It seems superfluous, after what has been written by me on this question of accommodation, to say more on the subject, so I shall merely direct attention and refer to what has been set forth at length in my previous reports. The want of room is every year increased and interferes with the progress and developments of the Library. It is to be hoped that the question of providing room for the legitimate needs and expansion of the Library will engage the Government's early attention.

BOOKS ISSUED FOR READING.

The number of works issued to readers from the shelves was 981, as against 990 in 1897, the books chiefly consulted were works on Zoology, Darwinism, Ceylon, Buddhism, Dictionaries, Encyclopædias, and other books of reference.

ACCESSIONS.

The past year has not been remarkable for any acquisitions of special value. Some books on Zoology and on Ceylon and some books of general reference were added to the collection.

The number of volumes added to the Museum Library was 152.

BOOKS ON CEYLON.

A Dutch Manuscript on Elephants in Ceylon, by Cornelis Taay van Wezel, acting "Gezaghebber" of the "Commandment" of Galle also "Land-drost" and "Hoofd" over the lands of Matara. 1713 A.D. Presented by O. Collett, Esq., F.R.M.S.

[This work was considered sufficiently interesting to be translated for the Ceylon Branch of the Royal Asiatic Society, and is published in the Journal of the Society for 1898.]

Original document of the Capitulation of Trincomalee, 26th August, 1795. Presented by Mr. Gerard A. Joseph. Au Loin: Impressions Hindoues (containing an account of Ceylon).

Translations of the Entomological Society of London containing a chapter entitled "On a Visit to Ceylon and the relation of Ceylonese Beetles to the Vegetation there," by George Lewis).

Letchimey: a Tale of Old Ceylon.

A Narrative of Events which have recently occurred in the Island of Ceylon, written by a gentleman on the spot. London, 1815.

Charters, &c., containing—

(1) The Charter or Letters Patent establishing the Supreme Court of Judicature in the Island of Ceylon and the High Court of Appeal in the said Island. London, 1801.

(2) The Charter or Letters Patent for making certain alterations in the Supreme Court of Judicature in the Island of Ceylon and in the High Court of Appeal in the said Island, and for abolishing the Provincial Courts and re-establishing the Courts of Landraad in the said Island. London, 1810.

(3) The Charter or Letters Patent for making further alterations in the Supreme Court of Judicature in the Island of Ceylon and in the mode of administering Justice in the said Settlements. Colombo, 1812.

Cases heard and determined in Appeal by the Supreme Court of the Island of Ceylon from December, 1846, to August, 1847, by Alex. Murray, Solicitor-at-Law. Colombo, 1848.

The following interesting articles bearing on Ceylon have been extracted from the Journals of the Royal Asiatic Society of Great Britain and have been bound and placed on the shelves:—

Description of the various classes of Vessels constructed and employed by the Natives of the Coasts of Coromandel, Malabar, and the Island of Ceylon, for their Coasting Navigation. By John Edye, Esq., late Master Shipwright of His Majesty's Naval Yard at Trincomalee, now in the Department of the Surveyor of the Navy. Communicated by the late Major-General Sir John Malcolm, G.C.B., K.L.S., M.R.A.S. (Journal, R.A.S., Vol. I, No. 1. London, 1834).

Notice of the Tabernacle or Car employed by the Hindus on the Island of Ceylon to carry the image of the god in their religious processions, with some remarks on the Analogies which may be traced in the worship of the Assyrians and other ancient Nations of the East, as compared with that of the Hindus. By the Rev. Joseph Roberts, C.M.R.A.S. (Journal, R.A.S., Vol. I, No. 1. London, 1833).

References to Ceylon (Transactions, R.A.S., Vol. III. London, 1835).

A Letter from Lieutenant-Colonel William Macbean George Colebrooke, of the Royal Artillery, F.R.S., M.R.A.S., transmitting three facsimiles of inscriptions discovered on the Island of Ceylon (Transactions, R.A.S., Vol. III. London, 1835).

Some Remarks upon the Ancient City of Anurajapura or Anuradhapura and the Hill Temple of Mihintale, in the Island of Ceylon, by Captain I.J. Chapman, of the Royal Artillery (Transactions, R.A.S., Vol. III. London, 1835).

Account of Pearl Fisheries of the North-West Coast of the Island of Ceylon. By Captain James Steuart, Master Attendant at Colombo. Communicated by Lieutenant-Colonel William M.G. Colebrooke, of the Royal Artillery, F.R.S., M.R.A.S. (Transactions, R.A.S., Vol. III. London, 1835).

A Sketch of the Constitution of the Kandyan Kingdom. By the late Sir John D'Oyly. Communicated by Sir A. Johnston, Vice-President, R.A.S., F.R.S.

Account of a Flag representing the introduction of the Caste of Chalias or Cinnamon-peelers into Ceylon. By Sir Alexander Johnston, Vice-President, R.A.S., F.R.S. (Transactions, R.A.S., Vol. III. London, 1835).

OLD MANUSCRIPTS.—194 manuscripts were consulted in the Library. The "Janavansaya" was transcribed from the copy in the Library. Buddhist priests have made good use of the Library during the year.

Owing to the large number of additions made to the Oriental Library of Manuscripts (since the issue of the last catalogue in March, 1892), I had a fresh catalogue compiled by Mr. H.M. Gunasekera, the Assistant to the Librarian. This catalogue gives all additions received up to date, and also gives descriptions of the contents of the manuscripts. The previous catalogue was very imperfect, and was more in the nature of a mere list of works. The new catalogue has been sent to the printer, and will I hope be issued soon. In connection with the compiling of this catalogue, the collection of manuscripts was thoroughly verified and the condition of the manuscripts reported upon by the Assistant to the Librarian.

Kottagoda Saranapalattissa presented the "Kachchayana," also known as "Sandhikappa." The work, though a common one, is useful. It is a grammar of Magadhi (or Pali) language. It is believed to be the oldest Pali grammar extant.

Maha Mudaliyar de Zoysa, in his "Catalogue of Pali, Sinhalese and Sanscrit Manuscripts in the Temple Libraries of Ceylon," says of this work:—

Tradition ascribes its authorship to Maha Kachchadana Thera, an eminent contemporary disciple of Buddha, but this is not now generally believed and the authorship of the work is still a moot point in the grammatical literature of the Pali language. It has several Tikas, Anutikas, glossaries, paraphrases, &c. written by various authors in Ceylon, Burmah, and Siam, which will be noticed in their proper places. Some commentators state that the Sutras, or aphorisms, were composed by Maha Kachchayana,

the Vritti Sangsananda, and the examples by Brahmadata. But little or nothing is known of these authors. The late Hon. Mr. James Alwis published the "Akhyata Kappa," or chapter on verbs, with an English translation, introduction, and notes. An edition of it was published in Germany by Dr. Kuhn, and a complete edition with a free translation by M. E. Senart.

CATALOGUING.

The second supplement to the catalogue was completed and laid before the Committee in manuscript and forwarded to the printer. The supplement contains an entry of all books received into the Colombo Museum Library since December 31, 1895, up to July, 1898. The method of construction is after the style adopted by me in previous catalogues, i.e., in the form of a dictionary catalogue (entries being made under author, subject, and title, with necessary cross references).

READERS.

The number of readers last year (i.e. of registered visits to the Library) was 764, as against 730 in 1897 and 570 in 1896. 82 tickets were issued to readers, including 35 renewals of old tickets and 47 new tickets. A party of young ladies has been visiting the Library for the purpose of studying zoology. The class is a private one, and is held under the superintendence of Mrs. Copleston. Several zoological works have been consulted and some studied.

CONCLUSION.

In the Museum Library every endeavour has been made to make the contents of the Library as accessible as possible to readers by the compilation of catalogues on approved and scientific principles. With the subject-catalogue of Part II (now being compiled) the entire collection of books and their contents will have been thoroughly indexed and catalogued. It now remains for readers to show interest and sympathy in the work of the Library by making use of it.

Libraries of all public institutions flourished and serve the purposes for which they are created in proportion to the active sympathy and intelligent interest of those who support and use them. In this lies much of the secret of their potency for good.

GERARD A. JOSEPH,
Secretary and Librarian

MR. RAMANATHAN AS A RELIGIOUS INSTRUCTOR.

[The following is copied verbatim from the Madras Standard. As to the versatility of our Solicitor-General there would seem to be no limit: but what this last phase of his teaching exactly indicates, we are at a loss to understand.—Ed. C.O.]

The "Gospel of Jesus according to St. Matthew as interpreted to R. L. Harrison by the light of the godly experience of 'Sri Parananda'" is the title of a recent book published by Messrs. Kegan Paul, Trench, Trubner & Co., of London. There is nothing attractive in the title of the book and many of our readers who are not Christians may not be tempted to read a book of this nature. But the book is of absorbing interest to us and deserves to be well-known in Southern India and Ceylon. The public do not know who 'R. L. Harrison' is nor who 'Sri Parananda' is. The former name may be that of a man or woman and the latter is not known except that it illustrates the modern rage for names similar to that of Vivekananda. But the 'Gospel of Jesus' is interesting to us as a book which embodies the truths of Christianity as explained

and interpreted to an Australian Theosophist by a well-known Hindu of Ceylon. 'R. L. Harrison' is a lady who is a native of Australia and who was for some time in Ceylon. She had given up Christianity and taken to Theosophy and was a confirmed Theosophist. 'Sri Parananda' is the assumed name of the Hon. Mr. Ramanathan, Attorney-General of Ceylon who is a Hindu of Hindus. The book before us contains in the shape of notes the teachings of the Hon. Mr. Ramanathan. Our readers will now see that the instructor is the Hon. Mr. Ramanathan of Ceylon and the person instructed is Miss R. L. Harrison of Australia. How long this instruction has been going on we cannot say; but we believe the main portion of the notes contained in the book were written on board the "Ballaraat" by Miss Harrison at the dictation of Mr. Ramanathan when they went to London for the Jubilee. In her preface to the book Miss R. L. Harrison acknowledges that "every word of the notes at the foot of the text fell from the lips of my beloved Teacher" and she adds prayerfully "may his commentary establish in Christ and God all who have thoughtfully read, discussed and doubted, and at last mourned and hungered for Truth!" The Hon. Mr. Ramanathan found in Matthew's record of the teaching and life of Christ a very close coincidence with Hindu Philosophy, especially that of the yoga system. The truth that he taught Miss Harrison may be summarised in his own words as follows:—"The great truth is that Jesus was not an idle dreamer nor a vain theoriser, but a man of the deepest spiritual experience, a true teacher of the kingdom of God, a veritable light into the world, whose doctrine *must* be recognised by all other men of spiritual experience as leading to the sanctification or healing of the spirit and thus to the attainment of God The true exponents of Jesus have little to do with history, but everything with doctrine, and you will find that the teachings of Jesus, so far as they are recorded in the holy books, stand on the firm ground of *actual* experience and are verifiable by those who by native disposition and previous culture are sympathetic enough to persevere in all earnestness and faith in the way ordained by those who have become sanctified in spirit."

A JOURNEY IN WESTERN THIBET.

"J. A. D.," in the second of a series of letters on the above subject, contributed to the *Times of India*, refers as follows to a conversation with the Bishop of Colombo, who is, of course, one of the leading authorities on Buddhism since the appearance of his very adequate and learned book:—

"During a visit to Ceylon the writer had a most interesting talk on the subject with the Bishop of Colombo, Dr. Copleston, the author of an interesting work on Buddhism. He seemed to think that the tendency of Sinhalese Buddhism is to endeavour to go back to the original tenets and practices of the early teachers of the faith, and to imitate the orthodoxy of the Thibetan Lamas. He mentioned the revival of the practice of contemplation, that striking characteristic of many Thibetan monks, who prefer to spend hours and days in contempla-

tion of divine things, lost to all sense of material things, and even to the physical discomfort of remaining in the same position for a long time. Several modern Buddhist writers have advocated the unity of Buddhism, but it is not likely that the Buddhist of Southern Asia would pay allegiance to the hierarchy of Lhasa, which would seem the only possible solution of the problem. Northern Buddhism has itself been modified by Hindu influences such as Siva worship, but such influences have been local rather than general in their effect."

