A somewhat melancholy interest attaches to the report on the Royal Botanic Gardens for 1895, it being the last one to which Dr. Trimen's name will be appended—for, as our readers are aware, and as a note to this report states, he will retire from the post of Director, which he has so well filled for the past sixteen years, at the end of next month. For the greater part of 1895 Dr. Trimen was absent on leave in England; but, as he testifies, the work of the whole department was efficiently carried on by his lieutenant Mr. Nock, in addition to his own duties at Hakgala. Mr. Clark, the head gardener, having resigned, in order to enter on a planting life, his place was filled by the appointment of Mr. H. F. Macmillan from Kew. Surely the services of Mr. R. H. Pereira might have been preserved to the department by an increase of salary: but such are the ways of redtape! It will be noticed that the drawbacks to be contended with at the Peradeniya Gardens are, according to the Director, "bad soil and want of manure." The former is an inherent evil, which can only be overcome by a free use of manure: and this, of course, means considerable expense. Various improvements to the Gardens are mentioned: and we hope that the childish and vulgar habit of scribbling on the Gardner cenotaph will be put a stop to by every possible means. The extracts given from Mr. Nock's report on the Hakgala Gardens are of much interest; and we would draw special attention to what he and Dr. Trimen say with respect to the great injury and loss to the department resultant to the pernicious practice of growing plants for sale to the public. Government has no right to compete with private nurserymen in this matter. The enormous spread of the oxalis weed is a serious affair; and we hope that some means will be found for eradicating it cheaply. Other enemies mentioned are monkeys, sambhur deer, elephants, and—visitors! As these last are supposed to be animals with a conscience if not honesty, their depredations are the least excusable of all. The Henaratgoda Garden is energetically and intelligently supervised; and we are glad to note the large increase in the number of visitors. This might, however, be still further augmented if greater facilities for visiting these gardens were offered by the Railway Department to strangers. The headman who tried to make a public road through the garden deserved suppression as much as his cheeky attempt. The report on the Anuradhapura Garden is calculated to make our Government blush with shame, if they are capable of such a feeling. We hope Dr. Trimen's indignant words will not be lost on them. The Badulla garden also seems to be studiously neglected by Government. The notes on economic plants are, as usual, interesting and valuable; and we would call the special attention of our planting readers to them,—in particular to what is said about coca. We have thus briefly referred to some of the salient points in this interesting report: but we recommend to our readers the careful perusal of the extracts which we give as a Supplement.

A REMARKABLE COFFEE TREE.—It is stated by the *Rio News* that in the vicinity of Brejoes there is a twenty-year old coffee tree which, according to the *Luz*, of Azeias, produced last year sixty pounds of coffee. The tree is so tall that in gathering the cocoa a ladder has to be used.

THE DIMBULA VALLEY CEYLON TEA COMPANY, LIMITED.

We hear that the sale of Elgin and Kelliehill to this Company is to be put through at the prices they were sold for, and this, we take it, indicates that Sir John Muir has withdrawn his objections to the sale; and if we are right in our surmise we would congratulate all parties on a settlement of what looked like a huge law suit.

THE KOSHENA COCONUT ESTATE CO., LTD.

The annual general meeting of the above Company, called for 2nd instant, but postponed owing to the non-attendance of a quorum has since been held. The following is the Directors' report:—

In presenting the accounts for the first year, the Directors have only to state that the property is rapidly increasing in value, it being carefully cultivated, and that when the Vendor's guarantee of 5 per cent dividend comes to an end (which it will in the course of another year) the Estate, it is believed, will be producing sufficient nuts to earn a handsome dividend.

The Vendor's guarantee of 5 per cent on the paid up shares will be paid on 15th May.

It will be necessary to appoint an Auditor for 1896.

By order of the Board of Directors,

C. E. H. SYMONS, Secretary.

The report was adopted, and Mr. John Guthrie was appointed Auditor for the current year.

THE PATTAGAMA PLANTATION COMPANY, LTD.

The following is the report of the above Company intended to have been presented at a meeting on Saturday which however was postponed owing to the non-attendance of a quorum:—

The Directors herewith beg to submit their fourth Annual Report.

The estimate of tea for the past year was 55,000 lbs.; but the actual crop has fallen somewhat short of this quantity, being only 53,695 lbs., which was sold in Colombo at an average rate of 49½ cents per lb.

On a reference to the annexed account, it will be seen that the actual working of the year shows a small margin of R2,253-46. The Directors recommend that the balance now at credit of profit and loss account should be appropriated in reduction of Suspense Account, which represents the loss incurred in working the estate previous to 1890 whilst the tea was coming into bearing; and they trust the shareholders will approve of this recommendation.

The shareholders have to appoint a Director in place of Mr. Stanley Bois, whose term of office has expired; and it will also be necessary to appoint an auditor for 1896.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, April 16.

CINCHONA.—The monthly auctions held in London, on Tuesday, were somewhat remarkable for the fact that Ceylon bark was entirely wanting. This shows, perhaps better than anything, the degree to which the island is now played out as a bark-producing country.

ESSENTIAL OIL.—Citronella offers 1s 7d per lb. on the spot, which is easier.

SEEDS (various).—Five bags fair araca sold at 12s 6d per cwt. For fair Spanish anise 30s per cwt. was paid ordinary Russian sold at 15s 6d to 19s per cwt. Amatto in large supply. For good bright W. Indian 4d per lb. was refused. Fair to ordinary dull Ceylon realised from 2d down to 1½d per lb. Crotonseed is again dearer; 10 bags dark mixed Ceylon realised 65s per cwt.

WHITE ANTS ON TEA ESTATES.

The first instalment of Dr. George Watt's paper on white ants, which is understood to be one of the chapters of his forthcoming Tea Report, has just been published, and though it deals with the ravages of these pests in Kangra and Assam in particular, the information imparted and the conclusions arrived at cannot but be of interest to tea planters in all parts of the country. Dr. Watt states that entomologists have not determined how many species of *Termites* (white ants) India possesses, but that they would seem to be numerous. In regard to their modes of life they are diversified, some raising castellated, others rounded, others superficial structures above ground, some living in cavernous excavations underground, some existing in vast colonies, some in isolated communities. Here in Madras we seem to have every variety, for what garden is not defaced by the unsightly mounds raised by these persistently destructive termites, what hedgerow not honeycombed by their marvellous efforts, what tree not encased more or less with their mud ways. They are ubiquitous, and they do not, unfortunately, confine their predatory excursions to the gardens and hedgerows, but invade the dwelling places of rich and poor alike, eating their way through walls, beams, rafters, mats, etc., in defiance of their enemy man, who is too frequently blissfully ignorant of their hated presence. Things are bad enough in Madras, but they seem to be worse in Assam, for Dr. Watt states that it would be very nearly impossible to dig a trench anywhere in that province without exposing several of the remarkable excavations—caverns 1 ft. to 2 ft. in size—made by the smaller white ants that live entirely underground, and particularly among the roots of bushes. These, we fancy, are not unknown in Madras; at all events there is a species of white ant here which runs up a short covered way above ground, in the grass or on the footpaths, and which excavates caverns filled with the curiously reticulated structure referred to by Dr. Watt and compared to the combs of a beehive. The writer of this has noticed that the working members of this species while forming the covered ways above ground are almost invariably attended by several guards, or what may be described as soldier ants, much larger than the workers, with big, bright brown heads and immensely strong nippers. They become most ferocious if disturbed, and when a piece of grass or other soft substance is held close to them, they will rush at it and seize it, holding it as in a vice, at the same time, when seemingly quite beside themselves with passion, exuding a bright bluish fluid from the region of their nippers.

In referring to the mud encasements, the work of white ants, Dr. Watt says that it is hard to believe that trees and shrubs are not injured thereby. If this coatings of mud are removed it will be seen that the bark underneath is paler than that which has not been encrusted, this being due to the superficial and drier layer having been eaten away.

"It is a very generally accepted opinion," Dr. Watt goes on to remark, "that white ants will not eat living and growing wood, and consequently that they do not kill, though perhaps they injure living plants to a certain extent. But there can be no doubt that white ants, if permitted to take up their abode for some time in and among the roots of a plant, do incalculable harm," for in their excavations

they remove the earth from the roots, which thus exposed form bark. But we will let Dr. Watt speak for himself:—

"Speaking of tea bush, it is by no means an unusual state of affairs to find the plant growing as it were on the summit of a dome of hardened earth that surrounds the cavernous dwellings of its colony of termites. A section made by means of digging a trench, for three or four feet deep, across the space occupied by the bush and hard against the main stem, will reveal a most unhealthy state of affairs. At a depth varying from one to three feet a large central cavern will be found, and fringing this numerous smaller ones. In fact, an elaborate system of excavations will be revealed and found to be occupied, like the Roman catacombs of old, by both the living and the dead. The roots that stretch across the larger caverns will be seen to have formed bark and to have assumed to all intents and purposes the condition of branches. The delicate absorbing fibrils will be observed to have also disappeared, so that it needs little explanation to enforce the opinion that there has been a useless accumulation of plant energy below ground at the expense of leaf production above." In addition to this, the effect of the excavations is to cause a serious disturbance to the drainage of the soil and to its powers of retaining moisture, and Dr. Watt urges tea planters, when white-ant encasements on tea bushes are discerned to attend to the trees immediately if they do not wish them to die off. Dr. Watt is convinced that white ants can and do attack living plants, and for the following reasons:—

"Let the mud encrustations of the bark be carefully removed and follow the ant roadways upwards until the stump is reached of a withered branch or the scar from which it was wrenched, and the observer will witness how white ants gradually devour and ultimately kill living plants. They will be seen to have eaten, or nearly so, the whole of the severed portions, but having found a passage through the external zone of living and growing structures, have begun to attack the fully formed wood. They have deposited a dense coating of mud within the gaping wound and splintered timber with the twofold object of preventing the process of healing and of supplying an absorbent plaster that will suck the moisture from the wound and transmit it to the air. In a very short time a layer of the wood will be thus killed and rapidly devoured. Layer upon layer follows, until the stem is cut into very seriously, if not entirely severed. The circulation of the sap having been thus intercepted, these mining engineers turn upwards into the dead and dying wood. Operating below ground and thereby diminishing the supply of moisture while availing themselves at the same time of every abrasion or injury to the stem or its branches, is it to be wondered at that the process of destruction, though it maybe slow and almost imperceptible, is nevertheless certain in its ultimate result?"

Slow and sure is their motto, and they certainly live up to it. Their patience is as inexhaustible as their numbers and the wholesale slaughter of myriads does not deter them in the least from their fell intent. They do not, however, as Dr. Watt remarks, as a rule, kill the green sapling nor attempt to eat their way through the external zone of green wood of healthy plants, for they live mainly on wood, not on green vegetable matter; but, given a chance, they will sooner or later convert the green wood into dead wood, to the ultimate extinction of all life in the bush. For instance, "let a boring insect make an entrance into the stem, branch or root, and white ants will soon follow. Let the planter prune ruthlessly, leaving large surfaces of torn portions of wood exposed to the action of the air, and if white ants are about they will rapidly cover up his slovenly work with a shroud of mud. The vigorous efforts of the living bark may, however, more or less completely embrace and enclose the scar, but sooner

or later the plant will give clear indications of its cankerous state by ceasing to be productive. The bark may appear quite entire and comparatively healthy. On being probed, however, it will suddenly snap asunder and reveal a mass of mud within a shell of living tissue."

The normal condition of a large percentage of the tea bushes in old gardens in Assam cannot be said to be a pleasant one for the planter, for Dr. Watt states that "hardly a tea garden exists in which the evil effects of pruning, followed, it may be, by the depredations of white ants, cannot be seen," and he goes on to say that it is no uncommon occurrence to find the lower half of the stem of tea bushes gnarled and rotten, with numerous mud stumps representing abortive banches, or having one side only alive, the places of the other side being taken by a great open scar, perhaps mud encased and infested with white ants. Sufficient has probably been said to show tea planters how very necessary it is to look most carefully after their tea bushes, and how cunningly his enemy the white ants will get inside the stems of the tea bushes and be the eventual death of the tree, or very seriously affect the propagation of leaf. "The best protection to the stem," says Dr. Watt, "far and away superior to all insecticides, is a healthy and entire bark with a vigorous sap wood." As the bushes grow older and their wood becomes fully developed, they become more liable to the attacks of white ants. In conclusion, Dr. Watt gives the following opinion with regard to pruning in order to strengthen the plants and to assist them in resisting the attack of white ants:—

"On general principles of tea cultivation I should in any case recommend a fairly early period being fixed for the first heavy pruning, say one year, or, if pressure of work prevent this, two years after planting out, but not later. I should also thin out all the sickly, useless lateral branches and unless, in exceptional cases where the main stem had been broken or was diseased, I should remove all branches from the stem for the first six inches. . . . I should make the season of first heavy pruning my trimming season also and thus give the plant once and for all the chance of healing up the bark, of forming in fact a healthy stem with as few abrasions or scars as possible. The argument against this course is that by allowing a longer period the plant has had time to throw down a well-formed tap root, and to thus carry the secondary ramifications well below the level of deep hoeing. I admit there may be some truth in that argument, but the advantages are certainly less than the disadvantages. The bush for example, has meantime formed a straight stem with long intervals between its leaves and consequently very few buds from which to develop branches hereafter."

Having briefly dealt with the manner in which white ants attack living plants and the destruction they are capable of effecting, Dr. Watt proceeds to deal with the remedial agencies against them. When and where possible, the white ants should be dug out, not merely by hand cleaning the stems and branches of the mud encasements, but by digging out and destroying the nest with its queen ant. Dr. Watt is not very sanguine of the value of any insecticide in the eradication of the pest for he considers that "thorough and cleanly agriculture should in the long run prove both more economical and more effectual." A useful preventive against white ants is adopted in the Gontal State, which consists in painting the stems of trees to a height of three feet above ground with a red looking substance, "I found," says Dr. Watt "the red paint, whatever it consisted of, was an effectual protection. In no case did I discover trees

encased with mud where the red ring was fairly visible. I enquired into the nature of the preparation used, and the particulars I obtained were published shortly after in a paper on the subject of *Al dye* (*Morinda citrifolia*, *Agricultural Ledger No. 9 of 1895 pages 3-6*), because in some of the preparations *al* was said to be the colour imparting ingredient." We publish on another page the passage relating to this, and the concluding portion of Dr. Watt's most interesting and valuable paper, which will no doubt be published in pamphlet form at an early date.—*M. Mail*, April 3^d.

THE KLANG COFFEE LAND FIASCO.

LETTERS FROM MESSRS. CHRISTIE AND FORSYTHE.

The following letters appear in the *Strait Times*:—

Sir,—My attention has been drawn to a statement made in the lengthy anonymous communication regarding the Klang land, which appeared in your issue of the 25th ultimo. Your correspondent states that he is prepared to "demonstrate" that I blamed the Selangor Government, and he refers to having a number of letters written by me to various persons, in which I refer to the action of the Selangor Government in terms of strong disapproval. I suppose the letters in question are from a private correspondence between Mr. W. Forsythe and myself here in Ceylon, and which Mr. Forsythe may have sent to his Agent in order that he might know what our opinions were. These letters were written in the middle of 1895 in connection with misunderstandings which arose regarding the wording of our titles and the drainage scheme, but they had no reference to the present state of affairs, and I have never in the least blamed the Selangor Government for the conditions which, in my opinion, rendered my land quite unfit for the purpose of present cultivation.

The brief your correspondent holds may impel him to inflict much that is of no interest and quite irrelevant on your readers, but he may as well plough the ocean as try to get over the fact that a lamentable mistake (he calls it "lucicrous") was made, that the land proved to be unsuited for immediate planting, and that, when nurseries were made, bungalows erected, and estimates of crops in the third and fourth years framed, there was no idea that years must elapse for the peat to consolidate or—strange phenomenon—the clay to rise up. I have never heard of the "dispute" your correspondent refers to. Those who lost their money believed (and I still believe so in my case) that everything had been done in good faith, but that an error of judgment had been made. It is quite another matter whether the land may become suitable for coffee in two, four, or ten years, and opinions on that point may differ. The block I owned had an unascertained depth of peat, and the experiment of seeing how long it would take to become plantable was one I was not prepared for.—I am, &c., Wm. NORTH CHRISTIE, St. Andrews, Maskelyne, Ceylon, April 14th.

Sir,—My partners and I have read with some interest the lengthy correspondence which has appeared in your columns in connection with what is known as "The Klang Land Fiasco." To briefly summarize the position of affairs, I beg to state that I visited Klang in February, 1894, and saw only the Chairman's coffee garden, the Datu Dagang's estate, and the few acres planted along the roadside. The two former plots of coffee I regarded as satisfactory, and I requested my agent to select land of a similar nature. He agreed to do so, but did not.

No mention was at first made of delay, or consolidation, or sour soil. We were to go straight ahead, and 500 acres were to be planted by December, 1896. I found upon arrival that we could not do this, and though my agent may be correct in asserting the will eventually become valuable and grow

Liberian coffee, wa, as tea planters, not altogether ignorant of coffee, cultivation, do not care to accept this assertion or experiment at Klang for a term of years in the hopes of ultimate success. I hold letters from my agent (which, being private, I naturally refrain from publishing) that would prove up to the hilt that our opening works from felling to planting were to proceed without a check. When I visited Klang and satisfied myself that our expectations were not to be realized, I decided to abandon at once. I do not wish to impeach my agent's *bona fides*, but I maintain the opinion which I expressed to him, and which he verbally admitted to me was true, viz., "he had been guilty of an error of judgment." The Selangor Government has accepted our view of the disaster, and I regard the terms offered us as liberal in the extreme. My partners and I have nothing more to say, for we realize that columns of newspaper discussion will neither restore the dollars lost, nor prove that the district south of the Klang river is, at the moment, a coffee-growing country.—I am, etc.,

W. FORSYTHE.

Pambayama, Kelani Valley,
Ceylon, April 22nd, 1896.

EXPORT TEA DUTY AT FORMOSA.

The following letter is taken from the *Foochow Echo* :—

Foochow, 5th April, 1893.

Dear Sir,—I am informed on good authority that the Japanese Custom in Formosa are now collecting the Export duties on Tea at the rate of \$1.12 per picul, which are received and all wed to be exported from Amoy free, while the native-grown article has to pay an Export duty of \$3.84 per picul.

Surely the 'Heathen Chinese' will not permit their own trade to be handicapped in such a serious manner which must affect not only Amoy but this port, and Shanghai as well.

Trusting that all merchants interested in the American trade will cry out against this crushing injustice to their business.—I am, dear sir, yours obedient servant,

MERCHANT.

The matter of the Formosa export duty on tea, referred to by our correspondent *Merchant* in today's issue of this paper, is of grave importance to many. Of course it touches most nearly the shippers of Oolong tea from Amoy and this port to America, where this description of tea is chiefly consumed; and in a less degree to the general shipper. Assuming that the Chinese will do nothing in the way of assimilating their duties with those of Formosa, the Chinese teamen will have to reduce their prices, or be prepared to hear the buyer say 'I am quite willing to offer you Tls. 17, for this string crop, less Tls. 1.90, to place me on the same terms as Formosa shippers as regards duty.' Unless something can be done it is patent that the tea trade in Formosa will increase very considerably, while that in China will correspondingly decrease.—*China Mail*, April 29.

TEA IN AMERICA.

NEW YORK, April 8.—There is the same quiet and uninteresting market except for choice and fine Formosa, which are scarce and very firmly held, while the low grades are in full supply and weak. On the other hand, the low grades of Japan below good medium are scarce and firm, while the higher grades are in good supply and steady. There is an over supply of greens and a buyer's market. Ceylon and India in fair request and growing in favour, as dealers more and more appreciate their value for blending purposes.

Last week the Montgomery Auction and Commission Company sold 7 643 packages teas as follows :—Moyune—360 Hoyson, 6 @ 54c; 878 Young Hyson, 23½ @ 64c; 452 Imperial, 15½ at 6c; 541 Gunpowder, 6 @ 11c. Pingsuey—1,342 Gunpowder, 21 @ 64c. Japan—50 pan-fired, 16½ @ 16c; 210 basket-fired, 16½ @ 10c; 21 capers, 16c; 1,375 Congou, 23½ @ 7½c;

288 India and Orange Pekoe, 16 @ 22c. Oolong—152 Foochow, 9 @ 7½c; 45 Amoy, 12 @ 7½c; 1,821 Formosa 40½ @ 14½c.

Today at noon the Montgomery Auction and Commission Company will sell 10,670 packages, viz.: 2,932 half-chests Moyune, including many desirable chops; 1,773 boxes Pingsuey; 131 half-chests Japan and Nibs; 30 half-chests Japan, basket-fired; 795 half-chests and boxes Congou, including fancy Ning Chows; 20 boxes Capers; 48 packages India, Java and Ceylon Pekoe; 302 half-chests and boxes Amoy; desirable leaf; 890 half-chests Foochow, including 492 half-chests of the celebrated "Man Thie" chop, new season's; 3,743 half-chests and boxes Formosa—a particularly attractive assortment of all grades.—*American Grocer*.

THE SPECULATION IN CAMPHOR.

Following the announcement of a break in the price of camphor in London, where the syndicate has reduced its quotations from 210 shillings to 180 shillings per hundredweight, equal to a reduction of over seven cents a pound, the refiners here have dropped their price four cents a pound, the result being an unsettled feeling as to the position of the article. When a similar reduction was made by the syndicate some months ago, it was not met by the refiners, and contrary action at the present time is believed to indicate that they regard the situation as one of less intrinsic strength than it was on the occasion of the previous break in London. It would appear from an examination of the statistics that the syndicate is very heavily loaded, and that its manipulation of prices has so far checked the demand for the gum and turned the consumption on to substitutes, that its ability to maintain the corner it has undertaken to establish is scarcely among the possibilities. The statistics of imports, deliveries and stocks at London in packages for a series of years, as given in the following tabulation, is of interest :—

	Imports.	Deliveries.	Stock Jan. 1
1890.....	13,722	8,157	—
1891.....	8,656	9,931	5,598
1892.....	8,429	10,029	4,327
1893.....	12,167	10,799	2,727
1894.....	11,981	11,633	4,883
1895.....	19,711	7,740	4,300
1896.....	---	---	16,270

The stock on March 1 had been reduced to 13,674 packages, the imports during the two preceding months having been but 675 packages, against deliveries of 4,398 packages. The stock, as shown by these figures, does not represent the entire London stock, although when taken in connection with the diminished imports since Jan. 1, it may be taken as indicating that an unusually large proportion of the world's stock is held there. In fact, latest Hongkong circulars state that stocks are small, and report transactions in excess of receipts, with prices at the time rather firmer after a drop during the month of February.

The syndicate is generally credited with holdings amounting in all to between 25,000 and 30,000 packages, and it appears to have had little hand of late in supplying the demands of the American market. The deliveries for 1895, as stated in the above table, show clearly the effect of high prices on consumption. In 1893-94, when speculation was induced by the growing demands of celluloid makers and for the newly exploited smokeless powders, while the prices approached somewhere near the average that the syndicate maintained last year, consumption was kept up by the outlets which the industries named afforded. But since then the powder makers have discovered new materials, and many of the larger outlets previously afforded through the drug trade have been supplied by cheaper substitutes. It is, therefore, safe to assume that the consumption of camphor is so far below the supply that an equilibrium can only be restored by the reduction of prices to a point which will regain for it the preference over competing articles. How long the syndicate will resist

this result is, of course, doubtful, but its inevitability would seem, none the less, to foreshadow the tendency of prices, and the ultimate ending of another futile effort to corner a natural product.—*Oil Paint and Drug Reporter*.

TEA AND COFFEE.

Ceylon planters are jubilant at the Chancellor of the Exchequer's statement in submitting the budget which states that tea is expelling coffee from the market. No doubt the Indian and Ceylon kinds are rapidly replacing those grown in China, but it is not quite so clear that all this satisfaction can be showed by those who are interested in the production of coffee. The important point it seems to us is that tea can be prepared quickly by the most ignorant of workman's wives, while the preparation of coffee as a beverage is a more elaborate and more protracted business. Even when purchased readyground the making of the coffee and its percolation through the receiver of a properly constructed coffee pot requires more care than the mere pouring of boiling water on tea does. Coffee also demands the consumption of more milk than is available in the poorer classes of households, whereas tea, with a little sugar, and little or no milk, is still a popular drink. Still acknowledging the greater convenience of tea as a beverage for the masses, coffee, especially if its use by the poorer classes can be simplified and popularised to a greater degree than at present, should always command so large a market that capital need not hesitate to invest in the production of coffee in the Straits or other suitable field for its cultivation.—*S. F. Press*, April 28.

COFFEE NOTES.

From the state of Espirito Santo there were exported last year 24,641,617 kilos (410,693 bags) of coffee, or 1,500,000 kilos more than in 1894. The official value of the coffee exported last year was 31,528,000 \$000.

The *Diario Popular* of São Paulo has had two branches from coffee trees of Ribeirão Preto on exhibition in its office. Each branch shows 21 clusters (*rozetas*) of fruit, all well filled and finely developed. This certainly does not confirm the recent reports of a greatly diminished crop.

It is reported from the city of Mexico that the representative of a syndicate of English capitalists has recently purchased 500,000 acres of coffee land on the isthmus of Tehuantepec, and that the tract will be planted in coffee trees. American capitalists have invested several hundred thousand dollars in coffee lands on the isthmus within the past few months.—*Rio News*, March 24.

TEA MARKET.

The Tea market wears a firm aspect, Indian tea coming in for chief notice, and the advance on the lower grades since the commencement of the month is over 5 per cent. Ceylon tea shows some improvement, both in quality and price, for the lower grades. China growth is out of favour for want of suitable supplies.—*L. and C. Express*, April 24.

MARKET FOR TEA SHARES.

Thursday Evening, April 23rd, 1896.

There has been continued strong buying of all the more prominent Indian Tea Shares, and the "Official List" again records advances—in some cases more than one during the week—in three or four of the issues included in its columns. In most cases there is scarcity of stock, holders preferring to hold on and await receipt of the final 1895 dividends, shortly to be announced.

Mining Lane Market for the produce marks an advance, with a scarcity of supplies of Indians and no excessive over-supply of Ceylons.

QUOTED SHARES.—East India and Ceylon Ordinary have been taken at 11½. Nothing in Prefs.

CEYLON SHARES.—C.T.P. Co. Ordinary have changed hands at 50½, with more wanted, and the Prefs. at 17½.

Eastern Produce shares have been taken, we understand, at 5½, cum final 3½ per cent. div. just announced.

New Dinbula B's have changed hands at 19 and at 19½.—*H. & C. Mail*, April 24.

PLANTING AND PRODUCE.

THE SINEWS OF WAR.—We print elsewhere an appeal and a remonstrance addressed by those members of the Indian Tea Association, London, who constitute the committee charged with the work of developing new markets for Indian tea to those companies and firms who have held aloof from helping the cause. It is usually very difficult to persuade the various members of an industry that something more than moral support is required. We take it that there are not two opinions as to the necessity for opening up and developing new markets, but it would seem that, although this is admitted as a general proposition, there is an absence of that practical support which is necessary if the work is to be carried on effectively. There is no lack of a certain sort of fervour on the subject but there is a want of money. Perhaps some of those persons who have hitherto smiled "a sickly sort of smile" when new markets are mentioned will be induced to abandon their lukewarm policy and "come down handsome." If in these days of comparative prosperity there is an insufficiency of funds, the outlook is not encouraging. Now is the time when money well spent will be of real service. It is the duty of those who will benefit by the increased consumption of Indian tea abroad to share in the initial expense, or if they do not take a hand they should, as a matter of course, state plainly why they do not. We hope the appeal will draw forth a supply of the needful, or, at least, lead to an explanation of the reason why.

NOT A BREAKFAST TABLE BUDGET.—The Budget was not calculated to please everybody, and the *Grocer* is not satisfied with it. It says: "From the point of view of that immense body of law-abiding and hard-working citizens, the retail shopkeepers, whether grocers or what not, the Budget is emphatically a bad one, a most disappointing one. We hear such expressions as 'a wonderful year,' and we have the Chancellor of the Exchequer boasting of his mammoth surplus. He has handed the largest surplus on record, beating by half a million the Lowe and Gladstone surpluses of six millions each. But what has been done with it? The Lowe year was that in which we drank off the Alabama claim, as Lord Derby said, and that year may be left out of the comparison. With the second example of a six-million surplus this week's Budget will not bear comparison, from the grocers' standpoint, for a single moment. Sir Stafford Northcote took a penny off the income-tax, took off the sugar duty and aided local taxation. All these were direct and substantial helps to the grocer, putting money straight into his cash-box. What does Sir Michael Hicks Beach do for the retailer of any kind? Absolutely nothing. The four and twenty blackbirds which ought to have begun to sing when his financial pie was opened have all flown away—most of them to sea, and the remainder into the farmers' fields! The Budget statement itself is not without interest; what we complain of is the misapplication of the surplus. The *Grocer* is pleased, of course, to learn that in the Customs Revenue tea has produced £3,745,000, or £120,000 more than was estimated. The Chancellor commented on the increased consumption, 10,000,000lb. of tea, and remarked that our trade in tea is being rapidly transferred from China to India and Ceylon. In 1875 no less than 122,600,000lb. of tea came from China; in 1895 about 31,000,000lb.; in 1875 23,220,000lb. came from India and Ceylon; last year the figure was 190,000,000lb. Then the cocoa receipts increased by £5,500, for we consumed last year twice as much cocoa per head as we did twenty years ago—ten ounces instead of five. On the other

hand, whereas we consumed twenty-one ounces of coffee per head forty years ago, we now consume but eleven ounces. Coffee receipts are on the decline, and so also are the receipts from dried fruits, notwithstanding raisins produced £5,000 more than last year. All this information is interesting enough, no doubt. But information is a poor substitute for cash—for the remissions of taxation which grocers and other retail traders had a right to expect. It was hoped, for example, that the Government would have swept away the coffee duty, and the fragmentary duties on chicory, cocoa, and dried fruits; or would, at least, have reduced the 7s duty on raisins and figs to the level of that on currants, admitting all kinds of dried fruit at 2s per cwt. It was hoped, again, that the additional ½ per cent on the Customs charges in general would have been remitted, since this exaction is irksome to those actively engaged in getting goods out of bond."

THE DIRECT IMPORT OF TEA TO MANCHESTER.—The quantity of Indian and Ceylon tea sent from India and Ceylon direct to the Manchester market was 1,198,429 lb.

COFFEE AND CHICORY.—It is necessary that there should be frequent plain speaking on the subject of coffee adulteration, and that something tangible should result. The Norfolk county analyst has just called attention to the subject. He says: "I have during the past quarter asked the police to collect some samples of mixed coffee; that is to say, coffee which has a declaration label on it that it is a mixture of coffee and chicory. I have long had a suspicion that in this county some very extreme mixtures were offered for sale, and the result of my examination proves it to be so, but the label is supposed to protect the seller, and therefore I cannot issue a certificate for prosecution. Nevertheless I think it is a very serious matter to find that coffee is sold with over 90 per cent of chicory. Coffee, like tea, contains an active principle which is really an essential food, whereas chicory contains nothing of the sort, and I am of opinion that no such trading as this ought to be allowed in your county. There is still the collection of samples by the police, each man in his own district, and I must as heretofore protest that by such an arrangement it is almost impossible to ascertain the actual amount of fraudulent dealing which goes on in the county. The percentage of adulteration for the year ending 25th inst. is 92.8, and if the samples of coffee were included it would be brought up to about 12 per cent., which is a high result."

