A. as I then saw the thin end of the wedge was introduced, of all the rascality since sprung from it. I have used it myself, but never have had an idea of it as a door to every evil the labour system may be surrounded with. All honest men must feel the truth, of what I have written, then why perpetuate a system so fraught with crime. Let it be banished for ever, now, and hereafter, and the very word and name be deleted from every honest planter's "Tamil Vocabulary."—
Yours faithfully,

AGRICOLA.

CEYLON TEA IN AMERICA.

SIR.—Though by no means an upholder of the Tea Cess, yet seeing that we are perforce obliged to pay it, it behoves us to at least try and get the best value for our money, and I think Mr Mackenzie's letter shows us how this can be done namely by judicious advertizing. I am quite prepared to support that part of his scheme, but I must emphatically protest against any more of our hard earned money being spent in supporting canvassers in America whether ex-planters or others. We have of late heard rather too much of certain gentlemen now in America, who appear to have constituted themselves into a mutual admiration society. Their object is laudable enough, to make an honest living, but I very much doubt if the results to be obtained by employing them will be at all commensurate with the expenditure necessary, and were the bulk of Ceylon proprietors consulted, I believe they would be found to be of my opinion.—I am etc.,

PROPRIETOR.

THE RESTRICTING OF TEA PRODUCTION.

DEAR SIR,—The efforts of some planters to create a monopoly of tea production are rapidly approaching the ridiculous and we may shortly expect to see a series of resolutions passed somewhat as follows:—By the Dimbula Association (who have all the land they want):—"That owing to the danger of overproduction Government put a reserve of R100 on all land for tea." By the Kurnegoda Association (who have plenty of Sinhalese labour):—"That owing, etc., Government put a tax of R10 on all immigrant labourers landing in Ceylon." By the Hapushima Association (a young district with good soil) "That owing, etc., Government put a tax on all manure imported." By the Muttegama Association (who have got their railway) "That owing, etc., Government make no more railways to young tea districts." By the Kalutotte Association (who have water transport) "That owing, etc., Government raise the railway rates on tea and manure." And so on. There is far more danger of increased production by manuring and introducing more labour which will take effect at once than from increased planted acreage which cannot affect the market for some years and which withdraws labour from the manufacture of tea in the meantime.—Yours truly,

B. B. B.

JAVA CINCHONA COMPANIES.

The annual general meeting of shareholders in the Western Java Cinchona-growing Company was held in Amsterdam on April 25th. The directors, in their annual report, mentioned that the Tjiloerian estate had been handed back to the Government, and that another plantation, Bajahang had been sold to a Dutch-Indian syndicate. The company received from its estates, in the course of 1894, 2,739 bales (203,000 kilos) of cinchona-bark. In 1893 the receipts were 2,137 bales (171,000 kilos). Besides cinchona, the company grows coffee; but at present the yield of that crop is insignificant—only a few hundreds of pounds. The total number of trees on the company's two plantations is 1,456,931 cinchona and 260,600 coffee trees. The average selling price of the company's cinchona in 1894 was 3 9/10c. per unit; in 1893 it was 3 8/10c. The year's working shows a profit of 21,614f. (about 1,800l.), the greater part of which goes to recede the loss on the operations for 1893, leaving a net profit of 10,727f. (about 900l.)

THE AMSTERDAM DRUG MARKET.—The Java Cinchona bark auctions, which will be held in Amsterdam on May 9th, are composed of 5,902 bales and 276 cases, weighing in the aggregate 517,823 kilos; the manufacturing-bark represents 26,705 kilos of sulphate of quinine, being an average of 5.40 per cent.

Liverpool, April 25th.—Kofa nuts continue to meet with a ready sale; 40 bags sold at 10d and 15 bags at 11d, while prime dry are held for 1s 3d per lb.—
Chemist and Druggist.

TEA CULTIVATION IN THE CAUCASUS.

The following information on the subject of tea cultivation in the Caucasus is extracted from a report to the Foreign Office, dated the 16th October, from Mr. P. Setevens, Her Majesty's Consul at Batoum:—

The tea plantations at Chakva, near Batoum, belonging to Messrs. K. and S. Popoff, tea merchants, of Moscow, have been considerably extended this year under the supervision of the Chinese tea planters, who were brought over in 1893; a large number, about 600, natives of the Caucasus, are also employed in working on the plantation of this firm.

In a letter to the "Caucasian Agricultural News," Mr. A. Solovtsoff, who for several years past has been cultivating tea on his estates at no great distance from the lands belonging to Messrs. Popoff, gives a somewhat interesting account of his experiences in the raising of this plant since the year 1884. He states that at that time his chief concern was the question of procuring tea plants for planting, he feared to order seed lest old seed should be sent, besides this the seed of tea contains a volatile oil in considerable quantity, which, during a long voyage, would be likely to evaporate, and thus the seed would have been rendered sterile. Even the seed raised at Chakva requires the greatest care and attention, as excessive dryness deprives it of the oil, and too much damp causes it to rot.

Eventually, however, he succeeded in obtaining a few plants, which arrived at Batoum in the month of July, 1885, together with some seedlings; the condition of both left much to be desired, as they had received but little care and water during their transit, and were to a great extent damaged by the Customs authorities, who used quicklime for the purpose of disinfecting them against the importation of phylloxera. They were, subsequently, transported to Chakva, and with as little delay as possible planted on his property; at first they grew badly and all the shrubs dried up, but some of the seedlings took, and from these he was able to develop his plantation.

The land chosen for the plantation was a red clayey soil, dressed with a thin coat of manure composed of thoroughly rotted leaves and branches, &c., that had fallen from the trees; after clearing away the manure the land was dug up for a depth of about 21 inches and the top soil was worked to the bottom.

The seeds ripen in the course of a year and are gathered in the month of October, at which time the plant also flowers. The seeds, after being collected, are strewed with dry sand and are kept in earthenware vessels. In March they are damped with a solution of camphor, spirits, and water, in order to force their growth. The seeds are left damped with this solution for some hours, and are then put back into the earthenware vessels, after being mixed with damp earth. In this earth the seeds begin to shoot up, and they are then transplanted into the nursery beds, the soil of which is the same as that of the plantation, but which has a certain proportion of sea sand admixed for the purpose of rendering it more friable. The seeds are sown at a distance of $3\frac{1}{2}$ inches apart at a depth of $1\frac{3}{4}$ inches. As soon as the young shoots make their appearance above ground it is necessary to cover them over with mats in order to protect them from the excessive heat of the sun, but this protection should be removed in rainy weather and at night. In dry weather the young seedlings have to be watered once a day, and under this system of cultivation it is found that every seed comes up; mole crickets, however, create great havoc among the seeds. These insects, Mr. Solovtsoff says, are the only enemies of the seedlings with which he has to contend, and they are most difficult to deal with, although it would appear he has found means whereby the ravages caused by mole crickets may be minimised. The methods which he adopts to attain this end are, the annual removal of the nursery beds to fresh ground, and the burying in the nursery beds, in a line with the burrows of the crickets, of grains of Indian corn boiled in a solution of arsenic, or, what is still better, a solution of corrosive sublimate.

The propagation of the tea plant by means of cuttings should be avoided, as a large proportion of the cuttings do not take, but the chief objection is that those that do only produce very weak plants.

Now that he has an almost unlimited supply of seedlings, Mr. Solovtsoff intends transplanting only the stronger ones into the plantation. The seedlings remain in the beds the whole year, and are then planted out 4 feet apart from each other.

The only attention which the plantation requires is that it should be freed from weeds twice a year. For the first year the young plants should be protected from the rays of the sun by branches of trees. It has not yet been found necessary to artificially water the plants in the plantation. Up to the present, pruning, with a view to increasing the crop of leaves, has not been resorted to, as the chief object has been to obtain as large a quantity of seed as possible for the multiplication of the plants. No manure has been used hitherto, but when planting out the seedlings this year it was intended to manure the soil with timber ashes and refuse from oil mills.

During the dry season, May and June, when the heat is very great, the grown up plants stand the climate very well, but as mentioned before, the young plants have to be protected from the sun. The winter of 1892-93 was exceptionally rigorous, the frosts being as severe as 6 degrees Reaumur, but neither the grown up plants nor the seedlings suffered in any way, although the latter were, for several days covered with snow up to the very leaves. This result is particularly gratifying when the fact, that the very young seedlings are planted in a quite open and low-lying plain fully exposed to the wind, is taken into consideration, and when subsequently transferred to the plantation do very well.

The plantation covers about 5 acres, and as planting has been carried on as seed has become available, it contains plants of all sizes, ranging from 5 years to $1\frac{1}{2}$ year's growth. The number of plants was 5,150, and about 8,000 seedlings were to be planted out during the present year, there is a sufficient quantity of seed in stock to raise 40,000 more seedlings, and the quality of the tea (*Thea Viridis*) is said to be good.

It is also reported that about 43,000 acres of Government land in the neighbourhood of Chakva have recently been purchased by the Department of Crown Estates for the purpose of turning them into tea plantations, and in connection with this, the above Department has ordered a Commission which will include the Inspector of Imperial Domains in the Caucasus, to proceed, at the end of this year, to India, Southern China, and Ceylon, with the object of thoroughly studying the methods of tea culture in those countries.—(No. 1481, *Foreign Office Annual Series*).—*Board of Trade Journal*.

THE GREAT WESTERN TEA COMPANY OF CEYLON, LIMITED.

A general meeting of the shareholders of this Company was held at the office of Messrs. J. M. Robertson & Co., the Agents and Secretaries, today when the following report of the Directors was submitted:—

Your Directors submit their annual report and accounts for the season ending 31st March, 1895, which are of a satisfactory nature.

The yield of Tea during this period has been 372,233 lb., which is 27,001 lbs. over the amount secured for the previous season; and the cost f.o.b. in Colombo is 29.49 cents per lb., including 3.40 cents per lb. expenditure on manuring.

After estimating the unsold Tea at a safe valuation, the amount realized for this product is Rs21,420.82, which is equal to fully 62.18 cents per lb., showing a net profit on the cultivation of about 13 cents per lb.

An interim dividend of 5 per cent for the half-year ending 30th September, 1894, amounting to R29,200, was paid on the 19th October, 1894. The sum now available for distribution is R92,202.27; the profit for the year representing 21 per cent on the Capital. The Directors recommend that the available amount be disposed of as follows, viz.:-

Depreciation—Buildings 10 per cent on	R21,443.12 =	R2,144.31
Machinery 15 per cent on	R16,302.04 =	R2,445.30
		R4,589.61
Reserve Fund	R10,000.00
Dividend at 13 per cent	R75,920.00
leaving to be carried forward to the next account	R1,692.66
		R92,202.27

The prospects for the season 1895-96 are favourable. The crop has been estimated at 400,000 lb. of Tea.

Mr. F. W. Bois having left the island on 19th February, has resigned his seat at the Board, and on the invitation of your Directors Mr. Henry Bois has become a Director.

In terms of the Articles of Association, Mr. Dunbar, one of the Directors, retires by rotation; but being eligible, offers himself for re-election.

It will also be necessary to appoint an Auditor for the new season.

Mr. J. C. Dunbar, who also represented Mrs. May Ryan, and Mr. C. G. Ryan, presided and the others present were Mr. T. Mackie (representing also Mrs. Mackie, Mrs. Stronach and Mr. A. Cantlay); Mr. H. Bois (who also represented Messrs. W. B. Baring and F. W. Bois); Mr. D. S. Pace as attorney for Mr. W. Jackson; Mr. R. Davidson as representing Messrs. W. Taylor and R. Collinson; Mr. D. R. Marshall and Mr. W. Moir as representing the agents and secretaries. Mr. Moir read the notice calling the meeting and the minutes of the previous meeting.

The CHAIRMAN in moving the adoption of the report said it showed an improvement on the previous one, last year's crop being exceeded by 27,000 lb. of tea, while the cost of the tea laid down in Colombo was less than last year, being 29.49 cents as compared with 31. The 29.49 cents included 3.40 spent on manure and the upkeep of a large cattle establishment. Their tea had realized 62.48 per lb. as compared with 57½ per lb. last year. The prospect for the coming season was very favourable. He had lately gone over the estate as Visiting Agent and in his report to the Secretary he stated that he saw a considerable improvement in the general condition and appearance of the property since the Company acquired it two years ago. The estimate for the coming year was 400,000 lb. tea. Whether they would continue to have the good prices that they had obtained this past year he could not say, but they hoped for the best. He ought to mention that since the report had been drawn up they had received telegraphic advice from London to the effect that there was R3,100 to be added to the amount realised for tea sold during the year bringing up the amount to be carried forward to R4,800.

Mr. MARSHALL seconded and the report was unanimously adopted.

On the motion of Mr. DAVIDSON seconded by Mr. PACE a dividend of 13 per cent was declared making a total of 18 per cent for the year.

The CHAIRMAN said that according to the Articles of Association it fell to him to retire this year, but he was eligible for re-election and was willing to serve again.

On the motion of Mr. MARSHALL seconded by Mr. DAVIDSON, Mr. Dunbar was re-elected,

On the motion of Mr. MARSHALL, seconded by Mr. PACE, Mr. John Guthrie was elected auditor.

A vote of thanks to the CHAIRMAN, proposed by Mr. MARSHALL, terminated the proceedings.

OPIMUM OR QUININE IN FEVER CASES.

The report of the Opium Commission contains expression of an opinion that we think will be open to much criticism and difference of view. In Ceylon, as in all fever-haunted countries, this question must be pronounced of more than ordinary interest. The report referred to, more than insinuates that opium may be quite as efficient a prophylactic as quinine in the treatment of fever. It may perhaps be thought that those interested in Ceylon might be scarcely unprejudiced judges on this dictum. It is, of course, the case that, as a cinchona-growing country, and as one that has suffered heavily by the serious fall in price of this, Ceylon should desire to see the use of the bark extended. At the present time, and at the present rate of consumption, it is little likely that the cultivation of the cinchona tree in Ceylon can be made profitable. Java, for various reasons, mainly of soil and climate, has given this island the go-by in this particular case. Until prices may advance there is no likelihood of our planters here being able to recover lost ground and able successfully to compete with the Dutch Colony in this production of Cinchona bark. Any chance that there may be of this advance in the future, must certainly be largely nullified if it is to be accepted on the report of the Commission that opium may be used as effectively in cases of fever as is quinine. What we desire in this matter is to hold the balance fairly between the value of the two prophylactics, if, indeed, opium is to be rightly classed as such. Let us for the sake of argument concede that the two drugs may be taken as on a level as regards both their preventative and curative effects in fever. Having for that reason conceded this, we may pass on to consider the further question as to whether, while quinine would be morally innocuous, the same can be said for the use of opium and the other drugs allied in character. Whatever the Commission may report as to the general effects of the use of opium, no resident in the East will deny that it possesses a fascination tending to lead from its moderate to its immoderate use. Even the Commission does not deny the baneful results of the last. And we have in Ceylon numerous cases around us justifying the contention that these follow in all such instances. Now quinine has no fascinating qualities. To most, we should say, it is absolutely nauseous. When resorted to therefore it leaves no temptation to use it save for its immediate curative effect. As regards opium—always assuming for argument that its anti-febrile qualities are equal to those of quinine—the case is entirely different. Once anyone—whether European or native—becomes accustomed to its use, the habit of resorting to it is liable to increase. It is a many-sided drug. Its effects in the earlier stages of use are pleasurable. It soothes the brain and relieves the oft-experienced trouble of insomnia, and in many other ways exercises a seductive influence. And yet what can be more shocking to witness, or more debasing to every good instinct of our nature, than the results of the constant resort to the drug? If for no other reason than this, we should advise people not to

act on the assumption that fever may be warded off or cured as efficiently by opium as by quinine. With the use of the last the cure effected can be attended by no such evil after-consequence. With that of the first there remains an ever present danger. It has yet to be proved, we believe, that our concession that the drugs are on a parity as regards their anti-febrile qualities may be claimed. But we have said enough, we think, to put people on their guard against being led away by what the Commission has reported upon this aspect of the question dealt with by it.

TEA SWEEPINGS; CAFFEINE.

LONDON, May 3.

That exceedingly occupied man, Mr. Christy, favoured me with a lengthy conversation this week. It was my desire to learn his views as to the recent Customs Order on the subject of tea sweepings. Before entering into detail with reference to this, Mr. Christy informed me that a mistake had been made by me when before imputing negligence as to this matter by the India Tea Planters' Association. It was, he said, mainly due to the exertions of Mr. Sighe of that body that the Circular mentioned had been issued by the Customs. He thought with me that there was a need for some better means than now exists for insuring concurrent action between the several bodies interested in this and similar questions, and I understood him to approve of your suggestion that a Joint Committee of these should be constituted by which such matters as this 'tea sweepings' question could be dealt with. He evidently thought that, so far as it goes, the Customs Order was a satisfactory one. It had certainly had the effect, he said, of wholly putting a stop for the present to the sale of these sweepings to continental revampers. He told me that this practice hitherto almost passed belief; that the trade had been carried on in the most unblushing manner, and with little or no attempt at concealment. It was, however, impossible now. When asked by me if the order did not leave it open to the warehousemen to continue their malpractices by not placing the sweepings in the dust box—as I had suggested to you seemed to be possible—Mr. Christy replied that attempts of this kind had been made. The Customs authorities had, however, become so active in the matter that these attempts had now been put a stop to, and he felt secure that no sweepings were now sold that had not been treated as laid down by the law. Mr. Christy showed me a sample of the tea that had been revamped at Rotterdam and sold for food in this market as Broken Pekoe Points. On my remarking that it *looked* all right, he observed that I could scarcely have read the analysis furnished of it and published in the *Tropical Agriculturist*. It was, he said, full of impurities of a serious kind, however fair-seeming it might be to the eye. He did not think, he remarked, that for the present it would be needful to take further steps to guard against repetitions of the offence.

INCREASED DEMAND FOR CAFFEINE AND ITS EFFECT.

"But what I strongly feel," Mr. Christy went on to say, "is that the whole present system of disposal of tea is monstrous. It is monstrous, for instance, that there should be an annual wastage of 400 tons in the form of warehouse sweepings. Nothing can justify this, and the whole value is abstracted from the planters' pockets. It is the practice of rebulking here that

is responsible for this waste. It seems to me that the tea planters now have the remedy for this in their own hands if they can only be stirred up to avail themselves of the opportunity. Perhaps you are aware of the fierce competition of the last few days at the Mining Lane sales. I had the representative of one of the largest tea-broking firms in here yesterday. He was quite hoarse with the shouting he had had to do at the previous day's sales. What is the cause of this sudden activity you ask? It is due to the fact that the caffeine manufacturers have within the last week or so almost swept the markets bare of the commoner sorts of tea. The demand for caffeine is greatly increased, and it is that which is causing the competition at the tea sales. This, of course, greatly strengthens the hands of the tea planters. They have been the victims hitherto of the home traders, who impose upon them charges for interest, and for losses in weight &c. that there is now no reason for. Let the planters at once say they will have no more of these charges and deductions. If they are continued, let it be known they will sell locally, and will not ship home for the dealers to work with. This would at once put a stop to the present bad system and would add largely to the producers' profits. First and foremost the abandonment of the practice of rebulking should be insisted upon. It is this that produces the 400 tons of annual wastage. Let the planters do as I have myself done, accept the Customs statement of tare and tret, and insist on buyers accepting that as the basis for purchasing with all risks upon it. The planters are now quite in the position to make this insistence. The game is in their own hands if they will but see it. I am quite content with the Customs' estimate of weights. Its officers open two or three boxes of a break, and upon the weights in these they make their estimate for the whole break. They cannot be, and are not, much out, and their results would be satisfactory both to the planter and buyer. The latter should purchase taking all risks upon that Customs' estimate, and then there need be no long warehousing charges, nor those for interest as now made, nor for rebulking. The wastage of 400 tons would then disappear. The large London tea agency firms will, of course, oppose my suggestion, but they no longer have the power for this opposition in their hands. The planters can now insist upon the observance of any course they deem best for themselves. Their tea sells as fast as it can be put on the market, and it need scarcely be warehoused at all. Where, therefore, is the ground for warehousing and interest charges? As I have said, a threat to sell the produce locally would bring the Home agencies to their bearings and put a stop to the unjustifiable burdens that have hitherto had to be borne wholly by the planters."

I have endeavoured to reproduce as faithfully as is possible for me to do what Mr. Christy said to me. To one so little acquainted with the practices of the tea trade as I am, it has, of course, been difficult to fully follow all that was suggested and remarked to me. But probably what has been written is accurate enough to place your planters *au courant* with Mr. Christy's views and opinions. The experience of that gentleman is so great, and the soundness of his judgment so highly respected, that much weight is to be attached to these. If I have accidentally in any degree misrepresented these, my apologies are due to Mr. Christy in

advance; but so far as my memory serves me do not think that this has been done, at a events not to any material extent—London *Cor*

THE MAHAUSA TEA COMPANY, LTD.

The Directors beg to hand you herewith a copy of the Crop Account and Balance Sheet for the year ending 31st December, 1894.

The Crop amounted to 148,287 lbs. (an increase over 1893 of 4,989 lbs.), and this has realised £5,308 0s 7d or say an average of over 8½d (8.59d) per lb.; 1d more than last year.

The expenditure amounted to £3,652 17s 9d (the expenditure at the Estates being R45,844.54, or at exchange 1.1½d = £2,602 12s 8d) The average cost per lb was therefore 5.91d.

The profit on the year's working amounted to £1,722 10s 1d, and this, after making an adjustment on account of previous year, and allowing for Manager's Commission, Interest, etc., leaves in Profit and Loss Account a Balance of £1,642 11 11

Out of this the Directors have paid a Dividend at the rate of 10 per cent. per annum for 6 months .. 607 10 0

This leaves for distribution .. 1,035 1 11
And from this the Directors recommend a final Dividend at the rate of ten per cent per annum, absorbing ... 607 10 0

And leaving a balance to be carried forward of .. 427 11 11

The total dividend paid for the year will thus be ten per cent.

Your Directors have decided to build a new factory on a site at the bottom of the estate, where water power will be available and where fuel will be more easily obtainable. They came to this decision with some hesitation, but it was strongly recommended by Mr. Buchanan, who visited the estate, and by Mr. Milne, the visiting agent. This arrangement necessitates the acquisition of a small piece of land for the new factory site and also permission for a waterway through a neighbouring estate, and as soon as these matters are settled the new factory and turbine will be purchased.

The estimate of crop for 1895 is 155,000 lb., and the estimated expenditure at garden is R43,027.

Mr. BRYANS is the retiring Director, and, being eligible, offers himself for re-election.

Messrs. WOODMAN, TULLOCH and EDDS, the Auditors, also retire, and offer themselves for re-election.

MEMO. OF AREA.

Under Tea Cultivation:

	A. R. P.
In bearing ..	467 1 35
In partial bearing ..	29 1 16
	496 3 11
Udder timber ..	13 0 24
Unplanted (including Forest) ..	100 2 27
	113 3 11
Total ..	610 2 22

THE CEYLON AND ORIENTAL ESTATES COMPANY, LIMITED.

REPORT OF THE DIRECTORS.

The Directors submit herewith the Audited Accounts for the past year.

Short crops were the rule in Ceylon during 1894, and the Company's estates may be said to have done well in giving an output of tea only 4 per cent short of the estimates. With a better market for all grades, the average price of the Company's tea sold in London rose to 9.16d per lb., as against 8.41d in 1893.

As will be seen by the accounts, there has been charged to capital, in respect of new buildings and machinery, the sum of £4,066 6s 11d. This expenditure includes the extension and improvements of Factories at Bogawatte, Denegama, Peradenia, and part of the cost of the new Factory at Keenakelle.

Renewals and repairs to buildings and machinery cost £691 1s 8d, which has been met out of revenue, and the sum of £500 has in addition been written off for depreciation.

Mr. Thring visited Ceylon last autumn, and returned well-pleased with the way in which Mr. Denison, and the Superintendents under him, have managed and developed the estates since his previous visit in 1892.

An agreement has been entered into for the purchase of Oorangalla estate, a property of some 470 acres, of which 300 acres are planted with tea. This place adjoins

Oodewelle, and having no factory of its own, the tea will be manufactured at Oodewelle as soon as the building there has been enlarged and the necessary machinery put up.

Deegalla estate, an outlying division of Nartupana, has been sold for £950, as its distance from the latter place made it expensive to this Company to work.

A third instalment of debentures, viz., 35 bonds of £100 each, was paid off on the 31st March. The debenture debt now stands at £89,500.

The balance at credit of profit and loss Account, after paying debenture interest and all charges, and providing for depreciation of buildings and machinery (as explained above) is £7,668 1s 10d, which shows a satisfactory return upon the capital of the Company. The Directors recommend that this balance be appropriated as follows:—

	£	s.	d.
To reduction of Debenture Issue Expenses Account ..	3,542	8	2
To payment of the Preference Dividend (less Income Tax) ..	983	16	9
To payment of an Ordinary Dividend at the rate of 5 per cent per annum (free of income tax) ..	2,763	4	0
To carry forward to next account ..	378	12	11

The retiring Directors are Messrs. Hugh C. Smith and Charles Arthur Reiss, who, being eligible, offer themselves for re-election.

The Auditors, Messrs. Broads, Paterson & Co., are appointed by the trustees for the Debenture-holders, but are eligible for election by the shareholders.

SCHEDULE OF ESTATES.

VARIOUS PLANTING NOTES.

TOBACCO.—The outturn of this staple product of the Peninsula is considered to be above the average this year. The leaves are now being cut and cured, and the merchants will commence their purchases by the end of this month. Last year the Jaffna tobacco fetched the highest price known for several years both here as well as in Travancore. The price of a Candy of tobacco of the best sort was in Jaffna last year as high as R250. But owing to a good crop here, and the large stock remaining in Travancore and Cochin, it is expected that the same sort will not fetch this year even R200 per Candy. —“Hindu Organ.”

TEA PLANTERS IN INDIA will be interested to learn that Russia threatens to become a rival in tea growing. The Agricultural Society of Russia has recently taken up the question of tea cultivation in the province of Batoum, and with this object has instructed Mr. Khugen to purchase large plots of land near Charka. Last summer they were examined by Mr. Krasnow, a Professor of Geography at the Kharkov University, who said in his report that they would, if cultivated, compare favourably with the tea plantations of Japan and Ceylon. A party consisting of Messrs. Krasnov, Khugen, and some other gentlemen was to leave Odessa about the end of February and visit the chief tea-producing centres of the world, including, Darjiling, Ceylon, China, Canton and Japan.—*Madras Standard*, May 1st.

RUSSIA AND TEA.

Mr. T. Klingen, "Chief of the Russian Expedition of the Appanages"—in other words of the Expedition to gather information about Tea in the East, has been in Ceylon for some little time, having visited Kandy and Peradeniya Gardens and the Estate Tea Factory and was very much interested in all he saw. Mr. Klingen was not very well afterwards, and has been keeping quiet; but having returned to Colombo, he called on us today and is prepared to run up to Nuwara Eliya and visit some of the plantations in the higher districts before going on to China and Japan.

For the present, he has only a very short time to give to Ceylon; but he hopes to return in November and spend two months here to collect all possible information about our industry and business. We hope the result may be to convince Mr. Klingen that Ceylon can supply all the delicate line teas required by Russia; and further that in the face of our *cheap labour*, favourable climate and great general facilities, it is hopeless for his countrymen in the Caucasus to compete profitably in the production of tea. We bespeak all attention for Mr. Klingen: he is attending the Colombo Tea Sales today and hopes to go to Nuwara Eliya tomorrow. So far from being jealous of the "Commission," there is nothing like letting Mr. Klingen see and learn everything he can in our Ceylon tea country to enable him rightly to estimate what our planters can do, and to stir up the interest of himself and his countrymen in our enterprise and tea. In December-January next, we hope Mr. Klingen will be able to visit the majority of our districts from the Western sea-borde to the *ultima thule* of Uva.

COMPANY REPORTS: THE MAZAWATTE
TRADE MARK.
COMPANY REPORTS.

With this are forwarded to you two Companies' reports, being those of the Hunasgeriya Tea Company and the Mahaousa Tea Company. The first of these reports states a profit for the year dealt with of £1,407 12s 2d. Out of this a dividend of 4 per cent is proposed, £498 being carried to the Suspense Account. The average selling price of the Tea is stated to have been 7.36d per lb. The Company has 789 acres under tea and 30 acres under cocoa. The directors of the Mahaousa Company report a profit for the year (nett) of £1,642. A dividend at the rate of 10 per cent per annum has before been paid, and a similar one is now proposed. This report has the advantage of letting us know the *cost* of the tea produced. This is stated to have been 5.91d on the average, and it must be confessed that this is a much higher figure than we had been prepared for when compared with statements of cost we have heard made by other growers of tea. The price obtained averaged 8.59d per lb., and the profit therefore falls considerably short of the 100 per cent deduced from statements before commented upon. The area of the Company's properties is, however, small, only 496 acres being in bearing, and this doubtless accounts for the higher relative cost per pound of made tea when that of larger estates is taken into comparison.

In reply to my application for the reports of the Madulsima and Ilaputale coffee companies. Mr. Davidson, their Secretary, writes me from Edinburgh that they are delayed in issue owing to

the sudden illness of two of the Directors and of himself, but he hopes to be able to send them to me shortly.

THE MAZAWATTE TRADE MARK.

You will see by the extract given below of a Law Report that the Mazawatte Tea Proprietors have again been successful in the hearing of the case against their trade mark in appeal. My own opinion is, as you know, that some of the judges who have tried this case have fully appreciated all the points involved. Probably no one who has not resided in Ceylon, or who has not watched the effects of estate names on prices in Mincing Lane, could fully do so. But Messrs. Densham have now got the use of their beloved "Mazawatte" name guaranteed to them, and respected as these gentlemen universally are, it would be hard to refuse them our congratulations on their reaching their haven of rest after all the disquietude the action against them must have occasioned.

IN RE DENSHAM AND SONS' TRADE MARK.

This was an appeal from a decision of Mr. Justice Romer (reported in our impression of January 23, and 11 *The Times Law Reports*, 184), refusing to remove the name of "Mazawatte" from the register of trade marks. The word had been registered by Messrs. Densham as a "fancy word" in connexion with tea under the Patent, Designs, and Trade Marks Act, 1883, and had also been registered for an extended use in connexion with tea and coffee. Since the amendment Act of 1888 was passed, an Act which, it may be remembered, substitutes, for permission to register a "fancy word," permission to register an "invented word," or a word having no reference to the description of the goods, and not being a geographical word. The case is of some interest, owing to the length to which decisions have gone in restricting the nature of the word allowed to be registered. The applicant was a Mr. Deakin, who did not deal in tea and coffee; but was prevented from registering a trade mark "Maaza" in certain classes by reason of the registration of the respondents' mark. Suggestions were made that the word "Mazawatte" was a compound of Cinhalese and Hindustani, and was descriptive of the goods, or geographical, or both.

Mr. Moulton, q.c., Mr. Hopkinson, q.c., and Mr. John Cutler were counsel for the applicant; Sir Richard Webster, q.c., Mr. Cozens Hardy, q.c., Mr. Neville, q.c., and Mr. Sebastian for the respondents were not called upon.

LORD JUSTICE LINDLEY said he confessed that at first he thought this appeal as hopeless as it possibly could be, and he thought so still. He entirely agreed with the decision of Mr. Justice Romer and the reasons given for the decision. The word "Mazawatte" was clearly, in his opinion, a fancy word in common use, and therefore within the description of a word allowed to be registered as a trade mark under the Act of 1883, the Act under which the respondents first registered. With respect to whether the word was a fancy word he asked the question whether anybody ever heard of it. The answer was that no one who knew Hindustani, Cinhalese, or English, and no one acquainted with the tea trade, ever heard of it. Then he got to the Act of 1888, under which the respondents had registered in another class. The question under that Act was whether the word was an invented word or a word having no reference to the character of the goods for which it was used, and not being a geographical name. He considered all these definitions as applicable. His Lordship characterized some of the suggestions as to the word being descriptive or geographical as absurd. He did not know, if this word was not capable of registration, how any word could be invented that was. It was not their Lordships' business, he said, to fritter away an Act of Parliament, and if they went the length of disallowing the registration of this word, he was unable to find how any word could be invented that could be used as a trade mark.

Lord Justice Lopes, after saying that the case had gone quite far enough in holding words to be incapable of registration, and that the effect of the decision, if this went any further, would be to evade the Act, gave judgment to the same effect.

Lord Justice Kay concurred, and the appeal was dismissed with costs.—*London Cor.*

COCONUT PLANTING IN CEYLON.

Coconut planting appears to be a thriving and promising investment in Ceylon just now. The price (in silver) has gone up, it is said, beyond the most sanguine expectation of those interested, and as a result the cultivation is extending rapidly. Capitalists invest their money in coconut plantations with the greatest confidence, and the acreage of new lands that will be opened during the next planting season will be much over what it was in previous years. The question that suggests itself is whether the present prices will keep up, or, if they should come down, how far should it be to appreciably affect the industry. No other planting product, whether native or English, rice or tea, could stand just at present a fifty per cent reduction, but "it can be safely said that coconuts would survive even a much greater reduction." The price may come down through over-production, but such an eventuality as over-production is not likely to occur for, perhaps, ten years, or till all the young plantations which exist at present come into bearing; it may go down through a waning of the demand, but there is no immediate likelihood of another product replacing the coconut partially or wholly; in fact, the field for coconut products is daily extending. It is admitted that the fall of exchange has not been without influence in promoting this industry.—*Irish News*, April 20.

PLANTING AND PRODUCE.

TEA IMPORTATION DIRECT TO MANCHESTER.—There is every prospect of the importation of tea to Manchester being continued. The trade has taken up the question in a very satisfactory manner, giving prompt attention to the samples, which have been and are being got ready as rapidly as possible. Up to the present the demand for the teas imported by the ss. "Linthgow" has been greater than the Custom House authorities and bonding warehouse could at once cope with. The Customs authorities have been most courteous, and have done the utmost possible with the staff at their command, which will certainly require to be increased in order to deal successfully with the gross weighing and taring of tea in such large quantities as will be imported to Manchester before long. We understand, says the *Manchester Guardian*, that although some Indian tea is usually ready at the garden by the beginning of May, this would not be suitable for the Manchester standard of taste, the first flushings being frequently poor in cup. The Manchester demand is for sound and good liquoring tea; consequently it will not be possible to obtain a shipment of this character earlier than the end of June, to arrive early in August, and arrangements to this end are being completed.

THE BUDGET AND THE TEA DUTY.—Discussing the Budget the *Daily Chronicle* says, referring to the Free Breakfast Table: "Every penny that Sir William Harcourt can spare ought unquestionably to be devoted to this object. The last Budget did something for the black-coated proletariat. It left the great mass of the people who live on small weekly wages exactly where they were, with their tea, their coffee, their cocoa, their currents, their liquor, their tobacco highly taxed. We say nothing for the moment about the liquor. Let us look at the other items in the list. Take tea. There

is a tea duty of 4d in the pound, which brings in nearly three and a half millions a year. This tea duty has to be collected, and so the tea must be sampled, repacked, and handled many times before the Customs are satisfied, and by the time the pound of tea has had the Mincing Lane profit, and the middleman's profit, and the retailer's profit added on to its original cost, plus the increment of duty and Customs expenses, which is reckoned in each time, the consumer will be taxed not 4d, but 8d in the pound. The same process is true of all dutiable articles, and we believe that in the case of dried fruits, which bring in a revenue of about £1,000 a day, the ultimate cost of collection to the consumer is excessive. It is really monstrous that the poor consumer should be taxed to this tune for his everyday needs."

JAVA TEA.—Java planters have given their attention lately to improving their methods of manufacture, and it is not without its effect. In its reference to last week's sales of Java tea the *Produce Market Review* says: "Owing to the great improvement which has been effected in the manufacture of these teas of late, chiefly through the use of Indian seed, many of the Java gardens are now producing tea of really excellent quality, the liquor being in many instances quite free from that disagreeable flavour which was formerly characteristic of these growths. At the present moment there can be no doubt that many of the Java teas now in the market are distinctly better value than any other descriptions at similar prices, and grocers have not been slow to appreciate this improvement, as they have lately been large buyers of these kinds."—*H. and C. Mail*, May 3.

TEA-GROWING IN BENGAL.

To the planter who has the "overproduction" fear already upon him, the history of the growth of the tea industry in Bengal alone during the past year cannot be pleasant reading, though it will undoubtedly bring joy to the hearts of all who are not pessimists. During last year there were 424 gardens under tea cultivation, an increase of only one on the previous year's figures; but in the average under cultivation there was a considerable increase, the figures rising from 93,000 acres in the previous year to 110,000, and the output being increased by a million pounds. The average output per acre, however, has fallen from 400 lb. in 1892 to 330 in 1893. A curious feature of the returns is the great increase in the number of temporary labourers employed in gardens and the equal falling off of permanent labour.—*Madras Times*.

HUNASGERIA TEA COMPANY, LIMITED.

The following accounts are now presented to Shareholders viz:—

Balance Sheet shewing the financial position of the Company on 31st December, 1894.

Profit and Loss Account, for crop 1894.

It will be seen from the Profit and Loss Account that the weight of Tea sold in London during the year amounted to 273,621 lb.; this included about 9,000 lb. of tea made from bought leaf. The average selling price was 7.36d per lb., and the proceeds amounted to £8,413 1s 3d including that sold in Ceylon.

The crop of Cardamoms realized £65 0s 1d.

Cocoa weighing cwt 17.2.20 was sold for £42 18s 7d the average price being 48.6 per cwt.

The total receipts from sales of produce thus amounted to £8,550 19s 11d.

The total expenditure for the year in Ceylon and London was £7,143 7s 9d so that a profit is shown on crop 1894 of £1,407 12s 2d.

It is proposed to appropriate the above profit as follows:—

To the payment of Dividend of 1	
for the year	£900 2 5
To the reduction of Suspense Account	498 9 9
	<hr/>
	£1,407 12 2

After crediting the above sum of £498 9s 9d the Suspense Account will stand at £659 18s 0d.

The crop of Tea estimated in the Directors' last Report was secured, and the profit derived shows a marked improvement on that of any former season.

The selling price of the Company's tea was very slightly below that of the previous year, while Exchange ruled considerably in favour of the crop just closed.

The latest reports from the Property state that the Tea is in first rate condition and cropping well, and indications all point to a good yield being secured during 1895.

The cultivated area is as under :

Tea	789 acres
Cocoa	30 "
	819 ..

Mr. H H Potts, a member of the Board, retires from office on this occasion, and being eligible, offers himself for re-election.

Mr. JOHN SAWYER, the Company's Auditor, also offers himself for re-election.

EASTERN PRODUCE AND ESTATES COMPANY, LIMITED.

(From the *Money Market Review*, May 4.)

The eighth ordinary general meeting of the shareholders of this Company was held on Monday last at Winchester-house, Old Broad-street, Mr. C. J. Lindsay Nicholson (the Chairman) presiding.

The SECRETARY (Mr. Douglas R. Smith) read the notice calling the meeting.

The CHAIRMAN: Gentlemen, I presume we may take the report as read, and I will now proceed to make a few remarks upon it. If I refer to the last meeting, and repeat what I then said, I could not do better, and that was the Company was never in a stronger and better or more favourable position; for, in spite of some little deficiency in the estimates consequent on bad weather, our nett profits have exceeded our last year's profit by about 30 per cent. The directors are very pleased to meet you, and to be able to speak so confidently of the concern. You will see by the report that we have made £26,466; that we propose to pay off the sum of £17,000 of debentures, and to pay a dividend, which will take £8,974, the highest dividend that we are able to pay under our existing circumstances. On the asset side you will notice that the outlay for buildings and machinery is now written off by an amount of £1,837, and it now stands at £9,281. Our machinery is all very good, but we put the knife in in the way of depreciation, thinking it best to be on the safe side. The produce on hand on the 31st of December amounted to £21,694—that has all been sold since, and sold well. Sundry debtors are £22,356—good liquid accounts—much about the same as last year. Our investments amount to £22,325, the bulk of which are in India Three per Cents. They are brought in at the value of 31st December, and I believe there is a considerable improvement in the value at the present moment. As to the course of tea, it is very difficult to forecast the future of tea prices. Competition now is very keen, production increases yearly, and there is a need of increasing consumption in markets abroad, such as Australia, America, and Canada, for it is in such that the nature of Ceylon tea is appreciated. I notice that eight years ago the consumption of Indian tea in the United Kingdom was 63,000,000 pounds, and of Ceylon tea 6,000,000 pounds. Last year the consumption of Indian tea in England was 116,000,000 lbs. and of Ceylon tea 71,000,000 lbs. (Applause.) So the Indian tea consumption may be said to have increased from 38 per cent to 55 per cent of the whole, while that of Ceylon tea in the same period has improved from 3 per cent to 33 per cent. (Applause.) There is one disadvantage that has been pointed out in connexion with Ceylon tea—it is so good, and goes so much further, that it benefits rather the consumer than the manufacturer, but that is a good fault, and we will endeavour to keep up the character of the tea. Australia, I notice, in 1894 took 7,000,000 lbs., or five times as much as in 1890, while Canada took 1,000,000 lbs., against 627,000 lbs. in 1892. I mention these interesting statistics to show how keen is the enterprise of both India and Ceylon, and to point out that we are very

much indebted to the intelligent zeal of our staff in Ceylon and their earnest desire to make your estates a success. (Applause.) the excellent result shown in the report now before us is evidence of the care displayed by the staff. We select some of our assistants from our office here, and I think our thanks are due to our secretary, Mr. Douglas Smith, for the judgment he shows in the preparation of young men for their Eastern career. (Applause.) There is one matter—which I dare say will occur to some of you—as to our debenture debt. Your board will not be satisfied until something is done and some re-arrangement of the debt has been arrived at, which will enable the shareholders to receive a dividend more in proportion to the earnings of the company. (Applause.) A prudent clause in our articles precluded at first any but a small dividend being paid until the debentures are reduced to £50,000. The prosperity, the assured position of the company, and the quicker reduction of the debentures leads the board to hope that some arrangement may be arrived at which may be more beneficial to the present shareholders than our present articles allow. I will ask you, however, to leave the matter in the hands of the board, and not to judge of the prosperity of the company by the amount of the dividend which we are now receiving. I do not think that there is anything further to allude to, but I will ask Mr. Cameron to second the resolution which I shall formally move, namely:—"That the report of the directors, dated the 19th April, 1895, be received and adopted, and that a dividend at the rate of 5 per cent per annum on the capital paid up on the preferred shares, and at the rate of 3 per cent per annum on the ordinary shares for the year ending 31st December, 1894, be declared and made payable on the 4th May, 1895." Applause.

Mr. RALPH A. CAMERON (managing director) seconded the motion. The chairman, he said, had touched upon most matters of importance, but there were two points which were encouraging. One was that, taking last year, the increased consumption of Ceylon tea had absorbed more than the increased receipts, and another encouraging feature was that of the re-export of Ceylon tea. There was no doubt that it had obtained considerable favour on the continent, and the re-exports had increased from year to year. It was reasonable to believe that when it had once obtained a footing in those countries, it was not likely to stop where it was, but that there would be a further development. (Applause.) Last year there was some slight falling-off from the estimate, but still they got over three hundred pounds an acre on the crop in bearing, and it netted 7½d per pound, or slightly over what they had received in 1893. The increased profit was to some extent due to the lower rate of exchange, but there was an increased yield, an increased price, and a smaller amount written off under the head of buildings and machinery, which would become less each year. With regard to 1895, the estimates were in, and were very satisfactory. There had been a drought in Ceylon a month ago, but the latest accounts were to the effect that rains had fallen. This was a somewhat early stage at which to predict results, but he had no reason to suppose that anything would interfere with the fulfilment of the year's hopes. They were adding to their acreage every year, and there would be another addition this year. There was one item in the profits which they attached considerable importance to, viz., the agency business. Including their own crop they had shipped a total of 9½ million pounds, or about one-eighth of the whole exports from the island. They had obtained the sole agency of a good many manufacturing firms, and enabled them to execute orders for machinery and requirements, and also to supply their own estates on advantageous terms. They were also now making arrangements to develop the engineering business at St. Sebastian mills, under their resident engineer, in the expectation of getting a considerable business in the island in the way of repairing machinery. Having the whole thing *in situ*, it only meant a development at no great cost, and he had no doubt they would find it a very satisfactory and profitable arrangement. Last year the profits from the agency business and some incidental sources had paid for the whole of the London and

Colombo office expenses and had left a considerable margin over, and he did not see why that profit should not increase. Looking at the whole position, it was a matter of extreme satisfaction to see that the success he had always looked forward to was within measurable distance, and they were justified in hoping for better things than they had even yet accomplished. (Applause.)

Mr. MERRICK asked if it was not possible to raise an amount at four per cent. to pay off the debentures. He would also like to know if the accounts could not be stated under separate heads, and why the meeting had not been held earlier.

Mr. T. A. WELTON said he had received the balance-sheet with the greatest possible pleasure. Having had something to do with the original formation of the company, he had never hoped, in the time which had elapsed, that so good a result would have been reached. The balance-sheet was particularly worthy of confidence, because, owing to the peculiar articles of the company, there was not the least inducement for the directors to spare in the matter of depreciation, to attempt to over-value stocks, or anything of the kind. The balance-sheet was a most severely true one, and the profits earned were excellent, considering the difficulties in the last few years in making headway in almost all departments of industry. (Applause.)

The CHAIRMAN said that the board would not lose any opportunity of getting money on the best terms, but it should be remembered that this company had no un-called capital, and its property was not situated in England. As to putting the accounts under three heads, tea, coffee, and cocoa, there was only one article of any importance at present viz., tea. The meeting had been held as soon as possible after the auditing of the accounts, but Easter possibly had made it a little later this year.

The motion was then put and carried unanimously.

The CHAIRMAN proposed the re-election of the retiring directors, Mr. Norman, Mr. Grieve, and Mr. David Reid.

Mr. CAMERON seconded the resolution, which was also agreed to.

Mr. REID returned thanks, and said that it was a matter of satisfaction to have been connected with this company, which had from its inception made such steady progress. The first balance sheet showed a balance of profit amounting to £35, while this year, after paying the full amount of debenture interest, they were able to show a balance of £26,600, although the average price of the tea, which was 1s per pound in 1888, was now only 8½d. In 1889 the company had no reserve fund, while they now possessed one of £10,000. Much was due to the ability of their able managing director, Mr. Cameron, who had watched most diligently over the business from the commencement. (Applause.)

The auditors, Messrs. Welton, Jones and Co., were next reappointed.

On the motion of Mr. MERRICK, a cordial vote of thanks was passed to the chairman and directors, and the meeting separated.

TEA PATENTS.

20,607. October 31, 1893. Tea rolling. Sutton, L.H., Brant Broughton, near Newark, Lincolnshire.

The hopper as well as the table has a rotary motion imparted to it by spur gearing on the shaft in order to impart a closer twist to the leaf. The hopper and table are mounted eccentrically, and they may be rotated in the same or in opposite directions by the bevel gearing shown. The interior of the hopper is ribbed for the purpose of checking the leaves, and producing a more uniform action upon them. The ribs serve also as guides for the weighted head-piece which is lowered upon the tea by a hand-wheel and is rotated with the hopper through the ribs. The saddle is pivoted at one side, and is swung aside when the head-piece is in position. The ribs may be dispensed with when it is desired that

the head-piece should not rotate with the hopper, and arms which come in contact with the saddle are provided to prevent rotation. — *Patent Journal*.

BOOMING COFFEE.

"To all who are seeking health or wealth, pleasure or profit, to the artist, tourist, investor, botanist, agriculturist, mineralogist, and archaeologist, Mexico offers the finest fruit districts, the most fertile agricultural districts, the richest mineral districts and the most nutritious grazing districts, in addition to being an ideal summer resort, as well as being an unexcelled winter resort, with homes for thrifty settlers and fortunes for investors." This is pleasant reading if you happen to be a landed proprietor in Mexico; but if you are not, you may be a little sceptical, may reach for the salt-cellar or think about general Scadder and General Choke. For the foregoing is an extract from a Philadelphian pamphlet entitled "Important facts about coffee: Its planting and profit in the republic of Mexico." Throughout the civilised world, we are told, there is at the present time a rapid and constant increase in the consumption of coffee, and, although there has been a very marked increase in the production of this new necessary article of diet in Central and South America, the still rising prices for the commodity indicate that the supply does not begin to keep pace with the constantly increasing demand. These, it is said, are now well-established facts. Are they indeed? We venture to doubt their accuracy nevertheless. But let us see how they cultivate coffee in Mexico. The altitude best adapted to coffee culture in that country ranges from 1,000 to 3,000 feet above sea-level, which, we are assured, insures freedom from malaria and all diseases that visit the coast sections, and is well suited to persons accustomed to living in temperate climates. "The preparation of the land for a coffee plantation is quite simple, consisting merely of a partial clearing of the virgin forest that covers the ground and the digging of holes one foot square and six feet apart and one foot deep into which the young plants are placed as they are brought from the nurseries. If the soil be rich and deep, 800 trees to the acre is a sufficient number, as results with this number have been found more satisfactory than with a greater or less number per acre." The italics are ours. Quite simple as the preparation of the land is, the method of cultivation, we gather, is even simpler. The work is all done by women and children, so it is very cheap, and it consists entirely of weeding. The planter in Mexico apparently occupies his times sitting on a fence, whittling sticks, picking his teeth and waiting for the third year. "During the third year the plantations yield sufficient coffee to cover all expenses, the cost of producing every 100 pounds of coffee prepared ready for market not exceeding \$8 per 100 pounds as a maximum, the market price of which at the present prices for coffee averages \$20 per 100 pounds." Appended to the pamphlet is "a careful and conservative estimate, showing the cost and profit of a 100 acre coffee plantation." Where is the planter who is not only too familiar with these "careful and conservative estimates?" It works out so beautifully:—"Thus the investor receives back by the end of the fifth year nearly five times the amount of his original investment and is the owner of a property valued at \$20,000." What a glorious prospect! Only five years planting, and then breaks a golden dawn and a perennial stream of silver dollars rolls rippling in. Will any bird be caught with such chaff? Working on just the same lines we are prepared to prove quite as convincingly that there is no more profitable investment or healthier life for persons with weak lungs than the cultivation of Dead Sea apples in the desert of Sahara.

In this pamphlet, which by the way is being scattered broadcast throughout the world, there is just one point which calls for serious consideration. Among the causes enumerated why the small capitalist should invest his money in a Mexican coffee plantation is the following:—"The decreased and constantly decreasing supplies received from Java,

Sumatra, Ceylon and other East Indian countries, which at one time furnished the world's supply. The decline in these countries being attributed to the leaf and bug disease and other causes, but which is *in reality due to overworked and worn-out soil.* Again are the italics ours. A statement like this, containing just sufficient truth to give colour to it, is calculated to do harm. And the worst of it is, there is in publication no hand-book, so far as we are aware, of the coffee districts of the East-Indies which contains the true version. We have before now urged on planters the advisability of advertising their districts in other countries. At present they are hardly known outside a very small circle in Mincing Lane. We do not recommend putting forth flaming pamphlets full of flimflams about the wonderful attractions of coffee cultivation in Indian jungles; but the product is still a fair investment, and, keeping well within the borders of truth the planter's life in Southern India has many attractions to offer. We should heartily welcome the appearance of a carefully compiled "Hand-book of Coffee Planting in Southern India" which would convey to English readers a true account of the districts, the life and the prospects.—*M. Mail.*

TEA PROSPECTS.

When one considers the very large extensions that are being opened out in the tea districts, the question of future markets is one that must force itself on our immediate attention. That the yearly output will steadily increase there can be little doubt, the problem is where to place it. A proprietor who has been recently through the districts has written a few notes on this subject to a local daily contemporary and has made one or two suggestions with which we entirely agree. He writes:—"With the enormous extensions being proceeded with in the Dooars and Sylhet in the shape of new gardens, and the large additions that are being made to old and new estates in Assam, it is difficult to grasp what our output will be in the year 1901, but I predict that it will not fall much under 180,000,000 lb. that almost all the well-known seed gardens have sold their full crop for 1895-1896 and some for 1897 goes to prove the large forward policy in extensions. From now our annual output will advance by leaps and bounds and the crucial test will soon be apparent. Can we place it and at the same time maintain remunerative prices? I am writing this in no pessimistic spirit as I am a staunch believer in tea, but unless we, as a body, bestir ourselves and give stronger financial aid to the Association to enable it to extend its wings and that as rapidly as possible, we shall assuredly live to regret our inaction and indifference in this important matter. In fact we are at present *riding for a fall* and will come the inevitable cropper sooner or later unless we can manage that our coming large increase in output be diverted into fresh channels for consumption."

This states the present position in a nut-shell. India *must* find new markets and that speedily. We are doing well in America and the success of our experiment in that direction should encourage us to turn to Russia with a practical scheme for introducing and pushing Indian tea in that country. Russia's demand is enormous and with all the favourable conditions now existing the present, as our contemporary's correspondent justly remarks is the most opportune time for beginning operations. The writer continues:—"I do not think there is much or anything to be gained by sending home fancy samples of teas to be bottled and looked upon by visitors as curious compounds, utterly unlike the leaf as sold for drinking purposes. Liberal contributions in money or good drinking tea would be much more to the point. I may be pardoned for saying so, but I consider the present contribution of gardens towards the funds of the Indian Tea Association are totally inadequate for the purpose of pushing the sale of Indian tea in other countries. The present

subscription to the Tea Association is 1 anna per acre, which I would suggested being raised to 1 annas and retained in force as long as deemed needful. This would give about one lakh of rupees per annum, which amount judiciously spent would do much to gain the desired object.

"Ceylon, in conjunction with that coming country, Travancore, will easily manage to fill the gap caused by decreasing imports from China, which leaves us no safety valve in that direction. So let us bestir ourselves and not be caught napping when the pinch comes. The charge I have suggested would be but a small item in the annual expenditure, and in my humble opinion no sounder, more necessary, or legitimate one could be levied."

This suggestion of the enhanced subscription and the despatch of a Commissioner to Russia are worthy of careful consideration and we earnestly hoped they will commend themselves to those in whose interests they are made.—*Indian Planters' Gazette*, May 11.

PLANTERS AND LABOUR SUPPLY IN CEYLON.

A very trenchant, practical and altogether important deliverance from an impartial, and yet experienced point of view, will be found on page 41, by an esteemed correspondent. It is almost as good as a summing-up of a great deal of the discussion that has taken place, and we commend its several statements, criticisms and proposals to the careful consideration of the community concerned. Is there any denial of the fact that the cry of "shortness of coolies" between March and June, is succeeded by a surplus of labour and short time work from July onwards? If not, it is not right to say that the supply of coolies is permanently deficient, and one question to be asked is, could the time for visiting the Coast not be altered from the busy, to the slack, months? This may be impossible at present, seeing the wet weather for travelling before the coolies in July-August; but if there were *through railway communication*, would the weather make so much difference?

In any case, we think the time has come to call on the Planters' Association to appoint a small, but efficient, Sub-Committee, to take into consideration all that has appeared in the local Press since 1st January last in connection with the subject as well as the Reports and information already in the Association's archives, and to analyse and report on the same with reference (1) to the actual planting requirements for coolies now and in the next five years, in the busy and slack periods of the year; (2) how best to reinforce the supply in the former, taking Mr. Young's suggestion for a through Railway as saving time and bringing more coolies, specially into consideration; (3) how better to distribute the supply as well as re-arrange the work required; and (4) to draw up regulations for general guidance as to the local engagement and discharge of coolies by all planting employers.—What transpired at the Dimbula and Maskeliya Associations will all be useful to the Sub-Committee if duly nominated.

COFFEE IN HAPUTALE.—We learn that the prospects of good Autumn and Spring coffee crops in this favoured district are exceedingly good. Two of the estates specially noted for their coffee are Gonamotava and Roehampton, and in connection with the latter it may be remarked that a contemporary was quite wrong the other day, in mixing up the proprietor (Mr. George Somes) with the recent London Tea failure. This gentleman has no responsibility whatever for the mercantile house which bore his name.

CHEAP TRANSPORT AND HOW TO GET IT:—No. III.

BY J. DAVIS-ALLEN.

WORKING EXPENSES.

(Continued.)

Continuing our remarks on the subject of Working Expenses we have now to glance at some of the circumstances by which the standard of cost per train-mile is liable to be affected, taking first the

LENGTH OF THE RAILWAY.

A locomotive can run week in week out a distance of 100 to 120 miles a day, according to speed and gradients. Lines, therefore, of a length—50 to 60 miles—which admit of a locomotive doing the double journey in the day are specially adapted for economical working in the item of train expenses, inasmuch as both machinery and men are kept fully employed. On the other hand fixed charges, as for management and terminals, tend to show less the longer the line, for the simple reason that there are more miles to distribute them over. We use the word "tend" to indicate the absence of any invariable relation between length and fixed charges such as subsists between length and train charges.

QUALITY AND TYPE OF LINE.

It is with railways as with boots, the inferior article wears badly and is costly in repairs and renewals. From which it follows that the wiser outlay of a restricted capital is on a first quality "little" railway (always supposing it will fit the traffic), with a solidly built, well-ballasted road, capacious waterways, and rolling stock of the best, rather than on a second quality "big" railway like—shall we say?—that which Mr. Waring proposes to build to Jaffna. It sometimes happens that the initial capital is so scanty as to compel the use of second-hand light iron rails, worn rolling stock, patched-up locomotives of obsolete pattern, and other economies justifiable only as being the sole alternative to no line at all. In these cases, and in all cases of inferior type or quality, Working Expenses will be increased in the items of maintenance and repairs, and the percentages in the table of costs which we gave in our last article will be correspondingly disturbed.

The question of gauge will come up for fuller discussion in connection with Capital Expenditure, but having a bearing on Working Expenditure also, some remark is called for here. Advocates of the broad gauge type of railway have done their utmost to prove that at all times, in all places, under all circumstances, the wider the gauge the cheaper to work; and amongst the apostles of this gospel none stands higher than Mr. F. J. Waring, C.M.G. witness the painstaking and accomplished paper he read on "Indian Railways" at the Institution of Civil Engineers in March 1889. With this paper, and the similar and more recently published utterances of Mr. Eddy, before us, we yet venture to hold that the relation between gauge and Working Expenses is an eminently contingent one, depending wholly on place and circumstances, and therefore that any conclusions must be doubtful which, like those set out in the paper aforesaid, are arrived at by a statistical method whose essence it is to mask peculiarities in averages. Mr. Waring's argument in favour of broad gauges is based on a table of 65 "Means" as they are called, calculated from the statistics of 12 Indian metre gauge lines and 8 Indian lines of the 5 ft. 6 in. One of the speakers in the discussion

which followed the reading of the paper challenged the way in which the "Means" had been taken out; he would have done better had he gone a step farther and asserted that the doctrine of means was altogether inapplicable. The very use of the word in such a connection ignores the radical difference between a *mean* and an *average*, a difference fundamental to the Science of Statistics. Following Herschel and Quetelet, we may put it thus: an *average* may exist for the most different and dissociated objects such as the height of the houses in Colombo, or the number of passengers landing daily, or the amount of money spent per passenger at the hotels. It may be convenient to convey a general notion of the things averaged, but it involves no conception of a natural and assignable central magnitude or norm, all differences from which ought to be regarded as irregular and anomalous. A *mean*, on the contrary, does involve such a conception. It implies a regularity in the fluctuations within the group of which it is the norm and fa cies, and an assignable maximum and minimum of variation. Again an *average* affords no assurance that what is to be, either will be, or should be, conformable to it; but a *mean* does. Mr. Waring's "means" are most of them merely averages, and will not bear the argument he bases on them. In other words, granting that the 12 narrow gauges average out badly against the 8 broad gauges, it does not in the least follow that the 13th narrow gauge will follow suit; if, however, his "means" were true means, it would follow.

Mr. Waring, then, has yet to prove us in error when, with a rapidly increasing consensus of authority behind us, we aver that broad gauge railways can economically meet the legitimate demands of the public in the matter of frequency of trains only when the volume of traffic is sufficiently large to load them to their full capacity; a state of things which nowhere obtains outside the densely populated manufacturing districts of the old world. In most of the districts now calling for railways the traffic, both passenger and goods, is, and must long remain, small out of all proportion to the carrying capacity and capital cost of such powerful machines as the 4' 8½" and 5' 6" gauges. The insistence on them under such circumstances has two inevitable and disastrous issues: (1) that to keep the capital outlay to the amount the traffic will bear, an inferior type of construction and equipment must be adopted; and (2) that to keep the cost per ton-mile (the favourite unit of the broad-gaugers) to a presentable figure, the work must needs be done with as few trains as possible, to the serious inconvenience of the public which is entitled to a certain frequency of service. And here we come upon a point of difference between broad and narrow gauges, and in favour of the latter, to which sufficient attention has not been given, namely that in virtue of the lower cost of their rolling-stock, the closer approximation of dead to paying load, with sundry other advantages, they are able to supply more economically the train-mileage in excess of pressing and present demand which is necessary if the latent traffic of a district is to be stimulated.

The returns of broad gauge lines look best when figured out per 1,000 gross ton-miles, and it is for this unit Mr. Waring pleads in his comparison of the Indian broad and narrow gauges. But a fitter measure of the *serviceableness* of a railway is train-mileage, and the check on extravagance is the ratio between expenses and earnings per train-mile; which figure also measures the effectiveness of the supply in stimulating demand.

Broad ganges seldom come out well under this test. Their working expenses in the items of maintenance and repairs wear a sinister look unless figured out on a mit which gives credit for gross load; but we question whether credit should be allowed for wear and tear due to the unnecessary dead-weight of quarter filled 5' 6" rolling stock—the average load on the C. G. R. according to the 1893 Report.

THE NATURE OF THE TRAFFIC

is commonly accounted a determinant of Working Expenses, and it is so in cases where (1) either goods or passengers are greatly in excess, or (2) the bulk of the goods traffic is mineral, or (3) the traffic is mainly end-to-end, or (4) is seasonal or intermittent. The effect of a predominance of either goods or passengers on cost per train-mile came up for remark in our last article in connection with the Cape Government Railways. The difference is seen mainly in the item of Station Charges, but to be material the line must be almost exclusively either for passengers, like the "Metropolitan" of London, or for goods, like the "Hull and Barnsley." Obviously these cases rarely occur in new countries, where, indeed, the bulk of the traffic is of a nature which admits of being dealt with by "mixed trains." The second and third conditions above-mentioned make for cheap working; the fourth tends on the whole to increase expenditure. But while undoubtedly the nature of the prospective traffic is a consideration to be kept prominently in mind by the promoters of new railways, in nine cases out of ten it is the specifications for plant and rolling stock, not the estimates of Working Expenses which will be modified thereby.

There are other factors, some technical, some economic, which share in the determination of Working Expenses, and which must therefore be taken into account before the standard of cost—2s 6d per train mile, can be safely used unchanged as a basis for estimates: wages, fuel, water, rates and taxes, climatic oddities. Our purpose however is, not to exhaust the subject, but to say so much thereupon as will serve to enforce the axioms that there are no fixed rules for railway enterprise: that precedents have no value except as hints and warnings; that if a railway is built of a certain pattern because other railways have been so built it is pretty certain to turn out unsatisfactorily; and lastly that in the problems which have to be solved before the first sod of any new railway can safely be turned the plain man has a share and a voice which he cannot judiciously delegate to the Engineer.

In our next article we shall deal briefly with the relation between Management—State and Company—and Working Expenses; and shall then take up some of the questions which arise in connection with TARIFFS.

PLANTERS AND LABOURERS: THE CINNAMON INDUSTRY AND THE DESERTION OF "PEELERS" WORKING UNDER A CONTRACT SYSTEM.

Tea planters in Ceylon are not alone in their experience of disturbing, if not contradictory, judicial deliverances in reference to the relations existing between employers and labourers on plantations. The oldest, and at one time the most important Planting industry in Ceylon—that of cinnamon (the spice which, sent from our shores to Rome in the time of the Emperor Augustus, sold for the equivalent of £3 per lb)—is much disturbed at present in its head-

quarters in the Negombo district by the difficulty of securing punishment for labourers who break their contract and desert their employers, perhaps at the most critical time of the whole year when the Cinnamon bark is ready to peel and when a few days and a change of weather may make a vast difference in the value of the crop. If ever there was a case where prompt punishment is needed, one would say it was in the case of deserters under such circumstances—labourers taking advantage of the absolute and urgent necessity of their employers to show their importance if not to vent their malice by running away from their contracts, knowing how extremely difficult it will be to fill their places. For, unlike ordinary estate coolies, cinnamon peelers are a class by themselves and may in fact be considered to be "skilled labourers." The only parallel we can give is that of the trained hands of a tea factory at the very busiest time of the year, without cause deserting their posts. How should the Law and the Courts treat such a case?

In the case of the spice industry, it is not, apparently, that in the present year there has been any special increase of "desertion" from cinnamon estates; but that the present Magistrate of Negombo—unlike any of his predecessors—has decided that cases of desertion and breach of contract such as we have described, should be proceeded against, not criminally—by issuing warrants for the apprehension of the deserters—but through civil actions. A "civil action" against a bolting cinnamon peeler!

Let us now proceed to deal more in detail with the state of affairs revealed by the proceedings in our *Supplement*, and in doing so, it will be observed how applicable is much of what we write to the case of tea planters and their labourers. First, to quote from the Introduction to Messrs. Lewis and Crawford's admirable compilation:—"Plaints under the Master and Servants Ordinance":—

"In any country, in which slavery is illegal, the relations between master and servant must necessarily exist by virtue of some agreement, either express or implied between the parties—in other words they are created by contract. The remedy for breach of contract is ordinarily by civil action. The experience however of different countries has shown that, so far as regards this class of contracts, the remedies afforded by the Civil Courts are inadequate for the due protection of either master or servant." "Whereas much loss and inconvenience are sustained by manufacturers * * * from fraudulent breach of contract on the part of artificers, workmen and labourers, who have received money in advance on account of work which they have contracted to perform; and whereas the remedy afforded by suit in the Civil Courts for the recovery of damages is wholly insufficient and it is just and proper that persons guilty of such fraudulent breach of contract should be subject to punishment" &c. (Preamble to the Indian Act No. 13 of 1859). In the words of Sir C. Marshall "a criminal prosecution is the only remedy in very many cases, which from the relative situation of the parties, and from the circumstances of most servants, can be made available to their employer." * * *

"It is because the circumstances of most servants would incapacitate them from paying damages that the breach of their civil contracts of service are thus punishable criminally. In other words, the fear of punishment, operating on the mind of the servant, is given to the master as a protection against misconduct in the room of a pecuniary indemnity, which, if awarded by a decree, could seldom be actually recovered (910 D. C. Coll, 1835, Judgments p.p. 490, 500).

Now let us see how the Cinnamon Planting Industry has been hitherto worked, and the fol-

lowing information on this subject is from an undeniable authority with long experience of the working of plantations:

PEELER-CONTRACTS AND THE ADVANCE SYSTEM.—The maintenance of the cinnamon industry depends upon, among other things, penally enforced contracts extending over a term of years. Advances ranging from R10 to R30 each are made to the peelers on written contracts, executed in the manner prescribed by clause 7 of the Ordinance No. 11 of 1865, whereby they agree to peel and prepare cinnamon "on all the days, except Sundays," during a term of three years, it being important to secure an adequate force so as to take in the available crop when the conditions for peeling are favourable; otherwise the crop depreciates if it is not harvested at the proper time from the spice becoming coarse in quality, or, if it has become too coarse to peel, the out-turn of quill bark is diminished. There are two distinct peeling seasons in the year, the *maha mosuma* or big crop, which usually begins some time in May and the *puchie mosuma*, or small crop, which commences on some date in November. The peeling is adversely affected by drought and the flushing of the bushes and whenever this happens harvesting operations cease till such time as the conditions for peeling are again favourable. Although, when a break of this kind occurs, the peeler is offered other work on the estate, at a rate of wages which the ordinary Sinhalese labourer is satisfied with, he seldom avails himself of the offer and leaves the village in search of more congenial occupation. If he succeed in the object of his search he is often tempted to stay away altogether taking care to conceal his whereabouts from the two individuals most concerned in his welfare, namely; the Cargany and Superintendent, thus defrauding the estate of his services and the money advanced. Others again take advances from estate after estate with no intention whatever of performing their share of the contract and with the money thus obtained by fraud hold high carnival during the Sinhalese *Auruda Mangalya* and having "rubbed themselves with oil" elude the clutches of the several dupes by mysteriously disappearing just about the time work begins on the estates.

The peeler being a skilled workman, his place cannot be filled by an ordinary labourer, with the result that serious loss is caused to the estate as previously stated. It seems to be unfair to the employer that a labourer absenting himself without leave during the period of his contract can practically deduct the time of his absence from the term he has to serve and it also seems unfair to both that if, on arrest after the expiry of the term of his contract, the labourer is willing to work and the employer to accept his services the Court cannot pass an order to that effect.

The intention of the existing Ordinance which governs the relation between master and servant is that breaches of contract should be treated criminally; but the law seems defective or capable of being so interpreted as to afford several loop-holes of escape to defaulters as the case under notice illustrates. The contract does not stipulate that notice of the date of commencement or resumption of work shall be given to the peelers, for the peeling season is a period well ascertained and understood in the business and, as skilled labourers, (peelers from their childhood up and descendants of peelers) they ought to know, and do know very well, when the cinnamon is peelable. It is absurd, therefore, to suppose that a peeler who keeps away for not one season only, but for several successive seasons and in some cases for the whole term of his contract is not aware that during his absence harvesting has been going on on the estate where he has contracted to work. To hold, as the Magistrate has held in case No. 19211, that a defaulter, who for a period of more than 11 consecutive months failed to attend and carry on the work he had contracted to perform, is not guilty because notice of the resumption of work could not be served on him in a *terra incognita* must work much mischief with a class of people who are so ready to take undue advantage of an opportunity for neglecting to perform their obligations. To illustrate:—It is a fact, well-known in the Negombo District, that about 9 years ago, owing to neglect on

the part of a Superintendent to prosecute deserting peelers, his successor in office, who was most alive to the interests of his employer, had to institute nearly 200 cases shortly after he assumed the management of the estate. This, it is said, led to the Government inquiring how it was that there was such a sudden and appalling increase of crime in the district!

Desertion, on the estate referred to, was soon checked by the prompt prosecution and punishment of offenders, but it is likely to break out again in an epidemic form on all estates generally when the news spreads out among the peelers that the evasion of notice in all that is required to justify the offence.

In case No. 19,217, the judgment, so far as it holds that the previous conviction of the defendant determined the contract of service and bars any prosecution for failing to return to work after the expiration of the term of imprisonment, is erroneous and against authority. The case reported in 4 S.C.C. 3, referred to by the Magistrate, is the leading case in point. The unqualified statement of the Superintendent in the previous case against the same accused that he was "not willing to receive him back" is taken by the Magistrate to imply a rescission of the contract, but it may also mean—and it is to be inferred from the statement having been made *before the conviction* that it was so meant—that the defendant should not go unpunished and that if the complainant's taking the man back was to end in the man being discharged from the prosecution he would rather not take him back.

If "the conviction and imprisonment of a servant for breach of contract operates as a rescission of the contract of service and the servant is not liable to be again convicted" then the servant might, if he is so disposed, "put an end to his contract, by a wrongful act, against the wish of his employers."

We think it can be seen from the above how the obstacles now thrown in the way of the planters in trying to recover and punish deserters, threaten to undermine the very foundations of the Cinnamon Industry—an industry already none too prosperous and which has to be worked with the closest regard to economy in every department. We think, therefore, that the Attorney-General should give every facility to have an appeal taken to the Supreme Court from the Negombo decisions, and then, if these are upheld, there should be a clear case for going to the Government and Legislative Council—as otherwise we may certainly expect a withdrawal of capital from the already far from popular, but on many grounds, important Cinnamon Industry.

ESSENTIAL OILS.

CINNAMON OIL, CEYLON.—A lively movement has taken place in the prices of fine qualities of cinnamon-chips, which ranged in the course of the last half-year from 17d to 23d per lb, the last quotations from Colombo being 2d to 2½d per lb for April-shipment. The total exports of chips average about one-third by weight of the total exports of Ceylon-cinnamon bark. The world's consumption of barks and chips together during the last few years has been, in round figures 2,500,000 lb a year. From our means of judging the position we are rather inclined to predict an advance in the price of cinnamon-bark oil.

CITRONELLA OIL. Since our last Report the prices of this important article of perfumery have gradually advanced to the extent of about 10 per cent. The consumers however have not taken any notice whatever of this occurrence, which in all probability is connected with the large exportation of the oil. For the past year the statistics show a quite unusually high figure.

With regard to the export of citronella oil to Germany it may be pointed out that the figure of 808,944 ounces does not represent the whole of the actual consumption, inasmuch as a large portion of our imports is shipped by way of England; the imports of our Leipzig house alone in the course of 1894 amounted to over one million ounces, while our New York firm alone takes more than one-third of the entire exportation of citronella oil to the United States. *Schmidt & Co., Leipzig, April, 1895.*

NEW ERA IN TEA CULTIVATION:
THE MANURING OF TEA.

There can be no doubt that we are entering on a new era of cultivation in respect of our great Tea Industry. For some years, our planters as a whole, treated with absolute indifference—if not scorn—the several warnings advanced to them in these columns by their good friend and prescient counsellor, Mr. John Hughes, the London Consulting Analytical Chemist to the Planters' Association. Mr. Hughes pointed out that it was impossible to go on taking from ½ to 2 tons of leaf per acre from their tea plantations without making any special return save in prunings and such cursory "tilth," or turning of the soil, as might be possible. In reply, many of the planters indicated their dread of manure—artificial preparations especially—as being associated in their minds with the declension and ruin of their coffee (although any connection between the outbreak of *hemileia vastatrix* or "green hug" and the application of manure has never been demonstrated); and they further hinted the proverb "Sufficient for the day is the evil thereof"—meaning that they meant to go on so long as their trees responded. But this was a shortsighted decision and its folly is now very generally acknowledged after the most practical fashion, namely, by the activity which is visible in reference to Manuring. A very short period has brought Mr. Hughes his revenge. Of course there were certain long-headed men amongst us who have all along, more especially when dealing with old coffee land, systematically applied manure, and these have not only been rewarded with better returns, but find their trees kept up in heart and vigour; while in some cases at least, their neighbours have had to complain of signs of weakness and a falling-off in crop. However, it is no use "crying over spilt milk," and our purpose in referring to the subject today is to introduce a further valuable paper sent to us by Mr. Hughes, full of most useful and practical suggestions which, we trust, will be taken into careful consideration and, as far as possible, acted on by the planters. If the several District Associations took up the experiment indicated by Mr. Hughes and endeavoured to formulate information from representative estates within their bounds, we feel sure that the value of their work would be generally appreciated. As regards the handling or moving of the soil—the "tilth" which Dimbula veterans so well recognise—we have more than once referred to our experience of Horagalla-Ingrugalla coffee estates, Hantane, well-nigh thirty years ago. How Mr. George Mackenzie (of Messrs. George Stenart & Co.) had advised the Superintendent to get ready a field for the application of 20 or 30 tons of manure to be sent up; how the latter set to work and had a big section on the hillside duly holed; but the manure never came and after some time the holes were filled in again—but what was the result a few months afterwards? An immense improvement in the coffee which so arrested our attention that we could not believe Mr. Arnott that no manure had been applied, so great was the contrast between two fields of the same age.

Mr. Hughes asks us to give the Railway returns for manure carried upcountry, as some index of the advance in cultivation. This we are enabled to do through the courtesy of the Railway authorities and it will be observed that the figures for the past six years indicate very

striking progress—an increase indeed of considerably over 100 per cent:—

	1889.	1890.	1891.	1892.	1893.	1894.
	tons.	tons.	tons.	tons.	tons.	tons.
Manure	2,572	3,576	3,355	3,141	4,154	5,818

But the progress made in the current year indicates a still greater advance. From the weekly tables we learn that in the past four months an unusually large quantity of manure has been transported:—

	Tons of Manure	
January-April 1895	..	2,381
Do 1894	..	1,468
Increase	..	913

Here, now, is Mr. Hughes' latest paper:—

THE MANURING OF TEA.

(Extract from Sir Wm. Harcourt's Budget.)

I will now turn to coffee. The consumption of this article has been steadily decreasing. In 1885-6 the revenue from it was £203,000. Last year it was only £170,000 compared with £3,500,000 derived from tea. While the population has increased 2,500,000, or 7·8 per cent the coffee revenue has diminished 16 per cent. Cocoa on the other hand is steadily growing in consumption. There has been an increase in the last year of 3,383,000 lb. as compared with 1893-4, giving an improvement of £14,000 in the revenue. Ripe fruit shows an increase of £30,000 over the previous year. These are articles representing three-fourths of the Customs revenue, which may be fairly taken as indicating the unbroken resources of the large mass of the nation.

The last number of the *Overland Observer* dated April 9th, contained an article on the above important subject.

The statement of a planter who informed the Editor that he had given up manuring owing to the depth to which the tap roots of his tea plants penetrated, was very properly severely criticised.

If the tap roots were found to have penetrated the soil to any unusual depth, it would indicate unusual vigour on the part of the plant, and a greater depth and porosity of soil than usually occurs on Ceylon tea estates.

Indeed the planter himself regarded the case he mentioned as quite exceptional, and in his opinion it should not operate towards dissuading tea planters from the practice of manuring. That being so, it seems scarcely necessary to have brought the subject forward.

The Manuring of Tea is, or should be, a matter of practical experience.

If good crops can be obtained without the application of fertilizers, planters would be very foolish to incur the additional expense caused by manuring.

If however, there is a marked falling-off in the quantity or the quality of the leaf, the experienced planter will very soon understand the necessity of instituting a careful enquiry into the process of manufacture, the mode of cultivation and the composition of the soil.

That tea is in itself an exhausting crop, and that the repeated and often severe pruning to which the trees, are from time to time, subjected, is also of an exhausting nature, cannot be denied.

How long the soil is capable of withstanding this exhaustion depends upon its chemical composition, its physical character, the particular situation of the estate as to exposure to wind and wash, and the general climatic conditions of the locality.

On really good deep soil protected from wind, under good management and in a favourable climate, tea may, and no doubt will be, produced for many years with satisfactory results without

any special manuring, beyond the careful return to the soil of all vegetable residue derived from an occasional pruning.

On the great majority of estates, however, a judicious and moderate application of manure, varied according to the nature of the soil, the altitude and the rainfall, seems to be the rational future treatment best adapted to the production of leaf of good quality.

That the altitude and rainfall should have an important influence upon the kind of manure to be selected has no doubt been already fully recognised by planters who have had any experience in manuring on estates having a considerable difference in elevation.

Thus for lowcountry estates a more mineral and less stimulating fertilizer will probably be desirable, while at an elevation of from 2,000 to 4,000 feet, a more nitrogenous manure will be found suitable.

These are points which, together with the analysis of the soil as to its richness in Potash (the dominant constituent of the soluble ash of tea) and in Nitrogen, which forms so important an element in the composition of the organic portion of the leaf, should engage the attention of the Analyst when recommending the most economical as well as the most suitable manure.

According to the experience of the writer, this practice of enquiring into the composition of the soil and the requirements of the crop is now resorted to much more frequently. During the last year more tea soils have been submitted for analysis than during any previous year since the writer's first official visit to Ceylon in 1877.

As recently as February last, ten tons of a special manure was prepared by a London firm according to the writer's suggestion, and after careful analysis shipped for a planter in Dikoya.

The local Railway returns should indicate whether manuring is being given up or not.

While recommending the judicious application of fertilizers according to the requirements of the soil and situation, it should be always remembered that manuring (from manus = a hand) originally meant the handling or moving of the soil; hence the origin of the bare fallow during the summer months which enabled the farmer to thoroughly turn and clean his land in preparation for wheat.

This turning of the soil and exposing it to the action of the air is of the greatest importance as an agricultural operation. During a professional visit to the Vine districts of Spain in 1879 the writer was much interested in observing the local custom of treating an old or partially exhausted Vineyard, namely by digging it over to the depth of three feet and so loosening the soil and exposing it to the atmosphere as to improve the mechanical condition, while also rendering the mineral constituents available as plant food.

These remarks may be concluded by suggesting that it would be a useful thing to ascertain how far the regular prunings of the tea plant constitute an exhaustion.

Let the prunings from ten trees be carefully collected and the leaves and twigs separated and weighed in their fresh green state.

Let these be carefully sun dried, again weighed, and about 1 lb. of the dried leaves, and 10 lb. of the dried twigs should be packed in sealed bottles and forwarded for analysis with the necessary particulars of the number of trees per acre, and the respective weights of the fresh and dried leaves and twigs.

The information so obtained would be of practical use and if the several District Associations would each take the matter in hand and agree to

the future publication of the results in a tabulated form, the details would be of general interest to the planting community of the Island.

JOHN HUGHES, F.I.C.

Agricultural Analytical Chemist,

79, Mark Lane, London, E.C.

May 3rd, 1895.

INDIAN PATENTS.

Calcutta, May 2nd.

Applications in respect of the undermentioned inventions have been filed, during the week ending the 27th April 1895, under the provisions of Act V of 1888:—

For Improvements in Apparatus for withering Tea Leaf.—115 of '95.—Robert Thomson, of Kinning Park Engine Works, Kinning Park, in the Country of Renfrew, Scotland, Engineer and Tea Planter, for improvements in apparatus for withering tea leaf.

Specifications of the undermentioned inventions have been filed, under the provisions of Act V of 1888:—

For Improvements in or connected with Stoves or Apparatus for Drying Tea Leaf or other produce.

—25 '95.—William Jackson of Thorngrove, Manno-field, Aberdeen, North Britain, Engineer, for improvements in or connected with stoves or apparatus for drying tea leaf, coffee, grain or other produce. (Filed, 29th January 1895.)

The fees prescribed have been paid for the continuance of exclusive privilege in respect of the undermentioned inventions for the periods shown against each:—

For Improvements relating to Electric Traction.—56 of '91.—Alexander Login Lineff, Electrical Engineer, of 88, High Road, Chiswick, in the County of Middlesex (England), for improvements relating to electric traction. (From 10th March 1895 to 9th March 1896.)

Whereas the inventors of the undermentioned inventions have respectively failed to pay the fee within the time limited in that behalf it is hereby notified that the exclusive privilege of making, selling, and using the said inventions has ceased:—

For a "Coffee-Peeler" to be called "The Hussani Coffee-Peeler."—63 of '90.—Mr. Syed Ameer Alee's invention for a "Coffee-Peeler" to be called "The Hussani Coffee-Peeler." (Specification filed 27th January 1891.)—*Indian and Eastern Engineer*.

THE LORANTHUS OF CEYLON.

A paper was read by Mr. F. W. Keeble entitled 'Observations on the Loranthaceæ of Ceylon,' in which country the author had made a short sojourn in 1894. After remarking that in Ceylon many species of Loranthus have large and conspicuous flowers, with the corolla-tube brightly coloured, more or less tubular and lobed, he pointed out that certain deviations from the typical regularity of the corolla-tube were correlated with the mode of fertilization of the flower by sun-birds (Nectarineæ), and this was made clear by diagrams and some excellent coloured drawings. Discussing the mode of distribution of the seeds, Mr. Keeble first quoted the views of Engler and Prantl, and the remarks in Kerner's 'Pflanzenleben' (English edition) on the dissemination of the European mistletoe, and then detailed his own observations in the case of tropical Loranthaceæ. The modes of germination of various species of Loranthus and *Viscum* were then described, as well as the curvature and growth of the hypocotyl, and the effect of contact on the latter and on its suctorial disc; the paper concluding with some remarks on the forms of fruit and seed of Ceylonese species of Loranthaceæ.—*Athenæum*, May 4.

A BIG DRIVE IN TEA.

[Here is a good example from the editorial page of the *American Grocer* of how a certain class of tea is pushed in America.—Ed. C.O.]

Last year tea was lower in price than known in this country since 1850. The average import cost per pound was 15 1-10 cents. Appreciating this fact, and with a desire to make it thoroughly known to the public and, at the same time, bring credit to the tea dealer, Thomas Martindale & Co. offered the trade through the *American Grocer*, a blended tea known as the "Caricol blend, packed in barrels and put up in packages, at a bulk price of 15 cents per pound. To do this required a knowledge of the merits of all varieties of tea and how to combine them, so that the mixture would make an infusion which had aroma, body and good color in the cup. The offer, a generous one, was welcomed, as Martindale & Co. reported as follows: "We have never had such a quick response to any announcement we have made as we did from our two special tea 'ads.' of June 14 and 21 in the *American Grocer*. We received orders within five days of the publication from eight different States, and our shipping department was never pushed so hard in shipping teas before." So popular became the "Caricol" blend that Martindale & Co. took pains to improve and continue it as a feature of their business. The best proof of its popularity is the sale of thirty-two tons since its introduction in June 1894. They now renew their offer to *American Grocer* readers. This affords a grand opportunity to make a special drive in a meritorious article, at bargain prices. Such a move benefits a store, in awakening a new interest therein on the part of consumers; strengthening the confidence of old patrons; giving the store a reputation for being up with the times, besides advertising the business in a way which interests, attracts and gives publicity. Try it!

AN EXTRACT OF TEA.

Samples have been submitted to us of a tea extract made by Mr. James D. Cahill, who claims an experience of twenty-eight years as a tea tester and planter. We have not made a chemical analysis of these extracts, but so far as we can judge, by ordinary examination, they have a true flavor, and make a liquor of true color. The inventor of the process claims that his method dissipates a large proportion of the tannin, and that it in no wise reduces the quantity of theine in the tea. It is proposed to manufacture this extract in this country. There are many obvious advantages of having in small compass for easy carriage an extract of tea which will yield the true aroma and give a good body to the liquor, whether cold or hot. This extract will be made here at 127-129 Water street, where space has been secured to carry forward this new enterprise.—*American Grocer*, April 17.

DRUG REPORT.

(From *Chemist and Druggist*).

London, May 2nd.

CINCHONA—The London cinchona auctions which were held on Tuesday, an interval of six weeks having occurred since the last public (sales) were fairly heavy. Eleven brokers offered supplies, the aggregate of which was as follows —

	packages	packages
Ceylon cinchona ..	468 of which	428 were sold
East Indian cinchona ..	1866 "	1693 "
Javan cinchona ..	110 "	110 "
South American cinchona	331 "	165 "
Cuprea bark ..	499 "	99 "
	3274	2405

The principal buyers in order of the quantity of bark purchased by them were:—The Agents for the American works (463,362 lb), the agents for the Frankfort-on-main factory (105,786 lb), Messrs Howards and Sons (101,655 lb), the agents for the Brunswick factory (60,674 lb), the agents for the Mannheim and Amsterdam factories (34,988 lb), the agents for Auerbach factory (18,200 lb). Drug-gists bought 34,853 lb and 53,990 lb mostly Cuprea bark were bought in.

COCA-LEAVES—A parcel of 20 bales fine green broken Truxillo leaves had been declared for sale, but it was privately disposed of before the auctions.

KOLA-NUTS—Steady. A parcel of 40 bags fair brown washed kolos was bought in at 1s 6d to 1s 8d per lb, chips at 1s 4d per lb. Of seven packages West Indian, one bold brown Grenada sold at 1s 6d. For another lot of four bags small to fairly bright pale kolos 1s 2d is asked a bid of 1s 1d being rejected.

NOTES FROM THE METROPOLIS.

I have been reading with great interest MR. ARTHUR SINCLAIR'S new book, "In Tropical Lands," from which you have extracted so fully in your columns recently. With regard to what Mr. Sinclair says as to the origin of the name *Musa paradisica* for one variety of

PLANTAIN,

I may quote the following from Yule's *Hobson Jobson* :—

The specific *paradisica* is derived from the old belief of Oriental Christians (entertained also, if not originated, by the Mahomedans) that this was the tree from whose leaves Adam and Eve made themselves aprons. A further mystical interest attached also to the fruit, which some believed to be the forbidden apple of Eden. For in the pattern formed by the core or seeds, when the fruit was cut across, our forefathers discerned an image of the Cross, or even of the Crucifix. Medieval travellers generally call the fruit either *Musa* or 'Fig of Paradise,' or sometimes 'Fig of India.' The Portuguese also habitually called it 'Indian Fig.' And this perhaps originated some confusion in Milton's mind, leading him to make the Banyan (*Ficus Indica* of Pliny, as of modern botanists) the Tree of the aprons, and greatly to exaggerate the size of the leaves of that *figus*. Col. Yule gives a number of quotations from writers of the 14th century and onwards illustrating this superstitious belief. He also shows who the other specific name for the plantain, *sapientum* (i.e. "of the sages") arose out of a misunderstanding of a passage in Pliny, who describes a fruit which Rumphius took for the plantain, but which was really the jak.

I notice that "Cosmopolite" writes to you regarding

A SUBSTITUTE FOR INDIARUBBER AND GUTTAPERCHA

which is a "new discovery" "in the forests of Surinam," and is called "bolaa." Surely *balata* is meant; and this is by no means a "new discovery," as reference to the past volumes of the *Tropical Agriculturist* will show.

SYMMETRY AND THE SUGARS.

A DISCOURSE ON ATOM LINKING.

We may safely affirm that to the major part of the fashionable audience which assembled in the Theatre of the Royal Institution, on Friday evening last, the utterances of the president of the Chemical Society were distinctly cryptic. Yet Dr. Armstrong spoke, almost pleaded, for his cause, with an enthusiasm and vigour which made it plain that he held the matter of his discourse to be of high importance if the nature of it was a little over the heads of the average scientific amateur. In a word, he was endeavouring to secure some recognition and appreciation for a small band of pioneer chemists who are working far away from the beaten tracks at some of the most fascinating problems which Nature presents in the "chemistry of the carbon compounds." School mathematics may fairly fit us for a conception of modern physical science, but school chemistry—the chemistry of the good old phosphorus and oxygen type—helps us in scarcely any sense to an understanding of the mysteries of "atom linking" and the marvels of "isomerism." The pioneer chemist is here slowly approaching the secret processes which Nature carries out in the laboratory of life. With a few of the simplest of materials—mainly carbon and water—Nature working with the vital processes of

animal and vegetable life can build up a thousand strange, unstable compounds which at present baffle the scrutiny of mere human chemistry. Carbon is peculiarly the element of the organic world. Organised material is almost exclusively made up of "carbon compounds"; but although the workings of the vital force which moulds them are still as great a mystery as Life itself, yet we know that the reign of the law of chemical combination is just as assured over the constituents of organised as over those of mineral matter. The chemist has never yet succeeded in forming a single organic cell. He is as far off as ever of constructing the long-expected lifeless protoplasm, but from the marvellous developments of the past 40 years he has the most lively hopes of some day building up a number of those organic food substances which at present have to be obtained for human needs by the sacrifice of other members of the animal creation. Dr. Armstrong did not, however, venture to forecast the future so far as this. He contended himself with the curious illustrations of progress offered by the wonderful family of "sugars." While the British house-wife would be content to classify the sugars into "lump," "moist," "Demerara," and so on, the British chemist would surprise her with the announcement that there are only sixteen possible sorts of sugar, and that those which she has enumerated are all one and the same. He would further remark that only eleven out of these sixteen have at present been met with in nature or prepared in the laboratory—for the fact need not be withheld any longer that the artificial preparation of the sugars is nowadays one of the commonest feats of commercial chemistry. Those other five "sugars" the chemist is as certain about as he is of his own existence. They probably have never yet come to light in all the long history of the globe we inhabit, but the chemist is serenely certain of their possibility, and will undoubtedly amuse himself one day by introducing them in a concrete form to the world. The main interest of the sugars is the proof they afford us of the wonderful practicability of the atomic theory. They may be all regarded as composed of carbon and water, but the secret of their diverse natures lies in the fact that these materials are built up either in different proportions, or, if in the same proportions, then in different ways. The atoms of carbon, oxygen, and hydrogen are like so many toy bricks, each fitted with mortices and tenons, so that they can be built up into edifices of varying shape. The hydrogen bricks have only one point of attachment, the oxygen have two, and the carbon four. A carbon brick requires either four hydrogen bricks or two oxygen bricks to satisfy all its links, or it may have two hydrogen and one oxygen bricks attached. Still more strangely, it may be compelled to go into partnership with only two hydrogen bricks, but in that case the chemist knows that the two spare links of the carbon brick are then joined to each other, for every link must in some way have a partner. But the business gets still more complex when instead of one carbon brick we have six of such bricks or various multiples of six, as in the case of the sugars. Dr. Armstrong illustrated this process of "atom linking," not by toy bricks, but with coloured balls with holes and pegs. Here we may have a whole line of carbon atoms strung together by two out of each of their four arms, and presenting on either side spare arms for the attachment of oxygen and hydrogen atoms in various symmetrical and unsymmetrical ways. It soon ceases to be a case of combining single atoms, and passes into one of grouping together special compound sets called "radicals," which, owing to this remarkable handiness of the carbon atom, are looked upon by the organic chemist just in the same light as the inorganic chemist looks upon his simple atoms. Every variation in the grouping means a new and probably quite distinct chemical compound, and yet not only are the ingredients the same, but may actually be in precisely identical proportions. Then, further, we have another strange thing in the so-called "law of symmetry." These carbon compounds vary according as the house of bricks built up is

symmetrical or unsymmetrical. You may have exactly the same number of each sort of bricks in the house, but if you have given it a lop-sided appearance, then a solution of the sugar produced will twist out of its path a ray of polarised light. Some compounds possess a right-handed, others a left-handed twist. Pasteur found out that he could prepare two sorts of tartaric acid, one natural, the other artificial. Both seemed practically identical, yet Nature's tartaric acid gave a left-handed twist to polarised light while Pasteur's gave a right-handed. Later investigations have shown that this curious rule of lop-sidedness seems to run throughout the whole of organic chemistry, and that compounds may exist which are the image of each other, just like a right-hand glove is an image of its left. We have endeavoured to give some faint conception for popular purposes of the matter which Dr. Armstrong dealt with. Knowing that through investigation such as this the world is indebted to the discovery of almost every new compound of value that modern chemistry has given us, there will be no difficulty in agreeing with him as to its high value and importance.—*Daily Chronicle*.

ESSENTIAL OILS IN THEIR RELATION TO THE BRITISH PHARMACOPŒIA AND TRADE.

By JOHN C. UMNEY.

Cinnamon Oil.—In regard to this, Mr. Umney submitted a table of results of analysis of bark and leaf oils, showing that the former are always under s.g. 1.030, and pure leaf oil above s.g. 1.050, so that the addition of the latter to the former raises the density, which is the condition that obtains in regard to Ceylon cinnamon-bark oil. The bark oil is further distinguished by having cinnamic aldehyde as the principal constituent (38 to 70 per cent in samples examined), while the leaf oil contains chiefly eugenol (80 to 85 per cent.), of which the bark oil contains only 4 to 8 per cent. The optical rotation of the pure oils is practically nil but leaf oils are dextro-rotatory. The following characters and tests seem those suitable for a new British Pharmacopœia:—Sp. gr. at 15° C., 1.024 to 1.030. Optically inactive. One drop of the oil in 5 drops of rectified spirit should not give more than a pale-green coloration with ferric chloride. The oil should not solidify with a solution of caustic potash. When treated with solution of bisulphite of soda solution, it should not yield more than 45 per cent. of non-aldehydes, equal to 55 per cent. of cinnamic aldehyde.

Citronella Oil.—No opinion was expressed as to the officialising of this oil, but the following were mentioned as the factors for the pure oil:—Specific gravity not less than .887, and the oil is soluble in 10 parts of 80-per cent. alcohol.—*Chemist and Druggist*.

A TALK ABOUT TEA AND TEA PLANTING.

Mr. Christison, late of Darjeeling, gave a very interesting lecture at St. James's Hall (Church of Scotland), East Dulwich Green, on Indian tea and tea planting in Darjeeling, to a large audience. The room was tastefully decorated with the Darjeeling planters' and the Nepaulese flags, and the lecture was illustrated by a number of lantern slides descriptive of all phases of planter life in Darjeeling. Mr. Christison, whose knowledge of all that concerns tea cultivation is founded on the experience of a lifetime spent as a tea planter, gave a most interesting account of the origin, history, and cultivation of tea.

TEA PLANTING AS AN OCCUPATION.

The latter portion of his lecture Mr. Christison devoted to the question of tea planting as an occupation for our young men, and on this point he spoke with his usual candour. In the course of his remarks he said: There is one topic more I feel I ought to touch upon before leaving this branch of my subject. I have very often been appealed to for advice by young men, and the friends of young

men, wishing to push their fortunes in tea. My advice has invariably been, and is: if you can make a livelihood, or find employment of any kind though poorly paid at home, by all means remain. Only leave Britain as a last resource. The difficulties of making rapid fortunes abroad have been multiplying, and the chances over the world are now pretty well equalised. If one finds himself compelled to push his fortune away from his native land my opinion is he should not turn to India, unless for a good Government appointment; but choose some country as New Zealand, Australia, or perhaps Canada or the healthier parts of South Africa, more congenial to the European constitution, where, if a fortune cannot be secured—which is the exception, not the rule, in these days—a home may be made for oneself, which cannot be done anywhere in India. The hill districts are the pleasantest to live in, but if the tea garden ranges in elevation more than 2,000 ft. (and I resided for twenty-eight years upon one which varied in elevation nearly twice that I doubt if they are so much more healthy, as represented, than the plains districts, and I believe the statistics of mortality, if carefully examined, bear this out. The plains districts of Assam, Cachar, and Sylhet, though more unpleasantly hot, especially at night, than most of Darjeeling and other hill districts, are more uniform in temperature, and, as I have remarked, little if at all less healthy. The Bhootan Dooars, being a recently opened-out plains-district, is, as I have said, still unhealthy; and all aspirants must bear in mind that though Darjeeling is reputedly a very fine climate (and the town itself is, to my mind, as fine as any in the world), the Darjeeling Terai—that belt of forest, or what was till recently forest, at the foot of the hills—is about the very worst climate in India. The prospects in tea are, I believe, much overestimated, and hence appointments are much run upon and difficult to obtain. With those who have tried the tea life, the rule has been to retire in a few years disappointed or broken in health, or to drag along penniless, and often in debt—life being, as it were, a continual struggle to earn a bare subsistence to keep body and soul together—the few successful men, holding on too long, mostly finding a grave sooner or later; retiring with fortunes or even a competency being the exception, as I have just said. No doubt a small proportion have come home with fortunes, or a moderate competency, but those have been obtained, as a rule, through the purchase and sale of land or investment in gardens under advantageous circumstances; but, alas, not a few of those who so retired lived a very short time, and seemed never to enjoy a day's real health after their return to their native land. Such is a fair though unvarnished statement of the case, from a careful study of the statistics of cases within my own knowledge and experience. Still, if any young man suitable for the work and life, energetic, industrious, persevering, and determined to work and get on, can meet with an appointment in a good concern, he is likely sooner to get into a position to support himself, and, if economical, even save a little, than in any other line I know. As yet tea appointments have not been thrown open to competitive examination, nor could they well be, as the tests ought to be character, industrious habits, and physical qualifications. The only way to obtain appointments is through knowing proprietors, directors, managing agents, or estate managers. As a proof that the supply of applicants far exceeds the demand many well-educated young gentlemen join tea gardens as what is styled "creepers," that is, giving their services for nothing, in addition to paying their own board—some actually paying a good round sum in shape of premium for permission to learn the business. Let such at least make sure that they are going to a good climate, and not find themselves set down in the Darjeeling Terai instead of Darjeeling Hills, as has happened. The main qualifications for the post, in order of importance, are a thorough practical knowledge of mechanical engineering, gardening or farming, building, surveying, accounts, tea-tasting, corres-

pondence, medicine. But mechanical engineering is not now of such importance as many attach to it, because in all districts there is, at the present time, no lack of thoroughly qualified engineers devoting themselves specially to that branch—a smattering of engineering being, in my opinion, worse than useless. The same in regard to medicine, as you can understand, a little knowledge is a dangerous thing, and there are now numerous qualified practitioners, with native doctors under them, on tea gardens. From this it may be gathered that the duties of a tea planter are multifarious. He should have a practical head, and adaptability, so to speak, and it will be well if he can turn his hand to anything, as will be illustrated later. To be a successful planter a man need not necessarily be muscularly strong, but he should be endowed with a constitution sound in every fibre, and have good powers of resistance to fatigue and contagion. He had well also be a good pedestrian and a fair horseman. The hours of attendance are long, though not always exhaustive, throughout the whole time of the operations; from 5 a.m. to 9 or 10 p.m. during busy and anxious times; but, as a rule, the more a man can be at his post, or at readiness to drop into it, and the closer his supervision, the better. During five to six months of the year Sunday labour and supervision is unavoidable in connection with manufacture. The life, as a rule, is a retired and solitary one, beset with peculiar temptations, and often wanting in plain comforts. To resist the climate, worries, and monotony of the life, a sound mind in a sound body is, in short, absolutely necessary; and no one can be a success unless he has his mind and heart in the work, and understands and has sympathy and a fellow-feeling for the natives. The management of the natives—which depends as much upon knowing not only their language but all their little idiosyncrasies of mind and habits—is a most important matter. On tea gardens, all Europeans, in relation to social standing and age, have the welfare, happiness, and comfort of numerous fellow-creatures in their hands to an extent to which there is no parallel in this country. Their influence and responsibility for good or evil, is therefore proportionately great. Every planter ought to remember his duty and responsibility towards a subject race in a heathen land, and so long as he is unswerving in the conscientious discharge of his own duties to his employers, just, honourable, and considerate in all his dealings with his people, and impresses upon them the dignity of all honest, faithful labour (a point in regard to which I fear the missionary is not always so successful as could be desired, any more than modern teachers in this country), his influence and example cannot fail to be immensely for good, and whatever befalls he will have at least the satisfaction of having tried to do his duty.

The lecturer was warmly applauded at the close, and his exhaustive account of all that concerns tea should do much to make the public better acquainted with all that concerns the growth and use of the product.

During the evening Darjeeling tea, of excellent flavour, provided by Mrs. Christison, was enjoyed by the audience.—*H. and C. Mail.*

HOW TO MAKE HEAVY BOOTS SOFT AND WATERTIGHT.

To make heavy boots soft, well soak them with warm water before a fire, seeing first that there is no dirt on them. When the water has soaked right through the leather, work it about in the hands to make it as soft as possible. Then give the boots a coat of neats-foot oil, let them be a respectable distance from the fire and keep turning them round so that the oil may dry in all over. As the water dries out the oil dries in, and as it gets absorbed more oil should be applied. If the boots are very bad, let them lie by a day or two, and then repeat the above process with both water and oil, working the leather well with the hand. To waterproof them, after the oil has well dried in give them

either a coat of mutton fat, or of neatsfoot oil and beeswax melted together, which, when cold, should be just a little firmer than ordinary dubbin.—From "*Work*" for May.

RESTORING COLOUR OF BROWN BOOTS.

First put the boots upon a pair of trees, or else the lasts they were made on, and in putting in the latter care should be taken, as the leather will no doubt have shrunk. If you have neither lasts nor trees, fill the boots out to their proper shape, or as near as possible to it, with pieces of thin soft paper or paddy pressing each piece in so tightly that a little pressure will not displace it; lace them, and so fill them right up to the top. Now, with a soft clean brush, give them a coat of lukewarm water; do not be afraid to let them get wet, and do not let them dry before you are quite finished with them. If they are not perfectly free from dirt, give them another coat, with a little yellow soap, and, when clean, wash this off with clean water. While they are wet give them a coat of very weak oxalic acid and water, using the brush freely, but hard. If this is not effective, add a little acid to the water, and, when the colour is brought down as light as desired wash the acid off with water and let the boot dry in a cool place. There are several washes sold for cleaning purposes which would no doubt be found suitable, such as Clark's, Brown's, Simpson's, etc., but the acid is cheapest, it costing only a penny. After the boots are dry, take them off the trees and work them about a bit to soften the leather. This will help to lighten them, as it works the water-stain out. Then give them a good cleaning with white or pale brown boot cream. If they are calf, and not Russian leather, be a little more sparing with the water.—*Ibid.*

MR. HUGHES ON MANURING TEA.

Calling upon Mr. John Hughes this week in the hope of learning something from him as to the prospect of getting your tea planters to manure their tea land, he favoured me with the perusal of an article he sent the *Observer* on the subject by the last mail. The practical character of the recommendations made in that article struck me very strongly, and no doubt it will be appreciated by your readers when published. Especially was I struck by the unanswerable character of Mr. Hughes' argument upon the case of tea plants which shoot their tap roots down to a depth at which manuring would be useless. "If," Mr. Hughes observed, "a tree be vigorous enough to do this, surely it is evident that the soil giving that vigour does not require the application of manure." But a report comes to me from Ceylon that a well-known planting authority is said to have abandoned manuring on his estates. I have not yet been able to verify this statement, or, if it is to be verified, to learn the reasons leading to the adoption of the course alleged. Perhaps I may succeed in obtaining the information before next writing. This report was mentioned by me to Mr. Hughes; but he had heard nothing of such a resolution having been taken.—*London Cor.*

THE SEASON IN MADRAS.—Yesterday the Board of Revenue telegraphed to the Government of India for the week ending the 18th inst. as follows:—"Good seasonable rainfall in the Circars and Central Districts, moderate elsewhere, except Bellary. Cultivation is proceeding where there has been rain. Standing crops are generally fair or good. Pasture is scarce, but fodder is sufficient, and cattle is in good condition. Prices are steady or very slightly easier."—*M. Mail*, May 23.

SCOTTISH CEYLON TEA COMPANY. LIMITED.

REPORT OF THE BOARD OF DIRECTORS,

To be presented to the shareholders at their sixth annual ordinary meeting, to be held at the offices of the Company on 16th May 1895, at 12 noon.

The Directors have now the pleasure to submit to the shareholders the accounts and balance-sheet for the year ending 31st December 1894.

	£	s.	d.
The net profits for the year are	£9,338		
6s 7d, which, with the balance of			
£611 4s 2d brought forward previous			
year, makes a total sum available			
for distribution of		9,949	10 9
An interim dividend on the ordinary			
shares of 5 per cent (free of Income			
Tax) paid in September 1894 ab-			
sorbed	£2,050		
Dividends on the 7 per cent Preference			
Shares have also been paid, amount-			
ing to		630	
It is now proposed to pay a final			
dividend of 10 per cent (free of In-			
come Tax) on the Ordinary Shares,			
making 15 per cent for the year, ab-			
sorbing		4,100	
To add to Reserve Fund (which will			
then stand at £5,000)		1,000	
And to write off for depreciation on			
Machinery and Buildings		1,500	
		9,280	0 0
Leaving a balance to carry forward to next			
account of		£669	10 9

The estimated out-turn of tea from the Company's estates for 1891 was 635,000 lb., and notwithstanding a spell of unseasonable weather, the actual amount secured fell short of that quantity by only 5,845 lb., the total crop amounting to 629,155 lb., which under the circumstances the Directors consider very satisfactory.

The Company's teas continue to maintain their prominent position in the London market, the gross average price obtained for the season being 9.233d, against 9.199d per lb. for 1893.

The average yield per acre was 407 lb., against 391 lb. in 1893, and 336 lb. in 1892.

The Ceylon Manager reports that all the Company's properties are in good heart, and the estimates for 1895 give promise of continued good returns.

There has been no increase during the year in the Company's acreage, which remains at 1,963 acres. The tea bearing area also remains unaltered at 1,544 acres.

The Directors would again take this opportunity of recording their appreciation of the services of both the Ceylon and London staffs.

JAVA CINCHONA DIVIDENDS.

The annual meeting of shareholders in the Coffee and Cinchona Company Pagilaran, of Java, was held at Amsterdam on April 30th. From the report then submitted it appears that on December 31st last the company's plantations contained 2,040,000 cinchona trees and 260,000 coffee trees. The output last year amounted to 1,998 bales of cinchona containing 150,346 kilos, with an average of 5.64 per cent of sulphate of quinine. In 1893 the output amounted to 1,817 bales containing 132,446 kilos of an average of 5.34 per cent. The coffee output is very small, the company practically depending upon cinchona. The result of last year's trading has been a loss of 9,287 florins, which, added to the loss of previous years, makes a deficiency of 91,061 florins. It is pointed out that a very small improvement in the cinchona prices, which last year only realised an average of 3.47c. per unit, would have been sufficient to convert the loss into a profit.—*Chemist and Druggist*.

PROFESSIONAL "RECRUITERS" OF COOLIES.

Amongst other matters which engaged the attention of the Indian Tea Association at their last meeting was the question of the registration and licensing of professional recruiters. The necessity for this step has been strongly urged by Mr. T. Buckingham, Chairman of the Assam branch of the Association, but the matter is to be allowed to stand over, pending the result of the protest that has been made by the Committee against the introduction of the revised draft rules in their present form.—*Pioneer*.

PLANTING AND PRODUCE.

(*H. and C. Mail*, May 10.)

THE BUDGET.—The free breakfast table idea does not make much headway. The usual expectations formed about the tea duty at this time of year were indulged in, but nothing came of them. It is true the Chancellor of the Exchequer laid great stress on the consumption of tea, and gave figures to prove the importance of the demand for tea, but he left the tea duty where it was. The main fact about the increased consumption of tea is that last year it was £94,000 in returns, and 5,650,000 lb. in weight, above the previous year. And no less than 85 per cent. of it comes from our own dependencies in India and Ceylon, as against 8 per cent. thirty years ago. Coffee, on the other hand, is decreasing, and one reason for the smaller consumption is no doubt the utter ignorance on the part of the ordinary householder as to how it is made. Tea is comparatively a simple affair, but simple as it is there are numbers who do not know how it should be made; and as for coffee, it is exceptional to find it drinkable.

JAVA COFFEE.—The cultivation of coffee in Java is rapidly increasing. Consul MacLachlan of Batavia, reports that the satisfactory results from the cultivation of the Liberian bean, both in Mid and West Java, become year by year more apparent as the principal difficulties attending the preparation of this coffee for the market are gradually being successfully surmounted. As a result, a marked improvement in the appearance and quality of the coffee is noted, and its favour is becoming more and more assured. The continued recurrence of the so-called "leaf" disease in the Java coffee on low-lying lands, from which the Liberian still preserves comparative—though by no means entire—immunity, causes more confidence to be felt in the latter, and many lands which have suffered most severely from the ravages of this disease in the Arabian plant are being replanted with Liberian. It has been decided to give up the Government cultivation of coffee in the Krawang Residency, and on January 1st, 1895, the law rendering the delivery in that district to Government obligatory was repealed.

NORTH BORNEO.

Mr. Leicester P. Beaufort, M.A., B.C.L., Barrister-at-Law, has been appointed Governor of British North Borneo, in succession to Mr. Charles Vandelaar Creagh, C.M.G., whose term of office will shortly expire.

The newly-appointed Governor will be welcomed as an old friend and the appointment of one we all know will not be the less appreciated when it portends the benefit of having a successor to Governor Creagh who has had the advantage of working under him and who will thereby be enabled to continue a policy which has brought the country to its present position through times of great depression.

Thirty-two Japanese and fifty-eight Chinese Agriculturists arrived by the ss. "Memnon," paying their own passages. Some of those new settlers brought their wives, the party including 5 Japanese and 11 Chinese women and nine children. Settlers of those nationalities are now arriving in small numbers by every steamer from Hongkong.

Mr. Sankara Narayana Pillay is arranging to bring Tamil settlers from Negapatam to this country, and

Mr. Ramasamy formerly of the Government Secretary's Office is reported to have left Madras with 30 Tamils for whom the land has been selected in P. Dent near Mempakul. A second batch is expected shortly to open a settlement near Kudat. It is satisfactory to learn that the protracted correspondence with the Indian Government which commenced in 1889 is at last likely to lead to some practical result.—*H. and C. Mail*.

COFFEE PLANTING AT SELANGOR.

A draft prospectus of the Friendship Estates Company Sungei Ujong, Selangor, shows a Capital of £5,000 divided into 500 shares of £10 each. The Company will take up some 1,000 acres of land—the larger portion of which is not far from the Kuala Sawah Station, on the Sungei Ujong line—for planting coffee. It is proposed to at once open up 300 acres, and 200 more will be opened up gradually. Tables showing estimated expenditure, receipts, profits, etc., have been drawn up, and "calculations are based on the sale of coffee at \$30 per pikul, whereas the present price is \$45 to \$47; should this price be maintained, profits will be nearly 50 per cent. greater than shewn."

AN UNPROSPEROUS TRAMWAY.—The following will be of interest to towns in the east which are contemplating the construction or extension of tramways. Here is what the *Singapore Free Press* says:—There is considerable danger that the Rangoon Steam Tramways will collapse unless immediate attention is paid to the financial position of the Company. Out of R15,452 earned past half year R15,000 had to be paid to debenture holders.

Letters Patent have been passed appointing Mr. A. J. Leach to be a Puisne Judge of the Straits Settlements.

"THE NUWARA ELIYA PICK-ME-UP."—A facetious and Epicurean correspondent of the *Singapore Free Press* writes:—"The latest thing in the way of pick-me-ups in Nuwara Eliya, the land of such potent spells, is termed the 'Cherry Blossom.' It consists of a half soda, a whole brandy, one cherry brandy, and a Benedictine, whisked up with a brush in cocktail fashion. It is good, though a trifle sweet for a morning pick-me-up. A better one is a 'baby' dry Monopole poured into a glass round which a red chilly has been rubbed until the glass is nicely coloured. It should be taken off with the head on it. Nothing equals it; but in these days of depreciated dollars even 'baby' Monopoles are a trifle expensive."

THE MILITARY UNIFORMS ORDINANCE.—Regarding the Military Uniforms Ordinance applicable to Ceylon the *Singapore Free Press* says:—"A similar ordinance will, it is believed, be in due time introduced here in consonance with legislation already passed in the Imperial Parliament. Some local employers of syces got up in quasi-military style will have to revise their liveries when this bill comes to be enforced here."

THE NEW BRITISH DOLLAR.—Specimens of the new British dollar will probably be issued from the Bombay mint about the end of the current month. It is stated in Hongkong that on every thousand new British dollars that the local Banks will import and pay out they will lose 61 cents. The new coin, it is urged, should not be permitted to be "chopped," as is the custom among Chinese shops in Hongkong, for it would be to the interest of trade between Hongkong and the Straits Settlements to have interchangeable currency, which would not be the case if dollars be "chopped" as it would then not be legal tender here.—*Pinang Gazette*.

JAPAN TEA TRADE.

The Tea trade has been opened by small quantities of new leaf, and the "City of Peking," which sailed today, took the first shipments. These, however, are not of much account, either in regard to quality or quantity, and teamen are not well pleased with the "cup" of what has so far been brought to market, though the parcels of leaf that have been sent to Yokohama have been eagerly bought up at high figures when compared with the opening rates of last year.—*April 27th.*

The Tea trade will very shortly be in full swing, arrivals are already coming in more freely, and in another few days some heavy parcels of leaf may be expected. Prices have been somewhat irregular so far.—*Japan Mail, May 3rd.*

CEYLON TEA AND THE "COMMITTEE OF THIRTY."

To the Editor "*Ceylon Observer.*"

Kandy, 27th May 1895.

SIR,—I beg to enclose Minutes of Proceedings of a meeting of the "Thirty Committee" appointed to administer the proceeds of the Export Duty on Tea levied under Ordinance No. —of 1894 for increasing the consumption of Ceylon Tea in foreignlands, held at Kandy on Saturday the 25th day of May 1895, at 7-30 a.m. —I am, sir, yours faithfully,

A. PHILIP.

Minutes of proceedings of a meeting of the "Thirty Committee" held at Kandy, on Saturday the 25th day of May 1895, at half-past seven in the morning. Present:—Messrs. A. Melville White (Chairman); A. Philip (Secretary); R. S. Duff Tytler; W. D. Gibbon; A. C. Kingsford; A. W. S. Sackville; Hon. Mr. Giles F. Walker.

The notice calling the meeting was read. The minutes of proceedings of a meeting of the "Thirty Committee" held at Kandy, on Saturday the 20th April, 1895 were submitted for confirmation. Resolved:—"That they be, and they hereby are confirmed."

MISCELLANEOUS CORRESPONDENCE.—Read letter from Mr. Geo. Greig, resigning his seat on the Committee, on leaving for England. Submitted letters from the National Bank of India, Limited, and memorandum from the Treasurer of the Colony. Read correspondence with Government on the subject of the disbursement of funds, under section 3 of Ordinance No. 4 of 1894, also letters from Sir E. Noel Walker to Mr. Philip.

Resolved.—"That in view of the apparent alteration in the circumstances and position of this committee brought about by the Colonial Secretary's letter of May 14th 1895 the expenditure indicated in the following memorandum be submitted to H.E. the Governor in Executive Council, and his approval thereto requested."

MEMORANDUM REFERRED TO.—Secretariat:—Approval of all necessary expenditure incurred in and about the carrying out of the provisions of the Ordinance No. 4 of 1894, including the charges connected therewith, say, office, clerical, accountant, peon, &c. &c. services; Tea samples, Pamphlets, Printed Matter, Photographs, and such like: Approval of expenditure on tea sent as samples and for distribution to the trade, and others; also cost of printing, lithographing, despatching &c. &c. pamphlets, and other printed matter; also photographs, as authorised by the Committee. Telegrams and Miscellaneous:—Approval of disbursements for all telegrams &c. despatched on, or about the business of the "Fund"; and of the resolution of the Committee that the sums hitherto paid by the Standing Committee of the "Ceylon Tea Fund" to the Planters' Association be in future defrayed by the "fund" Grants of Tea &c.:—Approval of the Committee's grant of Ceylon Tea for free distribution in the Transval. Approval of the Committee's grant of

Ceylon tea for free distribution in San Francisco. Approval of payment of certain charges on Ceylon tea for free distribution in Switzerland. Approval of the necessary disbursements in obtaining a complete analysis of Ceylon Tea-Black (and green, if available,) and of black and Green Teas (China and Japan) generally used in America, for the purposes of the Committee under the Ordinance.

CEYLON TEA IN SAN FRANCISCO.—Read letter from Mr. John Leechman, conveying his thanks to the Committee, for the grant of 1,000 lbs. of Ceylon Pekoe Tea in 4 oz. packets, for free distribution in San Francisco, and his assurance that he will take pains to distribute the packets where they are most likely to do good service in increasing the interest among the public in Ceylon Tea and in creating a wider appreciation of their excellent qualities.

CEYLON TEA IN CALIFORNIA & C.—Read letter from Messrs. Castle Bros, San Francisco, with reference to the grant of tea made to Mr. J. R. Foster.

Read letter from Mr. P. Schooley, Homestead, P. A. offering to act as a Representative, or agent, and enclosing references. Resolved:—"That the letter be referred to the Committee's Agent in America, when appointed."

REPRESENTATIVE TO AMERICA.—Read letter from Mr. Wm. Mackenzie dated New York 21st March, London 5th, 8th, 12th, 26th April, and 3rd May. Resolved:—"That Mr. Mackenzie be thanked for the services he has rendered to the Committee as their Representative."

APPOINTMENT OF A REPRESENTATIVE TO CARRY OUT FURTHER WORK IN AMERICA.—Read letter from Mr. P. M. Short. Resolved.—"That Mr. Wm. Mackenzie be appointed as the Representative to carry out further work in America, and that the Chairman be authorised to arrange with Mr. Mackenzie the question of salary."

LETTER OF INSTRUCTIONS TO THE CEYLON REPRESENTATIVE TO AMERICA.—Considered draft letter of instructions to the Ceylon Representative to America in regard to carrying out further work. Resolved:—(I) "That as amended it be adopted." (II) "That the resolution appointing Mr. Mackenzie, as Representative to America, and the letter of instructions as approved be forwarded to Government stating that the action, which the Committee proposes taking in America will be on the lines contained therein and asking for the approval of H.E. the Governor in Executive Council.

Read letters from Mr. S. Bierach.

Read letters from Mr. Thomas A. Cockburn. The "Thirty Committee" then adjourned.

A. PHILIP, Secretary, "Thirty Committee."

NYASSALAND COFFEE CO., LD.

A meeting of the Directors of the Nyassaland Coffee Company, Ltd. was held yesterday in the office of Messrs. Julius & Creasy. The business before the meeting was of a formal character regarding the incorporation of the Company. It was reported that some delay had occurred owing to certain title-deeds not having come to hand, but it was mentioned that this would be rectified at an early date.

KEROSENE OIL AS A DEODORIZER.—An old Colombo resident reports to us the great success he has experienced with kerosene oil as a deodorizer—a very little thrown into a cesspit, or otherwise used, is quite sufficient to absorb all evil odours &c.

DR. A. S. LORNBURG. Indian Medical Service, has filed the specification of an invention for "making glazed black tea, whereby a waste product in the ordinary process of tea-making is utilised, and a tea is produced which has a much higher commercial value than the tea produced by the ordinary methods of manufacture now in use.—*Madras Times, May 30,*

Correspondence.

To the Editor.

MANY-HEADED PALMS IN THE
JAFFNA PENINSULA.

DEAR SIR,—The following additions to your list of many-headed palms may be interesting. There exists at a temple near Manipay a coconut tree with two heads branching at a height of about twenty-five feet and both are very fruitful. The only other instance, which I know of, is a young tree near Kankesanturai with two heads. The enclosed photograph represents wonderful fruitfulness in the coconut plant, which I saw last week at Punnalai, at the extreme western point of the Jaffna peninsula. From the man in charge of the garden which belongs to the Magistrate of Kayts, I ascertained that the plant had only one shoot in an abnormally big nut when brought with others from the plant offerings of the Temple of the Serpent at Aynativoe 18 years ago. Very soon it began to put forth different shoots which at one time numbered 26. I counted about 16 at the time of my visit, some vigorous and others as small as plants a few months old. The man told me that a Cobra has been taking its abode in it, which those in the garden hold in sacred awe. About two miles from this spot near the Jaffna Collego, I saw, many years ago, in a small garden, several palmyra trees some with two and some with as many as five heads.—I am, yours truly, L.

[The photograph shows quite a grove of foliage and branches all apparently belonging to the one young palm.—ED. T.A.]

HYBRID COFFEE.

SIR,—It is a pity no endeavours were made to secure a hybrid coffee several years ago. Owing to the present and future high prices of any variety of coffee, the cultivation of a good hybrid would have found much favour just now. The Maragogipe coffee sent by Mr. Manton to Andella Estate in Kegalle is thriving. There are besides on that estate about 2 doz. Arabian trees grafted on Liberian stumps with a first crop on them. Liberian coffee is also planted amongst them, the object being by the aid of ants and bees to secure fruit, a percentage of which may possibly give hybrid plants. I send you a dead "grafted tree" (cause of death unknown) for inspection. On the living trees the peculiar *dark* bark of the Liberian appears in the Arabian grafts in streaks. In other respects there is nothing different in them from ordinary Arabian. W. P. F.

P.S.—Of course there are distinctive types in the Liberian, as regards shape and size of leaf and fruit and bean. In a very large nursery of Liberian plants, in 3 different spots, 3 plants have come up, quite Arabian in type so far. They will be looked after, as the Liberian seed in cherry came from a place where Arabian also grew. When cleaning the cherry, not a single Arabian cherry was found, and all small cherries were rejected.

[Up to the time of the advent of leaf-disease planters were so satisfied with the Arabian trees that experimenting in grafting never occurred to them any more than painting the lily. But after the visitation of that scourge it would have been well, as "W. P. F." remarks, if some experiments had been made in scientific grafting. We very much question, however, that coffee will naturally hybridize as tea does, as Liberian coffee has been long enough cultivated with and near Arabian, to have produced some results. The dead specimen sent to us shows a successful graft of Arabian on a short Liberian stump, very close to the roots, and, our correspondent says, "those still living have a first crop on them," which is a very encouraging circumstance. But being mules themselves, and the hybridization of coffee being apparently difficult through the blossom only, it may be feared that they will not readily hybridize with the Liberian trees growing near them. We shall, however, be glad to hear further on this interesting subject from W. P. F.—ED. T.A.]

THE LABOUR QUESTION.

DEAR SIR,—Without in any way wishing to run down the planter I think that he has in many instances himself to thank for the annually recurring scarcity of labour in the spring months, which is to my mind to a great extent the result of his own improvidence. Those who have travelled about much in the Planting Districts will, I think, agree with me that speaking generally, all through both the Cinchona and Tea Planting Enterprise, people seldom had enough plants in their own nurseries for their requirements, though in many cases each knew nine or twelve months before the planting season began what amount of land he intended to open. This is most strongly evidenced in the case of cinchona by the large sums of money made by many who grew nurseries chiefly and solely for the sake of selling plants. In the case of tea, the scarcity of plants in the country during each planting season has been less in evidence owing to the possibility of planting and at stake.

In like manner, every spring one has found a general scarcity of Factory accommodation all over the country, save on such estates as are fully factored, which I maintain might in most cases have been avoided had the planter exercised a little more forethought, and agitated for extension at the proper time, say a year before it was actually required instead, of waiting until he was so badly-burst that immediate assistance was impossible. My upcountry friends will no doubt answer this last accusation by a question: Where is the much-abused V. A.? But the V. A. has not to work the factory and I do not think that he would refuse to support any reasonable application for extension if it were proved necessary by the Superintendent who has every opportunity of gauging his own requirements, and is the proper person to agitate.

In the question of labour, the planter is generally left very much to himself; yet how many of them, the younger generation particularly, take any thought for the morrow?

My experience of the last three years is this:

1. A sufficiency of labour from July-December (inclusive).

2. A plethora of labour in January and February.

3. A scarcity of labour from March-June.

Instead of trusting in Providence to give them coolies during the pinch and making no calculations as to future requirements, I would advise that planters one and all should adopt the following suggestions:—1. Make such coolies as want to go to the Coast in the spring give in their names, say in October, and endeavour with the assistance of their kanganies to make Rumasamy stick to his word, which is to my mind not an impossibility as he is very much like a school-boy.

2. Pay off all such coolies as are going to the Coast for any length of time in January after Pongal.

3. Send money to the Coast as early as possible to get coolies to replace those who are leaving and for any further requirements as estimated.

I do not deny that there are planters who have adopted these suggestions already; but I do maintain that they are not generally practised throughout the country. I do not guarantee that their general adoption would obviate the present scarcity of labour, but I do maintain that a trial of the system could do no harm and might possibly do good and would at any rate be better than the present happy-go-lucky method of trusting in Providence and crimping your neighbours' coolies too prevalent in some of our planting districts.

The difficulties that I foresee in working on the above system are, first, of getting the recruiting kanganies to start for the Coast early enough to be back by the 1st March, and the other of limiting the number of coolies who really go to the Coast to those who give in their names in October. If coolies knew that having given in their names they will be turned adrift in January they will no doubt refrain from giving them in at the time and will demand to be paid off on a month's notice certain, and I admit that the influence of the kangani alone

would prevent them from playing tricks of this nature; but shall we ever get rid of the kangani system?

If the coolies who are going to the Coast could be paid off in January, those who remain behind would get more regular work in the slack months than they do now, which would be an advantage, as in my opinion there is nothing so demoralising for the cooly as working short time? Where we are so severely handicapped in the matter of labor now-a-days, is, that in the first place we require our labor most at the very time when the coolies are on the move towards their homes in India, whereas in the coffee days we could well dispense with labor after crop was in and pruning finished, in the western districts at any rate; and, secondly, because tea estates in full bearing cannot possibly employ the labour, which they require to secure the Spring rushes of leaf, steadily throughout the rest of the year, and this difficulty will be intensified when all our tea is in full bearing and is far more serious than it was in the days of coffee, when pruning and handling meant an annual expenditure of from R15-20 per acre against say from R4-5 in the case of tea, allowing for an average of two prunings in three years.

The Labour Question is not by any means an easy one to solve, and it certainly requires a pull all together to place it on a better footing than it is at present. We shall probably go to sleep over it now until next Spring, when we shall wake again, let us hope, to tackle it, not like Mark Twain's ants as we appear to be doing at present, but on the best of the many systems which may have been propounded in the meantime, and at any rate mindful of the motto

“UNITAS SALUS NOSTRA.”

VARIOUS PLANTING NOTES.

COFFEE IN BRAZIL; ROOM FOR EXTENSION.—As an inducement for the construction of a branch of the Sorocabana railway to Lenções, S. Paulo, we read that the municipal council of that place reports that the Municipality now possesses 8,520,000 coffee trees, of which 4,245,000 are from three to six years old, and the balance under three years. The area suitable for coffee still uncultivated amounts to sixty-million alqueires of land.

INDIA'S TRADE WITH THE FAR EAST.—In concluding an article on this subject the *Madras Times* says:—

It is in China, therefore, that we may expect to find our keenest trade rival in the Far East, at least in regard to cotton spinning. Especially will this be the case if Japanese energy influences the development of cotton-spinning in China. India's greatest hope lies, first, in the possibility that Japan will try to make herself the medium of supplies to China; and, second, that “honest money” may yet become current in India once more, in place of the inflated, though still undersized, Rupee of the present day.

SILK INDUSTRY IN ENGLAND.—In view of the depression in agriculture and in the textile industries, Mr. A. R. Sennett's suggestion in the *London Times* that silk culture should be resuscitated in England is worth consideration. In 1694 the Huguenots had in Canterbury alone a thousand looms, giving employment to some 3,000 people. By the skill and perseverance of Pasteur, silkworm farming has now been placed upon a sound scientific footing. It might be reintroduced without a great capital expenditure, and would give remunerative employment to a large number of men, women, and children. The scheme is one says the *C. World*—that could be materially assisted by large landed proprietors planting mulberry trees upon their estates and farms, especially in counties possessing such temperate and equable climates as Devonshire, Somerset, Hants, Sussex, and Kent.

PLANTING IN TRAVANCORE.—The Report of the Planters' Association shows the statistics of the three divisions for the year ending 30th June 1894 as follows:—

	Cinchona.	Tea Total.	Coffee Total.	Cultivation Total.	Forest and other Land.	Grand Total.
	acres	acres	acres	acres	acres	acres
Southern ..	60	5396	2018	7474	16507	23981
Central ..	110	3579	1288	4977	1825	9802
Northern ..	1768	357	1075	3200	33995	37195
	1938	9332	4381	15651	55327	70978

We shall have later returns in our Directory.

“CHEAP TRANSPORT AND HOW TO GET IT.”—We call attention to the third of Mr. Davis-Allen's practical and informing papers. It will be observed from his summing-up that he is by no means dogmatic, though with a strong leaning to the “narrow gauge” for economic purposes. We have no doubt that Mr. Davis-Allen could say much about the evils of a “break of gauge” where a continuous line is concerned; and that is the reason why we advocate a beginning at Colombo, and independently of the existing broad gauge system, of the proposed metre-gauge Northern line, and also that a Kotte-Kelani Valley line that start from the capital instead of as a branch from the Kandy line. Lord Dalhousie, when Viceroy in 1855, fixed the 5½ feet gauge for India, and Sir Henry Ward in Ceylon naturally followed his lead in 1858. In our first Memorial for Railway Extension from Nawalapitiya to Haputale, we expressly urged that the line should be on the 3½ feet gauge, and were backed by Messrs. Tottenham and Cromwell. How it came about that Governor, Engineers and all concerned, became convinced in 1877 that there should be no break at Nawalapitiya, and afterwards in 1885 at Nanuoya, is too long a story to tell now. We know it is a sore subject with some in Uva; but it simply came to this in Sir Arthur Gordon's time, that unless we followed the lead of that very able as well as autocratic Governor—who would have nothing to do with a new Survey or break of gauge at Nanuoya—we should not have got a locomotive line sanctioned into Uva in his day, nor for many years after. Governor Gordon as good as “rebelled” against the Colonial Office, in order to force the sanction of the long-delayed Haputale section.—Mr. Davis-Allen speaks of “quarter loads” over our railway in 1893. We should like to know if this applies to the upcountry line? We scarcely think so. Goods traffic between Colombo and Kandy at any rate used to be specially heavy and concentrated, and we fancy it must be growingly so on the Dimbula-Uva line.—With reference to Mr. Davis-Allen's second paper in a recent *Observer*, with its striking deliverance as to the special effect of sharp curves on Working Expenses—a fact almost ignored by Engineers up to ten years ago or so when the late Professor Fleeming-Jenkin, Professor of Engineering in the University of Edinburgh (of whom Mr. Davis-Allen was a pupil) first brought it out prominently—it is worthy of consideration whether there should not be an examination of our older Ceylon lines in order to see if any curves could be profitably eased or straightened—if that be possible;—and this might be a matter in which an inspection and report from Mr. Waring would be of practical value.

MR. CHRISTY OF LONDON ON TEA

SWEEPINGS AND TEA SALES :--

GREAT DEMAND FOR CAFFEINE :—400 TONS
OF TEA ALLEGED TO BE WASTED!

Mr. T. Christy's efforts to put a stop to the iniquities of some of the London warehousemen and wharf owners are widely known and highly appreciated, both in India and Ceylon. To his exertions there can be no doubt that we are primarily indebted for the issue of the late Customs Order and for the beneficial results that have already followed it. It appears certain that the Customs at home are now fully alive to the importance of this matter, and that they are not likely to allow it to drift back again into the former bad practice. But when discussing this subject with our London correspondent, Mr. Christy took the occasion to review the whole system under which at present our teas are placed upon the London market. This system he believes to involve much injustice to the growers of tea, and we strongly recommend what he has said to the consideration of our own planters and of their representative body, the Planters' Association. We think it probable that Mr. Christy could hardly have insisted so forcibly as he now does upon certain remedial measures open for their adoption, had the state of the tea market remained as it has hitherto been for years past. But if our London correspondent has rightly understood Mr. Christy's view, a great change has now come over the late situation. The demand for Caffeine is enormously increasing, so much so, indeed, that tea sweepings can no longer supply the raw material for its manufacture. The consequence has been that the commoner teas are being largely bought to supplant that source of supply. So large are now these buyings, that late sales in Mining Lane have been the scene of most unusual excitement, and the lower grades of tea have been cleared off as fast as they could be put on the market. This fact, Mr. Christy observes, puts the tea planters in a position to dictate their own terms as to procedure at home between the landing and disposal of their teas. It is well-known that for years past the complaints as to home charges on tea have been constant and strong. But power to remove the causes for these complaints has hitherto not been possessed, and planters have had to submit almost without remonstrance to whatever course the home agencies chose to follow and to pay the charges consequent upon that submission. But if we may accept Mr. Christy's opinion, the position has been reversed by the new demand above referred to. It is now the planter's turn to dictate how his tea shall be dealt with after its arrival in England. Any opposition that may be offered to his dictation, we are told should be met by a threat to sell all teas locally. That it would be feasible to carry this threat into effect is very doubtful, although something might be done in that direction. But Mr. Christy thinks that the threat alone would suffice to extort compliance. It has always seemed to us that there was much in the procedure as to reweighing and rebulking that should be susceptible of improvement. We are quite content to accept Mr. Christy's insistence that both are entirely unnecessary. If our planters are also of that opinion, the sooner they take steps to act with reference to this matter the better. It certainly does seem monstrous, as Mr. Christy has expressed it, that the value of no less than 400

tons of tea is annually lost to our own and Indian planters by persistence in a system that is believed to be wholly unnecessary.

Since the above was written, later news has come to hand rather weakening Mr. Christy's view of what the planters can do by way of reform; but certainly, it is undoubted that there is ample room for amendment in the present system.

STEAM BOILERS IN TEA FACTORIES.

(Communicated.)

The leading article in *the Observer* of May 1st suggests a few notes which may possibly be of novelty and interest to steam users in tea factories. The Perkins' boiler is an invention several years old, but which has I believe not been adopted to any great extent. The writer remembers some years back seeing a boiler and engine by this inventor which had been originally in a paddle steamer on the river Tyne, and were afterwards in operation in the works of a large engineering firm. It may be briefly described as a boiler consisting entirely of small tubes screwed together, supplying a triple expansion engine, and working as would be expected with a very high economy of fuel. The gauge glass (if the expression be allowed) was constructed of mica, as glass would not be able to resist the decomposing action of water at so high a temperature.

It may be worth pointing out that roughly speaking the efficiency of a Steam Engine depends on the difference of temperature obtainable in the steam before and after doing its work in the engine, and Engineers have been led in pursuit of this principle into the construction of high pressure boilers and triple expansion engines. Perkins' 400 lb. pressure combination was a very bold attempt to carry this out, and was possibly rather in advance of its age. There are however several water tube boilers in general use working very successfully at less ambitious pressures. The rationale of putting tubes in boilers is of course the increase of heating surface. In the *tubular* boiler the flame passes through the tubes, the water being outside; in water tube or *tubulous* boilers the reverse principle obtains, and it becomes a matter for careful consideration, how far the difficulties of incrustation may be met in a boiler of the latter type. Regarding the comparative cost of transport of different types, unless the expense of transport be very high indeed it is not easy to see where the probable economy will come in in using a boiler of a higher first cost than those of cheaper design. The greater difficulties of joints and connections with high pressure boilers and engines, and the higher training necessary for their management, [though boilers of this type are of course less liable to disastrous explosions,] will probably outweigh the prospective advantages of high pressure steam in the eyes of a careful planter. Simplicity of repair is of course a factor of considerable importance in places remote from the refinements of mechanical civilisation.

The question of boiler cleaning has been cropping up lately in the Ceylon Press, and the article already quoted ends with a timely warning about the lively time coming for steam users here, when their boilers have come to years of decrepitude and decay. I believe I am correct in saying that organised boiler inspection is little known here. The simplest way to insure this being properly done is to have boilers insured. The insurance company, in their own interest, have

periodical visits made by a qualified inspector, whose recommendations as to repairs and maintenance must be attended to by the user, who is thus practically relieved from a somewhat irksome responsibility.

For preventing incrustation of boilers the names of specifics are legion. In some cases a very cheap product is labelled with a high-sounding name and palmed off on the ignorant at an unblushingly outrageous profit. Such *apparently* absurd remedies as potatoes are said to be efficacious, and I have even heard of a dead dog being recommended by an intelligent workman as an infallible cure.

The simplest remedy for incrustation is usually found to be the use of a small quantity of caustic soda, or soda ash containing caustic, which precipitates the lime salts held in solution in a form in which they can be easily removed. Tannate of soda may also be cited as a useful remedy.

The dangers of scale formed on the skin of the boiler are too well known to require any explanation. It is now some months since the London *Engineer* on the strength of some safety valve story (a) if such things were never heard of at home,) published a violent diatribe on the prospective dangers due to planters' ignorance of boilers. Although the reflections on the intelligence of the planting community were somewhat uncalled-for, there is no doubt that the question of Boiler Inspection and Insurance might profitably engage the attention of the Planters' Association. A system of mutual insurance might possibly meet the case.

It may not be out of place in this connection to point out the unwisdom of irrational appeals to government inspection. In a recent number of *Engineering* were some comments on this point, apropos of the explosion of a compressed gas cylinder, of the kind now in very general use for supplying lime-light lecturers, dentists, and so forth.

It is not impossible that a boiler explosion in this country may create a scare and a demand for outside inspection. Which is the safer guide to the steam user, the possibly perfunctory advice of a Government inspector, or the recommendation of the representative of the Insurance Company who take on themselves the responsibility of making good the financial losses of the client who follows their recommendations; but to dwellers in our enlightened colony with the railway and telegraph department before our eyes, it is perhaps less necessary to point out the human limitations of governmental infallibility.

NOTES FROM OUR LONDON LETTER.

LONDON, May 10.

MR. CHRISTY'S VIEWS AS TO THE CAFFEINE MANUFACTURE

absorbing a very material quantity of your tea are to be accepted, the necessity for such new markets may not soon become an imperative one. But then tea of quality sufficient for caffeine making purposes can, I suppose, be grown at low elevation. The present Government reserves, if planted upon, should be capable of producing something particularly fine.

BULKING TEA AT THE BRITISH CUSTOMS.

With respect to the views of Mr. Christy just referred to, I may tell you that the per contra side of the question has been exposed to

me this week. Mentioning to a gentleman highly experienced with tea matters Mr. Christy's suggestion that rebulking should be abolished and the Customs' estimates of weight be imposed upon buyers, he remarked that such insistence would be likely to heavily handicap British grown teas in their competition with China teas. On my asking why it would do so, he observed:—"Perhaps you are not aware that China teas never have to be rebulked. You see all of this is collected in small lots and is never dealt with until it is received at the port of shipment. Then the native experts classify it, and it is packed in large breaks, being accurately weighed into the chests. Thus, you see, China shippers score upon two points over Ceylon. They avoid the small breaks that are such a bugbear to our brokers and their teas are never rebulked on arrival in this country. Buyers here therefore willingly accept the Customs' weight declared upon these teas. They would never do so with Ceylon or Indian teas unless these were declared to be factory bulked. Of course the Chinese system has one great drawback. Their teas are never known by estate marks, and the estate branding of Indian and Ceylon teas is much valued as a guide to purchasers. But this is largely compensated for by the extraordinary skill of the Chinese in grouping their teas. It is very rare for a single chest in a break of 200 boxes to vary appreciably in quality from the others, and so buyers may rely upon the flavour of single samples qualifying the whole break. So you see it does not seem to me that Mr. Christy's suggestion could be acted upon so long as any tea comes home from Ceylon that has not been factory bulked. Rebulking here must be continued so long as uncertainty remained as to the degree of care exercised on estates upon packing the chests with accurate weight. Ceylon planters are notoriously sinners about this, and until this reputation has been amended purchasers will not buy teas of their's on the Custom's weight. Rebulking will be insisted upon, and would be, in my opinion, absolutely necessary. No, I could never see any difficulty in the way of tea being accurately weighed into the boxes on the estates, neither can I believe that it would be impossible to avoid the number of small breaks sent home by your planters. Until they mend their ways in both these respects Mr. Christy's recommendation can never have effect, and rebulking, with its attendant evil of loss by spilling must remain the practice."

Mr. John Hughes thinks it might be best for something of the China system to be introduced in Ceylon, the teas being locally purchased by Syndicates and packed in large breaks by it in Colombo. No doubt this would do away with the rebulking nuisance, but then could the advantage of estate marks be retained? Mr. Hughes is probably influenced by his belief that tasting is far more efficient in Ceylon, owing to the softness of the water, than it is in London, and that teas so graded would be more reliable under local classification than they can be under the existing system.

TALGASWELLA.

GENERAL REPORT FOR CIRCULATION AMONGST THE SHAREHOLDERS OF THE COMPANY.

Upon this occasion I was accompanied over the estate by Mr. James Forbes, the Chairman of the Board of Directors, and it being his first visit to Talgaswella, he will no doubt have conveyed to the other Directors the impression he food of the property.

Speaking generally of the appearance of the estate, there is an improvement noticeable in the condition of the bushes in fields Nos. 2, 5, and 6, but the others are much the same as when last reported on, and although the weather at the present time is most favourable for the growth of leaf, the flushes are not, I regret to say, so strong and vigorous as might have been expected at this period of the year. Still the returns to date show (as was anticipated) a considerable advance on the yield for 1891, the figures being 40,317 lb. and 29,481 lb. of made tea respectively. The Estimate for the year is 130,000 lb., and though the quantity already secured is somewhat disappointing, it is quite possible that this figure may be reached, or at any rate closely approached; a good deal, however, will necessarily depend on the effects produced by the South-west winds which sometimes are very destructive in this district.

One of the great drawbacks to Talgaswella, as has been frequently mentioned, is the irregularity in the growth and development of the bushes, and were it possible to separate the good from the bad, the former would probably not occupy very much more than half the cultivated area. This is the chief reason why the returns have hitherto been so disappointing, and it moreover constitutes a serious difficulty in carrying out manuring operations, the indiscriminate blending of good and bad being such as to negate the possibility of any general system of abandonment of unprofitable land. While fully realizing the difficulties of dealing with tea which is only partially productive, the directors decided a few months ago to set aside a sum of R3,500 for manuring two of the best fields with castor cake and bones, (in the proportion of two of the former to one of the latter,) and it is hoped that the result of the experiment may be sufficiently encouraging to justify further operations under this head in future years.

In order that the best effects may be produced, the fields set apart for this treatment are Nos. 1 and 4, which have always given the largest returns of leaf and present the best cover of tea. The quantity being applied to each bush is 3 ounces of the above mixture in semi-circular holes on the upper side of the tree.

Forking in the manure is to be tried over a small area but the experiment of turning over the soil a few months ago, in field No. 1, has not proved beneficial.

The acreage already manured is about 70, costing R22 per acre, and the intention is to continue operations until the R3,500 set aside for the purpose has been expended.

The quantity of manure per tree is very small, but I understand that satisfactory returns have followed similar doses in the Udagama district. Besides the artificial manuring, about 12 acres of the tea in No. 1 field have been gone over with the contents of the cattle shed.

GENERAL CONDITION OF THE PROPERTY AS REGARDS FIELD WORKS.—The estate, taking it as a whole, is cleaner than it was on the occasion of my last visit, but the system of regular monthly weeding is not, I am afraid, carried out so systematically as could be wished. To clean an estate, and to keep it clean, it is absolutely necessary that the ground should be gone over every month and the weeds should be buried or otherwise destroyed.

PRUNING AND PLUCKING.—Neither of these works are quite so well done as on estates where Tamil coolies are exclusively employed, but bearing in mind the material Mr. Broadhurst has to deal with, the general condition of the bushes is fairly satisfactory.

ROADS AND DRAINS.—The outlet road is in a very rough state just at the present time, but the roads on the estate are in pretty good order and the drains have lately been cleaned out.

FACTORY AND MACHINERY.—Everything under this head is satisfactory and in good working order, but a new sifter will probably be required next year.

OTHER BUILDINGS.—An Assistant Superintendent having been appointed, some repairs to the small Bangalow will be required and the lines will want looking to from time to time.

LABOUR.—There appears to be a good supply of

Sinhalese labour available just at the present time, but of Tamil coolies there are only about 10 left.

EXPENDITURE.—The estimate for the year, including Colombo Charges and Directors' fees, amounts to R10,877, of which R16,058 has been spent to end of April.

This estimate does not provide for the cost of manuring, and it having been decided to appoint an Assistant Superintendent, there will be some increase under head of salaries, though not very much, as it has also been arranged to substitute a native tea-maker for the European who is now in charge of the Factory, and this will result in some saving of wages.

The estimate provides liberally enough for all necessary works, and if Mr. Broadhurst adheres to it, and maintains a good quality of tea, there is reason to hope that the result of the season's operations may not be altogether unsatisfactory, but a great deal will of course depend upon the market, and as regards the crop we are assuming that the season is a fairly favourable one for flushing.

FURTHER REMARKS.—In taking up the visiting of Talgaswella last year, it was on the understanding that I might not be able to continue it, and I shall be glad now if the Directors will make other arrangements for carrying on the work. Seeing, however, that henceforth until the close of the year, there will be very little doing but plucking, weeding and pruning, I should hardly think another visit will be necessary for some time to come.

EDWD. S. GREGOR.

May 10th.

A SCOTTISH COUNTY COUNCILLOR AT THE TEA SALES.

Mr. Henry Robertson of Edengrove Fifeshire, senior partner of the firm bearing his name, which carries on an extensive produce business in Dundee is a passenger by the "Liguria." For fully six months Mr. Robertson has been touring in Australia and New Zealand. Today he paid a passing visit to Colombo and in the course of his walk round the town attended the tea sales at the Chamber of Commerce Rooms. Mr. Robertson is a member of Fifeshire County Council, a staunch Liberal, and for many years has been connected with public life in that part of Scotland in which he resides.

MR SHOLTO SKRINE AND COOLY LABOUR SUPPLY AND MANAGEMENT.

We are gratified to learn from Mr. Skrine—who has had 24 years' experience as a planter—that he agrees with nearly everything that has been written editorially in the *Observer* in respect of the Labour Supply question. He does not believe in their being any special deficiency, taking the country as a whole; but he is emphatic in supporting our view that if there be a short supply now or for the future, no practical remedy is worthy of comparison with that of *through Railway Communication* between Ceylon and the Cooly Districts of Southern India. The enormous saving in the time now lost along the North road, or waiting at or near ports, and the saving of money and extortions to the coolies—alone should tell heavily in favour of the Railway. That a Indo-Ceylon railway should make it easy for the coolies to return is a decided advantage; for often at present, they become dissatisfied in facing the difficulties attending their return, while if they were able to go promptly when they had made a little money, all the more readily should they come back again to Ceylon.

As regards recent local troubles, Mr. Skrine cannot help thinking that a great deal is due

to mismanagement, and to the want of interest taken in their coolies by some of the younger generation of planters. Like so many of his compeers, Mr. Skrine has kanganies who have been with him since he began felling in Dikoya, while the rate of advances on his force of coolies is ridiculously low. Much mischief is done, in his opinion, through inexperienced men trying to save expenditure after a foolish, shortsighted way—by cutting down the weeding contract, or rate for pruning or other work—rendering coolies dissatisfied and perhaps getting bad work done. He has tried, on the other hand, to be liberal in such matters while insisting on good work, and he has thus always had enough of coolies and a reserve from weeders to put on plucking when an urgent "rush" was in hand. All these and other hints ought to be carefully considered by young planters; but let not the grand and only effective remedy for a deficient coolie supply be ignored, namely the completion of the INDO-CYLON RAILWAY.

We trust Mr. Skrine will have a pleasant time at home, and while in London that he will put in a strong word with absentee proprietors and agents about the importance of Railway communication between India and Ceylon.

FOR FUNGI, BUGS (SCALE INSECTS), &c.

[I have taken the enclosed from a "Report of Work of the Agricultural Experimental Station of the University of California," just received. It ought to be useful to planters and to embody in your *Tropical Agriculturist*.—*Cor.*]

For Powdery Mildews use sulphur, dusting it on plants.

For Fungi in general use Bordeaux mixture, made as follows:—For every 10 gallons take 1 pound of lime and 1 pound of bluestone. Dissolve these separately in hot water and mix when cool adding the rest of the water. Spray on the plants. Or spray with ammoniacal copper carbonate solution, made as follows:—Dissolve 1 ounce of copper carbonate in 6 ounces of ammonia and add 10 gallons of water.

For Fungi and Scale Insects use lime, salt, and sulphur mixture, a winter wash composed of lime 8 pounds, salt 3 pounds, and sulphur 4 pounds, for each 12 gallons of water. Mix one-fourth of the water, one-fourth of the lime, and all the sulphur, and boil for one and a half hour; put the salt with the rest of the lime and slake with hot water; add to the above and boil half an hour longer; add the remainder of the water and apply as a spray.

For Scale Insects use resin soap, as follows:—For 100 gallons for summer use take resin 18 pounds, caustic soda (98 per cent) 3½ pounds, and fish oil 2½ pints; for winter use, resin 30 pounds, caustic soda 6½ pounds, and fish oil 4½ pints. The material is put in a kettle and covered with 4 or 5 inches of water. The lid is put on and the mixture boiled two hours or more, and then the rest of the water is added, a little at a time. Spray on the plants. Or use the gas treatment: Cover the plant with an oiled tent, and for each 100 cubic feet of contents place in a bowl beneath the tent ¾ ounce of water, ¼ ounce of sulphuric acid, (oil of vitriol), and ¼ ounce of potassium cyanide (58 per cent), being careful not to inhale the poisonous gas nor to allow it to escape from the tent for half an hour. The leaves may be injured if used during the middle of the day.

For insects in general use kerosine emulsion, as follows: Make a soap-solution of half a pound of soap to a gallon of water. Heat it to boiling and add two gallons of kerosine. Pump it through the spray pump, with good pressure, for five to ten minutes. For use add ten times as much water as you have of emulsion. Apply as a spray. Sour milk may be used instead of the soap solution. The emulsion is made more effective by the addition of a very small amount of arsenic to the soap solution, or of "bulbael" to the kerosine.

For Fruit or Leaf-eating insects, use Paris green or London purple as a powder at the rate of 1 to 5 pounds to the acre distributed by walking or riding over the field, carrying a pole, at both ends of which are hung muslin bags containing the poison. As a spray use 1 pound to 200 gallons of water. In spraying these arsenites the nozzle should be held at some distance from the plant and no more should be applied after the leaves begin to drip. Do not use these on crops where the poison would be injurious to health.

PRODUCE IN AMSTERDAM.

Consul Wm. Robinson, in his Report to the Earl of Kimberley on the trade of Amsterdam in 1894, states:—

Any hopes of a revival in trade and commerce which may have been entertained at the close of the year 1893 were doomed to severe disappointment.

COFFEE.—The total importation of coffee into Holland in 1894 was 121,000,000 lb. Java sent about 85,000 bags more than in 1893. Macassar and Sumatra sent but small supplies. Prices of good ordinary Java ruled very steadily throughout the year. Prospects for 1895 are not unfavourable as respects the size of the Java crop, although this will not be so large as the present one.

TEA.—The demand for tea was very slack in the first months of 1894, with gradually declining prices, which reached their lowest point in July and August; towards the close of the year there was a better demand, and advanced rates were obtainable. The market closed very firm. The sales in 1894 showed a not inconsiderable increase over 1893, the greater proportion being, as usual, Java tea. British India, not blended, does not meet the Dutch taste, but some English mixers of cheap blended teas have succeeded in finding a market here for their produce.

COCOA.—The importation of Java cocoa in 1894 was about 50 per cent. larger than in 1893. The finest descriptions sold in February, 1894, at 8½d to 9d per lb., but in consequence of the absence of demand, the price fell to about 7d per lb. at the close of the year, having touched 6½d in October.—*L. and C. Express*, May 10.

TEA IN CALCUTTA.

THE FIRST SALE OF THE SEASON.

The opening tea sale of the present season in Calcutta was held on Thursday last. According to the local correspondent of the *Pioneer*, an unusual amount of interest attached to it, owing mainly to the great advance in tea shares that has recently been seen. It is not explained how, exactly, this was supposed likely to affect the sale, but we may presume that some people considered that a rise in tea shares indicated a coming rise in the tea market! Any such gentlemen can hardly look back with unmixed pleasure the actual results of the sale, for, now that this is over, opinions differ as to whether it was satisfactory or the reverse. The correspondent already referred to says that, compared with the opening sale of last season, medium class teas were lower, but in descriptions valued not higher than 7½ annas, and on the other hand in the finest descriptions, prices were fully maintained. The tea-brokers are of opinion that on the whole the sale

went well, but agents of tea gardens seem a bit dissatisfied. The correspondent himself thinks that bearing in mind that about 60 per cent of the crop is of the class that sells at 7½ annas and under, it should be taken as satisfactory that there was a fairish demand for such. There is another point of view, however and seen in this the apparent firmness of demand, for inferior qualities, and slackness of inquiry for medium sorts, is not altogether satisfactory. There is some risk of Indian tea-planters attending too much to quantity and too little to quality. Any such policy would be short-sighted, and would certainly bring about a destruction of the trade, if the Chinese were to bestir themselves and compete more actively than they have lately done. No doubt, a larger quantity of low class tea must be grown, because there is a market for it, and because many buyers cannot afford to pay more than a certain price. But speaking generally, the taste of the great consuming public in the United Kingdom is likely to improve rather than to deteriorate, and India's hopes lie in an improvement of quality rather than in a simultaneous reduction of both quality and price.—*Madras Times*, May 24.

INDIAN PATENTS.

CALCUTTA, May 9th.

Applications in respect of the undermentioned inventions have been filed, during the week ending 4th May 1895, under the provisions of Act V. of 1888.

William Bull, Civil Engineer, of Calcutta, for improvements in burning bricks and tiles.—*Indian & Eastern Engineer*.

SERDANG—SUMATRA; No. V.

(By an ex-Ceylon Planter.)

LIVE AND LEARN.

My silence since my last has been longer than I intended; but I was called to the other end of the "Oost Keast"; and what with travelling, prospecting, and writing reports, time has gone ahead, and left me a bad second. So now I must endeavour to catch time by the fetlock, his forelock being beyond my reach.

I read lately that most of the aphorisms which are always on our lips are trash; and misleading at that. One, however, surely stands good: "Live and learn." I remember when I was a youngster at dinner one evening a fellow S.D. asked the chief "how long it took to learn coffee planting thoroughly?" The reply with a genial laugh was: "Well, my boy, I've been planting coffee for a quarter of a century, and I learn something new every day!" The youngster was ferried across by Charon 15 years ago; and the P.D. is now a well known cross-country man with fox-hounds in the Midlands.

We all remember in planting a new clearing, how it was always drilled into our ears, "Be careful, and don't turn the tap-root." A few days ago I met a man who, I am told, puts turned tap-roots to good account. However, I am due to visit him shortly; and will try and get hold of his *modus operandi* and describe it to you. But in any case he must surely be a genius! Another maxim always drilled into us in the pruning season was "Never touch a primary," though if I remember rightly, Mr. W. Sabonadiere in his monograph on coffee-planting adds "until necessary." But even then, (I speak from memory,) his restrictions are rather severe. A few miles from here is an estate where on the four-year-old coffee, every primary is tipped! And this is the thushness of it. The planter, working for his own experience, noticed that his trees threw out no secondary branches. "I'll force them to," said he. And he tipped every primary. He knew not at the time that the reason his bushes were unable to make wood was that the enormous crop upon them took up all their strength. Strangely enough, his experiment was a success; and now he has a fine supply of wood for next year, as well as his present crop. The wood, of course, is largely in

the shape of gormandizers; but these are always crop-bearers; and if it is attempted to cultivate Liberian coffee into the symmetrical shape of the friend of our youth, Arabica, disaster will ensue both to the bush and the bank-book.

I am a firm believer in the force of heredity, and we must not forget that Liberian coffee is only a very few generations from forest trees. So it would be absurd to attempt to train it *à la Arabica*. Every bush must have individual treatment; and men who know the plant ken full well how marked is the individuality of each bush. In this cultivation a pruning knife is a planter's worst enemy. (The experiment mentioned above, I do not include as cultivation. It was a bow drawn at a venture; and luckily hit the mark.) At the same time an enormous amount of good can be done by judicious handling. I remember a saying attributed to old Dr. Thwaites of Peradeniya, viz.: that in pruning, we planters without a moment's thought would rip off valuable wood which it would take the Almighty and the bush a long time to put on again. One of the best known planters in the Native States once told me that in Liberian coffee he would leave everything to nature. This, I think, is going too far. Nature, animal or vegetable, must, to a certain extent, have its way; and among the minor crowds Liberian coffee is one that must be humoured; but cannot be forced.

Interesting figures next letter.

THE INDIAN GOVERNMENT AND THE SALE OF QUININE.

Regarding the sale of quinine in pice packets, the *Calcutta Gazette* says:—Reviewing the operations as a whole, and having regard to the novelty of selling quinine by the dose, and the various difficulties of detail which had to be overcome at starting, the Lieut.-Governor considers that the scheme has been quite as successful as could reasonably have been expected. An effective demand for cheap quinine among the masses of the people has been called into existence; the demand is shown to vary from month to month in general accordance with the conditions tending to produce fever; and there seem to be grounds for hoping that it will continue to increase if stimulated by judicious administration. Under the scheme as now modified the post-offices all over Bengal will continue to be the main agency for distributing quinine. The Lieut.-Governor trusts that District Officers and the higher sanitary officials will lose no opportunity of helping to promote sales and of spreading information as to the wishes of Government in the matter. In the Darjeeling district (in parts of which the mortality from fever is extremely high) quinine is now sold, or shortly will be sold, at no less than 19 rural centres in addition to places where there are post-offices. The vendors are for the most part respectable shop-keepers. They are supplied with parcels containing 102 packets of quinine, on the same terms as postal officials to remit the price to Government, less commission of six packets per parcel. All Magistrates of districts are authorised to indent on the Superintendent of Jail Manufactures for the necessary supplies of quinine; and they should arrange to remit the sale proceeds to that officer.

COFFEE Vs. WHISKY-TODDY.

"Coffee and how to get it good" is the title of an article in *Science Siftings* of date April 27th. The different varieties are described and in dealing with coffee as a stimulant, in cases of accident, its use is recommended in place of the usual over-stiff whisky-toddy, not only for medical reasons, but because it renders the patient liable to the charge later, from those not familiar with the facts, of his having been injured on account of drunkenness.

COLOMBO TEA SALES:
A VISITOR'S IMPRESSIONS.

"Surely I have come to the wrong place?" was my mental remark when I stood on the threshold of the Chamber of Commerce Rooms, to which I had been directed as the venue of the great Ceylon tea sales. But for the positive assertion of the brass-plate which faces the street I should have retraced my steps and sought for the tea mart elsewhere, so different was everything from my preconceived ideas. With tea sales one naturally associates the presence of tea. There was not an ounce of it about! Seated in free and easy fashion at tables were some twenty or thirty gentlemanly-looking men, whose *dishabille* of white duck, deliciously cool to look at, with the accompaniment of the inevitable chieroot, appeared strange to the Britannic eye, to which, business and a black coat with "tile" hat are inseparably connected. The restful pose and the air of inactivity are, however, only superficial, and a close observer can see in the tea buyers all that alertness and mental alertness which Cousin Jonathan is credited with possessing in larger measure than his neighbours. For my own part I should say that if Jonathan did come to Ceylon he would not have a walk over! The gentleman—I use the term advisedly and not in the general sense so often employed—who at the moment conducted the sale, for the brokers have their turns, spoke in low incisive tones in pleasing contrast to the oratorical flourishes often to be heard under similar circumstances. The broker was there to sell, and the buyers to buy and the lots were disposed of in marvellous quick time. I should not forget the native buyers who were present. They took a back seat, only at long intervals, bidding, with oriental stoicism and, to outward appearance, taking no interest in what was going on.

For fully an hour I sat listening to what, to me, was quite unintelligible—the sale of Pekoe, Pekoe Souchong, dust, fannings, &c., under brands the name of which is legion. And as I prepared to leave I reflected these are the men who buy and sell the tea, which will find its way into the billy-can of the Australian squatter, the pannikin of the Canadian voyager, into the windows of the palatial establishments of the great British cities, into the highland shelling, to lie alongside butter, paraffin oil and matches, and to American tables, I hope in greater quantity than in the past, because in this matter Jonathan, I understand, has shown the lamentably bad taste to prefer Japan's and China's to Ceylon tea.

—♦—
TROUT FISHING IN THE HORTON
PLAINS

We do not think the introduction of trout into the stream passing through the Nuwara Eliya plains, or that in the Barrack plains can be spoken of as yet as a great success. Nor can the term be applied to any of the streams in the neighbourhood at about the same level, or away on the Elk Plains or Bopatalawa. But, certainly, repeated experience seems to shew that in the Horton Plains river and Billuloya, the trout are prospering to the heart's content of the most ardent sporting fishermen among us. On the Horton Plains in fact, the experiment can be pronounced an unqualified success. And it is not difficult to explain why this should be the case. It is not simply that the additional elevation of 1,000 feet above sea level constitutes an

advantage with the cooler temperature of the water, over that prevailing in the lower and warmer Nuwara Eliya region. Far more important, however, is the exemption of the Horton Plains' stream from sudden and disturbing floods. The watershed on the side of Totapella or the neighbouring mountains above Horton Plains is, comparatively, of limited extent, and consequently such floods are never seen in the streams there as may occasionally be witnessed in the Namoya, the Seta Ella or the Buluh Ella. Then again there is the freedom from bazaar debris which is a drawback in Nuwara Eliya. We are not surprised therefore to learn of the Horton Plains stream being comparatively full of trout and of good size affording excellent sport.

Our latest report has come from Capt. Bayley who, on a recent visit, much enjoyed fishing in the stream, capturing of a morning with the rod, a couple of extremely nice fish from 1 to 1½ lb. each. His son, lower down in the Billuloya obtained one of no less than 4 lb. and this proved later on, though not observed at the time, to be full of spawn—an evidence of how thoroughly the trout are becoming acclimatised. Capt. Bayley states that more delicious eating than the fish he captured, could not be desired; but he considers it very necessary there should be some check on indiscriminate fishing and even on natives and others using nets, in the higher streams. It seems that while a Local Board rule exists that no one can fish in Nuwara Eliya without a license costing Rs30 per annum—the money being devoted to the Trout Fund—no such regulation can legally apply beyond the Board's limits and consequently any one is at liberty at present to go and fish on Horton Plains. So far as all intelligent persons, and especially Europeans are concerned, we trust a sense of honour will prevent their going to fish there or in any other stream in which trout have been placed, *unless* they have previously given substantial support to the Trout Fund by taking out a license or by paying a special subscription. It should not be difficult through the resthouse-keeper to learn the names of all who visit Horton Plains with rod or net, and we should be glad to publish the same if it will help the purposes of the Trout Fund. It may have been observed from the report of our Nuwara Eliya correspondent, published the other day, that the last batch of trout ova imported was not very successful, and that 30,000 more ova have been ordered. This means continued expenditure and the necessity for liberal support; and certainly all who are able to enjoy the sport of the resulting trout fishing, whether on the Horton Plains or elsewhere, ought to be foremost in extending their support. If all interested come forward as they should, the continued success of the trout-breeding experiment must be assured; and perseverance in supplying the streams with fresh stock should secure a very satisfactory measure of success in the lower streams, although the trout may never be so lively and numerous, or the sport so good as in the higher Horton Plains' river.

—♦—
TEA SEED IN DEMAND.—A seller of well-known local tea seed reports:—

"The demand for tea seed is as keen as ever. We are full up of orders for the next four months. We have just completed twenty muads Single for Java! The proposal that the Planter's Association should buy and hold land is splendid. I wonder if they would care to buy up tea-seed bearers."

TEA-GROWING ON THE CAUCASUS.

THE RUSSIAN COMMISSIONER IN CEYLON.

The Manager of Abbotsford plantation, writes:—

I have had a very pleasant visit from the Russian Commissioner who seems to be a most suitable man as Chief of such an Embassy.

He is I should say a very good all-round man, and specially strong in Botany and Agriculture. As far as I can see, the main object of his tour is to ascertain what tropical and subtropical plants are suited for cultivation in the Caucasus, and he pays particular attention to everything connected with tea, but I do not think Ceylon need fear competition from that quarter, as from experiments being carried on at present the cost of production would be from 5 to 10 times what it is here.

The soil it seems is good though the features of the country are as a rule very steep or even precipitous and though the climate is suited to the growth of tea, I gather that they suffer from severe wind storms from the fact that grevilleas cannot stand their gales.

I hope Mr. Klingen will have a very pleasant time of it in Ceylon and that he will take a big shipment of our teas along with him on his return to Russia.

He paid the Colony a splendid compliment when I gave him a cup of it here. "This is excellent tea it is like China." [He meant the very best China, doubtless!—*Ed. T.A.*]

NORTH BORNEO ESTATE NOTES.

BYRE.—More and more coffee in bearing, and plants growing well, topping a few as high as 9 feet. Coconuts growing remarkably well. Put in 80,000 coffee beelits.

KABELL.—Some nice flushes have set. Coconuts growing well, some of them will want little further weeding except from cattle of which a few have been turned in amongst them. Felling by the Development Corporation for the Trading and Planting Co. in the Boad Creagh district for coffee is in progress. Loong Piasow Coffee, a few ripe berries showing heavy rains make the weeding expensive. Coconuts coming up nicely.—*British North Borneo Herald.*

THE AMSTERDAM CINCHONA-AUCTIONS.

May 9th.

Our Amsterdam correspondent telegraphing on Thursday evening, states that at today's auctions of Java cinchona-bark in Amsterdam only 3,953 packages out of the 6,178 offered were sold, the remainder being mostly very firmly held. The tone at the auctions was rather more quiet than had been expected, and during the sale a slight decline occurred. The unit, nevertheless, averaged 2.92c per half-kilo, which was about 0.08c below the rates paid privately and 0.07c above the average unit of the last April auctions. The following equivalents of sulphate of quinine were bought by the manufacturers:—Philadelphia and Paris 2,212 kilos; Brunswick 1,941 kilos, Mannheim and Amsterdam 1,557 kilos; Frankfort-on-Main 3,879 kilos; Auerbach 2,081 kilos. Druggists and others bought 2,724 kilos. The total quantity of quinine offered was 26,705 kilos; that sold 17,394 kilos. The prices paid for manufacturing bark ranged from 6c to 53½c (equal to 1d to 9½d per lb); for druggists' bark, from 7½c to 67c (equal to 1½d to 1s per lb).—*Chemist and Druggist.*

JAVANESE LABOUR IN BORNEO.

At the latter end of last month I visited the Tobacco Estates of The New Darvel Bay (Borneo) Tobacco Plantations Limited to enquire into the condition of Javanese labour on these plantations. I visited Lahad Datu, Lamine and Segama plantations. I found very little sickness existing amongst this race of people and their average of sickness compares very favourably with the Chinese coolie. They are well housed and contented looking, the number suffering from fever were in a very small

proportion to the whole, and this was the principle form of illness affecting these people. This is all the more satisfactory considering that they are employed in building, jungle cutting, and making roads and drains, &c., which latter is not the healthiest form of occupation generally speaking. Working on this Estate at the present time the numbers are, Javanese 243 men 32 women Banjarese 106 men 9 women, and the average number of both races employed during 1893 and 1894 was 130 and 270 respectively. The total death rate during the same years 1893 and 1894 was for the former 1.7 per cent and for the latter 0.8 per cent.—*GEO. W. JOHNSTONE, Acting Principal Medical Officer.—Medical Department, Sandakan, March 15th 1895.—Brit. North Borneo Herald.*

A CEYLON TEA TRUST.

We read in *Truth* of May 9th:—It is announced that the documents for the transfer of the Ringarouma Tin Mines to the Company have arrived in London, and the subsidiary Company which is to work the property is in course of formation. The Directors have also acquired the Oolapane Tea estate as a going concern, for working which the Ceylon Tea Trust, Limited, will be formed almost immediately.

SEYCHELLES.

The auction sales of the damaged goods landed from the Messageries Maritimes ss. "Australien" have already realized Rs 63,000. Every shop in the place is crowded with "all sorts and conditions" of cotton goods etc. Never within the memory of "the oldest inhabitant" have the Seychellois been dressed in such gala array—silks and furbelows galore! There will be no necessity for importing any cotton goods for the next two years. Prospects of a vanilla crop very poor. Liberia coffee up. It is estimated that more than one million plants have been put into the ground during the last three years. Mr. J. Risely Griffith has left for St. Kitts. Everyone looking forward with pleasurable anticipation to the arrival of Mr. Cockburn Stewart. He will not be on a "bed of roses" at the commencement of his regime; for the Exchequer is on the verge of bankruptcy; but he will be "the right man in the right place" and will pull through if any one can.—*Merchants and Planters' Gazette.*

CEYLON AND ORIENTAL ESTATES.

To the Editor of the *Financial Times.*

Sir,—Being a shareholder in the Ceylon and Oriental Estates Company, Limited, I have received a copy of the report of its directors for last year, and considering the way the undertaking is handicapped by heavy payments for interest and commission on the capital borrowed to float it (the public having been very chary in applying for shares), and the high cost of the London management, I suppose I may congratulate myself on getting an additional 2 per cent dividend for the year, though 5 per cent. is, I think, no great thing out of a gross profit of 50 per cent. and compares badly with the dividends of other Ceylon Companies. The repayments for debentures and commission on their issue absorb about 50 per cent. of the gross profits, and the cost of London managements about 15 per cent. more the latter being double the average of any other Ceylon Estates Company. Hitherto the directors have very generously surrendered their fees, but naturally with the improved results of the year's working they consider themselves entitled to remuneration, which last year amounted to £700. If multiplicity of counsellors ensures good management, this Company is admirably managed, for there are seven directors, five of whom are ornamental, as I do not suppose they know anything about tea planting.

The directors congratulate themselves upon the yield of their estates during an unfavourable season

being only 4 per cent. below the estimates, but they neither say what these estimates were, nor what the average yield was, as is the general practice.

The shareholders would probably learn, if they did give this information, that the average was the smallest of any Ceylon Company. It is, doubtless, a comfort for the shareholders to learn that the managing director, having paid his periodical visit to Ceylon at their expense, is well pleased with the way their representatives there have managed and developed their estates.

Having an experienced visiting agent in the island, I am puzzled to know what advantage the company gains by the expenditure of £184. The manager could well afford to pay his own expenses out of the very handsome salary he receives for managing the company. He resides chiefly in Somersetshire; the duties he performs for this salary are therefore nominal, and his office a sinecure.

The directors inform us that they have purchased the Ooragalla Estate, of some 470 acres, but do not condescend to inform their shareholders how and what they paid for it. If the ornamental directors are good for nothing else, they are quite able to draw out a straightforward report, which I do not consider theirs to be.—I am, &c. PEKOE.

MAURITIUS.

SUGAR—THE WEATHER AND THE CROP.

Port Louis, May 7th.

The weather continues to be favourable for plantations and the vegetation is very luxuriant all over the island.

VANILLA.—The market is firm and bare of good quality. An important lot of 488 kilos, quality was sold this week at R32 per kilo, 285 kilos at R26 to 28 per kilo. As we mentioned in our last the outturn of the crop will not exceed 4,000 kilos.

We quote nominally:—

	R.	R.	per kilo	
1s quality	32	to 33	"	} above
2nd do.	28	to 29	"	
Good to middling	25	to 26	"	} 6 inch.
Vanilloes	14	to 18	"	

ALOE FIBRES.—The market is firm. We have to quote the sale of a few bales good quality at R240.—*Merchants and Planter's Gazette.*

CINNAMON: QUARTERLY SALES IN LONDON.

The second quarterly auctions took place in London on Monday, when 1,200 bales were offered and the whole sold. There was good competition with an advance of ¼d to 1d per lb. in prices compared with the previous quarterly sales.—*Examiner.*

GRAPHITES.

At a recent meeting of the Geological Society of Glasgow, Mr. John Smith exhibited a series of specimens of graphite as follows: Graphite from Ceylon where it occurs in a very pure form in metamorphic strata being probably the result of alteration of a coal seam through heat. It is a brilliant variety being built up of thin scaly crystal such as are found in blast furnaces which are making No. 1 pig iron. Graphite from Travancore. This seems much the same as the former specimen only more compact, the component crystals being smaller. Graphite from a blast furnaces known as "Kush." This variety comes from the furnaces, both with the slag, the black dirt, and the iron. When the latter is very "rich" numerous scales of graphite are squeezed out to the surface of the "pigs" on cooling, and which after slow in consequence quantities of corroded-looking little holes. Many of these graphite scales are so thin as to float in the air when they become detached. The brilliancy of their surface does not seem to be affected by time, as some exhibited were not tarnished in the least. Mr. Smith also exhibited a sword-shaped piece of clayband ironstone from

Waterland, Ayrshire. It measured 19 in. by 1½ in., with very sharp edge; and its peculiar shape has resulted from the meeting of two "joints" in the rock, which are curved in three directions.—*Indian & Eastern Engineer.*

PLANTING IN NORTH BORNEO.

The River Klias is on the West Coast of North Borneo and was, presumably, the former mouth of the Padas River. A number of Chinese have settled on the Klias but the majority of the population are of Brunei extraction and are a tall, well-made, good-looking lot of people. The soil is suitable for any tropical cultivation and this district in former times exported a large quantity of pepper which was grown on the high lands near Bundu. The great amount of moisture in the air should enable the Klias district to grow a cotton similar to the sea Island cotton. Of towns the chief is Menumbok which is the most convenient place for receiving sago but the water supply is not good, the result being that the sago of Padas is worth 40 cents a picul less than the Sarawak sago. As many thousand piculs are exported yearly from Menumbok it would probably pay the Mill owners to make a water supply cistern at the hills to the West and North West of Menumbok, the cost of which would be paid for by the higher price which the better washed sago would command. Mempakol is a small village on the point opposite to Labuan and is the chief custom station of the district and is the residence of the Magistrate, Mr. J. G. G. Wheatley. Being open to the sea it has a pleasant breeze, at times very strong, and being connected with Menumbok by a telephone and bridle road and with Labuan by the telegraph cable it will probably continue to be the chief judicial village in Province Dent but its want of water will be detrimental to its progress. The sago factories formerly at Mempakol have been removed to Menumbok and the latter appears to be a rising station. From Mempakol to Menumbok the distance is about two miles which is planted, nearly all the way, with coconuts which thrive well. These plantings were begun at the instance of Mr. Joseph Wheatley who in several cases gave the seed, bought at his own expense, and the plantings have latterly been so numerous that the Padas district probably contains the largest quantity of coconuts of any district in North Borneo. The exports of sago from Benoni, Bangawan, Qualla Lama, &c. must be considerable but the navigation at times to Labuan is stopped by the weather. At present all the sago from those ports goes to Labuan.—*British North Borneo Herald.*

CINNAMON PEELERS AND THE LAW OF CONTRACTS.

A correspondent writes:—"I have seen the letter in your paper of the 27th. There may be conflicting opinions among lawyers and laymen about a second conviction for desertion, but the decision of the Collective Court in a Ratnapura case reported in Supreme Court Circular vol. iv. pp. 2-6 clearly lays down the law on the point and a Magistrate is bound to follow the ruling of the S. C. Ask the lawyer, who gave it as his opinion that the Magistrate was right to refuse to send a defaulter to jail twice for the same offence, whether he has read the judgment of the Appellate Court above referred to. Planters must try to get men, after being in jail, punished a second

time. Not for the *identical* offence for which they had been previously punished, but for a *fresh* breach of the same contract. Why should not a servant, who contracts to work for a period of 3 years, be prosecuted and punished on each and every occasion he makes a breach of the contract? How otherwise is it possible to enforce the contract? If the contract is determinable by the misconduct of the servant then a contract for a specified term of service is a farce. If a man can be punished more than once for, say, theft, why not for a statutory offence such as desertion. Both Mr. Jardine and Mr. Nicholas have secured a second conviction in cases of repeated desertion."

[We are in receipt today of a long and interesting letter from the most experienced ex-Cinnamon planter in the country, which will appear in our Monday's issue.—ED. T. A.]

DRUG REPORT.

(From *Chemist and Druggist*)

London, May 9th.

CAFFEINE seems to be rather less firmly held. It is true that the manufacturers are unwilling to mention any time for delivery, although the nominal quotation remains 15s to 16s per lb; but we have it on good authority that one brand at any rate may be had from second-hand holders for delivery in about six weeks at 21s per lb; on the spot there is practically nothing obtainable.

CARDAMOMS—A fair demand was shown at the continuation of the auctions on Friday, and of 51 cases offered on that occasion 43 found buyers, but there was no change in the quotations; fair bold yellow Tellicherry cardamoms sold at 1s 9d per lb.

COCAINE—A somewhat weak market; there has been no alteration in the official quotations, but it would not be surprising to see a further drop soon, there being now several holders of crude cocaine, some of whom are rather anxious to sell.

COCA BITTER—At the public auctions held in Amsterdam on May 7th, 70,000 kilos of Van Houten's brand sold at from 66 to 67½ cents an average of 66.85 cents per half-kilo; the tone was very animated; at auction on London May 7th, 500 2-cwt cases of Cadbury's brand sold at 12½d to 12½d per lb, making a decline of from 2d to 7d per lb.

ESSENTIAL OIL.—Sales of 15 tons Citronella oil in drums have recently been made at 13½d per lb, cif for near-at-hand; and 12½d per lb, cif for shipment until the end of August; on the spot 1s 2½d to 1s 3d is asked for tins.

QUININE—At Friday's drug auctions 5,000 oz Auerbach quinine were to have been offered, but this parcel was said to have been sold privately before the sales; there has been no business in the Mincing Lane market this week, and there are sellers of German bulk at 1s per oz.

VANILLA—There was a fair supply of good quality at the last auctions. It realised full prices, medium grades being again dearer. Fine 6 to 8½ inches brought 21s 6d to 24s; 5½ to 7½ inches, 16s 6d to 18s; dark and chocolate, slightly crystallised, 3½ to 5½ inches, 16s to 18s 6d; ordinary dry down to common foxy, from 15s 8d down to 3s 3d per lb.

