VII. Dress, Accoutrements, and Duties—*cont.* Duties—*cont.*	drill is carried on in the evening from 5 to 6 o'clock. When dismissed marching drill the recruit commences his riding drill, and at this he has about 1¼ hour actually in the schools, or say from half-past 5 till a quarter to 7 o'clock for five mornings in the week (Thursday being a saddle or kit inspection morning). A smart active man may get through his riding in 6 months, but 7 or 8 months is nearer the average time. While the recruit's mornings are spent in riding drill, he has to go through a course of gun and guard and sentry drills in the evenings, one hour being allotted to each drill, generally from about 4 to 6 o'clock. A man may with ordinary attention be fit for dismissal in each in about two months' time. Sword exercise generally follows. The new cavalry exercise is so simple, that it may be learned in a month, but the recruit's hand and arm cannot be moderately broken in to use the sword in less than 6 weeks; besides these drills there are carbine, pistol, and stripped saddle drill from 10 to 11 a.m. in the verandahs of the barracks, or under trees; pistol drill may be got through in a week; but a man will take a month to learn carbine drill, or to be able to put a saddle together properly, and learn to clean it. In addition to the above there is repository exercise for all artillery men, to teach them the various parts of a gun, &c., use of tangent, a scale, method of cutting furzes, elevating guns, mortars, &c.; and heavy ordnance and mortar drills is also part of the necessary instruction. This is generally the last taught, and it is practised in the evenings. A horse artilleryman cannot be said to learn all his drills, harnessing and driving a pair of horses included, in less than 12 months at the soonest; and even then, supposing him to be a man of a fine healthy constitution. Once dismissed his guard and sentry drill, the practice of the horse artillery, on account of the small number of men in the troop, is to put the recruit on duty with the rest of the men as far as regimental guard duty. The routine of duty with the older soldiers is guard once in four or five days; mounted drills or parades about three mornings in the week, home by 7 o'clock in the cold weather, or half-past 6 at a hot station in the hot weather. On returning from morning drills, &c. the men are allowed 10 minutes, when the trumpet sounds the turn out for stables, and one full hour is spent in grooming; after this the horses are watered. It is usual in a hot season to water the horses at 2 p.m. by the horse-keepers, and not to turn out the Europeans. In the evening an hour is spent by all ranks in the stables, except on Saturday and Sunday. The best periods for drills are from 5 to 7 in the morning for mounted duties, and from 5 to 6 in the evening for foot drills. The average number of nights the men have in bed during the week is according to the number of men for duty, which is sometimes heavy from troops of horse artillery being so short-handed. I have known it one night in two for some portion of the troop. (*By the Officer commanding* 1*st King's Dragoon Guards.*) The routine of a soldier's duties is as follows:—At gun-fire in the morning the men rise, and at 6 o'clock turn out for field-day or exercise for 1½ hour; stables till 8, breakfast at 8.30. The remaining part of the morning is spent in cleaning up saddlery, accoutrements, &c. under cover. Dinner at 1 o'clock, dismounted drill at 4 o'clock p.m. for half an hour, and evening lines from 5 to 6 employed in grooming horses. The men appear healthy, and do not seem to suffer in any way in health from the above, but the horses are not so well groomed as they ought to be. There are no covered stables, though they have been frequently applied for, and the stable duties in the hot season are much curtailed for fear of exposing the men to the sun. In the wet season it often happens that the horses for several evenings consecutively are not cleaned at all, owing to the heavy rain; and the men are frequently caught in heavy showers, and there being no shelter are completely wet before they can reach their barracks. At this station the best hours for drills, parades, and marches is from daybreak to 8 a.m. and from 4 p.m. to sunset. There are no general orders on these subjects except that guards do not turn out after 7 p.m. The men are on duty on an average every fifth night, or, in other words, four nights in bed during the week. (*By the Officer commanding* 1*st Madras Fusiliers.*) The usual routine of a soldier's duties is guard duty once every three or four days, the tour lasting for 24 hours. There are usually from three to five drills or field-days per week, lasting for one hour, generally from half-past 5 to half-past 6 a.m. Recruits are also out at drill or exercise every evening from 5 to 6 p.m. So far from suffering in health from such drills, the men benefit to a great degree by the early rising and the necessity of keeping sober. Being unsteady from the effects of liquor whilst under arms is a serious offence. In a tropical climate the best hours for drills and exercises are unquestionably from 5 to 7 o'clock in the morning, and for marching from 2 to 7 o'clock a.m. Medical men may theorise as much as they please, but practical men will universally adopt these hours. If the men have not three nights in bed, the commanding officer would bring the circumstance to the notice of a higher authority, and the duty would be lessened until the object is attained. The rule and the average is three nights in bed for one on duty. Strictly speaking, there is no duty excepting what is made such in any of our cantonments with a view to accustom the troops to such duties as they might be called upon to perform on actual service. Were all the public offices concentrated within a field-work, as they should be, nine-tenths of the guards might be struck off without inconvenience; but I consider that putting men on guard duty every four or six days is necessary, simply for exercise, but such duties are apt to be considered essential to the safety of the place; and when troops are required for purposes for which troops are maintained by the State—for actual warfare—the severity of the self-imposed duties is supposed to be such that the troops are not spared for their appropriate callings. 3. (*By Officer commanding Artillery.*) The quarter-guard at Bangalore is very close to the barracks. Guards are changed daily at half-past 9 a.m. after the mounted drills are over. There are roll-calls at 1 o'clock, 6 o'clock p.m. on holidays, and 8 p.m. If men are behaving disorderly, check roll-calls are sometimes ordered, but this is very seldom. There is apparently no bad effect upon the men from night guards, and every precaution is taken for the comfort of the men on guard. (*By the Officer commanding* 1*st King's Dragoon Guards.*) The whole of the guards of this regiment are mounted in the vicinity of the barracks, and their duration is 24 hours each. There are three roll-calls by day and two by night. The men do not appear to suffer in their health from night duty, except during the wet season, when colds and rheumatism prevail. I would recommend a waterproof cape with a hood for men performing that duty during the wet season. (*By Officer commanding* 1*st Madras Fusiliers.*) The guard mounting takes place within barracks squares or on the contiguous parade ground. The tour of duty lasts for 24 hours; there are usually a morning roll-call at 6 or 7 o'clock, when there is no parade or drill, a breakfast

References to Subjects and Queries.	REPLIES.
VII. Dress, Accoutrements, and Duties—*cont.* Duties—*cont.*	and dinner roll-call, and the 8 o'clock roll-call, exclusive of check or punishment roll-calls, which are seldom resorted to. Night duties are not injurious to health in a tropical climate; they are far healthier than day duties. Guard-rooms should be lofty buildings, thickly roofed and freely ventilated, with roomy verandahs; no injury to health need be apprehended in such rooms. It is not the night duties, but the being crowded in small guard-rooms, hot, unwholesome, stifling, during some portions, and being suddenly exposed to night air during other portions of the night, which is injurious to health. The thermometer in a decent guard-room, when closed, should stand within a degree or two of the range obtaining in the open verandah. Night duties would not then be injurious to health.
VIII. INSTRUCTION AND RECREATION.	1. The means of instruction and recreation at this station are as follows:—
	(*By the Officer commanding Artillery.*) There are no ball courts for the Artillery, but there is a skittle ground and a writing school for the men under the schoolmaster. There is also a good library for the troop at head-quarters; no day rooms or soldiers' clubs exist, neither are there soldiers' gardens, workshops, or gymnasia. In the lines there is no theatre, but there is one in the cantonment. More good and wholesome amusement might be found for the men. There is no restriction placed upon the men as to going out in the sun, and no bad effects arise from it. I find that the men do not expose themselves so much as they did formerly, yet I do not think they appear the healthier for it; the men were more hardy formerly.
	(*By the Officer commanding* 1*st King's Dragoon Guards.*) The men have one good ball court and a skittle ground. There is a regimental school with a serjeant as acting schoolmaster, a cantonment library, and a reading-room in the barracks sufficiently lighted. There is also a room where tea, coffee, and ginger beer are sold and newspapers provided, but there are no workshops, gardens, or gymnasia. There is, however, a theatre, which has an amateur company, and is well supported by soldiers and inhabitants of the cantonment. The skittle ground is under cover, and is used both during the heat of the day and wet weather, and the reading room is also open at all hours during the day. The men are not allowed out of barracks during the day without cap covers, which is found to be beneficial to the health.
	(*By the Officer commanding* 1*st Madras Fusiliers.*) Within the barracks square occupied by the Madras Fusiliers there is a ball court and a skittle shed, but there is little inducement to frequent either, as there is no shelter for lookers on, and the ball court becomes a furnace from 9 a.m. to 4 p.m., the time when the men have leisure to play. Were the ball court and skittle alley located in a tope of trees affording shelter from the intense glare of the sun, they would be frequented, but they are surrounded by barracks, high walls, and a gravel barrack square, the reflected glare of the sun from which objects is overpowering, and sufficient to destroy the eyesight. Day rooms, soldiers' clubs, workshops, theatres, gymnasia, and gardens are things unheard of, but the arid gravel square, surrounded by high buildings, multiplying the reflections of the sun and concentrating its rays to intensify the heat of a tropical climate, is the sole prospect afforded to the unfortunate inmates condemned to pass the greater portion of every day in listless inaction, watching the lambent sunbeams dancing and dazzling in the fiery atmosphere, until the brain reels under the torturing fascination. Immediately the noonday gun announces that the canteen is open, a rush is made for the raw spirit dram to steep the senses in oblivion, and to forget the tormenting monotony of a vacant existence. The regimental library has no attractions for men who read with difficulty. The canteen and the cot divide the hours unoccupied by the daily routine of petty duties; alcohol and the unrefreshing day sleep each contributing to engender disease and accelerate mental and physical decay. As regards confinement to barracks, the monotony of a private soldier's life is sufficiently painful without aggravating it by a sense of imprisonment. Restriction to barracks under these circumstances is seldom resorted to except as a punishment, and the health of the troops has not suffered from the liberty allowed them.
	2. (*By the Officer commanding Artillery.*) To improve the efficiency of the existing means of recreation and employment, I would suggest the addition of a ball and cricket ground.
	(*By the Officer commanding* 1*st King's Dragoon Guards.*) I would suggest that a covered gymnasium be erected, and also that a swimming bath be provided for the use of the men.
	(*By the Officer commanding* 1*st Madras Fusiliers.*) Soldiers require an extensive playground attached to their barracks, such as I have previously described. The canteen would then be deserted, and health, efficiency, and discipline would be promoted to a degree that, in a pecuniary point of view, would prove most advantageous, and would reimburse to Government tenfold the outlay required to furnish the recreation ground with all the necessary appliances.
	3. (*By the Officer commanding Artillery.*) Savings' banks for soldiers are in vogue, and are most beneficial to the men, inducing many to put by their pay; but I find whenever they are ordered on service, they generally draw out the whole of their pay and spend it.
	(*By the Officer commanding* 1*st King's Dragoon Guards.*) Savings' banks have been instituted for some years, and are found to be beneficial.
	(*By the Officer commanding* 1*st Madras Fusiliers.*) The best thing a soldier can do with his pay is to spend it freely on material comforts and full feeding. A poor soldier is worth half a dozen rich soldiers. The State must provide for the soldier's after-life and old age; he has nothing to do with the future; present efficiency, health, comfort, and enjoyment should be the object and aim and limit of his views. I would discourage all hoarding, which is a misapplication of the means granted to him by the State to keep himself efficient and fit for work.
	4. (*By the Officer commanding Artillery.*) Good verandahs are attached to the barracks and other buildings to enable the men to take exercise during the heat of the day, and there are very fine trees in the lines.
	(*By the Officer commanding* 1*st King's Dragoon Guards.*) There is a verandah on each side of every block of buildings occupied by the men, where they take their exercise without injury during all weathers.
	(*By the Officer commanding* 1*st Madras Fusiliers.*) The barracks of the Fusiliers occupy three sides of a square, with narrow verandahs on the inner side. One-half of these verandahs are

References to Subjects and Queries.	Replies.
VIII. Instruction and Recreation—*cont.*	exposed to the sun during the early part of the day, and the opposite verandahs during the remainder of the day. No verandahs shade the outer sides of the barracks; the blank wooden shutter must be closed on one side or the other to keep out the sun. Nothing can be conceived more comfortless. Not a tree is allowed within the square to mitigate the heat and glare of a sun doubly insupportable from the reflection of its rays thrown off the hard ground of the gravel square. Trees 20 feet apart would interfere with no purpose for which the square is now used. There is no place where the men can take exercise unexposed to the sun. The skittle alley would afford shelter to a few.
IX. Military Prisons.	(*By the Officer commanding Artillery.*) The floor of the guard-room being of stone, it is desirable that there should be in each a raised platform covered with boards for the prisoner to sleep upon, the cold arising from the stones being prejudicial to their health. Well fastened doors are also required at the entrance to the privies to prevent the terribly offensive smell which arises from them and renders the place of confinement intolerable at times. In the Foot Artillery barracks the floors of guard-room and cells are altogether too low, and consequently very damp in the wet season. In these likewise boarded platforms for sleeping upon are urgently needed. (*By the Officer commanding* 1*st King's Dragoon Guards.*) As the general rule nearly all the cells in the station are bad. They are too hot, badly ventilated, and much too small for a tropical climate. They might be improved in some particulars by a higher roof with a ridge ventilator and a verandah all round. (*By the Officer commanding* 1*st Madras Fusiliers.*) The interior of a solitary cell in India is very dismal, being about nine feet square, badly ventilated, and badly lighted. In it the solitary system of imprisonment is carried out to perfection. Long confinement in such a place without exercise must produce a prejudicial effect on the prisoner, physically and mentally. In my opinion the treadmill would be an important and valuable substitute for the solitary cell and long periods of imprisonment.
X. Field Service.	1. (*By Officer commanding* 1*st King's Dragoon Guards.*) The following circular to officers commanding regiments in H.M.'s service gives the local regulations :— "Head Quarters, Madras, April 30th, 1857. "Sir,—In consequence of the great loss of life from cholera in the wing of H.M. 43rd Regiment Light Infantry, the following local regulations for field medical service have been drawn up for the guidance of officers in command of regiments. "1st. To prevent undue exposure to the sun the hours of marching should, in the first place, be fixed so as to bring the corps to its new encamping ground by an hour after sunrise, the pace not exceeding 2½ miles an hour, including stoppages. In the hills and in feverish jungles it is safer to march by daylight. "2nd. Except when leaving the old and nearing the new encamping ground, the men should march with files well loosened; but every man should retain his place in sections or fours. "3rd. To prevent falling out there should be a halt (for five minutes), half an hour after starting and the same every hour afterwards. On these occasions good drinking water should be supplied by puckallies marching with the advanced and rear guards. It will further this object if the quartermaster in passing leaves a supply of water a mile or two from the new encamping ground. Nothing can be more dangerous than drinking the water usually found by the road side. "4th. Any man who from sickness or fatigue seems unable to march should receive a ticket permitting him to fall out. A non-commissioned officer should be left with him to bring him before the medical officer of the rear, who will decide whether and how he is to be carried. Tickets so issued to be collected at the end of the march and sent to the orderly room. "5th. Before marching off the men should have it in their power to obtain half a pint of coffee and a bit of bread or biscuit, and a similar refreshment may be provided for them when half the march is completed. "6th. As nothing is so apt to induce disease as intemperance, the utmost vigilance is required to prevent the sale of arrack, toddy, or other intoxicating beverages. The regimental cutwal or peon should go with the advanced guard to remove from the road side all natives vending suspicious drinks, and to watch all arrack shops whilst the corps is passing. "7th. Between the hours of 8 a.m. and 4 p.m. soldiers should not be permitted to leave camp; they should be strictly prohibited from entering any village, and natives should not be permitted to idle about camp. "8th. Bathing. No good opportunity for ablution should be missed, but an officer per company and a medical officer should be present at all bathing parades. Though all men ought to be marched to the water, it should be left optional with each to bathe or wash as he pleases. "9th. The encamping ground should not be near any village. The camp should front towards the open country, and men should be prohibited from passing in rear of it. Before the camp equipage cattle are unloaded, the senior medical officer should minutely inspect the ground, and satisfy himself that the place is healthy and the water good, and for this purpose he should precede the column after their first halt. "10th. If there is more than one well or tank, the best water should be selected and reserved for drinking. Should the water be bad, vegetable and gaseous impurities—by far the most dangerous—may be rendered innocuous by boiling, as all that is necessary is to heat it to boiling temperature, and a sufficiency for drinking purposes may be thus prepared immediately after breakfast. "11th. Forced marches. Should it be deemed necessary to shift the camp, the move should be as short as possible, as a night march is always fatiguing, and pitching camp in the dark is attended with many disadvantages. "12th. Halts. It is not generally expedient to halt more than once a week (Sunday). It is better to divide a long march into two than to halt on a week-day, as it is very difficult to keep men out of mischief when they are both fresh and idle.

