Violets will not do well in this climate without shelter from heavy rain and strong sun, so a thatched shed, 63 ft. long and 4 ft. wide, with open sides, has been erected in the nursery for their protection. Under this the white and blue Neapolitan violets have done remarkably well, producing an abundance of large, well-formed, sweet-scented flowers, some of them $1\frac{1}{2}$ in. across.

The wattle fences round the lower nursery were blown down in July, and part of the wall of the upper nursery collapsed during the heavy rain in August. Both were at once repaired. The upkeep of wattle fences, which require constant repair, is a great waste of labour, and a permanent and effective fence of wire and wire netting should be provided.

A temporary plant shed, 60 ft. long, was erected in November and thatched with talipots to protect the seedling annuals. The six thatched plant sheds have been repaired, but are now very dilapidated and require entire renewal.

5,037 wooden labels were made during the year, also 3 plant tubs and 90 plant boxes.

85 plums and 27 apples were grafted at the end of the year, and most of them have taken well.

675 packets of seeds were sown in pots and boxes, 73,388 seedlings were pricked out or transplanted during the year, 46,472 cuttings were planted in the nursery and propagating houses, and 6,530 plants were potted. The raising of such large quantities of stock is rendered necessary by the great loss from black grub and bad weather.

Borders and Shrubberies: Improvements, &c.—90,115 plants and seedlings of ornamental trees, shrubs, garden plants, and annuals have been planted during the year in the supply and upkeep of the gardens. All the borders were maintained in good order, and a new border was made to the east of No. 1 summer arbour. The pruning, thinning out, and digging out of the shrubberies was attended to, and manure applied. A hedge of *Frenela rhomboidea* has been planted along the public road below No. 3 summer arbour. Vacant places in the shrubberies have been filled in with suitable plants.

The greatest improvement during the year has been the erection of a barbed wire fence protecting the fernery and the part of the garden lying between it and the entrance gate. The wire was purchased locally and fastened to wooden posts. The total cost was only Rs. 281. It is much to be desired that the whole garden should be fenced in like manner, a portion being done every year. The length of fence erected this year is 400 yards; the fence is 5 ft. 6 in. high, with five rows of wire. 200 yards of 2-in. mesh galvanized wire netting, 3 ft. wide, has been fixed against it, beginning from the entrance gate, to keep out small animals. The undergrowth on the land between the fence and the cultivated garden, averaging 35 yards wide, has been cut out and all the rubbish burnt off. A path has been traced from the north corner of the fernery, winding through this new clearing, and joining the main drive near the gate, and two branch paths have also been traced from it to the main drive. The length of these paths is 380 yards, of which 130 yards have been partly made. A flight of ten steps has been laid at the end of the first branch path leading into the drive at the end of the pond. At the top end of the gully to the north of this retaining walls, 8 ft. long and 5 ft. high, have been built on each side of the stream, and a small ornamental wooden bridge has been made over it. Retaining walls have been built on each side of the gully to a length of 130 ft. A culvert was laid in the gully to the south, at the point where the path passes over it.

Classified Herbaceous Garden.—This has been a very trying year for herbaceous plants, owing to the excessive wet weather in the latter part of the south-west monsoon. Much damage was done by hares and other animals. The ground on the south-eastern side was cleared and dug, and six new beds, similar to those already existing, were made in it and partly planted with different kinds of grasses.

Rose Garden.—A new lot of roses, received from Messrs. Smith & Co., were planted in January and pruned down closely at the beginning of February. They then grew fast and flowered freely in April and May, but suffered severely from the abnormal weather later in the year. A protecting fence of wire netting is much needed for this garden and the adjacent herbaceous garden.

The Oxalis Pest.—This has been much reduced in some parts of the garden, but continues to appear in new places. 85½ bushels of tubers and leaves were weeded out during the year, and on one day in October the whole staff of coolies was set to work and weeded out no less than 108 lb. of tubers.

6.—HENARATGODA GARDEN.

The vote for upkeep of this garden was increased this year to Rs. 3,000, and a special vote for wire fencing was granted. The general condition of the garden has consequently been much improved.

Roads.—The roads and paths have been kept in good order. About 130 yards of road from the nursery have been raised, widened, and gravelled. Four culverts have been built. The bridge at the entrance to the garden is in urgent need of repair.

Wire Fence.—About 2,000 yards of wire fencing were put up along those boundaries of the garden which are not protected by the river. The fence was supplied by Messrs. Palmer & Co. of Westminster. Iron posts are fixed at every 18 yards, supporting four strands of stout barbed wire, strengthened by steel droppers between the posts. The erection of this fence is a very great improvement to the garden, and plots of important and valuable plants can now be laid out without fear of their being damaged or destroyed by cattle straying into the garden as was frequently the case before.

Buildings.—The conductor's bungalow was repaired, whitewashed, and painted. The roof of the conservatory, which had become rotten, was rebuilt with new timber. The visitors' shed was patched up temporarily towards the end of the year, and materials were obtained for the purpose of rebuilding it during 1898 in a more substantial way.

Upkeep of Garden.—The lawns, borders, &c., have been kept in order, and a considerable quantity of manure has been used in improving the condition of the various cultivated plants in the garden. A cart and a pair of bulls have been purchased and have proved of much use.

Experimental Cultivations.—A good deal of time and labour has been expended on the cultivation of economic plants. The experiments on rubber, begun last year, have been continued. Over 200 tappings have been made on 34 trees of the younger plantation of Para rubber. The plantation of vanilla has done well, and a considerable number of cuttings have been sold. The land formerly occupied by tea and part of that occupied by Liberian coffee has been cleared. New experimental plantations of rhea fibre, pineapples, coca, cardamoms, *Payena Leerii* (guttapercha), *Sansevieria* (bow-string hemp), gambier, and *Polygala butyracea* (a new fodder plant), have been laid out, and are doing fairly well.

Visitors.—The number of visitors during the year was much the largest on record, being 323 as against 106 in 1896.

7.—ANURADHAPURA GARDEN.

The vote for upkeep of this garden was this year increased from Rs. 1,200 to Rs. 2,000, and the general condition of the garden has been very much improved in consequence. A special vote was sanctioned for the erection of a wire fence.

Buildings.—The cooly lines, which had become utterly ruinous, were put into a fair state of repair, but really require to be entirely rebuilt. The much-needed repairs to the conductor's bungalow were commenced towards the end of the year.

Wire Fence.—About 1,250 yards of wire fencing were put up along the sides of the garden which are not protected by the elas. The fence is exactly similar to that at Henaratgoda.

General Upkeep.—The number of coolies employed in the garden has been increased, and a sum of money set apart for the purchase of manure. The general condition of the plants in the garden is now fairly satisfactory. A number of the palm trees have been much injured or destroyed by beetles, which bore into the buds. Trial has been made, but without much success, of kerosine emulsion as a preventative. Among the palms thus injured is unfortunately included the doum palm, which was just beginning to branch.

The weeding, clearing, and manuring of the garden has been attended to. A number of wira trees have been cut down, affording more room for the more valuable trees planted amongst them. The end of the garden near the Tissawewa has been drained and planted with various fruit and rubber trees.

The Government Agent has kindly provided a few seats for the garden, which are much appreciated.