CEYLON PRODUCE IN LONDON.

CARDAMOMS.—Of the total of nearly 400 cases offered in auction last week about 320 cases found buyers at previous rates to a decline of 1d per lb., as follows:—Mysore kind from Ceylon, fine bold plump pale at 3s 3d, rather smaller at 3s 1d to 3s 2d, boldish pale bright at 2s 9d, medium size ditto at 2s 4d to 2s 5d, medium bold lean part yellowish at 2s 1d to 2s 2d, smaller at 1s 9d to 1s 10d, small brownish at 1s 7d to 1s 8d, and pickings at 1s 4d to 1s 5d per lb. Malabar kind from Ceylon, boldish pale bright at 1s 10d, medium ditto at 1s 7d to 1s 8d, medium size dull at 1s 5d, small brown at 1s 2d to 1s 4d per lb. Seeds realised 1s 9d to 1s 11d, bold 2s 1d per lb.

CINCHONA BARK.—The market is quiet, and only a few small transactions have taken place privately.

At the Amsterdam auctions yesterday 6,100 packages Java barks were offered, and met with a good demand, about 4,000 packages being sold at an average unit of 2.92 cents., against 2.87 cents. at the 1st series; private sales have however been made in the interval at 3 cents.

The following are the Board of Trade Returns for the first four months of this and the last three years:—

	1895.	1894.	1893.	1892.
	Cwt.	Cwt.	Cwt.	Cwt.
Imported in four months ..	17,042	22,485	38,410	38,449
Exported in four months ..	13,367	19,753	31,372	42,192

SULPHATE OF QUININE.—The market has become quiet, and business is limited. Sellers of second-hand German ask 1s, and there are buyers at 11½d per oz.—*Wilson, Smithett & Co.'s Report*, May 10th.

PLANTING NOTES FROM DIKOYA AND MASKELIYA.

There have been some nice showers in these districts which have made everything look much brighter and fresher; but they seem to have little or nothing of the wild earnestness of the monsoon about them, and are of a quiet, easy-going decorous character, and clear off in a most unexpected manner just when one's mind is made up, that after all appearances notwithstanding, the rain *must* be the big one, taking a preliminary canter. Doubtless, however, that coming events cast their shadows before and that we shall have more than enough of wet weather shortly.

COCONUT FIBRE IN AMERICA.

THE ONLY FACTORY IN THE UNITED STATES.

The fibre factory of the Mobile and Honduras Manufacturing Company is in full blast. The establishment is located in the three-story, triple-front building on the west side of Commerce street, just north of St. Louis.

This is not only the largest and most important coconut fibre plant in the United States, but the only one. There was a factory of the same sort in California, but recently it burned. It was not the equal of this factory in size or equipment, nor was its location a good one. The coconut fibre used there was obtained from Samoa, some 4,000 miles away, while the product was sold in the Eastern states, fully 3,000 miles in the opposite direction. The Mobile factory gets its fibre from the islands of the Caribbean sea, distant but 1,400 miles, and its product can be sold near at hand, the most distant points of sale being not more than 800 miles. The product of the California factory had a ready sale, and it is argued from this that the Mobile enterprise will meet with success.

The fibre is brought here on the nut and is manipulated until it can be used for all the purposes for which horse hair is found useful, while the cost is very much less than horse hair. The principal use is that of stuffing for mattresses. It is said not to lump or lose its shape and to be peculiarly objectionable to the genus *emex lectularius*.

In the north warehouse of the three combined in one building is stored the stock of coconuts. These are taken to the second and third floors by a conveyer for storage, and then sent down to the first floor, when required, by means of chutes. On the first floor the nuts are husked, six Jamaica negroes performing this work. Each has a knife something like a big chisel, fixed upright in a cast iron standard. To husk a nut, the husker lifts it in the air and brings it down heavily upon the knife, so that the blade sinks into the husk; then, by a wrenching motion, the husk is riven and the nut falls out. The negroes are skilled in this work and are very quick at it. They were all living here when the factory started. They have been engaged for some months in husking and have piled the first floor to the ceiling with the husks. There are about 140,000 coconuts and husks in stock, a supply sufficient to run the factory six weeks.

In the middle warehouse are machines for clean-

ing the fibre and removing all the softer material. To this end, the husks are placed in a breaker, where they are crushed by rollers. The refuse is carried off by spiral and sprocket conveyers to the furnace room, where it is used for fuel.

The fibre is next treated to a steam bath, chemically prepared, after which it is carried and picked in machines devised for this purpose. It then goes by a system of conveyers to the third floor, where it is spread out and dried. Next it is brought to the second floor and twisted into ropes, by means of rope-making machines. This is to give the fibre a "curl." After this the ropes are placed in a dryer, worked by a fan, which forces air to pass over 5,000 feet of steam piping. When thoroughly dried it is put in a machine which untwists the ropes and picks the fibre apart, though the cull of each strand remains as a permanent characteristic. The fibre is then packed in 200-pound bales and is ready for market.

The middle warehouse lower floor also contains the engine, of Erie make, 50 horse-power, while in the south warehouse, lower floor, are the boilers two in number, each 50 horse-power, of Erie manufacture.

Throughout a perfect system of conveyers is used, so that little or no handling of the material is required. The machines are automatically loaded and their product carried through the circuit in the same manner. All refuse is quickly removed to the furnace room. The company proposes also to do away with the dust that is thrown out from some of the machines, and a dust conveyer will soon be at once introduced.—*Straits Budget*.

THE NAHALMA TEA ESTATE COMPANY, LIMITED.

REPORT OF THE DIRECTORS OF THE NAHALMA TEA ESTATE COMPANY, LIMITED,

To be presented to the shareholders at the first annual ordinary general meeting to be held on Thursday, 6th June 1895.

The Directors have the pleasure to submit the general balance sheet and profit and loss account for the nine months ending 31st December 1894, duly audited—

The net amount at credit Profit and Loss Account at 31st December 1894, after providing for General Expenses, Directors' and Auditors' Fees, Interest On Debentures, &c.	£	s.	d.
..	2,287	8	1

An interim Dividend of 4 per cent. on the ordinary shares was paid 13th December 1894, amounting to	560	0	0
It is now proposed to pay a final Dividend on the ordinary shares at the rate of 2 per cent. (making a distribution for the nine months at the rate 8 per cent per annum free of Income Tax), which will absorb	280	0	0
It is proposed to write off the preliminary and other Expenses connected with the formation of the Company, requiring	475	15	2
It is proposed to place to credit of Debenture Redemption Fund	625	0	0
Leaving to be carried forward to next year, subject to payment of Income Tax on profits, a balance of	346	12	11

£2,287 8 1

The Directors recommend the distribution of a final dividend at the rate of two per cent. on the ordinary shares of the Company payable so soon as the realization of the produce permits, making, with the interim dividend paid 13th December 1894, a distribution at the rate of eight per cent. per annum, 1st April to 31st December 1894, such dividend to be paid to those shareholders whose names appear on the share register on the 6th June 1895, after which date such shares will be transferable *ex* such said dividend.

The acreage of the Company's properties on 31st December last was—

Tea in full bearing	436
Tea not in bearing	10
Jungle	246

692 Acres

The Ceylon Manager reports the estates in good order. A new turbine is now being erected which it is hoped will effect a saving in the consumption of wood. With a favourable season, the crop for 1895 is estimated at 220,000 lb. The Directors deeply regret the loss the Company has sustained through the sudden death of Mr. Hugh Hodgson Anderson, the late Secretary of the Company. Mr. John Abernethy, the Director retiring by rotation, being eligible, offers himself for re-election. The Directors ask that their remuneration may, from the date of the formation of the Company, and in future, be paid to them free of Income Tax. Messrs. Fox, Sissons & Co., Auditors to the Company, offer themselves for re-election.

THE EADELLA ESTATES COMPANY, LIMITED.

(By Telegraph.)

KANDY, 3rd June 1895.

The Report was adopted and a dividend of 13 per cent was declared. The remaining capital is R10,000 called up. There were present Messrs. Gibbon (Chairman, in the absence of Mr. Forbes Laurie), Gordon Pyper, Kynaston, and Munton, besides leading share holders who were represented by proxy.

Your Directors have pleasure in submitting the annexed statement of accounts and balance sheet for the past year ending 30th April 1895.

The working and yield of the estates have been so far satisfactory that, despite the lamentable fall in prices of cocoa and disappointment as regards that product, it has been more than compensated for by the returns from tea, and the Directors are gratified at being able to show a considerable amount of profit to be dealt with by the shareholders.

After writing off 10 per cent depreciation on factory and machinery, and 2-5th of preliminary expenses (1-5th more than last year), there remains at credit of profit and loss R20,936-63, and it is recommended that a dividend of 13 per cent be paid, carrying forward R1,436-63.

The clearing of last year has been very successful as regards cocoa and shade, but less so in respect of Liberian coffee, the vacancies in which will all be supplied with basket plants during the present monsoon.

Another clearing of 52 acres is felled, roaded and drained, is being prepared for planting with same products. Both clearings will be planted up with coconuts.

The 221 acres tea gave about 465 lb. per acre. The yield of cocoa was 188½ cwt., and Liberian coffee 100 bushels cherry.

CAPITAL.—In view of large extension of new clearings, it will be necessary to call up the remaining capital of R10,000.

THE TONACOMBE ESTATE COMPANY OF CEYLON LIMITED.

Report of the first general meeting of shareholders in the Tonacombe Estates Company of Ceylon Ltd., held at Ambewatte House on Monday the 3rd June 1895.

Present:—Messrs. W. H. Figg (Chairman) W. Bowden-Smith, H. Chamberbatch, F. J. de Saram.

By Attorney: Messrs. A. Fetherstonhaugh, W. S. Bennett, Major W. F. Bunn.

Proposed by the CHAIRMAN and seconded by Mr. F. J. DE SARAM:—"That the report and accounts presented by the Director be adopted." Carried unanimously.

Proposed by Mr. F. J. De SARAM and seconded by Mr. W. BOWDEN-SMITH:—

"That a dividend of 5 per cent on the paid up shares be declared payable forthwith" Carried unanimously.

Proposed by Mr. W. BOWDEN-SMITH and seconded by Mr. F. J. de SARAM:—

"That Messrs. Campbell, Cumberbatch and Figg the provisional Directors be elected Directors for the current year" Carried unanimously.

A vote of thanks to the chair terminated the meeting.

ACREAGE.—The Acreage of the Company's properties is as follows:—

Tea in bearing	-	-	321 acres
Tea in partial bearing	-	-	42 do
Tea not in bearing	-	-	91 do
Cleared for planting in April	-	-	14 do
Coffee	-	-	75 do
Cardamoms	-	-	65 do
Forest and Timber	-	-	74 do
Uncultivated land	-	-	954 do

Grand Total 1,636 do

It having been decided that the Estate year shall end on the 31st March, your Directors have now pleasure in presenting their first report covering a period of nine months.

During the nine months under review 80,775 lb. tea have been secured and realised an average of 53½ ct. per lb.

The total cardamoms picked amounts to 13,747 lb. of which say 5,000 lb. have sold at an average of Rs 1.64 per lb. The balance is estimated in the accounts to realise the same price.

303 29-32 Bushels Coffee have been harvested, and realised R5,371.96. or R17.67 per bushel.

The total expenditure amounts to R42,009.56.

The balance available after paying all outstanding amounts to R26,727.20, and the Directors propose distributing it as under:—

To pay a dividend of 5 per cent on the Ordinary Shares..	R14,000.00
To write off Preliminary Expenses	6,446.13
„ cost of Tea Extensions	5,879.89
To carry forward to next account	401.18

R26,727.20

The Factory has been considerably enlarged, and is now capable of dealing with from 200—225,000 lb. made tea. Tea is being manufactured for an outside estate on favorable terms.

An engine has been ordered, as it has been thought desirable to have alternative power in case any unforeseen accident should happen to the turbine. This will cost, say, R8,000, and will be charged in current year's expenditure.

During 1895-96 it is proposed to plant 84 acres of land (30 of which are virgin forest) with Tea and 15 acres with Cardamoms.

The prospects for next season appear to be good. The Tea is estimated to yield 130,000 lb.: Coffee 350 bushels Parchment Cardamoms 17,000 lb. on an expenditure, of R53,662.50.

The Provisional Directors retire, and, being eligible, offer themselves for re-election.

VARIOUS PLANTING NOTES.

FRUIT FROM THE ANTIPODES.—Since our last issue, one of the P. & O. Company's fruit steamers has arrived from Hobart, Melbourne, and Adelaide. From Hobart there are 22,393 cases and 212 half-cases; from Melbourne, 894 cases and 32 half-cases; Adelaide sends 121 cases; or, altogether, 23,408 cases, and 244 half-cases of Apples.—*Gardeners' Chronicle*, May 11.

AN ANONYMOUS DONOR OF £80,000.—The Parks and Gardens Committee of the Liverpool Corporation met on Wednesday last and visited the recreation ground in Wavertree, presented to the city by an anonymous donor at the last council meeting. Votes of thanks were passed to the generous donor, and it was stated that he had expended over £80,000 on the purchase and laying out of the land.—*Ibid*.

COFFEE.—We have received from Mr. W. S. Terry, of Hilo, a sample of coffee raised by him in Hilo village, from trees that have been planted only three years. These trees have borne quite young and abundantly. The berries were large and plump, perhaps too large for the trade, as smaller berries are generally preferred. But the early crop from trees only three years old is a good omen, and affords encouragement to other coffee-growers.—*Hawaiian Planters' Monthly*.

TASMANIAN APPLES.—Tasmanian Apples are arriving in excellent condition this year, and a portion of the cargo of the ss. "Cuzco," which brought 12,000 cases, was recently sold by auction at Covent Garden Market, realising prices which are said to be remunerative to the Colonial growers, whilst they are decidedly satisfactory to the London consumers. The excellent quality of the Tasmanian, Ribston Cox's Orange, New York and Sturmer Pippins, and of the Scarlet Pearmain, Alfriston, and Prince Alfred are widely recognised. They fetched from 9s to 16s. per case, coming into competition with the last of the Nova Scotia and Canadian Apples, which are selling at from 16s to 20s per case.—*Journal of Horticulture*.

A NEW HYBRID EGG-PLANT.—Mr. Hart writes from Trinidad:—"Among seedlings of Melogena or Aubergine (*Solanum melongena*), L, there lately appeared in our gardens a plant with the shrubby habit of the Aubergine, or Egg-Plant, and with similar flowers, but bearing fruit having the exact form of a deeply sectioned Tomato, and of a bright red colour. The size of the fruit is about 2 inches in its widest diameter. The interior of the fruit has more the appearance of the Egg-Plant than the Tomato, but there is a likeness to both. It would make a very good decorative plant, as the fruit appears to be of a more lasting character than either the Egg-Plant or the Tomato. I should be glad to know if anyone has seen a similar production. J. H. Hart, Supt., Royal Botanic Gardens, Trinidad, W.I."—*Gardeners' Chronicle*, May 11.

SISAL HEMP (*AGAVE RIGIDA*, VAR. *SISALANA*) AT VERA CRUZ.—In a report on the trade and commerce of Vera Cruz, reference is made to the Henegren or Yucatan hemp, which has become more generally known of late as Sisal, stated to be from the fact that the fibre was first exported from Sisal, a small coast port about 27 miles west of Progreso. In view of the low price that has ruled for Sisal hemp for some time past, it will be of interest to know that the export from Vera Cruz varies from 19,000 to 45,000 bales per month, the average weight of each bale being about 350 lb. It has been remarked that this year 1895 will have the maximum quantity of land under hemp cultivation in Yucatan, which means that the production of hemp has reached its limit. Under the existing circumstances of low prices, high monetary exchange, and scarcity of the Indian labour, many of the farmers are planting Maize instead of replanting hemp. New lands, as well as old hemp-growing areas, are now being used for growing Maize and other products.—*Ibid*.

THE IMPORTATION OF BANANAS INTO AMERICA.—In a recent Consular report from Baltimore, it is stated that of all the tropical fruit now imported into the United States, the Banana reaches there in the largest quantities. Its cultivation for the foreign market in Jamaica only dates back about twenty years, and it is from that colony that fully eighty-five per cent. of those consumed in the Atlantic States are now derived. There are at present four steamships exclusively employed in the Banana trade with the port of Baltimore, and which can land their fruit from Port Antonio in a little over five days, and almost as fresh and green as when cut. A proportion of each cargo is disposed of in the city of Baltimore, but the largest part is transferred to heated or refrigerated cars, according to season, and sent by rail as far west as Chicago. In connection with the Orange culture in Florida, it is stated that the crop which is the chief source of supply for the eastern States was completely destroyed by the severe weather, and that the growers are actually buying Oranges in California to meet their engagements.—*Ibid*.

PERAK AGRICULTURAL SHOW.—Perak is to have its show! An Agri-Horticultural Show will be held at Batu Gajah on Friday and Saturday the 12th and 13th July. Well done the go-ahead Straits Settlement!

NATAL TEAS were lately shewn freely at the Rand Agricultural Show by Messrs. Hindson & Co., a firm that began planting in 1887 and has gradually increased its output from 600 lb. a year to close on 300,000 lb. The capital invested is said to be £60,000, from 500 to 600 acres being planted with yearly additions. The firm's estates are said to be fully equipped with machinery.

TEA.—In the matter of over-production of tea the *Madras Times* makes the following comment:—

At a recent meeting of the Dimbula Planters' Association, Ceylon, the chairman put forward a resolution to the effect that the Association trusted that in future Government would not sell land for tea cultivation at an upset price of less than R100 an acre, or more, according to locality. The chairman's object was to prevent over-production. The resolution, which was lost by a large majority, caused much discussion, one planter making the sensible remark that whether or not Ceylon planted another acre of tea, or shut up altogether no Indian man would care, and there are thousands of acres in India to every ten acres in Ceylon. To hear the over-production party talk one would think Ceylon was the sole tea-producer of the world. They forget that Ceylon is a very little place after all is said.

THE SURVEYOR-GENERAL'S RETURN OF RAIN-FALL in Ceylon during 1894 and the means during different periods, is issued as a Supplement to yesterday's *Gazette*. We shall give a *resumé* in due course, meantime remarking that the heaviest fall of rain recorded for last year was on Sembawatta, Kitulgala (1,600 feet elevation), namely 221.29 inches distributed over 222 days, the means for 11½ years being 218.38 inches, while the minimum fall was at Manaar with 24.94 inches on 60 days, the means during 24½ years being 37.84 inches. The next heaviest falls were:—St. Martin's, Rangalla (3,500 ft.) 168.62 inches on 196 days; Digalla, Awissawella (400 ft.) 168.32 inches on 209 days; Dnedin, Awissawella (400 ft.) 166.98 inches on 204 days; and Coldstream, Watawala (3,800 ft.) 159.94 inches on 208 days.—The Sembawatta fall of 221.29 inches compares with that on Padupola given in the P.W.D. return which for last year was 232.71 inches.

COFFEE IN NYASSALAND.—We are much interested by the letter on this subject which Mr. D. B. Cameron of Assam sends us, our correspondent being brother-in-law to Mr. Duncan who went to Nyassaland as horticulturist to the Church of Scotland Mission in 1878. Mr. Cameron had also a brother associated with Mr. Buchanan of Zomba who died there in 1893. We find that though Commissioner Johnston, C.B., in his official Report, published in August last year, through some curious blunder, distinctly gives Mr. John Buchanan, C.M.G., the credit of bringing out with him "a small coffee plant from the Edinburgh Botanical Gardens"; as the very beginning of the coffee enterprise yet Mr. Buchanan himself in his book on the "Shire Highlands" published in 1885, distinctly gives the credit where it is due. We quote from the latter as follows:—

With Mr. Duncan's arrival in 1878 came another supply of seeds, and besides, a variety of fruit-trees from Grahamstown. Mr. Duncan brought with him from Edinburgh three coffee and one tea plant, and a number of grape-vine cuttings. Two of the coffee and the tea plant ultimately died; but one coffee-plant (*Coffea arabica*) lived and grew, and has shown that coffee is at home in the Shire highlands.

It is strange that Mr. Johnston in writing his Report, should not have referred to Mr. Buchanan's book.

COFFEE CULTIVATION IN MAURITIUS—both of the Liberian and Arabian varieties continues to attract attention and the local press write freely on the subject, quoting largely from the *Tropical Agriculturist*. We see no more mention of tea in our latest file of papers.

KOLA-GROWING IN CEYLON.—We are indebted to Mr. W. J. Robson for two very nice, healthy plants of Kola from his Matale plantation, and a fresh gathered pod of considerable size. We shall see that a due trial is given to all and the result for the lowcountry reported later on.

THE ALLIANCE TEA CO. OF CEYLON, LD—for which Messrs. Whittall & Co. are Agents and Secretaries—now own the following flourishing tea estates:—Aberdeen and Lovat, Uda Radella, Lecombe Group, Calsay, Glencagles and Thornfield aggregating a total extent of 2,853 acres of which 2,369 are cultivated, and all but 14 acres in tea.

CONDENSED COFFEE COMPANY, LIMITED.—Registered by Warner and Seligman, 21, Great Winchester-street. E.C., with a capital of £1,500 in £1 shares. Object, to enter into an agreement with W. H. Thew, and, generally, to carry on business as tea and coffee growers, blenders, and merchants. The directors are to be nominated by the signatories. Qualification, one share. Remuneration £50 per annum each.—*Financial News, London, 13th May.*

LABORERS FOR CUBA.—Several Manzanilla planters and merchants, in combination with a certain number of emigration agents and owners and consignees of steamers in Spain, are endeavouring to bring over from Galicia, Catalonia and the Canary Islands, 50,000 laborers within the term of six years, to be exclusively employed on plantations on the southern side of the island, and it is said that 5,000 Cubans have already been engaged and will arrive at Cuba, together with 1,000 more from the peninsula, the latter exclusively for account of Manzanilla planters. Those workmen, who are selected among the class of agriculturists and are accustomed to labor in the fields, are at from 20 to 40 years old and will earn \$15 gold per month, with board.—*Ibid.*

INVENTIONS AND PATENTS.—In his report on the working of the Calcutta Patent Office during the past year Mr. G. W. Forrest discusses the question of whether it is better to adopt the English system of entering into no inquiry as to the novelty of patents, or the American system of having a thorough investigation made in each case. He points out that, in India, the Act leaves it discretionary to make inquiry into novelty, but, owing to there being but few competent experts in the country, the exercise of this power must necessarily be more or less unsatisfactory. In England, he finds the consensus of opinion to be that it is better to make no inquiry into novelty. The policy which has been pursued, therefore, has been to curtail, as far as possible, all preliminary investigation, except in cases in which the invention is likely to effect the interests of the State, or that of the poorer classes who cannot protect themselves.—*Pioneer, June 1.*

COCONUT-PLANTING IN THE NORTH-WEST.—The progress of coconut palm planting in the Puttalam district is shewn by the following figures summarized from a return received for our Directory:—

Division.	Aeres Cultivated.	Nc. of Trees.
Arachchewille	.. 385	17,300
Chenakudayappo	.. 495	33,200
Mawalkumdu	.. 475	29,500
Periyakulam	.. 500	35,000
Sembatta	.. 775	50,000
Bammewattan	.. 374	25,400
Periya Ottapana	.. 325	19,900
Palachola	.. 895	56,700
Daluwa	.. 500	35,000
Talapalm and Manjadi	.. 800	54,000
Total	.. 5,524	356,000

A DAY AFTER THE FAIR.—Holders of Ceylon cacao must, we fear, be pretty sick of it, judging from the following from a London correspondent:—"Forty shillings was the highest bid got by—for some Ceylon cacao last Tuesday (7th May), for which one hundred shillings was refused in 1893."

"COLONIA: THE COLONIAL COLLEGE MAGAZINE." Spring Session, April, 1895. Contents:—The Colonial College; Old Students' Column: Communications from Africa, Australasia, Canada, India, United States; A Visit to Canada; The Opportunity! Oranges and Vegetables in Florida; Notes on New Zealand; Water Supply; How to Cultivate the "Bump of Locality"; Frozen Meat; Estate, Farm and Building Notes; College Notes; The Athletic Club Report; The College Evening Entertainments; Notice to Correspondents; Old Students' Directory (revised).

MR. ARTHUR SINCLAIR, SENIOR—has taken up his residence on Primrose Hill, Kandy, in the bungalow which he occupied for so many years in the "sixties" and "seventies" when Visiting Agent for Messrs. Lee, Hedges & Co. (who, at the time had a very extensive estate connection) and for a time acting for Messrs. Geo. Stenart & Co. Mr. Sinclair has been planting tea on the old place; but he will doubtless be making a round of the districts, to note the very great changes wrought in the past decade. Mr. Sinclair paid flying visits to country on his trips to and from Australia in recent years; but he did not stay long enough to note in detail the revolution.

A NEW DUTCH COCOA COMPANY.—The business of the firm of J. & C. Blocker, cocoa manufacturers, of Amsterdam, has been turned into a company, under the style "Internationale Cocoa-fabriek." The object of the company is to manufacture cocoa, cocoa-powder, chocolate, butter of cocoa, and other cocoa-derivatives, to trade in these articles and the raw materials from which they are made, and the buying and selling of cocoa-products made by third parties. The capital of the company is 1,000,000f. (about 85,000l.), in 200 shares of 5,000f. each, of which the firm of J. & C. Blocker obtain 120 in consideration of the transfer of their factory to the company. The company will issue debentures to the extent of 750,000f. (625,000l.), bearing 4 per cent. interest, of which 300,000f. are irredeemable and secured in first mortgage on the company's factory, and 450,000f. redeemable at any time. The whole of the debentures are taken up by the three Messrs. Blocker, one of whom, Mr. D. Blocker, will act as managing director, and a second, Mr. J. Blocker, as secretary.—*Chemist and Druggist*, May 18.

LIGHT AND CHEAP RAILWAYS IN NEW SOUTH WALES.—We notice that the Assembly of New South Wales has sanctioned the construction of a small railway from Jerilderie to Berrigan. It is to be a cheap line, at £2,000 a mile, and will run for a considerable distance on the main road. There is also a stipulation that landowners are to give the necessary land. In referring to ways and means, the Premier Mr. Reid said that there was plenty of money for works of this character—indeed, he had but to hold up his little finger, and he was afraid of the quantity of money that might now be borrowed in London. But he was keeping himself proof against the temptation.

TALGASWELLA TEA COMPANY.—We direct attention to Mr. E. S. Grigson's very satisfactory Report and we learn on the best authority, that for the four months (January-April) this year, the tea has realised 17 cents average above last year and the quantity made shows an increase of 13,000 lb. Altogether there is better news of tea in the Southern Province than we have seen for a long time: Mr. Abeyesundere is making capital tea and gathering big returns on his place and others are doing well. The South has certainly the advantage in cheap, abundant labour.

THE SANDAKAN COFFEE ESTATES COMPANY (LIMITED) has issued an advance prospectus. The capital is £25,000 in £1 shares, of which the vendor takes 5,000. The object of the company is shown in its title.—*L. and C. Express*, May 17.

CEYLON TEA IN AMERICA.—The Committee of Thirty have nominated Mr. Wm. Mackenzie as permanent Tea representative in America, subject to the approval of "the Governor in Council"—who must henceforth approve of all that is proposed to be done. We had no idea Mr. Mackenzie would accept a post that will necessitate a couple of years at least, we should say, of work in America. If he does, however, and cordially works with Mr. Blechynden, we may anticipate some good results.

MANURE IN CEYLON.—The demand for manure in Ceylon is a healthy sign, inasmuch as it indicates that cultivators are alive to the fact that the fertility of the soil must be maintained. Apart from the common commercial fertilizers such as bone dust, castor cake, &c., there is a good market now for fish manure, imported and locally prepared, while blood from the Colombo slaughter-houses and night-soil treated in Kandy are also being utilized. Of late people from South India have been going about offering such substances as cattle manure dried in cakes, dry goat and sheep manure, and even ashes—all brought over from the neighbouring coast. The prices demanded per cwt. are R2.00 for the first, R2.50 for the second, and R1.50 for the third!—*Chemical Trade Journal*, May 11.

YAMS.—Our crop of yams was harvested in February, and the results were nearly equal to last year's return. Last year our return was 0.68 lb. per square foot or thirteen tons to the acre, while this year our return stands 0.63 lb. per square foot which is slightly less. The heaviest weight of "Negro Yam"—one root—was 30½ lb. "Yellow Yam" gave roots weighing 11 lb.; "Afou" 14 lb., and "Devil Yam" 20 lb. to 25 lb. The "Buck Yam" is an excellent variety and splendid for table, but does not yield a heavy return. The "Yellow Yam," which is the same as the "Dominica Yam," yields an excellent table dish. The "Negro" and "Barbados White Yam," the "Horn Yam" and the "Snake Yam" proved to be of excellent quality, and superior in many respects to those commonly grown in Trinidad.—*Trinidad Bulletin*.

SPONGES MADE OF COCONUT FIBRE—WHAT NEXT?—A Fort mercantile man sends us the following extract from a home paper and asks if it is news to us. It certainly is that artificial sponges are being made out of coconut fibre. Has the experiment been tried in Ceylon? We quote as follows:—

The report that artificial sponges have been made by chemical processes out of coconut fibre has given a new incentive to the industry of growing coconut palms in some of the Pacific islands. The fibre of the coconut and the long leaves of the trees are fine and strong, but very dissimilar to sponge in texture; it would require a stretch of the imagination to see any connection between the two in any way whatsoever. But science has created stranger births than this. The fibre of the coconut is bleached, pressed, beaten, and then worked up into a mass by boiling until the whole is a thick mucus substance. When dried it feels like a tough, dry sponge, with no elasticity or spring about it. It is full of holes and cavities, so that air can go in and out of it.

The new sponge is then passed through other peculiar processes. It is steamed and worked artificially by machinery or the hand until it becomes as pliable as the finest sponge. This process is continued until the mass is soft and silky to the touch. While being steamed it can be pulled and moulded into any form or shape, but as it dries again it becomes tough and strong. After drying, the sponge is finally bleached for the last time. If too dark it is made lighter by being bleached with steam and sulphur, and if not of the proper yellow it is artificially coloured with harmless chemicals. The artificial sponge is then ready for selling, and it would require an expert to detect it from the genuine article.

AN OLD COFFEE PLANTER—leaves the island today in Mr. Joseph Fraser of the Pitakande group of Matale estates, on a trip home of from 6 to 9 months. Mr. Fraser is well-known to be very successful in his cultivation of tea on old coffee land and he has now added cacao to his products. Asked today how tea on old coffee land has met his expectations, he gave us a decidedly concise and canny yet significant reply:—“Tea on my places has just done twice as well as ever I expected it to do.”

THE AUSTRALASIAN DEMAND for Indian tea has, we are glad to see, opened well this season. Messrs. Forbes and Walker learn by wire that the exports compare as follows:—

To AUSTRALIA AND NEW ZEALAND.

	lb.
From 1st May to 31st May (by wire)	..269,000
Same period last year	..106,000

For Ceylon tea this year, the same firm give the following comparison:—

To AUSTRALIA AND NEW ZEALAND.

	lb.
Total export from 1st January 1895, to date.	..4,200,000
Same period last year	..3,546,000

THE “AGRICULTURAL GAZETTE OF NEW SOUTH WALES” Vol. VI. Part I April 1895, has for contents:—The Black or Spear Thistle—(Carduus lanceolatus, Linn) J H Maiden. Weeds of New South Wales—J. H. Maiden. Part II, Digests of Reports of these from Country Districts. Botanical Notes.—Spread of a Cassia this Season; A Bulbous Plant suspected to be poisonous to Stock; Some Plants recently introduced into the vicinity of Homebush Sheep and Cattle Sale-yards, J H Maiden. Cross-bred Sheep and Rotation of Crops—J Coleman. Report of Sugar Beets Grown at Hawkesbury College Farm—June, 1894-95 (with Note by the Chemist—By the Principal and the Experimentalist. Some Fruit Pests.—A H Benson. Some Australian Weevils or Snout Beetles—A S Olliff. Entomological Notes from Hawkesbury Agricultural College—C T Musson. The Honey Bee.—R Holms. Part II.—The Anatomy of the Reproductive Organs of the Queen and Action of Fertilisation.—R Helms. Bee-keeping—Uniting Nuclei and small Swarms. Albert Gale. Chemical Notes.—Bonedust from Orange; Honey from Richmond River; Weight per bushel of this Season's Wheat. F B Guthrie. Practical Vegetable and Flower Growing.—Directions for the month of May. Orchard Notes for May.—General Notes. 28-Spotted Lady Bird and Tomatoes; Ramie Fibre; Growth of Forest Trees. Agricultural Societies' Shows, 1895.

COCONUTS AND TRICKING A CRAB.—In Africa there exists a certain member of the crab genus commonly known as the Great Tree Crab. This peculiar shell-fish has an offensive trick of crawling up the coconut trees, biting off the coconuts, and then creeping down again backwards. The theory is that the nuts are shattered by the fall, and the Great Tree Crab is thus enabled to enjoy a hearty meal. Now, the natives who inhabit regions infested by this ill-conditioned crab are well aware that the lower portion of the crab's anatomy is soft and sensitive, and they believe that the “bivale” was thus constructed in order that he might know when he had reached the ground, and when, consequently, he might with safety release his grasp of the trunk. So what they do in order to stop his depredations, which often ruin the coconut crops, is this: While the crab is engaged in nipping off the coconuts, they climb half-way up the trees and there drive in a row of long nails right round the tree, allowing an inch or so of the nails to project. The crab has no knowledge of disaster nor yet of the fitness of things. As he descends, the sensitive part of his body suddenly touches the nails. Thinking that he has reached the ground, he naturally lets go. Instantly he falls backwards and cracks his own shell on the ground.—*Public Opinion.*

OVER-PRODUCTION IN INDIA—is now the chief risk before Ceylon tea planters—and the extract we give elsewhere from the *Planters' Gazette* shows the enormous impetus to planting extension in the Doonars and elsewhere, given by the foolish cry in Ceylon and the unfortunate response of Government, that no more land should be sold for tea. What Ceylon might do, was the one great fear before Indian investors up till last year; and now they are making up for lost time, while every lb. of their tea is equal in strength to 1½ lb. of Ceylon at least. In Bengal alone the area cultivated, increased last year from 93,000 to 110,000 acres. There is nothing for it but to conquer America for our teas, by *Advertising.*

SHORT LABOUR SUPPLY.—A proprietor writes:—“All very well to say Estates don't get proper work out of their coolies, but can they *double* it? Ceylon needs 20 to 30,000 additional labourers and next year will need as many more to keep pace at all with the leaps and bounds of tea! “Clippers” are the only remedy if labourers run short, but the fault with these machines is they don't take off bangy.”—Has our correspondent examined the figures we gave on Saturday? Where are the 147,000 surplus coolies? (“A good many of them, serving under Sinhalese!” answers today in person, a well-known Northern planter to our astonishment.) We call attention to further letters on the question; but must again protest against any meddling with, or transfer of the Cess before the end of 1896 at the earliest.

PERAK, KINTA MONTHLY REPORT FOR APRIL, 1895. Mr. F. W. Mais of the Trigonometrical Survey, visited the District on business connected with his Department. The Resident Engineer for Railways made a successful trial trip over the railway line between Kota Bharu and Kampar stations on the 30th, preparatory to opening the through service from Teluk Anson to Ipoh on the 1st May. The survey for railway extension from Ipoh to Tanjung Rambutan (8 miles) is proceeding rapidly. Already about a mile of earth-work has been constructed, so that the whole work should be completed well within this year. Good progress has been made in laying the line for the much needed Ipoh water-works, and when the pipes arrive from England the completion should be rapid.—*Perak Govt. Gazette.*

COCONUTS IN FLORIDA.—A writer in the *Florida Fruitgrower* speaks of coco-palms in that region bearing at the rate of 200 to 500 nuts annually. We deem this to be almost a physical impossibility; and certainly when we personally travelled through Florida in 1884, we saw nothing in the soil, climate or vegetation to warrant such returns. Coconut palms were few there ten years ago, and we confess we did not happen to go to where they grew—our object being rather to inspect orange gardens. But surely the Florida cultivator who peaks of anything over 200 nuts, includes all the small nuts which drop immaturely? Can he give us undeniable testimony that 200 fully matured nuts are gathered from single palms in a year? He speaks of a large demand by planters for “sprouted nuts” at from 10 to 15 dollars—say 35 to 50 rupees—per 100. Florida, no doubt, going to be a great palm-growing land; already, says the writer we quote:—“We have nine-tenths of the coconuts grown in the United States, and I have yet to see one killed by the hard winter of '94-95.” Last winter played havoc with the orange trees, and it is marvellous that the palms withstood the frost,

LIBERIAN COFFEE IN SERDANG—SUMATRA; No. VII.

(By an ex-Ceylon Planter.)

LIBERIAN COFFEE—FACTS, NOT FANCIES.

The following figures are all calculated in katties and piculs:—1 kattie=1½ lb., 100 katties=1 picul, 1 picul=133½ lb. avoirdupois.

The figures given on page 50 of the *Planting Moleworth* work out thus:—

123,000 cherries=1 cwt. clean coffee. Ergo 137,446 cherries=1 picul clean coffee. So far Ceylon.

My experience in another country with old coffee and poor soil is that 220,000 cherries=1 picul clean coffee.

Here in Serdang it has been found that 160,000 cherries=1 picul clean.

It is of course well-known that the size of the cherry and of the bean diminishes as the tree grows older. Therefore the deduction is that the Ceylon figures were gathered from young coffee in good soil.

My figures were, as I have stated, from old coffee in poor soil.

The Serdang proof was from coffee between 4 and 5 growing in splendid land, but worked "on the cheap."

Here, I myself have counted several trees of 20 months old, and found several with fruit on them from 2,000 to 2,430 per tree. This is equivalent roughly to a kattie a tree. Trees planted 10 ft. by 10 ft. =435 per acre. Result, pl. 4 35-100th per acre before the trees are 3 years old. I do not, of course, pretend to state that *all* the 20 months old bushes are like this. But it will give nearer 2 piculs per acre than 1 before it is 3 years old. The trees are healthy and making new wood.

A neighbour has counted on some of his four-year-old trees, now rising five, as many as 4,000, 5,000, 6,000, and even 7,000 fruit on a single tree. Work this out at 435 trees per acre, and 2,000 cherries per kattie of clean coffee; and say if it is not better than a smuck in the face with a dead rat.

I think I have given you sufficient food for reflection for today.

P.S.—Since writing the above I have received from an obliging friend the following:—

From coffee 18 years old, after having been abandoned for five years, the yield per tree was from 2 to 3 katties.

Each kattie = 2,212 beans clean coffee from 1,426 cherries. Both the yield after abandonment, and the large proportion of clean coffee (not parchment) from the cherry speak volumes for the soil.

There is a grand blossom out today; and young bushes though apparently choked with fruit, are sparkling with the snow-white flowers.

Best sign of all: the air is busy with the hum of bees.

A NEW CEYLON COMPANY.

The following are amongst the new joint stock Companies recently registered; The whole of the ordinary shares. The Ceylon Tea Trust, Limited, registered by the Nugget Exploring Company, Limited, 42 Old Broad Street, E.C., with a capital of £60,000 in 10s shares. Object, to adopt and carry into effect an agreement, made May 6, 1895, between A. Nelson, on behalf of this Company, of the one part, and the Nugget Exploring Company, Limited, of the other part; and, generally, to acquire, work, manage improve, develop, and turn to account tea estates or other landed property in Ceylon or elsewhere. The signatories, who take one share each, are F. C. G. Kitso, 3, Bernard Street, Russell Square, W. C.; A. H. Buley, 32, Goldhurst Terrace East, N.W.; E. C. Bredin, 53 Stratford Road, W.; H. W. N. Bonlend, 42, Old Broad Street, E.C.; C. B. Rile, 131, Lion Grove, N.W.; A. F. Roberts, 42, Old Broad Street, E.C.; C. T. Chevallier, 3 Throgmorton Avenue, E.C.; A. J. Lungley, 205, Milkwood Road, Herne Hill. The directors are to be elected by the signatories. Qualification 100 shares. Remu-

neration £50 each per annum. Condensed Coffee Company, Limited, with a capital of £1,500 in £1 shares. Object, to enter into an agreement with W. H. Thew, and, generally, to carry on business as tea and coffee growers, blenders, and merchants. The directors are to be nominated by the signatories. Qualification, one share. Remuneration, £50 per annum each.—*H. and C. Mail.*

THE AMSTERDAM CINCHONA MARKET.

Writing on May 9th, our Amsterdam correspondent observes:—"Today's cinchona-bark sale was a disappointment to most parties concerned. Although opening pretty firm, the feeling eased off as the sale proceeded, and the result was an average unit of only 2.92c.

Druggists' barks were very dull, and except for fine red qualities there was very little demand.

Mr. Watering, the Amsterdam merchant who has lately returned from an inquiry into the state of the cinchona-market in Java, states that to some extent he has a good opinion of the future of the article. There is no doubt (he tells me) that Java cannot go on shipping the quantities it is sending at present as uprooting is being carried on to a great extent and already there are some 5,000 bouws less under cultivation than formerly. At the same time it must not be expected that this means that Java cannot send the same quantity in 1895 as in the preceding year, as cinchona is such a peculiar article that the yearly crop can hardly be controlled. It is possible to allow the crop of bark remain on the trees a year or two, whilst the owner of a plantation has it in his power to increase the crop at his will at any given moment.

Cinchona cannot be grown at the present prices even in Java, and, therefore, every extra quantity shipped means plucking the hen instead of marketing the eggs. The more Java sends now the sooner the hen will be done for, but how long this may last is difficult to say.

There are rumours that the planters are taking more interest in the erection of the quinine-works in Java, and that, after all, the factory is likely to be founded, even if on a less extensive scale than was proposed; but more will be known of this in a short time.

Mr. Buchler, the Brunswick quinine-maker is now in Java. The exact object of his visit there is not known at present, but it is thought that it is in some way connected with Java quinine-works."—*Chemist and Druggist.*

NEW PLANTATION COMPANIES.

THE NYASSALAND COFFEE COMPANY, LIMITED.

Friday's *Gazette* in publishing the memorandum of Association of this Company states that the objects for which the Company is established is to procure two blocks of land, 3,500 acres in extent, and situated at Nyassaland, B. C. Africa, from Mr. J. H. Carson, and to plant the same with coffee and tea. The nominal capital of the Company is Rupees Three hundred thousand (R300,000), divided into three thousand shares of Rupees One hundred (R100) each, of which Rupees One hundred and Seventy thousand (R170,000) are now called up with power to increase or reduce the capital. In case the Company shall increase its capital by the issue of new shares, such shares may be issued upon the terms specified in the Articles of Association for the time being of the Company. A share has been taken by each of the following gentlemen:—Messrs. F. Macindoe, G. J. Jameson by his Attorney F. Muirhead, A. Orchard, E. R. Wallock, W. Shakespeare, E. M. Dowie and V. A. Julins.

THE KILANI VALLEY TEA GARDENS COMPANY, LIMITED.

The Memorandum of Association of this Company is published in the last *Gazette*. The objects for

which this Company is established are—To acquire the Kelani estate situated in the Kelani valley district of the Island of Ceylon, and to farm, manufacture, or cultivate tea, and or) any other products or trees, plants, or crops which may hereafter be approved and either on the said estate or elsewhere within or beyond the limits of Ceylon, and to prepare, manufacture, treat, or make marketable the produce of any such farming or cultivation, or any like produce, and to sell, ship, and dispose of such produce, either raw or manufactured, at such times and places and in such manner as shall be deemed expedient. The capital of the Company is R300,000 divided into threethousand shares of R100 each, with power to increase or reduce the capital. In case the Company shall increase its capital by the issue of new shares, such shares may be issued upon the terms specified in the Articles of Association for the time being of the Company. A share has been taken by each of the following gentlemen:—Messrs. Walter Seale, F. Macindoe, G. J. Jameson, E. R. Waldoek, W. Shakspeare, V. A. Julius, and Edw. Booth.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, May 16.

ANNATTO—Bright seed is in good demand at full prices, 20 bags from British India being all sold at from 4d to 4½d for good red.

CAFFEINE—We hear of very little business this week. A few pounds might probably be had at 27s per lb on the spot, and for delivery the market shows, perhaps, a slight touch of an easier tendency. In New York, according to reports dated April 27th, 5-lb. lots have been sold at 80.50 per lb and "extreme scarcity" prevails.

CINCHONA—The principal parcel at today's sales was one of 43 serons "Crown" bark from Callao, which sold cheaply as follows:—35 bales fair sound Huanoco quill, at 6½d to 7½d; and 8 serons Loxa, fair but partly mixed at 1½d per lb.

COCA—Of a 21-bale parcel rather broken but dry Truxillo leaves, only two bales sold (damaged) at 7½d to 9½d per lb; for sound leaves 10d is asked, a bid of 8½d being refused.

COCAINE—The fresh decline in the price of Hydrochlorate of cocaine, which we foreshadowed last week, has taken place, a 9d reduction being announced on Monday. The wholesale rates for cocaine in tins are:—Lots of 100 oz and over, 17s 6d; lots of from 25 to 100 oz, 17s 9d; lots of under 25 oz, 18s per oz. Bottles are charged 3d per oz extra.

ESSENTIAL OILS—At today's auctions the usual assortment of essential oils was offered, but hardly anything was sold except two cases so-called Cinnamon oil, which realised 7½d per oz. Thirteen cases yellow camphor oil were bought in at 30s per cwt. The other parcels offered do not call for any remark.

QUININE—Dearer; on Wednesday 10,000 oz H B or B & S bulk were reported sold at 12½d on the spot, and today 12½d per oz was paid for 12,000 oz more. There are now only a few sellers at the last-named price. At auction 5,000 oz were offered and bought in at 12½d.

VANILLA—Rather dearer, at from 15s 6d to 25s for good to fine bold.

INDIAN PATENTS.

Calcutta, May 22.

Specifications of the undermentioned inventions have been filed under the provisions of Act V of 1833:—

For the treatment of Textile Vegetable Fibres.—35 of '91.—Alfred Francis Bihlerback Gmoss, of 21, Alfred Place, West, South Kensington, in the County of London, England, Chemist, for a new and improved process for the treatment of textile vegetable fibres. (Filed 12th December 1894.)

For making Glazed Black Tea.—53 of '95.—Dr. A. S. Lethbridge, Indian Medical Service, No. 1, Kyd Street, Calcutta, for making glazed black tea whereby a waste product in the ordinary process of tea making is utilized, and a tea is produced which has a much higher commercial value than the tea produced by the ordinary methods of manufacture now in use. (Filed 18th April 1895.)—*I. and E. Engineer.*

THE CEYLON TEA ROLLER CASE.

LAW REPORT MAY 18TH.

JUDICIAL COMMITTEE OF THE PRIVY COUNCIL.

(Present:—LORD WATSON, LORD HOBHOUSE, LORD MACNAGHTEN, and SIR RICHARD COUCH.)

BROWN AND THE COLOMBO COMMERCIAL COMPANY LIMITED V. JACKSON.

This was an appeal from a decision of the Supreme Court of Ceylon of March 21, 1894, affirming a judgment of that Court of September 13, 1892.

Mr. Moulton, q.c., Mr. Bousfield, q.c., and Mr. J. C. Graham appeared for the appellants; Sir Richard Webster, q.c., Mr. Finlay, q.c., and Mr. W. N. Lawson for the respondent.

The case was recently argued before a Committee consisting of the Lord Chancellor, Lord Watson, Lord Hobhouse, Lord Macnaghten, Lord Morris, and Sir Richard Couch, when they reserved judgment.

LORD WATSON, in now delivering the opinion of their Lordships, said.—The respondent, William Jackson, a mechanical engineer at Aberdeen, obtained letters patent for Ceylon, granting him the exclusive privilege of using an invention relating to "machinery or apparatus to be employed in imparting the necessary curl to tea leaf by means of flat or hollow-fluted surfaces" for 14 years from July 4th, 1881. The present action was brought by the respondent in the District Court of Colombo against the appellants, one of whom is a company registered in England and carrying on business as estate agents and engineers in Colombo, and the other a merchant in Colombo, who act as assistant manager of the company. In this plaint the respondent charged both appellants with infringement of his patent by importing into, selling, and using in Ceylon machinery and apparatus for rolling tea leaves, having substantially the same arrangements with those described in his specification; and he craved an injunction and an account of profits. The main and the only defence stated which it was necessary to notice consisted in a denial of infringement. The learned judge of the District Court found that the patent had not been infringed, and dismissed the action. His decision was reversed, on appeal, by the late Chief Justice Burnside and Mr. Justice Lawrie, who remitted the case in order that an injunction might be granted and an account of profits taken. In pursuance of the remit the District Judge issued an injunction, and also decreed against the appellants for R19,861, at which sum he assessed the profits derived by them from infringement. On appeal to the Supreme Court that judgment was affirmed, and, thereafter, the appellants brought the previous judgment of the Appeal Court before that tribunal by way of review, when it was affirmed by a majority, consisting of Lawrie and Withers J.J., Bonser C.J. dissenting. In considering the question raised by the appeal, there were three different apparatus for tea-rolling to which it was necessary to refer. The first was the "Standard" machine which had been used in the Island of Ceylon, without its having been patented, for some time before the date of the respondent's invention; the second was his patent machine known as the "Excelsior"; and the third, the appellants' offending machine, which went by the name of the "Rapid." All these machines had precisely the same object—to prepare the leaves of the tea plant for sale by imparting to them a curl which, before the introduction of machinery, was effected by rubbing the leaves between the palms of the human hand. The mechanism of all three machines consisted of practically the same parts. They might be shortly described as—(1) two plane surfaces (one or both of which might be corrugated between which the leaves were rubbed, technically known as the upper and lower rolling tables; (2) a case or cover, in connexion with the upper table, whose function it was to confine the leaves while they were operated on; (3) arrangements by which the leaves could be fed into the space between the two tables and were discharged after they had been rolled; and (4) a revolving shaft to which the two tables were so geared or connected that, when the machine was at work, they moved in opposite directions, the one above the other, and

rolled or curled the leaves between their surfaces. Neither the "Excelsior" nor the "Rapid" was in any sense a new machine. They were, both of them modifications of the mechanism which was employed in the "Standard" machine, and the only point to be determined in the case was whether the modifications or improvements which constituted the respondent's invention, or a substantial part of them, had been appropriated by the appellants. The novelty and utility of the respondent's modifications or improvements were not challenged. They related to the upper section of the apparatus, and therefore an inquiry into the infringement of which the respondent complained did not involve any comparison between the parts of his and the appellants' machine other than the upper rolling table, the case which had already been generally described, and the mechanism by which those were, more or less directly, connected with each other and with the actuating shaft. In all three machines the upper rolling table and the case rested upon, or were in some manner connected with, a stage or frame work which was directly geared to and actuated by the shaft. In the "Standard" machine, which represented the state of public knowledge in Ceylon at the date of the respondent's patent, the upper rolling table was rigidly connected with the stage or framework which was moved backwards and forwards in a line nearly at right angles to the direction in which the lower table was similarly moved. In one respect the upper mechanism differed materially from the device adopted either by the respondent or by the appellants. The case for retaining the leaves during the process of rolling was made to cover the upper table, and was carried along with it by the table when in motion, fresh leaves being introduced through an aperture in the top of the case, which was fitted with a lid. In the respondent's patent machine the case was made open at the top and detached from the upper rolling table, being rigidly connected with the stage of framework. The table was placed inside the case, but not connected with it or with the stage, and, within the case, it was allowed an inch or two of free play all round. Accordingly, when the machine was at work, the upper table did not move until it came into contact with, and was pushed or impelled by, the inner surface of the case. In the appellants' apparatus, a case open at the top was also used, its form being in no material respect different from that of the case which was employed by the respondent in his patent machine. But the appellants' rolling table was not detached, and was not allowed to have free play in any direction. It was rigidly connected with the stage or framework, and was directly actuated by the revolving shaft. It was altogether independent of, and derived no motion or impulse from the surrounding case. The claim made by the respondent in his specification, which the appellants had been held to have infringed, was in these terms:—"The arrangement of transmitting motion to the top rolling surface through the case or jacket surrounding it, whereby such rolling surface is left free as regards vertical movement from the mechanism operating it." The respondent's patent being not for a new machine, but for improvements upon the mechanism of an old and known machine, his exclusive right could not be permitted to exceed the exact terms of his specification. Assuming that the words "case or jacket," in the claim just quoted, meant the case which their Lordships had already described, it appeared to them to be clear that the appellants' machine did not violate the exclusive privilege of the respondent. No motion was transmitted to the appellants' rolling table through that case: and the table had not free play in any direction, although it might be vertically raised or lowered, when requisite, by means of mechanism introduced for that purpose by the appellants. The respondent, therefore, could not succeed in the action unless he could show that, upon a fair construction of his specification, the words "case or jacket" included not only the enveloping case already described, but the whole stage or framework of the upper table directly connected with the shaft. If that were what the respondent really meant his claim would hardly cover the appellants' arrangement, because in it the rolling surface was not in any proper sense, "left free as regards ver-

tical movement from the mechanism operating it." But that the respondent had no such meaning in view was, in their Lordship's opinion, clearly apparent from the terms of the specification taken in connexion with the drawings to which it referred. Their Lordships would therefore humbly advise her Majesty to reverse the judgments appealed from, and to dismiss the respondent's suit with costs in both Courts below. The respondent must bear the costs of this appeal.

LIBERIAN COFFEE IN SERDANG—SUMATRA; No. VIII.

(By an ex-Ceylon Planter.)

There are about 1,000 acres of

COFFEE

under cultivation in Upper Serdang, and nearly the same quantity of land is now in course of preparation for planting. There are rumours that the Sultan himself has a mind to plant on his own account: but though I know from his own lips that he is keenly interested in the coffee enterprise, I cannot say whether or not he really intends to turn planter. At present I regret to say that H. H. is seriously indisposed. I am told that he is the most progressive of all the Sultans on the East Coast, and lends a willing ear to any scheme tending to the advancement of his territory and the welfare of his people. Unfortunately he has recently dropped money heavily over an irrigation scheme for paddy, and in the cultivation of ramie; into both of which he was urged to venture by Europeans. So, consequently and naturally, he is now going ahead cautiously.

All the land here is low-lying: and I do not think there is any coffee growing above 300 ft. elevation. I only know of one estate where shade is being systematically grown. On another estate, cotton trees are planted throughout part of the coffee; but, so far as shade is concerned, this is a farce. There is no doubt in my mind that shade is necessary to Liberian coffee. In case of a long drought the land gets so hard baked and is so burning hot that the coffee receives a severe check which is mitigated by shade trees. The shade should be planted, if possible, a little *before* the coffee. I have known cases where men have been too late with their shade: and in this connection it should not be lost sight of that whereas you can always remove your shade if you find it superfluous, you cannot at a moment's notice stick in a full-grown shade over 3-year old coffee, should you find your plantation being baked alive.

About

SHADE

again, I have heard it said that it is too much to expect the soil to grow two products at once. But the shade trees give back in their droppings a good deal of valuable manure. We are too apt to forget that weeds and vegetable matter going back into the soil give back *more* than they have taken out of it. For in addition to restoring what they have taken from the *soil*, they add what they have absorbed from the *atmosphere*, no inconsiderable item. "Of *shades* we can offer a charming variety," and I think the Father O'Flynn of them all is Dadap, (*Erythrina E. Indica*). Of this, two sorts are in use, Dadap Solo, and Dadap S'rep, otherwise known as Dadap Java: and in Java I have bought the latter variety from a man at 3 cts. per stick, the same man refusing to let me have his Solo for less than 10 cts. per stick. For my part I think it is six o' one and half a dozen o' t' other: nobbut what I wouldn't take Dadap Solo if it was going at the same price as S'rep. The other shade trees are *Albizia stipitata*, and *Alb. moluccana*. Of these I have no personal experience; but I am told that the former is preferred, the latter being too brittle and causing much damage to the coffee by the branches falling in windy weather. This sort of accidental damage I believe to be much exaggerated. A tea story will give an example. I was walking with one of my S. Ds. when we came upon half a bush lying across the path. "There's 50 lb. off *this* year's crop,"

grumbled the youngster. "Foot it up, young man," I said handing him my pocket-book. It worked out to 125,000 lb. per acre! I have seen a peppery P. D. in a frightful fume over a trifling accident which could not affect either crop or expenditure by the minutest fraction of an enth: and I believe exaggeration unconsciously finds its way into many of our forecasts. Sure it is that I have known many upright honourable men branded as scamps and liars only because they were led away by a too sanguine temperament.

But let us get back to the coffee. Our mistake in Ceylon has been to bother the bush too much, and not to worry the soil enough. In regard to fruit bearers,

CULTIVATION

means the mamoty far more than the pruning knife: and this is a fact too often ignored or overlooked. By the use of the mamoty, I mean the constant working of the soil: not the indiscriminate shoving in of manure. I have known *Planters* die prematurely from too free use of stimulants. PLANTS also. *N'est ce pas comme cela*, Mr. Editor?

LALANG

is the curse of this part of the world. To dig out "twitch" or "eooch-grass" at home is child's play to working out lalang in Malaya. It is the most pernicious weed that was spread abroad when our first parents were hoofed out of Eden. It means the sweat of your brow; and no error.*

By the way, if it is true that the human form divine has been improving in stature and comeliness generation by generation and century by century since the transformation of the rib, what hideous apparitions Adam and Eve would present to our latter-day eyes. I can only imagine them as Aztec Tom Thumblets without a bath.

It is rather a come-down when you have fancied yourself an Isaiah to be told to take a back seat with Nahum and Habakkuk. But I have to do so. I flattered myself that I was the first to prophesy that a few more years would see the greater part of Upper Serdang under coffee. Rude shock! I am told that years ago a well-known Dikoya planter, now opening land in Province Wellesley and Selangor, told the people here that this was not tobacco, but coffee land: and I have before me a *Deli Courant* of July 1892 containing a long article written by a Frenchman prophesying the future of coffee in this district. I am stronger on "language" than on languages: but a friend has kindly promised to translate the Frenchman's article for you; and you shall have it later on. It is not over accurate, but practical readers will be able to winnow out the chaff.

W. TURING MACKENZIE.

COFFEE IN PERU.

It may be of interest to coffee planters in the East to know that Peru, which has for many years produced coffee that has been absorbed by domestic consumption, and has recently appeared as an exporter of coffee, is now likely to be a considerable competitor with other countries. Coffee planting began and coffee is still cultivated near the port of Pacasmayo, with success. But although the cultivation on the coast could be somewhat extended, it must always remain restricted, as there are only certain favoured localities in which the planter can hope for a good return. In other districts its progress is considerable, and production is naturally stimulated under recent quotations.—*L. & C. Express.*

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Eardrums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN, LONDON

PLANTING AND PRODUCE.

THE LAW'S DELAY.—At last the judgment of the Judicial Committee of the Privy Council has been given in the well-known tea roller case, and will be found in another column. The verdict is against Mr. Jackson. It is not for us to express an opinion on the merits of a case which has occupied the attention of so many legal luminaries, but we may express sympathy with those concerned. The difficulties which beset inventors and patentees are so many and so perplexing that more than ordinary pluck is required to enable a man to go through with the work. The intricacies of the patent law, the pitfalls into which it is possible for the most careful to stumble, are too many for the ordinary mind, and it will be admitted that the inventor and manufacturer of machinery is well entitled to the profit accruing to his labours when the trouble, risks, and annoyance which attend him are considered. For three or four years this case has dragged on—decisions have been given practically neutralising each other, and now comes the final, from which there is no appeal, and the respondent has to accept the situation and pay the costs. The process of endeavouring to uphold one's view by an appeal to the tedious process of the law courts is work for those who have both patience and philosophy.

COLOMBO COMMERCIAL COMPANY.—In consequence of the judgment in the tea roller action, the directors of the Colombo Commercial Company have decided to pay a bonus of five per cent on the ordinary shares.

THE RUSSIAN MARKET FOR TEA.—Referring to the new season's China teas, the *Grocer* says: "Although China teas do not exercise the same sway over the London market that they did years ago, owing to their position having been undermined by the successful introduction and growing popularity of Indian and Ceylon kinds, they nevertheless enjoy a high reputation among Russian consumers, who prefer them to any other teas; and, as is proved by statements from reliable and independent sources, the Muscovite teamen are always prepared to buy the new Monings in large and increasing quantities, at the utmost market value, regularly as the seasons come round. Not only is this the case at the beginning of the season, when the excitement of selecting and buying the teas is at its highest, but afterwards and all the year through, so long as they have orders to execute; and purchases, begun at Hankow in the spring, often go on and are completed in London during the following autumn and winter. These subsequent dealings in the article take the shape of exports of tea from this port to Russia; and as evidence of the preference that is given to China growths over all other sorts by foreign countries, it may be mentioned that, as officially returned, the shipments of China leaf from hence to the Continent and elsewhere during the first four months of the present year amounted to 5,715,429 lb. out of a grand total of 9,330,040 lb. Ceylon &c., to all other places not specified. Whilst black-leaf teas are taken off our market by Russian purchasers when they run short, the red-leaf or Foochow descriptions are shipped indirectly to Canada, Germany, and other quarters of the globe, and the inquiries from shippers here, as a rule, contribute a deal of support to the market for China tea when the home trade are disinclined to operate."

THE OLD STORY RETOLD.—There are, however, times when common congo, ruling abnormally cheap, and pence per pound under the rates current for low-priced Indian and Ceylon teas, attracts the attention of the wholesale dealers, blenders, and purveyors of packet teas, and then considerable parcels change hands at relatively higher prices. The reason for this transference of demand, the writer in the *Grocer* goes on to say, it rendered abundantly clear by the fact that China tea for the purposes of blending or holding over keeps its strength and flavour much better and longer than either Indian or Ceylon kinds, and and on that account some persons buy enough of their favourite sort to last them all the year. Thus it is that new China teas bought on the easy terms now prevailing are almost sure to be worth as much, if not more, in six or eight months'

time as they are at the moment; whereas in former seasons it was an ugly feature of the trade, especially when prices on the average were ruling comparatively high, for dear-bought teas to visibly depreciate in value sooner than could have been imagined by the merchants or dealers. Besides the proportion of common China teas that are wanted on certain occasions to comply with the standard of cheapness as fixed by the modern tenpenny and shilling canister, there are likewise the requirements of purchasers—to the tune of many millions of pounds—to be satisfied who make a speciality of fancy sorts, such as capers, green, gunpowder, and scented teas, which are most in request in the north of England, where the taste for these showy, delicate and choice qualities is stronger than in the southern countries; and instead of the leading firms getting the biggest profits out of superior Indian and Ceylon teas, as they did when they were first offered and were the rage with the country consumers, who paid something extra for the novelty of them, the conditions have since been entirely reversed, and a handsome premium is not now infrequently obtained on China teas of rare excellence of make, cure of leaf and richness of bouquet.

ANOTHER LARGE TEA DEALING COMPANY.—We may think what we like about the good old times of tea dealing, but even in these days there is some profit attached to the handling of tea. Another large firm of dealers has converted its business into a joint stock concern. Although in this instance the profits of the business are not entirely derivable from tea, the leaf has played an important part in building up the fortunes of the firm. The International Tea Company's Stores, Limited, which has been formed, acquires the business of wholesale tea, provision, and food produce importers carried on by Messrs. Kearley and Tonge, of Mitre Square Aldgate, together with their retail distributing business, comprising upwards of 200 tea and general produce stores established by them in various parts of the country, under the name of the "International Tea Company." The capital is £900,000 divided into 80,000 6 per cent. Cumulative Preference shares of £5 each, and 500,000 Ordinary shares of £1 each. The vendors Messrs. Kearley and Tonge have agreed to act as managing directors for a term of years for a remuneration of 5 per cent. on the profits after payment of the Preference dividends. The profits for the three and a half years to October 27, 1894, are stated as follows:—April 18, 1891, to April 30, 1892, £33,577; May 1, 1892, to October 29, 1892, £30,663; October 30, 1892, to October 28, 1893, £52,096; October 29, 1893, to October 27, 1894, £66,148. The purchase price is £900,000, of which £500,000 is taken in Ordinary shares, £100,000 in Preference shares, and £300,000 in cash.—*H. and C. Mail*, May 24.

COFFEE, CINCHONA, TEA IN JAVA.

Acting-Consul MacLachlan writes as follows under date, March 8th, on the Trade, Commerce, and General Matters relating to the Island of Java for the year 1894:—

COFFEE.—The total production from private and Government lands has been 59,500 tons as against 18,700 tons in 1893. Provided that atmospheric conditions are favourable, an increased quantity from private estates may be looked for in future, as fresh land is being continually opened up in the east end of the island, the crops from which are now coming, for the first time, on the market.

The Cultivation of the Liberian bean, both in Mid and West Java, is rapidly increasing, and the satisfactory results obtained from its introduction become year by year more apparent as the principal difficulties attending the preparation of this coffee for the market are gradually being successfully surmounted. As a result a marked improvement in the appearance and quality of the coffee is noted, and its favour is becoming more and more assured.

The continued recurrences of the so-called "leaf" disease in the Java coffee on low-lying lands, from

which the Liberia still preserves comparative, though by no means entire immunity, causes more confidence to be felt in the latter, and many lands which have suffered most severely from the ravages of this disease in the Arabian plant are being re-planted with Liberia.

On May 3rd it was decided to give up the Government cultivation of coffee in the Krawang residency, and on January 1st, 1895, the law rendering the delivery in that district to Government obligatory was repealed.

TEA.—Exports of tea show a small falling off as compared with those of the preceding year, being 8,735,000 lb., as against 8,792,000 lb. Prices which had ruled pretty low during the year, showed some improvement towards its close.

CINCHONA BARK shows an increased export over the previous year of 1,458,000 lb. from private, and of 146,000 lb. from Government lands. Prices, already at a low level, have further declined in face of the enormous supplies.—*I. & C. Express*, May 24.

NOTES FROM OUR LONDON LETTER.

LONDON, May 2.

It was mentioned in a late letter of mine to you that I had heard it reported that before last leaving Ceylon

MR H. K. RUTHERFORD had instructed the managers of estates in which he was interested

TO STOP ALL MANURING.

We were much surprised to hear this, because it had always been understood that Mr. Rutherford had been almost the earliest pioneer in tea manuring on his far-famed estate Mariawatte. I know Mr. John Hughes told me, now several years back, that he had been concerned with the supply of manure for that estate, and it had always been understood that very good results had followed their application. We naturally, therefore, attach much importance to Mr. Rutherford's experienced opinion. In answer to a question addressed to that gentleman by me, he has obligingly written me to the following effect:—

"Although it is an undoubted fact that the yield of tea can be very materially increased by manuring, still there is also a very great risk of bringing in some disease to the roots of the tea bush by the use of artificial manure. We consider it the wiser policy at present to circumscribe our manuring to the experimental stage, and carefully watch results before launching out on a large scale in this direction."

No doubt it must be wise to proceed in the matter of manuring with caution, and from all I hear it would seem to be advisable to have some advisory officer in the Island capable of deciding what localities and soils would benefit by the application, and what had better be left without it. I have learned that here at home the large farmers never make a change of practice without expert opinion first being sought. Every case seems to need special consideration. Thus manure applied to lands bordering the estuary of the Thames, that nearly all lie below high tide level, would simply be ruined were manure applied to them. These get their nourishment, apparently, largely from percolation from the river. To apply manure therefore to lands so situated is to supersaturate them, and to produce the same evils as are apparent in the case of many sewage farms. Speaking on this subject with an old and experienced coffee planter this week, he concurred with Mr. Rutherford as to the necessity for

proceeding with great caution. He instanced to me a coffee estate of his own on some 50 acres of which he had lavishly applied manure. The berries upon the trees were simply wonderful to see, but not one came to maturity, and the trees were completely killed! It seems to me that with regard to tea manuring you require a resident expert. I believe that such a man, although perhaps it would be wise to have him officially selected, need not be a salaried official. The private practice he would be sure to obtain would probably make his employment in the island exceedingly lucrative. Of course in Mr. John Hughes your planters have a most competent adviser, but I hardly think he can do all that could be done by a man on the spot.

ROYAL BOTANIC GARDENS, TRINIDAD.

We have received a copy of Annual Report for the year 1894, by J. H. Hart, F.L.S., C.M.P.S., F.M.S.L., Superintendent, and quote three paragraphs of special local interest:—

CACAO.—The varieties of Cacao obtained from Nicaragua in 1893 are doing fairly well with the exception of *Theobroma bicolor* which appears to be particularly tender in the Gardens. Plants of the old Ceylon Red obtained for comparison with our varieties are growing vigorously. In December Baron Eggers, a Danish Botanist, who has interested himself largely in economic Botany, visited the Gardens. He was accompanied by Senor Seminario from Ecuador who is largely interested in Cacao in that country. I learnt from him that they have several varieties under cultivation which are not present in Trinidad, and I have made arrangements to obtain these with a view to comparing their quality with our own produce. It should be remembered that Trinidad depends for the major portion of her crop upon the introduced variety known as Forastero or Foreign Cacao, and it is quite possible that other introduced varieties will thrive as well as the Forastero, and it may be better, and that "new blood" will be of the greatest service. It is stated that in Ecuador the Cacao tree grows naturally, attains a large size and cultivation is of the most primitive character, the crop being taken practically from real Cacao Forests. If such is the case there must be an amount of vital energy in the trees which our varieties do not possess, and it becomes desirable in the interests of our planters to test the value of the varieties cultivated. A special variety mentioned, is known as "Esmeralda" which I am informed is thin-skinned, and of fine quality.

COFFEE.—The demand for Coffee plants has not been large this year, and so far as I am aware, no systematic planting has been started.

Our seedlings in the Nurseries have suffered from the disease known as *Cercospora coffeicola*, a leaf fungus. This is not the leaf fungus of Ceylon, and is probably not to be regarded in a very serious light, for although it does considerable damage to young seedlings, it has not been found to injure fruiting trees to any appreciable extent. We have fruiting trees the picture of health with scarcely a leaf injured, while close beside these, are nursery beds where the fungus has done considerable damage. It thus appears that once the plant gets beyond the seedling stage it is practically safe from attack.

COLA. *Sterculia acuminata.*—Among the plants to which especial attention has been directed during the past year has been *Sterculia acuminata*, or the "Cola Nut," and a "Circular Note" was issued calling attention to the advancing price of the marketable article. The Cola tree thrives well in Trinidad, as it simply requires the same conditions and soil as suit its "first cousin" the Cacao tree. There cannot be a doubt that Trinidad can in a few very years put a large quantity of this article upon the market, if prices continue to rule high enough to make it remunerative to the grower. Produce sent home during the past year from the Botanical Department was valued at 1/3 per lb., and on this becoming known,

many urgent enquiries for plants were received at this office, the greater proportion of which we were able to supply, and we are now making provision for a large increase. Eighty of our nuts make a pound when dry, and one of our trees produced last year nuts to the number of 990 or over 12 lbs. of dry produce, this at 1/3 per lb. gives 15/ per tree. The tree bearing this quantity of nuts is not larger than the average size Cacao tree of Trinidad but is somewhat taller, and has received no special culture whatever. The nuts fall when ripe, when they should be at once collected, peeled and placed in the sun to dry, no fermentation being necessary. When they have become partially dry the outer skin of the "nut" or seed should be removed, and the cotyledons divided. When this stage is reached the drying process should proceed as rapidly as possible, and when the nuts have become hard and brittle, they are fit for market.

PLANTATION TOOL PROSPECTS IN CEYLON.

The makers of cultivating tools and plantation implements for Indian use should be advantaged by the large development which has of late attended the raising of the coconut in Ceylon. Plantation devoted to its growth appear to be in a thriving and prosperous condition. The prices (in silver) of this fruit has gone up, it is said, beyond the most sanguine expectations of those interested, and as a result the cultivation of the nut is extending rapidly. Capitalists are investing their money in coconut plantations with the greatest confidence, and the acreage of the new lands that will be opened during the ensuing planting season will be much over what it has been in previous years. The question that suggests itself is whether the present prices will keep up, or, if they should come down, how far it may appreciably affect the industry. No other plantation product, whether native or English, rice or tea, could stand just at present a fifty per cent reduction, but "it can be safely said that coconuts could survive even a much greater reduction. The price may drop through over-production. But such an eventuality as this is not likely to occur for, perhaps, ten years, or till all the young plantations in existence come into bearing. Values may fall through a waning of the demand, but it is stated that there is no immediate likelihood of any other growth replacing coconut, even partially. In fact, the field for coconut products is daily extending. It is admitted that the fall of exchange has not been without influence in promoting this industry. Yet none the less is the intelligence we are able to communicate matter for much satisfaction to the cultivating and plantation tool-making industry.—*Implement and Machinery Review.*

IN SELANGOR, 1,026 acres of customary land have been taken up for the avowed purpose of planting Liberian coffee. Of these 500 acres have been given out during the past year. All coffee estates with two exceptions have begun to shew crops, the older trees on Weld's Hill yielding as much as 10 pikuls to the acre.—*Pinang Gazette.*

SMOKERS SHOULD USE

CALVERT'S DENTO-PHENOLENE, A FRAGRANT LIQUID DENTIFRICE AND MOUTH-WASH.

Editor of *Health* says:—"The most effective preparation for ridding the mouth of the aroma of tobacco, and leaving a pleasant taste."
Sold in 1s. 6d., 2s. 6d., and 1 lb. 7s. 6d. bottles,
by Chemists, &c.

F. C. CALVERT & CO., MANCHESTER.

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce).

Colombo, June 21, 1895.

EXCHANGE ON LONDON.—Bank Selling Rates:—On demand 1/1½; 4 months' sight 1/1 3-16; 6 months' sight 1/1 7-32. Bank Buying Rates:—Credits 3 months' sight 1/1 7-32 to ¼; 6 months' sight 1/1 9-32 to 5-16; Documents 3 months' sight 1/1½ to 9-32; 6 months' sight 1/1 5-16 to 11-32.—Closing rates.

COFFEE.—Plantation Estate Parchment on the spot per bushel, R16'00 to R17'00.

Estate Crops in Parchment, delivery to per bushel, —No quotations.

Plantation Estate Coffee, f.o.b. on the spot per cwt, R80'00 to R87'00.

Plantation Estate Coffee f.o.b. Special Assortment per cwt,—No quotations.

Librian parchment on the spot per bushel, R12'00 to R12'50.

Garden and Chetty Parchment on the spot per bushel, R14'50 to R16'00.

Garden and Chetty Coffee f.o.b. per cwt,—No quotations.

Native Coffee f.o.b. per cwt, R70'00 to R71'00.

TEA.—Average Prices ruling during the week: Broken Pekoe, per lb 59c. Pekoe per lb 50c. Pekoe Souchong, per lb 41c. Broken mixed and Dust, per lb 30c.—Averages of Wednesday's sale.

CINCHONA BARK.—Per unit of Sulphate of Quinine per lb 01½c. to 3c.—1 to 4 %.

Twigs and Branch.—No quotations.

CARDAMOMS.—per lb 80c. to R1'90.

COCONUT OIL.—Mill oil per cwt, R16'12 to R16'25. Dealer's oil per cwt, R16'00 to R16'12.

Vol. VII.]

JULY, 1895.

[No. 1.

PICKLING OF SEED.

THE treatment of seed before planting is not altogether unknown to the natives of Ceylon, but it is doubtful whether the efficacy of pickling or steeping is fully recognised by them. A very common practice among our gardeners is to mix their seeds (those of chillies, brinjals, cucumber for instance) with ashes, but as far as we know the objects with which this is done is to prevent insects from attacking the seeds before they are planted, to keep them tolerably dry and prevent them from becoming mouldy. Again, natives often hang up parcels of seeds that are intended for planting, 'in the smoke,' that is, above their fire places so as to allow the seeds to be well smoked—the objects in this case being the same as before. Now the latter practice will no doubt also preserve the seeds to some extent from insect-attack after they are planted, but we doubt if this effect is recognised by those who adopt the practice.

We have heard of one or two cases where paddy and other seeds are soaked in a solution of urine, in order to prevent the seeds being destroyed by insects as well as to hasten germination and nourish the young plant at the start; but this is not a common practice. In English text-books on agriculture, we generally read of pickling cereal seeds in bluestone solution as a remedy for the fungoid disease known as "smut" and "bunt." Dr. Freeman in his text-book says:—"A solution of

$1\frac{1}{2}$ lb. of sulphate of copper in 2 gallons of water with suffice for one quarter of corn."

Town and Country thus refers to the pickling of corn seed:—"A solution of sulphate of copper (bluestone) is used for pickling seed wheat, as a remedy for smut. The strength of the solution generally used is 1 lb. of bluestone to 4 gal. of water, and some kinds of wheat are treated with a weaker solution, say 1 lb. of bluestone to 5 gal. of water. Supposing you have to use 7 lb. of bluestone, dissolve it in 5 gal. of hot water, and then bring the solution up to 28 gal. with cold water. This solution is put in a tub of convenient size, and the wheat dipped in it. For dipping purposes the seed may be put in wicker baskets, perforated kerosene tins, or thin bags such as bran bags. The solution penetrates every part of the wheat in a few seconds, when the grain is lifted out and allowed to drip for a short time. The wheat is then ready for immediate sowing, or it may be kept for a few days before planting. See that the bluestone you use is pure. Buy it from some reputable house, because it is sometimes largely adulterated with sulphate of iron. It is said that dipping the seed for five minutes in water of the temperature of 127 deg. Fah. kills the spores of smut."

We find the following in our notes of Prof. Wallace's University lectures:—"There are three kinds of pickles or steeps in use: alkaline, metallic and neutral. Urine, sulphate of soda and lime are alkaline steeps, and do pretty well, the action

being the formation of a soapy material with the sticky part of the spores of fungi. Of metallic steeps, copper sulphate, sulphate of iron and arsenic are the best—sulphate of copper being the most effective, as it destroys the spores at once. After treatment with bluestone, 1 lb. of archangel tar, made thin by hot water, may be added to each sack (4 bushels) of grain to prevent birds taking the seed. The seed is then dried with ashes or lime. Some think that this dressing prevents absorption of water by the seed, but if this were true it prevents the absorption of too much water in wet weather."

Neutral steeps such as common salt Prof. Wallace thinks useless, and of nitrate of potash (nitre) and nitrate of soda he expresses a similar opinion. The application of salt to coconut holes in planting nuts is no doubt a modification of the pickling process, and though Prof. Wallace (referring to fungoid attack) considers salt of no avail, there are many in Ceylon who place great reliance on the action of salt in preventing the attacks of white-ants and other insects. (Query—How would the process of *steeping* nuts in a saline solution before planting do?) Dr. Nicholls in his book on *Tropical Agriculture* mentions that crude salt or seawater may be sparingly applied to coconut trees, and further states that "when coconut palms are cultivated inland, and they do not thrive, an application of salt or seawater has often been found to make them grow vigorously and bear fruit." Dr. Nicholls is here referring to his West Indian experience. The effect of the nitrates of potash and soda as soluble nitrogenous manures would be to force the plant into vigorous growth in the early stages, when it is most liable to be attacked by pests.

An Indian agricultural officer of high standing, writing to us on the subject of treatment of seeds, says: "I pickle all kinds of seed before sowing, even potato seeds, small and delicate, I keep steeped in camphor water, the bottle being kept stoppered up for two hours with the seed in it. This is not only a protection against fungoid diseases, but it actually helps germination. Plants that do not ordinarily grow from seed, such as the mulberry, the Jerusalem artichoke, &c., can be easily grown from seed by this means. . . . In the case of large seed, I do the pickling in the ordinary way, *i.e.*, I dip the seed in sulphate of copper solution (1:100) and immediately afterwards get it dried by a mixture of ashes, lime and rape dust. The pickling is done chiefly with the object of preventing mildews. Ashes, lime and rape dust are insecticidal manures. The drying is essential, as too long souking of seeds in sulphate of copper 'burns' them up and in fact kills them outright."

We commend the above remarks to the serious consideration of our correspondents. One of the most annoying experiences of cultivators is the non-germination of seed from various causes. But both bluestone and camphor are cheap substances and obtainable at most bazaars (being known respectively by the native names of *palmanikkan* and *kapuru*), and it will be within the means of all to at least give these remedies a good trial, and if the trial prove successful, of adopting them into constant use.

Greatest amount of rainfall in any 24 hours on the 17th instant, 2·12 inches.

Recorded by P. VAN DE BONA.

OCCASIONAL NOTES.

The present number commences the Seventh Volume of the *Agricultural Magazine* which was started in July 1889. Since that date it has been enlarged and we trust also improved. To our supporters to whom we owe so much in the past we offer our hearty thanks, and hope that they will continue their kind patronage in the future also.

We regret to find that a few copies of our last issue did not reach their destination owing to the loss of their wrappers. We shall be glad to supply the June number to those who will report to us the non-receipt of their copies.

Mangrove Bark.—The following is a concluding note on this subject, and should have completed the notes in our last issue:—*Kandelia Rheedii* belongs to the order Rhizophoraceae. It is an evergreen shrub or small tree found on the shores of muddy creeks. The bark is used in Tavoy for dyeing red, but probably as a mordant. It is said to be employed in Cochin as a tanning material.

GRAPE CULTURE AT NASIK IN WESTERN INDIA.

Nasik, one of the most ancient sacred cities of the Hindus, is situated on the river Godavery near its source, to the north-east of Bombay. Its average rainfall is 35 inches, and its elevation about 1,900 feet above sea level. The climate is very salubrious and the soil fertile. Although its distance from Bombay is 120 miles by rail, its shortest distance from the sea is only about 60 miles; and it is reputed to have the double advantage of mountain breeze and sea breeze, the latter finding its way through the Peiet gorges. In the city and its vicinity are grown fine vegetables and excellent grapes.

Presuming that it will interest your readers to hear something of grape culture in this place, I shall give a brief account of one of the Grape Gardens there which I visited lately. Viticulture, as I saw it practised at Nasik, seemed to me a very simple affair. With the exception of the pruning and training, it resembled pretty

much the growing of any ordinary fruit tree. The expensive trellis work or "pandal" so inseparably connected with the culture of grapes in Jaffna and other parts of Ceylon, was absent; and the vines looked almost like bushes of 5 or 6 feet in height. There were 800 vines in one garden, planted two in each hole, thus making 400 pairs; and these were trained for support on to 400 trees of *Erythrina Indica*, a plant belonging to the natural order *Leguminosæ*, and well-known in Ceylon by the name of *Eranudu* in Sinhalese and *Mulmuruku* in Tamil. This tree, the gardeners say, is peculiarly suited for the purpose, as their growth close to the vines, so far from injuring the latter, seems to benefit them. Your readers will remember that this is one of those few trees that are held in high favour on the estates in Ceylon for growing as shade trees for Cacao plants. The nitrogen theory propounded with regard to plants of certain genera of the *leguminosæ* order may probably account for this virtue in *Erythrina* trees. Besides, these plants have the advantage of being deep-feeders, sending their roots down into the subsoil and abstracting nourishment which is beyond the reach of the roots of the vine and many other cultivated plants. Further, judging from the nature of its wood and the very small amount of ash left behind after burning it, the *Erythrina* tree does not seem to require much mineral matter for its growth. Whether owing to these causes or any others, it is a fact confirmed by the experience of grape-growers in India that the *Erythrina* tree is admirably suited for training vines upon; and the advantage of this method of training consists not only in economy (the expenses of putting up pandals being saved), but also in the trees affording a certain amount of shade and shelter as protection against the excessive heat of the sun and violent winds at certain seasons of the year.

In the vineyard under notice, each pair of vines is planted six feet apart either way; but I should think 6 feet by 8 or 10 would be a better distance. The soil approaches a clay loam in nature and the land is pretty level. Although the vines are seven years old now, their main stems are not thicker than a man's thumb, thus showing that the growth of wood has not been unduly encouraged, which, I should think, is an important point to be kept in view in grape culture in the tropics:

The bushes bear two crops in the year, one season lasting from April to October, and the other from October to April; and so the plants are pruned about the end of April and October respectively. In pruning, only two buds or eyes of the shoots of the previous season are left. The vines began to yield a little when two years old, and ever since the crop has been increasing steadily.

The manure applied is old well-rotted night soil, which the gardener, who is a Hindu called "Municipal Manure." He uses twenty carts of it a year, *i.e.*, ten carts each season. He buys the manure at the nominal rate of four carts for a rupee.

As to watering: during the rainy season there is no need at all for any artificial irrigation, but in dry weather the vineyard is watered from wells once a week,

Another particular I elicited from the man is, that the only disease the vines are attacked with is mildew, which he called "White Disease"; and this they get very seldom, and as it does not do any serious damage, little notice is taken of it. As regards the longevity of the vine at Nasik, he said that vineyards planted when one is a little boy, last, if carefully managed, till he becomes an old man, thus assigning to them about fifty year's lease of life.

I have been taking some interest in grape culture, because I have an idea that it can be made a very paying concern when carried on on an extensive scale in the North and several other parts of Ceylon; and the Indian vineyard which I have here described, although not a very extensive one, is sufficiently large to give us some idea of grape culture on a fairly extensive scale, for it is worked on a system that can be applied to much larger acreages,—a fact that can hardly be said of the small grape gardens in Ceylon, though indeed they are good in their own way.

E. T. HOOLE.

P.S.—I shall on some future occasion send you a detailed statement as to the yield, expenditure, profit, &c.—E. T. H.

MARKS ON LIVE STOCK.

Certain marks, both artificial and natural, are met with in the bodies of our domestic animals. These we seldom notice, but they are often found to be of the greatest importance when such animals are intended for the market. The *artificial* marks which are very frequently, or one may say always found on the bodies of cattle in this island, are made by branding them with a hot pointed iron. Branding is generally done for the purpose of indicating ownership. The usual practice in villages is to have three letters branded on the side of the animal. These letters being the initial letters of the name of the village where the owner resides, that of his family, and his individual name. This system is very often useful in preventing cattle-lifting which unfortunately was very common at one time. The practice of forming as large characters as possible on the bodies of animals is not only unnecessary but causes a great deal of suffering to the animals. The branding of distinguishing marks necessitated under existing circumstances can hardly be put a stop to now, without revolutionizing a system that has existed so long, and that is believed to have proved useful: but there is nothing against modifying it and enforcing the necessity of making such distinguishing marks as small as possible, thereby reducing the area of irritation which the animal has to suffer. But there is another form of branding, a practice which is not only heartless, but extremely cruel and deserving of punishment. This is the use of the hot iron to make so-called ornamental lines upon the skin of a beast. These artistic designs often extend from one end of the body to the other, and are generally of a very complicated nature. Some carry on this practice quite thoughtlessly, without considering how unnecessary it is, and what an amount of suffering it causes the animal. There are others, however, who are foolish enough to believe that this mode of branding improves the

physique of the animals operated upon. The abuse of the branding iron deserves the attention of not only those who are interested in the prevention of cruelty to animals, but also of those who are concerned with the improvement of the breed of cattle in the country. Indeed, we ought to be able to criminally prosecute every man guilty of such wanton cruelty.

The *natural* marks found in the body of animals chiefly consist of coloured patches of white, black, &c., and hair-marks in the form of a feather, commonly known as *Suli* in Sinhalese. These latter marks are formed by hairs being arranged in a peculiar form on the surface of the skin. Animals having white patches on a single limb are supposed to be unlucky; but white patches on two similar limbs, either the fore or hind, go to recommend an animal. Again, three white legs or two whites taken diagonally are considered an unlucky arrangement. Four white legs and a white patch on the forehead go to form the best marks that an animal could possess and are known in India as *Panchkalyan* or the "five graces." As regards feather marks (*Sulis*), Arab horse owners consider two on the forehead in a line with the eyes to be lucky. One between the throat and the chest is considered to be of such great value that its occurrence makes every other unlucky mark that may be present of no consequence. The unlucky marks recognized among the Arabs are numerous, but the following are the principal: two marks on the forehead, one above the other, inclined to a side; one on the side of the neck; two on each side of the neck; one on the chest and one underneath the chest. There are some people who even go the length of attaching importance to hair marks on the body of man.

LAWS OF CEYLON RELATING TO AGRICULTURE.

6. No appeal lies to any Court against the decision of any Council, Government Agent, or Inquirer, but the party aggrieved may petition the Governor after applying for relief in the first instance to the Government Agent. Application to the Government Agent for this purpose must be made by a written petition within 14 days exclusive of Sundays and public holidays from the date of the decision complained of. Application to the Governor must also be made by petition within 14 days exclusive of Sundays and public holidays from the date of communication of the Government Agent's order.

7. In default of payment of the penalty imposed by the President, Government Agent or Inquirer, the defaulter may be sentenced to undergo simple or rigorous imprisonment for a period not exceeding 14 days.

8. The Council or Government Agent or the Inquirer may direct that a portion of the penalty be paid to the person aggrieved by the act in respect of which the penalty was imposed. The acceptance of such sum by the person aggrieved debars him from suing for the recovery of any damages sustained by him by reason of the act complained of.

CHAPTER VII.

Construction, Repair and Improvement of Irrigation Works.—In order to provide means for the

construction, repair or improvement of works connected with the cultivation of paddy lands and to keep channels which supply water to such lands free from obstruction and in proper order, it shall be lawful for the Government Agent, at his own instance, or on the application of a reasonable number of proprietors to call a meeting of the proprietors to determine by a majority of the proprietors present either in person or by proxy in writing, whether it is expedient that such works be constructed, repaired or improved; and if so, whether or not Government aid is necessary for such work. If the majority present shall determine that such aid is not necessary, they shall proceed to determine the rate of subscription in money or of contribution in labour payable by each proprietor towards the work and their decision shall be recorded and shall be binding on all the proprietors whose lands are benefitted by such work.

If Government aid be deemed necessary, the Government Agent shall make application for such aid to the Provincial Irrigation Board. The application shall be accompanied by a specification showing the allotments likely to be benefitted by such work and the names of the proprietors of the allotments. The Provincial Irrigation Board may, if it thinks fit, cause plans and estimates to be prepared.

3. If the estimate does not exceed R2,500, the Provincial Irrigation Board, with the sanction of the Central Board, may execute the work.

4. If the estimate exceeds R2,500, the Provincial Irrigation Board may refer the matter to the Central Irrigation Board, who may sanction the work. Such sanction shall be published in each village affected by the work by beat of tom-tom.

5. The costs of all works undertaken in any province shall be defrayed from, and shall not exceed, the portion of the irrigation fund apportioned to such province for that year.

6. In case of works the cost of which cannot be defrayed from the irrigation fund, application shall be made to the Governor in Executive Council by the Central Irrigation Board. The application must set forth the necessity for, and the probable cost of, such work together with a specification of the lands likely to be benefitted thereby.

(To be continued.)

THE MAUND.

The real value of the maund has often perplexed us in our perusal of Indian reports and periodicals. The word is hardly ever used in Ceylon except with reference to tea seed, in which connection the maund is understood to imply a weight 80 lbs. What is strange is that, seeing how variable the maund is, those who make use of the word do not indicate its value in terms of the standard pound avoirdupois so as to avoid misconception. In order to clear our doubts about the real value of the Indian measure, we lately consulted a competent authority (an agricultural officer of high standing in India) and are glad to be able to give our readers the benefit of the information with which we have been supplied. The following is our referee's reply to our query:—

The maund varies very much in weight in different parts of India. The Imperial maund has

a fixed weight, which is $40 \times 80 \times 180$ grains troy (a rupee weighing 180 grains.) In Bengal in some districts it is a quarter more, and in some a quarter less, and it varies between the two extremes. But in the same locality one article may be measured by one standard and another by another standard. A *seer* ($\frac{1}{16}$ of a maund) of silk in Maldah weighs $82\frac{1}{2}$ tolahs or rupee weights, but a seer of oil 95 tolahs, and a seer of vegetables $10\frac{1}{2}$ tolahs. In Bombay one maund = 28 lbs. avoirdupois = 1088 $\frac{1}{8}$ tolahs: a seer being $27\frac{3}{8}$ tolahs. But there is also a *pucca seer* in Bombay equivalent to 72.59 tolahs. At Poona a seer = 76.66 tolahs = 1.9714 lbs. avoirdupois = 2.33604 lbs. troy = 9583 British Imperial seer. But 40 seers do not always make a maund in Poona. The *Kutcha* maund of Poona weighs $12\frac{1}{2}$ or 14 Poona seers. At Satara, however, the seer weight is big. It is either 92.75 tolahs or 93.25 tolahs or 115 tolahs (at Mamdapur). In Sindh a maund = $82\frac{1}{4}$ lbs. avoirdupois. At Surat the seer = 35 Surat tolahs = 45.5729 British seers. The Surat maund = $37\frac{1}{2}$ to 38 lbs. avoirdupois. At Broach the seer = 40 tolahs (not 80). The Madras maund = 3038.19 British Imperial maund. One Bombay maund = 1.12 Madras maund. ("Now," says our correspondent, "you can make out how savage we are on this side the Strait.")

THE ACTUAL CAUTERY: ITS USE AND ABUSE.

The hot iron is used in Veterinary Surgery as a "counter-irritant" in diseased joints, tendons and ligaments, and to promote the absorption of bony deposits when they are just forming. It is generally applied at a red heat and acts by reflex action, amending deep-seated faulty nutrition and setting up a healthy reparative inflammation. It is a much severer irritant than a blister, and often removes pain very rapidly when repeated blisters have failed to do so.

There are three kinds of instruments commonly used in this operation, viz., (1) the wedge-shaped iron for linear firing, (2) the budding iron used in the case of small round circumscribed bony deposits, and (3) the pyro-puncture for parts covered with loose, thin skin such as the stifle joint; and the firing performed with these different instruments varies accordingly. The main principles involved in all three methods are, however, the same. The operation is done when the animal is strong enough to stand it and the weather fine. When all the four limbs have to be fired, which is very seldom the case, only one or two are treated at a time; and on no account should firing be done in a series of crossed lines close to each other, for the portions of the skin thus isolated will slough off being deprived of their proper blood supply. It should be remembered that the actual cautery is an extreme measure, and is only resorted to as a last resource in very severe cases where milder remedies have failed or in cases of chronic lameness to which the latter are unsuitable. Formerly, even in European countries, it was a too common practice to fire the animals for very slight ailments, and even to adopt firing as a preventive to certain diseases. This was owing to the natural tendency

of abusing a good thing without understanding its proper use as was also done in the case of blood-letting. It was currently believed that the part cauterized by the hot iron contracted and formed a sort of permanent bandage around the part, and thus helped to strengthen and brace it. But this idea is not quite correct. For a short time after the operation, the skin, no doubt, is tightened, as may be seen by its "drawn appearance"; but it soon resumes its natural elasticity and does not embrace the underlying parts more firmly than it does in its normal condition. The way in which firing actually exerts its curative influence is by reflex action as already mentioned. The benefit that follows its use is also partly due, in the case of overworked and ill-used animals, to the long rest which the owner is obliged to give the animal after it is fired.

While in the western world the abuse of the actual cautery is discomtented and more or less discontinued under the light of Veterinary Science, in eastern countries such as India and Ceylon it is still continued to a great extent. Slight cases of lameness that can be cured by milder measures, and those that require internal treatment, such as tonics, and good nursing are treated in a reckless manner with the hot iron. This rough and ready method of treatment is also looked upon in certain quarters as a sort of panacea to the ailments and complications that sometimes accompany dentition in calves and dogs.

But such abuse is due more to ignorance than to wilful or wanton cruelty. The natives of India have great faith in the use of the hot iron. Instances are met with of their using it on their own bodies and those of their children as a preventive against certain diseases. It is, however, to be hoped in view of the efforts which are being made to spread scientific knowledge in India and Ceylon, that such ignorant practices will soon be things of the past.

The hot iron, besides being used for veterinary purposes, is also employed for branding cattle. Some native cattle-owners are satisfied with branding the animals with the initial letters of their names, while others make the process a complicated one by adding to them certain superstitious designs or drawings; and even the initials themselves are in some cases too many to be put on the poor animals, on account of the multiplicity of names possessed by some villagers.

In the *Ceylon Independent* of the 27th ultimo is found a graphic account of the cruel method of branding practised in certain villages. As though a single branding in this manner were not enough, cattle that have the bad luck to be stolen, not unfrequently receive a second branding at the hands of their new possessors, which is done in order to guard against identification of the animal and detection of the theft. But by far the worst cases are those in which no proper care is taken of the animals after branding, and the raw surfaces are allowed to fester and breed maggots and become big deep sores that take a long time to heal. The brand marks should never be excessive nor any deeper than is essentially necessary; and the wounds should be treated with carbolized margosa oil so as to keep out flies and prevent the evil effects of septic germs. Now that the Society for the

Prevention of Cruelty to Animals is up and doing in Colombo, I trust we may confidently look forward to some reform in this matter.

E. T. HOOLE.

BOMBAY, 9th May, 1895.

THE RHEA FIBRE PLANT.

The genus *Boehmeria* is represented in Ceylon by more than one species, *B. malabarica* (the Sinhalese Maha-diya-dul) being a recognised fibre plant common in Ceylon and used by the natives for making fishing lines. Regarding the genus, Dr. Watt says: "All the species of *Boehmeria* receive popularly the name of Rhea or grass cloth fibre plants, and, indeed, the bushy or herbaceous members of two or three other allied genera equally fall within that designation, since they all yield delicate, white, silvery and exceedingly strong fibres. It seems likely, however, that true Rhea fibre is the produce alone of *B. Nivea*."

A trial of the Rhea or Ramie fibre plant is now in progress at the School of Agriculture, Colombo, from cuttings imported from Calcutta. We also hear of an agency having been established in Colombo for a Rhea Fibre Company in England, and that already some gentlemen (in the interests of this Company we believe) have been prospecting for land of an extensive acreage in the Rayigam Korale. In view, therefore, of the local interest that has begun to be evinced in Rhea, we append a short account of the cultivation of the plant based on the article in Watt's Dictionary of Economic Products:—

Soil.—The rhea plant is exceedingly hardy, and thrives in almost any description of soil. But preference should be given to a rich, light, sandy loam, well worked and sufficiently shady. The subsoil should be good, as the roots penetrate 12 to 14 inches deep in search of nutrition.

Climate.—For profitable working, a situation should be chosen which would promote the quickest growth of the stems, and yield the greatest number of cuttings with the best quality of fibre. A situation fulfilling these conditions would most probably be found in a tropical climate with a moist atmosphere and fairly good rainfall. It would succeed in almost any part of the tropical plains of India.

Preparation of the Soil.—The land, if not naturally rich, should be manured: it should also be ploughed to a considerable depth, and tilled lightly so as to remove the weeds. Furrows or small trenches 3 feet apart should then be made, and the land kept ready to receive rhea roots or cuttings by the end of the rainy season. An analysis of rhea shows that the most favourable manure should contain nitrate of soda, sea-salt and lime.

Planting and Care of the Crop.—Rhea is easily propagated. It grows readily from root or stem cuttings and from seed. Supposing the mode of propagation by root-cuttings to be adopted, the young lateral shoots with their roots should be cut off and planted in furrows before the end of the rainy season, to a depth of 3 inches; a little watering may be necessary should the weather be dry.

It would be found that plants will grow rapidly to a height of 4 or 5 feet; that the roots will become stronger every year, the plant being peren-

ual. The first crop may be ready in two months from the date of planting out, especially in favourable situations. There are many advantages in a rhea crop; it is perennial, and does not therefore require to be renewed every year. It resists variations in temperature owing to the roots penetrating into the subsoil. Year by year the roots spread, becoming stronger and more productive. The crop is never destroyed by caterpillars or other insects, owing to the quantity of tannin which the bark contains; and lastly, three or four cuttings may be taken off the same ground every year. But it has a serious advantage in that it is one of the most exhausting crops known, requiring the land to be left fallow before anything else can be put on the same field after the removal of the crop.

Cutting the Rhea.—Some experience is necessary to decide the right time for cutting. As a general rule, care should be taken to effect the cutting before the plant becomes covered with a hard or woody bark, the formation of which is indicated by the green skin turning brown, the discoloration commencing at the bottom of the stem. A practical way of finding whether the plant is ready for cutting is to pass the hand down the stems from top to bottom. If the leaves break off crisply, a crop of cuttings may be taken off the plants. Dr. Forbes Watson says that the plants are ready for cutting when $3\frac{1}{2}$ to 4 ft. high. "If the length is not more than 2 feet, the fibre is very fine, but the chances are you get more waste, and not such a good percentage of fibre. In the long stems the fibre is not so fine as in the medium ones." Care should be taken, however, not to remove more than can be treated for extraction of the fibre within the 24 hours. "Experience," says Mr. Theo. Moerman, "has enabled us to establish the fact that the fibre of the second cutting is superior to the first, and that in every instance it is preferable to cut the stalks before the plant flowers and before it is completely mature in order to obtain a finer and softer fibre."

Outturn.—Dr. Forbes Watson says: "Estimates have been made shewing that you could get 40 tons per acre, but I think these require to be verified before we can accept them. Anyway, I do not think we can conclude for the present—I hope I shall be mistaken—that each crop will yield more than 250 lbs. per acre. You may, therefore, obtain 3 crops or even 4, in the year, which would bring it to 1000 lbs. per acre." But the outturn is variously estimated by different authorities quoted by Dr. Watt in his Dictionary of Economic Products. In a pamphlet on Ramie issued under the authority of the Department of Agriculture of Queensland, we read "under favourable circumstances an acre will produce 40 cwt., but 30 cwt. is regarded as an average crop."

POULTRY DISEASES.

If fowls are kept clean and well protected from wind and rain, and are not over-fed but given equal quantities of both soft and green food and a regular supply of pure water, they will not often get sick unless disease is introduced through infection or contagion. When a fowl contracts disease, it is best as a rule to kill it before it gets worse and communicate it to other birds of the flock. In cases of valuable animals attempts must necessarily be made to cure the disease.

Besides actual disease there are certain natural ailments, as they may be called, to which fowls are liable and which require treatment. These may be included under bad fledging, weakness, and cramp.

Bad fledging.—Chickens often suffer much whilst their feathers are growing especially in a chilly rainy weather. The breeds which feather rapidly suffer much in this way (like the Shanghai) and this is perhaps the reason why the bantams which take long to fledge are so hardy. As soon as a brood appears drooping whilst the feathers grow, give some bread soaked in water, or if beer is easily procurable it is advisable to soak the bread in it; above all things keep them off from moist places. This ailment seldom or never lasts more than seven or eight days.

Weakness.—Highly-fed chickens which grows fast are generally subject to this. It arises through their fast growth and has to be remedied by giving animal food such as worms and bone dust. In warm weather dip the feet in cold water twice a day. The above diseases should not be confounded with *cramp* which also disables the animals from walking and standing on his legs; for cramps cold water is highly injurious, the only treatment in such a case is warm fomentation and the application of turpentine to the legs.

ACTUAL DISEASE.

For actual disease it is deemed advisable to have well-sheltered and well-ventilated shed as an infirmary, which the healthy fowls should not be allowed to enter.

Gape is another troublesome infectious disease. The chief causes of this disease are foul water with decomposing vegetable matter, exposure to rain, and want of nutritious food.

Symptoms.—A number of worms are found in the wind pipe, jerky breathing, constant flow of saliva and offensive odours.

Treatment.—Camphor of the size of a grain of millet should be given with water. In well-marked cases the worms must be removed by introducing a loop of horse hair into the trachea. This should be repeated several times till the worms disappear; a feather stripped to the top may also be used to remove the worms.

A. M. FERNANDO.

(To be continued.)

MANUFACTURE OF SUPERPHOSPHATE.

It is advisable in the first instance to burn the bones and convert them into what is known as bone-ash, as fresh bones or bone-meal produce a slimy mass on treatment with acid which is exceedingly difficult to dry.

To prepare the superphosphate from bone-ash it is necessary to have a receptacle to mix the ingredients which is not attacked by sulphuric acid. A wooden trough lined with lead (a sheet of lead hammered to fit the trough) is about the best; but the wooden trough, pitched inside will answer the purpose, or a hole in the ground lined with cement. In this receptacle the ingredients are mixed in the following proportions:—For every 40 lbs. of bone-ash add 1 gallon of water and 15 lbs. strong sulphuric acid (commercial oil of vitriol.) Pour the whole of the water into the tank, then add *gradually*, stirring constantly with a wooden pole the sulphuric acid. The acid

combines very violently with the water, and unless it be added as directed above, an explosion may result. Now add gradually, a little at a time, the bone-ash, stirring constantly with a stout pole or hoe. The above proportions should yield a mass possessing the consistence of stiff dough. If it is not stiff enough some more bone-ash may be added. Leave it to itself for a few hours, when it will dry to a friable mass, easily broken and in a fine state of division. Protect from rain when drying. The manure is now ready for use. Although burning the bones destroys the organic matter and diminishes the proportion of nitrogen, this loss is more than compensated for by the ease with which the product can be dried and handled. If fresh bones or bone-meal be used the fat which they contain prevents the complete action of the acid, and the resulting product is so slimy as to be unmanageable in many cases. If it is preferred to use fresh bones or meal, the following proportions are said to be the best:—

Dilute every half gallon of acid with one gallon of water, as directed above: that is, add the acid to the water, stirring all the time. Never on any account add water to the acid. Pour this diluted acid upon 20 lbs. of the bone-meal in the trough, taking care to pour slowly, stirring all the while. The sticky mass must now be mixed with loam, wood-ashes, peat, or gypsum, in order to dry it. Instead of burning the bones the oil may be removed by steaming them, but this is rather a troublesome process. Simple boiling with water is better than nothing, though in no case is the product so satisfactory as that prepared from burnt bones.

Instead of using acid, bones may be rendered soluble by allowing them to ferment. The following is a good plan:—

Dig a trench and fill it with alternate layers of wood-ashes and bones, beginning and ending with wood-ashes. Moisten each layer of ashes when laid, and keep the whole moist by watering from time to time. In a few months the heap may be turned over.

Bones are also dissolved by placing them in a pit and drenching with a hot solution of lye, 1 lb. of potash lye to every 4 lb. of bones. Cover with earth, and stir occasionally for two or three weeks, when the mixture may be turned out to dry.

It will be seen that treatment with acid is the most rapid, and the product just as satisfactory, but caution is required in mixing the ingredients. —*Agricultural Gazette, N.S.W.*

ASSIMILATION OF NITROGEN BY PAPILIONACEÆ.

It might almost be said that no discovery of modern times, in the field of biology, has given promise of being of greater or even equal value to that of Hellriegel. So long ago as 1876 Berthelot suggested that microbes in the soil very possibly exercised an influence on plants by enabling them to absorb nitrogen. This Hellriegel has demonstrated to be actually the case. He has shown that certain plants form on their roots minute tubercles within which advantageous microbes are, as it were, housed. This discovery has been confirmed by Wilforth as by Lawes and Gilbert and many other observers. It may be said not only to have revolutionized our knowledge of the

methods and materials of plant nourishment, but to have given a completely new turn to scientific agriculture. It has materially advanced the investigations into the subject of the preservation of soil fertility, and has given a rational explanation of the value of certain leguminous crops, in the rotation that for centuries has been an accepted maxim in most civilized countries.

Theodore de Saussure originally raised the question whether the nitrogen of the atmosphere has been utilized by plants in the formation of the nitrogenous materials of their structure. Bous-singault demonstrated that this was not so, but that they derived their nitrogen through the roots, from compounds in the soil that contained that element. On this subject Prof. Julius Von Sachs (*Lectures on the Physiology of Plants, translated by Prof. Marshall Ward, 1887*) says:—

"The view was once held that it was ammonia salts particularly which being absorbed by the roots of plants, or perhaps indeed by their leaves in the dew and rain water, yielded the nitrogen for the period compounds of the plant. But the result of our water-culture proves, in the first place, that plants are able at any rate to absorb the whole of their nitrogen in the form of compounds of nitric acid; but if, on the other hand, the attempt is made to replace the latter by ammonia salts, experimental difficulties make their appearance which we will not here discuss in detail. If, further, it is remembered that the ammonia produced in nature by the rotting and decomposition of organic remains, especially in vegetable soil, is easily transformed in the presence of potassium salts into compounds of nitric acid, which may be detected everywhere in vegetable soils and waters, and that nitric acid is contained in rain water, although in very small quantities, one comes to the conclusion that (apart, perhaps, from certain special cases and particularly apart from parasites and fungi) ordinary green plants obtain the nitrogen for the formation of their proteid substances, and therefore of their protoplasm, from salts of nitric acid."

Now, when a work published only the other day and by one of the greatest of botanists, affirms that plants obtain the whole of their nitrogen from compounds referable primarily to nitric acid, and when it has to be added that since the publication of that work it has been demonstrated that certain plants at least have the power, through the agency of microbes, to draw on the atmospheric supply of pure nitrogen, it will at once be apparent how great a revolution has been thereby effected in the theory of plant-life. And this is what has actually taken place within the past few years.

The well-ascertained fact that while peas, beans, and other papilionaceous plants develop a high percentage of nitrogenous material, the yield of that substance is not proportionately increased by the addition of nitrogenous manures to the soil on which they are grown, is at once explained. So also the further fact that on crops of that nature being removed from the soil, they leave it richer in nitrogenous matter than before cultivation. On the roots of such plants minute tubercles are formed. These, it has been ascertained, contain microbes which have the power of building up within their bodies the atmospheric nitrogen that has permeated through the soil. On the death and decomposition of these microbes the foster plant is supposed to

utilize the nitrogen compounds thus formed, and the soil is presumed at the same time to be enriched, through the cultivation of plants which possess the valuable property of harbouring these minute parasites.—*Dr. George Watt.*

COMMON MORTAR.

(Continued.)

Coral, shells, and limestone are the substances generally used for the production of quicklime. The ordinary coral of the Jaffna Coasts forms a rather important article of trade, being taken in considerable quantities to the S.W. coast of the Island by the native crafts called *dhoonies* at a trifling rate of freight, and there sold to lime burners: the product of the kilns being said to be more highly prized than that made from the limestone of the country, and second only to that made from marine shells. In the Central Province, where shells cannot be conveniently obtained, the rock of the limestone formations which crop out at various places is calcined.

In the production of mortar the quicklime obtained by burning carbonate of lime has to be slaked, and this is done by throwing water over it. In this operation a good deal of heat is given out.

Heat is generally an accompaniment of chemical action. In the human economy the oxidation of the carbonaceous matter in the blood gives rise to what is known as animal heat which is so essential for a healthy condition. The amount of heat given out during chemical action is an indication of the force with which chemical action takes place, and the stability of the compounds which result. The more heat given out in the formation of a compound, the harder is it to decompose that compound.

Quicklime in slaking falls into powder forming what is called slaked lime or slack lime, a compound of quick lime and water. The change is represented chemically by the following equation:—

56 parts by weight of quicklime taking up 18 parts of water to form 74 parts of slaked lime or, to call it by its proper name, calcium hydrate. In the preparation of mortar it is important that *all* the quicklime should be thoroughly slaked, for a piece of unslaked lime in a wall, by combining with the vapour of water in the atmosphere after the mortar has been applied, is apt to expand and so spoil the smoothness of the wall. Quicklime has a great affinity for water, and, if left exposed for any length of time, will absorb atmospheric moisture and gradually become converted into slaked lime. Further, slaked lime has a tendency to revert to carbonate of lime, and if carbonic acid gas be available, it will exchange the water with which it is in combination for carbonic acid gas, and so become converted into carbonate of lime. The change may be expressed thus:—

Thus after slaked lime has been applied to the wall of a building (in conjunction with sand, in the form of mortar) it slowly parts with its combined water, and takes up carbonic acid gas from the atmosphere, where, as has already been pointed out, it exists in comparatively large quantities. A newly-plastered room may remain damp for a considerable time, for after the water which goes

to dissolve the slaked lime and mix it with the sand has been evaporated, the water of combination has gradually to be given up, and the slaked lime become converted into carbonate of lime. It is sometimes found even in old walls that the internal plaster contains slaked lime in the unaltered condition.

It may be said that water acts in three ways in relation to lime, (1) it combines chemically with it to form the hydrate of lime, which we have agreed to call slaked lime, and (2) it partially dissolves this slaked lime, so forming what is commonly known as limewater—a solution of slaked lime in water, and (3) it acts as a medium, a mechanical medium we may say, for mixing slaked lime and sand.

Carbonate of lime is insoluble in pure water, but is soluble in water having carbonic acid gas in solution; this can be easily proved. If we take some lime water, prepared by dissolving slaked lime in water, and breathe into this solution, we pass into it carbonic acid gas, which is contained in our expired breath. I cannot here say more in explanation of how this gas comes to be found in our breath, than merely mention that it results from the oxidation in the lungs of the waste carbonaceous materials found in the blood. Well, by breathing into this solution the carbonic acid gas combines with the quicklime part of the dissolved slaked lime and so forms carbonate of lime. The change is similar to that which I stated took place in the hardening of mortar, namely, the conversion of slaked lime into carbonate of lime, by the combination of quicklime with the carbonic acid gas in the atmosphere. Both changes are representable by the same chemical equation

Now you will observe that the liquid turns milky, the reason of this being that particles of carbonate of lime which has been formed are in suspension in the water, since carbonate of lime is insoluble in water. If, however, we continue to supply carbonic acid gas to this mechanical mixture of carbonate of lime and water, we shall find that the liquid again becomes colourless, owing to the fact that carbonate of lime is soluble in water which contains carbonic acid gas in solution.

(To be continued.)

CEYLON WOODS.

The timber trees of Ceylon have been ably dealt with by the late Mr. William Ferguson, and his pamphlet on the subject has served as a useful handbook to the students of plant-life in Ceylon, but we venture to think that the following list of the trees of our forests which are of economic value will prove of interest to our readers, especially as specimens of the wood from these trees can be seen at the School of Agriculture. The collection was made by the Conservator of Forests himself who, with the permission of Government, presented it to the School Museum. The numbers in italics indicate the numbers of the orders in Dr. Trimen's list of Ceylon Plants, those within brackets being the numbers of the specimens themselves. The Sinhalese names, where known, are also given:—

2 Dilleniaceæ.

(1) *Wormia triquetra*. Diapara.

- (2) *Dillenia retusa*. Godapara.
 3 Magnoliaceæ.
 (3) *Michelia glauca*. Wal-sapu, Wal-buruta.
 (4) *Michelia champaca*. Sapu (Champak).
 4 Anonaceæ.
 (5) *Cyathocalyx zeylanicus*, Kekala, Ipetta.
 (6) *Polyalthia coffeoides*.
 (7) *Xylopia parviflora*. Netawu.
 9 Capparidæ.
 (8) *Crataeva Roxburghii*. Lunuwarana.
 11 Bixineæ.
 (9) *Scolopia crenata*. Katukurundu, Katukenda.
 (10) *Trichadenia zeylanica*. Titta-gas, Tolol.
 (11) *Hydnocarpus venenata*. Makulu.
 19 Guttifereæ.
 (12) *Garcinia echonicarpa*. Madol.
 (13) „ *spicata*. Ela-gokatu.
 (14) *Calophyllum spectabile*. Domba-kina.
 (15) „ *Burmanni*. Guru-kina.
 (16) „ *Inophyllum* Domba.
 (17) „ *tomentosum*. Kina.
 (18) „ *bracteatum*. Walu-kina.
 (19) *Mesua ferrea*.—Na (iron wood).
 20 Ternstroemiaceæ.
 (20) *Ternstroemia emarginata*.
 (21) *Adinandra lasiopetala*.
 (22) *Gordonia zeylanica*.
 21 Dipterocarpaceæ.
 (23) *Dipterocarpus zeylanicus*. Hora.
 (24) *Vatica Roxburghiana*. *Mendora.
 (25) „ *affinis*.
 (26) „ *obscura*.
 (27) *Shorea lissophylla*.
 (28) *Hopca discolor*.
 (29) „ *cordifolia*.
 (30) *Doona trapezifolia*. Yaka-halu.
 (31) „ *gardneri*.
 (32) „ *macrophylla*. Honda-heraliya.
 (33) „ *ovalifolia*.
 (34) *Vateria acuminata*. Hal
 (35) *Stemonoporus* sp.
 22 Malvaceæ.
 (36) *Thespesia populnea*. Suriya (tulip tree.)
 (37) *Bombax malabaricum*. Katu-imbul (red cotton tree).
 (38) *Cullenia excelsa*. Katu-boda. (Wild durian.)
 23 Sterculiaceæ.
 (39) *Sterculia foetida*. Telambu.
 (40) *Pterospermum suberifolium*. Velanga.
 24 Tiliaceæ.
 (41) *Pityranthe verrucosa*.
 (42) *Berrya ammonilla*. Hal-milla (Trincomalee wood).
 (43) *Grewia orientalis*.
 (44) „ *tiliæfolia*. Daminiya.
 (45) *Elaecarpus serratus*. Weralu (wild olive).
 (46) *Elaecarpus anœnus*.
 (47) „ *subvillosus*. Gal-weralu.
 (48) „ *zeylanicus*.
 (49) „ *glandulifer*.
 29 Rutaceæ.
 (50) *Acronychia laurifolia*. Ankenda.
 (51) *Atalantia monophylla*.
 (52) „ *zeylanica*. Yakinaran.
 (53) „ *missionis*. Pamburu.
 (54) *Feronia elephantum*. Diwul (wood apple).
 (55) *Citrus aurantium*. Dodan, (orange).
 30 Simarubaceæ.
 (56) *Ailantus malabarica*. Kumbalu, Wal-biliu.
 32 Burseraceæ.
 (57) *Canarium zeylanicum*. Kekuna.
 (58) *Filicium decipiens*. Pehimbiya.
 33 Meliaceæ.
 (59) *Azadirachta indica*. Kohomba.
 (60) *Melia dubia*. Lunu-midella.
 (61) *Walsura piscidia*. Kiri-kon.
 (62) *Chickrassia tabularis*. Hulan-hik.
 (63) *Chloroxylon swietenia*. Brruta (Satinwood).

- 35 Olacineæ.
 (64) Lasianthera apicalis. Urukann.
 36 Ilicineæ.
 (65) Ilex wightiana. Andun-wena.
 37 Celastraceæ.
 (66) Pleurostyliia Wightii. Piyari.
 (67) Celastrus paniculatus. Duludn.
 (68) Elæodendrum glaucum. Neralu.
 (69) Salacia prinoides. Hin-himbutn-wel.
 38 Rhamnaceæ.
 (70) Zizyphus jujuba. Maha-debara. Masan.
 40 Sapindaceæ.
 (71) Hemiggyrosa canescens.
 (72) Schleicheria trijuga. Kon (Ceylon oak).
 (73) Sapindus lanrifolius. Kaha-penela.
 (74) Nephelium longoua. Mora.
 42 Anacardiaceæ.
 (75) Mangifera indica. Amba (Mango).
 (76) " zeylanica. Amba, walamba (wild mango).
 (77) Odina woodier Hik
 (78) Semecarpus gaudneri. Badulla.
 (79) Campnosperma zeylanicum. Aridda.
 (80) Spondias mangifera. Embarella (Hog plum).

(To be continue d.)

GENERAL ITEMS.

There are three species of *Sansevieria* to which the name bowstring hemp is usually given, though there are a dozen species in the genus. The three species are *S. guineensis*, *S. zeylanica*, and *S. latifolia*, the first-named being known as African bowstring hemp. *S. zeylanica* is the best known, however, and is common in Ceylon from which it takes its name. Among the Sinhalese it is known as *Niyanda*, while the Tamils call it *Maral*. A report (No. 5. Fibre Investigations) issued by the United States Department of Agriculture includes an interesting summary of information regarding bowstring hemp, by Dr. Dodge, the fibre specialist. As a result of an exhaustive enquiry into the subject, the cultivation of *Sansevieria* would

appear to be a most desirable and profitable industry, as the plant possesses advantages which should recommend it to the intending fibre-grower, perhaps better than any other fibre-yielding plant. The plant is very easily propagated, quick of growth, the fibre is of the best quality—fine, white, lustrous and strong—and realizes high prices. Forty to fifty pounds of fibre is said to be got from one ton of leaves. According to Dr. Roxburgh's estimate about 1½ tons of fibre could be calculated on per acre per annum with two harvestings in the year.

It is certainly annoying to see a service-bull expending his energy in pawing up the ground and other destructive work. The Editor of the *Agricultural Journal* of Cape Town, referring to the question of working stud-bulls for carting or ploughing purposes, says. "Usefulness on the farm was not the only advantage of this employment of the bull, but it kept him most quiet and docile—a matter of considerable importance—as these high-bred animals are apt to become very surly and even dangerous as they get older Exercise will aid in keeping a worked bull healthy and in no way detract from his value as a sire."

It is said that canaigre, the new tanning materials from *Rumex hymenosepalus*, is expected to enter largely into arts and industries other than leather-making. In the manufacture of dye-stuffs and mordants it is said to be very valuable, and high hopes are entertained of canaigre becoming an important article in American agriculture.

The Editor of the *Cape Agricultural Journal* answers the question—"Which is the most effective way of destroying ants in a garden" as follows: Arsenic and sugar is a most effective poison for getting rid of ants. The sugar and arsenic must be finely pounded and then moistened and laid about in small quantities where the ants are.

COLOMBO, AUG. 1ST, 1895.

[No. 2.

NITROGENOUS MANURES AND THEIR EFFECT.

HERE are ten elements absolutely essential for the production of plants. These are nitrogen, hydrogen, oxygen, carbon, sulphur, phosphorus, potassium, calcium, magnesium, and iron. It is to the first-named element (nitrogen)

that I wish to call attention, and I will endeavour to show how important it is that we should become well acquainted with it. Nitrogen was discovered by Rutherford in 1772, and is a colourless inert gas, slightly soluble in water. It occurs free in the atmosphere, of which it constitutes 79 per cent, or 11 lb. to every inch of the earth's surface. The nitrogen and oxygen of the atmosphere combine under the influence of electric discharges, nitrous acid being formed, which is converted into nitric acid by the action of ozone or peroxide of hydrogen. It forms several compounds useful to those engaged in horticultural and agricultural pursuits. Ammonia is a compound of nitrogen and hydrogen.

Owing to the complicated changes of nitrogen in the soil, it is of the utmost importance that we should study the natural sources of its loss and gain there if we wish to become well acquainted with the difficult question of soil fertility. How does the soil obtain nitrogen in a natural way? The presence of organic nitrogen which is found in the soil has been formed by the decay of vegetable and animal matter. It is also brought down in rain as organic nitrogen, ammonia nitrates, and nitrites. The amount obtained in this way was determined at Rothamsted to be $1\frac{1}{2}$ lb. per acre per annum. But this varies in different parts of the country. It is estimated that an acre of fertile soil contains from 6,000 to 30,000 lb. of nitrogen in the first 18 inches, but the larger half is in the

first 9 inches, and the quantity decreases the deeper we go, 96 per cent. of it being present as organic matter.

From the above it seems that we have an inexhaustible supply of nitrogen in the soil, when our most exhaustible crops (Turnips) only remove about 150 lb. per acre. But probably not more than 5 per cent. of the nitrogen in the soil is in the form of nitrates, and thus available as plant food. Fallow land always contains a much higher percentage of nitrates than land under crop; for instance, the first 27 inches of soil over an area of one acre of fallow contains from 33 to 60 lb. of nitrates; land under crop only contains from 5 to 14 lb. in the same bulk of soil. This shows how quickly the nitrates are taken up by a growing crop.

These nitrates are most abundantly formed during the late summer and early autumn months, when the soil is warm, especially after cereal and other summer crops are removed. Nitrates, it should be remembered, are very soluble in water, and if light sandy soils are allowed to remain bare during the winter a very large proportion of this valuable manure will be washed out by the heavy rains. To prevent this loss some kind of winter crops should be grown, as these take up the nitrates. If the crops are of no other use they can be dug in during the early spring, and will then form a good organic manure which is beneficial to light sandy soils, as it helps to make them more retentive.

I have stated that our most exhaustive crops remove about 150 lb. of nitrogen per acre, and from experiments at Rothamsted it was found that from 35 to 45 lb. of nitrates per acre were washed out of the soil into the drains per annum, making the total loss of nitrogen about 157 lb. per acre in one year. Gardeners must bear in mind that this loss goes on the same in garden soils, and therefore to keep it in a fertile condition we must replace this loss by the application of some nitrogenous manure, such as the following.

Ammonium Sulphate.—This is a compound of ammonium and sulphuric acid. It contains 20 per cent.

of nitrogen, equal to 25 per cent. ammonia. This is the most concentrated of all nitrogenous manures and is very soluble in water.

Potassium Nitrate.—This is a compound of potash and nitric acid, and usually contains 13 per cent. of nitrogen, equal to 16 per cent. ammonia. It also contains about 45 per cent. of potash. It is a very valuable manure. Any gardener can increase the supply by the following process:—Make a compost heap of vegetable matter, such as garden refuse, and mix with it a fair proportion of wood ashes and lime. The wood ashes, which are rich in potash, can be obtained by burning all fruit tree prunings and hedge trimmings. The lime added helps to decompose the organic matter and liberate the nitrogen, which then chemically combines with the lime; but another change takes place by which the nitrogen leaves the lime and combines with the potash, thus forming potassium nitrate. The compost heap must be frequently turned so that all parts become thoroughly oxidised.

Sodium Nitrate.—This is a compound of soda and nitric acid, and contains about 15 per cent. of nitrogen, equal to 19 per cent. ammonia. It is very soluble in water, and contains its nitrogen in a form that can be immediately appropriated by plants.

Peruvian Guano.—This manure varies from 1 to 12 per cent. of nitrogen. It is a more general manure than the preceding, as it contains nitrogen in three forms. 1, As organic nitrogen; 2, ammonia; 3, nitrates, and is, therefore, a more lasting manure.

Dried Blood.—Blood contains nitrogen equal to from 12 to 16 per cent. ammonia, but it is slower in action than any of the above manures, as it has to undergo decomposition before it is available as plant food.

Fish Guano.—This is also a slow acting manure. It contains nitrogen equal to from 8 to 10 per cent. ammonia.

Farmyard Manure.—This is the most general of all manures. One ton contains from 9 to 15 lb. of nitrogen, besides other valuable manurial ingredients, such as potash and phosphoric acid.

Animal Urine.—One ton of this from horse stables contains 36 lb. of nitrogen; from cows, 30 lb.; and from sheep, 38 lb. Most gardeners can get a good supply of stable manure, and many persons have noticed the black streams draining away from it. If the value of the fertilising ingredients of this liquid contain was better known it would not be allowed to waste as it does. This is the analysis of it in 100 parts. Water, 82 per cent., and dry substance 18 per cent. The dry substance is made up as follows:—

Ash	10.7	Magnesia	0.4
Nitrogen	1.5	Phosphoric acid	0.1
Potash	4.9	Sulphuric acid	0.7
Lime	0.3	Silica	0.2

It will be seen by this analysis that the liquid contains, in addition to nitrogen, five of the mineral ingredients that are essential for the production of a healthy growing plant; the one not mentioned is iron, but plants only require a trace of this ingredient. And it is usually present in soils. It must be borne in mind that all the manures mentioned, except the sodium nitrate, the potassium nitrate, and part of the Peruvian guano had to undergo a process, next to be dealt with, before they can become available as plant food.

Nitrification.—This is effected in the soil by two micro-organisms (Bacteria). The first, known as the nitrous organism, converts ammonia into nitrous acid; the second, the nitric organism, converts the nitrous acid into nitric acid.

Carbon as organic matter must be present for the existence of these micro-organisms. Air, heat, and moisture are the three things that promote nitrification. It is very feeble at a temp. of 40° F., and ceases at 32° F. It is, therefore, necessary that the soil should be well drained. If the soil is waterlogged the air is shut out, and nitrification ceases, the nitrates present becoming denitrified, with the result that the nitrogen is set free. We must understand that nitrification takes place exactly the same in the soil of the smallest pot, under the gardener's

care, as it does in any prepared border, or in the open field. If the soil in pots become waterlogged nitrification ceases, and if allowed to remain long in this condition the roots will perish.

Basic Condition of soils.—Sufficient lime and potash must be present as carbonates or sulphates for the nitrates when formed to combine with, nitrate of lime and nitrate of potash then being formed, and these are the two sources from which all plants obtain their nitrogen from the soil. If any soil is not in a good basic condition it cannot be fertile.

How Plants Obtain Their Nitrogen.—The dry substance of plants usually contain from 2 to 3 per cent. of nitrogen, and they all (except the leguminous plants) obtain it from the soil principally as nitrates. Some gardeners still favour the idea that the foliage of plants has the power of absorbing nitrogen as ammonia from the air, but the most eminent botanists in England and on the Continent have concluded that the quantity obtained by plants in this way is so small as not to be worth considering. We may deduce from this that damping down houses, when closing in the afternoon, with liquid manure, as practised by some gardeners, does not benefit the plants so much as they think. Some, however, consider that the fumes of ammonia are injurious to red spider and other insect pests.

Leguminous Plants.—Peas, Beans, and Clover belong to this family. These plants have some power, not yet properly understood, of absorbing the free nitrogen from the atmosphere. Dr. Paul Sorauer, in his popular treatise on the "Physiology of Plants" (1895), says "As far as our scientific knowledge goes, the leguminous plants can subsist on the nitrogen they take from the atmosphere, while cereal crops, fruit trees, and indeed all other phanerogams, must obtain this substance in some soluble form from the soil. Nitrates seem to be the most suitable form of salt from which plants obtain their nitrogen. Ammonia, which can probably be absorbed in minute quantities even in a gaseous state, is less suitable." It is a fact that leguminous plants can be grown in a soil devoid of nitrogen. These plants do not rob the soil of this element, but act as purveyors of it to the soil.

Why is Good Loam so Valuable?—The first 9 inches of an old well-drained pasture is full of nitrogen, in three forms—nitrates, ammonia, and organic matter. The first 9 inches of soil in 1 acre, if weighed when dry and all roots removed, would contain about 2,250,000 lb. of soil. At 10 per cent. of nitrogen this quantity of soil would therefore contain 2250 lb.; but the turf we use for potting has all the roots in it, and these by their decomposition yield a large supply of nitrogen. Clover being a leguminous plant, greatly increases the nitrogen in a pasture.

How is the Nutrition of Pot Plants Effected?—The various composts we use for potting purposes should contain sufficient food for the growth of the plants; but the food in the richest soil can only last for a short time in the limited space of a pot, and therefore we should try to make the best of the soil. It is a common practice when sifting soil to throw but the lumps of turf that will not pass through the sieve. This is a great mistake. These lumps should be rubbed through, as their decay greatly increases the supply of nitrogen to serve as plant food.

When the soil in pots is getting exhausted the plants cease to grow vigorously, the foliage becomes pale, and the plants is weak in the growing point. We must now supply it with food. Soluble artificial manures are generally used where good liquid manure cannot be obtained. Great care should be taken not to overfeed, as this encourages rank growth; young tissues are built up too fast; the plants are not well matured, and when in this condition are more liable to prevalent diseases. Dr. Sorauer says that "the majority of diseased plants he received from gardeners was the result of overfeeding."

I have used tons of chemical manure, and from practical experience I find it better to under than over-feed. If we wish to keep our plants healthy

we should know the composition of the soil we have to deal with; also the composition of manures, and the ash constituents of plants. We should then be able to mix our own compounds to suit plants under our care. In conclusion I may say that of all the elements essential for plant life nitrogen is the most important. It is one of the chief elements of protoplasm, and this is the substance which gives life to plants.—(*Paper read by Mr. J. Gay, at a meeting of the Wornley and District Horticultural Society*).—*Journal of Horticulture*.

THE VITALITY OF SEEDS.

In the course of his investigations on the behaviour of matter at low temperatures, Professor Dewar was led to consider the effect of great cold on bacterial life and seeds. Although bacterial life is destroyed by boiling in water at a temperature of 100° C., it can still endure unaffected a degree of cold much greater in proportion. Professor Dewar submitted seeds for the space of an hour to a temperature of 182° C., and found that they afterwards went on putrefying or germinating as the case happened to be. In a moment of scientific inspiration, Lord Kelvin suggested that the first life might have been brought to this planet by a seed-bearing meteorite. But though it has yet to be explained how this meteorite was ever originally equipped with seeds, the discoveries of Prof. Dewar are interesting in a way because they give colour to Lord Kelvin's theory. They show that spores may live upon a planet through long periods of low temperature. The popular press is never tired of trumping up the old stories of the power of mummy-wheat to germinate after long ages of time. Let it suffice to say that these exaggerated estimates of the powers of retaining vitality which seeds possess, have not been substantiated.

In a recent number of that interesting journal, *Science Gossip*, Mr. H. B. Guppy put forward a proposal which we commend to all who are interested in biological science. In his investigations on the dispersal of seeds, Darwin came to the conclusion that a period of twenty-four hours as the limit of time, and 500 miles as the limit of distance, was the most that could reasonably be permitted to the agency of birds in stocking islands with seeds carried either on or inside their bodies. Mr. Guppy suggests that observers should examine such specimens of water-fowl as are common in their neighbourhood in order that we may have more definite data as to the dispersal of seeds and their vitality.

Some observers have testified to the fact that wild ducks frequently carry seeds a distance of perhaps a thousand miles or more, and that these seeds retain their vitality and germinate, sometimes without much delay, at other times after a year or two. We know that the common European species, *Xanthium spinosum*, has spread over the whole of South Africa, and we are probably right in thinking that the seeds of this plant have been carried in the wool of sheep. Here the seed did not, as in the case of the water-fowl, pass into the stomach of the animal, but there seems to be no reason why birds should not transport seeds in their internal organs across oceans and continents. Modern experiments with the seeds of cereals show that they lose their vitality after ten years at most, and usually much sooner; but much depends on the state of the seeds at the time they are gathered from the parent plant, the mode of preservation, and the influences they may have been exposed to during preservation. Mr. Sowerby, who has, at the garden of the Royal Botanic Society, in Regent's Park, experimented with a variety of seeds of various ages, and produced in quite distinct countries, declares that he has not met with any of fifteen years of age, to his own knowledge, to grow. The most aged seeds he has known to vegetate were those of the Australian Baobab Tree (*Adansonia Gregorii*), ten years old. One of the most curious cases of the vitality of seeds is reported in the *Journal of the Royal Botanic Society* for 1855. A handful of fruits of *Aucuba*, taken from a shrub in the gardens at

Regent's Park, were planted in a pot in July, 1832; two plants appeared above ground in February, 1833; fourteen in 1835, and two more in February 1836. It may, perhaps, be found that the process of ripening after the fruit has been removed from the parent, especially when buried in moist earth and at a less rapid pace, may account for the difference in time of germinating.

Another point on which more light is wanted is the vitality of seeds after being carried over long distances by winds. Of course, with Cryptogama the matter is easy enough, for we have in the wind an agency capable of distributing spores over long distances; but with phanerogamous plants difficulties arise. Berthelot, indeed, avers that after a violent hurricane he saw an annual belonging to the *Compositæ* (*Erigeron ambiguus*), widely distributed throughout the Mediterranean region, suddenly appear at various spots on the Canary Islands, where it was previously unknown. It is probable, therefore, that the seed had been blown across from Portugal or North Africa. How interesting would it be if we could place a mark on certain seeds, and casting them to the winds, find the identical ones in some spot hundreds of miles away from home! *The Adventures of a Seed*. What a sale such a book would have among botanists and biologists!

Darwin's experiments to determine the vitality of seeds in sea-water, the results of which were published in this Journal, do not seem to have been imitated by more recent investigators; but here surely is an interesting field for study. We may perhaps be allowed to quote one of the experiments. Darwin found that out of eighty-seven kinds of seeds, sixty-four germinated after an immersion of twenty-eight days, and a few survived an immersion of 137 days; and in another, that out of ninety-four dried plants, eighteen floated for above twenty-eight days. Combining the results of the two experiments, Darwin concluded that fourteen plants out of every 100 in the flora of a country might be floated by currents moving at the average rate of the several Atlantic currents, a distance of 924 miles, and might, on being stranded, furnish seeds capable of germinating.

While on the subject of the power of seeds to withstand the power of water, it may not be uninteresting to state that it is a well-known fact that the Coco-nut is one of the first plants to make its appearance on coral islands, and it is, according to Sir John Lubbock, the only Palm which is common to both hemispheres. The seeds of the Coco-nut are, of course, well protected against mishaps by the loose texture of their husks, and can float easily on the water. The seeds of the common Duckweed, again, lie dormant at the bottom of the water all through the long autumn and winter, but at the approach of spring they rise to the surface with unimpaired vitality, and germinate forthwith.

Some years ago the British Association took up the question of the vitality of seeds, and instituted a series of experiments, in which Professors Danby, Henslow, and Lindley took part. In the Report for 1857 we find a valuable summary of the results of the experiments from 1841 to 1857 inclusive. In the table showing the greatest ages at which the seeds experimented with germinated, we find that the seed of a species of *Colutea* belonging to the *Leguminosæ* germinated after forty-three years. This is the only plant mentioned in the list whose seed preserved its vitality for so long a time as forty-three years, though it would appear in general that the seeds of leguminous plants retain their vitality for a long time.

We are unaware that any experiments are being carried on at the present time on this interesting subject; certainly the British Association dropped the matter after the year 1857.

De Candolle in 1816, experimenting with seeds about 15 years old, obtained results which go to prove that the natural orders, *Malvaceæ* and *Leguminosæ* excel all the orders examined in the duration of the faculty of germination. Comparing these results with those obtained by the British Association investigations, we find that the longest period a species of *Malvaceæ* retained its vitality was 27

years. Beside the Leguminosae, the seeds of species of the following orders retained their vitality after a period of twenty years. Umbelliferae, Ranunculaceae, and Myrtaceae. Returning for a moment to the statements mentioned above, as to the powers of different seeds of resisting external influences, we find that cereal grains have been proved by Edwards and Colin to bear a short exposure of 122° F. in water, as well as a dry cold of 70° below the freezing point; while Hemingway, in a paper published in the *Ann. of Nat. Hist.*, 1st series, viii, 317, states that seeds of Elder germinated after being twice boiled in making wine, being present during the vinous fermentation, and remaining for twenty months in the dregs of the cask. *H. C. F.—Gardners' Chronicle*

TROPICAL AGRICULTURE IN NORTH BORNEO.

COFFEE—COCOA—COCONUTS—PEPPER—
GAMBIER & C.

It is always interesting to know what other people think about you, and especially so when the critic is a shrewd observer and a man of practical experience, and for these reasons what Mr. Strutt has to say about us is read with particular attention. It is very satisfactory to find him referring favourably to the growth of coffee, Manila hemp, cocoa, coconuts, sugar cane, cotton, pepper, gambier sago and arrowroot; the growth of these plants that is: as to whether their cultivation is likely to pay Mr. Strutt says there are two ways of judging (1) by the full knowledge of the future supply of other tropical countries and of the probable demand (2) by comparing the cost of production with other places where the particular plant is grown, but it may be better to divide these points under three heads 1 Possible competition, 2 Probable demand, 3 Cost of production as compared with other countries.

We will in the first place consider gambier. This product grows in Malaya only and as it is imperative that gambier gardens should be in large forests and with facilities for cheap transport, there are not many places left, even in Malaya where a conjunction of these two advantages exists. As to the probable demand, a reduction of the present London sale price would cause a large increase of consumption while as to comparative cost of production, we have tens of thousands of acres of the best forest covered gambier land permeated by rivers that facilitate its being put on board the export ship at a minimum of expense; one of the main items of its cost in the Straits is that the forests now have been felled so far inland that the gambier has to be carted over miles of roads, whereas here the carriage would all be by water which is of course much cheaper than the cheapest form of land carriage. The price of gambier was \$5.30 in 1885 \$6.50 in 1892 and \$9 now.

Next, as to sago, the prices of the last three years have caused practicable sago swamps generally to be drawn upon to about their limits of production. The price of pearl sago now is \$3.60 per pikul as against \$2.50 in 1884 and new uses for sago are constantly being discovered, no falling off in demand therefore need be apprehended, rather the reverse, while the production is limited to Malaya and its islands solely.

Manila hemp has been produced in those parts of the Philippines only that have a suitable climate, and nowhere else at all, and owing to the heavy taxes and other causes at work in those islands, the Philippines have very much to fear from our competition than we from theirs.

With regard to these three products therefore we may claim a portion of a monopoly of supply, while the demand is capable of enormous expansion at a reduced sterling price such as the fall in silver, plus the unusual facilities North Borneo has to offer, entails.

Tapioca though not referred to by Mr. Strutt is the next product we will mention. It can be grown in most tropical countries in the world and it is therefore under the third head, comparative cost of production, that North Borneo would be in a better position than elsewhere; in the West Indies where tapioca used to be largely made the cost of labour is much higher than with us while in the Straits from whence much tapioca was exported some few years ago, increase of population has taken for other purposes a lot of the land then used thereby causing, as in the case of gambier the cost of land transport to be so heavy that it would necessitate a considerable rise in price to make it pay, while in North Borneo the factory could be erected at the mouth of a river and the roots carried there by boat, and subsequently taken by lighter to the export ships side.

Much the same has to be said about sugar; the advantages that North Borneo has to offer for the cheap production of this product are so numerous and so great that it becomes a question whether even at the present phenomenally low price, sugar could not be produced at a profit; our cane flourishes with a vigor rarely equalled in any other country, its juice yields saccharine matter of a density in excess of that elsewhere, the labourers' wages are cheaper than in almost any other sugar country, much cheaper than in most of them, we cannot be beaten in our transport and shipping facilities, and there is an enormous market in Hongkong where one refinery alone puts through two hundred thousand tons of rough sugar annually. In Queensland last season the simple cutting of the cane and carriage to the mill cost as high as 5/6 a ton which is more than half the entire cost of cultivation, upkeep, cutting and transport to a well situated mill in the Sandakan district, would be.

As to coconuts though they can be grown in most tropical countries yet the actual land most suitable for them is circumscribed and the demand for them grows with the increase of population in the tropics and with the discovery of new uses for their products in Europe faster than fresh trees can be planted up. Singapore exported to Europe last year over Pels. 800,000 of copra. Coconuts are one of the best paying, steady and reliable plants to cultivate.

As to cotton, the demand for it in this part of the world may be said to be only beginning now, and yet Japan imported 153,000,000 lb. in the year 1893.

It will therefore be seen that with regard to Mr. Strutt's three points we have little to fear from the competition of other countries, that the demand for most of our possible products is steadily increasing, and that we are singularly well situated with regard to advantages for cheap production. It is rather other countries that have to fear us than we them.

As for the "sample" Mr. Strutt speaks of, the sample of sago North Borneo sent forward in 1893 was valued at over \$160,000 and this is only an earnest of what we could do with all the products we have mentioned if only their cultivation was once properly started.

Mr. Strutt speaks of crops that take two or three years to produce results, but cotton begins to bear at nine months of age, cane also takes the same length of time to mature, tapioca is an eleven or twelve month crop and gambier a fifteen or sixteen months one.

Mr. Strutt speaks reassuringly as to the health of the country, this is a much misunderstood question. North Borneo is freely acknowledged by those who should know best, its European inhabitants most of whom have had plenty of experience in other tropical countries, to be particularly healthy. It must not be forgotten that the class that has almost exclusively come under the cognizance of Europeans at a distance has been almost entirely employed on tobacco estates, and tobacco planting at the best is not a healthy occupation while under the conditions that prevailed on most of the estates when first started, it was simply deplorable; but all others in North Borneo, employers, natives and coolies alike are healthy enough, as witnesses the staff of Government Officials.

On the whole therefore we have to congratulate ourselves that we have been visited by so close an observer and one who while friendly is quite prepared to be critical as Mr. Strutt is, for the more keenly everything in connection with the country is looked into the better the facts will show.—*British North Borneo Herald*.

AUSTRALIAN HARDWOODS AND THEIR USES.

(Being the substance of a Paper, read at the Imperial Institute, by C. R. FENWICK, Esq., A.M.I.C.E., sometime Manager of the West Australian Land Company.)

In the forests of the Australasian Colonies, and especially in those of Victoria, New South Wales, West Australia, Queensland and Tasmania, there is a great variety of excellent timbers, which come under the designation "hardwoods," the chief of which are the iron barks, (*Eucalyptus siderophloia*, (*E. crebra*, *E. Sideroxyylon*, *E. paniculata*, and *E. vryata*), stringy barks (*E. obliqua* and *E. piperita*) blue gum (*E. globulus*), flooded gum (*E. saligna*), box (*E. hemiphloia*), black butt (*E. pilularis*), woolly butt (*E. longifolia*), black wood (*Acacia Melinoxyylon*), beech, banksia, the so-called myrtle, rose wood (*Dysoxylon fraserianum*), mountain ash (*onygdalina*), and two varieties of the Eucalyptus peculiar to West Australia, namely the Karri (*diversicolor*) and the Jarrah (*marginata*).

These timbers are applied to numerous purposes. The iron bark, black butt, and box, are extensively used in harbour-works and railway construction. Iron bark, however, has practically become scarce, as, although there are large areas of this timber in the interior of New South Wales and Queensland, most of the accessible timber has already been cut.

The question has been raised by the Governments of the above Colonies as to the policy of encouraging the export trade in timber, in view of its growing scarcity and of future local requirements.

As regards West Australia, however, no doubt can be entertained as to the superabundance of timber in that Colony; moreover, the climate there is more favourable to rapid growth than that of the Eastern Colonies.

Of the hardwoods of West Australia, *Karri* and *Jarrah* possess the most practically useful qualities, and at the same time, command facilities for transport and shipment, as these trees flourish in vast quantities in near proximity to the coast. They have been used extensively in railway construction, in harbour-works, and for bridges, roof-timbers, ship-building, etc. The opinions of many railway engineers may be quoted, testifying to the strength and durability of *Karri* timber, as well as to its superiority over Baltic pine for railway sleepers.

Among the smaller varieties of timber *Yate* (*Eucalyptus cornuta*) should be mentioned as a hard, dense wood, somewhat similar to lancewood, adapted for wheel-spokes and carriage-shafts. Its cost, in the Thames, should be from £9 to £10 per load.

The *Jamwood* tree (*Acacia acuminata*) is close-grained and hard, takes a high polish, and merits the notice of cabinet-makers. The *she-oak* (*Casuarina*) is also worthy of mention as being useful for lighter work, such as panels, wheel-spokes and tool-handles.

The question as to the paving material best adapted to the heavy street traffic of our large towns is one of very great importance, and opportunities have been taken for testing the adaptability of the Australian hardwoods for street-paving purposes. Many of these have been tried, but *Karri* and *Jarrah* assert for themselves a marked individuality; they have been laid in many parts of London and in other towns, and with them the nearest approach to the perfection of street-paving has been attained, the difference between the wear of *Jarrah* and of *Karri* having proved to be inconsiderable. Both preserve an excellent surface under heavy traffic, and they have out-worn soft wood laid near them to a remarkable degree. A pavement of *karri* blocks, laid in the City of London, on a gradient of 1 in

27, has remained dry and not slippery, while the adjoining soft wood pavement, which retains more moisture, was slippery and dangerous.

The Surveyors to the Vestries of St. Pancras and Chelsea, in which districts hardwood pavements have been laid, are of opinion that it is economical to use these blocks for street-paving where there is heavy traffic.

Investigations made by Mr. Thos. Luslett, Inspector of Timber for the Admiralty, into the relative merits of some of the best known timbers, show that Australian hardwoods, when under tensile, transverse and crushing strains, take high rank as compared with British oak, greenheart, teak and red pine. Thus, among seven timbers, *Karri* stands fourth under the heading of tensile strain, and second under crushing strain, and ranks next to greenheart. Under crushing strain the resultant figures are *Karri*, 5.13 tons; English oak, 3.41 tons; *Jarrah*, 3.19 tons per square inch, and blue gum, 3.07 tons. It is to the high resistance to crushing strain that *Karri* chiefly owes its superiority as a paving material. The hardwood pavings preserve a more even surface than those of any other woods, hence they are much more durable. Those of *Jarrah* and *Karri* having lasted at least three or four times as long as soft wood pavements, the cost of relaying and the consequent serious interference with traffic and public convenience are, therefore, very greatly reduced by the employment of those woods.

All hardwood paving should be laid with close joints. A better and more even surface is preserved with closely laid bitumen-jointed blocks, and the objection that space is afforded by wood pavement for the accumulation of foreign matter, is thus reduced to a minimum. One square yard takes 46 blocks, closely laid. The price on railway trucks, in London, for most of the Australian hardwoods is about £6 per load, for large scantling and piles about £7 10s. per load. (A load, 50 cubic feet, weighs about 1½ tons, or 1¼ tons ship's measurement, and contains 800 blocks 9 ins. by 3 ins. by 4 ins.)

A word of advice may be given to the producer; it is, that more care must be exercised than at present in the selection, cutting, and seasoning of timber intended for the European market. Complaints have been made of samples, that they have been shipped when green, and therefore unfit to stand the ordeal of a voyage through the tropics, the result having been their condemnation at sight. A bad impression, thus created, is not easily overcome.—*Imperial Institute Journal*.

THE CULTIVATION OF COFFEE IN MAURITIUS.

He who would advocate the culture of coffee in Mauritius would probably be looked upon by those who consider themselves to be in the know as a fit subject for Beau Bassin Lunatic Asylum. Yet, on a close examination of the subject, it will be found that the reasons which can be given why the cultivation should not be a success are but few.

We admit of two, and those probably powerful ones, namely, leaf disease (*Hemilia vastatrix*) and the havoc that hurricanes might produce.

Although coffee was formerly, to a very limited extent, grown in Mauritius, it was never cultivated; that is to say, it never received that care and treatment which is usually accorded to the plant when grown as an article of commerce. It was left in a wild state: topping, handling, and pruning, if ever heard of, never being carried into practice; in fact it was left in that state which is generally known as Native Coffee.

There is no doubt whatever, that leaf disease does still exist in Mauritius on the few remaining trees that are occasionally to be met with, and, in any experiment that may be made to promote the industry, there are a brought under cultivation would certainly be, more or less, attacked by it. But it must be remembered that in Southern India and Ceylon, where the disease was most virulent, it took many years before the tree was rendered too weak to

respond to the efforts of nature to throw out new wood or to mature the crops; and, further, that before this happened, large returns had been obtained from the Estates.

In certain localities, although affected by disease, coffee is still being successfully cultivated in Ceylon, and many planters, afraid that Tea is being over-produced, are returning to their old love.

The supposition is, that even though the trees may eventually succumb to the effects of the disease, a sufficient number of remunerative crops can be obtained to justify the initiatory expenditure.

Unfortunately, there is very little virgin forest left in Mauritius, so that the culture would here be handicapped in respect to soil, from the commencement; but, on the principle, "nothing venture, nothing win," we see no reason why, at suitable elevations, small areas should not be put under coffee on land which has been cropped with sugar cane. The cost would be very small compared with that which has to be incurred when opening up primeval forests in new districts, where the timber has to be felled and cleared away, where bungalows, cooly-lines, stores &c., have to be built and roads and drains have to be made. On very many Sugar Estates all these are already provided. The formation of nurseries, and subsequent living, holing planting, and periodical weeding, comprise the whole of the absolutely necessary expenditure, until the trees come into bearing.

We are not prepared to say positively, that land which has already been under sugar cane is suitable for coffee cultivation, but we consider the experiment is worth a trial; for if only four cwts per acre be obtained, the return would far exceed, acre for acre, any that has ever been in the past or ever will be in the future, derived from the growing of sugar cane.

How the coffee would be affected by hurricanes is entirely speculative.

Fortunately visitations such as that of 1892 are few and far between and frequently many years elapse without Mauritius experiencing a stronger blow than is annually felt in some of the Coffee districts of Ceylon. There are at certain seasons of the year, the air has been known to be thick with leaves torn off the trees by the wind, yet, the crop suffered but little. In such exposed places, the trees were topped low, from 2 feet to 3 feet, and the plants, when young, were carefully staked. Were this to be done in Mauritius, and wind-belts judiciously planted, there is no reason why the ordinary hurricanes that visit the island should have any more effect upon the coffee, than have the strong winds which prevail in other countries where the bean is grown.

We invite those of our readers and their friends, who are sceptical about the growth of *Coffea Arabica* in Mauritius, to visit the Experimental Tea Garden at Curepipe, where a small clearing of this species may be seen in a perfect state of health and vigour.—*Mauritius Planters' Gazette*.

AGRICULTURE IN BRITISH HONDURAS.

In continuation of previous information on this subject (*Kew Bulletin*, 1894, p. 97), the following extract is taken from the Annual Report for 1893 (*Colonial Reports*, Annual, No. 116, 1894) on the agricultural resources of British Honduras. It is noticed by the Governor that a valuable impetus has been given to the cultivation of fruit for export by the organisation of a new steamship company by local capitalists. Already, owing to this cause, increased applications have been made for the purchase or lease of Crown lands, and better facilities are afforded for the disposal of agricultural produce:—

The principal products of the Colony, in addition to mahogany and logwood, are sugar, rum, Indian corn, bananas, coconuts, and plantains, and, according to the returns supplied, the quantity produced during 1893, and in the case of bananas, coconuts, and plantains, the quantity exported for the same

period, are as follows: sugar, 1,490,920 lb.; rum, 57,178 galls.; Indian corn or maize, 47,607 bushels; bananas, 189,420 bunches; coconuts, 1,177,315; plantains, 506,400 fruits. The returns for sugar, rum, and Indian corn cannot, however, be considered as strictly accurate, and probably are very much below the actual quantity produced.

Under bananas, coconuts, and plantains only the quantity exported has been given, as no reliable figures could be obtained as to the quantity grown. In endeavouring therefore, to arrive at an approximate estimate of the bunches of bananas and the number of coconuts and plantains annually produced in the Colony, a reasonable allowance must be made for home consumption by a population of nearly 33,000 souls. There is a very considerable decrease in the quantity of bananas, coconuts, and plantains exported in 1893 as compared with the four previous years, but this decrease is almost entirely attributable to the disastrous effects of the gale of the 6th of July, which wrecked or very seriously damaged nearly all the plantations in the southern districts of Stann Creek and Toledo. Considering the geographical position of British Honduras, the fertility of its soil, and the general salubrity of its climate, it is surprising that the number of its agricultural products as articles of commerce is not greater than it is. By the establishment, through the efforts of his Excellency Sir Alfred Moloney, K.C.M.G., in 1892, of a Botanic Station at Belize attached to the grounds of Government House, an attempt has been made to create a nursery for the cultivation of plants of economic value of all kinds. But the condition of the soil in Belize and the proximity of the station to the sea have proved the present site to be not altogether suited for its purpose, and it is hoped to shortly transfer the Botanic Station to the Stann Creek district, where a site of some 75 acres, admirably adapted for its purpose, has been generously placed at the disposal of the Government by the board of directors of the British Honduras Syndicate. Even at Belize the Botanic Station has proved of value, for, from the experiments made there, and from experience gained of the resources and capabilities of the Colony, it seems clear that the following products, addition to those which have already proved successful, can be grown with advantage and with profit to agriculturists; cacao, castor-oil plants, coffee (*liberica* for the lowlands, *arabica* for the highlands), rubber (*Castilloa elastica*), *Cola acuminata*, cotton, grape-fruit, ground nut, henquen, jute lemon, lime, nutmeg, pine-apple, pimento sapodilla, shaddock, tobacco, and vanilla. In addition to the above the following kitchen-garden products, as they are generally termed, can be readily cultivated: artichoke (Jerusalem), asparagus, beans of various kinds, cabbage, carrot, cauliflower, celery, corn, cucumber, edible gourds, Indian kale, lettuce, melon, mint, ochro, parsley, potato (Irish and sweet), peas, spinach, and tomatoes.

Bearing in view the short-sighted policy of depending on logwood and mahogany as the staples for the Colony's trade, it is to be hoped that the oft-repeated exhortation of his Excellency the Governor that the future of British Honduras must depend on its agricultural development will be borne in mind, and that in time this Colony will become what it is eminently fitted by its climate and fertility to be, the garden of Central America.—*Kew Bulletin*.

PEPPER-RAISING IN CAMBODIA.

The pepper plant, says M. Adhemard Leclere, in the *Revue Scientifique*, is not a bush, as some writers say, but a vine, which has to be supported by a tree when wild, and by a strong stake when cultivated. The author has seen the vines growing nearly wild near Chandoc in Cambodia, where they had been planted by the villagers and left to themselves. They grew vigorously and to a considerable length, but bore only a few bunches of fruit, and that of an inferior quality. An abundant crop of good Pepper can be obtained only by careful and skilful cultivation. The industry thrives in the province of Kampot,

where it is pursued in some twenty villages. At the village of Suam Ampil there are eighty-nine planters, and more than a hundred plantations, containing 48,441 stocks. The plants are propagated from cuttings, which are made about eighteen inches long, and are taken from stocks two or three years old. They are supported by stakes about ten feet high, which are solidly planted in the ground; and are fertilised at the season every year with a special manure, which is composed of eight parts of good soil and one part of pounded shrimp shells. The plants are liable to attack by a minute parasite that destroys their fruitfulness, to obviate which they are treated with a decoction of tobacco. The first crop, but an insignificant one, appears in the third year from planting. A crop of about a kilogramme per stake of two plants is gathered in the fourth year, and the increase continues for eight or ten years. Exceptional plants in good soil may return four kilogrammes per stake; but a crop of from two to two and a half kilogrammes is considered a fair average. Some plants will live fifty years, but they are seldom remunerative after forty years, and, as a rule, a plant thirty-five years old is considered of no further value. The plants bloom in May and June, and the gathering of the crop begins in February. The bunches which have turned red are picked and the others are left for future visitations. The berries are stripped from the bunches and dried in the sun till they are black, when they are packed and made ready for sale. White or grey Pepper is produced by letting the berries get a little riper, and cleansing them from their outside envelopes. In some districts the removal is assisted by soaking the berries in sea-water. One labourer can usually take care of about one thousand stakes.—*The Indian Agriculturist.*

PEACH CULTURE IN THE SIMLA DISTRICT.

We have received from Mr. W. Coldstream, C.S., Superintendent of Hill States, Simla, Tract No. 8, on the advantages of cultivating peaches. Considering that three persons, if not four, were associated in its production we are somewhat disappointed by this meagre pamphlet of six pages, even though we see that it is printed and published for the edification of local zemindars. After describing the advantages of having trees planted round houses, the conclusion is arrived at that the *peach* is the best tree to plant as "it grows rapidly—comes to maturity, or fruit-bearing—in three or four years—is most easily cultivated from the seed and is usually very prolific." We are then told that "in very rich soil trees six years old have yielded one thousand peaches each in a single crop," and here at the outset we find ourselves obliged to protest. Any one who has ever tried it, even on poor soil, knows that one can get lots of peaches, but that to get good peaches, not the rubbishy bitter little hard green peaches of the villages, you must obtain the best kinds, must cut off about three-quarters of the fruit when set, must prime carefully and manure heavily, and these are just what the villagers will not do. No doubt, on the outskirts of hill villages, manure of a sort!—is plentiful, only too plentiful, but who ever heard of a native fruit-grower cutting off any of the young fruit to improve the rest, any more than he heard of a native gardener who would of his own accord gather his peas before they were as hard as bullets, or his turnips until they were more fit to give rope-fibre than food?

No doubt, peaches, if only some attempt is made to get good ones, are good things to grow, and even when hard and bitter they make good stew; but there are other fruits as good, such as apricots, Bokhara plums, and, above all, apples. It seems to us that there is no want of fruit trees generally in the North-west Hills, but that what is wanted is improved cultivation and consequent improved quality. Hints on these important matters are unfortunately absent from Mr. Parson's 'directions for sowing and rearing' which we need hardly reproduce, as they contain nothing but what any Forest officers must have known long ago.

We take the greatest interest in the work with which officers like Sir Edward Buck and Mr. Goldstream have identified themselves, but we hope that in future Tracts of the kind, Mr. Coldstream will impress upon his ranas and zemindars the advantages of improvement in quality as much as those of increased number of trees.—*Indian Forester.*

AGRICULTURAL INDUSTRIES—OLD AND NEW—IN MAURITIUS.

In previous issues of our paper, we have commented on Agricultural Industries that we think might be successfully cultivated on a large scale in Mauritius, such as Ramie fibre, Coffee, Tea, &c. We now purpose, briefly, to treat on minor ones, which with proper attention should prove equally if not more, lucrative, acre for acre.

Vanilla.—We hesitate to touch on the subject of Vanilla culture, seeing that Mauritius has for many years held its own in the London and Continental markets against the produce of other countries, and that, in the cultivation of the plant and preparation of the bean, Mauritius planters have never been excelled. This being the case, we would eschew any attempt at giving instruction to a maternal grandparent, and content ourselves by saying that, disappointing as the cultivation of the vine has been of late years disheartening as it is to see plantation after plantation succumb to a disease which has hitherto baffled all attempts at eradication and elucidation, both by experienced planters and scientific men, by selecting either virgin forest or wellgrown coppice, and by planting on live wood which has been freed from excessive shade, vanilla can still be grown to give a handsome profit on the small expenditure this mode of cultivation would entail.

Cacao.—Experience shews that in some parts of Mauritius the soil is well adapted to this culture. The few trees that are to be found in the country are strong, healthy specimens, and they crop freely. It is a tree that should be planted only at low elevations—not more than 500 feet above sea level—and in deep, rich soil; it requires a well distributed rainfall and should be sheltered from the effects of wind as much as possible. The specimens that there are in Mauritius suffered severely from the hurricane of 1892, but the recuperative powers of the tree are great, and in twelve months after that calamity, those referred to were laden with fruit. The cultivation is very simple, and the preparation consists in removing the seed from the ripe pod and drying it sufficiently for transport to European markets.

Banana.—The development of this industry is sadly behindhand; a surprising fact, considering how freely the tree grows, and the quantity of land there is available for its cultivation. The varieties appear to be but few; whether this be the case or not, it is seldom that any but the poorer sorts are offered for sale. No effort appears to be made to cultivate the fruit systematically; stools are stuck into the ground anyhow, the tree is allowed to grow without any attention being paid to it, and when, or before, the fruit is *pleine* it is cut down and sent to market. In countries where the banana is cultivated for export, the land is thoroughly prepared, laid out in squares and properly drained, irrigation being resorted to when necessary, where water is available. That considerable care is given to its culture is not surprising as steamers of 1000 tons and upwards are often fully freighted with bunches of bananas collected in Fiji and the adjacent islands; these find a ready sale in the Australian capitals. An acre or two of land, near a railway station, cultivated on systematic principles, would not only keep the wolf from the door, but enable its owner to live in comparative luxury. Apart from its value as a dessert fruit, it has a marketable value in the shape of flour. Not long since a sample of flour prepared from the Moko plantain was sent to London, for which six pence per lb was offered. A 15 lb bunch will yield 3 lb of prepared meal, which at 6d per lb = one shilling

and six pence per bunch. A piece of land, one hundred and twenty square yards in extent, is said to be capable of yielding four thousand pounds of fruit annually. Should this be the case, at the above price, the returns per acre would be almost fabulous. This is a minor cultivation which should commend itself to the attention of small capitalists.

There are other cultures to which we hope to draw the attention of our readers in a future issue. *Mauritius Planters' Gazette.*

SPRAYING FRUIT TREES.

It is generally understood by orchardists having British experience that quassia chips are largely used in preparing liquid for syringing fruit trees. A recent issue of the *Gardeners' Chronicle* contains a series of recommendations by the Board of Agriculture for preparing such liquid. 1. The extract of 7lb. of quassia, obtained by boiling quassia in water, to 100 gallons of water with 5lb. of soft soap. 2. The extract of 5lb. of quassia to 100 gallons of water, with 5lb. of soft soap and five pints of paraffin (kerosene) well stirred. 3. Extract of 4lb. of quassia to 100 gallons of water with 4lb. of soft soap and four pints of Calvert's carbolic acid, No. 5. 4. Six pounds of soft soap and 2 lb. of finely-ground bicarbonate and a quart of kerosene, boiled and well stirred together. This is sufficient for 100 gallons of water.

The soft soap is dissolved in a tub with hot water. The quassia chips are boiled in water and put into another tub. Where paraffin is used it should be well stirred up with boiling soap and water before it is mixed with the cold water. Water-carts or ordinary barrels or wine casks set upon frames with wheels should be brought full of water to where the materials are being prepared, either at the farm buildings or in an extemporised shed with a copper in it, and the requisite amount of dissolved soap and other ingredients added. Knapsack and other hand machines can be used for small apple trees, plum and damson trees, and for filbert and cob-nut trees.

It is important that syringing should be commenced early in the spring. Directly there are signs of infestation the process should be begun. As the hatching out of caterpillars is not simultaneous, but is extended over some days, the syringings must be renewed if necessary.

Some fruitgrowers in several parts of the country have tried the cheap arsenical insecticides used extensively in the United States and Canada. These have not yet been generally adopted in Great Britain on account of their intensely poisonous properties, although from experiments made with them they have been proved to be most effective there.—*Australasian.*

THE KADAMBA TREE.

This tree is indigenous to Ceylon, and is known among botanists as *Anthrocephalus Cadamba* (the Kadamba of the Tamils). It has an erect stem with many branches; the flowers, which have a peculiar sweet smell, forming a small globe. The fruit is about the size of an orange: this is eaten by the poor natives in India, while the leaves are given to cattle as fodder. The bark is considered to be of great value as a febrifuge and tonic; its taste is bitter and astringent. The fresh juice of the bark is applied to the fontanelles of children when that soft portion of the head sinks; at the same time a small quantity mixed with cumin and sugar is given internally. The juice of the bark mixed with an equal quantity of lime juice, opium, and alum has been applied with great benefit round the orbit of the eye to subdue inflammation. The tender leaves, when applied in the form of a paste, resolve glandular swellings, and the large leaves prove an efficacious remedy for eczema. A decoction of the leaves is used as a gargle in cases of aphthæ and stomatitis. The fruit is considered to be cooling, a destroyer of phlegm and impurities of the blood. The wood of the Kadamba tree is of great economic import-

ance, is soft, yellow-coloured, and even-grained, weighing about 40 lb. per cubic foot. It is used for building purposes in Assam, and may be used as material for beams and rafters, being also good for joiner's work. In Calcutta it is one-third as cheap as mango wood. Kadamba trees grow wild throughout India, and are principally used for fuel. The closely allied *Manjal-Kadamba*, the *kolon* of the Sinhalese (*Adina Cordifolia*), and Nir-Kadamba or Chelemba, the Helamba of the Sinhalese *Stephegyne parvifolia*, are sometimes used by carpenters in Ceylon. The wood of the former is extremely fine and like that of the box tree being light and durable, though it does not stand damp well; it is used in Bombay for planting for the floors of houses. The former, which is of a light chestnut colour, fine and close-grained, has also been used for flooring-planks, packing boxes, and similar purposes.—*Indian Agriculturist.*

VARIOUS PLANTING NOTES.

ANTHRACITE COAL & SOOT AS A MANURE.—Will you allow me to ask your readers' opinions as to the value of small anthracite coal instead of soot for agricultural use. I am in a position to get quantities of anthracite "duff," i.e., coal not much coarser than sand, at a very small cost; and as it contains over 90 per cent. of carbon, it has occurred to me that I might use it as a substitute for soot. There will, of course, be many of your readers who will be able to advise me on this matter. G.S.H.—*Gardeners' Chronicle.*

BIG ORCHARD.—The largest orchard in the world is said to be that belonging to Elwood Cooper, of Barbara, California. It is a tract of 1700 acres, and contains 10,000 Olive trees, 8,100 in full bearing, the remainder being young trees set out during the past year and a half. Besides the Olive trees there are 3000 English Walnut trees, 4,500 Japanese Persimmon trees, 10,000 Almond trees, and about 4000 other fruit and nut trees. The 10,000 Olive trees yielded 40,000 quart bottles of olive oil last year, which found a ready market at 4s a bottle. The nut trees bore thousands of bushels of nuts, to say nothing of the Japanese Persimmons. Taken in all, it has been calculated that Mr. Cooper's orchard brings him in an income of not less than 750 dol. per acre every year. *The People.*—*Ibid.*

AGRICULTURAL EDUCATION IN ABERDEEN UNIVERSITY.—Rev. Dr. Smith, Newhills, Aberdeenshire, convener of the Committee on Education in Agriculture of the Aberdeen University Court, has issued a circular on the subject to County Councils. He points out that the Ordinance of the Scottish Universities Commission, which is expected to receive the Royal assent, and so become law in the course of a few weeks from this date, lays down a systematic course of study for the B.Sc. degree in Agriculture, extending over not less than three academical years, and embracing, in addition such residence and practical work at a farm as shall be required, at least twelve courses of instruction in the following subjects, viz.:—1, Mathematics or biology (i.e., zoology and botany); 2, Natural Philosophy; 3, Chemistry; 4, Principles of Agriculture (i.e., Agriculture and Rural Economy); 5, Agricultural Chemistry; 6, Geology; 7, Veterinary hygiene; 8, Agricultural Botany; 9, Agricultural entomology; 10, Economic Science as applied to Agriculture; 11, A course in one of the following—(a) Forestry, (b) experimental physics, (c) engineering; 12, Engineering field work. The above enumeration of subjects presents an adequate field out of which to construct various useful curricula of study, and it will be the duty of the University Court, when matters are more advanced, and when the views of the County Councils have been ascertained, to organise such courses so as to suit the agricultural needs of the northern province. A conference of public bodies interested will take place in Aberdeen University Buildings on July 12 next.—*Ibid.*

TEA PLANTERS AND COOLIES:
THE CEYLON SYSTEM OF "ADVANCES" AND
"TUNDUS."

We publish no less than five letters elsewhere on the subject of the relations between planters and coolies and the evils attendant on the system of heavy "advances" and "tundus." There is a remarkable diversity of opinion on some points; but all the writers—and indeed all who have joined in the discussion during the past month—are agreed in their condemnation of the extent to which advances and the giving-out of "tundus" has been carried. In the first place, as to the actual scarcity of labour, taking the plantation districts as a whole, we have the same difference of opinion now that has distinguished the correspondence from the beginning. We had the support of the Chairman of the Planters' Association in saying that in some, if not many districts, there were enough of coolies for the work in hand, while the day was fast approaching when, probably, "short-time" would again become the rule through too much labour. An old friend and planter, however, calls us to task to-day for hinting at a sufficiency of coolies—he does not know an estate that has been even fairly supplied since November last. But lower down in the same column, another "Old Planter"—writing on the same day—says:—"I don't think there is any scarcity of labour in the island; quite the contrary." However, such diversity of observation and experience does not really matter so much now; for, we are, confessedly, on the border of the slack time of the year for flush, and the season when the flow of coolies sets in to the island rather than from it. A practical question arising out of recent experience is, how, next year, to try and prevent so large a home-going of coolies in what are the busiest months for flush with many of the planters, namely March-June; and to transfer this ebb of the tide to the slack months? We suspect the answer of the coolies will be in many cases,—how can we go travelling with our women and children in the wet monsoon season? A difficulty this, which might certainly be blotted out by *through Railway communication.*

We now turn to the Advance and Tundu system; and we really think that the discussion is ripening for practical action by the Committee of the Planters' Association. One writer, it is true, says it is no use of the Association passing Regulations, for no one will keep them. But on this line of argument, we might as well be told, there is no use in having District Associations or a Parent Institution at all. We gather from the present and previous correspondence that a large majority of the planting community agree with us that no kangani and coolies going about the country seeking a new employer, should be taken on, unless they can show a satisfactory letter of all being clear with their last employer; and, further, that if such a regulation were generally in force, much of the difficulty about recovering advances would be overcome. If these two propositions are admitted, it surely ought to be possible for the Parent Committee to call on each District body to consider and advise on the wisdom of formulating and promulgating such a Rule as we have named and to take the signatures of the employers in every district who are prepared to abide by it when once it has passed a General Meeting of the Planters' Association. The penalty of a breach after that date should, of course, be that the offender be

sent to—Jericho! And although public opinion is not strong nor united in some districts, we scarcely think that many would care to incur the risk of being regarded as outside the pale and of having their names returned to the Kandy Committee. The difficulty about giving up "tundus" altogether and forthwith, as suggested by "Agricola" is well-shown by "37 years in the country," namely, that a refusal is met by a proctor's letter, "a case in Court," and the loss of all advances through the recalcitrant Superintendent being referred to "a civil case" against his triumphant kangani. We cannot see how this obstacle in the way of abolishing "tundus" is to be got over, unless "J.A.R.'s" practical suggestion of a heavy stamp duty at the outset on every tundu would act as a deterrent?

We are less inclined to call on Government to interfere with the rate of interest—always a ticklish matter—but certainly, coolly and kangani debtors to Chetty and other usurers deserve protection quite as much as the ryots in India, to the extent that the interest claimed should never aggregate more than the principal.—In conclusion, we think it quite time that a Sub-Committee of the Association be named to take the whole subject into consideration and to prepare a circular to be sent to every District Association as well as to the principal Agency Houses if not the Chamber of Commerce, on the lines already indicated.

THE NEED FOR HORTICULTURAL
SHOWS IN CEYLON.

(From a Planter.)

From the *Observer* just to hand I find Ceylon is quite famous now-a-days for its varied and numerous festivities, and I trust, Horticultural exhibitions and Flower Shows may be added to the festal programme. Pity it is that the minor industries of Ceylon are not sufficiently encouraged, by occasional Exhibitions, and well supported, and surely if delicate basket work, tortoise shell work, and lace work, were taught at the Orphanages and public Girls' Schools, they would attract visitors and purchasers. A Horticultural and Industrial Exhibition is a quiet but very interesting display, and must not be forgotten in these days of public festivals.

TEA IN THE UPPER CHINDWIN.

The following is the report of Mr. C. W. A. Bruce, Assistant Conservator of Forests, on the tea industry of the Upper Chindwin:—

The following is a list of the villages of the Upper Chindwin which export tea-seeds, the inhabitants of all being Shans:—Kaungkan, Tingin, Kawya, Maungkan, Tason, Onbet, Mainwe, Tawanthe, Malin.

Tradition says that these *kins* (clearings) were cleared and planted some 200 years ago, the seed having been brought from Palaung (Northern Shan States.) No one has ever heard of wild tea in the jungle; the gardens were originally planted for the sake of the leaves, that is, to make lotpet, the so-called pickled tea of Burma. However, some 20 years ago there arose a demand for the seed, at first intermittent, but since British occupation steady, and this has now become the main source of income to the owners, though the pickled tea is still collected and made as of old.

The first thing to be done in planting a *lotpetkin* is to find the right kind of soil, what is known as *myeni*, literally red earth. In this soil the tea-tree flourishing to perfection, the look of this earth is very characteristic, being a light red

or buff-coloured friable loam, which occurs in patches, and wherever these patches of red earth are found on the banks of the Chindwin there villages have been built and tea planted. The jungle being cleared of all brushwood and undergrowth, 3 or 4 seeds are dibbled into holes, the holes being either 2 or 4 cubits apart. The object of dibbling in more than one seed is to guard against blanks; however, all the seeds that germinate are allowed to grow. After the plants come up all the tending the gardens receive is periodical clearing of grass, small plants, weeds, and brushwood; the ground is never hoed nor the plants pruned, except when the ravages of a parasite known as *Chibaung* have become so extensive as to kill the portions above ground, the dead tops are then hacked down with the ordinary Burmese *dama*, the plant at once throwing up stool shoots or root-suckers which in three years take the place of the old cut down plant. The small plants become large enough to give a crop of leaves in 3 years if the *kin* is kept free of jungle, but not till 5 years if the garden is dirty. Seed is borne when the plants are 8 years old, but they do not come into full bearing till 15 years of age, the normal existence of a tree being 40 to 50 years if not attacked by the parasite mentioned above. Some trees last longer than this, but old trees do not bear such good crops of seeds or leaves as middle-aged ones, being usually stag-headed, and are generally cut down, their places being taken by vigorous shoots thrown up by the stools, some stools as large as 3 feet in girth being seen. A light shade is beneficial to the plants and lessens the labour of keeping the gardens clean, as the shade kills out the rank grasses, such as *thekke* &c., which spring up if there is no shade. Heavy rains are not good for the seed-crop, as the seeds drop off without ripening; however, if the seed-crop is poor the leaf-crop is usually good and *vice versa*.

Each house owns from one to three *kins*, the various properties being bound by rough cactus hedges.

As already stated there are two kinds of crops—the leaf-crop and the seed-crop. (a) *The leaf-crop.* The trees flush three times a year in—(1) Tagu to Kason (April—May); (2) Wazo to Waganug (July—August); and (3) Tawthalin to Thadingyut (September—October). Of these three flushes the first gives the best leaf and brings the highest prices. The method of plucking is to pluck the whole shoot except one leaf which is left. Thus if there are three leaves in a shoot the shoot is nipped off just below the second leaf. Each owner then takes his crop of leaves and throws it into an iron cauldron full of boiling water; it is left in this water till the leaves turn a yellow colour; the water is then thrown away and the leaves rolled by hand on mats; it is then ready to be sold to traders, who take it away either packed in bamboo crates or in the internode of the *myetsangye* bamboos (*D. Hamiltonii*). If one wanted to keep this tea it must either be kept buried in the ground or the crates and bamboos must be kept in water. Kawya village which has the largest extent of *kins*, makes on the average 20,000 viss of *letpet* annually. The price at the village for the produce of the first flush is usually R16 per 100 viss, for the other and later flushes R12-8-0 per 100 viss.

The seed-crop ripens in October and November; it is then collected, dried in the sun, and sold to Burmese traders, who come up for it. The trader shoots the seed into the bottom of his boat, the bottom being roughly lined with mats, and then takes it down to Ketha or Tonhe, where he sells it to the native agents of "tea-seed chiefs."

The price of the tea seed on the garden varies from R3 to R10 per basket, but to understand the method of buying the seed one must bear in mind that the trader, always a Burman comes up in January or February to bargain for the seed crop of the following November. If possible, the trader makes a contract that the owner will sell him all the produce of the garden for a fixed sum per basket. Thus in January 1894 the Manngkan villagers contracted to sell all their seed at R5 a basket. The trader then advances on the condition that, if the villagers cannot pay him back in tea-seed, they must pay him 100 per cent. on his money. If the trader cannot get a con-

tract for the whole crop he always manages to make advances for a certain proportion of the crop on the same condition. Thus this year all the villagers of Kawya have had advances on the condition that they pay back next November (in seed), each basket to be counted as R3. Any left after the villagers have paid back their advances usually brings double the contract price. The trader then hires boats and takes the seed to Ketha or Tonhe, the rate of boat hire being from 2 annas to 4 annas per basket, according to distance, at Ketha. He will sell to agents of the tea planter for an average of R17 per maung (a maung=1 basket 10 pyis or 26 pyis). This is practically the end of the business as far as Burma is concerned, as from here it is carried by Chin or Manipuri coolies in baskets, Scotch fish-wife fashion, to Manipur. No tax is collected or any transit dues exacted anywhere along the route. The Chins are said to carry a load of one basket and a quarter, the average weight of one basket being 14 viss, and get R5 to R6 for the journey.

It will be seen that as in most trades the middlemen are the best off and absorb most of the profit. The Burman trader makes, even if he does not go in for the advance system, over cent per cent, and of course his profits are doubled if he does. The Thaugdut Sawbwa has, I am told, petitioned the Government to be allowed to levy transit dues on the tea-seed passing through his State, though on what he bases his claim to the right, I fail to see. No Thaugdut coolies or men in any way are interested in the trade, the development of which is solely due to the Bengalis and Burmans. The Sawbwa's clerk Maung Kyauk Lon, alleges that the Sawbwa used to collect 6 annas per basket in Burmese times; this statement is false, according to every other person I have questioned. The only transit tax the Sawbwa has ever levied was one on boats and rafts passing Thaugdut town; this has of course now been long discontinued and had never anything whatever to do with the tea-seed trade. I believe Messrs. The Bombo Burma Trading Company are experimenting as to the feasibility of sending seed to Assam and Calcutta; of course if they succeed that will settle all matters of transit dues both for Thaugdut and Manipur. I see no reason why the Bombay Burma should not succeed as no care to prevent shaking, the effects of damp or of heat, is taken, any way prior to the seed reaching Manipur, by the present method which seems to be as unscientific as possible, and yet the tea-seed has, as is well-known, a first class reputation in Assam for germinating properties. The tea-seed experimented with, however, I would recommend being bought at any cost in November; the best way, of course, would be to advance money on the following season's crop, this system being the custom; or else only the leavings and old seed which has been lying about can be got, which naturally would not have the same germinating power as fresh ripe seed.