References to Subjects and Queries.	REPLIES.
X. Field Service—*cont.*	"13th. The use of sour milk from brass vessels and eating unripe fruits is very hazardous, and the utmost care should be taken that no tainted food is admitted into the camp. "14th. To have a good night's sleep—than which there is nothing more important to health—tattoo should sound shortly after dark. Lights should be extinguished, loud talking and noises stopped by 7.30 p.m.; and no tent peg or baggage allowed to be removed before reveille." 2, 3, 4. (*By the Officer commanding* 1*st King's Dragoon Guards.*) I have not been on field service or marched in this presidency, and I cannot give an opinion as to the working of all the regulations in questions 2, 3, and 4. (*By Officer commanding* 1*st Madras Fusiliers.*) During a march or in the field, when any doubt exists as to the healthiness of the encamping ground, the opinion of the surgeon is accepted. On field service the encamping ground is selected by the Quartermaster-General's department, and a sanitary officer (medical) is appointed to carry out the sanitary regulations in force for the preservation of the health of the troops in camp. Water is supplied to field hospitals and to the troops generally by puckallies and bheasties. Tents for hospitals and the troops are so constructed as to admit of ventilation being readily regulated according to circumstances. Those for field hospitals are supplied in proportion to the number of troops. The sick are carried in doolies and in carts, but ambulances are about to be introduced for that purpose. Hospital supplies are provided by the Commissariat department; and in the field, supplies of medicine are obtained from the medical storekeeper in camp, and they are transported in carts and on bullocks. Regiments are provided with field medicine chests.
XI. STATISTICS OF SICKNESS AND MORTALITY.	No information under this head.
XII. HOSPITALS.	1, 2. (*By the Deputy Inspector General of Hospitals.*) The subject of the hospital and questions connected therewith have been already fully answered by the executive medical officers in their reports on hospitals, particularly by the surgeons in medical charge of Madras Artillery, Her Majesty's 1st Dragoon Guards, and the 1st Madras Fusiliers, at Bangalore. (*The Officer commanding Artillery.*) The position of the Horse Artillery hospital is good; it is between the barracks and the sick lines. The distance from the front to the horse lines is 433 feet, to barracks 156 feet, and from the rear to the sick stables 137 feet. It is about 100 yards from the bazaar. The site is open, freely ventilated, and healthy. The Foot Artillery hospital is in a good position, and is 172 feet from barracks, 516 feet from stables, and half a mile from the bazaar. A few officers' houses are near it. The site is freely ventilated, open and high, with nothing to interfere with the ventilation. It is generally healthy as to elevation, drainage, &c., the burying ground, which is about 600 yards distant, being the only thing that is likely to cause sickness. (*By the Officer commanding* 1*st King's Dragoon Guards.*) The hospital is situated to the westward of the barracks, a main road running north and south separating them from the hospital enclosure. The barrack latrines in the barrack square are 90 feet distant from the hospital enclosure, and 150 feet from the female ward. The sick horse lines are the nearest stable, being only 150 feet distant, and the riding school grounds adjoin the hospital. The riding ground, together with one private residence, separates it from the large Ulsoor tank, which lies immediately to the north, at the foot of the sloping ground on which the hospital stands. The stabling of a private residence adjoins the building on the east, 113 feet distant from the nearest ward. One of the main roads running east and west is 60 feet from the principal ward, and separates it from a private residence to the south. There is a bazaar to the eastward, and another to the westward, about half a mile distant. The site of the hospital is not open and free to ventilation, unless to the north, where it is too much so. The buildings being on sloping ground, northerly winds blowing over the surface of the Ulsoor tank in this direction wafts damp cold air into the wards, which cannot be kept out, as the doors and the windows on the ground floor are all jalousies, without glass or panels. The guard-house, serjeants' quarters, and the high hospital wall are only 34 feet from the principal ward, and prevent circulation of air from the south, as they are on higher ground than the hospital. On the west ventilation is very bad and impure, as the wind coming in this direction blows over and through the barrack latrines and sick horse stables; and at times the smell has been so offensive that I have been obliged to shift the patients out of the nearest hospital ward. And on the east the closeness of private residences and stables impedes ventilation. The following is an extract from one of my reports:—In the hot weather the prevailing winds are westerly; and not many yards to westward of the hospital the barrack latrines are situated. At times the smell is so disagreeable from this cause that "patients are obliged to be shifted to the opposite side." Since then the new female hospital is building half way between the latrines and the ward found so offensive, and no doubt the female hospital will be unbearable when a westerly wind is blowing. It is decidedly not a healthy site for a hospital, and the building is decidedly not a healthy one, nor ever will be, for the following reasons:—1st. The northerly wind blowing over the Ulsoor tank so close wafts damp air into the wards; 2nd. A main drain, into which all the drains from the whole of the barrack urinals are led, is only about 100 feet from the hospital compound; 3rd. The riding ground is too close; 4th. The neighbouring houses being on higher ground are too close, and the hospital is confined; and 5th. The closeness of the barrack latrines and sick horse stables, independent of the hospital buildings themselves. (*By the Officer commanding* 1*st Madras Fusiliers.*) The hospital is situated in the middle of the centre square of the three inclosures into which the barrack buildings are divided; in front of the barracks is the parade ground, to the right, divided by a road; officers' compounds in the rear, and to the left the bazaar similarly divided from the cavalry barracks. The building is immediately surrounded by a wall 10 feet high, and beyond that is the barrack

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	buildings, which seriously interfere with the ventilation; the site is otherwise healthy; no malaria proceeds from marshes in the near neighbourhood of the bazaar. This latter, which, however, like all Indian bazaars, is filthy, causes intolerable stenches, and is no doubt prejudicial to health. 3. (*By Officer commanding Artillery.*) The supply of water to the Horse Artillery hospital is abundant from the Ulsoor tank, which is distant about a quarter of a mile. This tank is just now not very clean, but a scheme for cleansing it is now on foot, so as to have a supply of pure wholesome water; there is also a good supply of water from the wells. The Foot Artillery hospital is supplied with water from a tank 800 yards distant. Very good water is also obtained from a large well. (*By Officer commanding* 1*st King's Dragoon Guards.*) The supply of water for the hospital is brought in puckallies from large wells close to the Ulsoor tank. This water cannot be the purest, as the water from the wells is filtered from the tank which receives the whole of the drainage of a very large bazaar, and of more than half the cantonment, including infantry and cavalry barracks. It can only be improved by running a large drain along the southern margin of the tank to receive the general sewage, and conveying it below the tank, as recommended in my annual reports. Hundreds of bullock loads of impure matter deposited in this tank are removed year after year when the tank is low, and the smell from it is most offensive. (*By the Officer commanding* 1*st Madras Fusiliers.*) There is no good water in the neighbourhood available. All water used for the hospital is brought from wells at three quarters of a mile distance, or from the Ulsoor tank. 4. (*By Officer commanding Artillery.*) An open drain or ditch carries off the surplus water from the Horse Artillery hospital into the Ulsoor tank, distant about a quarter of a mile. The surface water from the Foot Artillery hospital is carried by an open drain to some low ground at a distance of 340 feet. (*By the Officer commanding* 1*st King's Dragoon Guards.*) There are no drains to carry the refuse water and other impurities from the hospital. (*By Officer commanding* 1*st Madras Fusiliers.*) There are no means of drainage except at the cook-room, the refuse water of which is carried by a drain in rear of barrack walls. 5. (*By Officer commanding Artillery.*) The male ward foundation of the Horse Artillery hospital is level with the ground; the female ward is raised 16 inches; there is not free perflation underneath the floors. The wards of the Foot Artillery are raised 2 feet 5 inches, but there is no perflation of air underneath. Most of the roof water from the Horse Artillery hospital sinks into the subsoil; the surplus is carried by a drain into the Ulsoor tank, now the great outlet for all drains, and in consequence very filthy, but is soon to be cleansed, and other outlets for the sewage of the station to be made. No guttering, ground slopes, drainage is sufficient. The roof water from the Foot Artillery hospital runs into an open drain; drainage sufficient. (*By Officer commanding* 1*st King's Dragoon Guards.*) None of the hospital buildings are much raised above the level of the ground outside, and the door frames at the bottom have sometimes failed to keep out the rain and water. A few feet to the south of the building the ground is higher than the floors from the sloping nature of the ground. Lightly the centre floors of the hospital were raised about 18 inches above the floors of the verandahs, and a step or two lead from all parts of the verandah to the ward. The floor of the hospital is supposed to be solid; what the perflation of air underneath the floor is can be judged from the following extract from a letter addressed by me to the commanding officer of the regiment on the 27th January 1858:—"One of the flags in one of the wards having sunk, and the wards smelling disagreeably, I had it removed to ascertain the cause, and the smell from the opening was so offensive that the apothecary and myself were obliged to run away from it quickly." There is no provision for carrying away the roof water, it sinks into the subsoil. The surface is sloping to the north; there are no drains to convey away the surface water. (*By the Officer commanding* 1*st Madras Fusiliers.*) The floors of the wards are raised 18 inches from the ground; there is no perflation beneath them; they are solid structures of stone and chunam. The roof water sinks into the subsoil. There is no drainage, the rain water either sinks into the ground or sweeps through the hot little square, then through the barracks square into the drain outside. (*By the Officer commanding Horse Artillery.*) The hospital is constructed of brick and chunam; the roof and walls are single, but sufficiently thick to keep the building cool. The walls are much too low and the accommodation insufficient; in fact this hospital has over and over again been condemned by the inspecting officers. The male ward has a verandah 12 feet broad on both sides; the female ward has a verandah all round 14 feet wide. Both verandahs are broad enough, but deficient in height, and they are very often used for the accommodation of the sick. The Foot Artillery hospital is built of brick and chunam, with single walls and roof, but sufficiently thick to keep the building cool. The ventilation is middling. There is a verandah front and rear 37 feet long, 11 feet 6 inches broad, and 9 feet high, but they are never used for the accommodation of sick or others. (*By Officer commanding* 1*st King's Dragoon Guards.*) The hospital is built of brick and (I believe) mud, unless round the doors and windows. The walls and roof are single, but sufficiently thick, except the roof of the verandahs which are plastered and low, being only from 12 to 8 or 9 feet high, and the place is very hot inside. There is only one verandah to the hospital 12 feet wide on all sides, communicating by steps with the wards, and shut up with jalousies in the shape of doors and windows. Being enclosed, it affords shelter from the sun's rays; the verandahs are occasionally used to accommodate the sick, as the hospital accommodation is so small. (*By Officer commanding* 1*st Madras Fusiliers.*) The roofs and walls of the hospital are single, but the former are not sufficiently thick; there are verandahs all round, with purdahs 7 feet 9 inches, sufficient to afford shelter from the sun; they are never used for the accommodation of sick or others. All the hospitals consist of one story only.

XII. Hospitals—*cont.*	(*By the Officer commanding Artillery.*) The hospitals of the Horse Artillery and Foot Artillery are so placed as to receive the full benefit of the prevailing winds. The windows of the fomer hospital open inside, and their construction is as good as the building will allow. The arrangement and construction of the windows of the latter hospital are also] conducive to ventilation and coolness. (*By the Officer commanding* 1st *King's Dragoon Guards.*) The hospital cannot receive the full benefit of the southerly or easterly wind. The whole verandahs are enclosed with jalousies, which act the part of doors and windows ; and the wards are so cold that I have been obliged to get coarse canvas curtains to hang up to the openings between the verandahs and wards to keep out the cold damp night air. The roof of the wards has lately been raised 3 or 4 feet, and swing glass windows have been put in the walls high up. The construction of doors and windows is not conducive to ventilation, as the cold night airs cannot be kept out. (*By Officer commanding* 1*st Madras Fusiliers.*) The hospital is not placed so as to receive the full benefit of prevailing winds. Only a very strong breeze can reach the hospital, shut in as it is by other buildings. The windows and doors are so placed that when a strong breeze blows, unless the windward side is closed, the wards are swept by draughts of air. 6. (*By Officer commanding Artillery.*) The ventilation of the wards of the Horse Artillery hospital is as good as such a building will allow of. When wind and rain come the doors and windows must be closed, which makes the wards close. The ventilation in the Foot Artillery hospitals keep the wards at all times free of odour or closeness. The Horse Artillery hospital has venetians, but there are no jalousies or jhilmils to the Foot Artillery. (*By the Officer commanding* 1*st King's Dragoon Guards.*) In addition to the jalousies and windows mentioned, ridge ventilation along the top of the wards has lately been added. The means of ventilation are sufficient to keep the wards free of odour or closeness, unless when the odour comes from outside. The jalousies are boards six inches wide, sloping over each other when shut; by means of a pivot at each end, and a connecting piece of wood, they are all raised up to a right angle, and admit the air freely. When shut they do not close sufficiently to keep out the wind, a space of about an inch being left unclosed between each board. (*By the Officer commanding* 1*st Madras Fusiliers.*) Ventilation is effected by means of doors and windows below, and openings in the roof above. By keeping all open the ventilation is sufficient, but for the reasons before given this is not always practicable. There are no venetians, but in the verandahs there are blinds of split bamboo and blue cloth. 7, 8. (*By the Officer commanding Artillery.*) There are no means for cooling the air in any of the hospitals, nor any apparatus for warming the wards. The floors of the Horse Artillery hospital and the Foot Artillery hospital are whitewashed once a week. (*By the Officer commanding* 1*st King's Dragoon Guards.*) There are no means of cooling the air and none of warming, unless the canvas curtains mentioned, put up for the openings between the verandahs and wards to keep out the cold wind, be considered such. The walls of all the hospitals are whitewashed every year, but oftener if required. The officer commanding the 1st Dragoon Guards believes that the ceilings of the ward of his hospital are seldom or never whitewashed. 9. (*By Officer commanding Artillery.*) The privies are very small; there are no urinals. The filth is conveyed away in night-carts. There is no drainage, but water is abundantly supplied. No cesspools exist, and the privies are rather offensive. In the Foot Artillery the drainage of the privies is good. There is a plentiful supply of water. The cesspools are some distance in the rear, and are not offensive. (*By the Officer commanding* 1*st King's Dragoon Guards.*) Tubs are to be used in the privies, and the contents carted away every morning. The privies are not used as yet. (*By Officer commanding* 1*st Madras Fusiliers.*) The privies are in the rear of the hospital, and the urinal fæces are carried away in tubs. They are not properly drained, but are not more offensive than is unavoidable. 10. (*By Officer commanding Artillery.*) The bath-room is merely a portion of the hospital verandah closed in, but is quite sufficient for the sick in both Artillery hospitals. (*By Officer commanding* 1*st King's Dragoon Guards.*) The lavatories are small rooms 12 feet by $8\frac{1}{2}$ off the passage going to the latrines. These are not sufficient for the hospital, and are much too small; and being so small and badly ventilated, they will more than likely smell very badly when used a short time. (*By Officer commanding* 1*st Madras Fusiliers.*) There is a bath-room in the rear of the hospital sufficient for the purposes of the sick. 11. (*By Officer commanding Artillery.*) In the Horse Artillery and Foot Artillery hospitals large tubs are used for bathing the sick. These are not sufficient in the former building owing to the small size of the bath-room. (*By the Officer commanding* 1*st King's Dragoon Guards.*) Large tubs are proposed to be used for bathing the sick. (*By Officer commanding* 1*st Madras Fusiliers.*) The sick are bathed in tubs, but the supply of water is limited, it having to be brought from a distance by puckallies. 12. The linen of the hospitals of the Horse Artillery, Foot Artillery, and Fusiliers is done by dhobies. (*By Officer commanding* 1*st King's Dragoon Guards.*) The linen is not washed in the hospital. It would be well if there was a washing machine in the hospital, as the linen would be better washed and last longer. It is now done badly, and injured by the men employed from their washing the linen by beating it against stones at the side of the tank. Two native tailors are constantly employed mending the linen from this cause. 13. (*By the Officer commanding Artillery.*) The storage is insufficient, but what there is is dry. (*By the Officer commanding* 1*st King's Dragoon Guards.*) The storage is dry, but not sufficient, as there is only one place 15 feet square. (*By Officer commanding* 1*st Madras Fusiliers.*) The storage is very limited, but dry. 14. (*By Officer commanding Artillery.*) Wooden cots 18 inches in height, 6 feet 6 inches long, and 3 feet broad, are used in hospital. They are taped with broad tape, and are quite sufficient. (*By Officer commanding* 1*st King's Dragoon Guards.*) The hospital bedsteads are wooden, with bands of wide tape in the centre. The bedding is straw; iron bedsteads and air beds are much required. The wooden bedsteads are with difficulty kept clean and free from vermin. (*By Officer commanding* 1*st Madras Fusiliers.*) Wooden bedsteads are used in the hospitals, with tape bottoms.