THE DECLINE OF COFFEE DRINKING.—The Chancellor of the Exchequer in his Budget speech delivered himself of some opinions on produce regarded from the revenue point of view. He believes tea is killing coffee, or driving coffee out of the market, because it is cheaper, requires less milk, and is easier for people to make. Whereupon the *Daily Telegraph* says that probably the true explanation lies in the last of these three reasons. Coffee does not get justice done to its noble possibilities. Many cooks betray it by being too idle or too ignorant to elicit its true qualities, and there is hardly a female housekeeper or mistress of a house who has any proper and adequate idea of the importance—we had well-nigh written the dignity—of the berry. Tea lends itself with a fatal facility to the teapot and the gossipable. Like gas, it is so desperately handy. Packed neatly in its leaden case, and preserving its aroma, it is only too easily employed, and perhaps is the explanation of much of the nervous maladies common among our womankind. The machinery of the tea-table is elegant and amusing without being exacting; and nobody is so stupid as not to be able to "make a cup of tea." Coffee, unhappily, ought to be roasted and ground, *ad hoc*, for the hour of using. It ought to be conscientiously concocted, with a knowledge of what is good and what is bad in this noble drink; and with all deference to the Chancellor of the Exchequer, milk ought never to mingle with the true and perfect cup Mocha. Coffee is the natural friend and consort of tobacco, which is another reason why it has not being favoured by the fair sex, whose verdict is so powerful in regard to coffee. But, as the impartial

friend of woman as well as man, we dare assert that quite as much might be advanced in favour of this infusion as of tea by way of a popular beverage. It is the coffee-maker, not this excellent and valuable gift of nature, who must be blamed for the victory, perhaps only temporary, which the tea-leaf has gained over the delicious berry.—*H. and C. Mail*, April 24.

NEW MARKETS FOR TEA, AND THE NECESSARY FUNDS.

The following letter has been addressed by the members of the American and Foreign Tea Committee of the Indian Tea Association to those companies and firms who have hitherto neglected to support the efforts made to open up new markets:—

The Indian Tea Association (London),
14, Saint Mary Axe, E.C.
April 11th, 1896

Dear Sir,—At the request of the General Committee we beg to invite the special attention of your board to the claims of the American Market Fund to your support, and to the following facts and figures.

We believe that our efforts to introduce Indian tea into America have already paved the way to relieve the London market of a large quantity of tea, which would otherwise have been thrown upon it with the effect of lowering the prices of all descriptions, including that class of tea for which at present there may be no demand in America. The figures published show that the consumption of Indian tea in North America has increased during the past year by over 2,250,000 lb. or 80 per cent over the previous year.

Outside markets took 38,000,000 lb. of the 1895 Indian and Ceylon crop, or an increase of 9,000,000 lb. over the previous year, and this expansion is doubtless largely due to the efforts made by the Indian and Ceylon Associations to open new markets in different parts of the world, and what the position of the London tea market would have been had it not been relieved of these extra 9,000,000 lb. your board can easily imagine.

If a leading company like yours refuses to join in the efforts being made, advantage is taken of the fact by others who then follow suit, and therefore we are very anxious that your board should support the work, is being which done in the interests of the whole industry.

We will thank you to bring this matter at the earliest opportunity before your board, and trust your reply will be a favourable one.—We are, dear sir, yours faithfully,

ARTHUR BRYANS, ROBERT LYELL, R. G. SHAW, A. G. STANTON, J. N. STUART, W. H. VERNER.

Members of the American and Foreign Tea Committee.

ERNEST TYE, Secretary.—*H. and C. Mail*, April 24.

LANTANA.—A planting correspondent writes:—A great outcry is being made by some of the sub-deputy Foresters of India against this useful and beautiful plant—the greatest curse, they say, "ever imported into India worse than the thistle or rabbits in Australia"! And they repeat the old yarn about "the first plant being brought out in a flowerpot, 30 years ago." It would be difficult for even a Forester's assistant to write greater nonsense than the above. I have known the Lantana in this garden of India for well-nigh 40 years and then it was fully as luxuriant on the hills around Kandy as it is now. Moreover very close observation leads me to the conclusion that it has done more to renovate the Kandyan hills than all the imported or Municipal manures. My only regret is to see it dying out in the unequal struggle with that more doubtful and less beautiful interloper, the Sunflower. The *Grevillea* is another plant which is doing splendid work in renovating our hill sides.

VARIOUS PLANTING NOTES.

PURCHASE OF A COCONUT PROPERTY.—We learn that Mr. Thomas E. de Sampaio, Advocate, has purchased Moregoda Estate, situated in the Henegoda district, from Mrs. Joseph Perera, wife of the late Stationmaster, for R10,000. The property is forty acres in extent, is fully planted and most of the trees are in bearing. The sale was effected by Mr. P. A. Ekanayake Mudaliyar.—“Independent.”

CALIFORNIA ORANGE CROP.—An exchange states that during the next three months southern California will be engaged in picking its orange crop, which is estimated at 2,800,000 boxes, or two-thirds of a full yield. The crop will sell for \$5,000,000, which is an excellent return from an industry only fifteen years old. About \$33,000,000 has been invested in the orange groves of southern California. There are in bearing 10,000 acres, and 80,000 more acres are planted.—*Bradstreet's* April 1.

WHITE-ANTS ON TEA ESTATES.—On page 827 we quote an interesting extract on this subject, and in a subsequent issue we hope to be able to give the editorial comments of the *Madras Mail* on the first instalment of Dr. George Watt's paper on white ants which is understood to be one of the chapters of his forthcoming Tea Report. With regard to remedial agencies Dr. Watt says that when and where possible the white-ants should be dug out, not merely by hand cleaning the stems and branches of the mud encasements, but by digging out and destroying the nest with its queen ant. He does not seem to be very sanguine of the value of any insected in the eradication of the pest.

AN ANCIENT ROSEBUSH.—The oldest rosebush in the world is found at Hildesheim, a small city of Hanover, where it emerges from the subsoil of the Church of the Cemetery. Its roots are found in the subsoil, and its primitive stem has been dead for a long time, but the new stems have made a passage through a crevice in the wall, and cover almost the entire church with their branches for a width and height of 40 feet. The age of this tree is interesting both to botanists and gardeners. According to tradition, the Hildesheim rosebush was planted by Charlemagne in 833, and the Church having been burned down in the 11th century the root continued to grow in the sub-soil. Mr. Raener has recently published a book upon the venerable plant, in which he proves that it is at least three centuries of age. It is mentioned in a poem written in 1690 and also in the work of a Jesuit who died in 1673.—*Inverness Courier*.

A SUCCESSFUL NURSERY.—“Some few issues ago,” writes ‘P,’ you had correspondence regarding tea nurseries. “At the end of November last I bought 1½ Bengal mds. seed from the Seaforth Estate—which was well sunk—and immediately put into a germinating bed in the open. The seed in two layers 4" and 2" deep respectively. In the meantime the nurseries were prepared on virgin soil—well dug and forked several times to the depth of 15". On Christmas day I began transplanting to the nursery, and up to date have put out 38,000 plants, all of which are coming through splendidly with the exception of the first bed, over which I erected the old-fashioned pandai. On the two next I put a layer of thatching grass on the ground, and these are doing fairly well; but on the remaining bed I put layers of ordinary bracken fern and in which there is hardly a failure. This may be of interest to your readers. The germinated seed was planted 1 to 1½ below the surface and has been regularly watered. I may add that I am still planting, and fancy I have another 5—7,000 plants in the germinating bed. This is the largest number of plants I have ever put out from a similar quantity of seed, and if the quality is equal to the ‘namma’ leaves I bought from, I think most planters will agree with me that, together with the quantity, the success of the seed is exceptional.”—*Planting Opinion*, April 11.

KLANG AND ITS COFFEE LAND is the title of an extract which we give in another column from the *Singapore Free Press* being a quotation from the report of the Government officer of Klang regarding the abandonment of coffee land in that district by Ceylon planters.

ORANGE GROWING is being abandoned on the peninsula of lower California, and the orchardists are cutting down the trees and planting the land with coffee, cotton and sugar cane. The low prices obtained for oranges lately grown on the peninsula have discouraged the growers, and they believe more profits will be derived from the other products, especially cotton, which grows well.—*American Grocer*, April 1.

“THE CEYLON FORESTER” for April has the following Contents:—Ceylon Forest Law; Forestry in Ancient Times; Climatic Influence of Forests; Wood Preserving in Switzerland; The Coccidae of Ceylon; Notes on Trees and Plants used for Drugs, Dyes, etc. in the A.C.P.; Botanical Notes on Trees; Government “Gazette” Notifications; Result of the Auction Sale of Ebony held at the Central Timber Depot on 10th March 1896.

THAT CITRONELLA OIL.—The kerosened citronella oil has begun to haunt the public drug auctions, where it threatens to become a frequent visitor. The first batch rejected by Messrs. Domicier & Co., consisting of four drums, marked P & C, was placed in sale today. It was catalogued as “mixed citronella oil,” and the broker declared that it contained from 40 to 42 per cent of kerosene. He was thereupon subjected to several charming inquiries as to whether this was a “sale by sample,” whether he guaranteed the genuineness of the kerosene, whether he was offering the oil as citronella or as kerosene, and so forth. No one made a bid, and the lot was “bought in.”—*Chemist and Druggist*, April 18.

PLANTING IN B. N. BORNEO.—The *British North Borneo Herald* of 1st April says:—We hear from the Commissioner of Lands, who visited the Byte Estate on the 23rd March, that a very heavy blossom was then on the coffee trees which promise a heavy crop during the next twelve months. We hear that Tek Seng has opened 100 acres of land for coffee, &c., and has planted 37,000 coffee trees and 2,000 coconuts and other fruit trees and hopes to open more land this year for which he has prepared nurseries. He complains of the want of communication and says that he has already damaged some rice by taking it by sea when the weather was bad. When the road to the Byte is opened it will run along the boundary of Tek Seng's land, after passing through the clearings planted by Mr. Pryer and the Trading & Planting Co. The want of roads has perhaps been one reason why the Sandakan peninsula has been so little cultivated.

SOUTH WYNAAD SEASONS.—For the benefit of our Ceylon readers we insert the following tables of the year's crop of the Perindottay estate originally sent to the *Madras Mail*. The jat, it must be remembered, has been pronounced by a well-known Ceylon man, Mr. William Taylor, as one of the worst he has ever seen. The outturn was 59,580 lb. more than that of the preceding year, and as there are 175 acres in bearing, the yield works out to just over 500 lb. per acre:—

1895 April	1,983 lb.
May	10,101 ..
June	7,432 ..
July	8,863 ..
August	9,660 ..
September	11,018 ..
October	13,318 ..
November	9,050 ..
December	7,831 ..
1896 January	5,840 ..
February	3,616 ..
March	Nil
	88,742 lb.

While on the Wynaad, we would draw attention to the first sale of tea from the Charanbadi District, Ka ambyle Estate, recorded in our Market Supplement as having obtained the excellent average of 10½ per lb.—*Planting Opinion*, April 11.

Correspondence.

To the Editor.

CEYLON TEAS IN AMERICA.

MR. MACKENZIE'S OPINIONS.

SIR,—The enclosed cutting from a New York paper of 21st March sufficiently proves the wisdom of Mr. Mackenzie in abstaining from joining in the proposed Empire Exposition (in Montreal) on behalf of the Thirty Committee [Extract reproduced below].

Mr. Mackenzie draws attention to the requirements of the trade in U. S. A.

(1) That samples should be sent over in time to allow the dealer to wire an offer before the teas are warehoused in London.

(2) Lightly fermented, well twisted Orange Pekoes—not Broken Pekoes (that is *if* broken).

"The run is on very good teas for quality, and to a much greater extent in Pekoes and Pekoe Souchongs, which can be landed here under 14 cents (7d). The demand is strong at present for Ceylons and Indians, and the quantity used is limited at present by the impossibility of obtaining teas unbroken in appearance, evenly twisted and lightly fermented, which can be matched for standards."—I am, &c.,

April 22nd. A. W. S. SACKVILLE.

CEYLON TEA IN AMERICA:
IMPORTANT LETTER FROM MR.
MACKENZIE.

New York, April 3rd, 1896.

DEAR STOPFORD SACKVILLE,—I think it would be well if I said something of the position here at present with regard to British-grown machine-made teas. Much of what I may say is necessarily vague, as it is impossible to get a hold of facts, though surmises are numerous.

I am afraid the great increase of imports of those teas into the States and Canada last year may lead one to believe it has been due chiefly, if not entirely, to the efforts made by the Indian and Ceylon Committees, and that if our success was so great in 1895, it only requires a vigorous prosecution of similar means to insure a complete victory in the near future. I wish I could delude myself into accepting that view. It would bring exceedingly comfort.

The increase in imports was chiefly due to the low price of teas. This led to buying in excess of requirements, and the inquiries among dealers leads me to think that much of the tea imported has yet to be consumed. If this be correct, it will tell against imports in the early months of this year. All we know about them so far is that the exports of Indian tea direct from London during January and February are very much below those of the same months last year. Of course, this may be off set by larger shipments from Calcutta.

The two largest importers of Indian teas now draw chiefly direct from Calcutta, one by unconditional consignments and the other by a method which should be largely used by shippers from Ceylon, but which so far is very sparingly adopted, (and only by one firm.) This firm sends samples of shipments to their agent here a week before the teas leave Calcutta and Colombo. The agent here examines the samples and wires values to London. If the valuation here is better than the values put

in London, on duplicate samples sent there at the same time from Calcutta and Colombo, the teas are transhipped at the London docks and sent on here, thus saving London charges. Many buyers here have asked me why this system has not been largely adopted in Colombo. The only reasons I can urge are, want of enterprise in Colombo, arising from great loss already incurred by consignors, and the small quantity of tea shipped from Colombo to London, which is controlled by firms who are tea merchants with agencies here. Most of the tea purchased in London and Colombo is sent to Australia, India, Russia, etc. The teas shipped to London are almost entirely on account of growers, who are not merchants dealing with American firms.

Companies managed by "live" men, might be asked to try this advance sample scheme here.

To consignors there is no inducement in this market, as inferior teas from London are sold as "just as good," at prices which would not pay Colombo shippers. Writing to the Secretary lately, I pointed out that teas were sacrificed at the auction, (there is one every Wednesday,) for figures much below their value. Since then at this week's auction good Ceylon teas were sold at 6½d. to 7½d. per pound, much below their valuations as the leading importers will not buy at auction unless at a price which shows a loss to the consignor, because they want to kill such business.

An interesting fact at this auction was the appearance of a small parcel of Ceylon green teas, but the tea should not have been offered at auction sale. The price of best quality was two cents over broker's valuation. But I saw the teas tasted and valued by two dealers who handle large quantities, as well as by a Canadian dealer. They all pronounced them excellent, but said Japs are so cheap that these nice teas have no chance. To me the teas appeared clean and free of dust, but as compared with Japs they had too many fannings. One dealer said the best grade with a little more sifting would be worth 25 cents. It sold at 17 cents. The price was better than that fetched by Ceylon blacks of similar quality at the same auction, which is encouraging, as millions of pounds of these teas would find a ready sale here. I hope this new departure may be more extensively tried. But next time the teas should be shipped to a fair and just man who will give them an honest trial, and who will not take an interest himself in having them go cheap. I do not mean to insinuate that they were not consigned to a just man; I do not even know to whom they were consigned. But I know others valued them considerably over the prices they fetched.

A few million pounds of Ceylon Greens sent here would keep down shipments of Blacks to London, and prevent any increase in the future in total shipment of Black Tea from Ceylon. The example would be followed in India, and the speediest solution of the difficulty of an overcrowded home market would be struck at once. Present prices are near the point where necessity steps in, and supplies the stimulus required to force growers to adapt their goods to the taste of the market they may beseeching. In the advance sample system, and in Green Teas, I think I see agents more helpful than even in the money being spent as aids to advertising. There is no doubt at all about the steady yearly tendency to lower all round prices, and we should exert ourselves in other ways than the mere spending of the "cess." And this I am not afraid to urge, every while Ceylon planters are under the

glamour of dividends of 45 and 50 per cent. Take another penny off prices all round, and what would be the value of shares now at 200 to 700 per cent premium? Growers all the world over are conservative in their ways, and not prone to adapt their goods to circumstances. But merchants, when not already too well off, and when they are in the position to control the articles manufactured by the companies, should hustle for the demand existing here, and not confine their energies to pushing one article into the market for another. The latter process is slow and costly the other is immediate in its action, and up to a few millions of pounds I believe there is more profit here in green teas than there is at present prices of the Black Teas, which are grown on estates giving 250 to 350 pounds per acre, and which average 6 to 7 pence per pound.

All the above relates to "views" and "surmises," to "faith" and "opinion," but I can give a sediment of facts. There can be no doubt there are many more dealers handling our teas pure and in blends than there were a year ago. All leading grocers in New York and Brooklyn now keep them. We have sent girls round to hundreds of shops to buy small quantities that we might test the quality. — — — — and others, by their extensive pushing of package teas, have forced several leading wholesale houses to bring out their own packets, and we have, at the present moment, many American houses working in conjunction with us in territory holding quite half the population of the States, who, a year ago were doing little or nothing for us. Between them they have scores of lady demonstrators and hundreds of drmmers, and all are pushing energetically in the various methods Americans adopt, issuing samples, pamphlets, circulars, and advertising in local papers, while we do the general advertising for consumers.

WM. MACKENZIE.

CEYLON TEA IN AMERICA.

Young's Hotel, Boston, April 8th.

DEAR SIR,—It may perhaps be of interest to you to hear news from these parts though you are probably well posted up from other sources.

I have now been in America for some weeks during which my whole time has been taken up interviewing the most prominent Tea Dealers in the various cities of the States. When I was here last year I was fairly successful in introducing Ceylon teas though it was very uphill work. This year I have been much impressed with the distinct stride our teas have made in public favor. While their consumption is still comparatively small and the inquiry for them to any large extent limited, there is little doubt but steady progress is noticeable, and where a deal of tea chests was quite a hard business twelve months ago, the same men will now buy fifty without very much pressing. This speaks for itself. It is quite evident that our teas are "catching on" to the American palate, but there is a lot of hard and persevering work to be done yet before we can rest on our oars, Oolongs and Formosa teas form the general consumption and these are not to be superseded easily. Nevertheless, his old Scotch adage of putting a "stout heart to a stey brae" will, I feel sure, tell in the long run, and Ceylon will in time win the day.

There is no doubt, that a good deal of harm has been done, and the good cause hindered by his many inferior Ceylon teas sent to America some two years ago. A prominent dealer com-

plained bitterly to me yesterday of the trash which was foisted upon them at one time, and illustrated a case when some 50 chests were purchased fully two years ago, and up to the present time it had been found impossible to dispose of any of them; he added that it was decided to throw them away on the rubbish heap!

I met our rosy Commissioner last Saturday along with Mr. Blechynden on board the "Umbria" starting back for England, and he will, doubtless, be giving the Association an account of his visit which will appear in your columns. So I will not add more. I hope to return to London myself on Saturday.—Yours faithfully,
J. M. MITLAND-KIRWAN.

THE OTTERY TEA COMPANY FOR CEYLON, LTD.

Colombo, April 30

DEAR SIR,—We beg to inform you that at a directors' meeting of the above Company held yesterday, an interim dividend of 5 per cent was declared for the 6 months ended 31st March.—Yours faithfully,
LEE, HEDGES & CO.
Agent and Secretaries.

MANURING COCONUT PALMS.

May 4.

SIR,—In your "All About the Coconut Palm," page 8, you describe how the lagging coconut plants should be manured. As stated therein, I marked a circle three feet from the stem and filled the trench cut beyond it with cow dung and covered it with the earth dug out. They say that this practice would breed grubs, worms and insects, which will eventually destroy the plants, which I may say are less than 4 ft. in height from the ground. I also find grubs in the cow dung utilised. Should I desist from manuring in this manner? Can plants which have been in the nursery for over a year, and about 3 ft. or more in height, be planted with advantage in estates?—Yours truly,

YOUNG PLANTER.

[Will some experienced coconut planter give his opinion on these questions?—ED. T.A.]

MANURING COCONUT PALMS.

May 11.

SIR,—Re "Young Planter"'s letter about manuring coconut palms in your valuable paper of the 7th inst., my opinion is as follows:—

There are different modes of manuring. I find by experience that instead of cutting a trench, and putting the cattle dung, &c., into it, it would be better to throw the manure over the surface about 2 feet from the stem and dig it in with the usual native-made mamoty. This I have found better for young palms than trenching.

Cattle manure here is used very extensively, contract cattle being kept for that sole purpose. I have never found the trees destroyed by grubs, worms, &c. Although I have only had 10 years' experience, I should like, myself, to see what older experienced men have to say on the matter.

With reference to "Young Planter"'s other query, *re* 1 year plants, they can well be planted to advantage, and will with care turn out as good as any.—I am, yours truly,

H. J. M. T.

CROSSMAN & BRO. ON COFFEE.

A circular letter issued by W. H. Crossman & Bro. (March 13, 1896,) discusses the outlook for coffee, and shows the errors of European statisticians as to the true position of the article. Messrs. Crossman & Bro. evidently endorse the estimate of 10,000,000 bags as the outcome of the Brazil crop of 1896-97. They admit that probably 1,500,000 bags will not be marketed, thus leaving 8,500,000 bags available for export,

If we examine these figures by the light of past records, we find that Brazil exported in six years ending June 30, 1895, a total of 31,086,000 bags (2,005,059 tons), or a yearly average of 5,681,000 bags (334,177 tons).

The average annual deliveries of all kinds of coffee for four years ending June 30, 1895, were 10,883,791 bags (610,223 tons), of which Brazil furnished 5,994,750 bags (352,632 tons) yearly average, representing 55.08 per cent of the world's total deliveries.

It Brazil's contribution to the world's supply is 55 per cent. of the present requirements (about 11,000,000 bags,) then if crop of 1896-97 turns out 8,500,000 bags, the rest of the world need only furnish 2,500,000 bags. But all other countries than Brazil have for several years furnished an annual average of 4,889,041 bags, and if in 1896-97 all crops outside of Brazil only come up to the average, there will be available for export next season a grand total of 13,389,000 bags of coffee.

Everyone knows that high prices have stimulated production and that new plantations are every year coming into bearing in Mexico, Central America, United States of Colombia, Africa and other points. If production outside of Brazil should show a like increase as in that country we would have a much greater supply.

Crossman & Bro. point out that at no previous time has the position been as it is now on the eve of a large crop, with less speculative interest or larger supplies of actual coffee. It certainly looks as if the trade would soon be face to face with the largest crop ever harvested, promising, as Crossman & Bro. say, a surplus of 2,500,000 bags in excess of requirements. And this points unmistakably to lower prices.

We compile from the Coffee Exchange statistics the following table showing the position of coffee during the last crop year:—

	Bags.
Stocks in United States, July 1, 1894 ..	297,130
Stocks in Europe, July 1, 1894 ..	1,591,423
Receipts in U. S., July 1, 1894, to June 30, 1895 ..	4,647,831
Receipts in Europe, July 1, 1894, to June 30, 1895 ..	7,211,545
Total supply ..	13,737,929
Less stocks in U. S. July 1, 1895 ..	549,015
Less stocks in Europe, July 1, 1895 ..	1,673,665
	2,222,680

Deliveries for consumption .. 11,515,249

Let us supplement this with a statement for the calendar year 1895, and we have the following:—

	Bags.
Total visible supply January 1, 1895 ..	2,678,207
Arrivals in Europe 1895 ..	7,342,593
Arrivals in United States 1895 ..	4,590,400
Total visible supply 1895 ..	14,611,200
Less visible supply January 1, 1895 ..	3,552,792

For requirements .. 11,058,408

If we make a third group of figures, waiving stock abroad, we have the following showing:—

	Bags.
Stock in Europe January 1, 1895 ..	1,150,652
Arrivals in Europe 1895 ..	7,342,593
Stock in United States January 1, 1895 ..	320,595
Arrivals in United States 1895 ..	4,590,400

Total supply ..	13,404,240
Less stock in Europe and U. S., January 1, 1895 ..	2,149,792

Consumption 1895 .. 11,254,418

If in 1896-97 the world needs 11,250,000 bags of coffee, and all countries outside of Brazil may be counted upon for 45 per cent of the total production, or 5,062,500 bags, it follows that we need from Brazil 6,187,500 bags. If the crop turns out as estimated—8,500,000 bags for export—there is an excess over the world's requirements of 2,312,500 bags, exclusive of the carry-over, which will probably bring the total to over 3,000,000 bags beyond any year's consumption on record. When supply exceeds demand, prices always go down. The outlook is for an era of cheap coffee, and thus this article will come to harmony with wheat, corn, cotton, iron, tea and other great staples, contributing further toward making the present a consumers millennium.—*American Grocer*, March 18.

PUNA AS A COFFEE DISTRICT.

During a recent visit to the Island of Hawaii, Mr. C. L. Wight, president of the Wilder S. S. Co., General Warfield, proprietor of the California Hotel, San Francisco, Mr. Desky, of Bruce Warring & Co., and the editor of this Journal had the good fortune to visit the coffee estate of Honorable R. Rycroft in Puna. The party arrived at Pohoiki, on the morning of the 23rd ult., and were most hospitably received by Mrs. Rycroft and her charming family.

Horses were procured for the party shortly after arrival, when all proceeded to the coffee fields which are situated some three or four miles inland from the steamer landing.

Miss Sophie Rycroft, the charming daughter of the genial Representative, accompanied the visitors, and proved herself to not only be well versed in coffee culture but an expert horsewoman as well. Mr. Rycroft's plantation is a sight long to be remembered, and demonstrates beyond the shadow of a doubt that all the conditions favourable for coffee growing exists in the district of Puna. Miss Rycroft explained to the party the various details necessary to the successful cultivation of a coffee estate, evincing a lively and intelligent interest in her father's affairs. On either side of the road leading to the coffee fields are to be found various kinds of citrus fruits and also many varieties of native fruits much prized in this country. Tropical foliage and woods abound everywhere and bear evidence of perfect freedom from all kinds of disease or blight.

Orange and lime trees grow wild on Mr. Rycroft's lands, while evidences of ancient coffee plantations are to be found in the many old trees dotted here, and there amongst the natural tropical growths. Mr. Rycroft's success in bringing coffee to the front as a staple industry of Hawaii will prove a splendid advertisement for the country as well as an independent competence for himself and family for the rest of his days. Mr. Rycroft's great mistake has been in not going into the coffee business years before he did. Although a resident of the district for over eighteen years it is only within the past five years that he has turned his attention to coffee growing. During that time he has succeeded in clearing and planting over thirty-five acres the trees on about 25 of which are now four years old. The remainder of the plant runs from one to three year's growth. This year he picked over 15,000 pounds from the four-year-old trees which is a good yield when it is considered that coffee trees are not supposed to give much returns before the fifth season the trees are all clean and healthy and give promise of a very large yield next year.

Having seen Mr. Rycroft's plantation we have not the slightest doubt as to the possibilities of the coffee industry in the future. At the same time there is not another industry that requires the exercise of as great care and intelligence in cultivation as coffee growing. The selection of suitable lands having due regard to quality of soil, shelter, and shade is an important matter with the beginner, but unless he also possesses a knowledge of the peculiarities of the plant itself he is liable to lose a great deal of money and time or end in complete failure before he discovers his mistakes. To those

contemplating going into the coffee business we would say select your district and then devote a few months of your time in finding out what others have done and their experience in the district you may decide to locate in. To those who may decide to locate in Puna we believe Mr. Rycroft would be only too pleased to give them the benefit of his experience. Although he has made many mistakes he has learned to avoid similar errors in future and as we said before has demonstrated that coffee planting can be made a success in the district of Puna. Mr. Rycroft has put in a complete plant for the preparation of his coffee for market, which is extensive enough to meet the requirements of a number of settlers in his neighborhood for some years to come. That his methods of preparing coffee for the market are up to date is amply demonstrated in the fact that he sold his whole output in this city a few weeks ago receiving therefor the highest price paid this season.

To return to our visit to the coffee field, after the party had inspected the various plantings and learned much that was new to most of the visitors the return trip was made to Pohoiki. General Warfield was delighted with all he had seen and especially the delightful climate of Puna. Upon return to Mr. Rycroft's home a splendid luncheon awaited the party at which was served coffee prepared from beans grown on the premises and which General Warfield declared to excite any coffee he had ever partaken of. For ourselves, we had imagined we knew good coffee and often enjoyed what we believed to be a very superior cup but since partaking of Mr. Rycroft's excellent brew we fear to return to our former decoctions so-called coffee. At all events we know of that we shall not again enjoy a cup of genuine good coffee until we have the good fortune to visit the home of Mrs. Rycroft. General Warfield was so much delighted with Mrs. Rycroft's coffee that he has ordered his next year's supply from Mr. Rycroft so that in future Hawaiian who visit the California Hotel at San Francisco, will find the most prominent item on the bill of fare, "Hawaii (Puna) coffee, à la Rycroft."

The district of Puna like almost the entire island of Hawaii is exceptionally conducive to good health. We were informed that Mr. Rycroft has only twice in seventeen years had occasion to call in the services of a physician. We look forward to Puna becoming, within a very few years one of the most thriving districts in Hawaii.—*Hawaiian Commercial Journal and Maritime Report*, March 10

THE STANDARD TEA COMPANY OF CEYLON, LIMITED.

The fifth annual meeting of this company was held at the office, 25, Fenchurch Street, on Tuesday, April 21. The directors present were Mr. Alex. Brooke (in the chair), Mr. Norman W. Grieve, and Mr. William Rollo. Among those present were Mr. H. L. Stables, Mr. R. J. Chippindall, Mr. Reginald W. Wickham, Mr. R. A. Bosanquet, Mr. John Anderson, Mr. J. L. Anstruther, Mr. Edward S. Grigson, Mr. E. F. Bosanquet, Mr. H. Atkinson, and Mr. S. Wilson.

The Secretary having read the notice calling the meeting, and the reports and accounts having been taken as read, the chairman said:—

Gentlemen,—I address you with feelings very different to those at our first meeting, when we were dependent for a dividend, while our tea was young, on what we deemed two somewhat broken reeds—bark and coffee. The former aided us then, but has failed us now altogether. Our first year it contributed towards our income above £2,000. This last year, 1895, it contributed nothing, some £5 or £6 in rely, less cost of cutting and transport. Coffee, on the other hand, as you will notice in the report, has kept up in quantity fairly and in price excellently, and realized by it almost as much as any year. It amounted to above 5 per cent. on the paid-up capital. However, we do not expect this year, 1896, to get even half the same quantity.