From what I saw of the gardens they were wonderfully healthy considering the little care taken with them, as, with the exception of the parasite referred to, the tress all seemed clean, vigorous, and full of leaf. I should say tea-planting with European methods would be a great success if only the labour question could be successfully dealt with. That once settled, all a planter who proposed planting in the Chindwin would have to do would be to prospect for red earth, and from my own experience of the forest I am sure I have come across several tracts of similar earth to that on which the tea is grown. I enclose a specimen of the tea parasite.—*M Mail.*

COFFEE, TEA, COCONUTS, &c. IN SELANGOR.

Coffee is the staple product of all estates in the district excepting the properties of Messrs. T. D. Hill, M. Lister, W. W. Bailey, none of these estates are more than six years old. "Batu," "Uganda," and "Setapakdale," together with portions of "Lincoln," "Hawthornden" and "Klang Gates" Estates, to the amount of 2,500 acres (approximately), have been granted only within the past two years.

It is probable that the best planting land is to be found in the Kuala districts. It is more than probable that the Ulu districts contain a greater proportion of land generally suitable for planting purposes. I venture to urge, as I have done before, the necessity of speedily determining, however roughly, what lands must be reserved on account of their metalliferous value and what may be regarded as immediately alienable to agriculturists. All lands in the State are liable to resumption for mining purposes. No great harm is therefore done if stamiferous deposits are found to underlie planted land.

Pepper cannot be grown at any considerable rate of profit at present. It is, however, to be found in a few native gardens, and may be seen to better advantage on Weld's Hill and Batu Caves Estates.

Gambier and tapioca do not obtain in the district.

Coconuts are of course grown in all parts of the district, but are used only as articles of consumption. The largest portion of land applied to their exclusive cultivation in the district is on the Ampang Road, 60 acres in extent, the property of Kok Kang Keas, widow of the late Captain Chiu, Yap Ah Loy.

There are a few fine specimens of the toddy palm (Kitul) on the Weld's Hill Estate.

Nutmegs are to be planted between coffee trees on a portion of Kent Estate. They are a lucrative though risky article of cultivation, in which, owing to the time and care required, a Malay peasantry is neither qualified nor disposed to indulge.

Tea has been planted by Mr. T. Hill on Weld's Hill and Eveleen Estates in small quantities, but with such success that I should like to see it more generally taken up.—*Selangor Government Gazette.*

CORK TREES FOR NATAL.

Mr. Robert Topham has asked the City Botanic Society to import a couple of thousand young cork trees, as the country was particularly suited to their cultivation. The same benefit was to be derived from the bark of the cork tree as from wattle, only that the trees when stripped were not destroyed, but bore another crop in about five years. In Spain the industry already benefited those who had taken it up to the tune of about half-a-million per annum. The suggestion was adopted, says the *Natal Witness*.

TEA IN TABLOIDS.

It sounds somewhat extraordinary, does it not, that so few housewives succeed in making really good tea? But it is undoubtedly true. That is, perhaps, partly the fault of the housewife, but it is still more the fault of the tea. Fresh tea leaves, as everyone knows, have to undergo a process of "curing" before they are capable of producing the beverage with which we are so familiar, and this process is generally by no means thoroughly carried out. In old days, when tea was a luxury, and fetched a high price, only the smallest and topmost leaves of the plants were plucked; but, in the present day, the demand for tea being so universal, and the price so low, planters in order to gain their profits, find it needful to pluck the larger leaves also. Now, the inner portion of these larger leaves is usually not reached by the "curing" process at all, and the uncured parts produce the unpleasant and bitter taste which characterises tea which has been over-brewed, or which has stood for a little while. The presence of this uncured portion can be shown in another way. If you take a good-sized tea leaf, and soak it in water, so that it uncurls, the centre of the leaf will be found to be quite green. But in buying ordinary tea, you pay for this uncured, and consequently useless portion, and also for the midrib of the leaf, which is also useless. There is no reason whatever why you should. If you use "Tabloids" of compressed tea you will succeed in making a perfect cup of tea, since the before-mentioned useless and harmful portions are carefully removed before compression. If comparison

be made between 100 "Tabloids" of tea and the quantity of loose tea possessing the same amount of virtue, the economy in bulk will be found to be enormous. Tea "Tabloids" secure economy and uniformity, and prevent waste, and they enable the consumption of tea in the household to be regulated with the utmost nicety. They are very specially adapted for tourists, travellers, picnic parties, &c.—*Colonies and India.*

COFFEE IN THE WEST INDIES.

The following interesting account of coffee planting in the West Indies is an extract from a private letter of a former well-known S. E. Wynaad coffee-planter, which has been placed at our disposal:—

I only got home some three weeks ago having been for a yachting cruise round the West Indian islands, a pleasant way of spending nine weeks of an English winter like this one has been! We went out *via* Teneriffe, then across the ocean to Barbadoes, where we met the cricketers, some of whom I knew. They were, I think, if the truth were known, awfully surprised at the way the representatives of that island walked into them. But they had only just landed after a very rough crossing and were thus greatly handicapped. From there to Trinidad, one of the finest islands of the lot, and so on through the Windward Isles across to Jamaica, Cuba, Bahamas and Bermuda and from there home *via* Maderia, landing at Plymouth on one of the most lovely warm Spring days (only a sample of two vouchsafed) imaginable. England may have its faults, but taking it all round it is a hard place to beat, and every time I get there after having been to other countries I vow I will never go out of it again. To us hardened *voyageurs*, the West Indies in many respects are the same as the East, and one felt annoyed at being considered lacking in wisdom when one refused to rave over the masses of tropical and tangled vegetation as we drove past them, or take an active interest in the glimpses of village life. As through clouds of dust and with the glass at 90° we bumped over bad roads in vehicles built in the year 1, drawn by horses foaled about the same time, it was very like doing the lowest part of your good city, Madras, on a particularly hot day in July. The flora and tropical growth in none of these islands to my mind touch those of Ceylon, and though one sees many new species, one sees a vast number of old friends, though not nearly so luxuriously grown. So when you read Froude's History of the West Indies, keep a salt cellar within reach so as to take a pinch or two of that proverbial qualification, and apply for an author's copy of the *new* edition which shortly will be edited by your humble servant.

Were it not for that terrible scouge, labour, even worse in these islands than with you, there would be, I think, a wonderful opening for capital and English producers, perhaps more paying than that "Golden lode" in the Londonderry mine of which we are all full of now. (I'm a shareholder!) As one sees those miles upon miles of densely clothed hills which run up to 5,000 feet and over on which grow many of the trees that are found on our best coffee and tea land, one notes the lovely "lays" and the abundant streams in every creek and one just longs for a gang of Kurumbers. You might knock down thousands of acres of forest mixed with dense bamboo and undergrowth and never come across a ridge or bit of grass. I went to many of the botanical gardens, and most of them had tea and coffee growing in them luxuriously. At Jamaica I was specially struck with a patch of coffee Arabica growing under fig shade. Though utterly uncultivated, unpruned, etc., and grown in what must have been very poor soil compared to that inland, it looked wonderfully healthy and robust. It was "wintering" a bit, but though I looked carefully at the leaves, I could not detect any signs of that fatal "russet" nor trace any marks of *rust* on those gradually yellowing leaves so well-known to us. And shall I own it, for this

felt sad. For I am still an East Indian coffee planter at heart, though out there I have frequently been mistaken for a gentleman! But I gathered comfort when I detected the somewhat slow and laborious work of our old friend the "Borer" and my fingers itched to place my boot against the stump and with my right hand draw the stem to me wondering whereabouts it was going to snap! "Give Borer time," I said to one of the botanical scientists who watched me attentively, "for his work must be done slowly, but when finished it will be done well!!" And like things are arranged often in this world, this man, who doubtless could have afforded me much information on other topics, seemed totally ignorant of this particular grub. As far as I could gather they did not suffer much from "leaf" in fact many of those to whom I talked had not seemed to have heard of it. I hear in St Vincent that land can still be picked up very cheap on Government leases and the American Market is within about 9 days. It was quite like old times to see this "fascinating" tree growing wild all over the place in most of the islands, and were I a younger man I think I would chance the labour difficulty and quietly begin opening—at St. Vincent for choice.

The Assam hybrid tea-bush too grew wild in the Government gardens at Jamaica. The cocoa planters seemed to have caught on to a good crop. To see the robust way these trees grow and fruit is a puzzle. Why on earth won't they do in the Wynaad? For here you see exactly the same jungle trees growing side by side with the cocoa trees that we have in Wynaad, where this "peevish" tree utterly refuses to do. I wonder if the Viceroy could tell us! And such a casual cultivation as it is too. The trees are planted some 10 ft. (more or less) apart, and grow to look very much as the rhododendrons do on the Nilgiris, strong and hardy, though perhaps slimmer, and the fine plump scarlet pods as they hang in bunches amid the dark green leaves look most tempting. I believe no manuring has been done to the trees in any of the islands; in fact I went out with a man who had come from home expressly to find out what effects manuring would have in the yield. I do not know if when young the plant requires care, but the estates I saw looked exactly like the surrounding jungle, with the exception that all the undergrowth was cut under the trees, which grew as it were out of grass land, utterly ignorant of the invigorating touch of the fork or mamoty. The wily mongoose was introduced here some years since and the place swarms with them. True, they have destroyed every snake, but they have also killed other reptiles who used to keep down in their turn, together with the snake, many insect pests which now, having Nature's enemy removed, attack the different products of the isle, cocoa included, the revenue of the island losing some £10,000 annually by their ravages. So much for trying to assist Nature! How can we expect better luck if we try to improve the value of the rupee by legislation?

I was greatly struck with the physique of the negroes. One would dread one's Roll Call had we to deal with two or three hundred of these chaps. The gentle cooly I allow thinks himself as good as his master in these days of education, and no doubt in some cases he is, but these go much further and think themselves better. No, believe me, there is nothing like travelling to find out the truth of things, and this trip has taught me that India, that place when we were there, at which we used to grumble so, getting up an hour before daybreak so as to get a good start, and then forced to sit up in our long arm-chairs, cheroot in mouth and drink, some of it inside, of the best near our hand, is not half a bad place after all. Granted, if one has been fortunate enough to "marry an heiress and declare a dividend" England is the place to spend it. But should we have missed our chance of becoming a partner in so good a commercial undertaking, there are far worse countries than India, and I often look back with sorrow to those jolly old days which used to be mine—sorrow I say that they have passed. It was jolly to think that your particular way of working your place was a little better than your neighbours. Your new horse (just coming on) had a turn of speed,

wasn't hammer-headed, didn't turn his toes out when he galloped, nor wanted another rib, and that when the rupee just went a leetle lower, say to 9d, you really would go home, and after having spent your store of sovereigns, just place a few in some South African or Australian mine, and coming out with those few sovereigns now taking bags to hold them, get some R25 for each and so be able to prove to your partner that the trip was not an extravagance but a saving.—*Madras Mail.*

COFFEE BLIGHT IN THE HAWAIIAN ISLANDS.

PROFESSOR KOEBELE ADVISING.

From the *Hawaiian Planter's Monthly*, we learn that resolutions have been adopted by the Kona coffee planters relative to the blight, which is reappearing in that district, and creating measles among planters. The reply of the Commissioner of Agriculture, which follows, explains the reasons why the lady-birds have not done the work expected of them:—

The selection of the *Cryptolemus Montrouzerie* lady-bird for Pulvinaria coffee blight is entirely due to the instructions received from Professor Koebele, who sent this valuable insect from Australia, and in parts of the islands where the lady-bird was sent (with the exception of Kona) the results obtained have been in keeping with his excellent judgment.

Under date of September 3rd, 1894, Professor Koebele writes as follows: "I have written you previously in regard to the feeding habits of the *Cryptolemus* and *Rhizobius*. You will do best always to select the *Cryptolemus* for the insects or scales upon the coffee plant, as this is the beetle to destroy the Dactyloids, as well as Pulvinaria and Lecanium, while *Rhizobius ventralis* will not feed upon the mealy bugs." That the *Cryptolemus* has done good work on all the Dactyloids and on the Pulvinaria is an established fact, to support which there is abundant evidence.

After the first few broods of these insects had been liberated in Honolulu, several months elapsed before they became numerous enough to enable us to gather colonies and send them to the other islands. Kona was the first district to receive the lady-bird, and the first reports received from there were quite encouraging. Mr. C. D. Miller, manager of the Hawaiian Tea & Coffee Company, writes under date of October 16th, 1894, and speaking of the *Cryptolemus* says: "The larva of the latter are doing good work on the infected coffee trees, and I believe in course of time the scale will be very scarce." Soon after this, letters were received from Mr. W. Muller and Mr. M. F. Scott, stating that from some cause or other, the lady-birds do not increase; and in another letter Mr. Muller stated that an insect attacked the larva of the lady-bird and destroyed it. From Mr. Muller's description, I recognized this insect to be the larva of the lace-winged fly, a *Chrysopa*, species unnamed. This insect is quite common all over the islands, and is classed as among the beneficial insects. I have bred numbers of them together in the same jar with the *Cryptolemus*, and with careful observation I have never seen them attack the larva of the latter.

I therefore suggested to Mr. Muller that he was mistaken in his conclusions, and that the true cause of the *Cryptolemus* not increasing was that the non-breeding season of the lady-bird was approaching, during which no increase was possible. All this was duly communicated to Professor Koebele, and his opinion asked as to the cause of the lady-bird not increasing. His reply is as follows: "The *Cryptolemus* beetle has its rest during the winter in Australia, when it does not breed, and the same will be the case in the islands; but you will see good work during the summer." This fact has been fully demonstrated in Honolulu. During the summer months the beetle increased to a marvellous extent, and its work on the Dactyloids and Pulvinaria was

truly wonderful; but as the winter months approached, its numbers began to grow less, until during November, December, January and February hardly one was to be seen; and the several blights on which it fed commenced to increase again. At the present time the *Cryptolemus* is again increasing, and wherever any of the blight is seen, the larva of the *Cryptolemus* is seen feeding upon it. I have spoken to Mr. Muller and Mr. Scott when they were in Honolulu and stated to them the above facts, and asked them to have a little patience until the summer set in, when there would be good work done by the *Cryptolemus*. I believe with Professor Koebele that this will be the case.

Your resolutions seem to imply (though I trust such was not your meaning) that I, as Commissioner of Agriculture, had selected and sent to your district the *Cryptolemus* lady-bird independently and without the sanction and advice of Professor Koebele. If such is your way of thinking, I must assure you that you are mistaken. In all matters pertaining to the entomological work of Professor Koebele with which I have had any connection, I have relied upon and implicitly followed his instructions in every particular.

You have done well to express confidence in Professor Koebele, but you are decidedly wrong in believing that he is in ignorance of the state of affairs in Kona. Just so far as I have been informed by the people of Kona, so has he been informed, and a copy of your resolutions will be sent to him by the next mail. He is now in Japan, a country which he reports as being much infected with scales and blights, and it is quite possible that he might find an insect to supplement the work of the *Cryptolemus* beetle.

Had my duties permitted me, I would have visited Kona and consulted with your coffee planters concerning blights and other matters but I have been quite unable to leave Honolulu. Constant vigilance is necessary in order to prevent the introduction of pests and blights, some of which, if introduced, would destroy the coffee industry in short order. I can assure you that as soon as possible after the arrival of Professor Koebele he will visit your district and do what is possible to relieve you of the blight on your coffee.

Trusting that you will soon be able to see the *Cryptolemus* at work on the *Pulvinaria*, and assuring you that anything that is in the power of the writer to help your industry will be done, I have the honor to remain.

TEA SALES IN BOMBAY.

As we announced the other day, an auction sale of Indian teas took place, on Saturday, at the office of Messrs. Grindlay, Groom & Co., of this city. Some of the tea-planters in Dehra Duna, Kangra, and Kumaon have arranged with Messrs. Grindlay, Groom & Co. to hold periodical sales of their teas in Bombay, and the first such sale took place at noon on Saturday, when four hundred and twenty-nine cases were put up, with the condition that the vendors had a reserved bid for each lot, and that the article would not be sold under their fixed prices. The first lot consisted of forty cases of orange pekoe from the Dehra Duna Tea Company, for which the highest offer made was six annas and ten pies per lb. Whereupon it was bought in at seven annas per lb. Upon this the wholesale dealers called the attention of the agents to the fact that in Calcutta, where such sales were regularly held, the consignments of teas were sold without any reserve, and that such a course should be followed here so as to develop and promote the new business. But as the agents were determined to hold to their reserve prices, the dealers left the room in a huff. However, on the sale being proceeded with, only five boxes of orange pekoe from the Raipur tea estate were purchased by a Peshian shopkeeper at eight annas and one pie per lb., leaving four hundred and twenty-four cases unsold. In Calcutta a large trade in tea is done for export to England, Australia, and other countries by the vendors selling their stock without reserve.—*Times of India*,

GAS LIME AS A MANURE.

Gas lime is a waste product in the manufacture of gas. It has not a high reputation, and can be bought at a low figure, and may sometimes be had for carting away. In its fresh state it has an evil smell, and contains sulphuret of lime and other sulphur compounds that give off sulphuretted hydrogen, and are injurious to vegetable life. It is these the farmer who uses it must guard against, and failure to do this brings about disastrous results, but when rightly understood the danger may be reduced to a minimum, for if gas lime is exposed the oxygen of the atmosphere soon destroys the bad smell by changing the sulphuret of lime into sulphite, and finally sulphate of lime or gypsum: in other words, by changing it from a positively poisonous substance to a well-known fertiliser.

In a sample of gas lime from which the water (that constituted about 40 per cent of it) had been evaporated, and that had been kept long enough to be used with safety as a manure. Dr. Voelcker found the following compounds of lime:—Sulphate of lime, 4.61; sulphite of lime 15.19; carbonate of lime 49.40; and caustic lime 18.23 per cent. A substance rich as this in lime compounds cannot fail to be of considerable service to farmers, and in actual practice it is found to have much the same effect as ordinary lime. The crop on which it does the most good are clovers of various kinds, beans and peas, tares and turnips. It is said to cause scab on potatoes, but this is probably only when it has been incorporated with the soil in a fresh state. On grass land it should be spread in frosty weather at a time when vegetation is dormant, so that it may have changed to a mild form before the growth of grass in spring; or, better still, it should be made into a compost with road-scrappings, ditch-scurings, or other refuse, before being applied. It is of great service in destroying moss, heath, acid-loving plants, and certain other useless vegetable growths.

On arable land it should be spread three or four weeks before being ploughed in, and it may be used at the rate of two, three, or four tons per acre. It is said that if applied quite fresh and ploughed in at once, it will destroy coltsfoot, or other weeds that may have taken absolute possession of the soil, and cannot be removed by ordinary means.

Miss Ormerod and Dr. Voelcker recommend it as an almost certain cure for "Finger-and-toe" or "Anbury" in turnips. The latter makes the following interesting statement:—"On visiting the fields where the turnips were effected (by the above-named disease) by wart-like excrescences, and forked and twisted into the most fantastical forms, I noticed a spot on which the roots were nearly all sound. On stooping down and examining the soil, I picked up some bits of a whitish-looking substance which appeared to me like dried gas-lime, and I learned afterwards that on this very spot a cart of gas-lime had been unloaded the year before. The chemical examination of the soil on this field showed merely traces of lime; and at my recommendation, the occupier applied a heavy dose of gas-lime which completely cured the evil."

Considering the above, we can come to no other conclusion than that gas-lime is of value to those who can easily obtain it.—*N. B. Agriculturist*.

A CELEBRATED OLD TREE.

Lecturing, last week, before the Royal Horticultural Society, Dr. D. Morris, Assistant-Director of the Kew Gardens, mentioned the presence at Kew of a living branch of the celebrated dragon-tree of Orotava destroyed by a storm in 1867. This was one of the most celebrated objects in the annals of natural history. It was first described—being even then a venerable tree—by the navigators in the early part of the 15th century, and was considered by Humboldt and others to be of extreme antiquity. The specimen at Kew was obtained many years ago and it is, probably, the only portion of the original tree now existing.—*London Times*, May 24.

DYSENTERY AND TYPHOID FEVER AMONG PLANTERS

Within a very short period of time we have had to record the death of an unusually large number of victims upcountry to Dysentery and Typhoid Fever, the two fell diseases which Europeans in Ceylon chiefly have to dread. We also know that a much larger number of cases have occurred than the public are aware of, in hospitals, hotels, and private houses,—where, if the patients have not succumbed, they have often been at death's door. We have repeatedly warned young planters of the necessity for keeping a careful watch over the water they use, and last week we struck another serious note of warning, for the appearance of which many expressions of satisfaction have reached us. We therefore think the time has come to speak out more forcibly and more plainly than ever, concerning this matter of the greatest importance, more especially as it affects our upcountry friends, the planters. No purer, or more wholesome, water exists in the world than that which issues from the thousand times ten thousand springs on our mountain sides, free as the air that perennially blows over and sways the trees that clothe them; and when a bungalow is built—as every bungalow should be, where possible—close by the source of such a “spring,” only the grossest carelessness and indifference can cause such a supply to become the means of conveying disease-germs into the food, or the vessels used for cooking. Yet so thoughtless and unsuspecting are some of the younger men amongst our planters, that older men, with long experience, often have to point out to them very objectionable arrangements in connection with even so pure a supply of water as this. With such a flow, issuing through a short spout from the ground, the rule should be that no open receptacle—neither a low tub nor a reservoir (unless protected), nor a hole in the ground, should be allowed under it, or near to it. A lazy kitchen cooly will often dip his bucket into such receptacles rather than wait for the bucket or saucepan to fill from the pure source; and as an eternal watch cannot be kept, such convenient receptacles are certain to be often contaminated by the people about the place.

But unfortunately the bungalows that exist and were built so many years ago,—as well as many which the exigencies of the case require to be built now—have not been and cannot always be built where this great desideratum of a pure spring of water, exists. Only the other day we heard a planter boasting of the beautiful supply of water to his bungalow, through a spout close to his kitchen door. And truly it was one to make the heart glad, if only it had issued there and then from the ground; but what he knew, but overlooked, and what we noticed was, that it had travelled over a mile by the road side from its source; and in walking along that road quite close to the bungalow, we had observed such things as decided us to be very careful not to drink of that water during our visit. Under such circumstances nothing but covered pipes to convey water from its source will insure it against contamination in an Eastern country. Our late senior, Mr. A. M. Ferguson, once offered a reward of R1,000 to anyone who could devise a satisfactory latrine arrangement for the lines in Abbotsford, and induce the coolies always to use it! Every planter knows how absolutely indifferent Tamil coolies are in this respect, rather, it would almost seem, preferring to

be surrounded by an environment of filth than otherwise, and justifying the joke of a planter that a cooly returning home in the dark lifts up not his ears for sounds from the lines, but his nose for the odour saying:—“Ah! I must be near home.” Well, no one earned the old editor's reward, and we think the Planters' Association or some of our large Proprietary Companies might safely repeat the offer. Not that we think the solution of the problem requires any special invention, so much as the best way to influence the coolies themselves, in a direction, for their own good, short of Government compulsion to which complexion it may have to come. For, the condition of things not only on the estates, but generally upcountry, has already become so bad as to be beyond further endurance. And it behoves every European who values his own health, and every estate owner, large or small, who values the health of his coolies, to put an end to vile habits, which, we say without fear of contradiction, have already costed their victims by the thousand, and which are responsible for the serious illness of planters and coolies who are at this moment hovering between life and death.

TEA CULTURE ON THE CAUCASUS.

Professor Krasnov says we have reproduced his opinions and information on this subject, as stated in conversation, very correctly; but there is an addition he made this morning which we deem of very considerable importance. In his opinion, there can never be large returns of leaf in the latitude and climate of the Batoum district. “The climate,” said the Professor, “is mostly like today in Colombo—very moist, with a great deal of rain nearly all the year round, and not nearly enough of sunshine or heat to induce such flushes of leaf as I see gathered in Ceylon and India.” He likens the climate on the side of the Black Sea to what is experienced in India at 8,000 feet above sea-level “and there,” he added, “I find planters do not cultivate tea—it is beyond the paying limit.”

The courteous and very intelligent Professor—whose home and university are in one of the richest provinces half-way between the Crimea and Moscow—cordially repeated his invitation to visit Southern Russia and see their beet-root culture (for sugar), wheat, fruit, &c.; and he added the best route is by steamer from Alexandria to Constantinople and thence by a first-class Russian line of steamers to Batoum.

THE INDO-CEYLON RAILWAY AND THE COOLY SUPPLY;

HOW TO SAVE 650,000 DAYS OF COOLY LABOUR.

It is quite amusing to us to observe the crass ignorance displayed about the connection between our Labour Supply and the construction of an Indo-Ceylon Railway. Let us take the very a-b-c. of the connection between the two, of which our local contemporaries are either ignorant, or else which they deliberately keep out of sight. At present some 35,000 to 45,000 coolies travel down the North road every year after a long journey through Madras and the crossing to Pessalau. In this way, it is not too much to say that from ten to fourteen days of work are *lost* both to the coolies and the planters. Now allowing for the risk of a proportion of the number having to pass some days in quarantine

in the Cooly Depôt—North of the Kelani river, or wherever it might be situated—we think we are safe in taking ten days for 40,000 coolies arriving by the Northern route as a very moderate average reckoning for the total loss of time. This will give us 400,000 days which an Indo-Ceylon Railway is likely to save to coolies and to planters. This means, to be again on the safe side the placing of R100,000—*one hundred thousand rupees* at least—into the pockets of the labourers and giving to the employers, the equivalent of an addition to their total cooly force of from 1,600 to 2,000 coolies. These great advantages derivable from the construction of an Indo-Ceylon line are patent and are in the very front of the undertaking. Nor should the saving of time in travelling back to Southern India be lost sight of. Quite so many coolies do not travel by land to the North as come in that way; but 25,000 may be taken for the departures and we have then a further saving of 250,000 days' labour or R62,500 to the coolies whose one great object in coming to Ceylon is to gather in as many rupees as possible to carry back to their villages.

As for the doubt cast on the opinions or desires of Mr. Edward J. Young, it is to us, who know how enthusiastic Mr. Young is about the early construction of an Indo-Ceylon Railway, perfectly absurd. Mr. Young did everything in his power to interest the Ceylon Government in the project and was woefully disappointed when he found that our present Governor received the scheme with disfavour. However he secured the publication of all the papers in the possession of the Government together with a preliminary Report from Mr. Waring and an expression of opinion on the part of the Resident Engineer for the South of India Railway. Moreover, Mr. Young hoped while in England to increase the interest felt there in the proposal; and we feel sure nothing will delight him more than to find the way made clear for the early consummation of a Railway union between this island and the opposite Continent.

As for the time when this important undertaking should be taken in hand, the late Duke of Buckingham—one of the shrewdest and most practical of British administrators—would fain have seen a commencement made twenty-two years ago and Sir Wm. Gregory bitterly regretted he could not put his hand to the work, while he intimates in his autobiography that had Mr. Kyle's scheme for a steam-ferry come before him at the outset, he would probably have been able to state the Duke's proposal. At any rate, with an influential Syndicate now in existence, whose one object is to promote this Indo-Ceylon Railway, is it not rather absurd to be told that the proposal should be relegated to some unknown limbo of the future! In answer to Mr. Caine, Mr. Sydney Buxton intimated that "any well-considered scheme of railway extension (in Ceylon) which may be brought (by private enterprise) to the notice of the Secretary of State will receive attention." We trust this may encourage Sir Geo. Bruce and Mr. Shelford to lay a formal proposal before Lord Ribon. They have already secured the consent and full approval of the Indian authorities, Mr. Fowler being understood to be especially favourable to their project, and the sooner the Engineers formulate a scheme of their own—say to connect Manaar and Colombo by a metre-gauge line—for the consideration of the Secretary of State for the Colonies, the sooner will they get a distinct pronouncement by the local as well as home authorities, and

know exactly how they stand in regard to the Ceylon Government.

One thing is very certain, namely, that only the prospect of interest-and-sinking-fund as well as working expenses being fully covered, is likely to induce the Colonial Office to sanction further additions to the Ceylon Railway Debt for new Extensions. If this be true, as we believe it to be—to judge from information from home—the time would appear to be most seasonable for the introduction of "private enterprise;" and it therefore behoves the Syndicate that has taken the Indo-Ceylon Railway in hand to formulate a proposal without further delay for the consideration of the Secretary of State.

A CEYLON PLANTER IN CALIFORNIA.

We take the following interesting extracts from a letter just received from Mr. T. A. Cockburn:—

The demand for your teas continues here, but does not increase so rapidly as I would like; the great want seems to be some attractive method of Advertising, something out of the common rut, and I need not again enlarge on the tremendous sensation caused by Natives, men and women, appearing on the streets in their striking and picturesque costumes and jewellery, and serving tea in the high class stores free of charge: I have very fully explained how these natives could very profitably be employed between the large Expositions being constantly held in some part or other of this vast country, and of course I include Canada.

I have had enquiries for Ceylon cinnamon and other produce, through a friend connected with a large tea house and general importing business of very great extent, and I furnished him with a list of well-known Ceylon firms and some of their London Agents. I also handed him a copy of your *Overland Observer*, containing a list of those firms connected with Ceylon, so I hope something will come of this enquiry: some 250 bales of cinnamon alone, were required immediately, I don't know if this is a large quantity but presume it is a fairly good order.

I have heard from three only of those to whom awards were given at the late Midwinter International Exposition, as to their wishes *re* medals and duplicate diplomas, and I trust that those who have not yet communicated with me, will do so as soon as convenient, as the authorities would like all matters connected with the Exposition, disposed of as soon as possible now.

THE RUSSIAN TEA COMMISSIONERS IN CEYLON:

TEA CULTURE NEAR BATOUM.

The Russian Commission sent out to inquire into and report on the cultivation and preparation of tea in the East consists of four members. But it does not seem to be considered requisite that they should travel together. We have already referred to the visit of Mr. Klengen and the interest he took in our Colombo tea sales, as well as in tea cultivation and preparation up-country. Two other Commissioners, Mr. Simonsen and another, devote their attention chiefly to preparation and machinery and they have also been taking notes in Ceylon, feeling that nowhere have factories been more fully or admirably fitted up than here. They will probably be back in November to decide on what machinery they should recommend for the Caucasus. But meantime, they feel, that the Ceylon and Indian system of fermenting and firing do not give the teas which are desired in Russia and they think they can learn more under these heads from the Chinese. And so all three have gone off to the Far East.

Meantime, we have had a call from the fourth Commissioner, M. Krasnov, Professor in Charkov University, a learned Ethnologist as well as Naturalist and an authority on Soil and Cultivation,

Professor Krasnov, true to his tastes, first visited our "Buried Cities" and then he passed to the Bintenne country to see something of the Veddahs, taking photographs as convenient. He travelled back to Colombo through Uva and Nuwara Eliya and on the way saw some of our tea country and factories. He is impressed with the careful system of cultivation and preparation observed in Ceylon, and thinks if we could only adapt our teas a little more to Russian taste—less fermenting and firing—that there should be a large demand. M. Krasnov says "less fermenting" because experiments made in this direction when he was in the Darjiling district shewed that suitable teas could thus be prepared for the Russian taste; and our visitor is strongly of the opinion that unless there be some such adapting, it will take a long time for our teas to make way with the Russian people. He tells us how some of the leading Russian tea dealers have commenced to "blend"; but also that he and others have had to change their custom because they must have the teas to which they were accustomed and not the harsher and stronger Indians and Ceylons.

Professor Krasnov has very little faith in successful Tea Cultivation to any great extent in Southern Russia on account of the cost of labour, although as he admits the heavy customs duty—about 2s per lb. on tea—should afford much encouragement in a wide margin of protection. He tells us that the soil and climate along the coast of the Black Sea and for a certain distance inland are very suitable for tea. Hitherto, experiments have been confined to the neighbourhood of Batoum. The first attempt was by a merchant who got some tea plants from China. These grew and bore seed and he planted a few acres and M. Krasnov has tasted tea made from his trees. Then came M. Popoff who introduced some Chinese as well as seed and planted up a small garden; but he has never done much with it and apparently lost interest in it. The Government so far has not more than a few acres under cultivation. They may increase this to a few hundred acres if the Commissioners so advise; but M. Krasnov has not much faith in the enterprise spreading. He tells us a British planter (and Indian coolies if he could get leave to take them over!) would be readily welcomed by the Russian authorities and allowed to profit by the "protection" of the 2s per lb. tea duty. But of course, how to get labour—the coolies—is the difficulty.

Professor Krasnov takes a deep interest in Ceylon altogether,—in its varying climates and vegetation—East and West, high and low,—as well as in the past history of the island and people. He hopes to spend some more time here on his return from the Far East. He leaves for China by the M.M. s.s. "Natal" now due from Marseilles.

JOTTINGS ON TOUR.

(By a Planter.)

PRICES OF CEYLON TEA.—The reason for the present good demand for Ceylon common and fine tea is thus explained in a letter received by the last mail: "In order to sell at 1 shilling a pound, the grades under 7d are likely to continue intrinsically dearer than those at 8d to 10d; for although China Congou is selling down to 3d, the packers can only use a certain small proportion of it for the one-shilling packet. The new season's Hankow teas are being bought largely for Russia at very high prices. Buyers for England have mostly to stand by, as teas costing 6d, are only worth at present prices 4d in this market."

WEATHER is a little more monsoonish today. Great complaints of want of water for Factory purposes, are made in many districts. Residents in such cool districts as Dolosbagie, where prickly heat was unknown, are now suffering from that troublesome, if not dangerous, complaint. It becomes a very serious matter when Dysentery and Typhoid Fever are but too prevalent. I fear the present unhealthy season will not tend to Life Insurance Societies reducing their premiums.

THE IMMIGRANT RETURNS are much pleasanter reading to the Planter, than they were. The totals weekly show a thousand or so to the good.

TEA EXPORTS are not formidable. We shall certainly have rather poor outputs from many Factories when the slack time comes. There is a lot of pruning in arrear now which must be attended to, and when this work has been delayed, it means that the bushes take a long time to recover from the action of the knife. Tea trees, like everything else in nature, require rest.

FRANCE is ceasing to be the home of the elaret drinker, as I learn from the letter of a Special Commissioner sent to Paris by one of the leading English papers which shows, alas, how spirit-drinking is spreading among the French.

CEYLON TEA COMMISSIONER IN AMERICA.—Is it not possible for Mr. Mackenzie to rile our American cousins by showing up their little peculiarities. Dickens, who, perhaps, wielded a more artistic pen than even our Commissioner, got into terrible trouble by his American notes. If Mr. Mackenzie would write less, and stay more in America, our cause, perhaps, would flourish better.

THE COMMITTEE OF THIRTY, it strikes an outsider, seems to be encumbered with red-tape, and does not seem to have the power of getting hold of the money that is accumulating in the banks from the collection of the Cess.

TEA AROUND GAMPOLA AND PUSSELLAWA.

In sending us information for our Directory, an old planter writes:—

Very few natives make their own tea. I only know one Chetty that does and he adjoins me. He calls his estate New Angamone, and it is some 120 acres. This is not in your Directory. You have Angamone as belonging to heirs of A. Brown and natives. The heirs of A. Brown have not owned it for years back!

HORTON PLAINS FOR A TROUT HATCHERY.

(From a Correspondent.)

Undoubtedly Horton Plains is where the hatchery should be. Rs500 would put up all the necessary buildings &c., and all other plant (not much required) taken from Nuwara Eliya. I believe that there it would be quite possible to raise yearlings. But there should be a European on the spot, or failure is inevitable.

One great drawback with the present arrangements is that Mr. Tringham has too far to go to see the ponds during the night, and indeed during the hatching of the ova, these should be attended by some one with little or nothing else to do. That is of course for say 3 weeks after the ova are put into the trays.

The present ponds are utterly unsuited for rearing trout.

THE SELANGOR PLANTATIONS Syndicate, Limited, has been registered by Linklater and Co., 2 Bond-court, Walbrook, with a capital of £25,000 in £100 shares. The object is to acquire from H. Huttenbach certain estates, plantations, &c., in the State of Selangor, in the Malay Peninsula, and to develop and turn to account the same in such manner as the company shall see fit. The directors are J. Somerville, A. Kent, and L. Huttenbach, Qualification one share; remuneration, 5 per cent. of the net profits divisible. —*L. and C. Express* May 24.

CEYLON MANUAL OF CHEMICAL ANALYSES.

A recent number of *The Chemical News* has the following review of Mr. M. Cochran's useful volume printed and published at this office:—

A HANDBOOK OF ANALYSES connected with the industries and Public Health of Ceylon. For Planters, Commercial Men, Agricultural Students, and Members of Local Boards. By M. Cochran, M.A., F.C.S., Professor of Chemistry in the Ceylon Medical College, City Analyst to the Municipality of Colombo, Member of the Ceylon Branch of the Royal Asiatic Society. Colombo: A. M. & J. Ferguson. London: Kegan Paul, Triebner, & Co.; Geo. Street & Co.; J. Haddon & Co. 1895.

This work ought to be highly prized not merely by the classes to whom it more directly appeals, but by every true Briton. Tropical and Subtropical agriculture is a pursuit in which a large portion of our national capital is invested, and engaging directly or indirectly a still larger proportion of our industry. It may claim our attention the more urgently as it is now attacked on various sides. The parasitic fungi and animalcules of tropical regions, the synthetic chemistry of Germany, the development of rival products, and the frauds of our own merchants, are all tending to reduce the most valuable lands of India, the West Indies, etc., to useless deserts. Hence the instinct of self-preservation should urge us to bring all the resources of chemical and biological science to bear on the questions involved.

To this good task Mr. Cochran here supplies a valuable contribution. He does not attempt to lay down new or special methods of chemical analysis but gives us results. He gives us, firstly a view of the composition of the soils and rocks, showing us the conditions under which such determinations are to be trusted here supplied it would seem that the soils of Ceylon are very rich in quartz and insoluble silicates. He explains the demands made upon the soil respectively by coffee, tea cinchona, and cacao, and what manures are needed to keep up a supply of suitable plant-food. Unfortunately, as far at least as coffee is concerned, its failure in Ceylon cannot be remedied by any fertilisers, since it is due to a parasitic fungus. This pest is spreading to Fiji, and we fear to Java. Whether a richer manure would enable the coffee trees to resist the enemy remains to be proved, and perhaps chemical research may lead us to some fungoids able to destroy the scourge.

We next pass to cereals, especially rice. The proportion of phosphoric acid in the mineral matter of rice is relatively high. According to the analysis of Kellner, Japanese rice is richer in fatty matter than that of America or of India.

A table is here given showing the average composition of cereal grains as produced in different countries, no Ceylon samples having been apparently analysed. Nor do we find any analyses of Australian or African grains.

As regards the cultivation of rice, the author recommends that it should receive nitrogen both in the form of nitrates and of ammonical salts. We regret to find that there is no analysis given of the drainage-waters from rice-fields. This water is said to be especially dangerous, and it would be important to know if this opinion is well-founded, and if so, whether the mischief is due to chemical ingredients or to the presence of morbid organisms.

The products of the coconut palm are considered at some length. The yearly value of a coconut plantation on good soil is said to be £8 15s. per acre. Attention is called to coconut butter, an article recently placed upon the market, and in many respects superior to the margarines.

The tea-crop makes a heavy demand upon the potash, and the phosphoric acid in the soil. There is no special mention of the composition of the soil of the "Mazawatee" estate, which is now, according to advertisers, producing such a large proportion of the tea consumed in Britain.

The tannin question is not overlooked. The author quotes Mr. Hooper for the statement that the finest teas are those which contain most tannin. A short

time ago an attempt was made to depreciate Indian and Ceylonese teas in comparison with those of China, on account of the greater proportion of tannin which the former were asserted to contain. The differences which the patriotic (?) authors so eagerly pointed out seemed due not to any inherent difference in the quality of the tea, but to a different manner of preparation.

Cinchona barks are cultivated in Ceylon on a commercial scale, the principal species being *C. succirubra*, *C. officinalis*, and *C. calisaya*. The proportion of quinine in the *succirubra* natural bark is 1.20 per cent, and the renewed bark 2.73, in addition to cinchonidine, quinidine, and cinchonine.

The cacao grown in Ceylon is chiefly the Caraccas variety, and it is much esteemed for the manufacture of chocolate. Much of it is exported first to America, and thence to Mexico. According to the analysis of Dr. Tatlock, F.R.S.E., it is exceptionally rich in albumenoids and in the characteristic alkaloid theobromine. It is an exhausting crop as regards phosphoric acid.

Into the useful information on tobacco, areca-nuts, arnatto, coca (erythroxyton), cotton, and datura, space does not allow us to enter.

Pepper, opium, indigo, and ipecacuanha do not seem to rank among the agricultural productions of Ceylon.

The latter part of the book is devoted to sanitary analysis. It is remarkable that the only sample of lemonade which came under the author's hands contained a considerable quantity of arsenic! It is noticed that the sender had "merely tasted it"—a fact which raises some difficult questions.

In fine, to all whom it may concern, this book deserves to be warmly recommended.

TEA ON THE NILGRIS.

THE CEYLON IMPORT TEA DUTY.

THE AMERICAN TEA CAMPAIGN.

THE NEW BOMBAY TEA MARKET.

Last month the Nilgiri Planters' Association appointed a small Sub-Committee of five of its members to enquire into one or two points connected with the tea industry. The question of chief interest had reference to import duty on tea in Ceylon, and after due consideration the Sub-Committee framed this Resolution on behalf of the Association:—"That this Association, deeming it improbable that Government would consider any proposal to impose a protective import duty on 'foreign' tea coming into India—and so follow the precedent afforded by Ceylon for many years—informs the United Planters' Association of Southern India that, in its opinion, it is useless to agitate in that direction, but that it is in favour of the Government of Ceylon being approached with a request to remove the present prohibitory import duty on 'foreign' teas introduced into that Island and so to enable Indian tea planters to enjoy in Ceylon privileges which India extends to Ceylon tea-producers." This is a very sensible resolution, in that there is every chance of its producing some result. The matter now rests with the U. P. A. S. I., which must represent the matter in its proper light to the Governor of Ceylon, and at the same time ask the Ceylon Planters' Association and the Colombo Chamber of Commerce for their support. The Sub-Committee, already referred to, at the same meeting as the foregoing Resolution was passed at, placed on record that it was unanimously in favour of supporting the Indian Tea Association. With that view the Honorary Secretary was asked to find out in what manner (whether by acreage or per pound of tea turned out) subscriptions were levied from other bodies joining that Association. It was further agreed that when this information had been received, an enhanced subscription should be levied (per pound of the produced or otherwise) with which to defray the expenses of directly pushing Nilgiri teas in other markets. We are glad to find that the Nilgiri planters are not going to stand aloof from the American campaign. Money is needed, and as whatever good is achieved must affect the whole industry

in India, it is only right and proper that all should pay their quota. We notice that a special fund is to be formed in order to directly push the sales of Nilgiri teas alone. An attempt is now being made to conduct tea sales in Bombay.

There is so far as we can see, no reason why a market should not be formed in Bombay. There must be a good demand for tea in that city, both for Home consumption and for export, more especially to the Persian Gulf. At first there is bound to be some difficulty in opening up a new business like this, and the seller will have to make some concessions. In this direction a local fund such as the Nilgiri Planters' Association proposes to raise might be of great service.—*Madras Mail.*

TEA-SWEEPINGS.

TO THE EDITOR OF *Fair Play.*

Dear Sir,—Referring to your article in *Fair Play* of the 10th inst., headed "An Important Question for the Tea Trade," we disposed of our tea-sweepings and damaged tea the seasons before last to a Hamburg firm; previously and since we have burnt all; but your return puts our quantity down as 40 tons, whereas it was composed of ship or country-damaged, 4 tons 10 cwt., sweepings, 19 tons 1 cwt., or 23 tons 11 cwt. in all, which equals a loss of one and one-sixth ounce per half-chest of tea landed and worked here during the season in question; and as we land more Indian tea which has to be bulked than the Dock Companies, or any other wharfinger, it is fair to assume that your returns are all wrong, and, so far as this wharf is concerned, incorrect. The Customs take the gross weight of every package of tea when landed, and the same weight has to be brought to the scale at final weighing, so that duty is paid on the net weight of tea as landed, consequently no loss through sweepings is caused to the importer or revenue. If loss is caused it must be through bad stowage, defective condition of chests, or bad working. By checking the landing weights with their invoices importers can easily see if they have any cause of complaint against the landing, housing, and working their teas in this port.—Yours truly, BUTLER'S WHARF, LIMITED, HY. LAFONE,
Managing Director.

Southwark, S.E., 13th May, 1895.

THE ORANGES OF JAMAICA.

THE BEST OF THE FRUIT GROWS WILD.

(From the "Weekly Times," of New York.)

In the month of February, 1894, the island of Jamaica exported 164,800 oranges. In the month of February of this year the exports of this fruit amounted to 5,752,150. In February of last year Jamaica's great competitor in the orange trade, Florida, enjoyed ordinary weather. This year found Florida ice-bound or frostbitten. It was Jamaica's opportunity, the greatest it has ever had, and how well it has improved it the foregoing figures show.

WHAT JAMAICA CAN DO.

What Jamaica can do to fill the gap made by the frost in Florida is indicated by the figures quoted. Yet it could have done a great deal more. When despatches from New York reported a steady demand for Jamaica oranges, the fruit was said to be rotting on the trees in the Parish of Manchester, from which the finest oranges grown in this colony come.

WHAT JAMAICA NEEDS.

"I know it," said the Jamaican, placidly.

"What we want here is American money, and enterprise, and push,"—which is as true as the truest kind of Gospel. But this fact should be borne in mind, and it is of the utmost importance to orange growers who are hoping to buy or lease groves here. Orange growing in Jamaica is not a business in itself. It is incidental to other labor, and not counted as a specially profitable

industry. Strictly speaking, there is not an orange grove, as the Florida grower understands the word grove, on the Island of Jamaica. Oranges grow wild here. As nearly as I can learn, the only cultivated orange trees on this island are owned by Mr. J. P. Clark, the Custos of Manchester, and I was told last night by an officer of the Colonial Government, whose duties make him familiar with the agriculture of the colony, that the cultivated trees had not done as well as the wild ones. The owner of a farm or property of, say, 1,000 acres, no more thinks of putting it all into oranges or relying exclusively on that fruit, than a market gardener on Long Island would devote all his energies to lettuce, and let the rest of his garden take care of itself.

The Government owns nearly, if not quite, 200,000 acres of land on the island, and much of this is well suited to orange growing. This land is sold at public auction. Any man may pick out a piece of Crown land he would like to buy, and notify the proper authorities. The land is then advertised to be sold at auction. On the appointed day the would-be purchaser appears and offers a certain sum. If the Government is satisfied with the offer, and there are no other bidders, the offer is accepted. If there are other bidders, the highest one gets it. Land sold in this way costs from \$1 to \$10 an acre. The dollar-an-acre land is generally rather inaccessible, the only road to it being a sheep path. The higher price represents land near a high road. To clear wild land, simply to "brush" it, costs from \$5 to \$8 an acre. Young orange trees can be bought at the Botanical Gardens.

Intelligent men here do not advise Americans to come here with the sole idea of growing oranges. Come to Jamaica and look around they say. Find the land you want, and buy it. If it will grow oranges, it will grow coffee and cacao, and a variety of other products. Many of these are far more profitable than oranges. Fruit-growing in Jamaica has proved remunerative even with old-fashioned haphazard methods. Backed by American enterprise, energy, and intelligence, it ought to be an excellent investment.

THE MAHAUSA TEA COMPANY, LIMITED.

Directors: W. L. Watson, Esq., S. Boulnois, Esq., A. Bryans, Esq. Offices: 45, Leadenhall Street, London, E. C. The following is from the report to be submitted at the sixth ordinary general meeting:—

The crop amounted to 148,287 lb. (an increase over 1893 of 4,989 lb.), and this has realised £5,301 0s 7d, or say an average of over 8½d (8.59d) per lb.; 1d more than last year. The expenditure amounted to £3,652 17s 9d (the expenditure at the estates being R45,844.45, or at exchange 1s 1½d—£2,602 12s 8d.) The average cost per lb. was therefore 5.91d. The profit on the year's working amounted to £1,722 10s 1d, and this, after making an adjustment on account of previous year, and allowing for manager's commission, interest, &c., leaves in profit and loss account a balance of £1,642 11s. 11d. Out of this the directors have paid a dividend at the rate of 10 per cent. per annum for six months, £607 10s. This leaves for distribution £1,035 1s. 11d. And from this the directors recommend a final dividend at the rate of 10 per cent. per annum, absorbing £607 10s.; and leaving a balance to be carried forward of £427 11s. 11d. The total dividend for the year will thus be 10 per cent. The estimate of crop for 1895 is 155,000 lb., and the estimated expenditure at garden is R43,027.

COCOA.

Mr. Alexander Leckie, St. George's House, Eastcheap, E. C., agent for Van Houten & Zoon, gave some interesting evidence last week regarding the cocoa trade. He stated that of the 2,500,000 lb of prepared cocoa annually imported into the United Kingdom, over 2,250,000 lb. comes from Holland, and more than half the total imported is Van Houten's cocoa. The process for making this soluble cocoa is not patented, but is kept secret. An essential part of it is the removal of a portion of the fat from the seeds. Fifty per cent is the average, and Van Houten's contains between 26 and 33 per cent. The witness was examined at great length regarding what the public consider cocoa to be and from his experience he said would not recommend any prohibition of the sale of mixtures of arrowroot, cocoa and sugar, or of soluble cocoas. He was also questioned as to how the latter are prepared, and as to the addition of alkali. Replying to the latter, he said there was no cocoa in the British market which contained any alkaline substance whatever. It could not contain alkali without spoiling the cocoa.

Mr. Leckie was then questioned as to the desirability of the standard for cocoa, and as to the law in foreign countries. He explained that Belgium has passed an edict declaring that cocoa which had been deprived of part of its fat could not be sold as genuine cocoa, although it might be sold as cocoa-powder. It further stated that cocoa which had in it any increase of mineral constituents whatever should be called *alkalinise*, and if there was more than 3 per cent it should not be sold. It was to have come into force on April 1st this year, but he had heard nothing of it. There had been no prosecutions. Van Houten had a large trade in Belgium, and they had taken steps in the matter, and had put the case before the Ministry, and had asked them to take steps to say whether the edict applied to Van Houten's cocoa. The Belgian authorities had issued an explanation which showed that *alkalinise* applied to free alkali.—*Chemist and Druggist*, May 25th.

CEYLON TEA IN AMERICA.

We have received a long letter from Mr. Elwood May on the subject of his revived "Ceylon Planters' Tea Company" in New York and the advantage of our planters backing up his work of advertising and distributing their teas. Mr. Elwood May must understand now finally, that the day for the Ceylon planters supporting any Company or individual separately in the tea-trade is altogether over,—that their money (the Cess) is meant to be spent for the benefit of all dealers in Ceylon tea in America,—and that (for good or evil), to Mr. Wm. Mackenzie as sole representative and Commissioner has been delegated all power under certain instructions from the "Committee of Thirty." It will be therefore a mere waste of time to address letters to Ceylon on this particular subject.

Another correspondent expresses his great surprise at finding that Mr. Blechynden, the Agent for the Indian Tea planters, has been empowered by Mr. Mackenzie to sell or give out Ceylon tea but without distinctive Ceylon labels, so that India gets credit for a tea much better suited to the American taste. This seems a grievous offence in the eyes of our correspondent and especially for the reason that the Ceylon planters so emphatically refused to unite with their Indian brethren at Chicago. We are not going to defend the consistency of our planters; but otherwise to us it seems a small matter which country gets credit so long as Indian and Ceylon teas supersede China's and Japan's. Let it be all India, or all Ceylon, yet both countries equally benefit by the relief to the London market.

Thirdly, we have an interesting letter from Miss Anna Ballard, the well-known lady writer, who lived for some time in Ceylon and whose services we know, Mr. Mackenzie wished to utilize, in writing descriptions of Ceylon tea plantations, preparation, &c., &c. for the American press. Miss Ballard adds:—

"I have just obtained a good point from a Scotsman, New Zealander of 14 years, on a visit to his relatives in Chicago and Scotland. He told me that

New Zealanders prefer the Ceylon tea to Indian. They like the Ceylon tea's flavour and delicacy. They find the Indian tea rather strong. He said that Ceylon tea needs no pushing there; for New Zealanders have already adopted Ceylon tea to the exclusion of all that is raised in any other country,—anywhere."

LIBERIAN COFFEE IN CEYLON NOT ECLIPSED.

(From a Kandy Correspondent.)

From time to time I observe statements of marvellous growth and bearing powers of Liberian Coffee in the Straits, Sumatra, Travancore, Borneo &c.

The general effect of such reports is to show how degenerate Ceylon is by comparison. The flavour of brag is upon all of them.

The last I saw was that on a 20-month old clearing a Liberian tree had attained the height of 58 inches and a spread of 50 and one of 60 inches with a spread of 54 inches.

The paragraph ended with the very shrillest of Cock-a-doodle-does.

In reference to this, my attention was called to a clearing of 18 months old in Matale. The highest specimens were 6 feet 3 inches high and 5 feet 3 inches spread—wholly beating the size of those mentioned as something very extraordinary in the Far East.

I do not think that correct impressions are conveyed by taking measurements of isolated trees in clearing.

I wish I could elicit from other growers of Liberian Coffee whether my belief is shared by them as to any improvement in Liberian Coffee from its acclimatisation here, and whether it is not a much earlier bearer than it used to be. The cultivation has been going on now for some little time and we should be hearing something about the new openings unless the silence is that of people who have found a good thing.

[As one indication, we had a planting visitor from a high district the other day who said he was going in for a Liberian Coffee clearing in the lowcountry forthwith.—ED. T.A.]

CURRENT NOTES.

(By an Old Planter long resident in a Northern District.)

The last *Observers* just to hand are very interesting to me; first of all and of most importance to the Ceylon Tea Planters we have the

TAMIL LABOR QUESTION

brought before us full of all sorts of complications and puzzles. To meet the present scarcity of labor on many tea estates in Ceylon, I would venture to suggest

FREE STEAMER PASSAGES,

for a few months only; some Companies joined by sundry estate proprietors might make private arrangements to convey coolies free to Colombo from Tuticorin to their estates; small steamers might be employed to bring these coolies; and the present general arrangements need not be in any way interfered with. There are estates and estates in Ceylon. Some tea estates will always be favourites, with the Tamil cooly, others quite the reverse, except the Superintendents hold out

SPECIAL INDUCEMENTS

for the cooly to locate on them. Roomy and solid and well-built lines, small gardens allowed, and encouraged, and, more than all, all the protection to the working cooly the superintendent can possibly give him, by keeping his account in the advance book in detail and saying practically to his kangany "Hands off, no unjust or extortionate interest on this estate if you please." Some tea estates are healthy for the cooly; others quite the reverse—some are steep, rather so! Others level, and easily worked and greatly liked by

the cooly men and women and boys: some get better rice than others, some have *long rice transport* which coolies detest, and abominate; where can you draw THE LINE, I wonder?

IMPROVE THE CONDITION OF THE ESTATE

for the Tamil cooly, make it more comfortable and he will be quick to find out the benefits you have secured for him and flock to the Totm, if it is not most unhealthy for him to live on. The present ancient kangani system is welded into all the Tamil Labor Ordinances of Ceylon and is an Institution too strong and vigorous, to be roughly huddled,—though perhaps it might be modified in various ways. Finally, this I will say: that coolies are keen observers, and will spread fevers quickly—too quickly sometimes—on the Coast, respecting the advantages of various tea-districts and various estates; and whether they are protected by the Dorai or not from the grip of the kangani.

And now to change the subject as it were: I read your recent remarks in *Observer* and can say there can be little doubt that

LOW-LYING SEA LANDS IN THE TROPICS are often *very unhealthy*. I know this from bitter *experience*. Take the mangrove swamps of the West India Isles, real hot-beds for fever and ague; even a fringe of mangrove swamps washed by the tropical sea-tides will produce fevers of various kinds. The fact is the fermentation that at times takes place under the shade of the mangroves and the fetid smell beneath the trees is the *true* cause of the miasma that rises for these swamps during certain months when the winds blow inland, and even if a Planter resides at an elevation and above these lowlying sea water swamps, at certain times of the year, he is liable to malarial fevers and kindred complaints; and coolies also. There is a spot only some 4 miles from Eastern Haputale where malarial fever abounds, most of the year—a veritable graveyard for the Sinhalese and Tamil cooly labourer. What is the cause of it. Fever laden winds from *Wellaway* and the lowlying country—all around that *village or town* in fact—all the country covered as it is with scrub to Hambantote is feverish and most unhealthy.

CEYLON TEA IN AMERICA.

THE AMERICAN TEA COMMITTEE OF THE INDIAN TEA ASSOCIATION

met some members of the Tea Committee of the Ceylon Association in London on the 2nd May, to discuss a proposal that the pushing of Indian and Ceylon teas in America should, to a certain extent be done conjointly and not in opposition, Mr. Mackenzie, the delegate sent by the Ceylon Planters' Association to America, having reported that he thought it would be possible to work together for the benefit of both countries and that working in opposition was, in his opinion, distinctly opposed to the benefit of both.

It was pointed out that the subscriptions from India would only amount to about £3,000, whereas the funds to be devoted by Ceylon to the same object amount to about £7,000.

After a general conversation as to the feasibility of the plan, and all those present having signified their approval of the idea, provided the details could be satisfactorily arranged, it was left to Messrs. W. Mackenzie and A. Bryans to draft a proposal to be submitted to the full Committees of both Associations in London on Monday, the 6th inst., it being understood that, if such scheme commended itself to the London Committees of the two Associations, it should be transmitted for approval to the Calcutta and Ceylon Associations with a strong recommendation from London for its adoption. The chief points are as follows:—

(1) That both Associations should contribute £2,500 each towards a joint fund to be used for advertising the teas of both countries in America.

(2) That, with a view to saving expense, these funds should be administered by one Commissioner, to whose maintenance in America the Indian Association should also contribute £500 and the Ceylon £1,000.

(3) That the nomination of such Commissioner should be left in the hands of the Ceylon Association, but that the appointment should be subject to the approval of the Indian Tea Association.

(4) That a small Committee of business men in New York (not necessarily connected with Tea) should be appointed, if possible, to advise the Commissioner as to the best way of administering the funds at his disposal and carrying out the proposal for advertising British grown Teas.

N.B.—The object of this Committee being to gain for the Commissioner the experience of business men in America, and to save time by avoiding the reference of matters of detail to London and Ceylon, it was thought that the Commissioner's hands should be as free as possible to carry out the work subject to the advice of this New York Committee provided:

(a) That he worked for the interests of both countries and

(b) That the money was spent on the advertisement of the Teas of both countries.

(5) The term "advertisement" is understood in its broadest sense and the Commissioner will be empowered to advertise the Teas on the lines already adopted, viz:

(a) By attending stores, food shows and other places, with native servants and sales ladies, if he considers it advisable.

(b) By the distribution of samples of Teas of both countries.

(c) By advertising in the Press, more especially, perhaps, in such towns as he may be holding exhibits of the natives aforesaid.

(d) And this is strongly recommended by the London Committees, by subsidising such persons or firms as are already pushing, or will undertake to push the sale of the Teas of both countries, provided such firms are willing to contribute a like amount, or an amount to be agreed upon, to such subsidies, and to render, from time to time, an account of the expenditure so made, it being considered desirable to leave the exact method of how this money should be spent to the firms receiving same, always provided it was spent on advertising, in some form or another, the teas of Ceylon and India, the subsidies to be repeated from time to time, provided the Commissioner is satisfied that they are being properly administered by those to whom they are granted.

(e) By such other methods of advertisement as may commend themselves to the Commissioner and be approved of by the Committee in New York.

(6) The Commissioner to have strict instructions to show no bias in favour of the teas of one country over those of the other, and all advertisements, of whatever nature, to be equally fair to both, this being the only basis on which it is felt that such a joint scheme can be worked to give satisfaction to those interested in both countries.

(7) That a Joint Committee be appointed in London consisting of three members of the Indian Tea Association and three members of the Ceylon Association in London and the Secretaries of each Association, who will have the appointment of the New York Committee and the administration of the funds remitted from Ceylon and India, and will consult together with reference to the reports of the Commissioner, and to whom he will be responsible, as far as the joint funds are concerned, and will advise their own Associations of the progress of events.

(8.) That this joint agreement shall remain in force for one year or until such time as the aforesaid funds have been disposed of in America.

CEYLON ASSOCIATION IN LONDON.

Report of the Executive Committee. For the year 1894-1895. To be laid before the Seventh Annual General Meeting on 10th June, 1895.

The number of names on the roll of the Association is 135, the same as in the previous year.

The year has been uneventful and the duties of the Committee have been light.

The only business before the Committee has been in reference to the Military Contribution of the

Colony. The increased demands, recently made by the Home Government on Hong Kong and the Straits Settlements on this account, aroused much alarm in Ceylon, where the Legislative Council, the Chamber of Commerce, and the Planters' Association with one accord passed resolutions deprecating in forcible terms the imposition of any increased charge on the Colonial revenue for Military purposes. These resolutions have been forwarded through His Excellency the Governor to the Secretary of State, and a request was made by the Chamber of Commerce and the Planters' Association that the President and Committee of this Association should take immediate steps to prevent any contemplated increase in the Military Contribution being enforced.

Your Committee has entrusted the fulfilment of this request to a Sub-Committee consisting of Lord Stanmore, Sir A. N. Birch, Messrs. Rutherford, Shand and Leake, and a letter has been addressed to the Secretary of State in support of the arguments used and emphasising the unanimity and strength of public opinion on the subject in Ceylon. The receipt of this letter has been duly acknowledged: but it is understood that no decision as to the future has yet been arrived at by the Home Authorities.

By the death of Mr. J. F. Churchill the Committee loses one of its original members, whose long career in connection with the Public Works Department had enabled him on many occasions to do good service to the Colony.

The Committee regrets the loss also of Mr. H. R. Farquharson, M.P. who died recently on his voyage homewards from a visit to Ceylon.

The Report of the Tea Committee and the yearly accounts are appended, as usual, to this Report. A further dividend of 1s. in the pound has been received from the New Oriental Bank Corporation, Limited.

REPORT OF THE CEYLON AND LONDON TEA COMMITTEE, MAY 1895.

The Committee has held three meetings during the year.

The first subject to engage its attention was a proposal that Ceylon should take part in the Empire of India Exhibition at Earl's Court, especially for the representation in some form of the Tea industry and for the supply of tea to visitors. As considerable expense would be involved in such a representation and it did not appear that an adequate advantage would be gained therefrom, the Committee declined to take any action in the matter.

Some alarm was caused towards the end of last year by the report to the Association of several cases of serious thefts of tea from packages *en route* from the estates to London. There was great difficulty in ascertaining with any certainty where these thefts were effected, for the packages that had been tampered with came from various firms in Colombo and had been carried by different lines of steamers and landed and warehoused at different Docks and Wharves in London. The Committee addressed a circular letter to the Dock Committee and the London Warehousemen, requesting that any similar instances of serious deficiency of weight on arrival in London might be reported to the Secretary of the Association; and at the same time public attention was drawn to the matter in the Ceylon newspapers. For a time these thefts seemed to have been checked, but during the present month two fresh cases have been reported.

The attention of the Committee was drawn by Mr. Francis Peek, Chairman of the London Wholesale Tea Dealers' Association, to the manner in which the Tea sweepings in some of the London Warehouses had been dealt with, an instance being given where the sweepings had been sent to the Continent and thence re-shipped to London for sale in Mincing Lane. Mr. T. Christy also pressed this subject on the attention of the Committee. The issue by the Customs, under date 4th March last, of London Port Order 11 of 1895, disallowing the exportation of "damaged" Tea from the Bonded Warehouses, will probably put an end to the practice complained of.

In consequence of the prevalence from time to time of rumours of excessive shipments of Tea from Ceylon, circulated, no doubt, with a view unduly to depress the market, arrangements have been made for the despatch from Colombo at the beginning of every month of official telegrams, giving (1) the actual weight of Tea shipped during the past month, and (2) the estimated weight of Tea to be shipped in the current month. These telegrams are circulated immediately on arrival among the Merchants and Brokers interested in the Trade.

The Committee had the advantage of hearing from Mr. William McKenzie, the Commissioner appointed by the Thirty Committee to visit America in the interest of Ceylon Tea, his views on his mission. Mr. McKenzie has subsequently laid before the Committee a scheme, drawn up by him in concert with the American Tea Committee of the Indian Tea Association, for joint action between India and Ceylon in advertising British grown Tea in the United States. A resolution in support of this scheme will be submitted for the consideration of Members of the Association at the Annual Meeting.

In concluding this Report the Committee would say a word of congratulation on the steadily increasing prosperity of the Ceylon Tea industry. It is a very satisfactory feature in the position that, though the prosperity is general and widespread, it has not so far given rise to undue speculation or inflation of values.

Examined and found correct, WM. ROLLO,

London, 27th May 1895.

Notice is hereby given that the seventh annual general meeting of the Association will be held in the Council Room, London Chamber of Commerce, Botolph House, No. 10, Eastcheap, E.C., on Monday, 10th June, 1895, at 12 noon to receive the annual report, to elect Officers for 1895-96, and to consider the following resolution:—"That this meeting approves generally of the scheme submitted to this Association by the Indian Tea Association for joint action between India and Ceylon in advertising British grown Tea in the United States of America and desires to submit the same for the approval of the Thirty Committee in Ceylon."

A copy of the scheme proposed is enclosed herewith. By order of the Executive Committee, WM. MARTIN LEAKE, Secretary.

4, Mincing Lane, London, E.C., May 27th, 1895.

FOOD FOR TYPHOID PATIENTS.

An upcountry lady of experience sends the following recipe as a useful suggestion for change of food:—

MILK JELLY.

1 oz. gelatine, 1 pint milk. Dissolve the gelatine over night in cold water. Next day boil 1 pint milk and pour over it; stir till dissolved and go on stirring until cold. Flavour to taste. A little cinnamon is invaluable in typhoid cases.

Two other simple preparations of milk are given in Dr. Vanderstraaten's chapter of Invalid Cookery at the end of his invaluable book on the Diseases of Children, and they are very easily prepared. We quote as follows:—

A NOURISHING BLANC-MANGE.

To one pint of milk slightly warmed stir in a large dessert-spoonful of liquid rennets and set aside to cool. This makes a soft blanc mange, very easily swallowed. Powdered cinnamon and sugar may be taken with it.

MILK AND EGGS.

Pour a quart of milk into a large, perfectly clean bottle; drop in the whites of three new eggs, cork the bottle and shake hard.

THE SEASON IN MADRAS.

Yesterday the Board of Revenue telegraphed to the Government of India for the week ending the 8th instant:—"Rainfall moderate in parts of the Circars and Deccan Districts and Salem. Light showers elsewhere. None in the Carnatic. The rainfall to date generally is below the average in the West Coast and Carnatic Districts. Ploughing and sowing is going on slowly in parts. Standing crops are generally fair. Pasture scarce, but fodder sufficient. Cattle is generally in good condition. Prices practically stationary."—*M. Mail*, June 12.

COFFEE, CACOA AND TEA IN SUMATRA.

A DREAM OF THE FUTURE.

VIII.

(Translated from the Deli Courant. 21st-24th Sept. 1892.)

In the year 1905, after 13 years' absence, I returned by chance to Deli, and I recalled to myself the recollection of former events. I speak of 1892 and the following years. By Jove! How all is changed! I might say half a century has passed over Deli, so much has it altered and improved in this time. If I direct my memory to previous times I see a country just passed through a severe crisis. The cultivation of tobacco which in 1889 has reached its culminating point, and which seems to be destined to run a course of prosperity without end, was, in consequence of the universal fall of prices in 1891, menaced with ruin. A panic followed: and a sensible diminution of credit, withdrawal of capital, and want of confidence in the future were the consequences of it. Carelessness of what tomorrow might bring forth, the privilege of the spoilt child of fortune, gave place to uneasiness. In addition to this came in 1892 an unlucky planting year caused, according to the idea of some, by sickness in the tobacco nurseries, which was a mystery to science, and mocked every attempted remedy. (Same as H. V. in Ceylon.—Translator) and according to the idea of others, by the exhaustion of the soil, and the bad climatic conditions of this particular season.

It is said that different ideas coming into conflict lead to enlightenment. But in this special case it remains a dark secret: and it was as difficult to see light, as to see your hand before your face on a dark night. For my part I made up my mind that I could not comprehend it at all; like the turkey-cock in the fable who could see something, but could not distinguish properly what it was. What I did not forget, although so many years had passed over, was the heart breaking appearance of so many estates. A lot of tobacco fields with plants dying from the root upwards: leaves crinkled up, or hanging limp and lifeless; and no sap in the stem.

The general result of the yield reached barely half that of our average crop. Surely this was the forerunner of the seven following lean years of the Bible. Some people—lucky fellows—escaped the prevailing plague, and made splendid crops. Without sorrow they saw the shrinkage in the production of the country; because it was bound to lead to a rise in prices: and they felt confident that what is in Deli true, as in Timbuctoo, the fortune of one arises from the misfortune of the other. Take it all round however, the cultivation of tobacco had received a severe check; and now you could see how weak was the foundation of the prosperity of the country. In the crowds at a Paris Fair you always hear the cry from the lottery booths: "Step up, gentleman, step up: every ticket wins." But it isn't quite the same in the big lottery, as you may call the tobacco planting enterprise in Deli. Some people win somewhat: but many lose ten times as much. Thus you could see at the time of which I am speaking, a number of hitherto prosperous plantations, collapsing like houses of cards, leaving behind them nothing; and worse than nothing, a land condemned for years and years to sterility. Yes: this land which ought to sweat out gold—so much has been put into it,—was now burning in many places—a dreary wilderness, a lurking place for wild beasts, and a rendezvous for wild pigeons. On this massacre of the poor innocents, the little ones were soon swallowed up: and one by one their plantations fell into the hands of some big companies, which at this date of 1905 are the sole owners of the soil, and possess, as you may say, the monopoly of the tobacco cultivation in Sumatra.

Victory always goes to the biggest money bag; and this rule has always proved true. If you look over all, this buying up of the land, you may almost say at a squeezing price, did no harm to Deli. Owing to their big capital, these Companies were enabled to introduce new modes of treating the tobacco, which were more in harmony with the progress of time. It is true that these changes were only made by degrees: but in these countries where habits once adopted are not easily eradicated, and where the *jalan p'lan-p'lan* (go slow) of the Malay has almost reached the force of law, you can only expect improvements and progress to make way gradually. But already in the year 1891 we have seen the first appearance of the steam plough in Deli. This was the first sign of the new departure; and a more systematic and rational style of cultivation appears to be set on foot here. Other improvements soon followed. Folk gave up the rough and awkward model of the sheds used for hanging and drying the tobacco. This old relic so past times, which especially was the cause of of much broken leaf in the tobacco, was superseded by the much simpler and more easily constructed sheds which you may now see everywhere, where tobacco once hung in the lower part of the sheds, will at once be lifted in big frames of from 500 to 1,000 trees each, so that it will not have to undergo any more the wretched manipulation so ruinous to the leaves, of lifting each single pole with 10 trees on each. The system of treatment and manuring of the soil, facilitated by the use of the steam plough, has improved since the time when a handful of guano was the Alpha and Omega of the whole artificial fertilisation. Without rest, people formerly wanted two or three successive crops from the same soil. Besides the working of the land with a mamoty about a foot deep, nothing was done to renovate the soil: and the strangest thing was that men succeeded in forcing from this overworked stuff one crop more! But as they came back to again re-plant the same fields, they found them sterile; and could not with even a double dose of guano restore the already lost fertility. Like the dried-up breast of a woman, the earth refused to give nourishment, and the soil which, perhaps, has no comparison in the whole East for richness, could produce nothing more than miserable, sickly looking tobacco. If our poor old Europe with its meagre soil had been treated in like manner, we should certainly by this time have reverted to the epoch of the ichthyosaurus!

But with the commencement of the power of the large Companies mentioned above, important progress was effected, of which the result was, that notwithstanding great vicissitudes, Deli has remained at the head of the tobacco-producing countries, and its produce has sustained its high reputation in all the markets of the world. A second benefit, rich in consequences to the future of Deli, was the outcome of the tobacco cultivation falling into such strong hands. These Companies, the sole owners of the whole of the tobacco lands, rightly avoided extending their cultivation on land which past experience had proved to be unsuitable for profitable cropping: indeed after the regulation of the production, the Sumatra tobacco regained its high prices; and the Companies found therein such a source of profit that they did not care, to embark on other cultivations.

They left free hands to the small capitalists, so that they could obtain big abandoned concessions; and now, having learnt by past experience, these gave up tobacco planting in order to go ahead with New Products.

From this time dates the foundation of the splendid plantations of COFFEE, CACAO, and TEA which make Upper Deli and Serdang the veritable garden of the East.

Conclusion.

The commencements were modest, and involved much hard work, capitalists venturing only cautiously into enterprises requiring long waiting, especially in a country accustomed by so many years of unexampled prosperity, to rapid strokes of fortune. It was necessary at first to combat the prejudices of a community devoted entirely to the cultivation of tobacco, and whose recent reverses had not yet shaken their firm faith. Further, there had here and there been experiments made in the culture of coffee, nearly all turning out badly: that was sufficient to condemn all new attempts in this direction. They did not ask themselves if the previous loss of the money was owing to the unsuitability of the soil, or to ignorance and to a want of confidence on the part of those who had undertaken the first experiments, and who, for the most part, took no trouble to pay attention to a cultivation the commissions on which would go to their successors. No; coffee had not proved at the first stroke that it could give 50 per cent per annum on the capital sunk; and that was sufficient to bury the question for ever. The cause was judged; and it was no good re-opening it. *Deprofundis!*

Meantime, some are returning to it: and the movement once started, will stop no more. The conviction in men's minds was growing, little by little, contrary to the prejudices entertained hitherto, that Liberian can give in this country truly surprising returns.

A planter having taken in hand the wreck of a small abandoned Liberian plantation in Serdang, not far from Loba Pakam, will show what this cultivation can give if worked with determination and energy. Many of the trees were dead, choked byalang and want of air; others, left to themselves, existed, but barren. In fact, at this time it was but the skeleton of a plantation. Notwithstanding that, there were in September some 1892 trees of really enormous strength and whose crop was as much as 15 and 20 cattie of cherry per tree. These giants which had struggled for life in deplorable conditions of abandonment were the living proof that the coffee tree had found its real home. What is more, the young plants, 15,000 to 20,000, put out in 1890-91 and reared with careful attention showed incomparable vigour, giving their first blossom at 20 months which promised to ripen at about 2½ years old. All these small bushes were healthy and well-grown, not bearing a sign of *Hemilea* which formerly caused so much disaster in Ceylon. An eloquent fact, which itself is worth a volume of prose was also acquired, viz: that compared with the coffee trees of the neighbouring countries, the Straits Settlements for example, where the cultivation of Liberian coffee has been carried on for a number of years, the tree of Sumatra gives not only a more abundant return, but also a heavier fruit. The following experiment proves it. Desiring to try some seed from outside.

Mr. de G. secured 10,000 from a well-known plantation in the Straits; seeds specially picked for nurseries: i.e. the biggest and heaviest, and which were beautifully and carefully invoiced at so many handsome dollars per 1,000 seeds.

My opinion having been asked as to the value of these seeds, I advised that they should be weighed by comparison with the seeds of the plantation itself. Herewith are the figures of comparison:—

	1st weighing.	
200 Singapore selected seeds	= 86 gr. = 3 oz.	
200 Sumatra " "	= 120 " = 4½ oz.	
	2nd weighing.	
200 Singapore seeds, not selected	= 81 gr.	
200 Sumatra " "	= 114 gr.	
	3rd weighing to prove the above.	
823 Singapore seeds not selected	= exactly 334 gr.	
It will be seen that these figures follow and confirm each other. Going further on we find that		
1,754 seeds Sumatra	} = 1 kilo = 2 1-5th lb.	
2,470 " Singapore		
from which		
108,748 Sumatra seeds	} = 1 pie. 62 kat. = 1 cwt. 99 lb.	
153,140 Singapore "		

That is to say, for a given weight it would need about ¼ more of Singapore seeds than of Sumatra; or again, that an acre which gives say 6 pls. in Singapore, gives 8 to 9 pls. in Sumatra. These trials were made before witnesses, and in perfect good faith, the beans being counted one by one: and the conclusions I derive from them appear unassailable. [Quite so: but the seed from the Straits would have to be at least ¾ dried to prevent fermenting, sweating or rotting on the journey: whereas the local seed was probably quite fresh, and only dried to the extent of the water being off it.—*Translator.*]

Thus one goes on: and little by little confidence in the future of coffee gains ground: then came the first virgin crops; and from that moment, like a flash, there was a rush for coffee. For who remembers the Deli of 1892? What a change! and what lee-way it has made up. In place of this medley of rough tracks through a rugged country there has grown up a net work of roads which act now as arteries to this emporium of wealth which Upper Deli has become.

From these plateaux formerly almost inaccessible to European enterprise, come down today in abundance the thousand and one products which help to feed the trade always increasing from the coast.

It is with the introduction of fixed and permanent cultivations that the fortunes of the country definitively rest on a solid foundation: the earth, no more confined to hysterical production only, and prematurely forcing out some thousands of piculs of tobacco, afterwards to be abandoned to brambles: but now, the land, everywhere and always at work, pours its unbroken tide of treasure into the hands of man. Behold the secret of the upward flight which the Deli of 1905 has taken!

Following the general progress the Railway, which in 1892 ended at Deli Toewa, that is to say nowhere, has now reached the glorious plateaux of Seblangit and Betenus, passing lightly over hills and dale; and who can predict that, link by link some day it will not penetrate even to the mysterious regions beyond which are still unknown. Lake Tobah has become a Spa!

And then what a sight for sair een: what a dazzling sight those thousands of coffee trees in blossom! This milky whiteness falling in the days of blossom like a bridal robe upon the earth, gives something of repose to these lands of violent contrast: here a monotonous dulness: there a wildness surpassing in abruptness the wildest of the Alps.

Another effect not less happy than the lasting nature of the cultivation is the greater attachment of us Europeans to the country in which we formerly were, so to say, birds of passage. In those times no one dreamt of spending his life in this road-side caravanserai. Like a bird on the branch: no one cared to build a nest. The only wish was to take wing and leave far behind a land without charm and without gaiety. Now they live and can manage to forget old Europe. E. M.

KEW GARDENS IN MAY.

People who can only manage to come once to Kew Gardens during the month of May do well to time their visit so as to hit off the moment when the hardy azaleas are in flower, and the wild hyacinths are making a blue carpet in the beech-wood that neighbours the plot of garden where these delightful shrubs grow. It is not every year that the bluebells and the azaleas are out at the same time. That only happens in fortunate springs. But this year spring is very fortunate, and the two events are coinciding perfectly. The azaleas will outlast the bluebells. The grey-blue haze that makes the little copse look as if the sky had dipped down into the grass, will have passed away long before the reds and pinks and oranges of the azalea garden are over. But at this moment both the wild flowers and the cultivated ones are in their prime; and we do not remember having ever seen their effects more happily combined. The colours of the azaleas are, or seem to be, unusually brilliant this year, while the recent spell of hot, dry weather has allowed their flowers to open without any disturbance. Neither the tints nor the forms of the blossoms have been spoilt by rain. Not a single flower has yet fallen; and though of the mass of buds upon the shrubs only a small proportion have yet opened, there is blossom enough to make the parterre a blaze of wonderfully lovely colour: and the brilliancy of this centre of glory is delightfully set off by the freshness and delicacy of its surroundings.

Mid-May, when alternate rain and sunshine have done their parts as they have done this year, is an exquisite moment for foliage. The trees are full, but they have not ceased to be transparent. Green is a colour still, not yet an obscurity. There is no trace of dust or dryness; not yet the grey oppression of midsummer density. All is delicate, vivid, diaphanous, fresh. The horse-chestnuts, the thorns, the lilacs, the laburnums are in flower. Lawns are powdered with daisies, longer grass is covered with fieldrush, butter-cups, and ground-ivy. The oaks and the Spanish chestnuts have advanced to the point of delicately defined leaf; while the beeches, though they have come out of that early ethereal stage when they seem rather to be sprinkled with green than clothed with leaves of definite shape and consistency, are still so slightly covered that little is lost of the stately forms of their grey boles, while new beauties are gained by the breaking up of the sunshine into dancing lights and shadows. The leaves are still small enough for the outline of each to complete itself distinctly to the eye; there is as yet no merging of detail in mass and group, and the general effect is bright and merry, like the flecking of mackerel clouds on a summer sky.

There is no part of the Gardens from which the eye may not take its fill of the vivid greens that belong specially to spring. But if we want to enjoy at one glance the greatest variety of tints, and the most striking contrasts of colour, we must follow the walk that leads between the Azalea garden and the beech-grove where the bluebells are, cross the low-lying shrubbery where the rhododendrons grow, climb the slope on the further side, and take our stand with the river to the left, and the beech-wood to the right, and the rhododendron valley in front of us. So we shall be able to see all at once the irregular screen of Scotch firs, cedars, and dusky hollies, that makes a dark foreground to the grove of light-green beeches; the deep-red, pale mauve and opal-white of the few rhododendrons, already in flower, which show up so finely against the green masses of their slower-flower-

ing neighbours; the flame-colours of the azaleas; the warm and tender pink of the young leaves of the copper-beeches that are scattered so generously about this part of the plantation; and the blue gleaming of the river through the belt of fine trees that girdles the grounds.

But though this spot commands at this moment the most beautiful view in the Gardens, and the blaze of azaleas in flower makes the most splendid show of all the year,—yet there is about it all just that touch of sadness that belongs to any climax. It is the best, but it is also the last show of spring. The next changes, the next showers will usher in the summer. Not only will the foliage be never again through all the year so tender, so vivid, and so varied as it is now, but so many flowers are already over, so many beautiful pages of the year are turned. The wild daffodils that made a little while ago such charming pre-Raphaelite pictures all about the Gardens are quite gone. So are all the rarer kinds of same family that filled the formal beds a little later, and contributed so handsomely to the yellow effects that make an essential part of the radiance of spring. The fine magnolia that stood like a white beacon in the centre of the Azalea Garden in the beginning of the month, has shed almost all its flowers. The Siberian crabs have shed theirs also, though some of their consins from China and Japan are only now coming into bloom. Over, too, is the splendid show of tulips that filled the space between the round pond and the Palm House. And though a few tulip-beds near the hot-houses still keep their brightness, the flowers are mostly overblown, and their magnificence is degenerating into garishness. One is not sorry to pass from them to the rock walk and enjoy the contrast of the quiet beauties of the multitude of interesting plants, common and uncommon, springing up in its crannies. Periwinkles, white and blue, scillas and fritillaries, a few lingering primroses, common dog-violets, ferns, familiar and unfamiliar, meurling their rough and tender fronds; saxifrages, columbines, forget-me-nots, lilies of the valley, white and yellow alyssums—all our common shrubbery friends mingle here in studied disorder with rare foreign plants. One of the first things to attract attention as we enter the walk, is the exceedingly tiny and exceedingly brilliant flower of the white sandwort from New Zealand, the minute foliage of which clings to the stones like moss, while each little blossom stands out with the distinctness of enamel. Another white flower of very different character that no one could pass without admiration, is the noble *Trillium grandiflorum* from North America. A week ago the most beautiful object in the whole rockery was a lovely double peach, covered with deep-pink blossom, which stood like a sentinel at the far end of the walk, seeming to guard the little defile. Now that also has lost its glory, and one passes its place almost without noticing that there is a tree there. But if some blossoms are passing away, others are still opening. Everywhere about the Gardens, the common yellow broom is coming into flower, and two magnificent bushes of the earlier flowering variety, known as *Genista praecox*, are still (or were when the writer saw the Gardens a day or two ago), in full beauty. With the afternoon sun shining upon them they flash and radiate like immense fires, but seen later in the evening, the coolness and tenderness of their pale yellow strikes one most. Some excellent effects of colour are got in beds without the use of a single flower by mixing the copper varieties of mint, plum, berberis, and beech, with variegated ribes,

euonymus, dogwood, and maple, and a most beautiful blood-red shrub that well deserves its name of *Acer sanguineum*. Everywhere there is an extraordinary profusion and variety of colour to delight the eye. And sight is not the only sense to be delighted in this seductive paradise. The air is sweet with most delicious scents, and the groves are musical with the songs of birds.—*Spectator*.

VISIT OF A BOTANIST.

Dr. Phil Carl Holtermann of Munster, Westphalia, is on his way out to Java where he will stay a year or so at Buitenzorg, specially studying the "fungi," and afterwards visiting New Guinea, Borneo, and Sumatra. Dr. Holtermann has been a few weeks in Ceylon, chiefly with Mr. Nock at Peradeniya and Hakgalla. He is anxious to see our pitcher plant (*Nepenthes distillatoria*) which used to be very common in the damp hollows between the Museum and Victoria Park, and specimens of which, we trust, are still to be found in that neighbourhood to interest such visitors as Dr. Holtermann. If not, they can be freely seen off the Galle road near Mount Lavinia and Ratmalane. We shall take care Dr. Holtermann sees at least one plant before he leaves by the ss. "Bayern" on the 21st. He hopes to spend a month in Ceylon on his return and to meet Dr. Trimen.

THE LAST CINNAMON SALES.

We were able, in last Wednesday's issue, only to call attention to the Report of a leading Firm of London Agents, on the Quarterly Sale of Cinnamon held in Mincing Lane on the 27th May last. The prices realized were in every way satisfactory—we mean, having regard to those which had ruled for months and years past, though values have not by any means approximated to those which the spice had fetched, say in the sixties and seventies. At the February Sales, there was a slight advance, which was said to be chiefly due to the limited quantity offered—only 766 bales—and to the scarcity of fine qualities. As we noted at the time, only two of the well-known marks aggregating less than 100 bales, were then represented, A.S.G.P. (Golna Pokna) and F. B., Franklands—the latter only a small parcel of 9 bales which showed an advance of fully 1½d a lb. It was feared that fuller supplies might affect prices prejudicially at the May sale; but so far from this being the case, the whole of the 1,063 bales offered found buyers and there was an advance in price in all grades, from ½d to as much as 1½d. The cheering features are, that none of the Cinnamon had to be bought in, and that the common and medium barks shared in the advance. At the February sale, it was only fine that showed any appreciable rise in price. Nor can the general rise be referred to a limited supply, as in May last year, the quantity which offered was much the same—1,073 bales; so that we are entitled to assume that there is an improving demand for our spice. It cannot be said that there has been any serious falling-off in our Exports, though from the better known estates there have been complaints of the effect of recent droughts and of the scarcity of peelers. Somehow, the Customs figures are maintained, chiefly, we suspect, from the produce of Native Gardens, from which in emergencies bark is obtained

all the year round. Anyway, 1894 with an export of close on two million lb. of quilled bark, was a good average year, the quantity shipped having been exceeded only thrice before at intervals. This year, too, the exports have been fair—the quantity of quilled bark being in excess of that exported during the corresponding periods of the two last years, and having been exceeded in 1892 by only 50,000 lb.; while in chips the current year is well ahead of the past three years with more than 100,000 lb. in excess. The explanation of the statistical position of the article being good is, we suppose, that there have been larger deliveries. Can any expert tell us what is the explanation of this? We have recently read of the value of cinnamon as an anti-septic being recognized in Western Medicine—the natives have always believed in its efficacy as such—and in a sick room, especially in typhoid, we have heard that a small quantity burnt at intervals in a brazier has a very wholesome effect. Then, there was much talk a short time ago of its efficacy—has the statement been confirmed by local medical experience?—in cases of cancer; but it is hardly likely these have told appreciably on the demand. Its chief use is for flavouring purposes—the growing consumption of chocolate and cocoa preparations should lead to an active demand—and in the preparation of incense in Roman Catholic countries. Whatever the explanation, the improved demand and the consequent better prices must be good news to long-suffering Proprietors, and will we trust continue and even grow; for even on the best estates the profits from cinnamon are but small, as compared with tea and coconuts. Let us hope a good time is coming for our historical spice.

Turning to the catalogue we find Golna Pokna, the well-known Kadirana property owned by the family—the proprietor, we believe died a Mayor of Bristol—heading the list with its spiceselling up to 1s 4d per lb. F. S. W. S.—Wester Seaton the property of the veteran Frederick Schrader—runs in its neighbourhood with prices ranging only 1d less; and is closely followed by Kimbulpitiya (also Mr. Schrader's property) and the marks of Rajapakse Mudaliyar, which fetched prices up to 1s 1d. The medima marks ran up to 9d; and even "unworked" cinnamon—that protest against needless and expensive handling of the spice in London Docks and Warehouses—was not neglected, as it usually is at the auctions, but was all taken off at prices ranging from 6½d to 8½d per lb. Good so far; and we are not surprised to find cinnamon reported locally as "firm." May it be always so!

NOTE ON EXTRACTION OF AGAVE AMERICANA FIBRE AT COIMBATORE.

When on tour in the Madras Presidency in 1892 I was much struck with the excellent quality of the fibre of *Agave americana*, which was exposed for sale in many shops in the Coimbatore bazar. A small quantity of the fibre was sent for report to the Imperial Institute, in connection with which I was at that time engaged in the investigation of fibres of Indian production which are, or might be, utilized for brush manufacture.*

Quite recently the Madras Agri-Horticultural Society received a communication from Dr. T. Cooke, Technical Sub-Director of the Imperial Institute, South Kensington, stating that fibre of *Agave ameri-*

* See Imperial Institute, *Hand-book of Commercial Products*, No. 12, Fibres used for Brush-making.

cana (grown, I take it in the gardens at Madras) has been very well reported on, and is considered to be nearly as good as Manilla hemp.

The only specimens of fibre of *Agave americana* which were sent to the Imperial Institute from the Madras Presidency were those obtained by himself at Coimbatore, which must be those which have been thus favorably reported on.

Dr. Cooke's letter to the Agri-Horticultural Society was communicated to me, together with a series of questions by a fibre expert, I accordingly deputed the Museum Herbarium Keeper to visit Coimbatore and gave him specific instructions as to the nature of the inquiries which he was to make. The result of his inquiries *in loco* is embodied in the following note—

Agave americana grows in all soils (red, black and gravel) in the Coimbatore district. It is planted extensively as a protective hedge along the Madras Railway line, and flourishes, in the open, freely exposed to the sun, and unsheltered by trees, shrubs, &c. In some places between Coimbatore and Erode where the agave is overgrown with creepers, the plants are unhealthy; and in other places (*e.g.*, near Tudiyalur), plants which are shaded by tamarind, nim and other trees, are stunted, while those which grow in the open, are rich in leaves and luxuriant in growth.

The age of the plants from which the leaves are taken for fibre is six to seven years. The old green leaves falling outwards from the central stem are cut for fibre.

The fibre is, as a general rule, extracted immediately after the leaves have been cut, or after a lapse of a few hours. Sometimes, however, the leaves are kept for a day or two and the fibre is extracted when the people have leisure.

The extraction of the fibre is performed by hand and no machinery is used. The fibre is extracted by two methods, viz. (a) scraping and (b) maceration.

(a) *Scraping*.—The leaves are cut, the sharp spines removed with a knife, and about six inches cut off from the top of the leaf. The leaf is then split longitudinally into four or five pieces, which are beaten with a wooden mallet and placed on a board 4' x 4' x 3" held firmly by the toes. The pulp is then removed by means of bamboo scraper, one edge of which is shaped in the form of a blade, and the fibre dried by exposure to the sun.

The fibre obtained by this simple process without washing or bleaching is very clean and free from pulp. The staple is not, however, very long. It is made into thread, which is used in weaving grass mats.

(b) *Maceration*.—As in the previous method of fibre-extraction, the leaves are cut, and the spines removed. The whole leaf is then beaten with a wooden mallet, and thrown in bundles into tanks or wells, in which it is left to macerate for a fortnight to twenty days, or until the pulp is quite decomposed. The bundles are then taken out dried and bleached in the sun.

The fibre obtained by this process is longer than that obtained by scraping, but is not nearly so clean.

A very large supply of the fibre could be obtained, if a demand of it arose. At present it is sold in the bazar at the rate of 2 annas per lb., but if a regular trade in it was started, the price would doubtless be reduced.

The mean temperature of Coimbatore is 78° ranging between a maximum of 97° and a minimum of 64°. The annual rainfall of Coimbatore is about 21 inches, of which half falls during the north-east monsoon (October to December), the remainder being distributed over the other months of the year.

(Signed) EDGAR THURSTON,
Superintendent, Govt. Central Museum.

DR. CLEGHORN AND REMINISCENCES.

I see from the *Observer* that Dr. Hugh Cleghorn is no more. I have a very kindly recollection of the dear old man whom I met when in Edinburgh between 1887 and 1889. Writing of Dr. Cleghorn reminds me in what good stead the fact of my "belonging to Ceylon" stood me in the West. (Alas! it is a stumbling-block and an offence to our

Government in Ceylon!) Through it I made many friendly and pleasant connections in many parts of England and Scotland, and it once served me well in Paris. But I must tell you of a strange experience I had in Scotland. I once happened to be travelling with a friend—a "visiting agent" we would call him here—who was bound for a sheep farm in the wildest part of Gallowayshire. I remember now passing Craigenvuy (with its associations of Carlyle) on our way, and finally reaching our destination for the night—a shepherd's cottage on the borders of Loch H——.

After supper my friend and I trudged across the moor to visit another herd's cottage about a mile off. It was a "misty, moisty" dark night, and as we walked along we heard the sound of footsteps approaching along the lonely road—for except for one country house, there were no dwellings but scattered herds' cottages for miles around. "Good night, Sir," called out my companion to the ghost of a tall man that came by us; then after a few words "Let me introduce you to my friend Mr. D." But the tall stranger seemed to have received a shock. "D—— D——," he muttered, "Where did I hear that name? Of course—you belong to Ceylon—any relation of Major D—— of the 'Rifles'?"

And so he rattled on till he carried us into the only decent house in the countryside, and there introduced me to the Sheriff of L—— and his daughter, who were his guests. But I had to say all I knew about Ceylon that night, for the benefit of my new friend who had last seen the place long before I had been born, and gave me what to me, was an amusing account of Colombo in his day.

But to return to Dr. Cleghorn; I once came before him for an "oral" in Botany. He was a venerable looking old man with a grey beard, and looked very much older than he must have been (about 7 years ago) for I find that he was only 75 when he died. Besides the good Doctor seemed to be more infirm than he should have been. "You belong to Ceylon!" he exclaimed as I presented myself before him, and straight-way we started to compare notes,—my venerable Examiner seeming quite cheered by the recollection of the "beautiful place" as he called it. But before we were aware that the prescribed ten minutes for the "oral" had slipped by, the sound of a hand-bell (indicating that the candidates must "move on" to the table of the next examiner) was heard. "What is the botanical name of the rice plant?" he hurriedly asked. I gave it him. "Quite right, quite right!" said the dear old doctor, shaking inwardly with laughter, while my lecturer on Botany who sat behind the Examiner, was literally convulsed. On another occasion I went before Marshall Ward and Prof. Balfour, and again through my Ceylon connection no doubt, I got the question:—"Is the fruit of the coconut palm a nut? If not, what kind of a fruit is it, botanically speaking?" I scored there, and as I returned after my oral I found two of our men discussing the nature of the coconut fruit. "Why, man," said one, "if a coconut is not a nut, what is it?" "It's a drupe of course—a fibrous drupe," replied the other, and added maliciously "not unlike your head!" But every time I look at the signature of "H. Cleghorn, L.L.D." written in a fine bold hand among the rest of the names at the bottom of my diploma-sheet, I cannot help smiling at the recollection of the little incident I have referred to above, and of how *Oryza sativa* pulled me through my Exam, and saved the conscience of dear Doctor Cleghorn. D.

GREVILLEA ROBUSTA IN ENGLAND.

(From the *Gardeners' Chronicle*, May 11th.)

Looking in recently at the Botanic Gardens at Cambridge, where visitors will always find much of beauty or of interest, either out of doors or in the fine open ranges of well-furnished glass-houses, I found an unusually fine specimen of this graceful plant. Considering the grace and beauty of *Grevilleas*, of which there are many species, it is rather surprising to find them so little and so seldom grown, unless for foliage plants in a small state. And yet

there are few greenhouse plants more readily raised from seed or cuttings, if inserted at the right time, or more easily grown. While for the clothing of walls, pillars, rafters, and arches, few plants can equal or excel Grevilleas. And yet I have known several good gardeners who have never seen these plants in bloom, unless at Kew, or in other botanical gardens.

This is the more surprising as they are about as easily grown as a *Cytisus*. The contrast between the two species may be said to be between glare and grace, and the glare of the gold has won by ten-hundred to one or more. In other words a thousand *Cytisus* are bloomed annually to one *Grevillea*. This proportion would assuredly be greatly altered if visitors to botanic gardens at this season of the year would enquire for *Grevillea robusta* and other species in flower. The specific name will probably surprise the uninitiated; for though we have such species as *elegans*, *elegantissima*, &c., few can beat the normal species for the extreme gracefulness of its drooping flowers.

For changes of habit or of colour, the following species may also be grown:—*G. alpina* (alpestris), *G. Fosteri*, *G. Drummondii*, *G. fasciculata*, *G. asplenifolia*, *G. Manglesi*, *G. lavendulacea*, *G. I. rosea*, and *G. glabra*. The fine specimen in the Botanic Garden, Cambridge, is planted out, and has a free head, which suits it admirably. *Grevilleas* also form model rafter plants, sweeping back to the ground lines with inimitable grace and elegance. The flowers also have great persistency after cutting, if the simple precaution is taken to cut the stems afresh every second day they are in water. Cut spray in vases and baskets in living rooms have thus been kept fresh and beautiful for a fortnight or three weeks after cutting.

There should be money in *Grevilleas* in bloom in a small state to the first enterprising florist who succeeds in putting them on the market in quantity, in sizes but little taller than the market samples of *Cytisus racemosus*.—D. T. F.

CHEAP TRANSPORT AND HOW TO GET IT—No. IV.

BY J. DAVIS-ALLEN.
RAILWAY TARIFFS.

The late Water Bagehot, Editor of the *Economist* and trusted adviser of the English Treasury Bench, avers in a posthumous work that chief among the essentials of a good business man is stupidity. Now stupidity is not commonly ranked among the virtues, and to call a man stupid is on all hands accounted inde; it would seem, therefore, as if Bagehot's literary executor had played the Fronde with him. But what he meant by stupidity is clear enough, and leaves one all the more surprised at his use of so opprobrious a term. He meant unflinching repression of the intellect to the here and the now; judicious indifference to the flaws and hitches of an argument so the conclusion be as desired; impatience of any display of wisdom beyond the needs of the case in hand; above all, abhorrence of originality as being akin to the caperings of a wild ass: aptitudes these with which the fortunate are born, to which the well-advised aspire, and without which the arts and pursuits connected with the *exchange* as distinguished from the *production* of commodities, notably of those commodities popularly known as "Scrip," cannot be successfully prosecuted. Now and again a man like the Premier of Cape Colony, Mr. C. J. Rhodes, despite his portentous originality and the far-brought and epic considerations by which he is habitually actuated, is able to exploit the commercial spirit by commercial methods for eminently uncommercial ends. Such cases are, however, rare, and of the bulk of the world's

business Bagehot's doctrine holds good. But not of all of it; not, for instance, of that department of railway administration which is concerned with the problems and devices of the

TARIFF.

In this field so unusual are the aptitudes in demand that those accounted "experts" (or let us say "authorities" and leave the meanean word "expert" to the law-courts and predatory finance) are not above a score, taking England and the United States together. How they groped their way to the views and methods in vogue today, and how little by little the labyrinthine tariff schemes which now obtain were elaborated, may be studied in the Parliamentary Reports and legislative measures extending from the Railways Regulation Act of 1840, the first of the general Acts, to the important Railway and Canal Traffic Acts of 1888 and 1894. In the earlier railway bills provision was made for allowing private individuals to run their own conveyances on the metals with the same rights as on the public highway! The tariff notions of those days were to match: so much a mile for so much weight, and (odder still to the modern man dead against preferential rates) special terms to regular customers. The numerous and often recondite considerations by which the classification and rating of freight are now determined were then accounted of only academic interest. Starting with the axiom common to most industries that cost of production is one of the chief determinants of price, the first railway managers anxiously endeavoured to assimilate the charge for every service to the cost of it, whereas now there is no pretence that the charge in any particular case bears any relation to the prime cost to the administration. The "Canadian Pacific" carries, or used a little while back to carry, wheat from Fort William at the N.-W. end of Lake Superior to the Atlantic sea-board at under prime cost of conveyance—stress of competition of course,—charging on the far shorter Fort William-Winnipeg section rates so much in excess of prime cost of conveyance as to average out at a profit on the entire system. So with most railways: local traffic and through traffic, long hauls and short hauls are differently rated; and places where there is competition with, say, water carriage, or which can supply return freight, get easier rates than places where the railway is the sole means of transport, or from which the cars run back empty. Or (still illustrating the same principle) an industry struggling under severe competition will be assisted by the concession of a pepper-corn rate on its output, it being to the interest of the railway to keep the industry on its legs for the sake of the inward traffic it puts on the metals. It should be noted that the grant-in-aid, for this is what the reduction of the rate amounts to, is made on the outward rather than on the inward traffic, because the latter, consisting for the most part of articles in general demand, any lowering of the rates thereon would necessarily be enjoyed by persons and industries needing no such assistance.

The late Mr. C. H. Parkes, Chairman of the Great Eastern Railway (England) once said to the present writer that while no hard and fast rules could be laid down for the classification and rating of railway traffic,

FOUR CONSIDERATIONS

were always present in his mind in dealing therewith; (1) that there is no assignable limit to the extent to which traffic may be created by the increase of facilities; (2) that the judiciousness of any proposed tariff change is best measured by its remoter effects; (3) that any

change substantially detrimental to the public will "in the long run"—a favourite phrase of his—prove detrimental to the railway; (4) that with respect to industry, railway rates are in the nature of a tax, of a tax too which, being heavier in proportion to the ratepayer's distance from his market, is levied on disability, and is therefore in conflict with the sound principles of taxation. If it be objected that there is more philanthropy than business in these maxims, we point for answer to the work which Mr. Parkes did in the light of them. He found the "Great Eastern" virtually bankrupt, a by-word and a shaking of the head to shareholders and public alike; he left it in 1893, after 19 years of original and intrepid management, a "first-class" railway, in many respects *primus inter pares*, notably in the frequency and punctuality of its train services, and in its treatment of third-class passengers. Few railway companies are well spoken of by shareholders and public alike: Mr. Parkes's Company was so spoken of. We cite him here because his achievements, among them the working men's suburbs East of the Lea which by means of the half-penny fare he may be said to have created, demonstrate the power of the tariff for good, and afford an object lesson in the wise use of it.

Oftener unhappily

THE POWER OF THE TARIFF

is either ignored or misused, and is shown in the disorganisation of business and the paralysis of industry. It is not too much to aver that the collapse of the English agricultural industries and a good deal of wrong-headed political agitation ensuing therefrom are mainly due (we say "mainly," because it cannot be too clearly kept in mind that no large economic change is referable to a single cause) to the amazingly low "long-haul" rates to the sea-board which obtain on the trans-Atlantic railways: a trifle over a farthing per ton per mile (6.39 mills exactly) being average rate for all classes of freight on the wheat lines of the United States.

English agriculture thus got its first wound from foreign railways; it would appear to be about to receive its death blow from English railways; and this by means of preferential rates in favour of imported food-stuffs. Aided, however, by the London Chamber of Commerce and the Mansion House Association, the imperilled industries have instituted in the Court of the Railway and Canal Commission a test-action against the London and South Western Railway under clause 27 of the Railway and Canal Traffic Act of 1888, which provides "that no Railway Company shall make, nor shall the Court or the Commissioners sanction, any difference in the tolls, rates or charges made for, or any difference in the treatment of, home and foreign merchandise in respect of the same or similar service." The applicants alleged that in the case of certain specified kinds of merchandise, namely bacon, fresh meat, lard, butter, cheese, hops, hay, and wool, the Company charged on the imported article an uniform rate of 6s per ton from Southampton Docks to London (76 miles) whereas, from Southampton and intermediate station to London the rates on the home-made article ranged from 9s 8d to 23s. The respondent Company admitted the preference, but justified it on the following among other grounds: That the lower rate on imported goods was an apportioned amount of a through rate covering ocean carriage; that it did not include certain terminal charges which for

fair comparison with the higher but inclusive rate must be taken into account; that the arrangement complained of was necessary to enable them to compete with water carriage to London; that the local traffic because insufficient in volume, badly packed, and necessitating more shunting, supervision, and risk, could not profitably be carried at the lower rate. In result the Court ruled that the Company had made good their answer in respect of all the articles in question except hay, hops, and fresh meat, on which three the rate was ordered to be lowered. The report of the trial

"MANSION HOUSE ASSOCIATION v. L. & S. W.

RAILWAY COY.

and the comments of the Press thereon merit careful study on the part of all concerned in railway administration. It is a leading case, and as Lord Jersey's recent motion in the House of Lords portends, will be followed by fresh legislation. For as the law stands, it has been shown to be inadequate to safeguard the trade of the country under the tremendous powers of control exercised by the railway companies through the tariff.

The Railway and Canal Commission mentioned above is a tribunal created by Act of Parliament in 1873 and reconstituted with enlarged powers in 1888. Its business, as we have just seen, is to adjudicate on the legality of rates and charges, and of claims to reductions thereof in virtue of certain "special circumstances" which have received statutory recognition. Questions of the classification of freight come within its jurisdiction; and it has power to order such "reasonable facilities" for traffic as the interests of the public may require. Similar functions are discharged in the United States by the Inter-State Commerce Commission. In several of English Colonies where the railways are in the hands of Government no important

TIME-TABLE OR TARIFF-CHANGES

are made without prior reference to the Chambers of Commerce, which are thus invested, and to the common good, with a quasi-official status in the Railway Department. Says the General Manager of the Cape Government Railways in his Administration Report for 1893.—"The plan I have adopted in concert with the Chief Traffic Manager of consulting in greater detail with Chambers of Commerce, and of meeting other public bodies interested in railway management will, I trust, remove some of the causes of complaint to which attention has been called. I think the Department is now more in touch with the public; and while I cannot expect total exemption from complaint or criticism I trust the public is satisfied that as much as possible is being done to meet its requirements. After all the whole object of the Department should be to meet the reasonable wishes of the public."

So far we have discussed our subject without specific reference to local needs and circumstances; to these we now turn. And first: the probable enlistment of

PRIVATE ENTERPRISE

for railway purposes in Ceylon has excited a good deal of enquiry as to how the public is to be protected against extortionate administration, and with this in view it has been suggested that with respect to rates Government should at the outset fix a maximum tariff. But we submit that such a provision would fall ludicrously short of efficient protection. As the facts to which in this article we have sought to draw attention clearly show, it would barely touch the more serious sources of danger. And supposing a schedule

of maximum charges were enacted, the cardinal question would still remain open, what may the public demand in return for the statutory rates? Mere conveyance from point to point? If more—how much more? Conveyance is only one of the services rendered by a railway Company. Handling and safe custody of goods at stations and in transit; special provision for fragile and perishable merchandise; collection and delivery of goods; passenger conveniences in all their variety; police safeguards—such are a few of the appliances, cited by way of reminder, which it is the multifarious business of railway administration to provide: are all of them covered by the statutory rates? If not, which may be charged for separately, and on what scale? How ineffectual against rack-rating and undue preference are the popular expedients of statutory tariffs and classifications (the two necessarily go together) is exemplified in the case of the Mansion House Association v. L. and S. W. Railway Company, and in greater detail in the 1892 Report of the Special Parliamentary Committee on Railway Rates (England). Nor are the expedients merely ineffectual; they are themselves evils inasmuch as they conflict with the pliability which is indispensable if tariffs are to be kept adjusted to the ever-varying needs and contingencies of trade.

Attempts to provide in advance and once for all against the innumerable points and varieties of conflict of interest stand now discredited. The best opinions are in favour of the reservation to Government of a right of control for specified purposes: which power shall be exercised as and when circumstances require by a tribunal similar in status and powers to the Railway and Canal Commission of England or, perhaps better, the American Inter-State Commerce Commission, and from whose ruling both parties have a right of appeal to the Supreme Court. Be it noted, that such a tribunal, with such powers is every bit as necessary where the railways are in the hands of a Government Department as it is where the railways are in the hands of a Board of Directors. It is indeed more necessary, for the red-tape of your public official is a deal less open to reason than the rapacity of your private capitalist.

Turning now to another matter, let us begin with Mr. Parkes' fourth maxim. In stigmatising

RAILWAY RATES AS A TAX

levied on disability, he had in mind, we may presume the first of the four principles of taxation enunciated by Adam Smith in the concluding section of his "Wealth of Nations," the principle that the subjects of a State should be laid under contribution for the purposes of Government 'as nearly as possible in proportion to their respective abilities.' That remoteness from market as a disability is obvious, and the inequity of taxing a producer *pro rata* on his remoteness is obvious too; what perhaps is not so obvious is the appropriateness of the word "tax" to such payments, and it may freely be admitted that whereas in England railways are private property, Mr. Parkes's description of railway rates might not be allowed to pass unchallenged. Where, however, railways are an appurtenance of Government, and are worked as a source of general revenue as in Ceylon, the appropriateness of the description is beyond reach of challenge. Consider the following statements of facts abstracted from the official returns for 1893:—(1). That after providing for Working Expenses, interest on Capital, up-keep,

and new works, the Ceylon Government Railway contributes Rs. 1,096,065 to general revenue, or in other words sustains nearly 8 per cent of the cost of the other Departments. (2). That this item of general revenue is drawn for the most part from the Tea industry which contributes upwards of 40 per cent of the gross receipts of the Ceylon Government Railway. (3). Those estates which send their Tea to and obtain their supplies from the coast otherwise than by rail escape the tax altogether. The inequality of incidence with respect to the industry as a whole may be gauged by the fact that in 1893 about 28,000 tons (net) of Tea were enrailed against 37,000 tons shipped; (4) that not only is some tea taxed and some (say 25%) not, but even upon the taxed section of the industry the incidence is most unequal, the Haputale estates, for example, being amerced more heavily than the Kandy estates in the ratio of their mileage from Colombo; (5) and generally, that in so far as the C.G.R. is employed as an instrument of taxation the coast is released from the burden of the cost of Government at the expense of the interior.

These considerations go to show that between the yield of say, the Customs and the surplus paid into the Treasury by the Railway Department there is no difference except the inequity of the latter; and, further, how ill-suited are railways for taxational purposes.

Under the circumstances which obtained in some of the Colonies, possibly also in Ceylon, it may be politic to make the existing lines contributory, within limits, to extensions, but even then the contribution should be equitably levied. Always it should be a principal care with a Government administering the railways of a country to redress geographical disabilities by one or other of the tariff expedients—the "zone system" to name only one, devised and practised by private enterprise.

A third peculiarity claiming a large share in the shaping of the Ceylon railway tariff—the fiscal tariff too—is to be found in

THE CURRENCY.

Accepting Mr. Parkes's principle of levying rates as if they were taxes, traffic will be classified and assessed according rather to ability than to prime cost of transportation, the aim of the management being to make a profit, not on each transaction, but upon all of them taken together. Now it is clear that in a silver-using country like Ceylon, so long as the gold-value of silver continues fluctuant, the kind of ability under discussion will hinge largely on exchange; and, further, that of two industries that industry should be able to sustain the higher rate which pays most in silver and is paid most in gold. What modifications exactly would require to be made in the existing tariff if in the classification and rating of merchandise these considerations were allowed their due share, we are not prepared to say. We need first a schedule of industries scaled according to the degree in which their incomings and outgoings are liable to be affected by the gold-price of silver; and such a schedule presupposes an investigation similar to that instituted by the German Government prior to the adoption of a gold standard.

COFFEE IN MATANG: MONTHLY REPORT FOR APRIL. —Che Muntih, who owns a coffee garden, near here, applied to me for 20 acres more land for the same purpose, and I hope more people will soon take up this cultivation.—A. T. Dew, District Magistrate, May 20.—Perak Government Gazette.

INDIAN PATENTS.

Calcutta, the 6th June, 1895.

Applications in respect of the undermentioned Inventions have been filed, during the week ending 1st June 1895, under the provisions of Act V of 1888.

FOR FLOORING STABLES AND PORTICOES.—182 of 1895.—H. Fornaro, Engineer and Contractor, residing at No. 17, Convent Road, Entally, for flooring stables, porticoes, passages for carriages and horses, foot-paths, etc., etc., in such a substantial way as has never been done before.

FOR IMPROVEMENTS IN THE CONSTRUCTION AND MANUFACTURE OF SHINGLES FOR ROOFS, WALLS, FLOORING BOARDS, AND SUCH SIMILAR PURPOSES.—185 of 1895.—Joseph Heim of Singapore and Penang, Merchant, residing at Penang, in the Colony of the Straits Settlements, for improvements in the construction and manufacture of shingles for roofs, walls, flooring, boards, and such similar purposes.

FOR IMPROVEMENTS IN AND CONNECTED WITH MACHINERY FOR PRODUCING COTTON SEED MEAL.—367 of 1894.—George Henry Croker, an Inventor, of 18, Bellevue Road, Seacombe, in the County of Chester, England, for improvements in and connected with machinery for producing cotton seed meal from cotton seeds. (Filed 23rd, May, 1895.)—*Indian Engineer.*

◆

"CAMPHOR"—A NEW PRODUCT:
WORTHY OF SPECIAL ATTENTION FROM
CEYLON PLANTERS.

THE Acting Director of our Botanical Gardens deserves the thanks of the planting community for being on the alert at this time, to bring his available supply of camphor plants under their notice. For, we have observed, equally with Mr. Nock, that the market reports speak of an anticipated famine of the raw product in the Camphor trade, and the camphor tree is one that may readily be grown in many parts of Ceylon. This is proved by the success which has attended the cultivation both at Peradeniya and Hakgalla, and it is Mr. Nock's belief that it will flourish—in the drier districts especially—anywhere between 2,000 feet and the frost-line. These conditions make it plain that there must be a wide extent of land suited to the cultivation of the camphor tree and we cannot help thinking that the present would be a favourable time for some of our more enterprising planters to commence to give it a trial. We learn that a small, young, plantation of camphor trees, is growing well at Peradeniya Gardens and the trees are in perfect health and vigour at Hakgalla. Uva ought from all accounts to be a "paradise" for the camphor tree!

The annual export of this product from Japan averages about 5,000,000 lb. (five million pounds) and the prices quoted in the *Pharmaceutical Journal*, dated 8th June, are for "Crude" Camphor from 155s to 160s per picul (picul = 133½ lb.) and for refined Camphor the quotation is 1s 9½d per lb. and even up to 1s 10½d. Camphor is an article of daily consumption; for it is "used as a medicine in diseases—from the most fatal form of Asiatic cholera to a mere cold in the head." It is also used in the manufacture of explosives and, we believe, enters largely into the composition of the smokeless gunpowder.

Apart from these possible outlets for large quantities, we must remember that the plant is an ever-green ornamental tree of the laurel family, and yields valuable wood for cabinets (especially for entomologists) and fancy articles. It is also used in ship-building, and the oil it produces is useful for illuminating and other purposes. Then again the

camphor is a long-lived tree. Some trees in Japan are said to be upwards of 300 years old, and in the *Pharmaceutical Journal* of Sept. 30th, 1893, it is stated "that in a village in Kochi (Tosa) there is a group of thirteen trees about 100 years old; and it has been estimated that these are capable of yielding some 40,000 lb. of Crude Camphor, and are, therefore, worth as they now stand (in 1893) 4,000 silver dollars!" The camphor is prepared from the wood of the tree by boiling the chopped branches in water, when, after some time, the camphor becomes deposited, and is purified by sublimation. We shall give a good deal of further practical information on the subject in our *Tropical Agriculturist*.

The drawback to the cultivation of camphor appears to be that the trees require to attain a certain age before its branches, &c., yield the drug in any considerable quantity. But this delay was the objection in Ceylon, with cinchona at first, and we must remember how our planters soon narrowed down the limit for returns in the case of cinchona to a few years; but, meantime, Mr. Nock would do a public service by experimenting with one or two of his trees and reporting the yield according to age. As, besides the branches, camphor is found in every part of the tree from the root to the leaves, we have no doubt that if the tree is found to grow well, a way will speedily be found to overcome the difficulty of age and we may then find it become one of our more important minor products, with a steadily increasing value as an aid to our staples. Let a fair and full trial then be given to camphor.

◆

NOTES FROM MID-UVA.

June 21st.

As yet we cannot boast of a pukka monsoon. After a few stormy rainy days, we have sultry weather here; today the vast dome overhead is arched and high, and the blue heavens are flocked with silvery clouds. Will it last? If so, the monsoon is almost a failure here, and the goiyas will suffer for want of a sufficient supply of rain, and this means to the native cultivators, privation and poverty.

THE TEA ESTATES look well, the recent high winds, however, have checked the flush; the coolies on most estates are healthy, but where streams are almost dry, and the coolies get their water from pools, full of decaying vegetable matter, there are bowel complaints; bad water, full of feculencies is the very bane of cooly life on some estates in Ceylon. Large tanks of various kinds might be introduced, with great advantage on some estates; and the water given out once a day to the labourers.

THERE are many CIVIL SERVANTS in Ceylon in these harsh times, who have retired from public life, in the prime of their intellectual life; what are they intending to do for their native land in their declining years, I wonder, now that they have leisure and settled incomes. I hear one old veteran has a little tea estate near Galle; might he not add an orchard also; how little grafting of fruit trees is carried out in Ceylon, compared with other countries. Might not old civilians take a liking to the cultivation and improvement of the various kinds of tropical fruit trees that grow in our fertile isle; the mango needs greatly to be improved by grafting, &c. Pensioned civilians in India have paid attention for years past to the improvement of fruit trees, have introduced new varieties and spent the evening of their lives in the cultivation of orchards and flower gardens to the benefit of the land of their adoption. Let the Ceylon retired civilians take a lesson from their learned brethren of India and who have retired on pension from public life,

NORTHERN PROVINCE, CEYLON.

(Extracts from Mr. Hopkin's Report on the Vavuniya District for 1894.)

Area, 1,062 square miles; Population in 1891, 8,159.
WEATHER, CROPS, AND FOOD SUPPLY.

The year's rainfall at Vavuniya was far below the average, but this is no criterion of the rainfall for the district, for in Kilakkumalai South there was a failure of the north-east monsoon, whilst the tanks filled fairly in other divisions.

Tobacco.—The area cultivated was 114½ acres as against 147 acres in 1893, the people having been discouraged by the great fall in prices obtainable during 1893.

The yield is estimated by the headmen at 661,000 leaves, against 607,200 last year. This does not mean that the outturn was really better this year, but that the estimates of yield were more reasonable. As I pointed out in last year's report, the headmen's figures are very unreliable. The returns for this year show a yield of 5,772 leaves to the acre, but this is still under the mark. An acre of tobacco is valued at R50 to R80, and tobacco of the second quality is worth 50 cents per bundle of fifty leaves. Taking this as the average price for all qualities, the yield would be from 5,000 to 8,000 leaves per acre.

Prices as below:—

	R.	c.
First quality, per 1,000 leaves	20	0
Second quality, do. ..	10	0
Third quality, do. ..	5	0

This shows an improvement on the prices obtainable in 1893.

Food Supply.—The food supply was sufficient during the year. There was a little scarcity in Panankamam towards the end of the year, but this was, I believe, due mainly to debt and improvidence.

The total outturn of paddy was estimated at 48,048 bushels, which is, I daresay, nearly correct.

This converted into rice would make 24,024 bushels, or 2.94 bushels per head of population.

To this must be added 9,420 bushels of kurakkan, or 1.15 bushel per head.

Garden cultivation is unknown, except in some Sinhalese villages. A few vegetables are grown in the chenas, mostly pumpkins, cucumbers, and "kecri."

I noticed a fine crop of mustard in a chena in Vavuniya clearing, but this was grown by a Sinhalese boutique-keeper.

NEW AREAS OF CULTIVATION.

Three hundred and twenty-nine acres 3 roods 23 perches of Crown land were sold during the year, the principal item being a block of 200 acres under the Maha Rambaikulam, which was sold to a Vavuniya syndicate.

Survey fees were deposited for 140 acres, and a sum of R1,150.50 as upset price of land applied for.

New Areas Cultivated.

Paddy, Tamil tanks ..	39	0	0	of 2 bushels
Paddy, Sinhalese tanks ..	25	3	8	
Garden lands (Sinhalese)	7	0	0	

Total. 71 3 8

WORK OTHER THAN ROUTINE.

The experimental garden is the only work which can properly be classed under the above heading. Fair progress was made during the year, and by the end of December fully half the garden was completely cleared and laid out. On September 1st I re-commenced planting in anticipation of the rains, and planted seedlings of mangosteens, nutmegs, guavas, custard apples, Colombo mangoes, and Pararubber, and a number of pineapple cuttings, all of which the Government Agent kindly procured for me in Colombo, and despatched to me via Mannar. Some breadfruits, limes, oranges, and crotons were received later from the Government Agent and planted out. From Anuradhapura Garden I received seedling bilimbis, with some shrubs and rose cut-

tings, and from Peradeniya Gardens two dozen Calcutta guavas. From seeds sent me by the Director of the Peradeniya Gardens I raised in the nursery Liberian coffee, jak, nutmegs, rambutans, bilimbi, avocado pear, and loquats, all of which thrive remarkably well: so well indeed that I think it will be better in future to raise from seed, where it is possible, all the plants required for the garden or for distribution.

The Liberian coffee planted is an experiment in which I am greatly interested. Should it succeed (and I am sanguine that it will) the people may be induced to plant and tend a few bushes in their compounds for their own use.

The Ratemahatmaya, who has received some coffee seeds to plant, tells me that there are a few bushes of *Coffea arabica* in Iratperiyakulam, which fruit fairly, but the people do not make any use of the berries, as "there are so few." He has sown a nursery with seeds of *Coffea arabica* procured from Matale, and intends to plant a small garden at Iratperiyakulam with plants of both kinds. I trust it may be a success.

TEA BLIGHT.

Dr. George Watt, who is at present in Assam enquiring into the causes of tea blight, has been making some interesting observations in the Naga Hills upon the wild tea plant. He has found only two blights upon the wild plant, and these the least serious of the many to which the garden plants are subject. Dr. Watt is, therefore, inclined to think that cultivation accounts to a large extent for the prevalence of disease in the gardens. He is of opinion that improvements should be carried out more on the lines of healthy cultivation, better seed gardens, purer (*i. e.*, blight-proof) stock than in insecticide. He also recommends that the jungles should be kept as far away from the tea as possible. One of the most remarkable pests is the "blister blight." Under this plague the leaves become blistered and shining on the upper surface, forming deep, circular pits all over the margin mainly of the leaf, each depression being from one-eighth of an inch to half an inch in diameter. On the under surface these pits appear as swellings or blisters covered with a white grey fungus. Some notion of the ravages of this blight may be gained by the fact that on the gardens of one Company alone 1,500 acres are more or less affected by it. Among other centres Dr. Watt has visited Kohima, Wokla, Mokokchang, Nazira, Moriani and Golaghat. His future movements will include Nowgong. In addition to his investigations into tea blight he has been engaged in botanical work. It has been discovered that the Sau tree, a plant belonging to the Mimoseæ, bears root tubercles—a fact hitherto unknown to botanical science.—*Englishman.*

THE USE OF "PEAT" FOR MANURE AND IN AGRICULTURE.

The following extract from a Queensland paper is worthy of attention by planters and other agriculturists in certain parts of Ceylon:—

ACIDULATED PEAT DUST.

To the Editor of the *Queenslander.*

Sir,—Some time ago some paragraphs appeared in the *Observer* on the above subject, when it was suggested by a correspondent that a most valuable manure for our farmers might be provided by utilising the peat from the bog at Dunwich, instead of the ordinary soil, for night-soil purposes in Brisbane. I enclose a letter on the subject cut from the *Farmer and Stock Breeder* in the hope that you will give it a place, believing that the subject is worth inquiring into.—I am, sir, &c.,
Q.

Sir,—When other nations are exhausting their soil and natural resources, we should conserve and not waste the immense store of plant food which is being poured so lavishly upon us. Our soil may, by this means, become so fruitful that in ten years it is pos-

sible to treble our food supply and Britain again be self-supporting. We have only to carry out nature's laws to do this, for such is the compensating scheme throughout the products of nature that that which the body does not appropriate the vegetable luxuriates in; and though we cannot create a single atom, we can, by conforming to the conditions of nature, change that which is already created into more useful forms, and convert what looks dead to the eye, and which has served its original purpose, into new and vital forms of usefulness. Nature has provided material in our almost inexhaustible peat bogs, which only require our surplus labour organising to dig out, dry, and prepare with acid, and we have at once the most perfect and complete disinfectant, deodoriser, and absorbent. Night soil sprinkled over or mixed with one-eighth its weight of dry acidulated peat-dust is converted into a harmless black soil, without smell, inoffensive to the eye, clean to remove, and has no danger to health; becomes at once a fertiliser of incalculable value to agriculture, and an untold blessing to the country from a national, economic, and sanitary point of view. The following advantages are claimed for this over any other system:—1. This has the greatest absorbent and de-colouring properties, and can be used without mechanical contrivances to either the pail system, the ordinary midden closet reconstructed, or the dry earth closet. 2. The acid combines with the ammonia in the urine, and forms sulphate of ammonia, the most powerful of all manures; in all sewage systems this is lost. In addition to the sulphate of ammonia, the product contains all the other elements necessary to the growth of plants on which we live. 3. The acidulated peat dust, by its acidifying the mass, destroys all germs of disease; bacteriologists have proved that these are destroyed in an acid medium. 4. Peat not only prevents offence in the removal and transit of refuse, but supplies very valuable humus to the soil. Besides this there would be no necessity for such a nuisance as manufacturing manure in towns, as this product may be profitably sent away (without offence) from large towns by either boat or train loads, or by steam tramways, to county depots, which might be established by County Councils in convenient districts for farmers to reach.—WILLIAM BOWLER, Long-sight, Manchester.

We invited the opinion and criticism of Mr. M. Cochran, F.C.S., on the above, and he has been good enough to write as follows:—

Referring to the letter of William Bowler in the *Queenlander* on the subject of acidulated peat dust as a sanitary absorbent and basis of a manure, I think his remarks are not unworthy of the attention of Municipal authorities when both the peat and the acid can be had exceedingly cheap, and where there are market gardens to utilise the product. I have no doubt the acid referred to is sulphuric acid, as this is the only cheap acid that would both char the peat, and retain the small quantity of nitrogen in it. Whether the process could be applied with economy to the Mutturajawella and Nuwara Eliya peat is another question, seeing the sulphuric acid would have to be imported. Hitherto, I think the class of manures made from the sanitation-products of towns has never been rich enough in fertilising ingredients to admit of other than a short carriage from the place of production to the place of application.

In order to use our own resources of peat deposits for sanitary and fertilising purposes, I think we should have to be contented with drying and charring the peat by heat. Charred peat should certainly make a first-rate absorbent, instead of earth, for the dry system of disposing of excreta. The product might be afterwards used on land near the town either before or after incineration, as might be found more economical. Peat charcoal absorbs all sorts of gases and especially ammonia. According to Stenhouse's experiments $\frac{1}{2}$ gram of peat charcoal (7 grains) absorbs 96 cubic centimetres of ammonia gas.

It would be interesting to know if anyone in Ceylon has ever tried the effect of charred peat pure and simple on land. It is true that chemical analysis does not reveal much manurial value in peat. Perfectly dry peat won't contain on an average more

than 14 per cent of nitrogen, a large proportion of which would be lost by charring. The ash left by burning air-dried peat varies between wide limits from about 1 to 33 per cent. A large quantity of it has from $2\frac{1}{2}$ to 10 per cent of ash, surface peat containing least ash. Of the ash not more than $1\frac{1}{2}$ per cent of phosphoric acid or 1 per cent of potash could be reckoned on. It would thus seem that charred peat would be rather a poor manure to spread on land; yet we find it stated in "Johnston and Cameron's Agricultural Chemistry" that 50 bushels per acre of charred peat has been used alone for the turnip crop with as good a return as was obtained from 50 carts of farmyard manure. It is not easy to account for a result like this if it was not a case of mistaking *post hoc* for *propter hoc*. The power charcoal has of absorbing atmospheric ammonia could scarcely account for it. We know that charcoal has the power of condensing oxygen in its pores and this oxygen oxidises other gases that are absorbed in a condensed form by the charcoal. If it could be shown, though I am not aware that it ever has been shown, that charcoal has the power of oxidising even to a very small extent the free nitrogen of the air to nitric acid, a plant food, then the mystery would be explained.

Professor Newth in his new book on Inorganic Chemistry 1894 mentions the results of more recent experiments thus "Saussure found that recently heated beechwood charcoal was capable of absorbing 90 times its own volume of ammonia gas; while Hunter by employing charcoal made from coconut shell found that 171.7 volumes of ammonia were absorbed by one volume of charcoal."

All this information from Mr. Cochran is of great importance to our planters and agriculturists and suggests several directions in which experiments ought to be made.

THE AMSTERDAM CINCHONA-MARKET.

June 6th.

Our Amsterdam correspondent, telegraphing on Wednesday night, observes:—"The exports of cinchona bark from Java in the month of May amounted to 402,700 half kilos. In April they were 615,000 half-kilos. On June 13th, 5,691 bales and 239 cases (weighing together 539,230 kilos) of Java cinchona bark will be offered by auction in Amsterdam. The total equivalent of sulphate of quinine in the manufacturing bark is 26,273 kilos, in the pharmaceutical bark 372 kilos. This gives an average of 5 per cent for the manufacturing bark. The May shipments from Java, continues our correspondent, give a moderate figure, and the feeling here is that the total shipments for 1895 will show a smaller figure than for the preceding year; thus far the deficiency is in fact rather marked. The feeling for our bark-sale of 13th instant is rather firm than otherwise, in spite of the heavy supply of bark. The diminished stock of quinine in London is also considered a favourable feature of the position of the two articles, and likely to work well for bark in a short time.—*Chemist and Druggist*.

MORE TEA. Yet another probable rival to India as a tea-growing country! The province of Batoum has been favourably reported on as being suitable for tea cultivation by M. Krasnov, a Professor of Geography at the Krasnov University, who said that, if cultivated, portions of Batoum would compare favourably with the tea plantations of Japan and Ceylon. The Agricultural Society of Russia, which has taken up the question of tea cultivation in Batoum, has instructed Mr. Khugen to purchase large plots of land near Charka. Messrs. Krasnov, and Khugen and some other gentlemen will visit the chief tea-producing centres of the world, including Darjiling, Ceylon, China, Canton and Japan, and they were to leave Odessa for this purpose about the end of February last.—*The Planter*.

Correspondence.

To the Editor.

GUINEA FOWLS.

DEAR SIR,—Will some one of your correspondents inform me (a) how long Guinea fowls' eggs take to hatch out, and (b) how best to rear the chicks.

ENQUIRER.

THE FIBRES OF CEYLON AND THOSE NOW IN DEMAND.

London, 24th May 1895.

DEAR SIR,—We have to acknowledge receipt of *Ceylon Observer* of 27th April for which we thank you, and are prepared to give anyone who may favour us with inquiries, all the information available in respect to fibres of various kinds.

The experience of manufacturers this season leads them to favour No. 2 "Pia" and No. 3 "Skin of palm leaf," &c, rather than the No. 1 Bamboo,—the latter being found brittle in working. We therefore send you duplicate samples of Nos. 2 and 3 only.*

The small quantity of No. 2 "Pia" that has so far come to Europe has realised fabulous prices which it would be misleading to quote for later supplies; we consider there will be a fairly permanent demand for this and similar material; from 6d to 1s per lb. appears at present a safe limit, according to quality. It is said that "Pia" is a shaving from the stem of the "Cabbage Palm" (?) (the French call it "ehou-chou"); but we are unable to say whether this statement is correct.

No. 3 "Superior Raffia" is described as a shaving from the wood of the "Cryptomeria Japonica" (?)—to us it looks more like the skin of a palm leaf,—similar but superior to the ordinary Raffia, which is the outer skin of the leaf of the Raphia Palm. The latter or ordinary Raffia is not good enough for our present requirements, the present value of the latter is about 5d per lb., the "Superior" (our No. 3) would be worth about double this price if here today; but for future shipments something lower may have to be accepted say from 6d to 9d per lb., but extra good even quality might realise considerably more. We think the demand for this material will be permanent, for several seasons at least.

We also enclose a specimen of "Rhea Fibre" in the Bark (or Ribbon as it is called).* The tendency of this manufacture is to work on the fibre in this rough state, provided it can be supplied in large quantities at low prices, that is, in hundreds or thousands of tons at from £6 to £8 per ton in London. It is said large contracts have been entered into at £7 per ton or less, but we doubt the possibility of getting supplies at this price, and we believe that if any important quantities could be regularly shipped say 100 to 500 tons per month at say £10 per ton cost freight and Insurance terms, or even at a little more, buyers would be willing to enter into contracts, provided a guarantee of regular supply could be given.

We would repeat our suggestion that likely materials of various kinds should be tried and a few lb. of each sent to us for report. Practical trials shall be made of all such as may appear suitable for any of the various manufactures using such materials.

* These can be seen at our office.—ED. T.A.

In conclusion we would ask for samples of the silk cotton (or floss) from the seedpod of the "Calotropis Gigantea" or "Mudar" for which a demand appears to be springing up again, present value about 6d per lb. landed in London.

"Semul" or tree cotton now called "Kapok" is wanted in fairly clean condition at 4d per lb. in London.—Yours truly,

THIRKELL & CO.

We referred the specimens to the Principal of the Agricultural School, who writes:—

School of Agriculture, Colombo, June 13.

DEAR SIR,—I am returning you the specimens from Messrs. Thirkell & Co. No. 5 silk cotton from the pod of *calotropis gigantea* (the Sinhalese *wara*) and No. 6 "Semul" or tree cotton, our kapok or (as it called by the natives) "puling" are both available in fairly large quantities in the island. The former as a wild shrub is a good deal scattered about the country, but in certain localities forms rather extensive thickets. Still its collection would be somewhat expensive. It has been mentioned as a paper fibre and a silk substitute. Dr. Watt considers that the cultivation of the plant will be profitable, as besides the floss from the pod, it also yields a bark fibre of excellent quality, and gutta-percha from the sap.

The "tree-cotton" is a favourite boundary tree and some trade in the cotton is at present being done in the Matale district, where it is very commonly met with.

Trial shipments might well be made with both the above "cottons" in order to make sure whether exportation to London will pay at the prices quoted.*

Superior Raffia, described as a shaving from the wood of the *Cryptomeria Japonica* would be difficult to match in Ceylon. It does not seem likely, on trial with screw-pine and yucca, that a substitute could be found, though some research in the direction of the sedges is advisable. The length of the sample sent is nearly 4 feet!†

Pia (said to be probably from a *musa* or *arum*) is more likely to be matched. Here is a strip taken at random from a bamboo which is something like it.

Rhea we cannot supply yet, but ought to before long. I have heard of land-prospecting for rhea in the Panadura district. We have about 100 plants flourishing here (at the school) and I hope to send you a sample of our fibre within a month. The sample sent is in a very rough state.

I wonder what Messrs. Thirkell & Co. would think of our *Niyanda* (*Sansevieria*) and *Muruwadul* (*Marsdenia*). The latter Dr. Watt considers "far superior to rhea." I enclose two samples from these specimens I have.

PALME.

Kew Bulletin, No. 45, September, 1890.

97. *Raphia Ruffia*, Mart. The midrib of the leaf of this palm, which sometimes reaches 35 to 45 feet in length, is used chiefly for poles for ladies' palanquins, ladders, &c. The fibre from the young unopened leaves is employed as string, and is largely exported to Europe under the name of "Raphia Grass." Various kinds of cloth, which are known as "Jabo," "Jiafotsy," "Sandiadiaka," and "Sikinivola," are

* There is a considerable trade in "Kapok" sent to Australia, United Kingdom and even India: the exports equalled 2,236 cwt. in 1891, but have fallen off greatly since.—ED. T.A.

† Here is a strip of the bark of *Gyrinops Walla* (*Sin. Walla*) which may perhaps be suitable for the same purpose as "Raffia" though not quite like it,

made from the fibre. From the stem the natives obtain a sweet liquid called "Harafa," and the shells of the fruits are employed as receptacles for various small articles and as snuff boxes. (Widely spread in the island, but always in valleys.) *Rojã* or *Fõmby*.

The above is a reference to the palm which is said to yield the ordinary raffia. The "fibre" referred to in this cutting must of course be quite distinct from the material known as "Raffia," and is no doubt of the same nature as "African Bass" the product of *Raphia vinifera* or "Bamboo" palm, noticed on page 3 of the accompanying *Kew Bulletin* (which please return) and also on page 248 of the *Tropical Agriculturist* of October, 1894, under the title of Piassava fibre.

Dr. Trimen mentions *Raphia Ruffia* on page 18 of his "Hand-guide," and again refers to it on page 25 thus:—"Worthy of special notice are the *Raphia* palm of Madagascar (*Raphia Ruffia*.) &c."

THE "BODIRI" SPECIES OF COCONUT AND HEAVY BEARING.

SIR,—If the species of the coconut reported at Galle be the *Bodiri*, the gathering of so many nuts as reported by your correspondent is no unusual thing, as trees of this species of coconut are known to yield more than the number mentioned at one crop, even when planted with coconuts of different species. The *Bodiri* is a small-sized coconut. D. A.

THE TRAVELLER'S PALM WATER: A TIMELY WARNING.

DEAR SIR,—It will be as well to warn your readers against imbibing the water from the above-mentioned palm, for I yesterday drew off some of the water from one of them into a tumbler, and found it to be infested with a number of thread-like worms. These "poochies" may or may not be inimical to humanity, but it would be as well to avoid the chance of their being so. The warning is not unnecessary, for I have frequently seen persons put down their heads and partake of the water as it gushed from the stem of the tree. E. F. T.

THE FIRST INTRODUCTION OF COFFEE INTO BRITISH CENTRAL AFRICA:

HONOUR TO WHOM HONOUR IS DUE.

DEAR SIR,—In your issue of May there is a statement *re* "the introduction of the coffee plant into Nyassaland which I cannot allow to pass without contradiction, as I am in a position to do so, being well acquainted with the facts. Although not personally acquainted with Mr. John Buchanan C.M.C. of Zomba, still, he has been known to me for at least 15 years, and from all accounts I have heard, I am certain he is too much of a gentleman to take the credit of being the first to introduce the coffee plant into Nyassaland, when the credit belongs to a brother planter. Mr. Johnston must have been misinformed as the parent plant of the thousands now flourishing there, was the survivor of three plants, *C. Arabica* which were taken out by Mr. Jonathan Duncan from the Botanical Garden, Edinburgh in 1878. This plant I believe is still alive at Blantyre. I may also inform you that this same statement was made by Mr. Johnston when in Scotland last year, but was contradicted in a local paper by a correspondent in Nyassaland who no doubt like myself was in possession of the real facts. By giving this a corner in your next issue you will greatly oblige.—

Yours &c., D. B. CAMERON,
South Sylhet, India.

CINNAMON PEELERS AND THE DIFFICULTY OF GETTING THEM HONESTLY TO FULFILL CONTRACTS:

THE OPINION OF AN EX-CINNAMON PLANTER.

SIR,—I was greatly interested in reading in the *Observer* of the 22nd inst, a record of some recent proceedings, in the Police Court of Negombo, in certain cases instituted by the Superintendent of Goluwa Poknna estate against defaulting cinnamon peelers; the Magistrate's decisions thereon; and your editorial upon the whole matter. Having suffered myself from the misconduct of "peelers" my sympathies went out at once to the Cinnamon Planters who, by the decision of the Magistrate, are left helpless against the wiles of the unscrupulous peeler. Their position hitherto has not been an easy one, and now it is made more difficult; if, indeed, it will not make cinnamon cultivation on estates so precarious as to render it profitless. To any one acquainted with the preparation of cinnamon it will be apparent that the first requisite is the certainty, as far as it can be made so, of the command of a sufficient force of skilled peelers at the times when the bark is in a fit condition to peel from the sticks. But if with the dread of a criminal prosecution and imprisonment for breach of contract hanging over them many now evade their responsibilities, what may we not expect will be the state of affairs when it becomes known that by breach of the contract and being once punished they can go free; or by evading the notice to come to work they can defy the Superintendent? I need not enter into a description of the conditions under which cinnamon cultivation and preparation have hitherto been conducted, as that has been done in a full and accurate manner by the gentleman who supplied you with that information in your editorial of the 22nd. I will only briefly narrate a few of my experiences with reference to defaulting peelers and make one or two observations. As Superintendent of Goluwa Poknna estate for nearly six years I had a surfeit of this kind of work: the most distasteful, and yet the most imperative, I was ever called upon to perform.

When I first entered upon my duties I knew next to nothing of cinnamon cultivation and nothing at all of preparation; and worst of all I was quite ignorant as to the character of the cinnamon peelers as a class; but knowledge came in time! My first enlightenment was on the occasion of giving out fresh advances. I had been instructed to increase the peeling force so as to make certain of having more than sufficient, allowing for a fair proportion of absentees, and gave orders to the kanganies to look out for men. As far as numbers went I had no reason to be dissatisfied; but when peeling time came not half of the new hands turned up. After a reasonable time I took out warrants against these men and then learnt that a good many were fictitious names, others those of children, and of men who had never peeled a cinnamon stick. The kanganies to get money for themselves had hired men, at 50 cents a piece, to appear and sign the contract, receive the advance, and then hand it over to them. Kanganies and men thus combined to defraud the estate, and also to jeopard the crop. In time this state of affairs improved by the weeding out of notoriously bad workers, but to the end there were always a certain number of men who took advances with no intention whatever of working them off. They

either cleared out from their village and disappeared for months together, visiting their homes by stealth; or they were screened by the kanganyes and headmen, who returned the warrants with the remark "not to be found", &c. I partially overcame this difficulty by making it worth the headmen's while to find the defaulters; and remarkable to say, coincident with this arrangement many of the men returned to their village! I have had to institute as many as 100 cases in one day, and quite 200 within a year! Let any one consider what this means, namely, that out of a skilled force of say 300 men, which you have done your best to make sure of by giving out advances on a contract, you find that when your peeling is at its best, and you could secure a large quantity of fine bark, quite one-third of your force absent themselves; not because they have any excuse for doing so, but that they are working on some other estate, where they have also taken advances, or are taking in the cinnamon from their own or a friend's few acres. When this is done, and the best of the season over, they *may* condescend to come and work for you, making lying excuses for not having come before, the kangany backing them up, for as likely as not the men have been taking in the cinnamon from his garden, while the Superintendent is at his wit's end to know what to do to secure his crop. Such a state of things is exasperating, for when kanganyes and men combine to deceive, you are helpless. I am afraid that their conduct has often caused me to explode, and to use words not necessary to the sentences uttered; and if the kanganyes had had anything but pachydermatous consciences they would have winced under the home truths told them.

In instituting cases against defaulting peelers, I have had to appear before 9 different Magistrates who occupied the Negombo bench in succession during the time I was on Goluwa Pokuna, and all held that if a defaulting peeler, after undergoing punishment, did not go back to work he was liable to be again brought up and punished; the offence was considered a continuing one.

The present Police Magistrate of Negombo seems to doubt the legality of this procedure; and as his decision has quite unsettled the previous views held on the subject, and his successor may disagree with his views, I think it was unfortunate that the Attorney-General did not allow an Appeal in case No. 19,217, as I understand he was asked to do. In the interest of the peelers themselves a ruling by the Supreme Court seems necessary; and it is much to be wished that the Attorney-General would reconsider his objection, as regards giving notice to peelers to come to work. As a matter of fact, at the commencement of peeling every peeler receives notice to attend; also at the resuming of work after each stoppage; but when men are away from their villages it is not possible to give them notice, for their whereabouts are often not known; and when these men absent themselves for weeks or months, and on their return are prosecuted, for the Magistrate to discharge them on the plea that they were not served with notice to attend seems to me unreasonable. Giving notice is really a matter of form, for every peeler knows perfectly well when his services will be required, and when he should attend. When dealing with men who have no fear of losing their character or influence in their village by its being known that they have made money by *successful* fraud—but who are rather looked up to and envied as clever fellows—it is, I hold, necessary when advancing money for which they are responsible, to make them

criminally liable. This may seem hard; but if a cinnamon peeling kangany is to be held only civilly liable for the money advanced to the men he brings as peelers, there is nothing to prevent his acting in the fraudulent manner I have described as practised on me, and the Superintendent has no remedy; for it is next to impossible to bring home the charge to the kangany, as none of his peelers would have the temerity to dare give evidence against him, knowing full well that to do so would mean his ruin. I have stated that prosecuting peelers and getting them put in jail was most distasteful to me, and in dozens of instances I have taken them back on their promise to return to work. The Magistrate often cautioning them not to break their word; but this leniency was so systematically abused by the men never coming to work and so necessitating fresh warrants being taken out that I afterwards, as a rule, refused to take them back before they were punished. I found that severe measures were the kindest to them and to others. Cinnamon peelers may not be worse than others of their class under like temptations, though some of their countrymen seem to think that they are, for they use this saying against them:—"Never trust a Haleya or a pig!" Be that as it may, their conduct was the main motive for my leaving Goluwa Pokuna; and I envy no man who has to make his living by depending upon them. Apologising for taking so much of your valuable space.—I am, &c.,

W. J.

AUSTRALIAN HONEY FOR CEYLON.

June 5th.

DEAR SIR,—I enclose a short account of the Grampian Apiaries, Dunkeld, Victoria, which has been sent to me, and as I am trying to introduce Victorian honey here, I thought it might perhaps interest your readers to learn something about the industry.—Yours truly,

PROGRESS.

[We can speak of the Australian honey as being excellent.—ED. T.A.]

BEE-FARMING IN AUSTRALIA.

Next to the world-renowned deep mining of the Golden Cities of Ballarat and Bendigo in Victoria and the gigantic search for silver from the equally deep mines of Broken Hill in New South Wales, there is perhaps no industry contributing to the original wealth of the community, which so fascinatingly appeals to the interest of the visitor to the Australian Colonies as does the culture of bees both by the Arcadian charm of its surroundings and by the novelty of its workings. Of all those parts of "the continent," as the Australians like to call it, where the professional Apiarist is wooing "the fickle goddess" with his stock-in-trade, the Victorian Valley is at once one of the best adapted by nature and decidedly *the* most widely exploited for the production of honey on a commercial scale. With the advantage of the dry and sunny climate common to the whole of Southern Australia this district is protected by mountain ranges from great extremes of temperature and is peculiarly suited by the comparative poverty of its sandy soil to the brilliant display of a great wealth of blossom on those trees and shrubs from which the bees can most economically gather their supplies in their work of laying up a winter store.

Leaving the train at the little way-side station of Dunkeld after a tedious journey from Melbourne at a speed which at its best would hardly equal that of a modern Atlantic liner, ten hours having been taken to cover one hundred and eighty miles! and proceeding in a buggy across country to the Northward, one's sense of beauty is soon agreeably impressed by the generally park-like aspect of the Plain with its undulating paddocks irre-

gularly studded with splendid flowering specimens of the red and white gums and acacias. Cheerily bowling along a well-kept road and rapidly nearing the lofty peaks of Mt. Sturgeon and Mt. Abrupt, which rise precipitously on either hand for several hundreds of feet, the visitor's attention is attracted to the opposite thickly wooded slope of "the Picaninny," stretching picturesquely between the rocky heights of its frowning neighbours, and which on its lower levels is patterned in clusters of white half hidden by the green of the bush, recalling the well filled cemeteries of the malarial coasts of Africa. Even a carefully guarded question invokes a supercilious smile from the driver over the "new chummi's" innocence with the information that the apparently marble grave-stones flashing back the sun-light are merely the painted hives of the Bee-Farm. A little later further evidence is forthcoming by an all-pervading drowsy hum, ever increasing till the Farm is reached, when the air is seen to be so alive with excited bees as to cause considerable feelings of alarm in the mind of the visitor. With the welcome protection of a veil, supposedly sting proof, and afflicting a *sang froid* which he is far from feeling the novitiate accepts, though with doubtful pleasure, the invitation of the Manager to watch the robbing of the hives, a form of entertainment which he will appreciate only till some more tender part of his anatomy is pierced by the far reaching stings of a few particularly savage and persistent bees.

The hives are built up of several layers of rectangular wooden cases, the two lowest of which are set apart for the "brood nest" where the "Queen" deposits her eggs and the young bees are hatched; above these are the "supers" for the storage of honey "beyond" that required by the bees, a specially perforated sheet of zinc between the "brood nest" and the bottom "super" being fitted to bar the access of the Queen-bee but allow that of the smaller worker bees.

The "supers" are arranged to hold thin oblong "frames" or square thick "sections" to form receptacles for the honey according as it is required in its viscous extracted state or in a complete comb for table use; in the former case the honey is removed from the frame by the centrifugal force due to rapid revolution round the vertical axle of a cage into the groves of which the frames after removal from the supers to the honey-room are placed for "extracting."

The comb of the frames, which is about one inch in thickness, is emptied by this means without being in the least degree injured, hence the frames are at once available for being refilled by the further industry of the bees, altogether a great saving of their time and labour on the old system of breaking up the comb by hand for the extraction of the honey which involved the building of new combs every time of honey-getting.

The number of supers varies from one to three depending on the strength of the colony; and in what the Apiarist calls a good "honey-flow," each super or set of supers yielding thirty to sixty lbs. will require to be emptied once in seven to ten days. From the extractor the honey is drawn off and passed through wire strainers of fine mesh into large iron tanks of several tons capacity, of which the interiors are painted with beeswax; in these tanks the honey is allowed to stand for several days that all minute particles of wax may rise to the surface and be skimmed off, after which there only remains the work of putting up the honey into differently sized tins and the wait for a rise in the market, often in these days of Victorian repentance for fiscal sins of the past, the most trying experience of the Apiarist.

But, of all one learns in the course of an object lesson from an expert on Bees, of the most absorbing interest are some points in the natural history of the Queen-mother and the way she governs; her remarkable fecundity which amounts to the laying in the height of the season of from three to four thousand eggs a day; her discriminating power exercised in depositing at will eggs of workers, drones, or queens, each in their special cells; the royal demands she makes upon the attentions

of the workers to her sufficient feeding and warmth and the general distress occasioned throughout the hive by her removal; these, together with the curious relations of the sexes in the internal economy of the hive, in that all the workers, warriors and law-makers are female endowed with a plenitude of power over the luckless drones or males, almost comparable to that among men to which soar the dearly cherished aspirations of the most rabid women's rights society, are some of the features which almost beguile into a deeper study of the habits of bee-life.

From the unlimited supply of bee-food scattered broad cast over the land, from the length of the bee season, practically from September to May, through which the blossoms last and the bees can work and lastly from the abnormal disparity between the honey values quoted in the English home market and the cost of its production here, even enhanced as it is at present by the evil effects of a prohibitively high tariff, it is evident on the face of it that under ordinarily favourable conditions of transport there is a great field for the expansion of this industry in Victoria.

There can be no doubt in fact that with its many advantages this Colony can in this respect successfully compete with California or other of the Americans, and that were only the excellent quality of the honey produced sufficiently known in Europe, the yearly output would quickly increase to the tune of several hundreds of tons and the retail price there become so reduced as to bring the luxury of its daily use within the means of the toiling masses of the great cities of the Old World.

THE RUSSIAN TEA COMMISSIONERS IN CEYLON.

On board steamer, 3rd June, 1895.

DEAR SIR,—Totally unforeseen affairs hindered me in my travelling, and when I returned to Colombo, I only just had time enough to fulfill some very urgent business and get on board the steamer in time before it sailed. In this manner I was deprived of the possibility of seeing you again. This was a double grief to me as it would have given me the greatest possible pleasure to see you once more as I should very much have liked to have narrated to you all my experiences and to have had the pleasure of hearing your valuable opinion about them.

As a matter of course, on my returning from China and Japan to Ceylon, my first visit will be to you. But now you must allow me, although it can only be by letter to thank you from the bottom of my heart for all your kindness to me and for the active help you gave me in my mission, thanks to which help I was enabled in a very short time to examine several large tea estates, and collected some most costly material for studying the tea business in the most advanced and modernized tea-country, which no doubt Ceylon is in comparison with any other tea districts of India. The European art, the amazing energy, the ingenuity, the expediency and practicalness, that is to be seen in the organisation of the total management as well as in respect to all the technicalities of the business, struck me as being most wonderful. I add in conclusion that the Planters received me everywhere in a very kind and hospitable manner and with the greatest readiness showed me their business; communicated to me a whole quantity of useful knowledge, obtained by many years practical experience, all of which was of the greatest value to me.

I should like to have once more the opportunity of shaking hands with those clever planters, who were my first instructors in tea matters and to whom I shall always feel exceptional and thankful acknowledgment.

In the hope of seeing you again, I remain,
Yours very sincerely,
JOHN KLINGEN,
Chief of the Russian Expedition of the Appanage.

P.S.—I examined the following estates:—
1. Abbotsford, 2. Dessford, 3. Naseby, 4. Scrubs, 5. Pedro, 6. Olyphant, 7. Monkswood, 8. Kandapola, 9. Portswood, (the last 5 by the letters of introduction from the Russian Consul, Mr. Frisch), and 10 Peradeniya Estate.

YOUNG PLANTERS AND PROMOTION: A COMPLIMENT!

C. P., June 20.

DEAR SIR,—Have you heard the latest news? Visiting as well as Colombo Agents now-a-days, in filling up Superintendentships, are particular in asking about the "tastes" of applicants. One of these young men, puzzled as to what was meant by the query, replied—"Well I'm a regular reader of the *Ceylon Observer*, and its monthly *T. A.*"; and at once got the rejoinder—"That will do, you are the man to look after an absent proprietor's interests" and so got the post! Yours truly,
FACT.

PRACTICAL ENQUIRIES ABOUT TEA FROM A SOUTH OF INDIA PLANTER.

DEAR SIR,—Will your tea authorities kindly state the probable results on the quality of the manufactured tea when the roll is slowly broken up before fermentation. Would any other effect than irregular fermentation result?

What effect has the late weather had upon the quality of the tea made?—Yours faithfully,
PLANTER.

TEA PREPARATION—QUERIES ANSWERED.

1,600 ft. Elevation, June 20th.

DEAR SIR,—*Ec* "Planter's" enquiries—I do not think the slow breaking up of the roll would have any beneficial effect on the quality of the tea. At this elevation, with the long rolling now common in Ceylon, the leaf is, as a rule, almost ready for the drier on being taken out of the roller, and any process that would retard the firing would tend to make the liquor soft.

In the very dry weather before April the teas gave a thin, harsh liquor, with some flavour, and with a greenish, mixed outturn. In the rush of leaf after the April rains the liquor was dark, dull, and pointless, with a dull outturn—the unfavourable weather for withering may have had something to do with this. Lately the teas have given a fairly thick, bright liquor, with strength and fair flavour, and a bright even fermentation.—Yours faithfully,
J.

ANTHRAX AND CARBUNCLES.

Colombo, June 25.

DEAR SIR,—The Malay planter's knowledge of Anthrax is very limited I am afraid. Anthrax has no relation whatever to "Carbuncle" and cannot produce Carbuncle, but does in man produce that fatal disease Malignant Pustule.—Yours truly,
J. WILSON BARKER,
M.R.C.V.S.

SHOULD CEYLON—AS THE CENTRE OF TROPICAL PLANTING LANDS—HAVE AN "EMPLOYMENT" OR "LAND EXCHANGE" BUREAU?

Among the Hills, June 28, 1895.

DEAR SIR,—I have been very much struck of late, with the many countries and varied planting

interests you seem to touch upon in the *Ceylon Observer*.

I have not been long in Ceylon; but in one week, I have seen correspondence in your paper giving planting news or asking for information from Florida, North Carolina, Jamaica, Central Africa, the Malayan Peninsula, Labuan, Borneo, &c. Now, it has struck me that something like an Employment and Land or Exchange Bureau might well be opened in your columns, to afford young men, who have been trained in Ceylon, the means of knowing where their services are required in other tropical lands, or where a little capital could best be invested to advantage where good land is available and cheap, &c.—Yours truly,
JUNIOR PLANTER.

[Our correspondent must know that it is our monthly issue of the *Tropical Agriculturist*—that forms the special bond of union between all sub-tropical planting countries. We are quite open to take up our correspondent's suggestion; but the first move ought to be on the part of owners of available cheap lands—whether Governments or private individuals—in other countries, and of proprietors wanting young trained Superintendents, or working partners with some capital. We should readily devote a column or a page of the *T.A.*, to such information, making a very nominal charge for the advertising. We suppose something of this kind is what "Junior Planter" means?—ED. *T.A.*]

LIBERIAN COFFEE.

DEAR SIR,—Can you or any of your readers interested in the growth &c. of this coffee, supply information much needed in the infant stage of the cultivation of this product. What is the best distance to plant? 12 ft. x 12 ft. or 10 ft. x 10 ft. as in the Straits, Perak, &c. The price of specially made pulpers is too high for small clearings varying from 20 to 30 acres. Can cleaning machines be obtained, as used in America for cleaning the dried cherry? Is it preferable to sell the parchment or the clean coffee? Some say the price of clean Liberian is the same as that obtained for clean or "rice" coffee per cwt., and that in the native market! Is it so? I have trees 20 months old averaging 700 cherries! At what age and before manuring are they likely to give 2,000—the tested yield in Madagascar and Penang—; lastly is topping objectionable? If so why?
YOUNG COFFEE.

[This correspondent is pretty well answered beforehand by "L. de S.",—given below—and from the Colombo Iron Works, he would no doubt learn all he requires about pulpers.—ED. *T.A.*]

LIBERIAN COFFEE CULTIVATION.

SIR,—A very interesting letter recently appeared giving particulars of yield in Serdang of this variety of coffee. The letter came from an old Ceylon coffee planter, and therefore, carries much weight. At present the clearings in Ceylon in bearing are few, and of these but a small number are properly attended to. Extended cultivation is going on quietly, but too slowly. Ceylon tea averages $7\frac{1}{2}$ d now. What will it be five years hence? When Arabian coffee began to fail, the cry was that planters had only one string to their bows, and then many products were recklessly tried. In Liberian coffee there is money to be made even if the yield is less, per tree, than in the Eastern States. The yield per tree varies there from 2,000 to 6,000 cherries. A bushel holds 8,000 to 11,000. The early berries are larger here, as in the Straits. Taking 10,000 cherries as the average per bushel, and with trees in Ceylon planted 6 ft. x 6 ft. or 7 ft. x 7 ft. and yielding only 1,000 to 3,000 cherries, it is possible to obtain in parchment at least 20 bushels per acre. At R10 to R12 per bushel present local rates, which are never

likely to be less for another ten years at least, there is an ample return, after meeting expenses, to give R100 to R150 per acre.

The cultivation has, of course, to be carefully carried on, and those who do not do it "on the cheap" will probably get nearly *double* the above yields. In poor soils I would advocate 5½ to 6 ft. apart, and in rich soils 7 to 8 ft., and not more *in Ceylon*. Good 2-ft. holes cut in poor soils and 18-inch holes in better land. Surface soil conserved and filled in. No dibbling and careless planting. Transplanters freely used for vacancies. Dadap and jak shading should be commenced early. Coconut or cocoa should also be put in. Much will depend on the climate, lay of land, &c., which of these auxiliary products will be selected. In some cases both can be planted at proper distances. Eventually such a thing as abandoned plantations will hardly be known. Hitherto Liberian coffee will be the favorite till some hybrid takes its place. It is not necessary to look for another variety as long as this kind gives an ample yield and fetches good prices. In a year or two more there will not be wanting positive proof of this. Judging by the appearance of certain fields, the proprietors of which are "ticking down the costs, &c., to a cent," and when found equally paying, or as nearly paying as the plantations in the Straits, &c., then there will be, no doubt, "the rush".—I am, &c.,
Panilwewa, June 29th. L. DE S.

VARIOUS PLANTING NOTES.

FAILURE OF THE ORANGE CROP IN FLORIDA.—One of our *Tropical Agriculturist* readers in Florida, writing by last mail, reports:—

We note on p. 663 that mention is made that the orange crop of Florida will not be over 2,500,000 boxes. We only wish it would be that large. We doubt if there will be 50,000 shipped from the whole state. As to lemons there will not be 1,000 boxes.

DR. D. MORRIS, C.M.G., ON THE CANARY ISLANDS.—In the course of an interesting letter from our old friend Dr. Morris, who continues to take a great interest in Ceylon, he gives us the following useful, not to say interesting, information:—

"The 'fibre lectures' will be published in full in the 'Society of Arts' Journal' in July and August.—I am glad to say I keep very well. I take my vacation in the winter and have lately visited the Canary Islands. They are charming places to go to. It is wonderful what English enterprise is doing there. The islands supply England with nearly all the bananas consumed in this country as also tomatoes, early potatoes and green vegetables. Geographical position is the essential factor in these matters.—We were very sorry to hear of Dr. Trimen's ill-health. We hope he will pick up during his stay in this country."

A CAMPHOR TREE INDUSTRY.—Exactly the same sneering objections as the local "Times" ventilated on Thursday, were offered at the beginning of our cinchona enterprise. "Who would care to cultivate a medicine tree?" was the cry; but how bitterly the scoffers regretted their attitude when the planters who put in a few hundreds or thousands of plants, cut them down or harvested the bark after 7 or 10 years—the cultivation costing nothing—and netted as much as 10s to 20s per tree. Now, in respect of the camphor tree, we are told, Dr. Trimen some years ago, discouraged its cultivation by planters; but surely the fact that there are successful clearings *now* of the tree at both Peradeniya and Hakgalla is sufficient to indicate that Dr. Trimen, were he here, would probably alter his opinion, that is *if* he ever expressed himself as our contemporary says. In any case, it is childish to discourage planters who are busy putting out trees of various kinds on their boundaries or among their tea, or in separate patches, from giving a trial

to the handsome laurel-like camphor tree, plants of which are now available at the Botanic Gardens. In this journal, our readers can see what American and English journalists—taking opposite views—say about the prospect. Our local contemporary in place of discouraging ought to feel it his bounden duty to do all in his power to get planters to add any likely product to their one string "tea"; and the fact that the Chinese and Japanese have been cutting down their store of indigenous trees, without replanting, is just the strongest reason why Ceylon planters should begin at once to try what cultivation can do.

TEA PLANTING IN BURMA is the title of an article in the *Asian* which discusses the question "may not Burma one day take her place among the tea-producing countries of the East"? The following is the concluding paragraph:—

"Planting in Burmah has not been conspicuously successful hitherto. Liberian coffee did well in an experimental garden at Mergui, when supervised by an energetic Deputy Commissioner, but attempts at planting on the Tavoy hills proved a failure, despite the liberal terms given by the local Government to enterprising men who took up land for the purpose. Tea, if we mistake not, has never got beyond the purely experimental stage, and Mr. Bruce's very interesting report, if it does not open up a rosy vista of opulent possibilities, at least gives food for thought."

TEA FACTORIES; STEAM ENGINES; TURBINES AND ELECTRIC LIGHT INSTALLATIONS.—A planter in sending in information for the Directory states:—

I don't know whether you require a memo of steam engines &c. on estates which perhaps in a Directory would be useful and if so:—there are two here, one 6 h.p. and one 12 h.p.—and water power—electric installation in factory and bungalow.

Now the fact is, we shall be glad to have a note of the power of every Steam Engine and Turbine on plantations, and also a note of wherever the electric light has been installed. We trust, therefore, many more will follow the example of the above correspondent. We have already got most of the information. We have always separately specified Tea Factories preparing from 500,000 lb. and upwards in our prefatory review.

COFFEE IN BRAZIL.—The committee of coffee factors appointed for estimating the crop for the year 1895-96, reports as follows:—"Heavy rains during the last three months have contributed to hasten development of seasonable and late fruit, but have hindered the production of *café das águas*, which is almost a total failure. The committee accordingly believes that the future crop will be of good quality unless injured by rains during the process of gathering and drying. The quantity of available for exportation will, it seems, hardly exceed 1,750,000 bags, subject, however, to be increased by the remainder of the previous crop, whose shipment is delayed by various well-known causes. In addition to the lack of efficient labour, agriculture continues to suffer from insufficient transportation facilities on railways, which, although they regulate their freight rates by a sliding scale varying with the fluctuations in exchange, fail to offer safe, speedy and regular means of conveyance either for imports or exports, thus increasing the cost of labour and even occasioning periods of famine in certain localities in consequence of the death of food-stuffs. This committee, then, in the performance of its duty calls the attention of the proper authorities to the just complaints of the planters, who require sure and speedy means of transportation and the actual responsibility of someone for the number and weight of the packages delivered here or in the interior.—Rio de Janeiro, March 19th, 1895.—*Joaquim de Mello Franco.*—*Cesar Duque Estrada & Co.*—*Miranda Jordao & Co.*—*Araujo Maia & Co.*—*Hermano Joppert.*"

OLD CEYLON RESIDENTS AND FIJI ESTATE PRODUCTS.—Mrs. James Dickson, the wife of a former Ceylon coffee planter, was at Colombo yesterday on her way to Fiji by the s.s. "Prinz Regent Luitpold." Mr. Dixon has a sugar estate, Navua by name, coffee having gone under there as in Ceylon, owing to leaf-disease. With the beet cultivation in Europe and elsewhere cane sugar manufacturing is also but a wreck of what it was, and a number of planters in Fiji have turned their attention to such other products as tobacco and tea. The greater cost of Tamil labour, brought there from India, however, has prevented the tea planters from competing profitably in the world's markets; and consequently tobacco cultivation appears to be the most promising one of those mentioned. Fruit cultivation, it seems, has also been resorted to considerably, because we were informed that Fiji already supplies Australia with all the bananas that country required, and also with a large quantity of pine-apples. There are still a number of former Ceylon men in Fiji.

THE TEA TRADE IN AUSTRALIA.—Mr. Thomson, of the firm of Messrs. Finlay, Muir & Co. returned to the Island by the "Arcadia" this week; but he has little information to afford as the result of his fortnight's stay in Melbourne and Sydney as inspecting agent for Messrs. Finlay Muir & Co., The taster for British-grown teas, he says, is undoubtedly growing; but he does not anticipate a very great increase in the near future, nor has there been a very marked one in recent months. His view is a decidedly pessimistic one. Three years ago, before the boom the Colonies were in a very different condition from what they are now, and, when one of our representatives said to him today: "The press of Australia tells us more of the sport there than it tells us of colonial commerce, he replied: "That's just it; the principal products of Australia at present are the horse and the book-maker." All the same, he thinks, British-grown teas are going ahead down there, though how far Sylhet and Finlay Muir teas are progressing he would not say. Mr. Thomson will remain for the present in Colombo.

COMMERCIAL FIBRES.—Dr. D. Morris, in a series of Canter Lectures before the Society of Arts, when reviewing the fibres of the palm order, recently drew attention to the remarkable vegetable substance, resembling whalebone in strength and elasticity, called bass or piassava. This was extensively used for making brooms and brushes, and consisted of the indurated fibre bundles thickly clothing the stems of palms. The fibres yielded by the husk of the coconut were of considerable commercial importance. They afforded material for brushes, mats and matting, cords, ropes, and tow. Coconut refuse, on account of its wonderful properties of absorbing moisture, had been recommended for use as a backing material for steel plates in the construction of men-of-war. Of all vegetable substances the most noted substitute for horsehair was the fibre of the Spanish moss (*Tillandsia usneoides*). The plant grew in long, hanging tresses on cypress trees in the swamps of the Southern United States. The supply of material for paper-making was becoming more dependent on wood pulp. The lecturer concluded the course by discussing in some detail, problems connected with the introduction of new fibres, the improvement of fibre plants by systematic selection and cultivation, and by a general review of the methods hitherto adopted by mechanical and chemical means for the extraction of commercial fibres.—*Chemical Trade Journal*, May 11.

A VISIT TO NORTH TRAVANCORE.—Mr. G. D. Brabazon of New Peacock, Pussellawa, and Mr. J. Coles of Ruauwela, returned yesterday (2nd) morning from Travancore. Both gentlemen speak highly of what they saw in Travancore. The climate, the soil, and the tea—though of this in bearing there does not appear to be much in bearing at present—all beat those of Ceylon; and the outlook for the district is in every way excellent if only the labour difficulty can be got over and better outlets provided for produce. While staying with Mr. Knight, Messrs.

Brabazon and his companion paid a visit to Mr. Benzie, who, it will be remembered, was got up from Ceylon by Messrs. Finlay, Muir & Co. to trace an outlet from their new property to Cochin on the west coast. The journey from Colombo to Travancore does not appear to be a very formidable one, and Mr. Brabazon declares that it is possible, within forty-eight hours after leaving Colombo, to reach the portion of Travancore he visited, the route being by B.I. steamer to Tuticorin, then by rail, then on horseback by road to the foot of the ghauts, a stiff ride up the ghauts, and you are at your destination in a beautiful climate, very much like that upcountry in Ceylon, but a good deal drier. The country Mr. Brabazon went over ranged from 2,000 to 8,000 ft., at which elevation, it is needless to say, it was "considerably cool." Though some of the land was very steep and broken, a good portion of it is undulating country, of patana interspersed with blocks of jungle, very similar to the Uva country, though the visitors declare that Travancore grass land is much superior to what we have in Ceylon, the short grass there being suitable for grazing purposes, and, as far as could be judged, as well adapted for tea as a good deal of the jungle in Ceylon. The jungle soil is pronounced to be splendid, and the little tea that was inspected, though not of the best jät, was doing excellently; the cinchona, of which there is still a little left in the district, though it was steadily coming out, was in very good heart: and at the lower elevations coffee promised to do very well. At the higher elevations Mr. Brabazon thought it possible that the frost they have occasionally there might damage the tea, but in every other respect he was wonderfully struck with the suitability of the country for its cultivation. As stated above, however, there is a difficulty about labour, and it is this that has decided Messrs. Finlay, Muir & Co. to, at first, only open a small portion of their twenty square miles of land, beginning with about three hundred acres and opening about ten thousand withina the next three or four years. This will be only small portion of the virgin jungle which covers about half the enormous acreage they have purchased. They hope to work up a labour force by degrees and, no doubt, they will be as generous in the matter of advances and rates of pay as they are known to be in Ceylon. The coolies in Travancore, who are all Tamils and are recruited from much the same districts as our own in Ceylon, seem to work on a very different system to the latter. They are advanced money in just the same way as are our own but, on arrival at the estate, they proceed to work the advances off at once and, as soon as this is done, they clear off apparently without much further ceremony, leaving the planter without any labour unless he goes on sending fresh advances out for more coolies. The coolies there, too, have the same objection to go to newly-opened land that they have in Ceylon, and altogether there is undoubtedly hard work to be done before Travancore planters put their labour supply on a firm and permanent basis; but Messrs. Finlay, Muir & Co., who are the principal—and nearly the sole—proprietors in that part of Travancore, have immense capital at their back, and are determined to persevere till they have brought their fine and extensive property under tea. If they succeed in doing this in the near future, it will undoubtedly throw a large amount of tea on the markets of the world to swell the already big total from India and Ceylon, and, as they procure their labour force from the same parts of South India as Ceylon planters do, their competition cuts in two ways. But this cannot be helped, and the only way to meet it is for us to increase our endeavours to open up new markets, and to grapple practically and speedily with the labour supply difficulty. Mr. Brabazon and his companion speak highly of the main roads in Travancore, which are kept in excellent condition, though they seem to require little attention compared to what our roads up-country do, owing probably to a lesser rainfall and to the superiority of the soil there for road purposes. One road Mr. Brabazon went over, and which was in first-rate condition, had not been repaired for some five years.

NATIVE ENTERPRISE IN TEA.—It may be judged that we have fully entered on a native era in tea when we are told of an ordinary Sinhalese proprietor near Anblaugoda, booking with a Colombo Firm, for 5 maunds of tea seed at £135 per maund, and in order to make sure of the seed, offering to pay three-fourths of the money down.

CINNAMON.—A report on the London Quarterly Sales held on 27th May, will be found elsewhere; there was keen competition and better prices, and surely the improvement should continue with limited stocks, and the troubles out here this year with "cinnamon peelers" and an erratic season?

TEA CULTIVATION IN SOUTH CAROLINA.—Mr. Shepard, the pioneer of Tea cultivation in the United States, is a regular reader of our *Tropical Agriculturist*. In a letter just received from him about his "T.A.," he adds,—

My little tea-farm is coming along very nicely, and is generally regarded as a success. But I want the experience of a few more years before making that claim myself.

"CAN NOT WE AUSTRALIANS GROW OUR OWN Tea" is asked in an editorial note in the *Melbourne Herald*. Reference is made to the growth of "Chimonanthusiragrans" in England and the writer says that "the project to grow tea in Australia, a contingency which would make the continent self-contained, does not imply anything like breeding polar-bears at the equator!" But to grow tea to pay, cheap labour is indispensable and also a good deal of rain well distributed.

THE NATIVE TEA PLANTING INDUSTRY is rapidly extending and the amount of money spread among the people in the Gampola, Nawalapitiya and Matale valleys, in consequence, is very considerable. One calculation said to be a safe one, is that not less than 2½ to 3 million lb. of leaf from native tea gardens will be bought this year by the factories in and around Gampola and Nawalapitiya. Then there has also been a very large amount of money paid away in these and adjacent districts to the Sinhalese for plucking on the regular plantations; but the people are so well-off now that it is difficult to get them to come to work where, a few years ago, they were begging for employment!

CINNAMON IN DYSENTERY.—We draw special attention to the following paragraph from the *Lancet* together with the note of the editor of the *Pharmaceutical Journal* :—

Surgeon-Major Avetoom has found the administration of a bolus of a drachm of powdered cinnamon bark taken morning and evening, washed down by a mouthful of water, very successful in thirty cases; observations were extended over a period of two years, ordinary cases were cured by one or two doses, the worst by six administrations (*Lancet*, March, 1895).

[These results would render the trial of cinnamon oil or cassia oil in suitable doses interesting, tho therapeutic result would probably be the same and would obviate the necessity of swallowing a large amount of inert "woody fibre."]

The other day we reported the wonderful effects of cinnamon in so-called cases of cancer. Now Ceylon is the special home of cinnamon, and it boasts of medical men of no mean reputation. How is it that one of them—say Dr. H. M. Fernando, M.D., B.Sc., London, Fellow of University College, does not give the world the benefit of original experiments with cinnamon, and tell us for the good alike, of European and native sufferers, whether the spice is of the value ascribed to it above and in threatened cancer.

THE VALUE of land in Kuala Lumpur so signally depreciated some four years ago is now reported to be as high as ever. The value of house property is also said to be undoubtedly greater than it has ever been.—*Pinang Gazette*.

SYNTHESIS OF CAFFEINE.—At the present time, when the production and price of caffeine are in a somewhat critical state, the announcement of the synthesis of the alkaloid has a special interest, although we must say the lines upon which Professor Emil Fischer, the successor of Von Hofmann, at Berlin, and his pupil Lorenz Ach do not appear to give immediate hope of the application of the process in a commercial scale. As this is the first synthesis of caffeine, details of the methods used will be looked forward to with considerable interest.—*Chemist and Druggist*.

THE ACTION OF COCAINE.—We observe from a recent paper by Ehrlich and Einhorn that they say that MacLagan first observed in 1857 that the alkaloid from *Erythrocydon Coca* produced a sensation of numbness when placed on the tongue; thus apparently anticipating Von Anrep, who found in 1879 that cocaine has the property of a local anæsthetic. It would be interesting to know upon what grounds the authors make this statement. We have the best reason for saying that Sir Douglas MacLagan made no observations of the kind in the year given.—*Chemist and Druggist*.

PROFITS OF DOOARS TEA ESTATES.—Twenty-nine per cent per annum all round for the tea-companies of a district is probably the biggest average upon record, yet this is what Messrs. Barry & Co. record for the season of 1894 in the Dooars gardens. Analysing the results of ninety-five joint-stock tea companies registered in Calcutta, they write:—"The highest profit realised, by any individual estate, approached 62 per cent, and the Dooars district takes the lead with an average return of 29 per cent on a capital of 46½ lakhs." In Assam and Darjeeling the average profits were over 12 per cent, while in Cachar and Sylhet they approached this figure, the average for all district being nearly 15 per cent.—*Local "Times,"* June 6.

AT WHAT AGE DOES YUCCA GLORIOSA FLOWER?—A correspondent from Peterhead, N. B., sends us a photograph of a plant of *Yucca gloriosa*, now in flower in that northern locality for the first time, though it has been planted forty years. It certainly produces flowers much sooner than that in the south, and although it does not flower every year, it does so very frequently, and as is natural, it always excites admiration. Neither is the production of flowers in this case to be looked on as a death warrant. Our Peterhead friends seem to have mixed up some story they have read about the Agave with the *Yucca*. The Agave really does die after flowering, but the *Yucca*—well, it is hard to kill a *Yucca*. Even London fogs will not do it. We saw one or two in flower on the Thames Embankment this year, and, indeed, the *Yucca* is an excellent town plant.—*Gardeners' Chronicle*.

PLANTING IN LOWER PERAK DISTRICT.—The coconut trees planted by the Penghulu and others are splendid, many five year old trees being full of blossom and fruit. The Indiarubber trees, too, have, done remarkably well, even on the poorest soil, but the coffee and pepper are very miserable. But several circumstances must be taken into consideration; first that the soil is very poor, secondly that much of it was poisoned by the cultivation of *nilam*, and that the Malays never could be brought to realize till too late the vital importance of keeping the land clear and the young coffee trees free from grass and weeds. They allowed grass to grow up and the coffee was permanently injured, besides which fires occurred and quantities of both pepper and coffee were burned. Further inland the soil improves and the gardens look much better. Where the coffee has been taken care of it is bearing heavily, and the fruit trees are very healthy.—Cecil Wray, Acting District Magistrate, April 19.—*Perak Government Gazette*.

PRÆDIAL PRODUCTS THEFTS COMMISSION.

Mr. James Westland as Chairman of the Northern Districts Planters' Association, and member of the Prædial Products Thefts Commission sends us copies of the questions now circulated by the Commission. Mr. Westland is most anxious to impress upon all growers of cacao and other products who have suffered from thefts, the absolute necessity of promptly answering these questions. Replies must be in the hands of the Hon. G. F. Walker by 5th July—so that it is a case of "now or never." Mr. Westland very properly remarks:—"As careful lists are kept of the names of all to whom these papers are posted, it may be taken for granted that those who do not reply, are not sufferers and have no cause for complaint."

QUESTIONS REGARDING THEFTS OF CACAO, COFFEE, GREEN TEA LEAF, CARDAMOMS, OR OTHER PRÆDIAL PRODUCTS.