AN ENTHUSIASTIC FRENCH ADMIRER OF CEYLON

M. EMILE BRUYAS, a French gentleman of means, visited Ceylon with his wife at the beginning of 1897; utilised the two months of his stay in the island to the best advantage; and on his return to his native land wrote his impressions of what he had seen, and had them printed, accompanied by reproductions of photographs taken by himself or (in a few cases) by local photographers. His book* is beautifully printed, and the photographic reproductions are often charming, showing that M. Bruyas has the eye of an artist. An unusual feature is that the sheets are not even stitched, but placed loose in a stiff cover; so that each possessor of a copy can have it bound as he please. Of the two hundred and fifty copies printed (all numbered) only *fifty* are for sale, the rest, we suppose, having been presented by the author to his friends, libraries, &c. He deserves the thanks of the island for his liberality; for he has certainly done his best to induce others to follow his example. To his book he prefixes a map (reduced from the one published at the *Ceylon Observer* Office) showing the route followed by him in the island. In his brief preface, M. Bruyas points out how easily and comparatively cheaply a trip to, and a short stay in, Ceylon can be made; and he strongly advises his compatriots to book through Cook's agency, the advantages of which he experienced more than once when in difficulties in our island. He concludes his preface thus:—

All the steamers stop at Colombo out of necessity, to take in coal, inferior Australian coal, but there is no choice; and if Colombo refused coal, all these magnificent steamers would become floating waifs; without any act of hostility, simply by refusing coal, the English could annul all foreign navigation in the Indian Ocean, and there would be no means of going to look for it elsewhere. Singapore and Aden are also English depôts, and it is not the coal of Djibouti or Kébao that would save the situation. Note that a coal depôt must be strongly protected, provided with lighters, and a multitude of coolies to carry out the supply quickly. Whence it results that it is absurd to have colonies when one is not certain of being able always to be in communication with them, and that it is prudent to think of organising them so that they can, if the necessity arise, be self-sufficient in everything.

* Emile Bruyas *Deux Mois à Ceylan*. Colombo, Kandy, Nurrelya, Badulla, Ratnapoura, Le Musée de Colombo, L'île Ramescheram, Anuradhapoura, Chronique et Statistique. Illustré de cent cinquante Reproductions dans le texte. —Lyon. 1898.

In the first chapter the author records his impressions of Colombo and its suburbs, including Mount Lavinia. Almost everything he saw seems to have struck him favourably, one of the few exceptions being the black European umbrella so commonly carried by the natives, which he denounces as out of harmony with the surroundings. He falls into a curious error in describing the Roman Catholic cathedral as "the most important and most ancient monument in Colombo, constructed by the Portuguese, who forgot to finish it." He also says that the visitor to the Kelani temple goes by the southern high road; apparently the temple at Wellawatta is meant. The goat's-foot ipomoea at Mount Lavinia attracted his attention, and he says he saw it nowhere else. Were Mr. William Ferguson living, Galle Face beach would doubtless still blaze with this blossom. The chapter ends with a description of the gems of Ceylon and the methods adopted by the wily dealers to entice strangers to buy.

In the next chapter, M. Bruyas describes his journey to Kandy by the railway which he strangely terms *narrow*. His opinion of our mountain scenery may be gauged by the following quotation:—"It was one of the most beautiful spectacles that one could have viewed. Although a great mountaineer, a *habitué* of the Alps, acquainted with the Pyrenees and the Tyrol, I declare that the line to Kandy and further on that to Nur-relya filled me with enthusiasm: it is still mountains, but the light is completely different." In Kandy M. Bruyas was fortunate enough to witness a *perahera* and to view the sacred tooth relic; he had a very poor opinion of the latter and its surroundings. The temple of the tooth, he says, was designed by a Portuguese architect, though he does not quote his authority; and he mistook the United Service Library for a Buddhist library. The Peradeniya Gardens did not equal his expectations; and of the plants that he took thence not one grew at Nice. He was interested in witnessing the manufacture of tea on an estate in Dumbara, where he also saw coffee and cacao growing. Regarding Ceylon tea M. Bruyas says:—

The tea of Ceylon is marvellously good and, moreover, one can feel sure that it is clean. When one has seen tea manufactured in China, one is highly disgusted: the steel tables that roll it are, in China, the dirty hands of unclean people, and there may fall into the material that is being manufactured all sorts of bodies as foreign as they are little appetising. In England the Ceylon tea has taken well, and they would like to make the conquest of America. The black spot is Japan, which is also going to set up factories, and during my voyage to Ceylon the arrival of two Japanese, whom the newspapers designated "Japanese tea spy" [*sic*], had put the country in commotion. I was forgetting the chief thing: in Ceylon, tea can only be cultivated from five hundred metres of altitude to eighteen hundred. The sea air does not suit it at all, and the first condition of this culture is to have very cheap labour; all those beauties who picked the little leaves with their little hands, in spite of their jewels, are paid about fifty centimes, a day, on which they sustain themselves, buy bracelets and economise, and are much happier than the work-women of Paris who earn three francs. I believe the tea would

sell very well in France, but it is quite useless to try.

In Kandy our author was present at a gymkhana (or a *gymnacka*, as he calls it), and was amused by an impromptu dance at the Queen's Hotel. He was pleased to meet a French planter from Mauritius, settled on an estate near Gampola, who engaged him to send out young Frenchmen to learn tea planting.

Leaving Kandy, M. Bruyas went by train and coach to Nuwara Eliya (or, as he prefers to spell it, Nur-relya), where he was struck with the "*Gracilea* or *Gravilea*" (*sic*) trees. A Russian couple arrived at the hotel at the same time as M. and Mme. Bruyas, and left next morning: "and that is called travelling" comments our author, who adds: "As for myself, I spent four days at Nur-relya without regretting them." He also asks why the fever-stricken officials of Indo-China and Tonking should not come to Nuwara Eliya for a change since their government has not found means to create a health resort for them in Indo-China or even in France. He ascended Pedro, saw no view, but found a reminder of France in a sardine tin. He throws unjustifiable doubt on the veracity of M. Cotteau, who states that when he ascended Pedro some years before he found fresh traces of wild elephants. We had a similar experience. At Hakgala gardens M. Bruyas was conducted with mystery to see a tree that bore fruit occasionally—the common hog-plum! From Nuwara Eliya our author drove to Badulla; and he speaks highly of the Ceylon resthouses, and adds, Why there are not similar institutions in France? From Badulla M. and Mme Bruyas drove via Bandarawela and Haputale to Balangoda and Ratnapura,—a route easier to descend than ascend, though Murray stupidly recommends the latter, says M. Bruyas. The grand scenery duly impressed the travellers; but the last part of their journey was rendered unpleasant by the illness of the driver's runner, who had an attack of what seemed to be cholera. However, ere arriving at Ratnapura he had recovered. The Maha Saman Devale was visited; and with reference to the Portuguese mural tablet M. Bruyas somewhat flippantly observes: "One does not know which to pity more, the beloved native, or the knight who bakes in his armour under the sun of Ratnapura." In the city of gems the travellers witnessed gem digging and polishing and bought some specimens. From Ratnapura to Kalutara the journey was made by boat down the Kaluganga; and so Colombo was once more reached.

In the next chapter M. Bruyas describes some of the contents of the Colombo Museum, situated "in the midst of the Cynamous-Park."

Starting off once more, M. and Mme. Bruyas went by the "Lady Gordon" south-about, calling at the various ports, and having an unpleasant experience at Trincomalee, where, in consequence of our author's taking a kodak snap-shot within the fort he was nearly arrested as a spy, and believes that he was "shadowed" afterwards. At Point Pedro our travellers disembarked

and drove across the peninsula to Jaffna, where the steamer was caught, and at Paamben, the object of their journey, the temple of Rameswaram, was reached. This was seen under great difficulties; and when our author and his better-half returned on board, they were quite exhausted with fatigue, heat, hunger and thirst. However, they would not have missed the sight for anything. On returning to Colombo M. Bruyas made arrangements at once for a visit to Anuradhapura, and went up to Kandy once more, staying there a couple of days to allow of the Governor's return from the "buried cities." At the Queen's Hotel our author came across some files of the *Paris Figaro* and *Vie Parisienne*, a perusal of which gave him no pleasure, but proved to him what utter rubbish forms the staple of the French press. His strictures are decidedly candid!

The next chapter is devoted to Anuradhapura, with which M. Bruyas was delighted; but he regretted the absence of Mr. Bell, not only because of the information he could have received from him, but also because he would have liked to testify to him his admiration of the results obtained with limited means. In his summary of Ceylon history there are some errors; but his remarks on the architecture and details of the ruins are of great interest. He comes to the conclusion that the dagoba is of Ceylon origin; and that any existing in India must be copies. Dambulla was visited on the return journey; and Sigiri was seen from afar. In Kandy and Colombo, thanks to abundance of money and the needs of some Kandyan family, M. Bruyas seems to have made a good collection of antique jewelry and objects of art. Alas, that Ceylon should be the poorer for these!

A short chapter contains a translation from the Mahavamsa of the description of the founding of the Ruwanweli dagoba; and the last chapter gives various statistics from our Handbook and a list of some of our planting manuals, &c.,—all this forming the text of some remarks disparaging to France by way of contrast. There is plain speaking:—

All these little books cost two rupees, and from their title alone one feels how practical they are, and what help they must afford to the new arrival, who besides is never isolated; he comes because, he has relations or friends already settled, with whom he makes a stay, and undergoes an education while waiting until he has bought a suitable piece of land. And it is thus that prosperous colonies are made, that young people, who, in Europe, would have vegetated for ever in narrow circumstances, are impelled towards a fair competence or even a fortune.

But it is not laborers, peasants that must be directed to the equatorial colonies: the white man cannot there carry on usefully manual labor.

It is the man having a little capital insufficient for the expensive life of Europe who will become the creator of an agricultural cultivation of large returns which will quickly give him a life of ease and freedom. Still he must be helped, protected; he must not have to create his industry from A to Z, he must profit by the experience made by his predecessors. He

must also be able to transport his produce and sell it and reinvest his profits.

When, then, on arriving at New Caledonia, for Tongking, or Guyana, or Madagascar, or simply in Algeria or Tunis, will our colonist find both a collection of practical and useful Manuals, and a Guide like the *Ceylon Directory*, which I have just run through. He would have a third of his success assured. But, for heaven's sake, do not let the practical manuals be compiled by members of the Institute or employees of the Minister for the Colonies, who have never gone beyond the fortifications of Paris; the best thing would be to translate the little English books, but that is too simple, no one would think of it.

We notice one amusing error, where our author is describing the contents of the Colombo newspapers: he says that they advertise "mummy boxes which are painted boxes for tea!" The *Tropical Agriculturist* is referred to as "une revue tres importante."

The return voyage to Marseilles is briefly sketched: and M. Bruyas concludes as follows:—

I shall be only too happy if these few pages should decide some intelligent Frenchman to quit the too well-known winter stations, in order to make the journey that I have just described, which allows of many additions.

One is so persuaded that France is the leading country in the world, that it is not bad to see a little the effect that one produces from a distance. Everywhere one is certain to enjoy a civilized comfort, and not to catch any illness requiring on one's return years of care. The expense is very moderate: there is no roulette on the route; for two, during three months, paying all that can be paid, I estimate it at less than twelve thousand francs; of course, purchases are separate.

All the ancient trinkets that adorn this work I brought with me, and I believe that a collector could still find some with a little patience, which is an additional attraction for tourists.

It would be of great interest to study this renaissance of Buddhism, of which the Theosophical Societies of Ceylon form the advance-guard; perhaps a great intellectual event is preparing over there, and I do not doubt that the French thinker, philosopher or literary man who wishes to learn would be heartily welcomed and put in possession of all the new ideas, which have absolutely nothing occult and scarcely anything religious about them.

Much happier shall I be, if my information should decide some willing young man to go and try the occupation of planter, either in Ceylon or in a French colony where, it is to be hoped, some day perhaps a colonist will cease to be considered as a disagreeable animal (to the officials), whom it is allowed to worry on every occasion.

For myself, if I had no matter what to plant, I should go to Ceylon by preference. I frequently read and re-read the Ramayana on the *Polynesian*; I am a little intoxicated with that beautiful poem so picturesque in its descriptions; it seems to me impossible that Sita and Rama exist only in the brain of the poet, and I am quite disposed to return to Ceylon, to visit all the ruins and search for traces of the expedition of Rama in quest of Sita with the charming form and graceful as a creeper in bloom in the month of May.

THE ROYAL BOTANIC GARDENS, CEYLON.

EXTRACTS FROM THE REPORT OF THE DIRECTOR FOR 1898.

CHANGES AND MOVEMENTS IN THE STAFF.

THE vote for skilled assistance has been expended in obtaining the services of Mr. J. Parkin, M.A., of Trinity College, Cambridge, who has been employed since March 20 of this year in investigations upon the chemistry of indiarubber (see below) and other subjects bearing upon the agricultural industries of the Colony. Mr. A. Perera, late second upper gardener, has been appointed to the new post of Foreman of Experimental Grounds at Peradeniya; the post he formerly occupied has been given to Mr. D. T. de Alwis, and the vacancy caused by the promotion of the latter has been filled by the appointment of Mr. T. W. de Alwis as third upper gardener.

GENERAL CONDITION OF THE GARDENS.