Meanwhile the estates are otherwise improving and maturing; the tea plants are becoming or have become more matured, and the yield is increasing. The directors have been well served by their managers in both districts—Maskeliya and Uda Pussellawa—by Mr. Craib on Goutavilla, by Mr. Bagot on St. Leonards, and by others on the different estates in that district, including Mr. Henderson, who superintended Liddesdale and Eskdale long before the company were the owners, and left the end of last year, I am sorry to say.

The accounts I have no need to go through seriatim; they explain themselves, but I shall be happy to answer any enquiries. Our debt, at one time considered by some financial authorities large, was brought into very modest dimensions on our last issue of capital. Exchange continued last year almost as favourable for the company as in 1891. It has since risen. Whether it will remain high or fall through Russia adopting a gold standard or other influence I will not venture to prophesy. In old days, when the rupee first began to drop and to affect our different Eastern exchange banks, the chairman at their annual meetings used to tell what the future was to be until they found that they were invariably wrong, when they dropped the subject. I will only remark to illustrate what an important matter it is to us, that on the scale of our drawings of 1895 a penny in the exchange means a difference of £1,000 to us.

However, as regards the past year, aided by coffee and a good exchange and increase of yield of tea, our profits have increased, and the directors have the pleasure of recommending a substantially increased dividend on a considerably increased capital. We began by dividing at the rate of 10 per cent., then after two years 12½ per cent., putting by something to the reserve fund, but we have never written off anything for depreciation of machinery and buildings. We now propose a dividend, making for the year 15 per cent. We desire to write off for depreciation £1,500, and to carry £2,500 to reserve. No further purchase of estates has been made.

We have had our great loss in the year through the death of our old friend Mr. Peter Moir. He was my colleague when the Standard Tea Company was first conceived and started. As a director he was very painstaking, looking into all accounts and reports, both Ceylon and home accounts, most minutely, regular in his attendances, and prudent and enterprising in his judgment. In him I lost a personal friend whom I had known intimately for thirty-five years, and for whom my respect increased the more I knew him. He was, I think, the most straight and honest man I ever met. To supply his place several considerable shareholders suggested Mr. W. Rollo, and the remaining members of the board were very pleased when they heard that gentleman would join and give the company the benefit of his long and intimate acquaintance with Ceylon planting affairs and of his excellent judgment. They had the pleasure of appointing him under the articles of association, and I am sure the appointment will receive the unanimous approval of the shareholders. (Applause.) I beg to move that the report and the accounts be adopted.

Mr. Norman W. Grieve seconded the motion, which, after a few remarks from Mr. Wickham, Mr. Edward S. Grigson, and other shareholders, was unanimously carried.

The Chairman proposed, and Mr. Rollo seconded: "That a dividend of 10 per cent., free of income-tax, on the £56,000 paid-up capital be declared, which, with the interim dividend distributed July 18, 1895, makes 15 per cent. for the year 1895; that this final dividend be payable on and after April 22; that £1,500 be written off for depreciation of machinery; that £2,500 be placed to reserve; and that £709 7s 4d be carried forward to year 1896." The resolution was carried.

Mr. Grieve proposed and Mr. J. L. Anstruther seconded, and it was carried, "That Mr. Alexander Brooke be re-elected a director."

Mr. A. E. Maidlow Davis, C. A., of 21, Rood Lane, was elected auditor of the company's accounts for 1896.

Mr. R. J. Chippindall and Mr. Henry Atkinson proposed a vote of thanks to the chairman and officers, including Mr. E. S. Grigson, the V.A., under whose advice were made the purchases of the company's estates that have turned out so well. An acknowledgment of the vote and some interesting remarks by Mr. Grigson terminated the proceedings.—*H. and C. Mail*, April 24.

CEYLON TEA PLANTATIONS COMPANY,
LIMITED.

ANNUAL MEETING OF THE PREMIER
COMPANY OF CEYLON.

(*Special Report for the Ceylon Observer.*)

The annual meeting of the shareholders took place at Winchester House, Old Broad St., on Thursday, April 23rd.

Mr. H. K. Rutherford, managing director took the chair, supported by Messrs. Reid and Tod, Directors, Sir Wm. Johnson Bart Secretary, and Mr. G. A. Talbot, Estates Manager in Ceylon. Among those present were Messrs. Alex. Brooke (of Messrs. J. A. Hadden & Co.), W. H. Anderson Dangerfield, G. A. White, Lee, W. Mackenzie, Frank Walker, John Ferguson, J. Russel Grant, and A. G. Stanton.

The SECRETARY read the notice of meeting and report, a copy of which reached you by last mail, after which the Chairman spoke as follows, in moving the adoption of the report:—

GENTLEMEN,—I presume, as has been the usual custom, you will accept as read the Report and Accounts which have been in your hands for some time. On each previous occasion when we met you here, the Directors have had the pleasure of congratulating you on the increased prosperity of the Company's business, and the Board, in laying before you its Ninth Annual Report, considers it highly satisfactory that the continuity of that favourable state of affairs has been preserved. The Accounts shew a net profit for the past year of £51,927, or £3,324 in excess of that of 1894. The year which we are now reviewing was on the whole a favourable one as regards seasonable weather for the Tea bushes giving a good crop of leaf, and you will not fail to observe that the yield of Tea was the largest we have ever reaped being at the rate of 437 lb. per acre over the large area of 8,073 acres. The crop harvested from our own Estates was 3,530,737 lb. being an increase of over half a million lb. on the crop of 1894. We bought green leaf from which we produced 665,603 lb. of tea, and we manufactured tea for other Proprietors amounting to 1,110,564 lb. these two sources shewing a decrease of 78,000 lb. Our Factories altogether turning out a total of 3,306,904 lb. of tea. The gross average price received for the crop was 8.09d as against 8.84d in the previous year or a fall of $\frac{3}{4}$ d per lb. and the rate of Exchange 15 18 3-32d of a penny in our favour as compared with 1894.

It will not have escaped your notice, that not only the price of the Company's teas but of all teas from whatever source has had a downward tendency for some years back. This need not be a matter of surprise when we consider the largely increased quantities being produced both in India and Ceylon. The former country especially is at the present time opening out large areas of land under tea, and we must therefore look for a greatly increased production in the next few years from that quarter. It should, however, be a matter of satisfaction to all interested in the cultivation of British grown teas, to note the extraordinary increase of exports to countries other than Great Britain. For the year 1895 these countries took 38½ million lb. of British grown tea or 33 per cent. in excess of the previous year, and it is estimated that the current year will see a very considerable increase on these figures. This ever widening consumption gives us hope that the increased production will be taken off the home market

and the further decline in price thereby stayed. The persistent efforts of Ceylon and Indian Growers in pushing their produce in foreign and colonial markets should not however be allowed to slacken and if steadily persevered in, may be crowned with a greater success than perhaps any of us at present foresee, and it is very possible, we may be able to look back on 1895 as the day of small things, and that we then had merely touched the fringe of the enormously greater consumption which will be found for British grown teas in our Colonies, Russia, and America, a few years hence. Coming back to the more immediate affairs of our Company perhaps the most important item in our Accounts calling for special remark is our Reserve Fund. Last year this stood at £50,000 and we now propose to increase it to £70,000. It cannot, I think, be denied that it is in large measure owing to our having created such a substantial Reserve that our £10 shares stand to-day at £30. The Board has firmly adhered to the policy, indicated to you some years ago, of keeping the Reserve entirely free from the risks of our Tea business and the Accounts now presented to you show you how this money is employed. We have £35,741 in Securities, which would if realized bring us a substantial profit, and the balance has been utilized in the purchase and development of our Coconut properties. When we made our first investment in these, we told you we looked upon this form of employing our Reserve as an eminently safe and remunerative one, and the Board has no reason to change its opinion. As the sum invested has reached a considerable amount, it will no doubt be of interest, if I briefly explain our position with regard to this product. We have now 4 Coconut Estates, viz:—Andigama, Mawatte, Jakwilla and Siragapathe. This latter property we had not intended purchasing until the beginning of this year and so bringing it into the 1896 Accounts, but as other parties were anxious to buy it, we had, in order to secure it, to take possession in December last. This Estate is equipped with machinery of the most approved type for producing fibre, and it comes to us as a going concern, for which we paid £19,411. Our manager estimates that for the current year it will yield a return of nearly 10 per cent., on this outlay, and that better results are likely to be obtained hereafter, when we have improved the Estate, by a higher system of cultivation. The other 3 Estates are not yet yielding returns, but we have every confidence that when they come into bearing, the profits will be satisfactory. We have arranged to plant up about 500 acres with coconuts this year out of our available forest land.

Engaged as we are in Agriculture, we are taught by the experience of every country and the vicissitudes which surround most products that are grown, that we cannot hope to escape the common lot, of having less prosperous years for our tea in the course of time. It is therefore needless to say that it is the duty of your Directors to provide in the good years we are fortunate at present in having, against the possibility of bad years. The fact that we are laying out half the Reserve in securities and half in such a safe product as coconuts tends in large measure to eliminate the speculative element, and to make the shares in this Company more in the nature of an Investment with an ever-increasing security. The public has not been slow to respond to the evident benefits of this policy, and shareholders have had a very solid advantage in the increased value of their shares as a setoff against any larger dividends that might have been paid them. The capital value of our tea properties you will observe is £5,223 less than what it stood at the previous year. There have been some minor additions to capital values, but the decrease is practically all accounted for by the amount written off for depreciation, and the sale of Balgownie estate. Allowing for the reserve; the amount at credit of brought forward; and the sum set aside for depreciation, our tea properties stand at £25 per acre fully equipped in every respect.

As you are aware, we have always refrained from laying before you our estimates of the current year, and you have invariably been content to receive the assurance of the board that your properties are being cultivated and cared for in such a manner

as not only to return you the best possible immediate results, but that they shall continue to yield as good crops in the future as we can be assured by an intelligent and careful system of husbandry.

You will now, however, I am sure, be anxious to hear what our Ceylon Manager, Mr. Talbot, has to say about the properties he has so ably managed on your behalf for the last 7 years. There is no man in Ceylon better qualified to speak with authority on the planting interests of that Island than Mr. Talbot who has devoted 25 years of his life to planting in Ceylon. I have repeatedly said from this place that much of our success is due to our Ceylon management and I am sure that while Mr. Talbot takes his well earned leave at home, Mr. Masfield, who has again been appointed Acting Manager, will, in conjunction with the other members of the staff, perform their duties to our satisfaction as hitherto.

You will be asked later on to pass a vote for a small increase in the Directors fees, in order that we may have the advantage of Mr. Talbot's services on the Board while he is in this country.

Should any shareholder desire to ask any questions my colleagues or I shall be very pleased to answer them to the best of our ability. Meantime I would move "That the Report and Statement of accounts as submitted be received and adopted and that a final dividend of 8 per cent off the ordinary shares making 15 per cent for the year free of income tax be declared payable on and after 27th inst." (Applause.)

Mr. HENRY TOD seconded the adoption of the report which was carried unanimously, the only questions put being by Mr. Dangerfield with reference to the Reserve Fund, remarking that the coconut estates opened out of this Fund were now called Investments and he presumed the profits from these would be henceforward included with the annual profits from the tea estates. He referred to some slight difference in the figures in two parts of the accounts, which he had no doubt could be explained.

Mr. RUTHERFORD explained that the discrepancy was due to the Sirangapathe Coconut Estate having had to be bought in December 95, in place of going into this year's account, as the directors had intended.

Mr. TALBOT then made a clear and concise statement as to the condition of the Company's properties in Ceylon. He said he would avoid detail but notice some of the chief points in the working of the properties; their policy had been directed to maintain the permanent value of their plantations rather than to extract from them for a certain number of years the maximum returns of which they were capable. This policy was seen, for instance, in their treatment of young tea. They took care that the maiden crops, by plucking lightly, should not be a burden to the trees, so that these were enabled to develop vigorously, up to their third and fourth year. They applied the same policy generally to any weak portions of their fields, so that such patches, being leniently treated should gradually gain full strength and be equal to the rest of the field. Another matter in which they had been careful was in the application of artificial manures. He could not help regarding such an application as, to a certain extent, living on capital, because artificial manures stimulated the trees to take everything they could out of the soil in a limited period. Their policy was rather to supply bulky fertilizers such as cattle manure, and for this reason they were looking ahead and planting up grass fields, as well as preparing cattle establishments, for all planters knew the value of cattle manure in dealing with our Ceylon tea soils. Another fact he would refer to was the utilization of water-power in their factories wherever at all possible, even at increased first expense. Other motors

might be cheaper in the first instance, but, in the end, there could not be a more economical satisfactory or better way of working than with water-power. Turning to the Company's coconut estates, he might say that these had given him much more anxiety than his duty of tea supervision; because he was here dealing with the reserve funds of the Company which had to be very carefully invested, and entering on an industry which was regarded as peculiarly one appertaining to natives. He might say however that the estates bought for the Company were all good; and as the result of his observation he felt sure that Europeans could work coconut plantations better than natives and secure larger profits. Finally he would like to say a word with reference to the Company's Superintendents whose work he had closely watched for the past seven years, and he could safely say that no body of men anywhere in the tropics did their work more faithfully than the Superintendents in the employ of the Ceylon Tea Plantations Company. Their responsibilities had very much increased of late owing to labour anxieties and the difficulties about coast advances, more especially in securing a due amount of work during the rush of crop from such gangs of coolies as might be rendered more independent and uncertain through the effects of the advances' system. But he felt sure the Superintendents would continue to give their utmost attention to the interests of the shareholders. (Applause.)

RE-ELECTION OF MR. RUTHERFORD AS CHAIRMAN.

Mr. D. REID moved the re-election of Mr. Rutherford as Director and in doing so spoke in the highest terms of his devotion to the interests of the Company, to which he gave the best of his thought, time and strength. (Hear, hear.)

Mr. W. HERBERT ANDERSON had much pleasure in seconding the resolution. To have such a Chairman as Mr. RUTHERFORD was a special advantage to the Company, for he took care that everything was thoroughly up to date in his work, and, come what may, the shareholders might feel secure that Mr. Rutherford would watch over their interests with the same untiring energy as before. (Applause.) Resolution carried unanimously.

[Mr. Talbot was also elected to serve on the Board of Directors during his year of furlough.]

SMALL INCREASE TO DIRECTORS' FEES.

Mr. WM. MACKENZIE proposed a resolution that the total of the Directors' fees for the current year should be £700, and in doing so expressed his astonishment at the moderate amount hitherto drawn, and now proposed, considering the great prosperity of the Company and how much was due to the gentlemen at the Board. He referred especially to the work of their Chairman at home and their Manager in Ceylon, Mr. Talbot. Their estates were among the finest properties in Ceylon, in every way admirably managed, and they had now a very considerable reserve fund, the investment of which was also, in his opinion, carried on with great judgment. He would therefore personally be prepared to go further than the terms of his resolution, which, however, he had great pleasure in proposing. (Applause.)

Mr. LEE seconded,—Carried unanimously.

AUDITORS.

Mr. DANGERFIELD moved, Mr. WHITE seconded, and it was carried unanimously that Messrs. Harper Bros. be re-elected Auditors.

THANKS TO THE CHAIRMAN.

Mr. JOHN FERGUSON said before they separated a hearty vote of thanks to the Chairman for presiding would, he felt sure, be approved of. The history of the Ceylon Tea Plantations Company was not only a credit to the Tea Enterprise in Ceylon, but had tended to the prosperity of the community, and had undoubtedly strengthened the credit of the Colony at large. (Hear, hear); and to Messrs. Rutherford and Talbot more than any others were due its continued success.

Mr. ALEX. BROOKE (of Messrs. J. A. Hadden & Co.) seconded the proposal, which he felt sure would be carried by acclamation. (Applause.)

THE ROYAL BOTANIC GARDEN REPORTS.

The yearly reports issued by the Director of the Royal Botanic Gardens, Peradeniya, are not, I think, quite creditable productions—scarcely worthy of our splendid Gardens and not altogether what the public seem to have a right to expect. They may serve the purpose of showing the Government how the little money is expended, but beyond, this the information, as a rule, is very meagre, and to the general public the details are trite and dry to a tedious degree. Compared with the periodical reports from many a less favoured locality the documents are decidedly uninteresting. Take Jamaica or Trinidad for instance, where Mr. Hart throws his whole heart into his subject, the result is an interesting and instructive report read and admired not only all over the West Indies but by every lover of tropical botany and practical planter in the Tropical World. In addition to this, Mr. Hart edits a Monthly Bulletin of miscellaneous information, which treats of every product in which the planter is specially interested, and chronicles in cheery style the results of careful experiments in cultivation.

Our Peradeniya reports are rather too much taken up by complaints as to the poverty of the soil and penuriousness of the Government. More money, more money, is the cry; and yet they suggest that it is beneath their dignity to continue selling plants to the public!

While fully sympathising with the talented Director under present circumstances, and remembering with admiration the labours of Dr. Thwaites and the legacies left to us by Gardner and Moon, yet, looking hopefully as I do to the future possibilities of Peradeniya, I am constrained to think that much more might be made of such a magnificent subject than we have been accustomed to receive.

Here is a garden of 150 acres, formed from the very cream of the Central Province in a moderately moist, forcing and delightfully equable climate—a garden in which some 4,000 species of the choicest plants on earth luxuriate and all this not only rent free but subsidised to the extent of about R50,000. And yet they complain!

Shades of poor Tom Edwards, Dick and Duncan, what a paradise this would have been for you!

I have said that too much of the report is taken up with trivial matters. Last year we had the compiler gravely exercised over the trespass of cattle, though such is the admirable situation of this Eden that the only vulnerable portion might be protected by a few hundred yards of barbed wire or prickly hedge. Last year a few ambitious ferns had grown on the top of the monument erected to the memory of Mr. Gardner, and the removal of these is thought worthy of special notice. Again, we read that "much labour is annually expended upon the extensive tract of these grounds known as the Old Arboretum, in weeding, pruning and planting, but we are unable to make much impressions on its wild character."

Would it be too much to expect that a few plots might be utilized here in a way to add considerably to the income of the establishment while adding to the interest of visitors? Say 10 acres of cacao of sorts; do. Liberian Coffee, do. Cocoa. I see nothing

derogatory to the dignity of even the Royal Botanic Gardens in this while I could foresee R10,000 profit annually. In the Royal Gardens, Port of Spain, one sees little plots of remunerative Cacao, and coffee with model little appliances showing the planters and others how it ought to be done. Are we a together above this sort of thing in Ceylon? Too proud to even or too conceited to learn.—*Cor.*

INTERESTING PLANTING NOTES.

Quite a severe drought, is again the report from most of the up-country districts this week, to the anxiety and discomfiture of all who risked planting with the first April rains. In Balangoda for instance the plants are said to look somewhat shaky. Here too the wind has already began to blow so strongly that one feels thankful for the precaution of shelter belts. On the upper ridges of this district particularly, the South-West is ushered in with hurricane force, reminding one of Wilson's bungalow—the New Galway of today—and poor James Wyllie who, on being asked by his V.A. on the morning after a terrific night, what he thought of it replied "On such nights as these I simply cover my head with the blankets and thank God I am not the proprietor."

What a change when we got over the ridge into Dikoya! Here it has also been dry during the week, but no wind to speak of and plenty flush. Further down the Valley into Ambegamuwa proper, all is now damp and dreary the thick mists drifting up from Kelani, and the flush somewhat checked for want of sunshine.

Upper Dimbula reports fine weather and first-rate flush, the total rainfall for the week being only 13 and the mean temperature 70°. Coolies come dropping in from the coast but not in such numbers as to meet requirements and by no means in proportion to the advances sent. Planters are beginning to pull long faces over this labour question.

The "Perlie Karun" coolie has cropped up in Matale East and threatened to assault the manager of Dangkande estate who very properly ran the rascal in. The marvel is that Laurie could restrain himself.

Like Balangoda this district of Matale East has begun its annual blow. And in this respect the locality of Moneriff can give odds against most places and yet look at the tea giving 600 lb. per acre all round! Those who doubt that there is vigour in the soil of this famous old district should see the Grevillea trees planted a year ago now 15 feet in height.

Better than Klang moss pots this,—though by the way peat was the only effectual cure ever found for potato blight. Might it not also withstand the nearly allied leaf blight?—*Cor.*

May 1st.

We are now passing through, that interval of weather, which precedes the big South-West Monsoon. "The rain it raineth every day," accompanied by lightning and thunder. Yesterday at early morn, I roamed over some of the high patenas about here; the Monaragalla range of hills wore a veil of deep blue; the hills of the Bintenne low lands were dark looking, with misty clouds between them, not a breath of wind refreshed the mountain climber. Above, were long broad streaks of sky blue, with fleecy clouds, but no movement of any kind above me or below. The very birds forgot to warbling nature was in a dreamy mood, and one could not help contrasting the festive scene in country lanes, in the old country on a fine May morning, and the fragrance of the hedgerow hawthorne, and

wild rose, and the song of birds. Planters are busy these hot and steamy rainy days, for tea bushes are throwing out young leaves most luxuriant. Pity coolies could not be retained on tea estates all the year round and work found for them, say nurturing when not otherwise employed. Their *scarcity of labour would be almost unknown.* OLD PLANTER.

COLONIAL FRUIT AND FOOD PRODUCTS.

Should the dream of the Imperial Federationists ever be realised (and we of this journal most cordially wish all success to the movement) one of the first subjects to receive attention at the hands of whatever body may be constituted to consider the best means of making the federation effective, would have to be creation of new industries in spots favourable for the growth or manufacture of certain goods which both ourselves and our colonies now obtain from foreign sources. Any scheme of Imperial Federation would we presume, encourage the formation of committees of experts to cast about for the most likely districts within the boundaries of the Federation which could be drawn upon for supplies of the character referred to.

COLONIAL PRODUCTS.

The result of such methodical collection and discussion of information on this point would speedily show us that the mother country and her dependencies could be easily developed into a self-contained and self-supplying area for almost all, if not all, requirements. We are, for instance, at present dependent upon foreign countries for our orange supply. There is no reason at all for this. Our Australian and West Indian colonies could undoubtedly furnish all requirements. Scents and essences are now mainly obtained from abroad. Our Australian and South African colonies could certainly, if developed, furnish these commodities. The olive, a most important commercial product, could also be cultivated in many of our colonies, and such articles as eucalyptus oil, culinary essences, castor oil, crystallized fruits, including citron, orange and lemon, and, in fact, a large number of articles which we now obtain from countries over which we have no governing control, could be produced in our own colonies by an expenditure well within the means of the communities concerned.

THE NATION'S FOOD.

Some large sacrifice will have to be made in order to successfully establish Imperial Federation, and a very large sum of money indeed would be well invested in a truly imperial effort to render the members of the great British Empire dependent upon no outside source either for its food supplies or for its supplies of necessaries and luxuries. We are threatened on all hands with severe competition in our produce growing and our manufacturing trades, and, seeing that our Queen rules over immense tracts of country in which all our requirements could be produced by free labour, and under conditions which appeal to us in every way as a freedom-loving race, it is evident that any great scheme of Imperial Federation must contain a well-considered clause, under the conditions of which the possibilities of our dependencies as the source of all supplies for the great commonwealth must occupy a foremost place. Our legislators have their hands full at present with matters of the gravest import to our Imperial interests, but such steps as can be taken by our great merchants to further the development of our colonies in the growth and preparation for the markets of such supplies as we have here indicated would earn the undying gratitude of their fellow countrymen. The very magnitude of the scheme, together with its comparative ease of accomplishment, should commend itself to all far-sighted Britons.

COLONIAL PROGRESS.

The progress of our Colonies can best be secured by developing their resources as rapidly as possible. There is no reason why we should be compelled to depend upon the foreigner for the major part of our food supplies, either in times of peace or war. There can be no ground here for jealousy in any shape or form, since in the future the continued strength and success of the British Empire will depend to a very great extent upon Colonial resources and aid. To export our Colonies is an indirect way to strengthen the Empire, and in this sense, whatever exports they can send us should be welcomed by the community in the name of the English-speaking race. We have given some sound hints as to the course that might be pursued with advantage in this direction, but the subject is too vast to be dealt with in a single article, or a dozen either. From time to time we shall keep the subject under the notice of our readers and all interested in this question. As far as fruit and food products are concerned, there is a great field before the Colonial growers. The one thing needful is to develop these great branches of trade on sound commercial lines, and as far as we are concerned, we shall do our utmost upon every suitable occasion to furnish such suggestions as may, if acted upon, tend to consolidate the Empire by ensuring the prosperity of each individual colony.—*Fruit Grower, Fruitwaver Forest*, April 22.

THE WYNAAD AND SELANGOR—ONCE BITTEN TWICE SHY.—We have been credibly informed—says *Planting Opinion*—that one of the reasons why Ceylon capitalists are not investing more freely in the Wynaad, is the recent collapse of the "Klang boom" in the Straits. We have referred to this fiasco more than once, so that we need scarcely point out that there can be no possible connection between the two cases. In Selangor there was a small garden of Liberian coffee doing excellently well on peaty soil of apparently identical character with the surrounding jungle. A number of Ceylon planters having put in hurried applications for land in the neighbourhood of the coffee-garden, Government sold the land by public sale, having made certain promises to undertake drainage works. Jungle was cleared and work was getting forward, when a personal inspection of the land by two experienced Ceylon men showed that the soil was utterly unsuitable for coffee, the peaty deposit being some twenty feet deep, while that on the small Liberian garden was only two feet deep, the subsoil being of excellent blue clay. All work was stopped, the land thrown up, and finally Government allowed the applicants to choose suitable land, of which there is really plenty elsewhere in the district. Now in Wynaad, a great deal has certainly been talked about the yields of certain quarter acre tea patches but they have got over that stage now and can point, to several fine young estates doing as well as any perhaps of their age in India. To be shy of investing in Wynaad because certain lands in Selangor purchased in a hurry turned out to be bad, is a somewhat silly method of action. However, there is no doubt that a boom is by no means an unmixed good, prices are bound to be inflated and the assured collapse would do lasting harm to the district. Let Wynaad be wise and hasten slowly, too much advertising sometimes defeats its own object. After all, though we are assured that applications are contrary to our former belief—coming in very slowly indeed, yet if once a well-known man purchases in a large way, the others will follow like a flock of sheep. At present men think it better to wait and see if other men are investing.

OUR PREMIER TEA COMPANY.

It is very satisfactory in the interests of the Colony at large, as well as of the tea enterprise, to observe the exceedingly good account of the stewardship which Mr. Rutherford and his co-Directors were enabled to give to the shareholders at the meeting of the Ceylon Tea Plantations Co. on the 23rd ult. in London. This Company is well entitled on every account to the first place in the long list of Ceylon Plantations Associations in the present day. It is one of the largest—if not the largest Tea Cultivating Company—in the world; it is the oldest in our Ceylon list; and it is among the most uniformly successful. It is interesting at such a time to recall the very beginnings of the Company and the plucky way in which the late Mr. David Reid—genial as well as specially shrewd and enterprising—and his colleagues in Railway Contracting and Engineering—Messrs. Rutherford and Tod, pioneered the way in “tea” on Mariawatte and other estates at a time when many of our oldest planters and merchants looked askance at the new product. We cannot but recall our own very first importation of tea-seed early in 1878—part of a larger consignment for Abbotsford,—which, on leaving for home, we left for a “practical” planter-partner to put in, in place of coffee, in an Ambagamuwa property; but which after vainly trying to sell in the Port of Colombo, he took and put “the stuff” in, out of sight at the top of his coffee fields with no idea of utilising it for a clearing. We merely mention this little incident to show how narrow was the circle of believers in tea from 18 to 20 years ago. All the more honour, therefore, to the few—Messrs. Harrison, Leake and James Taylor, Sir Graeme Elphinstone and the late Mr. David Reid and Mr. A. M. Ferguson, senr., especially—who led the way with the new product which has conferred such unexampled prosperity on Ceylon.

As regards the present position of our Premier Company, nothing can be added to the very explicit and admirable remarks of Messrs. Rutherford, Talbot and Wm. Mackenzie. If anything is calculated to send the shares of the Company still higher in value, it is the exposition of the policy which has guided the working management of the Company's estates. But it is noteworthy (as both the Chairman and Mr. Mackenzie pointed out) that while the £10 shares are now valued at £30, the actual average cost per acre of tea in the Company's books is no more than £25, or taking the current value of shares, £75 per acre—a figure which compares favourably with several other companies, more especially when the established well-equipped position of the Company's tea estates, and the large *Reserve Fund*, is considered. Indeed, it is time surely that the company should have “Coconut Palm” added to its title; for, such an addition, in view of all we know of the Company's investments in this product, ought materially to add to the stability of the shares and the future maintenance, if not increase, of dividends. Altogether, therefore, we have only hearty congratulation to tender all round—and notably to the working Superintendents and overseers—on the prosperous position of the Company—a prosperity that, as we said elsewhere, reflects to the credit of our planting enterprise at large and of Ceylon as a Plantation Colony.

unprecedented in the history of the rubber trade, for within a single year from the first recorded exports Lagos has taken rank as one of the largest exporters of rubber in the world—second, in fact, only to Pará. A short time ago some figures were printed in this journal showing the increase in rubber shipments from the port of Lagos during the first half of 1895. Through the courtesy of her Majesty's acting collector of customs at Lagos, Reginald R. Gace, Esq., it is now possible to complete the record for the year—the first in the history of India-rubber in Lagos—as follows:

Months.	Pounds.	Value.	Average Value.
January, 1895 ..	12,131	£ 1,213 10 3	£0 2 0
February ..	15,888	777 0 11	0 0 11½
March ..	26,316	1,419 7 8	0 1 1
April ..	39,763	2,078 16 6	0 1 0½
May ..	216,916	11,700 0 7	0 1 1
June ..	268,619	12,577 2 6	0 0 11¼
July ..	461,765	22,593 13 3	0 0 11¾
August ..	351,990	19,951 18 3	0 1 1½
September ..	673,160	36,172 19 9	0 1 1
October ..	1,059,158	57,117 1 10	0 1 1
November ..	983,394	52,802 13 0	0 1 1
December ..	948,404	51,488 9 4	0 1 1

Total, 1895.. 5,060,504 £269,892 13 10 £0 1 0½

The Gold Coast Colony had previously been regarded as a notable example of rapid development in rubber production. But the export from that colony, though beginning in 1883, amounted only to 3,395,990 pounds in the calendar year 1893, according to the latest official figures received by *The India Rubber World* from Accra.

Samples of Lagos rubber began to reach the United States shortly after the first receipts from that colony in Europe, and of late there have been considerable receipts of it at New York, but inquiries in the trade bring out the fact that American manufacturers have as yet treated the new rubber with caution. Considerable time is always required for a new product of rubber to become known to the manufacturing trade and to establish a reputation. Lagos rubber has been used in English factories, however, and to some extent in Germany and Austria. Up to date the total product from Lagos has been shipped direct to Liverpool, where the quotations lately have been 1½ @ 1s 10½d. It is asserted in New York that Lagos rubber is good, and that it has been improved since it first began to arrive. It is classified as “oysters,” “strips,” and “buttons.”