1. Have you personal experience of thefts from estates under your charge? If so, from what estates, and to what extent?
2. Whom do you consider to be the thieves generally,—estate coolies, villagers, or others, resident or non-resident?
3. To whom is the produce disposed of? Do you know if there are known habitual receivers of stolen produce in your neighbourhood? If so, who are such receivers generally?
4. Can you estimate roughly what your annual loss is proportionately to your crops?
5. Do you sell any of your produce locally? And to what extent? And to whom?
6. What precautions do you take against thefts of produce? And what does this cost you annually.
7. Do you make use of watchmen, and what is your experience of their efficiency?
8. Have you instituted cases in any Police Court? If so, in what court, and with what results? If not, why have you not done so?
9. Do you consider the existing laws afford sufficient protection? If not, what alteration would you suggest?
10. Have you experience of police patrols? And if so, do you advise the introduction of such patrols throughout your district?

QUESTIONS REGARDING THEFTS OF MADE TEA.

1. Have you actual experience of thefts from factories under your charge, and on what estates? If not, do you know of such thefts elsewhere; or, on what do you base your opinion that such thieving is carried on to an appreciable extent?
2. Do you consider this is due to general pilfering on a small scale, or to occasional and more serious thefts?
3. What precautions do you take to prevent this? Have your coolies free egress and ingress at your factory? Or is any system of searching or of other preventive measures adopted?
4. Do you sell tea locally? And to what extent, and to whom?
5. Whom do you consider to be the buyers or receivers of stolen tea?
6. Do you know or suspect that there are habitual receivers in your neighbourhood?
7. What remedies do you suggest?

CINNAMON.

THE SECOND QUARTERLY AUCTIONS of the year took place yesterday, when 1,063 bales Ceylon were offered, as compared with 766 bales at the February Auctions, and 1,073 bales at this period last year. The moderate supply met very good competition from the opening, and resulted in the entire quantity being disposed of at better prices, the rise in common and medium grades ranging from 3d to 1 1/2d per lb. a similar advance being also realized for the good and fine sorts.

"Firsts" ranged in value from 11 1/2d to 1s 4d for fine to superior, 10d to 11d for good, and 8 1/2d to 9d for ordinary and medium. "Seconds" fine to superior 11 1/2d to 1s 2d, ordinary to good 8d to 9 1/2d. "Thirds" good to superior, 9 1/2d to 1s 1d, ordinary to middling 7 1/2d to 9d. "Fourths" good to fine 7 1/2 to 10d, and ordinary and medium 7d to 7 1/2d per lb. "Unworked" sold at 6 1/2d up to 8 1/2d per lb for fourths to firsts.

Of Chips 228 bags were offered and sold at 2 1/2d to 2 3/4d per lb.

Stock of Ceylon 3,158 bales against
 1894 1893 and 1892
 2,871 3,237 and 4,042 Bales.
 The next auctions will take place 26th August.
 London, 28th May, 1895.

TROUT-HATCHING AT HORTON PLAINS.

Mr. Drummond Deane writes:—"As regards a Hatchery at the Horton Plains I think it would be successful if the waters could be leased from the Government and the hatching and fishing run by a Club. At present, to my knowledge, many people catch trout in the vicinity of Nuwara Eliya who have never paid a subscription to the fund and some of them well able to afford to pay."

How would it do to have Mr. Tringham's whole time secured for trout operations and to inspect and control the fishing?

Mr. Drummond Deane had some very good fishing at Nuwara Eliya a few days ago, catching with a March Brown fly between 4 and 6 p.m., four trout weighing 2 lb. 12 oz., 1 lb. 2 oz., 1 lb. 4 oz. and 3/4 lb. respectively. The weights were verified at the Club. The water was, of course, clear.

A DIETETIC AUTHORITY ON CEYLON TEA: ITS SALE IN FRANCE, &c.

We have received a communication from Dr. Yorke-Davies, London, author of a work on health and dietetics in which some highly complimentary references to Ceylon tea were made and which we adverted to in these columns in our review, some time ago. Dr. Yorke-Davies writes:—

"I am very much obliged to you for your kind review of my book. I am also grateful to you for pointing out to Ceylon planters that they owe a little gratitude to me, and you certainly put it very plainly to them that they might do worse than 'oil the machine.' I am quite aware from what I have heard and read that I have popularized the use of Ceylon tea, the world over. Some years ago Sir Andrew Clarke wrote letters against it in the papers and in praise of Chinese teas, and I went at him I remember, as I did not think his remarks were justified.

"I have no personal interest in Ceylon now, but for the sake of 'auld lang syne,' I have no doubt I shall from time to time have something to say about it, and there is no man in England whose opinion on dietetics has half the weight that mine has. As the work you were kind enough to review will soon be in its third Edition in England and America, its influence will be beneficial, and it is better that a British colony should be benefited by my aid than that China and its unsavoury inhabitants should profit. I am quite aware that hundreds of firms in England sell Ceylon tea, but I am equally aware that many of them sell it to retailers who mix it with other teas. As it is essential for my purposes it should be pure Ceylon only I mention this firm for this purpose. But my advocacy of Ceylon tea benefits all equally."

Dr. Yorke-Davies also sends us an advertisement from France headed the *Association du Thé Agra Ceylan...Opinion au Docteur Yorke Davies*. (Translation), "The Agra Ceylon Tea receives at present from the public the high favour which is due to it. There is no doubt that it is better and has a more delicate bouquet than any other; and, as it contains more theine and less tannin than India and China teas, it is also more healthy. It is not injurious even to those to whom digestion is difficult."

The doctor adds: "This was sent me by a patient in France so that you will see that even there my name is used to strengthen public opinion as to the merits of Ceylon tea."

EXTENSION OF CULTIVATION.

(Extracts from Mr. H. W. Brodhurst's Report on the Kalutara District for 1894.)

There was a great demand for land during the year under review, and applications were received almost daily at the local Kacheheri. The return of lands sold in 1893 and 1894 is as follows:—

Year.	No. of Lots.	Extent.			Avr. price per acre.
		A.	R.	P.	
1893 ..	36 ..	99	2	1 ..	R. 14 60
1894 ..	158 ..	1,494	3	35 ..	26 36

The returns furnished by the Mudaliyars show an increase of cultivation under the following heads:—

	Acres.		Acres.
Paddy	1,040	Cocoanuts	310
Tea	647	Other products	88
Cinnamon	107		

On the other hand, there has been a large decrease under the head "Fruit Gardens," which can only be accounted for on the ground that cocoanuts, tea, &c., are found to be more remunerative than fruit-growing.

With regard to the extent under paddy cultivation, which is estimated at 41,010 acres, as compared with 40,000 acres cultivated in 1893, the correctness of the figures cannot be guaranteed, but there can be no doubt that there has been a considerable increase. In the case of private lands by is probable that many fields which did not repaid the cost of cultivation when the grain tax was levied are now being cultivated. But, on the other hand, there has also been an increase in the number of leases Crown fields at the usual rental of R2 per bushel, the figures being—

Year	No. of Lots	Extent Bushels.
1893	78 ..	219
1894	105 ..	284

This increase would seem to indicate that in the Kalutara District at any rate paddy cultivation is not altogether an unremunerative branch of agriculture.

The crops were fair, though some little damage was caused by drought. The rainfall amounted to 71.99 inches, the average of the previous five years being 88.22.

I am indebted to the Secretary of the Kalutara Planters' Association for an estimate of the amount paid to Sinhalese labourers on the tea estates. The sum expended in 1894 was approximately R300,000, an increase of about R50,000 over the figures, for 1893. The influx of this capital has done much to improve the condition of the people, especially in the Pasdun korale, and the steady extension of the tea industry is an important factor in the rapid development noticeable in the District.

THE NAHALMA TEA ESTATES COMPANY, LIMITED.

The first annual ordinary general meeting of the shareholders of this company was held yesterday, at the offices of the company, 39, Victoria Street, Westminster, S.W. The chair was occupied by Mr. Arthur W. Marshall, chairman of the board of directors.

The Secretary (Mr. John Holgate Batten) having read the notice convening the meeting, the chairman proposed, and Mr. Macbey seconded, "That the directors' report and balance sheet to December 31, 1894, be adopted." The resolution was carried.

The Chairman then proposed, and Mr. Abernethy seconded, "That a final dividend at the rate of 2 per cent on the ordinary shares of the company be paid so soon as the realisation of the produce of the company's estates permits of such payment, making, with the interim dividend of 4 per cent, paid December 13th, 1894, a distribution at the rate of 8 per cent. per annum, from April 1st to December 31st, 1894. That such dividend be paid to those shareholders whose names appear in the share register on this day, and that after this date such shares be transferable ex. such said dividend." The resolution was carried unanimously.

The Chairman next proposed "That the share holders of the Nahalma Tea Estate Company Limited, beg to express their sincere sympathy with the family of the late Mr. H. H. Anderson in the sad loss they have sustained, and they instruct the directors to enter upon the minutes of the company their appreciation of his zeal and energy in promoting the best interests of the company." The resolution was seconded by Mr. Abernethy and carried unanimously.

Mr. Macbey proposed, and Mr. Noel Paton (by proxy) seconded, "that the directors' remuneration from the date of the formation of the company be paid to them free of income tax." The resolution was adopted.

The Chairman proposed, and Mr. Macbey seconded, "that Mr. John Abernethy be re-elected a director of the Company." The resolution was carried.

The re-election of Messrs. Fox, Sissons, and Company as auditors to the Company for the year ending December 31st 1895, at a remuneration of seven guineas, was proposed by the Chairman and seconded by Mr. Abernethy and carried unanimously.

A vote of thanks to the Chairman closed the proceedings.—*H. and C. Mail.*

PLANTING AND PRODUCE.

TEA SWEEPINGS.—In our issue of March 8 we congratulated the Indian Tea Association and the tea planting industry generally on the issue of an official Order by the Customs authorities dealing with the question of tea sweepings. We assumed that this order would be effective in putting an end, or at least mitigating, the abuses about which there have been so many complaints. The tone of our brief note seems to have been too much for the feelings of a correspondent who contributed to a Ceylon paper a letter upon the subject of the Customs Order. The correspondent referred to not only does not think much of the Customs Order, but he rebukes us for offering any congratulations upon it, and thinks that in crediting the Indian Tea Association, which we did innocently enough, with agitating in the matter, we have done an injustice to Mr. Christy, who has taken a prominent part in directing attention to it. According to our critic we said "all is well" when "all is not well." If there is going to be further trouble over this tea sweeping business, and the correspondent, we imagine, will feel disappointed if there is not, our congratulations were, to say the least, premature. We thought that the Customs order was a step likely to prove effective in remedying the evil, until this correspondent opened our eyes. He complains of the vagueness of the Customs order, and suggests that either the owner of the teas dealt with should be able to claim the spillings of their chests, or all sweepings, whether previously placed in the "damage box" or not, should be subject to the admixture recommended to Mr. Gosehen by Mr. Christy. Possibly this view is a sound one, but in the meantime it is but fair to give the Customs Order a trial, and if it prove the dead failure the correspondent predicts, something might be done towards furthering his own views.—*Ibid.*

SALE OF ESTATES.

Mousagala estate in the Passara District which was recently sold by Mr. C. B. Smith to the Namunukula Tea Estate Company realised £5,000. We recall the very first clearing on this fine property during our visit to Thomas Wood of Spring Valley in 1865. Mousagalla was then the property of Mr. G. S. Dutt and he handed it over to his friend Mr. C. B. Smith for a very moderate price. It proved a veritable gold mine to the latter as a coffee plantation and coffee continued to do well up to a recent date. It is now however all in tea—323 acres with 25 acres reserve.

We also learn that Florence and Tunisgalla Estates in the Knuckles District have been pur-

chased by Messrs. A. H. Pargiter and J. H. Brown for £6,250. They comprise some 300 acres in tea, 30 acres cardamoms and 200 acres uncultivated or reserve.

CEYLON TEA TRUST COMPANY.

(From our Correspondent.)

June 14.

A very big Company is just being advertised that has a Ceylon connection. It is called the Ceylon Tea Trust, and has been incorporated with a capital of £60,000 for the purpose of developing tea estates in Ceylon. Enclosed you will receive copy of the lengthy advertisement made by this new Company in the *London Times*. You will observe that the only estate mentioned is that of Oolapane. This is not a very extensive estate apparently, and the project advertised, we presume, is intended to cover the acquisition of other properties, though none of these are mentioned. The scheme appears to be fathered by a body calling itself the Nugget Exploring Company, though what this may be, or what possible connection it can have with the tea enterprise, I neither know nor can surmise. The title chosen of the Ceylon Tea Trust may intimate a very wide range of business:—

The subscription List will Open this Day (Monday), 10th June, 1895, and Close at 4 p.m. for both town and country on Wednesday, 12th June, 1895.

The Nugget Exploring Company (Limited), through their Bankers, invite subscriptions for 60,000 shares at par.

The Ceylon Tea Trust (Limited), Incorporated under the Companies Acts 1862 to 1890, whereby the liability of the shareholders is limited to the amount of their shares. Share capital £60,000, divided into 120,000 shares of 10s each. Issue of 60,000 shares, payable 2s on application, 3s on allotment, and balance, 2s 6d on 1st July, 1895, and 2s 6d on 1st September, 1895.

Directors.

H. W. Pritchett, Esq., 1, Winchester-avenue, Monkwell-street, E.C.

F. C. G. Bitso, Esq., 3, Bernard-street, Russell-square, W.C.

E. C. Bredin, Esq., 58, Stratford-road, West Kensington.

A. H. Baily, Esq., 32, Goldhurst-terrace east, South Hampstead.

This Company is formed to acquire, cultivate, and develop Tea Estates in Ceylon, an industry which of recent years has yielded satisfactory returns on capital invested.

The following quotations for Ceylon Tea Companies' Shares are taken from the *Ceylon Observer* of 3rd April, 1895.

From Messrs. Gow, Wilson, and Stanton's List of May, 1895.

Acreage.—This Estate, consisting of 164½ acres situated in the heart of the tea-producing portion of the Island of Ceylon, has already been profitably worked by the present owner, having 100 acres in full bearing, with the remainder just commencing to bear.

Besides this, 400 acres highly suitable for tea growing, adjoining the Oolapane Estate, can be secured by this Company, which increased area, when properly cultivated and in full bearing, should enormously enhance the profits now being earned.

Situation.—The estate is situated at an elevation of 1,800 feet in close proximity to the celebrated Mariawattee Estate, whose average yield from the earliest planted fields has for years past been nearly 1,000lb. per acre per annum.

Transport.—The facilities for transport on this estate are exceptionally favourable, as, in addition to the Ceylon Government Railway passing through it (a station being actually on the property), it is intersected by good cart roads.

Water Supply.—The estate being bounded by the Mahawela Ganga (the principal river of Ceylon), there is an unfailing supply for working a tea factory.

Yield.—Despite the small portion of the estate in full bearing, last year's crop amounted to about 60,000lb. while, judging from the yield of the oldest planted tea the capacity per 10 acres of cultivated land should yield at no distant period about 100,000lb. of tea per annum, this year's crop being estimated at 80,000lb.

It is proposed to erect a large factory, which on the present output of this estate should effect a considerable economy; in addition to which a large profit may be derived from the purchase of native tea from adjoining estates to be manufactured and sold by this Company.

THE INDO-CEYLON RAILWAY:

THE VIEWS OF MR. SHADBOLT: COLOMBO TO BE THE "LONDON" OF ASIA."

We are pleased to be able to lay before our readers, the following very clear conclusive letter addressed to us by Mr. Shadbolt, Chief Engineer on the Madura-Paumben Survey, whose Report on this and on the crossing to Ceylon we reviewed the other day. It will be observed that Mr. Shadbolt is convinced the line must be on the metre-gauge and run direct to Colombo traversing Adam's Reef by means of a solid breakwater rather than by screwpile bridges as proposed by Mr. Waring. This is very important; for, we believe the Indian Engineer must have consulted the Marine Surveys and based his Report on the information therein contained. A breakwater, we need scarcely say, depends chiefly on local labour and material and every year should see it grow more stable, requiring nothing in upkeep if the surmise be correct as to the reef rising and being added to steadily. Here is Mr. Shadbolt's letter:—

To the Editor, "*Ceylon Observer*"

Coonoor, 25th June, 1895.

DEAR SIR,—I have to thank you for copies of the *Ceylon Observer* of 8th and 18th June. I see in the latter a reference to my Report, so I suppose you have seen it. It has apparently been placed at the disposal of the Press on this side, so there is no impropriety in my now sending you a copy.

So far as you have referred to the matter, your views on the subject appear to be in sympathy with my own. The following seem to me the most important points:—

(1.) The line must be on the metre-gauge; The whole of Southern India is occupied by this gauge.

(2.) The line must run direct to Colombo and not be hampered and depreciated by trying to work it in with existing lines.

(3.) With regard to Adam's Bridge the shoals have a tendency to increase and become more stable and a form of construction should be adopted which would encourage this. See "Report" for views on the water currents.

These are three points in which I fancy I differ essentially from Mr. Waring.

The following are matters of speculation rather than observation:—

(4.) I believe the natural position of Colombo ensures it a future of immense importance. Its situation will make it for Asia what London is to Europe.

(5.) The political value of the railway would be enormous with regard to the Far East in allowing the military resources of India to be concentrated at such a commanding point.

(6.) The fear of Ceylon being merged in India is absolutely puerile and rests on nothing. The idea of Madras annexing anything is almost unthinkable.

I am merely sending these remarks as you appear to be warmly interested in the matter.—
Yours faithfully,
E. I. SHADBOLT.

We need scarcely say that we are greatly obliged to Mr. Shadbolt for expressing so strong an opinion as to the future of Colombo and on the political value of the Railway to the Imperial and Indian Governments. No less to the point is his rebuff to those who would raise the bogey of Annexation at this time in order to block the path of an Indo-Ceylon Railway. We feel sure that Mr. Shadbolt's letter putting so many points with such admirable clearness, will have a good effect both in Ceylon and in England, in removing obstacles in the way of commencing an undertaking which on local, Indian and Imperial grounds is so desirable and potential for good.

THE OUTLOOK FOR CAMPHOR.

An American journal—the *New York Drug Report* v.—interested from the wholesale and retail point of view?—thinks there is no need now to fear a scarcity:—

The speculation, which is now the feature of the crude camphor market in London, is of considerable interest to the refiners of this very important drug.

Ever since the war commenced between China and Japan there has been more or less speculation in crude camphor, and the price of the refined has been advanced several times since last summer, but at times the price has weakened, owing to lack of support from consumers and temporary withdrawal of speculators in the crude. The latest advances in the refined which our market reports have chronicled, were caused by another speculative manipulation in London of the crude, and it is reported that a well-known financier is at the back of the movement. The price has recently been advanced from one hundred and twelve shillings to one hundred and fifty shillings, c. i. f., and very heavy purchases have been made by those engaged in manipulating the market. The speculation is doubtless based on the condition of affairs at the sources of supply. Judging from all the information that has been received, the conditions do not appear to warrant any movement of the character of the present one. While it is true that for several years the output of Japan and Formosa amounted to 60,000 piculs, of one hundred and thirty-three pounds each, and while it is also true that the production of Japan has been steadily declining, with the prospect of the camphor forests of that country soon becoming extinct, the fact must not be overlooked that Formosa has enormously increased her output, which had been greatly curtailed by the action of the Chinese authorities in heavily taxing the gum. Concessions granted by the Chinese to a syndicate some three years ago did away with the vexatious restrictions upon this important industry, with the result that the production is greater than it ever was, and now exceeds that of Japan. The production of both varieties in 1893 was, in round numbers, 56,000 piculs, and in 1894, 55,000 piculs, almost up to the output of some years ago. The supply has proved more than ample for all requirements of the trade, notwithstanding the large increase in certain directions in the demand for the refined article, as naphthaline has to a considerable extent taken its place as a moth destroyer. Quite a larger supply of crude has been carried in Hongkong, and at no time has there been any prospect of a scarcity.

A CAMPHOR FAMINE.

The news that the price of camphor was advancing at the rate of a penny or two per pound every day, as the result of the recent war between China and Japan, and that England and the Continent were threatened with something like a camphor famine, has caused considerable alarm. That this should be so is not surprising, seeing that camphor

is an article of daily consumption, used as a medicine in diseases from the most fatal form of Asiatic cholera to a mere cold in the head. Its value as a disinfectant is thoroughly established. Beyond this, its use has helped to check the spread of Asiatic cholera. It has been tried in Naples by the famous Dr. Rubini, whose testimony to the merits of camphor as a cure of cholera has never been disputed. In the great cholera epidemic of 1854, he administered camphor, taken internally, to 400 cholera patients, every one of whom recovered. Proctor, during the cholera epidemic in Liverpool in 1866, treated 123 cholera patients with camphor, and there were but three cases of relapse. The drug has indeed even more beneficent properties than the general public are aware of. A large dealer in the drug says the present unprecedented demand for it is due to the fact that more camphor has been sold for future delivery than is at the moment obtainable, and that the stock on hand does not exceed four or five thousand hundredweight.

The greater portion of our camphor comes from China and Japan. Before the war it was cheap, but as soon as hostilities were begun the price went up. With the close of the war the manufacturers thought camphor had reached its top price and must recede, so they did not increase their stocks. But it turned out that they were wrong, and those who delayed buying had to pay a higher figure for camphor, the price of which, like that of everything else, is regulated by the relation of demand to supply. Camphor costs today from £7 to £8 per case of a hundredweight; but a few years ago the price touched £9, and at a former period even reached £20. There is no reason why the price should not advance beyond the very moderate figure it stands at now, which is not excessive compared with what it was in former years. Camphor is dearer in China today than in London, a case that costs £7 16s here being sold in China for £9.

It would appear, therefore, that there is less camphor in England today than is necessary to meet the requirements of the manufacturers; and when the Continental buyers begin to purchase heavily, it is more than likely that camphor may fetch £12 or perhaps even £14 a case. A good deal of camphor is held by a syndicate, who, however, will, it is understood, sell to manufacturers at a moderate price sufficient camphor to carry on their business. But speculators who have sold camphor they did not have, and could not now obtain, will suffer. Should a warm summer bring dysentery or cholera to England, the demand for the drug will be very great. Camphor has been nearly all obtained by the Chinese, who are greatly demoralized by the results of the war, or by the Japanese, whose Government have restricted the production by passing a law that the camphor-trees shall not be cut down but only tapped. It will take the Chinese seven or eight months to prepare the new crop of camphor for the market, camphor-making from the gum being a very tedious process. The gum has to be washed and spread in the sun to dry, and undergo other treatment. Camphor-making is not a regularly organized industry, but a monopoly of certain tribes in China, some of whom are now in rebellion against the Government.—*St. James's Budget*, May 31st.

OUVAH COFFEE COMPANY, LIMITED.

Report to be presented to the Thirty-second Ordinary General Meeting of the Company, to be held at No. 5, Dowgate Hill, London, on Wednesday, the 19th day of June, 1895, at 12-30 o'clock p.m.

The following annual accounts are now presented to shareholders viz.:—Profit and Loss Account for Crop 1893-4, Balance Sheet made up to 31st March, 1895.

CROP 1893-4.

In the Directors' last report the coffee crop of the above season was estimated at about 600 cwts., and it will be seen that the actual weight sold in London amounted to 556 cwt. 2 qrs. 6 lb.

The proceeds amounted to £2,774 9s 2d, giving an average of 99s 8d per cwt., against an average of 99s 2d obtained for the previous crop. Coffee sold in Ceylon realised £119 7s 11d.

The crop of tea was estimated at 540,000 lb. and the actual weight sold from the Company's own estates was 555,650 lb. Besides this, 446,147 lb. of tea manufactured from leaf bought from neighbouring estates were sold.

The value of all tea sold was £36,185 2s 4d, or an average of 8-66d per lb. as compared with 10d for the previous season.

Cocoa, weighing 57 cwt. 0 qrs. 21 lb. realised £172 12s 4d, the average selling price being 60s 4d per cwt., against 71s 4d for the former year's crop.

It will thus be seen that the total value of all produce sold amounted to £39,251 11s 9d.

The total expenditure for the year in Ceylon and London, amounted to £31,499 16s 1d, and deducting this from the value of the produce, a profit is shewn on the season's working of £7,751 15s 8d. To this has to be added the sum of £331 5s 3d, brought forward from last year, giving a total of £8,083 0s 11d at the credit of profit and loss account.

An Interim dividend of 2½ per cent. on the capital of the Company was paid on the 10th January last, which absorbed £2,500 of the above-named sum, and the Directors now recommend that £3,500 be applied to the payment of a further dividend of 3½ per cent., making 6 per cent. for the year, and that the balance of £2,083 0s 11d be dealt with as follows:—

To be written off Cost of Ledgerwatte..	£1,000	0	0
To be credited towards Cost of Badulla			
Tea Factory.....	1,000	0	0
To be carried forward to next Account..	83	0	11
	£2,083 0 11		

The coffee crop was less than half that of the previous season, the crop of 556 cwt. being secured from an area of 765 acres, or at the rate of about three-fourths of a cwt. per acre. The proceeds of the coffee crop were £2,893 17s 1d as against £6,876 7s 7d for the previous year, shewing a falling off of £3,982 10s 6d.

The crop of 555,650 lb. of tea was obtained from an area of say 1,310 acres, being equal to an average yield of 424 lb. per acre, but this area include 254 acres of young tea from which only small pluckings were obtained.

Shareholders will see from the above that the returns from tea are well up to expectations, and that the shrinkage in revenue as compared with last year is entirely due to the short coffee crop.

Cinchona bark weighing 19,607 lb. has been shipped to London on account of crop 1893-4, but not yet realised. Owing to the low prices ruling for bark the proceeds will be very small, and they will be credited to crop 1894-5.

CROP 1894-5.

The promise for this season is good and it is hoped that the following crops will be secured:—

Coffee	1,000 cwt.
Tea	575,000 lb.

If prices remain at or about their present level the year's working should therefore result in a highly satisfactory profit.

The factory at Badulla, referred to in last report, was opened for the manufacture of tea in January last, and since then has been working continuously and giving entire satisfaction.

During the past year 150 acres have been planted up in tea, and it is proposed to plant up a further 150 acres in the autumn of the current year.

The area now under tea is as follows:—

T E A.		
Over 5 years old ..		1,017 acres.
Planted November-December 1890	283	„
Do .. 1891	109	„
Do .. 1892	45	„
Do .. 1893	115	„
Do .. 1894	150	„

Total area under tea ..	1,719	acres.
Total area under coffee..	669	„

INDIAN AND CEYLON TEA.

ANNUAL REVIEW.

38, Mincing Lane, 11th June, 1895.

The close of another year, marked by the issue of the statistics for the twelve months ending 31st May, finds the position of the two main branches of the Tea Trade attracting general attention; and not without reason, in view of the vast commercial interests involved.

In contrast with the discouragement that some have had to face in other departments of the Empire's commerce, producers of Indian and Ceylon tea have the satisfactions of being identified with a stable and promising industry—liable, it is true, to fluctuations affecting the degree of its prosperity, but built upon the secure foundation of administrative experience, and freed as far as any industrial undertaking can be from dependence upon the chances of a merely speculative enterprise.

The result of the year's work has been exceptionally good. To some extent, circumstances have contributed to make it so: an increase of only moderate dimensions in the production; sustained demand at home; growing demand from other markets; low rates of exchange and freight—have told in favour of producers. But behind these several factors of success stands the evidence that those on whom the burden of responsibility primarily rests—the managers and those who direct and assist them—have shown their capacity to maintain the general excellence of their produce; often to increase the productiveness of their gardens; and to do so without excessive expenditure.

The outcome has been to widen the margin between cost and proceeds to the point which enhances the value of plantations for the time being, and enables provisions to be made for contingencies of the future.

How far these contingencies may affect us in years to come it is difficult to forecast; but it would seem mainly to depend upon—

1. Whether increase in production be gradual or excessive in any one year.
2. The point to which the total supply eventually expands.
3. The result of the efforts made to induce consumers abroad to use our tea.

Higher rates of exchange or freight; difficulty in obtaining labour, have, of course, to be regarded as possibilities; but they may be counterbalanced by economies resulting from amalgamation of small estates with larger ones; by abandonment of outlying or inferior plots difficult to cultivate profitably; and by gradual increase in the productiveness of the plant itself arising from high-cultivation, of which some are now reaping the fruit.

Should the conditions hereafter be less favourable than they are today, the wisdom of the policy that has made extensions, roads, and bridges; given a complete equipment of buildings and machinery; and created reserve funds—out of revenue—will be emphasized.

These are matters of deeper concern than market movements, variations of climate, the relative success of one locality as compared with another, or the temporary transference of demand from one class of tea to another—important as these are to individual interests. The stability of the industry, as a whole, rests upon a wider basis: and its position will be appraised and its prospects gauged by the record of results achieved during a series of years, adverse as well as prosperous. This record entitles Managers to look back on the past with satisfaction, and justifies proprietors in regarding the future with reasonable confidence.

Among the features that have marked the season now closed, two stand prominent, viz., that the United Kingdom has taken a larger quantity of British-grown tea than ever before; and, that a higher price has been obtained for it than for the previous crop. But we are approaching the limit of consuming power at home; there only remains a margin of 11 per cent. to be gained; and we cannot expect the other kinds in use to be entirely displaced.

The need of opening up fresh markets consequently becomes pressing. Outside the United Kingdom such markets exist; they are capable of taking far more than the surplus production of India and Ceylon, and they must be won—for the result will be worth the trouble and expense of gaining entrance to them. Looking merely to statistics, the progress made in this direction may seem slow; but the fact is that during the past season prices have not admitted of its being more rapid. The development will be seen when there is plenty to spare from the home market, and quotations for the lower qualities are not maintained here at a level which checks Colonial and foreign trade. That consumers abroad do not yet appreciate our finer qualities, and as a rule only take the cheaper sorts, is a matter of regret. In time they may do so; but it is well to take note of facts—and those who are prepared to spend money on an enterprise of a somewhat missionary character in other countries will best do so in helping to create and foster the sort of business most likely to follow through the ordinary channels of trade.

Seeing that since 1887 we have lost ten million lb. of the annual re-exporting trade of the United Kingdom, the gain since then of 5 or 6 millions in the quantity of British-grown tea that we yearly send abroad is the more significant.

Another feature of the year is the reduction of the margin between quotations for the commonest and good medium grades. This need not be taken to indicate any indifference on the part of consumers to the quality of the tea they buy; the prices paid for the finest descriptions negative such an idea—it is the natural result of receiving a large percentage of good tea. The Assam crop as a whole has been especially good: Darjeeling has sent much high-class tea; while other districts and Ceylon have either maintained or gained ground in respect of quality. The net result has been a crop of high average merit, containing a smaller percentage of common tea than the previous one—which has raised the average value, while to some extent contracting the range of quotations.

This has proved of more advantage to some districts than to others—but to regard it as a reason for relaxing efforts to make fine tea, and for merely aiming at a heavy yield, would be unwise: although upon this point we would not lay down a rule for general application. For while experience teaches that a heavy crop of low average quality leads to general depreciation of values for all but the very best tea—it also shows that some estates cannot trust to the chances of a short crop, inasmuch as their plant does not enable them to reach the market's standard of fine tea.

A wide variety in character, in order to meet the varied tastes of consumers in different parts of the Kingdom, is necessary; and we repeat our suggestions to Managers to keep to a type of tea distinctive of their estate; if they have not found the one most suitable to their soil and plant, to make experiments until they succeed; and not to change it in order to make some other kind said to be in demand. Other points to aim at are—

1. Such regularity as may be possible all through in grading and liquor, so that when buyers see the mark for sale they may have some assurance of finding what they have waited for.

2. Avoidance of breaking the leaf, or of needless subdivision into various grades; which will help to raise the size of brooks—a matter of increasing importance as shipments become larger.

3. Bringing produce to market at regular intervals from the beginning to the end of the season.

The policy outlined has been followed with good results by many of the largest producers. It fits in with the modern principles on which the Home Trade work; viz., of buying regularly through the nine busy months of the year, and of keeping to a growth found suitable to their particular business.

By attention to the points we have named sellers gain their special outlets and keep them.

We would especially bring these matters under the notice of our friends in Ceylon, asking them to avoid

shipping so many separate invoices at short intervals; and to do their utmost to prevent their teas from losing their individuality. In some cases this has occurred, and it is a risk which Ceylon—whose prospect as a tea-producing country are most promising—must guard against: for it tends to bring down prices to a dead level; and may possibly account for the average value of Ceylon tea having fallen more than that of Indian during the past four or five years.

There are other matters of detail conducive to the profitable working of Estates, but they are of minor importance, and we leave them for direct reference to advisers in London as occasion arises.

There remains a subject of general interest, viz., the effect of the war in the East upon the production and export of China tea. As regards the home trade, there should not be cause for apprehension, for the low point to which our cost of production has fallen makes it unlikely that China Congou sufficiently good can be laid down here cheap enough to undersell our teas and so displace them to any considerable extent.

We will therefore conclude by calling attention to the statistics below; and to the statement of results realised by most of those who sell in London, which by the courtesy of our friends we are permitted to publish.

They justify a hopeful view of the future of the Industry if it is worked on the business-like lines that have hitherto been followed, and the efforts to extend it still further are tempered with caution.

The following figures show the proportions used at Home and Exported:

Of duty payments for the twelve months ending May 31st—

	1895	1894	1893	1892
Proportion of				
Indian	52.50 %	54.50 %	51.51 %	50.80 %
Ceylon	33.50 "	32.00 "	30.52 "	28.15 "
China and Java	14.00 "	13.50 "	17.97 "	21.05 "
	100	100	100	100

Of Exports from the United Kingdom for the twelve months ending May 31st—

	1895	1894	1893	1892
Proportion of				
Indian	12.50 %	10.30 %	9.40 %	11.30 %
Ceylon	18.50 "	13.30 "	10.32 "	8.20 "
China and Java	69.00 "	76.40 "	80.28 "	80.50 "
	100	100	100	100

The progress of the Ceylon trade is shown by the following statistics:—

Year ending 31st May	Imported lb.	Sold in Auction Pkgs.	Avg. price per lb.
1895	74 million	870,000	83d
1894	72½ "	850,000	83d
1892	64 "	790,000	94d
1890	34 "	450,000	11d

INDIAN CROPS—Results of some of the crops sold in London, Season 1894-5.

Districts:—Assam, Assam and Cachar, Cachar Sylhet, Darjeeling and Terai, and Dooars Chittagong.

Totals:—Average-yielding 97,120, Crop 42,284,000 lb., Per acre 435 lb., and Average price 1894-95 10-55d.

Returns for	Acreage	Quantity. lb.	Per Acre.	Price per lb.
1893-94	91,300	40,083,000	439	9.65
1892-93	85,780	34,900,000	406	11.30
1891-92	78,500	34,640,000	441	10.17
1890-91	71,600	29,600,000	413	11.75

WM. JAS. & HV. THOMPSON, Brokers.

TEA: MESSRS. W. J. & H. THOMPSON'S ANNUAL TEA REPORT—is always good reading. We give it in full above, with such statistics as are of interest. It is satisfactory to find that the leading Mincing Lane Brokers take so hopeful a view of the stability of the enterprise, while they afford some admirable advice to the planter. We commend the Report to the careful attention of our readers.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, June 6.

QUININE—The last business reported before the holidays was at the rate of 12½d per oz for B and S or Brunswick quinine on the spot, and at 13½d per oz for ditto, October delivery; the London stock has again been considerably reduced in the course of the last month, the warehouse figures being:—

	oz.
Imports in May	24,202
Deliveries in May	139,784
Stock on May 30	2,332,164

No business is reported this week, and 12½d per oz remains the general spot quotation.

CAFFEINE—Very scarce on the spot; business has been done this week in small quantities, at 27s per lb on the spot, and we hear that one of the makers has sold at 21s per lb for August-September delivery. On the other hand, another manufacturer is said to be willing to accept 19s per lb for delivery not before end of July.

CINCHONA—The exports of cinchona from Ceylon during the periods from January 1st to May 6th have been—

1895	1894	1893	1892
lb	lb	lb	lb
276,220	827,879	1,723,379	2,136,843

COCOA-BUTTER—On June 4th about 70 tons of Van Houten's cocoa butter were sold by auction in Amsterdam at an average price of 64 7/8c per half-kilo, the lowest price realised by any lot being 64½c, the highest 65½c. The tone at the auctions was quiet.

COCAINE—The reduction in the convention-price announced last week was followed on June 1st by another, and still more drastic, move on the part of the combined makers, the price then being reduced by 1s 6d per oz at the time—viz from 16s to 14s 6d per oz for lots of at least 100 oz, and from 16s 6d to 15s per oz for smaller quantities. The cause of these continued reductions is thought to be the determination of the combined makers to crush out an outsider in Southern Germany, who has just started cocaine-making. It was thought that the last shot would have silenced this intruder; but the contrary was the case, the "outsider" replying to the challenge by a further reduction in his quotation to 14s for 100-oz lots which still leaves him six-pence below the convention-price. The end of the fight will probably be the inclusion of the outsider in the syndicate, followed by a general advance in the quotations. From another quarter we hear that the object of the cocaine refiners in reducing their quotations is not, as is generally supposed, that referred to above, but that their intention is simply to secure cheaply certain parcels of raw cocaine which have just arrived.

THE AGAVE OR ALOE FIBRE.

TO THE EDITOR, "THE INDIAN & EASTERN ENGINEER."

SIR,—Some months back a letter appeared in the columns of your paper, asking for information as to the methods of preparation of the so-called Aloe Fibre.

A brochure, entitled "All about Aloe and Ramie Fibres," was published in 1890, at the press of the *Ceylon Observer*, by Messrs. A. M. and J. Ferguson, one of the many contributions of that firm to the literature of Tropical Agriculture, embodying a translation of a pamphlet published in 1882, from the pen of M. Evenor de Chazal, of Mauritius. The translation does not, however, include the diagrams of the somewhat crude machinery then employed in the extraction.

On the estate in Ceylon where the present writer is employed, the ropes used for suspending the sacks of tea to the runners on the wire shoot, are made on the estate, from aloe fibre, prepared without any mechanical appliances whatever.

The coolie takes a leaf, cuts off the ends square, and hooks one end on to a nail projecting from a board. The leaf previously beaten with a stone is scraped with a half coconut shell, till the fibres at one end are loosened. These are then tied in a free knot, and hooked on to the nail (the leaf being reversed), allowing the fibres to be set free at the other end.

The fibres are next hung up to dry, twisted into a yarn, which is wound on to spools, which yarn the operator twists into a 3-ply rope, his toes being used as fingers to hold the yarn during twisting.

Notwithstanding the extremely barbarous *modus operandi*, the ropes are cheaply made and stand their work very well.

Having in view that the aloe plant requires no cultivation whatever, it would seem to suggest the possibility of remunerative enterprise in this island.—Yours, &c.,

J. S. S.

Ceylon, June 4, 1895.
—*Indian Engineer*.

PLANTING AND PRODUCE.

THE CEYLON ASSOCIATION IN LONDON.—The annual meeting of this Association is a matter of more than ordinary interest. The work performed by the Association is thoroughly practical, and there is such evidence of life and vigour about its whole proceedings that the year's record is well worth careful attention. The Ceylon Association, whether it undertakes work great or small, always means business. It is, therefore, very gratifying to find that the movement for joint action between India and Ceylon in advertising British-grown tea in the United States was one of the chief items of the Association's programme at its meeting. We do not wish to under-estimate the difficulties attending a completely harmonious union of forces in this matter. That the basis for a workable arrangement should have been arrived at reflects credit on the diplomacy of those concerned in bringing it about. The force of circumstances has out-weighed minor considerations, and in view of the absolute necessity for finding new and important markets it has been decided to endeavour to sink small differences and avoid friction. It augurs well for the future prospects of the joint scheme that it has received the approval of the Ceylon Association in London.

PRODUCE AND THE BOARD OF TRADE RETURNS.—The Board of Trade Returns for May are fairly satisfactory. As regards produce, the clearances for home consumption of tea, coffee, and cocoa show increases, tea in particular. The quantity of tea is 23,816,000, compared with 18,169,000 lb.—an increase of 5,647,000 lb. Of this increase 2,000,000 are due each to India and Ceylon, and 1,000,000 lb. to China.

THE AVERAGE PRICES OF PRODUCE.—A new issue has just been made by Mr. Effingham Wilson of Mr. Augustus Sauerbeck's chart of the average prices of general commodities in England. The figures again demonstrate that the period of decline is not yet at an end, or was not so in 1894. Mr. Sauerbeck takes forty-five representative, or principal, commodities, and compares their prices with the average of the ten years 1867-77, which is adopted as "100." As they rise or fall against those prices, the index number goes above or below this 100, and since 1873 the course of prices has been almost uninterruptedly downward. From 1888 to 1891 the average was about 70, or 30 per cent. below the standard of 100; and in 1894 it was under 64, or 36 per cent. below. Taking particular articles in illustration, the average price of tea was 11½d. per lb. in the ten years adopted for standard of comparison. That price, in other words, together with the "average important price," was 100 in the index number. In 1894 tea fell to 4½d per lb. which brings the number to 47, or a fall of 53 per cent. In no instance, except that of coffee, which has risen 17 per cent, is the price now higher than it was five-and-twenty years ago.

NUGGETS AND TEA.—A prospectus has been issued this week of a company called the Ceylon Tea Trust, Limited. The share capital of the concern is £60,000 in shares of 10s, and the object as stated in the prospectus is "to acquire, cultivate and develop tea estates in Ceylon." There are numerous extracts in the prospectus from various newspapers in praise of Ceylon tea, but the main fact of importance which we gather from the prospectus about the Ceylon Tea Trust is that the directors "have in view the purchase of several well-known estates, and have already practically arranged to acquire, on terms most favourable to the shareholders of this company, the Oolapane Estate. Upon the board of a tea trust it is natural to look for the names of men

well-known as representatives of the Ceylon tea industry. Subscriptions to this project are invited by the Nugget Exploring Company, Limited, while the directors of the Trust are H. W. Pritchett, 1, Winchester Avenue, Monkwell Street, E.C.; F. C. G. Ritso, 3, Bernard Street, Russell Square, W.C.; E. C. Bredin, 58, Stratford Road, West Kensington; and A. H. Baily, 32, Goldhurst Terrace East, South Hampstead. These gentlemen may be acquainted with all that concerns tea planting, but their names are not familiar to us in that connection. If they understand tea planting they are unnecessarily modest in failing to mention the fact. Investors, although they are prepared to ignore details at times, are apt, when in more thoughtful mood to attach great importance to information of this kind.—*H. and C. Mail*, June 14.

NEW AREAS OF CULTIVATION IN KEGALLA.

The extent of land, exclusive of chena, which was newly brought under cultivation during the year, is computed in round numbers to be 2,500 acres; and the area of the various products is estimated approximately in the following proportions:—

Tea	1,250
Coconuts	1,000
Fruit gardens	150
Cacao	100
Total	2,500

The extension of cocount planting is noticeable, but the other denominations require no comment. Paddy cultivation does not perceptibly increase, for the very good reason that there is hardly any more land which is capable of being asweddimized.—*Mr. F. H. Price's Administration Report for 1894.*

CEYLON TEA IN THE UNITED STATES OF AMERICA.

(To the Editor "*Tropical Agriculturist.*")

Sir,—At the request of the Chairman, I enclose the accompanying letter from himself and the connected papers for publication in the newspapers for general information.—I am, &c.,

A. PHILIP,
Secretary.

Kandy, July 2nd, 1895.

(Copy of Letter.)

Sir,—A wish has often been expressed that more could be published about our representative's actions in America and London with a view to pushing Ceylon tea in foreign lands—a wish with which I sympathise fully. But it must be remembered that Mr. Mackenzie's relations with the Committee must necessarily be confidential, as his duty is to advise the Committee; and in doing so he is bound to mention names and occasionally some disagreeable facts and incidents, which it would be quite impossible to publish.

I enclose, for publication, some extracts from a letter recently received, with names in most cases omitted.—I am, &c.,

A. MELVILLE WHITE.
Madulkelle, July 1st, 1895.

Extracts and precis of Mr. Wm. Mackenzie's letters to the XXX Committee, June 2nd to 7th, 1895.

Mr. Mackenzie writes:—

I have had a long interview with Mr. ——— who appears to be the agent in Chicago for ——— of Colombo. He says he took up Ceylon tea after the close of the Chicago Exposition. He says:—"In 1894 I sold 5,000lb. pure Ceylon of which I imported 3,000 lb. Since the beginning of 1895 my importations to hand and on the way amount to 17,000lb. and before the close of the year will be 50,000lb." He condemns giving quantities of samples and says Indian teas are being sold as Ceylons. He says dealers have the call for Ceylon tea, but India has the market.

Of course the condemnation of sauples and trade, against India have been caused by the circulation of a quantity of your samples by the Iowa Company and the Sylhet Company's agent in Chicago. We must be prepared for such complaints of rival agents. I have thanked him, have pointed out that the Bounty system is not approved of and that India gives no bounty, yet its teas are selling freely; have added, 'I shall be glad to hear from you how we can specially assist you by some other means than a bounty.' I have assured him Ceylon teas are beating Indians in all countries outside Britain, and am to send him Gow, Wilson & Stanton's diagrams."

Mr. Mackenzie goes on to say he is in correspondence with a strong firm in New York who are compiling a very stylish book on Ceylon teas which they are to distribute to educate Americans. This firm writes:—"We are prepared to take hold energetically and can guarantee you large results. We are willing to spend our own money, but should like you, who are alike to reap the benefits of our advertisements, to share in the expenditure."

Mr. Mackenzie says they wish to import direct on through bill of lading, and to have their packages leave Ceylon with their own marks and brands.

Mr. Mackenzie further writes:—"I have not yet met Mr. Rogivue, but I have had an interview with one of the principals of his financial agents. That gentleman speaks enthusiastically of past results and future prospects, but was not in a position to give me definite figures, which I am promised when I meet Mr. Rogivue himself. The difficulty with the Russian tea business is the enormous amount of ready capital it requires. The duty is 1s 10½d per lb and has to be paid *in full* on each shipment before any of the tea can be removed. . . . It is very gratifying to know that Ceylon teas sent to Russia have increased from 500,000 lb in 1890 to 2,100,000 lb. in 1894. I had a long and very interesting interview with Mr. Densham of Mazawatte fame. He has so far been disappointed with the result of his advertising and pushing in America. The same expenditure would have increased his business to a greater extent here than it has done in America, and *mark this, when, in the future, results from our efforts may be disappointing*, he thinks our fund and that of India combined, is a fleabite; just about a fourth of what his firm think well to spend in Britain and Ireland. He says Ceylons are his main teas, his high priced teas being pure Ceylon. . . . I find it generally believed here that we must make a market for Indian tea in view of the expected increase of shipments from there. Other countries take Ceylon in preference—see Indian decrease and Ceylon increase to Australia. Here in Britain Indians are taken more readily, and to prevent a glut in London we must find markets for our teas which are preferred abroad. . . . As I have had the "wire" intimating that I might spend the £1,000, I have sent £100 to Chicago and have the written assurance that this sum will be covered by a similar amount, and I hope to get it covered twice perhaps three times. . . . I am also arranging for some more advertising in Commercial journals and in the Canadian *Grocer* papers which reach the trade rather than the consumer. To touch the latter is a very expensive undertaking and cannot be begun *till I know you have plenty of funds in hand.* . . . If we can interest a few strong people, and the enquiries I am making prove that interest is being roused, and these few make a business; other dealers must handle article in self-defence. . . . I have now seen a wire from Chicago to the effect that the £100 I gave the Co. for their agency there has been covered by a large distributing house. Messrs. ——— also covered it.

"I met Mr. Rogivue at the office of his agents here two days ago. He is confident his work in Russia has materially helped to bring about the rapid increase in the consumption of Ceylons there during the last four years. His own business is increasing by leaps and bounds. His figures for 1893 were double those of 1892; and 1894 was nearly 70 per cent a head of 1893. His success has stimulated many Russian dealers to take up our tea. Russia is such an important field that I think the Committee might

well devote £—per annum to helping Mr. Rogivue's work. I saw the standards kept at the office of ——— & Co. for their guidance in buying teas for Russia. They are similar to those which are required for America—whole leaf long wiry twist and well free of brokens and dust. Neither Russia nor America care for Broken Pekoes, but will take eagerly long wiry well twisted Broken Pekocs. . . . I was asked at Lipton's why Ceylon now shipped so large a proportion of broken teas. The market does not want them, as is proved by the fact that high grown B. P.'s are selling down to the price of Pekocs and good Souchongs."

39, Arthenhall Gardens, Hampstead, June 14th 1895.

The Secretary Thirty Committee Kandy.

SIR,—I have to acknowledge receipt of yours of 15th ultimo.

I enclose some letters I have had from America. You will note proposed Canadian Exhibition is defunct. It was the idea of promoters interested in pickings.

I have replied to ——— that he shall induce his principals in Colombo to go into the tea business when we could assist him, with others, by general advertising, and when results justified perhaps some special assistance might be given. One trade advertisement in trade journals is attracting notice. I send the Chairman a paper today with an advertisement I inserted. That is the first in this paper. I am arranging for a page with a startling illustrated advertisement in the Canadian Grocer. I have had an application for some aid to start a *Ceylon tea packet* in Toronto. The firm is a strong one and would cover once, any amount I gave. I have asked these to cover twice, when I might think of it. But so many are pushing Ceylons in Canada, that beyond general advertising, I don't consider we need do much. I might be tempted if I had our contribution twice covered.

Messrs. Brown Sinclair and I had an interview with Mr. Rogivue and his supporters here three days ago. They satisfied us as to the financial position, and we agree in thinking strong support should be given. Mr. Rogivue says advertising is very cheap in Russia where journals are few. He would advertise, distribute samples, and have a booth at the Novogrod fair if he is supported. His sales now are about 250,000 lb. per annum, and he expects a considerable increase this year. Indirectly, by stimulating other dealers to import Ceylons, he has done us great good

In 1890 India sent	100,000 lb.	to Russia.
„ 1894 „	400,000 „	„
Ceylon 1890	500,000 lb.	
1894	2,100,000 „	

I am, &c., WM. MACKENZIE.

(Extracts from letters from Mr. Mackenzie to Mr. Bryans representing Indian interests.)

I, and a good many others, regard the position of our teas as follows:—We cannot, for reasons connected with labor and scarcity of suitable available land, extend much in Ceylon. We are getting near the limits of our output. We have a market here for 100,000,000 lb. of our teas, if I may except the opinions of our largest handlers. We are besides cutting out India in *all other countries*, see our increase to such during last five years, and compare with India's.

Britain takes Indian teas, but last year imports slightly exceeded deliveries. Indian exports may increase very largely, and will have difficulty in finding markets. Ceylons, will, we grant, suffer if Indians have great increase.

We must, therefore, for our protection against India, endeavour to find outside markets for our teas. But surely under the circumstances India should make a more strenuous effort than she has hitherto done. Her £3,000 a year is a mere bagatelle.

(Advertisement in the "Shipping and Commercial List and New York Price Current.")

"TEA: What kind do you drink?"

"It is easier to imagine than describe the impurity imparted to tea, when rolled to produce the necessary twist, for nearly an hour in a hot room under a perpendicular sun by the hand and arm of an unclean, perspiring, and half-naked Jap or John.

"CEYLON TEAS ARE MACHINE MADE AND ABSOLUTELY PURE."

EXTENSION OF CULTIVATION IN SABARAGAMUWA.

The area of cultivation extends gradually but surely every year, though in the absence of any regular surveys it is extremely difficult to assign any definite acreage to this increase in native gardens. Tea cultivation is becoming more common among Kandyans, and in Kukuln korale, at Ayagama, considerable clearings, have been made by lowcountry Sinhalese.

Finlay, Muir & Co. continue their clearings at Hopewell and Meddekande, and Messrs. Leaf and Worship at Morahela are cultivating Liberrian coffee as well as tea with cacao.

On receipt of the long expected survey plans of lands at Massimbula and Yahalewela in Atakalan korale, I hope to bring forward for sale lands well suited for cacao and coconut cultivation.—*Mr. Wace's Administration Report for 1894.*

CULTIVATING CAMPHOR.

In a recent issue of the *Gartenlaube*, the leading illustrated weekly of Germany, there is an article on "A German Industry in the Virgin Forests of the Island of Formosa." The writer treats his subject, which relates to the manufacture of camphor, from a patriotic point of view, not omitting to call attention to the fact that the intrepid pioneers to whom the extension, if not the creation, of the trade is due are his German countrymen. Only the coast-trip of the island, he says, is under effective control of the Chinese, and the dangers connected with the pursuit of camphor-distillation in the inhospitable forest-covered mountains of the interior are by no means slight, the country being inhabited by warlike savages, who distrust all foreigners, and entertain particularly inhospitable feelings towards the Chinese, whom they are fond of decapitating and torturing in a casual way—an attention which the Chinese repay with interest when they get the chance. In spite of these unpropitious conditions, German traders at the port of Tamsui, in the north of the island, organise regular camphor-expeditions into the interior, often many days' march from the coast. Camphor-trees, like primroses and Minor Poets, grow in clumps, but, unlike the last-named class, the trees cannot roll each other's logs. They must wait until the hardy German pioneers perform that work, cutting them up and boiling the valuable principle out of the chips, looking round uneasily the while to see that no Philistine Savage lurks in ambush. This is the reason

that the camphor trees (unlike the Poets) often flourish unrecognised for a century, without anyone to make known their essential worth. At last, however, their turn comes, and they are none the worse for the maturing—a ripe, fifty-year old tree yielding upon an average as much as a picul (133½ lb.) of camphor. The German traders at Tamsui own some 900 or 1,000 rough stills, which they carry along with them on their expeditions, and put up in the first favourable location they meet with. A charge of about 2 cwt. of camphor-wood chips yields from 4½ to 7 lb. of camphor, and this is a fair day's work for a still. The chips are boiled in water over an open fire, and the resulting steam, upon cooling, yields both essential oil of camphor and camphor. In Formosa most of the oil is thrown away; in Japan it is employed in lacquer-making, and for other purposes. From Tamsui the camphor is sent to Hong-Kong in cases, and is thence brought into European commerce. The yearly value of the trade has lately been about 35,000*l.* Now that the Japanese own the island, we may expect the enterprising German to take a back-seat; for if there is anything the Jap can do well, it is to make the most of camphor-wood and its solid and liquid distillation-products.

The *Spectator* adverts to a curious incident in connection with the Formosa cession. That event, he states, will directly affect every druggist and manufacturer of projectiles in Europe in consequence of camphor being produced only in Japan and Formosa, and of the use that is made of it in medical practice and in the composition of all the new explosives. The Japanese have limited and taxed the export of camphor, and its cost is therefore going up and may reach a high figure; but if the Japanese push their advantage too far, the *Spectator* thinks that Science will avenge herself and provide a substitute. The *Spectator* is so innocent that we scruple to add that Science is trying every day to make artificial camphor, and we doubt whether the Formosa affair will hasten the consummation a bit.—*Chemist and Druggist*, June 8.

INTERTROPICAL ADVERTISING.

A professional man writes:—

"I think the suggestion of 'Junior Planter' is a good one. If you had a heading in 'T. A.' 'Situations Wanted, Assistants Wanted &c.' many men would advertize. I send an advertisement to start." We are quite ready to devote a column of the *Tropical Agriculturist* to special short advertisements of the kind referred to at a very moderate rate, and our correspondent's will begin the list.

SPRING VALLEY COFFEE COMPANY, LIMITED.

REPORT.—To be presented to the Thirtieth Ordinary general meeting of the Company to be held at No. 5, Dowgate Hill, London, on Wednesday, the 19th day of June, 1895, at 1 o'clock, p.m.

The following annual accounts are now presented to shareholders, viz.:—Profit and loss account for crop 1893-4. Balance sheet made up to 31st March, 1895.

CROP 1893-94.

In last year's Report shareholders were informed that the coffee crop of the above season was estimated at 720 cwt., and it will be seen that the actual weight sold amounted to only 660 cwt. 1 qr. 13 lb., exclusive of clean and refuse coffee sold in Ceylon. This crop realised £3,345 11s 9d, the average selling price in London being 98s 5d, as compared with 99s per cwt. obtained for crop 1892-3.

The yield of Tea from Spring Valley amounted to 196,650 lb., the estimate in last Report being 200,000 lb., and this, together with 52,700 lb., bought from neighbouring estates and manufactured at Spring Valley, sold for £9,507 5s. 6d., or an average of 9*l.* 15d per lb., the average selling price last year being 9½d per lb.

Cinchona Bark to the extent of 23,641 lb. was also sold for £192 6s., the average selling price being 1½d per lb.

The total proceeds from the sale of produce amounted to £13,045 3s. 3d., and deducting from this £11,730 7s. 5d., the total expenditure in Ceylon and London,

there remains a profit of £1,314 15s. 10d. on the year's working.

To this has been added the sum of £1,517 15s 11d brought forward from last year, making a total of £2,832 11s 9d at the credit of profit and loss.

On the 10th January last an interim dividend of 1½ per cent was paid on the capital of the Company, and the Directors recommend that a further dividend of 2 per cent be now declared, making 3½ per cent for the year, and leaving £32 11s 9d to be carried forward to next account.

The result of the above Crop is in accordance with the estimate given by the Directors in their last Report, in which they pointed out that season 1893-94 could only work to a small profit on account of the very small Coffee Crop, the large area of Tea not in bearing to be maintained, and the necessity of incurring considerable expenditure on the further extension of Tea.

CROP 1894-95.

The Coffee Crop for this season has been variously estimated, and at one time it was feared that it would be no larger than that of last year. The bushes are, however, reported to be maturing their Crop much better than was expected, and the last advices from the Estate point to a Crop of about 1,400 cwt. being secured.

The Crop of Tea from Spring Valley for 1894-95 is expected to be about 215,000 lb., against 196,650 lb. secured for 1893-94.

If the above Crops of Coffee and Tea are secured, the Board expect that a reasonable profit will be earned, but it must be remembered that the Company has a large area of young unproductive Tea to be maintained, and that it will also be necessary to still further increase the tea area during 1895. The acreage to be planted up will, however, largely depend on the condition of the coffee after the present crop has been gathered.

From the following statement it will be seen that 164 acres of tea have been planted up during 1894, bringing the total area up to 1,003 acres.

The area under tea on Spring Valley is as follows:—

T E A.			
Over 5 years old	..		521 acres.
Planted Nov.-Dec.	..	1890	100 "
Do	..	1893	218 "
Do	..	1894	164 "
Total area under tea			.. 1,003 acres.
Total area under coffee			.. 565 "

The attention of shareholders is directed to the notice calling an extraordinary general meeting with regard to the acquisition of Kottagodde Estate by the Company.

J. ALEC ROBERTS, Secretary.

10th June 1895.

NORTHERN PROVINCE.

(Extracts from Mr. Jackson's Report on the Mannar District for 1894.)

Area, 432 square miles; Population, 23,800.

The total of the paddy crop reaped during the year is estimated at 6,371 bushels, against an estimate of 5,035 reaped in 1893; while in 1892, when there was a good crop throughout the District, the amount reaped must have reached 150,000 bushels.

The tanning bark industry afforded means of support to a considerable number of people. The quantity of bark collected, however, has dwindled down to a fourth of that collected during the previous year, due to the increasing scarcity of bark in the jungle. Only 82 tons were exported during the year under review, as against 328 tons in 1893.

(Extracts from Mr. Hopkins' Report on the Mullaitivu District for 1894.)

AREA, 936 SQUARE MILES; POPULATION IN 1891, 7,342.

FOOD SUPPLY.

Taking two bushels of paddy as yielding one bushel of rice, the grain available for food is: rice, 23,924 bushels; dry grain, 6,016 bushels; total 29,940

bushels, which is equivalent to 4.08 bushels per head of population, which is perhaps fairly correct.

Palmirahs and Coconuts.—The planting of these is gradually increasing:— Palmirahs. Coconuts.

Acreage in 1893 ..	798	..	782
Acreage in 1894 ..	806	..	814

There is no reason why large plantations should not be made in Karikkadmulai South, where there is much suitable Crown land available.

Manioca.—I am glad to see that this valuable product has "come to stay." Introduced by Mr. G. M. Fowler in 1886, it made its way very slowly at first, but now the cultivation is advancing "by leaps and bounds."

Three cart loads of plants were sent from Jaffna by the Government Agent in 1886 and distributed amongst the people of Putukudiyiruppu. I can find no mention of the produce until last year, when the yield was reported to be 9,400 lb., value R470 at 5 cents per lb. In 1894 the yield was 20,000 lb., value R800 at 4 cents per lb.

Indian Corn is strangely neglected in the Wannai. It is reported that a quarter of an acre was sown in 1894, which yielded 5 bushels.

New Areas Cultivated.			Acres.

PROGRESS IN OLD PUSSELLAWE : AND THE NATIVE TEA INDUSTRY.

And old planter who had not been above Gampola and through Pussellawe for 30 years, gives his impressions of a recent visit as follows:—

"I drove six miles up the Pussellawe road last week in a burst of the monsoon; but as it is nearly 30 years since I was last up there, I remember nothing but mere names, and an occasional field of coffee, and coffee stores now *non est*. But patnas have been, and are being planted up everywhere, rendering it impossible to recognize old boundaries to all but those engaged in, or watching the proceeding. Added to this, extensive *greivilled* plantations and old landmarks have become undistinguishable. It was thought the natives would never recover from the loss of their *coffee* gardens, but *tea* has more than compensated them in the surrounding patnas, and doubtless these have been the salvation of many of our own old estates also. For one native proprietor of coffee garden, there must be a dozen in tea. Little, well-planted, well-kept, model estates of 30 acres, giving 300 to 500 lb. an acre are common enough in native hands. Yet the old king still flourishes along this road better than I have seen it elsewhere, and all the trees are heavy with crops. If coffee was 'king,' tea seems likely to be 'emperor,' not 'queen.' I asked a native the other day, if he would sell such a garden of 31 acres, and he replied,

'NOT FOR R500 AN ACRE!'

A European bought one some time ago and I am told it is now giving 650 lb. made tea an acre, and that his price is R600 an acre—made out of patna land. These gardens are all, of course, in small tracts; but there are large tracts of such land belonging to estate proprietors still unplanted. Against this, the tea on the old estates, planted in old coffee and cinchona land, does not seem to be doing half so well, and some of it rather badly. The old 'Black Store' on the Pussellawe road, so well-known, (and familiar enough to me 30 years ago) is still in existence, bearing evident signs of old age: store walls have followed decay, or ravages of white ants upwards, till now only the upper half is left. Between this and Gampola extensive tea factories enliven the scene in every direction, and strings of leaf carts meet you at every turn."

EMIGRATION FROM SOUTHERN INDIA.

Emigration from the Madras Presidency is the subject of a leading article in the *Madras Mail* of a recent date. A decrease of 17,746 in the number of emigrants, as compared with the previous year, is applicable to all the countries which tap India for their labour supply, with the single exception of Mauritius. The favourable character of the season in Tanjore and other districts is stated as the cause of the falling off, in this connection, it being explained that it is difficult to give accurate figures owing to the impossibility of distinguishing between passengers and emigrants. As regards Ceylon, it is stated that the number decreased from 91,021 in 1893 to 87,235 in 1894. Of the labour-agencies maintained at Madras by the Mauritius and Natal Governments, it is recorded that the accommodation and the treatment of coolies were all that could be desired. Interesting figures are given, having reference to Burma, the Straits Settlements, Mauritius and Natal.

PLANTING NOTES FROM COORG.

SOUTH COORG, June 19.—Dr. Voelcker has said that the laterite soils of the coffee and tea districts of Southern India are deficient in lime. Knowing the composition of bones and that they are largely made use of as manure for coffee, one is led to infer that this deficiency is made up for and hence the coffee thrives. But although bones may supply the food requirements of the trees of lime, yet it is to be feared that they play a very unimportant part in correcting any sourness that may result in the soil from an overplus of humus. This is a matter of some importance as all coffee estates are the sites of old forest land, which are consequently very rich in humus, and this is being continually augmented by cattle manuring, the burial of weeds and other debris and the droppings of shade trees. I am afraid that many of the ills that coffee suffers from are to be put down to the sourness resulting in the soil from an overplus of humus. Professor H. Tanner, F.C.S., says:—"The phosphate of lime present in bones is the tri-calcic phosphate. When the bones are acted upon in the soil by rain-water, which, as you know, contains carbonic acid—or when acted upon by the carbonic acid produced in the soil—in each case we get one equivalent of the lime removed by the carbonic acid, and the tri-calcic phosphate acted upon then becomes bi-calcic phosphate and carbonate of lime. The bi-calcic phosphate dissolves gradually in water, and is thus taken up into the circulation of plants in a soluble form." Bones, then, act in a small way like quick lime in absorbing the carbonic acid produced by the decay of humus in the soil. But the union that is effected between the one equivalent of lime (tri-calcic phosphate consist of one part phosphoric acid and three parts lime) and the carbonic acid renders it inactive and of very little further good. And when the small quantity of lime that is liberated is taken into consideration, it becomes almost insignificant. The conclusion one naturally arrives at then is that, although bones are used as manure, applications of quick lime are necessary.—*M. Mail*.

TEA SWEEPINGS.—We are indebted to Mr. John Hamilton of Messrs. S. Rucker & Co. for an admirable letter on this subject which puts the whole business in a very clear light. Mr. Hamilton shows that those interested in tea plantations are no losers. For, although the tea sweepings may be from the shippers' own estates, by the system of weighing in vogue they had already been credited with the tea before the package was opened, so no loss falls on them. Re-selling tea sweepings is of course another question, and there the planter is injured, as Mr. Hamilton readily admits.

“THE DEVELOPMENT OF NEW MARKETS FOR INDIAN AND CEYLON TEA.”

Under this heading, Messrs. Gow, Wilson & Stanton have prepared one of the diagram-circulars for which they are so famous and a supply of which is promised us by next mail. From a single copy in advance we gather that the present publication is due to the development of the trade in British-grown teas outside the United Kingdom and the considerable influence this has begun to have on the London market. We are told, in fact, that “the growing of Tea in British Dependencies is gradually revolutionizing the Tea trade of the world. The change of taste in favour of Indian and Ceylon Teas, which commenced in Great Britain, has been gradually but steadily extending to other countries,” and then the new London firm adds:—“we are so impressed with the *absolute necessity which exists* for continuing to encourage foreign demand, that we again bring the matter forward without apology.” By means of coloured blocks, the increased consumption in each country from 1890 to 1894 is very clearly shown. The result is very remarkable, for whereas in 1890, less than 13½ million lb. of Indian and Ceylon tea sufficed for the demand outside the mother country, in 1894 the total requirements equalled no less than 28,400,000 lb. or an increase in five years of considerably over 100 per cent. Nevertheless, that there is need for further efforts in order to get a greater hold of outside countries, is made evident from the following:—“With the coming crop from India estimated at about 140,000,000 lb., and that from Ceylon at about 91,000,000 lb., the importance of using every available means for increasing the consumption of British-grown Tea becomes so great that no efforts should be neglected by which new fields may be opened up. The prosperity of the Tea trade depends mainly upon the creation of sufficient demand to cope with the ever-increasing production; and unless constant attention is bestowed upon the discovery of new outlets and the extension of existing markets, the danger of over-production which has been the ruin of so many flourishing industries, might prove equally disastrous to the Tea producer. Looking at the diagram, it is clear that many markets which five years ago were comparatively insignificant, have since attained sufficient importance to exercise considerable influence upon the course of prices.” Interesting particulars are given respecting the Australian, American and Continental markets and the advance may be shewn as follows:—

Approximate quantities of British-grown Tea used outside the United Kingdom:—

	1890. lb.	1894. lb.
Australasia ..	7,500,000	12,300,000
U. S. A. ..	1,300,000	3,300,000
Turkey and Persia ..	1,100,000	4,300,000
Canada ..	800,000	1,900,000
Russia and Germany	600,000	2,500,000
All other places ..	2,100,000	1,100,000
	13,400,000	28,400,000

We shall not forestall by giving further details from a document which is certain to be of the greatest interest to every tea merchant and planter; but we may allude to what is said about “tea prospects.” The industry, both in India and Ceylon, is considered “sound”; in the former it has lasted 50 years without any serious blight or enemy attacking it, and there are now some 380,000 acres under tea and a capital of about £15,000,000 sterling invested in the enterprise. In Ceylon, the industry is

said to date back some 15 years—(but Loolecondra plantation has been uniformly cropped for over 23 years now)—and our area is put at 280,000 acres under tea, representing £11,000,000. We shall very shortly be able to give the exact figures for the Ceylon Tea Industry up to the middle of 1895, and we suspect they will not—allowing for native tea gardens—fall far short of the 300,000 acres. But we shall see. With the markets of the world before them, and no other countries besides China, Japan, and Java, producing any appreciable quantity of tea, the planters of India and Ceylon are rightly exhorted to make strenuous exertions in the direction of fostering the outside demands and then they may feel secure against any danger to the immediate future of their industry.

PROGRESS IN LOWER PERAK.

The following day Towkay Leong Fee, of Ipoh, came to see me and applied for a grant of 1,500 acres of land between Teluk Anson and Changkat Jong. He proposes to plant Coconuts, Liberian Coffee, etc.—*Mr. Wray.*

PROSPECTS OF TEA AND BIMETALLISM.

A shrewd observer writes:—“I see no cause for misgivings about tea—apart from the *rupee*. There is no knowing what Balfour, the bimetalist, may attempt during the two years he may be leader of the House. Albeit he knows no more about it than ——— you or I do.”

THE SELANGOR PLANTATIONS SYNDICATE, LIMITED,

has been registered at home by Linklater & Co., 2, Bond-court, Walbrook, with a capital of £25,000 in £100 shares. The object is to acquire from H. Huttenbach certain estates, plantations, &c., in the state of Selangor, in the Malay Peninsula, and to develop and turn to account the same in such manner as the company shall see fit. The directors are J. Somerville, A. Kent, and L. Huttenbach. Qualification, one share; remuneration, 5 per cent of the net profits, divisible.—*Pinang Gazette*, June 17.

LIBERIAN COFFEE—JAVA COFFEE.

The British Consul of Batavia reports that the cultivation of the Liberian bean, both in Mid and West Java, is rapidly increasing, and the satisfactory results obtained from its introduction become year by year more apparent as the principal difficulties attending the preparation of this coffee for the market are gradually being successfully surmounted. As a result, a marked improvement in the appearance and quality of coffee is noted, and its favor is becoming more and more assured. The continued recurrence of the so-called “leaf” disease in the Java coffee on low-lying lands, from which the Liberia still preserves comparative—though by no means entire—immunity causes more confidence to be felt in the latter, and many lands which have suffered most severely from the ravages of this disease in the Arabian plant are being replanted with Liberia. It has been decided to give up the Government cultivation of coffee in the Krawang Residency, and on January 1st, 1895, the law rendering the delivery in that district to Government obligatory was repealed.—*American Grocer.*

QUININE AND IPECAC IN DYSENTERY.—The following combination has been used in the Mandoli Regiment at Bhrtpore in many cases of acute dysentery. It is said never to fail:—Sulphate of quinine, 2 grains; powdered ipecac., 5 grains; ammon. chloride, 10 grains; tinct. opium, 12 grains; water, to 1 ounce. To be given every four hours (*Practitioner*, May, 1895.) *Pharmaceutical Journal*, June 15,

THE MALAYAN PENINSULA AND ITS MINERAL AND PLANTING ENTERPRISES.

Mineral statistics of the world, show the important position held by the Malayan Peninsula in respect of mineral resources. We ask ourselves what the relative condition of Ceylon would be were she as highly favoured as to mineral deposits as is the country of which the Straits Settlements form a chief division. Our own output of minerals is almost entirely confined to plumbago, with a certain proportion of gems in rubies, sapphires, &c., and the export value of the whole is insignificant as compared with that of the exports of the Malayan Peninsula. Since 1888 the output of tin alone from the latter has been 30,000 tons, being more than half of the total production of the world in the time mentioned. The balance is made up of the production of England, stated at 9,000 tons; that of Australia at 6,500 tons; and a residue from America, Tasmania, and some European countries, at 13,000 tons. What coal is to Great Britain, tin must be to Singapore and surrounding States. It is a never-failing source of revenue and we are only surprised that, as the Straits Settlements command the whole of the trade, they have not long ago surpassed in the race for wealth every other Colony possessed by Great Britain. As the great wheat production of India and Canada has almost wiped out the cultivation of the staple at home, so has the tin industry of the Malay Peninsula operated upon the output of the tin mines of Cornwall. Cornish enterprise has had to compete with the almost entirely surface yield of the same metal in the highly favoured peninsula.

If, in the future, our Eastern neighbour can be made in addition to rival the planting industries of Ceylon, it must attain a pre-eminence in prosperity. With its enormous natural advantages it is hard to see how its progress towards this pre-eminence can be checked. Already many Ceylon planters have become the pioneers of tea and coffee cultivation both in the British Provinces and in the Protected States. A wise policy has for years been pursued towards the latter, and their Malayan rulers seem to have cordially availed themselves of it. Among these none have shown themselves more capable than our past frequent visitor, the late Sultan of Johore. Should his successor continue steadfast to the policy of progress inaugurated by the deceased Prince, and that policy be followed by other native rulers, the day must soon come when the Malayan Peninsula will be one of the most progressive and wealthiest corners of the globe.

TEA SHIPMENTS FROM COLOMBO TO THE UNITED KINGDOM.

The figures, month by month, and the official estimates, are respectively as follows:—

	Shipments.		Estimate.
	1894.	1895.	
January	6,255,140	8,252,147	7,500,000
February	4,912,602	5,903,169	6,500,000
March	7,208,470	6,752,570	7,250,000
April	7,006,095	7,080,228	7,600,000
May	8,104,333	10,527,182	9,500,000
June	9,225,740	8,255,000*	9,250,000
Total	42,712,380	46,770,296	47,600,000

* About.

The above shows that the estimates have generally been liberal and yet wonderfully correct, seeing that for the six months, they are less than one million lb. in excess.

VARIOUS PLANTING NOTES.

CROPS IN INDIA.—Says the *Pioneer* of June 30:—The latest season report shows that the crops in every part of India are doing well, and 1895 may prove a most prosperous year for the cultivators. The cattle are in good condition, and fodder is reported sufficient from every province.

WANTED A NEW OIL.—As regards essential oils, a letter from Mr. Geo. Piesse, of the perfumery firm of Piesse and Lubin, says "if as a result of distillation, you can find an essential oil which is soluble in spirit and if *odourless*, it will be of much commercial value, as such an oil would be used for the reaction of strength of ottoes without destroying their bouquet. The odour of some woods, flowers, plants etc., is so intense and so small in bulk, that they have to be reduced in perfume and increased in bulk, for ordinary trade and manipulative purposes. This is at present done with spirit or castor oil, both of which are imperfect."

THE IMPORTATION OF BANANAS INTO AMERICA.—In a recent Consular report from Baltimore, it is stated that of all the tropical fruit now imported into the United States, the Banana reaches there in the largest quantities. Its cultivation for the foreign market in Jamaica only dates back about twenty years, and it is from that colony that fully eighty-five per cent. of those consumed in the Atlantic States are now derived. There are at present four steamships exclusively employed in the Banana trade with the port of Baltimore, and which can land their fruit from Port Antonio in a little over five days, and almost as fresh and green as when cut. A proportion of each cargo is disposed of in the city of Baltimore, but the largest part is transferred to heated or refrigerated cars according to season, and sent by rail as far west as Chicago. In connection with the orange culture in Florida, it is stated that the crop which is the chief source of supply for the eastern States was completely destroyed by the severe weather, and that the growers are actually buying oranges in California to meet their engagements.—*Gardeners' Chronicle*.

THE INCREASED PRODUCTION OF TEA.—At the annual meeting of the Doears Tea Company the Chairman specially referred to the question of the enormous increase in the production of tea both in India and Ceylon, and said this would be one of the dangers they would have to meet, unless they could open up new markets abroad:—

He feared that without some such relief it would be a case of "the survival of the fittest," but he was pleased to say that the Doears Tea Company were strong enough to stand the test and that they would be found among the fittest. It was certainly a matter of congratulation to observe how by degrees they were obtaining new markets. Probably there was nothing that required the attention of all who took a keen interest in the welfare of the tea industry more than this question of new markets. During the past year he had been on the American committee which was endeavouring to push the consumption of Indian teas there and he was quite certain that Indian tea was getting better known and appreciated in America. The danger, however in this country in their having a larger supply than they could get rid of was great, and to show them how they had to guard against this he would point out that the tea crop for India last year was 125,000,000 lb. of tea, and, according to the latest estimates, this year's crop would be 140,000,000; while the crop for Ceylon last year was 84,000,000 lb. and this year it was estimated to be 91,000,000 lb. showing altogether an increase of some 21,000,000 lb. over last year. In this country the normal increase was only 2,000,000 lb. so it would be seen that it was of vital importance that the exports to other countries should be increased,

SPRING VALLEY COFFEE CO., LD.—We are now enabled to publish the Report of the sister Company to that of "Ouvah," given yesterday, Mr. Alfred Brown being Chairman of both, and the Colombo Commercial Co., local Agents. The Spring Valley is not quite so prosperous, but its total of 3½ per cent of dividends is likely to improve and the Company has done well to acquire Kottagodde estate adjacent to Spring Valley and which has a good deal of tea further advanced than that on the main property. We think this is bound to strengthen the "Spring Valley Coffee Co."

PLANTERS, MANURE AND AN ANALYTICAL EXPERT.—Our London Correspondent in writing about the need of an Expert on the spot for planters to consult in connection with their manuring operations, forgot that we have Mr. M. Cochran, M.A., F.C.S., who has already done so much good analytical work here, and in conjunction with Mr. Hughes, and who, we have no doubt, often now is consulted by planters to test the manures they buy or import. Mr. Cochran's Manual lately published by us, ought to be in the hands of all planters engaged in extensive manuring operations; for it contains a vast amount of information of service in a variety of ways to Managers of Estates.

THE STRANGEST INSECT IN THE WORLD.—The aweto, as the Maoris or natives of New Zealand call it, or *Hipialis virescens*, as naturalists term it, is found in New Zealand, and is a vegetable caterpillar of from three to four inches in length, and, so far, science has not been able to say whether it is a vegetable or an insect. It is always found at the foot of large myrtle-trees that have beautiful red flowers on their stems, and a beautiful creeping clematis as white as the snow. The Maoris call this tree by the name of rata. The aweto buries itself among the roots of the rata, a few inches below the ground, and there lives until it is full grown, when it undergoes a most wonderful change. The spore of a vegetable fungus, termed by naturalists *Sopharia robertsii*, fastens itself to the neck of the caterpillar, just between the head and the first ring, and then grows upwards to the height of from six to eight inches. Many people assert that there is never more than one stem, but such is not the case, for some have been found with two stems, although very rarely. The stem shoots up out of the ground, above where the caterpillar is living, about two or three inches; below the earth it grows into the aweto, until it fills up every possible space within the outer skin without changing the form of the insect in the slightest way whatsoever, but simply substituting a vegetable matter for animal matter. As soon as this takes place both the plant and the caterpillar become dry and hard and die, but retain exactly the same form as when alive. The whole has a brown colour, and the insect appears a wooden caterpillar, with a huge horn standing up from the back of its neck. How the caterpillar manages to propagate its species no one can tell. Usually the caterpillar becomes a chrysalis, the chrysalis changes into a moth, the moth lays eggs, and these eggs again become caterpillars, and so on without stopping. Many reasons are given why the plant shoots up from the back of the neck of the aweto. One is that the aweto has a slimy substance oozing out from its neck, which, while the aweto is boring at the foot of the rata tree for its only food, catches the seed of the fungus and holds it fast there till the latter begins to grow. When it has sucked all the vegetable life out of the aweto it must naturally die, for it finds no further nourishment. The aweto is often found in large numbers.—*Public Opinion.*

THE DIRECTORS OF OUVAH COMPANY LIMITED—have a very satisfactory Report to present this time and we congratulate the shareholders on its contents. A full 6 per cent for the year will be realized in dividends and the prospects are good. The £10 paid shares of the Company which a few years ago were under £3, are now fast approaching par.

CAMPHOR TREE CULTIVATION.—We attract attention to further interesting extracts given elsewhere bearing on this subject. We have no doubt that a good many planters will give a full and fair trial to the tree, now that plants have been made available. Our contemporary of the "Times" takes an utterly wrong view of the comparison which may be instituted with cinchona. Is he ignorant of the fact that the bark tree proved the salvation of scores if not hundreds of Ceylon planters—the bridge which enabled them to cross from the era of "coffee" into that of "tea?" That there came a wild rush and loss of money afterwards, carries its own lesson for the future camphor-tree planter; but certainly the lesson is not that there should be no fair trial of the new product. It will be time enough to bring up the latter portion of our cinchona experience when we see a few scores or hundreds of acres under camphor beginning to turn into thousands; if such a time should ever come.—Meantime, Mr. Nock informs us that he has not got a tree large enough, he thinks, to experiment with; but he has coppiced some at Hakgalla with good effect and may be able to collect from 50 to 100 lb. of bark and twigs to experiment with. Perhaps Mr. Cochran of Colombo could give an opinion as to the value of the product.

THE FIVE-FINGERED ORANGE.—The five-fingered orange is a queer thing. It grows in exactly the shape of a human hand, with a thumb and four fingers. It is a half-open hand, that of this curious fruit, and the close resemblance to a lean, long-nailed Chinese hand is startling. Even the nails are identical, hard-pointed and claw-like, tipping the orange fingers with a length equal, in some cases, to three inches. It is no interloper in a well-regulated family of oranges, but a regular member, belonging to the orange variety. It has a family name and a Christian name of its own, but its pet name is "five-fingered orange," and nobody but the botanist cares to call it by the long one, which means the same thing. The orange tree is a ragged little shrub that does not average more than five or six feet in height. It does not grow straight, and it would be very difficult to find two consecutive inches in the entire tree whose line of direction is the same. Even the branches grow in spiral forms, so that the width of the tree is often as great as the height. There is a generous supply of thorns hidden under the leaves; they are slender, tough, and long, and are located in all sorts of unexpected places. The leaves are fleshy, long, and narrow, and of a dark green colour. They resemble a lemon leaf more than an orange leaf. Indeed, in both this instance and in the colour of the ripened fruit, this singular plant seems to claim a very close consinship to the large lemon family. The flowers come out in June and July, and are very similar in appearance and odour to the ordinary orange blossoms, save that instead of the familiar creamy white colour they have a delicate pinkish tint which is very beautiful. They commonly grow in clusters of two or three blossoms on alternate nodes. The strangest thing connected with the perfume is that it is the

fruit and not the flower that is most odorons. The fruit when ripe is so redolent that its scent can be recognised a mile from where the orange is growing.—*Public Opinion*.

TEA IN IRELAND.—Some curious information on this subject will be found elsewhere given before a Royal Commission: Irish witnesses made out that the finest of Indian teas were drunk in Ireland, that tea makes an excellent substitute for milk and meat and that if the population of Ireland had not been allowed to fall off through emigration, Ireland would require nearly a million sterling worth more of tea per annum than at present.

ARECA PALM: ABNORMAL GROWTH.—A Negombo correspondent sends us a part of the top of an areca palm with a series of young plants developing from the fruit—a case of vegetable monstrosity in fact. The Director of the School of Agriculture who has seen it, writes:—

“Instances are fairly common of premature germination of seed as in the jak fruit and papaw—the latter fruit when cut very ripe sometimes presenting a mass of little seedlings. But to judge from the specimen sent the ovary would seem not to have developed into the typical fruit, and the ovule on being fertilized would appear to have passed into seed (which then germinated prematurely) while the pericarp became suppressed. It is impossible to assign an ultimate cause for such abnormal growths.”

SISAL HEMP (AGAVE RIGIDA, VAR. SISALANA) AT VERA CRUZ.—In a report on the trade and commerce of Vera Cruz, reference is made to the Henegren or Yucatan hemp, which has become more generally known of late as Sisal stated to be from the fact that the fibre was first exported from Sisal, a small coast port about 27 miles west of Progreso. In view of the low price that has ruled from Sisal hemp for some time past, it will be of interest to know that the export from Vera Cruz varies from 19,000 to 45,000 bales per month, the average weight of each bale being about 350 lb. It has been remarked that this year 1895 will have the maximum quantity of land under hemp cultivation in Yucatan, which means that the production of hemp has reached its limit. Under the existing circumstances of low prices, high monetary exchange, and scarcity of the Indian labour, many of the farmers are planting Maize instead of replanting hemp. New lands as well as old hemp-growing areas, are now being used for growing Maize and other products.—*Gardeners' Chronicle*.

COFFEE IN SIAM.—A recent visitor to Singgera tells us that he found there a coffee estate, managed by a European, which was most healthy and flourishing. There was not the faintest trace of disease, while every indication was present of a bumper crop in November. There were 500 acres all fully planted with trees 8 ft. apart. In the centre of each group of four is a pit about 18 in. deep, and measuring 18 in. by 12 in., into which all the prunings are thrown, together with cattle manure. The son of the Governor, we are told, has also gone in for the same cultivation, but on a different principle. He has 400 trees planted about 20 ft. apart, and he manures them in the Java style. That is to say, he digs a circular trench one foot wide and two deep, at about 18 inches from each tree, into which he puts cattle manure. Then, at about 6 inches from the trunk, he digs a second smaller trench in which rotten fish is placed. The result of this rich feeding has been that the trees went ahead well at first, but are now beginning to droop. We also know of a coffee plantation not 100 miles from Bangkok the progress of which is being very anxiously followed. So far all is going well, and the first crop is beginning to shew itself. It looks so promising that it seems a pity to have to sacrifice it to the law which declares that, to allow the first crop to mature, is to ruin the trees.—*Siam Observer*.

CACAO AND “WILL YE NO' COME BACK AGAIN.”—The American cacao buyers whose absence from the London market we have all had to deplore, and whose spirited bidding and solid coin are still with gratitude remembered, are said to be turning up again at Mincing Lane and “feeling around” cacao. A London correspondent writing on the 25th June says:—“The market for cacao is better during the past two or three weeks, and our brokers are more hopeful of the future. Some American orders have come on the market, and prices have hardened.”

THE “OIL FIND” AT CALCUTTA.—With reference to the supposed discovery of kerosine oil in Calcutta, the theory now put forward to account for the phenomenon is that, some time ago, retail dealers in explosive oils, such as kerosine, were restricted from having on their premises, at any one time, more than a few cases. The dealers, however, found it more advantageous financially to purchase a large number of cases at once; and to evade the restrictions imposed upon them; all cases in excess of the number allowed by law were carefully buried so as to be out of the way when the authorities came to inspect their premises. It is supposed that, while the cases lay buried on the plot of ground in question some or all, of them succumbed to the effects of damp and rust, and the contents of the cases escaped into the ground. To make matters certain, the piece of ground not yet excavated will be dug up, and there is little room for doubt that what remains of the original oil cases will be found.—*Times of India*.

THE CEYLON CINCHONA ENTERPRISE.—What a pity that “Baillie Street” planting publications are not in the hands of our contemporaries. The following is from the local “Times”:—

A handful of early pioneers, who had planted cinchona unwitting of the high value of its bark, and who were able to harvest before the great rush into cinchona in 1878, 1879, and 1880, undoubtedly made large sums of money. Those who were wise enough to grow cinchona seed or plants for new clearings also did remarkably well, but for the remainder, who made use of this same seed and these same plants, only to find their fields of cinchona killed out ruthlessly and suddenly by canker, in spite of all precautions, their experiences were sad in the extreme. Now, the first private planting of cinchona in Ceylon took place in 1868, and the prices continued to be remunerative up till 1884-5—or for 17 years. One would think, following the above parallel that the time to warn Ceylon Camphor pioneers would be in 1912 and not in 1895—just as the enterprise is beginning!

THE TEAK TRADE OF SIAM.—An extremely interesting State paper on the teak trade of Siam has been written by Mr. J. S. Black, Acting British Vice-Consul at Bangkok. He states that practically the whole of the extensive teak forest of Siam are in the hands of British subjects, either in virtue of original lease, or by an arrangement which practically gives a lease of the forests. Nearly half of the purchasers of the wood are also British subjects, many of these are Burmans, who are generally men of small means. With the traditional tact of their race these tradesmen manage to win the confidence of Bangkok capitalists who advance them almost the whole of the necessary outlay. This is no ordinary undertaking, for three or four years must elapse between the times, when operations commence to the time when the wood reaches the market. In addition to this large numbers of expensive elephants require to be secured, while considerable disbursements have to be made in the shape of advances to coolies. Serious loss is occasioned every year, again by thefts of the teak, which is apt to get stranded in the rice-fields, or stuck in the banks in its passage down stream. At these points thieves are always watching, and they seldom miss an opportunity of making off with the loss. More than half a million sterling is said to be embarked in this industry.—*Pioneer*, June 23.

THE MONSOON IN SOUTH OF INDIA.—Great uneasiness is felt in Madras at the continued delay of the monsoon. The crops in South India, are beginning to wither up, and, unless rain comes soon, famine is sure to follow. The heat is intense. In Bombay rain began falling on the eve of the 11th instant, and it is hoped that the monsoon has set in.—*Madras paper.*

"A SHORT GEOGRAPHY OF BENGAL." by W. H. Arden Wood, B.A., F.C.S., Principal of La Martiniere College, Calcutta, Examiner to the Calcutta and Punjab Universities with maps and illustrations, is a very full and useful little book giving first of all a general view of the province, (its surface features, river system, climate, plants and animals, products, industries and commerce, &c.) and then dealing separately with each division,—Bengal proper, Bihar, Orissa and Chota Nagpur. There are 12 minor maps besides the chief one and some 20 other illustrations, one showing the "Snowy Range above Darjeeling from the Railway and Cart Road" being particularly effective.

TEAS AND THEIR STRENGTH.—The Budget Speech specially dwelt on the difference in strength between Indian and China teas in referring to the supercession of the latter in the United Kingdom. Sir Wm. Harcourt said:—

In quantity, the increase is 5,659,900 lb. in excess of that of last year; and the rate of increase is 2.6 per cent, which is a good deal more than twice as great as the increase of the population. It is a satisfaction to know that, whilst our people at home have the benefit of the increased consumption, our dependencies abroad have the advantage of the profits of production. (Hear, hear.) The teas of India and Ceylon now constitute 86 per cent. of the whole, whilst in 1864 they formed only three per cent. of our consumption. And it must also be borne in mind that the much stronger growths of Indian tea, admitted at the same duty, really represent a far larger consumable commodity than corresponding quantities of the Chinese growth, and I would ask the Committee to observe this fact, that really the introduction of this stronger infusion at the same duty is, in fact, equivalent to a reduction of the tax, because you get a larger consumable quantity of liquid at the same tax.

THE INDIAN TEA CROPS ESTIMATE.—In some quarters the belief in tea as a paying speculation is unbounded and large sums of money are being invested in gardens. It is only to be hoped that the larger outturn will not so flood the market as to bring down prices to a point which will not pay the proprietors. The following table, compiled by the Indian Tea Association, gives the estimated outturn from the various districts for 1895-96:—

	lbs
Assam	57,531,590
Cachar	19,403,880
Sylhet	22,272,900
Darjeeling	8,069,210
Teral	3,176,000
Dooars	19,854,210
Chittagong	112,000
Chota Nagpur	238,800
Kangra	3,000,000
Dehra Dun, Kumaon, and Kangra	2,006,000
Private and native gardens ..	4,000,000
Total	139,690,520

As compared with the actual outturn of the past year, this shows an estimated increase of 13 million pounds—an advance of 10 per cent., the bulk of which will be thrown upon the London market. The trade in China tea is declining gradually and may be said to be practically out of the field; and yet it is an undoubted fact that by removing taxes and other obstructions, China tea could be so reduced in cost as again to enable it to take its place as a competitor.—*J. P. Gazette,*

THE CHINESE LIKE TEA-TABLOIDS.—Forwarding tea to China is very like sending coals to Newcastle but that is what Messrs. Burrows, Wellcome & Co. have been doing. A correspondent of the firm's in the interior of China (South Shan-si), in acknowledging two cases of tea-tabloids, says:—"All over China north of the Yellow River, tea is comparatively little drunk, the soil and climate being unsuitable for its cultivation, and the time and difficulty encountered in transporting up from the Yang-tse Valley rendering it somewhat expensive. Boiled water and thin gruel of millet are the usual drinks of the masses so that the tea-tabloids are greatly appreciated. The ingenuity which is displayed in the tabloid is very striking in the eyes of the Chinese as well as our own."—*Chemist and Druggist.*

KINDS OF IVORY.—Four principal kinds of ivory are known in the market: that of Guinea, the Gaboon, or Angola, which is a little greenish, so that it is sometimes called green ivory, and which whitens with age; Cape ivory, which is of a dull, light, somewhat yellowish colour; Indian or Siamese ivory, very rare and white, with a tinge of rose colour; and the fossil ivory of Siberia, remains of the mammoths of the olden time. Of these, the West African ivory is most highly prized, being finer and more transparent than the others. It is pretended that experts, when they see a well-preserved tusk, can tell whether the animal that wore it came from East or West Africa, or north or south of the equator. The farther north the animal's habitat, and the more elevated and dry the situation, the more the ivory is coarse and inferior. The principal market for ivory is at Liverpool, and nearly one-third of the stock imported there is used in the Sheffield cutleries. Another considerable market is at Antwerp. The annual exports of ivory from Africa represent the product of sixty thousand elephants, and this means a rapid reduction of the elephantine population of the continent. Various artificial ivories, or imitations, are manufactured to supply the increasing demand. There are vegetable ivory—tagua seed from Peru, or wood injected with chloride of lime; sheep bone, macerated with the wastes of white skins; paper pulp with gelatin, celluloid, and caoutchouc; a preparation of potatoes; and a substance obtained by treating milk with certain reagents. The expediency has been suggested of establishing elephant farms, to form a more certain source of supply than hunting wild elephants is destined to become. Ostrich farming has proved practicable, why not elephant farming, too?—*Home paper.*

THE JAVA GOVERNMENT CINCHONA PLANTATIONS.—We direct attention to the following interesting statement referring to the Cinchona industry in the hands of the Government in Java:—

The cinchona bark harvest in the Government cinchona gardens in Java in 1894 was 590,214 half-kilos, of which 522,051 half-kilos were *Ledgeriana* bark, possessing an average yield of 6.55 per cent of sulphate of quinine. The total cost of harvesting, transportation to the trade centre of Bandoeng, and other expenses in 1894 were 52,195 florins. The total cost per half-kilo of producing cinchona-bark in the Java Government gardens and supplying it free to the collecting centre has been:—

	In 1890	per half-kilo	22 30c	or about	4d per lb
1891	do	19 15c	do	3½d	..
1892	do	15 87c	do	2½d	..
1893	do	16 29c	do	3d	..
1894	do	14 71c	do	2½d	..

These figures show a remarkable reduction in the cost of production, but it must be remembered that nothing seems to be allowed for the cost of land or capital, and that the figures therefore do not represent the probable cost of production to a private planter. The expenses on the bark in Java from the plantation to ship board are 4c per half-kilo (equal to about ¾d per lb.). The net profit of the Government gardens in 1893 was 18,449 florins on the sale of bark, and 745 florins on that of young trees and seed.—*Chemist and Druggist,*

COFFEE PLANTING IN MEXICO.

CITY OF MEXICO, May 20.—The demand for good coffee lands in Mexico continues, although few sales of importance have been reported recently, and the work of planting young coffee trees goes on without abating. It may be said that within the last three years the coffee industry of Mexico has received more attention than all others combined; it now, according to the *Two Republics*, "ranks second or third in importance," and it is believed that within a few years it will take first place, leaving silver mining the second place. There is every reason why coffee culture should assume a very important place among Mexican industries; the wonder is, in fact, that it should not have taken that place long ago. But there is no reason why other industries quite as reliable and remunerative should be abandoned for coffee. Yet at present there is danger of too much attention being given to coffee. It is a convenient fact that the soil that will produce coffee will also produce many other valuable articles of commerce; so that on the same plantation may be grown coffee, sugar, tobacco, and cotton, besides cereals and vegetables. Of course, all these crops cannot be grown everywhere; but there are many sections where they can be, and everywhere in the semi-tropical regions the majority of them can be grown. This being the case, it would seem to be rash to place all one's reliance on a single crop, no matter what that one may be. In fact, the future of the tobacco and sugar industries of Mexico is probably as bright as that of coffee. The quality of Mexico's tobacco is being constantly improved as the planters gain experience, and the foreign demand for it is constantly increasing; so that it may be taken for granted that the time is not very far distant when tobacco growing will be one of the country's greatest industries. When it is stated that, notwithstanding the fact that Mexico probably possesses more first-class sugar lands than any other country, she does not manufacture enough sugar to supply the home market, it will be understood that there is a future for the sugar business in Mexico. In some sections cotton must assert its importance, and should not be neglected in those sections, since Mexico, instead of exporting that fibre, is actually importing it. Then there are the cereals which grow practically everywhere coffee does, and many valuable vegetables that the coffee planter should not neglect. Experience has everywhere proved that it is not wise to centre all hopes in a single crop. The Southern planters of the United States have learned by bitter experience that it will not do to place their entire trust in sugar or cotton; but in both combined they may rely, or in either combined with cereals or vegetables. The coffee growers of Mexico should likewise be fruit growers, sugar growers, and tobacco growers, as well. One crop may fail, and possibly two, but it is very seldom that all crops fail; there may be overproduction of one crop, but hardly more than one the same year."

WALNUT-SHELLS IN GROUND CINNAMON.

It appears that there is a big demand in certain quarters of commercial London for walnut-shells, which are used for adulterating ground cinnamon. Dr. Bernard Dyer and Mr. J. F. H. Gilbard have been looking into the matter, and they say in the *Analyst* that the microscopic detection of powdered walnut-shells in the cinnamon is not difficult, the scler-

renehyma of each being so different. The following figures of the chemical examination seem, however, to be more generally useful:—

	Average of five samples of chips and quill	Ground walnut- shells
Moisture (loss at 100deg C)	12.41	9.97
Approximate volatile essential oil	1.57	0.27
Fixed ether extract	2.14	1.60
Alcoholic extract after ether	12.57	3.67
Total ash less sand	4.22	0.87
Ash soluble in water	0.46	0.37
Ash insoluble in water	2.76	0.50
Fibre	34.25	47.67
Nitrogen	0.51	0.20

The items 'volatile oil,' 'alcoholic extract,' 'insoluble ash,' and 'nitrogen' would all be of assistance in calculating the percentages in mixture of ground cinnamon and walnut shells.—*Chemist and Druggist*.

CULTIVATION OF THE ROSE.

(BY A HOOSIER, FLORIST, INDIANA.)

SITUATION AND SOIL.—The rose does not require as sunny a situation as is often given it, but can be grown far more satisfactorily if planted where it will get all the morning sun, but be shaded through the afternoon; and they should not be planted so near to trees as to be overhung by them.

The best soil for rose gardens is a compost of two parts rotted sods and one part well decayed manure. The manure should not be on the surface, but buried down into the earth, for the roots of roses penetrate a considerable distance. A quantity of fine gravel and sand mixed through the soil will be highly beneficial, as this will give a drainage.

SUMMER TREATMENT.—If the season is hot and dry, the first part of July spread the clippings of the lawn around the rose bushes, to the depth of six inches; the growth will then not be retarded by the drought, and the latter part of August will give again a shower of fine bloom. Shallow hoeing can be practiced weekly with good results. A liberal supply of water twice a week will be sufficient, unless the season is very dry.

STIMULANTS.—The best stimulant is liquid manure made from old rotted cow manure. To prepare it take two gallons of manure, pour over it boiling water to extract the strength and destroy insect life. The liquid drained from this quantity of manure and mixed with clear water, until it is the color of tea will be sufficient to water three dozen rose bushes.

Soot tea can also be used occasionally with happy results. A quart of boiling water poured over a table-spoonful of soot will make a fine fertilizer. One half-pint of this liquid can be used to each plant once every month. The two stimulants must not be used together.

ANTS A PEST IN THE ROSE GARDEN.—It is very often the case when rose bushes do not thrive as they should, that the trouble is caused by ants burrowing around them. A good remedy for this is to dig a good coating of ashes into the soil around them. This never fails to drive all insects from the soil, and soon the bushes will resume a healthy look, and grow all the better from the application of this fertilizer.

GRUBS.—The grey grub is very destructive to young rose bushes. The surest and best way to get rid of the grubs is to lift the bush and search the soil carefully. They are often found one foot away. Before planting again scatter a little wood ashes through the soil. Grubs are not found of soil which contains wood ashes.

INSECTICIDES.—There is nothing better to keep rose bushes free from all kinds of insects than tobacco insecticide soap. If this is used on the foliage there will be no trouble with lice, worms or any of the many pests which soon destroy the foliage and flowers.—*The Mayflower*.

TAR PAVING.

This is made by mixing with fine breeze or small coke just enough of thick refuse coal tar to make it somewhat sticky. After preparing the foundation (which, by the way, should be of concrete), put a thin layer on the smooth prepared surface, then spread a couple of inches of metal or pebbles, or coarse gravel, or even small coke, then another layer of prepared breeze covered lightly with fine sand. The whole is now patted to an even surface. Sifted coke ashes will do: it is essential that all ingredients should be thoroughly dry, and the tar made hot and mixed with breeze and put on whilst hot.—*From Work* for October.

A SIMPLE AND EFFECTIVE WAY TO STAIN FLOORS.

Take one pint of methylated spirits, in this dissolve 4 oz. of shellac, then add as much brown umber as will give the tone required in at least two applications; this will give a walnut finish. Similarly, Venetian red may be added for mahogany, and yellow ochre for pine. When dry, smooth down with fine glass-paper; it may then be kept looking fresh by wiping over with a little linseed oil applied with flannel. It also forms a capital basis for wax or French polish; or it may be finished bright by giving two coats of best oak varnish.—*From Work*.

THE KIRKLEES ESTATE COMPANY, LIMITED.

The memorandum of Association of "the Kirklees Estate Company, Limited," is published in Friday's *Gazette*. The object for which the Company is established are stated to be: To purchase all that estate called Kirklees, situated in the District of Uda Pussellawa, Ceylon, together with all the buildings, machinery, and stock thereon and thereto belonging, and the crops thereof (as from the first day of January, One thousand Eight hundred and Ninety-five, for the sum of Ninety thousand Three hundred and Fifty-two rupees and Ninety-four cents (R90,352.94) Ceylon currency, upon such terms and conditions as may be agreed upon between the Company and the proprietor or proprietors of the said estate, and to manufacture tea leaf and (or) other products. The nominal capital of the Company is R100,000 divided into 1,000 shares of R100 each. The following gentlemen have already purchased a share each:—Messrs. James Forbes, Thos. Jones, G. W. Carlyon, G. H. Alston, Alf. H. Ayden, A. J. Sawyer, and C. E. H. Symons.

FORMOSAN CAMPHOR.

Formosan resources and industries are of course attracting a good deal of journalistic attention in Tokyo. The camphor forests of the island are spoken of as a probable source of wealth, in view of the facts that Japan and Formosa are practically the only camphor-producing countries in the world—the Borneo vegetable being of a different character—and that the demand for camphor has increased of late years. A naive comment is made by one of our vernacular contemporaries, namely, that camphor has been discovered to have properties fatal to the mildew parasite; an assertion that might have been addressed with greater interest to our ancestors several generations ago. What we specially note, however, is that the writers in the vernacular press seem to ignore the important point that Formosan camphor can not be suitably refined without the addition of a certain proportion of the Japanese

vegetable. If the experts of this country can discover the cause of that peculiarity, they may succeed in imparting a greatly increased value to the camphor forests of Formosa.—*Japan Mail*.

HYDRAULIC LIMESTONE IN CEYLON.

We are asked if we can mention any localities in Ceylon in which limestone of a character suited for burning lime having an hydraulic property can be obtained. So far as we know there are only one or two districts where stone of this description is found. Recently a letter appeared in these columns the writer of which attributed the fertility of the soil of the Jaffna peninsula to the presence of an extensive formation of limestone. This is to be found therein in deposits over a large area, and it is a very curious formation. It is to the presence of this that the growth of the peninsula is due. Upon and around it the coral insect has for ages been busy, and gradually the neck of land with its outlying islets, have arisen above sea-level. Owing to the large admixture of magnesia in this limestone, its result when burnt is distinctly hydraulic. Indeed it has been used for construction work in the salt lagoons that intersect the peninsula for very many years, the lime obtained from it setting very fairly well under water, whether salt or fresh. It is not powerfully hydraulic, perhaps owing to the limited amount of magnesia present in the rock. The stone is readily recognised by its hardness and pale yellow colour. It is expensive to burn, as it requires firing for a much longer time, and with a more intense heat, than suffices to calcine the ordinary coral limestone to be found in the neighbourhood. Consequently the cost of this lime is fully four times as great as that of ordinary coral lime. For above-water work, however, it possesses many advantages over ordinary lime. It sets to an extreme hardness, and is susceptible to a high polish, while its natural straw colour remains in the plaster obtained from it. Probably, the stone may hereafter form a valuable item of export from the Jaffna Peninsula. It is possible, moreover, that by some chemical admixture the hydraulic properties possessed by the lime it yields may be materially increased, nor is it likely, that with the artificial Portland cement imported into this island at the present low rate, it would pay to attempt such experimenting on any commercial scale. Owing to the enormous competition in the manufacture of Portland cement by the Belgians and Dutch, the cement mills of England can now hardly be made to pay. The product of these, although decidedly superior in quality of that of their foreign competitors, has an enforced sale at prices which admit of export at an exceedingly low rate, and it is at least questionable whether any local production could compete with it in either price or quality. Nor can it be likely that such an exhaustion of raw materials for English cement-making can arise as to ever raise the price of it to a point at which we could expect successfully to compete except, perhaps, in localities where the cost of inland transport might reduce the balance. Chalk and clay, the two prime ingredients of the artificial Portland cement, are too plentiful throughout England to make it likely that the manufacture can ever become restricted for want of these two items. Here, in Ceylon, the first of these is wholly absent, while the second is not of the quality best suited for the production of cement. While, therefore, answering the question addressed to us to the best of our ability,

we should recommend the preference to be given to the best cements imported to the exclusion of any attempt to utilize local material. At the same time we should be glad to hear from correspondents who may be aware if the magnesia limestone we have mentioned, and which some believe, to be limited to the Jaffna Peninsula, is to be found elsewhere in the island.

THE AMSTERDAM CINCHONA TRADE IN THE FIRST HALF OF 1895.

June 20.

During the first half of 1895 five public sales of cinchona-bark have been held in Amsterdam, the following being the quantities of bark offered at them:—

	Jan 24	Feb 28	April 4	May 9	June 13
Bark which had been offered previously (packages)	2,431	3,282	3,051	1,319	2,287
New lots (packages)	5,335	4,906	2,755	4,563	3,404
Total	7,766	8,188	5,306	5,902	5,691

Average per cent sulphate of quinine 4.63 4.85 4.91 5.10 5.00

It will be seen that, out of a total of 33,353 packages, fully one third has been offered more than once—a circumstance which, although intrinsically of little importance, has contributed to intensify the already depressed condition of the market. The bark offered consisted of the following varieties:—

	Kilos
C Succirubra	101,635
C Ledgeriana	2,606,566
C Schuhkraft	2,207
C Officinalis	29,032
Hybrids, &c	310,747
Total	3,050,187

It deserves attention that druggists' barks of really fine quality are steadily becoming scarcer, the Government druggists' barks especially having fallen off greatly in respect to appearance. The richest parcel of bark offered during the half-year was one of 13 bales broken stem-quill of C Ledgeriana. It represented 13.05 per cent of sulphate of quinine. The average richness of the manufacturers' barks was 4.88 per cent. The total quantity of sulphate of quinine in the bark at the five first auctions of the last five years has been—

Year	1895	1894	1893	1892	1891
	kilos	kilos	kilos	kilos	kilos
	143,237	96,158	98,809	77,849	56,609

The division of the bark by weight, according to the percentage of quinine represented by it, was—

Per cent	1-2	2-3	3-4	4-5	5-6
Kilos	23,985	235,612	594,77	897,514	742,235
Per cent	6-7	7-8	8-9	9-10	10 and over
Kilos	407,017	119,030	11,800	16,113	4,230

The following figures show the exports from Java up the last four years in Amsterdam lb. (about half-kilo each);—

	1895	1894	1893	1892
January	657,000	893,000	900,000	370,000
February	756,000	458,000	355,000	433,000
March	449,000	522,000	626,000	369,000
April	615,000	515,000	679,000	350,000
May	402,700	900,000	714,000	400,000
January-May	2,879,700	3,288,000	3,244,000	2,012,000
June-December	—	8,917,700	7,342,000	6,532,000
Total	—	12,205,700	10,586,000	8,544,000

—Chemist and Druggist.

AN INVESTMENT IN TEA.

Mr. J. M. Murdoch left for Ratnapura today after spending a few days in Colombo. A year ago he purchased Carney estate, Ratnapura, and the object of his visit to Colombo this week was to dispose of a three-quarter share of that property to Mr. George Wilson, who came to the island on a globe-trotting trip two months ago and has been staying with Mr. Murdoch, and who leaves tonight for Bangkok by the "Oxus." Mr. Wilson hails from Dumfriesshire, and he was through Colombo some years ago. The price he has paid for the three-quarter share of Carney is £6,000. The estate com-

prises in all 204 acres; of which 142 are opened in tea, yielding 600 lb. to the acre. Six acres of the property formerly formed a part of Mr. W. G. Sandison's Asoka estate, and this portion is therefore producing seed-bearers—a fine paying little block. Mr. Murdoch will continue in sole charge of the estate.

THE WORK OF BACTERIA.

The investigations of bacteriologists during the past fifteen years have been of great benefit in the treatment of diseases and in explaining many operations and phenomena that were little understood. It has been discovered that the majority of the diseases which afflict man and animals are caused by bacteria. Bacteria are small plants, and represent the lowest form of organised life. They are invisible to the naked eye, and can only be studied by the aid of the most powerful microscopes. Twenty-five thousand of them placed side by side would not make a line more than an inch long. They consist simply of a single cell and multiply, not by the seed, but by each individual simply dividing itself into two or more. They are in the air, in the earth, on the clothing and body, in the mouth and nose, in fact everywhere, almost. We are indebted to these little plants for boils and abscesses, for fevers that exhaust our vitality, and the more deadly contagious diseases that decimate our population. They cause the dreaded tuberculosis in our cattle, cholera in our pigs, and glanders in our horses. And yet their work is not at all bad. While some are destroying others are building up. While some are working against us others are working with us. The bread we eat is made light and palatable by the work of some of these little plants; beer acquires its head from the same source. The delicate flavour so characteristic of good butter is mainly produced by the work of bacteria in decomposing the casein. They cause the souring of milk and the ripening of cream, which enables us to avoid heavy losses of butter-fat in the buttermilk.—*Mark Lane Express.*

INDIAN PATENTS.

Calcutta, 27th June 1895.

The fees prescribed have been paid for the continuance of exclusive privilege in respect of the undermentioned inventions for the periods shown against each:—

FOR IMPROVEMENTS IN STOVES OR AIR-HEATING APPARATUS.—21 of 1891.—Samuel Cleland Davidson of Sirocco Works, Belfast, Ireland, Merchant, for improvements in stoves or air-heating apparatus. (Form 15th July 1895 to 14th July 1896.)

Whereas the inventors of the undermentioned inventions have respectively failed to pay the fee within the time limited in that behalf it is hereby notified that the exclusive privilege of making, selling, and using the said inventions in British India, and of authorising others so to do, has ceased:—

FOR IMPROVEMENTS IN THE MEANS OR APPARATUS FOR DRIVING FANS FOR VENTILATING AND OTHER PURPOSES.—213 of 1890.—Mr. S. C. Davidson's invention for improvements in the means of apparatus for driving fans for ventilating and other purposes. (Specification filed 21st March 1891).—*Indian Engineer.*

THE COFFEE ENTERPRISE IN MEXICO is evidently going to be an important one to judge by the intelligence quoted on our fourth page. Mexico has hitherto given a total export of about 200,000 cwt. of our old staple; but we may expect her to run up to the half-million and even the million cwt before many years are out.

THE UNITED PLANTERS' COMPANY
OF CEYLON LIMITED.

REPORT, 1894.

The Directors now present to the Shareholders their fourth annual report, with the accompanying accounts to the 31st December, 1894, and are glad to be able to show continued satisfactory progress. With the rather finer system of plucking recently adopted, the yield of tea has been somewhat smaller than the previous year. This must, however, be partially attributed to the abnormally dry season in Ceylon, but slightly improved prices have compensated for the shortness of yield. During the year 129 acres of new land have been planted in tea, and are reported upon satisfactorily. The accounts now presented show a balance of profit of £6,823 19s. 8d., after paying an interim dividend at the rate of 5 per cent. per annum, all current expenses and upkeep of machinery and buildings, and after writing £2,000 off the Factories and Machinery account, £1,000 off the new clearings account, and making further provision for the Superintendents' Fund. The Directors now propose to add £1,000 to reserve account, bringing the amount of that account up to £5,000, to pay a final dividend of 3½ per cent., free of Income Tax, making 6 per cent. for the year, and to carry forward a balance of £944 19s. 8d. The Directors have again to express their satisfaction with the energy and zeal displayed by the Superintendents in the management of the estates.

PLANTING AND PRODUCE.

WEIGHTS AND TARES.—Referring to the growing tendency in Mincing Lane to do away with tares and allowances of very description, the *Grocer* says: "This has been shewn in the consideration of an alteration in the terms under which various articles of produce are being sold, proposed by importers, and which is receiving considerable opposition from the dealers. At present those proposals are, we believe, confined to coffee, cocoa, pepper, and sugar, though it is not at all unlikely that, if the proposed alterations were to be adopted, tea, various spices, and other articles would soon receive attention with a view to the abolition of draft allowances. At present it is not practicable to give the exact nature of the proposals, as we understand there is difference of opinion even among those by whom they are advanced. With reference to coffee, it will be remembered that on casks a draft varying from 1 lb. to 5 lb., according to weight, is allowed, and on bags from 1 lb. to 4 lb. The allowance on sea damaged packages was in addition to these ordinary drafts, which therefore remain though the damage allowance is discontinued. In the opinion of some the remaining draft allowance is unreasonable because excessive, and it is even urged that such allowances are felt to be detrimental to the port of London, because shippers prefer to send their consignments to Continental ports, where it is stated, these allowances do not exist. Inquiries have, however, been made into the matter, and it has been found that though there is no draft generally allowed on the Continent or in the United States on Brazilian coffee, yet drafts similar to those of London are allowed in the case of East India and Central American, and all other coffee which forms the bulk of the trade of London. Seeing the loss which there is upon coffee from sampling (brokers' samples being very heavy), etc., it is not unreasonable to expect that there will be considerable opposition to any attempt to abolish the draft. With reference to cocoa, pepper and sugar, certain alterations in the present methods of weighing and taring are also suggested, whilst a strong protest is being made against what is considered an excessive amount of 'turn of the scale' which is recognised in the port of London. The advocates of the change urge that what they call the liberal terms which are now obtained by buyers from importers are having a detrimental effect on the trade of the port, and that

shippers are sending their produce to ports where they have not to make such large allowances. Careful inquiry as to Continental customs, however, shows that many of the terms which prevail in London are similar to those of foreign ports. It has also been pointed out that trade in the port of London is more affected by steamship competition than by such questions as drafts and tares. Whatever be the explanation of the alleged falling off in the trade of the port, care must be taken that the buyers are not unjustly treated in order to assist the importers."—*H. and C. Mail.*

LOCAL NEW MANUFACTURING
INDUSTRIES.

We had no idea that Messrs. Cave & Co. had got so far as "construction" of new instruments in what we supposed to be their Musical Instrument Repairing Department; but this is what we read with both surprise and satisfaction in their latest "Review":—

To test the skill of our staff we attempted the manufacture of a pianoforte. The result was most successful. The piano sold for a good price within a few days of completion, and stands in excellent order. We have built a pipe organ with success. We have manufactured harmoniums, and for value in this line we challenge competition with English manufacturers. Our staff of Sinhalese mechanics connected with our pianoforte-repairing department is now very large. The head men have been with us for ten years or more. During this time they have worked under experienced European assistants and have become very proficient. Their work is always accurate and reliable.

Our picture-framing department has become very extensive, giving employment to a large number of hands. It is fitted with machinery and appliances enabling us to execute framing work, in the best possible style, expeditiously and economically. We hold large stocks of materials necessary for this class of work, including 30,000 feet of various kinds of moulding. With this large stock we are able to manufacture frames, suitable for the smallest miniature or the largest oil painting, in two hundred different patterns. We can also make photo-screens and frames of other materials than wood, such as plush, leather &c. as well as of any of the woods of Ceylon.

We have, ourselves, given considerable attention to the manufacture of golf clubs, which have been very readily appreciated by purchasers, and our increasing sales are an indication of our success in this matter. All material used in their manufacture is imported, and is of the finest quality. The timber both of heads and shafts is thoroughly seasoned, and the irons are of the best material and finest models procurable. We invite the comparison of these clubs with those of any other maker, for strength, finish, modelling, lay, driving power. The price, which is considerably lower than that of imported clubs, is a further recommendation.

These results in so many departments—reflect the highest credit on this enterprising Port Firm and their staff and we would point out that nothing is more desirable in an agricultural country like Ceylon than the establishment of such manufacturing industries and nothing more deserving of encouragement at the hands of an intelligent, progressive Government. But what do we find? That most of the raw material used by Messrs. Cave & Co. is taxed at the Customs and this is also the case to a great extent with the extremely interesting new industries started by Messrs. Geo. Armitage & Co. In both cases, the tariff is decidedly discouraging although we pointed out at the time, how easily the necessary raw materials in these industries could be added to the free list, when a revision was made last year. Messrs. Cave & Co. furnish us with the following memorandum:—

All raw material has to bear duty. For Pianos, organs and harmoniums:—Wires, reeds, felts, leathers, celluloid, &c.; Framing:—Moulding, glass and boards for backs as well as cardboards for mounts. Golf Clubs, &c., all raw materials pay duty. We are making the last by the gross at a time. Our new Oil Engine is likely to be ready for work early next week; but how wrong that we have to pay 25 cents duty on every gallon of oil used for it. We trust the time is fast approaching when Ceylon may have a far more enlightened Customs Tariff than the present one.

VARIOUS PLANTING NOTES.

CENTRAL TEA COMPANY OF CEYLON, LTD.—Under this title a new company has just been registered, with a capital of £45,000 in 10 shares. Object, to carry into effect a certain agreement, and to acquire certain tea estates in the island of Ceylon. The directors are J. S. Holmes, H. K. Rutherford, and W. H. Anderson. Qualification, £250. Remuneration to be fixed by the company. Registered office, 21, Mincing Lane, E.C.—*H. and C. Mail.*

VALUE OF PLANTATION PROPERTY IN COORG.—From the Travancore *Star* do we get the following interesting paragraph. Such estimates have seldom been made outside of Ceylon:—

The planters of Coorg have done a wise thing in trying to estimate the value of their industry. Being a first attempt, it cannot be viewed as more than an approximation to accuracy, but it goes far to show the magnitude of the interests involved, and for the reason will be found useful. According to this estimate European and Native Coffee Estates in Coorg represent a capital value of from £1,700,000 to £2,000,000, they circulate annually about £300,000 in upkeep and employ 50,000 labourers. Coorg is a small province and if it can show so large a stake, how much larger must that be of the Nilgiris and Malabar, the Shevaroyes, the Pulnis and Travancore combined.

A CAMPHOR INDUSTRY.—We have seen nothing to discourage planters of camphor trees from anticipating a time when such trees should prove profitable yielders of the valuable product, or add considerably to the wealth of their properties. Cinchona trees in South America forests were very old in many cases; but marketable bark was also got freely from trees of five years and upwards.—Here is an account of the process of camphor extraction:—

After a tree is felled, the wood is cut into chips, which are placed in the rude boiler or still. This is provided with a false bottom, through which the steam rises, and as it passes through the wood it carries with it the camphor. The vapor is then conducted by the pipe to a condenser containing several partitions filled with cold water; in the sides of these partitions are apertures opening alternately, so that the vapor takes a circuitous route, and in the passage the camphor is deposited in crystals upon the bamboo screens. From these screens the crystals can be readily removed, and they provide an efficient means for draining off the oil. The process is an ancient one, but it is so firmly adhered to by the natives, and it suits the purpose so well that there appears to be a long future for it.

Experiments are likely to be made locally before long, and we shall publish the result, meantime collecting all useful information on the subject.

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Eardrums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN, LONDON

AGAVE RIGIDA VAR. SISALANA.—We have at present planted out 14 large plants each about 5 to 5½ feet high, the largest leaf measuring 54 inches long by 4 inches broad; 36 smaller sized plants, 3 feet or under: 90 plants, 2 feet or less; 42 plants about 1 foot high and 95 plants about 6 inches high. These two last are waiting favourable opportunity to plant out. Altogether we have 277 plants and about 30 more suckers just beginning to show from the base of the old plants.—*Agri-Horticultural Society of Madras.*

CEYLON STAPLE EXPORTS.—The comparison for two half-years as shown in the Chamber of Commerce return, 1st Jan. to 1st July, is as follows:—

	1894.	1895.	Increase.
Tea, lb.	45,225,500	51,667,796	6,442,296
Coffee, cwt.	12,981	38,303	25,322
Cocoa, „	11,178	18,962	7,784
Cardamoms, lb.	163,761	213,742	49,981
Cinchona, „	1,029,998	498,973	531,025*
Cinnamon „	892,513	1,107,183	214,670
Coconut Oil, cwt.	189,243	143,629	45,614*
Plumbago, „	122,582	130,539	7,957
Dessicated			
Coconut, lb.	1,648,487	3,588,915	1,940,428

According to the Customs Department, the comparison for the same periods, is as follows:—

	1894.	1895.	Increase.
Tea, lb.	48,320,114	53,962,285	5,642,171
Coffee, cwt.	13,129	41,104	27,975
Cocoa, „	12,372	20,298	7,926
Cinchona, lb.	803,143	528,777	274,366*
Rice, (imported)			
bushels	3,184,117	3,572,992	388,875

* Decrease.

TROUT IN THE HORTON PLAINS.—Mr. Thomas Farr of Bogawantalawa has a letter in the local “Times” on this subject which is a little puzzling. He says no one has hitherto poached; but what is “fishing without a license” but poaching in a special degree? However, we are glad to learn that it is unlikely coolies or other natives interfere with the fish and the following information is interesting:—

“It may not be generally known that there are about ten miles of the Belihuloya on the Horton Plains, running at an elevation of from 6,600 feet to over 7,000 feet, of sufficient depth and volume to be eminently suitable for the well-being of trout, and every effort should be made to thoroughly stock the whole river. Funds will, I feel convinced, be readily available as soon as it becomes known that this splendid stream is to receive the attention it merits from the Trout Fund Committee. That the fish will breed it is, I should say, very probable, and the larger the number of fry introduced the greater will that probability become. Between fifty and sixty good fish have been taken out of the stream during the past six months, and very nearly all of these are from the 250 fry turned down by Mr. Fowler last year. Judging by the condition and growth of the fish, there seems to be abundance of food, in spite of the entire absence of any indigenous fish upon which they could prey. These fish, the so-called stone loach, so common in all other up-country streams, could easily be introduced, should the stock of trout become so large as to make this desirable.”

It is not very likely, however, we repeat, that the present Trout Fund Committee will go on stocking Horton Plains stream if the subscribers are to be charged Rs per day for fishing, apart from their present or prospective contributions to the Fund, seeing it would be open to any outsider who gives nothing to said fund, to get on equal terms by a five-rupee license. Clearly the Committee must get full control from Government of all the streams it undertakes to stock and look after, and then one subscription-license-fee will be enough for fishing in any or all. As soon as this is arranged, we feel sure funds will flow in most liberally—but not before.

DRUG REPORT.

(From *Chemist and Druggist*)

THE AMSTERDAM CINCHONA-AUCTIONS.

June 13th.

Our Amsterdam correspondent telegraphing on Thursday night, states that at the cinchona-auctions held in that city 5,930 packages of Java cinchona were offered, of which only 3,474 sold at an average unit of 2.87c per half kilo, or about 9-16ths d. per lb., a decline of about 2 per cent on the auctions of May 9th, when the average was 2.92c. The result of the sale was a great disappointment to many holders, who had expected a slight advance. The approximate quantities of sulphate of quinine (in kilos) purchased by the principal buyers were as follows:—Philadelphia and Paris, 8,227; Brunswick, 984; Mannheim and Amsterdam, 461; Frankfort-on-Main and Stuttgart, 2,471; Anerbach, 1,791; Howards & Sons, 2,445. The range of prices for manufacturers' barks was from 1½c to 29c, for druggists' from 7½c to 75½c per half kilo. The general tone is dull and depressed.

London, July 4.

CAFFEINE—Very firmly held, and almost unobtainable on the spot—27s per lb being the nearest quotation. For delivery 21s to 22s per lb is asked.

ESSENTIAL OIL—Citronella oil is very firmly held at 1s 4d on the spot for fair native brands in tins or bottles, and 1s 4½d for ditto in drums. The prices for arrival are 1s 3d for tins, and 1s 3½d for drums, c i f terms—shipment within the next six months. Lemongrass oil rather scarce and firm at 1½d per oz on the spot and 1½d c i f terms. Bids in the last-named position slightly below the quoted price have been refused.

QUININE—Rather easier. Small sales have been made this week at 12½d per oz for HB brand, second-hand. B & S brand in the same position cannot easily be had below 12½d per oz.

INDIAN TEA SALES.

(From *Watson, Sibthorp & Co.'s Tea Report*.)

CALCUTTA, July 23rd, 1895.

14,857 packages changed hands in the sales held on the 18th instant. There was an active demand from various markets and prices for all grades, although somewhat irregular, were very firm with here and there an upward tendency, especially on the better grades. The demand for the Colonies and Bombay was stronger than it has been lately and kept suitable teas very steady.

The average price of the 14,857 packages sold is As. 8-0 or nearly 8½d per lb. as compared with 15,531 packages sold on the 19th July 1894 at As. 10-5 or about 10½d per lb. and 15,607 packages sold on the 20th July 1893 at As. 8-0 or about 9½d per lb.

The Exports from 1st May to 20th July from here to Great Britain are 22,968,603 lb. as compared with 19,426,878 lb. at the corresponding period last season and 17,162,847 lb. in 1893.

NOTE.—Last sale's average was As. 8-3 or about 8½d per lb.

EXCHANGE.—Document Bills, 6 months' sight, 1s 1-5-16d

FREIGHT.—Steamer £1-16-3 per ton of 50 c. ft.

(From *William Moran & Co.'s Market Report*.)

CALCUTTA, July 23rd, 1895.

TEA.—During the past fortnight there has been a rather better feeling in the market, and at both the weekly auctions, held on the 11th and 18th instants there was more spirit in the biddings. Good to fine teas have sold at firm prices, occasionally showing some slight advance. Medium sorts have been very steady, excepting good leaf pekoes without much liquor, which have gone a trifle easier. Common and ordinary sorts are, if anything, a shade higher.

The quality generally has been rather better, though the proportion of really good and fine teas has not been large. The quantity offered was 30,946 packages, of which 30,008 were sold.

TOTAL QUANTITY OF TEA PASSED THROUGH CALCUTTA FROM 1ST APRIL TO 21ST JULY.

	1895.	1894.	1893.
Great Britain	23,074,574	20,455,878	17,575,502
Foreign Europe	81,033	38,720	32,419
America	55,940	46,170	23,330
Asia	611,408	349,312	373,586
Australia and New Zealand	1,077,244	855,236	835,480
	24,900,199	21,745,316	18,840,317

VARIOUS PLANTING NOTES.

CAMPHOR is one of the articles which have of late been mounting up in price. From about 75s to 170s per cwt., such is the extent of the recent rise in the value of this article. For years past, it appears, a wholesale destruction of the camphor tree forests has been going on in order to obtain the product, and to such an extent have the depredations been carried that there was considerable danger of the tree a few years hence becoming completely extinct. With the object of preventing this it has been decided that in future the trees are not to be felled, but only bled, and as a consequence supplies are likely henceforth to be on a smaller scale. Already the imports have greatly decreased, only 3,355 tubs having been landed this year in comparison with 6,410 in the corresponding period; but consumption is likewise adapting itself to the restriction of supplies, the deliveries having fallen from 6,710 to 3,550 tubs, and so stock show very little alteration from a year ago, being now 4,015 tubs, compared with 4,585 in May last year.—*Dundee Advertiser*.

moth-catching PLANT.—Read letter from Rev. G. Richter, dated Mercara, 22nd February, 1895 (at Agri-Horticultural Society, Madras,) forwarding a cutting from "Public Opinion" dated January 18th, of a Moth-catching plant and recommending the Society to introduce the plant:—

"This plant (*Arangia albens*), which is a native of Southern Africa, was introduced to New Zealand quite accidentally about seven years ago, and since then it has been extensively propagated there, on account of its effective service as a killer of destructive moths. Wherever the climate is mild the plant is an exceedingly free grower; it twines and climbs with great luxuriance, and produces immense numbers of white or pinkish flowers, which have a very agreeable scent. These flowers attract innumerable moths. On a summer evening a hedge of arangias will be covered by a perfect cloud of moths, and in the morning there will not be a single flower that does not imprison one or two, and sometimes as many as four insects of various sizes and genera. The action of the arangia is purely mechanical. The calyx of the flower is rather deep, and the receptacle for its sweet juices is placed at its base. Attracted by the powerful scent and the prospect of honey, the moth dives down the calyx, and protrudes its proboscis to reach the tempting food. But before it can do so the proboscis is nipped between two strong, hard black pincers, which guard the passage and once nipped there is no escape for the moth, which is held as in a vice, by the extreme end of the proboscis, and dies miserably. The rationale of the process is not yet explained. A plant of arangia, covering a space of ten yards in length will destroy many hundred moths every night, and consequently prevent the ravages of fifty times as many larvae. It is however, a singular fact that in New Zealand, where the plant has often been cultivated for the express purpose of destroying the detested codlin moth (*Carpocapsa pomonella*), that wily insect declines to enter the trap.—*Detroit Free Press*.

THE BEST SOAPS FOR WARM CLIMATES
 Are CALVERT'S TOILET SOAP (6d. Tablets) and PRICKLY-HEAT SOAP (6d. and 1s. bars), pleasantly perfumed, for Bath or Toilet, containing 10 per cent. of Pure Carbolic. Very serviceable as preventatives of Prickly-heat and other skin irritation. Sold at Chemists, Stores, &c.
 F. C. CALVERT & CO., MANCHESTER.

MARKET RATES FOR OLD AND NEW PRODUCTS.

Vol. VII.]

AUGUST, 1895.

[No. 2.

DAIRYING.

DAIRY, as the term is commonly understood, is an establishment where cattle are kept for the production of milk, either for sale or for the manufacture of butter and cheese. As dairying is carried on in Colombo, the cattle kept may either be the property of the nominal proprietor of the establishment or not. Where they do not belong to the proprietor a contract of some kind is entered in to between him and the real owner of the cows. Commonly, the owner or owners of the animals agree to defray the cost of feeding them, and also to pay the coolies who attend on the cattle, on condition that all the milk produced should be purchased by the proprietor at a uniform rate of say 12 cents per "bottle" of 26 oz. On the other hand, the so-called proprietor sells the milk to his customers at from 18 to 20 cents per bottle. If strict supervision be carried out, especially during milking hours, the system would not be so objectionable, but as a rule this method of dairy is adopted by those who are employed at other work, with the result that the proprietor exercises little or no control over the establishment, and while its sanitary arrangements are neglected, there is generally ample scope for the adulteration of milk, and wilful carelessness in the matter of dieting, with which, indeed, from his position, the proprietor has little right to interfere. To the proprietor himself the system is at least temporarily remunerative, for without any expenditure of capital on his part, he secures a fair return for his enterprise.

In the system where the cattle kept in the dairy are the property of the proprietor, the most frequent cause of failure is the want of system in management, due to a deficiency in technical knowledge, the result of which is that while at one time the dairy is found to be in a flourishing condition, with a large output of milk which is readily disposed of, at another the dairyman has a large number of dry cattle thrown on his hands, and finds that the cost of feeding the stock greatly exceeds the value of the milk sold. No dairy of any dimensions should be without a stock-bull, and if the services of this animal are judiciously made use of, and the calving of the cows carefully regulated, one of the chief causes of failure in this connection will be prevented.

One modification of the system, according to which the proprietor is the owner of the dairy stock, is the plan of immediately disposing of the cows as they go dry and purchasing fresh animals to replace those sold. In many ways, especially from a financial point of view, this is an admirable plan, but it has its drawbacks in that the dairyman will be selling and buying stock all through the year, that these sales and purchases will be regulated by market rates which he is of course not in a position to control, that he will be constantly running the risk of importing disease into his dairy, that there may not always be a supply of cattle to meet his requirements, that the dairyman forfeits the future advantage of securing a select herd of cows by breeding.

It is manifestly injudicious for any owner of stock to dispose of a cow which is a good milker and a regular breeder, because it has to be fed while

it yields no milk for the time between its going dry and coming into milk again: and it would be equally unwise for a dairyman to retain animals that do not combine the above qualities, and continue to feed them with the prospect of their coming into milk again at some time, and yielding the owner supplies that are below the average.

The object of every dairyman should be to put together as satisfactory a herd of milking cows as can be had, and when he has got them to keep them as long as he can with advantage to himself. It is, of course, not possible to do this all at once, but it can be done gradually. All animals in the first selected herd which have turned out to be poor milkers or irregular breeders should be got rid of; and such cows as in course of time may become unthrifty or old, should be weeded out. But let the good animals be retained, a good stock-bull kept, and good progeny for the future use of the dairy secured, and the stock so managed that a uniform supply of milk will be always kept up. Here we have an ideal system of dairying or rather dairy farming. The advantages—financial and otherwise—of such a system cannot correctly be gauged till at least the fourth year of its working, by which time the heifers bred on the farm will have begun to supply the places of their dams, after which there should be little if any expenditure of capital on account of stock purchased. Under these conditions the sale of the bull calves born on the farm will be an important item of revenue. The management of a dairy worked on this system, in addition to securing financial success, will combine all the pleasure that can be desired by a cattle-fancier in the complete control he could exercise over his herd, and the opportunity afforded him of applying his technical knowledge of stock to the best advantage, and seeing results work out to his satisfaction.

OCCASIONAL NOTES.

The amount realized by the sale of stock held at the Government Dairy on the 12th July was R1,262'00. The twelve cows fetched R787, or an average of R65'58. Of these fifteen, five were Sind cows which realized R533'00, or an average of R106'60. The calves (fourteen in number) fetched R475'00, or an average of R34'00. Of these nine were Sind bull calves which realized R421, or an average of R46'77. The different purchasers were Messrs. S. C. Obeyesekere, F. Schrader, Drs. Rockwood and Stork, Messrs. Jacob de Mel, Rodrigo, Farquharson, Maricar, Robson, Juanis, Buckworth, and J. W. Vanderstraaten. On the whole the sale may be considered a very satisfactory one.

Of late there has been some discussion in the press as to the relative merits of the Gazerati and Sind breeds of cattle. Without taking any sides in this discussion, we should wish to state that the Sind breed of cattle have been given a good trial in the Government Dairy and have not been found wanting. To the Government Dairy authorities is due the credit of having selected the breed for the purposes of the dairy and so introduced them into the Island, and to the notice of the Ceylon public. By the sales which are periodically held in the dairy, the public are given an opportunity of securing animals of a superior type for improving the breeds of cattle

already existing in the Island. Before very long the influence of Sind cattle upon the indigenous breed should be marked.

We would draw attention to the specially interesting paper on Contagious Diseases in Insects, by Professor Woodworth of the State University, which we have taken over from the official organ of the Department of Agriculture of the Cape Colony. The question of how to get rid of our plant pests is always an important one to the agriculturist, and any contribution that shows the way to solving it in some measure, is always welcome.

An editorial note in the *Indian Agriculturist* again reminds us how much in need we are of stock inspectors in the Island—for the matter of that in Colombo—to carry on work that, from being distributed among a number of irresponsible parties, is imperfectly done or altogether neglected. The suggestions made by Mr. William Smith in his notes on "Murrain" which appeared in the pages of the Magazine a little time ago, should surely have carried weight as coming from one who is not lacking in local experience, or knowledge of stock, and is a veterinary surgeon to boot. Veterinary Science—at least in its relation to cattle—has up till now been in that state which has been suggestively described as "marking time."

Here is how the *Indian Agriculturist* refers to this subject:—In a country like India, whose interests are almost entirely agricultural, the importance of a training college for veterinary assistants is too obvious to need demonstration. Agricultural stock is the standby of the cultivator all over the country, and not only in those districts where stock-raising is undertaken as a regular and independent pursuit. The necessity, then, is clear of having a body of men distributed throughout the country sufficiently acquainted with the principles of the morbid pathology of animals to detect and report special outbreaks of serious disease in due time. Experts are not wanted, and could not be supported, except at a few more important centres. But there is, we believe, an opening for youths who have attended a veterinary college long enough to advise stock owners as to the precautionary measures that should be taken to protect their animals against contagious and infectious diseases, to superintend the inland trade in cattle, to treat ordinary animal ailments, to take charge of public veterinary dispensaries or private stud farms, and to collect information upon veterinary subjects generally for the public benefit. A great cry is periodically raised about the degeneration of the live stock of the country, and unfortunately it is too seriously warranted by the facts. It is difficult to see how any permanent improvement can take place, or even how the process of degeneration is to be arrested, unless more attention is paid to animals and the conditions under which they thrive. Like everything else, live stock needs study, and its importance in the economy of Indian life is surely a strong reason for the bestowal of pains upon it.

LAWS OF CEYLON RELATING TO AGRICULTURE.

CHAPTER VII.—(Contd.)

7. The Governor in Executive Council may call upon the Central Board to report on similar works.

8. On receipt of such report and estimate the Governor, with the advice of the Executive Council, may ask the Legislative Council for a money vote.

9. The Central Irrigation Board shall cause the specific works in aid of which money shall have been voted to be undertaken and executed by the Provincial Irrigation Board of the province in which such works have to be constructed; the sum voted shall be expended upon such specific work exclusively, and for no other purpose. Provided that any unexpended balances may be reserved so that the same may be applied in reduction of the amount which the Legislative Council may be asked to vote for other specific works.

10. (1.) The cost of irrigation works shall be a first charge on allotments of land benefited thereby, except in case of exemptions by the Central Irrigation Board.

(2.) The Government Agent shall have power to alter and amend the specification from time to time, and to enlarge it as additional lands may be benefited.

(3.) Such specification shall be conclusive on the point that the several allotments of land mentioned in it are liable for the repayment of the said cost, which shall be a first charge on the allotments, and shall take precedence over all mortgages, hypothecations and encumbrances whatsoever.

(4.) Every specification prepared under this chapter and all amendments and alterations of the same shall from time to time be published in the *Government Gazette*.

11. Such charge shall extend as respects each allotment to the proportion due from each allotment as assessed under the provisions of this Ordinance, and shall be recovered in the manner provided in Chap. IX. of this Ordinance.

12. The Provincial Irrigation Board shall cause all irrigation works to be executed, the option being left to the proprietors to perform the necessary earthworks at their own expense, unless such proprietors shall have been specially exempted. Provided that the officer in charge of the work shall cause the earthworks to be otherwise performed if the proprietors fail to perform the work when required to do so, or perform the same unsatisfactorily.

13. If land be wanted for keeping watercourses and channels free from obstruction, or for the construction or repair of any irrigation work, and there is any hindrance to its acquisition, the Governor may declare that the land is needed for public purposes, and order the land to be bought by Government according to the laws now or hereafter to be in force for the acquisition of land for public purposes. The sum paid for the land shall be included in the cost of the work, to be recovered as hereinafter provided.

H. A. J.

(To be continued.)

BAZAAR DRUGS IN VETERINARY PRACTICE.

Arsenic.—White arsenic or arsenious acid is often sold in the native drug bazaars under the name of *S. Sudu pasanam* or Tamil *Vella pāsānam*. White arsenic is prepared by heating arsenical iron ores, it is either met with in the shape of a white powder or porcelain-like pieces. When a small quantity of the powdered arsenic is heated in a glass tube, the vapour which escapes cools on the sides of the glass in the form of minute crystals. Arsenious acid dissolves in water very sparingly, generally about 1-100, but in the presence of an acid or an alkali, it dissolves more easily. Arsenious acid is an irritant poison and is used medicinally only in very small doses. Animals often tolerate this drug to a great degree, but this toleration depends on their respective humours,—if the term may be used,—for cases are on record, where even dram doses of arsenic administered daily have not affected animals, and in other instances twenty grains have often killed an animal. It is a cumulative poison, as even small doses of the drug repeatedly given have known suddenly to develop serious symptoms resulting in the death of animals.

Arsenic in medicinal doses acts beneficially in the stomach by promoting appetite and increasing the functions of the organ. It readily enters the blood and even all the tissues and organs, but is as readily expelled. The drug increases, the tissue changes and acts as a valuable alterative and tonic. It is useful in chronic rheumatism, nervous diseases such as epilepsy and paralysis, also in chorea in the dog. By increasing the tissue changes it acts beneficially in mange and other skin diseases by tending to cast off the scaly diseased portion of the skin. Externally arsenic is an irritant, caustic and an antiseptic. It is useful in troublesome skin diseases when applied in the form of a paste consisting of one of arsenic to five of charcoal and ten of lard. But this must be used with great caution, as any abraded surface of the skin would cause absorption of the substance into the system with serious results. In treating scab

in sheep, arsenic is the chief ingredient in the dipping mixture; a very useful dipping mixture is prepared by taking eight ounces each of arsenious acid and carbonate of potassium, six ounces each of soap and sulphur, and boiling the whole in twenty gallons of water. This quantity is sufficient to dip twenty sheep.

For internal administration arsenious acid is generally mixed with the food; but a solution of arsenic is prepared by heating together four grains each of arsenious acid and potassium carbonate to an ounce of water. Tuson gives the doses as follows:—Horses and cattle take from 5 to 10 grains, sheep 1 to 2 grains, and dogs $\frac{1}{2}$ to $\frac{1}{6}$ of a grain. The liquor as prepared above is given to horses and cattle one to two fluid ounces, sheep $\frac{1}{2}$ to 3 drams, dogs 5 to 20 minims. The liquor is always given diluted in a sufficient quantity of water to form a draught.

Lime.—Calcium oxide, Sing. *hunu*, Tam. *shunambu*. Lime is prepared by burning limestone, coral or marble. Burnt lime or what is commonly known as quicklime takes up a certain quantity of water when added to it and forms calcium hydrate. Lime water, which is much used in medicine, is prepared by stirring quicklime in water, and filtering or decanting the liquor. When thus prepared it is a colourless inodorous liquor, possessing a peculiar alkaline taste. When lime water is exposed to air a thin film or layer is formed on the top of it consequent on the combination of the lime, with the carbonic acid gas of the air. Lime water also turns milky if the air from the lungs is blown into it.

Lime is an irritant, it has a corrosive action, it prevents acidity. Both slaked lime and lime water are used as antacids in diseases of animals, the more useful and handy preparation being the lime water. In indigestion and hoven it is given with much benefit. Young calves suffering from diarrhoea are given milk diluted with 50% of lime water with very beneficial results. In vomiting in dogs lime water often proves useful.

Externally equal parts of lime water and oil form a very useful application in burns and scalds. This mixture is commonly known as carron oil. Horses and cattle take from one to two drams of quick lime and dogs five to twenty grains. Four to five ounces lime water are given to cattle and horses and two to eight drams to calves and dogs.

Chalk.—Calcium carbonate, Sing. *ratahunu*. Pure chalk though not met with naturally here, is imported largely and is easily procured at any bazaar. It is prepared for medicinal purposes by finely powdering the crude substance and triturating in water, thereby removing the coarse particles of foreign matter which are often found with it. When thus prepared it is of a dull white colour, is porous and has an affinity for water. Chalk is very useful in the treatment of indigestion, chronic diarrhoea, and dysentery. Externally the powder may be used as a reliable desiccant for wounds.

Dose for a horse, one to two ounces; cattle, two to four ounces; dogs, eight to twelve grains. It is best given with milk or congee. Chalk when given in large quantities should be followed by a laxative. It may with advantage be given in cases of diarrhoea with catechu, and in indiges-

tion with ginger and coriander. In dysentery, when much pain is evinced, opium and chalk form a useful compound.

Ammonium Chloride.—Sal ammoniac, Sing. *Nava-saran*. Is met with in the bazaars in a more or less crude state. It is prepared by adding hydrochloric acid to "gas liquor" and evaporating the excess of water. The salt is of a fibrous structure and has a "saltish" acid taste. It dissolves readily in water. Large doses of this drug are poisonous to animals. In medicinal doses it is a useful stimulant, it also promotes the secretion of urine and sweat and increases the action of all glands. Ammonium chloride is given with good results in fevers, pneumonia, diarrhoea, rheumatism and dropsy. Externally a solution of the drug is a stimulant to bruises and sprains; a useful cooling lotion is made by dissolving equal parts of ammonium chloride and nitre in cold water. Doses: horses and cattle take from $\frac{1}{2}$ to $1\frac{1}{2}$ ounces and dogs five to twenty grains.

Sulphate of Magnesia.—Epsom salts, Sing. *lunu* (purgative). The vernacular term for Epsom salts is the same word as is applied to any salt, but in the bazaars it is known under the name of "purgative" salts. It is found in its natural state in certain mineral waters, but is generally prepared from the mineral magnesite by treating it with sulphuric acid. The salt as found in the native bazaars is often in the form of large rhombic crystals, but sometimes the crystals are small, much resembling sugar. It has a nauseous saline bitter taste, and a cool sensation is felt when a crystal of the salt is placed on the tongue.

Magnesium sulphate is a purgative and a useful febrifuge. For cattle and other ruminants it is the best known purgative, though it is not advisable to give purgative doses of the drug to horses. In this animal it has certain ill-effects, inasmuch as it is often productive of gripe. Cattle take from one to two pounds as a purgative. Horses two to three ounces as a febrifuge.

Sulphate of Iron.—Green vitriol, Sing. *annawedi*. Is met with in the bazaars in the form of green crystals. It is obtained by dissolving iron in sulphuric acid, but more frequently got in large quantities by treating ferruginous shale with the acid. The crystals of iron sulphate are of a bluish green colour and on exposure deposit a white powder.

In large doses this drug is an irritant, but medicinal doses act as a very useful tonic in debility. It is an astringent in diarrhoea, and is also given with advantage in diabetes and dysentery. Doses: horses and cattle one to two drams and dogs one to ten grains.

W. A. D. S.

LADY BIRDS.

Lady-birds belong to the family Coccinellidae, of the order Coleoptera. They may be shortly described as follows:—Hemispherical; upper side convex; under side flattened; head small, retractile; antennae eleven-jointed, thickened at their tips; legs short; feet apparently three-jointed, the second joint being very small; colour usually variegated, many species black with red, or red with black spots. When grasped the insects emit a yellowish unpleasant-smelling fluid from the

abdomen. The blunt, four-corned, usually variegated pupæ hang on leaves. The fully-developed larvæ are longer than the beetles; they closely resemble those of the leaf beetles, but are not so thick-set, and their longer legs stick out more laterally. They are covered with warts and little spines. The larvæ and beetles of most species feed chiefly on aphides and shield-lice; they are therefore useful. The yellow eggs are laid in heaps.

We have lately heard a good deal in Ceylon about Mr. Koebele and his Australian lady-birds, in connection with the visit of that gentleman to the Island. Through his agency the white scale (*Icerya Purchasi*) which did such damage to the apple orchards of California has been entirely eradicated by means of the lady-bird, *Vedalia cardinalis*. Professor Cook of the California University, an entomologist of repute, has lately published a report of his observations with reference to the work of the Rhizobiids—another species of lady-bird introduced by Mr. Koebele into California. The most troublesome pest in connection with orange and lemon culture is the black scale, scientifically known as *Lecanium Oleæ*, but it is now authentically announced that this pest can be got rid of through the agency of Rhizobiids—the three important species being *Rhizobius too-woomba*, described as a small black beetle with a brown head and thorax; *R. debilis*, which is about the same size as the other but is entirely black above and below, and *R. ventralis*, which is larger, entirely black above, with short light hairs and brown below. A single pair of Rhizobiids, according to Albert Koebele's estimate, could produce 15,000,000,000 in a single year, and Professor Cook considers this, from his observations, to be a reasonable estimate. Details of the wonderful effect of the lady-birds in clearing orange, lemon, and olive orchards are given by Professor Cook, who says: I have been a hard student of entomology for thirty years, and I am free to say that it is the wise and certain policy for this great fruit state to keep Mr. Koebele in Australia for some years hunting and shipping to us more of these natural aids in fighting our insect foes.

The Pacific Rural Press likewise express its views in enthusiastic terms on this matter, thus: "The triumph of the *Vedalia* over the cottony cushion scale has been counted the most sweeping victory for entomological science, but it is now a question whether the rout of the black scale by the Rhizobiids will not indeed prove a greater victory because the area invaded by the black scales is wider. . . . Now there seems to be demonstration which cannot be controverted, and Mr. Koebele's later achievements in the gathering and shipment of these friendly insects to California may beat his record on the *Vedalia*."

The two pests about which at present the planting community in Ceylon are exercised in mind are the green coffee bug, *Lecanium viride* and *Orthezia nacreæ*, a comparatively new pest, which, however, it is apprehended, will do much damage to tea. In a communication to the *Tropical Agriculturist* for June last Mr. E. E. Green, our local entomologist, states that he is daily expecting a consignment of lady-birds from California to experiment with on the above-mentioned pests, mentioning that the two species indented for are *Novius Koebelii* and *Vedalia cardinalis*. Whether the beetles have arrived yet and

what results have followed so far, we are not aware. Seeing the success with the Rhizobiids on *Lecanium oleæ* it is a pity that some of the latter were not imported for trial upon the local species of Lecanium—the green coffee bug, but no doubt Mr. Green has been well advised, and we await the result of trials with much interest.

[Since the above was written we have heard with regret that the lady-birds consigned from California were all found to be dead on reaching Ceylon.—Ed. A.M.]

THE VALUE OF KAINIT.

The best known and most used of potash manures is *Kainit*, a mineral deposit occurring in Germany, and consisting chiefly of chloride of potassium, sulphate of magnesia, and water, with usually chlorides of magnesium and sodium. An average sample should contain about 13½ per cent of potash.

Dr. Fream referring to the value of potash says that light soils generally yield better crops after treatment with potash salts, and also recommends it for vegetable soils. A paper by Dr. Marloth which appears in the Cape Journal of Agriculture gives interesting details of experiments which go to show the importance of mineral fertilizers, and particularly of potash. Referring to kainit he says: "Kainit, one of the most excellent crude potash salts, is rich in magnesia compounds, which by their water-absorbing properties have a marked effect in making and keeping the soil compact and moist. It is thus exactly what is needed by light sandy soils." The writer then goes on to state that on ascertaining by analyses the relative proportions of the principal food ingredients removed from the soil by the commoner crops, it will be found that there is always much more potash removed than phosphoric acid, while all natural fertilizers as well as most artificial mixtures contain comparatively little or almost nothing of potash. To this then is attributed the fact that soil cultivated for a long time by means of natural or artificial manures, without the additional application of potash, do not give results that are expected of them. Many soils again are naturally deficient in potash and need special applications of potash manures to improve them. "It is to be specially noted," says Dr. Marloth, "that the potash supply derivable from ashes is exceedingly small, limited, and the quality so variable, that purchase is only advisable if the strength is guaranteed by chemical analysis." This writer then goes on to give details of experiments which would appear to conclusively prove that special applications of potash salts, preferably in the form of kainit, are necessary for the production of large, healthy and early crops. Kainit is also believed to be injurious to all ground-pests (including the irrepressible white-ant), and, if this can be conclusively proved, it will greatly enhance its usefulness in the tropics.

Kainit guaranteed to contain 12 per cent potash, is obtainable for about £2 per ton in England. We should be glad to see trials made with this and another cheap and useful fertilizer (Basic cinder) in the colony.

AN IMPORTANT LETTER ABOUT RHEA.

The *Agricultural Gazette* of N.S. Wales for April last publishes a letter from Mr. W. Leedham Crowe, of 10, Jeffrey's Street, St. Mary Axe, London, which contains some valuable information about Rhea from a practical source. The following is taken from it:—"For many years I have been greatly interested in the properties and possibilities of this fibre, and have examined many processes, more or less successful, for treating it. Twelve years ago I presided over a meeting in Loudon of merchants and brokers, on which occasion fabrics of every description were exhibited, made from pure Rhea, and from Rhea mixed with wool or other fibres. It was there demonstrated by tests that in the case of fire-hose Rhea had something like three times the existing power to moisture of flax. These fabrics were all made in Angouleme from Rhea grown in Algeria, and treated, I believe, by the Favier-Renny process. The quantity grown there, however, is small, and not of the best quality. I have been interested in growing Rhea in Johore, and in its importation from China and other places.

"In India it cannot be grown successfully to pay. Undoubtedly in N.S. Wales and Queensland there are districts where it could be cultivated to advantage. The two main difficulties are, however, its decortication and the insuring a regular supply at a sufficiently low price. Where I differ from your article is the necessity for a machine to decorticate the stems. I am convinced that the cost and expense of working machinery would be too great for the value of the fibre. Some very efficient machines for this purpose have been produced, those of Messrs. Death & Ellwood among others, and which were tried in Johore, but abandoned. The simplest method of decortication appears to be the Favier process—of subjecting the cane to steam in chests for about 20 minutes, when the covering can be removed by hand, and the ribbon left free. Hitherto it has been decorticated, brought to this country in ribbons, and then treated chemically to remove the gum, but the carriage upon ribbons is very heavy, and the entire process should be carried out upon the spot where it is grown. Many processes have been patented for treating the ribbons, but the most successful appear to be the simplest—a treatment with soda and hot water. If Rhea fibre in merchantable condition can be produced in quantity and laid down in London at a moderate price, it has an immense future. A number of syndicates and small quantities have at various times been formed here to work special methods of treating the fibre. All have failed, and why? First, for want of a regular supply; secondly, because the cost of the fibre when prepared was excessive. Our manufacturers are ready to buy and use Rhea, and anxious to get it, but must have a continuous supply ensured. They will not otherwise alter their machinery, or introduce a new fibre to the market. Rhea must largely compete with cotton, which is now very low, but if the finished fibre, which packs closely, were sent home, it might do this successfully. I have at various times imported the Rhea ribbons from China at a cost of seldom much under £20 per ton delivered here, but such a price is prohibitory. If a small regular supply were ensured to commence with, and the

practical use of the fibre established, a stimulus would be given to production, but until that takes place, Rhea will remain the Will-o'-the-Wisp of sanguine speculators."

CONTAGIOUS DISEASES OF INSECTS.

Insects have long been known to be subject to contagious diseases. This knowledge, however, has not been widespread, and comparatively few have considered it in its bearings on practical agriculture. That it has important bearings in this direction no one can doubt who has observed the progress of an epidemic amongst insects. None of the plagues recorded in history has ever carried such destruction in its path as to be compared with the havoc wrought by some of the common insect diseases.

The earliest known of insect epidemics was the disease known as *muscardine*, affecting most seriously the cultivated silkworm in France and Italy. This disease was easily recognised by the fact that the dead worm became in a short time covered with a whitish powder. Between thirty and forty years ago another still more serious disease was recognised in these countries and called *pébrine*. This disease at one time threatened the very existence of the silk industry of European countries. Still a third disease of the silkworm, the *flacherie*, rivalling even *pébrine* in its destructive power, was first discovered and carefully studied by the renowned M. Pasteur. The disease of the bee known as foul brood was recognised as a contagious disease fully twenty-five years ago, and has claimed, and still claims, the attention of beekeepers on account of the enormous losses it has cost. Another, quite as important as the diseases just mentioned, and one full of suggestiveness, is the disease attacking the chinch bug of the eastern United States. This disease has been known for more than a quarter of a century, but never carefully studied till during the last ten years. Who has not heard of the wonderful effects obtained by spreading the disease in Kansas, an effect as striking as the work of our *Vedalia cardinalis*.

Every one has probably noticed some examples of these contagious diseases, even if not recognizing their nature. The common house flies often seen dead and sticking fast about the window, and surrounded by a whitish halo, is a common form. Scale insects, especially *lecaniums*, covered and almost hidden by a whitish powdery substance, are commonly to be seen.

Plant lice are not uncommonly found sticking to the plant, dead and discoloured and looking much as though killed by kerosene emission, but when no treatment had been made. Caterpillars may often be found hanging by one leg to the plant and the whole body soft and rotten, or dried, stiff and shrivelled. In some one or another of these forms we have quite likely become acquainted with a few of the diseases of insects, but it is doubtful if any of us has a proper idea of their extent and prevalence.

These diseases are all due to the multiplication within the body of certain specific organisms, certain germs. An epidemic may be due to one kind alone or may be a number of diseases attacking the insect together. Three different kinds of organisms are known to produce diseases among insects.

1. *Protozoa*, represented by the organism causing *pébrine*. It is a very lowly organised animal, which in its growing condition is simply a mass of protoplasm of no definite shape and of microscopic size. It finally becomes spherical and motioulless, and the whole interior becomes broken up into a minute mass of oval spores. The contents of each spore breaking out through one end of the spore wall and beginning to feed and grow, completes the life history of the animal. All the organs are attacked, and besides being hereditary the spores are scattered over the leaves from a diseased insect and are eaten by the others with their food and thus the disease spreads.

2. The *bacteria*, which are credited with most of the contagious diseases of man, are also important insect parasites and may be represented by the disease of fowl brood. These are very lowly organised plants, increasing almost wholly by simply separating into two equal halves, growing to full size and again dividing, and so on, though a few produce spores occasionally. The species producing insect diseases belong to the genera *micrococcus* and *bacillus*, the former spherical and the latter cylindrical.

3. The true *fungi*, such as produce the *muscardine*, are much higher developed plants, and two, or perhaps three, very distinct groups are parasitic on insects. They all have this in common, that they are composed of long threads, the mycelium, and short round or oval bodies, the spores. As a rule the spores germinate on the surface of the body; the plant burrowing its way down into the insect there grows till the insect dies, and then again passing through the skin produces the spores, which are so conspicuous on insects dying from these diseases. The spores may not be produced, or only in limited numbers, when the weather is dry or when the insect is so small as to dry up too soon. In these cases a splendid crop may be produced if the dead insect is dropped into a bottle partly filled with water.

The fact that most insects lay many times, often many hundred times as many eggs as can, under ordinary conditions, develop to maturity, is quite well understood. The destruction of the great majority of the young insects is chiefly accomplished through the attack of their natural parasites, and of these parasites the contagious diseases are by all odds the most important. My own observations at Berkeley for three years are to the effect that at least nine out of every ten deaths of such insects due to parasites are caused by some form of contagious disease. For these insects, therefore, nothing else determines the abundance or scarcity of scale insects as completely as do contagious diseases. A very little lessening of the virulence of a disease during any season will enable the scale to overrun the plants, and on the other hand a little increase in the severity of the attack will practically annihilate the scale insects. Everyone has seen examples of these conditions. I have repeatedly seen cases where a disease was particularly abundant and the decrease of scales ascribed to some useless wash or to lady-birds, when these latter were even less abundant than usual. Mistakes of this kind should never occur with a reliable observer, but are very liable to occur unless

care is exercised. This is especially necessary when a new wash or insect parasite is introduced.

The relation of lady-birds to diseases is well worthy of attention. There seems to be evidence that would indicate that a great increase in the numbers of our native species of lady-birds follows or is associated with a serious attack of some form of contagious disease on scale insect or plant louse. This apparent relation between lady-birds and disease of the food of lady-birds, coupled with the fact that the relatives of the lady-birds are fungus eaters and that the lady-birds themselves were once undoubtedly also fungus eaters, suggests very strongly that with some species at least disease of the food is necessary to great lady-bird increase.

Another point in reference to diseases must also be considered. There must be some means of conveying the germs of a disease from insect to insect. While the scales are active there appears to be sufficient means for the spread of the disease. It is a fact that the largest number usually die soon after settling and have apparently become affected while active. Those that have escaped the infliction up to this time, however, would seem to be very unpromising subjects for the disease, both by their freedom from contact and on account of their special means of protection. Now, it would seem that lady-birds serve a very important function in the spread of the diseases. Any one who has observed the actions of a lady-bird either while it is a larva or an adult will have noticed that it does not settle down and devour each scale it comes in contact with; instead, it has the habit of moving restlessly about, nibbling here and there and only now and then taking a full meal. A better arrangement for spreading diseases could not be desired than this habit of the lady-bird. Indeed, the relation of the ladybird to contagious diseases opens a wide field for study, and at the present time I know of none in the whole range of applied entomology more interesting and of more practical promise.

DAIRY PICKINGS.

The Colonial Veterinary Surgeon of Cape Colony writes with reference to the occurrence of blood in cows' milk:—If it is real blood there must be rupture of some small blood vessel in the glands of the udder. If it is merely a bloody-looking sediment which appears in the milk especially at the bottom, there is some diseased condition of the ducts of the gland. It would be as well to ascertain first, whether it is in one or more quarters of the udder; this could easily be done by milking each teat into a separate vessel, and if it is found to be in one only, the milk of that teat could be thrown away, and the milk from the others used. Regarding treatment, I would recommend that the cow be kept in the house or in a small camp where she would not be hustled about or have to walk too much, and relieve the udder by milking her thoroughly dry three times a day. Examine the udder carefully after it is milked out, and if there is any undue hardness or stiffness about any of the quarters, bathe it with warm water after each milking and rub on some fat or oil over the affected quarter immediately after. Rub the udder with a pressing motion in a downward direction.

"We never could fathom the inwardness of the practice of wet milking. No milker we ever met could give a satisfactory reason for adopting the habit. Every milking we ever examined in which this method was adopted had a decidedly cowy odour that was not present when the herd was dry milked. The habit of the wet milker in placing his fingers in the milk, or squirting the fluid on them direct from the cow, is an all-sufficient cause for the odour. Such milk is nuclean, and no treatment that can be applied to it can sensibly alter its character. A person afflicted with the wet milking habit, for it is a grievous affliction, should be scrupulously neat concerning the things he handles at milking time. A thorough washing of hands should be a cardinal requirement with him previous to beginning the operation of milking, and a vessel containing clean water to moisten the fingers, should be among the chief requisites of the proceeding. Better still, abandon the nasty method by learning the cleanly dry way of milking. The latter has the advantage of leaving the teats uninjured by chaps in cold weather, as well as relieving the milker of the suspicion that he is in some degree responsible for the offensive odour in the fluid. The matter of chapped teats in winter is one that is a trouble to the cow and milker. When the latter is of the wet sort the chap trouble is constantly augmented, for the reason that the cause for it is reinforced at every milking until the cow becomes fractious at such times, and gives an inferior yield in quantity and quality. Wet milking has always been in our thought as filthy milking, and it is barbarous withal. Cows dry milked can be stripped easier and better than by the other method of milking. In a dark stable during the winter, the accidents possible to milk, when the cow is handled by a wet milker, are too suggestive to require description. The best that good care and feed can accomplish can be overcome by the foulness that is inseparable from wet milking."—*Diary Review*.

We read in the Cape Journal of Agriculture that there is nothing to equal tobacco water (using about 2 oz. of tobacco) for animals puffed up with gas (hoven). The tobacco solution should be given in 3 or 4 doses.

The *Dairy Review* draws attention to the trouble that can arise from rusty cans in dairies. Thorough rinsing out with warm water or steaming will not remedy the evil to which special attention must be paid. Milk carried in rusty cans are said to acquire a "beastly smell and a tallowy taste," which even cling to the butter made from the milk. Analyses of milk kept in such showed it to contain "a considerable amount of iron," which we have little doubt must be hurtful to those (particularly young children) who consume the milk.

A cheap and successful remedy for sore teats is zinc ointment, which should be always kept in a dairy.

CAMPHOR.

Camphor is a concrete volatile oil found in different species of plants, and especially those of the Lauraceae order. Camphor of commerce is chiefly obtained from the *Cinnamomum Camphora*. This plant is also known as *Camphora officinarum* and *Laurus camphora*. The camphor laurel is a tall tree with smooth-handsome evergreen leaves; it is much branched and bears small yellow flowers. It is largely met with in China, Japan and Formosa. The wood and leaves of this tree contains the volatile oil which forms the camphor. Most of the camphor imported to Europe is the produce of Formosa; Japan stands second and China third in this respect.

Camphor is prepared by the dry distillation of the chips of wood of the camphor tree. The distillation is carried on by boiling the chips in water contained in wooden vessels and allowing the steam to pass through vessels containing straw dipped in water. The volatile camphor as it passes crystallizes among the straw from whence it is collected. This forms the crude camphor of commerce. The best camphor and the largest quantity is obtained in Japan from trees growing close to the sea, the sea air exerting a beneficial influence in the production of the article. Crude camphor is purified by a process of resublimation, in this the object being to have as much interstitial water in the camphor cake as possible. The crude camphor is mixed in the proportion $\frac{1}{4}$ to $2\frac{1}{2}$ of water, and is heated in a copper vessel which is kept cool by dashing cold water on to it; after about three hours' heating the vessels are opened, and camphor deposits in the form of small cakes found on the sides of the vessel are taken and thrown on to cold water. In Europe camphor is refined in quite a different way, and at one time this process was a secret in the possession of Hollanders, but refineries are now met with in all parts of the continent and in England and America. Crude camphor is mixed with 3 to 5 per cent of slaked lime and 1 to 2 per cent of iron-filings. This mixture is introduced into a series of flasks made of glass, placed on a sand bath and heated by means of metal plates without directly introducing fire, the heating going on for about forty-eight hours. The flasks are then removed from the sand bath and broken by sprinkling cold water on them, when large cakes of camphor formed in the flasks are removed.

India imports about six lacs worth of camphor from China and Japan.

There are two other important plants which yield camphor, viz., the *Dryobalanos camphora* of Sumatra and the *Bhemea balsanifera* of China.
W. A. D. S.

COMMON MORTAR.

(Concluded.)

The third and last ingredient used in the preparation of mortar is sand. The word sand is generally used in a very wide sense, and is applied to any kind of rock or mineral matter in a fine state of division, or to any earthy matter containing a fair admixture of silica. Sand, however, is strictly speaking, pure silica, or oxide of silicon—and its

chemical formula is Si. O_2 . In a free state as well as in combination (as a constituent of rocks and minerals) silica forms about half of the solid matter of the earth. It occurs free in nature in two crystalline forms as quartz and tridymite, and in the amorphous state as opal. Chalcedony, flint and agate are mixtures of amorphous silica with quartz and tridymite. The aluminium, potassium, calcium and iron silicates mixed in different proportions constitute a large number of minerals. The sand used in the preparation of mortar though not quite free from impurities is almost pure quartz sand or silica. Sand is mixed, with mortar to distribute the contraction caused by the slaked lime imparting with the water with which it is combined or mixed and becoming converted into carbonate of lime. The presence of sand in mortar thus prevents, to put it in a practical way, cracks and inequalities in the plaster when it dries. Besides this, it is believed that the silica also gradually combines with lime and that silicate of lime is thus formed, which tends to increase the hardness of mortar as it sets. When evenly and carefully applied to a stone structure, after wetting the bricks in order that they may adhere the more firmly by the mortar, soaking into the pores of the bricks, the adhesion caused by good mortar is astonishing. There are various opinions as to the superiority of some qualities of sand over others. River sand for instance is very generally considered to be the best for preparing mortar, but sea-sand is more commonly used, probably, for one reason, because it is more conveniently obtainable. The practically pure sandy deposits that occur in some situations (geologically, no doubt, old river beds or former tidal areas of the sea) are considered by some to be quite suitable for the purpose of mortar, though others insist on the sand coming fresh from the sea or rivers. Excellent samples of mortar are prepared by grinding down the white sand from these dry-land deposits, and a beautiful marble surface produced on walls by polishing the mortar after application with a smooth rock-crystal. In the preparation of this special mortar, lime made from shells is used.

Ordinarily, coral lime is preferred to lime prepared from lime-stone.

In mixing mortar it is advisable to use two parts of sand to one of lime, for setting bricks in buildings that are required to be particularly substantial; for ordinary brick work and plastering, $2\frac{1}{2}$ of sand to one of lime may be used. But on these practical points I would rather not say anything authoritatively. My endeavour, in this paper, has been to tell you something about the chemistry of mortar, and I trust I have explained my subject with tolerable clearness.

RHEA (RAMIE) AND CHINA GRASS—A DISTINCTION.

In a note on Rhea Fibre by Dr. Watt, in the *Agricultural Ledger Series*, he states that it was Roxburgh who first pointed out certain differences between the plants, called by the above names, as they were grown in China and in India. Other botanists following him also attempted the separation of the two forms. Modern writers, however, regard these as only varieties of a common species. A

few years ago Dr. Watt himself in the first volume of his *Dictionary of Economic Products*, pointed out that whatever views botanists might ultimately uphold, there was a practical consideration of the greatest value that hinged on the controversy. This may be here briefly stated, viz., that the plant that yields the true China grass is met with in cultivation in tracts of country that have a sub-temperate climate, while the Rhea—that is to say, Malay and Bengal stock—occurs in moist tropical regions. The latter is, moreover, a more robust plant, has longer and narrower leaves with white tomentum on the veins of the under-surface only; while the former has large broad leaves with the base subcorlate, concite and densely coated below with adpressed white hairs. Now, if this distinction holds good, it would obviously be a mistake to attempt the cultivation of the temperate-loving plant in the tropical plains of India. From time to time fresh supplies have been imported from China and distributed all over this country, so that India may fairly be characterised as having fully attempted the acclimatisation of the China grass, but done little or nothing towards endeavouring to extend the production of what (for the sake of convenience of expression) we may characterise as its indigenous stock. On this subject Mr. W. T. Thiselton Dyer (Director of the Royal Botanic Gardens, Kew) has written:—

"The point raised by Dr. Watt from the botanical point of view, has been dealt with by Sir Joseph Hooker in the *Flora of British India*. The further distinction in adaptability to climatic conditions, which chiefly concerns planters, has been observed in nearly every part of the world where these plants are grown for fibre purposes. The Ramie or Rhea, properly so called, may be looked upon as the tropical representative of the China-grass, and it is on that account probably better adapted for cultivation in hot and moist countries. Under such conditions it is a very robust plant and yields valuable fibre.

"Whether this fibre is at its best really as good as the best China-grass (*Boehmeria nivea*) is a point that appears not to have been definitely settled. It may turn out to be simply a question of soil or climate. At Kew we find we cannot successfully grow *B. tenacissima* in the open where *B. nivea* itself remains in the ground all the winter, and furnishes in the summer a large crop of vigorous stems. The China-grass may, therefore, give a larger and better supply of fibre under cool conditions, whereas the Ramie or Rhea may do equally well under essentially tropical conditions. The question as regards India may be settled by cultivating under various conditions of climate and soil authentic specimens of each plant, and by instituting, as suggested by Dr. Watt, a careful chemical and microscopic analysis of the fibres yielded by Indian-grown plants of what are known to be the true *Boehmeria nivea* and the true *B. tenacissima*."

GENERAL ITEMS.

The *Mark Lane Express* thus refers to the value of seaweed as a manure:—Seaweed decomposes very rapidly and should either be applied fresh as a top-dressing or ploughed in at once on arable land. It also makes an excellent compost with any vegetable refuse, ditch parings, peat, mould,

etc. The quantity of water which the fresh weeds contain will always restrict its use to land near the coast. It is too bulky in this state to cart far inland, but when partially dried before removal, this objection is in some measure overcome. In this way it is said to be largely dealt with on the west coast of Ireland, the fishermen collecting and half drying the seaweed by exposure to the air, and then selling it to farmers to be carted inland as a dressing for their fields. There can be no two opinions as to the value of seaweed as a green manure, containing as it does all the substances required for the growth of either cereals or green crops. Its ash is rich in salt, potash, sulphuric acid, and phosphate of lime. In fact, chemists tell us that this product of our shores contains at least twice the quantity of these valuable matters as the plants which are ordinarily grown by farmers as green manures. When, therefore, it is intelligently used so as to conserve in addition its most important nitrogenous constituents, seaweed is a fertiliser which is not easily beaten. Consequently, those who are fortunate enough to farm within easy reach of the coast will be very unwise if they neglect to avail themselves of such a valuable manure. Farmers so situated may well betake themselves to the "harvest of the sea" after the harvest of the land is safely gathered in.

It is claimed by those who offer kainit in the market, that the manure is death to all insect life—grub, white-ant, cutworm, &c., &c., and that it is of more importance from a manurial point of view than it is generally considered to be. Indeed, a number of experiments carried out at the Cape have gone to show that when added to farm-yard manure, guano, and other practi-

cally perfect manures, it has a wonderful effect. Kainit is comparatively cheap, and some experiments with it might with advantage be carried out in this country.

The chocho appears to be making satisfactory progress in N.S. Wales. The Editor of the *N.S.W. Gazette* draws attention to the fact that the plants may with advantage be allowed to remain in the ground till they shoot up the second season. After the second season it is recommended that the root should be carefully removed, when it will be found that a large tuber has been formed, somewhat jelly-like in appearance when cut, which can be utilized either by boiling as a vegetable, or fed to pigs, for which purpose it is considered particularly valuable.

It would appear, from the result of a trial shipment of passion-fruit that no very certain or remunerative trade in the article could be expected in England.

We hear of the successful treatment of horses affected with ticks, fowls with lice, and other animals with either of these pests or with scab, by means of sulphur administered internally. The results would appear to be quick and effectual, and the treatment worth trying, but the doses much be regulated and not given at random.

Dr. Patterson, in the *Gardeners' Chronicle*, has recently advocated the cultivation in England of the "aubergine" more commonly known amongst us as the "Brinjal," partly on the ground of its being "an excellent remedy for those suffering from liver-complaints."

* The TROPICAL AGRICULTURIST *

◇ MONTHLY ◇

Vol. XV.]

COLOMBO, SEPT. 2ND, 1895.

[No. 3.]

CINNAMON OF CEYLON.

THE following interesting paper is specially contributed by Mr. PETER DE ABREW, of Colombo, a Fellow of the Imperial Institute:—

The island of Ceylon has always been noted for its cinnamon (*Laurus Cinnamomum*), a spice which finds a ready market in Europe, especially in its southern countries, Spain and Italy. The South American States use it chiefly for incense, and other countries purchase it for chemical and confectionery purposes.

A species of cinnamon grows in the Malabar coast of India, Manilla, Cochin China, Sumatra, Leeward Islands, Bourbon, Brazil, Arakan, and in some parts of Queensland, but the quality of the spice grown at those places is far inferior to that produced in this island of "spicy breezes," and its marketable value does not compare favorably with ours. Ceylon cinnamon was at one time a considerable source of revenue to the Government of the island, but now, owing to the lowness of the price, its value in this respect is comparatively small.

As far back as the time of Augustus Cæsar, the Romans had communication with India, and it is said that they traded largely in cinnamon obtained from Ceylon. A pound of it is recorded to have fetched as much as £8 at Rome. Its value now is about 7½d. per lb.

When the island was invaded by the Portuguese, the Sinhalese king, who lived not far from Colombo, paid an annual tribute of seven thousand pounds of cinnamon to the European invaders. There is no authentic record to show how the native monarchs caused the spice to be prepared, but it is known that they were very jealous of foreigners knowing the *modus operandi*. In 1602 the king of Kandy sent, as a present, some pepper and cinnamon to the king of Holland.

When the Dutch held sway here, they, knowing the value of the spice, paid much attention to the cultivation and production of it. Finding it to be more profitable than they expected, His Excellency Governor Fa'ck in 1670, encouraged the industry and the systematic cultivation of cinnamon. His successors were much benefited by his labours; they reaped rich harvests before they eventually left the island, but did not pay any attention to the preservation of the shrubs.

When the British first occupied the island they found the gardens neglected, and His Excellency Sir Frederick North set about putting matters to rights and encouraged the development of the cultivation.

Cinnamon grows in both the low and the high districts of the island. In the former it thrives well in a loose sandy soil, and its quality is of a superior and more marketable grade than that found at higher elevations. As at present cultivated, it is not allowed to grow to more than the size of a shrub. The slender sticks, from which the bark is to be peeled to make the cinnamon of commerce, are cut down as soon as they reach a height of five or six feet.

There are records that pieces of furniture have been made from the wood of the full-grown cinnamon tree, but that must have been prior to the introduction of the present method of cultivation. The wood is white and light, and is used for fuel. It is questionable whether it would be suited to the making of furniture even if allowed to develop fully.

The leaf, when tender, is dark red or scarlet. As it matures it gets to be deep green. The blossom is a very pretty white one.

The fruit is somewhat like an acorn, but not so large. When ripe it used to be gathered up and put in nurseries for germination, but this is seldom done now. Says an old historian:—"

"It is gathered by the natives for the purpose of extracting oil from it. The process they employ is to bruise the fruit, boil it, and skim off the oil. This they use for the hair and body on great

occasions, and also for burning in their lamps. When mixed with coconut oil it gives an extremely good light. The kings of Candy use it for this purpose, and formerly commanded their subjects to bring them a certain quantity as a yearly tribute. When any ambassadors are sent to these princes they always burn this oil during the time of audience."

There are no records extant, nor information attainable indicating that either the Portuguese or Dutch conquerors manufactured any oil from the fruits. Neither during the early period of the British sway, nor now, is the process practised. Perhaps the mention of it here may lead to some experiments in this line, which may ultimately result in a marketable oil.

The fruits are devoured by crows and other birds, and the propagation of the shrubs in their wild state is due to these birds, which swallow the berries, the kernels of which, not dissolving in their stomachs, are passed out uninjured.

The Sinhalese name for cinnamon is *Kurundu*, and it embraces the following different species—

1. *Pancy Kurundu* or Honey Cinnamon.
2. *Capuru* " " Camphor "
3. *Sevel* " " Soft "
4. *Dawul* " " Fiat "
5. *Kimbul* " " Crocodile "
6. *Veli* " " Sandy "
7. *Nalu* " " Chippy "
8. *Kela* " " Wild "
9. *Pothu* " " Strippy "
10. *Mas* " " Fleshy "
11. *Nika* " " Long-leaved like *Nika*.

Each variety is characterised by some quality more or less closely related to the name applied to it.

During the time of the Dutch and the early British period, the Government monopolised the cinnamon trade, which monopoly was commonly known as the "*Mahabadda*." Government paid every attention to the cinnamon department, as the produce then was the chief source of revenue. The gardens were well protected and responsible officers appointed to supervise the department. These officers were "sons of the soil" of distinguished birth, and were held in the highest esteem by the Government. They had unlimited powers vested in them. The name of Rajapakse Maha Mudaliyar may be mentioned as one of them. J. H. C. makes the following reference to this distinguished chief in the *Saturday Magazine*, published in London in 1835. " When the Dutch slave masters agreed to consider as free, all the children of their slaves, this amiable person not only followed their example, but was even anxious to bestow immediate liberty upon all slaves possessed either by himself or by any of his relatives. He is extremely hospitable to Europeans, a man of extensive information, and the best Sanskrit and Pali scholar in the island. The print represents Raja Pasa in the rich costume of his country, attended by two servants bearing umbrellas. It is copied from a picture kindly lent by Sir Alexander Johnstone." It may also be mentioned here, that this noble chief was given a burial with British military honours, a mark of recognition which no other native gentleman had.