BANGALORE.

XII. Hospitals—*cont.*	15. (*By Officer commanding Artillery.*) The cook-house of the Horse Artillery hospital is too small and too close to the sick wards. The diet is properly cooked, and can be sufficiently varied. The Foot Artillery hospital is 100 yards from the sick wards. (*By the Officer commanding 1st King's Dragoon Guards.*) The old kitchen has been removed, and the new one is not yet built. The diets are properly cooked, but cannot be sufficiently varied for want of proper kitchen ranges. (*By Officer commanding 1st Madras Fusiliers.*) The kitchen is good and sufficient. 16. Copies of diet tables, &c. are forwarded. They are in strict conformity with the forms and regulations laid down in the medical code. 17. (*By Officer commanding Artillery.*) The provision for attendance at the hospital is as follows:—1 hospital serjeant, 1 European nurse, 5 male coolies, and 2 female coolies, which are ordinarily quite sufficient. When extra coolies are required, they are supplied by the Commissariat; also, under any peculiar circumstances that may render it absolutely necessary, an orderly comrade may be allowed to attend on a sick soldier in hospital under the sanction of a commanding officer. There is no separate establishment for the Foot Artillery. (*By Officer commanding 1st King's Dragoon Guards.*) The following is a list of the hospital subordinates and servants allowed by regulation for the attendance on the sick of the regiment, but it is seldom that the full allowance of hospital subordinates are present with the corps, as they are constantly removed from the regiment for service with other corps and detachments.

Description.	No.	Description.	No.	Description.	No.
2nd Apothecary	1	Cooly maistry	1	Cooks	2
Assistant Apothecary	1	1st class Coolies	3	Washermen	2
2nd Dresser	1	2d do. do.	8	Sweepers	3
Hospital Serjeant	1	Tailors	2	Toties	3
Do. Writer	1	Puckallies	2	Dhooly-bearers	6
European Nurse	1	Conicopoly	1		
Native Nurse	1	Assistant Conicopoly	1		

One assistant apothecary has been taken away from the regiment five times in two years, and the second dresser about eight times; and now the senior apothecary has been removed on one day's notice to go to China with the 44th Regiment. The system does not work well, as may be seen by my letters on the subject; permanent hospital subordinates are much required.

(*By the Officer commanding 1st Madras Fusiliers.*) The hospital attendants are, 1 hospital serjeant, 1 hospital nurse, 3 first-class coolies, and 8 ward coolies, which is sufficient.

18. (*By Officer commanding Artillery.*) The Horse Artillery hospital is too low and has not sufficient accommodation, but otherwise the sanitary condition is good. No epidemic has prevailed since I assumed medical charge, upwards of a year ago, and there has been no hospital gangrene or pyæmia. The Foot Artillery hospital has been abandoned as being unfit.

(*By the Officer commanding 1st King's Dragoon Guards.*) At present one of the barracks is used temporarily while the hospital is undergoing alterations. The alterations in the hospital itself are now finished. I look on the improvements made as of very little use, and I am sure it will be found ultimately that what I said in my annual report for 1858 regarding the improvements then contemplated, but now executed, will turn out to be true, and the money expended has been thrown away. Before the alterations a number of men were attacked with acute rheumatism while in hospital, and it was necessary to invalid nine men with that complaint. For this class of patients and those attacked with dysentery it is now much worse, as it will be found colder in the cold season.

(*By Officer commanding 1st Madras Fusiliers.*) There has been no epidemic disease, hospital gangrene, or pyæmia of late; but I consider that with any great increase of sick or peculiar atmospheric condition, or other predisposing causes, they might reasonably be expected. The amount of accommodation is far too limited, as the total area of the six wards, allowing 1,000 cubic feet for each adult, gives room for only 84 patients; but as there is one ward occupied by the women and another by the nurse, there is only proper accommodation for 67 men. The buildings are also too much shut in, with no means of ventilation except by doors and windows, on opening which the whole ward is swept by draughts.

19. (*By the Officer commanding Artillery.*) The present hospital for the Horse Artillery, I believe, has been condemned as being too low, small, and inconvenient, besides requiring more commodious bath-rooms, privies, store-rooms, and a separate ward for ophthalmic cases, as also one for confining patients suffering from mental aberration. A new hospital is about to be built for both Foot and Horse Artillery.

(*By Officer commanding 1st King's Dragoon Guards.*) I think that the sick soldier requires as good accommodation as the healthy soldier, if not better. The hospital, after undergoing all the improvements it was possible to make, now affords very inferior accommodation, and is not half as good as the men out of hospital have. I do think a new hospital should be erected as recommended by Dr. Mouatt 26 years ago, who in all his annual reports stated, "The wards were so narrow that there was not room for tables for the men to dine off;" by the Deputy Inspector General of Her Majesty's Hospitals; by the Superintending Surgeon of the Division; by Col. De Butts, late Engineer of the station; and by myself, as seen by my annual reports since the regiment has been here, and I believe by all commanding officers of regiments. I would also suggest that the open high ground in front of the barracks is the proper place for a hospital, as recommended by Col. De Butts, and for the same reasons as I have given in my annual reports.

The following are some of the objections to the present hospital, and which now exist after all improvements:—

1. There are no small wards for serious cases or maniacal patients.
2. The wards are so narrow that there is not room for dining tables for the men.
3. There are no covered places where the men can walk about and take exercise, unless the covered way to the latrines.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	4. There are no nurses' quarters, nor quarters for the apothecary, some of whom could not get a place to live in nearer than a mile, and have to go backwards and forwards to the hospital all day long, as their services may be required. 5. There is no way of regulating the temperature of the wards, or keeping out the cold air at night. 6. There are two steps from the wards down to the closed verandah where the close stools are kept. The exertion of going up and down these steps will be likely to be attended with injurious consequences to weakly patients when suffering from dysentery or fever. 7. The whole hospital is much too small for any regiment. The table filled in shows what it is capable of holding:—77 beds, allowing about 1,000 cubic feet of space for each bed; whereas the allowance, according to the regulation, is 1,500 cubic feet per man. Unless the beds are put almost touching, or in the verandahs, it is impossible to put into the wards more than 64 beds; but, according to the Hospital Regulations, page 38, sect. 7, par. 2, allowing 1,500 feet for each man, it is only capable of holding 54 patients. 8. The hospital is scarcely raised above the ground, and will be always damp in wet weather. 9. The buildings are too crowded together, too close to the public roads and the neighbouring houses, which impedes the circulation of air into the wards. I would suggest a new hospital to be built, with inner and outer verandahs, at least as good as the men's barracks. It has been hitherto found that men are reluctant to leave good barrack-rooms when unwell, and come into an inferior building, such as the present hospital is; and when they do come in, they are discontented, and wish to get back to their barrack-room, unless they improve rapidly, which cannot be expected in the present hospital. I have generally been obliged to send men out as convalescents as quickly as possible, as I have found they have come round more quickly in the barrack rooms than in this bad hospital. (*By Officer commanding* 1*st Madras Fusiliers.*) The occupation of two of the wards as nurses' quarters and female ward, besides being objectionable, as seriously curtailing the accommodation of the men, is also highly improper from the necessary indecency to which it leads, the men being quite visible while sitting at stool, from the women's ward. The only means I can suggest of remedying these defects is by the entire reconstruction of the hospital on a better site and on a different plan. 20. (*By Officer commanding Artillery.*) There are no convalescent wards in the Foot Artillery or Horse Artillery hospitals. Patients recovering from disease are allowed to take exercise morning and evening in an ambulance when considered necessary. There is no suitable fenced-in ground or shaded walks to take exercise in, and there are no seats. (*By Officer commanding* 1*st Dragoon Guards.*) Two bullock convalescent carts are employed to take out convalescents for a drive mornings and evenings. There are no suitable grounds, walks, trees, or seats set apart for the use of the convalescents. (*By Officer commanding* 1*st Madras Fusiliers.*) No provision is made for the exercise of convalescents. 21. (*By Officer commanding Artillery.*) The sick wives and children of men are treated in the female ward in the Artillery hospital. The present arrangements are sufficient, and no improvement is necessary. (*By Officer commanding* 1*st King's Dragoon Guards.*) A female hospital is building, consisting of one ward, 30 feet by 20 feet, with a 12 feet enclosed verandah all round. This verandah is partitioned off to make four small rooms for a female nurse and lying-in patients. It is too small and badly planned for the accommodation of 78 women and 104 children. It should have had an outer verandah all round, and more than one ward. The present arrangements are not satisfactory, and the only improvement to be suggested is a new hospital, and at least as good as the men's barracks. (*By Officer commanding* 1*st Madras Fusiliers.*) One of the men's wards is used for the women and children, the nurse occupying a small ward. This is an objectionable arrangement in every way. 22. There are no special local hospital regulations not included in the General Presidency Medical Regulations. 23. (*By the Officer commanding Artillery.*) The medical officer has no power beyond representing any sanitary defects as far as the buildings, &c. are concerned. As to diet or medical comforts, he orders whatever he considers necessary for the patient in the way of extras. (*By Officer commanding* 1*st King's Dragoon Guards.*) The medical officers appear to have little or no power in matters appertaining to the sanitary state of the hospital. If I had any power, a better hospital would have been built long ago, as good as the men's barracks. I have always been able to get the hospital repaired, and to make arrangements about the diet. I have not marched in this presidency. (*By Officer commanding* 1*st Madras Fusiliers.*) Medical officer can recommend repairs and cleansing when necessary, and has entire control over diet and medical comforts within the hospital at stations, camps, and on the march. 24. (*By Officer commanding Artillery.*) There is no convalescent hospital at present; but if a convalescent ward be attached to each hospital, it is all that is necessary. (*By Officer commanding* 1*st King's Dragoon Guards.*) The hospital is too small to have any part of it for convalescents, as it is only capable of containing 63, or by regulation 54, beds. The authorities imagine it is capable of holding 77 patients, but I am at a loss to know where the bedsteads could be placed, unless in the verandahs. There is no place in or near the station for convalescents. It would be a great advantage to have some place about a mile or two outside the cantonment to send convalescents to. The separate building, commonly called a convalescent ward, is included in calculating the amount of accommodation available for a regiment, and cannot be used for convalescents, as it is required for the sick. Quarters for the medical subordinates are also much required. (*By the Officer commanding* 1*st Madras Fusiliers.*). There is no convalescent hospital or ward, nor do they appear to be required. (*Remark by the Commander-in-Chief.*) "The present Dragoon hospital is not so well placed as it might be, neither is it a first-class building, but still it is not altogether so objectionable as represented, and even were it so, sanction for a new hospital could not be given by the Government of India in the present state of the public finances." (Signed) P. G.

XIII. Burial of the Dead.	(*The queries under this head are answered by the Rev. J. Gorton, M.A., Chaplain of St. Mark's.*) 1. The distance of the burial-ground used by British troops is as follows:—From the Foot Artillery barracks, 80 yards; from the Horse Artillery ditto, 800 yards; from the Dragoon ditto, 380 yards; from the old Dragoon ditto, 1,200 yards. The prevailing winds are N.E. and S.W. The N.E. wind blows from the burial-ground over a portion of the cantonment, and the S.W. would blow over the new Dragoon barracks only. 2. The soil is gravel and red clay, the drainage is good, decomposition takes place readily, and the ground is carefully kept. 3. The grave space allowed is 6 feet by 4, and the interval between the graves about 4 feet. They are never reopened. Interment is compulsory at ordinary times within 24 hours, and during epidemics when notified by the surgeon. There are no regulations in force regarding the burial-grounds where the native troops bury or burn their dead. 4. The grave-yard is never offensive. 5. The dead of camp followers and bazaar people are buried or burned in localities beyond the limits of the military cantonment. 6. No injury accrues to the public in this station in military limits from the present practice. 7. There is to be an alteration carried out almost immediately, or a new burial ground for the cantonment generally, and the troops in garrison. The land has been selected and given by the Commissioner of Mysore for this purpose.

I. Topography.	1. The country surrounding the station is undulating, with bold projecting masses and ridges of granite, syenite, and greenstone. Fragments of these rocks everywhere strew the ground and jut from the soil; they sometimes rise in rocky ridges, bleak and bare, from 40 or 50 to 100 or 150 feet in height, and from partial decomposition and disintegration, leave tor-like masses of the rock poised in fantastic forms, presenting a strange picturesque appearance, often with a castellated outline. This aspect is very little diversified with trees, but in the hollows formed by the undulations, or in the more level grounds, the mango, tamarind, banyan, and palm trees, grow well. Arboreous shelter is much needed, and planting is desirable. The whole country around Secunderabad undulates, and the soil everywhere is composed of the granitic sand derived from the above-named rocks, and the general character of the country is extremely dry. There is very little wood and no jungle for miles around, and there is no collected body of water of any kind, except after a heavy rainy monsoon (a very rare occurrence) when the tanks, which are numerous, and some very extensive, become full. 2. The general elevation of the station above the sea is 1,800 feet. The station is so widely scattered that the elevation of different points varies; most of the barracks occupy the undulating ground, generally at its highest levels (with some exceptions, which will be specially named). The highest point in Secunderabad is about 110 feet above the Moosy river at Hyderabad, 6 miles distant. At the time of writing, after a season of great drought, the tanks are almost entirely dried up. A very fine tank, called *Hoossain Sagur*, impinges on the cantonment on the W. side, and when full, which it has not been for nine years, it inundates the lines of a Native Infantry corps in that direction. The Moosy, a mere water-course, through which the country drains, is 6 miles off. Certain parts of the cantonment are as high and as healthy as any ground adjoining, but there are places in the station, (especially the lines of one Native Infantry corps, those on the Hoossain Sagur tank, and in a much less degree the old European Infantry barracks) which are at a lower level, and have not proved as healthy as other sites. (Remark by H. E. the Commander-in-Chief.—The old European Infantry barracks have proved eminently unhealthy for nearly 30 years past; *vide* my observations on them in my inspection tour, Report of February 1859. (Signed) P.G.) 3. The table land of Bedur is about 70 miles direct from Secunderabad, and is 700 feet above the station.