Whether the heavy production in this little English colony will be long maintained is a problem on which no one seems prepared to express an opinion. The output of Accra and Benguela rubbers is not as large today as in some past years. Then it is remembered that at one time Mozambique and Madagascar grades came forward in surprising qualities, but fell off in a short time, when the supplies near the coast had become exhausted. It is considered probable that the same thing will prove true of Lagos rubber, even if there should be enough rubber trees back of the coast to yield a permanent supply in smaller quantities. Already advices have been received of smaller receipts at the Lagos coast since January than during the preceding months. There are no water-courses in Lagos, as in the Congo country to facilitate the collection of rubber at points distant from the seaboard.—*India Rubber World*, April 10.

NEW TEA FACTORIES.

The Eastern Produce and Estates Co. are at present erecting a large tea factory on Halwatura estate, Kalutara, the property of the North and South Sylhet Tea Company. When completed the new factory will be capable of turning out three-quarters of a million lb. of tea per annum. The factory on Naminacooly estate, Passara, which in addition to serving the estate of that name will make the tea grown on Canavarella and Mousagalla estates, is also being erected by

THE INDIA-RUBBER CROP OF LAGOS.

Returns have come to hand from Lagos which substantiate the reports already published in *The India Rubber World* respecting the remarkable development of the crude-rubber industry, so recently introduced in that West African colony. It has been

the Eastern Produce and Estates Company. The building is well nigh completed and the installation of machinery is expected to arrive about August. The factory when working at full swing will have an output of half a million lb. per annum.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed, during the week ending 2nd May 1896, under the provisions of Act V of 1888:—

For improvements in the methods, machinery and appliances used for withering or desiccating tea leaf. No. 267 of 1890.—Charles Arthur Dutton, manager, Lukwah Tea Company, Upper Assam, for improvements in the methods, machinery and appliances used for withering or desiccating tea leaf. (From 12 May 1896 to 11th May 1897.)—*Indian and Eastern Engineer*, May 16.

RUBBER STATISTICS FROM PARA AND WASHINGTON.

According to Reimers & Meyer's table of the exports of crude India-rubber from Pará and Manaus for 1895, it will be seen that the shipments again broke the record, the excess over the figures for the preceding year having been exceptionally large. The receipts at Pará for the calendar year were 45,438,442 pounds, and the shipments slightly more, or 45,788,613 pounds. The names of the leading exporters are given below, with the consignments for Europe and the United States, the figures representing pounds:—

EXPORTERS.	United States.	Europe.	Total.

In 1889 the percentage of the Pará shipments going direct to Europe was 42. The figures declined to 38 per cent in 1892, and advanced in 1895 to 46 per cent.

From the treasury department at Washington comes the revised official figures of the India-rubber movement for the United States for the calendar year 1895,

* Representing Reimers & Meyer (New York and Boston); Heilbut, Symons & Co. (London and Liverpool); and the Boston Rubber Shoe Co. (Boston).

which are presented below in comparison with the statistics for 1893 and 1894:

	1893.	1894.	1895.
Imports.	lb.	lb.	lb.
India-rubber	39,634,706	35,370,889	41,766,774
Gutta-percha	487,970	704,168	3,031,155
Total	40,122,676	36,075,057	44,797,929
	\$	\$	\$
India-rubber goods	340,690	393,731	309,513
Gutta-percha goods	50,001	53,173	75,962
Total	390,691	356,954	385,475
Exports.			
Boots and Shoes	205,637	211,393	214,592
All other	1,235,499	1,324,751	1,432,027
Total, domestic	1,441,046	1,536,144	1,676,619
Foreign manufactures	169,622	4,097	7,571
	lb.	lb.	lb.
Crude India-rubber	1,846,727	1,615,076	2,217,697
Gutta-percha	19,616	461,602	47,859
Total	1,866,343	2,079,678	2,265,556

With respect to the countries whence the crude India-rubber was imported the government statement supplies these figures, relating of course to pounds:—

	1894	1895
United Kingdom	4,987,096	7,479,816
Germany	1,195,363	1,055,015
Other Europe	2,065,612	2,496,492
Mexico	129,038	158,419
Central America	1,116,547	1,391,002
West Indies [Venezuelan]	32,646	30,758
Brazil	23,642,155	23,603,173
Other South America	1,594,781	1,748,778
Africa	122,217	56,023
East Indies	461,166	736,159
Other countries	24,185	11,089

Total India-rubber	35,370,889	41,766,774
Gutta-perch	704,168	3,031,155

Grand total 36,075,057 43,797,929

The last table which will be given here relates to the value of exports of domestic manufactures of India-rubber (including boots and shoes) for several past calendar years:—

Year.	Value.	Year	Value.
1886	\$ 782,610	1891	\$1,349,491
1887	845,096	1892	1,555,411
1888	833,126	1893	1,441,046
1889	937,497	1894	1,536,144
1890	1,175,151	1895	1,676,619

—*Indian Rubber World*, April 10th.

LEGAL REPORTS.

THE CITRONELLA OIL DISPUTE.

TREATT *v.* DOMEIER & Co.

In the High Court of Justice on Wednesday, Baron Pollock and Mr. Justice Day, sitting as a Divisional Court, heard an application in the matter of the arbitration between Mr. R. C. Treatt and Domeier & Co. The application was to have set aside the award of the arbitrators, and it was made at the instance of Messrs. Domeier & Co., for whom Mr. Joseph Walton, Q.C., and Mr. Hollans appeared. Mr. Treatt was represented by Mr. Chitty.

Mr. Walton, in opening the motion, said that the claim out of which the arbitration arose was one by Mr. Treatt against Messrs. Domeier & Co., and the question which arose between these gentlemen was whether Messrs. Domeier & Co. were bound to take delivery of a quantity of citronella oil, an article made out of some kind of grass, which possessed a pleasant smell, and which was used for various purposes, such as scenting soap and other things. The terms of the contract being that if a dispute arose it was to be referred to the arbitration of two members of the Brokers Produce Association, the matter was submitted to Mr. Green and Mr. French. There was no dispute about the facts, and although

some evidence was taken by the arbitrators, it was taken at their own suggestion, and was the evidence of an analyst whom they thought it right to consult, and who turned out to be the same gentleman as Domeier & Co., had called as their witness. The contract was signed by the brokers, and was that they had bought to the order of Domeier & Co., the purchasers, about 2,000 lb. citronella oil in drums—"quality guaranteed equal to sample"—and any dispute arising out of the contract to be settled by arbitration. The question arose on the words in the contract, "citronella oil," which was the thing to be sold, and quality guaranteed equal to sample." The sample was a small bottle of the oil, and apparently it was all right, smelling all right and looking all right. Then the bulk was tendered, and it smelt all right and looked all right. The purchaser, as was the custom in these cases, analysed it, and it turned out that instead of being citronella oil, 66 per cent. of it was something else. It was adulterated with 55 per cent. of kerosene, a mineral oil, and 10 per cent. of essence of lemon to correct the kerosene and give the compound a smell which very much resembled the smell of the right citronella oil.

Baron Pollock: Does citronella oil come from the citron tree?

Mr. Walton: Yes, I suppose so.

Baron Pollock: Lemon oil serves for a great many purposes?

Mr. Walton said yes, but this was not made from lemons, and the etymology did not indicate the real origin of the article, which was really made from a grass. In this case the seller had put more than half of kerosene, which had very little smell, and they added the 10 per cent. of lemon to give it the necessary smell.

Mr. Justice Day: Is "citronella oil" known in the market?

Mr. Walton said yes; it was dealt in considerably. In this case, when the purchaser found this out, he refused to take it, and said he had bought citronella oil—

Mr. Justice Day: Not something else made to look like it?

Mr. Walton assented. Then Mr. Treatt said, "But you analysed the sample," and no doubt they did, and it turned out that the sample was just as much a sham as the bulk was.

Mr. Justice Day: Then you say that the whole thing was a fraud.

Mr. Walton: No; I do not say that; but I say it was a sham. There is no suggestion of fraud against anyone; but the stuff was a fraud. I do not suppose Mr. Treatt mixed this stuff up.

Mr. Chitty: This "stuff" has been sold as "citronella oil" for the last thirty-five years in the London market.

Mr. Walton: There is no evidence of that.

Mr. Justice Day (to Mr. Walton): You are bound by it, if it is to sample and is marketable as citronella oil.

Mr. Walton: But the arbitrators refused to decide that question at all. The gentleman who appeared before them for Messrs. Domeier called at attention to the law on the subject, and pointed out that it was not enough that the stuff should be equal in quality to the sample, but that it must correspond with the description.

Mr. Justice Day: It must be substantially the same article as the sample.

Mr. Walton said that it must be, first, citronella oil.

Mr. Justice Day: Marketable as citronella oil; but it may not be citronella oil.

Mr. Walton replied that the point was explained to the arbitrators by the solicitor who appeared for Messrs. Domeier, but they pooch-pooched it. There were many cases like this where goods were the same as the sample, but which did not answer to the description of the thing sold, and that was provided for under section 13 of the Sale of Goods Act. There was an implied condition that the goods should correspond with the description, and if the sale was by sample it was not sufficient that the bulk of the goods corresponded with the sample if it did not also correspond with the description. The same thing was dealt with under

section 15 of the Act, which provided that in the case of a contract for sale by sample there was an implied condition that the goods should be free from any defect which rendered them unmarketable.

Baron Pollock: Your point is that it is not a question here of buying to sample, but of whether the article sold was the article delivered?

Mr. Walton said yes, and it was said by the gentleman who appeared on the other side that this statute did not apply to an article like citronella oil.

Baron Pollock: Why not?

Mr. Walton replied that he did not know, but at any rate that seemed to be said by the affidavit. The arbitrators were asked to deal with that question specifically, whether this was the thing that was sold; and they were asked to state a case, and they declined. They were asked to postpone their award so that application might be made for an order that they should state a case. But they refused, and what was done was this. The agent who appeared for Messrs. Domeier went off post-haste and took out a summons, which he served upon them at half-past four o'clock that day; yet, in spite of that, they made their award, which, he ventured to think, was an improper thing to do. The terms of the award showed that the arbitrators had not considered at all the question which had been put before them. They said: "We decide that the quality of the three drums tendered to the buyers is equal to the sample guaranteed to the contract, and these three drums must be taken by the buyers." They did not deal with the question whether the bulk—the drums—tendered contained what was known, and commercially known, as "citronella oil" or not. They only found that the quality was equal to the sample, and therefore that the bulk must be taken.

Mr. Justice Day: If it is "citronella oil," the only question remaining is, Does it correspond with the sample?

Mr. Walton said that what he complained of was that they did not say it was citronella oil.

Baron Pollock: Do you admit that they analysed the sample before they purchased the bulk?

Mr. Walton: No, my lord.

Baron Pollock: You do not contend that it must be pure citronella oil?

Mr. Walton said he contended that it should not be 60 per cent of something else. In one of the affidavits it was said that there was called Mr. Albert Domeier, who swore that he had had dealings in this oil for 35 years; that he had tested and examined the sample as he had done for 45 years—namely, by smell; and that by his smell he was recognised as one of the best judges of these oils in the world, and from his examination he was quite satisfied that the oil was citronella oil. What he (Mr. Walton) desired to say was that if the arbitrators had made an award saying that it was citronella oil, notwithstanding that it was so largely adulterated, he would not complain. The affidavit of Mr. Chance, which he had been reading, went on to say that he had pointed out to the arbitrators that Domeier & Co. had rejected the goods because they did not accord with the description, and that, if so, it was immaterial whether the goods corresponded to the sample or not; and he submitted that they were entitled to reject the goods, first, by virtue of section 13 of the Sale of Goods Act, because they did not correspond with the description in the contract of sale, and, secondly, by virtue of section 15 sub-section 2, because the goods contained a defect, rendering them unmerchantable, not apparent upon a reasonable examination of the sample. They had proved by witnesses that the samples were adulterated with 55 per cent. of kerosene and 10 per cent essence of lemon, and that citronella oil adulterated to that extent was unmerchantable as citronella oil, and did not come within the description of citronella oil and that Mr. Domeier's examination of the sample was a reasonable one. No evidence was called for Mr. Treatt, but Mr. Jones on his behalf had contended before the arbitrators that the Sale of Goods Act had no bearing on the matter. Mr. Walton argued that the question whether this was citronella oil or not had thus been distinctly raised, and that the arbitrators seemed to have taken the view that it did not matter if the goods were

equal to the sample. That was all that they dealt with in their award. Mr. Domeir in his affidavit said his firm contracted to buy this at 1s 8½d per lb., and that they found that the goods were not citronella oil, and not saleable or merchantable as such. Mr. Walton submitted that the questions the arbitrators had to decide were—first, whether this stuff was citronella oil, and second whether it was equal to the sample, which was not disputed.

Baron Pollock asked if Mr. Domeir analysed the sample.

Mr. Walton: No.

Baron Pollock: He trusted, like many other people, to his nose.

Mr. Walton: No doubt: but he was deceived by the essence of lemon.

Mr. Justice Day: The affidavit says that by his smell he was recognised as one of the best judges of citron oil in the world. His examination was "reasonable" from the commercial point of view.

Mr. Walton replied that that evidence was given to bring the case within section 15 of the Act which said that where there was a sale by sample there was an implied condition that the goods should be free from any defect rendering them unmerchantable, which would not be apparent on a "reasonable" examination of the sample. To bring it within that section he had to prove that reasonable examination. But the adulteration was done so cleverly that it deceived Mr. Domeier, even though he was so good a judge. No one had suggested that a mixture containing only 35 per cent of citronella oil, and the bulk made up of kerosene oil, could be citronella oil.

Baron Pollock: If the arbitrators were satisfied that it was citronella, according to the custom of the trade, they might have said so.

Mr. Walton: And that would have made an end of the matter.

Baron Pollock: Their view was that it was merchantable citronella oil, but they did not say so.

Mr. Walton: They told Mr. Domeier that that was not necessary, and that the only question was whether the guarantee of the contract was satisfied.

Baron Pollock: Why did they not do it?

Mr. Chitty: Because they do not live in the Temple, my Lord, if I may make such an answer. They took the view that they subsequently decided the question.

Baron Pollock: Although they do not live in the Temple, they admit that there is 65 per cent that is not citronella oil, and yet it is marketable. It would be satisfactory even to those who do live in the Temple to know why they do so.

Mr. Chitty said that although they did not traverse the statement that there was 65 per cent not citronella oil, yet for all that the article was what was known in the market as citronella oil. When they wanted it chemically pure, citronella oil was sold in the market at 4s 8d per lb.

Mr. Walton: We do not admit that.

Mr. Chitty said he knew that; but it was the fact nevertheless, and this was sold at 1s 10d per lb.

Baron Pollock: That is my chief difficulty. It may be that this was citronella oil; but if so, why did not the arbitrators say so? They only said that this was sold by sample, and was according to sample.

Mr. Chitty replied that their Lordships were not dealing with an award made by a lawyer. What the arbitrators said was that the bulk was delivered in accordance with the contract.

Baron Pollock:—No, in accordance with the sample.

Mr. Chitty said that if they had said it was in accordance with contract there would have been an end of this matter, and he submitted that in substance they had said so. The contract was to sell according to sample. The sample was delivered to this gentleman with the thirty-five-year-old nose of which he seemed to be so proud, and he took all his usual means of testing it. He had been in the habit of buying this oil from Treatt, and shortly before this transaction he bought 2,800 lbs. of it from Treatt, and a dispute about it arising, he went to arbitration upon it, and was beaten, and the goods had to be taken by the buyers upon appeal. For the pure essence of this grass, properly distilled, one had to pay 4s 10d to 5s per lb.

Mr. Walton said that that was contradicted, and that his evidence was that the price of the oil supplied by Mr. Chitty's client was never more than 2s.

Baron Pollock (to Mr. Chitty): You say they purchased 2,800lb. of citronella oil of a like description. Does that mean with 65 per cent. of other oil?

Mr. Chitty: Yes. He then repeated the terms of the arbitrators' award, and contended that the point whether this was or was not citronella oil was fully decided by the arbitrators, although they had not put it into their finding. If they had left out of their award the words "is equal to the sample," and had only said, "We find that the three drums must be taken by the buyers and paid for," it would have been a perfect award. The only technical fault was that they said "is equal to sample."

Baron Pollock: No; the objection is that there are two things the arbitrators have to decide, and they shy at one.

Mr. Justice Day: It looks like an attempt on their part to screen the fraudulent practices of the trade in selling a thing which is only 35 per cent. of the article described.

Mr. Chitty: No. The point is, that this stuff has been sold as citronella oil for many years.

Mr. Justice Day: Fraudulently.

Mr. Chitty: Not fraudulently.

Mr. Justice Day: A thing that is 65 per cent. kerosene and 35 per cent. citronella oil, which it professes to be.

Mr. Chitty said that it was an article which, pure, sold at 4s 10d per lb.—

Mr. Walton: That is contradicted.

Mr. Chitty said that, pure, it was sold at that price; but here the purchaser was buying at 1s 8d per lb., and he must have known that he was not buying pure citronella oil. He had also been buying it for thirty-five years, and had tested this and previous samples by the smell; and everybody else in the City of London who dealt in this oil had been in the habit of buying it in the same way—by the test of smell.

Mr. Justice Day: They have all been imposed upon.

Mr. Chitty said no, not more than the people who bought flannellette thinking there was flannel in it.

Mr. Justice Day: If this is what is known by commercial people as citronella oil there is no fraud at all. But that is what the arbitrators will not say. They seem to be screening the trade.

Baron Pollock: It is of the very essence of these arbitration cases that the arbitrators should find out questions laid before them, so as to give satisfaction to the parties. They should not say, "Oh, you tell us there are two questions; we think there is only one." I am rather inclined to agree with my learned brother that it is to screen the trade, but I will not put it so high. Yet here we find that the arbitrators are asked to decide a point one way or other, and they have not done so.

Mr. Chitty admitted that the arbitrators had not distinctly said that this was citronella oil in the commercial sense.

Mr. Justice Day: But they were asked to do so, and they ought to do so.

Mr. Chitty: Then it would have to go back. He then went on to argue that under the terms of the agreement for arbitration, which were under the rules of the Produce Brokers Association, Domeier & Co., not being satisfied with the finding of the arbitrators, should first have appealed to the Council of the Association before coming to this Court.

Baron Pollock then delivered the finding of the Court. He said there were two questions to be decided. The first was, Ought this award to go back on the ground that the arbitrators had not, in substance, decided the matter brought before them? It had always been a well-known rule of law that where goods were sold they must be of reasonably merchantable quality, in which case, whether the sale was by sample or not, there was always the previous question whether the goods delivered were those which were contracted for. And in the Sale of Goods Act, where the contract was by description, the goods must correspond with the description. Where the goods were sold by sample as well as by description, it was not sufficient that they corresponded with the sample if they did not also correspond with the description. In this case

the defendants said that the goods were sold not only by sample, but also by description, and that the plaintiff, in order to succeed, must prove that the goods delivered did correspond with the description of the goods sold. The arbitrators had not said so, and therefore this was an insufficient and imperfect award, and it was proper that it should be sent back. The other question was that under the terms of the arbitration agreement there was no appeal to this Court until after appeal to the Council of the Produce Brokers Association. On this point his Lordship held that it was perfectly consistent with the provisions of the Arbitration Act for the matter to have been brought into this Court.

Mr. Justice Day concurred, adding that for himself he should have preferred simply to have set the award aside in this particular case.

The question was accordingly referred back to the arbitrators, on the understanding that if any difficulty arose in getting the gentlemen who formerly acted as arbitrators to proceed with the matters, that difficulty should be dealt with according to the rules of the Produce Brokers Association applicable in such cases.—*Chemist and Druggist*, April 25th.

DRUG REPORT.

(From *Chemist and Druggist*.)

London, April 23rd.

KOLA NUTS.—In spite of the recent large arrivals, the market seems to have gained some little firmness, and sales of fair quality East Indian kolas are reported at 8d per lb.

OILS (Essential).—Citronella oil slow of sale and easier on the spot as well as for arrival. Lemongrass quiet at 2½ per oz.

THE AMSTERDAM MARKET.

Our Amsterdam correspondent writes on April 21st, that the auction of Java cinchona-bark, to be held in Amsterdam on April 30th, will consist of 5,319 bales and 239 cases, weighing together 517,985 kilos. The bark is of rich quality, the average percentage of sulphate of quinine being 5.67 per cent of the total weight, representing a weight of 28,899 kilos of sulphate of quinine.

IS THE CAMPHOR-MARKET BREAKING DOWN?

Another penny-a-pound reduction in the price of camphor was declared on Monday by the English refiners. This lowers the quotation for bells in 20-cwt lots to 1s 10d per lb, and is the third drop within a month, the first having been declared by the English refiners on March 30th, when half-ton lots were lowered from 2s 3½d to 2s 1½d per lb. Such a persistent wasting-away of the quotations on the verge of the chief consuming-season is well calculated to fill the holders of stock with alarm, and make them doubt whether a general breakdown, which may reduce the price to about half its present figure, be not impending. One is often and complacently told that manufactured chemicals, such as morphia, quinine, and refined camphor, are now-a-days connected only with the slenderest of threads to the commercial movements of their parent-articles. We should hesitate to affirm that the assertion is true in any case; it certainly is not in that of camphor. The whole situation of that important drug during the past twelve months has turned upon the proceedings of the "Syndicate" which was formed about a twelve month ago, and of which we revealed the names and the policy in May, 1895. At the begin-

ning of that year, before the Syndicate had entered the market. crude camphor—Formosa camphor—was offered freely at 79s per cwt., c.i.f terms, and although in March and April, ostensibly owing to the annexation of the Island of Formosa by Japan, there was a slight upward movement, that ripple would no doubt have died a natural death within a few weeks had there not appeared upon the scene a prominent firm of London drug-brokers who began to buy up, on account of three capitalists not in any way connected with the drug-trade, every parcel of camphor upon which they could lay hands. The operations of the Syndicate during the ten or eleven months of its existence have naturally been conducted with much secrecy, but occasional glimpses of light have been thrown upon its doings, from which it is believed that the three operators have bought among them about 40,000 packages of crude camphor, at an average cost of about 130s per cwt. Under the influence of the Syndicate purchases crude Formosa camphor (now the leading variety) rapidly rose from 115s per cwt. spot in April to 207s 6d spot in September. Then came a turn. The Syndicate may have become tired of buying, or its policy may have been changed, but the sudden sallies of the broker into the Commercial Sale Rooms and his periodical raids upon daring counter-speculators who had to be cornered came to an end and no sooner did the Syndicate cease to buy than the market commenced to droop. Last week Formosa camphor was offering at as low a figure as 130s per cwt., c.i.f., but then the Syndicate broker once more put in an appearance, and supposed purchases on his part to the extent of about 3,000 piculs once more caused a temporary inflation. Now the broker is gone, and the market has fallen to pieces with him. The fact seems to be that the Syndicate have grievously miscalculated (if they considered at all) the available supply of the drug. Within the past four or five years the output of Formosa camphor has been quadrupled, and it is now tolerably clear that the Japanese occupation of the island, instead of diminishing, has greatly stimulated the production. The high market-prices caused by the operations of the Syndicate account for the increased production, and as the buying up of all available parcels would be a task exceeding even the powers of the three great capitalists who form the inner ring, the position of these gentlemen to-day is an extremely awkward one. Under these circumstances we should not be surprised if the report were true that the Syndicate have ceased to act in unison; that, some time ago, their camphor stock was parcelled out among the members; and that one of them has, by this time, quietly disposed of the bulk, if not the whole, of his share, while the others still hold on. The camphor-venture will probably, in the end, engulf that portion of profits on the copper speculation of the Syndicate which remains after the disastrous failure of its Zanzibar clove speculation and at any rate the names of the speculators will live in the drug market as those of gentlemen who, without any apparent reason, disturbed the course of the camphor market for a whole year. We should like to know, however, who, besides the brokers, has derived a pennyworth of good from all this buying and selling. Not the Syndicate, which has made no profit collectively from the venture, nor the refiners, who, besides being compelled to buy from hand to mouth, have most of them been obliged to sell at rates that cannot have been very profitable. The remaining Syndicate members hold between them an enormous stock of crude camphor (which is an undesirable article to keep in stock anyhow, because it loses weight rapidly); in fact, it is currently believed that the published London drug-statistics give but a very imperfect idea of the true quantity stored at various warehouses on Syndicate account. If the owners openly endeavour to realise this supply they will certainly knock the bottom out of the market altogether; if they continue to buy, their last state may be worse than their present one, for they must then be prepared to secure quantities that would tax even their huge resources. As for the refiners, they have to cope not only with second-hand holders, who are pretty well supplied but one of their own fraternity, who is among the largest

DEAFNESS. An essay describing a really genuine Cure for Deafness, Ringing in Ears, &c., no matter how severe or long-standing, will be sent post free.—Artificial Eardrums and similar appliances entirely superseded. Address THOMAS KEMPE, VICTORIA CHAMBERS, 19, SOUTHAMPTON BUILDINGS, HOLBORN; LONDON.

continental manufacturers, is apparently competing against them, and has just issued, through his London agents, a circular in which after quoting bells in 1 to 5 cwt. lots at 1s 10d per lb. (the other refiners' quotation of 1s 10d per lb. only applies to 10 to 20 cwt. parcels), he gives it as his opinion that it is pretty safe for buyers to take advantage of the present state of the market to lay in supplies on that basis. To that view we should be very loth to subscribe.—*Chemist and Druggist*, April 25.

DEATH OF MR. JOHN BUCHANAN BRITISH CENTRAL AFRICA.

Messrs. W. H. Davies & Co. write to us:—

We have received the following notice from Mr. Robert Buchanan dated Michirn, British Central Africa, March 14th, 1896:—"I grieve to intimate to you that I have received a telegram today, stating that my brother John Buchanan, who left here on the 2nd inst. for Europe was taken ill on the River Journey, and died in high fever, soon after reaching Chinde on Monday 9th March."

In the *British Central Africa Gazette* of the 1st ult. we read:—

We deeply regret to announce the death of Mr. John Buchanan. C.M.G., British Vice-Consul in this Protectorate. Mr. Buchanan had started to return to England with his wife and child. Upon reaching Chinde he became very ill, presumably with fever, and died in a few hours. Mr. Buchanan left Blantyre seemingly in good health. His illness commenced as he was travelling down the Lower Shire and culminated in this serious attack at Chinde which proved fatal.

It is hardly necessary to dilate on the loss to this community which is brought about by Mr. Buchanan's death. He was almost the only pioneer left of the first band of Scotchmen who took up the work which Livingstone laid down. Mr. Buchanan came out to this country, we believe, in 1876, having been appointed horticulturist to the Church of Scotland Mission stations. After a change in the Mission staff, which occurred consequent on a dissidence of feeling between the managing committee of the Mission and its servants in Africa, Mr. Buchanan resigned his appointment and set up as a coffee planter. He was practically the first person to introduce the cultivation of coffee in a practical way. It was stated by the Commissioner in his 1894 report that Mr. Buchanan first introduced the coffee plant. There is some doubt about this detail—the priority of the experiment being credited to one or two other people—but for all practical purposes it is correct to say that "Mr. Buchanan started coffee planting in British Central Africa. Assuredly without his dogged perseverance and persistent efforts during some seven or eight years, British enterprise in this part of Africa would have perished still-born, or would have been confined to the evangelising efforts of the missionary societies.

Though ceasing to be a lay member of the Church of Scotland Mission, Mr. Buchanan never lost his interest in Mission work, and being almost the best Yao linguist that this country has yet produced he was able to assist the Mission by translating portions of the Bible into the Yao language. He also maintained for years a school in connection with the Mission at Mlungnsi. When Consul Hawes was transferred from the Nyasa Consulate to another post, Mr. Buchanan became Acting Consul and remained so until September, 1891. In the year 1889 he afforded great assistance to the Commissioner in making treaties with the native chiefs and in laying the foundations of the present British Protectorate. For these services he was made a C.M.G. Upon the lapse of his appointment as Acting Consul he received that of Vice-Consul which he retained up to the time of his death.

It would seem as though Mr. Buchanan, like so many others, had fallen, victim to the terribly unhealthy Zambezi valley. Only a few weeks ago he

was at Zomba paying farewell visits and remarked to the writer of this notice that, although he was then in good health, he dreaded the journey to Chinde as he had never dreaded it before; he had an instinctive feeling that he would suffer severely in passing through this malarial district, and referred to the analogous case of the late Mr. Monteith Fotheringham as one which had caused him considerable uneasiness.

There is no doubt that this fact of the 200 miles of unhealthy Zambezi-Shire marshy country, which is our present road to and from the coast, is a most serious obstacle to the satisfactory settlement of British Central Africa. The days and days which are passed in uncomfortable little steamers in these fetid marshes are quite sufficient explanation of the deaths which occur from time to time amongst the people arriving at Chinde. Chinde itself is not an unhealthy place, neither is Blantyre, nor Zomba, nor many other settlements in the highlands of British Central Africa. It is the intervening malarial lowlands that cause so much damage with their generation of poisonous malaria. In the days to come, when the railway is made from Blantyre to Quelimane via Chiromo, and when in one day we can pass from our healthy highlands to a comfortable ocean-going steamer, the dangers of residence and travelling in British Central Africa will be almost at an end.

VARIOUS PLANTING NOTES.

FIBRE MACHINERY.—We would draw attention to the advertisement in another column on this subject. Mr. Lehmann has, we learn, made the largest coir fibre plant for the West India Fibre Company, an American concern, ever ordered, to produce per day 10 tons of fibre for spinning and mattress purposes.

TEA COMPANY DISPUTE.—In February last the Dimbula Valley (Ceylon) Tea Company, Limited, was sued with a capital of £200,000, and it met with a very good reception amongst investors. According to the last mail advices from Ceylon, a difficulty has arisen in connection with the sale of the Belgravia and Elgin estates to the company, and Sir John Muir, who has been in the Dimbula District, is understood to have telegraphed to England to stop the transfer of the property until his arrival home. In the meantime the sale was completed, and the estates have been worked for the company.—*City Leader*, April 25.

TOBACCO IN INDIA:—In an article in the *Pioneer*, it is pointed out that not only has India's export trade in the raw article fallen away, but also that the trade in the manufactured article remains practically what it was 20 years ago, *i.e.*, confined to insignificant dealings with the Maldives, the Straits Settlements, Ceylon and Arabia &c., the total value, of which in 1894-95 was R34,382. On the other hand imports of manufactured tobacco (other than cigars) valued in 1893-94 and 1894-95 at 17½ and 14½ lakhs respectively have about trebled in value during the above-mentioned period. The only satisfactory feature is stated to be the rapid progress made in the export trade in cigars, which during the past ten years has increased from 230,924 lb. and valued at R158,892 to 593,539 lb. valued at R6,08,944 (in 1894-95) the United Kingdom being the chief market.