An increase of ten per cent. having been made in the vote for labour at Peradeniya and Hakgala Gardens (to be spent upon experimental work), the general condition of these gardens has been much improved, and a number of new experimental plots of economic plants have been laid out. A number of alterations have been made in the former with the view of improving the general appearance and picturesqueness of the garden, which is now decidedly increased. Many improvements have also been carried out in the branch gardens.

PERADENIYA GARDEN.

The general condition of this garden, both as regards its beauty and utility, has been much improved during the past year, and reflects much credit upon the Curator, Mr. Macmillan.

From his report I make the following extracts:—

Planting and Cultivation.—An unusually large number of new and unique plants has been planted out in localities in accordance with their natural families or uses. A great number, some of considerable size, were lifted and replanted in more suitable places. The latter operation has been attended with wonderful success, considering the unusual deficiency of the rainfall in August and the lack of any special implements. Fresh clumps of bamboo have been planted along the riverside, and old and decayed ones have been thinned out or removed. A new avenue of royal palms (*Oreodora regia*) has, after careful preparation of the ground, been planted along the northern portion of the Main Central drive, from the Great Circle, for a distance of 310 yards; in after years this should form a splendid avenue, twice as long as the one at present existing, which is becoming somewhat dilapidated.

The collection of crotons referred to in last year's report has been lifted and transferred to the steep path leading from the conservatory to the fernery. A collection of caladiums has been formed and planted along the shady borders of Liana drive, and a collection of ornamental Scitamineæ has been planted along the paved path leading from this drive to the entrance.

The portion of the garden referred to above, containing the conservatory and octagon house, and which it is intended to call the flower garden in future, has been made much more interesting and beautiful by the clearing away of ungainly growths, the levelling and clearing of the ground, the removal of termites' nests and dominant weeds, and the formation of new flower beds. New "orchid-flowered" cannas introduced from Italy, dwarf caladiums, dahlias, and others, make an effective display here and are much admired. The trelliswork arbours have all been removed to more effective positions, and on each is being trained one kind of climber only, instead of several as formerly was done.

The fernery, which had lost much of its beauty by becoming overgrown and crowded with tree roots, has been completely renovated and considerably extended, superfluous trees being removed, the beds being thoroughly dug and raised, the old soil partly replaced and manured, and the surface covered with small and large pieces of cabook, which counteracts the effect of drip from overhanging trees and prevents too rapid evaporation of moisture. A large variety of ferns, ground orchids, and other shade-loving plants have been replanted in the beds, new and wider paths made and paved with cobble stones, and flights of steps built where required. The fernery has thus been rendered more accessible and interesting to visitors, and of more value to the gardens.

The rockery has been overhauled in a similar way to the fernery, and the path and flight of steps have been brought into line with the walk through the nutmeg grove.

Perseverance with the lake has been rewarded with more success this year, and gives reason to hope that it may ultimately be made a very ornamental sheet of water. The tortoises continue to do much damage to the water lilies, and destroyed three plants of *Victoria regia*. A path has been made round the lake, and a seat placed on the north side.

The following plants flowered here for the first time in 1898, viz., *Aristolochia serrata*, *Bursera succulenta*, *Calpurnia lasiogyna*, *Cola acuminata*, *Cynometra polyandra*, *Fagraea fragrans*, *Grammatopodium speciosum*, *Hedyotis angustifolium*, *Hydrolea spinosa*, *Hymenopyramis brachata*, *Ilex punctata*, *Nandina domestica*, *Pentarrhophia laniflora*, *Polygala butyracea*, *Pometia* sp.

HAKGALA GARDEN.

Mr. Nock has, as always, kept this garden in beautiful condition in spite of the drawbacks of a very insufficient supply of water. During the drought in the latter part of the south-west monsoon the garden had to be watered with water carried a long distance.

Tree Ferns.—A second consignment of six *Alsophila crinita* was despatched to Kew in April, and arrived safely.

Manure.—Early in the year Mr. H. D. Solomonson, of Hilversum, Holland, generously presented us with ten bags of Ohlendorf's Peruvian guano (two kinds) for trial. It was applied generally to the plants in the beds and borders, pot plants, and the plot of lucerne. The results were remarkably good both as regards immediate increased growth and the rich colouring of the foliage and flowers, and I can confidently recommend this manure for horticultural work. The cattle have continued to give a large and useful supply; a shed for this is needed, as manure stacked in the open soon loses its value.

Visitors.—The number was 1,880 as against 1,776 last year. The largest number in any one month was 297 in April; the smallest, 74 in August.

Weather.—Taking it altogether, the weather during the year has been very trying for this garden. It has been remarkable for the longest and severest drought for the last sixteen years. The four months May, June, July, and August were all considerably below the average. The rainfall during August, as will be seen from the details below, was only 61 in. The drought, being accompanied by brisk, drying winds, killed out a large number of plants, and having no permanent supply of water we were put to great straits, especially during the latter part of August, when water had to be carted and carried from the river at Sita Eliya, a distance of over a mile.

On the other hand, the latter part of the year was very wet and dull. No less than 44.57 in. of rain fell between the 23rd September and 31st December (or on 99 days), there being only sixteen rainless days during that time. This was as disastrous to the young plants as the drought was before, especially in December, with its twenty-seven rainy and sunless days, which caused large quantities of plants to damp off. The wettest months were April, October, and December. The quantity of rain falling in these three months was 40.64 in., which is only 4.27 in. short of that which fell during the other nine months of the year. The three driest months were February, July, and August, which together only gave 5.67 in., February and August giving only 1.35 in. (in 59 days).

The total rainfall for the year was 89.55 in. on 213 days, against the average of 91.29 in. on 208 days for fifteen years.

The highest temperature in the sun's rays was 133.0 on 12th April against 138.0 on 23rd April last year. The mean amount of cloud was 6.7, exactly that of last year. The cloudiest month was November with a mean of 8.5 against August last year with a mean of 8.2. The brightest month was March with a mean of 3.1, against February last year with 4.8.

HENARATGODA GARDEN.

This garden has been kept in fair order during the year. The visitors' shed with a small working room attached has been erected. The number of experimental plots has been increased. It is intended to take this garden in hand during 1899, and completely overhaul it and its contents.

Experimental Cultivations.—The experiments on rubber tapping have been continued. New plots of various kinds of economic plants have been laid out.

Visitors.—The number was 222, against 323 last year.

Weather.—The year was wetter than usual, but August was very dry. Total, 132.75 in. on 193 days, against 118.61 on 191 days in 1898.

The average fall for the eight years 1891-98 is 100.93 in. on 161 days.

ANURADHAPURA GARDEN.

This garden has been kept in fair order during the year, but has suffered much from the severe drought, there being but little water in the tanks.

Economic Plants.—The varieties of Egyptian cotton sent from Peradeniya are doing well, and have seeded freely. This district seems well suited to the growth of cotton, but unfortunately there is no market for the produce, owing to the distance from the coast and the collapse of the Ceylon Spinning and Weaving Company. Sago does well in swampy places. Guaiacum grows luxuriantly, producing seed in abundance. The camphor plants are growing well, and some that are partly shaded are over 12 ft. high. When the water supply is more certain and railway communication opens up access to the markets of the south, there are many plants, fruits, &c., that should prove very successful in energetic hands.

Ornamental Plants.—The *Victoria regia* has been successfully grown and flowered in the pond. *Brownea grandiceps* has produced seed.

Show.—A fruit and flower show was held by the Government Agent in April, and gave encouraging evidence that many fruits and vegetables, &c., are now cultivated in this Province that were formerly unknown there.

BADULLA GARDEN.

This has been kept in fair order. A small guide to its contents was published as one of the "Circulars," with a view to making known the variety of useful plants it contains which have proved suited to the climate, and which are worthy of further trial by Uva residents. The present

Conductor will retire on 31st January, 1899, and it is intended to make some alterations in the garden and method of working.

Difficulties were experienced with the water supply in the early part of the year, but it has been more satisfactory since. The garden has been kept weeded and clean, and the usual routine work carried on.

The durian tree flowered well, and bore a number of moderately good fruit. Para rubber seeded well in January. The new fodder plant, *Polygala butyracea*, flowered well, but we have not enough of it as yet to try its value as fodder. The other new fodder, the Florida beggar weed, *Desmodium tortuosum*, is doing very well.

NOTES ON ECONOMIC AND ORNAMENTAL PLANTS.

The following report deals with those plants which are important in cultivation in the Colony, or are undergoing trial in experimental plots in the different Botanic Gardens:—

Tea.—The total export is once again larger than in any preceding year, being 119,769,071 lb. against 116,054,567 lb. last year. Exchange has been very steady at about 1s. 4d., and prices have been low, but with a tendency to rise later in the year.

The extension of this cultivation has now practically ceased, but large areas planted during the last few years continue to come into bearing, so that for some time yet the total output will probably slowly increase. One of the most promising features of the past year has been the large increase in the export to countries other than the United Kingdom, America taking 2,180,188 lb., against 830,873 lb. in 1897, and Russia 2,714,003 lb., against 439,349 lb., whilst the export to other countries has also increased very much. Australia now takes the large amount of 15,126,891 lb. The net result of this has been an actual decrease of the export to the United Kingdom by 2,796,226 lb., which should help to improve the prices obtained.

The cultivation as a whole has been favoured by the absence of disease, but signs are not wanting that this immunity is gradually coming to an end, and that, like all other cultivated and wild plants, tea will have to contend with enemies both of insect and fungous nature, whose ravages will be rendered more easy and destructive than is the case with wild plants or the smaller crops by the great expanses of land which are covered with tea to the exclusion of other plants. During the past year unusual drought in the early months and a partial failure of the south-west monsoon have decreased the yield of tea considerably. A number of insect enemies have done damage (see Mr. Green's report below), and the "gray blight" fungus of Assam, which is one of the most troublesome pests with which the Assam planters have to deal, has been more injurious than usual. It has been in the Island for many years, and is chiefly prevalent in the Yakkessa, Kotmale, and Pussellawa districts, though cases of its occurrence have been noticed in many others. The disease seems to spread more readily at low elevations. Though at present comparatively unimportant, this may become a very serious pest if planters are not upon their guard against its first appearance, and do not take care to eradicate it as far as possible when noticed. Other fungi have at times been noticed upon the tea, but none very commonly.

A few small estates of tea, &c., have of late been allowed to go out of cultivation, and this raises a question of much importance to the planting community. Unlike coffee, tea when abandoned does not die out, and consequently these estates form places in which both fungi and insects can, so to speak, develop a taste for tea which they may not have had before, and from which they may afterwards spread, to the great detriment of cultivated tea elsewhere. Wherever practicable, abandoned tea, &c., should be destroyed.

The chemistry of tea cultivation and manufacture is now being made the subject of exhaustive study by Mr. M. Kelway Bamber, the expert engaged by the Planters' Association, and it is hoped that the methods of manufacture will be improved in consequence and become less haphazard than is at present the case.

Coffee.—The export again fell largely, being only 13,313 cwt., as against 19,383 cwt. in 1897. and 86,009 cwt. in 1890. Native as well as plantation coffee has shared in this fall.

A number of varieties of Arabian coffee have been received from the Java Botanic Gardens, and are now growing at Peradeniya. Plants of the hybrid (Liberian-Arabian) are also doing well, but of course it will be some considerable time before we can obtain any crop from them.

Cacao.—The export has again risen from 34,503 cwt. to 36,982. in spite of the ravages of the cacao canker, which has been a troublesome pest during the year. The life-history of this fungus has been very thoroughly investigated during the year by Mr. J. B. Carruthers, the expert engaged by the Planters' Association. His observations and conclusions, with recommendations for treatment of the disease, have been published in pamphlet form by the Association. The treatment of the pest now rests with planters of cacao themselves, and there seems no reason to apprehend very serious danger to this cultivation, if proper pains be taken to attack the disease promptly wherever it may appear. As was predicted, the planting of the hardier *Forastero* varieties is extending, and the older varieties are being steadily replaced by them.

Coca.—The experiment plots of *Erythroxylon Coca* have been extended during the year, but there has been no demand for plants or seeds, except from South India.

Kola.—The trees in the experimental plot at Peradeniya, planted in 1891, have flowered in 1898 for the first time. The climate here does not seem to suit them.

Cardamoms.—The export of this product has slightly fallen, being 531,473 lb. against 532,830 in 1897. The cultivation has been a very profitable one in some districts, and the area devoted to it is being rapidly extended in the northern districts of the Central Province. A caterpillar pest which has done some damage is described in Mr. Green's report.

Other Spices.—The total exports of cinnamon continue to increase; that of chips has risen from 1,067,051 lb. in 1897 to 1,414,165 in 1898. Vanilla continues to be planted in small quantities. Of nutmegs, cloves, pepper, betel-pepper, ginger, &c., all of which are on trial in the gardens, there is nothing of special interest to report here.