* Additional barracks completed for two-thirds of a battery, at present accommodated in tents, and not included.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	4 The river Moosy is about 6 miles from Secunderabad, and the artificial lake called *Hoossain Sagur* borders the S.W. side of the station. At the point of the station indicated above the Hoossain Sagur tank is liable to overflow between the months of June and October, and it would remain at the skirts of the station for a short time till subsidence from evaporation and extensive irrigation took place. No overflow ordinarily occurs, and its effect on the station would be limited. The ground is very irregular from the undulations named above. Nothing like ravines are produced, but depressions or hollows are frequent, and there are few water-pits, and none likely to affect health. 5. The station is very open, and free perflation of air everywhere exists. Trees are abundant in the grounds of the officers' lines, but nowhere in excess, and the only part where there is objectionable closeness of houses is the site of the Native Infantry lines, on the Hoossain Sagur tank, to which the great bazaar of Secunderabad is contiguous. The temperature of the station is decidedly raised by reflected sun-heat. The rocky ridges in every direction and the masses of rock jutting almost everywhere from the soil, some in close contiguity to buildings occupied by the troops, absorb and reflect heat, and raise the temperature of their neighbourhood during the night by radiating the caloric which they have acquired during the day. The station is much exposed to cold and variable winds during and after the rainy monsoon, and when the rains have quite passed away. There is an extreme dryness combined with cold, parching yet chilling the surface, and producing internal congestions resulting in hepatic disease, dysentery, diarrhœa, and fevers often of a typhoid type. Hot land winds prevail from March to June, which exhaust and enervate the system; but health is generally better among the troops, though small-pox and cholera then prevail sometimes, and no doubt the exhausting effects of a long continued high temperature on the system, especially on the skin, leave a proneness to the diseases of the succeeding cold and wet season. 6. There is very considerable cultivation in the country surrounding the station, but great tracts are sterile and uncultivable from the rocky nature of the soil. There is an extensive tract irrigated from the Hoossain Sagur tank, which is adjacent to one part of the station, as has been said, but is very remote from the greater portion. There are also patches of land in many places in and about the station irrigated from smaller tanks and wells, but none nearer to any barracks or lines than 200 or 300 yards. Artificial irrigation is certainly not in general observed to have any effect on the health of the station; the only question is concerning a tract which is the line of drainage from the old European Infantry barracks, particular attention to which is being paid; but owing to the land not belonging to the British Government, but to the Nizam, difficulty is found in establishing a conservancy over the tract which it is desirable to be able to do. There is no actual prohibition of rice cultivation, but practically there is no opportunity of carrying on such cultivation in close proximity to any part of the station. The only extensive tract under rice cultivation is the land irrigated from the Hoossain Sagur tank, and no part of this approaches within a mile of any place occupied by troops. Patches of rice cultivation occur in many scattered spots in the low levels about the station, but in no way prejudicial to the public health. No indigo is cultivated nor any preparation of hemp or flax carried on near the station. 7. The large city of Hyderabad is 5 miles from the nearest point of the cantonment, and the bazaars and town of Secunderabad form an integral part of the station, joining on to some of the regimental lines, but very remote from others, and the new buildings for European troops are far away. The relative position will be best learnt by the plan. 8. The geological formation of the district is altogether primitive; granite, syenitic granite, with veins and dykes of basalt and other forms of hornblende rock. The surface soil is composed of the detritus of the above-named rocks, where the rocks themselves are not protruding in a crystalline state and the sub-soil is altogether composed of the rock itself, either crystalline still, or what is more frequent in a soft friable decomposing state. This is more particularly the case with the granite rock in which the felspar is abundant with quartz and no mica. The hollows and depressions, rarely considerable enough to be termed valleys, are of a more alluvial soil, but still principally composed of the rocky detritus. At some miles from the station there are tracts of the regur or black cotton soil. The old parts of the station appear as if they were but sparsely populated before occupation. The place in which the new barracks are is quite new ground. 9. Water is found in the lower levels about 6 feet below the surface, but in the higher grounds, where many of the wells are, water is not reached under 50 feet, and many wells are deeper than that. The depths do not greatly vary in the dry and rainy seasons, but the quantity of water issuing varies very considerably. 10. Owing to the undulating conformation of the ground, and the non-retentive character of the surface and subsoil, as noted above, the rainfall flows readily away, and there are no surface springs near the station. With the two exceptions specified above, all the public buildings are on the higher undulations where no water lodges. The two points of the station alluded to are more or less liable to drainage from higher levels, but the locations of each regiment of the force are so widely apart, and each so distinct in its topography from the others, that it is impossible to give an answer which shall be applicable to all. It may be said generally that, with the exception of the Native Infantry lines, on the Hoossain Sagur tank, and in a less degree the old European barracks at Secunderabad, no place occupied by troops is liable to have the drainage from higher ground pass into its subsoil. 11. The water supply is derived altogether from wells. It is not stored in tanks for the use of the troops, and there are no tanks within the cantonment. The superficial area of the great tank above adverted to varies from a few hundred square feet, which in dry seasons it covers, to several square miles to which in rare seasons it is said to extend. The tanks are rarely full. The smaller neighbouring tanks are often quite dry, but the large one is never quite so. As a general practice no tank is used both for drinking and bathing; but it is possible that when the Hoossain Sagur tank comes up to the borders of the cantonment (which it has not done for nine years) the water may be used for both purposes. When the Hoossain Sagur tank floods the neighbourhood it is said to produce fever on the side on which it extends. The only way of preventing it is by removing the lines of the native corps to another locality, which it is understood will be effected when arrangements now going forward are completed. 12. The water supply being obtained from very numerous wells, the amount cannot be given even approximately; but it is generally very abundant, liable however to run low in the dry season, if the previous rain-fall has been scanty, and after a succession of deficient monsoons

SECUNDERABAD. MADRAS.

I. Topography—*cont.*

(as in the present year 1860) water for all purposes is scarce. In colour it is almost always quite clear, but sometimes it is slightly opaque and white from earthy and saline admixture. It is quite inodorous. The following are the results of the analysis of water at Secunderabad:—

		Specific gravity.	Total Solid Matter per Gallon.	Organic Matter per Gallon.	Inorganic Matter per Gallon.	
			Grains.	Grains.	Grains.	
Trimulgherry -	Well, near Hospital - -	1000·26	10·32*	2·64	7·68	The water of these wells and tank was examined microscopically, specially with a view to discover the ova or young of dracunculus, but they were not found.
	Barrack Well -	1000·3	17·68*	3·44	14·24	
Hoossain Sagur -	Tank - -	—	33·6	8·0	25·6	
Native Infantry Lines	1st Well - -	—	38·72	11·28	27·44	
	2d do. - -	—	119·28	—	89·18	
	3d do. - -	—	44·416	—	16·016	

* In each case the inorganic constituents were found to be carbonic acid, lime, chlorine, soda, silicic acid, sulphuric acid, and magnesia. Mere traces of the three last were discoverable.

Samples from the site of the new Trimulgherry barracks have been analysed by the Professor of Chemistry at Madras; also from the Hoossain Sagur tank, and from the wells in the Native Infantry lines in its vicinity, and both pronounced remarkably pure.

Water is raised by the ordinary native method in a skin bag, lowered by a rope running over a pulley, and hauled up by a pair of bullocks moving up and down an inclined plane, and discharged into a reservoir, whence it is led where it may be wanted in conduits of masonry, or it is carried in skins placed on a bullock, which is the usual way of conveying it about. The water supply is liable to run short in seasons of drought, which are frequent here, and (as in the present season 1860) to become insufficient for so large a body of troops, including so many horses and other animals. Engineer officers are of opinion that water might be stored to a large amount in the hollows of the undulating ground by the erection of suitable embankments, which it is very desirable to effect.

(Remark by H. E. the Commander-in-Chief.—See the observations of Col. Arthur Cotton with respect to storing water at Secunderabad in my inspection tour, Report of February 1859. (Signed) P. G.)

13. No remark.

14. Inquiries as to the selection of new stations are submitted for the consideration of a committee composed of officers of the Engineer and Quartermaster-General's Departments, and of medical officers, who inquire into the subjects named, each in his particular line. There seems nothing to suggest on this head.

II. CLIMATE.

1. The instruments available for conducting meteorological observations are a standard barometer; standard thermometer; Fahrenheit's thermometer; self-registering maximum thermometer; do. minimum do.; wet and dry bulb do.; Daniel's hygrometer; Regnault's do.; Lind's wind gauge; rain gauge.

The following table contains 10 years of observations from January 1st, 1850, to December 31st, 1859:—

Months.	Barometer Mean.	Mean Temperature.	Mean Daily Range.	Mean Maximum.	Mean Minimum.	Mean Dry Bulb.	Mean Wet Bulb.	Mean Sun Temperature.	Rain, inches.	Winds.		Days of Sunshine.	Remarks as to Dew, Clouds, Winds, Storms, &c.
										Direction.	Force.		
January -	28·88	73	14	78	64	74·7	62·6	93	·37	N.E.&N.W.	Calm	—	Weather fine and pleasant, a little dew.
February -	·61	76	16	82	66	79·6	63·4	99	·57	N.W.&N.E.	Moderate	—	Clear and pretty cool, little or no dew.
March -	·33	81	14	87	73	83·4	68·7	104	·49	N.E.&N.W.	Moderate	—	Clear and cloudless, rather warm, no dew.
April -	·31	86	15	92	76	88·0	70·2	104	·71	N.W&S.W.	High winds	—	Hot, with high winds, occasional storms of dust.
May -	·82	89	13	95	82	91·4	73·4	113	1·71	W. & S.W.	High winds	—	Very hot, with frequent dust storms and hot winds.
June -	·65	83	9	86	77	86·5	74·4	98	3·32	N.W. & W.	Moderate	—	Cloudy and pretty cool, hot winds cease.
July -	·62	80	8	83	75	83·1	74·3	92	4·84	W. & S.W.	High winds	—	Cloudy and rainy, with high winds.
August -	·56	79	8	83	74	80·6	74·5	92	4·84	W. & N.W.	High winds	—	Very cloudy, with heavy rains and strong winds.
September	·64	78	9	82	73	79.9	76·1	86	3·60	N.W.&S.W.	Moderate	—	Cloudy and rainy, dew.
October -	·78	78	11	82	71	79·4	70·7	92	4·59	N.W.	Moderate	—	Very cloudy, with heavy showers, dew.
November	·56	76	12	79	67	75·0	65·3	91	1·5	N.E.&N.W.	High winds	—	Overcast, with 2 or 3 heavy showers, dew.
December	·70	73	13	77	64	72·8	62·4	82	·8	N.W.	Moderate	—	Overcast, weather pleasant, little or no rain.

3. The climate may be characterized as remarkably dry. The average number of days on which rain falls is 50; the average annual rain fall 28 inches. From January to June the air is very dry, the first two months being very chill, and at the same time parching, with great variableness in temperature, while from March to June hot winds blow, and the heat

References to Subjects and Queries.	Replies.
II. Climate—*cont.*	is excessive. Fogs are infrequent, and dew very rare. Tree planting is much needed in the open, exposed ground of Trimulgherry, lately occupied for building the new barracks. There is no canal or other irrigation near enough to the places occupied by the troops (except what has been already noted) to influence the climate. The air is generally clear and pure, but liable in the hot season to occasional dust storms, but not influencing the atmosphere generally in any unfavourable manner. It is a very changeable climate, and great attention is required to clothing and shelter from the weather to prevent bowel complaints. The diet is particularly attended to, as also shelter and clothing. No drills or exercises are allowed during the hot weather, after the sun has obtained any power. The most healthy months are undoubtedly those of the dry and hot season, March to June, though cases of ardent fever and sunstroke are then of occasional occurrence, and cholera and small pox generally prevail more or less, but principally among the native population. It must be stated, however, that the excessive heat depresses and relaxes the system, and produces a tendency to the diseases which the succeeding cold and wet season developes. July, August, and September are the most unhealthy months. Hepatitis, dysentery (sometimes of a malignant type), and diarrhœa and fever (common, continued, and ephemeral), occasionally of a remittent, and sometimes typhoid form, are the prevalent diseases. 4. The only district near the station which may be at all considered more healthy is the table land of Bedur, about 70 miles from Secunderabad. Its elevation above the station is only about 500 feet, by a gradual ascent of the intervening country, and it is about 150 feet above the level of the plains immediately below. Its drainage is perfect, the ground sloping in all directions to the lower country, and the soil being hard and gravelly. The water is very good, and the supply abundant, procured from very deep wells, with but two exceptions that I know of, and those are a fine spring near Khanapore and a warm spring from the hill side near the town of Bedur. Although the elevation is but slight, still, looking down from the table land to ground on a lower level, something of the indefinable effect of a hilly country is imparted, and the whole aspect of the surface of the plateau is entirely diverse from that of the vicinity of Secunderabad, the geological formation being the *laterite*, a clay ironstone, exhibiting none of the rocky elevations which so abound about Secunderabad, and which certainly produce unfavourable effects on the atmosphere, as to absorption and radiation of heat, if not in some less appreciable electric or other conditions of the air. An outpost established here, say for two companies of infantry, with frequent reliefs, and hospital accommodation for about 50 patients, would form an agreeable and beneficial change for the European troops of this large force, and very many invalids would certainly benefit by the journey thither, and the change of air and scene. 5. The stations at which I have served are Trichinopoly, Belgaum, Palaveram, Madras, Bellary, French Rocks, Bangalore, Mercara, in India; Meeaday and Tonghoo in Burmah, all salubrious; Bangalore and Mercara decidedly conducive to health; Secunderabad I consider less salubrious than the others, on account of its changeable climate. Mangalore, Palamcottah are not conducive to health. Kolengsoo and Hong Kong, in China, and Prome, in Burmah, are decidedly injurious. (Signed) E. Apthorp, Brigadier Commanding Hyd. Sub. Force. The stations at which I have served are Madras; climate hot and debilitating, but, for an intertropical place, not insalubrious; St. Thomas's Mount, near Madras; its climate partaking of the same characteristics; Palaveram, near Madras, inland, of the same character generally, but hotter; Kulladghee, S. Mahratta country, intensely hot during part of the year, cool and bracing for four months; not insalubrious for a place within the tropics - Cannonore, very humid climate, relaxing and enervating; Bellary, hot and dry, not condu; cive to health; Bangalore, on a table land, generally very salubrious; hot season very short, and not so intense as in the lowlands; Secunderabad, climate trying for its vicissitudes; certainly not conducive to health, and without care and temperance positively injurious. (Signed) Robert Cole, Deputy Inspector-General Hospitals, H.S.F. I have served at the stations of St. Thomas's Mount, Kamptee, Saugor, Mhow, and Secunderabad. The two latter I consider the most healthy. Saugor was always considered feverish. Kamptee, on account of its extreme heat, was a bad station, and St. Thomas's Mount was healthy, but very hot. Kamptee is the only one which I consider positively injurious. (Signed) Francis Hastings Cobbe, Capt. Ex. Engineer.
III. Sanitary Condition of Station.	1, 2, 3. Maps and plans. 4. The following table shows the barrack accommodation. Date of construction.—Madras Artillery and Old Barracks, not known; Trimulgherry Barracks, 1858. Total number of rooms or huts, 148. Total regulation number of non-commissioned officers and men, 1,961.

III. Sanitary Condition of Station—*cont.*	5. There are no windows in the barracks, except in serjeants' and end rooms, and in the artillery barracks. Large double doors, glass and Venetian, are all on opposite sides, and open, the former inwards and the latter outwards. In the artillery barracks the windows open inwards. The artillery barracks have a verandah on both sides, the whole length 18 ft. 6 in. broad. The old barracks have double verandahs on each side. The breadth of the outer verandah is 10 feet, and of the inner 12 feet; the Trimulgherry barracks the same: breadth of each 12 feet. The inner verandah of the Trimulgherry barracks only is occupied by the soldiers, in consequence of a battery of artillery being located in them, in addition to the regiment of infantry. This arrangement is temporary only. The old barracks and the new infantry barracks have properly constructed jhilmils. The artillery barracks have none. (Remark by H. E. Com. Chief.—The barrack accommodation at Secunderabad is accurately described in my inspection tour, Report of February 1859. (Signed) P. G.) 6. In barracks cots are supplied composed of three boards each, 6 ft. 4 in. by $10\frac{3}{5}$ in. by $1\frac{1}{4}$ in.; two truss heads, each 2 ft. 7 in. × $4\frac{1}{2}$ × $2\frac{1}{2}$; eight truss legs, each 1 ft. 5 in. × $2\frac{1}{2}$ × $2\frac{1}{2}$ at the top, and × $4\frac{1}{2}$ × $4\frac{1}{4}$ at the bottom. The bedding consists of one cotton settringee, the size of the cot; two upper sheets; one quilt of double chintz, 7 ft. 4 in. × 4 ft. 4 in., containing four seers of cotton; one good blanket, to measure, when double, 7 ft. × 4 ft. No improvement can be suggested. In tents cots are used, but the flooring of tents is covered with tarpaulings in wet or damp weather, and with straw in dry. Men's bedding is carried for them on the march. (Remark by H. E. the Com. Chief.—For upwards of four years I have made every effort in my power, but with little effect, to obtain iron cots of an improved pattern for the whole of the European troops in the Madras Presidency. (Signed) P. G.) . There are two descriptions of tents in use with troops. The tent European for European troops, and the tent native for native troops. The tent European is an oblong in shape, the tent native elliptical, with only one entrance. Their dimensions are,—tent European, 21 ft. × 15 ft.; cubic space, 109 feet; superficial space, 13 ft.: tent native, 22 ft. × 12 ft.; cubic space, 71 ft.; superficial space, 8 ft. Twenty-five men are allotted to each tent, but, from separate tents being provided for the hospital and the guards, it never happened that 25 men occupy a tent at any time. 8. The barracks and guard rooms are ventilated by doors and windows, by ridge ventilation in tiled buildings, and skylights and upper wall ventilators to terrace buildings. There are no huts. The tents are ventilated by the doors. The ventilation is quite sufficient to keep the air pure by night as well as by day, if proper attention is paid to keeping the ventilators open. Means of cooling are by kus kus tatties to the doors and windows kept constantly saturated with water during the hot months. They are constructed by attaching the dry kus kus grass to a frame work of split bamboo. The cost of a door tatty, 6 ft. × 9 ft. is eight rupees, and of a window tatty 6 ft. × 7 ft., six rupees eight annas.