There are hardly any landmarks left now of the old cinnamon monopoly days. The "*Walawwa*" (residence of a chief) of the Maha Mudaliyar Rajapakse, and a store house of the department, are now rejuvenated and are residential bungalows. There are no traces of other buildings left.

Captain Percival, writing in 1805, refers to the "*Maha Badda*" as follows:—

"Each particular district where the cinnamon grows is bound to furnish yearly a certain quantity of cinnamon, proportioned to the number of villages and inhabitants which it contains. The Cingalese, in return for their services, have each a piece of land allotted them, rent free. They are also exempted from other government services, and enjoy other privileges in proportion to the quantity they deliver. Those who are employed to bark the trees are called '*sachalias*' by the Dutch, and by us

'*cholias*.' Over them are placed officers of a superior class, whose business is to superintend the workmen, to take charge of the woods, and to prevent cattle and improper persons from trespassing there. Besides these there is a set of officers of a higher caste called cinnamon *Moodeliers*, whose business is to judge and punish all small offences, and to superintend the different districts and villages where the cholias reside. Over the whole a head-officer, usually known by the Portuguese name of Captain *Cannuillé*, which means Captain Cinnamon. The chief Moodelier receives all the reports concerning the woods and the cinnamon affairs in general from the inferior officers and transmits them to the Captain, who is accountable only to the Governor."

With the depression in the market the department was abolished, and the grounds have been since sold. What was left as crown land is leased out, and gradually its area is also diminishing owing to Government land sales. There are, however, large private blocks still under cultivation, but it is feared that coconuts will replace the cinnamon before long.

There are two crops or seasons for the preparation of cinnamon, called the "*Maha Mosama*" and the "*Kuda Mosama*," or the big and the small season respectively. The "*Maha Mosama*" begins in May and ends in August, and the "*Kuda Mosama*" from the middle of October to about Christmas. During crop time the workmen go in gangs to the gardens and cut down the peelable sticks, which they easily find out from the colour of the leaves, or by making an incision on the bark of the tree. The knife used for cutting the sticks is called the "*kettha*." As the cutters go on from bush to bush, cutting down the sticks and putting them on the ground, another gang of men gather them into bundles and carry them on their shoulders to the "*waduja*" or peeling shed, erected on a central site. When a sufficient quantity of sticks has been cut down and brought to the shed the cutters return, and after the noontide meal they begin peeling operations.

Seated on the ground with outstretched bare legs, which serve as a support for the sticks, they peel the bark off in longitudinal sections with a knife of the shape of a spatula. They are remarkably clever and quick at the work, and they have to be so, or else the bark would dry and the sticks would be unfit for peeling. The peeled sticks are gathered by boys, and stacked away in a heap to be eventually sold as firewood.

The bark that is peeled off is packed into blocks in layers, and put away in a cool place for several hours, being occasionally sprinkled with water. It is then taken out from the blocks, and the outer skin is scraped off with a curved knife. This is chiefly done by women or boys. A small tripod of cinnamon sticks about a foot and half high is made. Another stick about three feet long is run down from the apex of the tripod to the ground. On this stick is placed the bark, which, held by the pressure of the heel, is gently scraped with the curved knife. The bark then gets to be of a yellowish or greenish hue, which depends on the maturity of the sticks from which they have been peeled off. It is carefully put aside for a few hours, and is then made into long quills by fitting in one strip of bark into another and filling up the inside with small pieces of it. The cleanest and the brightest barks are used for the outer covering of the quills, and the rest is used for the stuffing. As the quills are turned out they are gently raised from the ground, and are placed in a stretcher made of coir strings and suspended from the roof. The moisture is thus evaporated and the quills get hardened, and after a few days they are slightly exposed to the sun daily until removed to the market. The ends of the quills are cut off to the usual length. The cinnamon is now ready for sale, and it is bundled into bales of one hundred pounds in weight, more or less.

The unpeelable sticks have their outer skin scraped, and the bark is chipped off. It is dried in the sun and "*picked*" and "*bagged*." It is then sold under the trade name of "*Chips*."

It is usual after the "Kuda Mosama" to prune the bushes, clear and weed the ground, and turn over the soil. This process of giving nourishment to the bushes, secures a profitable crop in the "Maha Mosama" of the following May.

Cinnamon is brought down for sale to the native merchants, who get it first hand. They examine the quality of the bark by smell and taste in a few minutes, and accordingly fix a price for payment—a very easy process, indeed, to what was done in the early days! . . . "The next step after the cinnamon has been carried into the Company's storehouse is to examine its quality. This task is imposed upon the Company's surgeons, and is disagreeable one it proves to be. It is performed by taking a few sticks out of each bundle and chewing them successively, as the taste is the only sure method of ascertaining the quality. The cinnamon, by the repetition of this operation, excoriates the tongue and the inside of the mouth, and causes such an intolerable pain as renders it impossible for them to continue the process above two or three days successively. The surgeons are, however, obliged in their turns to resume it, as they are responsible for the goodness of the cinnamon; it is customary for them to mitigate the pain by eating a piece of bread and butter between whiles." . . .

Before the cinnamon is exported it is sorted into grades of the following assortment:—

No. 1 quality..... 20%	No. 3 quality..... 26%
No. 2 " " 50%	No. 4 " " 4%

Superior and extra superior grades are sold separately. The bales are packed in jute cloth when shipped.

Genuine cinnamon oil is obtained from the chips and cuttings from the quills. Inferior oil is obtained from a mixture of the bark (chips) and leaf. The Dutch paid the greatest attention to the distillation of the oil. They were the first to introduce the present process of distilling. Capt. Percival describes it as follows:—

"The fragments and small pieces which happen to be broken off in packing up the bales are collected and put into large tubs, about a hundred weight into each, with just as much water as is sufficient to cover them completely. This mass is left for six or seven days to macerate and is afterwards poured, by little and little, into a copper alembic, to which a slow fire is applied. The water which comes over, called '*Aqua Cinnamoni*' is received in glass vessels of a peculiar construction, and it is nearly of the colour of milk, and the oil floats at the top of the glass recipient. The process is slowly and cautiously conducted; one tub being usually distilled off in twenty-four hours. Two commissaires (who were members of the Council of Justice in the time of the Dutch) are appointed to superintend the whole of the process, and one of them is always required to be present to prevent the Apothecary who conducts the distillation from smuggling any of the oil. After remaining for some time in the recipient, the oil is carefully skimmed off under the eye of the commissaires and put into large bottles, which are sealed with the Government Seal and brought to the Governor, by whom they are placed in a chest secured in the same manner. The reason of all these precautions is the great scarcity and value of this oil. It is only made at the Company's laboratory at Colombo, and the quantity is much less than can be procured from an equal weight of any other spice."—*Imperial Institute Journal*.

SOME WELL-KNOWN TEA PESTS.

REMEDY FOR RED SPIDER.

At the meeting of the Microscopical Society on Monday night, Mr. Miles read an interesting paper on Tea Pests, which was illustrated by slides. He said:—For many years planters in the various tea-growing districts have suffered in varying extent from the ravages of two well-known pests *viz.*, the tea mite (*Tetranychus biculatus*), more commonly

known as "Red Spider," and the Tea Bug (*Helopeltis thevora*) or "Mosquito Blight." There are several other pests to which I shall refer later on, but as these occur only spasmodically, their visits are not so much dreaded as the first two named.

I shall first proceed to give you a short account of the Tea Mite or "Red Spider" of which I exhibit a coloured drawing of the male species. I am indebted to the work of the late Mr. J. Wood-Mason for the following description of its structure and habits:—"The mite lives in societies on the upper surface of the full-grown leaves beneath an exceedingly delicate web, which it spins for itself as a shelter. This web, ordinarily invisible to the naked eye, is often rendered visible by the deposition upon it of dew in minute globules, which give to the leaves, when bathed in the sun, an indescribably splendid appearance of being sprinkled over with minute diamonds.

"The mites lay their eggs in hollows close to the ribs of the leaves usually. The eggs are oblate spheroids, flatter at one pole, by which they are firmly and broadly attached to the leaves, than at the other, at which their transparent shell is suddenly drawn out into a long and tapering and slightly curled glassy process. They are red, like the Mite itself, and at the close of segmentation on present at their surface a beautiful reticulated pattern, due to the presence of a concentrated and dark-coloured layer of protoplasm around the nuclei of all the cells of the blastoderm. The young arachnids leave the eggs as six-footed larvæ, which do not attach themselves as parasites to the bodies of insects and spiders, as do their distant relations the Trombididæ, nor undergo any of those strange changes which many other mites pass through in the course of their development, but attain to the adult condition by a simple change of skin that usually, though not perhaps invariably, is made on the same leaf as that on which they emerged as larvæ from the egg. The shells of the hatched eggs remain glued to the leaf for some time as microscopically small objects resembling porcelain saucers.

"Preparatory to the final moult the Mites draw all their legs in under them, become perfectly motionless, and appear to change from red to white; but no change of colour actually occurs, the appearance of whiteness which the thin and colourless old skin presents being due to the access of air to the interval between it and the new.

"The male differs from the female not only in size but also remarkably in the form of the body. The former sex is the smaller, and in the shape of the body resembles a plover's egg, being broadly round at the anterior end and pointed posteriorly, while the latter resembles an egg which is similar and semi-circular in outline and nearly equal at both ends.

"The mite injures the tea plant by repeatedly puncturing the leaves and pumping out the liquid contents of the epidermis (? and parenchyma) through the punctures by the aid of the pharyngeal pump with which it, like all other arachnids, is provided. A freshly punctured leaf exhibits a regular and pretty pattern of irregular star-shaped patches of light green worked upon a dark ground. The pale spots are caused by the mites and in the centre of nearly every one of them two most minute punctures can only with difficulty be made out even by the aid of a microscope. In order that the manner in which the punctures are made may be understood it will be necessary briefly to describe the mouth-parts of the animal. These consist of (1) a conical rostrum or beak, the sides of which are embraced and partly formed by (2) a pair of short, stout and jointed palpi or feelers which end in a pair of pincers, and answer to the great claw-bearing feelers of the scorpion and to the first maxillæ of an insect, and of (3) a pair of jaws or mandibles, which do not enter into the composition of the beak above and in front of which they lie but between which of them, on the contrary, there exists a wide interval. The rostrum is not serrated on the edges so as to resemble that of an ordinary tick, as it is in the European *T. telarius*, but on each

side of the minute slit-like opening which constitutes the mouth, and is placed at its lower extremity, it bears two minute, curved and probably moveable spines. At the end of the short fixed arms of the pincers of the feelers open the ducts of the salivary glands, which furnish the viscid secretion wherewith the animals spin their protective webs. The mandibles or jaws are a pair of long and delicate needle shaped rods which ordinarily lie retracted out of sight into their sheaths ready to be shot-out with lightning rapidity. It is a remarkable fact that the sheaths, which appear to be none other than the basal joints of the mandibles, retain their primitive embryonic distinctness throughout life and do not coalesce in adult life so as to form a single common sheath as they are said to do in *T. telarius*. It is more probable that the leaves are punctured by these mandibular needles, and that the two little movable spines placed at the sides of the rostrum serve only to keep the sucker-shaped elevation around the mouth closely applied to the wounded spots in order that the buccal pump may act as effectually as possible, than that the latter perform the double duty of lancets and retentive hooks.

"I propose for the tea mite, which would appear to be unknown to science, the name of *Tetranychus bioculatus*, in allusion to its double (really two pairs of eyes)."

The tea mite is most destructive in the early part of the season, and increases at such a rate if there is a drought that a tea garden appears of a dull brick-red colour even when viewed from a distance. As soon as the heavy rains set in it disappears from the eye, but considerable numbers must be lying dormant as they quickly reappear if there is a break in the rains accompanied with hot sun.

The most important matter so far as planters are concerned is the discovery of an effectual remedy against this pest, and I take the following from Indian Museum Notes. Vol. 3. No. 1. Although experiments have not been conducted on a large scale, and therefore further tests are necessary before pronouncing a definite opinion, it would seem that a most valuable discovery has been made:—"A very complete and interesting series of reports by Mr. G F Playfair, on the results experiments conducted in Cachar upon the subject of the sulphur treatment or red spider, have been furnished by Messrs. Barry and Co. Five tons of refined flowers of sulphur were sent up to the garden for application as a remedy against red spider (*Tetranychus bioculatus*), which is one of the tea planter's most inveterate enemies. The sulphur was applied over an area of 138 acres, and the results appear to be so successful that the treatment seems likely to prove of the very greatest value.

"The method adopted was to put the sulphur into bags made of loose woven cloth and sprinkle the tea bushes by simply shaking these bags over them. In some cases the bushes were first splashed with water, but in localities where water was not easily obtainable the sulphur was applied without any previous watering. The sulphur was found to adhere fairly well, even on dry bushes, in spite of the high wind which blew both at the time that the sulphuring was going on and afterwards. The average cost of the treatment has been estimated by Mr. Playfair at Rs 8-4 per acre, including the price and freight of the sulphur and the cost of application. The sulphur was applied in the first instance at the rate of one hundredweight to the acre, but a large area was afterwards sulphured at the rate of two hundredweight to three acres, and an experiment was made over eleven acres of sprinkling a mixture of one part of sulphur with two parts of sifted lime. The last application does not appear to have been so successful as the undiluted sulphur. Besides destroying the red spider most effectively, Mr. Playfair is of opinion that the sulphur treatment is also useful against the mosquito blight (*Helopeltis thewora*) which is perhaps an even more destructive pest than red spider. Upon this point it will be useful to make further observations, as mites (such as red spider) are the only pest against which sulphur seems to have hitherto been successfully used in other parts of the world.

"It may be noticed that washes made of soap and sulphur combined have been recommended both in the United States and in England for use against mites like the red spider. The wash is sprayed on to the plants by means of a force pump fitted with a nozzle to give a very finely divided spray. This method of applying the sulphur may possibly prove cheaper and more effectual than dusting it on to the leaves, though Mr. Playfair's experiments with sulphur in powder seemed so successful as to leave little to be desired. Compounds of soft soap and sulphur can now be purchased in England ready made, so as only to require the addition of water."

It is well to know that this insect can be of use to man, as the following curious note will show:—

"A note written some years ago by Mr. M. H. Clifford, late of the Forest Department, has recently been found among some old papers in Dehra. According to this note native hakims extract a kind of oil from the large velvety red mites (*Tetranychus sp.*) commonly known as red spiders (*Birbhoti* in the North-West Provinces. The oil is sold for medicinal purposes at a high price, and even the insects themselves fetch as much as a rupee per tola. It will be interesting to learn if anything further is known of the medicinal virtues attributed to this mite."

I have been searching through various old records to find out the earliest reference to these pests, and it would appear that in the year 1868 attention was first drawn to the subject. This date is also confirmed by enquiries I have made of these in a position to know when visiting the various tea districts. I shall now give you two extracts from the Proceedings of the Agricultural and Horticultural Society of India for 1869 and 1874, respectively.

I think there can be no doubt that these refer to "red spider" and "mosquito blight," the black spots of the latter being at first mistaken for a fungus. It is extremely probable that these pests were in existence for some time prior to the year 1868, but their depredations must have been on such a small scale as to prevent any serious notice being taken of them. Here is an extract dated 20th January, 1869:—

"The Secretary stated it would probably be in the recollection of some of the members present that Dr. Thomas Anderson had kindly offered to send to the Rev. M. J. Berkley certain specimens of tea leaves from Assam affected by a kind of black smut, and of blighted tea leaves from Cachar, both which were submitted at the monthly meeting in September last. Dr. Anderson had recently received a reply from Mr. Berkley, of which he now submitted the following extracts:—

"(1.) From Cachar I do not find any fungus. The spots are like those which occur in the genus *Depazea*, but there is not a trace of perithecia and they may arise either from some constitutional condition or from some peculiarity of weather. In many of the spots the whole of the parenchyma has vanished, and there is scarcely anything left in the centre, except the discoloured cuticle. The spots in this case are quite transparent when held up to the light. (2.) Black Smut. I have in vain hunted for perfect fruit. The fungus belongs, as far as external characters go, to Leveilles genus *Asterina* but it is different from any species in my Herbarium. I should be glad to have specimens gathered early in the season, and then I may perhaps tell you whether it is undescribed or whether it really belongs to *Asterina*. (3.) One leaf has incipient *asterina* without any perithecia, and the other has been sprinkled with the eggs of some mite, but I should not think with the red spider of our hot-houses.

"It would be well to get me a fresh supply of diseased leaves from one or more estates, and I shall have great pleasure in examining them. It is very desirable to have further specimens of No 1. The fungus in No 2 is superficial, and belongs, as I believe, to a genus very widely spread, and requires damp for its development."

Dr. Anderson mentioned that since he had seen the leaves from Cachar to Mr. Berkley he had himself observed the diseased form of leaves (genus

ally) called "blight" by the Cachar planters) on some tea plants at Darjeeling. He carefully examined the diseased bushes, and could find no diseased leaves in any other stage of the disease but that forwarded to Mr. Berkeley. He, however, found several leaves with a small insect lying under the epidermis of the leaf, and he supposed that this insect must have devoured the parenchyma and caused the transparent spots ("blight") with which the leaf was covered. Dr. Anderson exhibited some of these leaves with the insect in position; also a few leaves with minute eggs of an insect, collected in patches on the surface of the leaf. Dr. Anderson said that he found many of the indigenous plants in the forest adjoining those tea estates in which blight had been observed were also affected. He particularly noticed *Gordonia Walliehi* a ternstroemiaceous plant nearly allied to tea a *Polygonum*, an *Osbeckia* and *Moesa Montana* as suffering much from the blight. Dr. Anderson showed young leaves of *Chiuehona Saccirubra* from a tea estate at Darjeeling; these leaves were covered with blight spots.

Since the meeting was held, Dr. Anderson has examined the insect with the microscope, and finds that it is the pupa of an insect, probably a beetle, and that it lies under the epidermis. Probably the destruction of the parenchyma is caused by the larva, and thus the almost microscopic eggs on the other leaves may belong to the same species.

The Secretary submitted the following extract of a letter from Mr. Grote on this subject:—

"Now about your tea bug, which on referring to your Gardener's Chronicle, 21st February you will find I brought before our R. H. S. Scientific Committee I now enclose a letter from Mr. Moore which expresses an opinion in support of Westwood, and assigns the bug to *Helopeltis*, a genus described by Signoret, who has figured a Ceylon species I have pointed out to Mr. Westwood that his proposed remedies are hardly applicable to large acres of plantation. I hope that the pessimist view of the bug's ravages may not be borne out by results. Similar insect visitations have occurred and again disappeared in the coffee plantations of Ceylon and the Wynaad."

The following are Messrs. Westwood and Moore's letters above referred to:—

"It is well known to me," observes Mr. Westwood "from the very remarkable upright horn on the scutellum. It belongs to the Cimicidae family (Cimicidae) and is closely allied to a species which sucks our chrysanthemum buds and greatly damages the blooms. The only chance of checking it seems to me to ascertain the place of deposit and destruction of the eggs if possible. Another plan (which has been suggested for checking the ravages of the Vine Tortrix) is to burn green wooks to windward of the plants. I should also think that if bird lined strings were stretched over the plants, great numbers would be trapped, or light bags with the insides coated with some sticky material run along the top of the plants, like fishermen's landing nets, the flies would be thrown and caught in the nets."

I have made several references to "mosquito blight," and I shall next proceed to give you a short account of this insect, which is even more destructive than the former pest. It is so named from its resemblance to the ordinary mosquito, although there is no relationship between them. It punctures the leaves and absorbs the juices leaving nothing but the upper and lower epidermis sticking together. After a time the leaf appears covered all over with brown spots which, however, soon change to black. The effect of this is to retard the growth of the plant, and although it makes a vigorous fight against its enemy it slowly succumbs to the attack.

This pest makes its appearance early in the rains, and gradually increases in numbers until the month of September, when it is in full force. By the end of this month many gardens in the Terai have to stop manufacture, as the tea bushes have entirely ceased to grow. Its effects are felt more or less in all the tea-growing districts, but its ravages are greatest in the Terai and lower Darjeeling Hills.

The first to draw attention to this particular pest was Mr. S. E. Peal, a well known planter in Assam, whose description of it appeared in the Proceedings of the Agricultural and Horticultural Society of India for 1872. There are eleven different species of this insect in various parts of the world, but only one so far has been recorded in India.

Another blight, known as "green fly," is reported from various places, but appears to be most prevalent in Darjeeling. It attacks the young shoots and prevents their opening out and development, whereby the outturn is considerably diminished. On the other hand, this retarded growth undoubtedly improves the quality of the yield, as the tea made from such leaf is always prettier in appearance and more flavory in cup and usually realizes extraordinary high prices. This pest therefore cannot be looked upon with the same degree of disfavour as the previous two.

Scale-insects made their appearance in the Kangra Valley and Assam in 1889, as several specimens were sent to me. I will read you a short note which I wrote at that time:—

"Since 1868 when they first began to attract attention, the family of Scale-insects have made themselves notorious as one of the most dreaded and destructive of all the known enemies of plant life. First noticed in Australia, they travelled on to Cape Colony, and finally appeared in California, and as soon as they had established themselves in a new district proceeded to spread in all directions. In Cape Colony and California the principal sufferer was the orange tree, and so great was the damage done, that many owners of orange groves were ruined. In Ceylon, the Scale-insect has done immense damage to the coffee plant, and many plantations have been closed in consequence.

"In order to mark its coming of age, so to speak, it has turned its attention to tea, and already it has done no inconsiderable amount of damage to the bushes. It first appeared on two gardens in the Kangra Valley in the early part of this year (1889), and has since been reported from Assam, but there is nothing to show the manner of its introduction in either district. There is reference in part I. Vol. I Indian Insect Pests, to a new cocoid found on *cinchona* in Sikkim which matures about April, and as the Scale-insect was first observed on tea about that time, there may be some connection between the two.

"There is little to describe about the actual insect, as it has not yet been observed in a free state. When a plant is attacked it soon becomes covered with little brown scales about one eighth of an inch in diameter, which adhere closely to the stem of the plant, but can be easily removed by inserting the blade of a penknife under them. Under the microscope these appear to be cases only, as there is no structure apparent, and in several I have detected a small puncture through which I imagine the imago escape. The insect appears to be most active in bright weather and almost disappears in the rains. Some specimens forwarded to me in November last were of quite a different character to those described above, the scale being soft and pulpy and covered on the outside by a thick coating of soft white waxy-looking substance. This may prove to be the female.

"Its effect on the tea plant is somewhat similar to that caused by the tea bug, but more marked, as the Scale-insect appears to absorb the juices of the plant through the stem, and the bush immediately begins to sicken, and would soon die down unless prompt measures were taken. The most effective remedy is the kerosine emulsion which has been used with very good results in the United States and Ceylon, against the form of Scale-insect attacking the orange tree in the former and coffee in the latter country.

"The formulæ for preparing the kerosine emulsion recommended by the U. S. Department of Agriculture, were reproduced in Vol. VII., Parts II. and III., of the Society's Journal.

"I have already discovered a parasite of the Scale-insect which closely resembles *Coccophagus cali-*

fornicus, figured in the periodica' Bulletin of the U. S. Department of Agriculture, division of Entomology, for March 1889. Though it may take some time for it to develop properly in order to be an effective enemy of the Scale insect, it is satisfactory to know that it is in existence.

"This short note is merely intended to draw attention to a subject which may occupy a prominent position in the near future. Though not wishing to appear as an alarmist, I fear that tea is threatened with a now danger, which may do more harm than any of its predecessors, judging by what has happened in other parts of the world. I would seriously impress on all connected with this great industry, more especially managers of gardens, to be on the alert, and at the first indication of this pest, to adopt remedial measures at once to stamp it out, otherwise there is no telling what the consequences may be."

Various other pests in the shape of white-ants, caterpillars, beetles, moths, etc., attack the tea plant from time to time but usually over limited areas and at irregular intervals. Although their visits cause a good deal of trouble and annoyance to the gardens concerned, besides occasioning loss, yet the amount of damage done is so small in comparison with the former ones that they do not attract much attention.—*Indian Planters' Gazette*

TEA IN THE UPPER CHINDWIN.

The following is a list of the villages of the Upper Chindwin which export tea seeds, the inhabitants of all being Shans:—Kaungkan, Tingin, Kawya, Maungkan, Tason, Onbet, Mainwe, Tamante, Malin.

Tradition says that these *kins* (clearings) were cleared and planted some 200 years ago, the seed having been brought from Pa'aung (Northern Shan States). No one has ever heard of wild tea in the jungle; nor have I ever come across wild tea in the forests in spite of having always kept a very sharp look out for it, and it is my opinion that the tea plant is not wild, at any rate west of the Irrawaddy (by the way, wild cinnamon [*C. Zeylanicum*] has been found by me fairly common in the evergreen forests of the Uyu).

The gardens were originally planted for the sake of the leaves, that is, to make *letpet*, the so called pickled tea of Burma. However, some 20 years ago there arose a demand for the seed, at first intermittent, but since British occupation steady, and this has now become the main source of income to the owners, though the pickled tea is still collected and made as of old.

The first thing to be done in planting a *letpet-kin* is to find the right kind of soil, what is known as *myeni*, literally red earth. In this soil the tea-tree flourishes to perfection; the look of this earth is very characteristic, being a light red or buff coloured friable loam, which occurs in patches, and wherever these patches of red earth are found on the banks of the Chindwin there villages have been built and tea planted. The jungle being cleared of all brushwood and undergrowth, 3 or 4 seeds are dibbled into holes, the holes being either 2 or 4 cubits apart. The object of dibbling in more than one seed is to guard against blanks: however, all the seeds that germinate are allowed to grow. After the plants come up all the tending the gardens receive is periodical clearing of grass, small plants, weeds, and brushwood; the ground is never hoed, nor are the plants pruned, except when the ravages of a parasite known as *chibawng** have become so extensive as to kill the portions above ground, the dead tops are then hacked down with the ordinary Burmese *dama*, the plant at once throwing up stool shoots or root-suckers which in three years take the place of the old cut down plant. The small plants become large enough to give a crop of leaves in 3 years if the *kin* is kept free of jungle, but not till 5 years if the garden is dirty. Seed is borne when the plants are 8 years old, but they do not come into full bearing till 15 years of age, the normal existence

of a tree being 40 to 50 years if not attacked by the parasite mentioned above. Some trees last longer than this, but old trees do not bear such good crops of seeds or leaves as middle-aged ones, being usually stagheaded, and are generally cut down, their places being taken by vigorous shoots thrown up by the stools, some stools as large as 3 feet in girth being seen. A light shade is beneficial to the plants and lessens the labour of keeping the gardens clean, as the shade kills out the rank grasses such as *thekke*, &c, which spring up if there is no shade. Heavy rains are not good for the seed crop, as the seed drops off without ripening; however, if the seedcrop is poor the leaf-crop is usually good and *vice versa*.

Each house owns from one to three *kins*, the various properties being bounded by rough cactus hedges.

As already stated there are two kinds of crops—the leaf-crop and the seed-crop, (a) *The leaf-crop*.—The trees flush three times a year in—(1) Tagu to Kason (April—May); (2) Wazo to Wagaung (July—August); and (3) Towthalin to Thadingyut (September—October). Of these three flushes the first gives the best leaf and brings the highest prices. The method of plucking is to pluck the whole shoot except one leaf which is left. Thus if there are three leaves in a shoot the shoot is nipped off just below the second leaf. Each owner then takes his crop of leaves and throws it into an iron cauldron* full of boiling water; it is left in this water till the leaves turn a yellow colour; the water is then thrown away and the leaves rolled by hand on mats; it is then ready to be sold to traders, who take it away either packed in bamboo crates or in the internode of the *myetsungye* bamboo (*Dendrocalamus Hamiltonii*). If one wanted to keep this tea it must either be kept buried in the ground, or the crates and bamboos must be kept in water. Kawya village, which has the largest extent of *kins*, makes on the average 20,000 viss of *letpet* annually. The price at the village for the produce of the first flush is usually Rs. 16 per 100 viss, for the other and later flushes Rs. 12-8-0 per 100 viss.

The seed-crop ripens in October and November; it is then collected, dried in the sun, and sold to Burmese traders, who come up for it. The trader shoots the seed into the bottom of his boat, the bottom being roughly lined with mats, and then takes it down to Kettha or Tonhe; where he sells it to the native agents of "tea-seed chiefs."

The price of the tea seed on the garden varies from Rs. 3 to Rs. 10 per basket, but to understand the method of buying the seed one must bear in mind that the trader, always a Burman, comes up in January or February to bargain for the seed crop of the following November. If possible, the trader makes a contract that the owner will sell him all the produce of the garden for a fixed sum per basket. Thus in January 1894 the Maungkan villagers contracted to sell all their seed at Rs. 5 a basket. The trader then advances on the condition that, if the villagers cannot pay him back in tea-seed, they must pay him 100 per cent. on his money. If the trader cannot get a contract for the whole crop he always manages to make advances for a certain proportion of the crop on the same condition. Thus, this year, all the villagers of Kawya have had advances on the condition that they pay back next November (in seed), each basket to be counted as Rs. 3. Any left after the villagers have paid back their advances usually brings double the contract price. The trader then hires boats and takes the seed to Kettha or Tonhe, the rate of boat hire being from 2 annas to 4 annas per basket according to distance to Kettha. He will sell to agents of the tea planter for an average of Rs. 17 per maung (a maung—1 basket 10 pyis or 26 pyis). This is practically the end of the business as far as Burma is concerned, as from here it is carried by Chin or Manipuri coolies in baskets, Scotch fish-wife fashion, to Manipur. No tax is collected or any transit dues exacted anywhere along the route. The Chins are

* The ordinary De of Burma, exactly the same as that which catch boilers use for catch boiling.

* *Loranthus Sr.*

said to carry a load of one basket and a quarter, the average weight of one basket being 14 viss, and get Rs. 5 to Rs. 6 for the journey.

It will be seen that as in most trades the middlemen are the best off and absorb most of the profit. The Burman trader makes, even if he does not go in for the advance system, over cent. per cent, and of course his profits are doubled if he does. No Thaungdut coolies or men in any way are interested in the trade, the development of which is solely due to the Bengalis and Burmans. I believe Messrs. The Bombay Burma Trading Co. are experimenting as to the feasibility of sending seed to Assam, Calcutta; of course if they succeed that will settle all matters of transit dues both for Thaungdut and Manipur. I see no reason why the Bombay Burma Trading Co. should not succeed as no care is taken to prevent shaking the effects of damp or of heat, is taken, any way prior to the seed reaching Manipur, by the present method which seems to be as unscientific as possible, and yet the tea-seed has, as is well-known, a first class reputation in Assam for germinating properties. The tea-seed experimented with, however, I would recommend being bought at any cost in November; the best way, of course, would be to advance money on the following season's crop, this system being the custom; or else only the leavings and old seeds which have been lying about can be got, which naturally would not have the same germinating power as fresh ripe seed.

From what I saw of the gardens they were wonderfully healthy considering the little care taken with them, as, with the exception of the parasite referred to, the trees all seemed clean, vigorous, and full of leaf. I should say tea-planting with European methods would be a great success if only the labour question could be successfully dealt with. That once settled, all a planter who proposed planting in the Chindwin would have to do would be to prospect for red earth, and from my own experience of the forests I am sure I have come across several tracts of similar earth to that on which the tea is grown.

There are two other points to be touched on, viz, a "maung" weight is spoken of above; this I am pretty sure is only a corruption, or rather the Burmese pronunciation of the word maund. I was informed that a "Maung" weighed about 22½ viss (viss=3.68 lb.) and that would bring the "Maung" to about 80 lb, i.e., the Bazaar maund of India.

2ndly, I believe some people still doubt that "Letpet" the pickled tea of Burma is made from *C. Theifera*; the plant in the Chindwin and Katha is undoubtedly *C. Theifera*, and is not *Elocendron*; and it seems absurd that such a point should need proof, considering most of the gardens in Assam have had all their extensions for some years planted with plants grown from Chindwin seed. Besides this Mr. Oliver sent specimens in 1892 to Calcutta which were identified as *C. Theifera*.—*Indian Forester*.

C. W. A. BRUCE,

Div. Forest Officer, Upper Chindwin.

THE CULTIVATION OF CHICORY IN BELGIUM.

The Belgium Government considers chicory a perfectly legitimate drink, on an equal with coffee and chocolate, for the adulteration of coffee, chicory, and chocolate, and the sale of such adulterated articles, are prohibited by law. All varieties of chicory, according to Jussieu, are indigenous to the European continent. The United States Consul at Ghent says that all these varieties may be traced back to the *Chicorée sauvage* (*Cichorium intybus*) and the *Chicorée endive* (*Cichorium endivia*). The former, commonly called small chicory, is especially cultivated for its leaves, which make an excellent salad. This wild chicory, so-called, is a very common perennial plant in Belgium, and is frequently cultivated in gardens. It has a fusiform and taproot; its stalk grows three feet or more in height. It is abundant along the roads and in the pasture lands of Belgium; in the gardens it develops much more, the height of the stalk often exceeding six feet, and its leaves are larger. The plant is sown in the spring

sometimes in beds, but more often along the borders. It only requires watering, and ordinary tilling and weeding. The green leaves only are ordinarily employed in medicine and domestic economy. For this purpose it is necessary to cut them from time to time, thus inducing new and more tender leaves to shoot forth; the stalk, too, must be frequently cut in order to delay as much as possible the florescence. Wild chicory is also an excellent fodder plant. Its most valuable property is its ability to grow in the worst soils, even such as are barren, chalky, or clayey. Almost all cattle eagerly hunt for the plant, and cows, which at first dislike it, rapidly become accustomed to its taste. By reason of its bitterness, it acts as a tonic, and animals who feed upon it are much less exposed to cutaneous diseases. Swine are especially fond of the roots. Among the varieties of wild chicory just described, the most important is chicory with large roots, known as "coffee chicory." It is a perennial plant, whose root, by torrefaction, acquires a bitter flavour, and an aroma, which is not unlike that of sugar converted into caramels. This is the variety which is daily increasing in commercial and industrial importance. In Belgium it largely replaces coffee in the lower ranks of society. West Flanders, in the district round Courtrai and Roulers, is its principal home. The method of its cultivation greatly resembles that of the beet. The seeds, which are very small, are sown by a hand drill, three rows at a time, during the months of April and May, and they are sown at a distance of about 15 inches apart. There are several varieties, or, rather subdivisions, of this variety. The two chief ones are known as the "wide-leaved chicory" (*à larges feuilles*), and the "eel-headed chicory" (*frisées à têtes d'anguilles*), of which the latter is considered the best. The seed is obtained by replanting in the month of March, the old stalks being dug out during the preceding autumn. In the course of a few weeks these go to seed. Each plant gives about 30 grains of seed. Another estimate gives 530 lb. of seed per acre. A temperate climate is required, and a vigorous soil, even slightly clayey, produces the best chicory with the heaviest roots. Sandy soils also are good, but the roots are generally lighter. The soil must be ploughed several weeks in advance. About 160,000 plants are raised per acre. A crop of from 11 to 14 tons of green roots is produced per acre. The harvest takes place in October and November. The roots must be immediately washed and dried, and then may be preserved for fifteen to eighteen months. The seeds, if put in a dry place, may be kept for seven years. The plant has no known disease, but is subject to the attacks of a worm which eats the roots. The leaves of the plant generally grow in a small tuft, are narrow, and do not exceed ten or twelve inches in height. The roots are carrot-shaped (slightly larger), dark grey in colour on the exterior, and nearly dead white in the interior. The roots are dried on perforated racks in kilns by means of coke fires, and are then cut by machines into small pieces. These are known as cassettes, and chicory is generally exported to America in this form. Afterwards it is ground and sold in powder under the name of granulated chicory. Only very recently a Royal decree has been promulgated in Belgium declaring the essential qualities of pure chicory, requiring all packages to be legibly marked with the name, and forbidding, under heavy penalties, the sale of any adulteration as the genuine article. A similar law exists respecting coffee.—*Journal of the Society of Arts*.

CAMPBOR AND CHINESE VEGETABLE PRODUCTS.

The reports of the British Consuls at the various ports of China and Formosa, that are now being issued from the Foreign-office, contain much that is interesting on the natural products of the countries in relation to the late war. Thus, for instance, with regard to the camphor supply, the trade in which, it was feared, would be seriously injured, even if the supply were not actually stopped. Consul Hurst,

of Tainan, gives the following sketch of the business done in camphor. Last year, 1894, he says, shows a satisfactory development. 13,971 cwts. having left the port, as gained 7,530 cwts. in 1893. From January to July the prices ruled rather low. In the latter month, camphor fetched, in the Hong Kong market, only £3 2s. per cwt. In August, however, on the outbreak of the war between China and Japan, there was a boom in the market, and the price rose at one time to £5 14s. per cwt. This was due to apprehensions entertained in Hong Kong of a blockade of the Formosa ports. The market quickly recovered from this abnormal figure, but prices were well maintained throughout the remainder of the year, the average price being about £4 per cwt. During the year, two more British firms (Parsees) have started in the business. There are now five foreign firms in Tainan, engaged in the camphor trade, namely, four British and one German.

In the course of the past year new districts have been opened up at Antoapo, Chan-liu-Ping, and other places in the Kagee district. An attempt was made last spring by the Kagee Magistrate to compel foreigners to convey camphor produced in Chan-liu-Ping by a circuitous road on its transit to the coast, instead of by another direct road, which shortened the journey by two days, on the plea that the former offered greater facilities for official inspection; but the Taotai, on being appealed to, at once admitted that foreign merchants were at liberty to convey their goods under transit pass by any route they pleased. The camphor produced is all brought down under transit pass; 71 passes were taken out in 1894, as against 57 in the previous year.

The new camphor forests are situated on the borders of savage territory, and the Chinese operatives, when cutting down trees and camphor distilling, are liable to attack by the savages. The hazardous nature of the occupation suggested to the Chinese authorities the levy of an impost, known as the "fang fei" or protection tax, on all camphor produced to pay for the maintenance of frontier guards to protect the camphor workers. Recently, owing to the exigencies of coast defence, the camphor districts have been largely denuded of troops, whose services were desired elsewhere. The continuance of the levy caused a certain amount of discontent on the part of the foreign merchants, as they said that these operations received merely nominal protection. Some outrages by savages had, at the time of writing, been reported from places in the district of Chip Chip. The camphor stores had been destroyed and the operators murdered, and the savages had escaped punishment.

In Chinkiang we are told that the chief item among native imports is wood oil, obtained from *Aleurites cordata*, which is invaluable in China for preserving or varnishing woodwork, and was imported to the value of over £150,000, though it is not exported to Europe.

A branch of culture, which, it is suggested, is open to fruit growers, is the extended growth of a kind of hawthorn, whose fruit is known in the north of China as "Sh'an ch'a." It is described as having a very agreeable, delicate, acid taste, and can be used either stewed, dried, or made into a jelly. Though largely consumed in Chinkiang, it is more especially a native of Shang Tang and Corea, and appears to be the *Crataegus pinnatifida*, Brongn. The plant is described as a very ornamental one in spring.—*Journal of the Society of Arts.*

LADY BIRDS IN THE KONA COFFEE DISTRICT.

KALLUA, KONA HAWAII.

June 6, 1895.

C. D. MILLER, Esq., President Kona Planters' Association.

Sir:—Your committee appointed to investigate the blight on coffee and the work of the lady bird *Cryptolaemus*, beg to report as follows: About three years ago this blight, a species of *Pulvinaria*, made its first appearance in Kona, along the nauka government road at Hohnalea. Thence it has spread and is still increasing and spreading until to-day,

it has possession of about one hundred square miles of valuable land. It not only infects coffee, but also a large variety of trees, shrubs and herbs, including even the taro.

Nearly a year ago we received the first colonies of the lady bird *Cryptolaemus*, and during the five succeeding months many thousands were sent to us by the Hon. Joseph Marsden, Commissioner of Agriculture. All of these colonies, with the exception of a few that were placed among the guava and ohia-ai trees, were liberated among our young coffee trees, which were then already suffering greatly from the effects of blight.

After the lapse of so many months, even allowing for a scanty reproduction during the winter months a decided increase of the lady bird should be noticeable. Instead of that, in all places where there was no restocking, the lady birds are practically extinct, and the blight has increased to a frightful extent, particularly upon cultivated coffee.

On the other hand the lady birds have found a more suitable habitat upon the guava, and since the beginning of summer have been increasing freely in those localities where colonies had been liberated upon coffee in their vicinity, and it is an undoubted fact that the larva feed upon the oggmasses and thus help to check the increase of the blight. The fact has recently been observed that the scaled off, curled up bark of the guava affords such favourable shelter for pupation, seems to be largely the cause of the increase of the lady bird amongst those trees. To the fact that the coffee tree does not afford such shelter is possibly due the apparent dislike of the lady bird to these trees, and the suggestion that artificial shelter be afforded is in this connection of value. That the lady bird is feeding and increasing in localities makes it a valuable addition to the already existing enemies of *Pulvinaria*. The history of its work so far, however, and particularly its long winter rest, makes it very unsafe to say, at this time, that it will afford speedy or permanent relief to coffee planters, and we do not advise that we rest satisfied with what has been so far attained, but that while acknowledging the valuable work that has been inaugurated by Mr. Marsden, we should urge upon him that further efforts be made with the view of discovering other enemies of the *Pulvinaria* to reinforce such as have been already introduced. Whether, in the meantime we resort to spraying or to constant restocking with lady birds from the guava, we trust that every member of this association will agree with us in concluding that a well managed coffee plantation in Kona will still prove a profitable investment.

[Signed]

WOLDEMAR MULLER,

Chairman.

—*Planters' Monthly.*

SEAWEED AS A MANURE

"There can be no two opinions," a writer in the *Mark Lane Express* says, "as to the value of seaweed as a green manure, containing as it does all the substances required for the growth of either cereals or green crops. Its ash is rich in salt, potash, sulphuric acid, and phosphate of lime. In fact, chemists tell us that this product of our shores contains at least twice as much of these valuable matters as the plants which are ordinarily grown by farmers as green manures. When, therefore, it is intelligently used so as to conserve in addition its most important nitrogenous constituents, seaweed is a fertiliser which is not easily beaten. Consequently, those who are fortunate enough to farm within easy reach of the coast, will be very unwise if they neglect to avail themselves of such a valuable manure. Farmers so situated may well botake themselves to the 'harvest of the sea' after the harvest of the land is safely gathered in." In Australia, especially where seaweed is used, it should be either quickly ploughed in or made into a compost with any vegetable refuse, leaves, stable litter, etc., and soil if laid upon the soil and allowed to dry before being covered its decomposition when it is ploughed in is much less rapid.—*Australian Agriculturist.*

THE CEYLON CINNAMON TRADE IN
DAYS OF OLD :

AN OILIO.

In going through the old East India Company's Letter Books at the India Office, I have come across some interesting passages relating to

THE CEYLON CINNAMON TRADE,

and the attempt of the Company to introduce THE CULTIVATION OF CINNAMON INTO ST. HELENA.

I have copied the passages *verbatim et literatim*: the first is as follows:—

London 28 Januarie 1660 [1].—Our Agent and Factors at Fort St. George.— . . . We have in several of our letters both to you and our Factors, in ye Bay, desired that you would procure for us, as much cinnamon of any sort as you could get, and being still very desirous of ye Comoditie, wee have taken into our consideration, the setting of a Factory for that purpose on ye Island of Zeilon, and have concluded, in regard of ye vicinity of your Residence, to ye said Island, that it will be most proper for you to undertake this negotiation. We doe therefore give you Commission and desire you seriously to consider how it may be put in execution, and brought to effect, and to send some fitt and able person to treat with ye King or his deputies for ye setting of a comodious Factory on ye Island, and that you draw up such comission and Instructions, as he may thereby be enabled, to capitulate upon sure and profitable termes. Wee leave this affaire, to your prudent, and serious management, and desire you to proceede therein with all diligence, And not to be disanimated, or beaten off, from this or any other hopefull, and profitable Designe, by ye Dutch whoe wee believe will not now dare, to disturbe us in our trade, or abuse us as formerly they have done, it having pleased ye Almighty to restore our *Kings Majesty*, by whose royall favour and assistance, wee doubt not but to recover from them due satisfaction for what is past, and a good settlement with them in trade for the time to come. However, if it should so happen, that ye said Dutch shall at any time hereafter, interrupt you in your lawfull way of Commerce at any place, or bring any losse, or damadge upon us, wee require you to protest fully against them, for ye same, and to drove up ye damadge to acerteine some which having attested under your hands, let it be sent home unto us, and wee doubt not but to receive full satisfaction from them.

Soon after the above was written (viz. in June 1661) the Marriage Treaty between Charles II. and the Infanta of Portugal was concluded by one clause of which it was agreed, that if either Great Britain or Portugal should ever take Ceylon from the Dutch the cinnamon trade was to be divided between the two nations. The next extract is as follows:—

London, the 20th. February 1661 [2].—Our Agent and Factors at Fort St. George.— By our ship *Discovery* wee advised you of our desires to have as much Cinanamon [*sic*] sent us home as might be procured, and to that purpose we Ordered you to endeavour the setting of a Factory upon the *Island of Zeilon*, and then referred it to your serious consideration how it might be put in execution, and brought to effect, and wee hope some progress is made therein. Wee now confirme that our Order, and if it shall not be already done, then wee desire you to undertake the same, with all convenient expedition, at an easie charge. That an attempt was made by the English Agent at Fort St. George to gain such a footing in the island is pretty certain; for in the *Beknopte Historie* (as translated in the C.B.R.A.S. II. Vol. IX) we read:—

At the end of the year 1663, the Governor Rijkloff van Goens returned to Batavia, and was replaced by Heer Jacob Hustaert, during whose administration nothing further happened, save that the English endeavoured to gain a footing on the Island by the

aid of the Candian Court: this they were, however, unable to do, as the relations between the King and the Company remained peaceable.

Of course, this may be a mere misapprehension of the unsuccessful mission sent by Sir Edward Winter in 1664 for the release of the English captives in Ceylon, as mentioned by Valentyn (see translation in *Lit. Reg.*, Vol. III, p. 424); but I think that it was hoped to kill two birds with one stone, and that the Dutch suspicions were well founded. Raja Sinha seems to have acted with his usual duplicity; for, which in 1666 he "communicated to His Excellency Van Goens a letter which he had received from the English" in 1667, we read, the company "captured some persons whom the King had sent as Ambassadors to the English, then enemies of the Honorable Company, at Madraspatnam, and brought them to Colombo." In the next extract, it will be seen, the Company unite the questions of the redemption of the captives and the acquisition of cinnamon in the frankest way:—

London, 7 December 1669.—Our Agent and Counsell in Fort St. George.— . . . We take notice what you write concerning ye Captives in Zeilon, and could heartily wish you could find out some way for their redemption, and to treat with the King of Can'y by some *Portugeze* or *natives* about it, and the bringing downe *Cinnamon* to the Eastward port of *Zeilon*, and advise us how it is with *Cuttiamrow*, for that the Dutch affirme, they have erected twoe forts there, and if any such beo, advise us when done, for that wee believe, it is purposely done, since wee have bin treating with them, and insisting upon that, as a free place, thereby to prevent us from having recourse thither.

It was quite true that the Dutch had recently occupied Kottiyar, and erected a fort there; as may be seen by the statements in the *Beknopte Historie* and in the Considerations written by Governor Van Goens for his successor, as given in Valentyn (*Ceylon*, p. 211). From the latter it would appear, that the occupation was for the purpose of levying customs duties on the extensive trade with the Coromandel coast; and that the earthen fort was intended to last but a couple of years. Finding that all their efforts to obtain a share in the Ceylon cinnamon trade were in vain, the Company then determined to try and grow cinnamon in St. Helena, as is seen by the next extract:—

London 8th January 1674 [3].—Our Agent and Counsell at Fort St. George. If you can by meanes of the natives from Ceylon procure any cinnamon plants, we would have you send a Box of them for St. Helena, and what direcons you can for the cultivating of them, for we would, by all meanes improve the plantation of yt. Island and if it cannot be raised by the plants, then if by seeds, or fruites, or by what other meanes and send them to St. Helena to ye Governr. with what direcons you can get.

In the next extract the cinnamon question takes precedence of the captives, though great sympathy is expressed for the latter:—

London, 15th December 1676.—Our Agent and Counsell at Fort St. George.— . . . Wee againe recomend to you the procureing of some Cinnamon Plants for St. Helena, and the release of Captives at Ceylon for whome wee have a great compassion.

From the next extracts it will be seen that the Company determined to have two strings to their bow; and, if they could not obtain plants of the true cinnamon from Ceylon, to grow cassia and other bastard kinds of cinnamon:

London 12th December 1677.—Our Agent and Counsell at Fort St. George.— . . . Wee have now made Cinnamon Tramboone Cinnamon Cassia Lignum and Turmerick our own Comodities, which you are to note, and if you can procure any Cinnamon Plants from Zeilone send them to St. Helena with Directions for Planting thereof, which we would doe to make an experiment.

London, 15th March 1677 [8].—Our President and Council at Suratt.— . . . Wee recomend to you the procuring us what quantities you can of the Sorts of Cassia Lignum formerly written for, and cannot beleve but you may procure some for us, as easily as the Comanders doe for themselves, which they could not doe but by yor Permission or at least connivance, wee would have you obtain some Plants of Tramboone Cinamon and Cassia Lignum as also Pepper and send them to St. Helena and Bombay with directions for the Planting and ordering them. (At the same time the Company wrote to their Agent and Council at Bantam to send clove and nutmeg plants to St. Helena.) In the next extract the Ceylon captives are referred to first, but the most stress is laid on the procuring of cinnamon plants :—

London, 3rd January, 1678-9.—Our Agent & Council at Fort St. George.— . . . Wee must still (and alwaies) reminde you to use all possible endeavours for redemption of the poor English Captives from the King of Candy, and would have you omitt no Invention for procuring Cinamon Plants to be sent as formerly directed, with great care, and the rather because (though it be a small thing) it may in consequence prove a great advantage to your native Country; One piece of a Sugar Cane carried by a Madera Ship to Barbadoes was the first cause of that Plantation and manufacture of Sugar, and that within the memory of some yet living.

The accuracy of the last statement I cannot verify. The last extract on this subject is as follows :—

London April 22th, 1681.—Our President & Council at Suratt.— . . . There is also another matter of Nationall concernment as relating to our owne interest, which must in most especial manner recomend to your assistance our care and invention vizt. The procuring for us by all possible contrivance very great quantities of Cassia Lignum Cinamon Tramboone & Cinamon Lamatt, which is the best expedient we can think of to keep downe the exorbitant price of the Dutch force England and all other Nations to pay for Cinamon since they were masters of the sole trade of Zeilone, wherefore to compasse all that is possible of those bastard kinds of Cinamon if our Stock should fall short you may take up money, and for price shall not limit you, knowing you will use this liberty with justice and discretion.

At the same time the Agent and Council at Bantam were instructed to buy at any price all the "cassia lignum" they could get, and send it home; and to continue this until countermanded. In the Court Book of the Company a few years later the following entry appears :—

15th October 1685.—Resolved, that the owners and Commanders of ye Compa shipping be permitted to bring home Cinamon of the growth of Ceylon free of stated damage.
So much for cinnamon.

As to TEA, there are many references in the Company's books to this commodity. Here is one, in which the price mentioned will make Ceylon planters sigh for the "good old days" :—

8th Sept, 1675.—It is ordered that a warrt be made out for payment of ye moneys due to the Governor for pots of Thea by him presented to several persons of quality for ye compa service, as also for 3 pots D.D. to Mr. Harris for ye Compa own use, weighing in all 74lb : 14oz : ¼ after ye rate of 20s per lb. according to a report now read and approved. In one of their letters to Bantam, the Company request 100 lb. of good tea to be sent ("no trash") for their own use, properly packed.

The conversation turning on

CEYLON TEA.

one of the members of the Council (who is also a member of the Council of the Royal Asiatic Society), said that he was very fond of cold tea, but found that it always turned thick. He had

asked planters for a remedy; but could learn of none, except the addition of more water. Perhaps some of your readers may be able to suggest a cure.

A meeting of the Royal Asiatic Society was held last Tuesday, when the Secretary read a paper by Hofrath Georg Bühler, C.I.E., P.H.D., on "Future Archaeological Explorations in India." In this the writer deprecated the abandonment by the Indian Government of archaeological explorations &c.; and urged the confining of work to the most important sites. The R. A. Society was asked to move the Indian Government in this matter. In the subsequent discussion Dr. Leitner, Mr. R. Sewell and others took part, the former at great length very discursively. Ceylon Buddhists may be interested to learn, that, in Dr. Leitner's opinion, the mahant at Buddha Gaya is the best possible person to be in charge of the Mahā Bodhi temple.

D. W. F.

Croydon, June 14th.

THE CAMPHOR TRADE :—FORMOSA AND KOBE.

The Orient for Orientals and Japan for the Japanese is a cry among merchants of this country which must not be lost sight of in considering the question. Formosa now being a part of this Empire, the Japanese are fairly entitled to make the best of it in their own interests. Already preparations are being made to lay a cable from Japan to Formosa, and regular steamers will shortly be running to the island, proving that Japan intends to monopolize the trade if that be found possible.

It will be learned with interest that Admiral Kabayama, the Governor-General of Formosa, has already been approached by Japanese merchants interested in the camphor trade and desirous of extending their operations to the South, with a view to obtaining permission to explore the camphor woods. His Excellency was, however, so exclusively occupied with strategical and political considerations that he was unable to make any reply. It is, however, assumed by those who are in a position to have accurate information that the camphor woods in Formosa, most of which are in the hands of the State, will be placed under strict control by the Government. It is a fact not generally known that there are large tracts of country in Japan covered with camphor trees which are yet practically untouched. These, however, belong to the Government, while the trees in the hands of private owners are rapidly dwindling in number and those remaining are in almost inaccessible mountain regions, where there is little or no water for distilling purposes. The Government forests are strictly protected, only the felling of old trees being here and there permitted, although it is generally believed that the axe of wood-poachers is not altogether absent. It has been the policy of the Government for several years to rigorously preserve its quasi-virgin forests, both for the general good of the country and in view of its own future wants, such as for naval yards and so forth.

Now to apply these facts to Formosa, it is suggested that the Government may adopt similar methods with regard to the camphor woods there. Admiral Kabayama, the Governor-General, being a naval man, will doubtless bear in mind the necessity for preserving trees with a view to the wants of the navy—a matter which will be of the greater importance, if as is rumoured, a great naval port is to be established at the Pescadores. Be that as it may, it is but reasonable to assume that in Formosa forest culture will henceforth be conducted on the same lines as in Japan. Those Japanese who are most interested in the development of Formosa believe that no camphor will be forthcoming thence for at least a year after the Japanese occupation is completed,—perhaps longer,—and that no cutting of trees will be permitted until the politi-

cal state of the island is settled and the title-deeds of the lucky possessors of camphor domains have been investigated and acknowledged by the new Government, after which permits will be issued with the greatest reserve.

As is already well known among those interested in Camphor production, the Nitrate King, Colonel North, has done a splendid stroke of business in cornering the article, which within a few months has gone up 100 per cent., and in the hands of such a powerful concern the price is not likely to give way, while, if it suits the ring, it may be driven up to almost any figure. It must be borne in mind, also, that it is to the interest of the Japanese to work with these speculators at home, as by carefully husbanding supplies producers can dictate terms to the whole world and derive great pecuniary benefit from the production of camphor in their own land and the newly acquired territory. They are indeed perfectly safe from competition, it being a well-known fact, as our Formosan correspondent remarks, that a camphor tree, like the oak, is a tree of slow growth, and for generations hence there will be no fear of production in territory outside of Japan. It should be remarked by the way, that woods of Camphor trees in Japan and Formosa are merely found interspersed among other trees; indeed we learn from the report of a Japanese who was recently sent by an important house of business to investigate the matter that the camphor trees in Formosa are by no means as plentiful as is sometimes supposed, the tree only growing in certain favourable situations. The production of camphor in Formosa cannot, therefore, be relied upon as inexhaustible.

One word more with regard to the probable direction of the future export from Formosa. It may be considered as certain that the Japanese will attempt to dispose of the article by way of Japan, unless, of course, they should see a marked advantage in sending it to Hongkong. That port, as is well known, has a reputation for wild speculation in camphor; it often occurs there that prices are 10 per cent. above those in Japan and if the consuming markets at home; and in the merchants of Hongkong choose to put so much extra money into the pockets of Formosa camphor producers, they will doubtless be made welcome to do so when opportunity occurs after on.—*Kobe Chronicle.*

THE COCAINE HABIT.

A *Tit-Bits* representative has had a talk with a London West-end pharmacist about fortunes spent on drugs, and the pharmacist has poured some sad tales into the willing ear. About cocaine, for example, the chemist said he has a customer, a very wealthy gentleman with an affection in his legs, who spends no less than £3 a week in cocaine. He is not alone in this respect, the chemist said; he could name hundreds of cases where members of the aristocracy only keep themselves going by means of cocaine or morphia. At present the cocaine habit is a perfect curse to many ladies in the West-end, who are ruining their constitutions and spending small fortunes in the purchase of the drug. A lady went to this disciple of Galen the other day, entering the shop in a very stealthy manner—a characteristic which most people addicted to the cocaine habit have—and bought right away 6 oz. of cocaine, costing over £20; and in a comparatively short period was back again, wanting the bottle replenished.

We admire the grand manner in which these West-end men speak of their customers who are rarely less than "members of the aristocracy." The curious thing is that we never meet in real life with pharmacists of position who talk so freely about what their customers take.—*Chemist and Druggist.*

"IN TROPICAL LANDS."

[This is from an old friend of a Ceylon planter now at home,—a county magnate of the old school. It must amuse the author, and his comments on Free Trade sound like a voice from the middle ages and his style exactly like Pepys;

He is the only man however, who notes the remarks on the manipulation of tea—and he *is right there*; only Ceylon has to provide for depraved tastes!]

(From a very Old Hand.)

Mr. Sinclair's book on Peru, &c., is very interesting. I have read all the Peru part. He seems to recommend the temperate parts to Europeans, the chief objection being at present insufficient carriage, but the valley of the Amazon is apparently too hot and steamy for any European workers.

I think at page 32 he suggests that tea should be dried in the sun like coca leaf, and undergo no other manipulation. This is just what was done years ago with very good Indian and, I believe, China tea. Dr. Bridge, of Wellington who was *very* fond of tea used to have it always, he told me from a friend of his, in that way and in sacks of leaves uncurled. They looked like a spread out yellowish brown leaf. Mr. Sinclair seems a bit of a Radical and a Free Trader. He says the potato famine of 1846 compelled Free Trade. This is not so, for it was decided in 1843 or rather in September 1841. When Parliament opened for business Major Beresford, afterwards War Minister, asked me to come and dine with him that day, for he would come home to Pall Mall and leave again for the House of Commons, but during an hour or so told me everything. He said he did not at all like what Peel was saying about Free Trade. I expect in 1846 the remaining half-crown of duty was taken off, many shillings having been taken off before that.

THE HALF-YEAR'S EXPORTS FROM CEYLON: JANUARY TO JUNE 1895.

It may be useful to offer a few remarks on the comparative table of exports, for the half-year ended the 30th June last, which we published in our Overland Edition of the 4th instant, and to bring some of the more important figures contained therein into a focus. Coffee, by prescriptive title, although alas! no longer by its total intrinsic value and its weight, occupies the first place in the table; and we are glad to note that it shows some increase. It is not a little that, after its lamentable decadence from over a million cwt. in the seventies, it should present even so respectable an outturn as 38,303 cwt. for the half year, as against 12,981 cwt. for the first half of 1894, and 32,939 and 25,392 for the corresponding periods of the two previous years. It would be too much, perhaps, to expect that our exports of this article at the end of the year will exhibit the same progressive increase, and that 1895 will show thrice the outturn of last year; but with the growing attention paid to the product—attention fully justified both by current and prospective prices and by the unwisdom of rushing into Tea—we may hope that Coffee has at last touched the bottom, and that there will be a gradual, if not very startling, growth in exports of all varieties of the fragrant bean.

The downward tendency of Cinchona has not been arrested, and is not likely to be, so long as prices remain what they are; but what a fall from the the 3½ million, 2½ million and more than 1 million lb., of bark sent away in the first half of 1892, 1893 and 1894 respectively to the less than half million lb., of the past six months! The time, though not yet, may come some day for the resuscitation of Cinchona; but meanwhile there is more than compensation in the steady

increase in the output of Tea. We have sent away already more than 51 million lb., of tea, as against 45 million, 42 million and 40 million lb., during the first half of the three years preceding. If the increase has been steady, and so far gratifying, it is satisfactory to note that the advance is no longer by the leaps and bounds which gave the whole Colony such pleasure when the industry was in its infancy. We are quite content, to let other countries outship us as they may, that the development of the industry should keep pace with the demand. For one thing, we are not lagging behind; nor have we come to the end of our tether; and the readiness with which all the tea that we produce is taken up is the best evidence that we are not going too fast. On the other hand, it would be a fatal mistake, against which we have uttered more than one note of warning, to place any restrictions on the reasonable and natural extension of cultivation. To do so while we are doing our best to find new markets for our teas and to strengthen our position in markets we have already won, would be to place ourselves in the unfortunate position of not being able promptly to respond to the very demand we have toiled to create, and to divert capital, as has already been done, from our own shores to other lands. While not relaxing in the least in the efforts which have made our teas known in every civilized country in the world, we should see to it, in our own interest, that the lack of Ceylon tea of any grade, would not bring our rivals into prominence, and thus weaken our own position in any place in which we have gained a footing. While saying thus much, are we not justified in drawing attention to the lower average which our teas fetch, week after week, in comparison with Indians, and even to the difference in price between our "stand out" teas and those of our big neighbour? In this connection we would draw special attention to the counsel contained in Messrs. Gow, Wilson and Stanton's circular, which we issued as a Supplement on last Tuesday. We cannot aim too strenuously after a high standard, and at the same time strive to maintain, and even increase, the fertility of our soils by the aid of manures and by intelligent cultivation. We wish we could believe that sufficient attention is being paid to these matters throughout the country. Of course, there are honourable and striking exceptions; but the general rule seems still rather too like contentment with things as they are.

The uncertainty of Cocoa crops is exhibited in the figures before us, which at 18,962 cwt. for the half year, give an advance of over 50 per cent on last year's exports, while they are short of those of 1893 which stood at 21,324 cwt. for the six months, the figures for the same period of 1892 having been 12,404 cwt. The alternative big and little crops which characterized coffee seem now to distinguish this product; but if the outturn of the current year should fall short of that for 1893, the producer will be entitled to much sympathy, especially in view of the way that prices have tumbled down. Still, cocoa is a very useful string to the planters' bow, as are also Cardamoms which, with an export of 213,742 lb., are a minor product by no means to be despised. The figures for the current year are in excess of those for the three previous years, and, with the prices now ruling, there is every encouragement for extensions into moist and shady corners of estates.

Cinnamon, despite reports of bad seasons and trouble with peelers, holds up its head bravely—the exports for the half-year of 693,891 lb. of

quilled bark, being in excess of the figures for the two previous years, though 100,000 less than the first six months of 1892 showed. In Chips, however, this year distances the three preceding years by between 130,000 to 140,000 lb., so that in the total it stands first. Prices too, after a long interval, are continuing to be satisfactory; and the steady demand for the spice augurs well for the future. The mysteries of Coconut Oil are difficult to fathom. The falling-off in exports this year of 46,000 cwt., as compared with last year, and of about 107,000 cwt. as compared with 1892, brings 1895 almost on a line with 1893, when 146,112 cwt. were exported during the first six months; but prices have not risen in sympathy with the limited supply. Can it be that the supply has shrunk in view of the restricted demand? The seasons have, no doubt, had something to do with the exports of Coconut Oil, as with those of Copra which stands at about one-fourth of last year, one-half of 1893, and one-fifth of 1892. The droughts of last year have told on Coconut crops, while the Desiccating Mills have proved greedy customers for all the nuts produced within a certain radius. The quantity of the desiccated preparations which have left our shores, is returned at 3,588,915 lb. or somewhat more than double the figures for last year; but it must be remembered that the latter half of 1894 saw a considerable increase on the first half, and that 1895 so far shows an advance of only half a million lbs on the figures for the corresponding months of 1893. An increase of 15 per cent in the output of desiccated preparations in two years should be nothing remarkable, if the taste for them is growing; but there are murmurs of over-production and leading to falling prices. We fancy that mills in which quality is studied, and the processes are carried on with cleanliness and thoroughness, have nothing to fear. Of Coconuts we exported over 5 million—an average number; but in Plumbago, there is a falling-off about 50 per cent as compared with 1892 and 1893. This year is slightly ahead of last year, when the exports of the mineral were only 122,582 cwt.; but as a demand has sprung up, and better prices are said to be ruling, the second half of 1895 may possibly see heavy exports. Coir shows an increase in rope, yarn and fibre, but not anything much, though the supply is believed to be in excess of the demand in London. The remaining minor exports call for no special remark; but deer, elk and sambar horns make a very small show with only 159 cwt.—a natural result, we suppose, of the measures taken to check the indiscriminate slaughter of game.

PLANTING IN SUMATRA:—TOBACCO vs. COFFEE.

Deli-Sumatra, July 6.

You are quite right, Sumatra would be better than German East Africa. But there are no billets going here as coffee is yet in its infancy; and the fine tobacco prices realised for last crop have, for the present, rather thrown coffee into the shade again. What is wanted is a moneyed partner for coffee here. I can imagine no better investment. Tobacco of course is better for those that know it. But it fully bears out the old Duke's saying—"A high rate of interest means bad security." The other day I was travelling with a Manager of a Tobacco Co, whose operations last year cost £35,000, and half of the crop has just brought in £70,000!! Pro-di-gi-ous!!

I have just had a run over to Perak; but only saw the immediate neighbourhood of Taiping. In no way was I favorably impressed; but I am prejudiced against the Peninsula perhaps.

Somebody in Kandy has got his hair off about my cock-a-doodle-does!

"DEATH IN THE TEAPOT."

WE believe the above saying to be "as old as the hills." Presumably, there must have been some reason why it found currency. Probably it had its origin in the ignorant use of the leaf during the early days of its introduction into Europe. But there certainly exists a further cause for it which does not seem to have become extinct even after a prolonged period in the extended use of tea. It is astonishing how little attention is paid by some housekeepers to the condition of the teapot. We have heard recently of a case of illness occurring in England due to this neglect. For some time all the members of a family seemed to sicken, and for no cause that could be assigned. At length it became noticeable that the nausea experienced was more frequent after the breakfast tea had been drunk. This led at first to a confirmation of the belief that had arisen that the tea obtained was not of the same quality or description that had been in customary use. Reference, however, proved that this belief was incorrect. It was then noticed that the disagreeable flavour and subsequent nausea was not experienced with and after the morning tea partaken of before the family got up. The fact that this was made in a different teapot to that in use at the table, led to examination of both. The result of this was to find the strainer of the latter, almost choked by a foul black deposit the issue to months of careless cleansing. The strainer was then wholly removed and the tea poured through one of the little wire strainers fixed to the spout now in such general and preferred use. After doing this the disagreeable flavour and unpleasant after-result to the tea drinking ceased. In many families too little attention is given to this matter of clearing the strainers of all deposit after use. The fixed strainer that was the cause of the ill-effects mentioned had far better go entirely out of use. Even with ordinary care this is always liable to retain some stale leaf, and it is the case that their use is being gradually abandoned for the suspended outside strainer. When this has not been adopted, much complaint may have arisen from the cause indicated. It cannot be too strongly impressed upon housekeepers that an absolutely clean teapot is essential to the good making of tea. Directly this precaution is neglected, the infusion of the best tea becomes more or less spoilt as to flavour, and, as in the particular case referred to, this neglect, if long continued, may become the source of illness. It has often been remarked that the common earthenware teapots make sweeter tea than those of metal, and it is probable that this advantage is due to the fact that the former are rarely provided with inside strainers.

ROYAL BOTANIC GARDENS,
PERADENIYA.

Mr. Hugh F. MacMillan has been appointed in Mr. Clark's place as head-gardener of Peradeniya, and is expected out on the 22nd in the B.I. "Rewa." He has been at Kew Gardens for the last two years and is highly spoken of.

A NEW TAPIOCA FACTORY was recently opened at Sungei Ujong. The factory is believed to be the largest in the Straits. The boiler is of 20 H.P. and the engine 16 H.P., the plant being capable of putting through 300 pikuls of tapioca root daily with ease.—*Pinang Gazette.*

COCONUT PLANTING NORTH OF THE

MAHAOYA.

July 16.

Of course the absorbing topic of interest to all agriculturists is the weather; and to those in the lowcountry the interest is intensified by its utter uncertainty of recent years.

THE SOUTH-WEST MONSOON

this year is, if ever it could be so characterized,

A MISERABLE FAILURE.

The little monsoon opened with over 5 inches in 24 hours, and shut up five days after with a total of 6.81. The big monsoon opened on the 11th June with over 5 inches and there was another heavy plump on the 18th of 4.50 and the monsoon closed with 11.77 inches. If quantity only is looked to, there was ample rain for the two months, but when it comes in deluges, in two or three days, when more than half runs off the soil, it is simply a snare; for it induces cultivators to sow, and, as rain does not follow at reasonable intervals the grain only sprouts to be burnt off. This has been the fate of numerous cheenas this year, and only those who happened to sow with the April rains have anything to harvest. This is hard lines for the poor goiyas.

Those who have had

COCONUT CLEARINGS

to plant have also suffered, and I know of one superintendent who is having the plants over a large acreage watered. From the 20th June to date, with the exception of two light showers, there has been no rain. Throughout all this time the weather has been very cloudy, the sun rarely shining for half an hour at a time. The clouds are all carried by a stiff breeze to the hills and I see that Maskeliya is already complaining of too much rain.

This has also been a very

SICKLY SEASON,

not only in the N.-W. Province but, as far as my information goes, all over the low country. This has greatly interfered with all works. Not much paddy was sown for the *Yala* crop, but there is much activity in preparing for the *Maha* sowing.

I see that all ordinary filters are condemned as tending rather to contaminate than purify the water. Can you or any of your learned readers tell me if the ordinary three chatty filter can be included in this category, supposing that the charcoal sand and pebbles are changed once a month?

THE CAMPHOR INDUSTRY IN CEYLON.

A gentleman who is experimenting, writes:— "You will find in the *Tropical Agriculturist* of November 1st 1893, p. 326 an account of Formosa Camphor Industry, but I cannot make out yet exactly how the camphor is caught. I have had some leaves and twigs boiling for 48 hours and the steam smelt very strongly of camphor; but it appears to have all boiled away, as I cannot find any camphor. I wish I had a proper still as I have some damaged branches that might be experimented on. It is a plant that coppices first rate, sending up strong shoots from the old stump in abundance. Old books I have, state that the camphor is 'extracted from the roots, leaves and young twigs' and if so why could not the trees be coppiced every 4 or 5 years?"

Another correspondent writes:—

"What is the nature of the camphor from the chips. I should not think it volatilizes and I should think that after boiling, it would float on the surface. A simple worm could be made for a few rupees; I'll be glad to show any one how."

Clearly the camphor tree industry has come to stay with us, whether on a little or big scale, time will show. We are on the lookout for more exact information as to preparation. Has any one in Ceylon got Spou's "Encyclopædia" (we miss the volume for "c")? Meantime we quote from the "Encyclopædia Britannica" in reference to Formosan camphor as follows:—

The crude and primitive process of distillation is thus described by Mr. E. C. Taintor in his *Trade Report of Tamsui, 1869*:—"A long wooden trough, frequently hollowed out from the trunk of a tree, is fixed over a furnace and protected by a coating of clay. Water is poured into it, and a board perforated with numerous small holes is luted over it. Over these holes the chips [of the camphor-wood] are placed and covered with earthenware pots. Heat being applied in the furnace, the steam passes through the chips, carrying with it the camphor, which condenses in the form of minute white crystals in the upper part of the pots." It is collected and stored in vats to await exportation, during which time it gives out from 3 to 4 per cent of uncrystallizable camphor oil of a yellowish colour, which has been suggested for use in medicine and the arts in the same way as spirits of turpentine.

CEYLON TEA IN RUSSIA:

WHAT M. ROGIVUE IS DOING.

M. Rogivue has written to Mr. A. Philip, Secretary of the Planters' Association, regarding the steps he has taken to push the sale of Ceylon Tea in Russia and giving an indication of his plans for the future. Through the courtesy of Mr. Philip we are enabled to publish the letter, which we do herewith in a slightly abbreviated form:—

Mockba, Moscow, May 16th, 1895.

A. Philip Esq., Secretary to the Planters' Association of Ceylon, Kandy.

Dear Sir,—Since my last private report to the late Chairman of the Planters' Association (Mr. G. F. Walker), and my letter to you of the 27th July—8th August 1894 the "Tea Fund"—as I have seen in the Ceylon papers—has been dissolved and replaced by the Committee of "Thirty" which, seemingly, devoting its entire time and available funds to and for the American Campaign, has none left for me, judging, at least, from the fact that since the beginning of its sitting, it never passed a word on my subject or on my work in this country.

I am however certain that the Committee of the "Thirty" and the Tea Planters of Ceylon will not forget and ignore that if Ceylon Tea is now making its ways in Russia it is entirely due to my efforts, to the work I have done, and the expenses I made during the past four years to introduce it, and that after all—although the progress may perhaps appear to be somewhat small and slow and not quite to expectations—I have done more for this purpose than I had promised to do with the limited funds placed at my disposal as free grants from the Tea Fund.

No doubt the progress would have been more rapid and worthy of note had I had the necessary means to advertise on a larger scale than I did.

I will however not complain any more and will leave it to the Ceylon Planters, their Associations or Committees to judge for themselves whether it is good policy from their part not to devote a little more attention on this part of the world, such a large country of tea drinkers as Russia is.

Reverting to the past four years of my operations since my arrival in Russia (July 1890) when Ceylon Tea was almost unknown in the country, and nobody would drink it, I may report the progress of its imports—resp., Consumption, in Moscow only as follow;

	Imported by me up to 31st December;—			
	1891	1892	1893	1894
Russ. lb.	49,153	112,280	161,579	209,256
by other Firms from London, especially through Germany about.....	Russ. lb. 10,000	25,000	21,200	380,000*
	59,153	137,280	373,579	589,256

for Moscow alone more than half a million pounds in 1894, to which is to be added the shipments from

* It is difficult to get here the exact figures at the Customs but these are about correct.—M. R.

London (direct or via Germany) to other places than Moscow* and the direct shipments from Colombo to Russia which in 1894 have been over 35,000 Eng. lb.

I have now four Retail Magazines in Moscow, one in Nijni Novgorod and one in Warsaw selling only Pure Ceylon Tea in packets and cases, of which the sign-boards with the words, "Ceylon Tea Pure and Economical" conspicuously shown in large gilt letters on black ground is a useful advertisement, as well as the magazines of my now 16 special agents in the province who have the monopoly of my mark, selling only Ceylon Tea and Ceylon products, to the entire exclusion of Chinese Tea. Besides I am selling my Tea wholesale to more than 400 clients—shop-keepers, retailers, Hotels, Restaurants, Buffet-keepers Hospitals, etc. all over Russia.

The teas I sell most are Pekoe and Pekoe Sou-chong worth in London 8½d to 10d and 6½d to 6¾d respectively which as a rule are found good qualities and answering the requirements according to the purse and taste of the generality of my customers, and all classes of Russians. Better teas like broken and orange pekoes, though selling also in small quantity, are not quite suitable, Russians as a rule, preferring a whole leaf tea and finding these latter sorts (broken and orange pekoe) too strong.

I have not overcome yet all the difficulties and have still to struggle hard against the Chinese Tea competitors who are sparing nothing for doing me wrong with nasty and dirty tricks to run me and my tea down. Not later than six weeks ago I was summoned to appear before the Kiew Criminal Court in order to answer a charge of having sold an article of consumption "Ceylon tea"—injuries to the health of people. The charge was a malicious one brought against me, no doubt by someone paid by the competition. The short of it was that a few sorts of my tea were analysed by the police laboratory, found all right and I was let off. * * *

In the year 1893 I spent Roubles 2,500 and in 1894 over Rb. 3,500 cash for advertisements in Newspapers, placards, pamphlets, circulars &c. and gave away gratis a great part of the tea the Tea Fund has sent me; but what is this for such a wide country like Russia! Five times more money ought to be sacrificed every year for, at least, three years still, but I really cannot do it alone.

Mr. Rogivue then refers to a forthcoming exhibition at Nijni Novgorod and states what, in his opinion, would be the best method for bringing the tea before the public at the Exhibition. He gives details as to the most effective method of advertising and sums up by saying:—

In all a sum of about Roubles 15,000 (say £st. 1400) would be required for the purpose, and I would be very thankful if the Committee of "Thirty" was to help me in the limit of possibility in covering it, for it is not in my power to bear it entirely alone.

I only wish that some Ceylon men interested in the subject would come over here and judge for themselves what I am doing to represent Ceylon Tea in this country.

You might have already heard of the expedition, the Russian Government has sent out for the sake of studying the cultivation of tea. As far as I know, the expedition consists of four gentlemen amongst them Professor Krasonow and Inspector Klingen, and according to the newspapers they arrived at Calcutta and are proceeding to the Northern Districts of India whence they will go, I think first to Ceylon and afterwards to China and Japan. The aim of this expedition is the study of tea planting for the Russian Government intends to make a trial with Tea plantation in the Caucasus, first in the district round Batoum. It was proposed to me to join the expedition.

Having sometimes difficulties with the Russian authorities, I should like to be able to prove to them

* Other places in Russia would be impossible for me to control, but I know that Odessa and St. Petersburg are importing a pretty large quantity.—M. R.

that I am the sole Agent in Russia for the Ceylon Planters' Association, and would thank you to send me a certificate to to this effect, legalized by the Russian Consul in Colombo.—I am, &c.

(Signed) M. ROGIVER.

PLANTERS' DIFFICULTIES IN THE STRAITS, SELANGOR.

So much has been written in the local press and elsewhere, on the alleged difficulties and restrictions connected with European planting enterprise in Selangor, that it would not be fair to the State to leave the subject entirely unnoticed in this Report, although I do not propose to deal with it in detail. I am not prepared to assert that difficulties and restrictions do not exist, although their extent has been somewhat exaggerated, but such of them as are not necessarily incidental to the conditions of the State (*e.g.*, the keen competition for labour between contractors, miners and planters, and the occasional clashing of planting and mining interests in the inland district) will, I hope, gradually be removed, and planters may rest assured that Government is as anxious as they are themselves that their enterprise should be rewarded with every success. Experience, however, has shown that granting concessions of large areas of land for planting purposes, without any provision for actual cultivation, conduces rather to the promotion of companies than the encouragement of agriculture, and I am glad to be able to state, from personal observation, that *bona fide* planters do not object to a fair cultivation clause, and also to call attention to the fact that every coffee estate in Selangor is now being cultivated with success. The formation of a Planters' Association, of which Mr. E. V. Carey is the energetic Chairman, is a matter for general congratulation, as European planters can now express their views on any subject with the weight attaching to conclusions arrived at by a representative body, and the Government can deal with them collectively, instead of individually. I hope that the time is not far distant when a representative of the planting interest will be invited to become a Member of the State Council.—*J. P. Rodger, Acting British Resident.*

PLANTING IN SELANGOR (STRAITS) 1894.

The development of planting, mainly in connection with the cultivation of Liberian coffee, both by Europeans and natives, has made very rapid strides during the last few years, and is one of the most reassuring features connected with the progressive development of the State. There is still, of course, a large area of metalliferous land, unworked or only partially worked, for mining purposes, but sooner or later, the deposits of alluvial tin (and no true lodes have yet been discovered) will be worked out, and the continued prosperity of the State will then depend upon whether or not tin mining has been replaced by some more permanent industry. Fortunately, the planting of Liberian coffee in Selangor has now passed beyond the experimental stage, and may fairly be considered an assured success, not merely at Klang, although planters have recently shown a special predilection for that district, but in every district of the State. It may now also be asserted, without much fear of contradiction, that contrary to the opinion formerly prevailing, Liberian coffee grows as well as, or even better, in rich, low-lying ground than on the hills. As far as Selangor is concerned, this has been conclusively proved by the present condition of the coffee estate planted in the neighbourhood of Klang, some ten years ago, by the Dutch Dagang, as the coffee on this estate, notwithstanding the somewhat neglected cultivation of native landholders, compares favourably with the most high-cultivated hill-grown coffee in any part of the State. The importance of his discovery can scarcely be over-estimated, as it renders immediately available for profitable cultivation vast

tracts of land in the coast districts, where metalliferous deposits are practically unknown, whilst it leaves the inland districts fully available for purposes of mining. Again, although the high price of coffee has recently attracted the special attention of planters to this particular form of cultivation, the soil and climate of Selangor are well adapted for other tropical products—such, for example, as pepper, gambier, indigo and sugar: possibly also cocoa and tobacco—and the fluctuation of prices may at any time cause a rapid change in the relative areas of land under cultivation for one product rather than for another.—*J. P. Rodger, Acting British Resident.*

THE FLORA OF MOUNT KINABALU.

In the *Transactions* of the Linnean Society, Dr. Stapf treats of the flora of Mount Kinabalu, drawing his conclusions from the collections of Dr. G. D. Haviland in 1892, and also using the material obtained by Sir Hugh Low more than forty years ago, and the more recent investigations of Mr. F. W. Burbidge. Dr. Stapf distinguishes four zones. The first, the Hill Zone, extending from the foot of the mountains up to 3,000 feet, is almost entirely occupied by cultivated land and young jungle, in which are found palms of the genera *Areca*, *Pinanga*, and *Calamus*, and numerous bamboos. In the cultivated fields grow *Caladium esculentum*, rice, bananas, tobacco, and vegetables. Next comes the Lower Mountain Zone, extending up to 6,000 feet, occupied for the most part by old jungle or primeval evergreen forest, abounding in creepers, epiphytes, and shrubs. The ground is covered with ferns and mosses, and bamboos grow in thick clumps. In the Upper Mountain Zone (6,000 to 10,500 feet) two formations occur, namely, evergreen dwarf forest and bogs. The forest consist of stunted, twisted, and weather-beaten trunks thickly draped with dripping moss and festoons of lichens. Only conifers grow into fine trees in sheltered spots. The shrubs blossom all the year round. Nine kinds of rhododendrons adorn the ridge, and at least five species of pitcher plants are seen climbing the trees or straggling along the ground. Ferns attain their most luxuriant development in this zone. The bogs are confined to a few spots, and produce a *Drosera*, a *Utricularia*, and some interesting Plants of Australian affinity. From 10,500 feet to the summit at 12,698 feet most of the ground is bare rock. Shrubs extend to 12,000 feet, and buttercups, potentillas, and gentians grow in certain boggy spots.—*Natural Science.*

INDIAN TEA FOR TIBET.

With reference to the necessity of extending the markets for Indian tea our correspondent with the Sikkim-Tibet Boundary Commission makes a suggestion which ought to commend itself to the Tea Association. The Tibetans, he says, only require their tea to possess three qualities—it must be Chinese, it must be coarse and strong, and it must cost from R2 to R2.8 per seer. They are also partial to receiving it in the form of bricks. If supplied in the ordinary way it would only confuse them. Our correspondent thinks that, bearing these predilections in mind, Indian tea planters might easily produce a tea which would just suit the palates of our Tibetan neighbours. But it must be Chinese, hints some objector. Why not? Let it be made up into bricks and smuggled across the frontier, the merchants taking care to sell it at fancy prices and calling it by some high-sounding Chinese name. But would that not be cheating? Well, if it comes to that, we should simply be deceiving the Tibetans for

their own good. There is no doubt ordinary Indian tea is better than ordinary Chinese tea, and if the Tibetans once began to drink it they would not be able to leave off. But with true Mongolian prejudice they refuse to believe in any except the Chinese plant. As our correspondent says: "There is hardly a doubt that it would be bought up greedily, but once let it be known that it is not the real (*i.e.*, the Chinese) article, and no Tibetan would take it as a gift." Upon such narrow-mindedness the everyday devices of commerce would be expended in vain.—*Englishman* *u.*

CAMPHOR TREE IN NORTHERN INDIA.

It is not only in Ceylon that the idea of planting the camphor tree is attracting attention. In a specially contributed article in the *Planter* to hand, the subject is seriously discussed, and attention is drawn to the probable suitability of the cooler ravines and valleys of the hill countries in India. It is pointed out that the camphor tree is no stranger to this country. We have tolerably good evidence from the records of the East India Company that at one time it flourished in Nepal and the ancient kingdom of Tipra, or Tipperah, which in the middle of the 17th century embraced the lands between the present Megna and the Upper Irrawaddy. Even within the present century, camphor was exported from Chit-tagong. The discovery by the hillmen of the secret of extracting camphor from the root of the tree probably led to the extinction of the plant. There is no reason, however, why it should not be revived.—*M. Times*, July 19.

VARIOUS PLANTING NOTES.

COFFEE PLANTING promises to be the most important industry of British Central America. The export of coffee for 1893 was nearly double that of 1892, and in 1894 again nearly doubles 1893, and the coffee crop of 1895 can now be definitely expected to fully double that of 1894. The land under cultivation for coffee has been greatly extended during the past year, and probably the acreage now planted is quite double what it was two years ago. The average coffee crop gathered throughout the country during the past year has been satisfactory, and the prices obtained on the London market have been good.—*Echo*, 3rd July.

CEYLON TEA IN RUSSIA.—In another column we publish an account of how Ceylon tea is being pushed in Russia by Mr. Rogivne. That gentleman, according to his own showing, has not found the task an easy one, and he too raises the cry for more money. One thing that will strike the reader is that, many as the difficulties are in America, they do not include the risk of being charged in the Police Court with attempting to poison the lieges! Truly the Russians are in a bad way and almost deserve to be left to poison themselves with China tea!

CEYLON TEA: PACKAGES AND SWEEPINGS.—

We are indebted to our friend Mr. Thos. Christy for two interesting letters by last mail to which we call the attention of our merchants and planters. In one place he pays a special compliment to our Ceylon packages; but he wants for West Africa and other moist regions that a special airtight lid should be adopted for cases of tea.—We regret very much that any injustice should inadvertently be done to certain London Tea Warehouse owners; but we feel sure Mr. Christy's letter will make all clear and give satisfaction.—Mr. Christy deserves well of our tea planters in every way; he gives an immense amount of time to the working of the manufacture of tea sweepings into caffeine or theine, and latterly has seen how a quantity of old stuff lying in the warehouse for a long time, could be utilised, much to the satisfaction of the importers, the merchants and the brokers.

PATENT 2,608.—February 6th 1894. Packing tea &c. Davidson, S. C. Sirocco Engineering Works, Belfast, and McGuire, F. G. Colombo, Ceylon. The machine shown is for shaking, during packing, the chests or receptacles in which tea and other granular materials are packed. The receptacle S is secured on a table C between jaws Q and the table is oscillated about its trunnions N by the crank F and may be at the same time rotated about the central pin M.—*Patent Journal*, June 26th.

TEA PESTS.—Mr. Miles read an interesting paper on well-known tea pests at the Microscopical Society, Calcutta, on Monday. It appears that the red spider leads off in warm dry weather. The rains when they set in wash this pest away, only to start another—the mosquito blight. When the rains, cease, this pest also ceases, and in bright weather is succeeded by the scale insect, and so on. One pest seems to be a benefactor—the green fly. But in that case why call it a pest? The enemies of the tea-plant are many, and Dr. Watt has lately discovered a host of new pests and blights. Altogether Dr. Watt has, we believe, collected between sixty and seventy pests and some thirty fungoid blights.—*Englishman*.

PRECIOUS STONES AND CHEMISTRY.—Mr. Arthur Chamberlin, in the *Mineral Collector (U.S.)*, says:—"An accurate scientific method has at last been discovered, whereby precious stones may be distinguished from the fraudulent gems which are now so numerous manufactured in the laboratories of Paris and other Continental cities. This is by testing them for their specific gravity, but not by the scales occasionally used for large stones, and which, however delicate, are unreliable. The new means of detection of bogus gems is simple and ingenious, and is likely to be widely adopted in the jewelry trade. It is the chemist who has added this knowledge to the lapidary's art. Several liquids have been discovered, which are more than three and a half times as dense as water, and in which, therefore, the amethyst, the beryl, and other light stones will actually float. The most useful of these liquids is methylene iodide, which has a specific gravity of 3.3, and in which the tourmaline readily floats. Moreover, it is not corrosive or in any way dangerous. It being impossible for the lapidary to prepare a number of liquids each having the specific gravity of a different gem stone, the methylene iodide is easily deluted by adding benzine to it. Each drop of benzine added makes the liquid less dense, and so it may be used to separate the tourmaline and all the lighter gem stones from each other. If it be doubtful whether a certain gem be an aquamarine or a chrysoberyl, all that is necessary is to place it in a tube of the liquid, together with a small fragment of true aquamarine to serve as an index. If it be a chrysoberyl which has a specific gravity of 3.6, it will sink like lead. If it be an aquamarine, which has a specific gravity of 2.7, it will float. If the liquid be then stirred and diluted until the index fragment is exactly suspended, the gem also will neither float nor sink, but will remain poised beside it. This method may be adopted with all of the lighter stones. But for heavier gems, like the carbuncle, the jargon, the sapphire, the ruby, the spinal, the topaz, and the diamond, a different liquid is necessary. This has lately been discovered by the Dutch mineralogist Retgers. He has found a colourless solid compound which melts at a temperature far below that of boiling water to a clear liquid five times as dense as water, and therefore sufficiently dense to float any known precious stone. This compound is the double nitrate of silver and thallium. Its most remarkable property is, that it will mix in any desired proportion with warm water, so that by dilution the specific gravity may be easily reduced. This fused mass may be reduced in density by adding water, drop by drop, so as to suspend in succession carbuncle, sapphire, ruby and diamond. These tests of precious stones may be made in a few minutes, and are absolutely reliable, as all stones of the same nature have the same specific gravity. None of the bogus rubies or diamonds have the same weight as those they are made to imitate."—*Public Opinion*.

CEYLON LABOUR SUPPLY AND THE PLANTERS' ASSOCIATION:

GOOD ADVICE TO YOUNG SUPERINTENDENTS

BIG AND FIRMS; THE INDO-CEYLON RAILWAY.

The Memorandum laid before the "Labour Supply Standing Committee" of the Planters' Association, and by it, amended and published in the form given elsewhere, is unquestionably one of the most practical deliverances of the kind, that has appeared for a long time. Leaders of the Association have been accustomed to say they can do little or nothing in respect of labour supply and management; but if only they gave us periodical bulletins of the kind before us—we speak of its positive not its negative opinions—good must inevitably result. It is no secret that when Mr. Melville White called this particular Committee together to discuss a question with which the country was supposed to be "ringing" there was not a single scrap of paper, no letter nor resolution from a District Association to lay before it. Even Dimbula, Maskeliya (the home of Mr. A. E. Wright) and the Kelani Valley were silent! Surely this shews how great has been the change which had come over the dreams of the planters since "the Ides of March"! Every one, a few months ago, supposed that enormous advances, multiplied crimping and a generally short coolie supply were to be the ruin of the Tea industry and our printers could scarcely keep pace with the letters and remedies which poured in upon them. Where are those dreamers, or physicians now? How marvellous the change which three months' steady immigration of coolies has wrought! And this brings us at once to a notable practical omission from the Memorandum before us, namely, a recommendation to Superintendents to endeavour to influence the coolies who wish to visit their country, to do so a little later and if possible to distribute their visits more equally over the year. In other words, it has to be pointed out to "Ramasamy"—who would not be at all slow to appreciate the situation—that the arrangement which fitted in admirably with "coffee"—through which all and sundry were allowed to make for "the coast" early in the year,—does not at all suit "tea"; for, indeed, the early months of the year and on up till May are frequently among the busiest. We do not think it would be at all impossible, to get the period of departure gradually shifted to what are really the slack months, say beginning about 15th May. We know that the risk of exposure to wet weather in passing to and fro, is a great objection; but with through railway communication, and even now with rail and steamer, this is bound to be obviated.

We now come to the Memorandum itself, and as the most notable passage in the whole document—and here especially do we recognise "the fine Roman hand" of the Chairman, we quote:—"The coolie is very much what the master makes him and there is far less change in the coolie than there is in some Superintendents of the day." This is most true, and it is a text on which Mr. Melville White and his fellow Committee men might very well enlarge. All the trouble which brought a Medical Aid Ordinance and tax on the planters in the "seventies" arose from the appearance of a generation of young planters whose one object was "to make haste to be rich" and who had little or no sympathy with the coolies or care for their welfare. To the very same cause in the present day may be traced the

evil of "over advancing," crimping and the flying about of "tundus" to the unsettlement of canganyes and the disorganisation of coolies. How different from the old typical planter after the pattern set by Robt. Boyd Tytler, Peter Moir—who has just passed away—and may more of a similar order. Who ever heard of coolies neglected in the lines, or sent to the Court to settle their quarrels in their day? And why should not Managers and Superintendents take as much pains in the present era? The very first requisite, indisputably, is a thorough working command of the language of the coolies. Can every young planter of the present day in charge of an estate, really understand a coolie who comes to him with a complaint, it may be, against his cangany? Are we going too far in suggesting that the Planters' Association might establish a form of examination in coolie Tamil and grant a certificate to young men satisfying two or three competent examiners? Such certificate would of course, not be all-important, but we venture to say, it would by no means be scouted by proprietors and agents looking out for men to take charge of estates. Very good advice is given as to the management of coast advances and we would press home their responsibility on our chief Agency and Proprietary Firms and Companies, as pointed out in the concluding portion of the Memorandum. For "crimping," evils of the "tundu" system and all other ills associated with the local transfer and scarcity of coolies, it is most correctly and comprehensively alleged that there is no better remedy than to increase the supply of coolies.

And now we come to what is said about "facilitating the journeys of coolies to and from Ceylon." Here we regret to find that the Chairman has forsaken the best traditions of the Planters' Association—ever in the van of progress,—and has adopted a narrow-minded, parochial, lukewarm view of a great and important undertaking. Here is what Mr. Melville-White wrote (as published by the local "Times"):

"The question of the Indo-Ceylon railway seems hardly within the range of practical politics yet and there may be a fear that the journey by rail will be too expensive and possibly bring the home of the coolie too near the country of his adoption."

This reminds us of nothing so much as the worse than lukewarm, the sneering allusions, with which certain individual leaders were wont to meet our programme for a Nawalapitiya-Haputale Railway in the early "seventies." The late Mr. George Wall was not alone in trying to give it the "go-by"; for several others supported him in "tickling the ears of the groundlings" by saying that it was not within the region of "practical politics" nor would be for a decade or score of years to follow. We need not say how such criticism and opposition served but to whet the earnestness of the few who stood by us; and to do the Association justice, that body as a whole gave uniform support to the memorials which the then far-away and neglected Uva Planters laid before it, although several of the leaders would have sneered them out of court if they dared. Now, we trust and believe it would be the same in the present case. For, let it be noted, the Indo-Ceylon Railway is the child in the first instance, of an eminent and very old member of the Association, Mr. Edward J. Young. He was specially chosen by the Association to visit Southern India and report on the Labour Question, and valuable as his Report may be in other respects, there can be no question than any im-

partial critic,—as well as Mr. Young himself—would confess that his most practical and notable suggestion for the improvement of the Cooly Labour Supply, was his starting, or rather revival of, the proposal for an Indo-Ceylon Railway. That being the fact, we would expect the Planters' Association to back up their Special Commissioner,—to be in the very forefront in urging on this great and notable work,—in place of its Chairman truckling to petty official and a miserably local unofficial opinion, by telling us "it is hardly within the range of practical politics." How is it to be brought within that range? How was sanction for a Railway to Nanuoya first and then to Hapntale secured—after seven years' battling in the one case and sixteen in the other? Not certainly by the Association or any of its leaders stating, this does not mean "practical politics." We might, however, pass this over on the part of the Chairman if he did not add the really childish remarks to apparently justify his position, that the journey by rail would be too expensive for the cooly and possibly bring him too near his home. The one proposition we would suppose, might be regarded as antagonistic to the other! But fancy anyone supposing that a Company, or other owner of an Indo-Ceylon Railway would not adapt their rates so as to catch the great cooly traffic from Southern India to Ceylon! Is it any wonder that the "Standing Committee" struck out two-thirds of the foolish sentence of the Chairman and contented themselves with saying (evidently not with unanimity):—"The question of the Indo-Ceylon Railway seems hardly within the range of practical politics as yet." It is a case with us of being "thankful for sma' mercies;" but certainly the day will come when the gentlemen who subscribed to this half-hearted declaration will be ashamed that they did not do their little best to show the world that they were practically and specially interested in an Indo-Ceylon Railway and that they were prepared to welcome and encourage every effort put forth to mature, and secure the beginning of what must be one of the most notable works of improvement ever undertaken in Ceylon or Southern India. For the planters it not only means a far more abundant supply of coolies with the means of tapping new and over-populated districts, but it also means cheaper and more regular freights from the great additional importance which must be given to the port of Colombo. For the coolies, it would not only mean freedom from much exposure to wet, cold, malaria, fever, and fatal illness; but also a great saving of time, which means money to them and their employer. We need say no more for the present. There is no better means of bringing any desirable undertaking—however large—within "the range of practical politics" than by urging it on public attention and by getting together all possible information concerning it. A work that has been the subject of two important Reports from leading Engineers in Ceylon and Southern India, with estimates and the results of surveys,—that has been taken up by a strong Syndicate in London with the favour it is understood of the India Office authorities, if not of those of the Colonial Office,—can scarcely we think be treated with the offhand remark that it is not yet, or "hardly yet within the range of practical politics."

GUTTA PERCHA IN THE STRAITS.—In Pahang, after 11th August, a Government notification prohibits absolutely the search for and export of gutta percha.—*Pinang Gazette.*

THE LABOUR SUPPLY QUESTION IN CEYLON.

LABOUR SUPPLY STANDING COMMITTEE.

Minutes of proceedings of a meeting of the Labour Supply Standing Committee held at Kandy on Friday, the 12th day of July 1895, at three o'clock in the afternoon.

Present.—Messrs. A. Melville White, (Chairman Planters' Association of Ceylon); A. Philip, (Secretary, Planters' Association of Ceylon); Hon. Mr. Giles F. Walker (M.L.C.), Messrs. W. D. Gibbon, James Westland, J. H. Barber, R. S. Duff Tytler, A. L. Cross, W. Maitland. A. W. S. Sackville, John H. Starey.

The notice calling the meeting was read.

The minutes of proceedings of a meeting of the Labour Supply Committee held at Kandy on Thursday, the 10th August, 1893, were read. Resolved:—"That they be and they hereby are confirmed."

Considered memorandum by the Chairman on the Labour Question. Resolved:—"That as amended it be adopted and published; (2) that copies of the memorandum be forwarded to the Ceylon Chamber of Commerce, and to the various District Associations for consideration."

The Labour Supply Standing Committee then adjourned.

A. PHILIP, Secretary.

Memorandum referred to:—

THE LABOUR QUESTION MEMORANDUM.

The so-called Labour Question may be conveniently divided into 5 parts, some of which are no doubt inseparably connected with the others, and act and react on each other.

These are:—I The supply of and demand for coolies.

II Facilitating the journeys of coolies to and from Ceylon.

III Coast Advances and local advances.

IV Crimping.

V The "tundu system."

In one or other of these forms the Labour Question has ever recurringly been before the Planters' Association almost since its foundation.

It is desirable to remember that the Planters' Association

(a) has no power to bind even its own members to carry out its decisions, much less non-members;

(b) its members are scattered all over the country and cannot be summoned to meet at a moments notice and without something fairly important for discussion, attendance involving an absence from other business of from 2 to 3 days.

(c) although the work of the Association is deputed to be carried on by a committee of 12 members yet the real work is voluntarily done by at most 10 members who attend nearly every meeting. Consideration of these conditions seems to indicate,

(1) that the Planters' Association is in no position to undertake the actual recruiting and introduction of coolies to Ceylon. It has no machinery and no funds for the purpose. Private effort has been successful hitherto in increasing the labour force in Ceylon from time to time; and if any scheme for combination is launched it will be found best to group a few neighbouring estates which are short of labour or which for other reasons desire to join. These have the motive of self-interest to make them work the scheme, it is in a manageable compass, each would (or should) know the men employed as recruiters, to whom advances could be given, one of their number might go to the cool districts if necessary, and being a small body agreements binding every one could be entered into at little cost. Such combinations will not be accomplished however until the Labour Question is a good deal more acute than it is at present. It is desirable however to state as emphatically as possible that it is not and ought not to be any part of the functions of the Association to procure coolies for those who are short of labour or in any way to interfere between employer and labourer except by way of recommendation. This has been the invariable attitude in the past, and circular after circular has been issued by the Planters' Association and Chamber of Commerce. Notoriously the recommendations in

these circulars have not been carried out generally by the planting community but no blame can attach to the Association for that, and that body can but repeat what has been recommended in the past.

(2) Facilitating the journeys of coolies to and from Ceylon is a work well within the province of the Association and a perusal of recent reports of its proceedings shows that it has never been backward in its endeavours to secure such facilities. Doubtless any further improvements which can be suggested in that direction will receive the early attention they deserve. The question of the Indo-Ceylon railway seems hardly within the range of practical politics as yet.

(3) Regulation of Coast advances, and local advances. This again is a matter entirely beyond the province of the Association except by way of recommendation. If the advice of the Association is not generally followed that body should not be reproached with the results. Individual effort *generally applied*, can best reduce advances, coupled with the introduction, of fresh coolies from the coast. Small combinations of estates could introduce fresh labour and in some of the small Districts these combinations might work well, but it is doubtful if small combinations could reduce advances where immense areas of cultivated land are adjacent, as coolies will naturally go where they can get most money and least work. There appears therefore to be no better remedy for the evil of high advances than *Increasing the supply of Coolies*.

(4) Local advances, crimping, and the "tundu" system are all bound up together and inseparably connected; and as with regard to Coast advances the Association can do no more than recommend a certain course. This has frequently been done in the past and nothing more can be done but to repeat the recommendations in the hope perhaps that some day they may be carried out. It is impossible to say that local advances should not be given. Opportunity to change from one estate to another must be permitted to coolies as well as to others, and notwithstanding all that is said against the "tundu" system, in it properly used and not abused lies the best safeguard of the employer. Like all the other *panaceas* proposed for the evil, its complete success depends on its universal use. As its universal use cannot among the planters be hoped for, so its success can only be partial. No one can be compelled to give a "tundu" although many are under that impression, but it must be manifestly unfair to the labourer to refuse invariably and under all circumstances to give a "tundu" *if the system is universally adopted*. To enable an employer practically to prevent a coolie obtaining employment elsewhere would be unjust, and would have the effect of driving labour from the country. At present "tundus" are far too recklessly given and those with "tundus" as well as those without "tundus" are far too recklessly taken on.

Crimping is at present intimately connected with the "tundu" system but that is because the system is abused or improperly used. Nor is Crimping confined to coolies or kanganyies alone. The Superintendent who at a day's or a week's or a month's notice tells his kangany that he the (Superintendent) must have more coolies, must be perfectly well aware that the kangany can only get these by crimping.

The Superintendent who can foresee his wants and takes the trouble to calculate what these wants may be, sends to the coast 6 or 8 months before he really wants them and will be prepared to give them work if they arrive before he expected them. And this in fact brings one to the root of the whole question. The coolie is very much what his master makes him and there is far less change in the coolie than there is in some Superintendents of the day.

If a coolie is ill, he gets a letter to hospital. Some Superintendents neither know nor care what is the matter with him, in many cases do not even know them by sight! If there is a row in the lines they are told to settle it themselves or go to Court.

It is useless to attempt any remedy whatever until the adhesion is gained of certain large employers of labour whose visiting agents must be aware of the difficulties existing on many estates including their own.

Until these large employers insist on their Superintendents procuring coolies from the coast annually and show them how to set about it, small individual proprietors cannot be expected to introduce new coolies on a scale large enough to remedy the evils, as if they did so the probable effect would be to enable the Superintendents of the large employers to recruit *their* force from such newly-imported coolies. It is desirable that Superintendents should show in their estate accounts what advances, given out in any month, are sent to the coast and what given for local labour, and the number of coolies so obtained should be shown in the same way.

BOUND FOR NYASSALAND.

Mr. G. M. Crabbe, of Uva—who has had eight years' experience as a planter in Ceylon—and is in every way fitted to be a Central African pioneer planter, leaves for Nyassaland via Bombay, Zanzibar and Chinde, at once. Mr. Crabbe will be associated with Mr. Owen in the service of the Nyassaland Coffee Co.; and we feel sure will do justice to his selection. We trust he may have an enjoyable voyage across, arrive in good health on the Company's land and have a successful experience of Central Africa.

PROGRESS IN NORTH BORNEO.

From a letter dated Sandakan, 18th June, we are allowed to quote as follows:—

We have seen but little of Mr. Henry Walker for some months as he has been busy on the West Coast climbing mountain gorges and doing other laborious tramps. Here things are progressing though slowly, it is said that tobacco land is getting short and when the pinch comes then we shall begin to see the country go ahead on proper lines I hope. Our coffee comes on well, and gives every promise of dividends before long; it is already in heavy bearing.

THE CENTRAL TEA CO. OF CEYLON, LIMITED.

We have before us a memo of Association of this Company under The English Companies' Acts which is subscribed to by Messrs. J. Saneroff, Holmes, H. K. Rutherford, David Reid, H. Todd, W. Herbert Anderson, A. Crabbe and William Johnston.

The capital of the Company is £45,000 divided into 1,500 preferent shares of £10 each, and 3,000 ordinary shares of £10 each. Two estates—Somerset in Dimbula, and Kabberagalla in Matnrata—have been purchased by the Company for £38,750 sterling.

THE TRAVANCORE CARDAMOM MONOPOLY.

The Travancore Government has at last decided to abolish the cardamom monopoly against which the planting community has been agitating for years past. The cardamom gardens were all surveyed last year and a regular assessment will be fixed on each holding, which it is expected will amount to the average income obtained by the Government from this source.—*M. Mail*.

INDIAN TEA IN AMERICA.—Says the *Pioneer* of July 27:—The Indian Tea Association has just issued another circular to all proprietors and agents of tea gardens, appealing for further contributions (four annas per acre on area and half an anna per maund on produce) in support of the endeavour to push Indian tea in America. The measures adopted by Mr. Blechynden at the Chicago Exhibition seem to have borne good fruit, and the Indian planter may rest assured that the game is well worth the candle.

COLOMBO TEA TRADE REGULATIONS :
THE CEYLON IMPORT DUTY OF 25 CENTS
PER LB. ON TEA.

We direct attention to the full report of the proceedings at the meeting of the Colombo Tea Traders' Association, published on some of the following pages, which cannot fail to be of interest to planters both here and in India. In respect of the first two subjects discussed and the Resolutions eventually carried, we do not know that much need be said. It seems only right that the planters should mark the gross as well as the net weight on the boxes if this is specially desired by the buyers in Colombo; while as regards the strengthening of boxes in the manner suggested, we shall doubtless hear a good deal more from the planters in their several Association meetings. One cannot help thinking Mr. E. B. Creasy's suggestions on the subject, published by us the other day, well worthy the consideration of practical men in the tea-planting community, and the various opinions expressed yesterday will all help to a right decision on the subject.

We now come to the third and last subject of discussion—bearing on "Ceylon and South Indian tea,"—and arising out of a Memorial addressed to Governor Havelock by Mr. G. L. Yonge, Secretary, on behalf of the United Planters' Association of Southern India; and we may say at once that we are amazed at the reception accorded to the Memorial in a meeting composed mainly of merchants and brokers. We are quite aware of the prejudice which prevails upcountry about admitting the teas of Southern India on an equal footing to the Colombo market. It is an unjustifiable prejudice in our opinion, and more particularly so, seeing how Ceylon teas have invaded certain markets in India without a word of remonstrance so far as we are aware. But still planters may very well say:—"We do not want to increase the supply of tea for competition with our own in the Colombo market." That is an easily understood argument, although looking at the question in any broad light, it is not one that merchants or statesmen would usually regard.

On the other hand, however, one would expect every steamer agent, merchant and broker to view the matter in a very different light and at least to admit fairly and openly that it was to the advantage of the Colombo market and port to encourage the addition to the local public sales of all the teas of Tinnevely, of South and North Travancore, and even of the districts beyond, should they find age.it to their advantage. But we cannot find that there was one at the meeting to advance this undoubtedly correct argument from the trading and business point of view. Now what is the explanation? We suppose it can only be that all present look at the matter almost entirely with the planters' eyes and as a matter of fact, the estate proprietary interest carries the day in the mercantile and broking circles of Colombo? Now, personally, our very limited interests are identical with those of the producers, and we are of those who, selling all their tea in Colombo, may be benefited, perhaps, by restricting the supply, and at any rate, by shutting out Indian teas from local competition. But is that a reason why as journalists, we should deal with this question after what seems to us, the illiberal and shortsighted fashion of the speakers at the meeting in question? We could scarcely believe our eyes in reading the remarks of the Hon. W. W. Mitchell, Chairman of the meeting, Mercantile representative in Council, one of our oldest merchants having close trading relations with

Southern India; and yet he stands up to justify at this time the maintenance of a local *import duty of 25 cents per lb. on tea* because there is a *five per cent ad valorem duty in India!* Why, the Ceylon duty, as Mr. Mitchell and every one in the room knew well—though not one mentioned it—is equal to fully *fifty per cent ad valorem* on the average teas that would come to us from Southern India. Now, before we go further, we would ask: "Is it fair as a matter of ordinary justice between man and man to take advantage of the low duty to send all the Ceylon teas we can to India, and to refuse to reciprocate on an equal footing?" We could understand Mr. Mitchell if he argued: "Let the Indian Government raise its duty against Ceylon teas to 25 cents per lb.—we don't want in respect of tea, to have any dealings whatever with the opposite Continent." That would be conservatism worthy of Peking; but it at least would indicate consistency, and a wish for equal dealing all round. *Fiat justitia ruat cælum.* Suppose, the Viceroy indicated in answer to the United Planters of Southern India, that unless the utterly prohibitory Ceylon duty were reduced, he would direct a similar rate of tax to be levied at all Indian ports, and especially Bombay, would Mr. Mitchell speak and vote as he did yesterday? And will any fair man amongst us say that Lord Elgin, on being told of this Colombo meeting, would not be justified in issuing some such ukase as we indicate?

But the Chairman had another argument: the planters of Southern India want to sell their teas in Colombo as their nearest market and Mr. Mitchell tells them, "there is no obstacle, you can do so in bond." Now, we are not up to the mysteries or technicalities of trading; but although the Chairman was allowed to indicate, *namine contradicente*, that the complaint of South India teas being shut out from the Colombo sales "fell to the ground," we might well expect anybody interested in Travancore, had such been present, to act the part of one of Ingoldsby's well-known characters:—

The Sacristan said not a word to indicate a doubt,
But he put his thumb up to his nose and spread
his fingers out!

Can sales be made in "bond" as favourably as in the open market in Colombo or is it putting South Indian teas on the same footing in our sales to have them in bond? Of course not; and therefore, surely, Mr. Mitchell trifled with the question at issue when he spoke of sales in bond. The issue was reached when reference was made to "blending" and it is a great pity we think that all reference to "bond" and an "Indian 5 per cent duty" was not left out, and an open avowal made at once that "tea planting opinion" in Ceylon was dead against Indian teas being allowed into the Colombo market to be bought, sold or blended on an equal footing with Ceylon teas, and that in deference to this feeling, the Chairman and the meeting agreed to oppose Mr. Yonge's Memorial. That is, we suppose, the actual fact and if we proceed to ask for a reason for this feeling, must it not be somewhat as follows:—

I do not like thee Dr. Fell,
The reason why I cannot tell;
But this I know and know full well,
I do not like thee Dr. Fell.

For, can Mr. Mitchell or any other merchant or broker in Colombo, tell us in what respect the average Travancore teas differ from the average for Ceylon districts of the same altitude? Practically, the whole agitation circles round "Travancore" which as

a planting district, has from the very beginning been considered an outlying division of Ceylon. Its tea must be superior to a good deal of our lowcountry produce; for Ceylon it is well-known turns out some of the poorest as well as some of the best of teas and one or two parcels of "Ceylon's" (as the Chairman knows) have even been rejected by Customs authorities, a thing that we suppose never happened to Travancore tea. One more illustration of the extraordinary anomaly to which Mr. Mitchell would bind us: Travancore coffee and cardamoms can come without hindrance for sale to the Colombo market, where they can be blended or shipped as "Ceylon;" it is only tea that is to be shut out! Then again and finally, we were told not so long ago, that our tea duty was specially required to shut out Java and China teas, and that there would be no objection to Indian teas coming freely into Colombo; but yesterday, we do not find a single voice indicating such an opinion! What has led to this change of view in Colombo? We pause for a reply.

COLOMBO TEA TRADERS' ASSOCIATION.

A Special General Meeting of the Colombo Tea Traders' Association was held in the Chamber of Commerce Rooms yesterday afternoon at three o'clock. In the absence of the Chairman, the Hon. W. W. Mitchell, C.M.G., was called to the chair; and there were present:—Messrs. F. M. Mackwood, G. H. Alston, C. A. Leechman, E. Benham, A. H. Thompson, H. Tarrant, L. Davidson, W. Haslam, W. E. Drury and C. E. H. Symons, Secretary.

SHORT WEIGHTS OF PACKAGES.

The CHAIRMAN said that the present being a special meeting there were no minutes to be read. He proposed that the meeting should therefore proceed to dispose of the business on the agenda. The first resolution was as follows:—

"To consider the following proposed addition to rule 8 of the present Sale Conditions:—In order to afford to buyers of tea a partial check on the weights of packages, it is proposed to add to clause 8 *all packages to have the gross weights marked upon them.*"

This resolution, he said, had been prepared by the Committee as a result of complaints, which had been very frequent of late, of weights turning out to be short—that was complaints of packages not turning out to be such as to correspond with the weights buyers had paid for. A number of instances had been brought before the Committee of the Association lately. Complaints had been laid before them where very serious discrepancies were shown to have taken place and the complaints were supported by the weights from the London Warehouses, showing the Customs weights, and affording proof that the packages did not contain the quantities that had been paid for. The Committee on various occasions, when these instances were brought before them, afforded the best advice which, in their opinion, they could give to these persons who brought the complaints before them. But as the outcome of it, all the Committee thought that, it would be well if some means were devised to enable buyers to check weights when taking delivery from the sellers' go-downs. At present, under clause 8 of the conditions of sale, it was stated 'to ascertain actual net weights 10 per cent of each break, but not less than three packages to be turned out and weighed, and the average result taken as representing the actual net weight of the tea in each package of the break,'—so that when a buyer went to take delivery of tea from a seller's go-down it was practically im-

possible to give effect to this. Clause 8 of the conditions of sale was therefore practically a dead letter. Buyers generally—at least a good many—took teas to the godown and there weighed them and then turned them out to ascertain whether they contained what they were represented to contain. They could not very well comply with the terms of condition No. 8 and it was in order to enable them to have some practical check that the motion had been brought forward, to require that all packages should have the gross weights marked upon them. If they had this, the buyer could, on taking delivery, pass a few packages over the scale and see whether the weights corresponded with the gross weight marked on the packages, and, if there was a discrepancy, to there and then draw the attention of the seller to it. He thought that was a very reasonable request. Some Superintendents of Estates marked both the gross and the net weight upon packages. They had, of course, to mark the net weight—they need not necessarily mark the tare—but if they gave the gross weight it would afford an opportunity for checking to some extent the weight of packages and to see whether the man's scales in the factory were correct or not. No one, of course, had any desire to pass off short weights, but at the same time weights and scales would get out of order and the resolution would enable them, on receipt of a complaint, to see where the weights were wrong. It was not asking anything unreasonable, and therefore he begged to propose the resolution.

THE GROSS WEIGHT SYSTEM.

MR. MACKWOOD said he had great pleasure in seconding the resolution, and it would be only reasonable, to give effect to the motion, if they asked the brokers, when printing their catalogues to state the gross weights of the packages offered. It was a great assistance to know that teas were bulked, and also an advantage to know that packages were hooked, and, he thought, that while it might not lead to increased bidding it would lead to bidding with more confidence if the gross weight were marked. He had all the more reason in supporting the resolution because he had himself been for the last three or four months considerably worried and troubled over this question in both capacities,—as a buyer, in having to get allowances made him, in some cases satisfactory and in others, unsatisfactory, and as a seller he had had the same trouble. Rule 8 as it at present stood absolutely debarred any man from making a claim in respect of tea if he had taken it out of a go-down. The rule was neither conducive to kindly feeling in the town nor to the advance of business. As a rule they could only send in claims to the man who knew all about the matter and the only man who was in a position to tell was the man on the estate. As things at present stood it was largely a matter of courtesy whether a seller would make a refund for shortage or not. He asked what could a buyer do supposing his claim was objected to. He could not go against an assurance by a man he had known for years and in whom he had the utmost confidence. He was of opinion that the gross weight system would help them very much. On the other hand, as regarded claims, he thought a line should be drawn somewhere as some of the claims were really frivolous. He had one before him at present. His firm recently sold 5 chests of tea that were probably not weighed in Colombo. They weighed it and it was found deficient according to the customs weights, to the extent of 5 lb. and a claim was made accordingly. With all the care that was taken in factories, trifling mistakes were likely to occur. This was a sub-

ject in which he took a deep interest. He had always passed a loss of weight when it did not exceed $1\frac{1}{2}$ per cent and he always expected to buy with the risk of such a loss. His personal opinion was that any claim made for one per cent, in view of the Customs' allowance and the rules of the trade, was simply frivolous.

THE USE OF THE SCALES.

Mr. ALSTON concurred generally, mentioning instances in his own experience where short weights had been discovered and where much trouble would have been avoided had the gross weight been marked on the boxes.

The CHAIRMAN spoke of a similar case which occurred last week, where if they had had an opportunity of passing the packages over the scales and comparing with the gross weight they would have been able to detect the shortage at once. As regarded Mr. Mackwood's suggestion as regards the brokers' catalogues it seemed to Mr. Mitchell that marking the gross weight on the packages became a condition of sale so that the suggested course would have been necessary.

Mr. MACKWOOD said he was all the better pleased, and remarked that if they did not meet each other in a fair and honest way and declined to come in, the men who stood aloof would suffer in the long run.

Mr. SYMONS pointed out that a considerable time might elapse before the purpose of the motion came into operation, and in the meantime the brokers should state it in the catalogues.

Mr. ALSTON:—If we make a condition of sale we must name a day on which it is to begin so as to give people a reasonable time.

Mr. MACKWOOD:—It is absolutely no trouble.

Mr. THOMPSON:—Notice should at once be given.

Mr. LEECHMAN suggested the 1st October.

Mr. MACKWOOD was of opinion that there was no necessity for delaying so long. He mentioned 1st September as the date when it should come into operation. So far as a date went the men who were willing to come in would do so at once.

The CHAIRMAN suggested that the words "to take effect from September" be added.

The motion with this addition was then put to the meeting and carried unanimously.

COMPLAINTS FROM OVER THE SEAS.

The CHAIRMAN said the next resolution was:—

"That in view of the numerous complaints of shortness in weights of contents of packages of tea it be urged upon Planters that in the interest of the grower as well as the buyer, it is important that greater regularity and accuracy in weights should be observed."

The Committee, observed Mr. MITCHELL, had had a good many complaints from over the seas. The following was received the other day from Australia as follows:—

"Weights.—We have had a lot of trouble with our Customs regarding the irregularity of weights and with very few exceptions we find that the weights marked on the packages are in excess of actual contents. Now this is a most serious matter, and as it entails in some instances the opening of every package it naturally much depreciates the value as you can well imagine; we therefore think that it is an important point for you to bring before your Chamber of Commerce for unless something is done to overcome this serious discrepancy of weight, Ceylon Teas will undoubtedly get a bad name in our market, solely on this account and it will mean a heavy loss to importers, for buyers are only too anxious to take advantage and make claims specially when they know that it can be proved on examination." He did not think the resolution needed much discussion. The above was not the only letter on the subject which had been received. He merely took it as a sample of the lot that had been

forwarded from different parts of the country. They could do nothing more than pass the resolution as an expression of opinion by the Association and with the view of impressing upon Planters and Superintendents the necessity for greater accuracy.

Mr. MACKWOOD supposed that in a good many cases all necessary care was taken. They had to recognise that Planters had a great deal of difficulties to contend with. His tea-maker might be dishonest and by wrong initialling, try to represent a larger quantity, than there really was. They had to deal also with a certain amount of moderate carelessness. For himself he thought where a good deal of the trouble arose was from the machines not being tested periodically.

The CHAIRMAN:—Weighing machines?

Mr. MACKWOOD:—Yes.

Mr. SYMONS remarked that the former resolution would come in and check that.

Mr. MACKWOOD, (continuing) said on the other hand there were certain eccentricities in tea which it was impossible to trace back to the factory. Last year amongst several other lines of tea his firm bought from 2,000 to 3,000 lb. for the Canadian market. To suit the purpose of their client they repacked the tea at Colombo at Messrs. George Stuart and Co's. Mills and the up-country man's weight was found to be perfectly correct, yet when the tea was sent to Liverpool for transshipment to Canada it was found to be four per cent. short.

The CHAIRMAN:—Do I understand you to second the resolution?

Mr. MACKWOOD said he would second the resolution to be in order, adding that he had never been enabled to get behind the cause of the discrepancy he had mentioned.

The CHAIRMAN:—I shall be glad to hear the experiences of any other gentleman. It is a matter of importance and unfortunately we all know it only too well.

The resolution was then put to the meeting and carried unanimously.

FAULTY TEA PACKAGES.

The CHAIRMAN submitted the following motion:—

"That in view of the fact that Ceylon tea is now, much more than formerly, distributed to all parts of the world the transit involving in many cases more than one transshipment the half inch Ceylon wooden planks at present used for tea chests are in the opinion of this Association insufficient for the weight contained in them and they consider that planks of at least $\frac{3}{8}$ th of an inch should be used."

This motion the CHAIRMAN proceeded to say was brought forward to some extent with the view of eliciting an expression of opinion from the members of the Association. Some, he knew considered half-inch planks were sufficiently thick, other members that packages ought to be of a different shape, while others considered they are not sufficiently thick. The last was his opinion, for, he had seen again and again packages coming down to Colombo altogether insufficient for the carriage of tea. After they had been delivered and nailed up after being opened he had known many instances where they were not fit to go the length of the Port.

Mr. MACKWOOD:—Are you sure that they were made of half-inch wood?

The CHAIRMAN was understood to reply in the affirmative, and, proceeding, he said they would have imperfect planks now and again; but he could not help thinking that if planks were more than $\frac{1}{2}$ -inch that that would go a long way to meet the difficulty. If they were a little thicker

that would provide a margin for imperfect planks. If the planking was thicker it stood to reason that it would stand better. Nothing had been said about imported packages of more select wood from Japan. He did not think the motion would apply to that. Perhaps others who knew more about the subject would say something about it. If, at all events, wood a little thicker were used, tea would have a much better chance of reaching its destination in better order, than at present. It might be said that the China packages were very thin. That was true but they were bound with rattans and being flexible were able to stand a great deal more knocking about than their Ceylon packages. Indian packages he thought, were of the same thickness, but he was not competent to speak on the subject and would be glad of information. As members knew, a great deal of Ceylon tea was subject to transshipment and that was increasing because more tea was going to the United States and Canada. The half-inch packages such as they get from upcountry were altogether insufficient to bear the strain. The half-inch hoops put on at present were useless. In many cases before reaching Colombo the hoops were torn off and thus served no purpose. He should be very glad to hear an expression of opinion on the subject.

Mr. BENHAM seconded in a few words.

Mr. MACKWOOD differed. He was of opinion that half-inch planks were sufficient, as regarded moni packages, and sufficient for country made packages providing these were covered with Jute hessian. Of course this only applied if the wood was properly seasoned and there must be no mistake in substituting wood $\frac{3}{4}$ of an inch thick for $\frac{1}{2}$ -inch wood. The majority of them packed their teas presumably for transshipment. The tea went out of the Southern Ports of the Island and the question arose whether the man upcountry had to bear the cost of $\frac{3}{4}$ -inch packages, which after all might not be necessary, or whether the buyer had to bear the cost. Jute hessian and a half-inch planking would stand any amount of knocking about and the cost of it would be cheaper.

Mr. ALSTON said he had tried covering packages with gunny. He had had to fight against the Company and only sometimes had he succeeded in getting claims paid. When gunny was used the shippers said "We can do what we like with it" and they tumbled it up till tea, wood and lead were all mixed up together and then they handed it to the consignee like a carpet bag. (Laughter).

Mr. MACKWOOD:—That is not condemnatory of the form of package. It is condemnatory of the bad usage.

Mr. DRURY said that, taken all over, there was nothing much to complain of and the boxes as used at present stood a fair amount of knocking about. The experience of his firm was that country-made packages, in many cases, were very bad indeed, particularly after they had been sampled, when the nails were apt to split them.

Mr. ALSTON suggested that "Country-made packages" should be specified in the motion.

The CHAIRMAN replied that there was no objection. Proceeding he went on to say that Mr. E. B. Creasy had written to the Association on the subject. That gentleman's letter had already been published in the newspapers. He suggested, instead of altering the thickness of the wood that it would be better to make the packages of a different size $20\frac{1}{2} \times 20\frac{1}{2} \times 20\frac{1}{2}$ —perfectly square, and they would then carry very much better than at present. Probably that was correct.

Mr. MACKWOOD remarked that that was a matter for planters. If they liked in sufficient numbers to adopt it there would be a supply to meet their wants.

The CHAIRMAN said it was very difficult to nail up again, a plank that was only half an inch thick. The motion was merely an expression of opinion. They could not force planters to adopt the course proposed. It was for them to follow it out if they chose.

Mr. MACKWOOD said that it should be left to planters to deal with accordingly to supply and demand. If they were going to express an opinion that $20\frac{1}{2}$ inches cube would be preferable—

The CHAIRMAN.—We do not do that. Do you move an amendment?

Proceeding, Mr. MACKWOOD said he did not. The fault of most of the wood—not all—was inherent, that was, a tendency to split, and so far as that point was concerned he could not see $\frac{3}{4}$ -inch Ceylon wood was any better than $\frac{1}{2}$ inch. He had not sufficient knowledge of the structure of the wood, but he understood it was this splitting tendency that was to blame.

Mr. DRURY said it was difficult for a person who had no experience to give advice. It seemed to him that two things had to be guarded against, splitting and, very often, the coming asunder of the joints.

Mr. MACKWOOD:—That is want of seasoning.

After further discussion Mr. Mackwood suggested that the better way would be to refer the matter to the Planters' Association with the view of eliciting their opinion.

The motion was put to the meeting and carried unanimously with the addition "that the experience of the Planters' Association in this subject be solicited."

THE DUTY ON INDIAN TEA.

The CHAIRMAN intimated that the Secretary had been addressed by Government with reference to a memorial by the United Planters' Association of Southern India with the view of being furnished with the views of the members. The memorial was as follows:—

To His Excellency Sir Arthur E. HAVELock, G.C.M.G.,
Governor of Ceylon, Ceylon.

Your Excellency,—I have the honour to address you on behalf of this Association regarding the import duty on Tea now in force in Ceylon.

I am directed to point out that whilst the tax, which has now been in force for several years, is quite unremunerative to the Revenues of your Excellency's Government, it operates very injuriously against the interests of Tea Properties in Southern India.

Ceylon possesses a market for teas from which all those of Southern India are shut out owing to the existence of the import duty and this Association ventures to urge the repeal of the Act imposing this duty not only in the interests of the Planters of Southern India but also in those of Ceylon itself.

The Association would respectfully advance the opinion that whilst no possible injury would be inflicted on the local market by the abolition of the duty a considerable impetus would be given to the tea industries of both countries.

It is well known that both for the London and the Colonial markets each of the teas finds a ready sale when blended and it would be a distinct advantage to both countries if the blending could be performed in Ceylon instead of at the various Ports of sale.

I am further directed to point out that the natural market for South Indian teas is Colombo and, the larger the quantity attracted thereto, the better for Ceylon.

Ceylon is in no way benefited by the exclusion of Indian teas as the latter is naturally absorbed at the various Ports in any case.

In conclusion I am to ask for your Excellency's best consideration of the prayer of the Association, and

I have the honour to be your Excellency's obedient and humble servant,
G. L. YONGE,
Secretary.

The CHAIRMAN remarked that the two salient points in the letter were first of all in regard to the sale of teas grown in Southern India in the Ceylon market, and secondly, as to the advantage or otherwise of their blending the teas. In regard to the former there was nothing to prevent the Planters of Travancore selling tea in Ceylon in bond as they had done before, so that fell to the ground. As to the advantage derived from blending, he thought, most of them would agree with him that they would much rather not have any teas blended with their Ceylon teas. (Hear hear.) What they had always prided themselves on was that their teas were pure and were not mixed with anything whatever that would cause them to be looked on with less favour. To abolish this duty would be to do away with the only safeguard preventing such a thing from taking place. —(Hear, hear.) If tea was let in from Southern India it would be mixed up with their Ceylon teas and sold, perhaps not labelled as "Pure Ceylon tea," but sold as "Ceylon tea." There was no possible advantage to be gained by their abolishing the duty and he strongly recommended the Government to continue the import duty against the very thing that these gentlemen recommended. (Hear, hear.) They could not now complain that in India they did not pay a duty on Ceylon tea, for 5 per cent. was levied in India.

Discussion took place as to whether the matter could competently be discussed, seeing it was not on the agenda.

The CHAIRMAN decided in the affirmative remarking that while there was no intention to push the matter he did not see any harm in passing a resolution.

Mr. MACKWOOD held the opinion that the Committee might be authorised to reply to the letter very much in the terms indicated by the Chairman. He was prepared to go very much further than Mr. Mitchell. If there was one problem staring them in the face it was the scarcity of markets for their plentiful supplies. To do what was proposed would be to add to their own natural increase some unknown millions of pounds of tea. He moved "That the opinion expressed by the Chairman that the duty on teas imported into Ceylon should not be repealed has the unanimous approval of this meeting and that he be asked to convey the same to the Chamber of Commerce.

The resolution having been duly seconded was carried unanimously.

The CHAIRMAN suggested that it should be circulated to all members of the Association so that those who were absent might receive official notice of the discussion.

Mr. LEECHMAN remarked that this course of procedure would strengthen the hands of the Association in replying to the Chamber of Commerce.

The meeting adjourned shortly after four o'clock, a vote of thanks having, on the motion of Mr. Mackwood, been accorded to the Chairman.

LOCAL TEA SALES AND SALES LISTS.

A Kelani Valley planter writes to the *Observer*:—
"Considering the large quantity of tea now disposed of in the local market, I think it would be an improvement, if you were to issue the local sale list, as a *Supplement* of a convenient size for filing; and

arranged in the same way as G. W. and S's London circular; i.e. with the Estates in alphabetical order, and the prices for the different grades of tea printed in columns. This would make it very much easier to compare the prices realized by different estates in the same district; and one would see at a glance if any estate in which one was interested, was represented or not. Should you not care about making the alteration, perhaps some of the brokers might adopt my suggestion."

Does our friend know the *Tropical Agriculturist*? In it he will find both local and home tea sales bound up each month in the convenient size he desires, though not alphabetically arranged in the case of local sales. Were it only for the convenience of easy reference to these sales, a practical Visiting Agent has said that every Tea Factory in the country should file the *T.A.*

"MODERATE CARELESSNESS" IN THE TEA FACTORY

At the meeting of the Tea Traders' Association, carelessness at the Factory, was stated to be one of the chief causes of these shortages, which not infrequently, lead to so much trouble. Mr. Mackwood, recognising the evil, makes allowance for "moderate carelessness." I wonder if the following facts can be included under this category:—Some time ago the representative of a well-known firm of buyers went Upcountry on pleasure bent. At a tennis party he was introduced to a planter, who in a burst of confidence told how keen he was on tennis saying:—"I have not seen a coolie for a week and I haven't been inside the factory for three weeks!" Curiously enough, about this time, the firm whose representative was tennis playing Upcountry, had occasion to make a claim for shortage on the identical planter who "hadn't been in the factory for three weeks." As is usual in such cases correspondence passed between the parties, and when the tennis-playing tea buyer had returned to his desk he received a letter stating that it was impossible that there could have been any shortage as the weighing and sending out of the tea were *invariably* done under his (the Planter's) personal supervision. A reminder of the tennis party and the conversation thereat resulted in a cheque being received by return. —*Cor.*

BATAVIA NEWS.

The *Batavia Nieuwsblad* says that the plantation called "Tjiseureh" on the "Gedeh," belonging to the "West Java Cinchona Company," has been purchased by Messrs. Mundt and J. C. Vanson. This plantation, covering an area of about 1,400 acres, will be planted with tea.

A new line is being laid between Butenzorg and Bandong in order to expedite communication between Batavia and Semarang. The cost of this line is estimated at fl. 6975.

A concession for Pearl Fishery in the territorial waters of the Islands about the Lampoeg districts, in the Sunda Straits and Semangka Bay, has been granted to Mr. Steenstra Toussaint.

The *Batavia Nieuwsblad* is informed that the Cinchona Company "Kertamanah" (directors Messrs. Tiedeman and van Kerckhove) at Batavia at the last meeting of shareholders resolved to buy up a lot of shares in the new Java Cinchona Company which will soon be established here.—*S. F. Press*, July 16.

LIBERIAN COFFEE IN THE STRAITS.—"Edinburgh" is the name of the latest addition to European-owned estates in Selangor; it is situated at Kepong, and will be opened up with Liberian coffee by Mr. Dougal.—*Pinang Gazette*.

INDIA PATENTS.

CALCUTTA, July 11.

Applications in respect of the undermentioned inventions have been filed, during the week ending 6th July 1895, under the provisions of Act V of 1888:—

For "The Killum-right, or Giant Blight Destroyer."—218 of 1895.—Daniel Powell, of No. 2 Bolton Road, Newport, in the County of Monmouth, in England. Gardener, for "The Killum-right or giant blight destroyer."

Specifications of the undermentioned inventions have been filed, under the provisions of Act V of 1888.

For improvements in the extraction and preparation of the fibres of rhea and other grasses and fibrous vegetables.—115 of 1894.—Henry Cecil Fellowes, of Leadenhall Buildings, 1, Leadenhall Street, in the City of London, England, Merchant, and William Robert Crozier, also of Leadenhall Buildings, 1, Leadenhall Street, in the City of London, England, Merchant, and Henry Ferguson, of 60, Ranelagh Road, Leytonstone, late of 10, Cleveland Terrace, Ranelagh Road, Leytonstone, in the County of Essex, England, Engineer, for improvements in the extraction and preparation of the fibres of rhea and other grasses and fibrous vegetables. (Filed 1st July 1895.)

For improvements in and connected with beating apparatus employed in opening and cleaning cotton and other fibres.—375 of 1894.—August Kirschner, of 19, Rue Cambon, Paris, in the French Republic, Engineer, for improvements in and connected with beating apparatus employed in opening and cleaning cotton and other fibres. (Filed 1st July 1895).—*Indian & Eastern Engineer*, July 20.

PLANTING NOTES FROM COORG.

COORG, July 15.

A sad event has occurred in the Bamboo, which has cast a gloom over the community there. Mr. Bell, a long-resident planter who was highly respected and esteemed, passed away on the 2nd instant and was interred the next day in the new Protestant Cemetery in the precincts of the new Bamboo Church.

THE ATTEMPT TO RAISE LIBERIAN HYBRIDS IN COORG.

AN UNSUCCESSFUL VENTURE.

It will not be out of place here to notice the non-success of Mr. Brooke-Mockett, the well-known Mysore planter, to raise many hybrids like the chance hybrids he has in his Liberian field. It was said at one time that he had a lot of seed like what he thought had produced the hybrids in question, which are a cross between the Liberian and Arabian species. The seed was sown, but after the resulting plants had been planted out and had grown up, it was found that although some of them bore some resemblance of the parent trees, there was marked degeneration. To those who knew anything of the matter, the result to the experiment was only to be expected if the seeds, as was most probable, were taken from the hybrids. The why and the wherefore of this is easily made clear. It is well-known that hybrids only bear heavily when their flowers are fertilised by the pollen of one of the parents, *i.e.*, if we have a hybrid between a Liberian and an Arabian coffee tree, in order that it may bear well and that its seed may be fertile its flowers must be fertilised by the pollen from either an Arabian tree or a Liberian or from both; but then it must be abundantly clear that the plants resulting from such seed cannot possibly be true hybrids; they would bear a stronger resemblance to, and have more characteristics in common with either the Arabian or Liberian *jât* than to their immediate parent, the hybrid, according to which pollen it was that fertilised the flowers of the latter. It is said that Mr. Brooke-Mockett was offered as much as £1,000 per bushel for his hybrid seed, but he declined the offer. He would have made a good thing out of it if he had accepted it, but the purchasers would have been dreadfully "sold." I am aware that some of this has appeared in other papers, but the importance of

what is here contended for does not appear to have been generally appreciated, so I trust it will prove interesting to your planting readers. Each hybrid is the result of the fertilisation of the flowers of one species by the pollen of another, and not the flowers of the hybrid itself by either its own pollen or the pollen of another species.—*M. Times*.

IMPROVED TEA MACHINERY.

Mr. J. R. Dalgarno, representing Messrs. Jackson's Patent Tea machinery, is once more in Ceylon and as usual he comes to introduce something new and an improvement on all its predecessors. One of the latest of Jackson's tea-drying machines is the "Paragon," a specimen of which has been erected on Labukelle estate, Ramboda, and another on Diyagama estate, Dimbula, drying from 350 to 390 lb. of tea per hour. The special machine under notice this time is the "Chota Paragon," a self-contained and very useful machine equal to from 160 to 200 lb. per hour and very compact, inasmuch as it occupies no more than 8 by 16 feet of floor space; while the consumption of dry wood fuel is equal to about $\frac{2}{3}$ lb. the lb. of dry tea. One of these machines has just been erected on Great Western and gives special satisfaction to so good a judge as Mr. Mackie. Among the improvements introduced into this machine are the following:—

1. In this new air-heater the tubes are placed across the Stove and the furnace bars. The first two vertical lines of tubes are pushed in and locked from one side of the Stove; the next two vertical lines from the opposite side and so on; so that half the cold air enters from one side of the Stove and half from the other, and is delivered uniformly heated along the two sides of the Stove, no matter how the furnace bars may be covered with fuel.

2. The drying chamber is placed on the top of the air-heating Stove in this machine, and special notice is directed to the fact that the hot air by this arrangement of Stove is admitted to the drying chamber *along the two sides and one end of it*, thereby ensuring the most uniform distribution of heat all over the drying surfaces, and a consequent increased drying effect and economy in fuel. By this arrangement *all* heat generated from the Stove must pass up through the drying chamber, which still adds to economical working.

3. The drying chamber being elevated to the top of the Stove provides for a great improvement in the discharge arrangement, which is now 3 feet above the floor level.

The drying chamber is fitted with 4 slow moving drying surfaces, the chains carrying these having motion imparted to them one independent of the other; so that each of these having the strain of only one travelling web on it will run for years without any special attention. A slow moving short feed travelling web is provided for the attendant to scatter the leaf on. The travelling webs can have 5 different speeds imparted to them, and the velocity of the air can be controlled for drying heavy and light teas.

We have no doubt that very considerable interest will be taken in Ceylon in this new machine, by the owners of estates who require an Automatic Dryer, and yet cannot afford any of the larger ones. The manufacturers of the machines are Messrs. Marshall Sons & Co., Ltd., Gainsborough.

COFFEE PRODUCTION AND CONSUMPTION.

To a Ceylon planter who is specially interested in "Coffee" we are indebted for the following interesting information and estimates in reference to the future production and consumption of our old staple. The figures and prognostica-

tions will no doubt be closely scanned by all who are looking to coffee as the safe product of the future:—

Extract from "The Export World and Herald" (published by Flint, Eddy & Co. New York) dated 29th April 1895.

COFFEE.—As the question of the future value of coffee is very interesting to many of our readers, we publish below an article prepared by a gentleman long familiar with foreign commerce in this article. The whose opinions cannot fail to be interesting. The problem is a very complex one, and the arguments in favor of his views are certainly most strongly put.

The idea prevailing in some quarters that ruling values of coffee are too high, because there has been a large shrinkage in the price of nearly every other product, is entirely wrong if values are governed at all by supply and demand. We purpose showing in this article that the consumption of coffee throughout the world has been and is steadily increasing, while the supply continues almost without appreciable change. There can therefore, be no permanent decline if any, in the price of coffee, unless the yield of several consecutive crops be in excess of yearly requirements. Our figures show that the consumption and production are almost equalized. The stocks in all countries, about the middle of the present year will probably show very little difference as compared with the same period of the preceding year, while during the season of 1895 to 1896 the visible supply will be smaller.

A careful study of coffee statistics enables us to present the following data which, we are sure will be interesting to our readers in coffee producing countries.

The production of the world in 1893-1894 was 9,110,000 bags, and careful estimates show the probable yield in the following years will be: 1894-1895 11,120,000 bags. 1895-1896 10,260,000 bags, divided as follows:—

	1893-94.	1894-95.	1895-96.
Africa, Mocha, etc. ..	150,100	199,000	200,000
Ceylon ..	26,300	38,000	39,000
Hayti ..	426,200	398,000	448,000
Java ..	433,100	799,000	750,000
Menado ..	5,000	1,000	4,000
Padang ..	89,700	47,000	50,000
Macassar, Timor, etc. ..	30,000	42,000	39,000
East Indies and Manila	270,000	250,000	298,000
Central America and			
.. Mexico ..	1,466,300	1,249,000	1,348,000
Colombia and Venezuela ..	1,206,900	800,000	1,000,000
West Indies ..	185,800	200,000	224,000
Bahia ..	365,000	300,000	350,000
Santos ..	1,767,000	4,000,000	3,500,000
Rio, Victoria and Ceara ..	2,697,000	2,800,000	2,000,000
Total ..	9,110,000	11,120,000	10,260,000

The Consumption of Coffee in 1894 was 11,350,000 bags, as follows:—

	Bags.		Bags.
United States ..	4,300,000	Asia Minor ..	65,000
France ..	1,140,000	Spain ..	100,000
Belgium ..	390,000	Portugal ..	35,000
Germany ..	2,119,000	Egypt ..	85,000
Austria ..	600,000	Bulgaria ..	15,000
Canada ..	25,000	Sweden ..	280,000
Great Britain ..	205,000	Norway ..	150,000
Switzerland ..	135,000	Pacific Coast ..	145,000
Denmark ..	120,000	Holland ..	520,000
Italy ..	200,000	Anstralia ..	335,000
Turkey ..	140,000	Russia ..	200,000
Roumania ..	25,000	Greeco ..	16,000
Servia ..	14,000		
	Value over 30 million stg. ..		11,350,000

While the production is subjected, from natural causes, to frequent fluctuations, the consumption has been continuously on the increase as may be verified by consulting the tables of deliveries in the United States, France, Belgium and Austria, which show that, from the year 1867, when the aggregate average yearly deliveries amounted to 4,200,000 bags,

they have gradually but constantly increased, until at the close of 1894 they footed 9,520,000 bags, this being more than double in the comparatively short space of 27 years.

A greater increase has been shown in the average annual consumption per *capita*, of coffee in the United States, than of almost any other article. except sugar, that of coffee having increased from 5.01 pounds in 1867 to 8.25 pounds in 1893. This is largely attributed to the improved methods of preparing coffee for retailing which presents it to the consumer in more convenient form than was the case several years ago.

The outlook, therefore, would seem to be for at least stationary values for some time to come. The figures given here certainly prove that present prices, rather than being fictitious, as some would have them appear, are in reality on a sound commercial basis.

THE RUSSIAN GOVERNMENT AND INDIAN TEA.

The Russian Government has lately removed the prohibition that has hitherto existed on the importation through Batoum of Indian teas intended for places in Central Asia. Until now this trade has been carried on through the ports of the Persian Gulf, but since the new decree has been issued it is being sent from Bombay to Port Said for transshipment there to Russian steamers proceeding to the Black Sea.—*M. Mail.*

PLANTING AND PRODUCE.

TEA COMPANIES' SHARES AS INVESTMENTS.—Under this head there was an article in a recent number of the *Economist*, together with a table showing the dividends distributed of the principal companies, the past and present market valuation of their shares, and the yield obtainable on the basis of last year's distributions. Says the writer in the *Economist*: "In view of the constantly diminishing return obtainable upon 'giltedged' securities, on the one hand, and the heavy losses sustained by investors in some other classes of Stock Exchange issues, on the other hand, it is scarcely to be wondered at that the shares of several varieties of industrial undertakings have grown steadily in public favour. . . . There can be no doubt, indeed, that the tea cultivating industry in Assam and Ceylon has been placed upon a thoroughly sound basis, with the result that so far at all events, as the United Kingdom, is concerned, the Chinese article has been practically beaten out of the field. In India tea planting has been going on for about fifty years, and at present about 380,000 acres are under tea cultivation, representing a capital of something like £15,000,000; while in Ceylon, where the industry dates back for only fifteen years, 280,000 acres are at present under tea, representing a capital of about £11,000,000. The fall in the value of silver, the introduction of machinery, and improved means of communication have, of course, greatly assisted the development of the tea estates in India and Ceylon; but when the fullest allowance is made for these advantages, the displacement of the Chinese supplies in our markets has been not a little remarkable. Naturally the supersession of the Chinese commodity has been accompanied by a very great reduction in the market values of tea, the decline in the past ten years having averaged about fifty per cent, but the reduction in the cost of production has more than compensated for the fall in price. The Indian and Ceylon companies have, therefore, been making larger profits of late, as a rule, last year's results having been benefited also by a slight improvement in the average price realised. Until quite lately, indeed, dealings in many of the Indian and Ceylon tea shares were matters of private negotiations, but gradually the efforts of some of the people largely interested in the industry to create a market for the shares are meeting with success."

THE POSITION AND PROSPECTS.—The *Economist* then sums up the outlook as follows: "Beyond the essential facts concerning individual Companies, which investors can readily procure for themselves, there are two or three features in the position and prospects of the Indian and Ceylon tea Companies as a whole which call for some remark. In the first place, it has to be borne in mind that hitherto the Indian and Ceylon planters have not only been able to supply the normal increase of consumption in this country, but they have also provided for the gradual displacement of the Chinese commodity; in future they will have to depend mainly upon the first of these factors for increased sale here, for it is not at all probable that the consumption of China teas will go altogether out of favour. It is obvious, therefore, that India and Ceylon will have to secure fresh markets for their constantly increasing production. At present the great bulk of the tea grown in both countries is shipped to the United Kingdom. Last year, for example, out of a total export from Calcutta of 125,446,000 lb., 116,083,000 lb. came to this country, while out of 84,592,000 lb. shipped from Ceylon 75,350,000 lb. were for the United Kingdom. Australia and New Zealand are the next largest customers, taking over 12,000,000 lb. from the two sources of supply; but other important markets require to be established if Indian and Ceylon tea is to command remunerative prices. Strenuous efforts are being made to foster a taste for British-grown tea in the United States and in Russia, and it is said that the prospects in both directions are encouraging; and in the trade it is thought that the expenditure of a little energy and a little money by the Indian and Ceylon tea planters would suffice to open up many other channels for their produce. The area of cultivation is being constantly increased and it is obvious that if fresh markets are not found there will be a tendency towards over-production, and a consequent reduction in prices. In the second place, skilled labour is becoming scarcer and more expensive both in India and in Ceylon, and as the new areas which have been planted in recent years begin to bear, the labour difficulty may increase. This, however, would cut both ways, for if labour becomes scarcer the tendency to over-production will naturally be checked. In the near future there is not likely to be any great increase in the output of tea either in India or in Ceylon, for it is one thing to open up new areas, and quite another thing to bring them to fruition. The only other point to notice is the value of silver and its effect upon the tea-planting industry. That the low price of the 'white metal' has been of great benefit to tea planters is indisputable, and it is equally obvious that any sudden and important rise in the value of silver would be prejudicial to the Indian and Ceylon industries, as it would diminish the purchasing power of the metal as measured in gold. That, in the opinion of the bimetalists, is 'a consummation devoutly to be wished,' but probably the tea-planting interest would regard such a movement with much less favour. It is scarcely worth while, however, to discuss the problematical effects of an international agreement which is never likely to take place, and without such an agreement no such rise in the value of silver as would materially affect the tea industry is at all probable. The outlook for the Indian and Ceylon tea companies is, therefore, generally satisfactory, though it is tolerably clear that the fears of over-production will only be removed by the success of the efforts which are now being made for the opening up of new markets, and the vigorous development of existing ones."

TEA TABLOIDS.—In an official report of a tour by Mr. W. R. Hearn* through the German and Italian colonies in the State of Rio Grande, Brazil, Mr. Hearn reports on his visit to one of the principal inns, where the accommodation and food were extremely bad, and adds by way of consolation: "Luckily we had with us a supply of tea tabloids, so that if the resources of a dwelling consisted of nothing more

than a tin of hot water, we could always be sure of a refreshing cup of excellent tea." Messrs. Burroughs, Wellcome and Co., the manufacturers of these tabloids, have conferred a great benefit on travellers by thus enabling them to carry their tea about with them.—*H. and C. Mail.*

QUININE-MAKERS AND THE CINCHONA SUPPLY.

We announced some time ago that Dr. Buchler of the Brunswick Quinine-factory, was now in Java for the purpose of inquiring into the condition of the cinchona-industry in that island. It appears that Dr. Buchler is the delegate of the combined German quinine manufacturers, and of Messrs. Howards & Sons, and in that capacity has made proposals to all the cinchona-planters in Java to make a contract for the purchase of their bark for a period of five years. The manufacturers propose to pay a fixed price of 6c. per unit per half-kilo of bark, and in addition to that to allow the planters one-half of the profit on all sales of sulphate of quinine above 24fl. per kilo, which is equal to about 1s 2d per oz. The Java cinchona-planters on their part would have to agree, severally and jointly, not to supply more than one-half of 235,000 kilos of quinine in the bark, these figures being estimated as the total annual consumption of the world. This would reduce the shipments of bark from Java to about one-half of their present quantity, the total exports from the island in 1894 having been equal to 211,750 kilos. of sulphate of quinine. Under the arrangement the German and English manufacturers together would monopolise the whole of the bark-supplies in Java, consequently the American and French markets would have to depend upon the supplies from British India, Ceylon, South America, and Africa, and it would follow that acceptance of the proposed agreement by the Java people would lead to an immediate advance in the price of quinine. It is considered very doubtful whether Dr. Buchler will be able to come to a satisfactory arrangement with the planters, as there is no trace of co-operation among the latter. About three years ago, when a similar plan was proposed by leading merchants in Batavia about one-half of the planters agreed to limit their shipments for a year to three quarters of their estimated possible output. Very few of those who had agreed to do so, however, kept their promise, and the experiment ended in total failure.—*Chemist and Druggist.*

RETIREMENT OF A WELL KNOWN INDIAN BOTANIST.

Mr. M. Lawson, the Superintendent of the Government Gardens and Cinchona Plantation on the Nilgiris, is permitted to retire from the service on the 31st instant. As, however, there will be some difficulty in filling his place, it is unlikely, an Ooty paper says, that he will be relieved on that date. Mr. Lawson, who was formerly Professor of Botany at Oxford, and in charge of the exquisite garden which stretches along the bank of the Cherwell, which Macaulay described in a beautiful passage, came out to India in 1883 at the instance of Sir M. E. Grant Duff. Since then he has done wonders for the gardens at Ooty, and established and worked, unaided by any expert assistance, the Quinine Factory, which now does such good work for Government.—*M. Times.*

FIBRE MACHINES.

There are few subjects that have for some time back so much engaged the attention of mechanical engineers, and generally of those with an inventive turn of mind, as the construction of machinery for treating fibrous plants. A great incentive was, moreover, given to the prosecution of this search in a particular direction, by the magnificent reward offered by the Government of India for

* Who will be remembered when in Ceylon.—*Ed. T.A.*

an ideal machine to treat the fibre of the Rhea or Ramie plant (*Boehmeria nivea*) commonly known as China grass. It is needless to enumerate the advantages to be derived from the use of suitable machinery for extracting various fibres; but hitherto none of the several machines that have been patented in England, the Continent and America, has given entire satisfaction when put to the test. Of late, attention has been specially attracted to a patent known as the "Todd Machine," of American origin, in connection with the fibre industry in the Bahamas and Florida, where it is reported to treat Sisal and allied leaf fibres with great success; while still more lately the "Gomes's patent" (said to be a purely chemical method) for extracting fibre from Rhea and other members of the nettle family and from the cortex of other plants, promises to revolutionize the trade in such fibres.

A prospectus issued by a Manchester Engineering House, which has reached our hands, offers to supply all descriptions of machinery for dealing with fibre plants, such as the extractor, decorticator, crushing machine, willow softening, seeding, scutching and brushing machine; rope-making machine, &c.—capable of dealing with leaf fibres, stem-fibres and coir. We are specially interested in "Extractor No. A" said to be capable of extracting the fibre from all descriptions of leaves and stems, when worked up in a green state and freshly cut. The hand-power machine of this description, suitable for small planters and agriculturists, and guaranteed to produce 150 lb. of cleaned fibre per day, is offered at a moderate price. It would seem to be a machine of wonderful capacity, and if one of the kind could be set up in Colombo, and the quality of its work demonstrated to satisfaction, we have little doubt of a local demand springing up in a country so rich in plants capable of yielding excellent fibres, particularly at the present time when fresh interest appears to have arisen in the fibre industry. The Manchester House concerned ought to establish a local agency and give the necessary demonstrations.

COFFEE CULTIVATION IN NETHERLANDS INDIA.

Papers laid before the Netherland States General give details of coffee cultivation in the islands beyond Java. In West Sumatra, and North Celebes, or Minahassa, coffee is grown as in Java by the inhabitants for Government at a fixed price on delivery—the price being far below the market value. The result is that the yield is declining. Elsewhere in these islands coffee-growing is free. At Bencoolen, where the inhabitants would not plant coffee under the compulsory system, free cultivation has proved such a success that several thousands of piculs of the berry are now exported. The coffee is grown in the mountains, and its cultivation affords an abundant means of livelihood to the people. The cultivation of the Liberian berry is extending also there, and promises to benefit the inhabitants of the low country as well. From Palembang, the yearly quantity exported has now risen to over 14,000 piculs, and the people living in the mountains draw so much profit from the cultivation of the berry that many of them take to it by neglecting the cultivation of rice. In the independent district of Korinchi, in S. W. Sumatra, coffee-growing has widely extended and gains increasing favour among the people. In South Celebes, too, the natives are actively engaged in laying out fresh plantations under coffee, and the same is reported from Bali. There, the export of coffee from Buleleng in 1893 reached 21,000 piculs. In the Lampong Districts (Sumatra), coffee is taking

the place of pepper, the cultivation of which is on the decline owing to the fall in quotations for that spice. In the Kwantan district (Rhio), the people steadily proceed with clearing forest land in order to plant coffee from seeds supplied by Government.—*Straits Paper*.

VARIOUS PLANTING NOTES.

MANURING OF TEA.—We hear that an Indian tea planter of long experience has been giving an opinion quite the opposite of that of the German Agricultural Professor from Japan. Large doses of artificial manure are no doubt undesirable; but small proportions with bulky stuff ought to do good in every way. A trial of small doses of bonedust with the buried prunings might be desirable.

TEA PLANTERS UP NORTH have been having an anxious time of it with red spider and backward leaf, but a change appears to have set in with the rains. Red spider is always destructive in the early part of the season, disappearing with the heavy rain. Mr. G. F. Playfair suggests the sulphur treatment as the most effective way of getting rid of the pest. The method is to put refined flowers to sulphur into bags made of loose woven cloth, and to sprinkle the tea bushes by simply shaking the bags over them. This treatment, it appears, is useful also in mosquito blight, the dreaded *Helopeltis thievora*. The sulphur, it is said, adheres fairly well even on dry bushes, and is applied at the rate of from 1 to 2 cwt. to the acre and costs about Rs.4 per acre, including freight in Cachar, where the experiments were made.—*M. Times*.

CEYLON TEA IN RUSSIA.—Read letter from Mr. M. Rogivue, Moscow, reporting on his work in Russia, and applying for monetary support towards advertisements, pamphlets, photographs, Snow-bills &c., for distribution, Erection and fitting of a Pavilion at the Nini Novgorod General Russian Exhibition &c. &c. Read letter from Mr. James Sinclair, also extracts from letters of Mr. William Mackenzie, in reference to Mr. Rogivue, and his work in Russia. Resolved:—(1) That the sum of £1,000 Sterling, be granted to M. Rogivue for the sole purpose of advertising and pushing Ceylon Tea in Russia in the manner indicated in his letters, dated 29th April and 6th May 1895 (2) that a credit to that amount be granted to the Ceylon Association in London, to be held at the disposal of M. Rogivue as he may require; (3) that a copy of this Resolution be forwarded to Government for approval, to the Ceylon Association in London, and to M. Rogivue; (4) that a letter on the lines of the draft approved by the Committee be forwarded to Mr. Rogivue, through the Russian Consul in Ceylon.

INDIAN TEA will not by any means have a walk over in America, Ceylon and China are already in the field and now Japan is preparing to enter the lists and run a tilt against its older and more firmly-established rivals. The American taste has yet to be educated to appreciate tea and just now it is very much in doubt as to what to adopt. Ceylons and Indians have rapidly risen in favour, but there are many who hanker after China tea and evince a special predilection for the Oolong of Formosa. It is said to be in strong demand all through the country but more particularly in the eastern states. We are told that compared with Japanese tea, no particular superiority can be claimed for tea produced in Formosa, but it holds a better place in the American tea market, commanding a price higher by 10 to 20 dollars per 100 cattles. The total export of Oolong tea every year to America is about 17 million pounds, worth 5 to 6 million yen. It has been proved that any attempt to grow Oolong tea in Japan is idle, but now that the island of Formosa has become Japanese territory, it will pay that country to abandon its hitherto unsuccessful experiments to produce Oolong at home and turn its attention seriously to the improvement of the original industry in Formosa and the extension of its markets.—*Indian Planters' Gazette*.

THE NATIVE TEA GROWING INDUSTRY IN CEYLON.

It is quite clear that we must lay to account in discussing the future of tea in Ceylon, a very large and growing area planted in gardens owned by members of the native community. In the height of its prosperity, the Native Coffee Enterprise was a very important one in the island; for, in 1868 as much as 218,584 cwt. of "native" coffee were exported against 789,090 of "plantation" coffee, or about a fifth of our total exports had to be credited to the native gardens. It will be a long time, before we can say the same of tea; for apart from the period required to bring the exports from native gardens up to 18 or 20 million lb. of tea, there is the fact that simultaneously with an extended cultivation under native auspices, will come an extended local consumption, so that probably from one-half upwards of all the tea produced by Ceylonese-owned gardens will be sold in the towns, villages and wayside boutiques for the benefit of the Ceylonese themselves. There is every reason why this extended use of tea among the Sinhalese and Tamils should be specially encouraged. To keep the people away from the arrack-shops will be one notable advantage, derived from tea-drinking, and also to conserve the health of a people who, from their carelessness in respect of the water they drink, frequently get fever and dysentery, where a little care, or the drinking of tea instead, might save them from such attacks. Then to get a market at our doors for the common kinds of our teas, is of course so much of a relief to the markets served by exports. The Indian tea planters have long seen the advantage of getting the people of India to become tea drinkers, and the Government has taken special steps and much trouble in the endeavour to encourage a taste by the establishment of wayside tea boutiques and refreshment stalls. In Ceylon, this part of the work may be left to the enterprise and intelligence of the native boutique-keepers themselves; just as the garden owners in the Gampola, Nawalapitiya, Kotmale, Pussellawa, Kadugannawa, Matale and many more valleys required no official nor foreign prompting to take to the cultivation of a plant which they saw was to be as profitable to them as ever coffee was. In some cases they have gone so far as to turn their paddy fields into tea gardens and splendid tea is grown on such alluvial flats. The progress upcountry may be judged from the information made available to us for the Gampola-Nawalapitiya valleys. In native tea gardens around Gampola extending from 1 to 125 acres each and aggregating 938 acres, the Manager of Mariawatte writes:—

"I buy leaf from these estates and gardens, but there are a great many more that sell to other factories. Messrs. Walker of Shamrock, Anderson of New Peradeniya, S. Agar of Kandy, C. E. Rowlands of Attahagie, F. H. Wiggan of Sogama, A. L. French of Ascot and G. C. Bliss of Atgalla could probably assist you with information as to other native holdings in tea. The acreages given are supplied by the owners, but how far they are correct I cannot say. Most of the gardens are only partly in bearing."

We are also indebted to Mr. T. R. Walker for a list of 44 native tea gardens extending from $\frac{1}{2}$ acre to 110 acres giving a total of 533 $\frac{1}{2}$ acres; and of another list counting up 33 places from $\frac{1}{4}$ to 30 acres each or a total of 119 $\frac{3}{4}$ acres. Both these lists will be given in our Directory. Mr. Walker in his letter adds:—

"Many factories take leaf now and if you could get them all to give you a somewhat correct list you will be astonished at the acreage. Barnagalla,

Mossville, Craighead, St. Clive, Carolina, Imboolpitiya, Goorookoya, Atgalla—all take in native leaf and from Polgahawella, Matale, Peradeniya, Pussellawa and Gampola you would get many acres. In the lowcountry—in Galle, Morawaka, Balangoda, Ratnapura, Kalutara, Kelani Valley there must be many native gardens and from what I see travelling about here, the native produce will be very great in a very few years."

The Manager of New Peradeniya estimates that he buys leaf from about 450 acres of native tea gardens. We shall, of course, be very glad to receive further lists of any gardens not likely to be in the above, if sent at once. But meantime, we may mention that our returns for the lowcountry of the Western and Southern provinces, indicate wonderful activity on the part of a number of Sinhalese in planting tea; and it is quite clear to us that in a very few years, we shall have to make a liberal allowance for the native crop of tea in Ceylon.

THE INDIAN TEA ASSOCIATION IN LONDON.

REPORT OF THE GENERAL COMMITTEE FOR THE YEAR 1894-5.

The following is from the fifteenth Annual Report of the Association:—

The General Committee of the Indian Tea Association (London) have the pleasure to submit to the members the following statement, on the conclusion of the fifteenth year of its operations.

RE-ORGANISATION.

At a general meeting held on July 9th last, at which Mr. S. E. J. Clarke, Secretary of the Calcutta Branch of the Association, and of the Chamber of Commerce of that city, was present; an interchange of views took place on this subject, and, as a result, a small Committee was appointed, under whose guidance arrangements were made with a view to keeping members more fully informed of the meetings, and of the work done by the Association, and its several Committees, and especially of maintaining closer touch with the Calcutta Committee. A set of suggested new rules was prepared by S. E. J. Clarke, while in England, and these have been placed in the hands of a special Committee for consideration and report, but up to the present no definite conclusion has been arrived at.

NEW MARKETS.

1. MR. BLECHYNDEN'S WORK AND ASPECT OF OPERATIONS IN AMERICA.—This subject has received continued attention from the American and Foreign Tea Committee, which met sixteen times during the year to consider Mr. Blechynden's operations and reports. These operations mainly consisted of "demonstrations" with native servants at four food shows at New York, Brooklyn, Chicago, and Washington, and in eighty-five "stores." But in the last few months these "demonstrations" have been strengthened by the addition of "sales-ladies," who, though affording a less striking and exceptional advertisement than the natives of India, speak no unknown tongue, and are thus able to explain effectively the merits of the tea. Mr. Blechynden has also included in his operations lectures, interviews with members of the Press, and notices in the newspapers.

There are no figures or ascertained results by which to gauge the measure of success resulting from these operations; but this, at least, may be safely accepted, that they have helped to stimulate curiosity and awaken interest about Indian teas in the States, and though the committee cannot prove that the operations have increased the consumption of Indian teas in America, there can be little doubt that they have served as good advertisements to start with. The mere fact that Mr. Blechynden has been able to send a list of one thousand grocers in the States, who profess to stock Indian teas, is good evidence of the increased attention given to those teas; and it

is not unreasonable to attribute the expanding consumption at least in part, to Mr. Blechynden's efforts.

On a careful consideration of the position the committee is of opinion that it is time to make a further advance. They think that there is not much more to be done through the medium of these small demonstrations at exhibitions, food shows, and stores. Something more is required, and the committee believe that it is to be found first in co-operation with Ceylon, and next in supporting the efforts of private firms and others, who are endeavouring to introduce Indian teas to the American public. The question of co-operation with Ceylon is dealt with below. The sale of British-made teas in America is now being pushed by many agencies and firms, among whom may be mentioned Mr. Lipton and Messrs Tetley and Co., who are both reported to be doing well, Messrs. P. R. Buchanan and Co., the Indian and Ceylon Tea Company, the Mazawattee Tea Company and others. Some two years ago, under the advice of Messrs. Gow, Wilson, and Stanton and Mr. Blechynden, this Association arranged to give some pecuniary facilities to Messrs. Reid, Murdoch & Co., of Chicago, for the purchase and sale of Indian tea, and since then 55,920 lb of the tea have been sent to that firm to keep up their special blend. The firm is also believed to be doing a good business in other Indian teas. The American and Foreign Committee, having considered all the facts before them, have no hesitation in recording their opinion that the opening of America to Indian teas can now be most effectually promoted by judiciously assisting, by advertisement and otherwise, the efforts of firms and persons now engaged in pushing the teas. This assistance of private firms can be effected either in co-operation with Ceylon or independently.

With further energy, perseverance, and the necessary funds, the future of Indian tea in North America is now assured, but the committee again wish to reiterate the necessity for such a subscription or levy from those interested in the future of the tea as will enable the committee to press forward with vigour for one more year at least the work of advertising and introducing the tea to the American public.

A note of the receipts and payments in connection with Mr. Blechynden's work in America from June 1894 to June 1895 is appended.

The names of the members of the American Tea Committee, who were empowered, at a meeting of the General Committee, to deal, not only with matters connected with America, but with those of all foreign markets, are: Messrs. A. Bryans, R. Lyell, A. G. Stanton, W. H. Verner, and C. W. Wallace, to which the name of Mr. J. N. Stuart was added, on his return to England.

2. PROPOSAL FOR JOINT ACTION WITH CEYLON IN AMERICA.—The committee have lately had under their consideration a proposal for joint action with Ceylon in America, and as the result of interviews with members of the Ceylon committee in London, aided by the report and advice of Mr. Wm. Mackenzie, the delegate of the Ceylon Planters' Association, who has just returned from visiting the United States, a scheme has been prepared for the consideration of the Associations, both here and in India and Ceylon. The scheme referred to was submitted to, and received the approval of, the special American Tea Committee and the General Committee of your Association; a copy has been sent to Calcutta; it has also received the unanimous approval of the Ceylon Committee in London, and it now awaits the sanction and approval of the Ceylon Association in Colombo.

The principal heads are: 1. Each of the Associations contributes £2,500 towards a joint fund to be used for advertising the teas of both countries conjointly. 2. In order to save expence these funds are to be administered by one commissioner, towards whose maintenance Ceylon will contribute £1,000 and India £500. 3. Ceylon will appoint the commissioner, but the appointment to be subject to the approval of India. 4. A small New York Committee to be appointed to advise the commissioner locally as to his

action in disposing of the funds, and in advertising, the latter to be understood in its broadest sense such as: (a) Attending food shows, stores, &c. (b) Distribution of samples of the teas of both countries. (c) Advertising in the press. (d) (This is strongly recommended.) Subsidising such persons or firms as are pushing British grown teas in such ways as have commended themselves, provided they are willing to contribute a like sum, and to render accounts of the expenditure. (e) Such other methods as may be approved of by the New York Committee. 5. The commissioner to use no bias in favour of India or Ceylon; all advertisements to be equally fair to both countries. Lastly—a joint committee here of six members (three members representing India, and three Ceylon) to appoint the New York Committee, administer the funds, and consult as to the action taken, and to advise their respective associations of the progress of events. The arrangements to be in force for one year.

Note.—Since this report was in type the committee has learned with regret that the scheme is disapproved of in Ceylon, and consequently falls to the ground.

3. UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.—Communications have passed between your committee and this Association as to the important subject of new markets, and it is satisfactory to learn that the planters of Southern India have identified themselves with their brethren in Bengal in the endeavour to find fresh outlets for Indian tea, and have generously subscribed to the fund raised for that purpose in Calcutta.

4. INDIAN TEA IN SOUTH AFRICA.—Copies of a communication received from a resident of Capetown suggesting the opening of business relations with that colony by the Association were received from Calcutta, and copies circulated for general information. The suggestion that the Association should interfere in trade matters received but little support.

5. INDIAN TEA IN SPAIN.—A proposition was held before your committee to make a grant for three years of £180 per annum towards the establishment of a tea room in one of the best parts of Madrid, where the want of some advertisement of Indian tea appears to be felt. But in view of the small consumption of tea in Spain and the paucity of funds it was thought unwise to divert money in that direction, although the field was a somewhat promising one, the price demanded for good tea being prohibitory.

THE CHINA-JAPAN WAR.

Little or no excitement has been caused on this side by the existence of hostilities between China and Japan, which might have been expected to interfere with the course of trade between China and those countries in the habit of receiving her teas. The fact, however, of hostilities lasting so long will, no doubt, have drawn one attention of consuming countries to the existence of other sources of supply, and have thereby led in a great many instances to the production and trial of British-grown teas, with results which cannot fail to be advantageous to producers in India and Ceylon.

MR. A. G. STANTON'S PAPER ON TEA.

A valuable contribution to the literature on the object of the supply and distribution of tea is made by Mr. A. G. Stanton, a member of the General Committee, in a paper read by him, before the Society of Arts, on January 23rd, followed by a discussion on the relative merits of Indian, Ceylon, and China teas. Copies of this number have been sent to America, India, and elsewhere, and quotations from the article are continually being made in trade journals abroad, particularly in Chicago. The diagrams, maps, and tables have been reproduced en bloc, and can hardly fail to impress the American public with a just idea of the importance of the industry.

[A reproduction of Mr. Stanton's paper is given in the appendix to this report.]

"TIMES" ARTICLE.

Under the head of "Indian Affairs" a valuable article appeared in the *Times* of 6th August, calling attention to the urgent need of new markets. This article was reprinted, with some correspondence re-

lating to it, and widely circulated both in England and in India. Copies were also sent to America and elsewhere, and it is hoped that the effect will be to convince planters of the necessity for combined and vigorous action in the direction of finding new outlets for Indian tea.

[A copy of this article and the correspondence is given in the appendix.]

THE LABOUR QUESTION.

The all-important question of labour supply has been under the consideration of your committee, and papers in connection therewith, received from Messrs. Begg, Dunlop, and Co., Calcutta, secretaries to the Tea Districts Labour Supply Association (with which is amalgamated the General Coolie Recruiting Association), were circulated to members.

A meeting of the General Committee was held on February 21st which was well attended, and a resolution was arrived at that it was advisable to support the action of the Managing Committee in Calcutta as to recruiting coolies through the established agency of the Association, with a view to removing the evils attending the system of obtaining coolies from Arkattis and contractors outside the association. A subsequent meeting was held on May 6th which was also largely attended, and at which Mr. D. Cruickshank was present, and explained fully the latest aspect of the question. A Committee was elected, consisting of Messrs. R. J. Boyle, D. Cruickshank, R. B. Magor, J. N. Stuart, and J. Stewart, to further consider the question. This Committee is now engaged on that work.

INDIA MUTUAL LINE AND THE "CONFERENCE" NEW AGREEMENT.

This line cannot be said to have worked quite satisfactorily to shippers, owing to the inability of the owners, from various causes, some of which were quite beyond their control, to maintain a thoroughly effective service, in terms of their contract. To the owners the result was not a financial success, and an appeal was made by them for more favourable terms, in consideration for improved service and an extension of the term of contract. At the same time they admitted their liability to continue on existing terms, and left the shippers at liberty to cancel the contract and make other arrangements, if they considered it in their interest to do so. On this, negotiations were opened with the "Calcutta Steam Conference," and several important meetings of tea shippers were held to consider the question, with the result that Mr. Magor was authorised to represent the shippers in these negotiations; and, mainly through this gentleman's efforts an advantageous agreement was entered into with the "Conference the chief points of which are: 1. Five years' agreement, terminable by two years' notice on either side, but not before March 31st, 1900. 2. Freight to be 10s net above the average rate for rough cargo. The advantages of the "conference" service will be manifest to all, and the vexatious question of rebate, against which your committee has strenuously protested for many years, has at last been eliminated.

SMALL BREAKS.

Representations having been received from India that some of the Darjeeling planters found it difficult to comply with the new rule fixing the limit of a full break at twenty chests, thirty half-chests, and fifty boxes, the Tea Brokers' Association of London was communicated with on the subject, and the operation of the rule was carefully watched, while the Calcutta Association was requested to nominate a delegate to represent the views of the Darjeeling planters. Mr. C. Milner, of Messrs. Lloyd and Co., having been named, that gentleman was invited to attend the Committee. Further experience seems to show that the new rule is working beneficially to tea proprietors all round, including those of the Darjeeling district.

REGULATION OF SUPPLIES.

Information, with a view of creating a more healthy public opinion on this subject, was sent to all members and at no time during the year was there such pressure on the market as to cause any serious collapse of prices.

BHUTAN-DOOARS ACT.

The proposed substitution of Act X. of 1859 for the Bhutan-Dooars Act received the attention of those members of the General Committee who, from their official life in India, were practically acquainted with the question, and representations on the subject were made to the Government of India through the Association in Calcutta.

THE DUTY ON TEA.

This remains as before at 4d per pound (to which point it was reduced in May, 1890), although the usual anticipation of a further reduction was indulged in before the Budget was produced this year. In connection with this question an interesting letter written by Sir Henry H. Howarth to the *Times* will be found in the appendix.

INDIA AND CEYLON IN THE IMPERIAL INSTITUTE.

The ill effects of blind rivalry between Ceylon and India were illustrated at the Imperial Institute, where a monopoly, obtained by Ceylon for the sale of its teas at a cost of £300, resulted in a heavy loss to those who found the money, and the discontinuance of the arrangement at the close of the year.

TREATMENT OF TEA COOLIES IN ASSAM.

A series of articles in a weekly publication, headed "More Slavery Under the British Flag," "The Free and Happy Coolie," &c., attacking the system of recruiting, and indirectly reflecting upon the planting community in Assam, having appeared, and being greatly based upon misapprehensions, Surgeon-General A. C. C. De Renzy, C.B., kindly undertook to reply to them, and an able letter from him (published in the *Home and Colonial Mail*) will be found in the appendix. The attention of the various London Tea Companies was called by the secretary to the importance of giving in their annual reports vital statistics as to their labour force, and other information evidencing the care which is usually taken for the coolies' well-being and comfort. This has been generally done.

ANTWERP INTERNATIONAL EXHIBITION.

The Indian Planters' Co-operative Tea Supply Association, Limited, supplied Indian tea both in cnp and in packet at the exhibition. Samples of fine Indian tea, including those lent by Messrs. J. B. Barry and Son, were shown, and information as to the progress of the industry was supplied by statistical tables furnished by Messrs. Gow, Wilson, and Stanton, also by handbills. A large number of circulars in Flemish and French were distributed. The secretary visited the exhibition with a member of the General Committee, and a report of his visit will be found in the appendix. A silver medal was awarded to the exhibit.

EMPIRE OF INDIA EXHIBITION.

Arrangements have been made for a tea house in the Indian City at this exhibition, which was opened on the Queen's birthday. Mr. E. F. Langdale, who is well known to the members, having previously had charge of the Indian Tea Stall at the International Health Exhibition, held at South Kensington in 1884, has undertaken the responsibility of the teahouse. In connection therewith will be an exhibit of Indian teas, and of other matters of interest in connection with tea planting in India, for which samples, &c., are being sent from Calcutta in response to a circular issued by the Association there. Messrs. Gow, Wilson, and Stanton have kindly supplied a large coloured diagram illustrating the progress made by British-grown teas, and the falling off in the use of China and Japan teas.

LONDON TEA SWEEPINGS.

Various methods had in times past been tried in order to get rid of the tea sweepings, including refuse and damaged tea. Consigned to the dust bin, they had been picked out, manufactured, and sold to the poor. Burnt, they had proved a nuisance to the neighbourhood. Consigned to the sea they had involved a considerable expense. Their destruction having been accordingly relinquished, they were after treatment exported to the Continent, and in some cases found their way back to this country, and were sold as good tea on this market. After considerable corres-

pondence, and with the assistance of Mr. T. Christy, the well-known chemist, who interested himself in the matter, a Port Order was issued by Her Majesty's Customs (copy of which will be found in the Appendix), which effectively stopped any further exportation of sweepings to the Continent. These teas are now "de-natured and converted into "caffeine."

A NEW INDUSTRY.

"Caffeine," or "Theine," is a new industry by which low class tea dust, as well as prunings and injured tea, hitherto considered not worth shipping, can be converted into money, much of the material being shipped from Calcutta in bags or boxes at a low rate of freight as "tea refuse."

"ADIATODA VETICA."

This is a new insecticide which has been discovered in India, in connection with which your committee have been in correspondence with Mr. R. J. Doyle, the Curator of the Indian Section of the Imperial Institute, to whom two complete sets of the papers received from Calcutta referring to this plant have been sent. A set of these papers can be seen at the office of the Association by members at any time.

[An appendix given with the report contains the following reprints, which have already appeared in our columns: "A paper on Tea by A. G. Stanton (of Gow, Wilson, and Stanton, 13, Rood Lane, E.C.), read before the Society of Arts, January 23, 1895;" "Foreign Markets for Indian Tea, article on Indian affairs, the *Times*, August 6, 1894;" "Ocean Freights," "Sir H. H. Howorth and the Tea Duty," "Treatment of Coolies in Assam," "The Antwerp International Exhibition," "London Tea Sweepings."—*H and C Mail*, July 12.]

ROADS, RAILWAYS AND PLANTING IN PERAK.

As usual, Mr. F. A. Swettenham, C.M.G., renders a full and able Administration Report on the State of Perak for 1894. Of much importance is it to note Mr. Swettenham's sympathetic deliverance in reference to the Planting Enterprise as follows:—

If the falling price of silver is helping the miners of the Malay Peninsula to crush all rivalry in Cornwall or Australia, the same cause will give a manifest advantage to the planter who sells his coffee, tobacco or spices in a market where payment is made in gold. The conditions of soil, of climate and rainfall that he requires are here, the transport facilities are good and improving yearly, labour is cheap and may be made plentiful, and all that remains is that the Government should be liberal in the terms on which it alienates the land. It is the opportunity of the planter, and it is also the opportunity of the Government; it would be a serious blunder if the fact were not grasped that the interests of both are identical.

Failures cannot benefit the Government, and at this moment, when European planting in the Malay Peninsula is still in its infancy, the man who brings us his capital, invests it in agriculture and loses it, can only serve as a scarecrow to frighten away intending planters.

Mining is and must ever be surrounded by risks; it is an unfortunate fact that many Europeans have invested considerable sums in mining ventures in the Malay States and have lost them, and yet it is not and has not been urged that the Government has placed difficulties in the way of acquiring mining land. When the British Government undertook to advise the Malay Chiefs in the Government of their countries there were no alluvial tin-mines in any British territory nearer than Australia, and no objection has therefore been raised to the regulations framed in the Malay States for the conduct of an industry that has now no rival in the world in the magnitude of its operations. We give to the miner what is often fine land covered with magnificent forest, and when he has destroyed the

timber he turns the soil upside down and after a few years abandons it, leaving huge stretches of country a sightless waste of water-holes.