Cocoanuts.—The cultivation of this palm continues to spread, and that largely in European hands. The export of most of the products of this palm has continued to increase: that of oil is 435,933 cwt., against 409,600 in 1897; that of copperah has risen from 106,601 cwt. to 506,277, chiefly in consequence of increased consumption in Russia; and all other products have also risen, excepting the nuts, only 12,027,714 being exported against 13,610,508 last year. The ravages of the cocoanut beetle are dealt with in the Entomologist's report.

Other Palms.—The export of palmyra fibre has risen largely to 41,522 cwt., the largest quantity on record. The plants of sago palm (*Metroxylon*) at Peradeniya and Anuradhapura have continued to do well, and a few are available for distribution to those who may care to experiment with this palm, which needs a swampy soil.

India Rubber.—A great deal of attention has been given to this product during the year. Mr. J. Parkin has spent the bulk of his time since March 20 in the laboratory here, carrying out chemical and physiological investigations into the processes of tapping and coagulation, &c. A tour was made in March to the Ratnapura and Kalutara Districts to see the plantations of Para rubber made by the Forest Department and on various estates. These trees are growing very well on the whole, and some have yielded very good rubber in promising quantity. The trees in the gardens have done well, and yielded a large quantity of seed, much of which was sold by auction at an average price of about Rs. 27 per 1,000. A large quantity of seed was also sold from private estates.

Early in the year a circular was published dealing with the cultivation, tapping, and probable yield of Para rubber. The climate and soil necessary were pointed out, and the land really well suited to this tree in Ceylon was estimated at 10,000 acres, chiefly situated in the Ratnapura and Kalutara Districts. In view of what is stated below, and of the fact that many persons are planting the tree at comparatively high levels or in otherwise unfavourable localities, I take this opportunity of calling renewed attention to the above estimate. Unless some much improved method of cultivation is discovered, or the price of rubber rises even higher than it now is, the chance of a profitable return in unfavourable localities is small. The tree itself grows as well in Ceylon as in its native home, Brazil; but the yield of rubber is very much less, and is less even than that obtained from similar trees in Java and the Straits. It should therefore not be planted in any but the most favourable localities available.

The whole question of what tree to plant has however been re-opened, when, so far as Ceylon was concerned, it might have been thought settled in favour of the *Hevea*. By the aid of machinery it is now possible to separate the pure or nearly pure caoutchouc from the latex or milk of any rubber-yielding tree, and the rubber so prepared has apparently the same quality, whatever tree it may have come from, and at the same time is very much purer than any natural rubber, even the best Para. When rubber thus prepared comes upon the market in quantity, the probable result will be that for some time it will obtain higher prices than any ever before obtained, but soon the price will fall to that now obtained for the best natural rubber, and the latter will fetch only a lower price. When the *Hevea* is tapped as has hitherto been done in Ceylon, there is always a large proportion of the latex which dries on the tree, owing to its extremely syrupy nature. This yields a scrap rubber, which at present fetches a good price, and it was upon this price that the estimate of pecuniary return given in the Circular was based. The price of this however, as has just been pointed out, will almost certainly fall. The rubber milk that collects in the tins or shells used in the tapping can of course be treated by machinery, and will fetch a high price, but the average price will not be improved owing to the poor value of the scrap rubber, which cannot be thus dealt with, and may even be lower than the estimate given. The whole question therefore stands in need of revision.

Further than this, the use of the machinery equalizes the quality of the rubber derived from different trees, and now it is no longer important to choose the tree which gives the best natural rubber, but rather that tree which yields the most rubber. There can be little doubt that the tree which gives the best return in this way will, for most districts of south-west Ceylon, be found to be *Castilloa*.

In view of the importance of the conclusions thus briefly indicated, it is proposed to publish details in the course of the next few months. The machine methods of preparing rubber have been patented. Mr. Parkin has also elaborated methods of preparation which are simple and inexpensive, and yield very good results. It is unfortunate that there is so little *Castilloa* in the Island that it is almost impossible to make a really fair test of the yield in different localities.

Both the new methods of treatment of milk above-mentioned lend themselves well to the obtaining of rubber from young stems, and experiments are in progress to test whether the cutting of young plants when eighteen months old or less will give a good yield; if this prove to be the case, it will of course obviate the present necessity and risk of waiting ten years for a return on the capital invested. Those who have large quantities of seed might well try broadcast sowing, or close planting of seedlings for cutting at a year or eighteen months old.

Guttapercha.—This year the trees of *Payena Leerii*, which give the "gatah sundek" of commerce, have flowered well, and we have a fair number of young plants available for trial. Owing to the slow growth and small yield, this tree is however not very suitable for private cultivation.

Rhea or Ramie.—The experimental plots of this product have been extended, but owing to the short time that they have been cultivated it is too early yet to draw any conclusions as to the yield per acre. The plant grows excellently well here, but needs much manure. The whole question has been gone into in a very thorough manner in a recent issue of the "Indian Agricultural Ledger," in which Dr. G. Watt pronounces on the whole against rhea as a probable successful and profitable export cultivation for India. Many of the reasons upon which he bases this conclusion are also applicable to the case of Ceylon. So long as the price offered for ribbons is so small, rhea is not very likely to prove a profitable cultivation in Ceylon.

Other Fibres.—Palmyra fibre has been mentioned above. Kitul fibre has been exported during the year to the extent of 3,794 cwt., the largest export on record. *Sansevieria* (bow string hemp), Sisal hemp, Mauritius hemp, and others are on trial in the gardens. A special number of the "Kew Bulletin" has lately been issued, containing a reprint of all the important papers on fibres that have appeared at different times in that Journal.

Cinchona.—The export has risen to 975,784 lb., against 653,346 in 1897, and 1,309,560 in 1896. Prices have somewhat improved, and though it would be perhaps unwise to recommend any extension of the cultivation, there seems some prospect of a return from those trees already in cultivation being obtained for some years to come.

Camphor.—There has been little application for this plant during the year, and considering the long period which must elapse before any return can be got, and the simple chemical constitution of this substance, this is hardly to be wondered at. It appears probable however that solid camphor can be obtained from the twigs and leaves, and as the tree coppices well like cinnamon this may prove a profitable method of cultivation, unless the present high price of the drug falls. Some prunings from the trees at Hakgala were sent to Mr. S. A. Owen, who obtained solid camphor from them by distillation at the rate of 15 lb. to the ton (*Ceylon Observer*, April 7, 1898).

Other Drugs.—Plots of ipecacuanha have been planted out, but we do not have much success with this plant, which seems to need some very special conditions of soil or climate which we have not yet been able to discover and reproduce. We have a lot of plants available for any one who will undertake an experiment with them.

A recent number of the *Agricultural Ledger* calls attention to the use in some parts of India of the seeds of the Totila (*Oroxylum indicum*) as a remedy in cattle ringworm and similar diseases. The tree is common in Ceylon, where its bark is used medicinally, and it may therefore be well to call attention to the paper above-mentioned.

Rice.—The chief point of interest in this cultivation which has come within the purview of this Department has been the outbreak of "weevil," dealt with in the next chapter.

Tobacco.—The decline in this cultivation of recent years has attracted attention, and it is intended to take up the whole question in detail during next year, if possible.

Grape-vines.—The vine is being tried with fair success in the garden at Anuradhapura, but the grapes suffer from the attacks of squirrels and other animals.

Citronella Grass.—The export of oil was the largest on record, amounting to 1,365,917 lb. A very full and interesting report upon this industry has been published in the semi-annual report of Messrs. Schimmel & Co. of Leipzig last October. It includes descriptions and figures of the processes and the machinery in use, and a map of the estates.

Other Oils.—Cocoanut oil has been mentioned above. The export of cinnamon oil has somewhat increased. Plants of different kinds of olives have been obtained from Italy and will be tried in some of the dry parts of the hills in 1899. A small demand, which may increase, has sprung up for kekuna oil (the oil from the seed of the candle-nut tree, *Aleurites triloba*).

Tanning Plants.—Gambier continues to grow fairly well at Henaratgoda, but no experiments have yet been made with it. A portion of the canaggre plot at Hakgala was dug this year. It

yielded at the rate of nearly $9\frac{1}{2}$ tons per acre. A quantity of the roots was dried and sliced, and was forwarded to England for report.

Fruit.—A large number of different kinds of papaws have been planted at Peradeniya, chiefly for the purpose of trying experiments upon the yield of pepsin. Pineapples continue to do well at Henaratgoda, and it is much to be regretted that when such magnificent fruit can be so easily and cheaply grown here, no attempt has been made to place it upon the home market, whether fresh or in tins. No other country can produce such large pines as those mentioned, and their flavour is excellent.

The oranges in the North-Central Province have suffered much from an obscure disease that manifests itself by gummy exudations from the bark, the parts above the gummy place dying off. Many of the best trees in the Anuradhapura District have fallen victims to this disease.

The fine varieties of mango in the south garden have begun to flower, but no fruits were obtained this year.

The European fruit trees at Hakgala have fared very badly this year, sixty of them dying during the severe drought. One of the plants of "Alucha yellow plum" raised from cuttings received from Saharanpur in 1895 fruited this year. This is a very promising plum; the flavour is good, and the colour a fine lemon yellow. The largest fruit was $5\frac{1}{2}$ inches in circumference.

Fodder Plants.—A small bed of the tree lucerne, *Genista prolifera*, was planted at Hakgala in July. It looks healthy and grows well, but is not likely to rival the true lucerne. The lucerne, *Medicago sativa*, has done very well at Hakgala this year. A small plot was cut over close to the ground on 5th February and dressed with Oldendorf's Peruvian guano. It grew in six weeks to a height of 24 to 45 inches, and gave a yield at the rate of $6\frac{1}{2}$ tons of green fodder per acre, or over 50 tons per year—a splendid yield.

The much-talked-of Florida velvet bean, *Mucuna pruriens*, var. *utilis*, does not thrive at all well at Hakgala, but does better in the more low-lying gardens.

Polygonum sacalinense, the sachaline is quite a failure at Hakgala, the plants merely existing.

The soy bean, *Glycine hispida*, was tried in Hakgala garden. Seed was sown in February, and grew very well indeed, but the monsoon, coming on just as they were ripening up, damaged them very much. The seed collected from these was sown in July, and began to grow well, but in August all the plants were eaten by some animal, presumably mouse-deer.

Carludovica palmata.—This plant was mentioned in the last report. A small plot of it has been laid out at Peradeniya, and during the year specimens of the leaves were prepared for plaiting as described in the written accounts of the manufacture in America. We were not however able to prepare specimens so good as those made in America and preserved at Kew.

Ornamental Plants.—The fine new varieties of cannas planted at Peradeniya have flowered well, and have been a great success. *Victoria regia* has been flowered successfully both at Peradeniya and at Anuradhapura. A fine specimen of the talipot palm flowered in the nursery at Peradeniya. Seeds have for the first time been obtained of the pretty Malayan palm, *Cyrtostachys renda*, which has red leaf sheaths; the specimens of it at Peradeniya are much admired and inquiries are often made for young plants, which we shall in future be able to meet to some extent.

REPORT OF THE HONORARY ENTOMOLOGIST.

Mr. Green has done an immense amount of work during the year; from his full report I make the following extracts:—

Owing to the drought up-country in the early months of the year and to the comparative failure of the south-west monsoon, there has been a marked increase in damage from insect pests of all kinds during 1898. Numerous complaints have been received of widespread injury from various insects that have hitherto attracted little attention. The more important insects of the year are noticed below.

Orthezia insignis, Dougl. (the lantana bug).—Considerable attention was drawn to this insect by its rapid increase throughout the Kandy District and along the railway. Besides the unsightly effect of the unhealthy and blackened vegetation, it was feared that the pest might spread on to the tea. That such fears were not altogether groundless was proved by the receipt from the Rangalla district of tea shoots thickly infested with *Orthezia*. Two small fields surrounded by chena scrub and native gardens were said to be attacked; but it is hoped that the strong measures taken have successfully checked its further extension on the tea. Fortunately tea does not appear to be a congenial food plant, and so far has only been attacked where the bug has been crowded off the lantana or other infested shrubs. The danger lies in the possibility of the insect acquiring a taste for the tea plant when it has once obtained a foothold there. On this account it is strongly advised that wide boundaries should be cleared back wherever lantana scrub or chena impinges upon tea fields in infested districts. It is most desirable too that measures should be taken to check the extension of the pest in waste lands. This is best effected by firing the scrub twice a year, if it can be safely done. At present the pest is principally confined within a radius of twenty miles round Kandy; but if unchecked, it may be expected to range over the whole Island within the next few years. A full account of its life history, with recommendations for its treatment, is now in the press as the next "circular" to be issued.