III. Sanitary Condition of Station—*cont.*	9. Barracks are constructed of brick in chunam by a recent order of the Government of India; mud and clay is to be substituted for chunam, except for basements and the few upper feet of walls. Barracks are tiled or terrace-roofed. Tents are constructed of good, strong Punjaree cloth, lined with blue dungaree. There are no huts. 10. Floors are constructed of granite. In the old barracks they are not altogether well raised above the level of the ground. In the Trimulgherry barracks they are well raised about four feet. The artillery barrack floor is also well raised. None of them have a passage for air underneath. The height of flooring from the ground is as follows:— Madras Artillery barracks, 1 ft. 6 in. average. Old barracks, 1 ft. 6 in. average. Trimulgherry barracks, 4 feet. 11. The materials and construction of barracks are perfectly suitable for the climate. A great improvement in these points has taken place within the last few years. Barracks are kept in repair by the executive engineer, and the roads by the assistant quarter-master general. Repairs are quickly executed. The deputy inspector general of hospitals, or senior medical officer present, is responsible for the general sanitary state of the cantonment. There is no prescribed time laid down by the Bengal Public Works code for cleansing and limewashing the walls and ceilings of barracks, but it is done whenever required. 12. There are two descriptions of lavatories, one the plunge bath, and the other the washhouse. Into the former the men plunge. In the latter there are tubs, and shelves for basins, and grated floors to keep the men's feet dry. They are supplied with water, the former from wells adjoining, from which the water is raised by bullocks; the latter are supplied by puckallies. In the artillery barracks there is one plunge bath and three washhouses; in the old barracks one bath and seven washhouses; and in Trimulgherry barracks three baths and ten washhouses. In the artillery and old barracks the water runs off into the general drainage. No drainage has yet been supplied at Trimulgherry. 13. Each separate barrack is provided with its cook-house. The means of cooking are as follows:—Two ration baskets; one copper boiler 9½ gallons, one 6½ gallons, with covers and ring handles; and one iron frying-pan are supplied to every 25 men. There is a table to each cook-room with a proportion of chopping blocks and 13 (qy. 3) lbs. of firewood per man daily. Water is brought by puckallies. The refuse water is drained away in the same way as from washhouses. Linen is washed and dried by dhobies (washermen), who are to be obtained without difficulty. 14. The privies have a drain along their rear, leading to a small cesspool, into which any refuse liquid escapes and is removed daily. The solid filth is removed daily by scavengers' carts to a distance. 15. The privies are ventilated by means of ridge ventilators, and some have ventilators in the walls also. A tin lamp is allowed to each privy. The barracks are lighted at night by globe lamps, one to every 12 men. 16. The drainage of the old barracks is now undergoing great improvement. Two extensive main drains are under construction, one on either side of the barrack enclosure, into which all minor drains from the barracks debouche. These two drains empty themselves into cultivated ground at the distance of 467 yards from the barracks. The dimensions of these main drains are in feet four by three at the broadest part. The drainage of the artillery barracks is good, and the outlet into a large pit in the soldier's garden distant from the barracks 140 yards. There are no sewers. No system of drainage of any kind has yet been established at Trimulgherry, but an estimate amounting to a very large sum is before Government for sanction. When the drainage of the old barrack is completed it will be ample. That of the artillery barrack is quite sufficient. (Remark by H.E. the Commander-in-Chief.—On this point see my Report of February 1859. (Signed) P. G.) No part of the barrack or hospitals is damp. At Trimulgherry the fluid refuse of the barracks is at present left to evaporate, but from all these buildings being erected on high ground, it runs off to a considerable distance, where it sinks into the subsoil. There are no cesspits. There is a nullah, which intersects or divides the main portion of the cantonment, occupied by the European portion of the community, from the bazaar, which is at times very unpleasant. 17. The extent of the cantonment is so enormous as to preclude any general surface cleansing, but parades and lines are kept clean by the followers attached to regiments; the bazaars by arrangements made by the superintendent of police; and the roads by the road department. Cleansing is done whenever required, and efficiently, by scavengers' carts being employed. Manure is either sold or removed. 18. The cantonment is singularly bare of vegetation. There are no old walls, hedges, &c., to interfere with ventilation. 19. Every main street of the bazaar has a subterraneous drain in the centre, into which all minoe drains converge, and which carries off rain water and filth. In a few of the back streets, however, this drain does not exist. A large portion of the bazaar is on high ground, so that on the whole the ventilation is good. There are many wells, but in some the water is brackish, and in the hot season water becomes scarce. In the hot season of the present year, 1860, the greatest inconvenience was experienced; bazaar people having to resort to wells outside during the greater portion of each night to obtain a sufficient supply for their wants by day. Latrines have been built. The bazaar is not overcrowded. The superintendent of police visits the bazaar once a week, and fines those in front of whose houses any filth or nuisance is found. Privies exist in convenient places, which are cleaned daily, and to which persons who have no privies are ordered to proceed. Natives, however, have a great repugnance to privies, and there can be no doubt that this order is extensively evaded. The houses in the bazaars both within and near the station are generally in good order. No dung heaps or cesspits are allowed in the bazaars within cantonment limits. Outside our authority ceases, and all belongs to H. H. the Nizam. There is no nuisance whatever experienced from wind blowing over the native dwellings. 20. The place where cows and bullocks are slaughtered is situated at a very short distance from the limits of the bazaar. There are two fixed places for slaughtering sheep, one in the middle of the bazaar about half a mile from the European portion of the station, and the other about three-quarters of a mile. The slaughter of cattle in other than the above places is strictly prohibited. The offal is sold to the villagers, and removed by them daily. No nuisance is experienced in the station from the condition of the slaughtering places.

SECUNDERABAD. MADRAS.

References to Subjects and Queries.	Replies.

III. Sanitary Condition of Station

21. The few horses there are in the bazaar belong generally to wealthy men, who build stables for them. There is no picketing ground in the bazaar. Every person who keeps a horse is responsible for the state of his stable. The manure is purchased by pot and brick-makers and is removed daily.

22. None of the mounted corps are provided with stables. The distance of the dung-heaps from the soldiers' rooms and hospitals is as follows:—

——	Barracks.	Hospitals.
Royal Horse Artillery	200 Yards.	800 Yards.
„ Horse Field Battery	700 „	700 „
Madras Artillery	280 „	200 „
Dragoon Regiment	640 „	970 „
Native Cavalry	*308 „	504 „

* From the men's hutting lines.

The manure is sold and taken away. The horses of the Royal Artillery are picketed in walled enclosures convenient to the barracks they temporarily occupy. One side of these enclosures is formed by the sick stables, shoeing sheds, &c.; another by the gun sheds. The horses of the Madras artillery and the European and native cavalry are picketed in enclosures surrounded with four walls and divided into rows, and with streets separating the different divisions and troops. The distance and position of these horse lines as regards the men's accommodation and the hospitals are as follows:—

——	Barracks.	Direction.	Hospitals.	Direction.
Royal Horse Artillery	40 Yards.	W.	570 Yards.	N.
„ Horse Field Battery	60 „	E.	640 „	N.E.
Madras Artillery	450 „	N.	640 „	N.
Dragoon Regiment	120 „	S.E.	453 „	S.E.
Native Cavalry	360 „	N.W.	100 „	W.

23. There is sufficient accommodation for married people, none of whom occupy barrack rooms with the men.

Officers' Quarters.

1. There is only one range of officers' quarters yet completed, viz.:—That for the subalterns of the infantry regiment at Trimulgherry. It is only just finished, and it is too soon to form any opinion on its sanitary conditions. There is no other than surface drainage; the ventilation is excellent. I have no improvements to suggest, for the reasons given above.

(Remark by H. E., the Commander-in-Chief. In reference to the health of the troops at Secunderabad for the last 30 years, see appendices to my Report of February 1859.

(Signed) P. G.)

IV. HEALTH OF THE TROOPS.

1. The station may be pronounced as generally healthy, but for occasional outbreaks of endemic disease, the same may be said of the district, and the population generally are hale and robust looking, but in the crowded neighbouring city of Hyderabad there are all the influences at work which tend to cause and to propagate zymotic disease.

2. The diseases most prevalent among the native population are cholera, small-pox, diarrhœa, and dysentery, Guinea worm, rheumatism, and fevers, (but not intermittent, to a great degree of a decidedly malarious form,) often producing spleen disease, though not as a constant or very marked consequence. Bronchitis in cold and wet seasons, when occasional attacks of pneumonia occur both among Europeans and natives.

3. The elevated table-land of the Deccan is for an intertropical region of an invigorating character as to climate to the natives of the country, who also seem never to lack the means of obtaining a livelihood, so are generally well fed. The unhealthiness which is observed, may be attributed to the intense heat of one period, followed by wet and cold with great vicissitudes of temperature. In the city of Hyderabad, and in some degree, though very much less in the town and bazaar of Secunderabad, overcrowding and want of attention to drainage and general sanitation produce disease among the population.

The following are the stations at which the troops have previously served:—

H. M. 17th Lancers.—Gwalior, Bengal; eight months. Left 10th January 1860. Health indifferent; intermittent fever and diarrhœa. On arrival at Secunderabad, 3rd April 1860, health good, but suffered on the march from cholera. Fever, dysentery, and diarrhœa have prevailed since arrival.

H. Battery, H. Brigade, Royal Artillery.—At Saint Thomas' Mount for twelve months; left on the 3rd December 1858. Suffered there from fevers of a low type, dysentery, and cholera. On arriving here the 21st January 1859, several men in the last stages of hepatic disease, from which class of disease they suffered severely for several months; during the last twelve months their health much improved. Suffering from mild forms of dysentery, fevers, and hepatic diseases.

No. 2 F. Battery, 13th Brigade, Royal Artillery.—At Bellary before arriving here for four months, and left on 8th November 1858. State of health tolerably good. Diseases of stomach and bowels and liver, and ephemeral fevers. Arrived here 5th December 1858 in very good health, and have continued so. Prevailing diseases, those of the stomach and bowels, and liver. Many cases of ephemeral fever.

No. 8 Battery, 13th Brigade, Royal Artillery.—Saint Thomas' Mount for a fortnight after arrival from England; health good. Left in March 1858, and arrived at Secunderabad in May, in good health. Have suffered from sun fever, intermittent fever, dysentery, and diarrhœa since, and a few cases of cholera.

4th Battalion, Madras Artillery.—Banda, north-west provinces of Bengal. On field service for the last two and a half years. Left 19th January 1860. On the whole, health very good

References to Subjects and Queries.	Replies.
IV. Health of Troops—*cont.*	on field service. General type of disease, febrile and local, with a few bowel and hepatic cases. Arrived at Secunderabad 3rd May 1860. Health very good. Diseases since arriving, intermittent fevers, diarrhœa, dysentery, and venereal, but scarcely any of a very grave nature. *H. M. 1st Battalion, 1st Royal Regiment.*—Camp "Curragh" for twelve months; left 25th July 1857. General health good; prevailing diseases, venereal and pulmonary complaints. Arrived at Secunderabad 12th December 1857, remarkably healthy, and continued so until following June; suffered much from dysentery and liver complaint, and fever of the intermittent or remittent form. Total number of deaths up to present period, 162 (?). No invalided to England. *H. M. 1st Battalion, 18th Royal Irish Regiment.*—Broken up into numerous detachments on field service, from May 1858, when the 1st detachment left Poona, to June 21st, 1859, when the head-quarters and five companies arrived at Secunderabad. Several detachments had suffered much from sickness in the summer of 1859; cholera and other forms of bowel complaints prevailed. Head-quarters and five companies arrived here on 21st June 1859 in an indifferent state of health; the remaining companies rejoined during the spring of 1860. Fevers, bowel complaints, and hepatic affections since arriving. *5th Regiment, Light Cavalry.*—Bellary, one year, six months, and eight days; left 9th November 1858; health good. Diseases, febris quotidiana intermittens, rheumatismus chronicus. Health on arrival very good. Arrived at Secunderabad 6th December 1858. Febris quotidiana intermittens, ulcers, cholera, and diarrhœa have been the diseases since arrival. *10th Regiment, Native Infantry.*—Rangoon three years; left 10th March 1858. Health generally good: principal diseases, dysentery, diarrhœa, dropsies, rheumatism, ulcers, and diseases of the skin; fevers, chiefly of quotidian type. Healthy on arrival at Secunderabad, 3rd May 1858. Fevers, chiefly quotidian, diarrhœa, dysentery, dropsies, rheumatic affections, abscesses, ulcers, diseases of the skin, and cholera, have been the diseases since. *19th Regiment, Native Infantry.*—Saugor, seven months; left 29th December 1859. Suffered a good deal from fever in September and October. Regiment arrived here 9th March 1860 in good health. For a month past fever and rheumatism very prevalent. *47th Regiment, Native Infantry.*—Bellary; there stationed nearly two years; quitted Bellary 9th November 1858. Health there very good; intermittent fever and rheumatism were the diseases. Arrived here in good health, 3rd December 1858. Ephemeral, quotidian, and other fevers, Guinea worm, rheumatism, and cholera have prevailed since. *49th Regiment, Native Infantry.*—Kurnool, from the 19th March to 20th November 1857. Suffered there from dracunculus, fevers, and rheumatic affections. 7th December 1857, arrived at Secunderabad with few sick. Cholera, fevers, and dracunculus have prevailed since arrival. 4. The site of the old barracks for the European infantry regiment (now occupied by a cavalry corps of 17th Lancers) has been very notorious for unhealthiness, owing, it would appear, to the barracks being ill-ventilated and over-crowded; to the ground being low, with rocks on one side and grounds under wet cultivation on the other (the latter not belonging to the British Government, and therefore not under subjection to sanitary conservancy). Great improvements were effected in the barracks previous to their occupation by the 17th Lancers, and everything has been done that it is possible for the local authorities to effect, to improve the sanitary condition of the neighbourhood. The lines of one of the native infantry regiments have also been more unhealthy than others, owing to their site being low, a large tank (Hoossain Sagur) on one side, and the town of Secunderabad closely contiguous. 5. The troops are not camped out as a regular practice, but on occasions of sickness prevailing it has been resorted to with good effect. (Remark by H. E. Com. Chief.—The 17th Lancers have lost 15 men by death in the barracks they now occupy, in six months, the total strength of the regiment being 600 men. (Signed) P. G.) 6. The deputy inspector-general of hospitals, who signs these replies, had, in another division, a sanitarium (Ramandroog) within his circle of superintendence, and the result of residence there on the health of invalids was in most cases very salutary. 7. Experience has not been sufficiently extensive to come to a conclusive opinion whether troops resident for some time in hill stations are more or less liable to disease on returning to the plains. 8. We most highly approve of selecting hill stations for troops. 9. Answers as to the diseases peculiar to hill stations will be received from officers whose experience will enable them to afford information. 10. Information respecting precautions as to diet, clothing, &c., will also be obtained from the above sources. 11. The hill stations vary infinitely, and the particulars respecting them will, no doubt, be afforded by officers who have had experience of each. 12. In our opinion there is certainly no period of residence beyond which injury is likely to be inflicted on the health of troops returning to the plains. 13. We know of no *special* precautions to be observed by troops on leaving hill stations, but only the established rules for the care of Europeans in a tropical country; above all, abstinence (if possible) from the use of ardent spirits, and, of course, avoidance of all unnecessary exposure to the sun's rays; the use of light body clothing, and protection of the head by a light helmet with non-conducting cover. 14. There are no sufficient data in Southern India, except perhaps in the case of the sanitarium of Wellington, on the Neilgherries, to enable a valid opinion to be formed whether it would conduce to the preservation of the health of troops to locate them on hill stations with short periods of service on the plains. Frequent change is beneficial, but there is the disadvantage of the great chance of sickness breaking out among troops while under movement. 15. No reply. 16. The range of elevation most suitable for hill stations must greatly depend on the character of the hill or mountainous range. A spot 3,200 feet above the sea level, on the slopes of the Neilgherries, would be in the midst of a malarious jungle; but the top of Ramandroog at that elevation is salubrious, because it forms part of a limited range of hills, surrounded by vast plains, with no thick forests at their base. The salubrity of any particular altitude will always be influenced by such and other like considerations. 17. Ramandroog is the established sanitarium for European troops at Secunderabad, 250 miles distant; there being no nearer place which could be occupied as a hill station, though