The trees or plants of camphor, cacao, mahogany, *Swietenia macrophylla*, teak, baobab, dividivi, guaiacum, *Cedrela odorata*, *Eucalyptus alba*, coca, cinnamon, Nagpur oranges, and others are doing very well.

8.—BADULLA GARDEN.

The vote for upkeep of this garden was increased for 1897 from Rs. 1,500 to Rs. 2,000. This has provided for an increased labour force, and the general condition of the garden has been much improved.

Water Supply.—Much difficulty has been experienced in obtaining a proper water supply for the garden from the ela which supplies the paddy fields above. Arrangements were made with the authorities in charge of the ela to obtain a supply during a fixed period each day.

General Upkeep.—During the first eight months of the year the time of the coolies was largely taken up in carrying water from the river for the use of the garden, and thus the general garden work suffered considerably. The garden has been kept tidy, the shrubs carefully pruned, and a number of duplicate trees cut out. The plant shed was thoroughly repaired, and both it and the nursery kept supplied with a good stock of plants.

Weather.—The first nine months of the year were very dry, but there was plenty of rain in the latter part of the year.

11.—NOTES ON ECONOMIC AND OTHER PLANTS.

Tea.—The total export is again the largest on record, exceeding 116 million pounds, an increase of 8 millions over 1896. Exchange has continued high and prices rather low (7·71*d.* against 8·21*d.* in 1896).

The immense area now covered with tea still remains singularly free from disease, but great care and attention must be exercised if this condition of things is to last. When an outbreak of any disease apparently due to insects or fungi is noticed, the affected plants should be at once destroyed by fire to prevent, if possible, any further spread of the disease. One or two cases have occurred during the year of outbreaks of disease among nurseries of young plants grown from Indian seed. Planters should pay special attention to their nurseries in this respect, as considerable risk is run of importing dangerous or troublesome diseases with foreign seed.

Coffee.—The exports of coffee barely exceeded 19,000 cwt., over 3,000 less than last year.

The planting of Liberian coffee has received a severe check by the very great fall in price which has occurred during the year.

Cacao.—The exports continue to increase steadily, being 34,503 cwt., as against 31,366 in 1896.

Much attention has been given during the year to the canker mentioned in last year's report. During the early part of the year an extended investigation of the diseased areas was made by the staff of this Department, and the disease was found to be common in nearly all parts of the Central and Uva Provinces. The disease was found to be due to the attack of a fungus, whose exact nature is at present unknown, but which almost certainly belongs to the class of fungi which cause the various cankers of stems and roots. The information collected was published in two of the circulars issued by this Department, in which also suggestions were made as to the treatment of diseased areas or plants and the prevention of further spread. It was suggested early in the year that a specialist in fungus diseases should be engaged by Government for the study of this disease. This proposal, being adversely reported upon, ultimately fell through. There is much misconception as

to the capabilities of a specialist. His speciality is simply to discover the exact nature and life history of the fungus causing the disease. Many persons seem to think that once this is done he will be able to propose some simple wash or other treatment which will at once stamp out the disease where it already exists and prevent its re-appearance or its appearance in new places. This is far from being the case. The treatment of a fungous disease must generally be by improved cultivation, destruction of diseased plants, disinfection of the soil and surroundings, and preventive measures generally, but to cure plants already diseased is usually almost impossible. Whatever may be discovered about the life history of the fungus, the treatment of the disease will be much the same. Had the disease been dealt with when it first appeared many years ago it would not now be so widespread. There seems now but little chance of freeing the old red varieties from it in most districts of the Central and Uva Provinces. The Forastero varieties seem much more capable of resisting the disease; the planting of these varieties is extending, and it seems likely that they will gradually replace the old red cacao to a very large extent.

Cocoanuts.—The export of oil shows an increase of 66,000 cwt.; that of copra has more than doubled (106,601 cwt. against 50,049 cwt. in 1896); that of desiccated coconut has increased from 10,603,598 cwt. in 1896 to 12,054,452 cwt.; that of coir has largely increased, and also that of poonac. The only export that shows a decrease is that of nuts, and this decrease is very small. The industry appears to be in a prosperous condition, but, like tea, the increase is becoming gradually less pronounced.

Rubber.—The interest taken in the cultivation of Para rubber has received a very great impetus during the year, and the demand for seed has been enormously larger than the supply. These gardens form practically the only source of seed from mature trees. The total crop this year was rather over 100,000 seeds, of which 88,500 were sold to planters in Ceylon.

As mentioned in last year's report, experiments in tapping the trees at Henaratgoda have been carried on throughout the year. The results so far obtained are of some interest, and will shortly be published in one of the circulars issued by this Department.

Carludovica palmata.—A small experimental plot of this plant (see last year's report) has been made at Peradeniya and a supply will shortly be available for distribution to persons who may wish to experiment with it.

Rhea.—Considerable attention has been drawn to rhea during the year, and several planters have experimented with its cultivation on a small scale. Plots of the two chief varieties have been laid out at Peradeniya and the other gardens, and have grown well. Unfortunately the plants at Peradeniya have on several occasions been partly eaten down by cattle straying into the gardens during the night, owing to the want of a satisfactory fence, and it has thus been impossible to test the quality of the fibre.

There seems a prospect of rhea becoming an important cultivation in Ceylon in those parts where there is an ample rainfall at all times of the year and a plentiful supply of manure, the heavy crops rapidly exhausting the soil.

Camphor.—Mr. Nock reports:—

The plants have continued to grow well at Hakgala, and some of them are now 9 ft. high. They require pruning, and any one desiring to experiment in the distillation of camphor from twigs and leaves can be supplied with a small quantity of material for the purpose. We have had very good accounts of the plants distributed in 1895; some of those in Galle District have already grown to a height of 12 ft. There have been numerous inquiries for plants during the year.

Vanilla.—The comparatively high price of vanilla has given a stimulus to its cultivation in Ceylon, and a considerable number of plants have been put out during the year.

Ipecacuanha.—The nurseries at Henaratgoda now contain about 2,000 young plants, most of which are available for distribution to those wishing to experiment with this new product.

Vegetables.—The vegetable gardens have been considerably extended during the year, especially by the planting of as many varieties of native vegetables as possible.

Fodder Plants.—The lucerne at Hakgala continues to do well. If grown as a garden plant and supplied with dressings of lime and manure it continues to give good and frequent crops for many years. Four small beds were sown in March, and gave three good crops before the end of the year.

The new fodder plant, *Desmodium tortuosum*, the Florida beggar-weed, has grown fairly well at all the gardens.