Paddy Pests.—In May and June considerable alarm was caused to cultivators of and dealers in paddy by the sudden increase of "weevil" among the stored grain, resulting in considerable loss of grain and depreciation of the value of the remainder. At the height of the panic paddy was sold in some places at the ruinous rate of 25 cents a

bushel. An examination of many samples and a personal investigation of granaries showed that several different insects were concerned in the injury. The common rice weevil (*Calandra oryzae*) was largely represented; but the greatest damage was caused by the enormous numbers of another small beetle which proves to be the almost cosmopolitan species *Rhizopertha pusilla*, Fab., a well-known grain pest. The following beetles were also present in smaller numbers:—*Tribolium castaneum*, Herbrt., *Lophocateris grani*, Alibert, *Alphitobius piceus*, Oliv., and *Tenebroides mauritanicus*. Besides the beetles, large numbers of a minute Tineid moth were present in all the granaries. It is probable that this insect is responsible for a large portion of the damage. Grains of paddy containing the larvæ and pupæ of the moth were observed, and from samples of damaged paddy that have been kept under observation for the last six months relays of the moth have continued to emerge, proving that they are breeding freely in the grain.

The cause of this sudden increase of injurious insects in the stored grain has not been definitely determined. It is well known that heating or fermentation, from insufficient drying, is a productive source of "weevil." Observations on the habits of the insects in confinement seemed to prove that they are unable to penetrate the husk of sound well-dried paddy, though defective grains were quickly attacked. Reports from the various districts on the circumstances prevailing at the time of harvest were rather conflicting. In several instances it was admitted that the grain had not been well dried, owing to heavy rain at harvest time. In other cases no such adverse circumstance occurred, and the grain was said to have been treated in the same way as in previous seasons. Happily the prevention and cure of the disease is comparatively simple, and was successfully put into practice. It consists in the inclusion of a certain amount of naphthalene powder with the grain in the granary; this substance keeps away insects from the grain and drives out those already in it. Six ounces are sufficient for 500 bushels of paddy. Circular No. 6 of this Department was issued in June, dealing with the pest and the method of treatment.

Helopeltis Antonii.—The so-called mosquito blight has been very prevalent in some of the low-country districts (Kelani Valley, Kalutara, Udagama), resulting in a great falling off of tea crop on affected estates. A visit was made to two of the infected districts, and the local conditions investigated. When the pest is at its height during the later months of the year there is an almost complete loss of leaf on badly attacked fields. The insects are present in enormous numbers. Children employed to catch them were, on one estate, bringing in from 200 to 400 insects each per day, without producing any apparent decrease in the number. This pest seems an exception to the rule that dry weather favours the spread of insect pests. During the dry months of January, February, and March the blight is practically non-existent. The insects commence to reappear with the April rains, and rapidly increase. This is the time to attack the pest. Every effort should be made to kill these survivors before they have had time to propagate. The eggs are laid in the young tea shoots, almost invariably at some point above the "initial leaf." The young insect emerges in 10 to 12 days' time. It follows therefore that a rigid system of plucking close down to the initial leaf, at intervals of 8 to 9 days, and the burning of the plucked shoots, must result in the destruction of a very large proportion of the eggs, and must tend to greatly check the increase of the pest. Our knowledge of the life cycle of *Helopeltis* is not yet complete, and will be made the subject of future investigations. Nothing is yet definitely known of the habits of the insects during the resting season. It is supposed that most of them die off as soon as the dry season approaches. A certain proportion, however, must hibernate and reappear in the spring, or resting eggs may be deposited and remain unhatched for several months. The determination of this point is most important.

Several other plant-sucking *Hemiptera* have been sent to me as attacking tea. They are brought in by the coolies employed to catch the *Helopeltis*. Considerable doubt exists as to the actual damage done by them. The commonest, and one somewhat closely allied to *Helopeltis*, is *Capsus rama*, Kirby, a greenish insect with transparent wings. It is often present in very large numbers on the blighted tea, and it embeds its eggs in the young shoots in a similar manner to the *Helopeltis*; but when kept in captivity no punctures were observed upon the tea shoots included with the insects.

Specimens of the common rice-sapper, *Leptocorisa acuta*, Thunberg, were received from the Udagama district with the information that they also were being captured in large numbers on the tea together with *Helopeltis*. This bug also refuses to feed upon tea in captivity. The presence of these insects on the tea requires explanation, and will necessitate careful observations on the spot.

The Spotted Locust, Phymateus punctatus Fabr.—A serious visitation of these insects occurred in several districts during the year. Damage was reported from the Badulla, Matale, Kadugannawa, Kurunegala, and Negombo Districts, chiefly to cocoa-nut and areca palms. Shade trees on cocoa estates were also defoliated. Investigations of the pest were made upon the spot, and a circular (No. 9) was published in December giving a full account of the insect and recommendations for treatment of infested estates. If these are carefully attended to, there seems no reason to anticipate any very serious spread of this pest.

The Cocoa-nut Caterpillar.—The small caterpillars that were reported to be ravaging cocoa-nut estates in the Eastern Province towards the end of 1897 have apparently not returned this year. The Government Agent, Batticaloa, in a report to the Colonial Secretary dated January 13, 1898, writes:—"From inquiries made, and on referring to some old diaries, I find that the pest has been known to exist for the past thirty years, sometimes breaking out with great virulence, and at other times disappearing altogether, but impairing the productiveness of the trees for a year or two after."

This caterpillar, which has not yet been scientifically identified, is gregarious, and feeds upon the under surface of the cocoa-nut fronds, consuming all the green parts, and leaving only the colourless upper cuticle of the leaf. It even attacks the immature nuts, and causes an unhealthy exudation of gummy matter. The insects conceal themselves from view by the construction of galleries composed of silk mixed with comminuted fragments of the leaf. The caterpillar itself is quite small, scarcely more than half an inch in length. The head and next two segments of the body are shining black, the remaining parts being cream-coloured with minute brownish specks. It eventually develops into a small grey moth, the front wings speckled with black.

To prevent the recurrence of widespread damage, action should be taken at the earliest re-appearance of the pest. The affected leaves should be cut off while the insects are still upon them, and burnt. It is a mistake to wait till the leaves fall off of themselves, for by that time the caterpillars have completed their transformations or gone to younger leaves. It is the custom of cocoa-nut planters to fumigate affected estates by burning rubbish on the windward side, so as to drive the smoke through the trees. It is doubtful if the treatment would have much effect as a cure, but it would be of considerable advantage as a preventive measure.

The Shot-hole Borer, *Xyleborus fornicatus*, Eichhoff, has been the subject of much correspondence throughout the year. Reports of injury to tea plants by this insect have been received from Watagoda, Nawalapitiya, Dolosbage, Kandy, and Deltota districts. Its presence is noticeable chiefly at the time of pruning, when the cut surfaces of the affected stems look as if riddled by small shot. On following out these holes they are found to ramify down through the stems, and to contain numerous dark-brown beetles and their whitish, maggot-like larvæ. This beetle (admirably figured in "Indian Museum Notes," iv., 2) belongs to the family *Scolytidae*. The insects of this family mostly attack dead or dying wood, but in the present instance they attack trees that are to all appearance perfectly healthy. Attack does not usually result in the death of the tree, nor in free-growing bushes does it produce any very marked result. The presence of these numerous galleries, however, must tend to produce decay by admitting water and other insects; infected trees also may very likely feel the effect of drought sooner, and this will mean a loss of flush. It is said that these insects cultivate a food fungus in their galleries (Hubbard, U.S. Dept. of Agr. Div. of Ent., Bull. 7) as is done by the termites and some ants. The burning of prunings in affected fields will help to check the pest, and the cut surfaces of the stems may be painted with some such greasy mixture as "Raupenleim," which will suffocate many of the insects in their galleries.

Numerous reports have been received of extensive defoliation of tea plants by the caterpillars of *Heterusia cingala*, Moore. They are said to appear in thousands and to eat every leaf of the trees. It should be clearly understood that all these excessive plagues of caterpillars are preceded by smaller broods which, from their affecting perhaps one or two bushes only, are overlooked or considered to be of no importance. If this early brood had been promptly destroyed, the later extensive injury would have been avoided.

The caterpillar of *Heterusia cingala* is a fleshy-looking insect of a dull brick red colour, about an inch long, broad, and thickset. The back and sides are set with small conical tubercles with a few short inconspicuous hairs. When full-grown it spins a compact straw-coloured cocoon in a folded leaf, and in from two to three weeks emerges as a bright-coloured moth that might be readily mistaken for a butterfly. The moth has a wing expanse of $2\frac{1}{2}$ inches. The fore-wings are dark metallic, blackish green, with an irregular white band and some whitish spots. The hind wings are black with a broad primrose yellow zone across the middle, the black parts veined with metallic blue. The extremity and base of the abdomen are rich peacock blue, the median are a bright yellow. Some moths kept under observation shed their small oblong yellowish eggs loose on the bottom of the box in which they were confined. But as the moth has a prominent ovipositor it is probable that under natural conditions the eggs would be deposited either in crevices of the ground or of the bark of the trees. *Heterusia cingala* is an indigenous species, peculiar to Ceylon. Its caterpillar is subject to the attacks of a parasitic fly, *Exorista heterusie*, belonging to the family *Tachinidae* which fortunately checks any very extensive increase of the pest. Of over 100 caterpillars sent to me from one estate scarcely 10 produced moths, the balance having been destroyed by these flies. The collection and destruction of the caterpillars by hand is the only practical treatment. A very badly affected field might be pruned down and the prunings burnt upon the spot.

Other leaf-feeding caterpillars of the tea plant that have been prominent during the year are:—

Orgyia postica, Wlk., a small hairy caterpillar with brushlike tufts, projecting forwards on each side of the head similar tuft on the tail, two shorter tufts on each side, and four very compact tufts on the back. The female moth is wingless—merely a bag of eggs which she deposits on the surface of her cocoon. The male moth is a sober-coloured insect with brown wings marbled in darker shades. As all the eggs—and they are very numerous—are deposited on one spot, the resulting brood of caterpillars is at first confined to one bush. This is the time to attack them, and they can easily be exterminated before they have wandered further afield and started fresh broods.

The Tea Tortrix, *Homous fasciculina*, Wlk.—This insect is always present to a small extent on the tea. The larvæ is a small greenish caterpillar that spins a few leaves together and feeds within them. Under ordinary circumstances it does no appreciable harm, but occasionally it unaccountably increases and makes itself obnoxiously conspicuous by spoiling the whole flush over acres of tea. The outbreak is usually of short duration, seldom extending beyond the period of one flush. In every instance that has come under my observation the sudden increase of the pest is as suddenly checked by an epidemic of a fungus disease that practically exterminates the caterpillars. The moth of this caterpillar is a small fawn-coloured insect, which when at rest is rendered very inconspicuous by its resemblance to the fallen bract of a plant.

The leaf roller, *Gracilaria theivora*, Wlsm, is a very minute moth with a correspondingly minute caterpillar. Its small size may be realized from the fact that during the first half of its existence it lives and feeds quite comfortably as a miner between the two surfaces of a young tea leaf. Later, it twists up a leaf into a purse-like receptacle in which it completes its growth. This insect is common, and is usually of no economic importance. This year, for the first time, I have had reports of considerable injury caused by it. It increased to an extraordinary extent in the early months of the year. This was no doubt due partly to the prolonged drought. During the rainy weather the leafy receptacles formed by the caterpillars become filled with water and their inhabitants drowned. The collection and destruction of the doubled-up leaves in which the caterpillars reside is the only practical treatment. If the pluckers were instructed always to remove such leaves, there would be little fear of any sudden increase of the pest.

The yellow Tea-mite, *Tarsonymus* sp., has also shown unusual activity this year. This species is very commonly present on individual trees, but in September and October, probably owing to the failure of the south-west monsoon, complaints were numerous of extensive blights caused by this mite. The animal itself is microscopically small. It affects the young leaves only, differing in this respect from the other tea mites, such as "red spider," which confine themselves to the mature leaves. The symptoms of the blight are a hardening of the young leaves, with a brownish scaly appearance on the under surface, especially on each side of the midrib, with, very often, the semblance of a supplementary rib on each side of the true one. The shoots become hard and small, and eventually the bush stops flushing. Leaves that have been attacked never fully recover, but always bear a roughened pitted look. The mites are always found on the newest growth, moving upwards as the leaves get older. Close plucking is therefore a logical mode of treatment, and in the event of bad attacks spraying can be resorted to. Many other species of *Tarsonymus* are destructive pests in other countries.