The Best Soaps for Warm Climates are CALVERT'S TOILET SOAP (6d. Tablets) and PRICKLY-HEAT SOAP (6d. and 1s. bars), pleasantly perfumed, for Bath or Toilet containing 10 per cent. of Pure Carbolic. Very serviceable as preventives of Prickly-heat and other skin irritation. Sold at Chemists, Stores, &c.

F. C. CALVERT & CO., Manchester.

THE AGRICULTURAL MAGAZINE, COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for June:—

Vol. VII.]

JUNE, 1896.

[No. 12.

SEASON REPORTS.

WESTERN PROVINCE.—The preparation for yala rice cultivation has been delayed in some villages owing to the drought, but the harvest prospects are generally good. The supply of fruits and vegetables are good, except in the Negombo district and some parts of Pasdun Korale (Kalutara).

CENTRAL PROVINCE.—Maha crops harvested with satisfactory results; operation for yala cultivation proceeding; fruit somewhat scarce in Nuwara Eliya. *Stock.*—Foot and mouth disease prevailing in Walapane.

NORTHERN PROVINCE.—Harvesting over in all parts except in Mullaitivu and Vavuniya districts, where paddy is being reaped and thrashed. Crops good. Some of the paddy lands are being ploughed and manured. Dry grain in ear, harvesting has commenced in many places, crop attacked by worms, tobacco being harvested and cured. *Stock.*—Cattle plague and foot and mouth disease reported from Vavuniya district.

SOUTHERN PROVINCE.—Yala cultivation proceeding, sowings retarded in some places owing to drought. Late second maha crop is being reaped in Hambantota district with indifferent results. Fruit and vegetables fair, and in Giruwa Pattu vegetables plentiful. *Stock.*—A few cases of foot and mouth disease in Giruwa Pattu.

EASTERN PROVINCE.—Paddy being harvested crops not so good as last year owing to rain and insect blights; in Trincomalee yield is fair except in Koddiyar Pattu, where the crop has been partially damaged by insects. Dry grain harvested in Trincomalee with a fair yield.

NORTH-WESTERN PROVINCE.—Maha crops harvested and yala sowing going on. *Stock.*—Cattle plague prevailing in three of the Korales of Kurunegala district.

NORTH-CENTRAL PROVINCE.—Yala cultivation going on. *Stock.*—Cattle plague still prevailing.

PROVINCE OF UVA.—Paddy plants thriving well, crop prospects good. Fruit and vegetables plentiful except in Wellawaya, Binteime and Udakinda. *Stock.*—Foot and mouth disease in Udakinda.

SABARAGAMUWA PROVINCE.—Second maha crops being harvested and operations for yala cultivation has begun in favourably. *Stock.*—Cattle plague in Beligal Korale.

Greatest amount of rainfall in any 24 hours on the 3rd May, 2·34 inches.

Recorded by M. W. K. BANDARA.

OCCASIONAL NOTES.

We would draw special attention to the paper on "The Forest Laws of Ceylon" which is commenced in the present issue. Forest law is one of the subjects in the curriculum of the Forestry School, and the publication of this paper, in the pages of the Magazine will bring it within the reach of all those who are interested in the subject both in the Forest Department and outside it. The paper when complete should be very convenient for reference to students of the Forest School and others.

We regret that a letter by Mr. Zanetti on Pruning and W. A. D. S.'s second contribution on "Minor Industries" have been crowded out of the present issue; they will appear in our next.

We have had many enquiries from those who have apparently not had the opportunity of acquainting themselves with the provisions of the Dairies Ordinance regarding the obligations which it imposes on dairymen, milk vendors and the like. For the benefit of such we may briefly summarise the clauses which specially deal with these obligations:—Every dairyman and milk vendor is required to register at the Municipal Office his name and the address of his residence and place of business. Three months' time is allowed for registration to those already engaged in the milk trade, but after the Ordinance comes into force previous notice is required from those intending to start business. All registered persons are required to affix to dairy and milk store, cart or other vehicle for distributing milk, their names and the words "registered dairyman" or "registered milk-vendor," and it will be unlawful for unregistered persons to sell or supply milk within Municipal limits. The occurrence of infectious disease in dairy premises or milk stores must be immediately reported to the Municipal Council. Whenever called upon by the Chairman of the Council, dairymen or milk vendors must be prepared to supply the names and addresses of their customers, and further help to ascertain their residences. Persons suffering from infectious diseases or having been recently exposed to infection are debarred from participating in dairy operations in any capacity. The sale and supply of milk stored in sleeping or dwelling-rooms or apartments rendered unwholesome from whatever cause, is forbidden. The penalty attached to any infringement of the above regulations is a sum not exceeding R200. The provisions of the Ordinance apply to dairymen, milk-vendors, dairy farmers, cowkeepers and purveyors of milk, whether resident within or without Municipal limits, and to dairy premises, milk stores and milk shops whether within or without the Municipal limits, by whom or from which milk is sold or supplied to persons within Municipal limits, and also apply to occupiers of dairies and milk stores or shops.

Since its foundation in 1884 the School of Agriculture has developed greatly, not so much by its own growth, for such growth, if it were possible, has been limited, owing to admissions into the school having been limited. It would perhaps be more correct to speak of the extension of the school by the grafting on to it of a number of other branch institutions. The first

institution which brought about this expansion was the Colombo Training School, for the training of Government vernacular teachers, which was established in connection with the School of Agriculture with the idea of bringing the future teachers of the native population under the influence of agricultural education, while undergoing their technical training as schoolmasters. With the Training School came the Practising School—a vernacular day school—as a necessary adjunct to the former. Next came the Government dairy—a large concern in itself—which is, of the various additions, most nearly an outgrowth of the original institution. Later on followed the extension of the dairy itself and its connection with the Model Farm; and as regards land acreage it is interesting to note that from a garden of some dozen acres, the extent now pertaining to the school is nearly 275 acres. At one time the idea of working the Technical School in connection with the School of Agriculture was thought of, but was ultimately abandoned as impracticable. The latest and not the least addition we have to refer to is the Forestry School, and we have little doubt that with the many interests which Agriculture and Forestry have in common, the connection formed will be to the mutual benefit of the two allied schools of Agriculture and Forestry.

The new Forestry School at the School of Agriculture was opened on the 15th May last. The classes to be held during the present year are Forestry (conducted by Mr. Brown, the Conservator of Forests), Forest Law (by Mr. Morgan de Saram, Advocate), Surveying (Mr. Dyson Blair, Municipal Surveyor), Mathematics (Mr. Walter Parys), and Botany (Mr. C. Drieberg, Supt., School of Agriculture). For the present six students have been admitted, three of whom have been drafted from the Forest Department, viz., Messrs. Jansz, Gaigode and Jayman. Three other students have been chosen after a preliminary examination by the Director of Public Instruction: these are F. C. Fernando, H. P. Ratnayake, and B. M. Mendis. A suitable part of the school has been set apart for the Forestry classes, and the nucleus of a Museum already exists in the large collection of Ceylon woods presented to the School of Agriculture last year. Accommodation has been provided for the Forestry students on the premises, as they will all be resident students. Altogether the arrangements made for the Forestry school appear to be satisfactory, and we heartily wish the new institution success.

We have to congratulate Mr. E. T. Hoole, 2nd Assistant, Colombo School of Agriculture, on having successfully gone through his Veterinary course at the Bombay Veterinary College. Mr. Hoole will make the second native Veterinary Surgeon in Ceylon, and we wish him a long and useful career in the Colony.

In another column we make an important extract from the *Indian Agriculturist* headed "The Cause of Rinderpest." The agricultural community of the East will never cease to be thankful to Dr. Simpson, Sanitary Officer, (or Health Officer as the official is called in India) of Calcutta, if he succeeds in what he hopes to do, in the way of combatting the dreadful epidemic known as Rinderpest, cattle plague, or (as it is loosely

termed in Ceylon) "murrian." The labours and achievements of Dr. Simpson—who, by the way, was a visitor here not very long ago—may well put our Veterinary Surgeons to the blush. "With the microbe now in our hands," says this benefactor of the agriculturist, "I consider it to be merely a matter of time to prepare a vaccine which shall not only be protective, but which shall also give us control over the disease." For the present we can only heartily congratulate Dr. Simpson and wish him further success in his bacteriological researches.

The quarantine premises of the Government dairy were declared an infected area on the 16th ult. owing to the occurrence of foot and mouth disease. We are glad to state that the dairy stock are once more in good health.

THE GOVERNMENT STOCK FARM AT TRINIDAD.

We have for the first time seen a report on the working of this institution. This report is of special interest to us, since it was his experience of the Trinidad dairy that led our late Governor, Sir Arthur Havelock, to suggest and afterwards sanction the establishing of the Ceylon Government Dairy. The interests of the Trinidad Stock Farm are more varied than those of the Ceylon Dairy Farm, inasmuch as while the latter confines its operations to the production of a supply of wholesome milk for use in Government hospitals and the breeding of superior stock, the former is further concerned with horse-breeding and poultry-keeping. As concerning us more nearly we shall confine our remarks to that part of the report which deals with the working of the cattle farm.

The year 1895 was, we note, a successful one both financially and as regards health of stock. 133,308 quarts of milk were produced at a cost of R3'87 cents (very nearly 8 cents in local currency) and supplied to the hospitals and jail: there being an increase of 22,053 quarts of milk over the previous year's output. The daily average of the cows milked was 73, yielding just 5 quarts daily per cow throughout the year. This is truly said to be a good average yield for the tropics, taking as it does into account heifers with first calves and drying-off cows. The following is the daily diet of artificial food per cow—totaling 8 lbs.—and given as a thin mash: Feeding flour, 2 lb.; ryemeal, 2 lb.; cotton seed meal, 1 lb.; coconut meal, 3 lb. The term "feeding flour" is new to us, and we are unfortunately unable to make out to what particular form of food it refers to. The feed is divided into two meals and given at 6 a.m. and 2 p.m. Except at milking hours the cattle are in the pastures, sunshine or rain. The manager is of opinion that coconut cake, no doubt the same as our "poonac," is not appreciated sufficiently in Trinidad, and that it ought to be very much more used than it is. The Ceylon coconut cake is the ordinary diet of working bullocks and has little reputation as a diet for milk cattle. The Government analyst reporting on the milk of the herd remarks: "The milk from the general herd is of first-class quality or slightly superior to the milk of English dairies." It is interesting to note that a cow from the farm won the first prize at the Agri-

cultural Show of the year for cows giving the best quantity of quality of milk. The animal, described as a cross-bred zebu, yielded at the trial 21 Imperial pints. For breeding purposes a red polled bull was imported from England at the high cost of £64, but owing to the effects of the climate the animal has turned out almost a complete failure. The manager refers to what seems to be his only trouble with his cattle—viz. the attack of the larva of a fly which has been identified as *Comp-omyia macellaria*. In this connection we have another advertisement for the well-known disinfectant so commonly used in all dairies, for, says the manager, "As a remedy to destroy the larva, I find Jeye's fluid the best and cleanest." When we read that "the health of the stock was perfect throughout the years" we are led to think that Trinidad must be a particularly healthy colony for stock, or that the care of the health of the animals must be in very good hands. Altogether the report under notice is a very satisfactory one, especially as regards the cattle farm. We are not surprised that our late Governor should have suggested the establishment of a Government Dairy in Ceylon after his acquaintance with so successful an establishment as the Trinidad Stock Farm. We heartily congratulate the manager on the good results of his work.

EXPERIMENTS WITH PADDY.

The following extract from the Annual Report for the year 1894-95 on the Burdwan Experimental Farm, dealing with the results of experiments in the manuring of paddy with different fertilizers is of local interest:—

The experiment with paddy has been carried on for four years with the ordinary variety of transplanted winter (*aman*) paddy commonly cultivated by the ryots of Burdwan, the amount of seed sown being also the same as that ordinarily used by ryots, viz., 15 seers per acre. The soil on which this experiment has been conducted consists of a rather heavy loam, such as prevails in the neighbourhood. The treatment of the plots is noted below:—Ploughings, 5; harrowing, 1; weeding, 1; and hoeing, 1. The manures supplied and the results obtained in the last two years are given in the following statement:—

Number of plot.	Area in cottahs.	Treatment with reference to manure. Quantity applied per acre.	OUTTURN PER ACRE.			
			1893-94.		1894-95.	
			Grain.	Straw.	Grain.	Straw.
		Mds. s. c.	lbs.	lbs.	lbs.	lbs.
64b	6½	Cowdung 150 0 0	3,641	4,388	3,291	4,287
65b	9	Unmanured ...	1,343	1,714	1,330	1,577
66b	9	Castor-cake 6 0 0	3,334	4,114	3,195	4,251
67b	9	Cowdung 150 0 0	4,443	5,691	3,840	5,279
68b	9	Unmanured ...	1,646	3,291	1,467	2,743
69b	9	Bonemeal 3 0 0	4,521	6,295	3,826	5,993
70b	9	Do 3 0 0	3,703	5,801	4,637	6,267
71b	9	Unmanured ...	1,786	2,332	1,574	2,061
72b	9½	Bonemeal 3 0 0	4,690	6,308	4,673	6,377
		Saltpetre 0 30 0				

N.B.—Plots 64b and 67b received 100 maunds and 50 maunds of cowdung respectively last year on Dr. Leather's suggestion, instead of 150 maunds per acre as in previous years.

It will be seen from the above that the highest outturn, *viz.*, 4,673 lbs. of grain and 6,377 lbs. of straw per acre during the year under report was obtained from the application of an admixture of bonemeal and saltpetre. This result corroborates those obtained in previous years. The outturn of the unmanured plots during the year amounted to 1,457 lbs. of grain and 2,127 lbs. of straw per acre.

THE FOREST LAWS OF CEYLON.

The earliest law on this subject is the Regulation No. 2 of 1822. "For the protection of the Revenue of Government derived from Timber growing in the Royal Forests and for imposing a tax on Timber felled in private Gardens." Timber, whether cut in the Forests of Government or in land the property of Individuals was liable to a duty of $\frac{1}{10}$ of the value thereof, save and except Jakwood, which was liable to a duty of $\frac{1}{5}$. Timber could not be cut without a license having previously been obtained. This license specified the number of trees to be felled and the place where and the time when the same were to be felled. The Collectors of each district were empowered to fix places to which the timber was to be brought to be valued or the share of Government to be taken, in order that there might be proof that the Regulation was being complied with, and in cases where this could not be conveniently done, the Collector was empowered to send proper persons to inspect and value the same. Such timber as was not taken for the use of the Crown was branded with a particular mark, and such as was taken for the Crown with another distinguishing mark. Timber cut without a license was liable to confiscation, and the person cutting the same was liable to fine and imprisonment. This Regulation was restricted and did not extend to palmyra timber or to coconut or areca trees, firewood, bamboos or other wood usually understood as timber fit for building or for carpenter's or joiner's use.

After this came the Regulation No. 1 of 1833, which repealed the Regulation No. 2 of 1822 and made other provisions in lieu thereof. This Regulation was in the same terms as the previous one, but with some alterations. The terms of the license were enlarged. In addition to the above provisions, the license contained the "terms and conditions" on which the timber was to be felled. The punishment was also altered. A breach of the Regulation subjected any person to a fine or in default of payment of the fine to imprisonment subject to hard labour.

Then followed the Ordinance No. 21 of 1848 "to regulate the felling and removal of timber grown on the Crown lands in this Island." This Ordinance also related to the removal of timber felled on Crown land. It prohibited the cutting of timber on Crown land without a license from the Government Agent or Assistant Government Agent of the province in which such land was situated. The terms of the license were the same as beforementioned. The license was directed to the headman of the district in which the land was situated and was liable to a duty leviable according to the description of the timber. An additional precaution was adopted; for the licensed person was bound, before felling timber, to produce the license to the headman to

whom it was addressed and to furnish him with a list of the names of the persons whom the licensee intended employing to fell and remove the timber specified in the license. After the timber was felled it was necessary to obtain a *permit* from the headman for the removal of the timber, which permit was issued after due inspection that the timber had been felled conformably with the license; a duplicate of this permit was to be forwarded by the headman to the Government Agent or Assistant Government Agent who issued the license. This Ordinance also required a *permit* to be obtained for the removal of timber felled on private lands; but the Governor was empowered by *Proclamation* to exempt any district from the operation of this enactment. Jurisdiction was given to the Police Court to try and determine any question of title to land; but this decision was to be no bar to any were proceeding in a civil suit in which the title to such land might be put in issue. Certain trees exempted from the operation of this Ordinance.

(To be continued.)

TOMATOES.

A Correspondent to the *Journal of Horticulture* deals with the failure of Tomatoes (due to a fungus, *Sclerotinia sclerotiorum*) by the roots becoming more or less rotten and the stems often dead at the collar. He recommends that the soil in which the plants are grown should be soaked with either Jeye's fluid, Little's soluble phenyle or lysol, a German preparation, at the rate of three gallons of solution per square yard, half a pint being employed to that amount of water. The surface should be loosened with a fork so as to let the solution enter evenly, and after letting rest a day should be turned and mixed to a depth of 18 inches. According to accepted views this cannot act on the seclerotia, but it cures the worst cases, especially if the plants at setting-out time are watered with a solution of a strength of 1 oz. to a gallon of water, and that amount given to a circle described a foot all round the plant. In ordinary cases this latter precaution is all that is necessary, but to stave off possible mischief later on, supply a solution, 2 ozs. (a wineglassful) to three gallons of water, two or three times at intervals of about three weeks or a month. The dressings have considerable manurial value, and are equally efficacious against "drooping" disease, as caused by *Fusarium solani* and eelworm.

Another plan, and considered by some quite as curative, is to dress the soil with quicklime, using a peck per rod, slaking with the smallest amount of water necessary, spreading and mixing with the soil to a depth of a foot. This and burning the diseased stems and roots, and giving the soil where the plants have been an extra dressing of quicklime at the time of removal, has been found an excellent preventive of both *Sclerotinia* and *Fusarium solani*, and also of eelworm.

A successful Tomato-grower who contributes some notes on Tomato culture to the *Journal of Horticulture*, recommends the following compost: Three barrows of turf of an open nature cut from the roadside, one of fresh horse-droppings, a bushel of charcoal and a bushel of woolashes. For giving the young plants a good start it is recommended that they should be grown in a mixture

of two parts loam one of leaf mould, with a little charcoal and woodashes. The compost which is used later on to induce fruiting should be prepared early and allowed time to mellow for use when required. In addition to occasional top-dressings a handful of blood manure is recommended for each plant.

THE DAIRY.

Cleanliness in the dairy must be understood to include other considerations than the exclusion of injurious microscopic bodies, and an instance of this truism appears in the following account of a comparatively recent experiment made in Denmark by M. Boggild, the "expert" of the Royal Danish Agricultural Society. A sample of milk from a creamery was sent to M. Boggild for analysis. Even before the milk had turned sour it had acquired a very bad smell, and a taste somewhat analogous to that of tallow. The farm whence the milk originated was found to be not only well conducted, but one which had a very good reputation in its district.

Nevertheless, M. Boggild observed that a tank employed to receive the milk was rusty, and, as he remembered having once before met with an analogous abnormality in milk from a farm where he had also observed a similar rusty receptacle, M. Boggild suggested to the farmer, as an experiment, to purchase another tank to be used side by side with the rusty one. The experiment was made, and whereas the milk became tainted as before in the old case, the milk placed in the new tank retained its normal qualities.

This result appeared convincing enough, but M. Boggild made it conclusive by further investigation with a view to ascertain whether it was rust itself that caused the mischief, or whether it might be due to bacteria, which, through inadequate cleansing, might also be present in the rusty vat.

To this end, therefore, it was not only thoroughly washed, but also steamed, so as to kill any contained micro-organisms. But even this precaution did not protect the milk, which was afterwards placed in the still rusty vat. M. Boggild also found it on analysis to contain a comparatively larger quantity of iron, which, moreover, increased in proportion to the extent of rusty surface covered by milk.

It was also shown that the butter made from this milk acquired its characteristic taste. This observation serves as an additional proof of the necessity to use only dairy utensils which are clean in the strict sense of the word.

Warts, we read in *the Cable*, are contagious, and a milker with a warty hand may very likely cause them to come on the cow's teats. The remedy for man and animals is to apply any caustic preparation to the wart until it is corroded away and a raw spot is made in its place. Then apply calomel to the raw surface and protect it with a bandage until healing is completed. When a milking cow is troubled with warts on the teats, and there is difficulty in milking, a silver tube should be used to draw out the milk, which will flow when the other teats are milked.

We read of the following being given to cows in Oudh to bring them into season: Wheat, 1 seer;

Hyocyamusniger, 1 oz.; liquid curd, 2 seers. These are mixed together in an earthen pot which is closed and buried in an old dung heap for a week. When well fermented it is dug out and the mixture given to cows in two or three instalments.

M. Arnault, the director of one of the largest dairies in Paris, firmly believes that food does tell on the yield and richness of milk. German authorities are of opinion that food has no influence in determining the amount of butter in the solids of milk: that attribute, they state, depends entirely on the temperament of the cow alone.

Milk contains from 10 to 14 per cent. of solid matter, consisting of 2.50 to 6.00 of butter fat, which is insoluble, and the rest of a matter which is not fat but is soluble.

THE NUTRITIVE PROCESS IN PLANTS.

Prof. J. Reynolds Green, D.Sc., F.R.S.
(Continued.)

But the mere fortuitous or pre-arranged meeting of the raw material is not sufficient. Whence comes the power to make any change in any or all of them? It must be evident on a little reflection that considerable work must be expended on such bodies to produce more complex ones from them.

We find that the increase in weight of the plant which must follow the building up of complex bodies, or the construction of its own substance from these simple ones, can only take place under certain external conditions, and of these the most important is exposure to sunlight. Exposure to sunlight, again, is quite inoperative, unless the tissue so exposed contains the chloroplastids already described. Evidently some relation exists between these two factors.

The chlorophyll can be extracted from the plastid which contains it, by the simple process of soaking the leaf in alcohol. When such a solution is made it has the same bright green appearance as the leaf itself, and its relation to sunlight can be examined. If a beam of light be made to pass through a prism of glass, it does not, as is well known, emerge as a simple beam, but the different rays of which it is composed are all bent from the straight line. Being of different degrees of refrangibility—that is, being deflected in different extents—the rays emerge from the prism separately, and, instead of a spot of white light, a band of all the colours of the rainbow, arranged in definite sequence, falls on any surface placed in the path of the beam after emergence. The band is known as the solar spectrum. If now various substances be placed in the path of the light before it reaches the prism, it is found that this band of colours is often very much affected, not being continuous, but crossed by vertical black or dim bands, indicating that certain rays have been sifted out or absorbed, as the light has passed through the solution of the substance under experiment. Chlorophyll is one of these substances; if a solution of it be tested as described, the resulting spectrum is found to be marked by seven distinct vertical patches which are called its absorption bands. It will be seen that one very dense band occupies a large portion of

what should be the red part of the spectrum; three less well-defined ones blot out nearly all the blue end, and there are three narrower and fainter ones in the green and yellow regions. If the leaf itself be examined with an appropriate arrangement of prisms, the same absorption of light is found to take place.

Here we have the explanation for the necessity of chlorophyll and sunlight. The radiant energy of part of the light is absorbed by the chlorophyll and affords the motive power for the chemical changes that take place. Many careful experiments led to the conclusion that the most effective rays are those which correspond to the broad black band in the red. In other words the chemical changes are brought about by the energy derived from the sun, which is made to do work just as truly as the energy which is derived from the combustion of the fuel of a steam-engine.

But it must not be forgotten that the chlorophyll is associated with protoplasm in the chloroplastid. The function of the colouring matter alone is only the absorption of the light; it can by itself go no further. The absorption is the same whether the chlorophyll be in the plastid or in the alcoholic solution; the further effect is different in the two cases. The energy secured by the chlorophyll is rendered available by the protoplasmic element of the corpuscle, which carries out the definite chemical change.

To trace the chemical reactions in detail would be beyond the scope of this paper. They are very varied, and even now very imperfectly understood. The result of them is to be found in the appearance of complex materials in the cell, some of them in solution in the cell-sap, others imbedded in the chloroplastids, others included in the substance of the protoplasm of the cell. We may, however, take a cursory glance at the principal ones, whose manufacture can be traced with more or less difficulty, particularly as they readily fall into groups such as we shall see are presented by the bodies finally stored in the reservoirs described above.

FORESTRY ITEMS.

Mr. A. C. Forbes, writing on "Knots in Timber" to the *Timber Trades Journal*, says:—

Timber without knots is almost as rare as fish without bones, and yet for many purposes knots must be considered as defects which depreciate the value of wood to a greater or less extent. Where wood is exposed to friction, as in flooring, or to strains which try its transverse strength, as in rafters, laths, joists, &c., knots are generally detrimental to the utility and efficiency of the goods made from it, and an endeavour is always made to cut such from the lower part of the stem in which the knots are small and extend but a short distance from the centre. The most objectionable form which knots assume is when they consist of plugs of dead wood embedded in the green or fresh timber, having no greater connection with the latter than a nail or staple driven into the wood. Thin boarding or laths containing these dead knots are of low value, as the knots are apt to drop out when the surrounding wood begins to shrink, leaving cavities and weak places in the

wood. Green knots also weaken the transverse strength of wood by interrupting the fibres and weakening the elasticity of the wood, but as they are nearly of the same hardness and texture as the surrounding tissues, and do not interfere with the cohesive strength, they are more readily tolerated than many other defects commonly found in timber.

Mr. Rudder, Forester, N.S.W., writing in the *Agricultural Gazette* of that Colony, quotes the following authorities as to the importance of forests generally in the economy of nature:—

Mr. F. B. Hough, Ph.D., in his *Elements of Forestry*, referring to the ruin that is brought about by the clearing of wood-lands, says:—"It is a familiar fact that there are many regions in Asia and Southern Europe, once exceedingly fertile and densely populated, that are now utterly sterile and desolate. The country bordering upon the Euphrates, and portions of Turkey, Greece, Egypt, Italy and Spain are now incapable of cultivation from this cause." The Hon. Geo. P. Marsh, in his work entitled "The Earth as Modified by Human Action," has devoted a large space to the discussion of the question. A more recent illustration of these effects is published in 1876 in the principal French Journal of Forestry:—"The Khonote Bucharia presents a striking example of the consequences brought upon a country by clearings. Within a period of thirty years this was one of the most fertile regions of Central Asia, a country which, when well wooded and watered, was a terrestrial paradise; but within the last twenty-five years a mania of clearing has seized upon the inhabitants, and all the great forests have been cut away, and the little that remained was ravaged by fire during the civil war. The consequence was not long in following, and has transformed this country into a kind of arid desert. The watercourses are dried up and the irrigating canals empty. The moving sands of the desert, being no longer restrained by barriers of forests, are every day gaining upon the land, and will finish by transforming it into a desert as desolate as the solitudes that separate it from Khiva."

The *Indian Forester* referring to the Ceylon Forest Administration Report for 1894 says:—We are glad to see that attention is being paid to the palmyrah forests in the north of the Island, and that an officer, Mr. Mansard, has been employed in roughly surveying the Crown lands in the Jaffna district which bear palmyrah or are fit for planting with it. He has reported that large quantities of palmyrah wood are being exported to India, and this seems to point to the importance of enquiries being also made in the neighbouring Indian districts such as Madras, Tanjore and Tinnevely, with a view to making reserves there also. In some districts in Madras, *e.g.*, Nellore, palmyrah areas have, we believe, been reserved, and in others, *e.g.*, Cuddapah and Anantapur, palmyrah plantations have been made, we understand, but we have not heard of any in the Southern districts having yet been formed. Nothing is more easy in the way of plantation than to grow palmyrah; all that is necessary is to sow the large fruits which germinate well and then to keep off cattle. We note that Mr. Brown gives 80 years as the time necessary to produce timber-yielding palmyrahs.

The same paper says that "fire protection in Ceylon seems to be still in abeyance, but the teak plantations were successfully protected during the year." Damage and destruction by forest-fires are by no means so common in Ceylon, while, to quote the *Indian Agriculturist*, "the forest officer in India must sometimes be in despair at the havoc wrought among the trees in his charge by the fires kindled wilfully by the people."

The Inspector-General of Forests in India in his annual report for 1893-94 states that in Bengal the total area burnt was 37 per cent. of the area protected, that is 689 square miles burnt and 1,889 protected. In Singbhoon, we are told, matters were worse, 629 out of 869 miles being burnt over, though 72 special watchers were employed. These two instances will give some idea of the enormous destruction by fire to forests in India.

The sixth annual prize-giving at the Imperial Forest School, Dehra Doon, took place on May 1st. Of 37 candidates in the upper, and 8 in the lower classes, 29 upper and 5 lower class students have been granted certificates, leaving 8 failures in the upper and 3 in the lower class. There were no honour--men among the students who passed out. We note that the prize given by Mr. Bagshawe, Conservator of Forests, Berar, for the best Engineering Note-book went to J. W. Modder, a student from Ceylon.

Mr. Hill, the Inspector-General of Forests, addressing the students at this prize-giving ceremony, said: To those students who have passed I would say that you have failed to learn more than a part of what the school can teach you, and that this is only a drop in the ocean of what you have yet to learn before you can prove yourself to be a credit to the school and worthy members of the Government service. Strive therefore to turn the knowledge you have acquired to good account, and by careful observation and appreciation of facts and phenomena that may come in your way, endeavour to make yourselves thoroughly efficient officers of the state and of the Forest service. You may have discouragements and disappointments, but you may rest assured that if you know your business, and work with energy and strict observance of those principles which we have tried to impress upon you at the school, you must succeed.

There has been a good deal of discussion of late as to the merits and demerits of the *Lantana*. The conclusion of the whole matter seems to be the opinion that the lantana while a pestiferous weed in cultivated areas and particularly in Forests, is a wonderful renovator of fallow land.

THE CAUSE OF RINDERPEST.

At a general meeting of the members of the Microscopical Society of Calcutta, held on the 9th ultimo in the Asiatic Society's rooms, Dr. W. J. Simpson, Health Officer, made some important remarks about his discovery—the diplo-bacterium, which causes rinderpest—a discovery, it may be added, the economic value of which is undoubted, especially in India. We are enabled to give a verbatim report of his remarks as follows:—

"I shall now exhibit to the members of the Society the micro-organism of a disease which is peculiarly interesting to India, as it produces a malady which is fatal to the cattle of this country,

and inflicts enormous financial loss on the agricultural population. I refer to rinderpest. This disease is of such importance that an Imperial Bacteriological Laboratory has been established at Almora with the special object of investigating its cause. Hitherto the researches have not been attended with success.