Fruit Trees at Hakgala.—Mr. Nock reports:—

A good many of the imported fruit trees have died during the year, some after the excessive rains at the end 1896, and others after those in August, 1897. We have a good batch of strong plants of Cherimoyer, and it is surprising that there is not more call for them for planting between 3,000 and 5,000 ft. The red guava, *Psidium Cattleianum*, ripens in this district during August and September. It is a beautiful little fruit, and deserves to be cultivated much more extensively than it is. There is no doubt that by cultivation and selection it could be greatly improved in size and flavour. The apple-shaped guava, *Psidium pomiferum*, ripened a good crop in October and November, the flavour and size being good. Several fruits measured 8½ in. in circumference. The fruit, however, is comparatively light, the weight being only 4½ to 5 ounces. Birds are very fond of the fruit, and protection must be afforded as soon as it begins to ripen. The English blackberries began to fruit in May and really bore well; one spray had on it at the beginning of May no less than 107 berries and flowers in all stages. Given good soil and cultivation, I see no reason why this useful fruit should not do well in all up-country gardens. Apple trees suffer much from canker. As many as 45 fruits set upon one tree, but I regret to say most of them were stolen. Strawberries continued to grow and fruit well, but the weather during most part of the year has been far too wet for them to ripen properly. They require to be protected from birds, and also regularly mulched with clean straw and the fruit kept well off the ground. A quantity of plants were set out in February among the trees in the camphor plantation, but they have nearly all been destroyed by the Samhur deer.

Ornamental Plants.—The handsome West African climber, *Camoensia maxima*, flowered freely at Peradeniya this year, and we shall probably have plants for distribution during 1898. The *Victoria regia* plant was killed by the windy weather of the south-west monsoon.

At Hakgala *Wistaria chinensis* flowered well in February and March and again in December. Hydrangeas, dahlias, and camellias also did very well.

Peradeniya, January 22, 1898.

JOHN C. WILLIS, Director.

THE CEYLON TEA INDUSTRY IN 1897.

The Ceylon Tea Industry.

AVERAGES FOR PLANTATIONS SELLING IN LOCAL MARKETS, DURING 1897.

DEPRESSION IN SHARES OF "RUPEE" TEA COMPANIES.

We are indebted to our evening contemporary, the local "Times," for the following useful summaries which are worthy of being included for ready reference in our *Tropical Agriculturist*:-

LOCAL TEA AVERAGES FOR 1897.

CEYLON ESTATES SELLING THEIR PRODUCE IN COLOMBO.

CEYLON COMPANIES AND THE LOCAL SHARE MARKET.

A detailed study of the state of the local share market, and the prospects of both sterling and rupee capital tea and other produce companies—more particularly those formed during the past two years—shows how severe has been the relapse after the inflation of 1895.

The reflex action upon the island generally has not become very manifest yet; but must already be bringing its influence to bear in many directions. What the natives felt during last year more especially was the dearth of rice due to the Indian famine, and enhanced up-country by the Allagala Rock-slip. The immigrant estate coolies, in most cases, suffered less than others in this way, because the majority of estates shared the additional cost with their labourers. This has tended to further reduce the profits of not a few public companies; but it is fully realised now that the prime and lasting cause has been the artificial charges to which the prices of our staple have in no degree responded. It is not a characteristic of the Ceylon planter to be a man of luck. If it came to him in the ordinary risks of tropical life and work he is prepared to take his chance and accept the results in a manly way. Low prices do not force a complaint from him if he is competing on equal terms with the rest of the world; but when he realises that he has not a fair field; that his case, in spite of his highly-praised pluck in refusing to be wiped out by the coffee crisis, has not received consideration in connection with the present financial operations permitted in India, then his indignation is natural, and his protests will become louder and more urgent until they are regarded. We hope the Governor, as largely responsible for the continued prosperity of the country during his rule, has already aided the Secretary of State on this situation. If this has not been already done, the figures which we give to-day will, we trust, supply His Excellency with some reliable materials.

In the six months, July to December 1895 eighteen rupee companies, having a paid-up capital of Rs. 848,500 and a nominal capital of Rs. 560,000, had been registered. In a similar retrospect, a year later, it was stated that the feature of 1895 was the number of sterling companies formed. The companies floated in London during that year numbered thirteen, with a paid-up capital amounting to £902,170, which showed that four and a half times as much had been invested in London as in Ceylon, where during the same twelve months the public tea companies founded numbered eleven, with a paid-up capital of Rs. 259,000 and a nominal capital of Rs. 940,000. 1897 has been notable for the entire absence, since the first month of the year, of the formation of any local companies except of a private nature. In the January of this year one company was registered, and its shares are now quoted in the official list; but, from January to January exclusive, the public were not appealed to in the matter of a single new rupee tea company. The floating of limited liability concerns in London

GEO. WHITE & CO'S TEA REPORT FOR 1897.

TEA IN CEYLON AND JAVA.

GEO. WHITE & CO'S ANNUAL INDIA, CEYLON & JAVA TEA REPORT.

LONDON, 31, FENCHURCH STREET, E.C.,
23rd March, 1898.

In taking a retrospective view of the season now drawing to a close, it is evident that the anticipation of excessive supplies, as foreshadowed in the first estimates given of the Indian crop, together with the increase also looked for from Ceylon, caused the trade to exercise much caution at the outset in making purchases. Subsequently however it was found that these expectations as to the yield from both the above-named quarters would not be realized, and this to some extent imparted confidence, though buyers remained nervous and business was more or less quiet throughout, owing to several causes, including the Jubilee festivities and the engineers' strike, &c.

INDIA.

The Indian Tea Association of Calcutta in May 1897, originally computed the total out-turn for that year at 156,669,000 lbs., of which it was thought 138½ million lbs. would be available for Great Britain. This was afterwards reduced to 148 million lbs. and 130 million lbs. respectively, and it would now seem that about 134 million lbs. will be sent to this country from that part. On the other hand, imports from South India (say, 3,000,000 lbs.) are not included in the above and will about counterbalance "overside" shipments from here to America, Canada, &c. Taking this into consideration, there will therefore be about 3 million lbs. more than last season to be dealt with.

Quality from the different districts generally was not of an attractive character. Assams proved the best. Darjeelings were on the whole, disappointing. Docars were at times good, but the bulk was below that of 1896. Cachars and Sylhets were of ordinary style, while the produce of the North West Districts and that of the Madras Presidency was not up to that of former years.

The features of the season therefore, has been the super-abundance of plain and characteristic Tees, which caused a very low range to be established for these descriptions, but as a set-off to this, really fine full-flavoured parcels benefited by their comparative scarcity, and commanded good prices. It is disappointing nevertheless to notice that the reduced scale of values has not, as is usual, stimulated consumption. In some quarters this is attributed to the impetus given to the sale of cocoa and similar articles by special advertisements which have possibly drawn public attention to them, while there is no doubt that the labour troubles which have affected some of our manufacturing industries, have much curtailed the spending power of the classes interested. Deliveries from the London Bonded Warehouses for the eight months from 1st July, 1897, were 85,837,000 lbs. versus 85,527,000 lbs. in the previous year, and therefore did not show the expansion expected; while Stock at the end of February was 64,080,000 lbs. against 55,425,000 lbs. on the same date in 1897.

From 1st July, 1897, to the close of last month the average for 927,000 packages sold on garden account was 8½d. per lb., in contrast to 9½d. per lb. for 890,000 packages, and 9d. per lb. for 800,000 packages in the corresponding intervals of 1896-7 and 1895-6. Planters have moreover had to contend with the results of earthquakes, higher rates of exchange and freight, as well as dearer rice owing to famine in several of the provinces.

CEYLON.