References to Subjects and Queries.	Replies.
IV. Health of the Troops—*cont.*	the table-land of Bedur, mentioned under a previous head, offers minor advantages of no inconsiderable value. Speaking generally, the diseases from which the European soldier suffers at Secunderabad are not such as are benefited by a hill climate: it may be rather said that they are prejudicially affected by it, dysentery and hepatitis leaving organic changes behind them which render relapses more liable in an intertropical hill climate. What is perhaps more wanted than a hill sanitarium is a good place of resort at the sea-side for invalids from this station. Masulipatam, 200 miles off, the nearest port, is a very unfavourable place for such an object, but good sites exist further north at Cocanada or Vizigapatam. A sea voyage from Masulipatam to either of the above places would do good; and if it were prolonged for two or three weeks it would be so much the better. A hill has been explored near Vizigapatam, which it is believed will be found suitable as a sanitarium. Should it turn out to be so, a sea voyage and short residence on the coast would be very advantageous preparation to very many of our sick, before resorting to the hill climate; for after such a preparation very many cases might safely be removed to the latter which it would not do to send abruptly thither. 18. There is a great similarity in the surface and subsoils of the stations of Southern India, being mostly on tracts of primitive formation. 19. Soldiers should not be sent to India under 20 years of age, and should arrive there drilled soldiers. November and December is the best period for them to land. The precautionary measures for preserving the health of troops on first landing in India may be all comprised in such attention as shall, if possible, ensure *temperance*, and avoidance, as much as may be, of exposure to the sun. 20. It seems to us a doubtful point, and still *sub judice*, whether troops should be sent direct to India from home, or to intermediate stations. A climate like that of Bangalore on the Mysore table-land, intermediate between the heat of the plains and a hill climate, is the best for seasoning newly arrived Europeans. 21. Troops are generally conveyed from Masulipatam to Secunderabad by what is called "transit," *i. e.*, by successive batches in carts, with relays of bullocks. This applies to detachments, but a whole regiment might be so moved, though the time occupied would be great. Still much sickness may be avoided by this mode, saving, as it does, the necessity of a great encampment, whereby disease is engendered and propagated. Rest houses at stated intervals on the line of road might be built. The system of transport is in good working order. 22. Twelve years' service in India is sufficient for soldiers, if belonging to home regiments doing duty in India; but there are fine old seasoned soldiers in the Indian army who are in their prime after such period of service, and go on till 20 or 25 years perfectly effective. 23. There seems nothing to desire in the manner of conducting medical boards at this station. 24. The time of year most suitable for invalids to leave India for home is from the 15th January to 15th March.
Diseases.	1. There are regular weekly inspections of the men of the European corps by a regimental medical officer, for the discovery of incipient diseases. The practice does not prevail in corps of the native army. 2. Scorbutus has not prevailed lately at this station, nor does it appear by the records to have ever prevailed here in a decided form, or to any notable amount. 3. During the last four years, 1855 to 1859, the total number of European sick treated was 10,423, out of which number there were 712 cases of hepatic disease, giving a proportion of 6·84 per cent. The above period includes one year in which hepatitis was particularly prevalent, and in which there were many cases terminating fatally, with hepatic abscess secondary to dysentery, and which appear in the returns under the latter disease. The greater number of the cases are simple, uncomplicated hepatitis, some following dysentery, and some produced by the congestion caused by intermittent fever. In the same period, out of 21,770 native sick, there were only 50 cases of hepatic disease, being 0·23 per cent. Prophylactic measures consist of every possible discouragement to the use of ardent spirits, avoidance of all unnecessary exposure to the sun, great care as to protecting the surface of the body, especially the abdomen, against the chills so frequently caused by the cold winds and vicissitudes of this climate. 4. Among Europeans, out of the above number of sick (10,423), there were only 10 cases of dracunculus. Among the 21,770 native sick, there were 601 cases, chiefly in two out of the five sites occupied by native corps. The origin of these parasites, and whether they form in the body or their ova are introduced from without, being in obscurity, no prophylactic measures that we are aware of promise to diminish the frequency of this disease. It is unquestionable, however, that the subjects of this and other forms of parasite which infect the human body are usually in a state of enfeebled health from other causes, and the situation of the native infantry lines on the Hoossain Sagur tank, where dracunculus most prevails, is such as, from the causes enumerated under another head, will induce deterioration of the general health and zymotic disease. 5. During the four years named above, 1855 to 1859, out of the 10,423 European sick, there were 2,038 venereal cases, being 19½ per cent. of the whole number. Out of 21,770 native sick, there were 938 venereal cases, being 4·29 per cent. A lock hospital has been established here for several years, with excellent results, both as to diminution of disease and lessening the severity of its character. 6. The epidemic and endemic diseases from which the troops at this station suffer are as follows: Fevers of the true intermittent type from malarious causes are rarely of an aggravated character, but the cold and wet season is apt to produce relapses of ague in those who have been previously subject thereto. Common, continued, and ephemeral fevers prevail to a great extent among the native troops in the cold and wet weather, sometimes assuming a quotidian or tertian form, and also among Europeans in a less degree. The spleen often becomes enlarged in natives, sometimes without marked ague. In the European soldier, an obscurely remittent fever, with an adynamic character, often running into confirmed typhoid, prevails during and immediately after the rains, and this was particularly observable at the time when asthenic dysentery prevailed last (in 1858), showing an apparent connexion in their etiology. Dysentery is the disease for which Secunderabad has obtained so unhappy a notoriety as an unhealthy station for Europeans. It may be said to be the endemic of the place, particularly among Europeans, during the wet months and immediately after, some years attaining a fatal malignancy, as in 1858, at others bein of the ordinary type, and not prevailing to so inordinate a degree.

IV. Health of the Troops—*Diseases—cont.*	Cholera prevails generally in the hot season, more or less, but not in a very marked degree in Secunderabad among the troops. The city of Hyderabad is a hot-bed of this disease when the tendency to it becomes developed, and from thence it extends by the frequent intercommunication of the people to Secunderabad, whence the cantonment becomes infected, as was observed in a marked manner last year (1859), when 98 cases of cholera occurred, 15 among Europeans and 83 among native soldiers, five of the former having died, and 49 of the latter. Small pox prevails, more or less, yearly in the hot season, but never to a formidable extent among the troops, vaccination being carefully performed. Rheumatism is very prevalent in the damp and cold weather, especially among natives. The following table shows the proportion of admission and deaths from these diseases :

	Europeans.													Natives.											
	Principal Diseases.													Principal Diseases.											
Official Years.	Numerical Strength.	Total Admissions from all Diseases.	Total Deaths from all Diseases.	Fevers.		Cholera.		Dysentery.		Small Pox.		Rheumatism.		Numerical Strength. 7. The zymotic diseases, which more generally prevail here, are those affecting the chylopoietic viscera. In years when bowel affections and hepatitis prevail, they originate during and immediately after the rains, from June to September. The climatic and atmospheric conditions are damp and cold succeeding intense heat, the cold being in the intervals, but more especially after the rains, very dry, parching the surface while it chills, tending to produce visceral congestions. That part of the station which in former years has proved so unhealthy, has been so much improved as regards cleanliness, drainage, water supply, and ventilation, &c., that a hope may fairly be entertained that disease will not prevail in future here more than in other sites in the cantonment. Great attention is paid to cleanliness, both as to the persons of the men and that of their barracks and out-offices. The excreta are removed in tubs from the privies and carried on carts to a distance. There are no cesspools for excrementitious matters. The drainage, when the system laid down is completed, will be very good near the barracks, but, as has been intimated, the British jurisdiction ceases at a quarter of a mile from the barracks, and at this point there is a low tract under cultivation, chiefly wet, and here sanitary conservancy must cease, though it is most desirable that control over the line of drainage should exist for at least half a mile farther on, or else it will be liable to stagnate at this point, and cause malaria. The ventilation of these barracks is good, by numerous doors, and by ridge openings in the central apartment, and openings in the roofs of the inner verandahs. Over-crowding cannot take place with a corps of the cavalry strength. There are eight barrack rooms of the aggregate cubic area given below. In each of these, allowing for absentees in hospital, on guard, &c., 60 men sleep nightly, which gives 1,800 feet of atmosphere per man. The men sleep in the centre apartments, and no cots are placed in the enclosed inner verandahs. There are outer verandahs also to these buildings.

Cubic Area of 8 Barrack Rooms.

Main Wards.	Inner Verandah.	Total.
447,883	427,105	874,988

(Remark by H. E. the Commander-in-Chief.—And yet with all these improvements the 17th Lancers, strength 600 men, have lost 15 men by death in these barracks in six months. (Signed) P.G.)

8. The soldier's duties have no effect in influencing epidemic disease; his occupations in barrack being monotonous and unvaried, he has nothing to divert his mind from idle habits, or evil practices, if he is inclined to them.

9. There has been no systematic practice of the use of quinine, the prevalent diseases, if malarious, not being peculiarly of that nature in which quinine would be prophylactic.

10. For the prevention or mitigation of epidemic disease, I should recommend that the masses of rock jutting out of the soil, especially those near the buildings occupied by the men, should be removed as much as practicable: some might be blasted or split by lighting fires, and dashing cold water over the heated surface; other masses might be rolled over into pits dug for the purpose, and then covered over with soil. The soldiers, especially those of the mounted corps, require some protection from the cold dry wind, when they return heated and perspiring from exercise. They then throw off their jackets and remain in their saturated under-clothing, till dried and chilled by evaporation, whereby internal congestions take place, and bowel complaints and hepatitis follow. A coarse woollen wrapper, which the non-commissioned officers should see that the men put on at such times, would most probably avert disease. The men should have provided for them the means of amusement and recreation, both of an indoor kind, when heat or other bad weather prohibits their going out, and games and athletic sports, at seasons when such pastimes can be carried on. Encouragement should be given to gardening. A fine large building exists at

SECUNDERABAD. MADRAS.

References to Subjects and Queries. | REPLIES.

IV. Health of the Troops —*Diseases—cont.*

Trimulgherry, built as a reading-room and coffee-room, but appropriated as a barrack, on account of the great increase of troops, but when the barracks now erecting are completed, this building should be assigned for the use of the men, and enlarged, if necessary, or another built. Books, amusing games, and tools, with implements of various handicrafts, should be provided. By such means the *tedium vitæ* of a barrack would be dispelled, the mind recreated, time occupied which might otherwise be given to bad habits, disease averted, and mortality lessened. The neighbourhood of the old infantry barracks (now occupied by the 17th Lancers), should be most carefully conserved as to all sanitary points, obtaining command over the low ground, where, as previously observed, the drainage is liable to stagnate, should be insisted on; most careful observation should be made, as to whether, when all precautions are used, and all local apparent causes of disease have been as far as possible removed, this locality continues more unhealthy than other parts of the cantonment, and in such event, the site should be abandoned, and the cavalry corps be located elsewhere. The site in question has been formally condemned by a special board of medical officers appointed by Government to report, and its continued occupation is only because a large accession of European troops compelled its use; but it is considered possible that with all the improvements in the buildings that have been effected, the numbers occupying the barracks never exceeding what they are now, and a strict conservancy of the neighbourhood being maintained, no greater amount of disease and mortality may exist here than in other spots of the cantonment occupied by European troops.

(Remark by H. E. the Commander-in-Chief.—See my former note respecting these barracks.
(Signed) P. G.)

The lines of the native infantry regiment situated between the town of Secunderabad and the Hoossain Sagur tank should be abandoned on account of their great unhealthiness. Guinea-worm prevails there to a great degree, and cholera when prevalent is sure to be found there.

To a faulty mode of laying out the Sepoy lines, a great deal of fever, which affects the native troops, seems mainly attributable. The rows of huts are placed back to back, with an interspace of about three feet only, producing a gully, always damp in wet weather, where the sun cannot penetrate, and the air is confined. The foundations of both rows of huts must be greatly damped by this arrangement, and such a place is very liable to be resorted to for offensive purposes. Each hut has its own little enclosed quadrangle, which the dressers, who go to visit the sick of the families, report are very often in a most foul state, and indeed this may be pretty well surmised from the appearance of the small external gutter, which gives vent into the street to the fluids from within. The rows of huts should be opened out, and the courts paved with the granite, which is every where around so abundant, and splits into laminæ very convenient for the purpose.

V. INTEMPERANCE.

1. The average number of confirmed drunkards varies. In one regiment there are 7 per cent.; in another 1 in 30.
2. The proportion of admissions into hospital from diseases directly caused by intemperance, is 1 in $23\frac{55}{68}$; of diseases caused indirectly by intemperance, 1 in $1\frac{68}{1551}$. The following table shows the effect of abstinence, temperance, and drunkenness, on the amount of sickness mortality, and crime:—

Diseases.	Total Abstinence.		Temperance.		Drunkenness.		Total.		Punishment ordered by.	Total.		
	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.		Abstinence.	Temperance.	Drunkenness.
Fever	59	—	112	2	78	—	249	2				
Cholera	—	—	2	1	—	—	2	1				
Dysentery, acute and chronic	53	—	178	6	147	—	378	6	Commanding Officer	5	769	378
Diarrhœa	18	—	40	—	28	—	86					
Other diseases of stomach and bowels	—	—	21	—	15	—	36	—	Regimental Court-martial		21	24
Ashalebes, acute and chronic	4	—	101	6	96	—	201	6	District		2	1
Diseases of the lungs	13	—	35	2	18	—	66	2

Dropsies	—	—	—	—	—	—	—	—				
All other diseases	48	—	129	1	67	—	244	1				
Total	259	—	785	19	575	—	1,619	19				
Average amount of strength	25		810		95		930					

Drunkenness is an offence and punished accordingly.

3. Arrack is sold in the canteen from the commissariat stores, and in some regiments brandy. Spirits are sold in the bazaar, but European soldiers are not permitted to purchase any. Spirit is no part of the soldier's ration, either at the station, on march, or in the field. It is never issued from the canteens before the dinner hour. The men are not in the habit of taking a dram before morning parade. As a rule, there are no convalescents, and a man though in weakly health, perhaps, and liable to relapse into disease, returns at once to barrack rations, with which spirits are issued on payment. No other drinks injurious to health are sold at the canteen or bazaar.
4. The consumption of spirits is certainly injurious to health; the amount allowed does not so much do the injury, as the authority and sanction given to spirit drinking by the issue thereof, and the desire for more, created in very many by the first dram indulged in, but the indiscriminate issue at all times and seasons, whatever may be the condition of the soldier at the time, is most pernicious. The consumption of spirits cannot be conducive to the discipline and efficiency of a regiment, but a moderate supply of good malt liquor is unobjectionable and generally beneficial.