"Rinderpest and other diseases of cattle have always attracted much of my attention, not so much on account of the diseases of cattle themselves, as on account of the relationship these affections bear to human diseases. I am convinced that, in the disappearance and re-appearance of disease among men, animals play an important part, and that it is necessary, for the investigation of the causes of disease, to keep in view man's relationship with his environment both in the animal and vegetable world. It has always been due to this relation that the diseases of animals and plants have interested me, and I have endeavoured to interest others in the same pursuit. It was in carrying out this policy that in September, 1894, while Monsieur Haffkine and I were examining diseased cows for comma bacilli and microbes generally, we isolated a small diplo-bacterium from a diseased buffalo. Some experiments, which were instituted at the time, failed to produce any noticeable effect on animals, so that the micro-organism was laid aside as one of those numerous harmless microbes that are so often to be found in animal tissues. I had, however, come across a similar bacteria in a human disease, which I have always been much interested in, and on account of this, I was not disposed to abandon the microbe altogether, and so after keeping this microbe in the laboratory for two or three months, I determined to further experiment with it, but in a different way from that which had resulted in failure. In December, 1894, I discovered that the microbe possessed distinctly pathogenic properties, which proved to be of a peculiar nature, and in a short time I found I was dealing with a microbe which produces rinderpest, the most fatal and most destructive disease amongst cattle in India and the East. It is thought to have originally come from China. The disease can be produced experimentally by the microbe in question, and on searching for cattle suffering from rinderpest, the same microbe has been isolated from them, which in turn reproduces the disease in animals.

"The microbe is a diplo-bacterium, varying from 0.3 to 0.6 m.m. in length, and about one-third of this in breadth. It has a clear space in the centre, and in old specimens this division is still more pronounced. Occasionally two diplo-bacteria are fixed, end to end, and give the impression of a longer bacillus. The microbe is not unlike the bacillus found by Dr. Kline in ordinary calf vaccine. It is easily stained by the ordinary dyes, fuchsin and gentian violet. It grows with air and without air, but gradually becomes attenuated in virulence by repeated growth in air, so much so that at the early part of 1895, two tubes rubbed into sores on the skin of an animal, would kill the animal, whereas 12 tubes now will only produce a slight illness. It is a motile bacillus, is sporeless, multiplies rapidly in bouillon with the formation of air bubbles, and forms air bubbles in stale cultures of galatine. It is destroyed at a temperature of 57°, even when only exposed for a quarter-of-an-hour. It is not unlike the *bacillus coli*, but

differs from this in its action on milk and in its pathogenic properties on large animals. On agar it grows as a luxuriant greyish white growth. It does not turn yellow, but retains its greyish colour constantly.

"Rinderpest is a disease that only affects an animal once. If the animal recovers from the attack, it will pass through later epidemics with perfect immunity. From this fact which is well-known in those parts of the country where rinderpest is particularly fatal, a protected animal possesses a special value, and is worth much more than an unprotected one. Besides being a very fatal disease, it is extremely infectious, every secretion and excretion from the animal's body being infective; one animal placed among a herd will be the means of conveying the disease to nearly the whole herd, for there seem to be very few animals which possess a natural resistance against the disease. The loss to the farmer and peasant is enormous. I have seen in Calcutta a *gowalla* lose his whole stock in less than a fortnight. It is no uncommon thing to come across a *gowalla* who has lost half of his stock from this disease, in fact, if a *gowalla* gets rinderpest, or *gotee* as he calls it among his cows, he is fortunate if it destroys only one-third or half of his stock. At those times when rinderpest is very prevalent in the country, the loss in cattle is so great that in many places it has a serious effect on the crops owing to the farmers having an insufficient number of cattle to work in their fields. It will be seen from these remarks that the study of rinderpest is a very important matter in the sanitary problems of this country. In 1871, when the Indian Cattle Plague Commission investigated this disease, and came to the conclusion that it was the same disease as that which had caused so much destruction on cattle in England in 1866, the question of protecting animals by inoculating them with the crude virus, *i.e.*, with the fluids taken from a sick animal, was discussed, so also was the amount of protection produced by ordinary vaccination with vaccine lymph; both of these processes had been tried extensively in Russia and Austria, but not with very satisfactory results.

"In inoculating with the crude virus, it was found that, though in many cases a mild disease was caused, very frequently a virulent type was produced, and that there was no real control over the disease. In the case of vaccinating with ordinary vaccine lymph, because of the view that rinderpest is allied to small-pox in man, the evidence as to protective effect was too conflicting to justify any practical action. With the microbe, however, now in our hands, I consider it to be merely a matter of time to prepare a vaccine which shall not only be protective, but which shall give us control over the disease. I have carried on a number of experiments in this direction, but they are not sufficiently advanced to make any observations upon them at the present time. In a number of these I have been fortunate in securing the able assistance of Veterinary Captain Gunn, the Veterinary Inspector for Bengal, who has from the first been most anxious to push forward the experiments. We propose to take advantage of the first large epidemic of rinderpest, which chiefly occurs in Northern India, to carry these experiments to a further stage, and with the microbe in our hands there is a prospect that not only will a vaccine for

preventive purposes be prepared, but also an anti-toxin for the treatment of those cattle that have become affected."

INSTRUCTIONS FOR DISINFECTION.

The following "instructions" (which we take over from the *N.S.W. Agricultural Gazette*) are those issued by the German Government for the disinfection of places where animals have been kept suffering from infectious diseases, and should prove very valuable to all stockowners:—
(*Extract from "The Veterinarian," October, 1895.*)

1.—CLEANSING AND DISINFECTING MATERIALS.

1. *Water and Steam.*—Hot water should be used in preference to cold water where it is available, and as near the boiling temperature as possible. One hour's heating of substances in boiling water is sufficient to disinfect them.

2. *Soapsuds.*—This may be made of either yellow or black soap, 1 lb. in 100 lb. hot water.

3. *Soda Lye.*—Dissolve 1 lb. of washing soda in 10 gallons water.

4. *Lime.*—Freshly-slaked lime-shell, either in the form of powder or mixed with twice its own bulk of water and used as a thin paste, *viz.*, milk of lime.

5. *Chloride of Lime.*—Fresh strongly-smelling chloride of lime may be applied in two ways, *viz.*, as a thick paste, *i.e.*, one part of chloride of lime to three parts of water; or as a thin paste—one part chloride of lime to twenty parts of water.

6. *Carbolic Acid Solution.*—Mix together one part of liquified carbolic acid with twenty parts of water, *viz.*, a 5 per cent. solution.

7. *Cressol Water.*—Made from cressol soap and nine parts of water.

8. *Coal Tar or Wood Tar.*

9. *Fire.*—The singeing of substances that can endure fire over their whole surface is a thorough means of destroying infection.

11.—CLEANSING AND DISINFECTING METHODS.

Before cleansing, all straw, fodder, litter, and dung should be removed. Thorough cleansing must always precede methods of disinfection. The cleansing of a stall or stable must extend to everything therein, and to the soil and subsoil. All old wooden boards, linings, and the like should be taken down and burned. The cleansing should begin at the roof, then go to the walls and partitions, and lastly to the floor. Hot water or hot lye is better than cold. The cleansing of a part of a stable or the like should extend to 4 feet beyond the infected part in all directions. The water used for cleansing should not be allowed to come in contact with anything that can be a carrier of infection until it has been disinfected, and it must not go into a stream. Anything of little worth should be burned.

1. Wood, stone, and iron fixtures, if not oil-painted, should be scoured and then washed. Woodwork with a rough surface should be planed smooth, and any ragged wood or porous or rotten wood should be removed and burned.

2. Plastered walls should be scraped down, so that the whole surface is renewed, and any loose parts or ornamental parts should be taken away.

3. Oil-painted surfaces are to be washed with hot, soapy water.

4. Stone, cement, or asphalt floors are to be scoured and washed.

5. Rough flooring of stone, earth, &c., should be dug up until the limit of the inspection is reached, and after disinfection the stones and earth may be replaced.

III.—CLEANING OF UTENSILS.

1. Wooden implements and utensils, including carts, barrows, troughs, sieves, besoms, also boots and shoes are to be thoroughly scoured and washed.

2. Iron and metal utensils, such as chains, rings, curbs, pails, &c., if they cannot have fire applied to them, should be thoroughly scrubbed clean and rinsed with hot water.

3. Leather materials, such as saddles, bridles, harness, boots, &c., should be cleansed with hot lye and then with water.

4. Clothes, ropes, halters, and all cloth materials should be washed with hot water, soap, and soda.

5. Clothes that cannot be so washed, also bedding, &c., should be aired for some days and several times beaten and brushed.

6. Hair-stuffed or wove-constructed goods must be similarly aired, beaten, and brushed.

IV.—DISINFECTION.

In ordinary circumstances the cleansing, if thoroughly done, will be of itself sufficient, providing that the infecting material has been reached. All walls, partitions, floors, &c. should, after cleansing, be whitewashed with milk of lime: iron parts should be tarred, lacquered, or painted.

If from the nature of the case the infection has not entirely been reached by the cleansing processes, the following regulations must be attended to:—

1. All straw, fodder, litter, dung, and sweepings from an infected stall or stable must be burned.

2. Fodder supplies, stores of straw or hay that may have been reached by the infection, but which are not themselves the carriers of it, should be well aired for some days and frequently turned for that purpose.

3. Walls and fixtures, floors, gutters, &c., should be washed with thick lime paste or with chloride of lime paste. Iron materials should be disinfected with carbolic acid solution or creosol water; so also stone or earthenware fixtures.

4. The soil or stone floor of a stable, &c., should be treated with milk of lime before any fresh litter is brought in.

5. Wooden and iron fixtures or apparatus that have been in contact with infection should, if possible, have a plane passed over them, or be washed with 5 per cent carbolic solution, or be painted or tarred, or the like. Leather stuff should be washed with 5 per cent carbolic solution.

6. Linen, cotton, hempen, or woollen goods should be put into a steam disinfector, and subjected to steam at the boiling point of water for at least one and a half hour. Should that not be attainable, they may be washed and steeped in boiling water, and if that cannot be done, they should be removed and burned.

7. The disinfection of the hands and instruments is obtained by treatment with 5 per cent carbolic acid solution.

THE DISINFECTION OF FÆCAL MATTER.

(*Annales de l'Institut Pasteur*, May, 1895.)

Von Vincent has made some experiments to test the relative efficacy of the more common disinfectants, viz:—

1. Green vitriol, blue vitriol, zinc chloride.
2. Corrosive sublimate (mercuric chloride.)
3. Chloride of lime, alkaline hypochlorites.
4. Lime, potash, and soda.
5. Carbolic acid, creolin, lysol, solveal, and solutal.

The following is a summary of his conclusions:—

1. A complete disinfection of faecal matter is unnecessary, except where pathogenic germs are known to be present.

2. As regards chemical disinfectants, one must distinguish true bactericides from deodorising agents, and have regard to their relative cost.

3. In these respects the best antiseptics for the purpose of disinfecting faecalia are blue vitriol, creolin, lysol, and then chloride of lime. Corrosive sublimate is useless, and so is zinc chloride.

4. When 1 per cent. of sulphuric acid is added to blue vitriol, its antiseptic power is increased, and when 1 per cent. hydrochloric acid is added to chloride of lime, it is much more efficacious, and these latter are the cheapest and best disinfectants of dung and litter.

Correspondence.

COCONUTS.

Dombowinne Estate.

Mirigama, 30th April, 1896.

SIR,—King Coffee has left a worthy successor in Queen Coconut. With the example before them of the fate of the former, courtiers will do well to act carefully in their relations with the latter. The former it must be admitted well rewarded his servants, so long as he flourished; and he died indeed a sovereign's death; for, his dependants willingly sacrificed their all in trying to save him. But his malady was beyond human skill.

Queen coconut is still, indeed, in the cradle, and there is no knowing what sort of a sovereign she may turn out to be. Though she is liable to no disease, yet she is surrounded by innumerable enemies. The chief of them is our "Ignorance of her ways and habits." Here are some useful facts for the benefit of the uninitiated:—

A well-dried ripe nut in husk	..	1	to	1½	lb.
varies in weight from	..	1	to	1½	lb.
Without husk	..	½	to	3¼	..
Its fluid weighs	..	0	to	1¼	..
Shell and brown coating of the
kernel	..	¼	to	¾	..
Kernel without the brown coating	..	¼	to	1¾	..
Thickness of the kernel in inch	..	¼	to	¾	inch.
Latitudinal measure of a nut in
inches	..	9	to	19	..
Longitudinally	..	9	to	20	..

In a husked nut weighing 40 oz., the white kernel weighs 20 oz. (For every oz. of the nut above 40 oz., the white kernel weighs ¼ oz. above 20. For every oz of the nut under 40 oz., the white kernel weighs ¼ oz. below 20 oz.) The

weight of the kernels of a given quantity of husked nuts is generally half their own unbroken weight.

An entire coconut divides itself into three nearly equal parts. I. Husk. II. The white kernel. III. The brown coating of the white kernel, the shell and the fluid.

The number of nuts which go to make a candy (560 lb.) of copperah varies from 800 to 2,000.

In a given quantity of good old copperah, the oil is $\frac{2}{3}$, and the punak $\frac{1}{3}$. In bad copperah, they are half and half.

In Europe coconut oil is priced according to the proportion of stearine and oleine of which it consists. It is due to the excess of these "fats" that Cochin oil fetches higher prices than Ceylon oil.

A pada boat carries 45 candies of copperah at 4 cents per candy per mile. (From Negombo to Colombo, only 2 cents per candy per mile.)

A cart carries 5 candies at 6 cents per candy per mile on good roads. On roadless sand it carries only two candies. And the toll, if there is one, has to be paid by the owner of the copperah in addition to the 6 cents.

A pada boat carries 18,000 husked nuts at 10 cents per 1,000 per mile.

A cart carries 1,500 husked nuts at 18 cents per 1,000 per mile on good roads.

To husk, to break and to dry a 1,000 nuts cost R1.25.

To husk only, R0.62 $\frac{1}{2}$.

The drought and the lightning cause much loss to estate: in some places, and do not in others.

The annual yield of a coconut tree varies from 0 to 900 nuts.*

The age at which the coconut begins to bear varies from 3 to 30 years. And the period it lives varies from 50 to 150 years.

Some trees may be picked 50 times a year, and some only once in 2 or 3 years.*

Picking costs from $\frac{1}{2}$ cent to 1 cent per pick per tree according to its height and the thickness of its stems and the number of its bunches.

Those who have observed these vagaries of the coconut and have discovered their causes, have often discovered them too late to derive much practical benefit to themselves.

Yours truly,

COCOPALMIST.

GENERAL ITEMS

In the Madras Presidency, 61.8 per cent of the people outside of the Presidency town are agriculturists, and the population was returned at the last Census as 34,336,196.

The *Agricultural Gazette* of New South Wales publishes the following remedies for locusts attacking fruit trees:—Spraying with Paris Green,—1 lb. to 160 gallons of water, will destroy large numbers. Poisoned baits, made as follows, are also very effective:—Take 50 lb. of bran, or a mixture of bran and pollard, mix with it thoroughly 1 lb., or even more of Paris green, London purple, or white arsenic. When tho-

roughly mixed add sweetened water (1 lb. of treacle to 1 gallon of water) to make the whole into a paste, which must be moist, but not so damp that it will drop off a spoon. Of this poisoned bait place lumps about the size of a walnut round each vine or tree, and also place a number of lumps on the side of the vineyard or orchard from which the locusts are coming. These remedies will kill very large numbers, but they are no use against a plague. The only remedy then is to keep the insects moving by driving them. Everyone in a district should unite to fight them.

It seems (says the *Live Stock Journal*) as if the old system of healing sprains of the horse's limbs is doomed. Fomentations, hot or cold, and the cruel operation of firing are giving way to successful treatment by dry bandaging and massage. At a recent meeting of the Royal Counties Veterinary Medical Association, Mr. William Hunting, President of the Royal College of Veterinary Surgeons, said when sprains occurred he had the leg wrapped in dry cotton-wool and bound in a linen bandage with as much pressure as could reasonably be put on. Orders were left that at night an ordinary flannel bandage should be substituted for the linen one. This he recommended as flannel was more elastic than linen, and that sometimes a bandage might be put on too tight, and the man in charge might notice its injurious effects in daytime, but would not watch it at night. He also recommended gentle walking exercise daily, the horse being led and not ridden, and commencing with half-an-hour daily. The massage should be performed when changing bandages, by hand-rubbing in the direction of the hair. The more the swelling, the less rapid the repair of tissues. He believed they could prevent the increase of swelling in an early sprain by firm pressure, provided that pressure was equalized and thoroughly distributed by the use of cotton-wool under the bandage. The advantage of dry cotton-wool an inch and a half thick was that it absolutely equalized the pressure throughout the whole bandage.

Mr. Hutcheon, Colonial Veterinary Surgeon of the Cape, referring to the retention of the fetal membranes in cows, says:—There are a number of medicines which are extolled as effective in expelling the fetal membranes or after-birth, but I have not much faith in any of them. The only satisfactory method is to introduce the hand into the uterus, and extract the membranes from their attachments. Oil the right hand and arm well, then introduce it into the uterus; lay hold of the protruding portion of the membranes with the left hand, and as you gradually draw up the membranes from their attachments in the uterus by the right hand, you pull up the slack with the left hand. The membranes are generally easily removed in this manner by the third day. Another plan is to inject a two per cent. solution of carbolic acid or Jeyes' fluid, or permanganate of potash into the uterus, this not only assists in neutralising the septic action going on, but the effort which the cow makes to expel this fluid, assists in expelling the fetal membranes as well. Decoctions of ergot of rye and savin are largely used, and laurel berries are highly recommended. The colonial remedy is soot and vinegar. I would recommend powdered ergot of rye and savin, of each half an ounce, infused in a quart of water, with a laxative such as half a pound of Glauber salts added. The usual cleansing drinks generally contain Epsom salts mixed with condiments, such as ginger, Mentian fenugreek, and anise seeds.

* Astounding! These statements upset all hitherto accepted estimates. What have our well-known authorities on Coconuts to say to them?—Ed. A. M.

COFFEE AND PEPPER EXPORTS FROM SOUTHERN INDIA: 1894-5.

Tellicherry, Sept. 20, 1895.

DEAR SIR,—Hitherto I have confined my Annual Statement of Exports of Coffee and Pepper to what has been shipped from the Malabar Coast alone; but this year, acting on a suggestion made to me by the *Madras Mail*, I have included the shipments from Madras and Tuticorin; the only other Ports in Southern India from which Coffee is exported in any quantity, so that the statement I now have the pleasure to hand you includes the total export of Coffee and Pepper from Southern India for the year ending 30th June 1895, or in other words from India, seeing that the cultivation of these products is confined to the Southern Presidency and the neighbouring States of Mysore and Travancore.

COFFEE.—You will gather from my figures that the total export of Coffee amounts to cwts. 2,91,621 which amount may be considered to approximately represent last year's crop; for although there was a certain quantity unshipped on 30th June last, my figures include an equivalent stock of the previous year's crop shipped during the year under review. Of the total quantity shipped cwts. 1,93,639 may be regarded as Plantation, and cwts. 97,982 as Native Coffee, which taking the average value of the former at R80 per cwt. and of the latter at R74 per cwt., represents respectively R1,54,91,120 and R72,50,668 or a total of R2,27,41,788 as the value of the Coffee Crop exported from India this past year.

Exports from Mangalore, Tellicherry and Madras may be taken as representing the crops from Mysore and Coorg, while those from Wynaad, the Neilgherries, the Neliampathies and the Shevaroy's find their outlet at Calicut and Beypore. Shipments from Tuticorin and Travancore ports are the produce of estates on the Pulneys and Travancore Hills. My statement speaks for itself as to the distribution of the shipments to Foreign ports.

PEPPER.—The total export of this spice amounts to cwts. 1,51,439, which I value at R25,74,463 taking the average price at R17 per cwt. The quantity probably does not represent the total crop, which would be considerably increased if the value of pepper was higher, the diminution in which has greatly affected the export.—I am, dear sir, yours faithfully,

RALPH TATHAM, Agent to Arbuthnot & Co.

MESSRS. ARBUTHNOT & COMPANY'S ANNUAL STATEMENT OF EXPORTS OF COFFEE AND PEPPER FROM SOUTHERN INDIA DURING THE SEASON ENDING 30TH JUNE 1895.

Cultivation.—Much has been done this year to improve the general upkeep and culture of the various classes of plants in Pérádeniya. Bad soil and want of manure are our great drawbacks. Most of the smaller ornamental plants in the central borders have been arranged to more advantage, much pruning and cleaning of the larger ones done, and many fresh specimens put out. Roses do not as a rule succeed here; those hitherto cramped in beds near the store have been removed and planted out at equal distances in well-prepared sites near the conservatory, and it is hoped they may do better under these conditions.

The Herbaceous Ground has been well looked after, the young Gardener in charge having taken a real interest in it. I find it improved in tidiness and appearance. Many plants of much interest are planted here, and nearly all are labelled.

The Nurseries have been laid out afresh; the beds now number 93, are made straight and uniform, and are well supplied with a fresh stock of plants for distribution. Much improvement has also been made in the number and quality of the stock of plants in bamboo pots, and large numbers of fruit trees, palms, and foliage plants have been propagated for distribution.

Much labour is annually expended upon the extensive tract of these grounds known as the Old Arboretum, in weeding, cleaning, pruning, and planting, but we are unable to make much impression on its wild character. A much larger labour force is needed to treat this portion of the Gardens in the way it should be treated.

During the year the following species were noticed in flower for the first time:—*Paulownia speciosa*, *Nematanthus longipes*, *Steriphoma paradoxum*, *Stenandrium Lindeni*, *Ixora grandiflora*, *Sclerocarya caffra*, *Couroupita antillana* (Cannon-ball tree), *Rhodamnia trinervis*, *Exostemma caribbæum*, *Cassia nodosa*, *Adenantha microsperma*, *Aristolochia gigas*, var. *Sturtevantii*, *A. sp.*, *Epidendrum falcatum*, *Cœlogyne macrophylla*, Hort. Bogor., *Angræcum Ellisii?* *Stemona tuberosa*, *Aloe sp.*, *Limnocharis Humboldtii*, *Cyrtostachys Rendah*.

Our *Lodoicea* palm ("Coco-de-mer"), now forty-six years old, which has been looking somewhat unhealthy for some years, was taken in hand in June. A trench, 2 ft. wide and 3 ft. deep, was dug all round it at a distance of 6 ft., and all the numerous roots from large trees near by were removed. The old soil was then carefully taken out, and new soil, mixed with leaf-mould and manure, added in its stead.

Several old trees having become dangerously decayed were removed, including a large one of *Elæocarpus amœnus* near the Museum. A very large rotten old tree of *Terminalia Belerica* in the centre of the fernery fell of itself.

A fine set of twenty-one new garden varieties of *Canna* were received from the Agricultural Society of Calcutta, and have flowered well, and been greatly admired.

It may also be mentioned that more seeds of *Victoria regia* were received from Madras in July, and three seedling plants raised from them were put out in the tank in the Gordon Gardens, Colombo, where they have duly flowered.

Weather.—Another dry year on the whole, but the months June, October, and December were very much wetter than usual, especially December, when double the average (of the last eleven years) fell. February and March, however, were very dry, and at the end of the latter month the Garden pond was lower than I have ever before seen it. The total rainfall for the year, 77.56 in., was 9.72 in. below the average of the past ten years, but the number of days on which it fell, 170, is 16 above the average for the same period.

The monthly rainfall is shown in the following table:—

	1895.				1895.			
	Rainfall.		Rainy Days.		Rainfall.		Rainy Days.	
	Inches.				Inches.			
January	... 3.18	...	7	July	... 4.51	...	19	
February	... 1.08	...	3	August	... 5.86	...	26	
March	... 3.74	...	6	September	... 4.59	...	22	
April	... 5.33	...	14	October	... 17.87	...	27	
May	... 2.96	...	7	November	... 1.78	...	8	
June	... 12.28	...	16	December	... 14.38	...	15	

Total, 77.56 in. on 170 days.

The greatest fall during any twenty-four hours was 6.58 from December 27 to 28. This being more than fell during the whole of February, May, and November. The remarkable feature of this table is the very small fall in November.

The heavy rains after long drought at the end of March caused a great building of termites' nests all over the Garden. No less than 371 large nests were dug out in two weeks.

Visitors.—The book kept at the lodge for the purpose was signed by as many as 2,283 foreign visitors (that is, not Ceylon residents). This is an increase over that of last year of 310, or 257 more than that given for 1893, which was the highest yet recorded.

3.—HAKGALA GARDEN.

I have a very full report on this Garden from Mr. Nock, the energetic Superintendent, who is continually and in every way improving its usefulness and beauty, so far as our means will allow. Under his skilful attention it has now become nearly what I had hoped to make it when I commenced remodelling it in 1881.

An important improvement has been the provision of new and proper accommodation for the coolies. The rotten old lines were, as mentioned in my last report, accidentally burnt down, and a special vote of Rs. 1,500 was granted the Department for the erection of new ones. With this sum we have been able to put up a permanent building 121 ft. 6 in. long by 12 ft. broad, containing fifteen rooms, each 12 ft. by 8 ft., the walls being 7 ft. high. The foundation and pillars are of stone, the weather side and the two ends are weather-boarded, cased inside with lath and mud plaster. The front wall and the partitions are of lath and mud plaster. The rooms are raised one foot above the ground, and there is a four-foot verandah the whole length of the front. The roof is covered with corrugated iron. The wood for the roof-timber, weather-boarding, doors, window-shutters, &c., was all sawn from the Garden property, and the lime was burnt on the premises. Each room has a door and window-shutter. The weather-boarding, wall-plates, verandah-posts, doors, window-shutters, and all exposed woodwork have received two coats of tar, and the pillars and plastered walls have been whitewashed. A long-felt want is thus now supplied.

I regret that Government was unable to sanction a vote for roofing also the Foreman's quarters with corrugated iron, and trust this may soon be provided; it is much needed, as rotten thatch soon affects the roof-timbers in the wet climate of Hakgala.

The potting-shed—an important place in a garden such as Hakgala—collapsed from decay at the end of the year. It is much to be regretted that our finances will not allow of the erection of permanent buildings—temporary structures are in the long run a loss in many ways.

Much labour has been expended on the Carriage Drive and paths, the heavy and sudden falls of rain at several periods of the year having done much damage.

Mr. Nock in the following report notes the great increase in nursery work for the sale of plants to the public at Hakgala, and I fully endorse his remarks as to the absolute injury and loss which result to the Department from this sort of work. I have frequently expressed my opinion that this business should be mainly left to private enterprise, and that the Botanic Gardens should not be expected to raise for sale quantities of garden plants, but be allowed a free choice as to making exchanges or giving specimens to suitable persons.

From the very full report of the Superintendent I make the following extracts:—

Roads and Paths.—The large drive from the fernery to below the Herbaceous Garden, for a distance of 162 yards, was remetalled towards the end of the year, but the unprecedented heavy rain on the 27th and 28th of December caused such damage that this will again have to be re-made, and the other parts of the drives were so much cut up that the greater portion will require to be re-made during 1896. The paths all over the garden were repaired where necessary and kept in good order. The new garden roller has been of much service for this work, and I have no hesitation in stating that it has already fully paid for its cost in saving of labour. Several new paths, 4 ft. wide, were made during the year, the total length measuring 391 yards. One of them starts from near the cattle-shed at the back of the bungalow, and leads round the back of the tennis court. This enables us to do away with the steep short road formerly used by the cattle. The other new path, which is 290 yards long, branches off from the one above the fernery and leads through the new camphor plantation, connecting with the old water-course path near the *Pinus* plantation. The trace is of an easy gradient, and this path will, when the surroundings are put in order, make a very pleasant addition to the walks of the garden.

Fernery.—A few thousand plants, mostly begonias and native ferns, have been set out in vacant places, and about 100 orchids have been fixed on to the tree stems. The tree-ferns and the banks of *Adiantum*s have grown well, and are in a very thriving state. A stone side drain 111 ft. long was laid down on the upper side of the path leading up to the *Adiantum* banks from the *Camellia* bed.

The bed of *Primula obconica*, which has been flowering so long and so well, was dug up, re-made, and re-planted. A bed in the lower part of this garden was planted with plants of the beautiful and interesting native fern *Aspidium aculeatum* var. *anomulum*, with begonias and other ferns planted between them. It has been stated, and is believed by some still, that after a time under cultivation this plant will produce the spores on the under surface of the fronds as in other ferns. This is not correct as far as my experience goes, and we can show plants here that have been cultivated for over ten years that still keep true and produce healthy spores on the upper surface only.

Nurseries.—The old nursery has mostly been given up owing to the pest *Oxalis*, which has got such a hold that it is impossible to eradicate it without allowing the beds to lie fallow for some time. New beds were made below the site of the old cooly lines, and we hope to be able to fence and lay out this plot during 1896 and make a good nursery of it.

Ten beds of Turkey oak (*Quercus Cerris*) were sown in the nursery at the beginning of November, and at the end of the year they were germinating freely.

Seven hundred and twenty-eight packets of seeds were sown in seed pans and boxes, and some were sown in beds in the nursery; 59,889 seedlings pricked out or transplanted; 90,162 cuttings of various garden plants and shrubs were put in nursery and propagating house; and 3,949 plants were potted.

Six thousand three hundred and ninety-eight wooden labels were made, and most of them used in the work of propagation, the painting and writing of these taking up a considerable amount of time. 117 plant boxes and a few plant tubs were also made for propagating purposes.

One hundred and seventy-two grafts of good varieties of plums were grafted on to stocks of the common cooking plum, and 29 apples were also grafted. Most of these have taken well. Some of the grafts put on last year have grown stout healthy shoots, 4 to 5 ft. long. More of this work would be done, but there is a great difficulty of obtaining stocks for the purpose.

The number of applicants this year was far above that of previous years, and the sum realized by the sale of plants was nearly double that of last year, and more than double that of 1893. This of course tells considerably against the upkeep of the garden, because much more labour has to be expended in propagation and nursery work. As all revenue is passed on direct to the Treasury, the more we realize the less the garden benefits.

Borders and Shrubberies.—74,063 plants and seedlings of various ornamental trees and shrubs and general garden plants and annuals were planted out during the year in the supply and upkeep of the gardens. In addition to these about 20,000 roots of a species of grass, which grows well under shade, were planted out under the trees above the propagating house.

Many plants died during the drought of February and March, and also from the effects of the rough weather in June, July, and December. A good deal of pruning was done in August, when the effects of the rough weather in June and July were more plainly seen. No less than 324 large trees and shrubs were destroyed during the high winds of the middle of June.

Labels.—837 large wooden labels, 18 in. long, 2½ in. broad, and ¾ inch thick, were made by the garden carpenter, and after receiving three coats of white paint, the names, authorities, and countries of plants were printed on them in black paint. Through the kindness of Captain F. Bayley we obtained a quantity of coal dust free. This was boiled up with linseed oil to the consistency of paint, and while boiling the lower 9 in. of the sharpened ends of the labels were dipped in it, and it was allowed to soak in. When thoroughly dry they were set out. The oil and coal dust preserves the wood from decay for many years. We have some, now fairly good, that have been in the ground for over seven years.

Eight hundred and two plants of *Eucalyptus* and other trees were planted out on the patana, above the young men's quarters, for shelter. I find, however, that unless the patana is cleaned and kept clear and free from weeds that few plants do well; and as we have not the labour for this, I am not very hopeful of much success.