Although scarcely equal to that of the preceding year, the 1897 crop was on the whole fairly good, but there was a noticeable lack of really fine invoices in the public sales during the summer months, and consequently prices were depressed, the average for July falling to 7½d. per lb. After August however, quality commenced to improve and the results were more satisfactory, until less desirable Teas again came forward. During the twelve months the amount which passed through the London Auction Room was:—

1897, 1896, 1895.
1,138,000 pks. 1,049,000 pks. 950,000 pks.
(Av. 7½d. per lb.) (Av. 8½d. per lb.) (Av. 8½d. per lb.)

No doubt the decline in the average is chiefly due to the inferiority of a portion of the crop consequent on abnormally inclement weather during the major part of the season. The coupled with adverse rates of exchange, freight, &c., has been detrimental to the interests of those engaged in the industry. The yield from the land showed an important increase, as total exports for 1897 were 116,000,000 lbs. against 108,000,000 lbs., and 98,000,000 lbs. in 1896 and 1895, while shipments to Great Britain rose to 93,998,000 lbs. contrasted with 93,336,000 lbs., and 85,753,000 lbs. in the two previous calendar years. Consumption however more than kept pace with receipts, which were 93,446,000 lbs. from 1st January to 31st December, clearance for that time being 95,172,000 lbs., opposed to 85,450,000 lbs. in 1896, of which 10½ million lbs. was exported in 1897, or say 2 million lbs. more than in the foregoing 12 months.

JAVA.

Supplies to this country were moderate, the quantity offered at Public Sale from the 1st July, 1897 to the 28th ult., being 26,000 packages versus

25,000 packages and 37,000 packages in the same period of 1896-1897 and 1895-1896. Quality was fully maintained and the style of manufacture for the most part was of a very useful description, particularly in the case of leaf plucked from plants raised from Assam and Ceylon seed, which has rendered the Teas serviceable to the Home Trade who now take them freely for blending purposes.

EXPORTS FROM THE UNITED KINGDOM.

The total amount of all Tea exported from the United Kingdom during the past eight months, as compared with the two previous years, is as follows:—

July 1st 1897 to end of Feb. 1898:—
July 1st 1896 to end of February 1897:—
July 1st 1895 to end of February 1896:—

| | India. | Ceylon. | Total British Grown. | China. | Java. |
|---------|-----------|-----------|----------------------|------------|---------|
| 1897-08 | 3,872,000 | 6,555,000 | 10,427,000 | 13,234,000 | 604,000 |
| 1896-07 | 3,252,000 | 6,131,000 | 10,083,000 | 13,554,000 | 605,000 |
| 1895-06 | 2,736,000 | 4,850,000 | 7,586,000 | 12,385,000 | 720,000 |

and the distribution for three complete years as taken from statistics furnished by the courtesy of H. M. Customs was as under, and from which it is evident that this branch of the industry is developing.

| | Continent of Europe. | United States. | Canada. | Other Countries. | Total. |

| 1897-98 | 30,000,000 | 263,000,000 |

Partly Estimated } Duty, until 30th April, 1890, 6d. per lb., afterwards 5d. per lb.

N.B.—"Overside" Transshipments to the Continent, America, Canada, &c., via London, and direct shipments to other Ports of the United Kingdom, are not included in the above. Prior to Season 1885-1886, the Ceylon figures given represent total exports from Colombo, the proportion sent from there to Foreign ports before that date being unimportant. Arrivals from Java are omitted, as they vary in different years, being regulated according to the state of the markets which take them.

The following figures will show the Exports to other Ports than Great Britain from Calcutta and Colombo the latter marking considerable developments.—

| | Australia. | Asia. | America. | Continent of Europe. | Total. |
|--------|------------|-----------|-----------|----------------------|------------|
| 1895-8 | 6,788,000 | 3,395,000 | 2,015,000 | 787,000 | 12,985,000 |
| 1896-7 | 6,092,000 | 4,222,000 | 1,927,000 | 437,000 | 12,681,000 |
| 1895-6 | 6,581,000 | 4,918,000 | 1,084,000 | 276,000 | 12,859,000 |

Shipments from Colombo 12 months:—

| | 1897 | 1896 | 1895 |
|------|------------|-----------|---------|
| 1897 | 13,234,000 | 1,774,000 | 831,000 |
| 1896 | 11,801,000 | 1,258,000 | 719,000 |
| 1895 | 9,580,000 | 1,187,000 | 394,000 |

The Board of Trade returns (which embrace statistics from all the bonded Warehouses in the United

Kingdom) for the past three calendar years were:—

| | Home Consumption. | Export. | Total Deliveries. | Bonded Stock, Dec. 31. |
|------|-------------------|------------|-------------------|------------------------|
| 1897 | 231,400,000 | 38,546,000 | 269,946,000 | 101,870,000 |
| 1896 | 227,866,000 | 38,240,000 | 266,106,000 | 103,799,000 |
| 1895 | 221,000,000 | 30,551,000 | 251,551,000 | 101,334,000 |

Owing to the check given to business, as indicated over leaf, the increase in the Home consumption was not so great as in 1896, but the quantity exported from here shows a comparatively important expansion.

It is not unreasonable to suppose that the more settled condition of the industrial situation in this country, coupled with additional progress in our dealings with foreign parts, will admit of improved business throughout the coming twelvemonth, and the more to conclude that our requirements will grow, and that we shall be able to dispose of 275,000,000 lbs. No official estimates of the India Crop are yet to hand, but we may probably look for the undermentioned supplies from the several producing countries, viz:—

| | India (including the Madras Presidency) | Ceylon | Java | Leaving China to furnish, say |
|--------|---|-----------------|---------------|-------------------------------|
| ... | 138,000,000 lb. | 102,000,000 lb. | 5,000,000 lb. | 30,000,000 lb. |
| Totals | 275,000,000 lb. | | | |

PROSPECTS.

Should climatic conditions be favourable and the 1898 crop prove good it will be of much assistance to the market. By the time the new Teas from India arrive to bulk the Bonded Stock, which at the moment looks rather heavy, will most likely be worked down, and the Trade will operate with confidence if there is a prospect of dealing with desirable and attractive parcels from both India and Ceylon. During the season now under review buyers have been overwhelmed with a heavy supply of uninteresting quality, which has led to a very low range of value for all but "stand out" grades, resulting in disappointment to nearly all those interested in the industry.

If the figures given above should prove accurate there would appear to be no difficulty in distributing the increased yield of British-grown Tea. It must however be borne in mind that we have hitherto been able to meet the annually augmented out-turn from India and Ceylon by a reduction in shipments to this country from China, which in 1880-81 reached the high total of 164½ million lbs. and are now only about 30 million lbs. A further diminution from this quarter can, perhaps, hardly be looked for, and therefore it is necessary that every endeavour should be made to further foster other markets, as has been done for some time past with considerable success by both the India and Ceylon Tea Associations and other agencies in Russia and various parts of the Continent as well as in Canada and America. If the local consumption in the East Indies amongst the teeming native populations could also be encouraged, a large quantity of coarse leaf and dust might be worked off which at present often does not realise sufficient to cover cost and freight to this country and tends to increase the supply of poor and low class grades which are really not wanted. The interests of growers would be much benefited if a mutual movement in this direction could be made by some influential Association which might be subsidised, even if it was considered advisable to make a compulsory "cess" for that purpose on each produce.