Specimens of a large termite of an undetermined species, but quite distinct from the ordinary "white ant," have been received from various districts (Watagoda, Madulkele, Nawalapitiya) and reported as damaging living tea bushes. The insects make their entrance through the taproot, and completely hollow out the main stems. The tree survives

for some time, so that the injury is not observed till too late, and suddenly collapses when dry weather sets in. The damage done is reported to be very considerable. Until the life-history of this particular species has been worked out it will be difficult to suggest any radical cure. Nothing is known of the nesting habits of the insect. As the termites probably travel for long distances underground, they are difficult to follow up. If the nest could be found and destroyed, the pest could soon be got under. A case of serious damage to tea seedlings by *Nematode* worms has been brought to my notice. The worms were said to have partially destroyed a good nursery of plants by eating off all the fine roots together with the bark of the taproot and young stems. The plants blacken and die off, and when pulled up are found to be entirely devoid of roots. I found the remains of the taproot and the cotyledons to be swarming with the young threadworms. If this disease should become prevalent it would be very difficult to raise seedling plants. Whenever signs of the worms appear the ground should be treated with one of the alkaline manures, e.g., nitrate of soda or of potash, preferably the former. These keep away worms and similar pests and are beneficial to the plants. Diseased seedlings should not be planted out.

Cardamoms have suffered heavily from the caterpillars of a small blue butterfly, *Lampides elpis*, Godart. In my own experience as much as 25 per cent. of the fruit has been damaged. The caterpillar itself is very hard to find, but its work is only too apparent. A round hole is bored in the side of the unripe fruit, and its contents completely eaten out. One caterpillar will consume four or five fruits in a night. This pest is a difficult one to attack; the grub-like caterpillars are so inconspicuous and hide themselves so effectually during the day that they cannot be collected, and the butterfly must be attacked instead.

Another small butterfly, *Cyaniris lavenderis*, Moore, has attracted attention at Peradeniya, where its caterpillar has completely ruined the appearance of nearly every plant of the Cycas family in the Botanic Garden.

Many other more or less injurious insects have been received and reported on. Caterpillars of some unknown moth were said to be damaging Mauritius grass near Colombo. The rice-sapper was prevalent on paddy in the Galagedara district. The larvæ of several Psychidæ—popularly known as bagworms or caddis—have been troublesome in the Gampola and Kalutara districts. "White grub" (cockchafer larvæ) were reported to have destroyed several acres of Guinea grass in Dolosbage. A large *Aphis*, determined by Mr. G. B. Buckton, F.R.S., to be a new species, and named by him *Lachnus pyri*, appeared in large numbers on cultivated pear trees in Nuwara Eliya.

The question of quarantining and fumigating imported plants and fruits has been under consideration, and experiments have been made with a view of determining the best methods of treatment for such cases. The risk of importing dangerous scale and other insects is considerable; the green bug of coffee and the lantana bug are both importations. Satisfactory results have been obtained by fumigation with hydrocyanic acid gas, and by the use of the gas in a more concentrated condition than usual in such work, and for a shorter period, the injury caused to delicate plants has been avoided.

Introduction of Beneficial Insects.—A consignment of lady-bird beetles of the species *Exochomus nigromaculatus*, has been received through the kindness of Mr. C. P. Lounsbury, Government Entomologist, Cape Colony. To avoid unnecessary delay the box was sent by post, taking four weeks in transit. Only five beetles and four larvæ (evidently born during the journey) were found alive when the package reached me. The rest were dead, perhaps owing to having been captured when adult. The insects were carefully packed in moss, with a supply of food in the shape of cochineal insects, which being restricted to the prickly pear were not liable to become a pest here. The surviving beetles were transferred to glass jars, and provided with local scale insects as food (*Pulvinaria psidii*, *Dactylopius citri*, and *Lecanium viride*, the green bug) upon which they commenced to feed freely. They were also tried with *Orthesia*, but steadily refused it. They have since been fed exclusively on green bug, upon which they have thrived very well, and have produced young ones which have been reared to maturity upon the same food. I consider the result of the experiment to be most encouraging, as proving the possibility of obtaining living beetles without the great expense and equal uncertainty of sending a special commissioner for their collection and transport. By securing a brood of beetles immediately after their arrival at the adult state, or while still in the pupal stage, the chance of their surviving the journey will be greater. Repeated small consignments would be more certain than a few large ones. The few survivors from the Cape consignment have now more than quadrupled their number, and fresh larvæ are appearing daily. When sufficient have been obtained specimens will be distributed for liberation in the coffee districts, but it is important to keep a good stock for breeding purposes. There has unfortunately been considerable loss owing to the cannibal propensities of the insects. I now find it advisable to have small jars with a limited number in each, and to provide plenty of cover in the shape of dead leaves or moss into which the insects can retreat when moulting, at which period they are most liable to the attacks of their neighbours. Adult beetles and larvæ must not be kept together, for the same reason. The eggs are concealed among the rubbish, and the larvæ also conceal themselves, so that when it is necessary to clean out a jar the rubbish must be kept under observation for a month, during which time many larvæ will make their appearance.

An exchange consignment of local lady-birds (*Chilocorus circumdatus*) was despatched by post to the Cape, but being delayed on the way, and not arriving for six weeks, the insects were all dead on arrival.

In a recent letter to the United Planters' Association of South India Mr. Lounsbury wisely cautions the planters not to expect too much from the colonization of foreign lady-birds, &c., pointing out that even when the introduction has been successful, local circumstances may tend to minimise the result. Climatic influences may be unsuitable. We are still quite in the experimental stage of the work, and must expect many failures, but the possible benefit is worth the cost of repeated failures. The work of Mr. Koebele in California and Hawaii shows what may be done in this direction. When we have to deal with large areas artificial treatment is usually impracticable, and we must fall back upon natural remedies.

LABORATORY.

The laboratory room in the Museum building has been very full during the year, and the want of space has been acutely felt. Mr. Parkin has occupied one bench from March 20 to the end of the year. Dr. Max Fleischer, now of Buitenzorg, worked here from February 2 to 24 and collected mosses in many parts of the Island. Mr. J. B. Carruthers occupied a bench at intervals for the investigation of the cacao fungus and other mycological studies. Mr. A. K. Coomaraswamy, of University College,

London, commenced work here on November 17, and other visitors have also made use of the laboratory for small periods. Besides the investigation of many points in economic botany, the Director has been occupied during the year in a thorough revision of the Ceylon and Indian *Podostemaceæ*, a little studied order of plants of much botanical interest. Mr. Parkin has made a very extended study of the coagulation of latex, chiefly in rubber-yielding plants, and has also worked at some other problems in Physiological botany.

The completion of the late Dr. Trimen's "Flora of Ceylon" has been vigorously pushed on by Sir J. D. Hooker, and towards the end of the year the fourth volume, containing the remainder of the Dicotyledons and the Monocotyledons to the end of *Eriocauloneæ*, was published, as well as the last series of 25 plates. The final volume is well in hand and will contain the *Cyperaceæ* and the Grasses.

RECEIPTS FROM SALES.

The receipts of the year were :—

	Sales.		Purchasers.
	Rs.	c.	
At Peradeniya	1,694	64	277
Hakgala	475	5	77
Henaratgoda	2,292	85	118
Anuradhapura	29	49	29
Badulla	76	9	19
Total	4,568	12	520

The total given in the revenue returns for 1898 is Rs. 4,433.78; this is due to the amount received in December, 1897, being credited to revenue for January 1898, whilst that received in December, 1898 is credited for 1899.

The estimated value of plants and seeds supplied gratis is Rs. 1,531.76.

The high price of Para rubber seed has swelled the receipts considerably. Other economic plants have also been sold in some considerable quantity.

EXPENDITURE.

The total cost of the Department for the year 1898 has been Rs. 52,713.44, and special vote towards Mr. J. B. Carruthers' expenses, £150.

JOHN C. WILLIS,
Director.

Peradeniya, January 25, 1899.

THE EFFECTS OF HIGH EXCHANGE AND INCREASED PRODUCTION ON THE TEA INDUSTRIES OF INDIA AND CEYLON.

13, ROOD LANE,
LONDON, E.C.

DEAR SIRS,

The diagram we give below shows how prejudicially the rise in Exchange during the last two years has affected the Tea industries of India and Ceylon

We also bring out a few points on this subject for the consideration of those affected, in the hope of inducing them to use every endeavour to have what is practically a differential tax on British-grown Tea removed.