During May the lower ornamental pond* was cleaned up and plants of the variegated New Zealand flax were planted at irregular distances along the margin.

Some improvements were also effected to the upper piece of ornamental water. Small clumps of *Lilium giganteum* and *Richardia æthiopica* have been planted round the edges of the banks, underneath the water. These two plants are found to thrive in such a position.

A few plants of both the yellow and white English water lilies arrived at the end of the year (from Messrs. Richard Smith & Co., of Worcester) in much better condition than was expected. They have been carefully attended to and introduced to the pond, and are making a good start. They will be a most useful addition to the very few aquatic plants of the hill country. A plot of *Bowkeria triphylla*, raised from seeds received from Madras in July, 1890, has flowered for the first time. It is a very beautiful and interesting flower. In May and June the *Hydrangeas* made a fine show, producing hundreds of large beautifully-formed and well-coloured flowers. *Chrysanthemums* and tuberous-rooted begonias also gave a good display of flowers during these months. In July and August there was an unusually fine show of roses, the blooms were of good colour and size, and produced in large quantities. *Camellias* also flowered well in November. Of the orchids, the most noticeable one that flowered during the year was *Dendrobium Calceolus*. It flowered in June, bearing three spikes containing 45 blooms of fine form and colour.

Oxalis violacea.—The spread of this weed has become quite serious, and every effort has been made this year to get it under. No less than 159 bushels of the small bulbs (from the size of No. 5 shot to that of a 2-oz. lead ball) have been picked out of the soil in the old nursery and several other parts of the garden. As they are so hard to kill, all that have been collected this year have been boiled to destroy them. Women and children have been employed, and although the work has been done as cheaply as possible it has cost about Rs. 100, which is a great drawback on the garden vote; it will take years to get rid of this pest.

Manure.—Our cattle have given us a good supply this year, and we have also had a valuable gift of about fourteen cart-loads from Mr. A. W. Jackson, of Sita Eliya.

Classified Herbaceous Ground.—This garden has suffered much from alternate droughts and heavy rains, partly through being on sloping ground, and also partly from being too crowded. The results during these last two years have been rather disappointing, and it has been decided, as soon as labour can be spared for it, to re-arrange the whole ground, making a sloping bank and terraces.

Wild Animals—Monkeys.—A group of monkeys, six or seven (the large *wanderoo*), which have frequented the gardens for some time without doing much damage, suddenly (in May) became destructive to the large Flame tree (*Sterculia acerifolia*) by breaking off the young succulent shoots. I tried shooting at them with small shot to drive them away, but they would persist in coming to this tree, so that I shot one with a bullet. They then remained away for a few days, but began their destructive work again, keeping out of my way, and I was unable to get another shot. They nearly ruined the tree, which was a fine one, and the largest we had in the gardens.

Sambur Deer were also very troublesome during May and June; in fact, the damage done was serious, as they ate or broke down nearly all the plants in the back of the shrubbery for a distance of about 200 yards, showing a special liking for *Fuchsia*, *Habrothamnus*, *Balsams*, *Begonia*, *Iresine*, *Polygonum*, *Tecoma*, *Anthericum* and other liliaceous plants, and we were very thankful when Messrs. Jackson and Mr. A. J. Kellow sent in their packs of hounds and hunted them out.

Elephants.—Five elephants were in close proximity to the gardens for several months of the year, and during August and September they paid several visits to the upper part and broke down and destroyed a few lengths of the water-piping. It is very interesting, especially to visitors, to know that wild elephants are so close, and, unless they do any serious damage, I think it would be a great pity to have them shot.

Visitors.—The number of visitors during the year was 1,528, being an increase of 17 over that of 1894, and about 1,000 more than it was ten years ago. The greatest number in any month was 295 in April, and the lowest in any month was 27 in September. I regret to report that on several occasions during the year orchids, which have taken years to establish, have been torn from the trees in the fernery and taken away. Suspected parties will have to be closely watched in future.

Weather.—The weather during the year as regards rainfall was 5 in. over the average of twelve years, but the number of days on which rain fell was exactly the average, viz., 205. The wind was much stronger in June than has hitherto been recorded, and much damage was done, and the same may be said of the heavy rains at the end of the year, which also broke the record. February and March, May, August, July, and September were the driest months in the order given, and December, October, and January were the wettest.

* A beautifully executed photographic view of this piece of water is given at page 38 of Mr. H. W. Cave's "Picturesque Ceylon," vol. III.

4.—HENARATGODA GARDEN.

The Arachchi in charge, Mr. S. de Silva, is justifying his recent promotion from Anurádhapura, and is carrying on his new duties with energy and intelligence. Cattle trespass is still a great trouble here, and it is obvious that nothing but a good barbed-wire fence will be of effective use. I hoped to have been able to secure the fencing both for this and for Anurádhapura Garden this year, and when in London obtained an estimate of the cost. This, however, reached Ceylon too late for consideration, to my great regret. Early in the year an attempt was made by a neighbouring headman to establish a cart road through the Garden, which was however promptly suppressed by the Government Agent.

There are so many interesting economic plants in this Garden that labels are much wanted, but permanent ones are expensive, and our scanty vote will not bear the cost.

Mr. Nock reports on the Garden as follows :—

The garden has been kept in very fair order, but with so small a labour force it is quite impracticable to maintain it in anything like such condition as it should be. Real cultivation is practically at a standstill for the want of a good supply of manure, without which it is impossible to do much in the way of improving the growth of the different plants under trial.

Paths.—The old paths have been improved by being widened and having new turf verges laid down. One hundred and ten yards of a new path were made from the nursery leading towards the double cocoanut. Another great improvement has been in cutting down the jungle near the boundary line and laying out a drive from the bridge at the entrance, the distance being 675 yards, and the width of drive 10 ft. This when finished and gravelled, besides opening up the garden, will be a great comfort and convenience for visitors.

Nurseries.—All the old and useless plants have been grubbed up and twenty-four new beds made. These have been stocked with a fresh batch of cuttings and seedlings of ornamental flowering shrubs and palms and useful plants.

Fernery.—This has been much improved by the addition of four beds, and the replanting and filling in with new plants, and though small has become a pretty and interesting part of the garden.

Borders and Flower Beds.—The plants in these have been pruned, and what manure can be spared has been forked in among them. New plants and supplies have been set out at various times during the year. A new bed has been made on the lawn opposite the entrance gates and planted with showy foliage plants. These are all doing well, and the appearance of this part of the garden is very much improved.

Double Cocoanut.—The young plant is very vigorous and healthy, and it is interesting to see how each year a larger and stronger leaf is sent up. There are now ten leaves on it, varying in age from one to ten years; the longest is 17 ft.

Conservatory.—The old decayed coir matting and roof-timber of this structure have been renewed. All the plants have been re-potted, and they and the building are now in good order.

Visitor's Shed.—This shelter is a wretched little place, and in a very bad state. It should be replaced by a more sightly, useful, and permanent building.

Visitors.—The number of persons who visited the gardens during the year was 124, being an increase of 59, or nearly double that of last year, which was 65.

Weather.—The first three months of the year were very dry, especially February, when the rainfall was 1.57 in., which fell on three days only. July and August were also very dry months, showing together a fall of only 2.92 in. On the other hand, the second and last quarters were noticeable for heavy rainfall. The quarter ending June 30 gave 38.81 in. on forty-seven days, and the last quarter 47.94 in. on fifty-four days. October being an unusually wet month, no less than 35.32 in. falling on twenty-seven days.

The total rainfall for the year was 14.06 in. above the average for the last four years, but the number of days on which rain fell was only five above the average.

The following table gives a monthly record of the rainfall, and the number of days on which it fell :—

		Fall. Inches.	Days.		Fall. Inches.*	Days.			
January	...	3.83	...	7	July	...	1.02	...	7
February	...	1.57	...	3	August	...	1.92	...	13
March	...	2.88	...	7	September	...	4.74	...	16
April	...	13.38	...	17	October	...	35.32	...	27
May	...	10.53	...	18	November	...	6.67	...	14
June	...	14.90	...	12	December	...	5.95	...	13

Total, 102.7 in. on 154 days.

5.—ANURÁDHAPURA GARDEN.

I was not myself able to visit this Garden during the year, but Mr. Nock, who was there in August, has given a full account of its condition. This gives me much concern, and it is indeed becoming a question with me whether the attempt to keep up this Garden any longer is worth making. The utter want of sympathy on the part of all the people, the indifference and even opposition of some officials, the very scanty funds (which render it impossible to effect any improvements, purchase manure, and properly house the coolies), and the distance from headquarters involving great expense and difficulty in transport, all tend to make me think that there is little to be done on the present lines, and to contemplate abandoning the attempt. It was in 1883 that I opened this Garden,

it being the successor of the one established by the late Mr. (afterwards Sir) J. F. Dickson, and transferred to my Department in 1881, at his suggestion, in the hope that more could be thus effected than he was able to do with it. The Provincial vote will again be unavailable for the Garden in 1896.

The following is Mr. Nock's report :—

The vote for this interesting and pretty garden of 15 acres is very small, viz., Rs 1,200, out of which the pay of the Conductor has to come. Until this year it has been supplemented by a Provincial vote of about Rs. 300, which has helped us considerably, and has usually been expended in the purchase of tools, carriage of plants from the other gardens, and for small improvements. This year, owing to some expenditure on native gardens of his own, the Government Agent could not see his way to grant us this vote, or even a part of it, and therefore little could be done beyond watering and keeping the place fairly tidy.

The trees and plants, both ornamental and useful, have grown well during the year, but it is disheartening that although numbers of plants have been raised for distribution very few have been applied for.

Manure here, as at the other branch gardens, is very much needed, but unlike the other gardens there is plenty of it to be had close at hand had we the means of transporting it. It was the intention this year to have bought a cart and pair of bullocks for this purpose and for carting gravel, out of the vote above referred to. A new hand-cart, watering pots, and a general set of garden tools, as well as a set of decent and permanent rooms for the few labourers, and a new plant-house are also urgently needed. Seats would be a great convenience, and I think would be an inducement for more people to visit and enjoy the garden. The cooly lines and plant-shed, which had fallen into a wretched state, were temporarily repaired and rethatched. This work was paid for out of the vote for contingencies from the Pérádeniya Gardens.

At the beginning of the year the small ornamental pond was cleared out and a new set of aquatics put in. A drain was cut from the middle channel across the fruit-tree plot to conduct the water to this part of the garden, and thus save labour in carrying it by hand.

The roads and paths which had become overgrown with "kalanduru" (*Cyperus rotundus*) have been carefully dug up and cleaned, but the paths especially are badly in want of a good coating of gravel. A plot of land formerly occupied by plantain trees was cleaned and made into a new nursery and supplied with a stock of seeds, plants, and cuttings.

Much labour was spent in digging out white-ant nests and levelling the hills. Near the entrance gates a row of the small bamboos were planted to take the place of the unsightly jungle stick fence there.

A quantity of fruit-trees and ornamental plants have been potted into bamboo pots for distribution, and a number of fruit-trees have been planted out.

Many of the economic and useful trees and showy plants have made good growth, and there is no reason, except want of energy, why they should not be more largely grown in the district by the villagers.

In the early part of the year considerable damage was done to the pineapples, plantains, and arrowroot plants by porcupines. These animals have also taken to the tuberous-roots of the Ceara rubber and have turned up the ground all about these trees. The damage by cattle trespass was again very considerable and annoying, and until the barbed-wire fence applied for can be obtained and erected this nuisance is sure to continue.

Weather.—The total rainfall for the year was 59·65 in., which fell on 103 days, against 45·56 in. of rainfall last year. The average rainfall for twenty-four years is 53·38, and of rainy days ninety-nine, which shows that the fall this year was much above the average, or 6·27 in., but of rainy days it was only four above the average.

The month of February was absolutely rainless, and May and July very nearly so, only ·06 in. falling in May on one day and ·04 in. in July on one day. Heavy rain fell in April, October, November, and December, totalling together no less than 47·47 in., against 12·18 in. only for the other eight months. So that the garden suffered from drought for the first nine months of the year, with the exception of April, and from floods during the last three months.

6.—BADULLA GARDEN.

Nor was I able to get to this Branch during the year, and have again to depend on the reports of Mr. Nock, who paid his usual visits. I desire, however, to call especial attention to the very small vote granted for this now beautiful Garden of 11 acres, only Rs. 1,500 per annum, out of which have to be met the Conductor's pay of Rs. 35 per month and the purchase of Garden requisites. The amount remaining available for labour is about Rs. 80 per month, which, as Mr. Nock points out, is barely equal to the pay in England of one working gardener. If anything more is to be done here beyond merely keeping the ground fairly tidy, our vote must be increased.

I quote the following from the report of Mr. Nock for the year :—

Most of the trees and plants have made rapid and healthy growth, which has improved the general appearance of the garden very much, and it is now a very pleasant resort for the residents and visitors, and a real ornament to the town. A great improvement has been the building of a pretty and permanent bungalow for the Conductor. It was designed and constructed by the Public Works Department, and greatly improves the appearance of the gardens. It is to be hoped that the Public Works Department may soon be authorized to build also a permanent plant-house and a few rooms for the garden coolies.

An improvement has also been effected by reducing the height of the Madras thorn hedge on the lake side of the garden. From almost any part of the garden the water of the lake is now seen.

The majority of the fruit-tree plants, comprising over thirty kinds, are doing well, and many of them have fruited during the year. Their future success depends in a great measure on the labour and cultivation that can be given them. The Para-rubber tree has borne seeds. These ripen here about three or four months later in the year than at Heraratgoda. The Giant Bamboo, Durian, Pimento, several conifers, and other useful and ornamental trees have now become established, and prove to do well.

The borders and flower beds have been very gay with flowers of such things as *Phlox*, perennial and annual, single and double Indian pinks, Balsams, Zinnias, Heliotrope, *Coreopsis*, and *Chrysanthemum*. With increased labour a great deal more might be done in this way. Labels and a few seats are very much needed both for the

A quantity of fruit-trees and plants of economical and ornamental trees and shrubs have been supplied during the year to the residents and resthouses in the district, but I regret that, though no fault of our own, we have been unable to supply all demands for such plants. I think a sufficient answer to any complaint on this score is our want of men and money. It is to be hoped that ere long a sufficiently increased vote will be granted to allow of the introduction, propagation, and distribution into the district of many more economical, useful, and ornamental plants, especially of fruit-trees likely to succeed. This was the intention when the garden was first opened, but owing to the withdrawal of prison labour it has been impossible to carry this out to anything like the extent intended.

Weather.—The rainfall, though not up to the average, was over 10 in. above that of last year, and was well distributed; the actual figures being 62·85 in. of rainfall on 136 days, against 52·23 in. on 120 days in 1894.

The monthly rainfall and number of rainy days are as follows :—

	Fall.		Days.		Fall.		Days.
	Inches.				Inches.		
January	... 6·48	...	11	July	... ·08	...	2
February	... ·55	...	5	August	... 1·85	...	7
March	... 2·27	...	8	September	... 1·96	...	5
April	... 4·95	...	13	October	... 13·63	...	29
May	... 1·23	...	10	November	... 4·84	...	16
June	... 5·47	...	11	December	... 19·54	...	19

7.—INTERCHANGE OF PLANTS AND SEEDS.

The exchange relations with other Botanic Establishments have been vigorously kept up, Wardian cases, boxes of bulbs and orchids, and a large quantity of seeds having been forwarded and received.

9.—NOTES ON ECONOMIC PLANTS.

Tea.—This year has been a most favourable one for tea; the yield everywhere has been good, and the increase in our exports greater than was anticipated. The total export was 98,581,061 lb., against 84,591,714 lb. last year, showing the very large increase of over thirteen million pounds (nearly as much as the whole crop of 1887).

The area now covered with tea is estimated at over 300,000 acres, and a small but steady extension is still going on.

The average price remained much as in 1894—*i.e.*, about 8½*d.* per lb., or perhaps a little more. It is gratifying to see a substantial increase in the export to Australia, which attained over nine million pounds (9,109,592 lb.), during the year.

Coffee.—A remarkable and interesting fact is a large increase in the export during 1895, this being more than double that of 1894, *viz.*, 65,833 cwt. This is the first time for many years that this has occurred. A gratifying circumstance, too, is that 6,076 cwt. of this is “native” coffee—nearly four times the amount of last year. It is to be understood that the increase is due not to any increased acreage, but to better crops; probably with less chances of infection, coffee has now to bear fewer “attacks” of leaf-disease, and so is able to ripen more fruit.

Liberian coffee, however, as yet shows no increase; but this seems likely to be altered in the future, as a considerable area has been planted in recent years and mostly appears to be doing well.

A small plantation of 36 plants of Sierra Leone or “upland coffee” (*Coffea stenophylla*) received from Kew in 1884 was made in April, and plants of *Lonchocarpus*, sp. (the one used in Trinidad as a shade-tree for cacao), planted among them for shade. The growth of the coffee plants has been very irregular, varying from a few inches to 3 ft., and cannot be said to be very promising. They have the appearance of plants out of their element, and look as if the climate here did not suit them. On the other hand, the *Lonchocarpus* is certainly at home, having grown very rapidly with a branching habit, and it promises to be a very useful shade-tree at low elevations. Some of the shoots have grown 8 ft. in nine months.

A plant of the “Abeokuta” coffee from Lagos was received from Kew in August.

Cacao.—This product has also yielded much better the last year, the exports being 27,522 cwt.—a very appreciable increase over last year.

A case of the Nicaraguan cacao, discovered by Mr. Hart and referred to in my last report, was received from the Government of Trinidad on September 13. Thanks to careful packing, the plants were in very good condition after their long journey of fifty-five days. The case contained sixteen Nicaraguan cacao plants and twelve *Forestero* plants from Trinidad, in all twenty-eight plants, as follows :—

From Nicaragua :—

- 2 Theobroma Cacao, var. *pentagona*.
- 1 do. var. *angustifolia*.
- 13 do. var. *Criollo*.

From Trinidad :—

- 12 Theobroma Cacao (var. *Forestero*).

All were alive, only two being doubtful, one of which has since died ; but this being one of the Trinidad Foresteros its loss is of no consequence. The plants were carefully nursed in the plant-sheds until they showed signs of fresh growth, when they were potted in large pots and placed under shade in the nursery to become established before planting out in the next south-west monsoon. I am very glad to possess these varieties, especially *T. pentagona*, and shall be curious to compare its fruit and seeds with our "old red" kind.

Sisal Hemp.—These have been growing much better during this year, and a few hundreds of young plants have been propagated from them. These will be ready for distribution in the course of a few months' time should any one wish to experiment with this fine fibre-plant.

*Cubeb*s.—The drought in the early part of the year killed one of our two cubeb plants ; and the remaining one looked very bad for a time, but has now made a start, and promises to become established.

Para Indiarubber (Hevea brasiliensis).—The very hot weather in March caused a good many of the blossoms to wither, and as the bad weather in May and June accompanied by high winds caused considerable damage to the young capsules, it was expected that the crop would be a poor one. However, owing to many more trees flowering this year, and the favourable weather in July, August, and September, we were able to supply all demands for seeds, and had a large quantity over for the nursery. The total crop was very nearly 100,000, 76,750 of which were sold, being advertised in the newspapers at Rs. 10 per 1,000 ; 2,000 were sent to Badulla Garden nursery and 1,000 to Anurádhapura, and the rest (20,000) were sown in the nursery here. These have grown into fine healthy plants, and are now ready for distribution.

None of the trees have been tapped this year. It has been usual to do this only in every alternate year, but the trees are now of such an age and size that they may be safely tapped every year. They have grown very much during the last twelve months, and many of them are now over 6 ft. in circumference at one foot from the ground, and would yield an appreciable quantity of rubber.

When in London I obtained, through Kew, a report from Messrs. Hecht, Levis, & Kahn on a sample of the rubber collected at Henaratgoda in 1894. It was considered of excellent quality, and valued at from 2s. 4d. to 2s. 1d. per lb., according to cleanliness from bark, &c.

Cola acuminata.—Another small plantation of twenty-three plants has been set out during the year at Henaratgoda, and most of them are doing well. The older trees have grown fast and look healthy, but have not yet flowered. The largest tree is now over 30 ft. high, but is only 12 in. in circumference at one foot from the ground. The Conductor has been successful in raising five plants from cuttings.

Bertholletia excelsa ("Brazil Nut") is growing very rapidly at Henaratgoda, is perfectly healthy, and a noble and handsome tree. It flowered in June, but, probably owing to the rough weather then, it has set no fruit. It is 64 ft. high and 3 ft. 4 in. in circumference at one foot from the ground.

Payena Leerii.—This, besides giving Guttapercha ("Gutta Sundek"), is remarkable in appearance, and will be valuable as an ornamental tree for planting at low elevations. It did not flower at all this year at Henaratgoda, but shows signs of flowering again next year. So far we have not been able to propagate from cuttings. The largest tree is 40 ft. high.

Uncaria Gambier.—A few seeds of this, from our own plants, were sown at the beginning of the year at Henaratgoda and germinated in March. The growth at first was very slow, but they made a start at the latter part of the year, and we have now twenty-five healthy plants 4 ft. 6 in. high, so that at last there seems a chance of getting this acclimatized here. Some seed received from Kew did not germinate.

Erythroxyton Coca.—Of this we have now a large stock of fine healthy plants, but there is practically no demand for them. It is rather surprising that no effort has been made to grow our large-leaved sort on a commercial scale here, as it seems likely to prove profitable. Mr. T. Christy, of London, has lately reported on some of this sort sent from Assam, which had been fired and dried, and was curled up like tea. Pronounced at first to be valueless, it was found on analysis to be very rich, and worth 1s. per lb., the price of the small-leaved Java sort being only 3d. Mr. Christy believes that higher prices still, 1s. 6d. to 1s. 8d., would be obtained for leaf so prepared for the extraction of alkaloid.

Camphor.—Owing to the war between China and Japan there was a scarcity of this drug at the beginning of the year, and as prices rose very high many inquiries were made for the seedling plants mentioned in my last report. We were able to distribute 975 plants to thirty-seven applicants. The number of localities where they have been planted for trial cannot be far short of fifty, and they vary from the highest to the lowest, and from the driest to the wettest localities, so that it will soon be seen in what climate they thrive best, but the tree is scarcely a native of the tropics. At Hakgala, with an average mean temperature of 62° and a rainfall of 89 in., the plants are doing well, and we have also some very healthy plants in the Anurádhapura Garden, where the mean temperature is about 80° and the rainfall 53 in. A small trial plot has been formed at Hakgala, and 200 plants have been planted out 12 ft. apart every way.

During the year Mr. Nock made an attempt to obtain some camphor from the wood of a tree at Hakgala, six years old, by distillation of the chips as described, but was not successful.

“*Sabai Grass*” or “*Bhabar Grass*” (*Ischæmum angustifolium*).—Seeds of this were received at Hakgala from the College of Science, Poona, at the beginning of August. They germinated well, but have not grown very fast. This grass is a native of North India, and is used for paper-making and in the construction of strings, ropes, and mats. It is common in the Western Himalaya, and grows best on a dry sloping site, and it is usually propagated from division of the roots. As a fodder, it is eaten by cattle when young.

Rumex hymenosepalus (“*Canaigre*”).—A box containing 30 lb. of roots of this valuable tanning plant was received at Hakgala at the end of the year in good condition from the Bureau of Agriculture and Forestry, Honolulu. They have been planted out in well prepared rich soil in the walled-in nursery for trial. If our soil will grow it, this will be a useful addition to our minor products, as there appears to be an unlimited market for the sliced and dried roots of the plant. It is a native of Arizona and New Mexico, where it grows in the driest regions. It is figured in Bot. Mag. t. 7433. The dry root contains about 33 per cent. of tannic acid—a higher average than the very best oak-bark.

Fruit Trees at Hakgala.—Mr. Nock reports:—

Several of the fig and peach trees bore a heavy crop, but unfortunately just as they were beginning to ripen the high winds at the burst of the south-west monsoon blew nearly every one off and greatly damaged the trees. The English blackberries during June and July produced a very good crop of well-formed and good flavoured fruit. It has now been proved that this fruits well and regularly, and can be recommended to all gardens at high elevations. It requires deep rich soil and to ramble over a fence. A few apples ripened in September; the largest was 10 in. in circumference, 3 in. deep, and weighed six ounces. It was as fine looking an apple as any one could wish for, and was perfect in colour and flavour. They require a rich free soil, which should be well drained, as they are very liable to canker.

In the early part of the year we received by parcel post from the Government Botanic Gardens, Saharanpur, one plant and six cuttings, each of fourteen varieties of Asiatic plums and one Chinese pear. They arrived in capital condition, and I am pleased to be able to report that every one of the plants and a good many of the cuttings have grown well. It was thought at first that as they came from a very dry country they would not be likely to thrive here, but they are in growth and foliage so much like the little cooking-plum that grows and fruit so well that I have great hopes of them, and from the splendid start they have made it is quite possible that we may get fruit from them next year.

Other Fruits.—A grape-vine presented by the Rev. Father Anthony has made a good start at Anurádhapura Garden, and promises to do well. It is only ten months old, but has put on some strong shoots and plump eyes, which have every appearance of producing fruit after the next pruning.

Eight plants of the celebrated loose-skinned orange have been introduced from Nagpur. They arrived in capital condition, and promise to do well at Badulla. It is proposed to propagate from them by buds and grafts as soon as possible.

“*Crawford's Cutch Company.*”—This Company has obtained from Government a monopoly for the collection of the bark of the mangrove trees growing on Crown land in the Trincomalee District, where they have established a manufactory of “cutch,” paying a royalty per ton on all exported.

This so-called “cutch” is an extract from the mangrove bark, and not the true “cutch,” which is an extract from the wood of *Acacia Catechu* manufactured in Burma and Northern India. Mangrove bark has long been extensively used by the native tanners, and there is a small export to India.

10.—HERBARIUM, MUSEUM, AND LIBRARY.

Herbarium.—No additions to the General Herbarium have been acquired during the year but many additional specimens were mounted and laid in the Ceylon Herbarium, in connection especially with the Director's work on the Flora, during the early part of the year.

The draughtsman and plant-collectors during my absence made excursions to Ratnapura, Balangoda, and Haputalé Districts collecting. The former has during the year made 26 finished drawings of Ceylon plants and six of exotic Orchids.

Museum.—In February I went carefully over the collection of 200 slabs of wood received in 1884 under their native names from the Pasdun kóralé, and labelled them with their Botanical names. It was with surprise and disgust that I found that very many, though labelled with different Sinhalese names, had obviously been cut from the same logs, thus 20 differently labelled slabs were “dawata” wood and 13 were “ná,” the actual number of different sorts being reduced from 200 to 128.

“*Handbook to the Flora of Ceylon.*”—The third part or volume of this appeared in London on August 1, with a further instalment of plates (Nos. 51–75). It continues the descriptions of the plants to the end of the *Balanophoraceæ*, i.e., 734 more species. One more part will complete the book, and I had hoped to do much toward its preparation in London (at Kew and the British Museum), but was hindered by indifferent health. Some solid progress has been made, however, and I hope to be able to finish this heavy piece of work by the end of the year at Pérádeniya.

Protection of wild Orchids.—As there was some danger of our rarer and more showy orchids, especially *Dendrobium Maccarthiae*, becoming eradicated by the practice of gathering them for export, I am glad to report that a Government notification has been published in the *Gazette* directing that their collection will not in future be permitted in Crown Forests in the Central, Southern, and Sabaragamuwa Provinces without a special permit from the Government Agent, which will be issued only on the recommendation of the Director of the Royal Botanical Gardens and with the concurrence of the Conservator of Forests.

11.—RECEIPTS FROM SALES.

Though the receipt from sales at the Pérádeniya, Badulla, and Anurádhapura Gardens are less than last year, there has been a considerable increase at Hakgala and Henaratgoda, owing chiefly to the sale of camphor plants at the former and of para rubber seeds at the latter Gardens.

The receipts of the year were :—

	Sales.		Number of Purchasers
	Rs.	c.	
From Pérádeniya	2,107	19	430
Hakgala ..	1,302	28	157
Henaratgoda	836	27	102
Badulla ...	57	45	13
Anurádhapura	35	97	37
Total ...	4,339	16	739

The estimated value of plants and seeds supplied gratis is :—

	Rs.	c.
From Pérádeniya	333	69
Hakgala	458	0
Henaratgoda	44	75
Badulla	55	75
Anurádhapura	8	0
Total ...	900	19

12.—EXPENDITURE.

The total cost of the Department for the year has been :—

	Rs.	c.		Rs.	c.
Salaries (including Exchange Compensation and 10 per cent. increase)	21,534	60	Pots, Tools, Labels, Books, &c.	3,985	53
Gardeners' and Labourers' Wages :—			Seeds and Plants	496	27
Pérádeniya	7,499	10	Upkeep of Racecourse Reserve	169	94
Hakgala	3,999	99	Special votes :—		
Henaratgoda	2,199	92	Cooly lines, Hakgala ...	1,500	0
Badulla	1,479	44	Towards publication of "Flora of Ceylon" (£250) ...	4,444	44
Anurádhapura	1,199	95	For new Meadow Mower	396	26
Travelling and Collecting	1,978	70	Total ...	51,143	86
Stationery	99	72			
Postage and Telegrams	140	0			

Pérádeniya, March 27, 1896.

HENRY TRIMEN, F.R.S.,
Director.

WILSON, SMITHETT & CO.'S TEA REPORT FOR 1895.

WILSON, SMITHETT & CO.'S CEYLON TEA MEMORANDA FOR 1895.

The chief feature of the market during the large part of the year under review was, unlike that of its predecessor, the maintenance of comparatively high rates for good common whole-leaf and the moderate value of good to fine tea—of satisfaction as regards low-lying districts, but of no little disappointment to some of the best known up-country gardens, whose teas had realized high prices generally during 1894. The scanty supply of common tea at the close of the latter year, consequent on the fine average quality of the Indian crop, caused a sharp advance for Soucheong and 'prize' as well as for low-priced Pekoes, and the opening sales of the year realized an average price 1 1/2 per lb. higher than that of the first week of 1894.

It is by compelling the attention of the distributor rather than the actual consumer that we look to see the use of Ceylon tea extended to all tea-drinking countries. Without this extension of the market, any increase of the latter stands in danger of being either neglected or gratified by spurious imitations of the real article. And although no little benefit must accrue from bringing the merits of Ceylon tea before the public in different countries, yet we firmly believe the chief power and ability to push the article rests with the large buyers and jobbers, who are ever on the alert to find new and remunerative outlets for the increasing supplies they are called upon to deal with.

Quality during 1895 was on the whole scarcely equal to that of the preceding year. This was most marked during the spring and early summer months, when the disappointing results obtained for many of the crack up-country marks were not so much due to the greater attention paid to low-priced teas as to lack of distinctive character and price. During the autumn months the quality left little to be desired.

grading.—On those Estates sending home the heaviest weight of tea it would, we think, be good policy to sort into four important grades: 1st, the finest crack broken leaf (dust and broken leaf); 2nd, the finest crack broken leaf (dust and broken leaf); 3rd, the finest crack broken leaf (dust and broken leaf); 4th, the finest crack broken leaf (dust and broken leaf).