MANUFACTURE.

Now that so many improvements in machinery for withering, fermenting, rolling and drying the green leaf have been introduced, it seems that not so much scope is left for an advance in this direction as formerly, and it becomes more and more evident that the great variations in quality (again noticeable in the past season) are almost entirely attributable to climatic influence while the bushes are maturing. Over this stage the Manager can exercise no control, but by directing his supervision to plucking and the different processes of manufacture a good deal may be done to counteract the effects of untoward weather. Instead of spending large sums of money on new clearance it would often be advantageous to increase the labour force and concentrate attention on the cultivation and improvement of existing gardens. Experience has proved that on the majority of estates, especially those situated at a high elevation, moderately fine plucking, which means the employment of a full staff, gives the best result, and in localities where Teas with special point can be produced it would perhaps be better to strive after the attainment of this, especially when ordinary and mediocre descriptions from low lying gardens predominate. These remarks apply to parts of Assam, Darjeeling and Ceylon, where choice flavoured Teas can be made and where by the enhanced prices obtainable the course suggested would probably often pay even if quantity was reduced.

SIZE OF BREAKS.

No alteration has been made in the limits for large breaks since last year which stand as under, viz:—
Indian—20 Chests 30 Half-Chests, 50 Boxes.
Ceylon—18 Chests, 24 Half-Chests, 40 Boxes. Breaks of lesser size are sold separately at the close of the auctions.

ASSORTMENT.

As the whole crop from India has practically to be dealt with in about six months, owing to the greater facilities now afforded by railway and accelerated steamer transit, while during this busy period large quantities are also coming forward

from Ceylon, buyers complain of the succession of small shipments which are often despatched at short intervals from the same estate, and this should, if possible, be obviated. The sorting into too many grades is also inadvisable. A Broken Pekoe of say 30 chests or more; a good Pekoe of 50 chests or over; a Pekoe Souchoong of 70 chests or upwards; with a break of Broken Tea or Pekoe Fannings will generally be found to answer. Parcels containing dust are not readily saleable and therefore this should be sifted out and packed by itself, for which purpose some of the patent packages now in vogue might be utilized so as to avoid leakage on the voyage resulting in the loss of weight which often occurs with country made chests. The exception to the foregoing is when a tippy Broken Orange Pekoe or Orange pekoe can be made, as these when really fine usually command high figures, whether from India or Ceylon. Should the quantity of leaf available for this not suffice for a full sized break in Chests it might be packed in Half-Chests.

N.B.—In view of the low scale of prices now established any plan that will effect a saving in the handling of Teas will be of interest to the grower and we have therefore compiled a few hints as regards packages, bulking, &c., warehouses charges, and weighing, and these matters are dealt with in our "Notes for the Tea Factory," published separately, copies of which we shall be happy to furnish to those concerned in the cultivation of the article.

ANALYSIS OF CROP FROM INDIA.

ASSAM.

The yield from this district has on the whole been above the average, many of the shipments being of a very desirable character, whilst the leaf of those possessing autumn flavour was in most cases devoid of the reddish appearance which often depreciates the value of closing invoices. Owing to the scarcity of good liquoring parcels from other quarters the Trade was anxious to secure these at enhanced prices. Output for 1897 was barely up to that of the previous year, being 58 million lbs. against 59½ million lbs. in 1896 and compares with 55½ million lbs. in 1895.

LITERARY REGISTER SUPPLEMENT.

[Under this heading, in future, we mean to give a four page "Supplement" with our *Tropical Agriculturist*, each month, when there is matter of sufficient value, so to be preserved.]

APRIL, 1898.

The Archæological Survey of Ceylon and its Work.

BY PROF. W. W. GEIGER.

Amongst the many objects that occupied the Eleventh International Congress of Orientalists held at Paris, it had the opportunity of noticing also the admirable work done by the Archæological Survey of Ceylon. According to a proposal which I made in the afternoon meeting of the Indian Section on September 10th the Congress accepted a resolution to express its warmest thanks to the British Government in Colombo for the varied and efficient assistance afforded to the historical inquiry about the island by publishing the Archæological Reports, as well as by editing the Mahavamsa and similar documents. The Congress hoped also that the work which has been undertaken so auspiciously, will be continued by the Government, and carried out in the same manner. Now I beg to add a few remarks to that resolution, which may explain its origin and its purpose. These remarks are only caused by the anxious desire to make the work of the Archæological Survey of Ceylon as useful as possible to the scientific world, and they are based upon the experiences which I myself had in making use of its publications for my own historical and linguistic studies.

First of all, I am sorry to observe that the Reports of the Archæological Survey of Ceylon are by no means so well known in Europe, and so much studied by European scholars, as we should expect and as they deserve. I beg to mention but one instance. In the year 1892 the Government published Mr. H. C. P. Bell's most interesting and comprehensive "Report on the Kegalla District of the Sabaragamuwa Province." But I am sorry I could not even find this work quoted in the German Oriental Bibliography, though the editors of this journal took the utmost trouble to make their list of books as complete as possible, and though they mention a good many papers of much less scientific importance. I know very well that in the winter 1895-6, when I was myself in Ceylon, the excavations of Sigiriya, undertaken by the indefatigable Archæological Commissioner, Mr. Bell, had led to very important results, and I suppose that in the meantime some detailed report has been printed on these operations. But I have not seen it up to the present day, though I am very anxious to hear more about the subject.*

All scholars, I think, will therefore agree with me that it is extremely desirable to give much more publicity to the printed reports of the Ceylon Govern-

ment than they seem to have at present. This can be done by various means. But first of all it will be necessary that the Ceylon Government should give orders for the regular dispatch of the Archæological reports to this Society and to the British Museum, and it might also officially entrust a certain number of booksellers in the different countries of Europe with the sale of its publications. I suppose, of course, that an arrangement of that kind has already been made for England; but as regards Germany, Mr. Otto Harrassowitz, at Leipzig, no doubt would come first into consideration, because he already has in his hands nearly the whole book trade between our country and the Oriental publishers. Besides, if I am allowed to judge from the most amiable reception and liberal assistance which I ever found in Ceylon, I may, perhaps, add the suggestion that as is done by the Indian Government with their publications, the publications might also be sent direct to such scholars as are especially engaged in Sinhalese studies.