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	5. It would be beneficial to health to abolish the issue of spirituous liquors at the canteen; the quantity issued might not always be hurtful; but as an habitual practice, spirit drinking in any quantity is prejudicial, and total abolition is the only remedy. 6. The use of malt liquors or wines in moderation is very much preferable to spirits, and even if used freely are less injurious than an equal amount of spirits. 7. There is a large consumption of tea, coffee, and ginger-beer, but the price of lemonade and soda-water is too high to admit of a very extensive use of these beverages. Tea and coffee are more desirable than spirits and malt liquors, but the two former, early and late in the day, and a small quantity of malt liquor at the mid-day meal, would be better than total abstinence from spirituous liquors. 8. No doubt it would be beneficial to the health of the troops to suppress the spirit ration, and to issue beer, tea, coffee, &c. 9. It would be beneficial to health to permit only tea, coffee, beer, &c. to be sold to the troops. 10. If beer or porter could always be procured the spirit ration should be discontinued, except when troops are serving in the field. 11. The bazaar regulations in regard to selling spirits are to be found only in the regulations of the Madras Government and Act of the Supreme Government, vide section xvi. and sections xliii., xliv., xlv., xlvi., and xlvii. of Regulations vii. of 1832, and Act xviii. of 1853. These are far too voluminous for entry here. They are strictly adhered to. The canteen regulations are as follows :—At $\frac{1}{4}$ to 12 a.m. daily the canteens are opened for issue of porter to companies for the dinner meal. From $\frac{1}{2}$ p.m. to 3 p.m. opened again for issue of malt liquor only. From 6 p.m. to 8 or 9 p.m. again opened for sale of malt liquor. The allowance daily to each man is 2 pints of malt liquor and 1 dram of arrack, or 2 drams of arrack if malt liquor is not taken.
VI. Diet.	1. The daily ration for the European soldier is 1 lb. meat, 1 lb. bread, 4 oz. rice, 1 oz. salt, $\frac{5}{7}$ oz. tea, or $1\frac{3}{7}$ oz. coffee, $2\frac{1}{2}$ oz. sugar, 1 lb. vegetables, 3 lbs. firewood. The articles of ration are the same the whole year round, with the exception of vegetables, the supply of which varies with the season, a due proportion of potatoes being provided for all seasons if procurable. The contractor is held responsible for the quality of the rations, and should there be any cause of complaint on account of inferior articles being supplied, he is fined. The rations are issued in the presence of the regimental authorities, and a warrant officer or staff serjeant of the commissariat. 2. A complete ration as above is supplied daily to the troops. The stoppage is 3 annas 4 pice a day. 1 lb. of vegetables is supplied to each soldier daily. 3. No improvement in the ration can be suggested. It has never been brought to notice that a soldier has attempted to sell any portion of his rations, hence no preventive measures have been adopted. 4. The means and apparatus for cooking have already been described. The kitchens are clean, light, well ventilated, and sufficiently supplied with water. Meat is both boiled and stewed. Coffee is prepared daily by contractors, and taken to the barrack rooms, or to the tents on the march, before morning parade. Men may take it or not as they prefer. 5. Gardens for the cultivation of vegetables might be advantageously established. There are already soldiers' gardens in the vicinity of the European regiment barracks. It is desirable to encourage native cultivators to establish vegetable gardens, and to issue gratuitously to them European vegetable seeds.
VII. Dress, Accoutrements, and Duties.	1. The parts of a soldier's dress are a wicker helmet with wadded cotton cover for the heat of the day, forage cap for early morning and evening wear, except in the hot season, tunic of cloth or serge, or khakee, according to season, ankle boots, trousers, cloth or serge, or khakee according to season; khakee suit in hot weather and fatigue duties, vest of flannel, cholera belt, cotton shirt, woollen socks. Accoutrements according to regulation. The present dress being suited to the variations of temperature, is unobjectionable. The present helmet might advantageously be exchanged for one of a more durable and serviceable nature. The men mount guard according to season in khakee (that is summer costume), or cloth during cold or rainy weather. Sentries are either under roof or supplied with suitable sentry boxes.
Duties.	1. It is most desirable that recruits should be thoroughly instructed and drilled at home before being sent to India, particularly men of the mounted branches of the service. The hot seasons and rains retard a recruit's progress, and many young men break down with the fatigue of a course of drill in the hot season. 2. The men rise at gunfire from 4.30 to 5 a.m.; go to bed at from 8 to 9 p.m. Morning drills and parades are four per week for one hour, commencing three-quarters of an hour after gunfire in the morning, and in the evening for one hour, half the hour before and half after sun-rise. Drills are curtailed in length and few in number in the hot season. The amount of drill carried on is conducive to health. The best hours for drills, parades, and marches are those already established by Indian regulations, viz., between gunfire and 7 or 8 a.m. and between 5 p.m. and sunset. The average number of nights the men have in bed are nine in a month (?). 3. Regimental guards are mounted close to the barracks. Cantonment guards are very few in number and are $1\frac{1}{2}$ miles off. The guards are taken for 24 consecutive hours. The roll is called at meal hours and at tattoo. During the day a check roll call is carried out as laid down in Circular dated 29 August 1855, Horse Guards. The night guards, being light, have not seemed in any way injurious to health. Strict attention is paid to the men's costume on guard. It varies according to the season of the year.
VIII. Instruction and Recreation.	1. The means of recreation and instruction are as follows. Two ball courts and skittle alleys are allowed to each regiment, and there are schools with schoolmasters properly trained and sent out. There is a splendid library and reading room at Trimulgherry, but it is at present occupied as a barrack. The 17th Lancers have a library and reading room, the accommodation of which is very insufficient, but will be improved. Complaints have been made of want of sufficient light at night. The Madras Artillery, the Royal Regiment at Trimulgherry, and the 18th Royal Irish Regiment have each soldiers' gardens. They are managed regimentally. There are no workshops. There is a theatre at the assembly, which is frequently at the disposal of the men, and nearly every regiment has a temporary theatre in one of their barrack rooms. There are gymnasia to the artillery and old infantry

SECUNDERABAD. MADRAS.

References to Subjects and Queries.	Replies.
VIII. Instruction and Recreation—*cont.*	barracks. These are not sufficient to keep all classes of men occupied. Workshops are much required, and encouragement should be given to men to practise the trades in which they have been brought up. The common class of men go out during the day in search of liquor. The habit might be much decreased by occupation in barracks. Except in the hot season, when men are prohibited going about in the extreme heat of the day, there is no restriction placed on the men quitting barracks by day when not on duty, but stringent orders are enforced as to dress being suited to the season and proper cover for the head from solar heat. (Remark by H. E. Com. Chief. See Colonel Cotton's proposal to provide every European regiment with a "recreation shed," annexed to my Report, February 1859. Nothing as yet done in the matter on account of the impoverished state of the public finances. (Signed) P. G.) 2. In addition to the recommendations given above the suggestion made by Colonel Cotton, commandant of Engineers, when at this station in 1859, to erect an extensive covering of sheet or cast iron under which soldiers might take exercise and practise different games at all hours of the day, and in any weather, is deserving of attention. 3. Savings banks have been long established by authority, and with the best effect. 4. There is not sufficient shade at this station, particularly at Trimulgherry, where trees are much required, nor are there any sheds for recreation. Every barrack is well provided with verandahs.
IX. MILITARY PRISONS.	1. The general military prison of Secunderabad is a new building, on the latest improved plan, unobjectionable as to ventilation, &c., and sanitary arrangements. The orders regarding discipline, diet, dress, &c., of the prisoners are strictly enforced.
X. FIELD SERVICE.	1. There are no local regulations for field medical service. 2. Recommendations made by medical officers in regard to marches, camping, &c., are generally attended to, but specific orders are often necessary to ensure the recommendations of medical officers being effectual, should it happen that commanding officers are unwilling to attend to them. 3. The practical working of medical recommendations for the preservation of the health of troops in camp consists in the senior medical officer at a station or in a camp being sanitary officer, and that not only on points of particular sanitary science, but also in regard to the general hygiène of the station or camp, his advice is to be taken and his recommendation attended to, if possible. It is advisable that the course laid down in the new medical regulations of Her Majesty's British service should be carried out in the Indian service, viz., that medical officers should be bound to offer hygiènic advice and suggestions, and commanding officers bound to state their reasons in writing if they see cause to reject such advice, for the information of higher authority. Commanding officers are directed to consult with the medical officers regarding the healthiness of the site upon which they propose encamping, and in such cases officers are to be guided by medical opinion, unless they see weighty reasons for setting it aside, which are to be at once reported to higher authority. 4. In the Madras Presidency there are no rules for field hospitals; the transport of the sick is carried on by closed doolies and six bearers, or open muncheels or litters and five bearers for the more severe cases, by sick carts carrying four men and drawn by four bullocks. There are no ambulances; transport of hospital supplies is by means of large field medicine chest carried by bearers or carts drawn by bullocks. (Remark by H. E. the Commander-in-Chief.—The question of organizing an ambulance department for the Madras Army, on a plan submitted by Dr. Duncan Macpherson, Inspector-General of Hospitals, is "*under consideration*," and has been so for the last two years. (Signed) P.G.)
XI. STATISTICS OF SICKNESS AND MORTALITY.	No information.
XII. HOSPITALS.	1. Plans. 2. The Madras artillery hospital is 240 yards west of the barracks; the old infantry hospital 312 yards west of barracks; Trimulgherry hospital is 880 yards south of barracks; the native cavalry hospital 640 yards north-east of hutting lines; native infantry Hoossain Saugur lines, 1,370 yards north of ditto; native infantry Tarbund lines, 100 yards west of ditto; native infantry, Mahreddipilly lines, 490 yards S.W. of ditto; native infantry, Chillakulgoodum lines, 50 yards east of ditto. A reference to the plan of the station will show that the regiments are located at so great a distance from each other that the lines of each corps form, as it were, a separate cantonment of themselves. There is no civil population here other than the inhabitants of the general bazaar, which is miles distant from many of the hospitals. The distances from the bazaar are as follows:— Madras artillery Hospital - - - - 1 mile N. of bazaar. Old infantry ditto - - - - - - 140 yards W. of ditto. Trimulgherry ditto - - - - - - 2 miles 170 yards N.E. of ditto. Native cavalry ditto - - - - - 2 miles 1 furlong 160 yards N.W. of do. (There is a bazaar, called the sudder bazaar, 100 yards S.W. of this hospital.) Native infantry Houssain Saugur lines - - 3 furlongs N. of bazaar. Native infantry Tarbund lines - - - 1 mile 4 furlongs ditto. Native infantry Mahreddipilly lines - - 2 furlongs 140 yards N.E. of ditto. Native infantry Chillakulgoodum lines - - 5 furlongs 190 yards E. of ditto. 3. The water supply of the hospitals is abundant and wholesome. 4. In the European hospitals all impurities are removed daily, as from barracks. There are no drains other than surface drains, and no sewers. There are small cesspools attached to the privies of some of the native hospitals. 5. In the artillery hospital the lowest ward is raised 1 ft. 10 in. above the ground; in the old hospital 1 ft.; and in Trimulgherry 1 ft. 8 in. There is no perflation of air underneath. The roof water sinks into the soil. Wherever pipes are used, as is the case with Trimulgherry and old barrack hospitals, to convey the water from the roof, stone slabs are let into the ground to receive it, from which it runs off and is carried away by the slope of the ground. The hospitals are built of exactly the same materials as barracks. Neither roofs nor walls are double: both are sufficiently thick to keep the hospitals cool. The Trimulgherry hospital is an upper storied building; the rest are tiled, with the exception of the Madras artillery, which is a bomb proof and frightfully hot. It is, however, a condemned

References to Subjects and Queries.	Replies.

XII. Hospitals—*cont.*

building. All the hospitals have front and rear verandahs, and are sufficiently protected from the sun's rays. The condemned hospital above referred to is always covered with grass chuppers in the hot weather. The verandahs are never used for the accommodation of sick or convalescent. The hospitals are only one flat, except Trimulgherry, which is a two-storied building. The following table shows the hospital accommodation:—

Date of construction, Madras Artillery, 1828; Old Barracks, 1839; Trimulgherry, 1858.
Total number of wards, 10.
Total regulation number of beds, 775.

Wards or Hospital Huts.	Regulation No. of Sick in each Ward or Hut.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.			Doors.

All the hospitals are so placed as to receive the full benefit of the prevailing winds. The windows open in the same way as the barracks already described for doors. The arrangement is the best that can be desired for ventilation and coolness. Windows would be insufficient, and therefore doors are provided instead.

6. The ventilation is by the same means as in barracks. The jhilmil forms the outer door, the glass door the inner; all the recent hospitals have both. The jhilmils in the old infantry barracks hospital can be opened and shut at pleasure. Those supplied to the Trimulgherry hospital on the contrary are fixtures. By the jhilmils, as here referred to, is meant the flaps which pin at each end on a pivot into the framework of the door, not the door itself. The means of cooling are the same as in barracks.

8. The only means of warming is by shutting the doors and windows. The walls and ceilings are cleansed and lime-washed whenever they require it.

9. The Madras artillery hospital privy is situated at the north-west angle of the building, and connected with it by a covered passage. In the passage there are commodes for patients who cannot go outside, and there are tubs in the urinal. To the hospital of the old barracks there are three privies placed at three angles of the building, and connected with it by covered passages. There are no separate urinals; in each privy a urine tub is placed. The Trimulgherry hospital has four privies and four urinals, two to the lower and two to the upper story, and situated at the south-east and south-west angles of the building, and connected with it by covered passages. The urinals in the upper story are emptied by means of pipes which lead to the urinals in the lower story. All the privies are provided with screen-walls, wooden seats, and tubs with metal linings, which are removed from within. They are properly drained and supplied with water. Three of the hospital privies, viz., those of three of the native infantry regiments, have cesspools for the reception of filth; they are only offensive when opened. All have been recommended to be removed.

10. In the Madras artillery hospital a portion of the front verandah is enclosed as a washing place. It is not sufficient for the sick, and from its situation it keeps the front of the hospital damp and dirty. In the hospital of the old barracks there are four bath-rooms, one at each corner of the building; round each bath-room runs a ledge with gutters, on which the men place their basins while washing. The arrangements are sufficient for the sick. In the Trimulgherry hospital there is a bath-room on each floor stated to afford inadequate accommodation for the sick, some of whom are necessitated to wash in the back verandahs.

11. The means of bathing are the same for all the hospitals, by a supply of bathing tubs; they are amply sufficient and convenient.

12. The washing of hospital linen is by dhobies, and is quite sufficient.

13. The storage is sufficient and dry.

14. Some of the cots supplied to hospitals are of iron, others are of wood; a frame on which broad-tape is bound, to form the bottom of the bed.

15. The cook-room of the Madras artillery hospital is a small outhouse in the north-east corner of the enclosure, to the lee side of the prevailing winds. The cook-room of the old barracks hospital is in the centre of the rear of the enclosure, at a convenient distance from the wards. At the Trimulgherry hospital the cook-room is to the south and back of the sick-wards, and at a convenient distance. In all the means and apparatus for cooking diets are the same, viz., the usual copper tinned utensils, frying pans, earthen pots, &c.; they are amply sufficient. The cooking is satisfactorily done, and can be varied as occasion requires.

16. The diet tables, diet rolls, &c., are too voluminous to enter here. It is suggested that a copy of the Madras Medical Code, which contains all the regulations, forms of returns, and reports, &c., now in force, be sent to the Royal Sanitary Commission.

17. As attendants on the sick a hospital serjeant is appointed for each regiment, a nurse with a salary for the female wards; a comrade is allowed as orderly to attend on very sick men, and native female attendants are provided for the women's ward, and male ones for the men's, in ample numbers.

SECUNDERABAD. MADRAS.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	18. The sanitary condition of the hospitals of this station is generally good, with one exception; that of most is very excellent. The old artillery hospital is small, ill ventilated, and on a bad plan, but it has been condemned, and a new one will be erected when other great works now going on will permit. The old European infantry hospital (now cavalry), partakes of the objectionable character as to site of the adjoining barracks, but it is on higher ground, and further away from the line of drainage and from the rocks, and is, in itself, in good sanitary condition. The exception alluded to above is the hospital of the native infantry regiment occupying the lines on the tank; it is far from the Sepoy lines, situated on the cantonment side of the Secunderabad bazaar; hospital gangrene frequently occurs in it, attributable to its being overcrowded, owing to the number of sick, to the cachectic condition of many of the men, owing to the unhealthy character of the site of their lines, and to the existence of an offensive cesspool within the small confined hospital enclosure. This latter defect is, at the present date, 1860, being effectually remedied. N.B. One European infantry regiment, (18th Royal Irish), having lately been added to the strength of the force, is accommodated in temporary barracks and hospital, on the whole, of very good character, while permanent buildings are being erected. 19. There do not appear to be any other notable deficiencies and defects than those named under the foregoing heads. 20. As a general rule there are no "convalescents"; those who are unfit for duty remain in hospital till effective, and then return to duty, (recommended by the surgeon, when he thinks it advisable, to be light), and to barrack rations. Exercise is taken by men in hospital who are convalescent, in sick-carts and doolies. There is no suitable fenced ground, shaded walks or seats, which are much needed. The old infantry hospital is the only one possessing them in any degree, and the enclosure has lately been much improved in these respects. 21. At every European hospital there is a separate building assigned for the reception of sick women and children. The arrangements are satisfactory, but out-offices are required for the women's ward of the Trimulgherry hospital. 22. There are no local medical regulations. 23. The suggestions and requisitions of the medical officer in all matters regarding his hospital receive every possible attention. 24. There is no accommodation for convalescents, and it is very much needed at this station. There are at all times, but especially when dysentery and hepatitis are most prevalent, a number of weakly men, who would be greatly the better for a place to receive them intermediate between the hospital and the barrack room, where diet and regimen would be under the direction of the surgeon, and more liberty might be allowed than is compatible with the discipline required for sick under treatment.
XIII. BURIAL OF THE DEAD.	1. There are four burial grounds used by the British troops, all within the station. The great burial ground is in the very centre of the cantonment; there is also one near the old barracks, one at Trimulgherry, and one near the temporary barracks occupied by the Royal Irish regiment; all of these are well selected with reference to the prevailing winds, with the exception of the one in the centre of cantonments. 2. The great burial ground is 345 yards by 90 yards; the old barrack do., 204 yards square; Trimulgherry do., 151 by 147 yards; Bohenpilly do., 130 yards square, Soil, granite debris with vegetable mould; subsoil, decomposed granite. Drainage, good in all. Decomposition takes place readily. The Protestant portions well kept, not so the Roman Catholic, which is not provided with the same means. 3. The following are the grave spaces:—Length, 7 feet; breadth, 3½ feet; depth, 6 feet; interval between graves, 3 feet. Graves are never reopened. Interment always takes place 12 hours after death. The depth of the graves of natives is, say, 3 feet for men, and 3½ feet for women. There is no prescribed interval for them between graves. Graves are never re-opened, nor more than one body placed in each. Interment always takes place within 12 hours after death. 4. During the recent extraordinary hot season, complaints were made that the great burial ground was offensive at night. The following remedial measures were suggested by the deputy inspector general of hospitals and supplied:—Coarsely pulverized charcoal and lime in equal quantities strewn over, and dug a few inches into the soil of all recent graves, and fissures produced by the intense heat, filled up also with lime and charcoal. It was subsequently ascertained that the exhalations were caused by the extreme dryness of the earth, causing the mould, when a grave was dug, to break into large clods, and these when the grave was filled in, left interstices through which the fœtid gas permeated. The clods were then broken up and pulverized previous to an interment taking place; the rain, however, shortly set in, and abating the heat, removed all cause of further complaint. 5. The dead of the camp-followers and bazaar people are either burned or buried at the places established for that purpose. 6, 7. No nuisance whatever arises from the present practice, and no improvements are required.