Whilst the operations last the Government secures a large revenue, and, as I have already explained, that revenue has been very usefully employed.

The case of the planter is the exact reverse. He converts the jungle into produce-yielding fields, he settles on the soil, it is to his interest to foster to the utmost a property which will only give him a fair return after the investment of capital and years of toil. His object is to keep the land in cultivation, and when one product fails (as coffee failed in Ceylon) he immediately turns his energies to the introduction of another.

Here also there is a permanent revenue to be gained from the export duty on produce, and it wants no great effort of imagination to see a day when the duty on agricultural exports may exceed that on minerals. The returns in the latter case are much more rapid; but to make it easy to mine successfully and difficult to plant with profit may be good shop-keeping, but seems indifferent administration.

I feel very strongly that the Government cannot pursue a wiser policy than the encouragement of the planter. I have been told that the terms in which land has been granted to planters in the Malay States under the regulations which I drafted are too liberal, that they are thriftless, and I have failed to safeguard the future interests of the Government and retain the power to share in the rising value of alienated lands. The revenue returns of the last five years given in paragraph 63 *ante* are some indication of the result of the policy hitherto pursued in Perak, a policy which was endorsed by the great experience and sound judgment of Sir Hugh Low. Up to the present time planting in Perak has been confined, with very few exceptions, to small native cultivators, but while the Government retains the power to determine the amount of the export duties and while there remain millions of acres of land available for planting, and the total area granted is only 157,209 acres, I do not think the interests of the State can be said to have been greatly neglected in the past or seriously endangered for the future.

SEVEN CEYLON TEA PLANTATION COMPANIES DECLARING HANDSOME AD INTERIM DIVIDENDS.

At the office of the Agents and Secretaries—Messrs. Whittall & Co.,—the Directors of the following Tea Companies met on 3rd August and declared the very liberal ad-interim dividends mentioned opposite each name:—

YATIYANTOTA TEA COY. LD.	..	10 per ct.
WE OYA TEA COY. LD.	..	10 per ct.
DUNKELD ESTATE COY. LD.	..	9 per ct.
UPPER MASKELIYA ESTATES COY. LD.	..	8 per ct.
GLASGOW ESTATE COY. LD.	..	8 per ct.
AGRA-OUVAH ESTATES COY. LD.	..	8 per ct.
MAHA UVA ESTATE COY. LD.	..	8 per ct.

It should be noted that the above are the actual percentages to be paid—the rate per cent *per annum* being of course double the above figures.

INDIA POSSESSES IN ITS TAMIL POPULATION a wealth of resource that it has not properly realised, says the *Madras Times*. Wherever Tamils go they are acknowledged to be wonderfully adept agriculturists or planting coolies; they are cheap, even as imported labour; and they are generally more law-abiding than the natives of the places they sojourn in. This being the case, why are they not made more use of at home? Why is the Indian planter crying out for labour, and why are numerous industries in which the Tamil coolie could shine neglected or untried altogether.

PLANTING IN THE STRAITS.

(From Mr. Martin Lister's Administration Report on the States of Sungei Ujong and Jelebu, for the year 1894.)

COFFEE.—Three leases were issued to coffee planters in the Seremban District, the area leased being about 2,500 acres. In the Coast District there were seven applications by natives for small areas amounting to 69 acres. The Collector of Land Revenue, Seremban, reports that the proprietors of the various coffee estates have largely extended their operations; that a new field has been opened on the Linsum Estate and that the Ribu Estate has been greatly improved. The Syndicate owning the Sinawang Estate has opened up about 300 acres of coffee, and Mr. Dunman has shewn great energy in the opening up of a considerable area at Terentang, adjoining Sinawang. A fair area of land also has been opened on the Gunung Angsi Estate.

PEPPER.—There is a considerable cultivation of this creeper in the Coast District, and, as pepper requires mulching, gambier is grown in connection with it, and the refuse after cooking the gambier and extracting the juice is used to cover the land on which the pepper is planted.

(From Mr. Cecil Wray's Monthly Report on Lower Perak, April 1895.)

The few cocoa trees at the penghulu's house have grown a great deal and look very healthy and are full of fruit, but the nutmegs do not look very flourishing. Some vanilla brought from Mauritius looks well and flowers freely, but does not set any fruit, which is only to be expected, as the owner does not understand the cultivation of the plant. A great deal of new land has been applied, for along the old road running through the Mukim from Kampong Padang to Kota Lumut, and the people are anxious to have the road cleared and put in order.

The penghulu has three splendid orange trees grown from seed given to him by the late Mr. F. W. Brewster some years ago. They are certainly the finest I have seen in the Straits. One of them, the largest, bore over 1,000 ripe oranges last year, and is now breaking down with the crop on it.

(From Annual Report on Krian District.)

SUGAR.—About 31,000 acres have been alienated for sugar planting in Krian, of which 13,000 acres are under cultivation, and employ permanently 7,500 Chinese and 2,000 Tamil labourers, besides Javanese and Malays. The price of brown sugar, which is the chief product of these estates, averaged between \$4.35 and \$4.85 from January to September, and fell in October to \$4.10, in November to \$3.40 and in December to \$3.10, since which it has gone as low as \$2.60 a pikul, a price that will barely cover the cost of production. The price of white sugar also fell steadily, till at the end of the year it had reached a figure the sterling value of which is lower than has been known before. The Gula Estate, which is the largest in Krian, is the only one under European management. I am indebted to the manager for furnishing me with a review of the year's progress. At the close of the year considerably over 2,000 acres were under cultivation; the area actually yielding a crop being over 1,600 acres. Owing to the difficulty of obtaining a supply of Tamil labour, part of the estate has been sub-leased to Chinese on what is known as the *rumah kechil* system.

The whole labour force at the end of the year was:—

Tamils, indentured	930
Do. free	570
Chinese Sinkhehs	54
Do. Lankehs	150
Malays and Javanese	175

Total .. 1,879

excluding women and children who are not labourers but who reside on the estate and number between four and five hundred. A new hospital was built on the estate; a steam still for manufacturing rum was erected, and sugar store, office and laboratory added to the plant, at a total cost of \$45,000.

A concession of 5,000 acres adjoining the Gula Estate has been taken over by the same Company from the concessionaries, Messrs. Kennedy & Stewart. The concession is now being demarcated: no work except a little jungle felling having been done up to date.

Mr. Koch, a private surveyor, surveyed 7,455 acres of sugar land during the first four months of the year, in addition to the work done by Government.

INDIAN PATENTS.

Calcutta, July 18th.

Applications in respect of the undermentioned inventions have been filed, during the week ending 13th July 1895, under the provisions of Act of V. of 1888:—

For a cleaning Apparatus for the "Acme" Tea Sorting Machine or other machines of the Reciprocating Class—223 of 1895.—George Murray Collom, Engineer and Tea Planter, care of W. G. Forbes, Esq., H. M. Mint, Calcutta, for a clearing apparatus for the "Acme" Tea Sorting Machine or other machines of the reciprocating class.—*Indian Engineer.*

TAPIOCA IN MALACCA.

A Syndicate has just purchased a tapioca estate of 5,000 acres belonging to Cho Bun Pu, and situated in the Negri Sembilan about 38 miles from Malacca. It is said that one third of the purchase money of \$28,000 will be furnished by the Hylam domestic servants of Singapore.—*S. F. Press.*

MAURITIUS.

Port-Louis, July 5.

THE WEATHER AND THE CROP.—The plantations have been well watered during the past month and the rain continued falling till the beginning of the month of July. The ripening of the canes has been retarded by the heavy rains with a rather high temperature. It will not be possible to begin cutting the canes before the 15 of next month or the end of August.

VANILLA.—The market is quiet. We have no sales to record. As we mentioned in our last, the outturn of the coming crop will not exceed 3,500 kilos.

We quote nominally:—

1st quality	-	R33 to 34 per kilo
2nd do	-	26 to 28 "
Good to middling	-	20 to 21 "
Vaniloes	-	14 to 15 "

ALOE FIBRES.—The market is quiet. We have no sales to record. We quote nominally:—

1st quality	-	R240 per ton.
2nd do	-	200 "

—*Merchants and Planters' Gazette.*

MYSORE PLANTING NOTES.

SOUTH MYSORE, July 26.—We have had seasonable monsoon weather for the past six weeks, but little rain has fallen for the last few days, although it can hardly be said that we have had a single break since the monsoon burst on the 4th of June, as rain has fallen every day and the sky has always been overcast.

The very long drought experienced has acted detrimentally on the coming crop. There was a big promise on most estates and an extraordinary show of bud on many places. On some trees I counted 54 spike in a bunch and the average would have been about 40. It is well-known that big bunches generally constitute a good crop. The extreme and prolonged hot weather dried up a lot of the bud. A lot of fine wood has totally failed to set its blossom. Luckily on account of the fine condition of the coffee after a small crop last season and the abnormal show of bud, even after the failure very good crops will, as a rule, be picked.

The scarcity of good Government jungle in favourable localities and the price of coffee keeping up and steady, has naturally caused a corresponding rise in the price of land; but I think the price of very ordinary jungle of about 12 acres near Mudigeri, which was sold by one Gowda to another for R7,000 "takes the cake." R214 per acre was paid some time ago by a European planter in public auction for a piece of scrub adjoining his estate, and by another, an extensive piece of deciduous jungle was only secured by him at the rate of nearly R200 per acre, the villagers having run the price up. These are exceptionally fancy prices, but they are instances of the upward tendency which has lately taken place in the price of jungle.—The borer has been rather more active this season than last. The rubbing of the stems of the coffee trees in the pruning, and just before the fly lays its eggs, seems only partially to check the pest, as the trees which are bored generally break off at the foot of the stem and often under the soil. The inference to be drawn is that the fly finds its way to the stem below the soil and deposits its eggs there. It will be necessary to rub as low down as possible in the next operation. The silver oak (*Grevillea*) has gained in favour, and a good many planters have been led to look favourably on it as a desirable shade for coffee. It is a light shade and its deposit is doubtless valuable; it grows quickly, which is another great point in its favour. As regards labour, most managers are not so well-off in this respect as they were a year ago.—*M. Mail*,

PICKINGS WITH A LOCAL APPLICATION.

An Australian exchange thus refers to the enterprising seed merchants and nurserymen of Heneratgoda:—

The available information in Queensland concerning tropical products is not great. This in the past has been largely due to the fact that the agriculturist on our Northern coast lands has up to the present confined himself to cane, coffee, and rice, and the commoner varieties of tropical fruits. Attention is, however, being devoted to other products, and at this juncture a useful budget of literature reaches us from Ceylon. Messrs. J. P. William and Bros., seed merchants and nurserymen, forward us their descriptive price lists of tropical seeds and plants, bulbs, tubers and yams, and a number of leaflets dealing with new products and with special varieties of old ones. All the seeds are those of tropical and sub-tropical cultivation, and the publishers show praiseworthy energy in pushing to the front new varieties and new species which are finding a ready sale in the markets of the world. We have a large area capable of growing pepper, spices, and oils, besides fruits, etc., and if we cultivate from the best of seeds and stocks, success should be assured. As an instance we may quote the giant pineapple, weighing from 10 to 28 lb., a fruit unknown to us here, where the heaviest pine never exceeds the lower figure.

KAPOK has lately been mentioned in connection with the revival of the fibre industry and the following correspondence in the Cape Colony *Agricultural Gazette* with reference to this article is interesting:—

The Melbourne *Age*, January 28th, urges the Victorian Minister for Agriculture to experiment with the South Sea Island (*sic*) plant kapok: which in the Goulbourn Valley, near Melbourne, rapidly reached a height of 12 ft. and bore numerous pods full of seeds and fibre; the latter being largely imported into Sydney and Melbourne for stuffing mattresses, cushions, etc.

The matter has been mooted in Parliament by Mr. Pendergast, M.L.A. showing that the Australian soil and climate suited the shrub, and that if grown freely, the fibre might soon form a new export to Europe. It is already grown in the Horticultural Gardens, Burnley, Victoria, and also at Shepparton by Mr. Matthews, so that it clearly deserves some help from the executive, and if its merits are attractive enough to extract a small cheque from the Cape Government, a rood of it may in good time be seen

flourishing on the Cape Flats, where seed could be sent broadcast through the Colony and South Africa.
Cape Town, February, 27th 1895. P. F.

If our esteemed correspondent will look up the back issues of this *Journal*, he will see that utilization of kapok down is a very old scheme here, even if it be a novelty in Victoria. Compare Vol. i. p. 120, where a report is given on what a correspondent sent as "East India Thistle Down." Then follows on page 162 a letter in which the plant providing it is reported from Calvinia; page 251 refers to proposals to mix it with silk and page 313 giving name and address of a manufacturer willing to pay cash for any quantity of it. Also consult *New South Wales Agricultural Gazette* V. p. 7, where a figure of the plant is given. Cape kapok is in the same predicament as Cape fibres, and so many other things that are Cape. They are bulky and will not bear our extravagant freights. They grow without labour or culture, yet the cost of collecting amounts to more than the stuff will fetch at the store of the exporter. It is true that the down of *Bombax Ceiba*, and to some extent of *Calotropis procera* are imported into Holland for upholstery stuffing, but who is it does the collecting? Not any person comparable to our well-fed darkie population, but famine stricken Indian ryots and their families, whose wage is calculated on a nice perception of the exact amount of pice and annas which will serve to keep their bodies and souls together. The lines have fallen to our labourer in far too pleasant places for him to go bothering about after *Gomphocarpus* down, and get perhaps sixpence for his day's collection.

The plant producing the down grows all over the colony, and could be cultivated as easily as hemp or ramie. But when manufacturers propose to go in for utilizing a new product they have an awkward knack of saying "Are you prepared to guarantee us under penalty not less than £ tons per annum, so that we may be recouped for our outlay and initial charges, and not find ourselves stopped short for want of material?" And nobody here will answer "Yes." Believe me, it is this obvious necessity of the manufacturer's position that has strangled in the birth dozens of fair-seeing proposals for the utilization of things which have a small value, a large bulk, and which unfortunately will not gather themselves, and jump into the exporter's bales without hands. My old friend, Samuel Cawood, spent a small fortune in trying to get the natives to grow and pick Sea Island cotton down along the Albany and Kaffrarian coast. He gave them the seed for nothing and offered fourpence a pound for the product. They put the seed in, some of them, and—let the cotton blow away. So speculative Samuel never got beyond the second or third bale. And mind you this was not cheap kapok for filling pillows, but costly long stapled cotton, beloved of Lancashire spinners. We are a peculiar people at the Cape, and if a staple won't pay for collecting and exportation, we let it severely alone.

P.M.O.

Dr. Weir, District Surgeon of Engcobo, Tembuland in a communication to the Department, states that he has found a combination of Ipecacuanha and Ammonia a very effective antidote in snake-bite. The method of treatment which he adopts is as follows:—"Scarify the wound and sprinkle a small quantity of powdered ammonia upon it, then apply a poultice of linseed meal with $\frac{1}{2}$ ounce of ipecacuanha powder. Give an emetic of ipecacuanha powder and follow it up immediately with ipecacuanha wine in medicinal doses combined with rather large doses of aromatic spirits of ammonia until recovery is complete." Finding this combination so effective in snake-bite he tried it in the treatment of the contagious lung-sickness of cattle, and with encouraging results. Mr. Smith the gaoler at Engcobo, who attended to the cattle, cured six out of seven cases affected. The prescription for a full-grown beast was:—

Ipecacuanha powder $\frac{3}{4}$ ounce, Carbonate of ammonia $\frac{1}{4}$ ounce. Mix in a pint of water and administer. If necessary half the above quantity may be repeated in 36 hours.

The same prescription has been successful in the treatment of influenza in horses.

The following is a description of how maizena is made from Indian corn, by one who has been making it for 8 years. The account appears in the Cape Journal:—

I take a big basing so that a few persons can sit around it. I then throw the mealie cobs into the water which softens the grain.

I then rasp the grains in the cobs, so as to make a rough meal, till all are rasped off. I then wash the cob and put all the meal, which is obtained by the above process, into clean water, and then put all the fine meal through a strainer into another basin. On the husks left in this first basin I pour a jug of water so that all the meal may be washed out; after that strain it through a piece of linen into a porcelain bowl. After the meal has settled, the dirty scum floating on the top must be removed, then clean water must again be thrown on and the white sediment stirred up. It must be treated in this manner until bubbles cease to come up, then it is taken out and placed in fine linen bags, which must not be too full. The bags should then be placed on a framework made of netted wire, so that air can reach them on all sides. Two or three times a day it should be turned over and the lumps broken up. When it is dry it is sieved and put into bottles. The bags protect the maizena from dust which is otherwise difficult to keep out. I usually make the rasp I use out of sardine tins.

AN OLD PLANTING DISTRICT WELL TO THE FRONT:

GO-AHEAD RANGALLA.

(From a Visitor.)

2nd Aug.—Just come back from a visit to Rangalla. The old district is coming to the front with fine central factories such as "Duckwari" with its telephonic communications 'twixt Manager's bungalow and his Factory and Assistants' bungalows; and new district cart road in the Nitre Cave direction and which the P.W.D. take their time to complete. The pleasant thoughts of such resuscitation of the go-aheadness of the old district are much mixed with sorrow at the loss of such men as the Martins and Nicol. It has still connected with it the Youngs, Pattenson and Burke—good men and true. Natives seem to be enjoying the prosperity of the tea enterprise. Good, large native gardens and well cultivated, attract the eye.

CUBAN SUGAR PLANTERS.

Consul Baker, at Sagua la Grande, Cuba, under date of June 12, reports to the State Department upon the sugar crop, saying:—"The sugar crop of 1894-95, having been marketed, leaves no doubt of a material decrease from the yield of the previous year. This, together with the very low price realized by the planters, leaves the sugar growers of Cuba in a helpless condition. They now frankly admit that they will not be able to secure loans with which to make the coming crop, which means that not exceeding one-half of the usual acreage in new cane has been planted, and a corresponding neglect in the gleaning of the present crop. In truth, the condition of the planters of this island is distressing; and the end is not yet, for when it is recalled that fully one-third of the inhabitants depend on the plantations for employment and a living, and that the owners thereof cannot obtain money to engage their labours, actual suffering must ensue."—Bradstreet's.

THE TICK PEST IN THE TROPICS.

Those living in temperate climates have probably small idea of the virulence of insect and other pests in the tropics. A plague of caterpillars may destroy a season's crop in England, but there is the winter's frost to be passed through before a second attack need be feared. It is otherwise in the tropics. Vegetation is much more luxuriant, and the food supply is permanent; and, when once a plague has obtained a firm foothold, there is no apparent reason why it should cease its ravages before it has entirely destroyed its particular host. It is fortunate for agriculturists that the great increase of any particular parasite seems ultimately to work out its own destruction; and frequently when all hope seems over, the plague rapidly and unaccountably disappears.

Surprise has been expressed that ticks infesting cattle have received so little real study. Quite recently the statement appeared that these parasites formed the least known part of the tropical fauna. But a great deal has been done in this direction of recent years, and there seems some hope of real progress being made.

Taking the conditions into consideration, it is a matter of great wonder that so few ticks exist in many parts of the tropics. No real attempt has been made to decrease their numbers, and there appears to be no season of the year when the climate is fatal to them. Vegetation is rank, and we know now that they can live to a great extent upon vegetable matter; further, even where there is a scarcity of small indigenous mammals, there are plenty of horses and cattle. The multiplying powers of ticks are enormous. In one case I determined the number of eggs from one female as over 20,000 (see Fig. 3), and almost all of these were fertile and produced young ticks. The increase in numbers of ticks in most countries is not marked, however, and we are driven to the conclusion that there is here, in the animal kingdom, a waste of material analogous to that in the seeding of parasites and saprophytes among plants.

It is not surprising now and then to hear of a long-continued plague of ticks from one place or another where cattle-rearing is a staple industry. In Jamaica, it is by no means uncommon for the traveller to get covered with "grass-lice." On pushing aside the branches overhanging the riding path, I have been immediately covered with firmly attached young ticks which needed much care and patience to remove. The ticks of Jamaica are now a very serious source of anxiety in cattle-pens, and much loss is attributed to these parasites.

During my stay in Antigua, complaints were loud and frequent of the ravages of a large tick, which infested the cattle between the months of May and September. In the cattle and sheep farms of the Cape of Good Hope and Australia the "tick" matter is absorbing much attention. Specially large and annoying forms are described from parts of India, Central Africa and Central America; while extraordinary tales are told of the destruction caused by these parasites in cattle-rearing districts of South America. Elaborate and expensive researches have been conducted in the United States Southern Experimental Stations upon the life-history of the ticks and their relations to cattle; and the exhaustive reports, issued from the Bureau of Animal Industry, form by far the most valuable part of our economic literature on these pests.

The books of travellers teem with references to the annoyance caused by ticks. Sir Joseph Hooker, in his "Himalayan Journals," describes their abundance in the frontier regions between Sikkim and Nepal, in pathless tracts destitute of animal life. He writes the following concerning the neighbourhood of Tonglo: "A large tick infests the small bamboo, and a more hateful insect I never encountered. The traveller cannot avoid these insects coming on his person (sometimes in great numbers) as he brushes through the forest; they get inside his dress, and insert the proboscis deeply without pain. Buried head and shoulders, and retained by a barbed lancet, the tick is only to be extracted by force which is very

painful. I have devised many tortures, mechanical and chemical, to induce these disgusting intruders to withdraw their proboscis, but in vain."

Bates, on passing through the grassy lanes of the second-growth woods on the Amazons, often found himself covered by ticks. It occupied him, he says, a full hour after his day's work to clear himself of the parasites.

Belt refers to the "grass-lice" on the plains of Nicaragua, as quickly covering any one travelling through the country, so much so, that the herdsmen or "vacqueros" keep a ball of soft wax with which to rub themselves. The smaller ticks are thus removed from their skin, while the larger ones are picked off by hand.

Many a time, in walking through grass in the Leeward Islands, I have been conscious of the peculiar itching at the ankles caused by the attacks of "bête rouge." The bête rouge is not in reality a tick, although often confused with it. Horses seem to be particularly liable to its attacks, with the result that they lose all the hair about the face and eyes. In all probability the poor animals suffer a good deal, for the personal irritation is extreme. The bête rouge is exceedingly minute, and, as its name implies, is of a brilliant scarlet. At night, after retiring to rest, the warmth of the body seems to increase the irritation to the utmost pitch, and sleep becomes absolutely impossible. Rubbing or scratching the parts attacked merely intensifies the discomfort, the creature pushing itself deeper into the flesh. Most painful sores are the result if the greatest care is not taken. The one certain remedy seems to be to anoint the inflamed spots with vasline. This substance not only soothes, but appears to destroy the bête rouge by stopping up its breathing pores. I have never succeeded in detecting the creature on the skin, but, when reading in or near an infested lawn, I have captured many by watching for the minute scarlet dots travelling over the white paper.

The damage done by ticks to cattle is undoubtedly very serious. According to observations by Leidy, the adult female tick is able to absorb 100 times its weight of blood, swelling during that time to an enormous extent. This food is rapidly changed into eggs. The adult male does not increase appreciably in size, but his demands upon the host have probably been greatly under-rated. An account of tick-infested cattle in Queensland states that they were so completely covered that the branding-iron had to be burnt through the ticks before it was possible to reach the animals' skins. A case in Texas is mentioned where it was found impossible to lay a silver dollar upon the body of the animals without touching some ticks. Again in Texas, 100 full-grown ticks were collected from each ear of a pony, while many immature ones were left behind. The mere abstraction of blood must, in this case, be a very serious drain upon the system.

When one considers, further, the irritation experienced by travellers from the few ticks fixed upon them in their daily rambles, it may be safely concluded that the penetration of the countless proboscides into the skin of cattle must of itself be a source of great discomfort, especially as these animals are quite unable to get rid of them. Calves not uncommonly are destroyed by the formation of balls of hair in their stomachs; and in tick-regions this is undoubtedly due to an attempt to get rid of the parasites by licking and biting them off.

It is quite conceivable, then that ticks do really cause the death of multitudes of cattle on the great estates where it is impossible to examine them closely. We should, however, approach this part of the subject with caution. Sickly cattle are usually covered by ticks, while the healthy ones have only a few; but it is questionable whether the ticks are the real cause of their emaciation. The case of ticks seems rather to be analogous to that of scale insects on plants. The latter pests appear in great quantities at any period of stress, when from lack of nutriment or other cause the plants become weakly. Thus, in Antigua, there is a marked disappearance of scale insects with the commencement of the rainy season. It seems probable that the prevalence of ticks upon

certain cattle is rather due to conditions of the blood or skin of the animal, closely connected with its general nutrition. This is an exceedingly important matter for determination, for upon it as will presently be shown, depends the only means of freeing the cattle from these pests.

Thus far the direct effects of ticks upon cattle have been considered. Certain alarming facts have lately been brought to light with regard to the relations existing between ticks and different well-known cattle diseases. The subject is by no means new having long been a fascinating one for cattle-breeders. The "louping-ill" or "trembling" of the north of Britain has been traced by some directly to the presence of ticks upon the sheep. The same may be said of a disease called "heart-water" at the Cape of Good Hope. Finally, the United States Department of Agriculture has for the last five or six years been conducting exhaustive experiments upon the connection between ticks and the Texas cattle fever, the results of which have appeared in the annual reports of the Bureau of Animal Industry already referred to. There is, in this latter case, present in the blood of the cattle suffering from disease, an infusorian which quickly destroys the red blood corpuscles. This minute organism has also been detected in the body of the tick. It has been again and again transferred from diseased animals to healthy ones by means of the tick, and tick alone.

Ticks, then, are in certain cases connected with the transmission of deadly disease. In how many more cases this is so remains to be investigated. It is quite possible that some of the obscure cattle diseases in different parts of the world are caused by ticks, and that other countries will, in their turn, be forced to face this problem.

There is now and then an outbreak of a severe skin disease among cattle in Antigua; and this disease does not appear to be known in the neighbouring islands. Judging from the climate and peculiar conditions of Antigua, the scarcity of water and lack of nutritious food for part of the year might be considered sufficient to account for a local disease; but there is also a large tick present, which has not been recorded from the other islands of the group. A loose theory has thus arisen that this "gold tick" is connected with, if not the direct cause of the cattle disease.

The evidence available does not tend to confirm this idea, but it is obviously impossible to solve the problem in the absence of proper appliances. I was led, however, to commence observations upon the gold tick, which may be of interest.

In considering the remedies for ticks, one is soon forced to the conclusion that direct measures against the parasite themselves will be of little avail. Methods of prevention are always preferable to those of cure, and in no case is this more so than with parasites of this class. Besides this, they are practically invisible at the most dangerous stage; and when we see the ugly, swollen, mature specimens, we know that their evil work is done. All large females should be carefully collected and burnt, however, as thus future attacks will be diminished.

The treatment of pastures is a very important matter. Here probably the parasite spends the greater part of his early life—usually on the ragged bunches of old grass left from previous years. The proper feeding or cutting of the grass, and the liming and draining of the pastures, will destroy myriads of the infant ticks or "grass-lice." For the sake of the animals, there is every inducement to render the pasture as nutritious as possible; and ticks do not seem to trouble the sleek cattle of the herd. It is an undoubted fact, moreover, that the improvement in food, due to change of pasturage, does in certain cases cause all the ticks to drop off infested animals. The first class of remedies will aim at cutting off the supply of ticks by treating the pastures.

The second class—one might say almost the only one which is attempted in the tropics—is the destruction of ticks upon the cattle.

The common method of tying the legs of the animal together, hurling it to the ground, and

smearing some tick-destroying compound over it, cannot be too strongly condemned, especially as there is no need for it whatsoever. Cattle may be handled with impunity if some form of cattle-bail is employed; by this means they may be driven one by one into a small trap, where they can be treated. But even this is hardly necessary if the application to the skin is in the liquid form; for with a powerful spraying machine, as many as one hundred cattle have been completely covered in the space of an hour.

Of pastes and powders and fluids recommended there is no end; and it will serve no useful purpose to give detailed lists discussing the merits of each. The points to be kept in view are that the liquid should be of an oily and non-poisonous nature, capable of clogging up the air-pores of the ticks. It should be cheap, and easily applicable without handling the cattle; it should, finally, not easily evaporate, or be washed off by the rains. A full discussion of remedies has recently been published by me, the following being taken from the summary at the end: "A number of types of washes for spraying are selected for description. All poisonous ones should be rejected, as there are non-poisonous preparations equally effective. Carbolic acid dips and other liquids, which evaporate quickly, need frequent applications, and should be discarded in favour of oily liquids or emulsions where the latter are equally effective. The best of all these is the kerosene emulsion regularly used for plants. There are many formulae for the preparation of this; a useful one (for ticks) is given." The formula referred to is as follows: "In two quarts of boiling water dissolve half a pound of soap; remove from fire; immediately add one pint of kerosene, and agitate. In from three to five minutes the liquid becomes creamy. It may be stored in this form in bottles or barrels. For use, add three of water to one of emulsion; mix thoroughly, and apply with a spraying pump."*

The third and most important class of remedies is closely connected with the nutrition of the animal. If we can render the skin or blood of our cattle so distasteful to the tick that the latter will not attach itself, we have a solution of the whole matter. We should confer immunity upon our animals, and, at one stroke, do away with the necessity of all the laborious and expensive methods now in vogue for the destruction of these parasites.

The first step in this direction has been taken; and, in various parts of the world, most excellent results are recorded from the addition of small doses of sulphur to the animal's food.

It has already been noted that the food of animals has an influence upon their infestation by ticks. Cases are not uncommon among cattle-breeders where a mere change of pasture will cause all the ticks to drop off. This change is obviously felt through the animal's skin.

It has also been mentioned that the ticks seem to congregate upon cattle in poor condition, while those with sleek skins are more or less untouched. Dr. Cooper Curtice (late of the United States Bureau of Animal Industry) suggests, as an explanation of this, that there is in well-fed cattle an oily condition of the skin obnoxious to the ticks; and this suggestion is the more worthy of consideration when we remember the aversion of these creatures to grease of any kind.

It is certain that sulphur taken internally will render the skin evil-smelling, by the exhalation of sulphuretted hydrogen, a substance highly obnoxious to all parasites. The following seem to be the physiological changes which take place during the passage of the sulphur through the animal's body to the skin. Sulphur taken in with the food passes the stomach unaltered. In the intestines a small portion is changed into sulphides of hydrogen and the alkalies. Part of these sulphides pass into the blood, and into the tissues from the blood, and act chiefly upon the central nervous system. The sulphides in the tissues are variously excreted. By the kidneys they are excreted as sulphates; if in excess, part is also ex-

creted in the form of sulphides. By the skin they escape as sulphides, giving the characteristic foul odour to the perspiration, and somewhat increasing its amount.

The doses of sulphur should be small, but they should be constant. The form in which the medicine is offered to the animals will best be decided by the manager of the estate. With stall-fed cattle there can be no difficulty at all; but with the cattle of large estates, which are seldom handled and sometimes not seen for long periods, it will be necessary to prepare the sulphur with salt as a "lick," to which cattle will readily help themselves if it is scattered about.

The success of this sulphur treatment has so far been encouraging, both at the Cape of Good Hope and in the United States. Doubtless with continued study other similar preventive remedies will from time to time be discovered, and thus rid the stockowners of the tropics of one of their most dreaded enemies.

—*Nature*.
C. A. BARBER.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, July 11.

ANNATTO.—Seed realises good prices. Twenty bags of bright quality from Coconada brought 33d per lb. today. A 44 bag parcel of good Madras seed is held for 41d per lb. and another lot of 17 bags was bought in at the same price.

ARECANUTS.—Still tending downwards. Two packages of fair quality from Ceylon sold today at 10s 6d per cwt.

CAFFEINE.—Easier. The market has quieted down considerably, and although 27s 6d is still asked on the spot, it is by no means easy to sell at that price. For October delivery the quotation is 22s to 23s per lb.

CAMPHOR (CRUDE) has been quiet all through the week, but this afternoon the syndicate buyers again appeared upon the market and purchased 100 piculs of Formosa camphor at 157s 6d per cwt. c.i.f., near at hand, thereby imparting a firmer tone to the drug. At auction 62 cases of Formosa camphor (1893 import) were bought in at 165s per cwt. Ninety-four tubs of Japanese camphor (1890 import) were also offered and bought in at 170s per cwt., which seems to be the lowest price. A bid of 167s 6d per cwt was refused.

COCA LEAVES.—From 10d to 11d per lb is asked for fair green broken Truxillo: a bid of 9d per lb. however, is to be submitted.

KOLA.—Tending easier. At the auctions several parcels were bought in at 1s per lb., for fair partly damaged seed and 1 bag of fair West Indian kola realised 11½d per lb.

OILS (ESSENTIAL).—At today's auctions several parcels of essential oils were offered, but the bulk was, as usual, bought in. Of Cinnamon oil 8 cases offered without reserve, and realised, respectively 6d and 3d per oz. Fair quality was bought in at 1s per oz.

QUININE.—A dead letter. No business has been reported this week. For second-hand German bulk 12½d per oz. is nominally asked, but 12½d would probably buy.

VANILLA.—At today's auctions a small supply sold at full prices:—Fine cottony, 7 to 8 inches, 19s 6d to 22s; 3½ to 5½ inches, 16s to 17s 6d; brownish, 14s to 17s 6d per lb.

WORK ON THE PALLEGAMA GRANT.—Mr. Russell Cox, who has lately taken over charge of Pallegama from Mr. Ross Wright, was in Colombo to-day on business, and we learn that considerable progress has been made with the new clearing on Pallegama. On the old clearing some 300 acres, abutting on the road from Pallegama to Nalande, were opened, and now the block that is being cleared is the corresponding stretch down the banks of the Kaluganga—about 210 acres. Felling is going on, and it is expected that the burn-off will take place at the end of the current month. When that is done the lower part of the grant will have been completely encircled; it will then be roaded; and, from that point, the *concessionaires* will work inwards, making roads on the watch-spring pattern till they get to the centre of their land, when they will make a straight road cutting through all the others to the lower end of the grant. The weather at Pallegama is very hot now; but the health of the place is good, and there is little trouble about labour. All the settlers on the land are doing well, and there is no lack of applicants for settlement.

* For further details, see papers in *Leeward Islands Agricultural Journal*, Nos. 1-3.

SALE OF A DIKOYA ESTATE.

We learn that Mr. Duncan Skrine has sold Warleigh estate, Dikoya, to Mr. Papillon for £7,000, Messrs. Skrine & Co. continuing as agents. The property is a compact one of 250 acres, all but 10 acres in tea. Warleigh was well-known as one of the best planted and richest coffee plantations ever opened in a Ceylon high district. It first appeared in our Directory for 1869 as 184 acres of coffee and it continued to bear heavily long after leaf disease had wrought havoc on some of its neighbours. We well remember Mr. L. H. Kelly on one of his periodical returns to Ceylon expressing "indignation" (or something akin to it!) that Mr. Skrine should have allowed the coffee which had given him so big a fortune, to be overgrown and choked by cinchona; but the answer of a practical man was,—"Warleigh is more valuable as it stands now, than ever it was in coffee alone." Whether the proprietor was fortunate enough to harvest his bark before the prices fell, we do not know. At any rate, we may congratulate both seller and purchaser in these days of tea, on the satisfactory contract just concluded, and we believe Warleigh will long yield heavy and good crops of tea leaf.

PLANTERS AND THEIR LABOUR LAWS.

In the Native States of Southern India are in a sad pickle as to debts, advances and contracts with coolies and maistries who may bolt into British territory, there being no common law. Mr. G. L. Yonge on behalf of the United Planters' Association in writing to the Government of Madras says:—

"The planting industry has assumed very large dimensions in the Native States and fresh capital is annually being employed in opening up the waste lands. The cultivated area in the three States of Mysore, Travancore and Cochin, to which the figures now submitted apply, amounts to 132,200 acres, with an annual expenditure of R93,78,000. The average amount of advances now outstanding on these properties is R30 per acre, or R39,66,000, of which R10 per acre, or R13,22,000, are considered bad or have been written off within the last four years. *The greater portion of this large loss is due by coolies and maistries now residing in British territory, against whom under the existing law there is absolutely no remedy.*"

And further on:—

The value of all the lands held on planting tenure in the three Native States amounts to £6,356,950, and it is for the better safeguarding and conserving of this valuable industry that the Association asks for the intervention of His Excellency in Council. The Association recognises with respectful gratitude the sympathetic attitude of the Madras Government, and it ventures to hope that, when the Government of India is made fully acquainted with the large interests which are at stake in Southern India, it will no longer refuse to give its consent to such remedial measures as may be necessary and which the Association trusts may be supported by His Excellency in Council.

In conclusion, I have the honour to forward the following Resolution which was unanimously passed by the Association at the meeting held at Bangalore early in this month:—'That Government be asked to empower British magistrates in the districts, in which accused resides or in which the contract was made, to endorse and cause to be executed summonses or bailable warrants against the said accused issued by a magistrate in a Native State.'

The Madras Government was favourable; but the Government of India saw difficulties in the way and so the *Madras Mail* advises:—

"The Secretary of State is the person to go to. We hope that the U.P.A.S.I. will decide to send to England representatives who are thoroughly au cou-

rant with all the facts, if necessary paying their expenses. There are 27 lakhs of good debts still outstanding in Mysore, Travancore and Cochin, and it will be worth expending some diminutive percentage of this huge sum in the endeavour to collect it. Lord Wenlock will be in England early next year, and we have but little doubt that he will do all he can to further the success of any representation that the planters of Southern India may think proper to make direct to the Secretary of State."

THE TEA CHEST QUESTION.

Ceylon planters are seriously considering the question of tea chests. The imported "momi" chests are apparently quite satisfactory, but the locally manufactured boxes, made of $\frac{1}{2}$ inch planks, do not stand opening for sampling purposes and nailing down again, and split up and break in transit. Making the chests a little heavier, it is rightly argued, will not make them any better, but it does not seem to have occurred to anyone that a batten diagonally placed on each surface would greatly strengthen the chests, if the opposite diagonals were taken on the corresponding sides. What smashes up a box is being dropped on the corner.—*Madras Times*, August 1st.

YATADERIA TEA COMPANY OF CEYLON, LIMITED.

An Extraordinary General Meeting of this Company was held at the Office, 13, Queen Street, on 2nd instant at 3 p.m. Present:—Messrs. H. V. Masfield in the chair; J. H. Starey (Managing Director); D. Fairweather (Director); B. G. L. Bremner (Secretary); J. R. Fairweather, and C. M. Gwatkin; and by proxy W. W. Church, A. H. Dingwall and H. W. Hornby.

The Secretary read the notice convening the meeting.

THE MANAGING DIRECTOR said that as usual no accounts were presented at the half-year meeting, but the shareholders would be interested to know that the tea remaining for sale at end of 1894 had realised more than was estimated by 8,838 lb. The profit for the half-year to 30th June (not including 10% brought forward from 1894) was about 21% on the capital. The tea secured in 6 months was 265,547 lb equal to 48.28 per cent of estimate of which to 30th June there had been sold 129,640 lb all the tea had been shipped to London. Seeing that at 30th June last year a smaller proportion of the year's crop was secured—which is a circumstance to be explained by the incidence of the pruning—it was evident that the very favorable result was due to the recent good demand for "teas for price," such of the crop as had been accounted for having averaged about 41 cents per lb. The value estimated for tea not accounted for being only 35 cents.

On a shareholder inquiring whether a larger interim dividend than usual might not be declared it was replied that of the 129,640 lb sold at 30th June, only 92,440 lb had been accounted for; and the majority of the meeting expressed approval of following the usual practice of moderation.

THE CHAIRMAN then moved that "an *ad interim* dividend at the rate of 12½ per cent for the half year ended 30th June, 1895 be declared." This was seconded as recommended by the Directors by Mr. J. R. Fairweather and carried unanimously. Vote of thanks terminated the proceedings.

MANGANESE.—The Government of India having learnt that there are increasing exports of manganese ore from the ports in the Madras Presidency, has asked the Madras Government, if there is a prospect of the continuance of the trade, to publish the figures in the monthly account of trade and navigation. It has also asked to be furnished with information as to the quantity and value of manganese ore exported from this Presidency to foreign countries during each of the last three years.—*M. Mail*,

THE MOCHA TEA COMPANY OF
CEYLON, LIMITED.

GENERAL MEETING.

A general meeting of the shareholders of the above Company was held today, at noon, at the Office of Messrs. J. M. Robertson & Co., (the Agents and Secretaries), when Mr. H. Bois presided, the others present being Messrs. W. B. Kingsbury, W. Moir, C. Minto Gwatkin, R. Webster, and Captain Sandeman.

Mr. MOIR read the notice convening the meeting, and after that the minutes of the last meeting, which were confirmed.

ADOPTION OF THE REPORT.

The following is the

REPORT OF THE DIRECTORS.

The Directors have the pleasure to submit their report and accounts for the year ending the 30th of June last, which are, they consider, of a satisfactory nature.

Both estates have slightly exceeded their estimates, 310,810 lb., having been made against 305,000 lb. estimated for: 108 bushels of pounded coffee were also secured on Mocha.

The yield of tea is equal to 375 lb. per acre in bearing, and deducting capital expenditure and that on produce other than tea, the cost per lb. delivered in Colombo was 26 cents, while the nett average price realised was 57.49 cents per lb., as compared with 54.01 cents per lb. averaged last season.

The nett profit for the year is R102,534.40, which is 25.38 per cent. on the capital of the Company, and adding R992.52, the balance brought forward, there is R103,526.92 to be dealt with.

	R
Out of this, the Directors have already paid an interim dividend of 8 per cent., absorbing ..	32,320.00
A bonus has been paid to Mr. Maclure and Mr. Tench, the Superintendents on the Estates, of	2,000.00
Expenses on clearing on Glentilt have been written off ..	623.01
There has been transferred to depreciation account ..	7,580.20
There has been transferred to reserve fund ..	15,000.00
Leaving available a balance of ..	46,003.71
	R103,526.92

Out of this balance it is proposed to pay a further dividend of 11 per cent. (making 19 per cent for the year) which will absorb ..	R 44,440.00
and to carry forward the balance of ..	1,563.71
	R46,003.71

The Company's properties now consist approximately of:—

834 acres tea in bearing
15 " under one year
60 " grass land
125 " forest and fuel trees
21 " buildings, roads, &c.

1,055 acres.

The estimates for season 1895-96 point to similar, or slightly better, results than those obtained in 1894-95.

Mr. F W Bois and Mr. E Christian having left the island, Mr. H Bois and Mr. W Moir have joined the Board at the invitation of the Directors.

The CHAIRMAN briefly moved the adoption of the Report. He had nothing of interest to add beyond the information contained in the Report. The working of the estate for the past year had been very satisfactory, and he had no doubt that the result of the coming year's work would be equally so.

Mr. WEBSTER seconded the motion, which was carried *nem. con.*

DECLARATION OF DIVIDEND.

Mr. GWATKIN proposed that a dividend of 11 per cent. be declared, making with the interim dividend of 8 per cent. already paid, a total of 19 per cent. for the year 1894-95.

Mr. WEBSTER seconded.—Carried.

The CHAIRMAN moved that Mr. W. Moir, one of the directors retiring by rotation, be re-elected to the board.

Mr. WEBSTER seconded.—Carried.

ELECTION OF AUDITOR.

Mr. GWATKIN proposed that Mr. H. J. Scott be appointed Auditor for the year.

Mr. WEBSTER seconded.—Carried.

REMUNERATION OF AGENTS AND SECRETARIES.

The CHAIRMAN then moved:—"That from the 1st of July, 1895, the remuneration of the agents and secretaries be as follows:—For office rent, Secretary's and clerical work, R1,500 per annum; for tea shipped $\frac{3}{4}$ cent per lb.; return commission on freight for receiving, transporting, shipping etc; $\frac{1}{2}$ per cent. commission on drafts drawn. as agents and secretaries of the company; on tea sold locally half cent per lb.; and one per cent. commission on account sales for receiving, transporting, storing, fire insurance, opening and closing, sampling, arranging sales and collecting proceeds."

Capt. SANDEMAN seconded.—Carried.

VISITING AGENT'S REMUNERATION.

The CHAIRMAN proposed:—"That from July 1st 1895, the fee of the visiting agent for each estate be R500 for four quarterly visits."

Mr. GWATKIN seconded.—Carried.

Mr. KINGSBURY proposed a vote of thanks to the chair, and this terminated the proceedings.

[We are indebted to our evening contemporary for the proceedings, our own reporter having through a mistake, missed the meeting.]

“COCHRAN'S HANDBOOK OF CHEMICAL ANALYSIS”:

AN INDISPENSABLE GUIDE TO THE MERCHANT AND BROKER AS WELL AS PLANTER.

MR. John Hughes, Agricultural Analyst, writing from London on July 12th in acknowledgment of a copy of the above work, says:—"I noticed some weeks since that a copy had been forwarded to the Chemical Society Burlington House, where it will be a useful work for reference in regard to Tropical Agricultural Analyses.

"The book is one that deserves to be generally known in order to be fully appreciated, for its contents are of practical use to the merchant and broker quite as much as it must naturally be to the planter. In regard to the latter I can safely say that if he will only carefully peruse its closely filled pages it should not be necessary to search elsewhere for practical information respecting the composition of Ceylon soils and manures. The work does great credit to the author who has compressed years of hard work, and many hours of calculation of the analytical results, into a practical form available for *immediate* use.

"Indeed the daily demand upon its contents, would suggest that a stronger and more substantial binding should have been added; but this is a matter that can be remedied in future issues."

TEA, COFFEE AND CINCHONA PLANTING IN JAVA.

Mr. A. E. Wright returned today by the M.M. steamer after two months' absence, chiefly spent in visiting his property in West Java. At Singapore when coming back he met at Mr. Swettenham's residence, Mr. Talbot on his way to East Java, and as he thought not looking very well. Mr. Swettenham was in good health and spirits, over his new work, and as Acting Governor.

In Java, Mr. Wright has this time travelled a good deal seeing the principal districts of the island; but we can only notice for the present, his "Wangiewatte" estate of over 1,600 acres—half in cultivation, half forest, all available, elevation 3,000 to 4,000 feet, such soil as Ceylon can nowhere shew—490 acres coffee giving good crops for a few years; but Mr. Wright has no faith in its permanency; 240 acres of cinchona; and at present 105 acres of tea, about 70 in

bearing. Mr. Wright and his partner Mr. Bingley believe in tea and have already a Jackson's Roller and a big Sirocco available, while 53 maunds of selected seed sent from Ceylon have been supplemented by some very fine "Assam" purchased on the spot—showing that Java planters and merchants have begun to import the best Indian seed freely. Evidently "Wangiwatte" and many more Java properties are going to be gradually turned into tea plantations. The climate and soil are all that can be desired; the labour fairly plentiful—lazy but cheaper than in Ceylon. As for transport Mr. Wright travelled from Batavia by rail 100 miles to within 10 miles of the property and then had to ride. All produce is carried on pingoes for these ten miles by the Javanese who contract for this work and like it; but a cart road is talked of, before the present Private Company is turned into a Public one about two years hence. We do not know what the Shareholders of the Upper Maskeliya and other local Tea Companies will say to our friend's enterprise in thus pioneering a Tea industry in a new division of Java; but there is this to be said that Mr. Wright had this Java property in a manner placed before him three years ago in England, and something had to be done with it. He is full of faith in what tea at 3,000 to 4,000 feet will do in Java. Hitherto the 6 to 8 million lb. per annum of Java teas have been produced in the low-country and from poor "jât." Now the era is approaching of high-grown fine teas from superior bushes and the result will be an increasing and serious rivalry to India and Ceylon.

As for climate, we can vouch for Mr. Wright returning in capital health and spirits;—only a little bit troubled by his fellow planters in Ceylon not taking up the local Labour Question (with reference to next Spring's difficulties, and the extended Irrigation Works in Southern India) a little more seriously and practically.

THE CASTLEREAGH TEA COMPANY OF CEYLON, LIMITED.

The Directors of this Company have declared an *ad interim* dividend of 7 per cent in respect of the half-year ended 30th June. The crop prospects are exceedingly good, the estimate of tea for the whole year being nearly secured in the first half of the year. This should be good news not only for the shareholders, but for Mr. L. H. Kelly and Mr. Wm. Mackenzie who came in for a great lot of criticism last year, a good deal of it, as it would now appear, of an unjust character. The unfortunate shareholders who sold out at R65 or anything below par some months back, are to be pitied. The shares are worth now fully R140.

COFFEE PLANTING IN SERDANG, SUMATRA:—NO IX.

(From an *ex-Ceylon Planter*.)

I see that some one in Kandy (*C. O.* 15th June) has had his nerves shaken by the shrillness of my cock-a-doodle-doo's. Tell him to let his hair grow quietly and knock off whisky, which is bad for nerves. At the same time I am glad to learn from him that "Liberian Coffee in Ceylon is not eclipsed." Nevertheless I would he could see things here for himself. I stated before that H. V. in Sumatra was present, but had to be sought for; and this is the case. Dr. Frimied in his report for 1891 (*T. A.* April 1895) says, "No doubt Liberian coffee suffers severely from leaf disease, but with liberal treatment and abundant manure it crops well."

I have seen most of the

LIBERIAN COFFEE

growing on the East Coast of Sumatra; and can safely say that it does *not* suffer from leaf-disease. The suitability or the extra fatness of the soil is in my opinion, the reason for this. And further, my cock-a-doodle-doo does not extend to *all* of the land that I have seen in this country. Regarding purchase of seed, I was talking a few days ago to another ex-Ceylon planter who recently imported some Liberian seed from Ceylon, one reason being that it was cheaper than local seed. With respect to disease, he said certainly it was prevalent in Ceylon, at the same time agreeing with my views as to its non-prevalence here. He further said that he had put his Ceylon nurseries far apart from those planted with local seed, for fear of sickness. I have not seen my friend's nurseries; but I hope to hear the result. However, I am not afraid for the Ceylon seed; and to show the nervous man of Kandy that I am not crowing Sumatra against the world I give the following facts. One of the finest fields in this neighbourhood is grown from seed from an estate in Singapore which always suffered more or less severely from H. V. though manured up to the neck. The coffee here, which has had no manure, shows no sign of sickness: which looks as if seed even from sickly trees may do well, when planted in more suitable soil.

As promised, I visited

THE GENIUS OF THE TAP-ROOTS.

He was a tobacco planter who took up coffee; but knowing naught about the planting thereof, jammed his plants in anyhow; and was horrified to be told by a Java coffee man that all his tap-roots were turned, and his labour wasted. Having exhausted all the language at his command (he is not much of a linguist but a fine languageist) he set to work. His bushes at this time were considerably over a year old. He bored down the root on one side until he came to the first kink. Just above this he cut clean through the root with a pair of strong garden scissors; and again 3 or 4 inches below, leaving the bottom part of the root to rot in the ground. Then covering up the hole, he tied the offending member to the lowest primary, so that he should know his man again.

We saw this operation in process; but my friend and I wished to see results. So we were taken to the coffee which had been first experimented on, some four months previous to our visit. Boring down, as before, we came to where the tap-root had been cut, and there found a strong healthy sucker, going straight; and well-established in the ground. The coffee was in perfect health; though our host told us that for some weeks after the operation it lost colour; the rich dark green returning after the subsidiary tap-root had made itself felt. The man himself was a perfect poet, both for fluency and force of language.

VARIOUS PLANTING NOTES.

A CORRESPONDENT WRITES FROM SOUTH-EAST WYNAAD:—"We are having a very heavy monsoon. During the past three days the average daily rainfall has been 2.55 inches and we are about 12 inches about the average to date for the year. Coffee generally looks very promising, but would be the better for a little sunshine, which I think we must soon have, as the wind has shifted a little during the past 24 hours, and there was some thunder yesterday.—*M. Mail.*"

COFFEE IN GERMAN EAST AFRICA.—The German newspaper *Das Echo* says that Dr. Richard Hindorf of Ruhrort, well-known for his activity in Wilhelmsland, German East Africa, and German South Africa, and now in the service of the *Deutsch-Ostafrikanischen Gesellschaft*, will shortly proceed by way of Ceylon and Java to East Africa, and that he will arrange to visit plantations of coffee in Ceylon and Java, where he formerly stayed for some time, in order to acquaint himself with the cultivation of tropical plants. He will also endeavour to procure skilled laborers. The coffee plantation at Usambara was laid out by him some years ago.

Correspondence

To the Editor.

CEYLON FIBRES IN REQUEST.

London, 29th May, 1895.

SIR,—My letter of 15th March was not written with any view to publication, but I have none the less to thank you for giving so much prominence to the subject.

I have also to thank "X" for his remarks, but it does not appear to have occurred to him, that if the proper scientific names could have been given, and the "habitat" known of any fibre or other material in demand, one would not have required to trouble public-spirited men like yourself to call attention to the subject, orders would rather have been sent for what was wanted, through the usual commercial channels.

Unfortunately whilst our countrymen—and may I say it, Colonists also—have been apathetic, other nationalities have been active in developing their over-sea resources and it has fallen within my own observation, that during the past year or two very large profits have been made in similar materials by our more active continental competitors who for obvious reasons withhold the *real* names of the plants from which the materials are obtained.

Surely we are not prepared to admit that French Colonies for example possess a monopoly of the valuable products which their greater enterprise have lately brought into the market? Rather should we endeavour to stir up all whom it may concern to make such inquiries, investigations and trials as may enable them to develop the supply of suitable novelties of all kinds.

The various collections of products in the Imperial Institute, Kew, and elsewhere are highly interesting, and valuable for many purposes, but those who would keep abreast or ahead of their competitors must look further afield and endeavour to utilise for themselves more of the natural products of such countries as Ceylon.

I may add for the information of "X" that "Piamater" is the name of the "innermost of the three membranes covering the brain."—not an inapt name for a medical botanist to give to the inner membrane (or shaving) of a plant. The French call it "choux choux" (or cabbage stalk); consequently the cabbage palm has been suggested.

I have a beautiful specimen described as "Arum Exculentrum" sent by an American Botanist from the tropics (very similar in structure and grain to the common arum). This is a valuable product.

Specimen No. 3 has been described as from the "Cryptomeria Japonica." I have seen similar specimens from the narrow leaf of a palm of which the "Raphia Raphia palm" yielding the ordinary Raffia may be cited as a type,—Freycynetia, &c.

At present the demand is running mostly upon the No. 3 class of fibrous materials. I would suggest the skins of the long leaves of the "Pandanus" or screw pine as specially worth attention, and any similar or other plants yielding suitable skins should be sampled.—Yours truly,

C. E. COLLYER.

Note on above:

Pia is said to be a shaving from the cabbage palm. *Areca Oleracea* is known as the cabbage palm of the West Indies: but the *Sabal Palmetto*, of the South United States is also there known as the cabbage palm or cabbage tree. As the word cabbage refers to the edible terminal bud of palms, it is probable that the term cabbage palm is given to different species of palms in different countries: compare "Coconut-Cabbage." A specimen of *Palmetto* is to be seen at Peradeniya. In Mr. Collyer's letter the reference to *Pia* and its derivation and the account of how the name cabbage palm was hit upon, leads one to suspect that the shaving is probably from the *cabbage* (or terminal bud) of palms. I shall endeavour to test this theory.

I see that Mr. Collyer again suggests that the leaves of the screw-pine (*Pandanus*) should be looked to for "Raffia." I think there must be a good deal in the way of getting out the skin of screw-pine and palm leaves. It is not so easy for the uninitiated to do it, I am making further trials.

CEYLON TEA EXPORTED TO MOIST CLIMATES: A PRACTICAL SUGGESTION.

London, June 25th, 1895.

SIR,—With your permission I would like to put before some of your advanced tea producers the necessity of adopting some plan to meet a requirement which has come specially to my knowledge by those with whom I work in our colonies in Africa, especially in the moist climate on the West Coast. The men in the Botanical Garden found that the tea being supplied to them, for instance at Old Cabaral was quite other than that which they had been accustomed to get in England. They ordered out small canisters, but these did not seem to answer because they could not be packed in bond. It then occurred to me to send out to Ceylon what are known in the trade in England as Canisters with self-opening lids. I therefore had some cases prepared to hold 4 tins, each tin, as far as we could get at the weight here, would hold about 25 lb., making 100 lb. of tea for a chest. These are now on their road to Ceylon, and the object is that they will arrive in the docks with the gross and tare marked on them, and these chests can be shipped to any of our clients, so that when a store-keeper in a town receives one of these chests, he can sell off 25 lb. in a tin. The party who buys this will be able to take out during the dry part of the day, just what is required for a week's consumption, put this air tight lid down again, and there is a canister perfectly secure, and the Tea will keep fresh to the last. As it is now, the chest is opened, a good deal of it gets spilt and lost, other parts get mouldy of course in a few hours with the damp, and the result is that a good cup of tea can hardly ever be depended upon.

I want to carry this point one step further. As I use these tins very largely and they are very much liked by colonists and people abroad, and they are very simple, I would wish to inform tea planters that they can order out the self-opening lids by the gross, then if they have no machine for making or bending the top plate of their tin box they can order out a top sheet with the lid fitted, so that all they will have to do will be to solder on the sides and the bottom from ordinary tin plate.

In conclusion I would wish to remark that, not having had any experience in this department in Ceylon, I make every apology for perhaps having brought forward a thoroughly well-known threshed out subject. On the other hand the facts that I put forward may point to the necessity of some such plan as I have suggested being adopted, as the colonies I have referred to and have been in communication with know nothing about this subject, and have never seen tea sent out in self-opening tin canisters nested in a case.—Yours truly,

THOS. CHRISTY.

CEYLON TEA AND TEA-SWEEPINGS: WHO WERE NOT AND WHO WERE TO BLAME:

CEYLON TEA PACKAGES PRAISED.

London, June 28th, 1895.

SIR,—The remarks based on your London correspondent, on page 576, headed "Mr. Christy of London on tea-sweepings and tea sales," has naturally, I think, irritated the gentlemen who own the Tea Warehouses of London, and some of them I have seen, feel hurt that all are brought under the lash when they have, up to the present time, endeavoured to hold the scales equally between the various interests affected.

In every letter that I have addressed to you or any information that I have given I have invariably stated how very much I am indebted to the majority of the owners of Tea Warehouses and to the gentlemen conducting them for the great assistance they have rendered to me. While I have in hand an "explanation" which is only due to these Tea Warehouse-keepers of London I would like, with your permission, to add the dates at which I commenced to work:

In 1888 I found that tea-sweepings were such an incubus to the warehousemen who did not know how to get rid of them that they paid as much as £5, and very often much more, for each clearance or riddance of a parcel of tea-sweepings. These tea-sweepings were sold by the parties who took them from the warehouses at a low price, to Germany, but of course very remuneratively, as they paid nothing for them: part was used for food purposes and passed through a very large tea establishment that was erected at Hamburg, and part was used in Germany for the manufacture of caffeine.

Knowing the state of affairs that existed I applied first to every one of the Government establishments, starting with the Custom House. Some of the replies I received were not even polite. Nothing daunted, I persevered, and put copies of the letters together with my applications, before Sir Frederick Dixon Hartland and Sir John Lubbock. I then went to the wholesale manufacturing Chemists who were most likely to work at such a product as caffeine. They smiled at me, saying "We wish you good luck and shall be very glad if you can carry this point. We have tried for years, and have only received snubs." Notice of motion was given in the House and Mr. Goschen was supported by the whole of the official element in the different departments in ridiculing the proposition that the chemical, Caffeine should be made in this country, as it was in Germany, from a material which was a waste product and actually cost money to destroy.

Mr. Goschen was eventually convinced that an alkaloid only was intended to be obtained and referred the matter to Mr. Prowse, the Secretary to the Custom House, who sent for me, and, to cut a long story short, with the assistance of Mr. Cobden Samuels, the chemist to the Custom House, a material satisfactory to all concerned for rendering the tea-sweepings totally unfit to be ever used for food was discovered in asafetida and lime. Within 6 weeks from this it was permitted to denature the tea-sweepings and refuse Tea in England.

The Wharves were, as a rule, quite as dubious as any of those interested, and felt confident of constant irritation and trouble from the Customs. Suffice it to say that they have not had one single instance to ground their fears upon in the work ever since 1888, so perfectly had the Secretary of the Customs arranged all the detail. In 1893, every wharf but one passed their tea-sweepings through our house to the manufacturers. By this time stocks of tea-sweepings were getting low in Germany, and the foreigners were able to bring sufficient pressure to bear to induce some few of the warehouses to allow them to have tea-sweepings again. They disregarded any interest I might have in the tea-sweepings, which only amounted to 3/ per ton, and barely paid the expenses of stamps, clearance at the Customs and arranging cartage of the tea under the supervision of the Customs officer, and other incidental expenses.

These Wharves who have not acted as I consider fairly towards me ignore all the trouble and expense I have been to; they ignore also the interests of the tea-producers and of the English manufacturers of Caffeine. They ignore also the special permission which had been granted by order of Mr. Goschen and the work carried out by the Custom House, which was a positive gain at the time of the transaction to these wharfingers, as I have shown in the former part of this letter, and this in spite of the Port Order No. 33, 1888 Regulations for the delivery of damaged tea free of duty for the Manufacture of Caffeine.

After reiterating all the facts, as you no doubt will be addressed by some of the Bonded Warehousekeepers I would like to ask them in reply—

1. If they have sold tea-sweepings to Germany after the Port Order was issued, stating that no further Tea sweeping should be shipped to Germany.

2. As another order has been issued stating that tea-sweepings may be denatured in this country and shipped off, whether they are now selling or whether they intended to sell their Tea sweepings (which are the produce of tea produced in the British possessions) to foreigners to be ground up under Customs supervision in this country and shipped abroad, thus entirely working against the British industry and British trade, and in direct opposition to the work done by the Chamber of Commerce, who assisted me with their valuable support when asking the favour of this Port Order in 1888.

Another question that it would be interesting to get them to answer is—

3. If the Caffeine manufacturer in this country do not offer them a higher price than they can obtain from anyone else.

I must ask you to accord this letter the prominence that you have put upon the writing complained of in your widely circulating journal.—Yours truly,

THOS. CHRISTY.

P.S.—Important matter is often consigned to a postscript, as in this instance. "The tea packages from Ceylon are so well put together that there is a minimum of leakage." This is the experience in some of the tea warehouses; hence the volume of tea-sweepings is decreasing.

WIND GALORE IN SOME PLANTING DISTRICTS.

New Galway, July 1st.

DEAR SIR,—The letter of the local "Times" correspondent quoted by you last week would appear to give this district "the cake for wind." Well, certainly we have had it pretty stiff lately doing considerable damage to young timber trees, store roofs &c., and although we must not forget the incident of the grindstone that was dislodged and carried away by its action on lower Ambawelle during the time of the great Alister of Bagpipe renown, the Kandapolla district can now say that, as during the storm that laid our U. P. M. low, a stone mile-post of the usual dimensions—i.e. about 4 feet long and embedded more than half its length in the ground, was overturned, to say nothing of the scores of large *acacia melanoxylon* and other trees uprooted, twisted and broken off.

The mile-post above alluded to is either the 7th or 8th from Nuwara Eliya—at any rate it is just above the coffee store on Maclaren's Park estate, and any one so inclined can "park" it by the road-side unless it has been carried farther away or re-erected since Saturday last.—Yours,
WINDY CORNER.

HYDRAULIC LIMESTONE IN CEYLON.

July 16.

DEAR SIR,—Re your article on this subject (appearing on page 132) you will find hydraulic limestone in a cave just below the high road a little beyond Padiyapellella in the Maturata district of Nuwara Eliya.

—Yours truly,

M.

LIMESTONE AND CLAY IN THE SOUTHERN PROVINCE.

SIR,—I have read your recent article re "Hydraulic Limestone," and as you seek for information whether the magnesia limestone is to be found elsewhere, I must refer you to the Southern Province. The hard palish-yellow stone is to be found

from the residence of the late Perera Mudaliyar at Unawattuna, in the Galle district till about Pelena in the Matara district, and has been largely used on the public works and private dwellings. You attribute the fertility of the soil of the Jaffna peninsula to the presence of an extensive formation of limestone, but I can assure you that the fertility of the soil between Unawattuna and Pelena is not in any way behind. Anyone who has visited this part of the country can well speak of the luxuriant growth of coconut trees and the well-bearing of nuts. Another thing unknown to many is that a good deal of the limestone, is not collected in outlying islets in the sea, but dug out from the ground where coconut trees over fifty years old are found growing. The veteran Government Agent at Galle should obtain fuller particulars on this point and make them public.

Mention has also been made by you that no good clay can be found in the island for the purpose of making cement. I should wish to know whether the clay in and around Dikwella, a village mid-way between Matara and Tangalla has been tested by anyone; it is the best clay I have yet seen and bids fair to be of great use hereafter. The pottery turned out at Dickwella is harder than that you see in the Colombo market; and on this point the energetic Assistant Government Agent of Matara, Mr. Lushington, should be able to furnish interesting data as well as send specimens of pottery to be tested.—Yours truly,

EX-MATARA RESIDENT.

THE FUEL QUESTION: WOOD-FUEL COST-

ING 3 CENTS (AGAINST COAL 12.5 CENT)

PER LB. MADE TEA?

Madulkellie, July 17.

DEAR SIR,—I have read with interest in the columns of your valuable journal the report of the Dinbula P. A. by which I was surprised to see that wood fuel is costing some estates over R2.50 per yard delivered at their factories. This seems quite prohibitive. Would not coal be cheaper? I should be very much obliged if any of your readers can give me the results of experiments with coal.

I have been told that coal in one engine in this district costs 1.25 cts per lb. made tea. From carefully kept figures I calculate that wood fuel at R2.50 per yard in my engine would cost quite 3 cts per lb. made tea. The fuel question is daily getting a more serious one and wood fuel is by no means plentiful.—I am, sir, yours
ECONOMY.

THE TEA-BUSH, TAP-ROOT, AND MANURING.

South India, July 20, 1895.

SIR,—With reference to your correspondent's remarks regarding Mr. Hughes' statement *re* the tap-root of the tea-bush, in connection with manuring, the latter-mentioned gentleman is made to appear ignorant of the principles of agriculture! How often will it be necessary to repeat the fact that deeply penetrating tap-roots are almost entirely destitute of the fibrous spongioles which alone are able to appropriate nourishment from the soil?

An examination of any deep-lying tap-root will convince the most sceptical on that point. It is true that even the dense, woody, cellular construction of a tap-root permits of the ascent of water, and it is equally true that salts in solution may be found in that water, *but*, (and this is an all-important "but") no nitrogen is present, and that owing to the following fact. The food of plants must first be nitrified before becoming fit for absorption and assimilation.

This necessary preparatory process of nitrification does not go on in the soil at a greater depth than two feet below the surface—consequently below that depth the tap-root finds no oxidized, nitrified food fit for appropriation. Your Ceylon soils being much more open in texture, as a rule, than the dense Indian soils, the process of nitrification may go on a few inches deeper below the surface, but virtually there is no appreciable degree of nitrification going on that is of any practical value to the plant, at a greater depth than two feet below the surface.—Yours faithfully,
J. MCKENZIE.

PEPPER-VINE GROWING:—A SERIES OF QUERIES BY A WOULD-BE PLANTER.

SIR,—I have a small Estate in Hewagamkorle about 12 miles from Colombo in the Cotte Road near the property once owned by Mr. Grinlinton. The soil is cabook and clay. It is partly planted with coconuts, and though the trees are about 15 years, they do not bear well. I intend trying pepper on it; with this view I procured your valuable book "All about Spices" from which I derived much information. But before I begin operations, I wish to supplement the information obtained from that Book with the following particulars, which I hope some one of your readers will oblige me by furnishing:—

1. Is the soil suitable.
2. Is it advisable to allow the vines to creep on the coconut trees; will the pepper-vine injure the coconut trees?
3. What is the effect of pepper among cinnamon?
4. What are the native (Sinhalese and Tamil) names of the following trees: Dadap, Kapok, Erythrina Indica, Nava, Halamba, Madre de Cacao, Chingkariang, Inga Saman, Boonglai, Jacca tree (these names are taken from the Book on Spices.)
5. A practical planter in the same book says that vines which grow on non-deciduous trees bear better; of the trees mentioned in 4 and of the following trees which are non-deciduous. Jack, Godapora, Goraka, Thiapora, Mille, Imbul Suriya, Erabaddu, Coconut, Arccanut, Hikkaha, Albizzia, Mollucana.
6. Which of these trees enumerated in 4 and 5 grow fast, or rather how long will they take to grow so large as to support pepper vines; and which of these trees will the pepper vine injure? Thanking in anticipation.—Yours faithfully,

S. W.-N.

P. S.—What product will best suit this soil and climate?

COCONUT PLANTING AND THE BEETLE ENEMIES OF THE PALM.

Singapore, July 22nd.

DEAR SIR,—I have been told that you are a great authority on the diseases of coconut trees. I should deem it a great favour if you would tell me if you know of any cure or means of exterminating the Red Beetle. Here none is known, and the place is gradually being eaten up by them. Do you consider it possible to save a tree when once attacked by this beetle? Again, I should much like to know the Ceylon method of catching the Black Beetle,—and do you do anything in the way of stopping up the holes made by them. As I am in charge of a plantation here, any details you can give me on the subject would exceedingly oblige.—Yours faithfully,
R. DUNMAN.

P.S.—Is there any reliable pamphlet published on the subject of coconut-growing?

[We regret to say that our Manual "All about the Coconut Palm" is out of print; but a fresh edition is being prepared, and in it Mr. Duffman will find all the information he requires, including the mode in which the black and red beetles are killed on plantations in Ceylon. There must be Tamil coolies in the Straits, we should think, who know the kind of iron rod with a bend or hook at the end, used to get at the big black beetle in his burrowings in the top and heart of the palms. The red beetle is a far more serious customer; but there is nothing for it, but to hunt him down and cut down and burn at once all trees affected beyond cure which probably contain a family of the beetle. Clear the estate too of all rubbish likely to give cover and then the attacks ought to be greatly diminished until they finally disappear.—Ed. T.A.]

THE PLANTERS AND THE INDO-CEYLON RAILWAY.

DEAR SIR,—Your recent article on the P.A. Committee's memo. on labour is much to the point. It is evident from what appears in your contemporary's article that the Chairman's draft was considerably modified in Committee, and if the editor of the "Times" is correct, for some reasons properly so. This must be said for the Chairman, that his draft may not have conveyed his own views say on the railway to South India, but may have been intended to summarise the opinions in regard to it held by various sections of the Planting Community.

What do the Committee mean by the crude paragraph:—"The question of the Indo-Ceylon Railway seems hardly within the range of practical politics as yet"? If the Committee had added "but it will be no fault of the P.A. Committee if it continues in that state longer"—a very excellent point would have been carried in support of a movement that must better our condition as employers of the Indian coolie. You hear some, but very few planters saying:—"If we join our estates to the Indian villages by Railway, we place Ceylon in the same position as estates, say in Travancore with the labor in the villages adjoining them." What nonsense! It will cost the Indian labourers at least *R3 to 4* going singly, or *R2 to 3* in gangs from Matale to India, and that is a sum the India coolie will think twice before he spends. For every cooly who will leave to go home by railway we shall have two coming back, for in any sudden difficulty arising on an estate from leaf coming in too abundantly, the Manager will be able to send a Kangany with *R50* to the Coast in 30 hours, and in a week he would return with a gang of coolies. If every planter will take the trouble to think over this matter, he will see that the Planting Industry must be benefited by quick, comfortable, and safe Railway transit service from India to Ceylon. I can understand the little magnates of our Ceylon Civil Service having the feathers in their little wings ruffled by the idea of Ceylon having its Civil Service carried on more in harmony with its size if we had closer communication with India; but I see no reason why the Planting community need fear any harm to its Indian labour supply, when brought into real touch with the regions from which that supply is drafted.

If the Chairman took the trouble to draft what was on the whole an able Memo., so as to bring the discussion on the Labour Question to a point, I believe he could bring his clear level

head to draft a Memo. on the pros and cons of the Ceylon-Indian Railway, that his Committee would lick into shape so as to prove conclusively that our Planting interests will be most materially strengthened, so far as its labour is concerned by a Ceylon-Indian Narrow Gauge Railway.—Yours truly,
PROGRESS.

CEYLON AND INDIAN TEAS: PURITY AND PROTECTION.

July 27.

SIR,—You "pause for a reply." You shall have it! India sends 140 million lb. of tea into the markets of the world and its purity is unchallenged, although 5 million lb. of China tea is annually imported for business (? blending) purposes into Calcutta.

Ceylon sends out 90 million lb., has a prohibitory import duty of 50 per cent on value of tea (monstrous anomaly in this year A.D. 1895) to ensure *purity*; and yet on at least two occasions, some of its tea produce has been stopped by Customs authorities as "unfit for human food."

One fact more:—Ceylon tea averaged 8½d per lb. last year, falling year by year, notwithstanding its protection of 50 per cent duty. Indian tea averages a penny more and improved its position last year, notwithstanding that all the protection it gets is 5 per cent.

Send the above and your yesterday's paper with my compliments to Mr. Chamberlain and let him see how his latest Colonial C.M.G. has been arguing—as a Manchester man and Free Trader. I enclose my card.—Yours truly,
CYNIC.

THE "LADY BEETLES" IMPORTED TO FIGHT "GREEN BUG" ON COFFEE.

St. Leonards, Nnwara Eliya, July 28th.

DEAR SIR,—I regret to inform you that the Beetles "*Vedalia Cardinalis*" to destroy green bug sent by the State Board of Horticulture, California, to Mr. E. E. Green have all arrived dead, owing to their having been packed in a closed pill box.

I have written to Mr. Cran, Chairman of the Board of Horticulture advising him of the condition the beetles arrived in and asking him to forward another lot suitably packed.—I am,
CHAS. H. BAGOT.

PLANTING IN THE NORTH BORNEO: A LETTER FROM MR. PRYER.

Sandakan, July 7th.

DEAR SIR,—A further few notes from here may not be uninteresting to your readers.

COFFEE PLANTING is always more or less in progress, but not on a quarter the scale it ought to be. Still a few more acres here and a few more acres there are put in almost monthly, while the existing gardens are always improving. Some of my coffee is now ten feet high, of a handsome pyramidal shape, and the branches cracking with the weight of fruit. This last fact is largely owing to dry weather during the last three months having retarded ripening and as soon as rain sets in, picking will be proceeded with rigorously.

I was looking at some 10 months' plants a few days ago, they were over 4 feet high, well shaped, and were showing fruit as large as small marbles, with any quantity of buds forming, these were from 8 leaf seedlings; but the latest idea is to put in plants already

showing laterals, the nurseries must be close to the fields in order to do this, and the planting requires a little extra supervision, but six months' weeding is saved.

As to thinning out crop or entirely stripping young trees as recommended by some people, I must say that after you have done nothing but spend money for two years or so and when you do see \$40 a picul clustering on your trees, to pull it off and throw it away does seem to me a curious thing to do.

As for the practice of the thing; first the planter makes a big hole, then he fills that hole with the most fruit-producing food, then he severely handles the trees so as to further force on fruit and then when the fruit comes he pitches it away! The whole thing is as tho' one took a child, fed it up on turtle soup and sherry, pork chops, cheesecakes and Christmas pudding, and then was surprised that he got bilious, and proceeded to give him castor oil. If what is wanted are trees that don't bear so soon, all that has to be done is to make small holes and fill with poor soil. But why people should prefer their trees not to bear soon, seeing that the main purpose and intention of a coffee estate is to earn income as large and as soon as possible, is inscrutable to me. As for any idea that early cropping is hurtful I have never seen any evidence of it, while it is always one's best trees that crop earliest. Mr. Hill in Selangor judging from his crop returns was not afraid of raking in the dollars as soon as they showed.

As to other cultivations, COCONUTS continue to be put in, and all promise well. The Gambier gardens are constantly being enlarged, and look like becoming of importance soon; a little cotton is being tried in three or four places, and there is a tendency to nibble at sugar and Manila Hemp.

Beyond this, matters in the country are not very bright, the tobacco news is the reverse of good and if the Chartered Company does not mind it will find a serious falling-off in its exports and consequently in its revenue. Up to the present its policy has been of a Micawberish character "waiting for something to turn up." Nothing does turn up, rather the contrary, and meantime any quantity of opportunities in coffee, sugar and other things are allowed to slip and the magnificent soil remains disregarded. However, the shareholders are clamouring for more action, and a new policy has been inaugurated. At first a few slips and errors may be anticipated, but the attitude of the shareholders and their instructions to their Directors seem to be: "Find out for us what this country really can do." It cannot be too strongly impressed upon them that the main resource is the soil, and in view of the shareholders demanding real action, it is to be hoped that this, the future mainstay of the country will have that attention devoted to it that it deserves, and which it has never yet received. If not, disaster is inevitable.—Yours very truly,
W. B. PRYER.

WHO FIRST INTRODUCED THE GREVILLEA (SILKY OAK OF QUEENSLAND) INTO CEYLON.

Fairieland, Kandy, Ceylon.

SIR,—Can you or any of your numerous correspondents inform me who has been the benefactor to Ceylon, in introducing the "Grevillea" into the island?—Yours, &c.,

SHELTON AGAR.

[We should suppose it came in first through the Royal Botanic Gardens and we know that

the late Dr. Thwaites was very strong in his recommendation of it as an ornamental tree. He persuaded the late Mr. A. M. Ferguson in the "sixties" or "seventies" to try grevilleas in his garden at Aloe Avenue; but the sea-air played havoc with them. The proper altitude in Ceylon is from 1,500 to 4,000 feet above sea-level.—ED. T.A.]

FRUIT IN UVA—AND THE MARKET?

July 10.

DEAR SIR,—Now we have our usual dry and hot season in Uva with gusty wind, more especially during the night and up to say 9 a.m. in the morning. Thunder showers are always welcome visitors to us in Uva at this time of the year, and the tea estates in Uva Province do tolerably well with occasional showers of rain till October and the periodical rains arrive. Just now our oranges are ripe on the trees, and you may take my word for it that there are few better climates for oranges, *et hoc genus*, than the Province of Uva affords. Sun and clear skies are essential climatic constituents, for all fruit-yielding lands, and the little sheltered valleys of Uva could be made to produce lemons (and they pay well), limes, oranges and shaddocks in great abundance. When choosing a spot for an orchard it is necessary to seek for a well-sheltered hill-side or valley, and if the soil be fairly fertile, it will do well in Uva; and if the land is poor C. P. manure can be used.

I wonder the Burgher landlords in Badulla do not pay more attention to their orchards than at present and extend them and introduce fresh varieties of fruit-bearing trees. Hakgala Botanical Gardens could I fancy supply young and good trees; next October I hope the Badulla house-holders will plant out fruit trees, they will yield them a nice income in a few years, with a Railway now to Bandarawela. I sent a basket of delicious oranges the other day to Colombo, each orange wrapped in thin paper, and they arrived in perfect condition. "OLD GARDENER."

P.S.—Just now a lady says it is all very well to grow oranges, mangoes, &c., but how about the ready market for them? I at once reply: Colombo with large steamers arriving daily and crowded with thirsty passengers, will buy 1,000 oranges a day and at a fair price.

[Colombo certainly ought, and yet we have heard of Matale men losing by consignments of fruit. Oranges have been as high in Colombo as 25 cents each, though usually 5 cents.—ED. T.A.]

VARIOUS PLANTING NOTES.

THE COMPANY for the working of the Pamanoeakan and Tjiassem lands has issued its annual report, which shows that a loss has been sustained in the preceding year of £268,346. This loss is ascribed to the small coffee crop of about 9,600 piculs; to losses on timber of £112,488; losses on rice of £54,005; charges for law suits £16,323, and further to a loss of about £80,000 on the working charges on the preceding year. Against this there is a profit of £240,000 on interest account. The prospects for coffee are favourable, and the estimate for this year exceeds the crop of 1894 by 4,000 piculs, good prices have already been made for the crop.—*L. & C. Express*.

THE OUTLOOK FOR INDIAN TEA.—Says the Calcutta Commercial Correspondent of the *Pioneer*:—

Calcutta, July 20.—The outlook for Indian tea is decidedly promising. The consumption is extending to Persia and Russia as well as in the United Kingdom, Canada, the United States, Germany and the Australasian colonies, which means that although supply is increasing, the demand seems likely to keep pace. Tea shares may therefore be considered a safe medium of fair interest-paying investments at the present time, and this is confirmed by the advanced prices of all stocks.

HAPUTALE, July 31.—Coffee is doing splendidly up here, and estates are giving crops such as they have not done these last six years. Of course, it is taking it out of the trees considerably; but at present prices proprietors are getting returns from the old berry that few of them expected to secure again. Tea is also doing very well, generally speaking. Undoubtedly our tea, like the coffee in the old days, takes a long time to show up, and is very slow maturing; but Haputale will by-and-bye be as good a tea district as any in the island. Its climate is not forcing like most other districts, and the growth is slow, but there is the soil, and one of these days there will be a rush to buy estates, and the voice of the company-promoter will be heard in the land.

TEA EXTENSION IN THE SOUTHERN PROVINCE.—Mr. J. Simpson Scowcroft, the well-known planter returned to Colombo today (5th) from Galle, having been engaged on the work of further opening up Mr. Jeronis Dias's property at Matugama in the S. Province, where Mr. Dias will eventually have a very large tea property. He originally bought 650 acres, 200 of which were lately opened up in tea by Mr. Scowcroft while the latter is now busy felling the timber on another 300 acres, and he expects to burn off in a month. The proprietor of the land is negotiating for the purchase of another 150 acres adjoining his present property, and has in view the acquirement end of 1,000 acres in all, in which case he will be the owner of one of the largest estates in the S. Province.

THE CASTLEREAGH TEA COMPANY.—This concern, until the end of last year, and while it failed to even approach the prospects formed of it, was naturally a "much-abused company." With no interim dividend for 1894, the shares—eleven months ago—stood at R65; but on the strength of a rather unexpected dividend of 8 per cent. for the year, they reached par in March last. Then, as it became known that the estimate of yield for 1895 was being realised practically in half the period, the price advanced until the shares were quoted, as now, at R135, ex-dividend. The dividend for the half-year ending June 30th—paid on Saturday last is 7 per cent., although, we understand, the profit for the same period ran into "double figures." The estimate for 1895 was 130,000 lb. of which 125,000 lb. were secured in the first six months. The superintendent has raised the figures for the year to 180,000 lb. only, to be on the safe side, but it is expected that this yield will be greatly exceeded. Mr. A. F. White is the manager of the estate, and he deserves more than a word of praise for his work.

COFFEA STENOPHYLLA.—Read the following report from T. J. Ferguson, Esq., dated Calicut, 27th February, 1895:—"In reply to your letter of the 16th instant, I planted the small supply of seed (in cherry) of the *Coffea stenophylla* immediately on receiving it from you about the end of June last. Only 10 or 12 of the seeds germinated and I only succeeded in raising 8 plants, all were weak and sickly at first; several seeds germinated 2 months after the others. I got fine well-grown healthy plants which have now 3 pairs of primaries, and average eight inches in height I have two healthy young plants with five pairs of leaves, and one sickly plant with four pair of leaves. One of the largest plants has been planted out in the open here for some months among some Arabian and Liberian hybrids fine robust plants among which the Sierra Leone plant looks a dwarf. I am sending all the plants, except the one referred to above, to be planted in Wynaad. A hybrid between these and Liberian might prove a valuable addition to the Planters' fields. It is difficult to believe that the Sierra Leone plants can bear large or even ordinary crops, it is so much smaller than the smallest Arabica of the same age."

Reports also were received from Mr. Woodrow, dated Poona, 26th February, 1895; Mrs. H. Munro, dated Poona, 25th February, 1895; Mr. W. Gollan, Saharanpur, dated 7th March; and Rev. Richter, Coorg, dated 22nd February 1895, stating that none of the seeds sent germinated.—*Proceedings Agri-Horticultural Society of Madras.*

TREE TRUNKS AS FILTERS.—"A well-known Austrian engineer, M. Pfister," says the *Railway Review*, "is stated to have discovered a remarkable property of the trunks of trees, namely, that of retaining the salt of sea-water that has filtered through the trunk in the direction of the fibres. He has consequently constructed an apparatus designed to utilise this property in obtaining potable water for the use of ships' crews. This apparatus consists of a pump, which sucks up the sea-water into a reservoir and then forces it into the filter formed by the tree trunk. As soon as the pressure reaches 1.5 to 2.5 atmospheres the water is seen—at the end of from one to three minutes, according to the kind of wood used—to make its exit from the other extremity of the trunk, at first in drops and then in fine streams, the water thus filtered being potable, freed, in fact, from every particle of the usual saline taste which is such a drawback to water obtainable by ordinary manner.—*Public Opinion.*

THE "INDIAN FORESTER."—June 1895 has for contents:—Original Articles and Translations.—A Tour in the Landes and visit to the French resin works, by E. McA. Moir. Note on the Regulation of Forest Concessions in Oudh, by 'O.C.' The quality of quickly grown Teak-wood, by P.M. Lushington. Correspondence.—The Legal Position of Forest Rights, letter from 'B.H.B.P.' Seeding of the Thorny Bamboo, letter from T.F. Bourdillon. Official Papers and Intelligence.—The Resolution on Forest Policy: Circular letter of the Inspector General of Forests. Reviews.—Forest Administration Reports for 1893-94 for Ajmere and the Forest Surveys. Report on the Nagpur Experimental Farm for 1893-94. Forest Administration in Southern Australia, 1893-94. Shikar and Travel. Elephant Catching Operations—The Sad Sequel. Elephant Catching, letter from H B Bryant. Extracts, Notes and Queries.—Obituary—H H Davis and G A Richardson, Death of a Cape Forest Officer, Walking Sticks and Umbrella Handles from New South Wales, by J H Maiden, Consumption of Timber in the British Isles, by W R Fisher. The Whittall Memorial. Timber and Produce Trade.

THE COST OF AN INDICATED HORSE-POWER.—An interesting paper under this title was submitted at the recent Montreal meeting of the American Society of Mechanical Engineers by DeCourcy May, who summarised his subject in the following table, showing the total cost of 1 I.H.P. per annum for various engines:—

Kind of Engine.	365 days of 24 hours.				308 days of 10½ hours.			
	Coal per 2,240 lb.				Coal per 2,240 lb.			
	\$	\$	\$	\$	\$	\$	\$	\$
Triple-expansion, pumping, Allis, 20 revs.	2	3	4	5	2	3	4	5
Triple-expansion, without pumps, Allis, 50 revs.	48	55	61	67	31	33	35	37
Compound mill, best engine	29	36	44	51	17	19	21	24
Compound mill average	39	46	52	58	22	25	28	30
Compound electric light average	122	139	159	174	78	84	90	96
Compound trolley	48	58	68	79	29	32	36	39
Triple-expansion trolley	45	54	64	74	26	29	33	36
Condensing mill	45	52	61	69	25	24	33	38
Non-condensing, 50 to 200 horse-power	70	76	81	88	49	53	57	60

The figures for engines below 50 H.P. vary so widely that they have been omitted. The above table has been calculated, says the *New York Electricity*, as far as possible from actual engines running under ordinary conditions, but it is not pretended that the figures represent true average values, the writer not having been able to collect information from a sufficient number of cases. The engines are nearly all high-class and of large powers; the figures in the table are therefore rather below than above the average.

COFFEE IN UVA AND DUMBARA.—This is evidently going to be a great year for what remains of coffee in Hapntale and Madulsema, and even the natives are beginning to look after their old trees. A traveller the other day from Lower Maturatta via Dumbara to Kandy, found the Sinhalese busy clearing out and manuring their coffee trees and full of the belief that all the troubles of coffee were now over, and that an era of prosperity was to set in!

WEST HAPUTALE, August 2nd.—Tea doing very well up here, one or two of the older places giving as much as 600 lb. an acre, though high up. A big clearing has just been burnt off on Meeriatenne, belonging to Mr. G. Anderson, and of which his son is in charge. There is a small clearing on Yellatenne, and there will be more land opened on Callander next year. The road through the Valley to Ohia is nearly completed, there only being a few more stones to blast, and rice and tea find their way to the railway along it. The four miles have been constructed for less than the planters' estimate, which was so much under Mr. Harvey's estimate.

CEYLON PLANTERS BOUND FOR THE FAR EAST.—Mr. E. Walker, of Galloway Knowe, Nilambe is in Colombo at present, and will leave for Singapore by the French steamer on Thursday; his object being to go on to Borneo, to a place to which he has been recommended by Mr. W. D. Gibbon, Mr. Walker intending to plant coffee there if he likes the look of the land after inspecting it. If he decides to invest he will remain in Borneo, but if he does not like the prospect he will probably go on *via* Japan and America to England, in which case he will return to Ceylon later. In any case he hopes to get some good shooting in Borneo. His place on Galloway Knowe has been taken by Mr. C. C. Herbert, of Badulla, who has been working under Mr. Alison. Another Ceylon planter bound for the Far East is Mr. W. Greig, who will arrive in Colombo tonight or tomorrow. Mr. Greig has for long worked on Beaumont, Pussellawa, but that estate has lately been taken over by a Limited Liability Company, and he is going to Selangor to plant coffee. He will leave by the same steamer that takes Mr. Walker. Mr. Picken goes to Beaumont to join his brother, the superintendent, in the working of the estate.

PROGRESS IN NYASSALAND.—The British Consul (Mr. Sharpe) who had just reached England has been giving information, reproduced in the London *Times* of July 20th, respecting the general prospects of Nyassaland, as follows:—

"The coffee crop this year is fully double that of last year, and last year's was double that of the previous 12 months. From present indications the 1896 crop will be double that of this year, so it is evident that enormous strides are being made. Although the industry is only in its infancy, this year's crop will be over 200 tons. The revenue is steadily increasing, and the returns up to April were considerably in excess of those of 1894. British Central Africa, with the Shiré Highlands, is as yet the solitary instance of a successful agricultural colony within tropical Africa. The work has not been done by borrowed capital; it is genuine and sound business, nearly all done by Scotchmen with their own small capital, who are now getting good returns. A great point about the country is its cheap labour, so that in the future it will be able to compete with any coffee-producing country. Another point is the comparative cheapness of transport, which must speedily become cheaper. A railway is badly wanted from the head of navigation on the Shiré to Blantyre, the centre of the coffee district, a distance of 60 miles." The protectorate itself as it stands is about as large as Great Britain, and it will be a very long time before anything like the whole of it can be opened up. In conclusion, Mr. Sharpe said:—"An attempt is being made to see if it is not possible to tame the zebra and make him of use for purposes of transport. If this can be done the tsetse fly will cease to be a terror so far as beasts of burden are concerned."

ELEPHANTS TO THE RESCUE.—Not alone in Madulsema and Hewa Eliya are elephants desiderated as transport aids by tea planters. We hear that there is room also for them in the Kelani Valley and we may shortly have an experiment of the kind on a Valley estate. A docile working elephant to drag in firewood, carry tea-boxes down and bags of rice up, might be a very useful adjunct to a big Tea Factory.

THE ORIENTAL ESTATES CO.—This is one of the few Companies connected with Ceylon planting, whose shareholders cannot be congratulated. There is no dividend to declare, although there is an appreciable balance on the right side to carry on, in the Report we print elsewhere. But then Ceylon is not at all to blame—the fault is all with Mauritius, as the following figures shew—

Ceylon: Income	£56,827
„ Expenditure	39,388
Profit	£17,439
Mauritius: Income	£51,732
„ Expenditure	52,753
Deficit	£ 1,021

OUR TEA SHIPMENTS up to the end of July are in excess of those to the same date of last year by over 9 million lb. Even if this excess were not increased during the remaining five months, our total shipments for 1895 would be 93½ million lb. or 3½ million in excess of the official estimate. Past experience shows that about 55 per cent of the year's crop is shipped in the first six months and 45 per cent in the latter half. This year gave a total of 51,667,716 lb. up to 30th June and applying the proportion, we would get 42,273,651 lb. from July to December or a total of 93,941,447 lb. which is very close on our previous estimate. The lesson would seem to be that between this date and the end of the year Ceylon is not likely to ship—at any rate to the United Kingdom—much (if any) more tea than she did during the same period of last year.

HOW BRITISH CENTRAL AS WELL AS East Africa—is to be opened by railway and steamers is well shown in the latest *Contemporary*. If the following plan is adopted, it will be a good thing for the Nyassaland planters:—

The *Contemporary* contains a plea by Mr. G. F. Scott Elliot for making our route into Uganda not a Mombassa railway, but a highway, half to railways and half of rivers and lakes *via* Nyassaland. He would make the merchant and his bales on the way to Uganda, go first by steamer up the Zambesi and Shiré Rivers to the Shiré highlands. Thence, by a railway one hundred and twenty miles long to be constructed to Matope, from which point the upper Shiré is navigable, and goods can be carried to the north end of Lake Nyassa. Here another railway (two hundred and forty miles) would lead to Lako Tanganyika. Tanganyika gives a clear waterway of four hundred miles to its northern end. Then another railway to the Karega River, and finally, down the Karega River to the Victoria Nyanza. In favour of this route Mr. Scott Elliot urges two things. It would cost about half-a-million less than the Mombassa railway, and it would kill two birds with one stone,—that is, while opening up Uganda, it would also open up the already flourishing settlements of British Central Africa, and make a beginning of the Cape-to-Cairo route. The proposal is a fascinating one, and will no doubt be carried out some day; but whether it ought to be done instead of—not as well as—the Mombassa railway, we cannot profess to decide. That is a matter not for us, but for experts like Captain Lugard and Colonel Colville.

THE CACAO CROP—now setting in the Matale and other districts is likely to be late through the effect of the prolonged drought. It is possible that the harvesting may not take place till January, so making a considerable difference in the exports of cacao for this year.

COFFEE CULTIVATION AT PORT DICKSON.—During June Mr. D. M. Lumsden arrived for the purpose of taking up his concession of 2,000 acres of land at the 11th mile on the railway for the purpose of cultivating coffee, and the survey has since been completed; clearings for three nurseries have been made and extensive felling of jungle is to be started in September next. Mr. Lumsden is expected to return in November from England.—*Pinang Gazette.*

GREEN BUG ON COFFEE AND LADY BEETLES.—We regret to learn from Mr. Bagot, whose letter appears elsewhere, that so far, Mr. Green's enterprise in indenting for the lady beetles—(said to be the special enemy of the bug insect on the orange trees and expected to do the same good service on coffee)—has not met with success. The beetles he ordered, all arrived dead, through being put into pill-boxes without any air holes. We should have expected the State Board of Horticulture, California, to have understood better how to send such insects on a long voyage. We trust the next attempt may prove a full success, both for Mr. Green's sake and for that of our remaining holders of coffee upcountry.

OVERPRODUCTION OF TEA.—Mr. J. Berry White, Chairman of the Jokai Tea Company, had some caustic remarks about his neighbours in his address at the annual meeting of the Company:—

In our report we refer to this in the paragraph regarding the market price during the last year, which was, on the whole, very favourable. The firmness of the market was no doubt in a great measure due to the fact that the yield was several million pounds under what was expected. In the current season an increase of nearly 20,000,000 lb. is expected from India and Ceylon. This increase, I have no doubt, will be absorbed, but at the cost of a fall in the average sale price of all low and medium class teas. I do not expect the special teas of Darjeeling and of Upper Assam will be much affected, as they have particular qualities which cannot be produced elsewhere; so the loss will fall on what I regard as the chief sinners in causing over-production—the Indian districts of the Dooars and Sylhet and the Island of Ceylon. I have spoken in a somewhat pessimistic tone of the consequences of this over-production. I hope you will not misunderstand me: I have no fear whatever for the future of our properties. We have been looking forward to some crisis consequent upon over-production for some time past, and have been putting our house in order. We have now our properties so fully equipped with labour, machinery, buildings and transport that after this year our expenditure must be very much less, and, notwithstanding the heavy outlay on betterments, we have kept the capital cost per acre of our cultivation at about £40. I do not apprehend that there will be any reason for reducing our dividend in future years, unless the crisis, when it comes—if it ever does come—be of a much more severe and far-reaching character than there is any reason at present to expect.

Mr. Alex. Laurie of the Jhanzie Tea Association at the annual meeting, was more genial:—

Before making the proposal to adopt the report, let me impress on our shareholders the great advantage that would arise to the tea industry generally, if everyone interested in Indian and Ceylon tea would combine to promote an increased demand for these teas. If everyone would only help a little by writing to friends in America, Canada, and similar places, urging the advantages offered by the use of Indian and Ceylon teas, in preference to the weaker teas from China and Japan, the aggregate of good to the industry would be immense.

KOLA NUT.—As of general interest to the cultivators of Kola, we readily give a place to the following information sent us by Mr. Philip, Kandy:—

“Our foreign agents write under date 25th June, 1895 as follows:—‘You will have to be very careful to see that you do not plant or distribute what is known as ‘Sweet Kola,’ that is the seed that has four or five cotyledons and divisions in it, as it is most difficult to do anything with it. The seed is principally sold in powder to adulterate the ordinary ‘Kola’ (*sterculia acuminata*). Our Kola nut plants are of the true cultivated superior variety.’”

ADVERTISING CEYLON TEA.—The Ceylon tea planting industry is regarded with great interest by London journals, who are always ready to extend a friendly lead to reports concerning it. It reflects great credit on all concerned in pushing the interests of Ceylon tea that the industry receives a remarkable amount of gratuitous advertising, and this has done a great deal towards popularising Ceylon tea with the British public, who like to have their attention continually directed to a really good thing. This is what an evening paper says: “Some idea of the extent of the Ceylon tea industry may be gathered from the fact that to produce last year's crop of exported tea no less than 340,000,000 lb. of green leaves were gathered from the plants, and conveyed for the most part on the backs of the pickers to the factories for manufacture. Last year there were about 305,000 acres of land in the island planted with the tea shrub, and there is every prospect of this acreage being doubled within another ten years.”

THE INDIAN TEA ASSOCIATION IN LONDON.—We direct attention to the able and comprehensive Report of the Committee of this body for the year 1894-95, as given on our fourth page today. “New Markets” is of course one of the most important subjects treated and in this “America” leads the way. The Committee is extremely hopeful of the prospect, due mainly to the good and persevering work of Mr. Blechynden with the comparatively small amount of funds at his command. We read:—“With further energy, perseverance and the necessary funds, the future of Indian tea in North America is now assured;” but the Committee call on the planters for subscriptions, so as “to press forward with vigour for one year more at least, the work of advertising and introducing the tea to the American public.” Now we consider this good news to be as important in the interests of Ceylon as in those of India; and indeed our Planters' Association might well pass a vote of thanks to Mr. Blechynden and his Committee for the valuable solid advance they have made against the common foe, during a period lost by Ceylon through prolonged discussion. In the report before us we have the proposal for “joint action” very clearly put and after reading the “conditions” we are almost as sorry as the Committee that it has fallen through. Two points of importance were that India had to contribute as much as Ceylon namely £2,500; while it also gave £500 for the Commissioner against £1,000 from Ceylon which was to have the selection. The scheme for working, so far as the heads in this Report go, seems quite a feasible one. But it is no use regretting what is beyond our reach now, and we can only hope Mr. Mackenzie will do his best in advertising, at Food Shows and by other means to accentuate and increase the advance already made.—There is a good deal more of useful information in the Report which indicates a great deal of work done on behalf not simply of Indian, but of British grown teas.

VARYING CLIMATES AND EXPERIENCES.

Life in the Tropics—as we are daily reminded—is not without its drawbacks. Some are even disposed to think that our own favoured isle of Ceylon has more than her fair share of discomforts. Yet those who take the trouble to compare the conditions of other climates, find that the worries and sufferings—like the blessings—are upon the whole pretty equally divided:—

“As different good by Art or Nature given
To different nations makes their blessings even.”

Few who experienced and survived the last winter in Britain will live long enough to forget the severity of the frost during January and February of this year, and now from the Antipodes we have accounts of a similarly abnormal wave of icy cold in July, the height of winter of course there. Private letters speak of the thermometer approaching Zero, with burst water-pipes in the inland towns of New South Wales; while daily skating on the upper roaches of the Lachlan adds a new experience doubtless much enjoyed by the young “Cornstalks.” But what about the orchards? There’s poor Towser who left his native Devon 30 years ago to devote his life almost single-handed to the formation of an Orangery. What a sad disaster this bitter frost must be to him!—apples, pears and grapes are of course safe; but alas for those delicious oranges which promised such a rich reward! I might have imagined the thermometer of my friend being a little out—like the Irishman’s which “did not affect the temperature”; but here comes a cutting from the *Sydney Morning Herald* of the 11th July:—

The Cold Weather.—At 6 o’clock yesterday morning the lowest reading at the Observatory within the 24 hours was reached, namely, 29·2 on the grass, or over 4½ degrees higher than on Tuesday morning. Some of the inland temperatures were, however, startling in their frigidities. At Kiandra the mercury fell to 10 deg. below zero, 42 degrees of frost. Kiandra, holding the most elevated position in the colony, is always sure to be returned at the head of the poll, under the circumstances. Yesterday afternoon a block of ice 2½ in. thick was brought into Parramatta from Castle Hill. It was taken out of a pond in one of the orchards. In the morning the ice in this pond was over 3 in. thick.

Imagine the effect of 2½ inches ice at Parramatta.

The great drawback to the Australian climate is not however the danger from extreme cold, but the extreme variableness of the temperature. It is this that kills off the poor Anglo-Indian who goes in search of a perfect climate, tortures the squatter’s wife with neuralgia and himself with rheumatism. A daily variation of 40° to 50° Fahrenheit is quite common. More safe is the old country with all its severity.

Here in Ceylon we do not boast of a perfect climate, but we at least run no risks from frost, while the range of temperature at medium altitudes is marvellously little. In the bungalow in which I reside, situated at 2,000 feet above sea level, the thermometer has just varied 3° viz., from 74° to 77° within the past month. Warmer than necessary certainly, but quite compatible with perfect health. As a proof of this I lately came across two European ladies who for 30 years have not been off the estate for a single night and never a day ill! After this, who will dare to disparage the climate of Hantane,

But apart from the climate, Australia has many disadvantages from which we are spared in this comparatively free country. The iniquitous system of Protection still prevailing there, the hateful jealousy of neighbours, the unutterable selfishness of the “squatocrat” are fast completing the ruin of these disjointed colonies; and it is much to be feared that, until the Japs or Chinese seriously threaten an invasion, no united action for any good or useful purpose is possible there. I take the following cutting from the *Sydney Mail* of 13th ult. to show the absurd length to which protection can be carried even in the most enlightened and liberally disposed of those ridiculously over-governed colonies:—

Under date 3rd June, 1895, Mr. William Hicks writes from South Apsley, Cow Flat P.O., N. S. W.,—“Having met with a severe accident at George’s Plains in March 1894, by which I lost a leg, I am importing an artificial leg from America. On arrival of the limb in Sydney I am informed that I must pay a duty of £2 5s 10d on the same. Now I think that is very unjust. Before ordering

the leg I did not take the trouble to find out if a duty was to be paid, never dreaming for a moment that a cripple would have to pay duty on an artificial limb in any part of the British Empire, and I was very much surprised to find that such is the case. The Government might as well charge a passenger with an artificial leg, or crutches, a duty before allowing him to walk ashore, even if the same was attached to his body. Will you please bring the case before the proper authority, with the object of obtaining a refund of the duty, and notify me if such can be obtained? I would not ask you to do this for me only I think that the omission of artificial limbs from the free list is an error, owing, no doubt, to the rarity of such imports, and that the duty is very severe on a man in my position.” As previously stated, no redress could be given.

Now our Government may be urgently in need of much improvement. We have the indefensible one-sided tax on rice, and the contemptible tax on light still staring us in the face; but we have not come to anything so asinine as a tax on wooden legs which a whole Legislative Council could not repeal! One would imagine that there the all-powerful working man had these matters very much in his own hand, but it must be confessed that the Australian labourist is politically the very prince of idiots.—*Old Colonist*.

The present mail brings us worse news still from New Zealand in regard to weather. Fancy 200,000 sheep perishing in one county! The following extract, is sent us from Dunedin by an old Ceylon resident:—

CHRISTCHURCH, July 10.
Snow commenced to fall in the city about 8 o’clock this morning, and a couple of hours later was lying on the ground to the depth of three inches. In the northern districts the fall is heavier. The farmers are having an anxious time in removing stock to sheltered spots. The snowstorm this morning was the heaviest in the district for years. It thawed very little during the day, and there is a very sharp frost tonight. It is feared there will be a great loss of sheep in the back country.

News from country districts states that the fall of snow this morning has been very heavy. The mortality among sheep within the district will be very heavy, and it is stated that 80 per cent of those got are very weak, and have been subsisting by eating the wool off the dead ones.

The loss of stock in the Mackenzie country is expected to prove serious. The rabbits are said to be dying in numbers, and are so tame that they will allow themselves to be handled. They can be seen in scores in the sheep camps, disputing the sheep’s right to a solitary tussock brought to view by the continual movement of the sheep. The latter are so weak that they can hardly walk out of the camp when tracks are made for them. The winter has been worse than any previous one because the snowstorms have been so continuous, without a thaw to form a crust on which the sheep can walk. It is estimated on good authority (says the *Oamaru Mail*) that 200,000 sheep have perished in the Waitaki County during the late severe weather.

THE HYDROSCOPIC PROPERTIES OF TEA.

A gentleman with a scientific training writes us:—I have received by this mail a brief note regarding tea from a friend who is working in conjunction with me in my researches. I mentioned some time ago, what, my customers said regarding tea sent home in bulk and packet. That the bulk tea was as different from the packet tea, “as night {from day.” The flavour being quite different. I instructed my friend to try and find, what the loss of flavour was due to in the bulk tea which was retailed out, in paper packets. In his letter he says that he opened a lead packet and exposed it to the action of the air, the tea was carefully weighed exactly 452 grammes. It was laid aside for 56 hours and then weighed was found to weigh 455·792 grammes, and at the end of three days, that is 72 hours, it was again weighed and the increase was found to be 5·42 grammes, that is the tea weighed 457·42 after exposing it for 72 hours to the action of the atmosphere; or to be better understood by those who are not used as yet to the metric system, the weight increased by nearly 1½ drams, 452 grammes being equal to one lb. almost. This increased weight was soon lost by placing the tea in a mattress containing Calcium Chloride, and heating it to 100° F. This proves that the increase was due to the absorption of moisture from the atmosphere. I hope to hear more from him regarding his further experiments. I think the above ought

to be sufficient to make the planters pay some attention to Mr. T. Christy's letter appearing in the columns of the *Observer* of the 19th ult. Mr. Christy does not need to apologise for the advice given as it is of the utmost importance, to exclude the atmosphere from Ceylon tea owing to their Hydroscopic properties.

EARLY DAYS ON THE AGRAS.

(From a Correspondent.)

I began on Sutton in the Agras in 1871 and '72, and subsequently on Clydesdale and Ardlaw in '74, all in coffee. Perhaps some of the present-day planters of that district could scarcely picture to themselves the rough life led by the pioneers in those districts $\frac{1}{4}$ -of-a-century ago. How when hunting Elk we came upon Glasgow estate then in the middle of jungle, and where we killed a Sambur while swimming or wading across the stream. And many a hunt we had on Holmwood (then not opened) bordering the Bopats; when the meet of the Dimbula Honnds with Wiggin, Tom Brabazon, young Renny, Pilkington, MacCall and the Grays often hunted on the plains—separately with packs; when the melted glass of the burnt down Duke's Hut, could be found on the Patnas, near Fisher's Pool; and when Atherton's bungalow near Land's End was standing, and now only a chimney marks the spot as you say.

INDIAN PATENTS.

Calcutta, the 25th July, 1895.

Applications in respect of the undermentioned inventions have been filed, during the week ending 20th July 1895, under the provisions of Act V of 1888.—

For an improved device for Weeding Nurseries or Plantations—230 of 1895.—William Hose, of Roydon Rectory, Diss, in the County of Norfolk, England, Planter for an improved device for weeding nurseries or plantations.

Whereas the inventors of the undermentioned inventions have respectively failed to pay the fees within the time limited in that behalf, it is hereby notified that the exclusive privilege of making selling and using the said inventions in British India, and of authorising others so to do, has ceased:—

For improvements in machinery or Apparatus for Rolling or curling Tea Leaf.—142 of 1888.—Mr. H. Thompson's invention for improvements in machinery or apparatus for rolling or curling tea leaf. (Specification filed, 17th April 1889.)—*Indian Engineer*.

COFFEE-GROWING IN PERU.

In a consular report on the trade and commerce of Callao, Mr. G. W. Wilson has embodied a pamphlet in regard to the coffee-growing districts of Peru, printed in Lima last July. The writer of this says:—Peru has been known for many years as a coffee-producing country, but the coffee grown on the coast has been absorbed by domestic consumption, and Peru's appearance as an exporter of coffee is of recent date, although she is now likely to be a considerable competitor with other countries. Coffee-planting began and coffee is still cultivated with success near the port of Pacasmayo. But although the cultivation on the coast could be somewhat extended, it must always remain restricted, as there are only certain favoured localities in which the planter can hope for a good return. The region which Peru offers to the coffee planter, unsurpassed in fertility, and almost unlimited in extent, is situated on the eastern slopes of the Andes, among the network of streams and rivulets that find their way into the great affluents of the Amazon. This region, known as the *montana* has hitherto been shut off from the world by lack of communications, and

above all by the difficulty of crossing the high ridge of the Cordillera that bars it from the coast. In spite of these difficulties, coffee has been cultivated both in the south in the gold-bearing districts of Sandia and Carabaya, and in the centre of Peru in the valleys of Chanchamayo, Vitoc, and Huanuco. It is the Chanchamayo district—for most of the coffee that passes under the names of Vitoc or Huanuco comes from Chanchamayo—which is the real coffee-planting district of Peru, and it is the production of this region that has elevated Peru to the rank of a coffee-exporting country. This is due to the completion of the central or Oroya railway by the Peruvian Corporation to its present terminus at Oroya. . . . The output of coffee from the whole region was about 1,500 tons in 1893, but extensive planting has lately taken place, and production will shortly be trebled.

It is considered that coffee can be raised at the expense of 5 Peruvian soles per quintal, or 100 lb., the yield of a tree after the third year being about 3 lb. Clearing ground is easy, the hill-sides being covered with dense but light timber, easily felled and burned. The average cost of clearing may be taken at 65 soles (6/ 10s) a hectare, or 26 soles (2/ 12s) per acre. The number of plants that can be introduced with advantage on a hectare is about 1,700 to 1,800, or say 700 to the acre, although a larger number are often put into the ground. Young plants can be obtained for 5 soles (10s) per 1,000.

Coffee is usually bought at the planter's door by Italian houses in Tarma at prices varying from 18 soles (1/ 16s) to 30 soles (3/), and the cost of transport of a quintal from Chanchamayo or from the Perené to the port of Callao by mule and railway is from 4 to 5 soles per quintal. Recent lots have been sold in New York at 22c (gold) per lb., a price which is equal to that of the best Mexican or Central American with the exception of one or two favoured qualities, and will improve when the coffee is better cleaned for the market. Freight to New York from Callao by the Merchant's Line is 3/ per ton, while the British Royal Mail Company have recently put down their rates from 5/ to 4/, in expectation of increased production.

The principal difficulty of cultivation in the Peruvian *montana* lies in the broken character of the ground. This in itself is favourable to coffee cultivation, as the hill-sides afford slopes where the young plants can be raised without being exposed to the sun all day long, and the expense of protecting the young plants by artificial shade is avoided. . . . Besides coffee, cocoa, tobacco, indigo, rice, sugar-cane, maize, &c., can be grown on the Perené, while wild vanilla is found in the forest, and could be brought under domestic culture. An experimental plantation of tea is also being made.—*Grocer*, June 22.

FASHION IN TIMBER.

For many years there has been a falling-off in the demand for many varieties of ornamental timber such as were at one time generally used by cabinet-makers in England. The effect of this has been especially noticeable in the periodical circulars issued by the large timber-broking firms, such as Messrs. Churchill and Sims and others. Our own local sales are also evidence of this fact. Not very long ago, ebony offered for sale here failed to obtain anything like satisfactory bidding. A correspondent remarking upon the failure, observes that there must be some reason for this falling-off. He finds this, he tells us, in the unsatisfactory character of the work now done in hard woods generally. He says that he recently imported some of the antique ebony furniture offered for sale at the London curio auctions. In his opinion there was no comparison to be drawn between the work in such wood of a century or two back and the modern exemplars of it to be obtained from the London cabinet-makers, even of those of the highest standing. It is rather difficult to decide why this should

be the case; but the explanation is probably to be found in the disinclination of buyers of the present time to pay the prices of a bygone age. In ebony furniture more than one century old, one can find none of that loosening and gaping of joints that is said to characterize the work of modern manufacturers. Why this contrast should be observable, it is difficult to account for, save under the supposition that the present rage for cheapness renders it impossible for the careful work to be done that is noticeable in the masterpieces of some of the older cabinet-making celebrities. As the result we learn that ebony and many of the ornamental timbers are going out of fashion at home. The beautiful carved work of Bombay is for the same reason largely ignored, while for cabinet work of two centuries back almost fabulous prices are still given. It cannot be denied that the tools fitted for working in these hard woods have greatly improved in quality, and are at the same time much lower in price than they were when these antique specimens, so eagerly sought after, were made.

A safe conclusion is, therefore, that the reason for the change in fashion which tells so seriously upon the prices obtained for many of our hard ornamental woods is more due to inferior workmanship than to any other cause. Improvements in mechanical working fail to compensate for that laborious and loving work that characterized the furniture of a century or so back. Even the best machinemade watches fail to compete with the handwork of some sixty or seventy years ago. One critic says he has in use a chronometer worn by himself and his father before him for over sixty years. It never varies from its regulated speed, and from year's end to year's end it never requires alteration. No modern machine-made watch, however costly, gives such results. Analogous reasons, it is believed, are the cause for modern hard wood ornamental furniture failing to find its former demand. Ebony, owing to the peculiarity of its grain, cannot be satisfactorily fashioned by any mechanical process. Each separate piece requires to be dealt with separately and intelligently. The art of doing this does not remain among even the most skilled workmen of this age. In this fact, is found the reason why of late years there has been a marked falling-off in the demand for furniture made of this class of woods, and for the failure to obtain prices for ebony, satinwood, &c., equivalent to those of even a quarter of a century back. Under all the conditions of our time, we fear the demand can scarcely be likely to rise again to its former level.

ORIENTAL ESTATES COMPANY :

THE CAUSES WHICH HAVE AFFECTED THE COMPANY'S REVENUE—THE OUTLOOK FOR SUGAR.

The ninth annual ordinary general meeting of the Oriental Estates Company, Limited, was held yesterday, at Winchester House, Old Broad-street, E.C., under the chairmanship of Mr. Quintin Hogg.

The Secretary (Mr. Henry Greey) having read the notice convening the meeting.

The Chairman said: In moving the adoption of the report and accounts, I should like to give you a sketch of what has been going on both in Ceylon and in Mauritius, the good we have met with and the evil that we have had to contend against, and the results of our stewardship. Let me begin with Ceylon. The weather there, though not very adverse, has not been very favourable, and the result has been a slight diminution in the output of the estates, which however, is not of import-

ance. It amounts to about 40,000lb in the production of tea but that has been met by a more than corresponding economy in the cost of production. This cost is, I think a fraction below that on other large blocks situate somewhat the same as ours. The price, which in July last year had fallen to a very low ebb indeed gradually rose until it showed an advance of nearly 2d per lb. This year there has been a gradual decline again until we have nearly reached the figure ruling last July. One element in the low prices last July was the heavy stock with which we commenced the year, and the price obtained for tea to-day is by no means helped by the rumours which come to hand from more than one quarter of very considerable extension in India of tea plantations. It seems that we can take here something like 120,000,000lb of Indian tea 80,000,000lb, of Ceylon and 40,000,000lb. of China. If there should be a fall in price, it is not unreasonable to expect that some of the lower qualities of China tea may fail to come here, and they may be further supplanted by the lower qualities of Indian and Ceylon. It is difficult to foretell what may occur; but there seem to be reasonable grounds for that hope. Those of you who have for some time followed the conditions of our Ceylon estates have noticed that there has been a considerable amount of land under cultivation which has not yet come into bearing. The policy of the board before I joined it, which was recommended by Mr. Rutherford and approved by you here, was to extend and get into cultivation all the land fit for that purpose that you possessed. There are about 1,200 acres which are opened and under cultivation, and which give us no return. When these areas come into bearing, our general cost of tea will be reduced. Then, again, we have had not infrequently during the past to erect a factory at an expense of several thousand pounds, and although, as we carry on such a large business, we may expect in the future to have some small items of machinery and extension to provide for; yet we hope we shall not have to erect a new factory or to spend so much as during the last few months. The lines laid down by Mr. Rutherford have been satisfactory to the board, and have worked out very well; I hope they meet with your approval also by their results.

Now let me turn to the Mauritius portion. I stand before you somewhat envious, because it is much more hopeful to grow sugar in a silver country than in a gold country. What Mauritius would be with a gold standard I cannot think; but by paying your wages in silver there you have a much better chance of weathering the storm than in the bulk of English colonies, where paying wages in gold means paying almost double. For many estates last year, with its extraordinarily low prices and most disastrous fall, is the worst I have known in my business career. I had only one estate that did not lose considerably. On your estates you lost a comparatively small sum. I suppose there are few sugar-cane estates, with the exception of those silver countries and with virgin soil and special reasons for cheap production, which can show anything like an even balance-sheet this year. The great fall occurred in 1884, and we have had nothing approaching it since, but in 1894 we had a fall below the lowest point yet reached, both beet and cane going lower than ever before in the history of sugar. Though this was a serious matter, and involved a loss of £4 a ton on low-priced sugars and of £3 a ton on the better classes, the trouble was aggravated by two other minor matters, which we should not, however, under ordinary circumstances, have looked upon as being minor ones. I refer to the weather, which in Mauritius was not at all favourable, and also to the cane disease. At the last meeting I told you there was a slight loss from cane disease. No provision had been made for it in the previous estimates, as our manager did not think it would amount to anything very serious; but last year in estimating for the crop about which we are talking today he did allow on one estate. It is not one of the company's estates, though you practically control it. The allowance made was 500,000 lb. out of 5,000,000 lb., which we thought was not unreasonable; but the misfortune was that it was only one-third of what ought to have been allowed

the loss amounting to 1,500,000 lb. That loss, together with the low prices, instead of making that estate the head of the list for production and profits, put it very low down in the list indeed. The disease did not affect the other estates to anything like the same extent, and so, though the quality of the cane was not so good, we have no great reason to complain of the disease. At Britannia the sugar in the cane, instead of averaging a trifle over 13 per cent., averaged only a little over 11 per cent.

The three adverse factors, therefore, have been the low prices, the disease, and the weather. The weather is not a serious item. It has diminished our output, but to nothing like the same extent as the disease. We have had, very unwillingly, slightly to increase our holding in Mauritius; but there was an estate which was being partitioned right in the heart of one of our properties, and which we took up owing to the need of giving a certain amount of land rest at Britannia. You have in your employ Mr. Nash, our head attorney, and Mr. Byrd, who take a very intelligent interest in the cultivation of sugar, and who are very well up to date in their operations. They have been resting the land largely, and giving it nitrogen by growing green crops and ploughing them in. Not only have they been able to give the necessary nitrogen in a better form than by the application of manure, but the manager tells me there is the greatest possible difference in the appearance of the canes which have been under these green crops and those which have not been so treated. To enable us to put the land thrown out under these green crops 300 acres were bought near the Britannia property. The directors did not want to buy the land but Mr. Nash recommended them to do so, and, believing it was in the interests of the company, the purchase was sanctioned. The opinion of the board is that we ought not to increase in Mauritius if we can avoid it. I am glad I did not prophesy last year as to the future of the sugar estates, for I should not have prophesied a fall of £4 a ton, and that fall would have nullified any remarks I should have had to make. We have now all we can do to weather the storm. We have sent out the most stringent instructions about the limitation of expenditure, we have been through the estates and found out the lowest point at which they could have produced in favourable years, and we have given a definite limit which will prevent your losing money at these prices. I do not think they can continue, and for this reason: Other people are losing very much more heavily than we are and it, is quite clear that the present price of sugar is below the cost of production on the Continent, and also below the cost of production in most parts of Cuba. Of course, I must except a few places with special advantages; but in the long run I look for some increase in the price of sugar. We must not lose sight of the disturbances in Cuba. Some men were expecting 1,000,000 lb. from the island; they are now talking of 600,000 lb. or 700,000 lb. I believe both figures are extreme; for the production could hardly have reached 1,000,000 lb., and it would not be as low as 600,000 lb. Apparently, the insurgents are insisting on the managers not cultivating their estates. You will have noticed something in the *Times* about it. The insurgent leaders have been saying that the Spanish officials will stay in the island as long as there is a revenue, and the only way to send them back is to stop the revenue—that is, the cultivation—and these declarations may have a certain amount of effect. The insurrection is not confined to any particular spot, but the insurgent leaders have gone on the principle of scattering their forces all over the country, and harrying those who do not agree with them. Some sugar estates are escaping this by paying a subvention to the insurgents; but all will not do that, and perhaps some, after they have done it, will still be harried. The result in Cuba must tend, at any rate, to have some beneficial effect upon the price of sugar in the market. I will now formally move the adoption of the report and balance-sheet which are in your hands.

Mr. Alex. W. Crichton seconded the resolution, and, in doing so, attributed the non-declaration of a

dividend entirely to the climatic and other circumstances which had existed in Mauritius.

In reply to questions,

The Chairman said that £45,000 represented mainly controlling interests in certain Mauritius estates which were not acquired by the present board, but which were part of its inheritance. The directors were working them to the best of their ability. With regard to dividends, the directors deemed it unwise to distribute anything at the present time, as it was necessary for the company to have a certain amount of working capital. Borrowing at high rates was often ruinous, and the sugar business was very risky. The reserve was on deposit at the bank.

The report was adopted.

On the motion of the Chairman, seconded by Mr. Rutherford, Mr. Norman W. Grieve was re-elected a director.

Messrs. Welton, Jones & Co. were re-appointed auditors, and a further resolution was passed to request them in future to add to the certificate the following words, or words to a like effect—viz, that "the balance-sheet is a full and fair balance-sheet, and correctly exhibits the true position of the company."

Mr. C. J. Thomas proposed a vote of thanks to the chairman and directors, which was seconded by Mr. C. Bishop, and passed unanimously.—*Financial News*, July 26.

CHINA TEA EXPORTS AND CONFUSING STATISTICS.

The experienced journalist who is good enough to send us the special telegrams of Tea Shipments from the Far East to the United Kingdom, writes under date, Hongkong, July 25 :—

"Of course you understand that these telegrams only cover the shipments to Great Britain. There is now a good deal which goes direct to the Continent, beside what goes to Odessa, which alone takes more than Great Britain does now that you, by putting tea into the mouths of the people there, have taken the bread out of the mouths of your unfortunate brethren in China.

"Statistics are becoming increasingly difficult to get; merchants go by the season; the Customs by the year; some returns are in chests and half-chests, some in lb., and what is worse the Chambers of Commerce of the different ports won't work together and the merchants even won't work with their own Chambers. Not even the Customs figures when they come to be made up are correct, for they do not include what comes to Hongkong by junk from Kwangtung and Kwangsi for shipment here. I wish Japan had been allowed and induced to take over the whole of China and 'run' it in the intelligent and enterprising way they do things in their own country."

THE AGRICULTURAL MAGAZINE.

The following are the contents of the August number :—Dairying, Occasional Notes, Rainfall taken at the School of Agriculture during July, Laws of Ceylon Relating to Agriculture, Bazaar Drugs in Veterinary Practice, Lady Birds, The Value of Kainit, An Important Letter about Rhea, Contagious Diseases of Insects, Dairy Pickings, Camphor, Common Mortar, Rhea (Ramic) and China Grass—a Distinction, and General Items. The two articles on lady birds and contagious diseases of insects are specially interesting, as dealing with a subject which is prominently before the planting community at present, viz., the taking advantage of natural means of destroying insect enemies. The article on kainit serves to show that potash is a far more important ingredient of manures than it is generally considered to be. We are glad to find that there is a demand on the part of private land-owners for the animals bred in the Government dairy farm.

SALES OF CROWN LANDS.

We direct the attention of the Government—since the Durbar has already closed—to the letter of a practical planter on this subject in another column. It shows how great is the amount of red tape which clogs the way of business in the direction referred to, and how very discouraging is the present attitude of, at least some, Government Agents and the officers whom they influence, in respect of applications for land. Never were the doings of an obstructive circumlocution office more fairly delineated, or the unwise action of the Government Agent for the Western Province more explicitly condemned. But the point is whether such action may not be the outcome of the deliberate, though undeclared, policy of the Government? It has apparently taken credit in some quarters for laying an embargo on local land sales, the result being as our correspondent points out, to drive a great deal of capital out of the island, and some of our best and most experienced colonists to exploit new planting enterprises in Java, Sumatra, the Malayan Peninsula, and Central Africa. We have no fault to find with such new enterprise; but certainly from the point of view of the people and taxpayers of Ceylon—whose interests (and not those of any one limited class) should be guarded and promoted by Government,—the movement is a dubious one. In supposing that their do-nothing policy checks local “over-production,” our Government forgets how entirely relative is this term. Limit Ceylon to 90 to 100 million lb. of tea exports and what benefit will there be, when Travancore, the Doors, and high districts in Java send forth the extra millions of lb. which might just as well have been turned out in Ceylon? There will be the same markets to go to and the same competition to meet. But how great the difference, as our correspondent shows, to the wage-earning classes in Ceylon is the fact that the extra production occurs outside, instead of inside the Colony! And very soon too, the General Revenue must suffer from this do-nothing policy—a policy which in being extended to minor applications for blocks of land, as additions to existing plantations, becomes at once specially worrying as well as ridiculously obstructive.

VINE-GROWING IN CEYLON.

An interesting experiment has just been commenced in the neighbourhood of the Agricultural School in Viticulture. M. Zanetti, an Italian, with some previous experience of this Colony has brought a consignment of young vine plants and cuttings from Australia. These have been put out on a piece of land allotted by the Principal of the School to the following extent:—800 plants, 2 years old and younger, down and growing, and nearly 1,000 cuttings. M. Zanetti wanted land and help *at once*, as the plants had been over a month out of the soil and could not have been kept much longer, so Mr. Driberg came to his rescue. He says that his experience is that there is no objection to any amount of moisture, provided the soil is open and naturally well drained. He, however, means to give trials in other places as well. This is all very interesting; but we have always regarded the Jaffna peninsula, Puttalam, Chilaw and Hambantota as peculiarly the districts in Ceylon suited to the vine. Bennett in his “Ceylon and its Capabilities” reported that his garden in the Magampattu (Hambantota district) produced very fine grapes from vines introduced by him from

Teneriffe in 1821. He used bones as manure, and got bunches double the size of those got from unmanured vines. In writing to a contemporary M. Zanetti says:—

Though not altogether so easily as in other tropics and soils, I am of the firm opinion, that vine growing in Ceylon, could be effected as a paying enterprise. The difficulties, presented by the rainfall and the want of certain chemical properties in the soil, could be surmounted; the first, by selecting only such soil as would be most permeable and most likely to keep its surface free from collected water and easily dried, such as sandy or very light gravel soil; the second, by using those fertilizers only, whose chemical qualities added to those of the soil, would furnish the plant the necessary nourishment, wanted to produce the delicious fruit and bring it to its full maturity, which, I believe has not yet been done, neither in Jaffna, nor by the amateur growers in the island.

It is well to remember that experiments with imported vines have not been unknown in the present generation. Capt. Bayley some years ago did much in this way, at Galle, in the Morowa Korale and other localities; but without such success as would warrant perseverance.

THE DOOMO TEA ESTATES COMPANY.

“The Doomo Estates Company” is (as already mentioned) to comprise the Verelepatena Estate purchased from Mr. Channing Esdaile for about £14,000 and the Doomo estate bought from Mr. Mason for about £7,000—or R250,236 and R127,600 respectively. The total area of both properties is 983 acres of which 560 are in tea, 120 coffee. Mr. Mason is likely to be Manager on Verelepatena.

CLUNES ESTATES COMPANY.

The annual general meeting of the Clunes Estates Company of Ceylon Ltd. was held in the registered office of the Company No. 18, Upper Chatham Street on the 16th August. The Chairman, Mr. Donald Cameron, presided, and there were also present Captain Sandeman, Messrs. W. R. Tatham, James Forbes, George Vanderspar, John Guthrie, V. A. Julius, W. Forsyth and Gordon Frazer, secretary.

The notice calling the meeting having been read and minutes having been approved

The CHAIRMAN said that the report of the Directors had been in the hands of the shareholders for the last two weeks and might perhaps be held as read. The balance sheet showed a very satisfactory result for the past year's working. After writing off the balance of preliminary expenses and allowing liberally for depreciation of the Clunes factory and machinery (Erracht factory being only just completed nothing required to be written off for depreciation this year) and carrying forward to next year a balance of R2,566.29 the Directors were able to recommend a dividend of 15 per cent which, with the interim dividend of 5 per cent, already paid, is equal to a dividend of 20 per cent for the year. The Directors were pleased to report that the labour on the estate was sufficient, and that the cart road, just completed, greatly facilitated working. It devolved on the meeting to elect a Director in the place of Mr. Julius who retired and as that gentleman was leaving the island, he did not seek re-election. The Directors regretted to report the resignation of Messrs. Buchanan, Frazer & Co. as Agents and Secretaries. The thanks of the shareholders were due to the firm for the very satisfactory manner in which they had conducted the business of the Company since its formation.

The meeting would also require to elect an auditor in the place of Mr. Guthrie who retired but who was eligible for re-election.

Several questions were asked by Mr. George Vanderspar relative to the acreage coming into bearing and the amount of reserve available.

Mr. TATHAM moved the adoption of the report and the payment of a dividend of 15 per cent.

Mr. VANDERSPAR seconded and the motion was adopted.

On the motion of Mr. TATHAM seconded by Mr. FORSYTH. Mr. W. H. Figg was elected a Director in succession to Mr. Julius.

Mr. Gordon Fraser moved and Mr. Tatham seconded that Mr. Guthrie be re-elected auditor. Agreed.

The meeting, on the motion of Mr. Forbes seconded by Mr. Vanderspar, resolved to accord a hearty vote of thanks to Messrs. Buchanan, Frazer & Co. the retiring agents and secretaries for the satisfactory manner in which they had conducted the business of the firm since its formation.

A vote of thanks to the Chairman brought the meeting to a close.

SALE OF A NATIVE TEA GARDEN AT PUSSELLAWA.

Aug. 17.—The nearly 6 acres of 2 year old vigorous tea was sold R700 to Ludowicke, owner of adjoining garden. There was a good attendance of native proprietors intent only on securing a bargain, if possible. Under all the circumstances it fetched about its actual value.

THE CORAL TRADE.

Owing to the depression in the coral trade, the Italian Government forbade coral fishing on the Sciacca banks in 1891. Manufacturers have thus been working their old stocks out. The finest coral still commands its price, but unless new banks are discovered its quantity must decrease from year to year, the Messina banks being practically exhausted. Some years ago a new bank was discovered not far from Malta, but the fishermen did not take the bearings of it with sufficient accuracy, and, although her Majesty's Government at Malta gave assistance, the bank has never again been found.—*East Anglian Times*.

EILA TEA COMPANY.

A general meeting of shareholders of the Eila Tea Company of Ceylon was held in the Registered Office of the Company, No. 6, Prince Street, on the 16th August. Mr. Henry Bois presided, and there were present Sir G. W. R. Campbell (by his attorney, the Chairman), Messrs. Tarrant, H. G. Bois and W. Moir. The Report, which is in the following terms, was held as read:—

The Directors have the pleasure to submit their Report and Accounts for the year ending 30th June, 1895.

The result of the working for the year may be considered satisfactory. The estimated crops have been realized and the prices obtained for the Tea sold have been considerably higher than those of last year. The average net price for 1894—95 is 42·83 cts. per lb. against 36·27 cts. per lb. in 1893—94.

No further Tea extensions have been undertaken in 1894—95, the expenditure this year having been incurred on the land opened previously.

The net profit for the year, after allowing R9,372 35 for depreciation, is R52,864·28 (equal to 17½% on the Capital of the Company) to which must be added the balance brought forward after payment of the Dividend for 1893—94 of R2,331 65 and the surplus value of 1893—94 Crop R1,899 20 together aggregating R57,095 13. Out of this an interim dividend of 5% has been paid leaving R42,095 13 available for distribution.

The Directors recommend that this sum be disposed of as follows, viz:—That Dividend of 10% be dec-

lared on the share Capital of R300,000 (making 15% for the year) R. 30,000 00

That a sum of R10,000 be carried to Reserve Fund 10,000 00
Leaving to be carried forward to next a/c 2,095 13
R42,095 13

The Estates now consist of

Eila	..	410 acres Tea, 5 years and upwards
		50 acres Tea, 1 year old
		105 acres Tea, under 1 year
		392 acres Forest
		957 acres
Kanangama	..	200 acres Tea, 5 years and upwards
		15 do 2 do do
		108 acres Forest
		323 acres

Mr. H. Tarrant retires in accordance with the Articles of Association, but being eligible offers himself for re-election.

The Shareholders will also have to elect an Auditor for Season 1895-96.—By order of the Board of Directors, J. M. ROBERTSON & Co., Agents and Secys.

Colombo, 30th July 1895.

The CHAIRMAN in moving the adoption of the Report, said the information which was before the meeting embodied everything which, he thought, would be of interest to shareholders, so that unless anyone had a question to ask there was nothing he could add to what had been submitted regarding the working of the past half-year. The price obtained for tea during the 12 months ending 30th June was considerably in advance of the price obtained in the previous year, which, in itself, was a very satisfactory feature. The crop on Eila was estimated at 210,000 lb. and on Kanangama 150,000 lb.—very much the same figures as last year. The condition of Eila estate was in every way satisfactory. Mr. Gibbon in his report of date 1st August wrote that the new clearing was a great addition to the value of the estate. This new clearing would produce now 15,000 lb of crop. The report on Kanangama was not very satisfactory. Mr. Gibbon wrote: "Kanangama, I am sorry to say, is suffering from an attack of *Helopeltis*, more especially, in field No. 2 and No. 3 division which had the disease so badly two years ago; Nos. 8 and 3 fields are not so badly attacked; No. 1 is fairly free and coolies are now collecting the insects at the rate of 3,000 per day." In the reports for the last two years very much the same report was sent in. In 1893 there was a bad attack and 1894 did not seem to have been so bad. Still the conditions were not very different, but, as energetic measures were being taken to keep the pest in check, he did not think they had any reason to believe the property would be seriously effected. The fields that had been attacked had been pruned down for a time, and that would affect the yield, but he gathered from what Mr. Gibbon and the superintendent wrote that the yield of crop would be pretty much what had been estimated. He moved the adoption of the report.

Mr. MOIR seconded and the report was adopted.

Mr. MOIR moved that a dividend of 10 per cent be declared on the capital of the Company.

The CHAIRMAN seconded on behalf of Sir G. W. Campbell and the motion was adopted.

On the motion of the Chairman seconded by Mr. H. G. Bois, Mr. Tarrant was re-elected a Director, and it was proposed by Mr. Moir seconded by Mr. H. G. Bois and agreed to, that Mr. Shattock be appointed auditor for the ensuing year the remuneration being fixed at R50.

This was all the business and the meeting terminated with a vote of thanks to the Chair.

VARIOUS PLANTING NOTES.

SEED-GERMINATION.—It has been ascertained by an extended series of experiments that rye and winter wheat will germinate in soil the temperature of which is as low as 32 degrees. Barley, oats, flax, clover, and peas will sprout at 35 degrees. The turnip is as cold-blooded as the rye and winter wheat, but the carrot needs 38 degrees, and the bean 40 degrees before they will make the initial effort to send the life-shoot in search of air and light.—*Home paper.*

TOBACCO IN NORTH BORNEO.—In North Borneo on the receipt of news of the very low prices fetched for last season's tobacco quite a stir was created in the colony. It is surmised in some quarters that the Bornean leaf was really worth a good deal more than it fetched, and that the cause of all this disappointment is attributable to the manoeuvres of a powerful Dutch "ring" which is believed to be doing its utmost to "smash" the Borneo tobacco trade and then buy up the estates cheap when the worst comes to the worst.—*Pinang Gazette.*

TOBACCO AT TRINCOMALIE.—Tobacco now being cured, has been grown extensively this year at Nilavelli, where Mr. Alvapillai of Ploly, better known by the very familiar name of Muthalaliyar, there owns several acres of tobacco lands. In consequence of the increased demands yearly for jungle lands at Nilavelli for growing tobacco, the Government has already surveyed several lots of ground there, and has notified the sale of a few plots early in May ensuing. The acre rate, it is thought, will range between thirty and sixty rupees.—*Cor., Local "Times."*

THEY APPEAR TO HAVE A ROUGH AND READY WAY OF TREATING TEA on its way down from Sylhet. A planter noticed the other day that some forty chests of tea—his tea which were packed in front of the saloon were getting wet. An official noticed it too, and had them covered up with an old purdah, which was secured to the boxes by nails driven into them. As the nails were two inches long, of course they pierced the lead. The advantages of the metal tea chest are apparently quite realised by Sylhet and other nothern planters, but they are afraid to use them on account of the rough treatment they will have to put up with. It is a wonder the planters stand this sort of thing.—*Bombay Gazette.*

NOTES FROM UPPER BURMA.—A former Ceylon man writes to a contemporary from Upper Burma:—"I have been over two months in Burma now, and have managed to travel more than 1,500 miles, and have seen a lot of varied country. The farthest point north I have reached is Shwedwin, 688 miles from Mandalay by boat. I had some fair shooting—sambur, wild duck, goose, and peacock; also saw tracks of bison and elephant, but had no time to follow these up. All the country up there is more or less hilly, and looked the very spot for tea and coffee—plenty of water and big timber, and the rainfall about equal to some parts of Kotmale and the country round Kandy; but the difficulties of labour and transport I am afraid, could not be got over. Freight by river steamers is enormous, and is more or less a monopoly of the Irrawaddy Flotilla Company, Limited."

TEA: AN OUTCOME of the overproduction scare has been the envy with which tea planters have come to look on the millions of people in India who should be, but are not, tea-bibbers. Several suggestions have recently appeared for capturing the Indian taste among which was the issue of free samples. It is realized now, however, that that this would be rather an expensive experiment, while another point which has impressed itself on enthusiasts is that it would be fatal to create a demand for highclass tea at low prices. The idea apparently is to teach the native to drink tea, the cheapest kind for choice, and then to feed the taste with stuff that will suit the depth of his pocket. One curious suggestion for arousing a passion for tea is to supply the jails free for a time, and to sell the tea later on at low rates. This is beginning at the bottom of the social ladder with a vengeance! It would be no bad idea to subsidise public places of amusement to hand round tea free of charge on feast occasions and to advertise it as a fine medicine against certain prevalent disorders.—*M. Times, July 11.*

THE "AGRICULTURAL GAZETTE" of New South Wales, Vol. VI. Part 5. May, 1895. Contents:—Useful Australian Plants, Beech or White Beech, (*Guelina Leichhardtii*, F. v. M.), J H Maiden; Weeds of New South Wales, Part III.—Digests of Reports from Country Districts (continued), J H Maiden; Botanical Notes, Yorkshire Fog (*Holcus lanatus*, Linn.); Is Goodia Poisonous to Stock?; Range of *Marlea vitiensis*, Benth, J H Maiden; Winter and Summer Protection for Bees, A. Gale; Report on an Investigation into the Potato Diseases prevalent in the Clarence River District, R Helms; Prospects of the Frozen Meat Trade on the Continent of Europe, A. Bruce; Beef-producing Breeds of Cattle, J L Thompson; New South Wales Tobacco in London, C R Valentine; Export of Poultry to England, C R Valentine; Practical Vegetable and Flower Growing, Directions for the month of June; Orchard Notes for June; General Notes, Warning to Fruit Exporters; Abortion in Cows; Remedies for Plant Diseases; To Destroy Stumps of Trees; Opium Poppy; List of Agricultural Societies' shows, 1895.

"LADY BIRDS" AND COFFEE IN HAWAII.—The following is on the whole encouraging for Mr. Green's experiment:—

"A report from the Kona Coffee Association, states that the blight still threatens to seriously injure the coffee estates in that district, owing to the fact that the lady birds prefer the guava bushes to the coffee trees, both being affected in the same way with the blight. The report assigns as a probable reason for this preference for the guava bushes, the fact that the latter furnish a better breeding place for the larva. If this be so, the trouble will only be a temporary one, as the lady birds must soon increase in such numbers as to cover all the bushes and trees in the district that furnish food for them. In other words, it is a question of owt; but whether the planters can afford to mile so long is quite another matter—one of dtalrs and cents, as well as patience."—*Honolulu Planters' Monthly, for June.*

TEA CULTIVATION IN JAVA.—It will be seen from the figures we append that Java last year sent to Europe over 8½ million lb of tea. The *Bataviaasch Nieuwsblad* states that the cultivation of tea is extending more and more in the Preanger. Tea is gradually taking the place of coffee and cinchona on the old plantations of Pandan Aroca belonging to Mr. Massink, Tjiwangi owned by Mr. Bingley, North Tjempaka belonging to Mr. Holland, and on Passia Telaga Warna; which new plantations have been opened on the estates of Tjidiangkar, Goenoeng Besir and on a piece belonging to Mr. van der Smithe. All these estates lie in the neighbourhood of Goenoeng Kosa. In the Bandung district also new tea plantations are being cultivated: *inter alia* Mr. A. Mohr has bought a large lot in the neighbourhood of the Kadjamandala from the N. I. Handelsbank, and Mr. Furth is busy with a newly opened plantation.

The Exports of Tea from Java to Holland and England for the eleven years 1884-94 have been as follows:—

	To Holland.		To England.	
	Kilograms.	Eng. lb.	Kilograms.	Eng. lb.
1884..	788,903	= 1,735,586	1,974,381	= 4,343,638
1885..	750,446	1,650,981	1,705,850	3,752,870
1886..	1,074,804	2,364,568	2,084,698	4,586,935
1887..	1,399,999	3,079,997	1,539,477	3,386,849
1888..	1,635,676	3,598,487	1,603,312	3,528,386
1889..	1,461,037	3,214,281	1,821,579	4,007,473
1890..	1,376,041	3,027,290	1,256,093	2,763,404
1891..	857,516	1,886,535	1,782,919	3,922,421
1892..	2,097,444	4,614,372	1,897,535	4,174,577
1893..	1,905,804	4,192,768	1,979,246	4,354,341
1894..	2,495,209	5,489,459	1,311,268	2,884,789
	15,812,879	= 34,851,324	18,956,858	= 41,705,083

A DIVIDEND of 35 per cent has been declared by the Hindoo Tea Company, Limited, for the year 1894, and is payable to the shareholders at the Company's registered office at Darjeeling.—*Indian Planters' Gazette.*

THE HEATHEN CHINEE IS PECULIAR.—In the good old days of the China tea trade the little dodges of the Chinese, or some of them, for it is not fair to tar them all with the same brush, were numerous and varied. It has been said that the decline in the tea trade would teach the Celestial a lesson, and that he would set his house in order and teach the world many things. Presumably he has not commenced to reform yet, or else old habits fondly cling to him. The following extract from the Hankow report of Messrs. Evans, Pugh, and Co. shows that "tricks that are dark" still find favour with John when an opportunity occurs. "There has been very great trouble and annoyance on all sides," says the report, "in consequence of teas, Ningehows in particular, having been sold from false muster chests. In some cases 'cents' have been sufficient to allow for the difference in quality, but there are many instances where condition is poor, and actual rejection the only safe course."—*H. and C. Mail*.

THE COLOMBO "PACKET" TEA INDUSTRY THREATENED.—We fear the example of Messrs. Nelson Moate & Co. of New Zealand is likely to be followed in the other Colonies and that the prayer presented will be acceded to, at any rate where anti-Free Trade views prevail. The substance of the Petition to the New Zealand Parliament is as follows:—

2. That a very large quantity of tea is annually imported into this colony in wholesale packages or parcels.

3. That after its arrival in the colony it has been the custom of the importers, for the purpose of the tea trade, to divide the wholesale parcels into packages of 1 lb. and $\frac{1}{2}$ lb. weight, and boxes of from 5 lb. to 20 lb. weight.

4. That in the making up and the sale of such small packages regular employment is given to many hundreds of men, women, boys, and girls in making wooden cases, paper bags, tin cases, printing labels, and mixing, wrapping, and packing the tea, and thousands of feet of timber are annually used in connection therewith.

5. That recently a practice has been started of having the small packages of tea packed in India, Ceylon, and elsewhere by coolie, Cingalese or other foreign labour, and so imported into this colony, to the great detriment of the labour industry of New Zealand.

6. That such practice is largely on the increase, and if the Parliament do not impose an extra duty of 2d per lb. on all packets and boxes of tea under 20 lb. in weight it will only be a matter of time before all the tea merchants in the colony will have their teas packed for them in Ceylon, India, or China, and thus many thousands of pounds now annually spent in employing labour in New Zealand will be expended in the above-mentioned foreign countries.

7. The following businesses and industries will suffer considerably, viz.:—Timber merchants (because thousands of feet of timber are used every month for making cases), carpenters (who are employed to make up the cases), bag makers, paper manufacturers, printers, tinsmiths, tea mixers, packers, and property owners.

8. That the component parts used in the making up of the packages made up in India, Ceylon, or China escape duty altogether, whilst those traders who pack up in the colony have to pay duty as follows:—viz.: 25 per cent on paper bags and labels, 1s 6d per cwt. on lead.

9. That it having been found that the above practice was seriously affecting the tea industry in the colony of Queensland, an extra duty of 2d per lb was imposed by the Legislature of that colony on all tea imported in packets and boxes.

10. The public will also in many cases be defrauded by having very common and inferior tea imposed upon them, in packets, upon the pretence that being labelled as "packed in Ceylon" or "India" the tea must be of good quality.

COFFEE PLANTING IN KLANG, STRAITS SETTLEMENTS.—Mr. J. H. M. Robson sums up the position of Klang as a field for coffee in his annual report by showing that 2,740 acres have been taken up by Europeans during the year, while 3,810 acres have been surveyed and will shortly be offered for sale. Coffee is, in fact, King of Klang. We shall give detailed information in an early issue.

FAMINE AT NYASSALAND.—Mr. R. Caldwell writes to *De Paail* from Nyassaland, saying: "A great famine has come upon us. Millions of locusts have arrived, and have devoured every green thing, except coffee plants. The kafirs' mealies were all consumed. They sowed again, with the same result. . . . Hunger and death stand at the doors of the people of this land, unless provisions can be imported. For the people around us, a famine fund of £1,500 would be required."—*Natal Mercury*, June 14.

CEYLON TEA IN AMERICA.—Our readers will be interested to know that the Ceylon Planters' Tea Company whose admirable brands of tea, Bhud, Tiffin and Bungaloo have won their way into the Vanderbilt, Astor, and leading families in all the large cities, are willing to send a sample free of charge to all applicants. The president of the company, Mr. S. Elwood May, whose skill, energy and intelligence has done so much for the island of Ceylon, informed me that they were giving away thousands of samples daily.—*American Paper*.

HOW CAPITAL IS LEAVING CEYLON THROUGH THE OFFICIAL LAND-SALES POLICY.—A proprietary planter of large experience writes:—"I was pleased to read 'A.J.I.'s' letter and your editorial remarks in the *Ceylon Observer* of 15th inst. I endorse every word you and he write. There is no doubt the colony is at a standstill, and, as you truly remark, a great amount of capital is leaving the island, more, perhaps than one thinks. I conclude £80,000 to £100,000 is invested by Ceylon men at the present moment in coffee, tea and coconuts outside Ceylon, and all in the space of the last 3 years, and more going and more bound to follow, all of which might well have remained in the island. Capital must find vent somewhere. I have had several applications for investments outside Ceylon from men who cannot get a 'wee bit' of land put up in the island. Many men are putting their money, having nothing better to do with it, into old abandoned, poor, wasted, unsuitable land, whereas India is opening and extending on virgin soil. This will tell against us in time." We commend these remarks to the serious attention of the Ceylon Government.

COCONUT PLANTING appears to be a thriving and promising investment in Ceylon just now. The price (in silver) has gone up, it is said, beyond the most sanguine expectations of those interested, and as a result the cultivation is extending rapidly. Capitalists invest their money in coconut plantations, with the greatest confidence, and the acreage of new lands that will be opened during the next planting season will be much over what it was in previous years. The question that suggests itself is whether the present prices will keep up, or if they should come down, how far should it be to appreciably affect the industry. No other planting product, whether native or English, rice or tea, could stand just at present a fifty per cent. reduction, but "it can be safely said that coconuts would survive even a much greater reduction." The price may come down through over-production, but but such an eventuality as over-production is not likely to occur for, perhaps, ten years, or till all the young plantations which exist at present come into bearing; it may go down through a waning of the demand, but there is no immediate likelihood of another product replacing the coconut partially or wholly; in fact, the field for coconut products is daily extending. It is admitted that the fall of exchange has not been without influence in promoting this industry.—*British Trade Journal*.

CEYLON AND INDIAN TEAS.

LONDON, July 26.

I had not had the opportunity before my last letter of reading the report of the Indian Tea Association. This, and what passed at the meeting of that body held last week, you will have been informed by the *Home and Colonial Mail* posted you last Friday. I refer to this matter now, because what fell from Mr. Berry White, the Chairman of the Association, has an important bearing upon a subject that was discussed by me this week with a well-informed ex-colonist. We were referring to recent writings by you on the subject of the mutual interests of

CEYLON AND INDIAN TEAS

in opening new markets for the teas of both countries, and more expressly that of America. "The *Observer*, to my mind," remarked my interviewer, "omits from consideration one, and that the most important, point of difference between the two tea-growing countries. It insists that by finding new outlets for Indian tea, the home market is strengthened to the advantage of both India and Ceylon. This would, I think, be perfectly true if both of those countries were on the same footing as regards the possibilities of further and extended cultivation. But while Ceylon can do but very little more in that way, the end of her tether being nearly reached, the possibilities for India are almost boundless. Let Ceylon, therefore, in her sinking of all rivalry, aid India in widening the scope of her markets, and she offers a direct inducement to her great rival to open out fresh land and to pour increased supplies into all the markets wherein Ceylon and India will compete. In that sense I cannot concur with the *Observer* in its denial that there exists any competition between India and Ceylon, or in its accusation that both countries have identical interests. Ceylon is, in fact, chained to a stake. India can enlarge her circle at will. Ceylon only holds her own because her teas always secure a preference among newly attacked communities. Yes, I know perfectly well that the *Observer* has the weight of general opinion on its side, but there are some who, like myself, differ from that general opinion. Read Mr. Berry White's speech as Chairman of the Indian Tea Association, and you will see how strongly he holds the view I have stated to you. He goes even further than I am prepared to go, and sees rivalry and competition in every step of progress made by either of the competing countries. Nor, it is evident, will he admit that Ceylon can be acting honestly in any desire she may express for joint action, or at least for the sinking of any apparent rivalry. Ceylon, Mr. White evidently thinks, must anticipate—as she probably would secure—getting the best in the results to any such arrangement. Well, I don't go the length of Mr. White's arguments, but it seems evident to me that any mutual action must be limited and restrained by the consideration I have mentioned:—viz. that India has boundless possibilities for extending her cultivation, Ceylon is markedly almost without a chance for it."

I have mentioned the opinions recorded above to those whom opportunity has afforded me a chance of discussing them with. I find, however, the view almost unanimously held that India and Ceylon teas are of so closely

ALLIED A CHARACTER,

that where one penetrates, the other will possess equal chances. Also that this alliance of character ranges them against

a common opponent, China tea, wherever it may be met with, and that united effort should be made to "cast out the devil" wherever he may be met with. But although it is admitted that I find this view almost universally prevalent, it seems to me that there is some cogency in the reasoning stated by the friend quoted above. It is difficult to realize a thorough community of interest when the aspects for the future are so wholly unlike. However I don't pretend to offer an opinion on a subject of which I know so little.—London *Cor.*

[We cannot follow the logic of our correspondent's friend. Suppose that Ceylon reaches its maximum export at 100 million lb. and that India goes on to 200 million lb., unless a market is found for the Indian surplus in America, will it not come on the London market and there drive down the Ceylon, equally with the Indian average price? We are, however—as we have often said—against the policy that would limit cultivation and production in Ceylon, as only tending the more to encourage planters in India, Java, &c., to cultivate tea far more extensively than they would do if they thought Ceylon men under the auspices of their Government, were going ahead.—E. D. T. A.]

BRAZIL COFFEE NOTES.

In the interior of S. Paulo coffee trees have been injured by frost. A S. Paulo telegram of the 28th ult. says that "the future coffee crop is appraised at about thirty millions." Thirty millions what? It is to be presumed that sterling is referred to, but it would be well to make all such statements precise.

The *Diario Popular* of Sao Paulo says that the recent cold weather was exceptionally severe at Sorocaba, the thermometer making one degree below zero (Cent.) There were heavy frosts, and it is said that the coffee plantations have suffered severely.

The exportation of Coffee from Santos during the year ending the 30th ult., is given by one of our exchanges as 3,904,078 bags.

The damage caused by frost to young coffee trees in the municipal district of S. Simao, Ribeirao Preto, Batataes and Jaboticabal is said to be enormous and will, it is thought, diminish considerably the crop for next year, which was expected to be large.—*Rio News*, July 2.

CEYLON PATENTS.

The following Grants of Exclusive Privilege have been made under "The Inventions Ordinance" during the half-year ended June 30, 1895:—

457.—To William Wellesley Pole Fletcher of Wishford, Ludlow, Ceylon, at present residing at 3, Edinburgh Terrace, Kensington, in the county of London, England, Civil Engineer, for "improvements in vehicles adapted for conveying chests of tea or other goods along common roads."—Jan. 2, 1895.

422.—To James Adam Hunter of Sunnycroft estate in Ruwanwella in Kelani Valley in the island of Ceylon, for "improvements in apparatus for cutting and gathering tea shoots and leaves"—Feb. 7, 1895.

445.—To Alfred Francis Bilderbeck Gomers of 24, Alfred Place west, south Kensington, in the county of London, England, chemist, "for an improved process for the preparation of textile vegetable fibres."—March 2, 1895.

448.—To Charles Meray Htorvath of Arad in the Kingdom of Hungary, publisher and engineer, for improvements in and connected with apparatus or machines for producing type-matrices."—March. 17, 1895.

449.—To John Carlyon Roberts of 16, Cromwell Grove West Kensington, London, England painter, for improvement in the manufacture of folding boxes or cases.—March 7, 1895.

451.—To Charles Smith of 39, Albert Road, Peckhams London, England, Commission Agent, for improvement, in sheets, counter-panes, quilts, curtains, shrouds and other like rills for protection against flies and other insects.—May 11, 1895.

456.—To William Jackson of Thorngrove, Manno-field, Aberdeen, North Britain, for improvements in apparatus or machinery for disentangling or separating tea leaves that get interwoven or united to each other in the process of rolling.—May 14, 1895.

454.—To Mir. Sultan Moberdeca of Madras, for an invention for sultan water lifts and buckets.—June 1, 1895.

453.—To Henry Cecil Fellowes and William Robert Crazier, merchants, both of Leadenhall Buildings, 1, Leadenhall street, in the city of London, and Henry Ferguson, Engineer, of 60, Ranelagh road, Leytonstone, late of 10, Cleveland Terrace, Ranelagh road, Leytonstone, in the city of Essex, England, for improvements in the extraction and preparation of the fibres of Rhea and other grasses and fibrous vegetables.—June 1, 1895.

452.—To Edward Robinson of 4, Castl nau Gardens, Barnes, London, England, merchant, for apparatus for drying Tea, grain and other substances.—June 5, 1895.

447.—To William Gow, of 13, Road Lane, in the city of London, England, Tea broker, for improvements in apparatus for treating tea leaves.—June 5, 1895.

E. NOEL WALKER,
Colonial Secretary.

Colonial Secretary's Office,
Colombo, August 4, 1895.

INDIAN PATENTS.

Calcutta, Aug. 8.

Applications in respect of the undermentioned inventions have been filed, during the week ending 3rd Aug. 1895, under the provisions of Act V of 1888:—

For Improvements in Apparatus for Rolling Tea Leaf and the Like.—238 of 1895.—William Jackson, of Thorngrove, Manno-field, Aberdeen, North Britain, Engineer, for Improvements in apparatus for rolling tea leaf and the like.

For Improvements in Tea Leaf Withering Racks.—240 of 1895.—Edward Bulteel, tea planter, at present residing at Kalacherra, in the district of Cachar, in the Province of Assam, and Henry Joseph Kersting Green, Engineer, of 30, Clive street, and 14, Garden Reach in the town of Calcutta, for improvements in tea leaf withering racks.

Specifications of the undermentioned inventions have been filed, under the provisions of Act V of 1888:—

For Improvements in Tea-rolling Machinery.—197 of 1894.—Lawrence Herbert Sutton, of Panitolla, Lakhimpur, Assam, Engineer, of the Jokai Assam Tea Company, Limited, for improvements in tea-rolling machinery. (Filed 26th July 1895.)—*Indian Engineer.*

PLANTING AND PRODUCE.

TEAMEN AND GROWERS IN CHINA.—Consul Mansfield, in his report on Foochow, says that to the teamen, or native traders, the 1894 season has, with few exceptions, been a fairly profitable one, while the growers are said to have done only indifferently well. As regards the latter, even if they have profited but little on the sale of their produce at the new low scale of prices now ruling, the fact of their having made any profit at all goes to show how large their gains must have been in years gone by. The foreign shippers felt themselves heavily handicapped early in the season by the depression of trade both in Europe and Australasia, but through being able to buy at low prices, and helped by some improvement in the consuming markets later in the year, the season has not been altogether an unprofitable one to them. Prospects are not bright as far as they can be judged of at the moment. So far from there being any chance of an alleviation of the imposts which weigh so heavily on the trade, it is understood that there is to be an increase in the likin

duties as a special war tax. Then there is a serious continual falling off in the deliveries of China tea from the London bonded warehouses, and the Australian markets have been taking year by year less China tea. Certainly the export figures show our trade with America to be steadily improving, but as yet that continent is only a small customer for Foochow Congous. No definite information is yet to hand with regard to the increased likin proposed to be levied on tea coming down from the interior. Should the rumour prove true, every possible effort will be made to induce the Chinese authorities to recognise the fact that the trade cannot bear increased taxation, and that the result can only be in the long run diminished supplies and proportionately reduced revenues.

QUESTION OF QUALITY.—Much is said in the home papers, says the Consul, about the inferior quality of Chinese tea shipped to England, and recommending improvements in this direction. The fact is, however, that, speaking generally, it is only the lowest grades that find a ready market for mixing with the higher priced Indian and Ceylon teas in what is known as the "shilling canister."—The higher priced teas of good quality frequently show losses which shippers can ill afford to meet. The great bulk of the teas now shipped from Foochow are, therefore, the commoner kinds at a value, roughly speaking, of from £1 3s to £1 9s per picul (133 1-3lb). Before this tea leaves the port it has to pay in likin and export duty about 10s 6d., which is out of all proportion to its cost. The tariff duty of 2-5 Haikwan taels (say 8s) per picul was, when the tariff was drawn up in 1858, supposed to represent an average *ad valorem* duty of 5 per cent. At the prices now ruling for the leaf, the duty on finest quality, which is only exported in small quantities, is over this 5 per cent. estimate, while the common tea, which, as above stated, forms the bulk of the export, pays about 30 per cent. *ad valorem* for export duty alone, without taking likin or inland taxes into consideration. The profits made by those engaged in the business are now so small and precarious that this heavy impost is slowly but surely undermining the whole existence of the trade. From Chinese accounts the coming season's crop promises to be extraordinarily good, but the movements of the Japanese fleet in the neighbourhood of Formosa have caused something like a panic among the native merchants here, who are afraid to send their money into the country for the purchase of tea. It is difficult to foretell what the effect may be on the trade during the season now approaching.

FREE INSURANCE AND PACKET TEA.—This is the latest plan for pushing the sale of packet tea. The Lindoo Valley Ceylon Tea Company state that for the future every packet and every fancy tin of their Ceylon blends, from 1s 6d to 2s 8d per lb. will contain a free insurance policy against accidents up to the limit of £60 for three pounds £20 for one pound, £10 for half pound, and £5 for quarter pound. In addition every quarter pound packet will contain a coupon, every half pound two coupons, every pound four coupons; and when the consumer accumulates 104 of these coupons, they can be exchanged for a yearly policy of £1,000 against fatal injury or permanent total disablement, and £500 for permanent partial disablement.

A TEA-TESTING CONTEST.—We learn from the *Canadian Grocer* that quite a novel departure in the way of entertaining instruction for grocers' picnics and like gatherings was introduced recently in Minneapolis, at the grocers' picnic. It consisted in a tea testing contest, whereby over fifty grocers tried their ability to guess the price of different kinds of tea under the instruction of an expert from some wholesale tea house. "The tea testing contest given at the grocers' picnic of Minneapolis brought out some strange evidence of ignorance in the value of teas in the men to whom a good knowledge of teas would mean a good many dollars in the course of a year," says our Canadian contemporary. "The three samples of tea to be tested were valued at 25 cents, 26 cents, and 19 cents respectively.

There were something less than fifty grocers taking part in the contest. The fact that one contestant marked the 19 cents tea up to 55 cents, and that there was a range of marking covering the whole range of price of teas, shows in a degree how many grocers simply make a stagger at guessing at the real value of the tea they buy. Now, not one of these grocers would think of taking some other man's word on the grade or butter they buy. Yet where a cent a pound is saved on butter by knowing how to test the grade, 10 cents a pound can be saved on tea, and this means 8 dols on a chest. The grocer who does not learn to test his own purchases of tea, yet insists on testing his own butter, simply wastes at the bung what he saves at the spigot."—*H. and C. Mail*, Aug. 9.

TRAVANCORE PLANTERS' ASSOCIATION.

Minutes of proceedings of an extraordinary meeting held at the Club, Trevandrum, Wednesday, 14th August, 1895.

Present:—Messrs. H. M. Knight (Chairman), J. S. Valentine, H. S. Buist, W. O. Milne, C. F. Ewart, R. T. Miller, C. Cary-Elwes and R. Ross, Hony. Secy. Visitors: J. E. Fowler, President, K. D. Association, and A. D. Adams.

The notice calling meeting having been read, the Chairman and Honorary Secretary resigned, but were unanimously re-elected.

The following resolutions were then put before the meeting and carried.

I. Proposed by Mr. J. S. VALENTINE and seconded by Mr. K. T. MILLER:—"That subscriptions to American Tea Fund be continued, viz., four annas per acre under tea, and half an anna per maund of tea produce being rates fixed by Indian Tea Association."

II. Mr. Ackworth's letter *re* Association paying half share of delegates' expences to United Planters' Association conference having been read. It was proposed by the CHAIRMAN that the following telegram be sent to Mr. Ackworth: "Travancore Association request you will act as delegate in terms of your letter 3rd Aug. Reply."

III. Proposed by CHAIRMAN, that a considerable deficiency exists in the current year's accounts. Each estate be asked for a donation of R10 for the year 1895, also that subscriptions for year 1895 be now called for.

IV. That the attention of Government be drawn to the resolution passed at general meeting held in 1894 *re* giving notice to owners of estates on which arrears of tax are due, and that an English translation accompany the vernacular, also that the Secretary be asked to revise the scale for calculating the duty on Liberian coffee the present rates on Easternside being equal to double duty.

V. That the following resolution be added to telegram to the Delegate "Trust that prompt action will be taken in laying the subject of Act XIII. before the Secretary of State by the United Planters' Association."

VI. Proposed by Mr. J. S. VALENTINE and seconded by Mr. H. M. KNIGHT:—"That this Association views with apprehension the evident determination of Government to refuse, on the plea of forest being reserved the granting of extensions to owners of present holdings, who have put all their available land under cultivation and that Government be urged to grant applications for such extension within reserves."

VII. Proposed by Mr. R. T. MILLER and seconded by Mr. H. S. BUIST:—"That with reference to the new medical grant-in-aid regulations, Government be requested to extend the grant to medical practitioners in residence in the tea districts."

VIII. That Government be requested to put in repair the bridge path from Kalthuritty bandy road via Shalakarey to Patanaveram, also that Government be asked to make a yearly grant of R120 to pay for boatman at crossing of river on the Rockwood cart road, the erection of Mynall and Kildonan bridges as per estimate and former applications; that the attention of Government be again called to the fact that no travellers' bungalow exists

between Coullapooly and Naduvanguad, a distance of 27 miles to the great inconvenience of travellers on that road.

Before closing the meeting the CHAIRMAN said he hoped before they met again next January, that a scheme would be formulated for combining the three districts of Travancore into one Association. The arrangement would not interfere with the present existing Associations, which would control their local business, but would strengthen their hand when dealing in matters with Government in which all were equally interested, and it must be obvious to all members of the Association, that it would be advantageous to have a Secretary near the Capital, who would act in common for the planting community. "Unity is strength," and he was sure that this fact would not be overlooked by any planter, at a time when Travancore seemed fairly launched into prosperous times; and provided fair justice is given us over Act XIII, he saw no reason why Travancore should not become the premier tea district of India.

R. ROSS, Hon. Secretary.

(Signed) H. M. KNIGHT, Chairman.

THE RIVAL MANUFACTURERS OF CAFFEINE.

We (*Chemist and Druggist*.) understand that Messrs. Boehringer and Sons, of Mannheim have just opened a factory in London where they have put up a plant for denaturing tea, sweepings for exportation to Germany. The two English name manufacturers offered to take the entire supply of sweepings from the docks on contract at 10s. per ton above the regular quotation of 6l. 10s per ton, but the Dock Company refused to entertain this proposal, and supplies all makers, British or foreign, equally at the old figure so far as supply goes. Four tons of denatured leaves are said to have just been shipped to Germany.

THE PLANTING DISTRICTS OF CEYLON IN 1895.—NO. I.

HOW IT STRIKES AN "OLD COLONIST."

"Together let us beat this ample field

Try what the open what the covert yield."

The gentleman who objected to his estate being described as *abandoned*, merely because it ceased to grow coffee, had some reason on his side, especially if his estate lay at a moderate altitude in one of the fertile valleys of Central Ceylon. There are few more interesting scenes than a wild maze of vegetation, and this may now be seen in perfection, where 25 years ago the land was devoted to one product—

A THOUSAND VARIETIES

where erstwhile only one reigned supreme. The rugged hill-side with its stiff, forced and formal coating of coffee is now dressed in the softest of drapery, plants growing with a spontaneity and arranged with an effect which makes us marvel at the hand of nature. There stands out like a gigantic prince's feather, the grand old *Kitul* overtopping the noble *Jak*; the sweet-scented flowers of the *Sapu* perfume the air, while the leaves of the firmly rooted *Bogaha* quiver in the morning sun. There too the shapely *Toon* has taken its appointed place, more at home than in its own native country where with characteristic perversity it is called a cedar! The umbrageous *Inga* has also found its way here and throws a refreshing shade over the tangled net-work of lovely creepers covering every inch of ground, the *Tropaeolum* trails through the *Lantana* while the black peeping eye of the *Thunbergia* looks out from amongst the *sensitive plants*.

Chiefly foreigners these, which have found a congenial home in Ceylon like the present ruling race; but there are many purely native plants equally beautiful and equally valuable, springing up wherever they can find space; the cinnamon and various kinds of camphor on the driest ridges, while cardamoms and ginger indicate where water is near. Guavas abound, and are much prized though to me always a disappointing fruit. But there is another and smaller fruit which deserves to be better known—not unlike the black currant, the virtues of which for colds and throat affections, the gudewives at home place so much faith in—it grows in pretty clusters on a handsome tree of moderate height—and curiously enough the Sinhalese call it “*Ugu-ressa*,” Ugu meaning I believe, the throat.* The *Papaw* is common and either for vegetable or fruit is a great boon; the *Avocado pear* is less seldom seen, and no great loss as the variety in Ceylon is rather a fraud; *Oranges* plentiful but sour. *Pines* might pass had we never tasted them at Gnayaquil. The sony *Soursop* is appreciated on a hot day, but is a poor relation and apology for the *Cherimoya*. The massive *Mango* tree provides in season the best of all Ceylon fruits. Plantains in profusion and *Tomatoes*—particularly the smaller kinds—in perfection, while the *Bead tree* from which we get our Margosa, the *Croton* and Castor oil plants are everywhere. These and hundreds more

“here disputing own a kindred soil
Nor ask luxuriance from the planter's toil.”

“Abandoned!” do you call it. Ye poor divi-
dent worshippers, may such abandon long be mine!

Seriously, the lesson to be learned from this is
surely

NEVER MORE TO ATTEMPT THWARTING NATURE
especially in the tropics—by the vandalism of
eradicating all the products save one passing or
temporary favourite; the more mixed the more
natural and permanent will the products become;
and under such circumstances the “Watte”
regained, will be much more interesting than the
“Watte” lost.

How to turn the various Products to the best
account is the absorbing problem for the planters
of today. To arrange the robust and strong so
as to shelter the more fragile from fierce winds
and to nurse the shade-loving fruitbearer under
the arms of umbrageous mothers.

Some of the best examples of what it is possible
to accomplish in this way I have recently visited,

ROSENEATH AND ANNIEWATTE

within a mile of Kandy. To those who remem-
ber these estates twenty or even seven years ago
and have not seen them since, a visit now will
indeed be a revelation. The erstwhile bleak, bare,
washed and bleached ridges swept by both mon-
soons and greedily devouring half the refuse of
Kandy with little to show for it. Now, see the
sylvan shade; what a transformation in a few years!

The kindly and easily propagated *Erythrina*, the
noble *Jak* and graceful *Grevillea* form the three
best shade trees. Next comes the *Inga* (name
after our fast vanishing friend the inca of Peru).
Under these the cacao thrives and yields in a
manner marvellous to see. True, no San Antonio
can be expected here; but, such cacao as may be
sufficiently remunerative; while tea and Liberian
coffee, though not courted shade, prefer it to the
wind-blown dry quartz which now responds more
profitably to the manure.

* One Sinhalese authority, says that it is of the
bark of the tree, a decoction for throat purposes
is made.—ED. T.A.

The surface soil is greatly enriched by the
falling leaves from the shade trees which drawing
their chief nourishment from the subsoil, return
50 per cent more than they take from the food
of the profit-giving products.

Altogether the transformation is very striking
and pleasing, while the returns are, I believe,
in keeping with the enhanced appearance of the
estates. The possibilities are thus shown to be
something not dreamed of in the early days of
planting. In this immediate neighbourhood or
within a radius of ten miles of Kandy

400 SQUARE MILES

might be treated with equal success. Labour—
or rather the want of it—is the chief difficulty
which meanwhile bars the way.

The native has unquestionably deteriorated, both
Tamil and Sinhalese especially near populous cen-
tres where they come in too frequent contact
with Europeans. And this is one of the saddest
facts that strike the returning Colonist:

“Man seems the only growth that dwindles here.”
And this does not apply merely to the poor de-
moralized coolie, but even more so to the families
of the well-to-do Sinhalese.

Let me record one example out of scores:—
Don Carolis—as I may call him—was a well-
known and very presentable figure on the Gat-
tember road 30 years ago—prosperous and deserved
to be; honest, active, snave and gentlemanly; more-
over as guileless a Christian as ever the C.M.S.
were instrumental in saving. I well remember the
late David Fenn taking a special interest in the faith-
ful old Don and frequently calling at his pretty
white bungalow by the lime kilns.

Don had a name-son, his special pride, a bright,
keenly intelligent and promising boy. With what
evident delight the old man smiled upon his son
as he returned from school laden with books!
No expense was spared in his education, though
at home every economy was practised in order
to leave at death the competence he had so care-
fully acquired, to his much loved son. Poor old
Don is now gone, so too is his hard-earned
wealth, and the precious son may now be daily
seen loafing around the corner grog-shop, the
bright intelligent eyes now blood-shot, glassy and
void of expression, but with shameless persistency
he begs a cent of the passer-by:

“I know you, sir,” he said to me yesterday in
better English than manners—“I remember you
coming to my father's house with Mr. Fenn.”

“You drunken scoundrel!” I replied. “Are
you the son of good Don Carolis?”

I must leave the reader to moralize. My func-
tion being merely to see and try to tell in a
plain way what may daily be witnessed around
beautiful Kandy. Next week I purpose re-visiting
some of the higher regions of the island.

A TOUR ROUND THE COCONUT DISTRICTS.

DELICIOUS MANGOSTEENS AND ORANGES AS WELL
AS—COCONUTS GALORE! TWO PLANTING
VETERANS: W. H. W. AND W. J.

At what age do mangosteens bear?—is a question
often asked, and it may interest your readers to
hear that on Mr. Wright's model coconut estate
at Mirigama, there is a little grove of beauti-
ful four year old mangosteens yielding a very
nice crop which rather upsets the native theory
that if you plant mangosteens your children get
the fruit.

I tasted oranges also (the trees grown from
seed) on the same estate, more delicious than any
I have ever eaten before. They were a sort of
large mandarin and almost seedless. Under the

guidance of the veteran W. J., I have been making a tour round the coconut districts and Mr. Wright kindly put us up and showed us a model estate indeed! Over the whole 300 acres there is not a single vacancy, and the marvellous care with which every detail has been thought out, and wrought out, convince one that our host is a personality far above the average. The bungalow nestles in a grove of fruit trees and the garden is full of beautiful flowers, while many rare orchids and other plants have the constant care of the proprietor, and the hospitality dispensed is unbounded.

W. J. is building up a big thing in Coconut property for the Ceylon Tea Plantations Company and in a few years, even if their handsome tea dividends should disappear, their income from coconuts will be larger. Happy are the shareholders whose directors provide so amply for the present as well as lay up for the future as is being done in this Company. K.

CEYLON TEA IN NEW ZEALAND.

Mr. John D. Darley, formerly of our planting community and well-known in Ceylon, writes to us from New Zealand under date 18th July:—

I enclose you a cutting from a local (Auckland) paper with reference to your teas. I must say I do not agree with it, and find there is nothing to equal good Ceylon tea. But a quantity of the tea sold as "Ceylon" is mixed with an inferior quality thereby giving it a bad name:—

"In the tea market there is a plethora of undesirable Ceylons. The growers in the island where every prospect pleases and only man is vile, are apparently plugging into quantity, and are forgetful of quality. If this policy is continued good-bye to the favouritism of Ceylon teas, which up to now have steadily advanced in popular favour. Reckless consignments of poor Ceylons have been advised from all quarters, while the difficulty of finding high-class quality is more pronounced than ever."

NATIVE CULTIVATION IN UVA.

The villagers and cultivators are reaping their harvests of paddy which seem pretty fair, but this evening's thunderstorm will I am afraid spoil some of the stacks that are not threshed out and prove to some of the lazy ones, that there is "many a slip between cup and lip," and perhaps set them levying black mail on their neighbours.—Crime is about much the same as usual and by no means decreasing; the village headmen and town Arachchies are a farce as guardians of the public, all they are good for is to levy blackmail and share the "spoils-of-the chase" with the rogues and vagabonds.—*Cor.*

COFFEE LEAF DISEASE.—It never rains, but it pours. Just after the "Secretary to the Agricultural Department, Ceylon" received a letter from England claiming the reward (mythical) for the discovery of a cure for coffee leaf disease, there comes a telegram to the same effect from a gentleman in Coonoor, who is really near enough to know we have little coffee left in Ceylon, and who also ought to know that as the disease prevailed on young estates with virgin soil, as well as on old, it could not be due to a cause he names. Still, our Coonoor friend has coffee near by him in Coorg to experiment on.

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Ear-drums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN,

TEA GROWING IN WENCHOW.

Consul M. F. A. Fraser writes in his Report on the trade of Wenchow for the year 1894, dated April 29th, as follows:—

The principal feature in the export trade was a large increase in the export of Tea, and this promises a large expansion hereafter, which is most gratifying to those interested in the progress of this struggling and ill-used port. Foochow will have to look to its rather faded laurels.

Green tea does not appear in the customs returns of cargo exported in steamers before the year 1893. In that year 149,467 lb of it were so exported, and in 1894 there were 253,733 lb of green, being hyson, gunpowder, and imperial. The beginnings recorded were very small, in 1877 there having been only 37,067 lb exported in steamer, and in the next year, 1878, only 90,667 lb all sorts included.

A visitor to Wenchow may see tea growing without the necessity of going so far afield as a visitor to Foochow. At Wenchow an hour's walk in almost any direction takes one into hills where tea is cultivated, as also tobacco, coir-palms, the tea-oil plant, the bamboo and the ubiquitous sweet potato. Even on the tiny river island on which the consulate stands, tea is grown by the Buddhist Priests. A cup of tea prepared "à la Chinoise" from leaves picked just outside the portals, and pure mountain water hard by, tastes delicious to the holiday pedestrian who has climbed up the steepest of stone-flagged parts over 1,000 feet to one of the numerous temples occupied by good Buddhaist and Taoist priests in the surrounding hills.

Nearly all the tea exported, however, comes from the Ping-Yang region. The town of Ping-Yang is about forty miles south of Wenchow, and is reached by canals over which there is an enormous traffic, mainly in fast boats of small size propelled by hand. In the trade report for 1893, Mr. Parker mentions that an enormous export of alum to Ningpo, quite 12,000 tons a year, takes place from Ku-ao-tow, the port of Ping-yang, ten miles further to the south. It is from Ku-ao-tow, I am informed, that great quantities of tea, bought by four Ningpo Chinese merchants, is shipped on junks and taken to Hui-p'u for the province of Kiangsu, the province just north of this one, containing Shanghai, Soochow, and Nankin. The tea so shipped is of coarse complexion, and indeed it is easy to understand that the finer kinds of this delicate article better sustain a quick voyage in good steamers than a long one in "wind-jammers" like the native junk, in which conveyance of over 500,000 lb. of tea take their way to the neighbouring northern province.

As for finer teas no pekoe black tea appears in the customs returns of steamer export before 1894, and then only to the extent of 50 piculs, i.e., 6,667 lb., but this first-crop tea, called pekoe, "whitedown," from the whitish down with which the leaves are covered, is grown to a much larger extent annually, and a great deal is taken overland to Hangchow, the capital of the Ningpo-Wenchow Province of Chekiang, whence some finds its way to the large city of Soochow.

Tea-firing.—At present half of the Ping-yang product goes south to Foochow, but we may expect that this proportion will diminish if not disappear. In 1893 a beginning was made by establishing a tea-firing concern in Wenchow. It has 160 firing-pans, to attend to which eighty men are employed in the season, earning each 140 cash a day, that is to say about \$1 (2s) a week. About 100 women are also employed by it in picking out stalks, old leaves, &c. from the teas at wages of ten cash a catty (1½ lb). The workpeople engaged in the work of sifting and packing are from the enterprising population of Hui-chow, the mountainous prefectural district in the province of Anhui, bordering our province on the west. "No business can be done without Hui-chow men" says a proverb well-known in China. These skilled Hui-chow men are paid by the season, and a double the rates of the local men. The native tea inspectors or "chaszees" are also Hui-chow men. In 1894 another firm set up 140 firing pans. These two together exported about 5,000 chests of tea last year. Three more are in train, so that in

the season of 1895 there will be five at work preparing green teas for exportation. This green tea, which is prepared at Wenchow, requires elaborate manipulation, covering a period of two months, which accounts for its greater cost. The preparation of black teas is not so elaborate. It seems almost a pity that one or two of our merchants do not settle here and buy locally. I am assured that as compared with Shanghai expenses they would save about \$3 per picul (133½ lb., the Chinese hundred weight) on commissions, coolie hire (porterage), cargo-boat hire, godown hire, and packing expenses. However, when the long-talked-of telegraph is built, the risk of losses in making such an experiment will be of course diminished.