I pass now to the form and the contents of the publications themselves, and I wish at first to draw particular attention to the epigraphical work done in Ceylon. Inscriptions which have been newly discovered, or which now can be explained in a more satisfactory manner than formerly, are at present generally published in the Reports of the Archæological Survey, together with the other materials. The third part, for instance, of the Report on the Kegalla District, which I mentioned above, is merely an epigraphical one, and it contains, amongst other documents, the important inscription of Dewanagala, which alludes to some historical events in the reign of Parakrama Bahu I, quite in accordance with the statement of the Mahavamsa. Other new inscriptions used to be edited and translated in the J.R.A.S. Ceylon Branch; not to speak of Rhys Davids' papers on old Sinhalese Inscriptions, formerly published in J.R.A.S. in England, and of Rhys Davids', G. Goldschmidt's, and Edw. Müller's articles printed in the *Indian Antiquary*. This arrangement, I think, is not a happy one. The materials are spread far and wide, and the continuity of inquiry is in danger of being lost. According to my opinion, it would be best to separate the epigraphical part totally from the purely archaeological work, and to publish the inscriptions and whatever belongs to their study in particular reports. Thus a kind of "Epigraphia Ceylonica" would be established, and I am sure that it would find the unanimous approval of all European students of Sinhalese and of Indian epigraphy. It is hardly necessary to add that not only the newly discovered inscriptions or those which will be discovered in future, should be published in these periodical reports for which I beg to suggest the title "Epigraphia Ceylonica." There are a good many inscriptions already printed and translated as for instance in Edw. Müller's "Ancient Inscriptions of Ceylon," which require a new study, and which can be edited now with many improvements both in the text and in the translation. I do not doubt that even

* I know only Mr. Bell's "Interim Report on the Operations of the Archæological Survey at Sigiriya in 1895," printed in the J.R.A.S., Ceylon Branch, No. 46 S. 44-56.

those scholars who made the first steps in that rather dark field will fully agree with me on this point. The "Epigraphia Ceylonica" must, therefore, be accessible to everybody who might be able to contribute to the elucidation of Sinhalese inscriptions in the West as well as in the East. For by common labour only, and particularly by the common labour of European and of Oriental scholars, can satisfactory results be attained.

But there is still one important point which cannot be passed over in silence. It is quite indispensable that each inscription to be published or newly explained in the "Epigraphia" should be reproduced in a good facsimile. Mere transliterations are of comparatively small value, and would be sufficient only in quite exceptional cases. We cannot accept statements without having the opportunity of controlling them, for even the most trustworthy and most careful scholar may make a mistake in reading Sinhalese inscriptions, and a misreading may lead him to conclusions which are totally wrong.

The edition of the "Epigraphia Ceylonica" must, of course, be entrusted to a man who combines practical knowledge with scientific method; and I am sure that the Ceylon Government has at its disposal more than one scholar who possesses those qualities. But I hope that nobody will find in this remark anything like a reproach against the present editor of the Archæological Reports. We are all so much obliged to him for the invaluable service he has rendered to the science, even risking his health and his life, that any reproach would be equal to ingratitude. My suggestions touch only the form of the publications of the Archæological Survey; and I should be glad if they would be approved by Mr. Bell himself. For the edition and translation of inscriptions discovered by him, Mr. Bell always made use of the assistance of some native scholars, and he has repeatedly mentioned this useful service with the warmest acknowledgement, although it unfortunately does not appear in each case who is responsible for the particular piece of work.

The epigraphical inquiry, however, must be supplemented, I think, by a systematic study of the literary sources of the Sinhalese history. The chief part has already been done in this respect by the edition and translation of the Mahavamsa, which we really may call a standard work. But I believe that it is now time to publish also the secondary sources in their original text, together with an English translation, as for instance the Pujavaliya, Attanagalamvamsaya, Rajaratnakaraya, Rajavaliya, etc. I am fully aware that some of these books have already been edited in Ceylon itself. But it is sometimes not very easy to get these editions; the Rajavaliya is not yet printed at all. Besides, I think that a translation of these works is hardly superfluous, because many scholars will make use of them as historical sources, who are not able to read Sinhalese books in the original language. As to the form of these publications, I would propose to print them, just like the inscriptions, periodically in separate parts, but with one general title, as "Monumenta Historiæ Ceylonicæ"; these "Monumenta" would include even interesting passages about Ceylon and its people, taken from Greek and Latin, Arabic and Chinese, and even from older Portuguese and Dutch authors, together with a historical and geographical commentary. Papers of that kind used to appear sometimes in the J.R.A.S., Ceylon Branch; but I think it better to reserve the Journal for what we call scientific inquiries. Even such a treatise as Appendix I (Constitution of the Kandyan Kingdom) in Bell's Report, already quoted, would be in the right place in the "Monumenta," and would be studied by many more scholars, no doubt, than can now be the case. In fact, I hope it will be possible, in the course of time, to collect in the "Monumenta," all the materials on which our knowledge of Sinhalese history is based.

I took the liberty to express a few wishes, felt, I suppose, by all the European scholars who are engaged in Sinhalese studies, regarding the publications

the Archæological Survey of Ceylon. My purpose was only to make its excellent works more fruitful and more accessible to the scientific world. Nobody will say, I hope, that my suggestions are merely utopian ideas which never can be realized, because the expenses required by them would be extraordinary. They chiefly touch, as I have already said, the outer form of the publications. I wish to separate on one side those materials which are somewhat different, and on the other, I wish to concentrate the divergent labours of such scholars as are really working in the same field. The "Monumenta" would of course, appear as sufficient material was collected and Government funds were available for the publication, and the same would be the case with the "Epigraphia." I admit that some more money would be required by the proposal to add good plates to each of the inscriptions published therein. But it would be sufficient to publish the work quite slowly, provided it is published in a perfect and entirely satisfactory manner. I believe also that it will be necessary to print a greater number of copies of each report than has been done till now. But I am sure that at least a part of the money spent thereon will be recouped by the greater publicity, and by the better sale of the publications in Europe, according to the arrangement which I propose above.

To summarise, finally, all I have said, I beg to suggest quite respectfully that the Government of Ceylon might resolve to separate the Reports of the Archæological Survey into three different publications:

- (1) *Archæological Reports*, containing the archæological and sculptural results of the excavations;
- (2) *Epigraphia Ceylonica*, containing the newly discovered inscriptions, or new interpretations of such inscriptions as are already known;
- (3) *Monumenta Historiæ Ceylonicæ*, a kind of "Quellenkunde," containing Sinhalese historical books and other literary sources belonging to the history of Ceylon in the original text, with translation and commentary.—*Royal Asiatic Society's Journal*.

"Sigiriya Frescoes."

TO THE EDITOR ["CEYLON STANDARD."]

SIR,—Some one has been good enough to send me copy of your issue of the 20th instant, containing a letter by Mr. C. M. Fernando, and a short editorial paragraph, relating to the "Sigiriya Frescoes."

I note that Mr. Fernando has returned to the charge, in defence of his theory of Sinhalese authorship for the paintings at Sigiriya.

I do not propose to enter here fully into the disputed question of their execution by native, or foreign, artists: this I hope to do later in my Archæological Report on Sigiriya. I desire now merely to correct one or two inaccuracies into which Mr. Fernando has slipped.

It may be assumed once for all that the frescoes at Ajanta in India, and those on the Sigiriya Rock, were executed, if not by the same hands, at least by artists trained in the same school.

Mr. Fernando's arguments against the importation of "exotic talent" for the painting the Sigiriya frescoes may best be quoted, and briefly touched on *seriatim*:—

(I) "*Cæteris paribus*, the credit of painting frescoes found in Ceylon must, *prima facie*, rest with the Sinhalese."

Admitted; but "other things are" *not* "equal"; little Ceylon is not giant India; the field of selection for competent artists is as 1 to 60 (25,000 square miles to one-and-half millions.)

II. "Two of the frescoes at Ajanta, as pointed out by Fergusson and Manning, depict scenes from the Mahawamsa, the ancient chronicle of Lanka."

The scenes referred to are—(a), the supposed landing of Vijaya in Ceylon; and (b) the, supposed introduction of Buddhism into the Island—given by Mrs. Speir in her "Life in Ancient India."