Table with 3 columns: 20,000 lb. to 50,000 lb., 50,000 lb. to 100,000 lb., and Av. price per lb. about.

ESTIMATED RELATIVE YIELD AND AVERAGE PRICE

Table with 4 columns: Realized for the District, Ceylon Tea Districts, Av. Price, and Av. Price per lb.

WEEKLY PUBLIC AUCTIONS OF CEYLON TEA

Table with 4 columns: Week ending, Number of Pags offered in auction, Av. price per lb. for corresponding week 1894, and Av. price per lb. for corresponding week 1895.

BOARD OF TRADE RETURNS.

Table with 4 columns: Imports of Tea during the past four years (1891-1894), Exports of Tea during the past four years (1891-1894), and Stock of tea in Bonded Warehouses (in U.K.) at the close of the past four years (1891-1894).

Home Consumption of Indian and Ceylon Tea compared with that of China, Java &c. last year, five years ago and ten years ago taken from the Board of Trade Returns.—1895.

Table with 4 columns: Per centage, Indian, Ceylon & China, Java &c., and Total.

Monthly Imports of Ceylon Tea during the past five years (1891-1895).

Table with 4 columns: Year, Total, and Av. price per lb.

Monthly Deliveries of Ceylon Tea During the past five years (1891-1895).

Table with 4 columns: Year, Total, and Av. price per lb.

Stock of Ceylon Tea in Bonded Warehouses at the close of each month—1891-1895.

Table with 4 columns: Year, Total, and Av. price per lb.

SUMMARY OF CEYLON TEA SOLD AT PUBLIC AUCTION IN LONDON

Between January 1st and December 31st, 1895, amount of quantity in lb. and average price realized.

Table with 3 columns: Quantity in lb., Average Price, and Remarks.

GEO. WHITE & CO.'S TEA REPORT FOR 1895.

GEO. WHITE & CO.'S ANNUAL INDIA, CEYLON AND JAVA TEA REPORT FOR 1895.

LONDON, 31, FENICHOE STREET, E.C.,
10th March, 1896.

Unusually regarding supplies, especially from India, has been one of the chief features noticeable during the season, drawing to close, although the amount from every quarter has not been after all so extensive, still the fear of this has for the past six months kept the trade in an unsettled state, and every importer should therefore be made to further develop other sources, in view of the increased quantity which will have to be dealt with when the large acreages planted both in India and Ceylon during the last year or two come into bearing.

INDIA.—Original estimates of 1895 crop, compiled by the Indian Tea Association of Calcutta, in April, showed 124 million lb. as available for Great Britain, which, coupled with the poor quality of first arrivals, depressed buyers, and prices ruled very low, until in August, Pekoes were selling down to 14d. per lb., and Pekoe Souchong 14½ per lb. In October a fresh estimate was issued from the same source, lessening the probable amount for this country to 124 million lb., while in February it was further reduced to 121 million lb. South India will also furnish about 24 million lb., which will not be included in shipments from Calcutta.

The better quality, especially from Assam, coming to hand towards the close of the year, and the desirable character of the cold weather Teas, coupled with the advent of a smaller output than was expected, having, the 1895 had not come favourably upon the market, however it has on the whole, been of a useful description, and gone freely into consumption, as will be seen by the figures, which were 59,822,000 lb. against 55,715,000 lb. for the previous year, when clearances were checked, owing to the high rates ruling for common to fair descriptions.

From 1st July, 1895, to the end of February, 1896, the average for 800,000 packages sold on credit account was 84 per lb. against 81 per lb. for 735,000 packages in 1894-5, and 81 per lb. for 735,000 packages in 1894-5. Prices during the season under review have not fluctuated so much as in former years, probably due in a great measure to the fact that the quantity of tea available for the market was not so large as in 1894, while the time exchange ruled fractionally in favour of growers.

It is also satisfactory to note that consumption kept pace with arrivals as far as the United Kingdom is concerned, and that the quantity of tea imported into this country in 1895, which was 59,822,000 lb., compared with 55,715,000 lb. in 1894, and 55,715,000 lb. in 1893. During the same periods the quantities sold in London were—

1894, 59,822,000 packages; 876,000 packages; 53,000 packages; (Av. 84d. per lb.) (Av. 81d. per lb.) (Av. 81d. per lb.)

1895, 59,822,000 packages; 876,000 packages; 53,000 packages; (Av. 84d. per lb.) (Av. 81d. per lb.) (Av. 81d. per lb.)

The highest weekly average was recorded in the early part of the year, when it reached 10½d. per lb., from which it gradually declined until the end of June, when it fell to 7½d. per lb., rising again by degrees to 9½d. per lb. in the early part of the autumn, when it will be seen that the average of the various grades of the market. Taken all round quality was maintained, no doubt, to some extent, this helped to popularize Ceylon Teas in quarters where China Ceylon has hitherto been largely used.

JAVA.—There has been a steady increase in the use of Java growths which have come into better favour since the introduction of the new grades, more suitable to the requirements of the home trade than formerly. Consequently there was greater inducement to planters to increase their acreage, and in 1895, 4,411,000 lb. against 2,806,000 lb. in 1894, which was virtually all absorbed.

EXPORTS FROM THE UNITED KINGDOM.—The total amount exported from the United Kingdom during the past eight months, compared with the two previous years, is as follows—

Year	India	Ceylon	Total British	Java
1894	2,750,000	4,850,000	7,600,000	2,806,000
1895	2,800,000	4,900,000	7,700,000	2,806,000
1896	2,850,000	4,950,000	7,800,000	2,806,000

The following is a Comparative Table, showing IMPORTS OF Teas into the Port of London from India, Ceylon and Java, for the two seasons—

Year	India	Ceylon	Total British
1894	25,500,000	29,000,000	54,500,000
1895	25,500,000	29,000,000	54,500,000
1896	25,500,000	29,000,000	54,500,000

Year	Total British	China	Imports
1875-76	140,000,000	174,500,000	314,500,000
1876-77	150,000,000	185,000,000	335,000,000
1877-78	155,000,000	190,000,000	345,000,000
1878-79	160,000,000	195,000,000	355,000,000
1879-80	165,000,000	200,000,000	365,000,000
1880-81	170,000,000	205,000,000	375,000,000
1881-82	175,000,000	210,000,000	385,000,000
1882-83	180,000,000	215,000,000	395,000,000
1883-84	185,000,000	220,000,000	405,000,000
1884-85	190,000,000	225,000,000	415,000,000
1885-86	195,000,000	230,000,000	425,000,000
1886-87	200,000,000	235,000,000	435,000,000
1887-88	205,000,000	240,000,000	445,000,000
1888-89	210,000,000	245,000,000	455,000,000
1889-90	215,000,000	250,000,000	465,000,000
1890-91	220,000,000	255,000,000	475,000,000
1891-92	225,000,000	260,000,000	485,000,000
1892-93	230,000,000	265,000,000	495,000,000
1893-94	235,000,000	270,000,000	505,000,000
1894-95	240,000,000	275,000,000	515,000,000
1895-96	245,000,000	280,000,000	525,000,000

INDIA.—Original estimates of 1895 crop, compiled by the Indian Tea Association of Calcutta, in April, showed 124 million lb. as available for Great Britain, which, coupled with the poor quality of first arrivals, depressed buyers, and prices ruled very low, until in August, Pekoes were selling down to 14d. per lb., and Pekoe Souchong 14½ per lb. In October a fresh estimate was issued from the same source, lessening the probable amount for this country to 124 million lb., while in February it was further reduced to 121 million lb. South India will also furnish about 24 million lb., which will not be included in shipments from Calcutta.

The better quality, especially from Assam, coming to hand towards the close of the year, and the desirable character of the cold weather Teas, coupled with the advent of a smaller output than was expected, having, the 1895 had not come favourably upon the market, however it has on the whole, been of a useful description, and gone freely into consumption, as will be seen by the figures, which were 59,822,000 lb. against 55,715,000 lb. for the previous year, when clearances were checked, owing to the high rates ruling for common to fair descriptions.

From 1st July, 1895, to the end of February, 1896, the average for 800,000 packages sold on credit account was 84 per lb. against 81 per lb. for 735,000 packages in 1894-5, and 81 per lb. for 735,000 packages in 1894-5. Prices during the season under review have not fluctuated so much as in former years, probably due in a great measure to the fact that the quantity of tea available for the market was not so large as in 1894, while the time exchange ruled fractionally in favour of growers.

It is also satisfactory to note that consumption kept pace with arrivals as far as the United Kingdom is concerned, and that the quantity of tea imported into this country in 1895, which was 59,822,000 lb., compared with 55,715,000 lb. in 1894, and 55,715,000 lb. in 1893. During the same periods the quantities sold in London were—

1894, 59,822,000 packages; 876,000 packages; 53,000 packages; (Av. 84d. per lb.) (Av. 81d. per lb.) (Av. 81d. per lb.)

1895, 59,822,000 packages; 876,000 packages; 53,000 packages; (Av. 84d. per lb.) (Av. 81d. per lb.) (Av. 81d. per lb.)

The highest weekly average was recorded in the early part of the year, when it reached 10½d. per lb., from which it gradually declined until the end of June, when it fell to 7½d. per lb., rising again by degrees to 9½d. per lb. in the early part of the autumn, when it will be seen that the average of the various grades of the market. Taken all round quality was maintained, no doubt, to some extent, this helped to popularize Ceylon Teas in quarters where China Ceylon has hitherto been largely used.

JAVA.—There has been a steady increase in the use of Java growths which have come into better favour since the introduction of the new grades, more suitable to the requirements of the home trade than formerly. Consequently there was greater inducement to planters to increase their acreage, and in 1895, 4,411,000 lb. against 2,806,000 lb. in 1894, which was virtually all absorbed.

EXPORTS FROM THE UNITED KINGDOM.—The total amount exported from the United Kingdom during the past eight months, compared with the two previous years, is as follows—

Year	India	Ceylon	Total British	Java
1894	2,750,000	4,850,000	7,600,000	2,806,000
1895	2,800,000	4,900,000	7,700,000	2,806,000
1896	2,850,000	4,950,000	7,800,000	2,806,000

The following is a Comparative Table, showing IMPORTS OF Teas into the Port of London from India, Ceylon and Java, for the two seasons—

Year	India	Ceylon	Total British
1894	25,500,000	29,000,000	54,500,000
1895	25,500,000	29,000,000	54,500,000
1896	25,500,000	29,000,000	54,500,000

CEYLON.—The Teas which came to hand in the autumn months were good; but planters appear to have had no incentive to contend against the high prices of the year, so that on the whole the crop was of a medium character, shipments from the higher elevation States on many occasions showing a falling off in value. From 1st July last per lb. against 56,000 packages in the corresponding period of 1894-5, which brought 9½d. per lb. Total Exports from Colombo for the past three years were 52,000,000, 54,000,000, and 56,000,000 lb., respectively.

JAVA.—Quality has been fully maintained in the production of this island, and the more favourable market for Pekoes and Pekoe Souchong at the commencement of 1895 induced larger shipments, imports being nearly 4½ million lb. in 1894 and 5½ million lb. in the twelve months of 1894 and 1895.

INDIA.—Original estimates of 1895 crop, compiled by the Indian Tea Association of Calcutta, in April, showed 124 million lb. as available for Great Britain, which, coupled with the poor quality of first arrivals, depressed buyers, and prices ruled very low, until in August, Pekoes were selling down to 14d. per lb., and Pekoe Souchong 14½ per lb. In October a fresh estimate was issued from the same source, lessening the probable amount for this country to 124 million lb., while in February it was further reduced to 121 million lb. South India will also furnish about 24 million lb., which will not be included in shipments from Calcutta.

The better quality, especially from Assam, coming to hand towards the close of the year, and the desirable character of the cold weather Teas, coupled with the advent of a smaller output than was expected, having, the 1895 had not come favourably upon the market, however it has on the whole, been of a useful description, and gone freely into consumption, as will be seen by the figures, which were 59,822,000 lb. against 55,715,000 lb. for the previous year, when clearances were checked, owing to the high rates ruling for common to fair descriptions.

From 1st July, 1895, to the end of February, 1896, the average for 800,000 packages sold on credit account was 84 per lb. against 81 per lb. for 735,000 packages in 1894-5, and 81 per lb. for 735,000 packages in 1894-5. Prices during the season under review have not fluctuated so much as in former years, probably due in a great measure to the fact that the quantity of tea available for the market was not so large as in 1894, while the time exchange ruled fractionally in favour of growers.

It is also satisfactory to note that consumption kept pace with arrivals as far as the United Kingdom is concerned, and that the quantity of tea imported into this country in 1895, which was 59,822,000 lb., compared with 55,715,000 lb. in 1894, and 55,715,000 lb. in 1893. During the same periods the quantities sold in London were—

1894, 59,822,000 packages; 876,000 packages; 53,000 packages; (Av. 84d. per lb.) (Av. 81d. per lb.) (Av. 81d. per lb.)

1895, 59,822,000 packages; 876,000 packages; 53,000 packages; (Av. 84d. per lb.) (Av. 81d. per lb.) (Av. 81d. per lb.)

The highest weekly average was recorded in the early part of the year, when it reached 10½d. per lb., from which it gradually declined until the end of June, when it fell to 7½d. per lb., rising again by degrees to 9½d. per lb. in the early part of the autumn, when it will be seen that the average of the various grades of the market. Taken all round quality was maintained, no doubt, to some extent, this helped to popularize Ceylon Teas in quarters where China Ceylon has hitherto been largely used.

JAVA.—There has been a steady increase in the use of Java growths which have come into better favour since the introduction of the new grades, more suitable to the requirements of the home trade than formerly. Consequently there was greater inducement to planters to increase their acreage, and in 1895, 4,411,000 lb. against 2,806,000 lb. in 1894, which was virtually all absorbed.

EXPORTS FROM THE UNITED KINGDOM.—The total amount exported from the United Kingdom during the past eight months, compared with the two previous years, is as follows—

Year	India	Ceylon	Total British	Java
1894	2,750,000	4,850,000	7,600,000	2,806,000
1895	2,800,000	4,900,000	7,700,000	2,806,000
1896	2,850,000	4,950,000	7,800,000	2,806,000

The following is a Comparative Table, showing IMPORTS OF Teas into the Port of London from India, Ceylon and Java, for the two seasons—

Year	India	Ceylon	Total British
1894	25,500,000	29,000,000	54,500,000
1895	25,500,000	29,000,000	54,500,000
1896	25,500,000	29,000,000	54,500,000

INDIA.—Original estimates of 1895 crop, compiled by the Indian Tea Association of Calcutta, in April, showed 124 million lb. as available for Great Britain, which, coupled with the poor quality of first arrivals, depressed buyers, and prices ruled very low, until in August, Pekoes were selling down to 14d. per lb., and Pekoe Souchong 14½ per lb. From 1st July, 18

THE DEVELOPMENT OF NEW MARKETS FOR INDIAN AND CEYLON TEA.

DEAR SIRS,

The growing of Tea in British Dependencies is gradually revolutionizing the Tea trade of the world. The change of taste in favour of Indian and Ceylon Teas, which commenced in Great Britain, has been gradually but steadily extending to other countries.

This development of the trade in markets outside Great Britain has now become sufficiently extensive to afford considerable relief to the London market, and to exercise a most important effect upon prices.

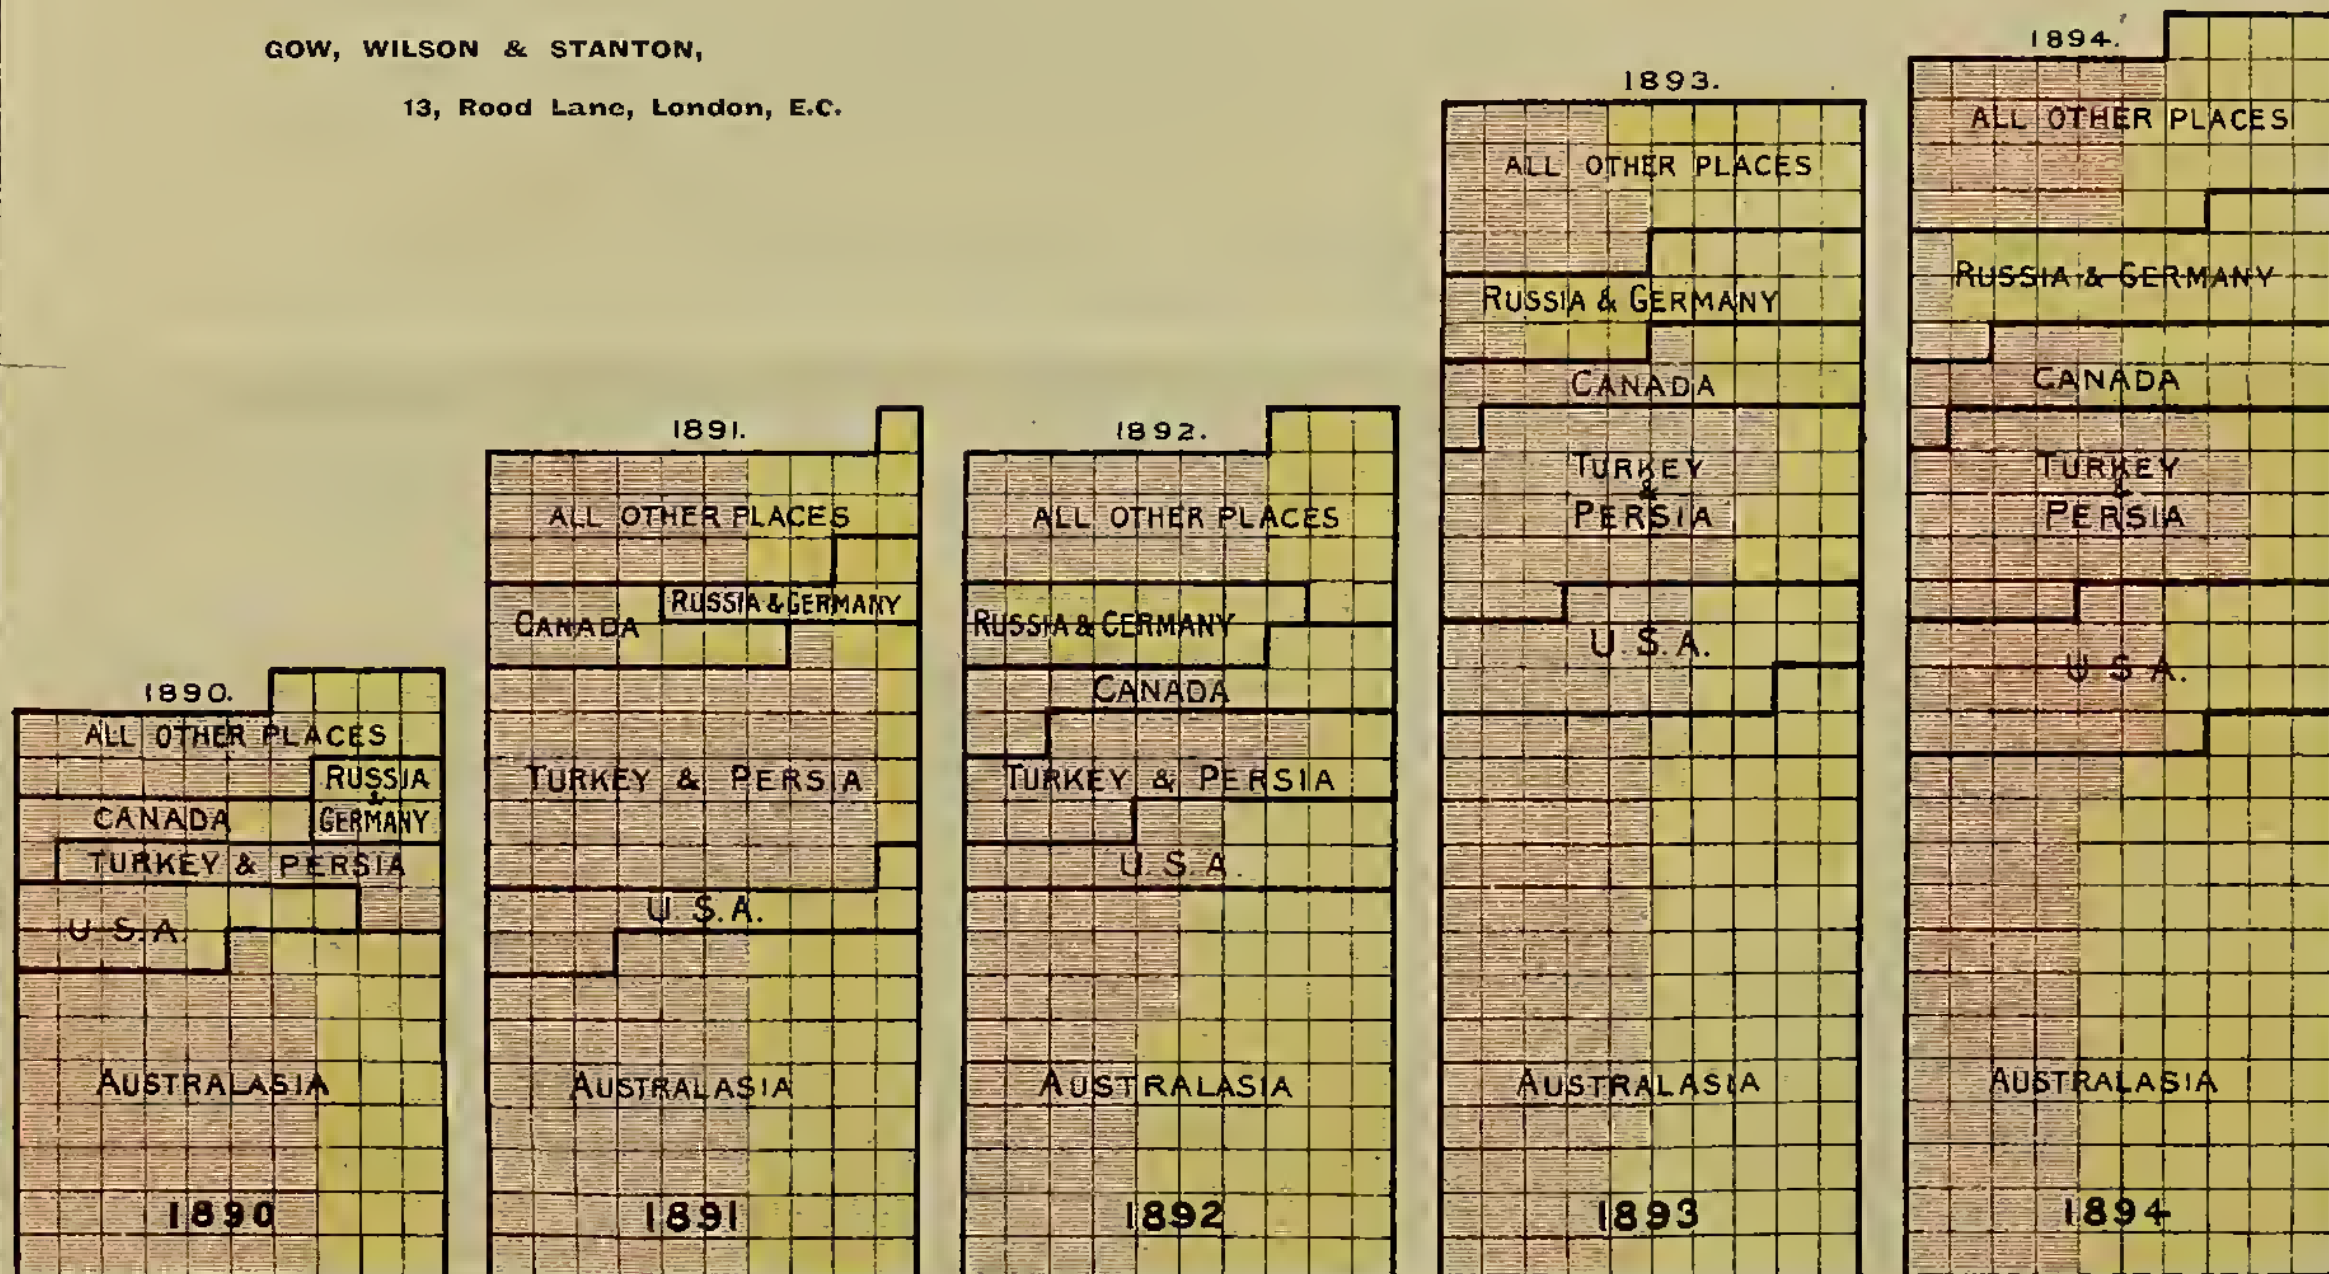

We are so impressed with *the absolute necessity which exists* for continuing to encourage foreign demand, that we again bring the matter forward without apology.

We are, DEAR SIRS,
Yours faithfully,
GOW, WILSON & STANTON,
Tea Brokers.

13, Rood Lane, London, E.C., June, 1895.

INDIAN AND CEYLON TEA TAKEN BY COUNTRIES OUTSIDE THE UNITED KINGDOM DURING EACH OF THE PAST FIVE YEARS.

GOW, WILSON & STANTON,
13, Rood Lane, London, E.C.

TOTAL IN LBS } 13,400,000 19,100,000 19,300,000 27,000,000 28,400,000.
EACH BLOCK REPRESENTS 100,000 LBS. TEA. INDIAN IS SHOWN IN RED CEYLON IN YELLOW

The diagram on the front page shows the progress made in the principal external markets during the past five years, giving also, as nearly as can be ascertained, the total quantities of both Indian and Ceylon Tea used outside the United Kingdom. The progress made is remarkable, and indications point to a still more rapid and important development in some of the chief markets, in the near future.

With the coming crop from India estimated at about 140,000,000 lbs., and that from Ceylon at about 91,000,000 lbs., the importance of using every available means for increasing the consumption of British Grown Tea becomes so great that no efforts should be neglected by which new fields may be opened up.

The prosperity of the Tea trade depends mainly upon the creation of sufficient demand to cope with the ever increasing production; and unless constant attention is bestowed upon the discovery of new outlets and the extension of existing markets, the danger of over production which has been the ruin of so many flourishing industries, might prove equally disastrous to the Tea producer.

Looking at the diagram, it is clear that many markets which five years ago were comparatively insignificant, have since attained sufficient importance to exercise considerable influence upon the course of prices.

Taking the most important market of all, namely :—

THE AUSTRALIAN COLONIES. One is surprised at the rapidity with which the taste has altered in favour of Indian and Ceylon Tea. In these Colonies the annual consumption of Tea amounts to about 30,000,000 lbs., and the quantity taken per head of population each year reaches about 7·66 lbs. Five years ago India and Ceylon contributed some 25 per cent., while at the present moment they supply about 45 per cent. of the total consumption.

Considering the similarity of race to ourselves, and the progress already made, there seems little reason to doubt that these Colonies will follow the example of the mother country in using almost entirely the Teas of our own dependencies,

NORTH AMERICA. The next market in point of size is that of North America, comprising the United States and Canada, in the former of which large amounts of money have been spent in endeavouring to foster a taste for both Indian and Ceylon Teas. The progress made has been slow, but after several years of anxious work and costly expenditure, an appreciable change has at length taken place in the public taste, and—as will be seen by the diagram—the quantity of both Indian and Ceylon Tea recently used has shown a remarkable increase.

So many different agencies are now at work for developing this extremely important market that it seems quite beyond doubt that the corner has at last been turned, and that an increasing outlet will in the near future be found in this locality.

RUSSIA. The expansion which has taken place in Russia in the use of Ceylon Tea during recent years is most encouraging, and affords almost a positive proof of its establishment in this large market, where some 70,000,000 lbs. of Tea are annually consumed. There is also a moderate sale for the more delicate liquoring kinds of Indian Tea.

Bearing in mind the strong demand which exists for fine China Teas and also for flavory Ceylons—the time seems to have arrived for Indian Tea proprietors to turn their attention to the conquest of this market. Ceylon has for years had a representative in Russia and has derived unquestionable benefit from his labours.

So much Tea reaches Russia through Germany, that exact figures cannot be obtained; the two countries are in consequence shown together in the diagram.

PERSIA AND TURKEY continue to use a large quantity of Indian Tea, and this market has also become a very useful outlet.

In addition to the above markets, there are various others which, in the aggregate, show important and encouraging results.

THE INDIAN TEA LEVY. The necessity for impressing upon Indian Tea proprietors the urgent need of continued subscriptions towards the fund for opening new markets cannot be too strongly insisted upon. Unless a liberal response is forthcoming to the appeal which has been made, there is danger lest the encouraging progress recently made in foreign markets should meet with an unfortunate check; an eventuality which, at the present juncture, would be essentially undesirable.

COARSE PLUCKING. A word of warning may be addressed to planters against the temptation to send home Tea of inferior quality, owing to the high prices ruling for the lower grades during the past season. Such a policy would probably lead to results most damaging to the general industry.

PROSPECTS OF TEA CULTIVATION. The cultivation of the Tea plant in India and Ceylon has been successfully carried on for a number of years, and has proved a source of considerable revenue to the proprietors. In both countries the industry has existed so long, and has proved so free from serious depredations, that it may be looked upon as fully suited to those lands, and as a thoroughly established agricultural product.

In India it has already a history of over 50 years, and has never been attacked by any serious blight or enemy of any sort; but its production has continued steadily to increase as the demand for it extended, until at present about 380,000 acres are under Tea culture, and a capital of some £15,000,000 is embarked in the enterprise.

In Ceylon, although the industry only dates back some 15 years, its progress has been one of uninterrupted success, and the climatic and geological conditions of the Island have proved most favourable to its profitable cultivation. About 280,000 acres are at present under Tea, representing a capital of some £11,000,000.

The fall in the value of Silver, the introduction of machinery, and improved means of communication have considerably assisted the Tea planter, and enabled him to gradually reduce the cost of production, and consequently to maintain, and in some cases even increase his profits, while the price obtained for his produce was declining.

At the present time the industry has every appearance of being thoroughly established upon a firm basis, and likely to continue a steady source of revenue, although like all agricultural products subject to good and bad seasons; still the Indian and Ceylon Tea industries have never yet been confronted with the evil of over production, and do not appear in serious danger of such a calamity, with the markets of the world before them and no other countries besides China and Japan and Java producing any appreciable quantity of Tea.

If only Tea proprietors will make up their minds as to the absolute necessity of strenuous exertions in the direction of fostering these outside demands, there seems little danger to the immediate future of the industry.

Now that so much attention is being bestowed by the public upon Tea investments it is more necessary than ever that no precaution should be left untaken which will conduce towards the prosperity of an enterprise gradually becoming more and more popular among investors, and one which has already done so much towards providing lucrative employment for many of our fellow countrymen, as well as natives of the Eastern dependencies of the British Empire.

GOW, WILSON & STANTON,

Tea Brokers.

13, Rood Lane, London, E.C.

TEA, COFFEE, CINCHONA, COCOA, AND CARDAMOM SALES.

NO. 23.]

COLOMBO, JUNE 8th, 1895.