The Wenchow *Orange* has an enormously thick skin, easily detachable. It is strongly scented and bitter, and is supposed to have medicinal virtues. It is exported chiefly to Tientsin and farther north, packed in tubs.

Whole streets in the city are occupied by the makers of the various parts of the paper umbrella, known to commerce as the *kittysol*, an ingenious perversion of a Spanish name for a parasol, "quitasol." Its simple components are bamboo and oiled paper, with the addition of a little decorative colour. The same thing is made in Japan, and called the "kasa," and depicted (*ad nauseam*) on Christmas cards, &c. Its domain is being invaded by what the Japanese graphically call "the bat's wing," the umbrella of European build; but while the large non-mandarin class of Chinamen are kept so poor, the difference between the shilling or two paid for the latter article and the four-penny "kittysol" will be a financial consideration to be taken into account.

Fish-maws are boiled into a nourishing glutinous soup.—*L. & C. Express.*

EXTRACT OF PALMETTO; A NEW TANNING MATERIAL.

The palmetto palm *Serenoa serrulata*, grows in North America, and is an evergreen tree having ribbed fan-like leaves of three to four feet in diameter. Round each bud four to six leaves grow every year, and these keep green for two years, when they become yellowish brown and die off. The stalks of these leaves grow to 1½ to 3 feet in length, the leaves are collected and cut up finely, the stalks being removed. The whole is then put into large tubs and lixiviated with hot or boiling water. The liquor is then concentrated to an extract when intended for shipment. To obtain the fibres, which are useful for rope-making, etc., the parts remaining in the tubs are treated after the liquor has been drained off with chemical agents. These have the effect of separating the silicic acid and decomposing the other portions, which become converted into a gummy mass that can easily be removed, leaving the pure fibres. The tanning process with palmetto extract is the same as with quebracho (*Apoth. Zeit.*, No. 30, 1895, p. 309)—*Pharmaceutical Journal.*

TEAS FROM THE FAR EAST.—Our Special Telegram elsewhere shows that the London demand for China teas—poor as it has been for these two seasons—is slackening even on the figures for last year. At the same time, as we learn from our files, the China exports to Odessa for Russia have increased considerably.

CLOSETS, Urinals, Night Commodes, Stables, Kennels, &c. should be lightly dredged (after cleansing) with CALVERT'S 15 per cent. CARBOLIC POWDER, to destroy bad odours and to kill or keep away insects.—The most effective preparation.—In ½ lb., 1 lb. and 2 lb. dredgers, at 6d., 1s., & 1s. 6d. each, from Chemists and Stores. F. C. CALVERT & Co., Manchester.

DRUG REPORT.

(From *Chemist and Druggist.*)

London, August 8th.

ANNATTO SEED.—Good bright offering at 3½d per lb.

QUININE.—Ten thousand oz Auerbach sold in auction at 1s 0½d; 1s 0½d is the outside price.

COCA LEAVES.—A lot of dark-brown Ceylon should have been sold without reserve, but no offer could be elicited.

CUBES.—Only 17 bags were offered. The fruit was slightly mouldy fair brownish to grey, but there was practically no demand, 3s being bid and refused.

KOLA-NUTS.—Privately several tons have been moved off at 10d to 10½d per lb. A few bags good West Indian realised 10½d to 11d per lb at auction.

VANILLA.—Although the quantity brought forward was small it represented different varieties. Mexican beans are quite a novelty on the market, as there have not been any here for a long period. The lot was, however, withdrawn without quotation. Tabati 4d to 7d; low foxy sold at 3s 9d per lb. Seychelles and Bourbon withdrawn.

CAFFEINE.—The dearth of suitable raw material is still in evidence. This scarcity is likely to continue, as the supply of such material is, and will be, restricted. Makers, although not quoting right and left, are supplying consumers according to circumstances, at from 20s to 22s per lb. A few second-hand lots may be picked up here and there at 25s to 27s 6d per lb.

INDIAN TEA SALES.

(From *Watson, Sibthorp & Co.'s Report.*)

CALCUTTA, August 27th, 1895.

Notwithstanding the unsatisfactory news from the London market the sales held here on the 22nd instant passed off with spirit and prices for teas showing any improvement in quality were generally higher, all grades, under eight annas may be quoted from 2 to 4 pie dearer, while the better sorts sold irregularly but mostly in favor of sellers. Buyers for the Colonies, Bombay and various other markets were very keen and secured a large proportion of the tea sold. 15,513 packages changed hands, of which nearly 5,000 packages go to markets outside the United Kingdom.

The average price of the 15,513 packages sold is As. 7-11 or about 8½d per lb. as compared with 18,994 packages sold on the 23rd August 1894 at As. 9-0 or about 9½d per lb. and 13,995 packages sold on the 24th August 1893 at As. 7-9 or about 9½d per lb.

The Exports from 1st May to 24th August from here to Great Britain are 41,786,089 lb. as compared with 39,784,288 lb. at the corresponding period last season and 39,295,591 lb. in 1893.

NOTE.—Last sale's average was As. 7-8 or about 8d per lb.

EXCHANGE.—Document Bills, 6 months' sight, 1s 17-16d.

FREIGHT.—Steamer £1-15-0 per ton of 50 c. ft.

EXPORT OF TEA FROM CHINA AND JAPAN TO THE UNITED KINGDOM. EXPORT 2 MILLION LB. LESS THAN LAST YEAR'S. CHINA COAST, Aug. 20.

The Exports of Tea up to date from China and Japan to the United Kingdom amount to 24 million lb., as compared with about 26 million lb. up to same date last year, 38 million lb. in 1893, and 24 million lb. in 1892.

CONFIDENCE IN CEYLON PLANTATION PROPERTY.—We learn that an absent proprietor of long business connection with the East and acquaintance with the ups and downs of plantation property, so values his Ceylon plantation that, on being lately approached with reference to a sale, he intimated that nothing less than sixteen years' purchase on his present annual profits would tempt him. This is certainly an indication of confidence on the part of a London man of business in the future of tea. Seven to ten years' purchase is usually considered enough for the tropics.

MARKET RATES FOR OLD AND NEW PRODUCTS.

(From S. Figgis & Co.'s Fortnightly Price Current, London, 31st July, 1895.)

GRAPE CULTIVATION IN CEYLON.

THE cultivation of the grape has been the subject of a number of communications which have from time to time appeared in the pages of this Magazine. Mr. E. T. Hoole

in particular has written much on the subject, in which he has evinced peculiar interest, no doubt having first had his attention drawn to the possibility of extending grape culture in Ceylon by his long experience of the industry in Jaffna. In a late number, this correspondent contributed a most interesting account of the cultivation of grapes in North-West India, and commended the system there adopted to the notice of cultivators in at Ceylon. Not long after the publication of this account we had a visit from Mr. Zanetti, with whom arrangements were subsequently made for carrying on an experiment in grape culture on the grounds of the School of Agriculture at Colombo. Mr. Zanetti is an expert in this branch of agriculture, of which he has had long and intimate experience of an extensive nature both on the Continent and in Australia. Hitherto grapes have been cultivated to a very limited extent in Ceylon, the Jaffna peninsula being the locality where the largest number of vines occur. But as far as we are aware no single grape grower in Ceylon possesses more than a couple of plants in his garden, and these have been grown as spreading vines on bowers or pandals. The continental method which is now being adopted wherever viticulture is an established agricultural industry has, we believe, never before been attempted in Ceylon, and its demonstration will be one of the features of the experiment at the School of Agriculture, where, moreover, the most approved systems of pruning, manuring &c. will be practised. Some criticism has been raised by the choice of Colombo for the

experiment, as it is thought that the climate is too humid for the grape. Single vines have however been known to flourish in nearly every part of Ceylon, and it will remain to be seen whether given a suitable soil, selected varieties, and expert-treatment, a vineyard cannot be established in the metropolis. We believe, however, that Mr. Zanetti does not intend to limit his experiment to Colombo. Personally it is a source of great gratification to us that an opportunity has been afforded for the carrying out of so desirable an experiment, which we can only hope will prove an unqualified success. We have already had many communications on the subject of the experiment, and some of our correspondents have given us their own experiences of vine culture.

LAWS OF CEYLON RELATING TO
AGRICULTURE.

CHAPTER IX.

Recovery of Money due under this Ordinance.

1. If default be made in the payment of any instalment, charge or rate under this Ordinance in repayment of any amount expended on the construction &c. of any irrigation work, it shall be lawful for the Government Agent or any person authorized by writing under his hand to seize the land herein declared specially bound and liable or any movables thereon to whomsoever such land crop or moveables may belong, and to sell the same by public auction at any time not less than twenty-one days from the date of seizure.

2. If default be made in the payment of any other sum payable under this Ordinance it shall be lawful for the Government Agent or any person authorized in writing under his hands to seize any property belonging to the defaulter, wheresoever the same may be found, and to sell the same by public auction at any time not less than twenty-one days from the date of seizure. Provided that no seizure of any land be made if the defaulter surrenders free and unclaimed movable property to satisfy the total amount of the debt. Provided also

that no land seized under section 1 be sold until and unless the crop or produce thereof and the movables thereon, if any, shall have been first sold.

3. The sale of immovable property shall be carried on the spot unless the Government Agent shall otherwise direct, or unless the defaulter shall consent to the sale being conducted elsewhere.

4. The person making the seizure may, if so authorized by the Government Agent, keep a person in possession of the property seized.

5. It shall be lawful for the Government Agent or any person authorized by him as aforesaid to demand, take and receive from such defaulter the several sums of money mentioned as follows:—

(a) In cost of proceeding to seize property—a charge not exceeding 50 cents for every R10 due.

(b) For keeping a person in possession—a charge not exceeding 50 cents per day.

(c) For the expenses of sale—a charge not exceeding 25 cents for every ten rupees of the net proceeds of the sale.

6. After deducting the amount and costs due, the overplus, if any, shall be paid to the owner or joint owners of the property sold.

7. A certificate of sale signed by the Government Agent is sufficient to vest the property in the purchaser. Such certificate is liable to stamp duty fixed on conveyances of immovable property and to any registration or other charges authorized by law, such duty and charges being payable by the purchaser.

H. A. J.

LABOUR.

A season of unwonted prosperity has set in in many planting districts for the Sinhalese agricultural classes, owing to the want of Tamil labour felt on the plantations, and entire families are leaving their homesteads for residence in close proximity to European plantations. The system of weekly payments if not insisted upon has still become imperative, as the tide of labour generally sets in the direction of prompt settlement and from R1.50 to R1.80 per week is easily earned by an adult male, while a woman or child earns from R1.25 to R1.50 on an average. And thus the Sinhalese ryot who had hitherto to depend entirely on his paddy fields for the support of himself and his family has practically averted the calamity of starving during bad seasons of *maha* and *yala*. The Government have also thus been relieved of the anxiety of having occasionally to provide villages with relief works.

News comes from the coast of India that the recruiting grounds of our immigrant labour supply are being largely tapped by Singapore planters, who are offering more advantageous terms than the Ceylon planters do. If our labourers went gradually away from Ceylon to their old *Dores* in other parts, and also to others following their example, and if capital coming to Ceylon is also driven away to countries where land can be got on more advantageous terms, Ceylon need be in no fear of an over-production of tea. But the Surveyor-General may fail to control the deliveries at Mincing Lane.

The general effect of tea planting, although largely beneficial to the neighbouring villages, is by no means an unmingled blessing to the younger

generation: as it is reported from the Sabaragamuwa Province that the attendance at the village schools have been greatly affected by the children being taken away to the neighbouring tea estates for gathering leaf. It may not be felt just yet, but it is the opinion of many reflecting minds that the suppression of crime among the Sinhalese villagers can be best attained by taking them in hand when young and teaching discipline and morality as in European countries. The school has ever been the nursery of the Church, and even if we did not carry the Christian's propaganda into the Buddhist villages, still Christian school masters who have oversight of the boys during school hours, can do an immense amount of good in watching their conduct generally and training them to love rectitude and truth and to control their natural impulses. To take a man whose character has been moulded and fixed and to fine scourge and imprisonment may satisfy the vindictive requirements of justice, but results have proved that it has neither cured the offender nor operated as a deterrent to others of his class. It is possible that compulsory education and the establishment of normal schools all over Ceylon may do more to suppress crime by training the Sinhalese youth while young than the increased rigorous treatment in jails will do after the criminal has been made by the general neglect of his moral education in his early years.

P.

PALMYRAH PALM PRODUCTS.

Mr. C. E. Collyer, the fibre referee for the Imperial Institute, reports as follows on samples of Palmyrah fibre:—

"The stiff fibre extracted from the base or sheath of the leaf-stalk, when in mature condition, of dark colour, and tough and supple in quality, is in considerable favour as a broom and brush making material, and has rapidly become one of the best substitutes for Bahia Piassava, notwithstanding a tendency to curl in warm and dry weather.

The consumption has kept pace with the supply, and its use could be largely increased if sufficient quantities could be obtained at moderate prices, of which according to the available information there is much doubt.

The light-coloured fibre extracted from the leaf-stalk itself is of a different character, and is at present of comparatively small value;—its want of life, toughness, and strength to recover its straightness after being bent, limit its use to common mixing purposes, and it is considered inferior to African Piassava for the lowest uses. It is possible a better and more extensive use for this fibre may ultimately be found, but in the meantime shipments would come to a very doubtful market."

The wood forms a valuable rafter for houses. Toddy is got by fermentation from the sweet juice of the flower, as with the coconut and kitul palms. Sugar (jaggery) is made from the unfermented juice. Fans are constructed of the young leaves, which in the very young stage are also woven into braids and thus exported. Baskets, hats and other articles are also made of the leaves, which have also from time immemorial served the purposes of writing paper. The soft pulp inside the shell or stone of the fruit is eaten raw, or

hardened into thin slabs by the mixture of a little lime, or fried into cakes after being mixed with flower, sugar, and coconut scrapings. The cabbage or terminal bud is also eaten. The seedlings are sometimes eaten cooked as a vegetable or made into pickles, while the germinating embryo within the stone is considered a delicacy and is sometimes reduced to a flour.

Mr. J. W. Mollison, Officiating Director, Department of Agriculture, Bombay, supplies some information with reference to the uses of the tender root which the seeds send down at the time of germinating:—The palmyran fruit contains two or three kernels, and if these are to be eaten raw, the fruit has to be plucked before it is ripe. In this condition they are sold in N. W. India at 12 for one anna when good or say 6 fruits per anna. Fallen fruits only are used for planting in order to get the radicle to be used as a vegetable. These radicles are from 9 to 12 inches long and 1 to $1\frac{1}{2}$ in. diameter at the thick end. The seedlings are grown as crowded as possible in the nursery, and are ready for digging in about four months. The vegetable is generally roasted before it is offered for sale, at the rate of 16 for an anna. Its cultivation in the Bombay Presidency, says Mr. Mollison, is important, because of the enormous value of outturn per acre, and because it might be economically imitated elsewhere in India. Nurseries, however, are seldom larger than $\frac{1}{10}$ to $\frac{1}{6}$ of an acre. In a nursery about 50 fruits are planted in a square yard, and these may produce 100 or more young tap roots. The gross value of yield per anna at ordinary market rates is R1,800, but if the vegetable is dear, the outturn per acre may be worth R300.

DAIRY PRODUCE.

The native cow as most of us are aware is a very poor milker. In fact, a Ceylon cow's average yield of milk per day is hardly over three to four pints. In many instances the cows are never milked. The coast cows (animals of South Indian breeds) which are being imported to the Island yield on an average six to eight pints of milk a day, and those of the better Indian breeds, notably the Sind breed, which has been introduced to the Island through the Government Dairy Farm, yield on an average from twelve to sixteen pints daily. Dr. Parkes in his Manual of Hygiene, puts down the average of an English cow to be 20 to 25 pints daily and occasionally up to 50 pints. Thus it is seen that the milk yield of different breeds of cows varies greatly. It has also to be noted that milk differs in quantity and quality in different animals under different conditions, for instance, the age of a cow, the number of calves produced by it, the age of the calf, and the system of feeding the cow, has much to do with these variations.

The ridiculously small quantity of milk yielded by native cows, is undoubtedly due to neglect on the part of breeders for ages past, the native cow in the villages being considered not so much a milker, but a producer of calves, which when grown up are used either for agricultural work or draught purposes, such as for the conveyance of loads or for trotting. Again, the villager requires an animal to plough his fields, and any small sized animal will do the work with the relative im-

plement. Such is the demand, and hence the supply keeps pace with it. As regards dairy produce, though in India milk and ghee are highly prized and often indispensable articles of diet, milk is seldom an article of diet in the villages here, and it is when used considered more or less a luxury. Ghee again is mostly used in medicine, and coconut milk is often considered a cheap and easily obtained substitute for it, whereas in India a native would be shocked to hear of the substitution of coconut milk for ghee, for he cannot conceive how one could be satisfied without the use of such an indispensable article. The only form in which milk is used in the villages is in the form of curds, and even for the production of this cattle owners have not sufficient encouragement, as there is no regular demand for the article. It is used generally on special occasions (feasts, &c.), but the curd obtained from cow's milk is considered to be inferior to that obtained from buffalo's milk. These remarks do not apply to the villages in the vicinity of towns, for in towns on account of the different classes of inhabitants and their different tastes, there is always a demand for milk, and the villager is ever ready to meet it, and obtain the advantages of profit thus offered him.

It is no surprise that in the light of the above facts that dairying has not been an industry among the Sinhalese villages, and a good milking cow is a rarity among them.

In India the native consumes the produce of the dairy in a variety of forms. First and foremost, the ghee or clarified butter is an indispensable article in the preparation of his daily food. *Tak* a bye-product of ghee-making is never wasted; *mawa* or *khawa*, a sort of desiccated milk is largely used by them; and lastly, curd is also a favourite with them.

In places where milk is turned into butter and cheese, and the bye-product obtained in the process of butter making, skimmed milk is also put to a variety of uses.

The conditions prevailing in Ceylon are such, that dairying as an industry will be more readily adopted in the vicinity of towns rather than in the villages.

In towns there is always a demand not only for pure milk but for its products. A large quantity of butter is annually imported to the island, and with all that, the consumers always prefer fresh butter, and are prepared to pay enhanced prices for the article they prefer. Dairy-farming in villages close to towns should prove a paying industry. When milk could be sold in a fresh state, there is not much difficulty in carrying on the trade profitably, but as it is doubtful when a large number of persons engage in the production of the article that there will be an equally large demand for fresh milk, it is essential that attention should be paid to the manufacture of butter.

A central factory where a cream separator could be worked, and where all the milk in the district could be disposed of, would be the best inducement for the villager to pay attention to this important industry. Under such circumstances, when they are assured of a ready market the inducement will be sufficient for them. A central factory need not cost much; a Baby Laval separator can be had for less than R250, and

a few more appliances such as cans, jars, churns &c. would meet all the requirements.

As an instance it may be mentioned that the experiments conducted in the Bombay Presidency and the North-Western provinces of India some few years back have given such an impetus to the industry, that at present there are over fifty or sixty small butter factories in the Bombay Presidency alone where cream separators are used with the greatest advantage. These factories have become central stations, where the out-put of milk in the adjoining villages is readily purchased. Bombay butter now not only meets the demand of the Presidency to a great extent, but as we are aware is obtainable even in many of the Colombo stores.

It has to be noted in this connection, that for the manufacture of butter the cost of fresh milk will have to be comparatively cheap, but if the price obtainable leaves a margin of profit to the owner of the cows, there is no reason to fear any possibility of failing in obtaining a proper supply of milk for the purpose of butter making.

The experiments at the Poona Dairy farm have shewn that 74 lbs. of cow's milk gave 3 lbs. 6½ oz. butter or 1 lb. butter from 21.72 lbs. milk. Again, 43 lbs. of buffaloe milk gave 3 lbs. 10 oz. butter or 1 of butter to 14.29 of milk.

Thus it is seen that buffaloe milk yields a much larger percentage of butter than cows' milk, and there is no reason why buffaloe milk should not be put to this use here.

The following analysis of cow's milk (Sind) and buffaloe's milk, at the Poona Dairy Farm is also very suggestive:—

	Cows.	Buffaloe.
Water	85.53	82.13
Butter fat... ..	5.43	7.73
Caesin	2.95	4.03
Milk sugar	5.40	5.31
Mineral matter ..	.69	.80
	100.00	100.00

W. A. D. S.

BLACK SMUT ON ORANGE TREES.

We have been sent some branches of an orange tree affected with black smut, with a request to suggest a remedy.

The fungus we may at once state is only a secondary disease dependent on a scale insect (probably a *Iecanium*), and we advise that the ordinary treatment against scale insects should be at once adopted.

Make a solution (by boiling) of ½ lb. of hard soap or 2 quarts of soft soap to a gallon of water. Cut the hard soap previous to boiling in thin slices to assist solution. To every gallon of boiling soap solution (off the fire) add 2 gallons of kerosine. Then churn the mixture violently with a force pump or garden syringe, driving it backwards and forwards through the nozzle, keeping the latter always below the surface during the process. By this means an emulsion will be formed, which, if perfect, should be of the consistency of cream, and the oil should not separate out, even if the emulsion be kept standing for days, and it should mix freely with water in any proportion. This, when required, should be mixed with no less than nine times its bulk of water, which, if used warm, will facilitate dilution

in the event of the emulsion having become lumpy. This should be applied to the trees in as fine a spray as possible with the help of a suitable apparatus (such as the Vermorel "Knapsack," sprayer, or the Antipest sprayer).

All parts of the tree should be wetted, and the treatment should be repeated at intervals as necessary, as there are times and seasons when the treatment will be all ended with much better results than at others. In addition, the trunk and larger limbs of the tree may be advantageously painted over (by means of a paint or white-wash brush) with the following:—Flowers of sulphur, 4 lb; soft soap and water, 6 gallons; or with "Parker's remedy" which is made up thus: a thin flour-and-sulphur paste containing three parts by weight of sulphur to every one of flour, the paste to be made by boiling in the ordinary way, and the sulphur to be stirred in while the latter is still hot.

ABORTION IN COWS.

We take the following from the *New South Wales Agricultural Gazette*:—In a paragraph on this subject which appeared in our February issue, it was stated that no preventive measures had ever been found to be of the slightest avail. Owing to this statement, Mr. E. R. Dean, of Goulburn, has written to the Department, pointing out that some of the American agricultural journals speak with much confidence of the great value of *Viburnum prunifolium* as a preventive of abortion. He mentions that Dr. Phares, speaking of the action of *viburnum*, says:—"It is a preventive in habitual miscarriages. It prevents miscarriage from any cause. It has never failed to prevent a threatened abortion so far as I can learn." And the *American Veterinary Review* endorsed this as follows:—"We simply add this is literally true, and confirmed by the thousands of cases since treated all over the United States and in other countries. No other medicine, perhaps, ever came so soon into general use and met with so unanimous a verdict of approval among the medical fraternity. This wonderful medicine is found native in the forests of most of the States between the Gulf of Mexico and the Northern Lakes, and is generally known by the trivial name of 'black-haw.' The bark of the root is used for making a tincture; or in emergency the decoction of fresh bark serves well. * * * If properly prepared and administered it is worth, for the purpose mentioned, more than all other medicines." Mr. Dean adds:—"Dose for a human being:—

Infusion	½ oz.	} Four or five times a day.
Tincture	1 drachm	
Powder	1 drachm	

Therefore say double or treble the quantity as a dose for a horse or cow."

(*Viburnum* is a genus belonging to the order *Caprifoliaceae*, and is represented in Ceylon by two distinct indigenous species—*V. coriaceum* and *V. erubescens*.)

GAMBOGE AND BENZOIN.

Gamboge is a gum resin yielded by the bark of *Garcinia morella* of Ceylon and South India, and *G. Hanburyi* of Siam, Cambodia and Cochin China. It is from these latter places that practi

cally the whole of the gamboge of commerce is obtained. It is said to be a powerful cathartic medicine, but its principal use is as a pigment in water-colour painting. It is also used to give colour to lacquer varnish, for brass work &c.

The following reference to the gamboge tree of Siam is from a report on the trade of Siam for 1893, extracts from which appear in June-July number of the *Kew Bulletin*: "The trees grow to a height of 50 feet, and are straight stems with no lower branches, owing probably to the dense shade of the forest in which they grow. None of those I saw had a diameter of more than 12 inches. Ten year's growth is said to be required before the tree is ready for tapping. This is carried on by the Cambodian and Siamese Islanders during the rainy months—from June to October—when the sap is vigorous, by cutting a spiral line round the trunk from a height of some 10 feet downwards to the ground. Down these grooves the resin wells out of the bark and trickles in a viscous stream into hollow bamboos placed at the base of the tree, and from there it is decanted into smaller bamboos, where it is left for about a month to solidify. To remove the gamboge the bamboo is placed over a red-hot fire, and the bamboo husk cracking, there is left the article left as pipe gamboge. The trees can be tapped two or three times during the season. . . . Care must be taken to prevent rainwater mixing with the resin in the grooves." The *Indian Agriculturist* of August 1st makes the following reference to gamboge:—

As to gamboge, so far as is known, two trees are to be met with in India which yield this drug. The *Garcinia pictoria* is found in the high mountain lands of the Wynaad, but attempts to cultivate it in the low country are said to have failed. A good kind of gamboge is extracted from this tree. The bark, according to Dr. Roxburgh, is spotted with many yellow specks, and contains considerable masses of gamboge inside. Samples sent to him be considered superior to most other kinds. This tree is to be found in the greatest abundance along the whole line of the Ghâts, and its produce would in time become an important article of export. The seeds yield an oil which is not purgative, like the gamboge resin. It has been said on high authority that "it is probable this gamboge might advantageously be applied to any use to which the gamboge of Siam is habitually put." The other Indian tree which yields a substance like gamboge is the *Xanthochymus pictorius*. It bears fine yellow fruit, like an orange, which is eaten by the natives, who find it very palatable. The fruit, when full-grown, but not ripe, yields a quantity of yellow resinous acrid gum like gamboge, of the consistence of a rich cream.

Benzoin—known also as gum Benjamin in English commerce—is a green resin obtained from the bark of trees in Sumatra and Siam. Benzoin is used as a stimulant and expectorant in chronic bronchitis, is one of the principal ingredients in Friar's Balsam, and is largely used for incense. White Sumatra benzoin is known to be yielded by *Styrax benzoin*, it is curious that the true character of the tree yielding Siam benzoin remains a mystery still, in spite of private and official efforts to clear up the matter. A report on the trade of Siam of 1893, referring to gum Benjamin, states that the whole of the Bangkok export goes to the

London market, and thence to France and Belgium to be manipulated into balsam, a small quantity being used locally for frankincense. Prices in 1893 are reported as bad, the first-class gum fetching about £165 per ton, the second-class about £10 per ton.

It is not generally known, remarks the *Indian Agriculturist*, that the *Terminalia angustifolia* is a tree which produces a variety of benzoin. It is obtained by wounding the tree, and is composed of large white and light brown pieces easily broken between the hands. When gently dried it forms a white powder formerly in great request as a cosmetic. It has a most agreeable smell. But the most striking ingredient of this resin is benzoic acid. In the churches in the Mauritius this benzoin was formerly used as incense.

A NEW FRUIT TREE.

Under this heading the *Australian Tropicul-turist* refers to a well-known Ceylon tree known by the native name of *kamaranga*, and incidently also makes mention of another fruit tree, common in gardens and much used as an acid in Eastern cookery, viz., the *biling*. Verily, we do not appreciate our Ceylon fruit sufficiently and it yet may happen that we will find ourselves purchasing tins of kamaranga and biling jam exported from the southern continent! The following is the notice referred to:—

For although known to experts for a number of years, the Averrhoa-Carambola may be classed as a new fruit tree, being almost unknown to the general public. We have tasted the fruit when ripe and when unripe. In its unripe state it is too sour and unpalatable for any use we know of. In its ripe state—but it must be quite ripe—we think it very good indeed. It has the taste of a plum not quite ripe. The fruit we saw was exhibited by Messrs. L. Summerlin and Company, and came from the garden of Mr. W. H. Day, Kedron Brook. We thought this tree the only one in the district, but we have since discovered several others in the Acclimatisation Society's Gardens, Boweu Park, from whence Mr. Day received his plant some 16 years ago. The Acclimatisation Society introduced the Averrhoa-Carambola or bitter Averrhoa, and the sweet variety or Averrhoa-bilimba, from China, but it has never become a favourite, so has been almost neglected. There is a fine tree at Bundaberg and some others on the Daintree River. From the mere tasting of the ripe fruit we were of the belief that it would make good jam and jelly. Our opinion has been confirmed, as we have been informed that Mrs. Soutter has made jelly of the fruit this present season, which Mr. Soutter pronounces to be "lovely," and "far before that of rosella." It would make splendidly into tarts. Its acidity, we believe, would act as a tonic and appetiser. The tree grows to a large size, some sixteen to twenty feet in height, and resembles the willow in form, the fruit hanging on long racemes which are drooped gracefully amongst the foliage. It yields all the year round and is always in bloom. The crop is said to be a heavy one. The fruit is oblong in shape, resembling in size and colour the sugar banana, but instead of being round like that well-known fruit, is ridged or furrowed with fine-pointed ribs running longi-

tudinally. We hope to see some notice taken of this really excellent fruit, as it has been too long in obscurity.

POULTRY DISEASES.

Roup generally attacks poultry after exposure to chilly winds and rain. It begins with a cold and is attended with offensive discharges from the mouth and eyes. The disease is highly contagious, and is conveyed by the saliva of sick birds falling into water or food to which the healthy have access. Separate utensils should therefore be used in feeding the sick. Affected birds should be kept warm and given a grain of pepper twice a day. Another good prescription is the following: The bark of murunga root (horse radish tree), garlic and ginger, pounded, and the juice administered twice a day. If the bowels are constipated a little gingly oil may be given. Roup generally runs a rapid course, and requires prompt treatment.

Diarrhœa is caused by acidity of the stomach or a chill. Unripe bael fruit (*Egle marmelos*) should be first roasted and a solution of the pulp, after filtering, given with a few drops of ginger. Poultry are sometimes killed by apoplexy which is generally the result of high feeding. It is seldom that anything can be done for the birds as they soon become unconscious. Relief may be given by opening the vein on the side of the neck (the jugular), and the head fomented with a mixture of vinegar and cold water.

It is a common experience for hens to lay soft eggs. This generally occurs with overfed poultry, and though sometimes caused by fright, is due to a deficiency of lime in the system. Bone dust should be strewn about the yard for the poultry to pick up.

For vermin on poultry, a mixture of powdered charcoal and sulphur should be rubbed over the body of the bird, and the poultry house cleansed and limewashed.

In damp or wet weather whenever fowls are found to be drooping or loose in the bowels, a small pill of mustard will be found beneficial, and help to ward off more serious complications.

A. M. FERNANDO.

ROYAL COMMISSION ON TUBERCULOSIS.

In concluding their *Report*, dated April 3, 1895, and signed by all the Commissioners, they say:—

"We have obtained ample evidence that food derived from tuberculous animals can produce tuberculosis in healthy animals. The proportion of animals contracting tuberculosis after experimental use of such food is different in one and another class of animals; both carnivora and herbivora are susceptible, and the proportion is high in pigs. In the absence of direct experiments on human subjects, we infer that man also can acquire tuberculosis by feeding upon materials derived from tuberculous food-animals.

"The actual amount of tuberculous disease among certain classes of food-animals is so large as to afford to man frequent occasions for contracting tuberculous disease through his food. As to the proportion of tuberculosis acquired by man through his food, or through other means, we can form no definite opinion, but we think it probable

that an appreciable part of the tuberculosis that affects man is obtained through his food.

"The circumstances and conditions with regard to the tuberculosis in the food-animal which lead to the production of tuberculosis in man are, ultimately, the presence of active tuberculous matter in the food taken from the animal and consumed by the man in a raw or insufficiently cooked state.

"Tuberculous disease is observed most frequently in cattle and in swine. It is found far more frequently in cattle (full grown) than in calves, and with much greater frequency in cows kept in town cowhouses than in cattle bred for the express purpose of slaughter. Tuberculous matter is but seldom found in the meat substance of the carcass; it is principally found in the organs, membranes, and glands. There is reason to believe that tuberculous matter, when present in meat sold to the public, is more commonly due to the contamination of the surface of the meat with material derived from other diseased parts than to disease of the meat itself. The same matter is found in the milk of cows when the udder has become invaded by tuberculous disease, and seldom or never when the udder is not diseased. Tuberculous matter in milk is exceptionally active in its operation upon animals fed either with the milk or with dairy produce derived from it. No doubt the largest part of the tuberculosis which man obtains through his food is by means of milk containing tuberculous matter.

"The recognition of tuberculous disease during the life of an animal is not wholly unattended with difficulty. Happily, however, it can, in most cases, be detected with certainty in the udders of milch cows.

"Provided every part that is the seat of tuberculous matter be avoided and destroyed, and provided care be taken to save from contamination by such matter the actual meat substance of a tuberculous animal, a great deal of meat from animals affected by tuberculosis may be eaten by the consumer.

Ordinary processes of cooking applied to meat which has got contaminated on its surface are probably sufficient to destroy the harmful quality. They would not avail to render wholesome any piece of meat that contained tuberculous matter in its deeper parts. In regard to milk, we are aware of the preference by English people for drinking cow's milk raw, a practice attended by danger, on account of possible contamination by pathogenic organisms. The boiling of milk, even for a moment, would probably be sufficient to remove the very dangerous quality of tuberculous milk."

CHEMICAL EXAMINATION OF CEYLON PLANTS.

Messrs. Hummel and Perkin of Yorkshire College, Leeds, have examined the *Toddalea acutecala* with a view to discovering the character of the colouring matter contained in it. The plant belongs to the order Rutacea and is locally known as Kudu-miris (S.) The root, about $\frac{3}{4}$ in. in diameter, possesses an aromatic odour; it is of a pale, yellowish colour, has a woody centre and a brown bark covered with a light, yellow, soft, powdery, pith-like substance.

Ten grammes of the external yellow powder were digested for two hours with 100 c.c. of

boiling alcohol, filtered, and the residue again treated in a similar manner. To the orange-brown filtrate an alcoholic solution of lead-acetate was added drop by drop, as long as a colourless precipitate was formed. After this had been removed by filtration, the filtrate was evaporated to a small bulk, and poured into five times its volume of dilute hydrochloric acid. A viscous, yellow precipitate was thus obtained, which increased in quantity on standing; this was collected upon calico, then first rinsed with cold water, and afterwards digested with boiling water. The turbid yellow liquid thus obtained contained resinous matter in suspension, but this was readily removed by means of ether. After boiling the clear aqueous solution excess of hydrochloric acid was added, and, on cooling, it deposited long, orange-coloured needles, which were collected and washed with dilute hydrochloric acid. To purify this product, it was dissolved in boiling dilute alkali and the solution digested with animal charcoal, filtered, treated with hydrochloric acid, and allowed to cool; the yellow needles which separated were collected washed, with water, and dried at the ordinary temperature. The product weighed 0.35 gram.

For analysis, this was converted into the platinumochloride in the usual manner, and the resulting amorphous, yellow powder dried at 100°. 0.294 gram, on ignition, yielded 0.0535 platinum = 18.19 p.c. The formula $(C_{26}H_{17}NO_1)2H_2PtCl_6$, requires Pt = 18.02 per cent. The analytical numbers accorded, therefore, with those given by *berberine-platinochloride*. Its identity with this substance was shown by a comparison of the reactions of the hydrochloride above referred to, with berberine hydrochloride obtained from other sources. The inner bark of this root (60 gram.) was found, on examination by the above method, to contain but a trace of berberine, so small, indeed, that this was probably derived from traces of the preceding yellow powder still adhering to it. It contained, however, some quantity of a sticky, resinous product, which was insoluble in water or dilute acids, but readily soluble in ether, and appeared to be identical with the similar substance present in the yellow powder. The quantity obtainable was too small for extended examination, and the preliminary experiments were not successful in extracting from it any crystalline substance. The central woody portion of the root yielded no berberine.

We have already heard a good deal of the insecticidal properties of *adhatoda vasica* known in Sinhalese as *adhatoda* and *agaladara*. A quantity of dried leaves of the shrub from the Imperial Institute collections was sent at the suggestion of Dr. Lander Brunton to Professor Giacosa of the University of Turin for examination.

Professor Giacosa reports that by following the method of examination described by Mr. Hooper in the *Pharmaceutical Journal* for April, 1888, he has been unable to discover any alkaloid in the leaves, but that these are especially rich in potassium nitrate. Dr. Watt, the Reporter on Economic Products to the Government of India, suggests that the unsatisfactory results obtained from experiments on dried leaves in Europe, may be due either to the fact that (1) the active properties possessed by the leaves in the fresh state are in some measure, if not wholly, lost

when they are dried; or that (2) there are certain periods in the growth of the plant, or certain seasons of the year, when the alkaloid is present.

An investigation as to (1) can only be carried out on the fresh leaves in a laboratory in India, while a careful collection of the leaves of the *Adhatoda* at different seasons would be necessary to afford material to finally clear up the points raised by (2). As there seems no doubt from the experiments carried on tea estates, that the fresh leaves possess insecticide properties, further experiment on the nature of the substance which gives the leaves these properties may furnish interesting information.

VINES AND LINE SUPPORTS.

(Communicated.)

The news that grape vines are found to thrive by the side of *Erythrinus* in Bombay, and that the cultivation is a simple affair would justify similar experiments being made in Ceylon with a view to the cultivation of grape in an extended scale.

In Jaffna it is become the fashion to have a grape vine in every compound, but beyond imitating an existing fashion and contributing a luscious fruit to the table, no attempt has been made by the comfortable and easy-going folk in the peninsula to extend its cultivation as an industry. And this may be due to the fact that there its cultivation is by no means an easy affair. Besides, the vines are permitted to cover a large area of ground over pandals, and one large vine well attended to and manured is amply sufficient to satisfy the demands of the grower. How well single vines can be made to bear has been illustrated in the well-known vine at Hampton Court. And this fashion set in Jaffna has been the method which has obtained in Ceylon all along wherever a vine was grown, whether in Kandy or Colombo, or Dumbara or Wahacotte.

The report of Mr. Hoole in the June number of the Magazine on Viticulture in India, at least in the vineyard referred to by him, affords a suggestion for extended experiments on the lines indicated by him. It may be that the *Erythrina* does supply nitrogen in quantity to satisfy the limited wants of a grape vine checked in its growth and dwarfed to the limits of the umbrage afforded by its host; or it may be that the vine is afforded certain natural and indispensable conditions at the foot of its living host which enables it crop without much artificial management beyond a supply of manure annually.

As regards the theory of nitrogen supplied by the *Erythrina*, while it may be interesting to cocoa planters to have it definitely settled, it may be also interesting to growers of pepper to know that the *Erabadu* and the *Dadap* do not show any better pepper vines on them than any other host from Jack to *Hoorie*, on which I have permitted my pepper to creep. I have found, however, that a live host is better than a dead stump for crop. The conclusion that is forced upon one is that the decaying leaves help to enrich the soil and thus to increase the crop. But there is yet another inference. A growing tree is known to supply itself with a large quantity of water from the ground by means of its roots, and this

constant action upon the soil round about its roots lead to two distinct and beneficial results in regard to the vine, whether pepper or grape, or any other creeper which may grow at its roots. During the wet season it takes away the excessive moisture which may lead to fungoid growths at the roots of the vines, and in the dry season it may without artificial aid, such as root pruning, bring about naturally and from the dryness of the soil the inspissation of sap which is necessary in a tree for the development of blossom and crop. If this is proved, then grape culture in Ceylon will be simplified into a system of superficial pruning and annual manuring.

Greatest amount of rainfall in any 24 hours on the 19th instant, .23 inches.

Recorded by W. O. ROWLANDS.

GENERAL ITEMS.

The Kew authorities and our local Entomologist would appear to be at some variance in regard to the new pest, *Orthezia insignis* vel. *nacrea*. Mr. Green in his paper on the subject stated that "there is little doubt but that we owe the introduction of this pest to plants received from Kew," . . . "where it is now said to be doing an enormous amount of damage." In the June-July number of the *Kew Bulletin*, reference is made to this report in the Miscellaneous Notes, where we read, "It is undoubtedly possible that the *Orthezia* may have reached Ceylon by way of Kew. It is not, however, very probable, and the reverse may just as well have been the case. It exists in the public exhibitions, however, from which plants are not drawn for exportation. The plants in the propagating houses from which distribution is made are kept scrupulously clean, and every precaution is taken to send them out free from taint of any sort or kind. . . . Mr. Green's statement as to the enormous amount of damage in the plant-houses caused by the insect, is very much exaggerated, . . . as far as Kew is concerned, the *Orthezia* is rather a scientific curiosity than a troublesome pest."

Owners of fruit trees who suffer from the ravages of the flying-fox might try this preventive, which is said to have been used in New South Wales with good effect:—"The alleged remedy is to dip strips of rag in hot melted sulphur, and hang them in the fruit trees. The idea was borrowed from an experiment in England where sulphur was used to keep off weasels and other vermin from destroying pheasants, partridges, etc., and it was thought that sulphur might have some effect on flying-foxes in keeping them off fruit trees. The remedy is simple enough, and an experiment on a small scale would be a trifling undertaking for the poorest fruit-grower."

Mr. Hugh McMillan, who has been appointed head Gardener of the Royal Botanical Gardens, Peradeniya is comes from Kew, where he entered the Royal Gardens in 1893, having been previously in charge of gardens in Wales. The *Kew Bulletin* notices two other Colonial appointments from Kew, viz, Mr. Charles Henry Humphries to the Gold Coast botanical station

in succession to Mr. William Crowther, and Mr. John Chisnall Moore to the botanical station at St. Lucia.

The *Scientific American* recommends the following treatment for destroying stumps of trees:—In the autumn bore a hole in the centre of the stump about 18 inches deep, and 1 to 1½ inches in diameter. Put in about 2 oz. of saltpetre and fill the hole with water; plug it up tight. In the following spring take out the plug, pour in 8 or 10 oz. kerosine, ignite, and the stump will smoulder, but not blaze, to the extremities of the roots, leaving only ashes.

A new method of preserving oranges has been discovered. The plan of burying oranges with three or four inches deep of soil above them is a decided advance in simplicity on the ordinary methods of keeping this favourite fruit. The inventor of this method is Mr. John Carson, of Clutha, Kew, whose reputation as an experienced grower of fruits is a guarantee of the efficiency of the new plan. The spot chosen for the experiment was on the shady side of a tall pine tree, to which the sun had access only for a time after rising. The oranges were buried as described on September 25, 1894, and they were lifted on Tuesday, April 9. They were quite ripe and perfectly sound and sweet when submitted to examination.

One of the unconsidered trifles that the Mikado has picked up as the result of the Chinese war is the monopoly of camphor. That drug is produced only in Japan and Formosa; and, though a variety known as Borneo camphor is obtained from Borneo and Sumatra, it cannot compete with the product of the evergreen laurel of the Eastern Asiatic islands. Inasmuch as camphor, apart from its many and varied therapeutic uses, is an essential ingredient in the composition of nearly all the new explosives, the demand for it is very large. The Japanese are well aware of the valuable monopoly they have blundered upon rather than sought, and have already begun to limit the export by imposing duties. As a natural consequence, the price of the drug has risen rapidly since the war came to an end, and bids fair to rise higher. Happily the commercial instinct of the Japanese statesmen is as sound as their political instinct, and they are not likely to abuse the monopoly they have acquired by forcing the price up to prohibitive rates. The chief concern of the Japanese Government will, for some time to come, be the finding of money to pay for the ships and munitions of war which will secure the Mikado in the possession of the spoils he has already won. Properly handled and wisely administered, camphor should prove a valuable source of revenue, and contribute a handsome quota towards the cost of the military preparations which pertain to the peace of the Dragon Kingdom.—*Indian Agriculturist*.

Mr. James Peter, of Berkeley, Gloucestershire, writes:—"I have received many inquiries asking for information regarding the use of carbolic acid as a preventive of abortion; and to save myself the necessity of answering so many letters, I give you the following particulars of the system I adopt:—Commence by mixing with sufficient hot water to make a bran mash, ¼ oz. ordinary

crude carbolic acid, then add the bran, gradually increasing the carbolic acid up to ½ oz., which is the maximum quantity I can get a cow to take in a bran mash. For a number of cows I measure out the requisite number of ½ oz. doses, and mix with the water and bran in a fodder barrow, and then give a good broad shovelful to each animal. Before I got rid of the disease I administered the carbolic mashes three times a week. I find it equally safe to give an animal a ½ oz. dose daily. I may state that I have regularly used carbolic acid in this herd for the last three years as a preventive against bacterial diseases, and in all my experience I never had animals keep so healthy and well as they have since I have done so. My opinion is that its use internally is a valuable remedy and a preventive against microbic diseases. The Royal Agricultural Society has asked me to revise my evidence before their Abortion Commission, owing to the numerous inquiries for copies of the evidence, and I understand they are now about to publish it in pamphlet form. I hope to make further experiments in another form."—*Mark Lane Express*.

Says the *Agricultural Journal of New South Wales*:—It is satisfactory to be able to report that, according to notifications received by the Department, the various remedies recommended have been most successful. No less than fourteen fruit-growers, whose addresses cover a very large portion of the Colony, have been able to clear their vines of black spot and oidium. From four different districts complete success has followed the use of bandages for codlin moth. Resin and soda wash has proved efficacious for woolly aphis, while Bordeaux mixture, in addition to its good results in black spot, has also proved beneficial for removing pear scab, shot-hole fungus and apple-scab. Spraying with Paris green has given good results for codlin moth and caterpillars in potatoes. There is one reported failure from East Orange, where Bordeaux mixture failed to cure twig blight and powdery mildew. It must not be supposed that the cases here referred to cover all the orchards and vineyards of the Colony, as doubtless there are many trials which do not get reported, and what is still more to be regretted, there are many cases of disease where no attempt is made to effect a cure. It is hoped that the publication of the successful results will act as a stimulus to those who come within both the classes last referred to.

The English "Wild Birds' Protection Act 1894" supplies a list of wild birds to be protected, but other birds may on the recommendation of a County Council be added. Mr. Cecil Warburton of the Zoological Laboratory, Cambridge, has done good service in preparing a complete schedule of wild birds "undoubtedly beneficial to agriculture, and which in the interests of agriculture it is very desirable should be protected under the act referred to." The schedule consists of four columns headed respectively "bird," "food," "pest," "eggs." For instance, *Bird*, the wren (*Troglodytes parvulus*); *Food*, insects, *Nest*; dome-shaped, with side entrances—*Eggs*, 6-12, white generally spotted with red at larger end, '67 x '5, April—June. A schedule prepared after this plan should prove use in every country.

[No. 4.

INDUSTRIES OF THE GOLD COAST.

CONSIDERABLE attention is now being paid to the plantations of coffee and cocoa at the Gold Coast, in the cultivation of which, but more especially the former, the natives appear to have become interested. Along the road

leading from the botanical station through the country of Akwapin to the interior, are large numbers of small clearings in which coffee plants chiefly obtained by purchase from the botanical station, are to be seen in the most flourishing condition. The Liberian coffee plant appears to thrive best, but there are large quantities also of the Arabian coffee plant, the berry of which, however, is small and, apparently, deteriorated. The Colonial Secretary, at Accra, says in his last report that it will probably be necessary for the Government at no distant date, if the coffee industry is to be fostered, to instruct the native cultivators in the proper way of preparing the berry for export. At present the most primitive methods are employed. The berries are scraped, by hand, with a round stone worked in the hollow of a large stone, and after this process they are washed and dried in the sun. It is obvious that a large crop could not be so dealt with, and that the employment of machinery in the near future is imperative. The initiative will have to be taken by the Government because of the general ignorance on the part of the natives of all machinery even of the simplest character, and because no single native cultivator possesses sufficient capital, enterprise, or experience to take the matter in hand. The only manufactures carried on by the natives are manufactures which the necessities of life have driven them to undertake. The most important is the manufacture of earthenware pots of various sizes, ranging from a capacity of four to twelve gallons, for the purpose of carrying and storing water for drinking and household purposes. These pots are

made principally in the country of Shai, which lies behind the trade port of Pram Pram, where the clay is admirably adapted for the purpose. The pots, which in shape are exactly similar to the English glass bowls used by dealers in gold fish, are moulded by hand and shaped by eye. They are baked in the first instance, and are then subjected to a slow wood fire for three days, when if the latter and important process has been properly carried out the pots come out black and hard. Before the pots have cooled each is polished by hand, and for this purpose the covering of the palm kernel is used. This thready covering is heated over the fire in which the pots have been baked, and is then taken in the palm of the hand and rubbed over the outside of the pots. It acts as a varnish and imparts to the pots a brilliancy which may best be compared to a well polished fire-grate. The pots are then packed longitudinally in crates made especially for the purpose and adapted to conveyance as a head load, and are carried to the markets where there is a ready sale for them. The market prices for these pots ranges between one shilling and sixpence and three shillings and sixpence each, according to size. The drying of fish is also a staple industry of the country. All the large sized sea fish caught by the coast fishermen are split open and cleaned. They are then closed and kept in salt water for three days until they begin to get putrid—which condition affords the flavour dear to the natives—when they are again opened and covered with salt, to prevent the presence of flies and other insects. They are then sun-dried, and become ready for food. The herring, which is a common sea fish on the West Coast of Africa, is treated differently. It is not subjected to the cleaning process, as in the case of the bigger fish, but is quickly roasted in clay-made ovens, and then smoked over an open fire, which is arranged on a shallow pit, about one foot in depth. Fish are also salted into barrels. These especially prepared fish are carried to the markets throughout the country, and form a recognised article of native diet. Their presence is soon made apparent, especially in the case of the sun-dried fish, by the putrid

smell which arises from them, and which, as the Colonial Secretary points out, appears to be one of the principal attractions to the unsophisticated native. Baskets and crates, adapted for carrying goods on the head, are extensively made in every part of the colony, and on the coast all the fishermen make their own nets often from yarn which has been manufactured out of native-grown fibre and cotton. In many of the villages of Akwapim and Krobo there are blacksmiths' forges, where rough ironwork is turned out, such as door hinges, door handles, bolts, window fasteners, &c. Mining and working for gold is extensively carried on, especially in Wassaw and Akim. The country is rich in gold, it is to be found everywhere in large or small quantities, and there is no native family in the country without its family gold ornaments of the purest gold and often of artistic workmanship. The insignia of the Court officials of a native king are almost invariably covered with beaten gold, and gold dust among the natives is a common medium of exchange. The natives mine for gold in a very primitive manner; they do not use mercury, and their returns are much smaller than they would be if more perfected systems were adopted. A native miner has but few implements—a long-bladed spud or dagger, a wooden bucket for bailing out the water or hoisting out the stuff, and a bowl for washing or "vanning" make up the list. He rarely makes his shaft more than three feet in diameter. Planting one end of his digger into a recess in the shaft he places the other end diagonally against the opposite side of the shaft, and supporting himself by it his foot is placed in another of the recesses. He then lengthens out his body and fixes his back firmly against the side of the shaft. Thus supported he removes the digger, plants it in another recess below the first, and by repeating the operation gets to the bottom of the shaft. For many years past gold mining on an extensive scale has been carried on by several English mining companies in Wassaw.—*Journal of the Society of Arts.*

A SHORT PROGRESS REPORT ON THE AGRICULTURAL INDUSTRIES OF TRINIDAD ("EXCLUDING SUGAR").

The Agricultural Industries may conveniently be divided into several classes.

Section 1.—Produce used for the preparation of Dietetic beverages. „ 2.—Cereals. „ 3.—Starches. „ 4.—Dyes and Tannins. „ 5.—Vegetable Oils.	Section 6.—Fruits. „ 7.—Spices. „ 8.—Rubbers. „ 9.—Fibres „ 10.—Timbers. „ 11.—Miscellaneous.
---	--

In writing of the various tropical Agricultural Industries, it has not been attempted to arrange them in the order of their relative importance, but to take them *seriatim* as they fall under the heads into which I have, for convenience, divided them.

Section 1.—PRODUCE USED FOR THE PREPARATION OF DIETETIC BEVERAGES.

CACAO.—*Theobroma Cacao.*—The success which has followed the cultivation of Cacao in Trinidad is known world wide, and no further words are needed to prove it. If other countries are to follow on the same lines, there are many points which should be most carefully and fully considered, the chief of which are brought to notice in a small book entitled "Cacao" which is published at the Office of the Royal Botanic Gardens, but would be too lengthy to incorporate in a Report of this kind.

The yearly production by Trinidad for the past five years is as follows:—

Year.	Lb.
1890	*21,552,593
1891	16,188,493
1892	25,041,635
1893	19,106,553
1894	21,608,384

COFFEE.—*Coffea arabica* and *liberica.*—It has been proved that *Coffee of first class quality can be successfully grown in Trinidad*, and the area under cultivation is slowly increasing. Arabian and Liberian varieties can both be successfully grown.

Machinery, which has enabled small planters to prepare their produce with economy has been recently introduced, and other inventions to hand, appear to be well suited to further aid settlers in this matter.

TEA.—*Camellia Thea.*—This does not grow well enough in Trinidad to warrant the belief that it could be profitably cultivated in competition with more favoured countries.

COLA OR KOLA.—*Sterculia acuminata.*—This product has lately come into some prominence, and the demand for it has much exceeded the supply; consequently, good prices have ruled.

It can readily be grown in the same kind of soil and under the same conditions of climate as "Cacao," and requires almost exactly the same treatment in every respect. The product however, does not require the expensive manipulation which has to be given to Cacao, having to be only well dried, to be ready for shipment.

Planters are now giving some attention to this matter and the demand for plants is increasing.

The industry appears a promising one.

Section 2.—CEREALS.

The principal products under this head that need consideration are Corn and Rice.

CORN OR MAIZE.—*Zea Mays.*—This can be, and is, very successfully grown generally throughout the Colony, and the produce has been proved by analysis to be better and more nutritious than the imported article as generally received. If the culture of Cereals were better understood by the people much larger areas might be brought under cultivation.

As it is, there is a great want of knowledge, as to rotation of crops, and as to the conservation and application of manures.

RICE.—*Oryza sativa.*—Rice of various kinds has been successfully cultivated in the Colony. In some districts, large areas are annually planted.

The produce is of excellent quality and quite equal, if not superior, to the imported article.

SORGHUM.—GUINIA CORN.—*Sorghum vulgare, Sorghum saccharatum.*—As a grain producer, this plant is exceedingly useful.

There are several well marked varieties of each of the above species, and some are much more productive than others. The plant has been successfully grown in Trinidad. Under the name of "Joar," it is one of the most important rainy season crops of India, forming with rice and wheat the chief staple foods of the country.†

PISTACHE, PEANUT, GROUND NUT.—*Arachis hypogea.*—This has been successfully produced on rich sandy soils, in the Siparia and other districts of Trinidad.

It produces an oil said to be a good substitute for olive oil, and often sent into the market as such.

The cultivation, so far as I can learn, is not extending.

PIGEON PEA, CONGO PEA.—*Cajanus Indicus, Spreng.*—This is probably one of the most useful legumes cultivated, and it answers well as a rotation crop with Sugar Cane, Corn, &c. It is most successfully cultivated in Trinidad, as well as other West Indian Islands.

* The fluctuation in the annual production is caused by crops like that of 1891 being late and shipped in following year.

† Church in "Food Grains of India."

Legumes.—There are many other leguminous plants which are successfully cultivated, and are especially useful for restoring nitrogen to the soil, as rotation crops; but they are so commonly known that it would be useless to discuss them here.

Section 3.—STARCHES.

The starch-producing plants are many, but they have so frequently been "trotted out" before the public at exhibitions that the majority are well known.

CASSAVA OR MANIOC.—*Manihot aipi Pohl*, and **ARROWROOT.**—*Muranta arundinacea.*—The first is a staple food for thousands of people in Mexico, Central and South America, and the West Indies.

The *Tortilla* properly prepared in Central American style, is a food which may be taken by the most delicate, relished by the most prejudiced, and enjoyed by the most particular connoisseur of dietetics. *Cassava meal* or *Farine* is also largely used in various ways. The starch of this plant is in common use throughout the West Indies. The plant is successfully grown in Trinidad and must be considered an important minor product.

Of the latter plant no large quantity is grown in Trinidad. An idea prevails that Arrowroot cannot be successfully cultivated.

This appears to have arisen from the fact that the variety generally grown is a very inferior one.

It has been successfully shown by the Botanical Department that when a superior variety is planted the produce is abundant and of first class quality.

Section 4.—DYES AND TANNINS.

LOGWOOD.—*Hematoxylon campechianum.*—One of the principal products in this class is Logwood, which forms so considerable an article of export from many West Indian and Central American Ports.

It is fully proved that Logwood of first class quality can be produced in Trinidad. Shipments made to European markets of wood grown in the Colony, realized prices above that obtained by any other West Indian Islands, viz.: £7 16s. per ton.

This proves that our wood is one of the best quality and can be grown to perfection in our lands.

It grows on poor as well as rich soil, but reaches a larger size most quickly on the better lands.

Once trees are established they will produce self-sown plants over a large area, and the plants require little or no protection from stock. (See Bulletin, articles 35 and 105).

DIVI-DIVI.—*Cosalpinia coriaria.*—This a well known tree, which produces seed pods used for tanning purposes.

It grows well in Trinidad and affords an article which has considerable repute. A large quantity is annually imported into European markets, and it obtains fair prices.

GAMBIER OR GAMBIR.—*Uncaria Gambir.*—This plant has only recently been introduced, and so far, I believe, only Dominica and Trinidad has succeeded in establishing the plants.

It forms an article of export from the East Indies, and the possibility of our being able to produce it economically in the West is a question which only careful experiment can solve.

ANNATTO.—*Bixa orellana.*—Some of the finest kinds of Annatto have been introduced to Trinidad where it has been as well grown as in the French Islands, which are the seat of the greatest production.

There would be no limit to the production, if the prices were such as would give good returns for its cultivation, collections, and preparation.

MYRABOLANS.—*Terminalia of species.*—These trees grow to a large size in Trinidad, and probably yield as much produce as in the country to which they are indigenous. Little attention is required after the first planting, and the collection of the produce is simple.

MANGROVE.—*Rhizophora mangle.*—This indigenous tree yields a bark which is excellent for tanning purposes, the only apparent objection to its use being the somewhat fanciful one of its giving the tanned hides a red colour.

Good "Cutch" can readily be produced by a simple operation. From the Mangrove lands of the

Gulf of Paria is obtained the greater part of the fire-wood used in the city of Port-of-Spain.

No cultivation is required.

TURMERIC.—*Curcuma longa.*—This plant produces a well known yellow dye. The roots are locally known as yellow ginger and are in demand among the East Indian immigrants, for curries, &c.

It has been most successfully grown in the Royal Botanic Gardens, Trinidad.

FUSTIC.—*Maclura tinctoria.*—This plant produces a yellow dye. The plant is indigenous and grows to a large size in Trinidad. It is valued at from 60/- to 105/- per ton at this date.

Section 5.—VEGETABLE OILS.

COCONUT.—*Cocos nucifera.*—The process of extracting oil from the Coconut is well known. Large areas of land are cultivated in Coconut groves in Trinidad, and the export of nuts is a large one. Several oil factories are now working and the oil made is of excellent quality. The meal or cake produced when extracting oil is of first rate quality, and very suitable for feeding cattle, poultry and pigs.

CARAP.—*Carapa guianensis.*—Carap or Crab oil only needs to be mentioned. Better methods of extraction than those at present in use are urgently required.

LEMON GRASS OR CITRONELLA.—*Andropogon schoenanthus.*—An essential oil can be distilled from the Lemon grass, which flourishes readily here.

ORANGE.—*Citrus aurantium and other species.*—Essential oils of Orange, Lemon, &c., &c., of high quality have been produced in Trinidad.

BAY TREE.—*Pimento acris.*—From the leaves and fruit of this tree is produced the celebrated Oil of Bay so much used in the composition of hair washes, &c. It is indigenous to Trinidad and grows well in almost any soil. The oil is easily extracted.

CLOVE.—*Caryophyllus aromaticus.*—From the leaves or fruits the essential oil of cloves is readily produced by aqueous distillation, the trees introduced in 1818 have reached a large size, and annually yield crops of fruit.

NUTMEG.—*Myristica moschata.*—From the fruit of the Nutmeg tree two kinds of essential oils are produced, namely that from the nut, and that from the mace which surrounds the nut.

Many other oils, natural, as well as "essential" can be readily produced.

Section 6.—FRUITS.

BANANA.—*Musa sapientum.*—Eight years ago it was scarcely possible to find the kind of fruit known as the Gros Michel or Jamaica Banana (the principal kind exported from Jamaica) in any district of the Island of Trinidad. The attempt to induce planters to grow it was so far successful that the larger portion of 40,000 plants imported by the Government were taken up by them, and large numbers were afterwards sold from Government Establishments.

For an Island, practically without a suitable fruit to export, to at once develop a fruit trade was not to be expected, and the attempt made in 1889 to set such an enterprise afloat, has succeeded, if not as fully as was expected, yet it has resulted in preparing us more effectually for any future effort that it may be necessary to make.

To-day can be purchased in the markets, fruit, that six years ago might be looked for in vain. At that time, little else was known here but the small varieties of fruit utterly unsuited for export, but now the demand for the better and larger variety is general among the people; and there are few indeed who do not know the Jamaica or Gros Michel Banana, and I look forward to the time when they will be generally cultivated both for home use, and for export.

Opinions differ as to the practicability of exporting fruit from Trinidad. Our first shipments consisted of small lots of fruit, inferior in size and badly packed, which naturally sold—outside the ring—in New York at low prices.

If we had had large cargoes and sent them by fast steamers, well packed, and had sold them, inside the ring; I am of opinion the result would have been different. But even this shipment would lead

one to believe in ultimate success, for if such fruit reached New York, in good or even fair condition, as it is known to have done, it is easy to see, that it is practicable to get it there in much better order on a five days' steamer, than on one which takes ten or twelve days.

Moreover, sufficient fruit was not forthcoming at the time. It was not to be had in the Island; and we have practically now, (even after the importation of such a large number of plants by the Government) only the nucleus, for commencing the growth of the banana on a scale suitable for export.

Abandoned sugar estates lands are not always the best lands for bananas, though much available land of this kind may be well suited for the purpose. To ensure success in banana growing and shipping, several points are necessary: 1st—Suitable land. 2nd—Easy access to Railway of Port. 3rd—Quick dispatch, and fast ships, and Lastly—Interested persons; not competing against formidable rings, to sell them for you in the American market.

ORANGE, LEMON, &c.—*Citrus, sps.*—Oranges of several varieties grow well in Trinidad especially in the valleys of the Northern range of hills.

The Tangerine and St. Michaels varieties both produce highly flavoured fruit equal to any in the world. The St. Michael Orange could be exported if the supply were sufficient, but it is as yet hardly equal to the local demand except perhaps in some few districts.

I consider there would be no difficulty in growing oranges in Trinidad for the American Market provided that proper arrangements are made for their shipment and sale.

To make it pay, the proprietors must allow the New York Ring to obtain an interest in the matter, and to see that it does not militate against New York trade, on the lines already established.

The same remark applies to lemons, which are grown here from European seed of excellent quality.

I apprehend no special difficulty in sending oranges or lemons to the American market in good condition. Parcels have, we are fully aware, arrived in bad condition. That does not prove that the Trinidad orange cannot be carried safely, but simply proves that the shippers did not know enough of the business. To pack fresh gathered oranges in barrels or boxes in damp weather without drying is certainly not the means to adopt to get them safe to market. Oranges to go safely, must be gathered and packed in dry weather; must be handled as if they were eggs, and must be well dried before packing, in chambers where they can be placed in single layers. In our dry season from January to April, excellent oranges can be had, and oranges too of a flavour quite equal if not superior to the well known Jamaica orange.

Section 7.—SPICES.

VANILLA.—*Vanilla planifolia* has been successfully grown in Trinidad, and the native species give a saleable product. The cultivation of this product has not yet assumed proportions to place the article upon the export list.

CLOVE.—*Caryophyllus aromaticus*.—This tree grows well but does not pay for harvesting the crop in Trinidad.

GINGER.—*Zingiber officinalis*.—Has been successfully grown of excellent quality.

NUTMEG.—*Myristica moschata*—Nutmegs when planted in suitable situations, produce regularly good crops, and realize good prices.

Trees in the Botanic Gardens, yield crops valued at £2 each, annually.

CINNAMON.—*Cinnamomum Zeylanicum*.—Grows well, none exported.

Section 8.—RUBBERS.

RUBBER.—Rubbers of several kinds have been planted, but preference is given to *Castilloa elastica* or Central American Rubber. This has succeeded admirably in several places, and a systematic outlay would probably give ample return. No export of produce has yet been made, but our trees have now reached a size when it will soon be practicable to crop regularly. Thousands of trees have been sold,

and I learn good success has attended planting in nearly every case, this is corroborated by the demands for more plants.

I look forward to a great future for this Rubber in Trinidad.

Hevea brasiliensis, or the tree producing Para Rubber, also grows well in Trinidad and might be useful, but it does not come into crop so early as the *Castilloa* and does not, so far as I have seen, give an equal yield, until it becomes of very large size.

Castilloa Rubber can be planted 200 trees to the acre. These will yield on good land at the 7th or 8th year some two to three pounds of Rubber per tree: and will give an increased annual yield.

Three pounds at 2/- x 200 = £60. Present price—1/9 to 2/11½.

The planter can decide for himself whether this would be profitable or not. The visible sources of supply show a decrease, and prices rule high and regular. *Hevea* or Para Rubber takes longer to bear, but the quality is said to be better, and prices rule higher than for the product of the *Castilloa*.—3/- to 3/1.

Section 9.—FIBRES.

FIBRES.—The best kind of plants for producing fibre have been successfully introduced, and are now growing well in many places in the Island. Several machines have been tried, but we yet want a machine of economic character. We have a native fibre, *Abutilon periplocifolium*, which can be most successfully grown. It strips easily, and the raw material can be baled and sent to Europe; I believe there is a great future for this fibre; 1st from the ease with which it can be grown, 2ndly from the facility with which it can be prepared for shipment without machinery, and thirdly, from the ease with which it can be shipped as raw material to be prepared at home by flax machinery. It is to be compared with the best Jute.

COTTON can be very successfully grown, but it gives such a poor return in comparison with other crops that no one grows it.

HEMP.—*Agave rigida var Sisalana*.—Sisal hemp plants of the true kind are growing well in many places throughout the Colony and we cannot doubt the possibility of producing large quantities of material if the success of the culture in other colonies would warrant extension of the area.

Section 10.—TIMBERS.

Many people think it ridiculous to plant timber trees, but when we know that the visible supplies of many kinds are yearly decreasing, it would appear to be a safe investment to spend money on the cultivation of forest trees of the best kinds. In Trinidad, wherever planted, the cultivation of timber has proved a success, but it is the absence of a quick return, which at present, (and we fear will continue to) militate against any proposal to cultivate timbers on a large scale.

On estates however where other cultivations are in progress, it would be easy and inexpensive to start groves of quick growing timbers, whose growth in a few years would pay the proprietor a hundred-fold for his outlay. It is indeed sad to witness the desolate look of some estates, on whose broad expanse not a tree is to be found, except perhaps round the homestead, where they serve the purpose of wind-breaks, and like

"Imperial Cæsar, dead, and turned to clay,
"May stop a hole, to keep the wind away."

An estate planted with *Mahogany* and *Cedar*, would pay better, once established, than the best forest land of Europe; *Cedar* may be taken to grow 1½ inches in diameter per annum, *Mahogany* 1 inch. I can show trees planted eight years ago giving these measurements. After twenty years they will probably make an average of half an inch per annum for *Mahogany* and three quarters of an inch for *Cedar*. The supply of Furniture woods to European markets is daily becoming smaller, and there would be a mine of wealth in a well established area covered with such woods as *Purple Heart*, *Mahogany*, *Cedar*, and others.

Section 11.—MISCELLANEOUS.

CINCHONA BARKS cannot be grown to advantage in Trinidad as there is very little suitable land for the purpose. On the hill areas, Succirubra or Red Bark would thrive.

TOBACCO.—A good quality of Tobacco has been successfully produced in districts where "vega" lands are available.

SARSAPARILLA has been successfully grown of excellent quality.

GENERAL REMARKS.

No one can, or wishes to deny, the importance of the Sugar interest to the West Indies, but its maintenance appears to depend a great deal upon how long European Governments will maintain the bounty upon the production of sugar from the Beet-root. In a fair fight there appears to be not the slightest doubt but that cane sugar can hold its own; but if the bounties are continued which give beet an advantage, the cane sugar industry (unless something wonderful intervenes) appears doomed, and what can replace it? This alas! is a question which has been often asked, and perhaps, never yet satisfactorily answered. Something new is required, but it is quite certain that no one can miraculously devise a "branspan" new article of export which will at once step in and take the place of the Sugar cane, or it would have been done long ago. People engaged upon prominent industries seldom find time to do more than to look well after the immediate work they have in hand, and considerations for the future, practically have but little place, until disaster is clearly foreshadowed. While all goes well, they "blow cold" on experiments undertaken in any other direction but their own, but as soon as difficulty comes, they are quite willing to "blow hot" upon anything advanced, in the hope of a solution of their troubles.

The Botanical Establishments of the West Indies, have, for many years past taken up the economic question of substitutes for current cultures, in view of their possible failure; and careful examination has been made into the various suggested means.

Numerous importations of plants have been made from all parts of the world, and cultivations hitherto carried on in the East, have been tried in the West.

There does not, however, appear much likelihood of our taking up the growth of any special Eastern produce, for the simple reason that we are at once placed in competition with East Indian cultures, and we know by comparison that the labour supply in the East and West favours production in the East, and unless disaster or disease sets in Eastward, there is little hope for the West successfully entering into competition, in the cultivation of the various products which can be grown equally well in both quarters of the Globe. This being so, the cultivator turns to the products of the West itself, in the hope of finding suitable ones for his purpose, and it is probable that his search in this direction has more hope of success; for it will be seen that our most promising substitutes are really Western products.

To fix upon articles in regular demand he first turns to "Food supplies" and secondly to "Manufactures."

Now the greater number of articles of tropical production are not "Food supplies" and failing Sugar, Cacao, and a few others, he can only rely upon the demand for the supplies of raw material, for supporting "Manufactures." The demand for manufacturing material is neither so constant or so regular, as the demand for Dietary articles, and careful examination is needed in selecting an industrial product that gives the producer the greatest security. Turning to a list of Tropical productions, (well seen in the pages of the "Public Ledger,") we find them very numerous indeed, and at first sight, it appears that it would not be difficult to find a substitute for any failing Industry, but planters know to their cost how much disappointment meets them at every turn in their attempt to do so. It thus appears that the only course left is to find out, *what can really be well grown*, and whether such is likely to have a steady market in the future, and whether the demand is from any cause increasing or diminishing.

I give a list of products, many of which might possibly be grown at a profit; but it must be clearly understood, that I do not for a moment suggest them, as in any way capable of at once becoming substitutes for the Major Industries; but simply mention them with a view of *pointing out the possibility* of turning attention to them in a profitable manner, should our present cultures fail. It will be noted that possible productions other than those legitimately belonging to Tropical Agriculture are not mentioned, viz.: Mining produce, Manufactures, &c.

List of Products.

- Arrowroot.* .. Can be well grown.
- Balata.* .. A native product. A Balata forest 50 years hence would be a mine of wealth, both for gum, and for wood.
- Bones.* .. What is done with waste bones?
- Canes—* .. Bamboo cane can be grown in unlimited quantity here.
- Bamboo*
- Citric Acid* .. Large supplies can be produced from our Limes.
- Cinchona Bark.* .. Would grow at 3,000 feet, but we have little land at that height.
- Cochineal.* .. Easily produced.
- Cacao.* .. Trinidad is in the front rank with this product.
- Coffee.* .. Can be well grown of first class quality.
- Coir. Coconut.* No attempt made to utilize it to advantage.
- Copra.* .. Worth £13 per ton. Coconuts sell at 20 to 30/- per 1000.
- Coconuts.*
- Corosos.* .. Thousands of tons could be easily grown. £6 to £9 per ton.
- Ivory Nuts.*
- Cotton.* .. Grows well, difficult to compete with old established countries.
- Cutch.* .. Fine "cutch" can be made from our Mangrove bark.
- Diri Diri* .. Grows well, worth 8/- to 11/- per cwt.
- Dragon's blood.* An indigenous tree produces this, growing in our swamps, worth £6 to £12 10 per cwt.

DRUGS:

- Aloes.* .. Can be well grown and manufactured here, worth from 15/- to 95/6 per cwt.
- Areca Nuts.* .. Grow, well, but waste on the ground, 8/6 to 12/- per cwt.
- Balsam Capiri.* A native tree, produce worth 1/- to 1/7 per lb.
- Balsam Peru.* Grows well here, worth 9/- per lb.
- Beans.* .. Grows well, cannot compete with forests of Venezuela.
- Touquin*
- Cardamoms.* .. Grows well, and produce freely, worth 1/4 to 3/9 per lb.
- Kola or Cola.* Worth 1/5 per lb. Grows freely.
- New Vomicia.* Worth 5/- to 8/- per cwt.
- Oils Essential—*
- various. Can be well produced.
- Sarsaparilla.* Can be as well grown here as anywhere in the world, 1.2 to 1/5 per lb.

FIBRES:

- Abutilon* .. A first class fibre, easily manipulated and promises best of all.
- Sisal* .. Can be grown of first class quality.

FRUIT:

- Bananas*
 - Oranges*
 - Lemons*
- } Already discussed.

GAMBIER

- .. Just introduced, production would have to compete with East Indian.

GUM KING

- .. This tree does well here, and samples of good gum have been produced, at present quoted at £20 to £25 per cwt.

INDIA RUBBER:

- Castilloa* .. 1.9 to 2/11½ }
- Columbian* .. 1/6 to 2/8 } per lb.
- Hevea or Para* 3/- to 3/14 }
- Mycobolans* .. Trees grow large and very quickly worth 3/6 to 8/- per cwt.

Oil, Coconut	Large quantities produced in Trinidad.
Rice	.. Can be well grown.
SPICES:	
Mace	}
Nutmegs	
Cloves	
Cinnamon	
Ginger	
Pepper	
Pepper Long	}
Tamarinds	
Topioca	.. Made from Cassava Starch, could be well made here if desirable.
Tea	.. I don't think we can compete with Ceylon, the plant grows here, but does not thrive.
Tobacco	.. Good Tobacco has been grown here, and Cigars have been made of excellent quality.
Turmeric	.. Can be well grown.
Vanilla	.. Can be produced of good quality.
Bee's Wax	.. Honey and Wax both produced here.
WOOD:	
Logwood	}
Fustic	
Lancewood	
Mahogany	
Cedar	
Furniture Woods	
Purple Heart,	
&c.	

In the foregoing list I have pointed out numerous articles that might be grown.

The circumstances which militate most against the introduction of new industries are those which are chiefly generated by the action of those who monopolize the Major Industries, in whose hands for the part rests the Legislation and Government of the Colony. Minor, Subsidiary or New Industries having always (as must be confessed is natural) to take a second place. Under these conditions, it is only when the tide turns, that they receive the attention they fully merit as industries which tend when combined as a whole, to the stability of the Colony. The Botanical Departments of the various colonies are always ready to afford the planter the benefit of any knowledge or experience they may have obtained, but they would not attempt to persuade anyone to enter into cultivation of what are called "Minor Industries," if the larger ones pay them better. Most certainly and emphatically No! But instead, it is for them to respectfully direct the attention of all planters in times of prosperity, to all such industries as may keep them from the serious error of carrying "all their eggs in one basket"

Probably the most encouraging of the so called "minor" or "subsidiary" industries are:—*Rubbers, Fibres, Cola, Dye-woods* and *Timbers.*

J. H. HART, F.L.S.,

22nd May, 1895.

NYASSALAND AND ITS RESOURCES.

(From a Correspondent.)

COFFEE-PLANTING.

Coffee-planting, although still in its infancy, may be looked upon as the chief cause and support of our prosperity in Central Africa. Nyassaland coffee last year fetched the highest price in the London Market. The prospects of coffee-planting in British Central Africa are excellent at present, and the industry will have a great future, when more capital has found its way into the country. Even now, compared with coffee-planting in India. Its cultivation in Nyassaland offers advantages to the planter. The conditions of the country would seem to be admirably suited to coffee. There is an abundance of running water in all the coffee districts. This is an absolute necessity for the washing process. The fertile slopes of the Shiré Highlands and Mlange are covered with a rich soil which contains every

element necessary for the healthy growth of the plant, and as yet the coffee disease has not made its way into the interior, although it has appeared on the coast of German East Africa and in Natal.

CHEAP LABOUR.

The greatest advantage of coffee-planting in Central Africa is the abundance of cheap local labour. Plantation work is very popular with the natives who live in the neighbourhood of coffee estates, while now that the country is quiet, people will come on foot for hundreds of miles to obtain work. Under their *capitaos* or native *maestries*, many of whom come from curious little colony of Mahomedans on the Lake, the coolies are admirably workers, steady, willing, industrious, and extremely cheap, 3s. 6d. a month being the cost of each adult male cooly to the planter. Land, of course, is excessively cheap, and a plantation cleared in May is planted the following December, the planter getting his first crops at the beginning of the third year, while in the fourth he may reasonably hope for a large return for his outlay. At present only the washing and pulping is done in the country, as there is no machinery for peeling and garbling in Central Africa, but some energetic planters have already set on foot plans for importing all the necessary machinery, which will shortly be established at Torona. At present the portorage is the difficulty. Parts of the Shiré above Chiromo are unnavigable, and now the whole of the exports and imports of Central Africa are carried on the heads of native porters, some 10,000 natives being engaged in the transport of goods.

TRANSPORT DIFFICULTIES.

They are, however, difficult to obtain, though cheap. The great want of the coffee planter is a railway from Chiromo to Blantyre; and it is easy to understand that those who have had the fruits of years of waiting and toil, detained perhaps for six months on the Shiré bank waiting for coolies, would gladly pay double to ensure their safe and speedy transport by rail. It is in fact a matter of life and death to the planter to get his produce out of the country before the heavy rains set in in November. It will, however, not be long before this dream is realised, as a company has already been formed, and a railway will shortly be laid down from Chiromo to Blantyre, which, it is hoped, will soon be extended to Matope, higher up the river.

CLIMATE.

The Shiré Highlands, with Blantyre and the Mlange Districts, are at present the chief seats of coffee-planting, and both are admirably adapted for colonisation; these districts being over, 5,000 feet in latitude, while parts of Mlange reach 10,000 feet. The upper Mlange plateau is very wet, with a rainfall of nearly 75 inches; otherwise the climate is perfection, as regards temperature, and very bracing. The S. W. plateau has the makings of an ideal sanitarium. Its clear air and exhilarating climate would give new life to the visitor from the heated plains, and its acres of rolling grass land afford excellent pasturage for horses, cattle, and sheep, which thrive there. Many European vegetables will grow there. It would, in short, be a favoured hill station, which would eclipse any in India, except perhaps Ootacamund, surrounded as it would be by breezy downs, with a splendid natural race-course and polo-ground, and all these advantages being obtainable within two days of Blantyre.

HOW THE COFFEE TREE BEARS.

There are, however, some difficulties to be overcome as regards Central African coffee-planting. The coffee shrub, although a native of Africa, is not found wild in Nyassaland, and does not grow there yet as it should, and as it grows in Ceylon. In Central Africa the tree at its first bearing produces an enormous crop of berries on the horizontal branches, but these then die off, and the tree, though it increases in height, bears very little more. It is then cut down, and at least two years must ensue before the new shoots make their appearance on the old roots. It is, however, hoped that by some new

process of pruning or manuring the coffee tree may in time give secondary branches which would rapidly increase the profits. The Nyassaland coffee, strange to say, was introduced into the country from Scotland by Mr. Buchanan, c. m. c., who brought a small plant from the Botanical gardens at Edinburgh. From this plant, which is still in existence in the mission grounds at Blantyre, all the trees in Nyassaland are descended.

There are, of course, at present very few so-called townships in Nyassaland. These are Chiromo, on the Shiré, Blantyre, the capital of the Shiré Highlands Fort Herald, Fort Johnston, and Fort Lister. Of these Blantyre is the most advanced. It is a picturesque little settlement of some thirty European houses, in the centre of the coffee-planting district, surrounded by plantations, beautifully situated beneath the hills in a well-wooded country. The climate is remarkably healthy.

DISEASES OF CATTLE.

There are difficulties which seriously impede the progress of colonisation in Nyassaland. First and foremost among these is the unhealthiness of portions of the country for cattle and horses. Horses die of the fatal lung sickness, which often clears off numbers of them, and they and the cattle die from eating certain poisonous plants that spring up at the commencement of the rains. Then there is the belt of tsetse-fly, fatal to all quadrupeds which come from without. It is a small grey fly, like an ordinary horse-fly, with crossed wings. It is the curse of the country. Were it not for the tsetse-fly the difficulties of colonisation and of extirpating the slave trade would be lightened a thousandfold. Were it not for this pest the whole country could be kept under control by a few troops of mounted police. Fortunately the tsetse-fly never appears in the hills or near the rivers, so that horses can be brought by boat up to Katunga. The following belt of country is also free from them, so that the horses can be taken in safety to the Shiré Highlands.—*Times of India.*

WHAT WILL NORTH BORNEO'S CHIEF EXPORT BE ?

The cultivations from which we have to choose in seeking an answer to this question are coconuts, coffee, cotton, Manila hemp, rattans, sago, sugar and tapioca. To commence with:

Coconuts.—The demand for coconuts and their products is little understood in England where when an intention is announced of planting up say 20,000 fresh trees, people ask "are you not afraid of overdoing the supply?" it being supposed that the chief destiny of the coconut is to be sold in half penny slices to little boys with strong digestions, or to be given as a prize at Aunt Sally.

Coconuts are a large article of diet throughout the Tropical East, constituting the main ingredient for giving extra flavour to rice and curry; coconut oil is largely used as a luminant; while in the form of copra Europe imports enormous quantities of the dried kernel; the number of the nuts required for affording fresh oil for women's hair is very large, and coconuts or their products are in request for a dozen other minor purposes. Some hint of the demand may be gathered from the fact that Europe last year took from Singapore alone *entl.* 1,000,893 of copra besides the quantity shipped from Java, the Philippines, Ceylon*, &c.; the rice-eating people of the tropical East increase in a manner difficult if not impossible to estimate, all of them with a fondness for coconuts, while as a luminant it may be noted that when the price of kerosine oil rose the other day the retail price of coconut oil rose, too, several cents a bottle in Singapore. It is now recognized that the oil fields of America are exhaustible,

* By reference to another column it will be seen that Ceylon's export of coconuts and their products totals over 50,000 tons a year on the average of late years.—*Editor.*

what will the effect on coconut cultivation be when this begins to be felt? But as it is, the present always enlarging demand for the various purposes mentioned caused by an increase of some millions of consumers yearly, most of whom live in districts where coconuts do not grow, calls for a supply that is barely met by the number of fresh trees planted yearly as is testified to by the fact, that copra has stood for months past at a price nearly \$1½ per picul higher than it commanded up to some three years ago.

Now the coconut is a particularly easy tree to grow requiring little up-keep after 30 months of age except from cattle (which also are profitable to raise) and the amount of coconut land, particularly in the district of which Sandakan is the place of export, is very large, capable of growing some millions of trees.

I think it may fairly be prognosticated that some time in the future the coconut oil making industry will assume enormous proportions in Sandakan Bay. A few coconuts have been put in in different places round the Bay, though not really many but it is at all events satisfactory to know that planting is always in progress.

Coffee (Liberian).—The amount of Coffee land in North Borneo is very extensive; if millions is rather a large word to use, at all events commencing from the rich soiled hills of the Segama and proceeding north-wards there are several hundreds of thousands. A start has been made in coffee planting in the country though on a comparatively small scale so far, but in two or three places the growing trees can be seen, gigantic in size and with their branches bending and cracking with the weight of fruit. No doubt South America is a strong competitor in production, but the consumption increases yearly (though not in England where the making of a cup of drinkable coffee is amongst the lost arts, and people spoil their digestions with raking Indian tea) but Europeans fight shy of South American, where at the worst you get your throat cut or are bombarded, while at the best your coolies are all liable to be called out for military service and the estate left to take care of itself, and let it be once widely enough known that there is a British protected State, virtually a British Colony, in which coffee can be successfully grown, and where wages are cheaper than in Brazil, and there will be no lack of intending planters.

Our coffee is quoted at 84s. per cwt. on the London market as against 68s. the price of fair channel R10 (Arabian).

Cotton.—An enormous expansion of the cotton goods making industry is in progress in China and Japan, and the suitability of North Borneo cotton for the mills has been most favourably reported upon, especially in comparison with Chinese. A large proportion of the cotton imported into Japan comes from Bombay, but we are much nearer Japan than Bombay is, while as against cheaper wages in India must be put the land tax for one thing and the expense of bringing the cotton from our country to ship's side there for another against no land tax and the sending of the cotton bales direct from the estate packing house to ship's side here, (when there is a cotton estate, at present there is not one). When this cultivation is commenced in earnest there are the prospects of a very large business as our cotton possesses several advantages, caring little if any thing for weeds and lasting for at least three years without replanting; one started in fact the expense of up-keep is very slight and little else has to be done but pick the crop as it ripens. The main difficulty I foresee is from deer and wild cattle which are very fond of the plant, but at the worst all that would be required would be wire fencing. However, our information on the subject of cotton is not yet complete enough to allow one to speak about it with quite the same certainty as about other things.

Gambier is a product which seems particularly adapted to North Borneo, owing to its demanding large supplies of firewood in the vicinity of the boiling house and to the need, it having hitherto been a low priced article, of cheap transport for it.

In few countries other than Borneo can a conjunction of these two advantages be effected. (The need for constant rains debars it from being grown in any country that has marked seasons). The export from Singapore has slightly risen during the last 10 years moving from 712,000 cwt. in 1886 to 812,000 cwt. last year; the prices used to range from \$4.50 to \$6.50 per picul and at these prices the "gambier and pepper" hong made enormous fortunes (in a great measure due to pepper however it must be confessed), but during the last few months the price has much gone up, and as I am assured at the gambier gardens here that our plants yield a first crop in two or three months less than in the Straits and also that the leaf matures again ready for picking in 3 months as against 4 there, it seems more likely gambier gardens will be opened here. As the forests get cut down for boiling purposes in the districts in the Straits and Islands where it is now made (as they are rapidly being done now) a gradual transference of this industry to Borneo is inevitable.

Manila hemp on the average year by year shows no great change in price while the export does not increase very fast, which seems to denote that we shall have to directly compete with and undercut the Philippines instead of merely becoming a fresh feeder to an increasing demand as in the case of copra, coffee, sago and other things. At present we lack a sufficient supply of properly qualified labour, but when we can show plantations of hemp large enough to guarantee uninterrupted work I think there will be plenty of workmen offering, at present owing to various causes we cannot do this and in fact the industry is in its extreme infancy, but that we can grow Manila hemp just as well as the Philippines there is no question, and in view of the harsh government and heavy taxes and exactions upon everything and everybody there, there is no reasonable doubt but that this industry also will gradually come over to North Borneo. Not to go any further, the export duty of \$1 a picul charged in the Philippines gives us a 10% advantage at once. In the Philippines it is mainly a "cottage" industry, the plants being usually grown in fields by "small" holders who bring the hemp to the towns where it generally passes into the hands of a middleman who passes it on to larger towns, sometimes on through consignment, sometimes to the agent of an open port firm, and in the event the hemp will sometimes travel once on a pony's back and twice in coasting boats, and pass through the hands of two middlemen and one merchant before finally being exported, all of which operations mean additional charges or profits, which however per contra means that the original producer there can make it very great deal cheaper than we can at present, but the fact that we can send direct from the estate to ship's side and without an export duty must tell in time.

MYNAH.

—*British North Borneo Herald.*

HARDY BAMBOOS.

Mr. Freeman Mitford's paper at the Royal Horticultural Society on Tuesday last proved one of the best and most interesting lectures that have been read before the Society. He had a grand subject and a novel one, and he handled it with the ease and knowledge begotten of enthusiasm and experience. It was by no means a compilation or a paper "made to order" or to fit an occasion. It is a matter for regret that it was not illustrated, either by specimens or by drawings. The Society, as too frequently happens in such cases, missed an opportunity. Nevertheless, when Mr. Freeman Mitford's paper comes to be read in full in the *Journal* of the Society, there is no doubt it will give a great impetus to the culture of these graceful and singular plants, and the Bamboo-garden at Kew already furnishes an excellent object-lesson open to the community at large.

We are apt to associate Bamboos with something tropical, and dimensions too gigantic for an ordinary English garden. Mr. Mitford's paper will do much

to correct this imperfect judgment. Big Bamboos there are, and many of them far too gigantic and much too tender ever to find a place in British gardens, but Mr. Mitford gave a list of between forty and fifty species and varieties, all of which are of suitable size, some dwarf, and adopted for carpeting the ground beneath trees, and all more or less hardy. Indeed, after a winter which has in many parts of our islands destroyed even the common Gorse, Mr. Mitford is able to say that not one of the species entirely failed. Nothing worse than a severe check has occurred, a check resulting in the formation of a sheaf of small canes, but richly provided with luxuriant foliage.

Mr. Mitford gave some excellent advice as to the necessity for not plucking out the Bamboos till they have recovered from the effects of their removal from their native countries or gardens where they have been grown. When received, the roots should be soaked in water for twelve hours, and then potted. They should then be placed in a cool-house, and but little water given at first. In February the buds begin to swell, in March the leaves appear. Water should then be afforded freely. In May the pot-plants may be hardened off, and at the end of the month they may be planted out in their permanent quarters, which should be duly sheltered from their deadly enemy—wind. In handling the plants the greatest care should be taken not to injure the roots, nor the points of the shoots, which are very brittle. They should not be trodden in, but the roots well watered-in so as to enable them to get firm hold of the soil without risk of breakage. The soil should previously have been well double-dug. By preference it should be a rich loam, and the plants mulched with cow-manure. Wire netting may be provided toward off the attacks of rabbits or pheasants. A little fern or bracken thrown over the stools in winter might be advisable. We need not follow Mr. Mitford in his enumeration of the species, but refer the reader to Mr. Bean's classification of hardy Bamboos, given in our volume for 1894 (March), where the species cultivated at Kew and elsewhere are enumerated and described, with illustrative cuts, some of which we now reproduce as opportunity to the occasion. *Arundinaria nitida*, fig. 33, one of the loveliest and hardiest, to quote Mr. Mitford, was formerly called *A. khasyana*, under the erroneous impression that it was a native of the Khasya mountains, a hot steamy region not likely to afford many plants hardy enough to withstand our climate. The species, it appears, is really a native of the Chinese province of Szechuen, a very different climatal region.

This instance, among many more, shows the great advantage that accrues from the association of Botanical research and practical cultivation. The culture of those plants, as in the case of Orchids, will lead to an immense advance in our knowledge of the plants, and to the gradual establishment of a correct nomenclature, and at the same time the information gleaned as to the native countries of the plants will afford most useful hints to the cultivator.

Incidentally, we may mention a curious co-relation alluded to, with becoming caution, by Mr. Mitford, and that is the circumstance that all, or almost all, the species known to be hardy have the smaller veins in the leaves arranged in small but conspicuous squares, the venation being, as it is called, tessellate. Mr. Mitford's paper was instructive and suggestive to a high degree, but as it will doubtless be printed in full in the *Journal* of the Society, we need now only counsel those of our readers interested in the subject to look forward to a future issue of the *Journal*. In the meanwhile we may refer them to Mr. Bean's *Monograph* already alluded to, and to Mr. Mitford's own communications to the *Garden*, and to our own columns.

At the conclusion of the lecture, some remarks were made by the chairman, Sir Alexander Arbuthnot, and by Sir John Llewelyn. Dr. Masters mentioned that *A. japonica*, better known as *B. Metake*, Hort., thrives well in one of the densest and most insalubrious London suburbs, and even under the shade of some old Lime trees, where little or nothing can be induced to grow.—*Gardeners' Chronicle*,

FOREST CONSERVANCY:

CONSERVATOR'S REPORT FOR 1894.

SHOULD THE FOREST DEPARTMENT BE
ABOLISHED AND KACHEHERI OFFICIALS
BE MADE FORESTERS AS WELL AS
POLICEMEN?

The Forest Department is understood to be standing on its defence. "Retrenchment" as a cry has rung through the island. Radical reform and retrenchment based on the sweeping-away of the immemorial Paddy Rents, and the absolute promise of Government, had been the idea in the public mind, as involving a corresponding cutting-down and re-organisation of the Revenue service. But very cleverly has our Executive got a Commission to spread out its Inquiry over the whole body of Establishments and to furnish such a Report as may afford an excuse for ignoring the original purpose in view and for indulging in the very minimum of alteration. Some people indeed, think that the whole affair will end in the Colonial Secretary doubling up a couple of Magistracies here—the Judicial rather than the Revenue Service suffering!—and cutting off an unfortunate Survey officer or peon elsewhere. We shall see.

But meantime, it has struck more than one would-be critic,—afraid to face the real problem of Retrenchment,—that a safe outlet for zeal in the public interests would be found in some of the outlying Services or Departments which have neither revenue nor judicial justification for their existence. Among these, the Forest Department was especially singled out by a native Unofficial Member of Council, apparently with the sympathy if not encouragement of the Executive; and this has led to the belief that there would be no objection in high circles to imposing Forest, as well as Police, duties on the occupants of the different Kacheheries, in order to justify the continued existence of the latter on their present scale. It is peculiarly unfortunate that, at such a juncture, the Conservator of Forests should have to go on leave and that he should furnish—for the second time—what he himself considers an unfinished and inadequate Report. Such as it is, we give extracts representative of the more interesting, practical portions elsewhere. But we would say that the very first duty of Mr. Broun on his return should be to supply a special Report with "the case" for the Department as a separate entity—summing up what it has done in the past, is doing now, and may be expected further to do in the interest of the Colony. This will enable a proper judgment to be formed, and if after such is weighed in the balance, the Forest Department is found wanting, we should be among the first to cry for abolition or amalgamation. [But let not this side business, divert the public mind from the real object of Retrenchment, based as it was on the Paddy Rents abolition.]

In thinking of the *raison d'être* of a Forest Department, we are always reminded of the shrewd Scottish Laird's injunction to his son and heir:—"Keep stickin' in a tree, Jock, it will aye be growin' when ye're sleepin'." It may be said why should Assistant Agents not see to this. Why not indeed? But unfortunately, where is the district revenue officer who has given himself the trouble even to establish a model Kacheheri garden with products familiar to the people in order to show what proper cultivation means, and the results? If Forestry and arboreal plantations are to be attempted at all, it is quite clear that they must have skilled

direction and supervision. The work must be well done, or it had far better be left alone altogether. We do not know that practical planters speak very highly of some of the efforts of the Department towards establishing plantations in the hill districts, and it is possible, that after these are once started, there would be economy in giving out their upkeep—weeding, supplying, &c.—on contract to the nearest estate superintendent who might be inclined to take up the charge. Experienced supervision would still be required; but a contract, if feasible, should save the moving about, or engaging, of a special force of forest coolies.

We must, however, look more closely at the Report before us, and the first broad fact that comes out is that although there was an increase of income last year—timber and other produce sold—from R361,000 in 1893 to nearly R381,000 in 1894; yet the deficit on the working of the Department which was close on R39,000 for 1893, was no less than R72,000 for last year. The largest portion of this deficit has accrued in the Western and Central provinces; while the Eastern, Northern, North-Western and Uva provinces show a surplus. But it seems the Eastern has done less well with its timber trade than in previous years owing to the re-establishment of the Indian import duties; while the falling-off in the North-Central province is due to the low price obtained for ebony. Then again in the Central, a good deal of timber delivered in December could not be paid for or credited till 1895. Nevertheless, explanation is required, and not afforded, so far as we can see, in justification of the high amount of charges in the Western and some other provinces. It will be necessary to show how far the Colony can count on an adequate return for this comparatively heavy and continuous outlay, in the future. If such return is not assured, most certainly there is need for the shears of economy to be effectually applied. That the Conservator's office should make an increased appropriation in 1894, up to wellnigh 10 per cent of the total outlay, seems also to require examination.

To turn to some of the actual work done, we are told of a total area of reserved forests equal to 52,000 acres with 162,000 acres taken up to be reserved, waiting for final proclamation, and 72,000 acres of fresh areas gazetted for settlement last year. A good deal of work has been in demarcating forest boundaries, in surveys and "working plans," which latter term applies to sample plots with planted trees in which measurements for annual increment are registered—teak in the North-Central province showing one of the best results. We pass over departmental details, with prosecutions and the control of chena cultivation, to draw attention to the Conservator's remarks (reproduced) as to Forest fires. The seed crop appears to have been bad last year, all except of the satinwood tree. We direct attention to the notes on the progress of the different plantations as perhaps the part of Mr. Broun's Report that is of most general interest, especially to our planting readers. We should like to have some criticism of these from neighbouring planters. We do not quote for the Eastern or North-Western provinces, although good work seems to be done in both. In the natural forests, a good deal of creeper and undergrowth cutting as well as the regulation of felling occupy attention. Nothing seems to come amiss to the Forest officer and roads and buildings appear in his list of work, while we are told that the Batticaloa sawmill

is doing well and has more than enough to keep it going, and it saves R200 a month; wire shoots in the Central and Uva provinces are also said to save much labour.

There can be no doubt of the important bearing that a great deal in Mr. Broun's Report has on the development and prosperity of the Colony. Apart from the "Reserved" and "proposed-Reserved" Forests already referred to, the Conservator calculates there are 2,404,490 acres of other Crown Forests in the Colony. Of forest plantations at the end of 1894 there were altogether 1,712 acres; while 22 miles of roads and paths had been made by the Department. The total of trees felled during 1894 of all kinds was 28,609; while between R6,000 and R7,000 of forest produce was granted free of charge for various purposes. Finally, we ought perhaps to notice the fact that against the R72,000 of deficit on the year's working, a "summary of outstandings due to the Department" at the close of last year, gives a total of R62,586.

FOREST SETTLEMENTS.

The following areas were finally proclaimed to be reserved forests during the year:—

N.-W. PROVINCE—Baddegamuwa forest, area 619 acres; Nariagama forest, 615 acres.

SABARAGAMUWA—Yalpana forest, area 55 acres. Grand Total 1,289 acres.

In the case of the last named forest 223 acres were taken up, but the area of forest secured to the Crown was only 55 acres.

It cannot be said that two square miles of reserved forest obtained as the result of forest settlements for a whole year is a brilliant record. It is partly accounted for by the complicated nature of the settlements undertaken in Sabaragamuwa, and partly to the fact that certain areas await completion of boundary surveys by the Survey Department before the final Proclamation is published.

A reference to form 1 in the appendix will show that the total area of reserved forests was 51,361 acres, or 80.25 square miles, on 31st December, whereas it had been reported to be 52,114 acres, or 81.47 square miles, on the 31st December of the preceding year. In paragraph 6 of my last report I pointed out that many of the so-called forest reserves in Sabaragamuwa contain large areas which are useless for forest purposes. The work of expurgation of such areas has been begun, and 1,203 acres, chiefly in Bambarabotuwa, have been excluded from the reserves. If all the areas which should be so excluded were taken out now, I fear that the area of the true forest left as forest reserves would be very considerably diminished.

There are 162,352 acres, or 253.67 square miles, which have been taken up to be reserved, some of which await, and have for some years past been awaiting, final Proclamation; others, inquiry regarding which is now in progress, and others again in regard to which the preliminary notification has appeared in the *Gazette*, but a settlement of which has not gone through the first stage. Of those regarding which the final report of the Settlement Officer has been sent, I have mentioned some in paragraph 6 above and others, such as the Barawa and Mettirigalla forests and others, mentioned in paragraph 9 of my last report, have been kept unreserved, as in the opinion of the Government Agent, it was desirable to acquire certain lands and to include them into the reserve.

The fresh areas gazetted for settlement during the year are the following:—

WESTERN PROVINCE.		Acres.
Fuel reserves	1,969
CENTRAL PROVINCE.		
Kelani Valley reserve (about)	8,000
NORTH-WESTERN PROVINCE.		
Moragalla forest	52

SABARAGAMUWA PROVINCE.

	Acres.
Gilimale (second settlement)	17,760
Kitulgalla	660
Eratne	10,173
Godagampola	377
Mahawettekanda, &c.	2,121
Yatipana	55
Udakarandapana	206
Kelani Valley (about)	28,155
Dehipahala	1,558
Badahelgoda	910
	61,975
Total	71,996

or 112.49 square miles. All this area is not forest proper: over half will most likely turn out to be private land or chena land unsuitable for forest conservancy.

The third portion of form No. 1 in the appendix shows that there are estimated to be another 3,900 square miles of forest, regarding which no settlements have as yet been attempted. The estimate is, on account of the very imperfect surveys in our possession, only a very rough one, but even if the estimate were considerably reduced it would, at the rate at which settlements now progress, take very many years to make settlements for the whole forest area. There are other Provinces besides Sabaragamuwa which are in urgent need of settlement, and I should much like to see a beginning made in the larger forest tracts of the dry zone which produce our most valuable timbers.

WORKING PLANS.

Fellings were carried on in compartment 5 of Conical Hill forest near Nannoya, stripes Nos. 1, 3, 5, 7, 9, 11, and 13 being cut over. The yield has been greater than that calculated by the Working Plan Officer, 2,836 cubic yards of firewood being obtained, and the estimate being only 1,810 cubic yards. As the estimate has usually been rather under than over the actual yield, this surplus comes as a pleasant surprise. Compartment 5 is one of the richest in the forest, the yield per acre having proved to be 235½ cubic yards per acre.

Four strips cut over in 1893 in compartment No. 1 were planted with *Eucalyptus robusta* and *Acacia decurrens*, and four strips planted in 1893 were supplied during the south-west monsoon.

Sufficient experience has now, I think, been gained by our staff to try and work the forest on a more natural system. The cost of replanting after clearing absorbs a large portion of the revenue obtained, especially as the young plants suffer much from the inroads of animals, and I have instructed the Forester to limit his future fellings in the strips to the taking out of suppressed trees and trees on the decline. This will have more than one advantage, for it will be possible to come back much earlier to the adjoining strips which have now to be left untouched until the growth on the cleared strips has attained sufficient strength to resist exposure. The cost of planting will be almost entirely done away with, and the character of the forest will remain unchanged. Near a health resort like Nawara Eliya it is a pity to see the forest of indigenous trees give place to the more monotonous Australian trees.

Mr. Hansard was engaged until October in making rough surveys of the Crown lands in the Jaffna district bearing palmira, and of lands suitable for planting. He has submitted a report containing his proposals for future operations, but it has not yet been submitted to Government owing to my having referred it back for some further data. His inquiries on the spot show that many areas are claimed on apparently very poor titles, and that at the rate at which palmira is now being exported to India there will soon be none left. The only way to make up for the improvidence of the people is for Government to make extensive plantations, which will not only provide fruit after 15 or 20 years, but which after 80 years will supply timber.

In the month of August, Mr. Ferguson was placed on special duty in order to prepare a working plan for the Haputale reserved forest. This forest has been much overworked by the Railway Extension Department, and it is necessary that strict rules be framed in order to ensure that none but badly grown and suppressed trees be removed until the forest shall have recovered from the effects of the heavy fellings made in the last few years.

North-Western Province.—Two sample plots have been started in the Puttalam District: one for na (*Messua ferrea*) in the Galkuli forest, and one chiefly for satin at $3\frac{1}{2}$ miles up the Kenankali road.

FOREST FIRES.

The Assistant Conservator, Eastern Province, followed the instructions I gave him in order to preserve the grass-surrounded teak plantations. I am glad to say that the result has been a total absence from fires during the year. I hope that this success will be continued, and that the plantations will benefit from the protection afforded.

The firing of patana and grassy plains to produce a fresh crop of herbage still goes on unchecked. Where the plains are surrounded by forest these are gradually giving way before the yearly fires. In the hills patana fires kill down seedlings and impoverish the soil. I should recommend that the patanas near the railway line be strictly protected, as the action of fire on the top soil encourages slips and fall of boulders when the rains begin. Apart from this, I think a little protection would have very beneficial results in improving the soil, and probably also the herbage. It is absolutely impossible for the more tender herbs to withstand the action of fires, and the ground is invaded by coarse mana and illuk grass, whose underground stems enable them to survive the fibre.

PLANTATIONS.

Western Province.—The plantations at Mirigama were cleared of undergrowth and creepers at a cost of R278.29. It was high time to take up this work, for the trees—especially the lunumidella and jak—were suffering much from the undergrowth and creepers. Domba, which a few years ago looked the least promising of all, is the species which has stood best. It is doing well, and the ground is already covered with self-sown seedlings.

Central Province.—Thirty-eight acres were added to the existing plantations viz., at Galboda 9 acres, at Kotagala 5 acres, and at Conical Hill 24 acres, bringing the total area of plantations in this Province to 529 acres.

The 9 acres at Galboda were added to the Blackwater clearing, and consisted of scrub and patana land. The plants put in were *Eucalyptus robusta*, grevillea, a few domba, and pepiliya (*Aporosa latifolia*). This piece is doing well, and hardly a vacancy is to be seen. The cost of this addition was R350, or less than R10 per acre. As a whole the Blackwater field is by far the worst of all the Galboda clearings. The soil in some portions is so poor that although there are few vacancies the plants will take a long time to make a start. I was glad, however, to note that the plants of *Acacia decurrens*, which were put in as supplies, have taken a sudden start, and that the portions planted with *Eucalyptus robusta* are doing well. In cool places, where domba and pepiliya had been put in, they are doing well. I do not think, however, that much can be expected from the portions planted with *Acacia melanoxylon*. Grevillea is doing better, and may make a start in another year or so. The total expenditure on this field for the year was R723.31. Dekinda No. 1 field is now doing well. It is planted with *Eucalyptus robusta* and grevillea, and the supplies put in were chiefly of indigenous species, such as domba, pepiliya, del, e'ambe, &c.

Dekinda No. 2 field is the best of the whole plantation. It is covered chiefly with grevillea, which is now forming leaf canopy. The cost of upkeep, chiefly of No. 1 field, amounted for the year to R851.54, 23.566 supplies having been put in.

Mapakande field has always been a source of trouble. However, I am glad to say that the plants are now doing well. Fifty acres were re-planted on this

field. About 135,000 plants were put out during the year, consisting of grevillea, take karavu, sapu, wild cinnamon, ctamba, pepiliya, domba, milla, wa, pehimbiya, and katuboda. The teak below the cool lines is doing very well, but some had been put on clayey spurs, and does not show much progress. Most of the *Casuarinas* have been killed out by white ants. The cost for the year was R3,839.55. Penhros field, on the whole, doing fairly well, that is to say, certain portions show good growth, while others make poor progress. The failure in many parts is due entirely to outside circumstances. For instance, some thousands of jak plants which were doing well have been destroyed by hares and pigs. *Casuarina*, which had attained a height of 10 to 15 ft., was killed by white ants as in the other clearings and white grub attached a number of *Eucalyptus robusta*. The supplies now put in will, I hope, do well. Experience now shows that the best supplies are those of indigenous species, such as katuboda (*Cullenia excelsa*), pepiliya (*Aporosa latifolia*), del (*Artocarpus nobilis*), damba (*Eugenia operculata et eet sp.*), suriyamara *Albizia (odoratissima)* liyan (*Homalium zeylanicum*), mihriya (*Dichopsis, sp.*), and other trees growing in the belts of forest close by. I myself made some experiments with some of these species, the seeds of which I dibbled mostly into poor soil, and the results have, I hear, been satisfactory. The total number of plants put out during the year was 34,029, and the expenditure on this field was R1,163.97.

The total expenditure during the year on Galboda plantations was thus R6,577.97, or R17.44 per acre. Since the beginning the total expenditure has been R39,414.81, or R104.55 per acre. If the revenue obtained from the plantation be deducted, the total expenditure amounts to R35,476.26, or R94.10 per acre.

Five acres were added to the plantation in the Kotagala reserve at a cost of R228.20, thus bringing the total area to 10 acres, which have cost altogether R453, or R45.50 per acre. The Assistant Conservator reports the plantations as doing well. The whole clearing was planted with *Eucalyptus robusta*. Twenty-four acres of strip clearings were added to the Nanu-oya plantations during the year, thus bringing the total to 106 acres. The clearings planted in 1889, 1890, and 1891 are not doing well, as most of the *Eucalyptus globulus* are attacked with canker. Happily in the older plantations a larger number of standards were left. These are now spreading their crowns and filling the vacant spaces. *Eucalyptus robusta* is doing well in the more recent plantations, and seems to be the tree best suited for the plantations, for *Acacia decurrens*, which would otherwise do well, gets eaten down by sambur. The plantations of the year at Conical Hill are doing well, but they also suffer from being browsed by deer. The plantations made near Scrubs estate and near the kachcheri are doing well. On the latter plantation, however, a portion of *Cryptomeria* trees are coming up only very slowly. They are somewhat exposed. The plantations near the nursery on Gallwey's land are doing very well. A wire was taken through the plantation by the Telegraph Department, and some trees hacked about, when it would have been practically quite as easy to have avoided the plantation altogether. On Christie's land the *Eucalyptus robusta* are doing well, but the *Acacia decurrens* have most of them been broken by cattle. The tables given in appendices B, C, and D show the rate of growth in the different plantations of the Central Province.

The total cost up to date for the 529 acres of plantations in this Province has been R49,330.55, or R93.25 per acre, or, after deducting revenue obtained from them, R31,630, or R59.79 per acre.

Province of Uva.

No money was spent on the Judges' Hill plantation, which can now be considered to be established.

At Elladaluwa no money was spent on the 13-acre block planted in 1889. It was found necessary to replant the whole of the 25-acre block planted in 1892, on account of the constant damage done by cattle. Several watchers were appointed in succession, but had to be dismissed on account of

neglect of duty. It appears to me that a few hundred yards of barbed wire would have come cheaper, and would have had better results. As the Assistant Conservator does not state by what means he proposes to protect the young crop he has again put in, I would suggest that even now the purchase of the barbed wire would be advisable. The cost during the year has been R904.39, or R32.88 per acre. The small block called "Mediriya" plantation in form No. 5 is the one mentioned in last year's report as having been planted with the large-leaf mahogany. Teak and toon and mahogany were planted in this area at a cost of R13.49. The mahogany has here also been attacked by borers. The Bandarawela plantations do not show a satisfactory progress.

HAPUTALE PLANTATION.—The 4½ acres planted with *Eucalyptus robusta* in 1889 are a great success, and it is time to thin out the suppressed trees. I have asked Mr. Ferguson, as part of his working plan work, to coppice a few trees, so as to test the capability of the stools to produce stool shoots. The next plantation, although not quite such a failure as anticipated last year, cannot be called a success, and many vacancies had to be supplied. Fifty acres were added to the plantation, but here there are also a number of vacancies, the result, I should say, of too late planting. The Assistant Conservator put them down at 15 per cent, but my estimate is higher. The cost of supplying and planting in this plantation during the year amounted to R2,042.15, or R37.13 per acre. The sale of 3,359 yards of firewood, chiefly remains of the trees taken by the Railway Extension Department, which were cleared out of these 50, brought a revenue of R5,497.

OHIYA PLANTATION.—Twenty acres in two blocks of ten acres of forest, which had been mostly cleared by the Railway Extension Department, were planted during the year at a cost of R1,037.29, or R51.86 per acre. The cost was more than covered by the sale of the firewood brought out of this clearing, by which R1,500 were realized after issue to the Railway Department. The cost of planting is higher here than elsewhere in the Province, but, on the other hand, the clearing can, so far, be considered a success. The Moratota plantation is said to be doing well. The cost of upkeep was R79.94, or R13.92 per acre. This is one of the small plantations which were started without reference to me. During the year 2,775 plants of different species were distributed free of cost to the Public Works Department and to the Local Board. I am not aware that this free grant was sanctioned by Government.

The total expenditure on the 161½ acres of plantation was during the year R4,497.32, or R27.85 per acre, and the total cost since the plantations were started R13,750.65, or R85.14 per acre. As the revenue obtained during previous years is not stated, I cannot show the net expenditure on these plantations. Appendix E shows measurements taken in the plantations.

Province of Sabaragamuwa.

No addition was made to the Para rubber plantations no account of there being no suitable land close by. The blank spaces at Yattipawa were supplied with plants grown from seed produced at Edangoda plantation. These appear quite sound and healthy. The trees which produced the seed were planted in 1891. The plantations look sound and healthy, and are the better for the grass which has been allowed to spring up and protect the soil. Some trees have suffered from inroads of cattle.

The following measurements were taken by the Assistant Conservator:—

Name of Plantation	Year of Plantation	Number of Trees measured	Average Girth in Inches	Mean Annual Increment in Inches
Edangoda	1891	120	12.12	4.04
Do	1892	50	8.75	4.37
Do	1893	20	4.12	4.12
Yattipawa	1892	1.8	9.13	4.56
Do	1892	108	9.37	4.78

The trees measured at Yattipawa were respectively on eastern and western aspects. As will be seen,

those growing on western aspects show slightly better growth, and both of them have grown better than those planted in the same year at Edangoda. The jak plantation at Edangoda has unfortunately suffered so much from attacks of cattle, deer, hares, &c., that the Assistant Conservator is of opinion that it does not pay to extend it further. It is a pity, for there is a large extent of land which would be suitable were it not for these enemies of the plants.

The hal plants put out at Edangoda and Yattipawa do not show satisfactory progress. This tree requires partial shelter for young plants. Mendora is doing well, and so is nedun. Both of these species, however, like protection when they are young and tender.

DEPARTMENTAL OPERATIONS.

Telegraph Posts were supplied in different Provinces I have requested all Government Agents to lay in stocks of telegraph posts in order that well-seasoned timber may be given without delay to the Telegraph Department to meet urgent indents.

It would also be satisfactory were the Public Works Department to give trials to a greater number of kinds of timber. For example, in the Eastern Province tumpalai was used for several kinds of works, and I have not heard that it has proved to be a bad timber, yet the Public Works Department now confine their indents to palu, knmbuk, and milla, the latter two of which cannot be said to be very abundant. The price of tumpalai is also lower, and the use of this timber would reduce the cost of public works for which it was used.

The work at the Central depôt was ably superintended by Mr. Gillam. Although the sales of satinwood for export to England were almost entirely confined to flowered satinwood, there being little demand at home for plain logs, the total sales would have exceeded those of 1893 had the last ebony auction only been a success. The average prices for ebony sold were improved, and very satisfactory prices were obtained for satinwood. The total value of sales amounts to R51,286.67.

CITRONELLA OIL.

Few oils are more largely used nowadays in soap-manufacture than oil of citronella. Within the last ten years the exports of citronella oil from Ceylon, now the only country counting for anything in the production of the article, have increased threefold, and there seems hardly any limit to the capacities of its employment in the soap-industry. Formerly a good deal of citronella oil distilled by a European manufacturer used to reach our markets from Singapore; that particular brand, as well as another prepared by a European distiller in Ceylon, was considerably dearer than the "native" distillate, which composed the bulk of the supply, and both are now rarely met with in the open market. The great increase in the production of citronella oil in Ceylon has gone hand in hand with a depreciation of the article, which was arrested only when the last margin of profit had disappeared, and when, in consequence of the energetic action of one or two large buyers, adulteration of the oil with kerosene—long a favourite method of certain distillers and exporters of turning a dishonest penny, while yet keeping pace with competition—had been rendered so easy of detection as to become almost impossible. In 1881, when the export of citronella oil from Ceylon was less than one-seventh of last year's shipments, the price of "fair native brands" in the London market averaged about 3½ per oz. (the year before, during a temporary outburst of speculation, it touched 6d per oz.), but in January, 1888, the same quality could be bought in London at 7.8d. per oz. The screw of competition could not be turned on any tighter than that figure, and in a trustworthy Ceylon report issued shortly afterwards we were told

that, although the cultivation of lemongrass and citronella plants for distilling purposes had attracted much attention in the western and southern provinces of the island, yet at the price then ruling a European distiller could make no other profit than was obtainable from the sale of the manure made from the grass after distillation. In that year the area under citronella and lemongrass in Ceylon, was estimated at about 10,000 acres, but in 1892, in spite of the unenviable market position of the article, the estimated area under cultivation had increased to about 25,000 acres, and it was then believed that over 450 native stills were employed in the industry. The subjoined figures, indicating the exports of citronella and lemongrass oils in ounces (an old-fashioned way of quoting the article which ought to have been abolished long ago) during the last fourteen years afford an indication of the enormous development of this industry:—

1881	1882	1883	1884	1885
1,950,501	2,940,043	3,916,398	4,997,333	6,570,132
1886	1887	1888	1889	1890
6,745,794	8,823,578	10,559,465	10,263,433	14,559,075
1891	1892	1893	1894	
15,263,581	13,512,626	10,696,481	15,015,532	

The statistics here given refer to citronella and lemongrass oils together, no separate records being kept of the two, but as the use of lemongrass oil is insignificant compared with that of citronella the first-named oil may be left out of account for practical purposes.

Until last autumn the price of citronella oil showed little or no improvement, but a moderate advance then began to take place, and within the last two months there has been a further important rise, the quotation of "fair native oil" in drums having advanced from 9½d per lb., c.i.f. terms, last March, to 1s 3d. per lb., c.i.f., terms, at the present moment. This unusual rise is partly due to speculation. Citronella oil has long been a favourite article of speculation with a few Mincing Lane houses, and this spring two or three of these firms appear to have sold oil on contract for future delivery without ascertaining whether there would be any difficulty in obtaining the material in the country of production. When the time came for covering their sales it was found that citronella oil had suddenly become scarce in Ceylon. It is said that the drought of last season had destroyed part of the crop, and as both citronella and lemongrass require a great deal of moisture, though they grow in poor soil, that statement may be true, but as the grass is cut and distilled twice a year a prolonged scarcity is not probable. Anyhow, the speculators were caught. They succeeded in purchasing a portion of the required supplies in America, where the use of citronella oil, formerly very large (in 1892 the States imported nearly 6 millions of ounces, in 1893 only 2½ millions), has greatly declined in the last two years; but when the Americans realised the real position of affairs they became buyers themselves, and with this fresh demand the Ceylon shippers have been able to run up their quotations still further. The first shipments of the summer distillation are due in London in August, and in all probability prices will again recede then, although a selling-price of less than 1d. per oz. seems to be an abnormally low one for the article. It is said that the consumption of citronella oil has increased enormously since last year, when the manufacturers of a much advertised soap began to use it largely.—*Chemist and Druggist.*

THE U. P. A. S. I.

THE SECOND GENERAL MEETING of the United Planters' Association of Southern India assembled at Bangalore on Monday (19th inst.) The most important question that will have to be dealt with concerns the Labour Laws. The draft Bill for the Compulsory Registration of Maistries is another important question, which will occupy the attention of the delegates for several hours. Freights is, we see, put down for discussion. If the United Association could devise a scheme which would enable planters to ship their crops home at the cheaper freight than heretofore, nothing could be better; but for the Association to try and squeeze the merchants who take on themselves the risk which the chartering of special steamers necessarily entails, is a petty and unworthy action. The Ceylon import duty on Indian teas is to come forward, and we anticipated that some action will be decided on which in every probability will meet with the approval of the authorities in Ceylon and permit the removal of the present inequitable impost in course of time.—*M. Mail.*

SELANGOR PLANTERS' ASSOCIATION AND THE LABOUR QUESTION.

Minutes of a general meeting held at the Selangor Club on Saturday, 27th July, 1895. Present:—Mr. E. V. Carey (Chairman), Mr. Tom Gibson (Hon. Secretary), Messrs. C. Meikle and E. B. Skinner (Committee Members), and Messrs. Hurth, C. G. Glassford, R. C. Meikle, B. Nissen and A. C. Rendle. Messrs. H. C. Rendle, H. M. Darby and J. Tait were elected members of the Association.

Proposed by Mr. Carey, seconded by Mr. Gibson. "That the Hon. Secretary be requested to ascertain from the Government whether the following rules—

- (a) All recruiters arriving in India with a letter from the Indian Immigration Agent, and those appointed by the agents of the Planters there, shall take out licenses in India;
- (b) No agent or recruiter shall receive any commission on coolies not entered in the list of Indentured coolies (Form A)—in Circular dated Penang, 8th November, 1887, and distributed amongst the Planters of the Straits Settlements and Native States, are still in force; and if so that the hardship of Planters not being able to recruit free coolies in India through paid commission agents, be brought to the notice of the Government; and that the Government be asked to make exception in the case of mercantile firms of standing and other recruiting agents of accepted respectability."

Mr. Carey read a report of his visit to Southern India, fully and clearly explaining the necessity of the above resolution, which on being put to the meeting was carried unanimously.

Resolved that the Hon. Secretary take steps to have the report printed and distributed to members of the Association.

—*S. F. Press.*

PLANTING AND PRODUCE.

CATCHING THE PROMOTER'S EYE.—The meetings of tea companies, which fell so thickly a few weeks since, are now nearly over. The present year is marked with a red letter in the history of Indian and Ceylon tea enterprise, and although the tide of success is high we will trust that it is still rising, and has yet to touch high-water mark. After allowing for favourable conditions in the form of low exchange and other advantages, there is a great deal to be said for the energy and adaptability of the planters on the spot and the representatives of the industry at home, who have placed the tea industry on such a satisfactory footing. The exercise of prudence as regards increased cultivation and perseverance about the question of new markets are points which have now to be steadily borne in mind. The success from a financial point of view of the leading Companies has caused the profes-

sional companymonger to look with greedy glances in the direction of tea gardens. We have heard of more than one instance of professional promoters in search of "properties" to turn to account. Fortunately the public are not likely to be caught in the toils of these gentry. The well informed amongst investors have become acquainted with most of the men of "light and leading" in tea, and are not likely to dance to the piping of mere outsiders. But no doubt we shall see some attempts made to float speculative tea projects on the strength of the past season's results, but unless the said projects are sponsored by the right people there is not much chance of their finding favour. The investor is not the wisest of mortals, but he is a little more shy than he once was of the wrong sort of joint stock company. All true friends of the tea industry, however, will fervently hope that the company jobber will continue to busy himself in other directions and leave tea severely alone.

THE BLACKMAN DRYER IN DARJEELING.—The first consignment of new season's Darjeeling tea ex Castleton, fired by the Blackman Drier, was sold at the Commercial Sale Rooms, Mincing Lane, on Monday last, by Messrs. Lloyd and Carter. The following prices were realised—viz., 27 half-chests orango Pekoe, 2s; 33 chests Pekoe, 1s 6½d.—*H. and C. Mail*, Aug. 2.

SALE OF CINNAMON AND COCONUT PROPERTY.

Mr. A. Y. Daniel, Auctioneer, put up for sale by Public Auction, at his rooms, today, (Aug. 21st) the lease for 7 years of the cinnamon and coconut property known as Cayton estate, situate in Talangama and comprising about 208 acres. Mr. C. D. Alwis opened the bidding with R500, and the lot was bought in at the last bid made by Mr. H. O. Abilem, of R2,000. The bidding was brisk at the beginning, but latterly was somewhat slack.

MANANGODA GOLDEN TIPS.

At today's (Aug. 21st) tea sale 1 box of Manangoda Golden Tips weighing 3 lb. was put up by Mr. Seale of Messrs. Somerville & Co. The bidding rose from R2 to R7.50 per lb. and the lot was knocked down to Mr. J. H. Love, the new Broker.

CAMPHOR TREES IN CEYLON.

An upcountry planter writes:—"I told you I would try and send you some information about camphor growing in Ceylon, but I can't. I got some seed here last year and as it grew very slowly (4,600 feet) I thought it would be better to try it elsewhere, so I sent some plants to a few friends in Haputale and some to near Gampola and told them their value. The Haputale trees are doing well, but I can't get any reply from Gampola. Here they grow decidedly slowly, but they are growing."

THE U. PLANTERS' ASSOCIATION OF S. I.

BANGALORE, Aug. 19.—The second Annual Meeting of the U. P. A. S. I. commenced its sittings at 11 a.m. today, 17 members being present. Mr. Digby T. Brett, the outgoing Chairman, delivered an address. He agreed with the action of the Government of Madras in abandoning the Estates Labour Bill and commended the sympathetic action of the same Government with regard to the Coffee Stealing Act, with

reference to which, he said, an opportunity would be afforded of waiting in deputation on the Viceroy during his tour in Southern India. Mr. Sprott Coorg was elected Chairman, Mr. Hockin (Wynaad) Vice-Chairman and Mr. Yonge, Secretary.

The first business dealt with was Act XIII of 1859 and the Estates Labour Bill. The Hon. Mr. Romilly moved that an address should be drawn up and presented by a deputation to the Viceroy on his tour in Southern India. The resolution was carried and a deputation was appointed to draw up the draft of an address. Mr. Parsons (Coorg) proposed that the Planting Member of the Government of India's Legislative Council should be advised to bring in an amendment of Act XIII of 1859, unless the Viceroy suggested another alternative, such as a Committee of Enquiry into the working of the Act in Southern India.

It was next proposed that the deputation should suggest the necessity of a Committee of Enquiry being appointed to enquire into the working of Act in Southern India. The Hon. Mr. Romilly proposed that the Viceroy should be addressed on the matter of the Coffee Stealing act, and, if necessary, an appeal should be made from him to the Secretary of State.

The resolution ran as follows:—"That the Sub-Committee already appointed to draw up an Address to the Viceroy includes in the Address an appeal for the Amendment of Section 9, Act VIII of 1878." Carried unanimously.

It was then proposed that, failing a favourable reply from the Viceroy, the deputation should inform the executive of the U.P.A.S.I. and take steps to wait on the Secretary of State.

CAMPHOR AND INDIA RUBBER.

A large number of camphor and India rubber trees have been planted at Jhansi as an experimental measure. The site selected, however, does not appear to be well chosen, owing to the absence of any deep wells in the locality.—*Madras Standard*.

HAWAIIAN COFFEE CROP.

The coffee crop this year will be much larger than that of last season. There is also a larger acreage bearing and the blight is not as bad as currently reported. There is very little coffee in the local market at present. Occasionally a few bags come in on local steamers which are readily bought up. Green coffee sold last week at 21 cents.—*Hawaiian Commercial Journal*, July 9.

THE TRAVANCORE CARDAMOM MONOPOLY.—The news that the Travancore Government has at last decided to abolish the cardamom monopoly against which the planting community has been agitating for years past is still going the round of the Indian press. As a matter of fact the Travancore Government although they did contemplate the abolition of the cardamom monopoly have been strongly advised against giving effect to their intention, as it would be practically impossible to assess each holding correctly. It would therefore be the source of regular loss to the Government, and this we learn has been satisfactorily explained to His Highness the Maharajah. The cardamom gardens were all surveyed last year and a regular assessment will be fixed on each holding, which it is expected will amount to the average income obtained by the Government from this source.—*Western Star*.

CACAO IN ITS NATIVE CLIME.

We are much interested in receiving a letter from Mr. Robt. Cross whose name was so closely associated with the early transfer of cinchona seed and plants from South America to Southern Asia. We had lost sight of Mr. Cross for some years and feared he had passed away like some others of the pioneers whose names are embalmed in the early volumes of this Journal, and which were "familiar as household words" among our planters twenty years ago.* Mr. Cross now comes forward to give us some of his South American experience of cacao, and we direct the careful attention of our planters to what he says on the subject. He makes a mistake in supposing there is much coast land in Ceylon or indeed in India suitable for planting cacao. Our coast lands are as a rule poor in soil, and nothing is so suitable or profitable to grow in them as coconuts, while cinnamon and paddy (rice) claim their own peculiar divisions. In other parts in the face of the South-west monsoon, tea flourishes, the crop being one of leafage; but to produce good crops of the rich cacao pods requires a soil that, unfortunately, is not readily found in Ceylon. Certain of our valleys in our hill districts have proved best for plantations, while there are also some good estates 40 miles inland at the foot of the hills. So much we may mention for Mr. Cross's information. What he says about the value of cacao beans or chocolate to travellers, or to an army in the field, in South America we have heard also related of both coca leaves (*Erythrocylon coca*), and kola nuts, as also to some extent of maté or Paraguayan tea. In certain respects, Mr. Cross's information comes to supplement that afforded by Mr. Sinclair in his book on "Tropical Lands" descriptive of what he saw in Pern, Trinidad, &c.

We would ask Mr. Cross to suggest how seeds or plants of the "large, robust and prolific sort" of cacao he describes, can be got for Ceylon planters. The kinds planted in Ceylon have been generally classed by Dr. Trimen as *Forastero* (the pale-fruited cacao) and the fine Red Caracas which was the first variety that came to the island and fortunately proved one of the best that could have been introduced. Later on Dr. Trimen mentioned that the *Forastero* trees were proving, in the experience of our planters, to be the hardier of the two and were giving better crops, than the finer and more delicate variety. We question if we have soil rich enough in Ceylon to carry the large and more prolific sort referred to by Mr. Cross, although an experiment with it would be extremely interesting.

BRITISH CENTRAL AFRICA.

(From the *British Central Africa Gazette*, Zomba, June 15, 1895.)

Mr. Grieve Macrone, Civil Engineer, arrived at Zomba on the 3rd of June to obtain permission from H. M. Commissioner to commence surveys for various lines of railway in the Shire Province. Permission was granted and Mr. Macrone left Zomba on the 5th of June to commence his surveys, which he hopes to complete before the commencement of the wet season.

* I considered it necessary that a practical gardener should assist Dr. Spruce in the forests, and establish the plants in the Wardian cases at Guayaquil, as well as accompany them on the voyage to India. For this work I selected a very able and painstaking Scotch gardener named Robert Cross, who was recommended to me by Sir William Hooker. He went out from England, and joined Dr. Spruce in Ecuador.—*Clements Markham in 1859.*

NOTES ON MLANJE DISTRICT.

(From Mr. Gilbert Stevenson's *Yearly Report*)

PROGRESS MADE IN DISTRICT IN 1894.

COFFEE.—Coffee continues to do fairly well, though its success up to date has not quite realized the expectations of the first settlers in the district. This is perhaps but natural. The enthusiasm that was first awakened on viewing the rich and fertile lands, which lie round the great Mlanje range of hills, has had time to cool; obstacles, which of course exist in every business venture, have had time and opportunity to make themselves apparent; but though experience has shown us that coffee planting is not altogether plain-sailing, yet it can truly be said that the coffee industry in the Mlanje district is a very promising one. Five plantations in all have been started: the oldest is 4 years old. An enthusiastic early settler in this district has termed Mlanje, "The home of coffee." A misapprehension has consequently grown up on this point. Wild coffee does not grow, as far as I am aware, anywhere in British Central Africa; nor prior to the advent of Europeans had natives cultivated coffee.

A TRIP TO MEXICO.

(FROM A CORRESPONDENT.)

After leaving Texas and entering Mexico from the north one is struck by the change in the conformation of the land. Texas is a low-lying flat country in the south, whilst Mexico is a succession of lofty rugged mountainous heights and fertile plains and valleys of a picturesque and interesting character. The boast of the Mexican is the climate, and well may he boast. It is as near perfection as possible. As I write this the thermometer stands at 72deg. in the shade at midday. In the sun it is always hot at midday, but wherever there is shadow there a cool refreshing air may also be found. There are no fire-places in any living rooms in Mexico, the temperature being almost equal winter and summer. Snow is unknown except on the highest mountains in winter time. The Americans are not slow to avail themselves of this salubrious climate, and a continual stream is constantly coming in from the States all the year round, in the summer to avoid the oppressive heat, and in the winter to escape the intense cold. Mexico City, which has a population of 400,000, is built on a plain which is some 7,000ft. above sea level, surrounded by mountains, two volcanic, rising some hundreds of feet; whichever way you may look out of the city mountains are seen forming a very picturesque background.

The tram service of the city is sufficient and maintained. The streets are well lighted with electric light. The railway service in the Republic is almost entirely under the direction of Americans, and as a rule comfortable travelling is to be obtained. Pullman cars are attached to all long journey trains. The lines in operation in the Republic up to September 16, 1893, reached an aggregate of 11,109 kilometres, earning about \$30,000,000 annually. The mileage and earnings are still on the increase. Tropical fruits are abundant and in great variety. Sugar, coffee, cocoa, and indiarubber grow luxuriantly. The country is very rich in mineral wealth, the principal metals being iron, copper, gold and silver, most of the mines working paying good dividends. Opals are found in quantities not far from Mexico City. Negotiations are pending with the Government for the construction of harbour and other works at the two termini of the Tehuantepec Railway, and when these works are completed there will be a regular service of mail boats from England, having

their ultimate destination in Australia, New Zealand, China, Japan, &c. By this route the distance to these countries will be considerably shortened. With labour cheap, good, and plentiful, a climate that will produce sugar, india-rubber, coffee, &c., in abundance with only rudimentary farming, many square miles of valuable mines still undeveloped, under a Government founded on the firmest basis of equity and justice, and upholding in the strictest sense the rights of property, a better field for British enterprise does not exist, and deserves the immediate attention of financiers. There are several points of interest in the country that would well repay a visit, and a more pleasant, instructive, and healthy holiday could not well be imagined than a trip to Mexico.—*Morning Post*.

HOW IT STRIKES AN "OLD COLONIST." —NO. II.

"Up the steep hill-side, where the labouring train
Marks the wide track that scores the level plain;"

PERADENIYA

has made marked progress during the past two years, notwithstanding the dry seasons. The cover is now closer even on the hill-side, while I never saw a race-course turned to such good account. The tea and Liberian coffee I saw being planted there in 1893 have thriven amazingly. Altogether this famous totum now comes in a good second to Mariawatte.

From the junction onwards to

GAMPOLA

there is not much worthy of note—the old paddy field which probably for thousand of years has been ploughed and harvested still gives a fair return. Tea is cultivated in a desultory way, the Sinhalese evidently preferring to plant on the bare ridges as being easier weeded.

Wherever there is a coffee bush it looks healthy, with decidedly less leaf blight than existed two years ago. About half way to Gampola is said to be the site of the "good white man's garden," Robt. Knox having lived there for some years—probably on the banks of the rivulet called Geeleeyoa.

Gampola itself shows but little sign of advancement; its chief product seems to be muck for the two adjoining estates, which are of more intrinsic value than all this ancient township.

SINAPITTIYA

is even a greater marvel than Mariawatte. Washed by a hundred monsoons during the time it was in coffee, one would have supposed there was little left to sustain the tea plant, but there it is worth £100 per acre!

Mariawatte itself leaves little room for improvement. I note that the little hill behind the bungalow with its nondescript soil, has now got pretty well covered but even tea draws the line at certain portions of the next estate. "A poor subject" as honest Willie Leggat said of it years ago.

Farther up towards

NAWALAPITIYA

and for a little beyond, there are some very good and well cultivated fields. *Hyndford*, and *Fyffe* will be interested to hear, is, though "gey" backward in patches, by no means amongst the hindmost of tea estates. *Gallebodde* has more substance, and is doubtless doing well, but somehow it always strikes me as a dreary, inhospitable sort of place, which I am glad to get past. I almost forgot to mention the forester's experimental plantation at Blackwater, which, however, does not strike me as likely to be a credit

to the department. I do not think if the whole Central Province had been searched, more unsuitable soil could have been found in which to grow such trees as teak—or a worse locality for the various natives of Australia which so clearly love a dry climate. The finest eucalypti in the world grow where the rainfall does not exceed 25 inches per annum, so that the idea of selecting the worst end of Ambaganmwa is so outrageously absurd that the man ought to be strangled in red tape who suggested such a thing.

Carolina shows the hand of a thoroughly practical planter.

Poor wet *Watawala* was always a straggling cold bedraggled place. *Rozel*, too, is somewhat mixed; but there are some beautiful fields of tea on the opposite side of the river, though farther up the same side we got a little mangy again with a tendency to overpluck the goose.

Before reaching

HATTON

we pass through part of one model totum—as well it might be, for the jungle cost over £20 sterling per acre, and here lie buried the savings of more than one poor dory! Albeit the place is a credit to the man who did the practical work of lining and planting the tea.

Hatton itself, the scene of the poor old Squatter's labours—and lying on the dividing ridge—never was, and never can be a very pleasant climate to live in, though tolerable for a time to the *Kadai Karen* who hatters on his 125 per cent profits. The township is characteristic of Ceylon and looks as if the crows had dropped it. In this respect we might learn a little from our friends in Australia or even the Spanish Colonist in the West who invariably lay out their villages with some method, the humblest hamlet having its "Plaza." Here we have a hideous jumble of sheds, overlooked by a somewhat garish looking hotel.

In

UPCOUNTRY

life generally, I find of course considerable changes during the last 20 years. Some for the better, some for the worse. There are better facilities for moving about, more amusements, more gaieties, but fewer substantial comforts. The food and ordinary home comforts of the average Superintendent have unquestionably deteriorated; partly perhaps his own fault, but chiefly is he the victim of circumstances. The beef for instance, never very good has now degenerated till often quite unfit for human food, and in this matter there seems a lamentable lack of enterprise in Colombo in not arranging for the import of good Australian meat. The other day I saw scores of splendid carcasses being landed at Port Said from an Orient Liner. If Egypt can, why not Ceylon? Manritins also, and I believe Hongkong get regular supplies from Sydney—while here we are still chewing the old cart bullock.

But beef is but one thing, there are many other little items which used to be considered necessary to life—now apparently out of date. In olden days every dory had his dozen or half dozen kye and the first thing one heard in the morning was the thumping of a bottle upon a enshion, the nett out-come of which was a pretty pat of fresh butter on the early breakfast table. Nor were these luxuries for the dory alone. Poor parturient *Carpie* whose own font had failed to feed the sharger baby, called daily for a supply of milk, while *Carnppen* himself recovering from gastric fever was never sent empty away. Now alas; the tables are turned,

and it is the Kanganu who has the cow: but such a cow! Recently a doray tired of the tinned article resolved to treat himself to a little real milk and sent his kitchen coolie for a supply from the lines. Would the fat shareholder as he reclines in his armchair, like to see the dairy arrangements on his estate? Let him follow me in imagination, down the rugged path to yonder lines and along the not over sweet-smelling verandah, in the farther end of which stands a poor corrugated little cow, suffering somewhat from diarrhoea, but this is her normal condition; beside her stands the attenuated ghost of a calf, weak and trembling from sheer starvation. But here comes the milkman, see him as he crosses the stream which runs past the sick coolie line, hastily washing out the old meat tin, leaving a little in the bottom with which to begin operations. Need I describe the tugging at the poor tortured creature; the supply was indeed meagre, but the mixture was sufficient to do its deadly work at the bungalow. Will any man marvel to hear that this doray got typhoid and shall we longer wonder that labour is getting scarce?

A CEYLON PLANTER IN CALIFORNIA.

San Francisco, California, U. S. A. July 10th 1895.

I have been to see several

TEA PEOPLE

lately, and the demand for "Ceylon" keeps increasing I am glad to say.

I met Mr. Leechman, a brother of the worthy Colombo merchants, he is a broker with good connection: Mr. Dent, an old Ceylon and China man, is now the Tea man of Messrs. Levy & Co., a very wealthy and large wholesale Grocery house; they are doing well and are pushing "Ceylon" in this market. A new man has come here, a Mr. Coppin, well-known on the London market; he intends to work up the Indian and Ceylon teas here, he does not do anything with Chinas or Japans. M. J. Brandenstein & Co., the largest handlers of teas on this Coast, tell me the demand for your teas is increasing slowly; I do not think they are pushing our teas, however, and I must talk to them and try and convince them of the error of their ways!

Mr. R. V. Webster is due in New York today having been to Canada, Chicago, &c, since he left here four weeks ago: He has done very well so far, this trip.

LIBERIAN COFFEE PLANTING IN SERDANG—SUMATRA.—NO. X.

The nervous man of Kandy raises two very interesting questions: (1) is Liberian coffee improving with acclimatisation? and (2) does it not bear earlier than it used to?

The first question is a very wide one. In this district I know three clearings all the same age: the conditions are very similar; and the seed is all from the same source. Two of the clearings are very fine, growing broad pyramid or cone-shaped bushes, all throwing out their primaries close to the ground, having a sturdy compact look, with only a run-away here and there. The other clearing, planted under exactly the same conditions and from the same seed—from the same nurseries, in fact, as one of its neighbours—is almost entirely composed of run-aways; great long-legged spindly things, six or seven feet in height, and no sign of a primary. Succulent green wood all the way, no sign of its ripening; and the more you cut it the more it runs away again. The only thing to do with such a beast is to cut it out and supply it; or to let it grow at its own sweet will, for there is nothing on it to handle; and it refuses to answer to the knife. The question is, how do you account for it? There are of course always

some run-aways; but for three quarters of a clearing to grow in this provoking way—"Oh, now, this is fair redek'lous!"

THE AGE OF BEARING

is an easier question to tackle; for we can fall back on "chiels that winna' ding." For instance Mr. Hill in his figures which he has given to the public, shows us that on Linsum estate in 1884, 28 acres under four years, and 12 acres under three years, together gave 99 cwts. on S'lian Estate, also in Sungei Ujong gave 92 cwts. from 8 acres under four years, and 28 under three in 1885. Weld's Hill in Selangor 1886 produced 325 cwts. from 19 acres under four, and 36 acres over four years old: while Batu Caves in Selangor in 1888 gave 78 cwts. from 11½ acres under four years old.

In Serdang I have just seen a sample sent to Europe from trees not yet two years old: and the same trees I estimate will have produced more than a picul per acre (133½ lb.) before they are three years. Regarding these trees the following blossoming figures may be of interest. The first blossom appeared in June 1894 when the bushes were between 10 and 11 months old. From this was taken the sample I have just mentioned. There was again a blossom at Christmas: but the first large blossom opened on 23rd February 1895. This was a very fine one; and was followed by others, all useful, and some distinctly good ones, on 23rd March, 24th and 25th May, 2nd and 12th June, and 3rd July.

Now if our nervous friend will give us the dates of blossoming and bearing in Ceylon in the seventies, the eighties and the nineties, the comparison will be most interesting. I am sure H. W. will be only too glad to give us his B. N. B. figures as well.

Perhaps few people know how much bucketing about a Liberian tree can stand. There is an instance of it here. Last Yule Tide a two year old tree was dug up, put into a tub and used as a Christmas tree. "After the opera was over" the tub was removed into the garden where it stood neglected for some months, when it was noticed that the coffee tree was throwing out suckers. It was promptly sawn down, and transplanted, with the earth round the roots, to fill up a vacancy, and is now coming on well, with three healthy suckers already throwing out primaries.

I should like to know if, by practical men, it is considered good to allow the first blossom to fruit, or whether it should be stripped "to allow the bush to strengthen." I saw some double distilled dunderhead writing to the latter effect in a Bangkok paper recently. Beneficent nature does not like her gifts thrown back in her face; and if she gives you a good blossom and you strip it, you may bet your last pair of boots that next season will be a bad one. The old dame will have it out of you one way or another. Who does not remember the prudent man who was not going to shave his einchona until a certain age? What did canker do for him? And where was the market when he came on it? Take what you can get and be thankful.

COFFEE

is going ahead here. In this district another "contract" of 2,000 or 3,000 bouws has just been taken up and will be opened forthwith. But there will be some awful howling grief in the future: and serve 'em jolly well right too! The idea here is for a man who could not tell the difference between K'Koffee K'Kokkonuts and K'Kabbages to open land close by an established coffee estate, and to copy the mode there as well as he can. Unblushingly they try and suck your brains. More land is shortly to be taken up; and, in short, it may be said that coffee is going ahead.

Once before I said that I would like to penetrate

THE BATAK COUNTRY.

Many thanks, old man, I'd rather take a split—not too much soda. A short time ago I heard something about the Batak Postal Service. Just now a neighbour has had a nearer experience of it: and I find that on this estate the Batak Post has been used more than once: but before my time!

Thanks be! But it may come again. I remember in Hewaheta years ago a planter who used to survey with pride every morning "the best clearing in the district, sir," with its splendid maiden crop. One fine morning the best clearing in the district looked strangely gray in the distance. It had been cut down in the night, the bushes carried into the jungle and stripped. The Battaks cut down trees from another motive. If they have trouble among themselves, or between themselves and a Malay faction they proceed by night to their nearest European, neighbour and cut down a few of his bushes, tobacco or coffee as the case may be, just sufficient to attract attention. On the spot they stick a decorated bamboo into the ground. Their message to you is scratched on the bamboo, and the decorations are symbolical of what you may expect if you take no notice of it: a box of matches; a bow with an arrow tipped with the very inflammable black hair of the sugar palm (*arenga saccharifera*): or something else tending to show that if you don't settle their little affair they will burn you out. In the case of our neighbour they first cut down 20 two-year old coffee trees; and this not having had the desired effect, they have since cut down 150! What they want is rather difficult to arrive at; but it has something to do with a man who was dead before any of the present lot of Europeans were in this district! The matter of course has been reported to the Battak Controleur. A similar case happened here a few years ago, and the man who cut down the tobacco was caught and got six months' hard. Poor devil! Perhaps a few words about

LAND TENURE

may not be out of place here. The system seems pretty much the same as that in the Native States across the water. A certain sum down, a lease for 75 years; and an annual quit-rent of one guilder (1s 8d) per bouw (1½ acres). I must confess that the lease-and-quit-rent system sticks in my throat. I think most Englishmen like to feel that their property is their own. I don't know what price is asked for land now. But one piece I know of, that could have been got for next to nothing two years ago, was spoken of at the rate of six dollars per bouw a few months since: and I doubt if that would fetch it now. The big contracts of 4,000 and 6,000 bouws are of course a drawback to any one who only wants a modest 500 acres of coffee. The Sultan of Serdang realises this and is prepared to give out his land in "lots to suit purchasers"; and late comers will have a hard job to find blocks with sufficient water. For though the country is a network of rivers, there are large tracts between the rivers without a drop of water.

THE WORLD'S GREAT FORESTS.

At a recent meeting of the American Association for the Advancement of Science reports were read by several members giving the results of their investigations as to where the greatest forests in the world are situated. The object of these investigations, remarks the *Journal of Horticulture*, was principally to ascertain the exact influence of forests for equalising the climate and the rainfall of the globe. In the provinces of Quebec and Ontario, north of the St. Lawrence river, there is one great continuous tract of forest, which extends northwards to Hudson and Labrador, and which measures altogether about 1,700 miles in length and 1,000 miles in width. There is also another large area of timber lands in South America, which occupies the valley of the Amazon, embracing large portions of Northern Brazil and Eastern Peru. This forest is estimated to measure about 2,100 miles in length by 1,300 in width. Recent explorations have shown that Central Africa possesses a tremendous forest. This forest is situated in the valley of the Congo, bounded on the north-east by the waters of the Nile, and by the Zambesi on the south. Its

width has not yet been surveyed, but its length is estimated to measure at least 3,000 miles from north to south. Again, there is another in Siberia, ranging from the plain of the Obi River, on the west, to the valley of the Indighinka, on the east, and embracing the great river valleys of the rivers Olenek, Lena, and Jana. The average breadth of this great forest region is 1,700 miles, and the average length from east to west about 3,000 miles. The principal trees in that vast and extensive taigas and urmans are the conifers, comprising pines of several varieties, firs, and larches. The central parts contain thousands of square miles which have never been explored, and to which not even the most experienced trappers have ventured to enter. It is stated that the beautiful semblance of the lofty conifers, which exclude the pale Arctic sunshine, is extremely bewildering to the eye—so bewildering that all sense of direction is lost. Their height averages about 150 feet, and they stand so closely together that walking among them is difficult.—*Australasian*.

A CUBEB MOVEMENT.

August 1st.

Our Amsterdam correspondent writes, under date of July 31st:—We have had a much better market for cubebs the last day or two, and higher prices have been paid. A holder today placed upon the market two parcels of cultivated berries, one of 16 bales (585 kilos), for which he asked 20 cents per half-kilo, another of 196 bales (8,300 kilos), for which he asked 25 cents. Both parcels sold very readily at full rates.—*Chemist and Druggist*.

PLUMBAGO IN SCOTLAND.

An important discovery of plumbago has been recently made near Newton Stewart, in Wigtonshire. Two beds are said to have been opened up, each about 20 feet wide. This is good news, as it will restore the trades connected with the mineral to the original source for raw material. British supplies are otherwise practically exhausted. Ceylon is at present the chief producer.—*The Investor*, July.

TEA IN NATAL.

The importance to the colony of the rapid and permanent advancement of our local industries can hardly be over-estimated, and that the tea planters have achieved remarkable success was amply demonstrated during the recent exhibition. The tea industry spends thousands of pounds annually in this Colony, and has been established in our midst for a number of years. We may instance the case of Messrs. W. R. Hindson & Co., Limited, of the Clifton Tea Estates, as indicative of what has been, and is being, done by growers. Commencing with an output of some 600 lb. in 1887, their return for present season is upwards of 250,000 lb. Over 500 acres are planted with tea bushes. A huge factory, equipped with the latest machinery, driven by water power, deals with the leaf during the many processes it undergoes on its way from the bush to the tea-chest, and gives employment to about 300 hands. A feature of the exhibit was the free distribution of thousands of neat little packets, containing about 2 oz. of the blended teas which have created such a sensation recently.—*Natal Mercury*, July 26.

LIBERIAN COFFEE IN WYNAAD.

The following is an extract from the Proceedings of a meeting of the Agri-Horticultural Society of Madras held on the 1st ult.:—Read the following letter from Mr. H. B. Winterbotham, dated Andhra Todi Estate, Vayitri, S. Wynaad, 6th May 1895:—“I am in receipt of your letter of the 4th May and I shall be glad to give you any information which

may interest you regarding Liberian coffee in which I take great interest. The height of this place above sea is about feet 2,400. The Liberian we find will grow from 500 feet to 3,000 feet. It ripens earlier at the lowest level and takes 14 months from blossom at this elevation to ripen its fruit, but it seems to bear very satisfactorily from 2,000 to 2,500 feet. The small piece from which I am collecting seeds planted 10 x 10 and now 14 years old has averaged over 12 cwt. clean coffee per acre for 8 years past. The trees are now 20 feet high or more, and the fruit has to be picked by small boys with ladders. The first two trees planted by me 20 years ago came from Kew. They are now large trees 33 feet high near my bungalow and from these nearly the whole district has been planted, there being now nearly 4,000 acres under this variety planted during the past 6 or 8 years and most of this will soon be coming into bearing and will I believe replace Arabian coffee almost entirely at low elevations.

Temperature during monsoon is steady at about 68° during winter (November to end of January) it is cold at night 50° sometimes running up to 80° in sun in middle of day. From February to May temperature runs up to 85° in the shade. Liberian coffee does not mind sun but requires a certain amount of moisture with good drainage and does not like heavy wind. Rainfall here is from 110 to 130 inches a year, very little falls from November to end of March. The country is rather steep and hilly. But the Estates near the ghauts get sometimes 200 inches. Those inland as little as 60. On all these places, there is good Liberian to be seen. The sample of coffee of this giant kind is good; something like a date-stone in appearance, has lately been valued at 85 to 90s. in London or say 10s per cwt. less than arabica. I am supplying seedlings to planters in large quantities, these if put into nurseries 6" x 6" apart shaded and watered till following June, should be plants 12" high and ready to go out into the open in pits 20" x 20". The plant does not grow very much the first year; after two years it comes on quickly. We find topping the tree or pruning in any way seems to put them back. Any other questions I shall be glad to answer."

Recorded with thanks.

PLANTING AND PRODUCE.

ANOTHER OUTCRY AGAINST TEA DRINKING.—The crusade against tea drinking carried on by some medical men deserves the attention of the Tea Association. It is not in the medical journals alone that doctors fulminate against tea. In these journals there is less chance of real mischief arising because they are not seen to any great extent by the unprofessional public. In the current number of the *Windsor Magazine* there is an attack on tea written by Dr. J. E. Cooney, which is very marked in its hostility. After recounting the well-worn stories of adulteration and "facing" of tea, and referring to these Chinese dodges as though the introduction of Indian and Ceylon teas had not put an end to them, so far as tea in this country is concerned, Dr. Cooney expresses the opinion that tea drinking "not only produces, but promotes and prolongs dyspepsia." This we have heard before. "Black tea is bad enough," he says, "but green tea is worse." He does not sufficiently emphasise the fact that scarcely any green tea is now used in this country. Indeed, he has very little that is new to say of tea, nor anything in its favour, except that it is refreshing under certain circumstances, and useful, medicinally, for "the headache of nervousness and exhaustion." He says "the difference between alcoholic drinks and non alcoholic tea infusion is in many respects but a question of degree; both are abused, and may be safely abolished and prescribed only as medicaments." If Dr. Cooney had confined himself to calling attention to the mischief arising from excessive tea drinking and improperly infused tea he would have done some real good; but he is less concerned with anything in its favour than with piling up all the old

arguments for or against the use of the leaf except under medical direction. The public are to a certain extent hardened against the warning of medical men, who continually cry out against the evils of eating and drinking generally, and say there is danger in almost every article of human food. They are constantly letting us know what we should not eat and drink; but, unfortunately, they do not console us with anything liquid but water, and that, they tell us, should be boiled. Most people are aware that strong tea cannot be sipped all day long with impunity, nor is it conducive to a healthy condition of the stomach when the leaf is stewed and served up at frequent intervals. On the other hand, there is plenty of testimony in favour of the refreshing and invigorating influence of tea consumed under rational conditions. Tea drinkers have many arguments on their side, and it is high time a "counter-blast" of some kind were issued in the interests alike of grocer, dealer, and consumer. This abuse of tea by medical men has become monotonous.—*H. and C. Mail.*

SYSTEMATIC FRUIT-GROWING ON A LARGE SCALE :

A NEW INDUSTRY FOR CEYLON :—ORANGES,
LEMONS, &C., SUCH AS HAVE NEVER BEEN
KNOWN HERE.

Last year we had a very interesting visit from Mr. F. Caley Smith of Messrs. L. Smith & Sons, Yolumba, fruit and wine growers and exporters. He travelled a good deal in Ceylon and right to the North of India, taking notes everywhere as to fruit; but also doing business for his firm. At Nuwara Eliya and Hakgalla, he gave and got information and was much interested in the small private fruit gardens he saw. The S.S. "Himalaya" has brought his brother Mr. Walter Smith on a similar business tour; but he is accompanied by Mr. Pearson, who after being several years in Ceylon, has latterly put in five years at fruit-growing in Mildura, and who is now convinced that given 100 acres of suitable land—sheltered, undulating, not too steep, decent soil,—oranges and lemons such as have never been seen here, can be profitably grown for export in Ceylon. We have recommended both gentlemen to visit Uva, but to take Peradeniya Gardens and Mr. Nock, as well as "Old Colonist" on the way. If our visitors are prepared to introduce the very best descriptions of fruit, and to take all the risk of their experiment, we would certainly recommend, if a suitable lot of Crown land—not exceeding 100 acres—can be found, that it be granted to them on certain conditions, after the fashion of the Pallagama grant?

MATALE : A NEW DEPARTURE. A PIONEER IN NEW PRODUCTS AND HIS SUCCESSORS.

It is said that Wiharagama estate, so long the property of Mr. Munton has been leased, with right of purchase, by Mr. E. Gordon Reeves.

Mr. Munton has been for a great number of years a proprietor in the Matale district, and well-known as being one of the earliest to experiment in new products when the fate of coffee seemed sealed. So far back as 1878 attention was given to Liberian coffee and cocoa on this estate; and it was one of the estates also that gave scope to the experiments of Mr. Schrotky in the campaign against the leaf disease.

From time to time after the reverses in coffee various enterprises were taken up, and this is one of the very few estates retaining the original Liberian coffee, if indeed there are others,

while cocoa, rubbers of various kinds, nutmegs and experimental hybrids of coffee, maragogipe, and cocoa and a number of other things have been taken in hand. It has been the means of supplying seed from the oldest Albizia trees in the island, and latterly meeting the demand for lands being opened up in Liberian Coffee, &c.

The lessees are said to be opening the reserve lands in tea, and as tea in the neighbourhood, over the river, opened by Mr. Muntun for Mr. Ross is very successful, there is no doubt whatever of the certainty of its success here.

Mr. Muntun was associated in the fresh enterprises of those days with such pioneers, as George Wall, A. G. K. Borron, Alexander Ross and others and has contributed not a little to the district by maintaining its value despite the backwardness of the tea industry in this particular locality.

With the further string to their bow, the new owners will ensure, with the reserve lands in tea, even better results than the present.

CINNAMON IN LONDON.

The third Quaterly Sales took place yesterday in Mincing Lane, when we learn by a telegram received this morning through Renter that the quantity offered amounted to 700 Bales, of which 600 found buyers. The market was excited, and consequently prices ranged from those which ruled at the May Auctions to 2d higher. The telegram adds, "reported large advance believed fictitious." It is somewhat difficult to determine exactly what this means as the sentence now stands; but if the word *shipments* be substituted for *advance*, it would make it clear that the heavy shipments which would appear to have been reported as coming from Ceylon were believed to be fictitious—hence the excitement and the consequent rise in value. Prior to the auctions telegrams were received wanting Cinnamon; but the knowing ones would not entertain any offer whatever, seeing that the exports were comparatively small. The next sales may see a drop of 2d.; but we hope that the price will be maintained. The prices realised at the May Sales for Ordinary were as follows:—

No. 1	9d.
2	8½d.
3	8s.
4	7d.

The comparison, therefore, with the August Auctions will be:—

No. 1	11d.
2	10½d.
3	10d.
4	9d.

Cinnamon Chips are badly wanted today, and R56 has been quoted per Candy.—Local "Examiner."

A LARGE ORDER FOR QUININE.

General Martinez Campos has asked for 600 kilogrammes of quinine for the army in Cuba. The Spanish Minister of War has consequently ordered that this enormous quantity of quinine be procured at once, and on consulting the chief of the military laboratory 200 kilos. was promised to be ready for delivery during the present month.—*Pharmaceutical Journal*, Aug. 18.

CHINA TEA IN SOUTH AFRICA.

As everybody knows, China tea is being rapidly ousted from the European market by the leaf of India and Ceylon, and not even the divorce of the rupee from silver, caused by the closure of the Indian mints, has arrested the movement. On the other hand, it is curious to find indications of a boom in China tea in the South African market. The steamer "Umkuzi," the name of which faintly recalls Mr. Rider Haggard's novels, cleared for Natal and other South African ports on the 10th current, carrying no fewer

than 12,416 chests of China tea which had been transhipped at Calcutta from Hongkong. Algoa Bay takes 7,568 chests, Natal 1,920, Cape Town 1,570, the remainder being divided between East London, Delagoa Bay and Morrell Bay. These figures bulk largely when compared with the export of Indian tea to South Africa, which in 1894-95 was only 19,986 lb.—*Pioneer*.

A GLUT IN THE TOBACCO MARKET.

At Amsterdam, a cry of alarm has been raised that there is too much tobacco in the market. The *Deli Courant* finds that there are good grounds now for fearing a glut in the tobacco market in the near future. Experts hold that danger arises the moment the output of tobacco in Deli exceeds 200,000 bales a year. That limit was reached by the crop of 1894. The outlook in 1895 points also to a heavy yield, and, should matters not mend, a crash is unavoidable in 1896 or 1897.

SUCCESSFUL AGRI-HORTICULTURAL SHOW IN THE STRAITS SETTLEMENTS.

From Mr. A. B. Stephens' Report on the Agri-Horticultural Show Held at Batu Gajah on the 12th and 13th July, 1895, we quote a few paragraphs:—

ECONOMIC PRODUCTS—was a poor show compared with last year, a sugar cane from Matang 35 feet long getting one of the first prizes. Coconuts were very fine, the best coming from Setiawana. Coffee had 12 native exhibits. Copra was exceedingly fine. Seven lots of oils were shown. Rattan was well represented, so was pepper, 20 lots being exhibited, Gapis Estate being first, Syed Musa second. Tapioca flour had 16 exhibits, but tapioca only one. Waterloo and Kamuning each won first prize for Arabian and Liberian Coffee, respectively.

MINERALS.—This was a new departure and a number of valuable collections of Ore and Minerals were shown—Mr. C. Wray's being the best, then came Mr. Fincham's, Mr. Plumbe's and others also being good. A very good working model of a mine was erected and the whole smelting operations for tin were shown.

ELEPHANTS.—About forty animals were shown, a very handsome spectacle—only about five elephants were exhibited at our Taiping Show. The elephant race was very amusing and a close finish witnessed; the elephants were afterwards put over some obstacles.

The Larut gaoi sent three railway truck loads of rattan and wood-work exhibits of furniture, and they were so much admired that not a single article remained unsold and H.H. the Sultan of Kedah wished to buy the whole lot as they stood.

The gentlemen who took charge of the different sections worked hard to make their divisions a success. Messrs. Metcalfe, Berwick, Cox, Harfleet and Fincham working exceedingly hard, and to the last named is due all that was shown in the Mining Department. Mr. Hanson gave me a great deal of assistance, and to him I owe the wire fencing which have such a finished appearance to the buildings generally. Mr. Marks did a great deal of hard work and was always ready and willing to push on everything, and to him a great deal of the success of the Show is due.

For the outside districts, as far as one could judge by results, I would mention Mr. Voules first, then Mr. Berkeley, who managed the elephants, etc., so well, and then Mr. Bowen, who if he did not win many prizes, tried hard. Lower Perak and Krian sent a great number of handsome and valuable exhibits, Upper Perak, Batang Padang and Larut sent very few exhibits. Kuala Kangsar had most of the fruit exhibits and got the prizes for them.—*Perak Government Gazette*, Aug. 16.

COFFEE NOTES.—The *Popular de Taubate* tells of two planters who gather their coffee with the pulp already removed, this service being performed for them by bats, which eat the pulp as fast as the coffee ripens. This species of bat should be cultivated!

COFFEE IN HAPUTALE.

FIELDS WHITE WITH BLOSSOM.

Coffee blossom full out today, and a really fine show, nothing to equal it for some years. Weather for setting has so far been all that could be wished. Leaf disease disappeared some time ago, and has not been bad at all this season. Up to date green bng practically nil. I wonder if the old king is really to take a new lease of life. I returned yesterday morning from a tour round the Haputale side of the district: Coffee on Nayabedde was one white sheet; not so much on Gonamotava and Roehampton. I understand they have just finished gathering a very big crop. Haputale and Sherwood, especially the latter, was a sight sufficient to gladden the heart of any old stager who can remember the blossoms of the sixties. Thotalagalla was very fine on their big acreage of fine coffee left. I would say they had blossom for an average of 4 cwt an acre, and on a few acres here and there more than double. Pita Ratmalie had also a good blossom; but somewhat patchy. On this estate it is reported the proprietors contemplate opening a hundred acres of their fine forest reserve in coffee next season, so that faith in the old king is also reviving. Nothing could look better than the coffee on Daubatenne, and that just after giving a crop of over 5 cwt an acre. Not so dusty in these degenerate days!—*Cor.* 27th. Aug.

THE U. P. A. S. I.

Thursday evening witnessed the conclusion of the second Annual General Meeting of the United Planters' Association of Southern India, which had assembled at Bangalore. The business before the meeting was transacted without waste of time and a perusal of the Report leads to the conclusion that the delegates have grown more familiar with the rules and customs of debate than heretofore. Thirteen District Associations were represented, one of which was that of the Coorg Native Planters. The Mysore Native planters had no delegate this year, Mr. Subbaiya, the President of the S.M.N.P.A., being prevented at the last moment from attending on account of ill-health. Mr. Digby T. Brett, who had made an efficient President for two years, retired and in his place Mr. Sprott, of North Coorg, was elected; Mr. Hockin, of Wynaad, being chosen Vice-President to fill the vacancy caused by the retirement of Mr. G. R. Evans, of South Coorg. Two or three well known faces were missed, the most notable absentee being Mr. Thomas Clarke, of South Travancore. However, his place was taken by Mr. Acworth, Honorary Secretary of the Central Travancore Association, who represented the whole planting community of the Province and who took a leading and able part in all the debates. On the last day a vote of thanks to H. E. Lord Wenlock was carried with acclamation for the sympathy and consideration which he has always shown to any representation of grievances or requirements from the United Association.

Turning now to the business transacted during the three days that the meetings sat; undoubtedly the most important question that came up for discussion was the deputation to the Viceroy, the greatest weight should be attached to the appointment of a Committee of Enquiry. The primary object to be attained is, we understand, not the redress of certain grievances, but the education of the Government of India in the circumstances which surround the planting industry in Southern India.

A fairly long discussion arose on the question of the affiliation of the United Association with the London Chamber of Commerce, some gentlemen being of opinion that such an action would be prejudicial to the planting interests. This is a subject on which a great deal can be said on both sides, so we will merely observe that it is a tentative proposal; that the affiliation can be subsequently cancelled if deemed

advisable, and that in Mr. Sanderson, a well-known broker of Mincing Lane, a representative has been obtained who is in close touch with the planters of Southern India and who can be safely trusted to advance their interests by every means within his power. We are surprised that no mention was made of affiliation with the Indian Tea Association of Calcutta, an important organisation whose aid might be found invaluable at times when questions in which the Supreme Government is directly concerned are brought up. Mr. Acworth spoke at some length on the Ceylon Import Duty on Indian teas, but was unable to follow his line of argument. Ceylon tea, as we know, is usually sold in England in packets, being first blended with Indian tea. But, said Mr. Acworth, it is a mere piece of clap-trap to say that Ceylon men wish to prohibit their teas being blended with an inferior article. By an inferior article, be it distinctly understood, a Ceylon mau means cheap China trash. Considering the situation of Colombo we consider the danger a very real one if ever blending became a big business in that island, as it probably would if the import duty were removed. If Mr. Acworth would tell us exactly what the Travancore planter wants in this direction, he would place the matter in a better position than it stands at present and enable Ceylon to know exactly what the Indian tea-planter requires.—*M. Mail.*

THE SECOND ANNUAL MEETING.

Second Day.

(FROM OUR SPECIAL CORRESPONDENT.)

BANGALORE, 21st Aug. 1895.

CEYLON IMPORT DUTY ON INDIAN TEAS.

This was the next subject for discussion.

Mr. G. L. YONGE (Secretary) read the correspondence with the Ceylon Government on the question.

Mr. G. L. ACWORTH (C. Travancore) said:—

MR. CHAIRMAN AND GENTLEMEN,—I do not know if anybody has seen the Ceylon papers which gave an account of the meeting of the Ceylon Traders Association at which our letter was read. They were handed over to me, and when I read the account I was exceedingly surprised that what purported to be a dignified meeting could deal with such a letter in so flippant and almost insolent a tone. One argument brought forward for the import duty was "why should not we have it? Ours is only 6½ per cent, while they have only 5 per cent in India." That is not the case. The import duty, on tea in Ceylon is 25 cents. That is, roughly speaking, from 3½ to 4d. That is pretty nearly 50 per cent of the value of Ceylon tea in London. Another argument they used was that they wished to prohibit their teas from being blended with inferior articles. That is a mere piece of claptrap. As a matter of fact, Ceylon tea, it is very well known, is hardly sold in England at all except in packets. There is not the slightest doubt if, in spite of all the spacious advertisements at the railway stations, &c., it is blended with Indian teas, that the people will hardly drink it without this. When my tea was first sent to England some years ago my broker said, "Don't trouble yourself about the flavour, we don't want that; we can get flavoured tea from Upper India. What we want is good strong liquoring tea." Ceylon has taken the place of China tea, and we want something to fortify it. I am a great admirer of the Ceylon planter; I admire his energy, push, perseverance and pluck, but at the same time he need not crow so loudly about it himself. Personally I do not much care about the duty being removed. I do not send my tea to Ceylon now, and I am not likely to send any. But the Association I represent is very strong on the subject, and I was particularly asked by the South Travancore Association to speak about it. I think myself the Ceylon planters are a good deal blind, or at any rate the Ceylon merchants are blind to their own interests. They seem to think that our tea would flood their market if blended with theirs. But looking at it from a merchant's point of view, is it not a good thing, does it not

increase the volume of trade, and does it not increase prosperity? For many years there has been a large market in Calcutta for Indian teas. It would have been 25 years ago of great assistance to the Upper Indian Planter if he could have got China tea in the Calcutta market to blend with his own. For nothing was more unpopular when they were first introduced than the Indian teas in the London market. Everybody spoke against it. I well remember the time. It would have been an excellent thing for the Calcutta planters to have got China tea to blend with their own, marked the chests as Indian tea, and sold it as Indian tea in London. This was never done, and I never heard of its being done. I cannot see how there can be any more danger of the Colombo market being flooded with our tea than the Calcutta market could be flooded with China tea. At any rate, there is not the slightest doubt that the enormous duty on Indian tea is contrary entirely to the spirit of British legislation or British trade. As the removal of it might be of use to the growers of Indian tea, I beg to move the following resolution:—“That in the event of an unfavourable reply from the Governor of Ceylon, the Secretary of this Association be requested to again address him with a view to the abolition of the heavy import on tea.”

The Hon'ble Mr. G. ROMILLY (Wynaad).—In seconding this resolution, I should like to add a few words. When I went to Ceylon I was given to understand that there was a very strong feeling in Travancore on the subjects which apparently does not exist. At any rate, I thought it a good thing to see H. E. the Governor of Ceylon on the matter. I see that in a leading article the *Ceylon Observer* does not take up the same attitude as the Ceylon Traders' Association, and certainly from the conversation I had with the planters upcountry, I am perfectly certain that the planters themselves would not treat our letter with derision.

The resolution was put to the vote and carried.—*Madras Times*.

TEA PACKERS.

With reference to these machines we may mention that one of the Davidson-Maguire packers has been tried on Gammadua estate—among others—with excellent results, namely 10,000 lb. of tea packed as follows:—Broken Pekoe 2,666 lb. in an hour, at the rate of 110 per chest; with pekoes 2205 lb. packed per hour, packing 105 lb each chest; of souchong and coarse teas, the packing was at the rate of 1,710 lb per hour or 96 per chest.

BOUND FOR EAST AFRICA.

AN IMPORTANT APPOINTMENT.

Count Von Zech leaves Ceylon tomorrow for German East Africa. In January 1889 the Count first came to the island, where he made a short stay, afterwards taking up an important position as Director of the German New Guinea Company. In April last Count Von Zech returned to Ceylon and since then he has been engaged in acquiring knowledge of planting matters. In this he has shown much aptitude and he now leaves Ceylon well equipped with a knowledge of high and low country planting in the matter of tea, coffee, and coconut cultivation. Count Van Zech's latest appointment is one on which we desire to heartily congratulate him. He has been appointed Imperial Commissioner in Usenbara, German East Africa. This important advancement will be learned with pleasure by his many friends in Ceylon, more particularly in Kandy where he has resided for some time. The New Imperial Commissioner leaves by the N.D. "Preussen" tomorrow. At Aden he will tranship and proceed to Dar es, Salem, where he will present his credentials to the Governor, the well known Major Von Wiseman.

PEERMAAD PLANTING NOTES.

Another estate, Arnakal has now got machinery, having for its motive power an oil engine, which it is hoped will be a success, for on many estates where the water in the dry weather is so deficient it is the only power which could be used. Although oil engines have not met with much favour in Ceylon there is no reason why they should not be successful. Their cost is not more, probably not so much as a steam engine, neither is the up-keep more expensive, for the consumption of oil is not great and they do not require a man in constant attendance while working. Once set going in the morning they can be left to run by themselves till work is over for the day.—*Cor. Western Star*.

SELANGOR NOTES.

Mr. J. H. French, Assistant Treasurer, Selangor, after a long spell in Ceylon and the Straits, is now going home on well earned leave.

The new Pension notification, whereby officers in the Selangor Service will in future draw their pensions at a lesser rate of exchange than at present exists for this purpose, provided they receive an increase of ten per cent on their salary during the rest of their service in the state, was a surprise to all concerned. Nobody expects to work for 10, 15 or 20 years without promotion, so that it practically means goodbye to a four shilling pension for all officers concerned, with perhaps 2 per cent exceptions. Nor apparently can this rate be relied on. There is no reason why the rate should not be further reduced.—*Singapore Free Press*.

MR. H. M. STANLEY ON TROPICAL AFRICA AND ITS DEVELOPMENT.

REFERENCES TO CEYLON.

One of the most interesting speeches at the Geographical Congress was made by Mr. H. M. Stanley, the intrepid explorer of "Darkest Africa," and the newly-elected Unionist Member of Parliament for North Lambeth, in the course of the discussion following a valuable paper read by Sir John Kirk, who took as his subject the important question of the extent to which Africa is suited for development by white races. Mr. Stanley, who was very warmly received, said he thoroughly agreed with the paper read by Sir John Kirk. It was a wise and an able paper, but he thought it looked too far ahead. Sir John talked about the fitness of Africa for colonisation, but so far, in Central Africa he knew no intention to colonise any part of it. He did know, however, of a good many intentions to make the thing possible in the region called Central Africa, and in the way of commerce, in the way of improving the blacks, and in the way of making the country fit for colonisation in the distant future. Their aims on the Congo were simply to develop the commercial possibilities of that region and prepare the way for those who would exploit the products of Africa. In 1876 and 1877 he descended the Congo, and he was then possibly as great a pessimist as any one could be. When he saw the immense river expanding broader and broader, and the shallows increasing, it seemed impossible that the river should ever be able to be invaded by a flotilla of steamers. But after diverging from one channel to another he found there was a certain rule and mode to be kept in the navigation, and possibly steamers might be constructed which would be able to go over the shallows and find the deeper channels. Then, on looking at the banks, he found there were certain seasons when the river rose very high, and finally he came to a place where the river contracted

and gave them an enormous depth. It was not, however, till he reached the sea and could take the whole question broadly into view that he saw the possibilities of the Congo, and he wrote in the last letter he sent from the mouth of the Congo in 1877:—"The time will come when this great river, now known for the first time, will be an international question. Happy the nation that will take time by the forelock, and be warned." They all knew the way they set about founding the State of the Congo. They did not lose any time in studying scientific geography. He had never seen a Colony that had been founded upon scientific geography. He asked what was known of scientific geography by John Smith, founder of Virginia, by the Pilgrim Fathers, by Cortes and Pizarro, or by the founders of New Zealand and Australia. To take another instance—Cecil Rhodes, the redoubtable hero of South Africa—he doubted very much whether he knew anything about scientific geography, and yet he had planned Colonies so vast as to be the wonder of the century. He did believe, Mr. Stanley continued, in pioneering slowly and cautiously, and not going too recklessly into rash enterprises. The pioneer must clear the way, find out whether a country was liable or not, and he must try to make the mechanical instruments of civilisation do for him a part of the work, such as travelling. On the Congo they had something like 40 steamers and 800 white men, where 16 years ago there was not one. Now, if those men had to travel on shanks's mare, with all the knowledge of science they might have, he doubted very much whether they would go very far; but, being taken aboard those vast steamers, they could travel thousands of miles north and south, east and west. So now they had the whole of the Congo basin navigated, and this was what they were trying to get the British Government to do in British East Africa. They thought they would be able to show that Central Africa was just as livable as India or Brazil. It required Sir Samuel Baker to go up to the mountainous parts of Ceylon to find that that region was capable of supporting English families and children. They had also found that English people and English children could live on the Congo. When they had completed the railway to Stanley Pool, and had got steamers going 15 or 16 knots instead of six or seven, and when they had got telegraph stations, they would have done wonders, and by that time they would have carried hotels and all necessaries of civilisation into those regions. People went to Africa and found that there were no hansom cabs, that they could not even get a cup of *café au lait*, that if they offered a thousand pounds for a loaf of white bread they could not get it. They found they had to carry their house and stores on their backs. So they went home at once and condemned Africa. Now that was not the way to look at a great region. India had been the white man's grave, but they found people there who never thought of going over to England. They found people in Brazil who never thought of going to Portugal, their mother country; people in Chili, Peru, and Mexico, who never thought of going to Spain, who had made their homes there and intended to live and die there; and the time would come when the whole of Central Africa, barring the maritime regions, of course, would be in the same position as Mexico and Brazil and Ceylon. But it took a long time for a nation to learn how to live. He had been in a certain State in the United States where there were more fevers in 24 hours than could be found in any part of Africa. He was

constrained to live in it for a certain number of months, and he had more fevers in that time than he had in five years in Africa. At that time that State contained only 425,000 men, women, and children, and now it contained 1,650,000. Why? Not because they had learned science, he was sure, but because they had learned the art of living. Take, on the other hand, New York. There they had a great city growing from year to year, and yet the most inventive people in the world had not learnt the art of living in hot weather. It was the same in Australia. A little commonsense only, not the study of scientific geography, would have enabled them to live, and people would have been able to pass safely from one street to the other instead of being stricken by the sun. It was the art of living they needed to teach in tropical countries. He had tried to teach young men from England and Scotland how to live in Africa, but he invariably failed, because if one saw one's good advice rejected, one got sick and tired of preaching it. He had seen a young fellow who, after going there with a whole-souled desire to distinguish himself, walked under the very hottest sun with a black cloth cap he was accustomed to wear in the temperate regions of Scotland. That man never returned to Scotland. He had seen another too fond of the liquor bottle, and he had said:—"My dear fellow, you do not need Dutch courage in this country any more than you need it in your own. Take a teaspoonful at night as a nightcap if you want it, but not in the day, when the sun is hot. Take a tabloid of quinine. That will be ever so much better." But those men never returned. He had gone himself seven times into Africa, twice across, and altogether he had been there 23 years, and he felt just as strong today as though he had never been there. He mentioned various other cases of men who had lived in Africa for many years and were quite as healthy as when they went to it. At present we were sending young men fresh from the college and from the University, fresh from their mothers' laps, into Africa, and they perished almost the first day they found a different atmosphere and a different sun. Before sending these young men into Africa they should go and study for two or three months the various arts of conquering these fevers, warding them off, and living wisely.—*Colonies and India.*

COFFEE CULTURE IN HONDURAS.

The United States Consul at Tegucigalpa in a recent report to his Government deals with the subject of the prospects of coffee culture in Honduras, and states:—

"The cultivation of the coffee plant is yet in its infancy in the Republic of Honduras. While there are numerous so-called plantations of coffee, they are small and indifferently cared for, and, consequently, the production is far from being up to the proper standard.

"The soil, climate, and conditions in Honduras are equal in every respect to those of Guatemala, Nicaragua or Costa Rica, where the coffee industry has already reached large proportions. The only drawback in Honduras is lack of means of transportation and facilities for shipment to the coast. At present there is practically no exportation of coffee from Honduras, the product of the plantations being readily sold at home. I have known the price of coffee, even in time of peace, to reach the sum of 40 cents (gold) per pound, and in time of war, as much as 75 cents, notwithstanding the splendid adaptation of the country to its production.

"The Honduran coffee is equal in every respect to the Mexican, Guatemala or Costa Rica on product,

and is well known to be of a superior quality, commanding a price in the great markets of from 20 to 25 cents per pound.

"In the Republic of Honduras land can be had in either of three ways—by direct concession from the Government or municipalities, by pre-emption under the agricultural law, or by direct purchase from individuals. In the first, two ways the lands will cost nothing, or a nominal price; in the latter the lands will cost from \$5 to \$10 per acre.