As regards (a), Mrs. Speir rightly remarks that the picture—from the horse worship introduced into it—illustrates “a northern adaptation of the story in the Mahawansa, related in a Nepalese work of Avalokiteswara” who saved “Sinhala” (Vijaya) in the form of a horse. The Sinhalese have always belonged to the *Hinayana* (“Lesser Vehicle”) school of Buddhism which knows not Avalokiteswara, the Bodhisatva of the northern *Mahayana*, or “Greater Vehicle.” Much the same comment applies to (b), it may equally as well have been based on Northern Buddhist works as taken from the “Mahawansa” of the Southern school—if the painting has anything whatever to do with the meeting between Mahinda and king Devanampiyatissa.

III. “Mr. Bell made a point of the fact that the Sigiriya frescoes were the only ones of the kind in Ceylon. I replied by saying that those of Ajanta were just as unique as regards India.”

The Ajanta paintings are not “unique” in the sense of the frescoes at Sigiriya. It is true that the former (as Fergusson records) “represent Buddhist legends on a scale and with a distinctness found nowhere else in India.” But there are other frescoes which in beauty of execution run them very close—if, indeed, they do not surpass them;—and which prove, further, that the art retained its full vigour for many centuries longer on the Indian continent. I refer to the wonderful paintings to be seen at Fathpur-Sikri, near Agra, the “royal abode” of Akbar in the 16th century. Here, in Ceylon, we have nowhere else mural painting attaining the standard of art exhibited in the Sigiriya frescoes.

Again, had Kasyapa employed Sinhalese *siñgaru* to adorn the walls of his marvellous citadel, it may reasonably be inferred that the services of the ancestors of the Nilagama guild of painters would have been enlisted; and yet at this day no tradition even lingers among these hereditary craftsmasters, whose work at the ancient Dambulla cave temple goes back to an earlier date than the occupation of Sigiriya as a capital. Shown the Sigiriya frescoes in the “pockets” themselves last year, these Nilagama men declared their inability to explain the process by which the colours have been permanently “fixed,” or to attempt to “restore” them in any degree.

(IV.) “Thus, from Mr. Bell’s own standpoint, there is nothing to prevent the supposition that these are the only existing frescoes of many that were painted, not only at Sigiriya but in other places as well, in the 5th century of the Christian era.”

Nothing at all, as far as Sigiriya is concerned—but a great deal as regards “other places” throughout Ceylon. If I have examined one ancient cave, vihare, &c., in the Central, North-Western and North-Central Provinces, I have examined well nigh a thousand,—and any painting rivalling the art displayed in the Sigiriya frescoes I have still to find. The surface painting faintly traceable on the “altars” of some of the larger Dagabas of Anuradhapura, on the walls of the so-called “Demala mahaseya” at Polonnaruwa, or in the caves of Handagala and Dimbulagala, is not devoid of merit, but belongs to a lower grade of art than the frescoes of Ajanta and Sigiriya.

(V.) Mr. Fernando harps on the allusion in the “Mahawansa” to the use of “vermillion paint mixed with tala oil” for the ornamentation of Ruwanveli Dagaba when built by King Dutugemunu (first century B. C.); and quotes Sir Emerson Tennent in support of the “claim the discovery of oil painting on behalf of the Sinhalese,” upon this single shred of not too reliable evidence.

Very good: let us admit for the moment that the honour of the discovery actually rests with the Sinhalese—though it really needs considerably more proof; let us go further, and assume that Dutugemunu did not go to the continent of India for his artists—as, for all the “Mahawansa” tells us, he well may—what then? He must be a bold man that would assert that the descendants of the Sinhalese (if Sinhalese they were) who painted the Anuradhapura Dagaba “altars” were capable of designing, and carrying out, the life-like frescoes of Sigiriya. Moreover, as is well known, Oriental art is strongly conservative—follows slavishly stereo-

typed forms and methods. Is it probable—is it even possible—that the art of fresco painting should, among the Sinhalese, have risen to the high level of Sigiriya in the fifth century, and gradually degenerate into the travesty which offends the eye and excites ridicule, at the modern Buddhist temples of Ceylon?

(VI.) “Kasyapa was a prisoner king. Betaking himself to the rock-fortress of Sigiriya, he lay for eighteen long years in concealment, fearful of the vengeance of his brother Moggalana, from which he only escaped by the crime of suicide. It is difficult to understand the opportunities which this prisoner-king would have had to communicate with India, and to import therefrom exotic artists.”

“Prisoner-king”—presumably a sort of “ticket-of-leave” Prince; allowed by the considerateness of a younger brother to have for only “eighteen long years,” the run of the Island, provided he kept in decent “concealment.” To Kasyapa’s credit, be it said, he behaved exceedingly well during his period of “probation”—he committed no more murders—he did not worry Moggalana (who by the way appears to have found it “convenient” to cross over to India, so as not to embarrass his elder brother in the least)—he merely amused himself by erecting, at vast labour and expense, a magnificent royal citadel,—just to show what “honest concealment” meant,” of course, under such conditions, intercourse with India would be quite impossible.

(VII.) “The presumption of exotic artists would imply that painting was the only art in which the ancient Sinhalese were lacking, great as they admittedly were in sculpture, architecture, engineering, &c.”

This opens up a far wider question; and one that must not be “begged.” Is Mr. Fernando prepared to prove that the *Sinhalese* were “great” in “sculpture, architecture, &c.”? Will he favour the Asiatic Society with a paper on:—“The characteristics of the *Sinhalese* style of ancient architecture, as distinct from the Buddhistic and Dravidian styles found in India”? I do not say the task is impossible; but it is not to be undertaken hastily. At present there is much ground for the supposition that the Sinhalese kings imported skilled artisans from the continent to execute very many of the ancient monuments of Anuradhapura, Polonnaruwa, &c., commonly attributed to the Sinhalese. Few are the forms of building and sculpture which cannot be easily traced to an Indian source.—Yours faithfully, H. C. P. BELL.

Anuradhapura, Jan. 22.

A Portuguese Church in Batavia.

INTERESTING NOTES OF DAYS OF OLD—200 YEARS AGO :
PORTUGUESE vs. DUTCH IN THE EAST.

MIT OUD-BATAVIA DE PORTUGEESCHE BUITEN KERK :
(G. Kolff & Co., Batavia.)

The above is the title of a little book, written by Dr. F. de Haar, published, as the title page indicates for the benefit of the fund for the restoration of the Church.

As the name (*Buiten kerk*), indicates, the church stands *outside* the *ouden wal* (the old rampart) and, according to the writer, is fully worth a visit. “You enter through a gate, the church yard, surrounded, as ‘at home,’ with a wall. A paved way leads one, past tombs covered with tombstones, to the chief entrance. You enter, to leave behind you, India and all that is, and will remain strange to you. You are on your native land.”

“... Those seats along the wall, they are the same where you have often sat as a child. These seats in the nave of the church, many a Sunday have you seen well known faces, singing there, out of the psalm book. Your eyes fall on the many coloured hatchments on the wall, and one which records the date of the building, 1695.