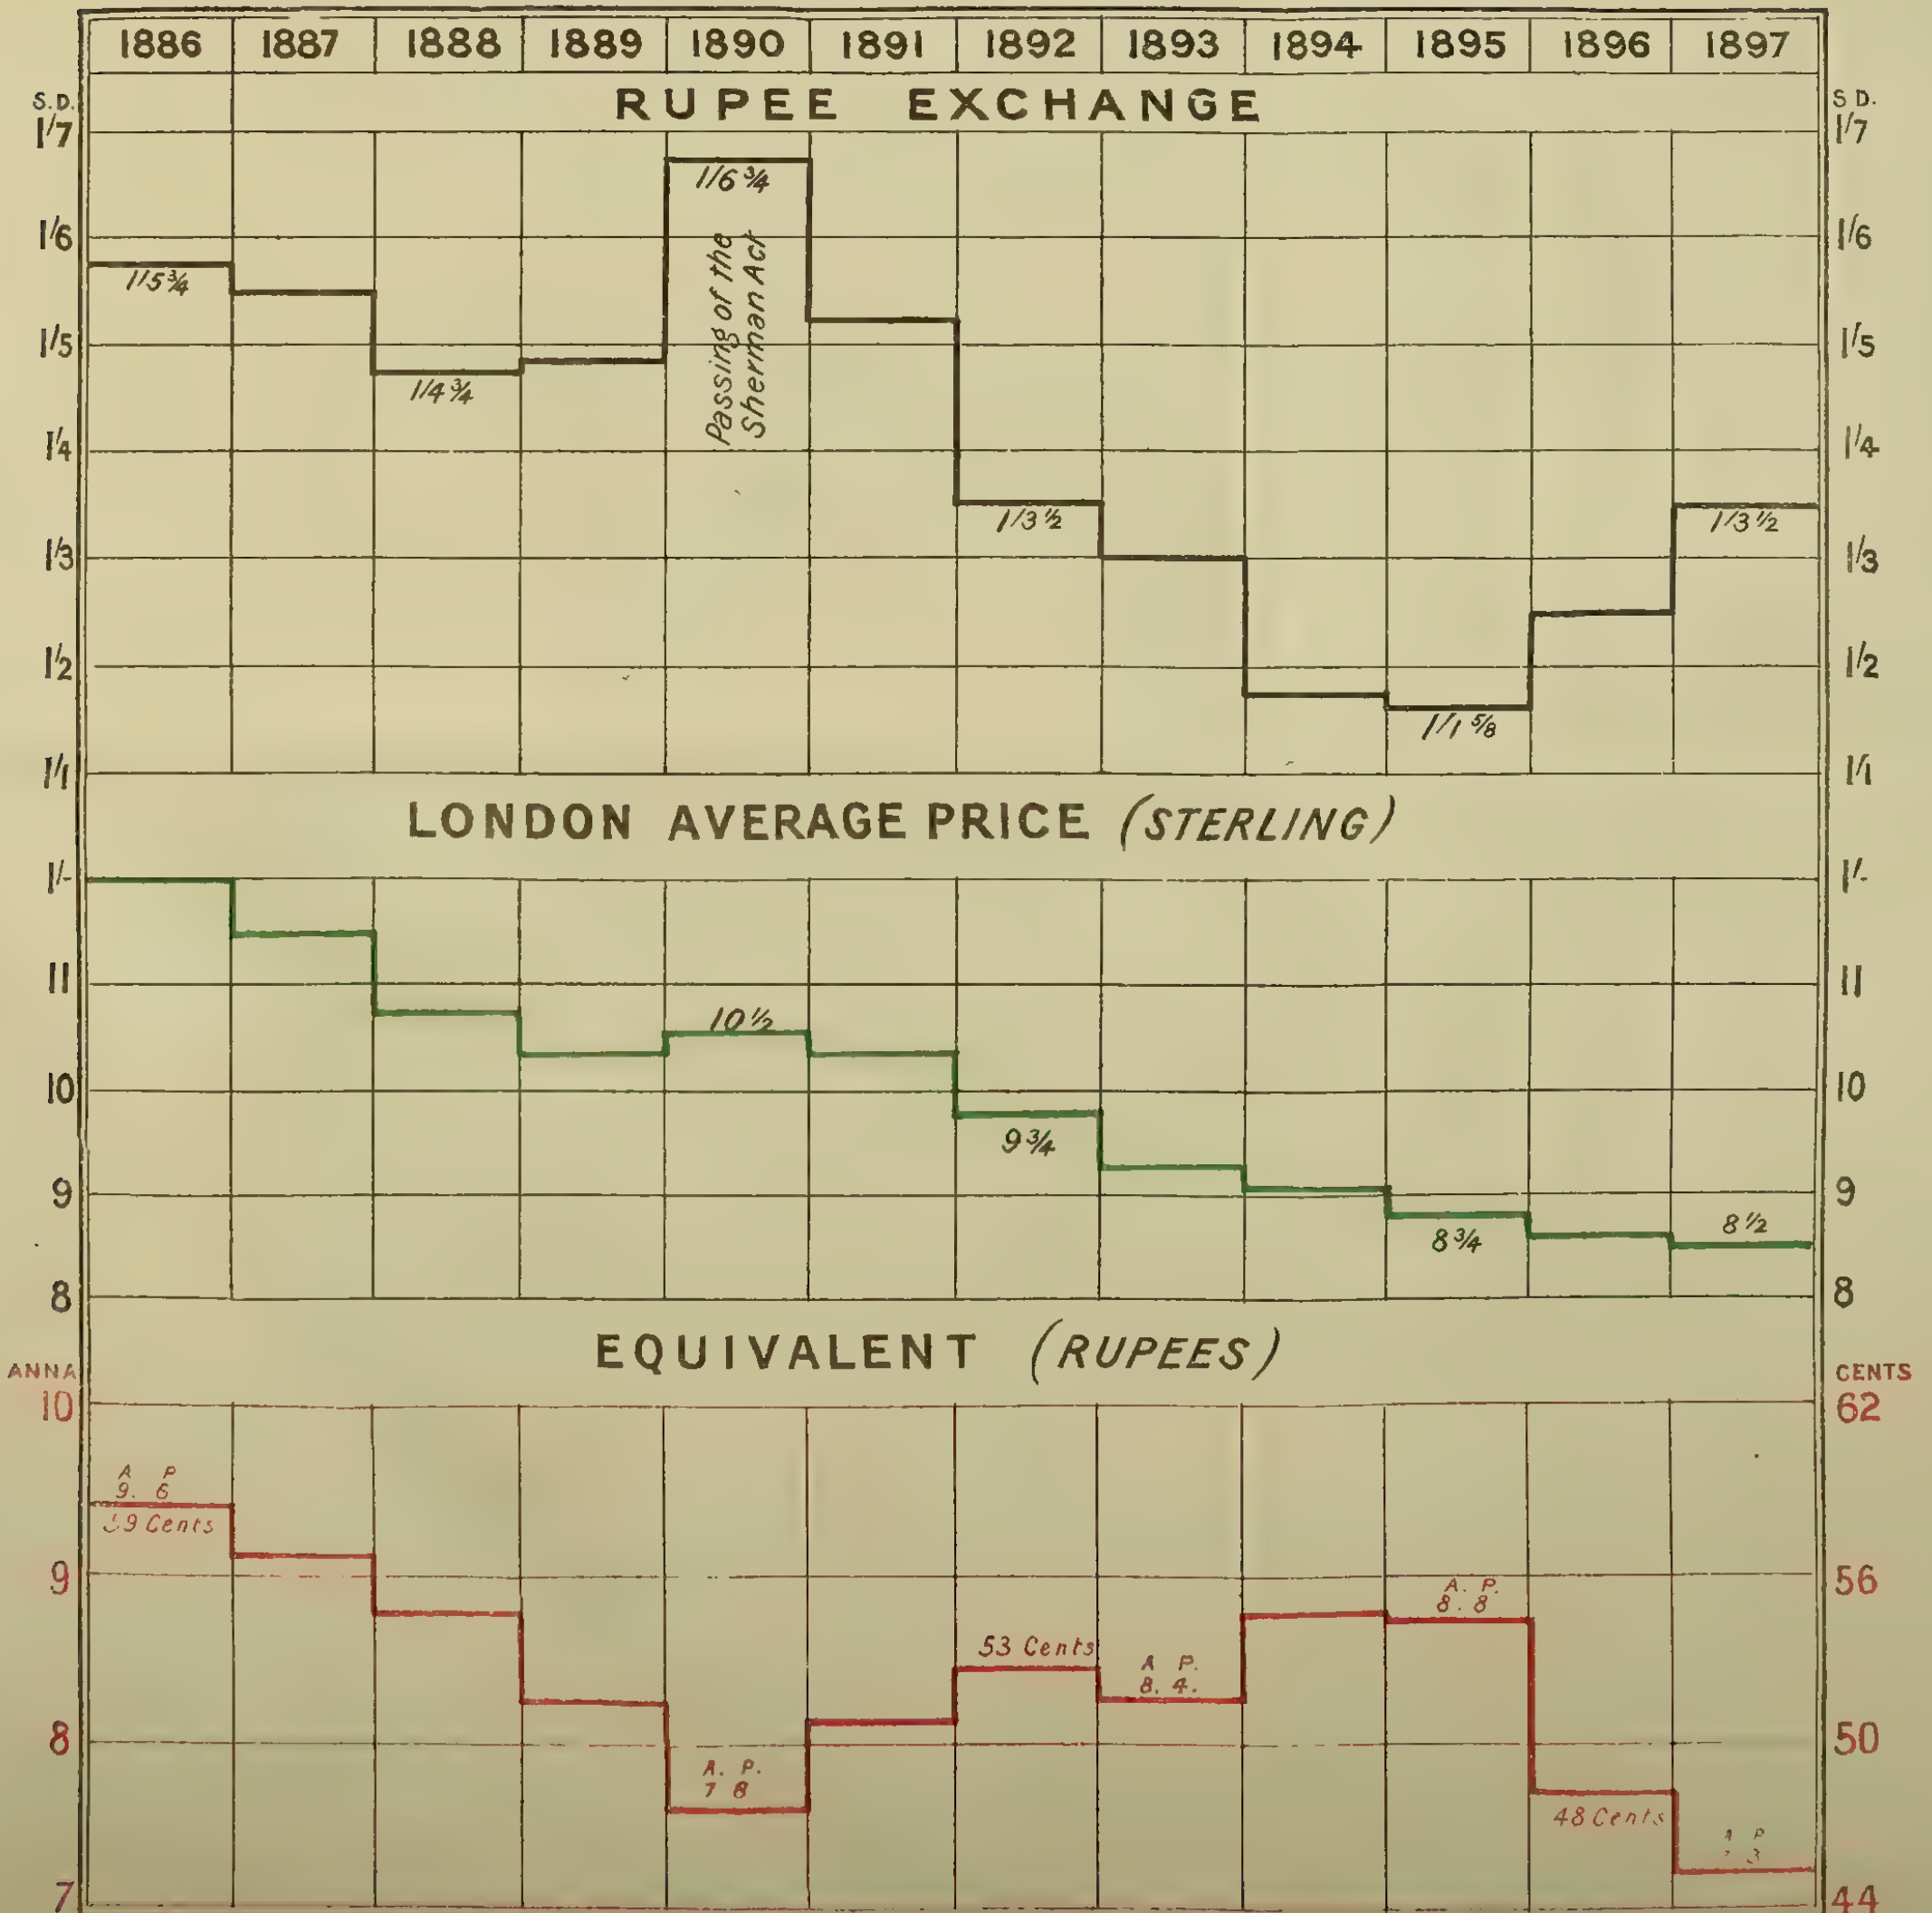

For many years we have impressed upon producers the necessity of forcing their product into new markets as the only means of counteracting the effects of increased production, and on the last page of this Circular we give another diagram showing to what extent the efforts made in this direction have succeeded.

We are, DEAR SIRS, Yours faithfully,

August 3rd, 1898.

GOW, WILSON & STANTON.

Diagram showing the fall in the average price of British-grown Tea; also the variations in the value of the Rupee and the approximate return in Rupees to the Tea planter at the various rates of Exchange.

— The black line shows the annual average value in sterling of the rupee.
 — The green line shows the annual London average price of British-grown Tea.
 — The red line shows the approximate rupee equivalent of the London price at the various rates of exchange, after allowing for freight, London warehouse expenses, &c., which are paid for in sterling.

On broad lines it may be said that Tea is produced in silver currency and paid for in gold currency. In other words, a certain very large percentage of the price obtained for the article has to be converted into rupees, in which the producing expenses are paid.

The higher the gold value of the rupee, the fewer rupees will the seller of Indian and Ceylon produce get for his sterling price, for when the rupee is worth 1s 4d the pound sterling exchanges for only 15 rupees, while it exchanges for 20 when the rupee is worth only 1s.

The Industries are now of such vast magnitude that a rise of 1d. in the exchange means a difference of more than £400,000 sterling to the producers.

The artificial value recently given to the rupee by the closing of the mints by the Government of India, handicaps the growers of India and Ceylon in their competition with their rivals in other Tea producing countries whose currency is ruled by natural laws.

Referring to the Diagram—The line showing the gold value of the rupee calls for little remark. The rupee fell steadily from 1886 to 1888. There was a very slight recovery in 1889, and a rapid rise in 1890, which was due to the passing of the Sherman Act by the United States Congress in that year. A heavy fall took place in 1891, and continued until 1895, when the rupee went as low as 1s 1½d for the average of the year. Then, at last, the closing of the mints began to tell, and the gold value of the rupee rose gradually to 1s 2½d in 1896, and 1s 3½d in 1897.

The real interest of the chart lies in the red line showing the silver equivalent of the London average price of the Tea, and from this it will be seen how great an injury has been inflicted on these industries by the closing of the Indian mints.

For a few years previous to 1896 the producer had been able to combat the almost persistent fall in the London average price of Indian and Ceylon Tea by the decline in the value of the rupee, and notwithstanding a fall of nearly 20% in the London market price, he received an increased number of rupees for his produce.

Since 1895 the planter has not only had to face still lower markets, but has received a less number of rupees, for his local expenditure, in proportion to the rise in exchange which has taken place; and although the fall in the London price was only about 6%, the fall in the remitting power amounted to a figure approaching 20%.

What is true of Tea is, of course, true of all Indian produce. Everything that has to be raised in India and Ceylon and sold abroad is injuriously affected in precisely the same way as Tea. China is not handicapped in this way, for the Chinese Government has not yet either adopted the gold standard, or employed methods for giving a fictitious value to the dollar. Silver in China, therefore, is regulated by natural laws, and hence we find industry is rapidly prospering in places, where the benefits of European administration are experienced.

Practically, India at the present time, when the rupee is but a little under 1s 4d of our money, gets only about 15 rupees for the sovereign for which she sells a commodity. Whereas a piece of silver, if current in China, of exactly the same weight and fineness as the Indian rupee, would be worth only 10½d. Consequently the sovereign obtained, let us say, for China Tea exchanges for 22⅞ silver pieces exactly equivalent to the rupee in weight and fineness. The difference between 15 and 22⅞ is about 50%. In other words, the gold which the Chinese trader obtains in Europe by the sale of his goods, returns in silver coin about 50% in excess of what it does in India and Ceylon.

Hitherto, fortunately for Indian traders, the Chinese have not been able to avail themselves of the advantage they have over their Indian competitors. But the whole of Europe is now scrambling not only for railway, banking, and other concessions, but for territorial possessions and for trading privileges. Is it not possible that, before long, European skill and capital will be applied to the creation in China of the industries which have made such strides of late in India?

Already machinery has been sent out, with instructions to endeavour to improve the quality of China Tea, and to make it more resemble the better qualities of Indian and Ceylon Tea, and we take the following extract from the Consular Report just issued on the "Trade of Shanghai for the year 1897."

"An interesting incident in the past season was the experimental use at Wenchow of a Machine Roller, which proved beyond doubt that the most ordinary China Tea is capable of astonishing improvements if treated by modern methods. Wenchow Tea made by the old native process is of the most inferior description, but by being carefully made and machine rolled a very fair drinkable Tea resulted."

We ourselves hold that it is no more possible to make China Tea resemble Indian and Ceylon Tea than to make Darjeeling-flavoured Tea in Sylhet, or Dimbula-flavoured Tea in the Galle District. We have no liking for the China-produced article, but that is no reason why the point of the above extract should not be watched, as the displacement of China Tea in the past has been largely due to its inferior quality.

China is a larger country than India—has varieties of soil and climate. It is difficult, therefore, to say what article cannot be produced. Suppose that, just as India created a Tea industry in competition with China, China should now, under European guidance, create a jute and an indigo and a grain industry. What would become of all those industries in India, handicapped as they are by a currency which gives the Chinese competitor so great an advantage.