"A new plantation of coffee will commence to produce a profit by the end of the fourth year after planting, and after the seventh year a profit of from 100 to 300 per cent. on the capital invested may be expected. The average cost of the production of coffee, after the plantation is well started and five years old, will not exceed 7 cents per pound.

"The preparation of the land for a coffee plantation will consist only of clearing it off well and keeping it clean. The young trees are to be secured from a nursery and cost from \$10 per thousand. Nurseries of course, are maintained on every plantation. The young trees are planted from 10 to 12 feet apart, in regular rows, like an orchard in the United States, and the holes are dug about 1 foot square and 15 inches deep.—*Planters' Monthly*.

VARIOUS PLANTING NOTES.

THE ESTATES COMPANY OF UVA LIMITED,—we learn officially, have paid an Interim Dividend of 4 per cent for 1895. We congratulate the shareholders.

COFFEE CULTIVATION IN JAVA.—The statutes have been published of the French-Netherlands Java Agricultural Company with a capital of fl 200,000, fully taken up. The object is the cultivation of coffee and other produce in Java.—*L. and C. Express*.

A KAURI TREE blown down recently in Western Australia measured 174 ft. from the roots to the first branch, where it was 14 ft. in circumference. Mr. J. Ednie Brown, the forestry expert, cut down a Karri 160 ft. high, which he estimated to be only 35 years old.—*Australasian*.

"LADY-BIRDS" FOR COFFEE.—We direct attention to an interesting letter from Mr. E. E. Green by this mail. We hope a full measure of success will crown Mr. Green's experiment and then he will indeed be a benefactor of coffee in Ceylon.

THE PINEAPPLE TRADE OF SINGAPORE has expanded greatly within the last few years. There are now ten European firms and nine Chinese firms engaged in the business, and the annual exports amount to 150,000 two-dozen cases of preserved pine, valued \$200,000. The pineapple is preserved whole and retains its delicious juiciness.—*M. Times*

CINNAMON.—The "Imperial Institute Journal" to hand by the French steamer contains a paper on "Cinnamon of Ceylon," by Mr. Peter de Abrew of Colombo. There is nothing new to us in Ceylon; but the information is concisely compiled—from our "All about Spices" and "Planting Review" among other sources.

ENGLISH PATENT.—4,741. March 6th, 1894. Packing, tea, coffee, etc. Moore, J. H., 7, Jansen Road, Leytonstone Road, Stratford, and Inger, J., 28, Minories, both in London. Tea, coffee, cocoa, and the like are packed in small quantities in a transparent wrapper preferably of gelatine, which is soluble in the water, milk, or other liquid used for making the infusion of tea, etc. The package is encircled by a paper band bearing a description of the contents. It may also contain a caramel made by dissolving about a pound of sugar in a quart of milk heating till the mixture becomes pasty, then solidifying it by cooling, and finally cutting up and coating with sugar.—*Patent Journal*, July 31.

INDIAN LABOUR IN WEST AUSTRALIA.—Mr. Aduljee Dinsha, a wealthy Parsee merchant at Perth, Western Australia, has been fined £400 by the local bench of magistrates for importing 40 Indian labourers without first entering into an agreement under the Imported Labour Registry Act.—*Times of India*, Sept. 2nd.

COCOA AND SUGAR IN TRINIDAD.—The exports of sugar from Trinidad this season keep well ahead of those of last year, and the expectation of a considerably larger crop will be fully realised. Cocoa also shows an excess over the hitherto record year (1892). Picking is now reported over, and attention is being already directed to the fall crop, accounts of which from various parts of the island being very conflicting. The weather when last mail left had been favourable, so that agriculturists generally were satisfied.—*L. Mail*.

TRAVANCORE PLANTERS' ASSOCIATION.—A meeting of the Travancore Planters' Association was held at the Club, Trivandrum, on the 14th inst. It was unanimously agreed to continue the subscriptions to the American Tea Fund. Mr. Acworth has been asked to represent the Association at the Annual Meeting of the Central Planters' Association of Southern India. Thus Mr. Acworth will find himself with 5 votes out of ten at his disposal viz. Central Travancore, Travancore, Kannan Daven, North Mysore State, South Mysore State.

REFORM OF BRITISH WEIGHTS AND MEASURES.—The Report of the Select Committee appointed to enquire whether any, and what changes in the present system of weights and measures should be adopted, has been published as a Parliamentary paper. It is recommended, according to *Nature*:—

(a.) That the metrical system of weights and measures be at once legalized for all purposes.

(b.) That after a lapse of two years the metrical system be rendered compulsory by Act of Parliament.

(c.) That the metrical system of weights and measures be taught in all public elementary schools as a necessary and integral part of arithmetic, and that decimals be introduced at an earlier period of the School curriculum than is the case at present.

THE HEAT OF THE SUN AS POWER.—If the coal mines of the world were exhausted, it would be a relief to know that other great sources of power are at our command; that no distress would ensue with such rapidity as to deprive us of a means of warmth. In fact our own mother country, England, has been contemplating the time when her fuel centres will have become diminished and the burrowed catacombs reaching far out beneath the ocean's bed will have been emptied of their precious deposits. Then the miner will take his pick and shovel and mount upward to the air and glistening sunlight. It will not be a useless errand to move towards the sun's light, because it is here, if all other resources fail, that we may look for greater power and wider possibilities. It is not the buried sunlight of the past ages that we need look for any more, for that is for ever gone. The heat of the sun, the living, reviving rays of our parent planet, will yield its energy for countless years to come to warm our bodies and light our homes. John Ericsson invented a machine with which he believed we would be independent of the coal supply, and make direct use of the heat rays of the sun. It might have been called a sun steam-engine—a steam-engine heated by sun-light. The vast tracts of the Sahara or the deserts of Asia can supply heat that would generate millions of horse-power in Ericsson's solar engines. The torrent of Niagara is not comparable to the incalculable waste of power on the scorching surface of these enormous plains. The engineering schemes of today will fade into insignificance in comparison with those that the fierce cry of future necessity will force men to execute. It would be a curious sight to see a fully equipped power-station situated in the centre of a dreary waste sending its threadlike lines across the desert to heat and light some distant town, thus guiding the warm sunlight that it may glow and glitter in the mosques and minarets of the Far East.—*Electrical Age (U.S.)*

AGRICULTURAL INDUSTRIES IN TRINIDAD AND BRITISH GUIANA.

A Commission in British Guiana has been inquiring how to "further the production of minor agricultural industries" and the Colonial Secretary in its behalf applied to the Government of Trinidad, for all the information available there on the subject. The matter was naturally referred to Mr. Hart of the Botanic Gardens who regarded it as "a large order"; but promised to collect a set of his Reports, although these had, in reality, been regularly forwarded to Mr. Jenman of the Guiana Botanical Department. Mr. Hart added the following pithy and practical paragraphs in his preliminary reply to his Government—paragraphs that carry a lesson for Colonies in the Far East as well as in the Far West;—

"While prices rule low, Sugar planters are specially kind to the Subsidiary Industries, but when prices are remunerative, they are, as a rule, at once put aside."

"How often I have advocated the planting of Log-wood here, the Government knows, yet in only one or two instances has either Sugar or Cacao planter attempted to plant it. Yet I know of estates in Jamaica abandoned by sugar planters, which have paid their purchase money by the sale of the log-wood grown on them, and many an abandoned sugar estate now pays as much or more in taxes to the Government (sold out as it is in lots to the settlers who grow "minor" produce) than when it was in full running as a sugar estate. Ruin of sugar estate proprietors, does not necessarily mean ruin to the country, but simply ruin to individuals. At least this is the outcome of the abandonment of estates in Jamaica in many cases. The sugar planter however does not see with the same eyes as a completely disinterested person."

However, Mr. Hart set about writing a special or as he calls it,—“A short Progress Report on the Agricultural Industries of Trinidad, excluding Sugar.” It is certainly comprehensive as well as concise, and we are not surprised at its securing the special praise of Governor Napier Broome who had it published forthwith for local and general use. We shall probably reprint it in full in our *Tropical Agriculturist*, meantime remarking that Mr. Hart shews the Trinidad Cacao crop of 1894—21,608,384 lb.—to be almost identical with that of 1890, although the crop for 1892 was nearly 3½ million lb. ahead. Alternate crops of cacao seem to be the rule in Trinidad as they assuredly have been in Ceylon, although our highest crop of cacao in Ceylon as yet has only reached to 30,658 cwt. (in 1893) or 3,433,696 lb., against more than seven times that quantity for the maximum in Trinidad.

In sending in his report, Mr. Hart called special attention to a remark made by the Expert of Fibres at the Indian and Colonial Exhibition, as follows:—

"The authorities in the several islands should decide generally that the growth and preparation of a Fibre is desirable; then a particular Fibre, the best for each locality, should be selected, and the trade in that fibre thoroughly organized. The importance of an organization cannot be over-estimated, and in support of this we may cite the case of the trade in 'Jute.' There are as we know from the results of investigations, not a few fibres capable of replacing this particular cast, some in fact being superior in all essentials. Nevertheless the trade in Jute holds its own unassailed, and the cause in so far as it does not reside in intrinsic superiority and commercial fitness must be sought in the concentration of attention upon this fibre, and the resulting organization of the trade. These facts deserve to be borne in mind by all who are contemplating the founding of any such enterprise."

The Report itself is, as we have said, both full and concise: it is divided into the following sections:—(1) Produce used for the Preparation of Dietetic Beverages; (2) Cereals (including maize, rice, sorghum, pigeon and congo pea, ground nut, &c.); (3) Starches (cassava, &c.); (4) Dyes and Tannin (including divi-divi, gambier, mangrove, &c.); (5) Vegetable Oils; (6) Fruits (a great variety; a large trade in bananas as well as in oranges and lemons for the American market, being anticipated); (7) Spices; (8) Rubbers (Mr. Hart anticipates that *Castilloa* rubber, 200 trees to the acre, should yield at the 7th to 8th year 2 to 3 lb. per tree equal to a gross return of £60 per acre!); (9) Fibres; (10) Timbers (about which Mr. Hart says that an estate planted with mahogany and cedar, once established, would pay better than the best forest-land in Europe,—mahogany growing 1 inch in diameter per annum; the latter, cedar 1½ inch); (11) Miscellaneous (cinchona, tobacco and sarsaparilla). In conclusion, Mr. Hart winds up with some sensible general remarks, shewing that the practical planter has to find out what can really be well (and we must add, profitably) grown; and he gives it as his opinion that in British Guiana and Trinidad as in the West Indies generally,—the most encouraging of the so-called minor or subsidiary industries are:—Rubbers, Fibres, Kola, Dyewoods and Timbers. It remains to be seen in Ceylon whether the demand for Rhea fibre is likely to be so much beyond the natural supply as to warrant cultivation. Sapan wood for a dye is a favourite growth on many lowcountry estate boundaries, but we do not suppose, the profit encourages extensive culture. Many of our planters will ere long be able to shew what useful if not valuable timber trees can do for them at different elevations; and quietly but carefully on a few plantations at least is a sufficient trial being given to rubber, though not in so many districts as we should like to see it planted in Ceylon. Altogether, Mr. Hart's Report when it appears in full in our *Tropical Agriculturist*, will deserve the careful attention of all sub-tropical planters in Southern India, the Straits, Borneo, East Africa as well as in Ceylon.

THE OTTERY-TEA COMPANY OF CEYLON, LIMITED.

The Memorandum and Articles of Association of "The Ottery Tea Company of Ceylon, Limited," are published in the *Gazette*. 3. The objects for which this Company is established are—among others—To acquire the Ottery estate and half of Stamford Hill estate, subject as to the Ottery estate to a mortgage, whereof £2,500 sterling remains due, situated in the Dikoya District of the Island of Ceylon; to farm, manufacture, or cultivate tea, and (or) any other products or trees, plants, or crops which may hereafter be approved; to purchase tea leaf and (or) other raw products for manufacture, manipulation, or sale. The capital of this Company is R500,000, divided into five thousand shares of R100 each, with power to increase or reduce the capital. The following have each taken one share:—Harry Creasy, W. Bridgeman Kingsbury, Robt. H. S. Scott, Frances Augusta Scott, F. R. Cyril Coleridge, Emily Joanna Coleridge, and Celia Elizabeth Coleridge.

VICTORIA REGIA IN THE GORDON GARDENS.

The plants that were sent from Madras died, I believe from not being sufficiently established before being sent over, this was no doubt due to their anxiety to send the Government plants as soon as possible. The seeds have germinated very well:—I have started and more may yet come up, so that all going well in a month or 6 weeks' time there will be an ample supply of plants for the Gordon Gardens.—*Cor.*

THE WANARAJAH TEA COMPANY OF
CEYLON, LTD.

The annual general meeting of this Company was held in the office of the agents Messrs. Baker S. Hall on 31st August. There were present:—Messrs. J. C. Dunbar, (Chairman); and Thos. Mackie, (Directors); J. G. Wardrop, J. Clark, L. Davidson, A. Stevenson, snr. The following were represented by proxy:—Mr. Keith Rollo, Mrs. M. Rollo, Messrs. A. Orchard, H. M. Alley, J. MacLiesh, Eric S. Anderson, R. H. Eliot, Geo. Noel and F. H. Wiggin.

The following is the report:—

The Directors have the pleasure to lay before the Shareholders their Report, Balance Sheet, and Profit and Loss Account for the season ending 30th June 1895.

In pursuance of a special resolution passed at a general meeting of the Shareholders on the 14th day of September, 1894, and confirmed at a meeting held on the 19th day of October, 1894, the capital of the Company was increased from R315,000 to R378,000, by the issue of 125 new shares of R500 each, which were issued at a premium of R100 per share. The premium so obtained, R12,873, as shown in the Balance Sheet, has been appropriated for the purchase of manures for the past and current seasons.

The ordinary working of the estate shows a balance at credit of Profit and Loss Account of R80,473.38. Of this sum an interim dividend of 5 per cent was paid in January last, and the Directors now propose that the balance be disposed of as follows:—

5 per cent off cost of Buildings (Depreciation Account) ..	R. c.	2,271 60
10 per cent off cost of Machinery (Depreciation Account) ..		2,023 45
Dividend of 7 per cent ..		26,460 00
Balance carried forward ..		30,813 33
Total ..		61,573 38

The satisfactory result of this year's working may be mainly attributed to the good coffee crop secured, and the favourable prices obtained for this product as well as for the teas, the latter netting nearly 64 cents per pound as far as yet ascertained.

The general condition of the estate has been most favourably reported upon by the Visiting Agent.

The weeding, which has always been such an important and expensive work on this property, continues to show a marked improvement, and it is to be hoped that reductions will be made until the average cost per acre is in accordance with the general rate in the district.

The young tea planted under the coffee continues to fill out, while the forest clearings show good and even growth.

The suppling of the estate throughout had had careful attention.

MANURE.—The effects of manure are so encouraging, that the Directors have been induced to apply the premium on shares to this work, as they are confident that the benefit to be derived by the Shareholders will be shewn by increased returns in the near future.

BUILDINGS AND MACHINERY.—The water-course, which gave some trouble, as mentioned in the last report, is now in a sound condition. A set of lines were put up to suit this year's new clearing.

The extension of tea cultivation this year is limited to a clearing of 72½ acres, the works of which are progressing and well forward.

Prospects for current season are, as regards coffee, not favourable, some 200 to 300 bushels only being expected.

Tea, on the contrary, shows a considerable increase, the estimate being 170,000 lb. as against 117,697 lb. secured in 1894/1895.

Labour supply is in a satisfactory state, and the amount outstanding for coast advances is reasonable.

The Directors who retire by rotation, Messrs. A. Cantlay and J. W. Vanderstraaten, being eligible, offer themselves for re-election.

Mr. Guthrie, the Auditor, offers himself for re-election. By order of the Board of Directors, BAKER & HALL, Agents and Secretaries.

The CHAIRMAN in addressing the shareholders asked them to accept the report as read and addressed the meeting as follows:—I do not intend to delay you long today, as I think such a satisfactory report needs little comment; however as at the meeting of directors this morning a letter was laid on the table from one of the shareholders, asking for information on various points, I consider I cannot do better than answer these now. The first matter in the report for consideration is the premium on shares; this might have been paid back to the shareholders in the form of dividend, or placed to a reserve fund proper; but your directors think it better that the money should be utilised for manuring, as the V.A. and manager report so favourably on the effects of the manure applied to date. It is however for you, gentlemen, to confirm or not our action which I may say is quite in order under J.S.O. No. 4 of 1861 and clause 77 of the Company's Articles of Association. The next item in the balance sheet is the amount written off for depreciation, as our machinery and factory are practically new, I hope you will consider the amount sufficient.

TEA.—Final accounts of sales of tea have now been received and I am glad to say that they show a surplus of R1,435.10 over the amount shown in report. The average nett price obtained for the crop of 117,187 lb. of tea is 65.8.

COFFEE.—The disposal of the coffee crop was a matter which gave your directors a great deal of concern. The best offer made locally for the crop of 1st Parchment was R18.50, but as your Directors were aware that R19.25 and over with a falling exchange, had been offered for crops they refused R18.50, and instructed the Agents to ship if they could not obtain R19. Unfortunately the price obtained in London did not come up to the local offer; but your Directors did what, at the time they considered best in the interests of the shareholders. The actual crop was

3,248 bushels 1st parchment.
120 " 2nd "
50 " clean coffee.
250 " dried cherry.

ACREAGE.—It may interest you to know the acreage at present under cultivation—we have of

Tea 155 acres planted previous to 1890	
136 " " in	90
250 " " in	91

541 under leaf season	1894-95.
300 planted in coffee	1892.
28 " "	1893.
101 " in Forest	1893.
72½ being planted in	1895.

1037½ acres of Tea
60 acres Grass and Timber
26½ Forest.

1,124

There was a considerable amount of coffee over nearly the whole of the tea acreage last season, but there were primaries on only 320 acres planted with tea '92 '93. Since the completion of the coffee crop these have been removed as they were past bearing. As the tea fields are being pruned, the coffee-suckers are being cut out except on the 320 acres where they are fairly promising and with good luck will give a considerable crop next season. As mentioned in the report the coffee crop for this season is to be a very short one; but the manager writes that he hopes to see the tea estimate of 170,000 lb. considerably exceeded, so that I think gentlemen we are now fairly started on the road for regular and good dividends, even though we do recommend you to carry forward such a large sum as R30,813. Next year if our anticipations are fully realized, you will be able to strengthen your position by putting a considerable sum to reserve fund.

Mr. ALEX. STEVENSON argued that the accounts as presented were not in order, and proposed the following amendment, which was seconded by Mr. CLARK and carried unanimously:—

That the following words and figures be substituted on the credit side of the Profit and Loss account in the place of those appearing under the heading of "value of tea" viz.—value of tea sold and estimated "value of tea in store and afloat 117,697 lb." R75,166.07.

It was then proposed by the CHAIRMAN and seconded by Mr. R. DAVIDSON:—"That the report and accounts as amended, be received and adopted," which was carried *nem con.*

The CHAIRMAN stated that the next matter before the meeting was the declaration of a dividend when it was proposed by Mr. CLARK, seconded by Mr. WARDROP, and carried,

"That a dividend of 7 per cent be declared payable forthwith, making with 5 per cent paid in February last, a dividend of 12 per cent per annum.

It was then proposed by Mr. CLARK, and seconded by Mr. WARDROP,

"That Messrs. CANTLAY and VANDERSTRAATEN be re-elected Directors of the Company."

Mr. ALEX STEVENSON, then proposed and Mr. Davidson seconded,

"That Mr. JOHN GUTHRIE be re-elected Auditor for the ensuing year at a remuneration of R100.

A vote of thanks to the Chairman and Directors for their excellent management of the Company during the past year which was proposed by Mr. CLARK and seconded by Mr. Wardrop, terminated the proceedings.

THE HAPUGAHALANDA TEA CO., LD.

The first annual ordinary general meeting of this Company was held today at 12 noon at the registered office of the Company, 22, Baillie Street, Fort, those present being:—Messrs. Joseph C. Dunbar, Chairman; Thomas Mackie, Director; Wm. Taylor, by his attorney Robert Davidson; Mrs. Grace Stronach, by her attorney Thomas Mackie; R. Lewis M. Brown, by his attorney Robt. Davidson; Robt. Davidson as a shareholder and on behalf of the Agents and Secretaries.

The Report of the Directors for season 1894-95 was taken as read.

Report of the Directors for presentation to the first annual ordinary general meeting of shareholders to be held on 30th August, 1895, at 12 noon.

Your Directors beg to submit their first annual report and accounts for the season ending 30th June, 1895, which they trust may be considered satisfactory.

The quantity of tea manufactured for the season (including estate and bought leaf) was 173,585 lb.

After estimating the unsold tea at a safe valuation, the amount realized for this product has been R85,929.01, which is equal to fully 49½ cents per lb.

An interim dividend of 10% for the half-year ending 31st December, 1894, amounting to R17,000, was paid on 22nd February, 1895.

The sum now available for distribution (after writing off over half of the formation expenses of the Company, and setting aside R1,625 for depreciation on buildings and machinery) is R17,278, out of which the Directors recommend payment of a final dividend of 10%, making 20% for the year, leaving a balance of R278 to be carried forward to the next account.

The prospects for season 1895-96 are favourable.

The CHAIRMAN after proposing the adoption of same said:—"I have not much to add to the very satisfactory report laid before you. The season owing to absence of rain was not quite so good as expected and owing to the necessity of pruning a large acreage the crop secured fell somewhat short of the estimate. This season, however, the prospects are better and there is a considerable increase in the estimate of crop. The Visiting Agent reports very favorably of the general condition of the estate and the vigour of the bushes, especially in the fields pruned some six months ago. Since the publication of the report final account sales of tea for the season have been received and show a surplus over-estimated value of R629.60. This amount has, therefore, to be added to the balance carried forward."

Mr. R. LEWIS M. BROWN, by his attorney ROBT. DAVIDSON, seconded the adoption of the report which was agreed to unanimously.

A vote of thanks to the Chairman, proposed by Mr. THOMAS MACKIE and seconded by Mr. ROBT. DAVIDSON brought the meeting to a close.

TURBINES IN THE KALUTARA DISTRICT.

Mr. Starey is erecting a Turbine on Becherton estate, equal to 20 horse-power, having a full water supply nearly the whole year round.

On Geekiyanakande, a 28 horse-power turbine is being erected, a boring for it being through 100 feet of rock, and here also the water supply is good.

SOME MORE ABOUT CAMPHOR TREES IN CEYLON.

Mr. Nock of the Hakgala Gardens is still experimenting. He made a still and condenser exactly like the one in Spon's Encyclopælia and charged it with 55 lb. of chips from a tree with a stem of 4 or 5 inches in diameter, and which he thinks is about only 6 or 7 years old. The fire was started and steamed away for 12 hours. The air all round about smelling strong and pleasantly of camphor, and the water seemed impregnated with it and even that which ran from under the condensers tasted strongly of it, but when he came to open the condensers, there was no camphor. He doesn't know if he had it too wet or not, but that is the only fault he can think of, and perhaps it was carried off in the water for the coolies? There is something he has not got hold of yet. Mr. Nock noticed in the paragraph in *Observer* of 22nd July:—"What we specially note, however, is that the writer in the vernacular press seems to ignore the important point that Formosa camphor cannot be suitably refined without the addition of the Japanese vegetable." What is the Japanese vegetable and is it an article that has to be put in to make the vapour solidify or what? perhaps there is something in this?

Mr. Nock has one of the camphor trees at Hakgala that grows more like a willow than an oak. This is one that has been coppiced. There are a few small ones, about a year old planted in the Anuradhapura Gardens, and healthier plants no one need wish to see.

CITRONELLA OIL ADVANCING.

The market for citronella oil presents an interesting study just at the moment. The importations during the year which closed July 1st were nearly three times what they were the preceding year, being the largest on record, yet the market price has advanced over fifty per cent during the past six months, owing to a scarcity of oil, which is not confined to this market, but is felt in all commercial centers as well as in the primary market. Truly this is a very anomalous condition of affairs. What brought it about is what everybody interested is anxious to know. The most reasonable explanation that has been advanced is that the prevalence of low prices for several years has largely increased the demand from soapmakers, many of whom had been using some of the cheaper French essences. Especially during the past year has this increase been felt, which resulted in such an enormous export from Ceylon. The course of the market during the past six months is good evidence that the demand still exceeds the supply. The situation is such that lots which were contracted for to be shipped from Ceylon in 1895 will not come forward until December, instead of at intervals during the year, as was expected, which will bring them here in the Spring. The scarcity at the source of supply was first attributed to excessive rains, which were said to have interfered with the distillation, and quite recently to drought. Although the market price has been

in the neighbourhood of twenty-five cent per pound in drums for several years, during which there was a steady increase in the exports from Ceylon, it is among the possibilities that the natives, now that they are sure of a large and increasing outlet for their product, are desirous of obtaining a higher price than they have been accustomed to, or, perhaps, they cannot keep pace with the increase in the demand. At any rate, the indications point to a further advance in the price before a decline occurs.

We append a table which, with the single exception of the last line, was compiled from the United States Government reports, and includes lemon-grass oil, but as there is comparatively a small amount of this oil imported the figures will serve our purpose, as indicating the growth of the industry. The figures in the last line represent the importation of citronella oil alone:

IMPORTS OF CITRONELLA OIL INTO THE UNITED STATES.

July 1 to June 30.	Pounds.	Value.
1889-90	174,457	\$39,818
1890-91	355,735	73,764
1891-92	477,623	113,750
1892-93	411,151	86,924
1893-94	274,279	56,811
1894-95	743,663

—Oil Paint and Drug Report.

AN IMPORTANT PEAT INDUSTRY.

THE MOSS LITTER AND PEAT INDUSTRIES: MR. W. LAING MALCOLMSON AGAIN TO THE FRONT.

The prospectus of this promising company has now been issued to the public. The capital is 225,000 in 1/1 shares. The vendors take 75,000 fully-paid shares in part payment of the purchase consideration, this, be it noted, being the largest amount they are allowed to take under the rules of the Stock Exchange. The balance—150,000—are now offered for subscription. This Company has been formed of the purpose of acquiring and dealing with peat deposits, works, machinery and plant; also the valuable patents and patent right (with all future improvements) for the treatment of peat and peat fibre, which are now the property of the Peat Industries Syndicate and of W. Laing Malcolmson, and for the purpose of establishing and developing these industries in England, Ireland, and Scotland. Forty-three patents have already been granted for the following countries:—Great Britain and Ireland, France, Germany, Belgium, Sweden and Norway, Denmark, Austro-Hungary, Russia, Spain, Italy, the United States of America, and Canada. The peat moors, 1,757 acres in extent, with the fully-equipped freehold moss-litter factory, are situate at Schoeningsdorf, near Meppen, Hanover, and the two fully-equipped factories for the treatment of fibre and agglomerated materials (the principal of which is freehold) at Maastricht, Holland, and the depôts at Lingen, Dedemswaart, and Paris. The prospectus would seem to indicate that the company has excellent prospects of making a very respectable profit out of the enterprise, and shareholders who now take the advantage of the present opportunity or taking up shares are not likely to regret it.—*Colonies and India.*

MR. CHAMBERLAIN'S RAILWAY POLICY.—In answer to our application to a good authority, we have the following satisfactory expression of opinion:—

"You ask me what I think will be Chamberlain's railway policy. I think that wherever it is shown that the safeguarding of the Empire or the extension of its Commerce needs the construction of a line of railway, Imperial assistance in so far as it depends on Mr. C. and his colleagues will be given, and given with a promptness and liberality to which up to date we have not been accustomed."—Reuter's report of Mr. Curzon's speech published in our Saturday's issue points emphatically in the same direction.

SUGAR PLANTING IN GUATEMALA.

A successful coffee planter of Guatemala, Mr. Leodore Engelhardt, has gone to Germany to purchase an outfit for a sugar house. To a representative of the New Orleans *Picayune* has said:

"Guatemala is one of the best countries in the world for the cultivation of sugar cane. There is never any danger of freezes, and the cane grows very large. It is an ordinary thing to see a stalk 20 feet high, with the thickness of a man's arm. In addition to its bulk, the cane is exceedingly juicy. It is my intention to purchase machinery for a mill that will grind 1,500,000 pounds per annum. The cane grows down there with slight cultivation, labour is cheap and the market accessible on account of good railroad facilities."

Mr. Engelhardt also intends to cultivate Indian corn, as the supply of it in Guatemala does not equal the demand. The people have found coffee so profitable they have been contented to pay high prices for corn. One hundred pounds of corn, he says, is worth \$6 in Guatemala money, which is about \$3 in the currency of the United States. He believes that money can be made from the cultivation of the soil adapted to corn, and intends to send down about thirty Louisiana negroes to do the work in the fields. The natives are too lazy, and one good negro from the States does the work, without complaint, of more than half a dozen of the labourers of Guatemala. The soil produces three crops of corn in one year.

PLANTING IN SELANGOR.—THE RECENT LAND SALE.

This is for the eye of the new Resident-General of the Native States who will doubtless quite see the force of the plea that whatever be the fortunes of mining, planting is the industry which should receive every possible facility, encouragement, and actual assistance. A correspondent writes.—We have had a spell of fine planting weather, which has been taken advantage of. The land sale at Klang on Monday last was fairly attended, but prices would have been far lower all round but for the receipt of Mr. Forsythe's commission to buy, just at the last moment. The Selangor Government ought to employ half-a-dozen extra surveyors, if only temporarily, and after selecting an expanse of good land, have it all cut up in blocks ready for sale, so that newcomers might have a chance of getting what they want at once, without having to wait an indefinite period for the next sale. It is in matters of this sort that the Government policy errs on the side of economy, though any amount of money is always available for building, and so on. The extra premium resulting from competition at these sales is a mere fleabite, and if the Government were content to get settlers, looking to the future for their reward in the shape of a swelling revenue, instead of adopting their present skin flint policy of auctioning, say 3,000 acres when 5,000 or 6,000 would be taken up and opened if obtainable on easier terms, it would be far better for the country.—*S. S. Press.*

CHEAP TRANSPORT AND HOW TO GET IT.—Mr. Davis-Allen favours us (see page 251) with another of his instructive papers, this time dealing with gauge in reference to curvature and gradient. It will well repay perusal. One question arises as to the advantage of the greater boiler-space available on a broad-gauge in climbing a heavy gradient. We travelled on the Queensland narrow-gauge in 1870 and our train—it did not seem a long one—had some difficulty in getting up the inclines: there were not a few unusual stoppages. But it is possible the engine was to blame. Great improvements in locomotives have been effected within the past 25 years. The Queensland narrow lines were designed by Mr. Fitzgibbon who was third on the original Ceylon Railway Staff in Sir Henry Ward's time, while we found the then Chief Engineer, Mr. W. T. Doyne, in 1870, busy engineering the first railway in Tasmania.

CHEAP TRANSPORT AND HOW TO GET IT.—NO 6.

CURVE AND GAUGE.

The destructive factors which come into operation during the movement of a train round a curve are: (1) the thrust of the leading outside wheel against the head of the rail due to the centrifugal swerve of the train; (2) the nip arising from the oblique position of the wheels relatively to the rails; (3) the sliding of the wheels owing to the outer rail being longer and the inner rail shorter than the centre line; (4) the crushing due to the load being thrown on to the inner rail by the elevation of the outer one. It is not to the credit of railway engineers that the manner and degree in which these factors are affected by gauge should be still debatable. The chaotic state of opinion and the lack of assured knowledge hereupon were aptly illustrated in the course of the controversies which arose over the Nawalapitiya extension: we continue to take our examples as far as possible from Ceylon. Writing under date November 11th 1874 Sir C. H. Gregory said "I do not consider that the existence of 5-chain curves, if unavoidable, would be a bar to the use of the gauge of 5'6";" adding later, "to work properly on such curves special appliances would be required both in engines and rolling stock, such as shortening the wheel-base and the use of radial axles or bogies * * * these are no novelty, and the result of their use is an ascertained fact, and not a speculative question depending upon experiments to be made." But the local railway staff were of a different mind, and the Director of Public Works (Mr. J. R. Mosse), fearful lest the adoption of 5-chain curves should eventuate in break of gauge, and convinced of the possibility of securing at a slight additional cost a limiting radius of 6·37 chains, sent in to the Colonial Secretary an elaborate statement of his views on the subject, supporting them by quotations from a formidable array of authorities. Amongst them Sir Guildford Molesworth to whom he had submitted the following questions on the point in issue between himself and Sir C. H. Gregory:—"Have you practical experience on the State Railways in India of curves of 330 feet (= 5 chains) on a long gradient of about 1 in 44? Do you know of any means, by radial axle-box or the like, of adapting rolling stock on a gauge of 5'6" to curves of 330' radius?" To which Sir Guildford Molesworth replied:—"We have no practical experience of curves of 333 (*sic.*) on a long gradient and I sincerely hope we shall have none either on a gradient or otherwise* * * I know of no method by means of radial axle boxes which would lessen the friction so as to reconcile me to curves to any extent of 330' radius." Nearly twenty-years have gone by, and thousands of miles of railway on all kinds of gauges to all kinds of curves have been built, since Messrs. Gregory and Molesworth thus darkened one another's counsel, yet there is well nigh as much room for dissidence now as then.

All we know assuredly is:—First, that the resistance due to curves is much greater than would appear from Morrison's stale formula, still given in Molesworth's "Pocket Book," according to which the measure of the resistance is the figure obtained by dividing the product of weight of vehicle, co-efficient of friction of wheel on rail, and gauge plus wheel-base by twice the radius of curve. Second, that with a wheel-base

be less than twice), the destructiveness of any given curve is less, the less the gauge. Hence it is that to accommodate broad gauge rolling stock to sharp curves, or (keeping to the particular) to enable 5'6" wagons to run round 5-chain curves without absolutely ruinous wear and tear, the wheel-base must needs be contracted to the dimension appropriate to metre rolling stock, namely 7 feet or thereabouts. Even so, the wear and tear continues greater on the broader gauge by the amount due to the heavier axle-load, speed being the same. Off the curve the expedient is all to the bad, because vehicles whose wheel-base is much under twice the gauge have a tendency to travel askew and spread the track; they swerve now to this side, now to that, striking the rail laterally with a force proportioned to their momentum.

Let us get to figures. According to Mellen Wellington's calculations, the destructiveness of a 5-chain curve per ton of train weight would be 61 per cent less on a metre than on a 5'6" gauge with a wheel-base in both cases approximately twice the gauge. And the same author's experiments on the New York Pennsylvania and Ohio railway gave the following noteworthy results: on two locomotive sections of equal mileage, with the same rolling-stock load, the one virtually straight, the other consisting for one-third its length of curves of 6·37 chains radius and for the remaining two-thirds virtually straight, the locomotive expenses alone during the trial year were 7 per cent greater on the curved than on the straight. The gauge was 4'8½." A similar series of experiments on the Ceylon 5'6" track should show that locomotive expenses are at least 12 per cent higher on sharp curve sections than on straight; probably more, on account of the higher degree of friction which obtains in climates like that of Ceylon. The heavier wear and tear caused by curvature is, of course, not confined to the locomotive; it is felt in almost every item of operating expenses, notably in maintenance of the track. Locomotive expenses are singled out merely because the difference may be more readily and accurately measured. The third item of certainty in the matter of curve and gauge is that in broken country, the shorter the limiting radius of curve the less the cost of construction; and (repeating what we have already said) the narrower the gauge the less the danger and damage accruing from this source of economy. Lacking better argument, the narrow-gaugers on the occasion of a famous test run over the "seven foot way" from Didcot to Goring, privily abstracted the grease from Brunel's axle-boxes. Under a similar necessity the broad-gaugers, Messrs. Hawkshaw and Bidder for example, have denied both these propositions, or, to be quite accurate, they have belittled the saving to be effected by sharpening the characteristic curve, and have affirmed that where a little railway can go, there, *and with equal ease*, a big railway can go also. To such amazing statements were truthful church-going men driven a quarter of a century ago in their laudable endeavours to prevent break of gauge. Sir C. H. Gregory on the contrary (and these samples of the extent to which opinion takes the place of ascertained fact in railway practice cannot be too carefully pondered), Sir C. H. Gregory was so convinced of the saving which might be effected in hill country by shortening up the limiting radius of curve by shortening a chain that, advising on the Nawalapitiya extension, he wrote, "if a sacrifice of efficiency must be made in order to limit the cost of the extension, I have felt that the sacrifice of the curves was

the one which would probably produce the largest saving of cost with the least amount of injury" and accordingly he made the characteristic curve what it is beyond Nawalapitiya, one of 5-chains radius. That he was right we will not say, in advising 5-chain curves, but his view of the effect on cost of construction was amply proved by Mr. McNair's surveys and estimates, according to which on the line in question a difference of 1.37 chains in the limiting radius of curve made a difference of R10,000 a mile, the line being in every other respect the same.

Queensland supplies another example. The Ipswich-Toowoomba railway, 78 miles in length, was in the first instance, surveyed for a 4'8 $\frac{1}{2}$ " track with a characteristic curve of 8.19 chains, the dimensions adopted in the older colony of New South Wales. The cost being found prohibitive, a new trace was surveyed for a 3'6" railway of the same quality but with a minimum curve of 5-chains radius. This was built by Messrs. Peto, Brassey & Betts at a total cost of 34% less than the estimate for the wider line, while on the mountain section where the line crosses the Little Liverpool and Main ranges the saving was nearly 70%. The Little Liverpool range 700', and the Main range 1400, above the level of the surrounding district are cut up into long thin spurs with deep, narrow, steep-walled ravines intervening; perhaps as difficult a bit of country from an engineer's point of view as any in the world; the kind of country where a difference of a chain in radius of curve makes an enormous difference in cost of construction. In this case close surveys and estimates showed that in the item of viaducts alone a reduction from 8.19 to 5 chains would effect a reduction in cost of no less than £29,000 per mile on the 22-mile section (1865 prices).

Much of what has been said under the head of curve and gauge might with equal propriety have been said under the head of

ALIGNMENT AND GAUGE.

We have seen why and to what extent sharp curves are less injurious the narrower the track. With a grip on the practical corollary therefrom, namely that sharp curves may be more freely used in setting out a metre gauge railway than one of 5'6", there should be no difficulty in apprehending the following crucial propositions. First, that except it may be in crossing a billiard table, the alignment to a broad gauge will rarely coincide with an alignment to a narrow gauge, the divergence being greater the more broken the country, the more closely it resembles the spur and gully type of formation. Second that a comparative estimate of the cost of a narrow gauge railway to the alignment of one of broad gauge is unfair and fallacious; and the more fallacious the more difficult the country to be traversed. A metre track should be allowed to pick its way, and to take full advantage of the greater facility with which it can mould itself to the natural contours of the surface, and thus elude the necessity for tunnels, cuttings, lofty embankments, and the long culverts which lofty embankments entail. To coerce a narrow gauge railway to the restricted alignment of one of wider type is to throw away a main source of its handiness and cheapness.

The fallacy should now be obvious which vitiates the cut-and-dry method employed in Westminster to calculate the saving in the item of earthworks resulting from a reduction of gauge: "subtract the cost of a parallelogram of the width of the difference of gauge and of

the depth and height corresponding with that of the cuttings and embankments"—quietly assuming, the reader will note, that in country broken up into spurs and gullies and on prairie or veldt as smooth as your Sunday hat, the alignment of the two will be the same! Where an orographical survey is available sufficiently detailed to show the contour lines for every tenth foot of altitude, alignment and quantities for a narrow gauge line may be approximately worked out from the plans and estimates for a broad gauge; but where as in Ceylon no such datum exists an absolutely independent survey is indispensable. And the assumption that all gauges must travel from terminal to terminal by exactly the same route is misleading with respect not only to earthworks, but to such costly features as tunnels, viaducts, bridges and culverts also; how misleading may be inferred from the instance already cited of the viaducts on the Queensland Southern and Western Railway.

GRADIENT AND GAUGE.

Were railways straight and level throughout, locomotives might be smaller or trains much heavier, so little would be the tractive power required—say from 6 lbs. to 18 lbs. per ton of gross weight behind the engine, according to speed, climate, and conditions of road and rolling stock; with about thrice this power of pull for starting. But very few railways are level throughout; most have a very appreciable percentage of their length on the slope; the Indian metre lines, for instance, have about 20 per cent, say 400 miles, of their united length on gradients worse than 1 in 200. The worst gradient on a line determines the weight of its locomotives, and with it all those items of construction and maintenance which in their turn are ruled by the travelling load.

But the influence of gradients does not end here; it is felt in cost of haulage also. For a gradient adds to the work of hauling the train, the much harder and costlier work of lifting it, and this at a rate such that the vertical rise per cent of distance traversed, the gradient in plain phrase, expresses the percentage of the train-load added to the resistance of haulage on the level. Thus if the resistance to haulage on the level be 10 lb. per ton of train-load, a gradient of 1 per cent (= one foot of rise per 100 feet length of rail) would add 22.5 lb. per ton of train load to the work to be done by the locomotive; a gradient of 2 per cent (1 in 50) would add 45 lb.; one of 2.5 per cent (1 in 40) 56 lb.; and so on. Or take a locomotive whose weight is so distributed as to throw 18 tons of it on the coupled wheels. Then reckoning its tractive power at one-sixth the insistent weight, and the tractive power required per ton of train load on the level at 10 lb., such a locomotive should move 672 tons—on the level. But now see the reduction of haulage capacity when the train requires to be lifted as well as pulled: On a gradient of 1 per cent. the locomotive would be equal to a load of no more than about 260 tons; on one of 2 per cent. 120 tons; and on one of 2.5 per cent. 100 tons only. In view of these facts it should be easy to understand why where a heavy traffic is to be provided for, no outlay is begrudged to secure a level track, the saving in haulage and upkeep more than covering interest on the extra capital thus expended. Our concern, however, is with cases of light traffic, with cases, therefore where the limit set to capital expenditure by the prospective returns is soon reached. Here the prime consideration is a cheap line, and sharp curves

and steep gradients, *cum multis aliis*, are resorted to as making for cheapness. But these expedients (and the fact cannot be too clearly kept in mind), all entail some sacrifice of efficiency, some increase of operating expenses, and are justifiable only as the alternative to no railway at all—the predicament of most projects which hinge on traffic “in sight.”

Of expedients for cheapening first cost, curvature, as we have seen, is less objectionable on narrow than on broad gauges. In the use of gradients, on the other hand, all gauges enjoy pretty much the same facility with the exception of those of less than one metre, which labour under the disadvantage explained in an earlier article. In all cases the train has to be lifted, and the extra work thus thrown on the locomotive is in no wise affected by the space between the wheels.

When however, gradients are complicated by curvature, and in hilly countries the one is seldom found without the other, then gauge begins to tell, and the metre and its congener the 3' 6" resume their superiority in this respect over the 4' 8½" and 5' 6". It is customary to represent the effect of curvature on gradient as the equivalent of an increase in the angle of inclination, according to a formula devised by the late Professor Rankine of Glasgow. But the formula does not square with the observed facts of experience, and it would be nearer the mark to represent the combination of curve and gradient as equivalent to a sharpening of the curve.

COOLY LABOUR IN S. INDIA AND THE SUPPLY FOR THE STRAITS.

EXTRACTS FROM REPORT ON A VISIT TO SOUTHERN INDIA.

By MR. E. V. CAREY, CHAIRMAN, Selangor Planters' Association.

As soon as I arrived at Negapatam I at once went to see Dr. Hardaker, who gave me application forms for four licenses (one for myself and three for my *Cangnies*) and a letter to the Assistant Collector, a native gentleman, who after hearing what I had to say, sent me on to the Port Officer, it being apparently the custom that the latter official should signify his approval of the applicant before the licenses could be issued. Having survived this ordeal I obtained my licenses, free of cost, but before availing myself of the privileges which they conferred upon me, I had again to take them to be countersigned, by the Port Officer and Emigration Agent. The time occupied by these proceedings was exactly five days, the previous record having been, I was told, a month, so I had every reason to consider myself extremely lucky; but I could not help thinking that the matter would be much simplified if licenses were issued direct on Dr. Hardaker's recommendation, which surely should be sufficient. There does not seem to be any other objection to the system of compulsory licensing, which to some extent prevents irregular recruiting by persons whose representations, as a rule quite false, must in the end do considerable harm to the cause of emigration to this country.

During my stay in Negapatam, whilst waiting for my licenses, I took the opportunity of sounding Messrs. Adamson, Mactaggart & Co. and Messrs. Ganapithay Pillai & Co., both of whom recruit indentured labour, with a view to ascertaining whether they would undertake the supply of free coolies also. The latter firm refused point blank on the ground that they were prevented by law and also that they could not work the two businesses harmoniously. Messrs. Adamson, Mactaggart & Co., however, acting upon my suggestion, addressed the Government upon the subject and endeavoured to find out what the legal position was, but up to the

time of my departure they had received no reply; they, however, expressed their willingness to recruit for us on reasonable terms provided no legal difficulties existed.

After some trouble and a lengthy search through many Immigration and Emigration Acts and Ordinances, I unearthed a Madras General Order dated 15th May, 1888—a copy of which I have handed to the Honorary Secretary for information of members—which does not seem to have been repealed and which covers copy of a Circular addressed by the then Acting Indian Immigration Agent, Penang, to Estate Managers in the Colony and the Native States. This Circular, which purports to have the force of law, is worded as follows, and is dated Penang, 8th November, 1887:—“I am directed to inform you that the following rules are to be observed with reference to the recruiting of labour in India. (a) All recruiters arriving in India with a letter from the Indian Immigration Agent and those appointed by the agents of the planters there shall take out licences in India. (b) No agent or recruiter shall receive any commission on coolies not entered in the list of indentured coolies (Form A).

“2. I will ask you to be good enough to communicate the above rules to your Agents in India—(Signed) H A THOMPSON, Acting Indian Immigration Agent.”

Commenting upon the above rules the Madras Government, in the same Government Order, p. 9 para 5, has the following:—“The proposal that agents and recruiters shall not receive a commission for any emigrants not entered in Form A cannot of course be enforced by this Government.”

The position, briefly summarised, is therefore this: the planter may go to India and recruit free coolies, he may send his native agent from here for the same purpose providing he pays him no commission; but he cannot employ even the most respectable and trustworthy agents at Negapatam to do the same thing because he is not allowed to pay such agents any commission, free coolies not being entitled to have their names entered in Register A, which is reserved for indentured labour only. This, I venture to think, is an exceedingly anomalous and untenable position, and I have no doubt that when it is pointed out to the Government exceptions will be made in the case of firms and agents of standing and position. The fact of the Madras Government declining to enforce the Order referred to does not do away with the difficulty in Penang, which must clearly be set right, for such enormous and comprehensive powers are conferred upon the Immigration Agent there by Indian Immigration Ordinance, No. V. of 1884, that it is conceivable that coolies recruited on commission through Indian agents (the fact having become known to the Penang authorities) might not be allowed to proceed to their destinations in Selangor.

Leaving Negapatam I went for a 10-days' round of the recruiting grounds at which I hoped to collect coolies, visiting Madura, Chittambaran, Kumbakonam, Tiripatooroo, Tullikapetty and other towns and villages. Wherever I went I found the coolies willing enough to listen to all I had to say and many of them to come with me, though somewhat sceptical as to the existence of such a place as Selangor, with its salubrious climate, high wages and already settled Tamil community.

I regret that I am unable to announce what the net result of my trip was, as the *Cangnies* I left behind have not come in yet; but I believe that I have secured 100 to 150 coolies, which was all that I wanted, and I am certain that had I been able to stay in India for two months or so myself I could have recruited 500 if I had been desirous of doing so. In one or two villages I found coolies who had been over to the Straits, but under indentures, and it was only when I explained that I proposed to enter into no contract with them, that I could in these cases obtain a hearing at all, the native recruiters who had got at them in the first instance having, according to their own accounts, misled them not a little.

To sum up, I attribute the poor influx of Tamil labour into this country to the following causes:—(1) Want of advertisement—the vast majority of the coolies I spoke to only knew the Straits by name as “Singapore” and had not heard of Selangor at all; (2) The heavy and steady drain upon the villages from the tea and coffee estates in India and emigration to other and better-known countries. In connection with which it may here be stated that the “congestion” cry appears to be much exaggerated; (3) The prevalence of the truck system, by which the labourer is practically kept always in debt to the “Jemindar” or headman, lessee of the land on which he lives, where he works, and from which he consequently often experiences great difficulty in getting away; (4) The system of recruiting as adopted by the agents of indentured immigration—*viz.*, R16 per head paid to native recruiters for every coolie brought to the depôt at Negapatam and passed by the Medical Officer. The recruits may not have had a rupee spent upon them, but the recruiter gets his money all the same, and these men are naturally strongly opposed to free labour operations where strict accounts of expenditure have to be kept. They are also practically the only recruiters the coolies in the villages have any experience of, and I should say the large majority of them are men who as long as they secure recruits, care little how they get them; and consequently command neither the respect nor the confidence of the inhabitants.

Although I saw many gaudy posters in the offices of the Negapatam houses which were supposed to be distributed as labour advertisements through the villages, I never came across one of them there myself, nor did I meet a single coolie who had seen one.

INDENTURED IMMIGRATION.—So much has been said of the unsuitability and poor physique of the coolies sent over through the agency of Messrs. Adamson, Mactaggart & Co., and other firms in Negapatam and elsewhere, that I took the opportunity of visiting the depôt, which is situated in a rather out-of-the-way quarter of Negapatam, whilst several batches of these coolies were being examined by the Medical Officer prior to despatch to the Straits. The depôt was a large airy building kept scrupulously clean, and the accepted recruits were as fine looking a lot of men and women as one could wish to see—indeed, Dr. Hardaker turned away several as unsuitable whom as far as physique went I would have been uncommonly glad of myself,—on the ground that their hands were not hardened by manual labour, or that they belonged to other than an agricultural caste. Each man was made to use the mamotty or changkoi in the presence of Dr. Hardaker until the sweat ran off his back, in order that his knowledge of the use of this instrument, which is more commonly used than any other for digging purposes, might be thoroughly tested. I also learnt that, in the case of Messrs. Adamson, Mactaggart & Co., a member of that firm almost invariably inspected their new recruits, after his Government examination, in order that there might be no doubt as to their fitness for exportation as agricultural labourers. I went over to India prepared to find the whole system of indentured immigration rotten, as I believed it, and as I know numbers of planters believe it, to be. But I soon saw for myself that it had a great deal to recommend it and that in many respects it was excellently worked, especially in every particular connected with the depot at Negapatam. It is the more to be regretted therefore that the many drawbacks which the system possesses, and which I do not propose to touch upon now, render it so unacceptable to planters who have been accustomed to free labour, that they do not care to avail themselves of its provisions and assistance.

The solution to the whole labour difficulty is to devise some means by which a sufficiency of labour may be attracted to the country, and not to compete for what we already have.

GENERAL.—I strongly recommend that the Association should have a native agent travelling by every steamer to and from Negapatam to look after and assist all coolies whose passages have been paid for

them by our Negapatam agents, and who unless in charge of some responsible and recognised guide, might easily get adrift in Penang.—E. V. CAREY.

New Amherst Estate, 27th July, 1895.

AN IDEA FOR CAPITALISTS.

Mr. Gambier Bolton, F.Z.S., who ought to know, says that there is money in wild-beast raising. He says that an extremely large business is only waiting to be worked up in this line. Its aim would be to supply specimens to the ever-increasing number of private and public collections. A piece of land on the south coast, well sheltered from north and east winds, and with a sandy soil, is recommended by Mr. Bolton as the most suitable site for this novel farm. How to stock it! “A small expedition, already seriously talked about, would produce the African mammals, such as lions, zebras, hippopotamus, the rarer antelopes, and eventually giraffes and elephants; while a skilled buyer sent to Singapore could obtain tigers, Malayan tapirs, and other Asiatic mammals; and bison, wapti, and pronghorn antelopes can still be purchased in Canada and America.” Mr. Bolton has no fears of the result of a well-managed enterprise on these lines.—*New Budget*, Aug. 15.

LIBERIAN COFFEE IN WYNAAD.

To Editor, *M. Mail*.

SIR,—Your issue of the 22nd instant contains a letter on Liberian coffee, written by Mr. H. B. Winterbotham, of Vayitri, to the Agri-Horticultural Society, Madras. As this gentleman has, I believe, a longer experience of Liberian coffee in Wynaad than any other planter, his opinions are valuable and should carry weight; but, in the course of the above letter, he makes two statements to which exception must be taken. He says:—“The Liberian we find will grow from 500 feet to 3,000 feet.” Again:—“It seems to bear very satisfactorily from 2,000 feet to 2,500 feet.” This would mean, by implication, that 3,000 feet is the highest elevation at which the cultivation of Liberian coffee could be successfully undertaken in Wynaad. This is a mistake; for in Nellacotta (S.E. Wynaad) we have very fine specimens which yield large crops, at an elevation of some 5,000 feet. I have some 60 trees, two of which were planted, as far as I can learn, about 18 years ago. These later are 30 feet in height, and bear heavily every year. They are now covered with immature fruit, the April blossom having been a fine one. The other trees, planted many years later, are from 12 to 15 feet in height, and also bear well. Avondale Estate contains two fine Liberian trees; while on Devera Shola Estate there are quite a number, 300 perhaps at a rough guess, all of which crop heavily. No Nellacotta planter has gone in for Liberian on anything like a large scale; but from the specimens extant it is quite evident that this species of coffee would do well. The limit of its successful cultivation can therefore be safely increased in Wynaad to 5,000 feet.

Mr. Winterbotham says:—“The sample of this giant kind . . . has lately been valued at 85s. to 90s. in London, or say 10s. per cwt. less than ‘Arabica.’” The proof of the pudding is in the eating, and Messrs. Patry and Pasteur’s Market Report for the week ending the 24th July contains the sale price at auction of a consignment of Wynaad Liberian (from S. Wynaad I take it, and the first consignment I think ever sent Home), “3 bags Wynaad Liberian” are there stated to have realised 74s per cwt. “3 bags Travancore Liberian” brought 46 per cwt. less; and I greatly doubt whether it would be safe ever to reckon on higher prices than these. 73 bags Johore Liberian fetched the high price of 86s 6d per cwt. It would be interesting to know the reason for this large difference. Probably the latter is a better variety with a finer bean.

TODA.

ART EXPORTS.

If we examine the returns of nearly every Eastern country we shall see the large proportion that art productions bear to the general volume of exports. Japan probably takes the lead in this respect, and China makes a very respectable second, while many other countries at least make a respectable show. But Ceylon is almost entirely outside the category of art-exporting countries. India makes a show with the products of her looms, with her Benares and Delhi work, and with the large quantity of carved furniture produced in the Bombay Presidency. Why should Ceylon form such a notable exception in this respect? For it is undoubted that among the Kandians, at all events, the faculty if not the genius for art is original. The taste shown in the designs of many Kandyan buildings of a former age, and in connection with certain work in metals, evidence the originality of this possession. Those designs have no parallel in any other country. They are unique. Anyone can recognise their features. Side by side with the work of India, Burma, Siam, or China, the trained eye immediately and without difficulty separates the work of the ancient Kandyan architect. It has a distinct and early recognisable style that is by no means deficient in attractive features and particularity. It is safe, therefore, to say that we have an original school of art among us, and the question thereupon follows why it remains so undeveloped and so unappreciated that its results bear no place in our export list? We have heard it argued that there is no appreciation of Kandyan productions in European countries, that they are not suited to the taste cultivated therein. But Japanese art is at least as eccentric as or even more so than, that of Ceylon, and yet the demand for its productions in Europe, far from waning, seems to increase day by day. Experts tell us that it is colouring that determines appreciation by European taste, and that the Japanese excel in this. Well, it must be admitted, we think, that Kandyan taste, with its affection for bright yellows and the sharp contrast that the use of these enforce, are scarcely consonant with the canons of European taste. If this be so, it seems a pity that failure to please in one department of art should exclude our native productions from appreciation by outsiders. Does it of necessity follow that because crudity in colour has existed through many ages that it must necessarily continue to deface native art? That crudity is at least peculiar and distinctive; but if it does not please, might not innovation upon it be allowed without carrying the stigma of Philistinism? Who, in Ceylon, is competent to advise and aid to some useful result.

CEYLON AND OTHER TEAS IN AUSTRALIA.

(From *Alfred Harvey & Co.'s Monthly Tea Report.*)

MELBOURNE, Aug. 20.

GENERAL.—The second series of sales of Foochow teas was held on the 14th, when equal to 21,000 half-chests were offered, of which 17,500 found buyers, the withdrawals, as in the first series, being almost confined to low grade common coango. During the interval between the first and second sales, almost all held over from the first sales have found buyers at prices then demanded. The selection in the second coango was, though limited, mainly good useful Panyong kinds, and for these the biddings were spirited throughout at 5 per cent. advance upon opening sales.

Some small sales of Indians ex "Bucephalus" were held on the 23rd, at which there was no change in value, and biddings were dull. Much larger printings will claim attention today—some 4,600 chests. The bulk shows no improvement in quality, and there is an increasing number of poor Kangra Valley and kindered growths boldly marked Darjeeling. It is almost a pity some of the more venturesome shippers do not send these *via* Colombo, marked with some crack Ceylon garden, and so avoid injuring the good name of one of their best districts.

Ceylon teas continue in very limited supply, and in consequence there has been a gradual firmness in all grades, with a substantial advance in good quality, especially fine and finest. Both the Foochow and Colombo markets are well above local values, and Calcutta remains without change. Stocks in bond on the 10th were 2,589,946 lb., against 3,576,816 lb. at same time last year.

CEYLON.—Shipments are 3,331,000 lb., against 2,200,000 lb. at the same time last year; or an increase of over 1,000,000 lb. in less than three months. Consumption is evidently much larger, as there is little or no stock on this market, and latter arrivals having been small, prices advanced for all kinds, more especially for hill-grown, fine quality showing 1d to 1½d advance. Prices paid were:—For dust, 5½d to 5¾d; bold red leaf, 5½d to 5¾d; good leaf pekoe souchongs, 6½d to 7½d; pekoes, 6½d to 8½d; broken and orange pekoes, 7½d to 11½d for choice. Stocks in bond on the 10th were 369,625 lb.

PLANTING AND PRODUCE.

TOO MUCH VIRTUE IN TEA LEAVES.—We had occasion last week to refer to the hostility to tea shown by some medical men. We can now give an instance where too much virtue was ascribed to the leaf. A chemist's assistant named Perdue recently appeared before the coroner for East London in connection with the death of a child. Perdue, in the course of the evidence he gave, said: "I have attended the sick, the dying, and bereaved in various parts of London." "Then the sooner you give it up the better for your patients and the safer for yourself," remarked the coroner encouragingly. "I am fully aware of it," continued the unabashed chemist's assistant, "but I never charge anything from anybody, and its wonderful what I can do with my skill." "What can you do?" asked Mr. Baxter. "I can make anything out of tea leaves," answered the witness; "it's really wonderful what you can do with them if you only try." "But that does not give you the right to act as a doctor," suggested the coroner. "I live only to do good to others," replied Perdue, "and if I do wrong I will stand the risk." "Do you make your medicine of tea leaves?" queried Mr. Baxter. The young man, whom the coroner called foolish because of his answers, denied the impeachment, but those who smelled a bottle produced declared that the decoction smelled strongly of the fragrant plant. According to the testimony of a duly qualified doctor, the stuff Perdue had prescribed was harmless, and the child's death really resulted from bronchitis.

A TEA LEAF ADEPT.—Interviewed by a Press representative, Mr. Perdue revealed some further secrets in connection with his use of tea-leaves. The reporter found Mr. Perdue hard at work with his hands buried deep in a brown trowley compound, which proved to be his own new and original preparation for the cure of gout. Leaving his bowl of ointment, he led the way to his tea-leaf repository at the back of his premises. There, according to his own sweet will, he either turns the tea-leaf into boot blacking or ink. For the manufacture of the former the leaves are put through a drug press, then through various degrees of oxidation, and finally mixed with sugar, vaseline, and oils. The result is a solid compound, which is cut up into halfpenny cakes, not unlike burnt coffee, and solid as blacking. The ink is made by a different process, but this Mr. Perdue keeps hermetically sealed in his bosom. Whatever may

be his true title to fame he has certainly an inventive turn of mind, and has succeeded in getting himself his ideas, and his wares much talked about in the locality.

A NEW TEA COMPANY.—Under the title of the Tingri Tea Company, Limited, a company has been registered by Collyer, Bristow & Co., 4, Bedford Row, W.C., with a capital of £60,070 in 10 shares. Object, to acquire the business of tea, coffee, and cinchona planters and cultivators, as hitherto carried on by the Tingri Tea Company, Limited, in the province of Assam, in accordance with an agreement expressed to be made between the said Tingri Tea Company, Limited, and G. G. Anderson (the liquidator thereof) of the one part and W. Groundwater, on behalf of this company, of the other part, and to carry on and extend the same.—*H. and C. Mail*

CAMPHOR IN FORMOSA.

CAMPHOR.—The actual quantity of this valuable product shipped from Tamsui was larger in 1894 than in 1893 by about 1,000 cwt., but the average price obtained in Hong Kong was less per picul of 133½ lb. by 1.60 Haikwan tael for the same period. This and exchange account for the fall in total value from £16,836 to £90,149. There were unusual fluctuations of price during the year. The quotations in Hong Kong during the June quarter touched a lower level than for many years previously, while for the latter six months of the year prices recovered themselves partly owing to the disturbed state of the producing districts which threatened the supply, and partly in consequence of the war and an anticipated blockade.—*Consular Report for 1894.*

OOLONG TEA IN FORMOSA.

Oolong Tea is both the cause and the condition of the commercial prosperity, not only of North Formosa, but in great measure of the neighbouring mainland port of Amoy. And whereas not many years ago Tamsui might have been regarded almost as a dependency of the former port, it is a question whether the relative position would not soon be reversed were the normal political status of Formosa to remain unchanged. The total export for the year under review was very nearly 18,300,000 lb., valued at £480,566, against 29,017,000 lb., valued at £730,590 in 1893. In mere bulk this is a falling off of some 1,700,000 lb. Nevertheless the true Formosa crop was probably larger than in 1893, and the smaller figures are due to a satisfactory cause, the decrease, namely, in the import of inferior teas from the mainland for mixing with the island-grown leaf. As much as 60,000 half-chests, or 2,580,000 lb., it is estimated (though this may perhaps be too high) should be deducted from the export of 1893 on this account. The firm stand made in 1894 by the foreign buyers in declining to accept teas containing more than a certain percentage of dust had a good effect. The great feature of the tea season of the year under review was the settlement of nearly half the entire crop in Tamsui itself. Such a proportion has never been achieved before. The figures are for 1894, purchased in Tamsui 205,000 half-chests: in Amoy, 220,000.* For the previous year the totals were, bought in Tamsui, 160,000; in Amoy, 305,000 half-chests. The standard of the crop, taken all round, was decidedly satisfactory, and showed more careful preparation by the Chinese than the crop of 1893. The autumn pickings were much better than any autumn teas for some seasons. Dollar prices were naturally high, owing to low exchange, and the country growers made money. So also did the native packers. And I may add that it is understood that the foreign firms engaged in this branch of commerce have no reason to be dissatisfied. Many native tea buyers closed their hong and returned to the mainland when the war with Japan

* Other figures which I have seen show an even closer approach to absolute equality.

commenced, a step which made matters considerably easier for the foreigners who remained and did business. The export of *Pouchong Tea* for Chinese, in the buying of which only native firms take part, increased by about 478,000 lb.—*Consular Report for 1894.*

TOBACCO IN FIJI.

Mr. Sutherland, the local manager of the Nadroga Tobacco Company, has been in town for the last day or two. He reports having harvested twenty acres of tobacco, which is now in the drying houses. Some 60 acres more are also in a forward state, and will soon be ready for cutting. The growth of the tobacco, we are glad to learn, is quite up to expectations, and leaves little to be desired with respect thereto.—*Fiji Times*, July 31.

TEA AND TARIFFS IN PERSIA.

Some light is thrown on the revolution in the tea trade which has recently occurred in Persia by the following extracts from the report for the financial year 1894-95 on the trade of Khorassan by Consul Ringler Thomson:—

The customs regulations as they affect British trade are as follows:—Persian and Afghan goods are charged a duty of 5 per cent. *ad valorem*. The importation of European and Anglo-Indian goods is forbidden, except pepper, ginger, and some other drugs (3 gold r per pound, 35lb): black tea (25 paper r per pound); green tea (14r 40c, paper, and 6r, paper, per pound, according to quality). Green teas destined for Transcaaspia and Bokhara may be sent in transit by Bitoum, Baku, or Ozanada, either to Ashkabad or to Bokhara, where the above duty must be paid. Now it is this last apparently simple clause which is to cause a revolution in trade here. In the first place, the natives of Russian Central Asia drink none but green tea, and up till now all of it has passed through either Afghanistan or Persia. But the dust in Afghanistan being very heavy, and the country sometimes disturbed, that route is not popular, and the great bulk of the green tea (either Chinese or Indian) has been brought from Bombay *via* Bandar Abbas to Meshed, and then sent on to Russian territory. In Persia, if the tea belongs to a British or Russian subject, only 5 per cent. *ad valorem* is paid on it; and, until the new regulations were introduced, 2½ per cent only was paid on the Russian frontier, and 2½ per cent more if it was despatched to Bokhara. Then if it entered Turkistan 11r per pound was levied on it. If the tea is the property of a Persian subject, the duty is nearly 10 per cent in Persia. The Chinese green tea is superior to the Indian, and costs about double as much, and therefore little or none of the Indian green tea entered Turkistan. But under the new regulations, the tea is to be taxed 5 to 10 per cent in Persia, and 6r or 11r 40c (paper), according to quality, on the Russian frontier, and nothing in Turkistan. In other words, the tea for Transcaaspia and Bokhara, which comes by this route, is to be taxed something like 50 per cent. The Russians, however, have hit upon a very clever plan, whereby the whole of the duty hitherto paid in Persia, say at least £3,000, will be swept into their pockets, after being multiplied by about ten (of course much depends upon exchange), and yet the price of Indian green tea in Transcaaspia and Bokhara (where it is drunk) will only be very slightly raised. The Chinese green tea will become, it is true, nearly 50 per cent dearer in Bokhara; but in Turkistan it will become considerably cheaper, and the Indian green tea so much cheaper that now it will probably find a sale in Turkistan.

HOW IT IS WORKED.

It has been managed in this way: Up till January last, all tea, black or green, arriving at Black Sea ports, paid a duty of 21r (gold) per pound (35 lb). The gold rouble is an imaginary piece of money. The only gold coins in Russia are half imperials, and these are equal to 5r (gold) each. At the present moment £1 sterling is worth about 9r 30 (paper),

and a gold rouble is worth about 1½ (paper). A paper rouble should be of the same value as a gold rouble, but such has not been the case since the Crimean war; and its value at one time was only half that of the gold rouble. Thus black and green teas arriving at Black Sea ports paid 21r (gold), or about 32r (paper) duty per pound. But now a concession has been made in favour of green tea, under which it may pass, in transit, through Batoum for Central Asia on payment of a duty of only 6r or 11r 40c (paper) per pound, according to quality. This great reduction in duty cannot fail to cause that route to be adopted in preference to the route through Persia for several reasons.

Firstly, the Russians have carefully worked it out, and reckon that the expenses by way of Batoum will save about 3r 12c per pound. If, then, we suppose 1 lb. of Indian green tea to cost 8a in Bombay, and 1 lb. of Chinese 1 rupee, we get the following result; but three factors must be kept in mind: 1. Exchange has been calculated at 1 rouble equals 6 krans equals 2 rupees, and it is sure to alter considerably. 2. The rate of transport through Persia to Bokhara (including the old rate of 10 per cent. duty) has been calculated at 4a per lb; that is the rate when forage is cheap and carriage easily procurable, but otherwise it would be much dearer. 3. The Russian estimate may be wrong, so that these statistics must be taken for what they are worth. This would make the Indian green tea 8c per 1 lb dearer when brought by Batoum than it was before January when brought via Persia, but the Russians reckon it will only be perhaps 2c dearer. Secondly, by the route through Persia the tea takes at least three months to reach Bokhara from Bombay, and often six, because transport is not always procurable, especially when forage is scarce, or wells dry up, or an arctic winter prevails. On the other hand, a merchant steamer travels from Bombay to Batoum in twenty-two days, and the remainder of the journey can be performed by a traveller in six days. Goods, of course, would take longer, but they should not take longer than forty days in all. Green tea is all that may pass, in transit, at these rates *via* Batoum for Central Asia; but it is expected that the route will be adopted now for other goods, such as indigo and muslin. Indeed, a large quantity of the former article has recently been despatched that way. And there is no doubt the regulations will be modified hereafter, if necessary, so as to draw trade by the new route. Meantime the merchants here are very angry and profess to be very suspicious about it, and it is quite possible that some little time may elapse before it becomes really popular.

THE RUSSIANS INSIST ON THE BATOUM ROUTE.

The Russians themselves do not expect great results all at once, if only because there is enough tea now in Bokhara to supply Central Asia for two years. The people here say the tea will be spoilt by the long sea route. This old fallacy is exploded even in Russia. Tea properly packed in lead-lined cases cannot be affected by a sea journey of three weeks in a well-founded modern steamer. Moreover, the Chinese tea has, in any case, to undergo the sea voyage from China to Bombay, and by the Persian route from Bombay has another sea journey of ten days. Tea gets more shaken several hours daily upon the back of a pack-animal than in the hold of a vessel, and the case which contains it is liable to more damage in the constant loading and unloading it undergoes. Moreover, in the former case it is likely often to be exposed to heavy rain for hours together, and sometimes to be immersed in water while the animals are wading through rivers. This happened recently to a couple of cases of tea which were brought here through Afghanistan.—The merchants say, too, that the tea will be impregnated with naphtha passing through Baku, &c. They also declare that numerous vexatious restrictions exist in Russia which neutralise the other benefits. There may be some truth in this, but one point they brought forward was found to be exaggerated. They stated that a deposit equal to three times the value of the tea is demanded at Batoum, and not refunded for three months. This is

what really happens: On arrival at Batoum the tea is sealed and despatched to Baku, where it is examined, and a deposit taken equal to the customs duty which will eventually be paid on it at Askhabad or Bokhara. Then it is shipped to Ozanada (across the Caspian) where the weight is checked. After this, if the owner wishes again to send on the tea, in sealed waggons, the customs agent at Ozanada at once gives him an order for the refund of the deposit at Baku, and the tea is sent on to Askhabad or Bokhara, where the duty must be paid. If, however, the owner wishes to send on the tea unsealed from Ozanada the deposit is not refunded until information is received that the duty has been paid on the tea at its destination. The Bokharan merchants, who have no agents at Baku, may pay the duty at Bokhara, and it is now being arranged that no deposit at all will be required, and that the duty will simply be taken at Askhabad or Bokhara. Several points in the regulations are necessarily only tentative. The Russians mean that the Batoum route shall be adopted, and they are likely to have their way. Meantime, as abovestated because Bokhara is now overstocked, they expect very little green tea at Batoum for a year or two. But the merchants who hurried their teas across the frontier to evade the new rules have been in a measure checkmated, for the inner customs cordon at Samarkand and elsewhere is not to be withdrawn at any rate until July 1st to 13th next. Curious to relate, green tea has, since the new tariff came into force, been arriving at Meshed in just the same quantities as formerly, and it is being sent across the frontier and paying the new duty. Of course, this tea was ordered six or nine months ago, but it is quite possible that green tea will continue to arrive here for some little time to come. Orientals are very conservative, and especially suspicious of novel methods, but once convinced where their pockets are affected they soon adopt them. The man who introduced sewing-machines into Persia was ruined because no one would have anything to do with them for a long time. Now they are as much in use in the towns as in India.

THE EFFECT OF THE NEW REGULATIONS.

The new regulations, then, are causing this revolution in trade here. European and Indian articles are rigidly excluded from Russian Central Asia, except necessaries, such as tea, indigo, muslin, pepper, and spices, which Russia cannot herself supply, and these, too, are, as we think, pretty heavily taxed. But we must remember that the new customs system will cost a great deal to maintain, and that in Russia proper all foreign goods are heavily taxed. Indeed, the taxation on this frontier is light compared with it and the 6r taxation on Indian tea is a distinct concession to England. Had 14r. 40c been charged on all green tea the people would have been compelled to drink nothing but Chinese tea. Of course, the Bokharans who had been drinking Indian tea would then have had to pay double or treble (for a better quality, however), and there would have been some discontent, but still it could have been done. In Russia a peasant has to pay 2s 6d per lb. for the worst tea (the duty is 21 gold r, equals at present 32 paper r per pound; a pound is equal to 36 English or 40 Russian lb.) The tea drunk by the middle and upper classes costs from 7s to 11s per lb. In Central Asia Indian green tea will hardly cost 1s per lb.

Black tea can now pay 25 paper r on this frontier, or 21 gold r (*i.e.*, about 32 paper) at Batoum. It remains to be seen which route will prevail. Probably the black tea will still continue to come this way, because in Persia the people drink black and not green tea. Therefore, the tea can be brought for sale either here or across the frontier. But the amount of black tea which goes to Russian Central Asia is small. It is only the Persians there, and a few Russians (including soldiers), who use about £10,000 worth per annum. For some reason only about half that quantity crossed the frontier last year. The traders do not seem to have thought it worth while to get black tea across before the introduction of the new regulations, or they were too much occupied

with the green. The fact is, the pure Russian ahead not much taste for Indian tea (or what is called Indian tea, for it is said that in Moscow much Indian tea is sold as Chinese). Now, this is not all prejudice, for there is a difference between the Chinese tea the Russians drink and Indian tea; and, whether it comes from the soil or the method of drying and preparing the leaf, it is easily distinguishable. Good Indian tea has more flavour and fragrance, perhaps, but the tea in Russia seems to be softer to the taste and more delicate and less bitter. How is it that the tea one gets in even Russia, at a railway station, is always good? That tea is left simmering on the samovar sometimes for hours, but if a small quantity be poured into a glass, and the glass filled up with boiling water, the decoction is always drinkable. Indian tea is stronger, and the English people prefer strong tea, but that does not explain all. There is no doubt that a very large quantity of cheap bad tea comes from the Indian markets. All of that brought to Meshed is of the vilest description, and is probably damaged stuff which has been subjected to firing a second time. Russians themselves say our process of drying is to blame, and that if our tea were subjected to the same process as in China they would gladly buy it. The Indian Tea Association, London, state that in 1881 the average price of tea in the London market was 1s 5d; now it is 9½d (and this includes 4d duty), and the Indian has driven the Chinese tea out. In 1881 Great Britain, they say, consumed 112,000,000lb. of Chinese tea, and 48,000,000lb. of Indian and Ceylon tea. In 1893 the consumption was 36,000,000lb. Chinese and 172,000,000lb. Indian and Ceylon. They further say that it only takes a nation ten years to get rid of its taste for bad teas, and to acquire a preference for good ones. Also that "China has not a chance against India and Ceylon. Her rule-of-thumb methods produced an article inferior in flavour and in high-class strength to that which the scientific appliances, the costly machinery, and the chemistry of arrested fermentation enable the British tea planter to send to the market." This may, and ought to be, all true, and there is no doubt that India can and does, turn out as good and perhaps better tea than the best from China. But she also apparently sends out a quantity of very cheap bad stuff, and the fact remains that an Englishman can always drink what is called Russian tea, but a Russian often cannot drink Indian tea.—*H. & C. Mail.*

SIR W. MACGREGOR IN NEW GUINEA.

Still energetic, our old Colonial Secretary, Sir W. MacGregor, is evidently intent upon developing his possession, as the following late telegram testifies:—"Mr. J. Fitzgerald, a Tasmanian miner and botanist, has been engaged by the Governor of New Guinea to explore the interior of that island for natural history specimens. Mr. Fitzgerald is highly recommended by Baron von Mueller.—*Fiji Times*, July 31.

TEA SHIPMENTS FROM SHANGHAI.

TEA.—The following notes on the tea market of last year have been supplied to me by a gentleman intimately acquainted with the trade. The Chinese have made fair profits this season all round. These profits encouraged free production of the leaf, and although the first crop showed a falling-off in quantity of 90,000 half-chests, or 12 per cent, the total season's yield amounted to 5 per cent. more than the previous season's total (say 45,000 half-chests excess). This quantity has proved rather more than was wanted, but notwithstanding this fact, the season's results have proved decidedly satisfactory to foreign buyers. Fine teas (especially Keemuns, owing to their comparative scarcity and low sterling cost, and to the fact that fine Indian and Ceylon tea was likewise in short supply, paid handsomely in England, profits of 25 and 40 per cent being quite common; the lower grades, however, on the average did little better than cover cost or pay commissions. The

good average result of the season's operations is however, no indication of any revival of the China black tea trade with England, which continues to shrink rapidly. The export of Congou from North China to England this season was only 16,250,000 lb. or nearly 4,000,000 lb. less than last season, and this is more than is wanted. There is no abatement in the speed at which British grown tea is ousting its heavily taxed rival in the London market.—*Consular Report for 1894.*

PRACTICAL NOTES FROM UVA.

(By an old Northern Districts Planter.)

The subject of a sufficient supply of

FIREWOOD

for tea furnaces is a most important one, and I thought over it for some time past.

BLUE GUM TREES.

Some years ago I planted some 18 blue gum seeds in ordinary patana land close to my present abode, scarcely thinking they would grow well, the spot where I planted these seeds being much exposed to bleak and cutting winds. Nevertheless, these blue gum trees grew up fairly well, and some of them are from 30 to 40 feet high. Some months ago I felled 3 or 4 of the best of them and was quite surprised to find how solid the timber was, and what excellent fuel it gave.

I am quite sanguine that both blue and red gums will thrive on most ordinary patana lands, and if so, the fuel question will partly be solved to the great comfort of most tea planters. Let some planters try how these Australian weird-looking trees will grow on abandoned coffee estates. This is an important matter, and the experiment is well worth trying. No doubt some ordinary jungle trees would grow well if transplanted when young and large holes cut even in the patanas all about here and elsewhere too. This subject leads me naturally to say a few words about

WIND-BELTS.

Old coffee planters like myself know right well that many ancient coffee estates were much impaired by cutting the outside jungle of their estates, and letting in violent gusts of wind that comes at certain times of the year. I myself did so, I am sorry to have to confess, and a near neighbour of mine almost ruined his totum by felling a long strip of jungle that kept out the winds of the N.-E. monsoon. Now, in these days wind-belts prevent such mistakes from playing havoc with

A WIND-BLOWN ESTATE,

and there are many tea estates that are much freer from wind and storm; now, than they were when coffee estates thrived, owing to the judicious planting of wind-belts. Then, again, how well most tea estates are drained. There is little loss from

WASTE MOULD

being carried away when in heavy rain and storms now-a-days. So much for modern cultivation of tropical tea estates. This part of the island is rather celebrated, you know, for its extensive cultivation of

INDIAN CORN.

For many years when I lived on the Kandy side of Ceylon, I never saw such a lot of Indian corn, and I well remember Hamilton, the farrier &c., of Kandy town, first called my attention to the

MAIZE

grown in Uva Province, asking me, a Western tropical if it was wholesome for horses and that he had just got in 200 bushels at R1 per bushel. Well just now it is selling at R1.50 to R1.75, while the price of paddy is R1.25 at Koolanle bazaar, I am told, and in the villages. By the bye, I hear many of the boutique-keepers are down with

FEVER,

and if I were to tell the readers of the *Observer* the number of fever cases treated monthly at the Dispensary they would hardly credit it! OLD HAND.

VARIOUS PLANTIG NOTES.

THE "AGRICULTURAL GAZETTE" of New South Wales, Vol. VI. Part 7 for July 1895, has for Contents:—The Bathurst Barr, (*Xanthium spinosum*, Linn.). J H Maiden. Australian Sandarach—J H Maiden. Economic Etymology—A S Olliff. The Honey Bee (Part III)—R Helm. Fruit from the Orchard to the Buyer—L G Corrie. Rotation of Crops—J L Thompson. Fluke and Liver Rot in Sheep—A Bruce. Analyses of Commercial Fertilizers—F B Guthrie. Practical Vegetable and Flower Growing—Directions for the month of August. Orchard Notes for August—General Notes. Agricultural Societies' Shows, 1895-6.

CEYLON TEA IN LONDON.—PEKOE SOUCHONG THE SAME AS LAST WEEK AND THE AVERAGE $\frac{1}{2}$ D. UP.—Our Special Telegram from Messrs. Gow, Wilson & Stanton reports that the market generally is very firm, and good liquoring Pekoes are dearer, while the market for poor liquoring teas is very firm. The price of fair liquoring Pekoe Souchong is 7d and the average 8 $\frac{1}{2}$ d. Reuter reports:—"Tone of Ceylon Tea: Very firm; fine qualities $\frac{1}{2}$ d higher, common qualities $\frac{1}{4}$ d higher." Fair Pekoe Souchong he quotes at 6 $\frac{1}{2}$ d and the average at 8 $\frac{1}{2}$ d, both shows an advance of $\frac{1}{4}$ d. 15,000 packages of Ceylon Tea were offered for sale, of which 14,000 were sold.

POISONED BY COCAINE.—"Death from misadventure" was the verdict returned, on August 14, upon the body of William Patefield, aged 22, a solicitor of Bradford, who died on the platform at the Leeds Midland Station. He had been in the habit of taking cocaine hypodermically, and before starting for London he went to the lavatory, drank a quantity of the drug mixed with water, returned to the platform, fell, and expired. The deceased's arms, forearms, and thighs were covered with marks such as would be caused by a hypodermic needle, and a quantity of cocaine was found in the stomach. Dr. Roberts, of the Leeds Infirmary, said in small doses the drug was a stimulant, and in large doses it produced a kind of intoxication. Eight or ten grains would be fatal, and it would be easy for a person to administer to himself an overdose.—*Pharmaceutical Journal*.

JAVA COFFEE.—The British Consul of Batavia reports that the cultivation of the Liberian bean, both in Mid and West Java, is rapidly increasing, and the satisfactory results obtained from its introduction become year by year more apparent as the principal difficulties attending the preparation of this coffee for the market are gradually being successfully surmounted. As a result a marked improvement in the appearance and quality of coffee is noted, and its flavor is becoming more and more assured. The continued recurrence of the so-called "leaf" disease in the Java coffee on low-lying lands, from which the Liberia still preserves comparative—have been imported and laid under the streets, distributing though by no means entire—immunity, causes more confidence to be felt in the latter, and many lands which have suffered most severely from the ravages of this disease in the Arabian plant are being re-planted with Liberian.—*Am. Grocer*.

THE INFLUENCE OF TREES.—As far as influence upon neighbouring crops is concerned, trees exert a deleterious influence upon the immediately adjoining portions of either by their shade—and some species are shadier than others, hence a difference in degree of effect—or by their competition for moisture. Some kinds, like cottonwoods, willows, and elms, require not only more water than others, but their root systems are capable of rapid and enormous extension in search of water, so that their influence is far-reaching. Grape-vines are of the same nature, so that it is almost useless to cultivate in the neighbourhood of a vine-yard, unless the soil contains a superabundance of moisture. The taproot trees are less injurious, because they supply themselves from greater depths; while the shallow-rooted ones, like black locust, beech, spruce, &c., compete on the same level with the annual crops.—*Public Opinion*.

THE COFFEE CROP OF LIBERIA has proved an almost entire failure this season. The prices for Ceylon and Straits crops of Liberian ought to rise.

FLUFFY TEA DUST.—It is rather extraordinary that Mr. Peter Short can nowhere in the Dimbula district, find a planter willing to supply the fluffy dust of the tea, now either sold to natives or burnt. We suppose the difficulty is to make up a sufficient quantity. If Mr. Short or the firm's Agent would start a cart or carts to itinerate and call at every store once-a-week, we should think all the fluffy dust could be secured with the minimum of inconvenience to the planters. It certainly does not seem businesslike for a bye-product worth 3d to 4d a lb. to be comparatively wasted or worse than wasted.

"TRIANGULAR" versus "SQUARE" PLANTING is a subject exercising Tea planters in some places up North. With the same distance between the trees, the former system seems to be the most economical as far as ground is concerned, bringing in 2,012.18 trees to the acre, against 1,742.47 on the "square" method. Triangular planting too, is said to possess the advantage of simplicity of execution. This is the method given in the *Planter*: Measure out a base line on flat land if possible. On the base line take any number of stakes, say, when planting 5 feet by 5 feet, take 21 stakes (20 spaces). Have two chains of 100 feet each, lay them out to the front from the 1st and the 21st stakes, and makes the ends meet, holding them straight and tight, put in a stake and there is the apex of your first triangle. Then lay the chains from the 21st to 41st, make another triangle, and so on; the triangles can be filled in by small boys. Simple enough indeed for anyone.

CINCHONA PLANTATIONS.—There are nearly four million living cinchona plants at the Government plantation in Sikkim and Nimboug. The outturn of the cinchona factory during 1894-95 was 8,318 lb. of sulphate of quinine, the produce of 393,150 lb. of yellow bark, and 4,032 lb. of cinchona febrifuge, the yield from 105,560 lb. of red bark. The outturn in 1893-94 was 4,765 lb. of quinine from 230,100 lb. of yellow bark and 3,848 lb. of the febrifuge from 91,800 lb. of red bark. Thus, while it took nearly 24 lb. of red bark to yield a pound of febrifuge in the previous year, 26 lb. of the bark were required for the manufacture of a pound of febrifuge during the year under review. On the other hand, in order to produce a pound of quinine, 47 lb. of yellow bark were required during 1894-95, against 48 lb. in the previous year. Owing to the increased demand for quinine, two or three hundred additional acres have been prepared for being planted with new trees. *Pioneer*, Sept. 7.

OFFICIAL RETAILERS OF QUININE IN ITALY.—A proposition exciting a great deal of indignation among Italian pharmacists has just been presented in the Chamber of Deputies by Signor Garlanda, who wishes the Government to supply sulphate of quinine in 1 gramme tubes to the general public at 10 centimes each, through the licensed vendors of tobacco and salt (this latter is a dutiable article in Italy). This bill reads as follows: "For public and hygienic reasons the Minister of Finance is empowered to furnish to the general public sulphate of quinine by means of the vendors of dutiable articles. The sulphate of quinine shall be supplied to the vendors in hornetically sealed glass tubes, each containing 1 gramme. Upon each tubes shall be placed a stamp value 10 centimes, which will be the selling price of the said tube." The Neapolitan pharmacists at once telegraphed to the President of the Chamber of Rome in those terms: "The Neapolitan pharmacists strongly protest against the proposition Garlanda, which violating sanitary law, injures vested interests and gravely offends professional dignity." Besides the Neapolitans, the chemists of Florence and Venice, as well as the pharmaceutical associations in Italy generally, are actively agitating for the rejection of this unjust and illogical bill.—*Ibid*.

COFFEE IN MEXICO.—A Mexico telegram of June 18th to the *Boston Herald* says:—"The coffee crop is estimated this year as available for export at 25,300 tons, against 20,700 tons last year. Many new plantations come into bearing this year."

VINE CULTURE IN COLOMBO.—We call attention to interesting details given elsewhere; but it will be time enough a year hence—or even later—to begin to speak of success, if such be the outcome of M. Zanetti's experiment. The very description of the soils in which the vine delights, indicates the boldness of the experiment in Colombo or its neighbourhood.

THE UNITED PLANTERS OF SOUTHERN INDIA are reminded by the *Madras Mail* of the proverbial saying: "Everything comes to him who knows how to wait"; but instead of the last word, an intelligent compositor has made it "wait"; and so the Indian Government is to hear some *wailing* with reference to planting wants.

PAVING STONES.—Colonel Waring mentions—in the *Review of Reviews*—that in New York the city ashes have been utilised by being converted into paving stones:—

Fifteen parts of ashes to one part of Portland cement, producing a concrete that would be admirably suited for the foundation of stone-block, asphalt, or other pavement.

SHIPMENTS OF CINNAMON.—For the last few days there have been unusually large shipments of cinnamon to London, the largest shippers being Messrs. Volkart Bros., Schultze & Co., and Messrs. de Soysa. Altogether over a thousand bales have been shipped, and the product is at present in great demand. An unfortunate mishap occurred this morning alongside the "Glen Orton," for a large bale of cinnamon, while being put on board, fell from the slings into the sea. The contents were recovered as speedily as possible, but were found to be wet and useless. —Local "Times," Aug. 31.

BRAZIL COFFEE CROPS.—An old Sao Paulo subscriber, who is familiar with the coffee-producing districts of that State, writes us as follows:—"Noticing the accompanying paragraph"—the item in regard to the damage by frosts, which appeared in our last issue—"I may tell you that as the result of a personal visit to the districts named therein, within the past few days, you may take it from me that the damage is practically nil. So far as these districts are concerned nothing has happened up to now to materially depreciate the future crop."—*Rio News*.

THE COORG COFFEE CROP: OFFICIAL FORECAST.
—According to the official forecast, the Coorg coffee crop for 1895-96 is estimated at 6,076 tons. Last year it amounted to 5,354 tons, and the annual average for ten previous years is set down at 3,561 tons. The coming crop is made up of 3,037 tons Plantation and 3,039 tons Native coffee. Putting the value of the former at £100 per ton and of the latter at £75 per ton, the coming crop represents £303,700 and £227,925 respectively, or in all £531,625. This at the current rate of exchange means 96½ lakhs of rupees.—*M. Mail*.

RUSSIAN TEA PLANTATIONS IN THE CAUCASUS.—The cultivation of the tea plant in the Caucasus seems so far to have been very successful, and (our Moscow correspondent informs us) it is expected that in the course of time Russia will be able to grow a large portion of her own tea, instead of importing this product from China and Ceylon. A Russian tea merchant in Charkoff only recently paid 70,000 roubles to a tea-planter near Batoum, on condition that he could have all the tea grown by the planter for a period of ten years. It is said that the tea grown in the Caucasus is of excellent quality.—*Daily Chronicle*, Aug. 22.

COFFEE PLANTING IN SELANGOR.—The "Selangor Journal," of the 23rd August says:—"We have received an addition to the ranks of European coffee planters in Mr. Spencer St. George Carey and Mr. W. Greig, who have arrived from Ceylon to take up land in Selangor.—Local "Examiner."

COTTON GROWING IN BORNEO.—"There seems," says the *Kobe Chronicle*, "little doubt that the commercial men of Borneo will be encouraged by the expansion of the cotton-weaving trade to devote their attention to the cultivation of cotton, and we may look forward to hearing even more about Borneo than has been our wont"—*S. F. Press*.

"**PLANTING OPINION**, a Fortnightly Journal (with Weekly Market Supplement) written by Planters for Planters," is published at Coonoor, and a copy of No. 1 has reached us. It is a modest undertaking of about 14 pages the size of our *Tropical Agriculturist*. We wish the venture all success, and take some extracts from it elsewhere.

TEA EXTENSION IN CEYLON.—It is rather a striking fact that while 188,000 acres were planted with tea in the time of Sir Arthur Gordon between 1883 and 1890, only 85,000 acres have been added during the term of our present Governor. In 1883 the total area was 32,000; now it is 305,000 acres of tea valued, we suppose, at not much less than ten million pounds sterling.

THE "AGRICULTURAL GAZETTE" of New South Wales, Volume VI Part 6, for June, 1895 has the following Contents:—Useful Australian Plants, J H Maiden, Colonial or Moreton Bay Pine ("Arucaria Cunninghamii," Ait.); Forest Wealth of Gloucester, A Rudder; Remarks on Weeds, the Soil and its Fertility, J G O Tepper; Fruit Culture, A H Benson; Australian Entomophytes, or Entomogenous Fungi, and some account of their Insect Hosts, A S Olfitt; Cultivation of Hops, J Coleman; Beef Producing Breeds of Cattle, J L Thompson; Chemical Notes, F B Guthrie; Poultry Notes, S Gray; Practical Vegetable and Flower Growing Directions for the month of July; Orchard Notes for July; General Notes; Scalline, an alleged Fodder Plant, Seeding of Red Clover; Sending Specimens to Department, Imports into United Kingdom in 1894; and Agricultural Societies' Shows, 1895.

COCONUT PRODUCTS.—We have a request from the Secretary of the "Jamaica Agricultural Society" for information in respect of the preparation of desiccated coconut and of coconut oil. The new edition of our manual will give nearly all that is necessary; but of course, machinery to express oil after the fashion of the few large mills in Colombo is an expensive matter; while even in respect of the desiccating process, a complete set of the machines used (including steam-engine and boiler to drive the same, if water power is not available) will run into £400 to £500. We understand that the Colombo Commercial Company has just shipped a set of machinery for a Coconut Desiccating Establishment to Zanzibar;—and no doubt the West Indies will want to follow.

A CURIOUS TRADE.—Consul Scott mentions a curious export from Swatow, viz., ducks' eggs, which he has observed on steamers bound south for Bangkok and the Straits. They have, for the most part, been incubated to within a few days of hatching. They are taken on board the steamers in shallow baskets in large numbers. In the baskets they are arranged in layers two or three deep, each layer carefully covered and surrounded with soft Chinese paper. No sort of artificial heat is applied to them. The baskets are placed anywhere about the deck, or slung to the awning supports. The soft paper and the heat of the climate as the vessel runs south are sufficient to preserve the newly-hatched ducklings from injury, and not only so, but before the vessels reach their destination most of the eggs are hatched out, and in lieu of the eggs that were shipped hundreds of healthy young ducks are landed at Singapore or Bangkok.—*Pioneer*.

FRUIT FARMING IN CALIFORNIA.—Mr. J. J. Macdonald, in a paper—in the *National Review*—entitled “The Fruit Farming Fiasco in California,” pours cold water upon the glowing pictures of fruit farming prosperity, and explains that fruit farming is very hard work, and yields very little profit:—

While California is not the “poor man’s paradise” which it is often represented to be, it is in many respects a good country, and there are many good people in it. One would naturally imagine that in a country of such extended area, with a population less than that of Chicago, a man willing to work should have no difficulty in getting employment, but there is no State in the Union in which the labour market is more congested, and it is far easier to get steady, continuous employment in Chicago than in California. Living, however, in cheap in California, and the luxuries of life are abundant. The fruit industry has been overdone, and the supply is greater than the demand. The country has been over-boomed, and is suffering from the reaction which follows that artificial mode of stimulation.

KANGRA VALLEY TEAS MARKED “DARJEELING.”—A merchant calls attention to the “general” paragraph of Messrs. Alfred Harvey & Co.’s Melbourne Tea Report—see another column—in which we are told of “an increasing number of poor Kangra Valley and kindred growths boldly marked Darjeeling”; and then the Melbourne firm adds:—“It is almost a pity some of the more venturesome shippers do not send these via Colombo, marked with some crack Ceylon garden, and so avoid injuring the good name of one of their best districts.” Of course this is meant as “a goak” by Messrs. Alfred Harvey & Co.; but in our estimation, it is a very sorry if not stupid one; for they must know that any one putting the name of “a crack Ceylon garden” on tea that did not belong to it, would run the risk of an action at law; and (2) that as tea is dealt with on its merits in Melbourne quite as much as in London, no one is likely to be deceived by “Darjeeling” or other highly esteemed marks on poor teas. Ceylon certainly cannot throw a stone at poor Kangra Valley teas; in view of the considerable quantity of inferior quality tea produced in this island as London and Melbourne as well as local prices show.

AN INTERESTING FACTORY.—Fray-Bentos which is about 45 miles distant. I daresay most people have heard of Liebig’s factory of Extract of Beef and this is the spot where the factory is situated. Before the factory was opened, this place was a small fishing village. It was founded by a friar, “Fray-Beneto.” The factory stands on a bluff overlooking the Uruguay which flows about a mile from the town. In the season, which lasts about five months, Liebig’s Extract of Meat Company here kill 1,000 cattle daily, and each carcass gives usually about 8 lb. of beef extract. The factory employs about 800 men, the staff including manager, clerks, engineers, tinsmiths, carpenters, physician, and school teachers. Capital schoolrooms are provided and there are two reading-rooms and an excellent library. During my stay the killing season was in full force, and in one day I saw 1,300 head of cattle killed. The rapidity with which it is done is remarkable. The average time of killing, skinning, and cutting up each animal being only seven minutes. The killing process is very good, far better than that practised at home. The Liebig’s Company import about 10,000 tons of coal yearly for the sole use of this factory. Mr. Gunther, a German, is the manager, and gave us some good partridge shooting, but the mosquitoes were so bad that we had to stop and take refuge in the nearest house. At length the river rose some six feet which enabled me to leave for Praysandu, a town about 58 miles from here.—Commander Neeld of H.M.S. “Beagle.”—*The Devizes Gazette*.

SIR WATER SENDALL—so long and honorably connected with the Public Instruction Department of Ceylon—has been interviewed by the *Westminster Budget* on the subject of “Cyprus” and the result is a very interesting paper which will be found in our *Tropical Agriculturist*.

ADULTERATED VANILLA.—A colonial merchant M. Gaston Baraton, appeared at one of the Paris police courts a few days ago, on a charge of selling adulterated vanilla. He had disposed of a considerable quantity of vanilla in both Paris and Antwerp which had previously been treated with ground glass, as a means of increasing its marketable value. M. Baraton protested, in defence, that he had merely used boric acid for the manipulation in question, and as evidence of the quality of his products showed the awards that had been given him at various exhibitions. He was condemned to six months’ imprisonment, and to pay a fine of 1,000f. (40l).—*Chemist and Druggist*, Aug. 31.

THE COLOMBO TEA MARKET undoubtedly deserves the more liberal support of our planters, seeing the exceedingly good prices which have recently been obtained there. When a lowcountry estate Broken Pekoe sells at over 70 cents per lb. apart from other very satisfactory sales, we should expect very considerable additions to the quantity sent to the Colombo mart. Our new buyers naturally want larger sales, and instead of 5,000 would like to see 10,000 chests brought forward weekly. Mr. Lampard has a strong opinion that a great deal more might be done in developing the Russian and other foreign markets direct from Colombo, if we had bigger sales and a more liberal policy all round. His views well deserve the attention of the “Committee of Thirty” and Tea Traders’ Association.

BANANAS IN THE UNITED STATES.—The *American Grocer* shows that the imports of bananas into the United States are equal to one million pounds sterling per annum!—

The imports of bananas for the past five years were valued at \$25,992,483, or an annual average of \$5,198,497. In 1884 the value of the imports was only \$1,892,013. Since then there has been a steady increase every year until 1891, the maximum year, as the following table shows:—

1884 ..	\$1,892,013	1888 ..	\$3,157,989
1885 ..	2,146,114	1889 ..	3,578,325
1886 ..	2,357,663	1890 ..	4,654,048
1887 ..	2,729,477	1891 ..	5,855,682

The banana has steadily grown in popular favor. It is nutritious, palatable, cheap and of great value as food. It is within easy reach of the poorest. For a nickel a day each member of a family of five may enjoy a ripe banana of good size and quality.

PLANTING IN CENTRAL AFRICA.—In Mr. Alexander Whyte’s report on the botanical aspect of the region over which he exercises influence in British Central Africa—principally the Shire Highlands—it is stated that when European implements are placed in the hands of the natives, they make good field labourers while with one or two exceptions all European vegetables do well, their plentiful supply contributing materially to maintain the health of the whites at the various stations. English potato tubers were spoiled in transit by the extreme heat; but by a little management excellent potatoes were raised from seed, and, as Mr. Whyte points out, the result is that the plants now growing are practically indigenous. They show no signs of disease, and are not so liable to degenerate as the offspring of English tubers would be. A large number of other economic and ornamental plants are also flourishing among them wheat, barley, oats, lobelias, roses, pinks, balsams, phlox mignoneite, and so forth. In fact, the British settler in the Shire Highlands will find himself very much at home in his tropical garden. Some familiar home flowers, however, assume gigantic proportions under an African sun. Geraniums grow as high as hedges; and sunflowers dahlias, amaranths, and cannas shoot up into tall, shrub-like plants.—*Pharmaceutical Journal*, Aug. 24th.

TOBACCO.—During the first half of the present year 106,292 lb. of tobacco—nearly the whole of which was in the form of cheroots—were shipped from Madras as against 77,005 lb for the same period in 1894.—*Ibid.*

THE JUTE INDUSTRY is increasing by leaps and bounds in parts of the Purneah district, and in a few years we shall in all probability see a greater area given up to its cultivation than is at present under indigo a crop which is far more precarious.—*Indian Engineer.*

CHINA TEA EXPORTS.—Our special telegram from the Far East shows a slight comparative falling-off in the current export of China and Japan teas to the United Kingdom. The important part of the season is now over and we cannot expect much addition to the figures just telegraphed.

THE TUSSER SILK INDUSTRY was once a flourishing one in many parts of India, but it has practically disappeared except in a very small way, and in but one or two districts. A certain difficulty attends the reeling of the silk from a tusser cocoon, and we are glad to hear that Mr. Otto Auz, of Hamburg, has the courage to propose to start a tusser reeling industry in India. A parcel of 20,000 cocoons was lately forwarded to him from Bilaspore, in the Central Provinces, where a certain amount of attention has been bestowed upon the industry during the past year. Mr. Auz's opinion of them is awaited with interest.—*Indian Engineer.*

THE CALCUTTA TEA MARKET.—We understand that the losses made by buyers during the first few months of the season—May to July—were simply appalling. Thousands of pounds sterling dropped by individual buyers form a very serious experience. The cause is found in the comparatively bad quality of the teas of this season, especially as compared with last year, and the Calcutta buyers in absence of good teas, appraised the value of those available, far above the value given to them in London. Teas judged as "finest" in Calcutta, were put down as only "fair" in London; "fair" became "medium," "mediums" were classed as "common," and "common" were deemed worse than "China's" or even the poorest "Ceylon's." India has evidently had one of the worst "tea" seasons experienced for a long time—hence the present firmness of our Ceylon average in the home and local markets.

COAST-LANDS IN MADAGASCAR.—The following is a passage from the letter of its Special Correspondent (Mr. Knight) in the latest London *Times* (Aug. 12th) descriptive of his journey along the South-East Coast of Madagascar:—

The coast scenery we passed on this journey is as beautiful as any I have ever seen. Spurs from the inland mountain ranges form grand promontories enclosing lovely bays. Every few miles some fine river pours its waters into the sea. All these rivers have narrow mouths, closed to shipping by narrow bars, but open out inside the sand dunes into extensive lakes or lagoons, with shores winding in many capes and bays. The hills that slope into these lakes are clothed with tropical bush and groves of palms and traveller's trees, while the plains and rolling downs which extend to the distant mountains are generally covered with fine grass, affording excellent pasture. But this magnificent country is very thinly inhabited, and the greater portion of it lies waste. We often travelled all day without seeing a human being or a sign of cultivation, and it was only around the rare villages that small but luxuriant patches of rice, maizos, cassava, and sweet potato testified to the richness of the soil. Sugar, coffee, and all tropical produce have been proved to thrive on this fertile coast, and this would certainly be as good as any country in the world for the white colonist, were it not for the coast fever, especially deadly at this season of the year—

the termination of the rainy season, when the subsiding waters leave leagues of foul mud to fester in the sun.

What has been said of parts of Ceylon is applicable:—

Thou'rt fatal as thou'rt fair.

FOREST DEPARTMENT, CEYLON.—Return showing the Revenue and Expenditure of the Forest Department for the five years 1890 to 1894, was called for by Mr. Coomaraswamy, M.L.C. It is unexpectedly satisfactory, the results as given by Capt. Walker being as follows:—

	R.	e.
Total Expenditure for the last 5 years	2,199,635	37
Total Receipts for the last 5 years exclusive of value of free grants and of stock	2,131,801	67
— — — — —		
Total deficit	67,833	70

The sum of R200,826.74 incurred during the five years on account of buildings, surveys, demarcation, planting, &c., from which no revenue can possibly be derived for many years to come, should not be shown as expenditure against the year in which it is incurred. This should appear as capital, being money sunk and invested in Government forests, the benefit of which will be derived in future years.

The large sum of R42,005.18, being amount of free grants of timber made during the five years, should appear as a credit to the Department, but which is not shown at all. Were these and other items correctly accounted for there would be no deficit, but on the contrary a large profit would appear to the credit of the Department; thus, the total receipts for five years being R2,131,801.67, to which, if added the value of free grants of timber amounting to R42,005.18, will give a total of R2,173,806.85. And if from the total expenditure for the five years, viz., R2,199,635.37, is deducted the amount expended for buildings, surveys, demarcation, &c., viz., R200,826.74, the total expenditure would be reduced to R1,998,808.63, thus showing a balance in favour of the Department of R174,998.22 for the five years.

NEW PRODUCTS AND RETIREMENT OF A PIONEER.—We call attention to the interesting paragraph headed "Matale" with the announcement that Mr. Munton has leased his Wiharagama property to Mr. Gordon Reeves and partners. This practically means the retirement of Mr. Munton from a long-continued series of experiments, struggles and successes with new products. Who speaks in Matale now of coconuts and arecanuts as new products—or of arnotto, Ceara rubber, castilloa and para, cloves, nutmegs, the sowing of sapan, lunumidella, vanilla, pepper and plantains forsooth?—Cocoa, Liberian coffee and marogogipe?—and yet for all of these, in his day, Mr. Munton has been accounted an "eccentric" but never a "genius"! Nevertheless how much valuable pioneering has he not done; while the remembrance of many failures and disheartenments in the struggle with leaf-disease does not, we feel sure, prevent his present giving up of the Matale property being any less a wrench. Wiharagama is on the Sudnanga, not many hundred yards from where Mr. Munton first crossed the river on horse-back in August 1859; but the estate was not purchased by him until about 18 years ago. Mr. Munton's previous purchase was Loehnagar in North Matale, also a very profitable investment. We can all see now that the resolute sticking to new products was in bygone days and even up till today, a real and commendable effort; but in the "seventies" and early "eighties" chiefly so,—as the struggle then was frequently a ghastly one. All honour to Mr. Munton and further success to Mr. Gordon Reeves,

DAYS OF OLD AND SPORT IN CEYLON.

(By a famous raconteur.)

August 16.

KANDY IN THE FORTIES.

To hark back a bit. In 1845 the only Hotel in Kandy was "Spencer's" kept by an old Mess Sergeant of the 18th Royal Irish. This was the building afterwards known as the office of Messrs. Keir, Dundas & Co. In this hostelry society was of a very mixed order, the food execrable, and discomfort rampant. Mr. Venn, in addition to his Colombo business, had a store in Trincomalee Street, Kandy, superintended by a "party" of the name of Walker. This unfortunate man met with some accident and Shipton cut his leg off. Asking Venn some time afterwards how this unfortunate fellow was getting on. "Oh!" said he, "first class, wonderfully cared for, public sympathy, my dear sir, public sympathy." But I doubt if he got very fat upon that. There was another shop of all sorts a little higher up, kept by a Mr. Hart, who besides announcing that he sold everything from a needle to an anchor, dabbled a bit in the fine arts, and did some sweet things in oils of a bold coloury nature. Remarking on one of these one day, I said, "Surely, Mr. Hart, that is copied from one of the old masters?" "Right you are," replied the artist, "that's taken from one of Crackers" (Caravaggio). Wolfe had a store on the Esplanade, Brodie was just opening in Malabar Street, and several other "Emporiums" were kept by Burghers. One of the evening amusements in Trincomalee Street was to inspect the bakers, where regularly every night the performance took place of a couple of perspiring coolies kneading an immense lump of dough with their naked feet! (This style may be going on at the present time for aught I know.)

At that period there was great progress being made in opening up

THE MATALE DISTRICT.

I well remember the Matala Resthouse being kept by a Mr. Carruthers, and an advertisement of his in the *Ceylon Herald*, in which Mr. Carruthers vaunted the extraordinary advantages offered by his establishment, adding "Here ladies may board themselves or can be boarded by Mr. Carruthers." At that time the Mahawiliganga was crossed at Katugastota by a ferry boat. The bridge was not completed until 1859 by the P.W.D., Churchill in charge; while my old friend Capt. Donald Graham built the Gampola bridge. Executions were carried out in public then, on a mound called "Gallows Hill," appropriately; somewhere about the regions of the Kandy new market. I happened to be present on one occasion, when the criminal, who was one of the biggest Sinhalese I ever saw, broke the rope three times in succession. Whether there was any collusion between the hangman and the culprit I don't know, but three times he was strung up and three times the rope failed to hold him—a grievous sight. Then young Kersterman who was afterwards in the Rifles, galloped off to the Pavilion where Lord Torrington happened to be staying at the time, and begged his interference which resulted in a temporary reprieve; this however came just in time to save a fourth attempt being made. The unfortunate man died afterwards in gaol, thus cheating the scaffold. I believe he was guilty of some atrocious murder.

Judging by your paper,

THE MERRY BURGLAR

appears to be doing a thriving trade in your part of the world. During my Ceylon experiences I suffered severely from robberies—the worst being the theft of my wife's dressing case with between £300 and £400 worth of jewellery. This was stolen out of a safe during the time I was ill in Colombo. At the same time everything in the way of linen, blankets, sheets, &c., were stolen out of the Glenloch bungalow, in fact a clean sweep of nearly everything that was portable. But not a clue, or a trace of these was ever found, although my name was marked upon all the table and bed linen, and even woven into some of the blankets. With you still, robbery appears of nightly occurrence, and detection by the Police unusually disappointing. Now, how is this? I will enlighten you. Say a wholesale clearance is made of some bungalow, the loot is carried off at once to one of the native schooners or dhonies in the harbour, and is safely landed at Tuticorin, or some other adjacent port, in the course of a day or two, and there disposed of. It is never kept in Ceylon, but directly the haul is made the enterprising cracksman embarks his swag, most probably some of the gallant crew being his pals. This is the way it is done! and if a proper search is instituted, just as one of these craft are getting under weigh I'll be bound a haul will be made. I remember pointing all this out to your late Superintendent of Police, but nothing came of that. Police, Lord bless you, I know a bit, especially about police sergeants in charge of districts, you bet! A more corrupt lot did not exist in my day, but all that is changed *n'est pas?*

There was a good deal of

ELK HUNTING IN THE FORTIES

and beginning of the fifties. There were two fine packs in Dimbula in 1850. One was owned by William Fairholme at Wattigoda conjointly with Fred. and Edward Palliser at Radella. The other by Jack Bannister at Bogahawatte. The Dimbula jungles then with the enormous acreage unopened, swarmed with elk, and there were also many more leopards knocking about than in these days, and many a costly English foxhound fell a prey to these whilst returning jaded after a long unsuccessful run; so that what with disease and occasional loss of hounds, a pack was an expensive establishment to keep up. The progeny raised from English stock were less subject to disease, better acclimatized, and not so subject to the prevailing maladies of pneumonia and enlargement of the liver, which was generally the case with all imported hounds. Many a nice pup have I seen brought up by a foster-mother in the shape of a Tamil girl, (no doubt this will shock your delicacy,) till they were able to lap the brose themselves, and good nurses they were, and proud of their four-footed charge.

AN ELEPHANT

put in an appearance in one of the ravines below Bogahawatte estate. Some coolies ran up to tell Bannister. He had no bullets in the house or bulletmould, so he set to work, and melted down some spoons, and cast two or three balls in a tobacco pipe, with which when hammered a bit into shape, he proceeded to load up; tracked the elephant down to the river, and shot him in the small stream close by where the short-cut goes up to Mt. Vernon above the Madecoombura Bridge. This happened just before I came to Kelliwattie, and I often saw the skeleton afterwards, when out after elk. The head was sent to Warminster. Of

course the late Sir Samuel Baker and his brother John kept a fine pack of hounds at Nuwara Eliya, which afforded great sport, and to which the brothers devoted themselves, as described in those delightful works, "The Rille and the Hound" and "Eight Years in Ceylon."

In the beginning of the "fifties," there were merely native paths to the

UPPER DIMBULLA ESTATES,

Wattegoda, Radella, Louisa (opening) and Pal-laradella through the patanas down to the ford at Medacombara. All estate supplies were generally carried up by coolies, by way of Pussellawa, down to the Kotmale Ferry, through patanas and paddy fields to the Limekulu Ferry, and then up a precipitous path through patanas to the Upper Wattegoda road, a mere track through the jungle, where now-a-days I believe the Medacombara, or Wattegoda Railway station is placed. There was a flat-rock where a halt was always made in completing the ascent from the river. This rock was always called "Rest and be thankful" and full advantage was taken of the same. I remember a fine powerful young Scotchman, David Bell, who was on Wattegoda and who carried a bushel of rice without a halt, from the Limekulu to "Rest and be thankful" as an example for his coolies to follow.

I had a great horror of

SNAKES

in my earlier days, and could in common with many others, specially fishermen, relate a variety of tales connected with these. I have only seen two Europeans who were bitten by them, Mr. Langshaw, then in the Wynaad; and the present Major Quarry, then a Lieut. in the C.R.R., was bitten by a tame cobra, he was in the habit of playing with—I believe a solitary case, except the late General de Saumarez, but the latter suffered to the end of his life from the virus. I once had a well-preserved python's skin offered to me. It was 22 feet long, and I afterwards regretted I had not accepted it, as it would have made a novel suit of clothes; this python was killed at Tippekardoo. Some of the old lowcountry Sinhalese can relate some very astonishing tales anent snakes. I remember asking an old elephant tracker what might have been the length of the largest snake he had ever seen in the Trincomalee jungles. His reply was to this purpose,—“The longest snake I ever saw was about the length of the shadow of a coconut tree at 5. p.m.” This must have been a whopper. The door leading into the verandah was the last I generally closed at Glenloch. One morning my appa called my attention to my having squashed the head of a cobra in shutting the door, a brute about five feet long! One of the chief regrets that press on my mind in connection with my sporting adventures, and with which I never cease to reproach myself is as follows:—Whilst shooting in the Hambantotta country not very far from Maha-Tisserama, quietly plodding along a sort of deserted road leading to a ruined dagoba, in coming round a corner I suddenly almost ran up against a huge elephant; he was standing with his back to me, and grasping the situation as he slowly turned his head round I killed him with the ear shot. Now this was a most wonderful elephant, a male, evidently stone-blind, and no doubt deaf, or he must have heard my approach. He was in very poor condition, much marked with leprous blotches about his head. His enormously large ears were torn and tattered all round their fringe; but the most remarkable thing was the formation of his head which instead of possessing the

concave features of the common or as one may say indigenous elephant of Ceylon, had hardly any temple depression but a rounded surface above the bulb of the trunk, in fact in every way he bore undoubted similitude to the African species. Now, how did this animal turn up in Ceylon. He was of a great age undoubtedly, the trackers said they had never seen the like, and in fact they first called my attention to this change in appearance. This I am now greatly exercised about, as it would have led to much discussion and many theories would have been started. I fully intended revisiting the spot a week afterwards, but both myself, and most of my coolies were seized with deadly fever. I lost some 14 of them, and how I ever got back into Badulla I don't know to this day. This was the result of being over-persuaded in a weak moment to accompany an Indian friend, who wished to kill an elephant, but who should not have chosen the month of August for his debut in the Hambantotta forests, and its malaria.

J. T.

A JAPANESE SEED AND PLANT FIRM.

The mail brings us a copy of the very ornamental and neat catalogue of L. Boehmer & Co., exporters of Japanese lily bulbs, plants, seeds, &c., Nos. 4, 5, and 28 Bluff, Yokohama, Japan, established in 1882. It is got up after quite an ornate Japanese fashion and includes photographs as well as lists and prices of plants, &c.

SALE OF HOOLANKANDE ESTATE.

The purchaser from Mr. Somes of this well-known Kellebokka estate is the Earl of Glasgow who is adding it to his Poengalla property which (though in Matale East) adjoins Hoolankande. Both estates are on the boundaries of their respective districts; but Hoolankande will henceforward be worked as one with Poengalla, the total area being 1,205 acres of which 800 acres are cultivated chiefly with tea though 10 acres are in coffee, 27 in cardamoms and 64 in timber, grass, &c.

HOW IT STRIKES AN "OLD COLONIST,"

RE PRÆDIAL PRODUCTS.

I'll example you with thievery.—Shakespeare.

Amongst the surprises I get on my return to the island is the apparent difficulty of obtaining evidence of thievery, and the consequent collapse of a Prædial Products Commission.

Now, I was never guilty of running down or disparaging the natives of Ceylon, my learnings being quite the other way. I have been accustomed to regard the Sinhalese as—like the Irish—“the best of all peasantries in the world” and to the latter the raw material as imported,—I have a great regard.

But there are striking exceptions and these are almost invariably located around our populous centres—the educated loafers to wit—than which no viler type of bipeds ever trod this beautiful earth. Aping all the worst vices and copying none of the virtues of Europeans.

About a quarter of a century ago I recollect writing to *The Observer*, and picturing as well as I could, the great chieftain thief of the mountain capital,

DON WANDEROO HAMY,

the employer of nocturnal coffee pickers, and prosperous merchant. Plump and sleek, as he drove in his own waggon to the railway station with buttons, rings and chains of gold, glittering in the morning sun. How he appeared in Baillie Street with his samples, and how the big mercantile bully of the day guffawed as he leaned back from the tiffin table declaring for the edification of all subs, that their own Agents in Kandy were the veriest fools in this island of imbeciles.

Here, said he, is Don Wanderoo Hamy again selling us 5,000 bushels good garden parchment at 1s less per bushel than the limit sent to our branch a week ago and at which the idiots are as yet unable to operate!

The matter attracted some notice at the time and a Commission was talked of which I was invited to join, but it came to little and soon after this a more insidious enemy to coffee absorbed our attention.

Don Wanderoo Hamy is dead and gone to the — land of his fathers; but he has left a marvelously prolific and fearful progeny around Kandy.

No evidence of stealing!

Let me in the plainest possible language tell my unadorned tale; I have only been in the island about three months at this time; but my experience has alas! been ample to qualify me as a first-class witness.

My first taste was from a "Contractor" who got heavy advances and under the impudent pretence of clearing for planting, carted off and sold all the timber, then bolted with all the estate tools and never more was heard of, leaving the dory to prepare the ground for planting as he best could.

Our special care and pride was, however, our nursery of the finest jat which we watched over and watered with tenderest solicitude till the rains came when ho, for planting out!

Imagine if you can, our exasperation at this stage, to find that during one moonlight night the whole of the available plants disappeared, nobody was supposed to know how or whither.

Not to be baffled by this we at once set to work to purchase and germinate the best seed obtainable for the purpose of planting at stake; but on taking a quiet walk last Sunday evening I found one estate coolie had been caught carrying off germinated seed. On hearing this I returned to the bungalow and sat down to dinner in no very thankful or Christian spirit.

"Boy! What is the matter with the curry tonight?" "No coconut sar." "Then why not coconut? Are 100 trees not enough to supply you?" "Only koorumbas, sar, thieves take all ripe nuts."

Well: I wouldn't like to write down all I said and thought on this occasion. I plead indigestion, and hope for pardon. I do not blame anybody in particular—except the devil, who seems peculiarly at home in this warm island. Least of all do I blame the present very able and painstaking P.M. who vigorously endeavours to do the best that can be done with such poor effete and pointless tools as are at his command; but pray do not drive me desperate by languidly saying, there is no evidence of stealing! Nor blame me if I adopt the remedy recommended by R.B.T. It may be rough. It may be risky, but meanwhile it seems the only feasible protection for honest industry.

PLANTING AND PRODUCE.

JAPANESE TEA.—In his official report on the trade of Tokio for 1894 Mr. Consul Troup says: "The tea export of last year amounted to 29,946,528 lb., as against 28,760,695 lb. in 1893. On the whole, the quantity of tea exported from here does not vary greatly from year to year. The market for new teas opened towards the latter part of April, and a large business was done during the following three months. The quality of the crop was superior to that of 1893, and silver prices have ruled from 20 per cent to 25 per cent higher than in that year. The fall in exchange, however, has admitted of the tea being laid down in the American market at lower gold prices. An impression appears to have prevailed there that the outbreak of the war between the two countries would interfere with the export of tea from both China and Japan. This has certainly not been the case as far as this country is concerned, but this notion, together with the more favourable conditions existing in the United States, contributed to stimulate the export during the autumn months. The result was that considerable profits were realised, and the

causes above enumerated have made the year a good one for both exporters and producers. Stocks here at the end of the year were low, mostly of inferior qualities, and very dear.—*H. & C, Mail*

THE AMSTERDAM MARKET.

August 22nd.

At the cinchona auctions, which will be held in this city on August 29th (writes our correspondent), 6,521 bales and 154 cases, weighing together 600,510 kilos, will be offered for sale. The manufacturing portion of this bark consists of 585,651 kilos, with an equivalent of 29,639 kilos of sulphate of quinine (5.06 per cent), the druggists' bark of 14,889 kilos, containing about 347 kilos of quinine.—*Chemist and Druggist.*

TEA BLIGHTS AND INSECTICIDES.

The following letter from Dr. Watt, dated the 6th of July, was read at the Sixth Annual Meeting of the General Committee of the Assam Branch of the Tea Association:—I regret to say that I am not in a position at present to give the Association any very definite statement of my investigations. So far I have found, not three or four, but perhaps over 100 blights, the majority of which are at present of no serious moment. One or two are, however, very important, and certain of the others might suddenly assume alarming proportions. I think it therefore essential that every enemy of the tea bush should be thoroughly investigated.

ADHATODA VASICA.

A special feature of my visit to Assam was to inquire into the value of *Adhatoda Vasica* as an insecticide. So far I have found: (1) That the value of the plant as an insecticide varies greatly according to the climate and nature of the soils on which it has been grown—richer in dry hot climates and poor soils than when allowed to run into large vigorous plants in damp rich soils. (2) That as found in Assam it does not appear to kill mosquito, though it undoubtedly stupifies the insects. I have, however, met a few planters who speak highly of *Adhatoda* in the treatment of mosquito, and I mention this circumstance since my personal experiments have not proved very satisfactory. (3) It kills red spider as also not of the minute insect pests.

These results are not, therefore, so far very encouraging, but I would caution the Association from rushing to the opposite extreme, *viz.*, that it is valueless. We have much to learn as to how we should grow the plant, when it should be cut and the way in which the insecticide should be prepared. I hold as strongly to my original opinion now, as I ever did, that we possess in *Adhatoda* an insecticide of considerable value. It costs nothing more than the labour of using it. The infusion possesses distinct manurial merit. It is quite harmless. I would not therefore abandon experimenting with it till we have conclusively demonstrated that it is less valuable than other insecticides, the merits of which more than compensate for their expense.

AN ENEMY OF PURE JAT TEAS.

The members of the Association will doubtless admit that it is a very general experience that pure Assam jats of tea are, as a rule, pale yellowish green in colour and flush late. When this yellowness becomes abnormally high it will be seen that it is not natural. The leaves get in addition a pinkish tinge and later are bronzed, become spotted, dry and unhealthy looking; the bush is also bangled. This is especially common on badly drained soils, or during exceptionally hot seasons, and on dry exposed situations. I have found that when these conditions occur (say in April and May,) such leaves are covered with a very minute parasite that belongs to the family of mites. So far as I can discover this pest is new to the literature of Assam blights. I do not say that it is exclusively the cause of the paleness in the Assam plant (for it is naturally pale coloured), but simply that I have never seen very

pale Assam tea without this pest. It is in fact all but universal on the Assam pure jats, and often makes plots of exceptionally good tea look mottled from the alternation of diseased and healthy bushes, or whole patches may have turned pinkish yellow. So far I have not found it on China or Hybrid. Now if it be confirmed by future observers that the flushing of the purer jat teas is retarded by this pest, Adhatoda will be admitted as assuming a new interest when I add that so far as my experiments go, it not only kills the mite, but the plants after one or two applications become bright green in colour and give indications of flushing. My experiments have not, however, been carried to the extent of demonstrating that the plants will flush as soon as the mite is killed, though they justify me in the expectation that this may possibly be found to be the case.

UNCOMPLETED EXPERIMENTS.

Besides being fatal to all mites the insecticide has proved invaluable in the hands of some planters against white ants. So far, however, I am disappointed with the results of my investigations into the subject of Adhatoda, but mainly because while moving from garden to garden I have not had the time to personally supervise the experiments that should be undertaken. It is on this account that I recommend that we should not too readily abandon the subject, since no insecticide possesses the advantages of Adhatoda, provided it can be proved to be a poison of the required potency.

BLIGHT-PROOF SEED.

But I would add that I am more than ever convinced that the pests of the tea plant are never likely to be destroyed by insecticides. Such treatment may assist, the more so when blights do not assume gigantic proportions. The subject will have to be dealt with on more general principles, such as improvements in the system of cultivation, more careful selection of seed, especially the production of blight-proof seed, and an extended study into the life histories of the blights, so as to put us in a position to deal with them at the stage in their lives at which they are weakest.—*Civil and Military Gazette.*

TEA BLIGHT IN ASSAM.

One of the most important results of Dr. Watt's recent deputation to Assam with reference to tea blight has been to convince the planters that, as Mr. Buckingham says, "there is as much to be learned on the subject of proper cultivation of the plant as in that of the remedy of actual blights." The Assam branch of the Indian Tea Association has approached the Government with a request that it will supervise the scientific labours of a chemist whom it is proposed to bring out with a view to his devoting several years to a thorough investigation of the chemical properties of the plant. It is felt that the Government of India is best qualified to select the most capable man for this undertaking, and in order that his work may be efficiently supervised it is proposed that he should be associated with one of the scientific departments. The Association is willing to pay his salary upon the understanding that the result of his investigations becomes its property.—*Englishman.*

A TEA EXPERT WANTED.

At the annual meeting of the General Committee of the Assam Branch Indian Tea Association, held last month, we notice that the question of the appointment of a scientific officer for the tea districts was discussed. We append for the benefit of our home readers the memorandum on the subject to be submitted to the Government of India. "The tea industry having for some years past felt the necessity of a thorough scientific investigation into the chemistry of the tea plant and its cultivation and manufacture desires to bring the matter before the Government of India for consideration and such co-operation as may be found possible. It

is understood that in a kindred subject—viz., investigation connected with silk—such co-operation, and even pecuniary support, has actually been rendered by the Governments of India and Bengal. It is accordingly felt that the support, not only of the Government of India, but also of local Governments, where tea cultivation is pursued, might reasonably be extended to an industry of such magnitude and importance. The Tea Association fully appreciates the assistance which the Government of India have rendered, and are still rendering, in the deputation of Dr. Watt, the Reporter on Economic Products, to investigate into the subject of tea blights. Without anticipating the report which Dr. Watt is likely to publish, it may be said that he has convinced the planters in the districts visited that there is as much to be learnt on the subject of proper cultivation of the plant as in that of the remedy of actual blights. But this involves a scientific investigation mainly of a chemical nature, which the planting industry, unaided, is unable to accomplish, not so much financially as in proper control and supervision of the operations of a scientific officer. It is contemplated that a chemist of established reputation should be brought out to this country, for a fixed term of years, say five, to receive such salary as would ensure his devoting his entire energy to this enquiry, but on the distinct understanding that the result of his investigations should be the property of the Association. The selection of such an officer it is felt that the Government of India would be better qualified to make than the Association. The direct assistance which the Government of India, it is believed, could render would be in the equipment of a laboratory, since the apparatus required might be utilised by Government in its chemical laboratories, at the close of the contemplated investigation. It is also suggested that the major portion of the apparatus and chemicals might even be lent for the purpose here indicated. In venturing to suggest direct aid, the Association considers that supervision of chemical inquiries is of the greatest importance, and for this purpose the chemical officer might be associated with one of the scientific departments of the Government of India. This Association believes that the desired aim of the investigation might be frustrated through a scientific officer not being supervised, there being the liabilities of his attention being diverted from the main points at issue. But, in venturing to make this suggestion, the Tea Association desires mainly to obtain an expression of opinion from the Government of India, and the final scheme may be matured hereafter."—*H. & C. Mail.*

THE KOLA NUT AND ITS PROPERTIES.

The introduction of the kola nut is comparatively of recent date, and as a marketable commodity its advent here is somewhat of a novelty; but it clearly has a future as an article of commerce. Its remarkable invigorating qualities have been much talked about. By use of the kola it is stated that the burden which could only be borne by eight Brazilian negroes can easily be carried by four African negroes. According to Dr. Gustave Le Bon, who has devoted some attention to the nut and its properties in the *Revue Scientifique* the introduction of kola is only of recent date. From a chemical standpoint, the composition of the nut is still imperfectly known; from a physiological standpoint its effects have varied very considerably. When the grains of the kola tree first came to Europe, chemists submitted them to analysis, and as large quantities of caffeine were found, it was naturally supposed that caffeine was the active principle of the kola, and that, therefore, it was much more simple to substitute this alkaloid for it. Maintained at the French Academy of Medicine by the high authority of M. Germain Sée, this opinion naturally retarded for a long time, at any rate in France, the judicious use of the kola. The question of the principles to which the kola nut owes its properties has provoked numerous inquiries, and many results have been obtained by different experiments. The most important analyses are those published by Heckel. He

found in the kola nut 2.35 grammes per cent. of kaffeine and .023 grammes per cent. of theobroma. The original part of the analysis of Heckel was to establish a particular body; the red colour of the kola, which exists in the proportion of 1.3 per cent. in the nut, he obtained by treating with water the alcoholic solution of the kola, but did not succeed in defining its chemical constitution. Having seen by experience that caffeine alone would not replace the kola nut, and finding in it no other substance than caffeine, theobroma, and the red portion of the nut, Heckel was led to suppose that to this red portion of the kola was due in great part the action of the nut. A chemist of Orloggen has maintained that the red of the kola nut was a glucoside, susceptible of decomposition in the presence of water into caffeine and a colouring substance. The red of the kola nut, under the influence of mastication, is transformed in a great part into caffeine when it arrives in the stomach. Heckel cites in support of his experiments upon man investigations in the laboratory, which show that the kola increases and prolongs the intensities of the muscular contractions, while with the caffeine the stimulation is of very short duration and wears itself out very rapidly. For those who desire to make use of the kola nut the advice is given to consume it exactly as do the African negroes—that is to say by masticating slowly fragments of the fresh nuts, and to reject completely all other preparations. Fresh nuts are to be taken in preference to dried nuts, as the last are valued little by the negroes and are produced from a very inferior variety of the kola. Nothing is easier than to obtain fresh nuts when required, for medicinal or other purposes, from the coasts of Africa, at a cost of two or three francs a kilogramme, and to preserve them in this condition for a long time. They have been kept for more than six months by simply covering them with moist leaves, and by rolling them up in sugar, or some saccharine preparation, they may be kept for a much longer time than this. Fresh nuts, by reason of their characteristic appearance, cannot be adulterated, whereas when they are dried it is impossible to recognise by their appearance the true kola from the false. The negroes frequently substitute spurious kolas for the true ones, and the former belong to a very different family, containing no trace of alkaloids.—*H. & C. Mail.*

COCONUT AND OTHER CULTIVATION IN CHILAW AND PUTTALAM DISTRICTS.

(From a Colombo writer.)

Rain has not fallen over Chilaw, for the last few months and every thing looks parched up and dry. Coconut trees have however not been affected and the hardy tobacco plants look green and flourishing, but tobacco is planted on small patches of land and every shrub is daily watered. There is in most parts of the district no grass at all and cattle are fed with plantain and coconut leaves. Coconut cultivation is extending on all sides, Mr. Baur has over 400 acres under cultivation and bids fair to be one of the largest proprietors in the district. As much as R100 has been lately paid for good forest land. There are yet large tracts of land available for cultivation. There is just a little fever prevalent in some parts of the district but the people who suffer have in most cases to thank themselves for it. One "intelligent native" especially eschews quinine and has built his bungalow on the bank of a river! He is a firm believer in an Indian quack remedy in which quinine forms no part! The writer advised him to try quinine and run up an upstairs bungalow as far away from the river as possible, and it is to be hoped that his advice will be taken. It is surprising how people will not take the most ordinary precautions. The climate is not always to blame. The water is as a rule always bad, but yet very few think of boiling it before drinking. Young Drieberg who superintends Mr. Baur's group of estates has never known a day's illness all the time he has been in the district.

Mr. Thorburn, the hard-working Assistant Agent, it is expected will go up shortly to Kandy as Office Assistant and Fiscal being re-placed by Mr. Noyes. Mr. Carberry is doing good work as Magistrate at Chilaw, and sits for a week, a month at Marawilla. Mr. Lovering is under orders to proceed to Bandarawella after a turn in a fever district. Some portions of the road are a bit cut up and certainly the coach service leaves much room for improvement. The Postmasters along the road seem to be a sleepy lot, and the time occupied in the delivery of the mail bags seem to be altogether absurd. Last but not least, Chilaw boasts of a club with a first-class billiard table, and visitors from the Metropolis have no reason to complain of the warmth of their reception in the land of coconut.

CEYLON SEASON REPORTS FOR AUGUST.

The abstract of season reports for the month ended August 31st is published in the *Gazette*. The condition of paddy crops and harvest throughout the island is generally satisfactory, but Hapitigam Korale reports that some fields have suffered from drought. Cattle disease is reported from several districts, while in some places the spread of the disease has been effectually suppressed. Fever, dysentery, chicken-pox and measles have been prevalent in the Galle district and many deaths have occurred. Hambantota reports fever and dysentery; and Badulla, cholera, dysentery and fever. The health of the inhabitants in other districts is fair.

THE TEA ROLLER CASE.

An application was made today before their lordships in the Appeal Court, on behalf of the defendants and appellants to withdraw the R3,000 deposited as security for costs that would be incurred by the respondents in the hearing of the appeal before the Privy Council. The appellants having been successful in their appeal, the application to draw the deposit was allowed.

IVORY, SPICES, AND BARK.

The statements about the African elephant becoming extinct must be all bosh. So one thinks as one enters another warehouse, the ground floor of which is devoted entirely to ivory. One of the quarterly sales had just concluded, and at least 120 tons of the valuable material was lying about in "lots." India and Africa are the ivory exporting countries. The best quality comes from Zanzibar, and is remarkable for its density and whiteness. That which is sent from the Soudan has often been buried for years, and frequently gets damaged. Sometimes when it "cracks" in the warehouse it "goes off like a gun," and fetches of course a lower price than some of the other kinds. That from the West Coast, also, is not of first-rate quality, being worth about half that from Zanzibar. The ivory imported is of all shapes and sizes. One big tusk weighed 137 pounds, and was considerably over six feet in length. Tusks of the rhinoceros, teeth of the hippopotamus, are also found here, and many other animals, such as the walrus, the narwhal, the sperm whale, also possess teeth or tusks which are imported in quantities, and which can be used for purposes in the arts for which true ivory is employed. Altogether, the ivory at the docks is an interesting sight, and an inspection of it might throw some light on more than one of the vexed problems of Central Africa.—*Westminster Gazette.*

NORTH TRAVANCORE PLANTING INDUSTRY.—Elsewhere will be found full and interesting information respecting the condition and prospects of the North Travancore district, in which both tea and coffee are likely to make a brave show through the enterprise of Messrs. Finlay, Muir & Co.'s Syndicate in the next few years.

COMPANIES AND SHARES : A CALL FOR CAUTION IN CEYLON.

The pace altogether in Colombo, we are assured, is getting too fast, and while there is yet time it would be well for the public to pause and consider the future. "Hastening to be rich" is a habit with a long pedigree, and a bad reputation. Even in the childhood of the world, when there were only flocks and grain to deal in, the wise and experienced of that age lifted up their voice against it as a snare; and to the more civilized nations of today with their Bourses and Stock Exchanges, this race for riches which has too often ended in crashes and disaster, has been proved to thousands over and over again, to be a way of life hard in the extreme and full of pitfalls.

But then there is, undoubtedly, excitement in it, and often much self-satisfaction. Everybody—in the slang of the day—thinks himself so knowing, and as having got a "tip" which he feels sure will "land him the coin." Besides that, he knows somebody who has put him "up to the ropes," and got him "into the swim;" and although it often turns out that this esoteric knowledge is but poor stuff, and the expected reward eludes these enlightened ones in the end, still human nature is hopeful, and often thinks more of what may be, than of what is. In this way, speculation is fostered, and when once a community is properly inoculated, and has gone fully in for this species of madness, one does not require to be able to forecast how it will all end.

In Ceylon there has always been speculation more or less, much of it of a legitimate kind—the risks that a man must take when he follows his regular business. But since the advent of Tea Companies and a Local Share Market, which gives every facility for the transferring of scrip, "dabbling in stock" has become, we are told, common among almost every class of the community with any cash to spare, and to make money on the chances of the market, is now, we are assured, one of the absorbing aims of life, at any rate among not a few members of the business and planting communities. It is under these circumstances that we are asked to give a word of warning in our editorial columns and to place the danger before the Colony, of overdoing "speculation in shares" in a forcible light. At the same time we are aware there is another side to much of the criticism offered to us, and therefore, after continuing to give the one side of the shield as depicted to us by pessimistic critics, we shall endeavour as well to bring into relief the other side with the views of those who, it may be, are sanguine if not optimistic. We are told then, on the one hand, that because, within the last six months or so, prices of almost all the tea stocks have risen, and some have gone up with a bound, investors have in some cases nearly doubled their capital. Further that now we have a very feverish state of affairs with a marked tendency to inflation of prices and an excited number anxious to share in the spoil, whose blood—our critic warns us—is at too high a temperature for them to be able either to think or act with ordinary caution. Reports of the local Share Market, it is added, too clearly show that Tea Companies' scrip is now becoming a thing to speculate or even gamble with rather than a medium for honest investment: and many who know nothing of the real position of affairs, put their money down with the sole intention of lifting it ere very long, plus what the wis-

dom or unwisdom of others may have added thereto. "It's a queer thing if I can't find a bigger fool than myself," is how a deal at a fancy price is supported; and while the "boom" is on, the bigger fool is supposed to be sure to turn up and offer an enhanced rate. What has been said of tea shares, applies, it is urged by the pessimistic, to Company formation. Companies are springing up like mushrooms; and in a late report, the local Share Market is said to be "a trifle weaker" owing "to the amount of capital required for new Companies just incorporated, and being now negotiated." High values are offered for estates, and when the Company has been formed, and the shares placed on the market, a rush sets in, and before results have had time to be shown, shares are at a premium, and a new race in speculation is inaugurated. What then, says the critic, is all this sort of thing going to lead to? We hold as strongly as any one in our midst, the soundness of the Tea Industry: but, our pessimistic friends assure us that no kind of business can afford to be treated in this way, without a day of reckoning having to be faced. Then it is alleged that although it is some time since the local banks took alarm, and placed their ban upon Tea Company scrip: yet that the effect has been not to check speculation but to send the men borrowing elsewhere. The condition of affairs is therefore depicted as a wild hurly-burly altogether, and while it is yet time, the public are warned to be cautious. The reaction is sure to come, and when the present unhealthy excitement has exhausted itself, and the mad carnival is over, there will be to many a retrospect which is unsatisfactory; the fragments to be gathered up will be of a sorry nature and worst of all, there will be "the mischief to pay."

All this is calculated to sober the least thoughtful amongst us and to cause them to ponder whether the present is a healthy condition of affairs in our local Share Market. At the same time, it is impossible to deny the force of certain "facts and figures" which put matters in a different light. The very fact that "scrip" is not regarded as proper security for loans, surely shows that the buyers of shares are working chiefly with their own money. Banks, we believe, only take shares as collateral security; but it is urged that every quotation in Colombo so far, may be justified on the basis of a 10—or at least 7 to 8—per cent return on the price. It is therefore insisted that the business up to date is perfectly legitimate and sound, and considering the good position of Ceylon tea, every Company so far announced, and some more to follow, can all be shewn to have a solid basis. The transfer of estates from individual proprietors to bodies of shareholders, so spreading the risk, and providing a ready investment for local savings, is considered good policy from every point of view; and more Companies are to be approved of since they afford means for the safe and profitable investment of local savings as well as of cheap money from home.

There is much, of course, in all this; but the question remains as to the safe limit for speculation in shares. For one thing, Ceylon tea is having a specially favourable innings this year through a bad Indian season; but that cannot be expected to continue; and therefore to base calculations as to returns on recent or present experience, can scarcely be safe in respect of coming years; and the word of "caution" is, therefore, after all necessary.

GRAPE CULTIVATION IN COLOMBO.

(Communicated.)

We have before referred to an experiment in grape culture that was going on in the neighbourhood of the Agricultural School in the Cinnamon Gardens. The vines were collected by Mr. Zanetti in different parts of the Central Districts of Victoria, and the cuttings taken from selected healthy plants under his supervision. Packing for transit was of course a most important matter, and particular attention had to be given to the vines during the voyage, in keeping the roots moist and at the same time preventing mildew. Ninety per cent of the rooted vines that were brought over are thriving well; the other ten per cent cannot yet be said to be total failures as they may in all probability strike from the bottom, though, of course in such cases, the crop will be delayed by two reasons. In connection with the Colombo experiment there are two nurseries. One nursery contains:—

125	Cuttings	Gordo Blanco
125	"	Champion Muscat
125	"	Black Prince
10	"	Lady's Finger
10	"	Snow Muscat Ambre
10	"	Gross Colman
10	"	White Marillion
100	"	Golden Chasselas

making a total of 740 cuttings.

A second nursery contains 150 cuttings chasselas (golden) 250 cuttings Muscat of Alexandra. Making a total of 400 cuttings.

The planted vineyard contains vines; two years old and under, of the same varieties as the cuttings excepting the Muscat of Alexandra, plants of which could not have been secured, and the Champion Muscat. A bundle of 50 plants of the latter variety were unfortunately stolen from Mr. Zanetti two days after their arrival in Colombo, and all attempts to trace the thieves proved unsuccessful.

The following notes the chief characters varieties that are being tried.

THE MUSCAT OF ALEXANDRA: A very easily grown grape, very prolific, fine flavour, small bunches but well filled, generally a very good cropper in hilly land of a rocky nature where patches of loose soil are obtainable.

THE CHAMPION MUSCAT: does not grow very rank or strong, but is a fair cropper, very large red berries with splendid flavour.

The vineyard contains about 750 plants of the following:—

Gordo Blanco.—Vines two years old, in their first bearing, very strong grower, good cropper, large bunches, though not very well filled, fine Muscat flavour, a white grape.

Black Hambro or Hamburgh.—A medium grower, fair cropper, splendid large black berries, very sweet, bunches large and full.

Black Prince.—Rare variety, large oval black berries strong grower, but must be expected to fail to crop once every two years.

Golden Chasselas.—The earliest grape in Australia, brought over originally from the South of Spain, splendid cropper, easily grown, affects sandy soils, medium sized soft golden berries with sweet juice, large and well filled bunches. This Mr. Zanetti thinks, should be the most successful in Ceylon, and liked most for its flavour.

White Marillon or Doradillos.—Very strong grower, good cropper, though late, good sized berries of amber colour and fine flavour.

Gross Colman.—Strong prolific grower, large sized black berries, poor cropper, of very superior flavour. Vines two years old.

SNOW MUSCAT HAMBRO.—Strong Muscat, good cropper, not very large berries but of very delicious flavour, very late.

LADY'S FINGER.—A strong grower, magnificent oval golden grape, came originally from Sicily, large bunches but loose, berries of exceptionally large size, very fleshy and of delicious flavour, hardier and more vigorous than any of the above, and all round the best. Vines two years old. The vines which were

over 6 weeks out of the ground were planted during the first week of August, and the 750 do not occupy much more than an acre. Supports have already been supplied and the vines tied on to them. Altogether the miniature vineyard of a month old presents a very pleasing sight, and it is as novel as it is interesting to see some of the little vines, two three feet in height, bearing blossom and a few actually with fruit. The experiment is one of vast importance to the Colony and will be watched with much concern by all. We heartily wish it all success.

QUININE FOR THE MILLION.

We are very pleased to find that the Ceylon Government is at length to follow that of India in a direction we have often recommended. The following is from Dr. Kynsey's Medical Report:—

"A scheme has been sanctioned by the Governor, and is in course of being introduced, for the sale at dispensaries and post-offices throughout the Island of quinine in small packets at a little over actual cost price. I anticipate that much good will result if the scheme proves a success; this valuable drug will be placed within the reach of the poorest village at trifling cost."

THE AGRICULTURAL MAGAZINE.

The following are the contents of the September number just out—I. Grape Cultivation in Ceylon. II. Laws of Ceylon relating to Agriculture. III. Labour. IV. Palmyrah Palm Products. V. Daily Produce. VI. Black Smut on Orange trees. VII. Abortion in Cows. VIII. Gambage and Benzoin. IX. A New Fruit Tree. X. Poultry Diseases. XI. Royal Commission on Tuberculosis. XII. Chemical Examination of Ceylon Plants. XIII. Vines and Live Supports. XIV. Ceylon Woods. XV. Rainfall taken at the School Agriculture during August 1895, and XVI. General Items.

Some discussion has been started in the pages of the Magazine on the subject of Grape culture—the outcome of the experiment at the School of Agriculture, where, from all reports nearly a dozen varieties of Australian vines have made a very promising start. It is to be hoped that these experiments will be the means of discovering the best varieties for grapes in Ceylon. The article on Dairy Produce is interesting, and the note on black smut on orange trees should prove of value to fruit growers. It is somewhat amusing to read of the high opinion in which the Carambola (a much despised fruit in Ceylon) is held in Australia.

NEW TEA COMPANIES.

THE CEYLON PROVINCIAL ESTATES CO., LTD.

The Memorandum and Articles of Association of the Ceylon Provincial Estates Company, Limited, are published in the *Gazette*. Among the objects for which the Company is established are—To purchase, or lease, or otherwise acquire any estate or estates, land or lands, machinery, implements, &c. in the island of Ceylon; to purchase tea leaf and (or) other raw products for manufacture, manipulation, and (or) sale; to manufacture tea leaf and (or) other raw products; to plant, grow, and produce, buy, sell, trade, and deal in tea, coffee, cinchona, cacao, cardamoms and other plants, trees, and natural products of any kind, or any of them. The nominal capital of the Company is one million rupees (Rs. 1,000,000), divided into two thousand shares of five hundred rupees (Rs. 500) each, with power to increase or decrease the capital. The following have already taken a share each:—Messrs. John Paterson, Stephen Brown, John N. Grant, F. J. de Saram, M. Bremer, Andrew Murray, and R. W. Paterson.

THE HIGH FORESTS ESTATES CO., LTD.

The *Gazette* also contains the Memorandum and Articles of Association of the High Forests Estates Company, Limited. The following are among the objects stated for which the Company is established:—

To purchase, or lease, or otherwise acquire any estate or estates, land or lands, machinery, implements, etc., of any kind whatsoever in the Island of Ceylon; to purchase tea leaf and or other raw products for manufacture, manipulation, and or sale; to manufacture tea leaf and or other products; to carry on the business of planters of tea and other products in all its branches. The nominal capital of the Company is one million rupees (Rs. 1,000,000), divided into two thousand shares of Rs. 500 each.

The following have already purchased a share each:—Messrs. G. W. Carlyon, W. Henry Figg, C. J. Donald, C. E. H. Synons, A. J. Saver, G. H. Alston, and J. Armitage Ogden.

SALE OF A KALUTARA ESTATE.

The mail has brought news of the sale of Polgahakande estate, situate in the Kalutara District, by Mr. J. Wight to The English Ceylon Produce Company, Limited, for £5,750. There are 291 acres of tea and 69 acres of reserve. We never heard of this Company—it must be another new one?

THE CANTON TEA TRADE.

The Canton tea trade, season 1894-95, has proved fairly remunerative. Declining exchange has enabled shippers to lay down their purchases on the London market at a low and continually lower cost. This, combined with a considerable falling-off in production (the natives having lost money steadily of late years), has helped importers in feeding the greatly reduced demand at prices that have paid them as a rule, if only in a small way. Ten years ago the season's exports from these waters amounted to nearly 20,000,000 lb.; it is now less than 10,000,000 lb. The bulk of this is scented tea used for mixing purposes; but the natural pungency of Indian and Ceylon products is the cause of its going out of fashion. Little is now required, and that only if very cheap. The trade is dying out. Taxation is not likely to be less; exchange has risen; and the rate of freight this season is to be higher; so that prospects are altogether gloomy."—*L. and C. Express*, Aug. 23.

THE TEA TRADE.

An important point has been brought to notice by Messrs. McCool & Co., in which the Ceylon tea shipper has hitherto had the advantage over his Indian competitor in the American and Canadian markets. We refer to the factory bulking and marking of teas on the chests. This, it seems the Ceylon planters have already attended to; but Indian gardens have often neglected it, though some large firms in America already make the bulking and tarring a *sine qua non*, and others give the preference to chests so dealt with. The matter is being taken up by the Indian Tea Association, who are circulating a minute on the subject, and now that attention has been called, it should not be difficult to remedy.—*Indian Daily News*.

ACACIA CATECHU.

Preparation of dark Catechu, or, as in trade, it is more correctly designated Cutch.

The trees that yield this substance are regarded as mature when about a foot in diameter. They are then felled and cut up into blocks two or three feet long. In some parts of the country the natives ascertain whether it will pay to cut the trees, by making a small notch into the heart-wood. Trees between twenty-five and thirty years old are regarded as best suited and are said to yield more or less according to the number of white lines perceived in the heart-wood. The bark and the outer sap wood are generally removed and rejected. The red heart-wood is then cut up into small chips. In certain districts the branches are not utilized in the preparation of the extract, in others they are so used.

The chips are then boiled in water in earthen pots for twelve hours. When the water is reduced

by one-half, the chips are taken out and the liquid placed in large iron pans or cauldrons and again boiled and stirred till it attains the consistency of syrup. The cauldrons are then taken off the fire and the stirring of the liquid continued till the mass is cool enough to be handled, when it is taken out and spread on leaves arranged within a wooden frame or mould and left for the night. In the morning the Cutch is dry and then exists as brick-like masses that each weigh 36 to 41 lb. These are broken up into pieces ready for the market.

The process of boiling and preparation of the dry extract varies considerably all over the region where the article is made, but the principle is the same as that given above, which may be said to be the Pegu system. Occasionally the chips are boiled a second time with the production of a small amount of inferior stuff. In other cases the red liquid is poured over fresh chips and again boiled.

From the widespread conviction of the necessity for stirring or beating the concentrated solution (on its being removed from the fire), it might almost be inferred that some chemical change was thereby effected similar to the oxidation produced by beating the indigo-vat solution. Thus, for example, in Baroda the decoction is strained through a blanket. For this purpose the blanket is dipped into the fluid, stirred about and then wrung out, while the blanket is being held at as great a height as possible. By this process the liquid falls through the air in a greatly divided stream or shower. And this is continued for an hour or so, the liquid being repeatedly wrung through the blanket, the trough is then covered over with a lid of split bamboos and the sediment allowed to subside. The water is then poured off and the extract cut into small cakes and allowed to dry.

In Buriya (Gujarat) the thick decoction is poured into pits, five or six feet deep, in the bottom of which baskets are placed. The liquid drains off, the chips are retained in the baskets, and the solid extract formed on the floor of the pits. This is removed and dried on leaves while exposed to the sun.

Speaking of the Pegu system, it is admitted that much difference of opinion prevails as to the value and extent necessary of the beating process. One writer says it is more of a "beating up" than stirring, "but I have never been able to a certain what the object or effect of the process is. Cooks differ, too, in the amount of beating up that is desirable, some being satisfied with half an hour's application." It will be seen below in connection with the subject of *Kath* that a peculiar system of encouraging crystallization (which may be analogous to the beating) is considered essential.

As to the amount of Cutch yielded by heart-wood, it had been stated that from 3 to 10 per cent. in weight would be a good average. In other words, one ton of timber, in the round, might be taken as yielding 250 to 300 lb. of Cutch.

The Cutch of trade appears in several forms. The Pegu variety occurs in masses with layers of leaves between the successive preparations. But Cutch is also met with in cubes of various sizes which often show the markings of leaves used in the moulds, or it occurs in sharply defined cubes or blocks from having been cut up by a string or wire run through the still plastic mass. In other cases it is sold in rounded balls or flattened cakes made in the hand.

In colour it is externally of a rusty brown, internally a dirty orange to dark liver-colour, and in some cases almost black or port-wine coloured. It is inodorous, but has an astringent bitter taste, followed by a sense of sweetness. It is brittle and breaks with a more or less resinous, shining fracture.

Having regard to the results of the several experiments which I have made, I draw the following conclusions:—

1. That whether the Cutch extraction be performed by the native or in a factory, the wood should be preferably reduced to thin shavings.
2. That as little water be used as may be, ten parts or perhaps less would suffice.
3. That the boiling be continued for half an hour only.—*Agricultural Ledger*.

Correspondence.

 To the Editor.

COFFEE IN SUMATRA.

Aug. 16.

[To the Editor of the *Deli "Courant."*]

SIR,—In a recent issue you stated that the rush for coffee in Serdang existed only in the imagination of the writer of the articles which have recently appeared in the *Ceylon Observer*.

Permit me to inform you of the following facts. Six months ago there were in Serdang seven contracts going begging, aggregating 25,000 bouws.*

All these have now been taken up for the cultivation of Liberian Coffee.

I enclose my card, and am,
 THE SUMATRA CORRESPONDENT OF THE
 "CEYLON OBSERVER."

THE CACAO, COCOA OR CHOCOLATE
 TREE—"THEOBROMA CACAO"—IN ITS
 NATIVE COUNTRY.

Victor Park, Corstorphine, near Edinburgh, N.B.

SIR,—This remarkable tree the beans of which yield the most valuable beverage known, is a native of the hottest parts of tropical America, being found growing wild in the Republics of Ecuador, Colombia, Venezuela and Brazil. When travelling in those regions I observed that two distinct sorts of trees which might be regarded as separate species produced the Cocoa of commerce. One of these of low habit from 15 to 20 feet in height is the variety cultivated to the greatest extent in the Spanish Republics, the West Indian islands and Ceylon. It appears, at least in its native habitat, to bear most abundantly on the more slender boughs and branches which crown the trees; with some fruits, however, on the trunks also. The fruits are moderate in size but the beans they contain, although not numerous, are often large and fine. This variety is considered richest in quality and may be seen growing up to an elevation of 3,000 feet. Contrary to the statements of various persons the tree thrives well by irrigation. Some of the finest cocoa grown in South America is obtained from plantations cultivated by this method. I have seen in Colombia several aqueducts for irrigating cocoa plantations which had been originally constructed by the Indians before the discovery of America.

The other variety which sometimes shoots up to a height of thirty to forty feet is of far more robust growth and dense vigorous habit and yields twice or more the number of beans. This is the sort for planting in India, Ceylon, and the East generally, but only in the low-lying and hottest situations. The fruit which is dispersed on the trunk and larger and smaller boughs is at first streaked with yellow and purple, finally becoming totally a pale golden colour when perfectly ripe. The mature fruit much resembles in appearance a frame melon. There is an extensive coast region of India and Ceylon bordering on the brim of the ocean in great part overgrown with wild forest which would be found well adapted for the cultivation of this superb variety of cacao tree. The same remark applies to many portions of land on the banks of the Irrawaddy and Southern Burmah.

It is singular that this large robust and prolific sort of cacao has not been identified by any of the botanical writers on the flora of South America. This is explained by the fact that botanical collectors invariably aim at the acquisition of the greatest possible number of species without devoting much inquiry about the plants cultivated by the natives of the countries in which they travel.

Of the value of cocoa as a beverage when prepared pure, it might almost be difficult to say too much in its favour. In the densely humid debilitating hot regions no other description of food is found so supporting and nutritive as the native prepared chocolate.

The Indian tribes inhabiting the vast forest domain of the eastern Cordillera of Colombia and Ecuador will travel long fatiguing journeys for several days in succession with no other support than a moderate sized bag of cocoa beans. Those beans are, of course, in a raw state, the shell being removed by the hand and eaten while travelling. In the Spanish Republics the successful leaders of GUERRILLAS who have often overturned and replaced Governments in those countries frequently owed as much of their success to a good supply of chocolate in their undertakings, as they did to their shrewd strategy and knowledge of mountain paths and local influences.

Since 1860 the use of cocoa in the United States has increased more than six-fold while that of tea and coffee within the same period has not quite doubled. The annual consumption in France amounts to 26,000,000 lb., Spain 16,000,000 lb., Great Britain and Ireland 14,000,000 lb. Apart from the consumption of this product by the different countries of Europe we have that of the whole of the Central and South American Republics—from Mexico to Paraguay—more than half a continent—whose chief beverage is undoubtedly chocolate.

In conclusion I trust that these remarks regarding the large growing prolific variety of cacao tree of South America as yet unknown to cultivators or planters of this tree in either Ceylon, Africa or the West Indian islands may not be without interest to your readers.—I am, sir, yours obediently,

ROBERT CROSS.

HYDRAULIC LIMESTONE AT JAFFNA.

Jaffna, Aug. 20.

SIR,—The article on the above subject on page 132 attracted much attention here. If it is the same stone from which lime was prepared some time ago, under the auspices of the Government Agent at the Kalumunai point, for use at the reclamation road at the Jaffna lagoon, off Karioor, it certainly abounds in several places in the Jaffna Peninsula. The stone varies in consistency in different places, from the hard stone fit for building purposes, to the fine gravel dust used in levelling and smoothing of our roads. However stones exactly similar to that found at Kalumunai Point are met with in several parts of Jaffna, along the sea coast as well in the interior, almost to an unlimited extent, and our workmen would be able to supply the stone at very low prices, at a cent a bushel, as they would calculate upon converting the ground into good garden land, by filling up the hollow places with earth after the stone is removed.

The chief item of expense in the preparation of lime with this stone would be that of firewood. There is hardly any wood fit to be used as firewood worth mentioning in Jaffna. However a forest officer of some standing in Jaffna lately said that the Wanny part which is estimated to be of some 500 square miles in extent, abounds with decaying firewood timber which can advantageously be cut and removed, and the undergrowth allowed to attain maturity and expansion; can this firewood be availed of? and even if it can be, how can the firewood and stone be placed in proximity to each other. They are now lying at a considerable distance from each other. Can the contemplated railway or even the tramway be made to do service either to convey the firewood to a convenient place at Jaffna, or the stone to a similar place at the Wanny. If this is done, cheap lime can be had in any quantity for building purposes or for making cement.

The Government Agent of the Province is just now in Colombo, on his annual visit to the metropolis, and there is not another man in all Jaffna whether native or European who knows more about these two points of firewood and stone, than he;

* 25,000 Bouws—43,750 acres.

and he would be glad to furnish information, especially as the palmirah fibro industry which he at one time encouraged is fast dying out; and hundreds of people in the interior villages of Jaffna who used to make a living out of it are thrown out of employment.

With their numerous buildings, cheap lime is a great desideratum in Colombo and Kandy, not to mention the other towns which are rising into importance. Already there is a thriving trade between Jaffna and the Ports of Chilaw, Calpenty, Pattalam, &c. in lime, and the trade would speedily develop if the supply could be maintained at a reduced rate. The value now paid for lime in the above ports is enormous, almost triple of what it costs in Jaffna.—
Yours faithfully,
PRO BONO PUBLICO.

PHYSIOLOGY OF THE CIRCULATION IN PLANTS.—CAMPHOR TREES IN SOUTHERN INDIA.

South India, Aug. 22.

DEAR SIR,—Will you kindly allow me the opportunity of commending to the notice of my brother planters a suggestive book called "The Physiology of the Circulation in Plants, in the lower animals and in man." This book comprehends a series of lectures delivered at the Royal College of Surgeons. Would it not be helpful if you devoted a column regularly to the review of any works that may appear from time to time that are likely to be helpful to planters by throwing side-lights perhaps on important agricultural questions. The title of the book mentioned may not appear likely to promise any practical help. But if we are to acquire a thorough knowledge of the laws of health and vigour in plants we must begin systematically at the beginning and surely a thorough acquaintance with the various processes in the normal circulation of the sap in plants, may be considered to be almost the first essential. Before meeting with this book I had come to the conclusion that the circulation of sap in plants, and the resulting processes of nutrition, could not be thoroughly, and intelligently understood apart from some insight into the processes of the circulation of the blood in animals and in man, for an insight into the one helps to elucidate the other, as there is a striking analogy between all the processes of circulation in plant, animal and man.

I imagine I hear some practical man incredulously exclaim: "How on earth can there be any analogy between a plant that takes up its sap mechanically by its roots, and the intricate organs of the animal and human body?" Such a man however is too practical to be aware of the fact that the villi of the animal and human intestines are exactly analogous to the roots of plants, and perform exactly the same office interiorly that the root does exteriorly.

Of course with each rise in the scale of organization the construction of each organ is increasingly elaborate and complicated, but the principle in all remains the same. When we bear in mind that the very same law of osmoses that governs the transmission of the sap through the membranes of the cellular tissue of plants, also controls the transmission of the blood through the membranes of the cellular tissue of the human body, we begin to apprehend how close the relationship must be. In the volume under remark, there is collected a vast amount of information regarding the various processes of plant life, which has been carefully culled from the works of the best authorities—especially from our great lion Herbert Spencer, but unfortunately many erroneous statements have been perpetuated in its pages such as the theory of the *capillary* ascent of the sap. However it is correctly stated that the ascent of the sap is also governed by the law of the diffusion of liquids, or fluids. The editor however seems to be ignorant of the fact that the principal factor that controls the ascent of the sap is the rarification of the air within the intercellular spaces of the plant, in the presence of light and sunshine. The editor contends that there are two *principal* currents of sap in plants. That a downwar

diffusion of sap is needed in order to store up the contents of the sap within the bark, &c. in autumn, is evident, but to affirm the existence of a *continuous* downward current is unwarrantable.

The circulation of the sap in plants cannot be altogether compared with the circulation of the blood, as the sap is of varying density and composition in different parts of the same plants. In the stem near the roots, for instance, the sap is in a diluted state, whereas in the leaves it is considerably thickened by the evaporation of a large percentage of its contained moisture. Of course the editor might here refer me to the density of the contents of the chyle ducts in the human body, but that is just the reverse of the conditions in plants. Again the author has perpetuated the error that the stomata of plants close in dry weather and open in wet! The fact is that the opening of the stomata depends chiefly upon the degree of pressure exerted upon the guard cells by the aqueous vapour within according to its varying density. The author also seems to be unaware that leaves possess both air stomata and water stomata. The air stomata under the leaves and the water stomata along the margin of the leaf. Early in the morning of a warm day large drops of moisture may be noticed on the margin of some leaves, which one would be apt to call dew, but is really water excreted by the water ducts.

But I have not time at present to add more to these hasty remarks. Perhaps I may be permitted another opportunity of doing so. Meanwhile I would only add that the careful study of a book of this kind will give the clue to much that is obscure and perplexing, in our study of plant life.

With reference to the cultivation of Camphor. The Camphor trees I have grown here although of vigorous growth show a tendency towards a *bushy* habit of growth instead of making a clear stem. The same tendency is observable in the Camphor trees growing in the Botanical Gardens at Ootacamund. May I enquire whether it is the same in Ceylon?—Yours faithfully,
J. MCKENZIE.

"LADY-BIRD" BEETLES AND MR. E. E. GREEN'S EXPERIMENTS.

Mote Hall, Bearsted, Kent, August 23.

DEAR SIR,—I learn from your last issue of the *Tropical Agriculturist* just to hand, that the parcel of "lady-bird" beetles has at last turned up, but that the beetles themselves were all dead. Mr. Bagot considers this failure to be due to the fact that they were packed in closed boxes. But I think that the long and inexplicable delay in transit is the real cause. It is a mistake to suppose that insects require a large amount of air. They will generally obtain a sufficient supply through the natural crevices between the lid and the box. In fact in my experience of the receipt of living insects by post, I have more frequently had to complain of over-ventilation, leading either to the escape of the insects or the drying up of the food plant. In the case of the "lady-bird" beetles from California, Mr. Crow has had a large experience in sending these insects to various parts of the world. He despatched them in the full fed larval stage with a sufficiency of food to last them until they had pupated. It was calculated that the beetles would be hatching out about the time of their arrival in Ceylon. But a delay of about three weeks naturally upset these calculations. Perhaps it would be advisable on another occasion to have the parcel consigned to the U.S. Consnl. It might come with less delay in the official mail bag.

Did Mr. Bagot examine the cotton wool or any *débris* in the boxes? This would probably have contained eggs laid by the beetles before dying, and a brood of young larvae might have been raised from them.—Yours very truly,

E. ERNEST GREEN,

FRUIT CULTIVATION IN CEYLON.

Aug. 30th.

DEAR SIR,—Your correspondent who invites growers of oranges to send them down to Colombo, as he pays nine cents a piece, is unaware that there would be probably no profit to the grower.

It is my experience that all fruits which the grower cannot retail himself leave very little profit if any, even when grown with another standard product. This is the case even with plantains, which I have had more than once to sell at a loss, owing to rings formed by middlemen who, as a rule, make no less than cent per cent.

There are other reasons which make fruit cultivation a failure, that is that contractors for hotels and the shipping have no standard of quality to furnish and the Colombo residents are at the mercy of their Apoops! I have never seen in the hotels or in private houses of Colombo any prime fruit of the classes which can be cultivated. A look at the Colombo market is sufficient to prove my assertion.

—Yours truly, A. V. D. P.
[For profit, fruit must be cultivated on a considerable scale for export to London; and we trust Messrs. Smith, Pearson and their friends will be able to give a fair trial to oranges and lemons.—ED. T.A.]

CINNAMON CHIPS: RISE IN PRICE.

Negombo, Sept. 4.

DEAR SIR,—Can you or any of your readers account for the unprecedented rise in the price of cinnamon chips this season? In one of your recent issues I find it stated that the price had gone up to R65 per candy, delivered at Colombo, I believe, you will be surprised to hear that the chips of Kimbulpitiya estate in Kadirane, belonging to Mr. Schrader of Western Scaton fetched R67 per candy. Golua Pokuna estate following closely with R66.—Yours truly, CHIPS.

TEA ENEMIES AND REMEDIES.

Kandy, Sept. 7.

SIR,—With reference to the advertisement that has been appearing for some time now in the *Ceylon Observer* of the Chiswick Compound and Spraying Machines, we think it may be of public interest to know that there is not the slightest doubt as to the successful results that are being obtained. The following reports from three tea estates in India have been received by a recent mail and bear out many earlier reports:—

Reports from three Tea Estates referred to.—1. Red spider has been bad, but is now disappearing as the monsoon has broken. Chiswick Compound is invaluable for this disease, a couple of applications generally being sufficient to eradicate all trace of the disease.

2. Blight was noticed rather early in odd spots, and the spraying machines were put to play on it promptly, and during the fine weather 10 machines were working every day and have been successful in keeping it under, and preventing much increase.

3. Blight. The trees are wonderfully free from blight notably on the cut down. Insects are caught and the spraying machines do a great deal of good. Blight is very slightly noticeable on one tillah of No. 5 and it is also to be found on some of the tillahs of No. 6, but otherwise there is practically nothing. Orange beetles have done a certain amount of damage but red spider has not been so bad as last year.—We are, sir, yours faithfully,
A. PHILIP & CO., Agents.

TEA AND ITS CHEMICAL AND PHYSIOLOGICAL ACTION.

Talawakele, Aug. 23.

SIR,—I read with much interest the account appearing in the local "Times" of H. H. C's. interview with Mr. Rogers of tea tabloid fame. I would beg to point out that some five or six months ago I drew the attention of your readers to the fact that it was not the tannin in tea that the bitterness was due. In my experiments on the action of tea

on the digestive system I have satisfied myself that the tannin is not so injurious to the digestive organs as many people make out. When introduced into the stomach it does not act, as is supposed by many, by tanning the mucous membrane of the stomach. It attacks the soluble albumen, or peptones, and is precipitated in the form of an insoluble peptone. This insoluble peptone acts mechanically only in retarding digestion. I find that there is no difference in the time required to digest meat fibre, to which infusions of tea have been added, the infusions vary from five to thirty minutes. Seven different glass tubes were used:

No. I.	contained meat fibre & digestive fluid.	
" II.	"	tea 5 m. inf.
" III.	"	" 10 "
" IV.	"	" 15 "
" V.	"	" 20 "
" VI.	"	" 25 "
" VII.	"	" 30 "

No. I. was the control experiment. The time in each case being noted, it was found that the five minutes infusion required the same time as the thirty minutes. I then repeated the experiment, but removed tannin from the tea with gelatine, and found no appreciable difference in the time occupied in the digestion of the fluid "sine" tannin and that with the tannin present. On removing the tannin from the five minutes infusion the bitterness was not perceptible, while, in the 10-30 minutes infusions it increased in proportion to the length of time infused. I have been able to isolate this bitter principle, and I don't agree with Mr. Rogers that it is *Crusta Tannic Acid*. It answers the tests for alkaloids, and I take it to be closely allied to "Thebaine" from what I have seen in people who use strong, boiled infusions or decoctions of tea. It is a yellowish powder. I have not delicate enough apparatus to ascertain its actual chemical formula. But I hope shortly to be able to give an account of its physiological action on the nervous system. The question of the detrimental action of the tannin in tea will ere long be a thing of the past. Why do those who consume large quantities of claret and other such wines at dinner not complain of the same symptoms, as tea drinkers, when these wines contain a much greater percentage of tannin than tea does? The astringent action of wine being most marked on the mucous membrane of the mouth even. With tea the action of the tannin is more than balanced by that of the caffeine. The discussion of the action of the caffeine I shall reserve for some future occasion. It is time the medical profession knew more about the chemical and physiological action of tea. 95 per cent of them know that it is the leaf of a plant that contains tannin and caffeine, and is used very much by ladies as a mild stimulant; further than that they don't trouble themselves. Apologising for taking up so much of your valuable space.—I am, &c., P. M. SHORT.

FLUFFY TEA DUST—AND THE DEMAND THEREFOR—WHO WILL SUPPLY IT?

Talawakele, Sept. 10.

DEAR SIR,—I herewith enclose a letter which may interest many tea planters.

It applies to fluffy tea dust a sample of which I sent home for valuation, after experimenting with it myself. At present it is either burnt or thrown out, in many cases it is sold to itinerant Moormen who sift out any tea that may be present. It is no uncommon sight to see heaps of it lying in the bazaars and the fanning operations being carried on. There are two serious evils, that are likely to arise from this selling fluff at the factory door. First, it affords a means of selling other teas, thereby encouraging thefts, by factory hands. Second, the tea thus sifted out is used to make up inferior tea packets for sale in the Harbour, much to the detriment of Ceylon teas. Now that it is known that this bye product has a market value, it ought to be collected in all factories, and sent down to a central depôt for baling and shipping.

The firms who are willing to buy it are well known in Ceylon, as you no doubt can testify to Mr. Editor. I am not at liberty to publish the name at present, but shall be pleased to furnish same to any firm caring to take the matter up, in the Planters' interest. A written guarantee will be given that no portion of the fluff will ever appear on the market in any form as tea.

I may say that red leaf can be put in also. Trusting that the Planters may move in the matter.—I am, dear sir, yours faithfully,
PETER M. SHORT.

Stratford, near London, E., August 8.

Peter M. Short, Esq., Talawakele, Ceylon.

DEAR SIR,—We have received the sample which you sent us and we find its present value to be 3½d to 4d per lb, delivered to docks in London. At this price we could take a quantity, and if you can ship 5 or 10 tons promptly we should be glad to receive same and would pay the higher price if equal to sample. Payment to be made on arrival here.—We remain, yours faithfully,

[Please don't publish firm's name at present.—P.M.S.]

COOLY SANITATION.

SIR,—I noted your letter in the August *Tropical Agriculturist* in which this subject is handled, and reference has made to the unearned reward offered by your former chief for the best hints on this subject.

The cooly is a creature of habit and custom: once establish a custom and he will hold by it; he also readily conforms to any prevailing customs of the place he works in.

It has been found impossible, by trial, to make coolies restrict themselves in the way of latrines, but it may be possible to bring about the desired end by the use of a little diplomacy. Elephants are shy and powerful but they are eventually driven into a stockade, (of course to their real and moral well being) but the commencement of the "drive" is very wide. Imperceptibly they are drifted rather than driven to the desired centre.

On the same principle it might answer to enclose a large area of land adjoining the lines, out-side of which any pollution should be strictly forbidden. This area could be kept clean by special sweepers, the model latrine could be put up in the centre of the area, its use being optional, or merely advocated. Gradually the area could be reduced, and the latrine increased in size.

It would be used in wet weather, in fact its use would gradually become a custom. Should this system be adopted by a majority of estates which employ labour, it might have some success, but any trials on a small scale must be doomed to failure and the experimentalist would get a bad name. This plan entails time and patience, but as these two factors have already been spent without success, they might be employed again. There should be no appearance of hurry or coercion until indeed the custom is established to have become a law.

INDIAN PLANTER.

GRAPE GROWING AT 2,200 FEET IN CEYLON.

Hindugala, Peradeniya, Sept. 12.

DEAR SIR,—Could any of your readers give me hints as regards grape growing at this elevation—2,200 ft.

I have a Muscat vine, from a cutting brought out nine years ago, from a *very* good vine in England, and although apparently strong and healthy it shows no signs of bearing yet.

It is planted on a sheltered sandy slope facing south-west.—Yours faithfully,

M. Q. WEBB.

[M. Zanetti is good enough to give his opinion through Mr. Driberg as follows:—

It would be a difficult matter to account for the non-bearing of a vine without seeing it *in situ*, but the following are the most probable reasons—its strength may be exhausted by the presence of suckers; the sap may be dissipated along unnecessary branches by the vine being allowed to grow rank without proper pruning, or lastly the cutting might have been got from a "water shoot" or non-fruit-bearing one in which case there is hardly a possibility of the vine ever bearing.

We should be inclined to advise Mr. Webb to try laying bare the roots as a means of checking growth, adopted with success by the late Mr. Dyke in Jaffna, who in that way, got his vines readily to bear fruit. But Jaffna has the peculiarly dry climate in which the vine delights.—ED. T.A.]

VARIOUS PLANTING NOTES.

LIBERIAN COFFEE.—A couple of firms in Nederland are endeavouring to buy up the whole Liberian coffee crop of west Java for 1896 and are prepared to pay sixty guilders per pikul.—*Daily Chronicle*.

COFFEE REDIVIVUS.—We attract attention to the very cheering account given to us to by a practical planter writing from Haputale, of the condition and prospects of our old ruling staple, on the estates that have retained an appreciable extent in cultivation. A comparatively dry season in our hill-country used always to be a good one for coffee. We congratulate the fortunate proprietors referred to, who should make a good profit, with coffee selling so well as it does now.

DANGERS OF PEAT LITTER.—In a meeting of the French Central Society of Veterinary Medicine, Mr. Railliet called attention to the dangers of peat litter as regards the propagation of intestinal parasites among horses. Having observed a veritable epidemic of worms among cavalry horses—over 250 out of 500 having, as he puts it, "their intestines literally crammed with ascarides"—he examined the turf litter used in their stables, and found in it an abundance of eggs of intestinal worms (*Acaris equorum*, *Oxyuris equi*) and even tenia, and he came to the conclusion that the turf litter was the hotbed of this epidemic of worms.—*L'Echo de l'Armée*.

THE EXTENSION OF TEA CULTIVATION IN CEYLON.—The following from the evening journal is a specimen of a series of unfounded statements:—

In fact, we were as good as told—and the editor of the paper (meaning the *Observer*) supported the contention—that Ceylon had seen her best days, that it had turned the corner of prosperity, and was starting on the downward track; all because the Government, falling in with the suggestions made by several District Planters' Associations, did not throw its reserve of jungle on to the market, and thereby unnecessarily increase the output of Ceylon tea.

Now the writer knows well that most of the above is from his own imagination,—that our special objection to the announcement of the Ceylon Government that it would sell no more land for "tea," was the effect it had in Northern India where an unprecedented extension in planting at once took place. Such a policy might, practically, have been followed, by only placing 2,000 to 3,000 acres a year in the market without the resulting mischief which the "Times"'s clamorous paragraphs about the wishes of Planters' Associations and the compliance of the Government, created on the minds of planters over the way. Our business has been to counteract this effect by shewing our Indian neighbours how large an area of available land there is in private hands in Ceylon—perhaps 120,000 acres, if reserves be counted.

TEA SHIPMENTS FROM AMOY.

A consular report dealing with the exports from Amoy states that the total tea export and re-export to foreign countries, which, during the year in question, as in the previous year, consisted almost entirely of Formosa Oolongs, for the period from Jan. 1st to July 31st amounted to 13,505,497 lb. against 7,159,935 lb. for a corresponding period last year—that is, an increase of approximately 47 per cent.

These figures, however, do not present a really accurate statement of the condition of the trade, inasmuch as a very large quantity of stock was remaining over from last year's supply, and, contrary to the usual custom of the port, considerable shipments took place in the early months of the year. The figures from the commencement of the season, up to Aug. 6th as given in a report published by the Amoy Chamber of Commerce, nevertheless showed a considerable increase in the amount of tea shipped during the season—namely, 6,543,749 lb. against 5,422,840 lb. for the corresponding period in 1893. This increase of about 17 per cent was justly due to the fact that the tea season commenced somewhat earlier than usual, and also to the brisk demand in the American markets, in view of the possibility of the export being temporarily stopped should Formosa fall into the hands of the Japanese. The shipments continued to the end of the season, and the total export of tea for the year was 5,811,428 lb. in excess of last year's export, Formosa tea showing an increase of 5,246,411 lb. It will be understood how large a bulk of the tea from this port is exported to America, when it is stated that 78.49 per cent of the total tea trade was with the United States market. The quantities of the three classes of tea produced in 1894 was:—Oolong, 26,561,388 lb.; Pouchong, 1,500,108 lb.; Souchong, 18,325 lb.; total, 28,079,821 lb.

LADY BLAKE OF JAMAICA

is a frequent writer in magazines. Her latest paper so far as we know is entitled "A Day in Barbadoes" published in "Timetri"—the British Guiana half-yearly journal—received by last mail. The article covers some 25 pages and is well-written; but a considerable portion is taken up with an historical retrospect. Lady Blake does not seem to have had on this occasion a pleasant experience of voyaging or steamer. She writes:—

After crossing the Atlantic from Southampton to the West Indies—a voyage which, under the most favourable circumstances is wearisome and tedious to a degree—it must be a very morose individual indeed, who fails to be pleased with the first sight of the bright little island of Barbados, glittering with greenness, and looking like a great emerald rising out of a sapphire sea. It is a relief to look forward to an escape of even a few hours from the discomfort of the steamer, which, since the anchor has been down, have become so aggravated—what with the maddening noise of the steam winches and the unendurable heat caused by the steam being turned into the pipes that work them—that one cannot help thinking that the early Christians paid the Church a very poor compliment when they typified it as a ship; had they been acquainted with the horrors of a modern steamer taking in cargo in Carlisle Bay, the ship would no doubt have been handed down to us as the type of the nether regions.

Before leaving the stuffy cabin where so many wretched hours have been passed, it is advisable carefully to fasten the port-hole. Boats innumerable swarm round the ships, and it is by no means uncommon for a brawny brown arm to be inserted through the cabin-window, in search of any goods or chattels that may be within reach, sometimes a thick hooked wire being used to fish up any bag or garment beyond reach of the hand. It is amusing to see the crowds of boats of all sizes and descriptions surrounding the steamer, from great bar-

ges, waiting to land cargo, to tiny little craft very much the size and shape of floating coffins, containing a couple of diving boys eagerly calling to the passengers to fling coppers to dive for. Making one's way as best one can down the rickety ship's ladder that sways uncomfortably over the side, it is a relief to find oneself ensconced in one of the boats, and after a pull of about half a mile over the blue waters of the bay, it is delightful to find one's feet once more on solid land.

From the sea Barbados looks not unlike the "Little England," she proudly calls herself. Fields of sugar-cane seen from afar resemble pastures, numbers of wind-mills crown the gentle slopes, and clumps of trees when looked at from the distance of a couple of miles or so, appear much the same whether they be mahogany or ash, sea-grapes or alders.