The *buiten kerk* was not built for those high in station and office, but for the labouring classes, and the services in Dutch, or even in Malay, were the exception. Portuguese was the language used. When the Dutch conquered their mortal enemy, the Portuguese had long been settled in the East. They knew more than any other nation how to adapt themselves to the conditions of Eastern life. They brought none of their women to the East, hence the race of what our fathers called "mixtisen" in the Portuguese Colonies. The teaching of the Jesuit fathers swelled the ranks of "blaok Portuguese" and out of the Babel of tongues heard in Batavia, there arose a bastard Portuguese, a *lingua franca*. At first services took place in the fort, a little church was built which was burnt down during the siege (1623). Services were then held in the *gemeene wandaplaats* (ordinary promenade) of the *stad hins*. In 1634 Dr. Molinens began to preach in Portuguese. A class of "swarte borgeren" or Mardy'ken also arose speaking Portuguese, and the language had taken such a strong hold on the people, that in the year (1611) when Malacca was taken, the Government expressed the fear "that Portuguese would eventually sweep out the Dutch language" and resolved to take measures to prevent such a result. It passed a rule that officers of the Mardy'ken Companies should be able to speak Dutch. But with little success, as in 1674 Mantzinker, the Governor-General, wrote that the "Portuguese language had the Upperhand" to his great regret. Not only did slaves and freed people speak it, but it was the home language of the Europeans. The Portuguese congregation knew so little Dutch in 1713, that only 3 out of 100 understood it. Measures were then taken to spread the Reformed Religion. A Bandanese, Cornelis Seenen (commonly known as Meester Cornelis) was thirty year "voorlezer."

He was "a local celebrity," still remembered when many Governors-General are forgotten. Unfortunately, through lack of intelligence, he could not attain the rank of *predikant*, which the Government would have gladly granted to him. *Meester Cornelis tuyn* (Master Cornelis' garden) still commemorates his memory. In 1651 the Government resolved to build a masonry church for the native Chinese. The place selected was where, in the time of Governor Coen, the English had their quarters. The foundation stone was not laid till the 1st Jan. 1673. This church was used by the Malay and Portuguese congregations, but latterly, exclusively, by the Portuguese and was known as the Portuguese *Binnenkerk* (the church within the walls). This church was burnt down on the 14th Jan. 1808. Many Asiatics and freedmen from Ceylon came to Batavia and increased the Portuguese congregations. These people are described as "conforming to the manner of the Nederlanders" and it was said of them (1705) "that they went about with the ridiculous haughty air of the Portuguese, clad like Europeans, but mostly without shirt, socks or shoes, with an antique and tattered coat with their coal black faces and feet, looking like a mountebank's ape 'rigged out' in his finery." The Batavian mardy'kers, who had served the hon. Company well in their wars, settled outside the city walls close to the bastion *gelbria*. There was already (1669) a cemetery for them here, and there was built of bamboo a church where the Portuguese were catechized. In consequence of the increasing numbers of those who came to be catechized Governor-General Camphuys (1689) resolved to buy the "garden of Gerbrandt Nieholt," to enlarge the cemetery and obtain a site for a larger church. On the 19th October, 1693 the first stone was laid "in the presence of the Director-General Joan VanHoorn, by his nephew the Visitor-General Pieter VanHoorn." It was the intention of the Government that the Portuguese should provide the funds for the building, but this was found impracticable. The church funds of Formosa were sent to Batavia, after Fort Zelandia was taken by Coxinga, the native chief. Part of this fund was used to provide for the French refugees to the Cape of Good Hope, and the balance 3,000 rix dollars were used

for buying the building materials of the *Buiten Kerk*. On the 23rd October, 1695 the church was formally thrown open for public worship. The Rev. Theodorus Zas, an aged man with "a ferocious monstache" dating 30 years back to the time when he preached in the fleet to those who took part in the blockade of Goa, preached the first sermon taking as his text 1 Kings VIII 29 and 30, in the presence of the Governor-General and others. In the afternoon Rev Jacobus Opden Acker preached in Portuguese. This is the history of the building of the *Buiten Kerk*.

Hers follows a description of the church (two views of the inside being given):—"Of the six frames within each window-frame, at that time four were of rattan lath-work and only two of the upper ones had panes. This was found to be more airy. Here and there, there were coloured panes. The gallery was supported by three turned pillars which now support the sounding board (organ). The rail of the gallery was in the same style. Chandeliers were used for lighting. The roof was supported by six wooden columns. The present stone pillars appear to date from 1725. It is a question whether the present quaint pulpit is the same as that supplied by Hendrik Bruyn for 260 rix dollars in the year 1695, or whether the two newly-made *heerebanken*, with carved work, have not been since replaced." The native burgher, Sergeant Anthoni Colle, a brave Mardyker, presented 300 rix dollars to the church. A silver plate to his memory dates from 1695.

As regards the organ, in 1782, the daughter of the wealthy minister, Johan Mauritz Mohr, of the Portuguese congregation, presented to the church a new one, in memory of her father. The old fashioned chair in the nave of the church is apparently the same that was presented by the Governor-General Vander Parra. The old Portuguese Testament and Malay-Psalms book with silver locks, the four salvers and jugs of silver presented by Camphuys are not to be seen now. Also the two silver fonts gifted by the native Captain Anthony Adriaansz, or the two cups of Sinjeur Joan Rodrigo (perhaps some of this is in the Willems Kerk).

On the walls are various hatchments with Coats of Arms of long-forgotten ladies and gentlemen, heroes of the age of periwigs, of no interest to the present generation save that of Hendrik Swaardkroon (at one time Commander of Jaffna); many hatchments of Governor-General removed to the *Binnen Kerk* were destroyed by a fire in 1808.

In getting out of the church, to the left of the entrance there is the tomb of Zwaardkroon and those of other "notabilities." He wished to be buried with the "commonalty," among whom we find the tombs of Frederik Riebal (Mardyker) Titus Anthonysson and his "good" wife Ragel Titise.

Since then those buried here were Company's servants who died in the hospital:—

"Perhaps in this neglected spot is laid
Some heart, once pregnant with celestial fire—
Hands that the rod of empire might have swayed."

Here follows a description from *Heydt* (Schouwplaats). About the year 1800 burials ceased here, "and now a quiet kitchen garden has been started within the walls in this wretched quarter." The Portuguese services were afterwards less and less attended, collections fell off "and the time came when one was glad to find a clergyman who could speak Portuguese, although it was 'high' Portuguese, not understood by the congregation." Abraham Antony Engelbrecht baptized in Galle on the 6th May, 1759, and who died in Batavia 23rd September, 1808 was the last *Predikant* to the Portuguese. *Sic transit*.

Some historical notes are appended and an extract from the Dagregister of the Fort of Batavia 16th August, 1728, describing the funeral of Zwaardkroon, whose coat of arms is described as:—

"Azur a sword points upwards hilted gold, the end broken. Issuing from the helmet a raised hand holding a green wreath."

The above is a summary of the contents of this very interesting little book.—F. H. de V.

TEA, COFFEE, CINCHONA, COCOA, AND CARDAMOM SALES.

NO. 21.

COLOMBO, JUNE 7, 1897.

{ PRICE:—12½ cents each 3 copies
30 cents; 6 copies ½ rupee.