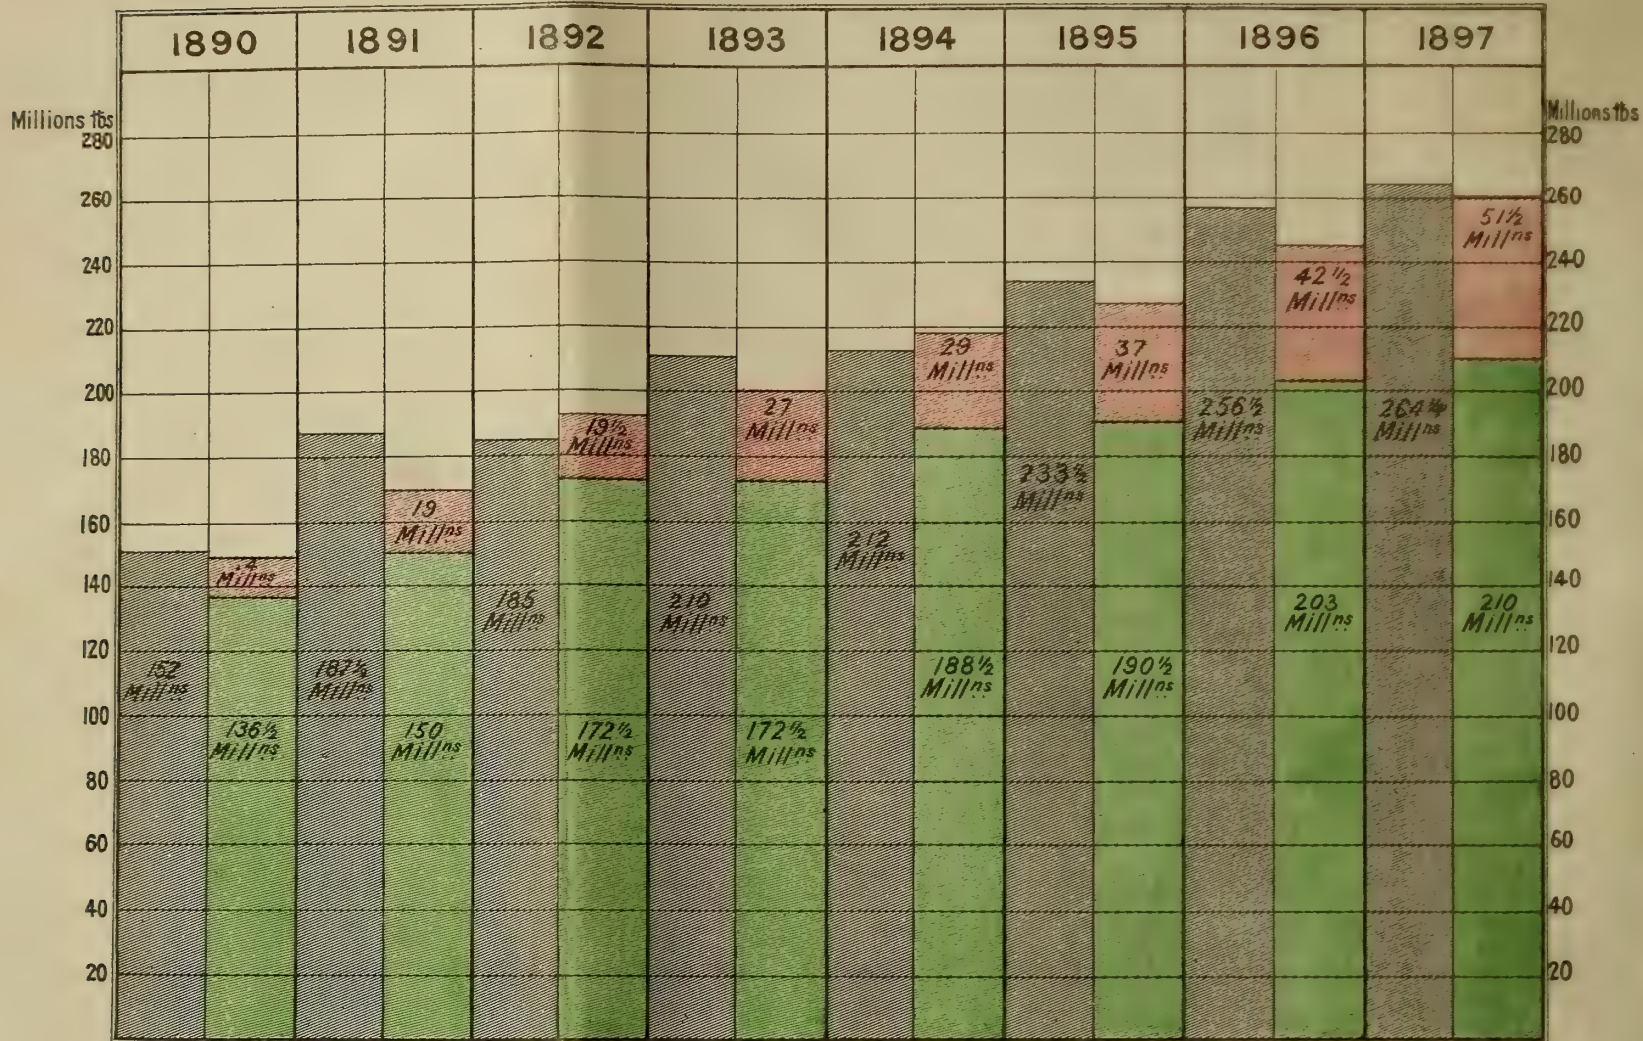

In a short time China will be provided with better means of communication with the rest of the world. If European skill and capital are applied, not only to producing all the things which China is capable of growing, but also to the manufacturing, say, of cotton, what will become of the competing industries in India, and what will be the effect, not only upon the mass of the population, but upon the revenues? A great depression of the industries, it need hardly be said, would very seriously reduce the tax-paying capabilities of all persons engaged in them.

The question of exchange is thus a most vital one for the Tea Producer of India and Ceylon, and when agitating for his grievances to be remedied he should draw attention to the vast amount of good that the industries have done in the past by opening up what would otherwise be waste land, and thus giving employment to about 1,000,000 of natives. He should point out the fact that the £35,000,000, which are estimated as having been laid out, was attracted on the belief that the enterprise would never be unfairly handicapped by the Government of the country; and that during the last year further extensions of cultivation have been greatly curtailed by the distrust created in the management of the monetary affairs of the country.

The Indian and Ceylon Tea producer does not, however, feel the whole of the disadvantage in which he is placed against his rivals by the disparity in the silver exchange, as China Tea has to bear certain internal and export duties; besides which there is some slight loss in converting "silver" into "copper cash," in which part of the producing charges are paid in that country.

NEW MARKETS.—It is beyond question that the fall in the average price of Tea is due primarily to the fact of supplies being in excess of demand. Owing to the amount of land planted during the last three or four years that will be coming into bearing, this state of things may continue for a time. Thus the only course open to producers is to turn their attention to new outlets. Before going further into this point let us see what has been done in the past.

Diagram showing the amount of Indian and Ceylon Teas produced in each year; also the amount consumed in the United Kingdom and taken by other countries.

- The grey columns show the Indian and Ceylon Crops in each year.
- The green columns show the Home Consumption.
- The red columns show the quantities taken by countries outside Great Britain.

The above diagram shows that with the aid of outside markets increasing supplies have been dealt with. The annual increases, amounting in the aggregate to over 100 millions pounds during the period embraced by the diagram, have been absorbed by the displacement of China or the increased use of Tea in this country and abroad.

The actual increase in the use of British grown Tea is distinctly satisfactory so far as it goes, but in face of further increases in supplies, and the small margin of profit left to the producer, the demand will have to be made to continue, if possible, without further concessions in prices. Both the Indian and Ceylon Tea Associations are doing good work in opening up new markets, but they will require more support from the Planters, as their difficulties are increasing instead of diminishing. The chief difficulty is again the fictitious value at which the wage-paying rupee is kept. It is in the endeavour to open up the important markets of Russia and America, representing some 150,000,000 to 200,000,000 lbs. of tea annually, that the difference in Exchange tells so severely in favor of the China article. The sympathies of the consumers of Tea in the United Kingdom have naturally been with their own kith and kin producing the article in their own Colonies; but there is no such sympathy with British-grown Tea in many other countries. Consequently, in foreign markets Ceylon and Indian Teas have to rely entirely on their merits.

We have in many previous circulars pointed out where new markets are to be obtained, and in conclusion we desire to impress upon all interested in producing British-grown Tea the necessity of keeping up the quality of their produce, and substantially helping the movements made towards the extension of new markets.

EXPORTS OF CEYLON PRODUCE FROM COLOMBO AND GALLE DURING THE PAST TEN YEARS.

WILSON, SMITHETT & CO.'S TEA REPORT FOR 1898.

CEYLON TEA IN 1898.

Messrs. Wilson Smithett & Co's MEMORANDA.

A survey of the Ceylon tea market during 1898 serves to bring into full relief the interdependence upon each other of the two great branches of British grown tea...

WEEKLY PUBLIC AUCTIONS OF CEYLON TEA DURING 1898 WITH AVERAGE PRICE REALISED.

Table with columns: Week ending, Number of Pkgs. offered in auction, Av. price per lb. offered in auction, Av. price per lb. for corresponding week 1897.

SUMMARY OF CEYLON TEA SOLD AT PUBLIC AUCTION IN LONDON.

Between January 1st and December 31st, 1898, estimated quantity in lbs. and average price realised - Average Price for the year is 7.75d per lb., against 7.83d in 1897, and 8.21d in 1896.

Table with columns: Origin, About lbs., Av. price per lb., As per lb. 1897.

Over 1,000,000 lbs.

Large table listing various tea origins (e.g., Darjeeling, Assam, Nilgiri) with columns for quantity and price.

100,000 to 300,000 lbs.

Table listing tea origins in the 100,000 to 300,000 lbs. range with columns for quantity and price.

30,000 to 100,000 lbs.

Table listing tea origins in the 30,000 to 100,000 lbs. range with columns for quantity and price.

30,000 to 50,000 lbs.

Table listing tea origins in the 30,000 to 50,000 lbs. range with columns for quantity and price.

The Average Price for all Ceylon Tea sold at Garden Auction in 1898 was 7.75d, against 7.83d per lb. in 1897, and 8.21d in 1896.

Home consumption during 1898 fell short of that of the previous year by 3,000,000 lb., this is to be accounted for by the almost commensurate decline in the shipments to the United Kingdom from Colombo...

Foreign Trade.—The efforts strenuously made during the past decade to introduce the Ceylon leaf into the various Foreign and Colonial tea-consuming countries continued during the past year to meet with unqualified success.

The expansion in the direct Exports from Colombo to other countries than the United Kingdom during the past year was most remarkable, and the safety against over production, to which we alluded last year, may now be said to be fully secured.

With an open opinion, this country will always afford the best and most permanent market for Ceylon tea as the greatest tea-consuming country in the world it is an undoubted advantage that it should not be relied upon to absorb the entire output of the island...

COFFEE AND PEPPER EXPORTS FROM SOUTHERN INDIA, 1897-98.

To the Editor "Ceylon Observer,"

Dear Sir,—I have the pleasure to furnish you with my Annual Statement of Exports of Coffee and Pepper for the year ending 30th June 1898, the total figures of which approximately represent what the crops of these products in India for the year in question amounted to. As usual, I further show the distribution of shipments to foreign ports, and have added the figures relating to exports for the three previous years for the purpose of comparison.

COFFEE.—I pointed out last year that the crop of 1896-97 was remarkable as being the smallest exported from India for many years. I regret now to have to add that it is no longer a record year, the crop for the past year showing a further falling-off of some cwt. 8,585. I am glad to say that estimates for the coming year would appear to point to the fact that we may expect a considerable improvement when dealing with the figures of the coming crop. Of the quantity shipped this past year, cwt. 121,517 may be regarded as Plantation, and the balance cwt. 81,658 as Native Coffee, showing an actual increase in Plantation Coffee as compared to the previous year of cwt. 4,335, and a falling-off in Native Coffee of cwt. 12,920. The value of Plantation Coffee this past year was R64,40,401 and of Native Coffee R35,92,952, calculated at R53 and R44 per cwt. respectively, which I consider an average value for the year, allowing for the difference in prices obtained for the produce of the several districts in which the crops were grown. The total value of past year's crop may therefore be taken at R1,00,33,353 as against that of the previous year, which I estimated at R1,35,48,478, but as already shown, last year's crop compared unfavorably in quantity with that of the previous year, and in addition the Coffee Market was weaker to the extent of an average of some R15 per cwt.

PEPPER.—The total exports of this spice amounted to cwt. 1,25,231, or some forty-four per cent less than what was shipped last year, the value of which at an average of R24 per cwt. amounts to R30,05,544. The price of pepper averaged R6-8 per cwt. over that of the previous year, and the bulk of the business was done with Calcutta. I do not think that last year's actual crop was shorter than the previous one, but there was not the usual quantity of the old crop in stock at the commencement of the year, owing to very large shipments to Europe that were made in the previous year.

I am, dear sir, yours faithfully,

RALPH TATHAM, Agent to Arbuthnot & Co.

Tellicherry, 1898.