I. TOPOGRAPHY.	1. The general aspect of the surrounding country presents the following features:—To the north it is rather confined by the town and suburbs of Trichinopoly; this town is built on the right bank of the river Cauvery, running from west to east, 2½ miles from the present cantonment, between which and the town there is much rice and other cultivation, plantain topes, &c.: the soil is a rich alluvial deposit, which gradually assumes a sterile and sandy appearance near the cantonment. To the south the country is open, sterile, rocky, and slightly elevated. On a sloping space, between the town and the above elevated ground, the cantonment is situated, somewhat advanced from its former position at Worriore. The Pootoor lines, and a considerable stream or canal, and a remnant of the old cantonment, form the natural boundary of the west side of the station. To the east and west the country is tolerably open, and dotted here and there with villages, patches of rice cultivation, mangoe, and other topes, more particularly on the western side. The ground around the station is uniformly flat. There are mountains in the north-west and to the south. There are no swamps near, or much water, except where the Cauvery overflows in the monsoon and the rice fields are under water. The banks of the Cauvery river are for miles covered with the most luxuriant vegetation, which space, as well as the land lying to the west of the station, is for a short time during the periodical rains under water, caused by the overflowing of the canal above alluded to. The roads east and west are lined with trees, and there are many topes or clumps of trees in the vicinity of the river. There is a small tank or swamp to the south-west of the cantonment in rear of the butts. 2. The elevation of the town above the sea is 250 feet. With the exception of the country to the east and west, the cantonment occupies an elevation superior to that of the country adjacent. The nearest water is the canal forming the western boundary, which supplies numerous tanks. There is no healthier ground adjoining the station. The Pulney hills near Madura are doubtless healthier, but are far to the south-west of this. The Calley Malay hills, some 20 miles or more distant, are highly the reverse of healthy. Two Roman Catholic priests two years ago went and spent a day and a night in these hills. One was destroyed almost immediately by severe low fever; the other was brought to Trichinopoly, where his life was for some time in imminent danger. 3. The nearest mountains are some 20 or 30 miles distant, and some 2,000 or 3,000 feet high. 4. The canal from the Cauvery, which is the nearest water, passes through the station at the lowest part, near Pootoor. The river overflows the ground to the east and west for some weeks about November. The nullah also overflows and covers the ground immediately in the rear of the artillery barracks, south-west of the station. The fort ditch enclosing the town of Trichinopoly, 2½ miles from the station, is the worst broken ground in the neighbourhood, and its effect on the health of those near it must be injurious, as it is the receptacle for all filth; it is, however, usually dry, except during the rains. There is also a tank to the north-east of the station, which, when drying up in the arid months, is supposed to breed malaria. 5. The station is open and freely exposed to winds. The temperature of the station is raised in parts by reflected sun heat, where the houses are close to each other, and in the European barrack and hospital squares. The station is exposed to hot land winds during the months of April, May, and June: and to cold north-east winds during the monsoon, when colds, accompanied by slight fever, are prevalent. 6. The surrounding country is cultivated generally near the banks of the river Cauvery, and more inland at some distance from the station. There are large Government works of irrigation near the station conveying water to the fields north, east, and west of the town, and the works of Annicut 15 miles distant. Artificial irrigation has generally no injurious effect on the health of the station. The cultivation of rice is not restricted within certain limits. There is no cultivation of hemp or flax in these parts, nor any injury to health from the cultivation of indigo, which is grown at some distance from the station. 7. The town of Trichinopoly, adjoining the station, is surrounded by the villages of Worriore, Teunore, Pootoor, &c., all within from 1 to 2½ miles of the station. 8. The geological formation of Trichinopoly is volcanic, that is, composed chiefly of granitic rock of different kinds, several of which are seen round the station, as the high Fort Rock, the Fakeer's, and Golden rocks, chiefly composed of that species of granite called Syenite, unstratified and of mamillary forms, having evidently undergone fusion, and in that state projected from below by volcanic force, and some stratified rocks thus displaced are here and there seen also, likewise some trap rock; but the sterile ground to the south is wholly granitic, in various stages of decomposition, giving a red sandy soil on the surface, but hard rock below. Along the valley of the Cauvery the soil is a deep rich alluvial deposit, but the high ground near the station is composed of broken granite, nodules of Kunkur (carbonate of lime) and laterite; also seen on the heights are iron ores. 9. The depth below the surface at which water is usually found is, during the dry season, from 25 to 30 feet, and from 5 to 15 feet during the rainy season. 10. The rain flows readily away, with the exception of the brigade ground, the surface of which is more elevated than the station, and the drainage from which passes into the subsoil and over the surface of the station. 11. The water supply of the station is derived chiefly from wells, every one of which is more or less impregnated with lime received during its percolation through the earth. The water is partly stored in open tanks; the one at General Bishop's house at Pootoor and those in the fort and town are of considerable size, but the supply for the troops is generally from wells. There are but few tanks in the station, and those small but generally full; some of them contain fish, water lilies, lotus, &c. Natives bathe in some tanks, the water of which

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	is used for drinking, as in the tanks in the town. The wells are nearly all in private gardens; the quality of the water differs very much at points very near one another. There is no nuisance from the tanks with the exception of the one to the north-east of the station, which, when drying up, is unhealthy to those living in its vicinity. 12. The water supply for the station is abundant, the smell and colour good and clear; but most wells are slightly brackish in taste, some few are perfectly sweet. The tank water is neither so clear nor so good. The well water is hard and contains carbonate of lime, which is partially removed by boiling; it is not found injurious to health, except to those subject to oxaluria. There is little or no lime in the river water. In private dwellings the water is raised by wheel, rope, and bucket, worked by hand. It is distributed to the troops conveyed on bullocks in puckals or leather bags. No doubt the river water, if filtered, would be better. The brackish well water is used only for culinary and bathing purposes. 13. Sanitary improvements, such as levelling ruined houses, now receptacles of filth and detrimental to health, repairing of enclosures, &c., cannot be carried out for want of legal powers, and from the proprietors disregarding repeated applications from the military authorities and the recommendations of the station sanitary officer. This want of legal control is in consequence of the ground being held on civil lease. 14. The sites of new stations are selected by committees of experienced officers, of which committee the senior medical officer is usually a member. Height is generally held as an important condition, and also distance from malarious swamps, and being out of the course of winds blowing over them. A healthy state of the native inhabitants of the district is also a condition, viz., that fever, cholera, or any other disease does not usually prevail among them. Cotton ground (regur) is found to be injurious, producing fever, and is avoided. I would suggest that these committees should be composed chiefly of experienced medical officers, instead of having one medical member, who may be, and often is, overruled by the military portion.
II. CLIMATE.	1, 2. There are few meteorological instruments available at the station, none are good, except an aneroid barometer, and some Fahrenheit's thermometers, and rain gauges. The tables at the station are too imperfect to be worth transmitting. 3. The climate is for two-thirds or three-fourths of the year hot. The mean annual temperature is about 85°. The greatest heat in the shade being a few degrees above 100° Faht., and in the sun many degrees higher (140°). The mean annual fall of rain is about 30 inches. The winds from October to May are generally from the east and north, but vary; the rest of the year generally from the opposite direction, W., S.W. and S. There is generally much glare and radiation of heat, a dry and sultry atmosphere often for months together. Whirlwinds, accompanied by clouds of dust and sand, recur at short intervals in May, June, and July. The rivers and tanks become dried up, and vegetation is completely suspended. The climate is enervating, impairing the digestive organs, and rendering light diet, with but little animal food, necessary. For three months woollen clothing is required, and light cotton clothing during the rest of the year. The weather does not admit of the troops being exercised much during April, May, and June, and then only in the early hours of the day. These months and July are the most unhealthy, and cholera and fever prevail during them. November, December, and January are the most healthy months. 4. The Pulney hills are at about 80 miles; the Shevaroy hills at about the same distance; the Neilgherries at about 145 miles, all within the division, are well watered by natural springs, and the climate is invigorating and salubrious. The greatest height is 7,000 to 8,000 feet. It is a received opinion that a lengthened residence of troops in these hills would render them unfit for work in the plains; but that they are excellent as a sanitarium. 5. The Deputy Inspector-General of Hospitals states that the period of his service is 30½ years, during 26 years of which he has been constantly in India, and has served in all divisions of the Madras army, including Burmah, and nearly two years on field service in 1857, 1858, 1859, in Central India, at the stations of Madras, Bangalore, Secunderabad, Ellore, Saugor, Rangoon, Tonghoo, and two years in the mountains of Goomsur. The difference in the comparative healthiness of the stations is much less than is generally supposed. The cause of the insalubrity of Secunderabad, generally attributed to barracks, seems to be still misunderstood. A temporary locality should there be selected, slight temporary barracks run up, and changed from time to time, till a healthy site was found.
III. SANITARY CONDITION OF STATION.	1, 2, 3. A map of the station and adjacent country, and a plan of the station itself, together with a ground plan, are forwarded. 4. Table of Barrack Accommodation.

(*Note.*—The return does not show the number of men allotted to each barrack room, and the cubic space and superficial area per man cannot be ascertained from it. The total aggregate cubic space of the infantry barracks would allow only about 530 cubic feet per man for 947 men, and the aggregate cubic contents of the artillery barracks, including the verandahs and hall, would give about 816 cubic feet per man for 148 men.)

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	5. The windows are on opposite sides of the barracks; they are fitted with iron upright bars and wooden crosspieces, and open inwards. The barracks of the artillery are furnished with folding venetian doors and glass windows all round the old portion enclosed. There is a verandah on one side only, running round the whole of the inner side of the barrack square. Its breadth is eight feet at the bomb proof, and 10 elsewhere. The artillery barrack has an enclosed verandah round one portion 12½ feet wide, a verandah, 12 feet wide, on either side of the new and central portion, and no verandah to the remainder. The verandahs are not usually occupied to sleep in, although in hot weather the men sometimes move their cots into them. They are never used by other persons as sleeping quarters. The enclosed verandahs of the artillery barracks are occupied as sleeping quarters by the men. There are no regular venetians. The windows are closed by wooden shutters or planks, which are fastened by buttons on the centre wooden upright. All the doors in the old portion of the artillery barracks are jhilmils; in the new portion there are glazed windows. 6. The cots are composed of three planks each, 1 ft. broad by 6 ft. 6 in. long, supported on tressels. The bedding consists of two cotton sheets 8 ft. by 4½ ft.; a Europe blanket 7 ft. by 6 ft.; a carpet 6 ft. by 3 ft.; and a quilt 7 ft. 4 in. by 4 ft. 4 in., and stuffed with cotton. The men are furnished annually with one sheet, one quilt, and a Europe blanket every two years. In tents, on the line of march, in damp or wet weather, straw is laid on the ground for them to spread their bedding on. 7. The European tent is rectangular, 21 ft. long, 15 ft. wide, 10 feet high in the centre; the height of the walls is 5 feet. The cubic space is 2,100 feet. There are two flys, and one set of walls. There are three cloths in each when made of Vizagapatam cloth, and four in each, when of other inferior cloth. The tent has two doors, each of which can be closed or opened at pleasure; when open, the portion of the wall lifted, forms a shade for the entrance. The ropes are of country cotton, and the poles of bamboo. The tent is to contain 25 men, each man having cubic space of 84 feet, and a superficial space of 12 ft. 6 in. The native tent is conical, with an elliptic base 22 ft. by 12 ft. diameter; height of pole 9 ft.; the cubic contents are 1,866 cubic ft., and the superficial area 264 ft. They are to contain 25 men, each man having a superficial space of 10·56 ft., and a cubic space of 74·64 ft. The tents have only one fly, the materials of which are the same as those for the Europeans. They have one door, which closes round the bottom, and a curtain 1 ft. 9 in. in height. 8. The bomb proofs have no particular means of ventilation beyond the windows and doors. The barracks and guard rooms that have been altered, are ventilated by the ridge having been raised two feet, leaving an open space running their whole length. In the old barrack room of the artillery, the ventilation is by the doors. In the new barracks, there are six ventilators 6 ft. by 2 ft., and six oval ones round the top of the room. The ventilation in the old barrack room, and the bomb-proof part of the barracks, is insufficient; but where the roof has been recently constructed, it is so, as regards those of the European infantry. The air of the barrack rooms is kept cool by Punkahs, and also by Kuskus tatties, placed against

TRICHINOPOLY. MADRAS.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	every alternate window and door, kept wet by coolies. These tatties are furnished by commissariat arrangement. 9, 10, 11. The artillery barracks are built of brick and chunam with flat roof. Those of European infantry, with tile roofs and ridge ventilators, with the exception of one-third, which is bomb-proof. The tents are composed of Vizagapatam cloth, as before stated. Huts are built by the Sepoys of mud or sun-burnt brick, with tiled or thatched roofs. The barrack floors are granite, raised from 6 in. to 2 ft. from the ground, and chipped. There is no passage of air beneath. The materials and construction are generally suitable for the climate. The artillery barracks might be improved by adding a verandah all round. The barracks are kept in repair by the executive engineer under the orders of the commanding officer. The repairs are not quickly executed. The military authorities are responsible for the sanitary state of the cantonment. The walls and ceilings of barracks are cleansed and lime-washed once every year, and oftener, if urgently required. 12. All the barracks are supplied with washing tubs (4 to a company), which are kept in the verandah and filled by the puckallies. There are two wash-houses supplied with water from wells, one is drained by an open channel round the square, and the other by an open channel running into an open drain which joins the main drain. The artillery barracks are unprovided with lavatories, although lately applied for, but they have a plunge bath 44½ feet by 19·8, and 10 feet deep, filled from an adjacent well and drained into the paddy fields in the rear of the barracks. 13. The cooking is provided for by the employment of 8 native cooks per company, who are paid by the men at the rate of 6 annas per man per month. A drain runs through the middle of the cook-house and under and across the barrack square, and joins the others. The artillery barracks have one cook-house attached, 38¾ by 15½ feet, with ridge ventilators. They are supplied from an adjacent well by puckallies, but have no regular drain for carrying off water, &c. The linen of each company is washed by native washermen in the river, and dried on the banks. The conveniences are sufficient for the wants of the station. 14. No drainage is required for the privies; the contents are carried away in carts every morning and deposited in pits at some distance from the station, the soil being occasionally covered with loose earth. The privies are provided with earthen chatties. 15. The new cook-houses are ventilated in the same manner as the barracks; the new privies by a space being left between the top of the side walls and the roof; they are lighted by lamps at night. 16. An open drain, about a foot every way, runs completely round three sides of the barracks, and along the fourth a deeper one about 1½ feet wide, which joins the others, where they run under ground and find an outlet into a large open ditch which runs into the nullah at Pootoor bridge. The outlet is about 50 yards from the nearest temporary barracks, but about 200 yards from the permanent barrack square. This drain carries off the water from the lavatory in the barrack square. The temporary barracks are drained by an open drain running along by the side of them and connected with the smaller drains round the barracks themselves. The artillery barracks are not drained. The drainage is sufficient for carrying away the surface water, &c. The barracks, with the exception of the serjeant-major's quarters, are generally dry and healthy. Eight houses in the European lines are, as compared with others, the focus of disease, as fevers and cholera therein are very violent, and two cases recently did not appear amenable to treatment till removed from the locality. The artillery barracks are not damp, being raised two feet from the ground. The refuse fluid from the artillery barracks drains off from the natural slope of the barracks into the surrounding fields, which are 3 feet lower, or sinks into the subsoil. There are no cesspits. The old ditch of the fort, 2½ miles from the station, is extremely foul. 17. The surface cleansing of the cantonment is good; it is efficiently done by scavengers' carts, the refuse, &c. being taken away daily. The horse dung of the cavalry is burnt. 18. The surface of the cantonment is generally kept free from vegetation, but there is some within the limit. There are numbers of old walls, thick hedges, &c., interfering with the ventilation of the station, &c., in the environs. There are several ruined houses before alluded to. 19. The drainage of the bazaar is good, ventilation defective. The water supply is bad, scanty and generally brackish. The bazaar is usually clean; there are latrines (open cesspits.) It is a mistake having them in this country, and an intolerable nuisance when the wind blows over them. In the general bazaar each house owner is required to keep the road and drain in front of his house clean with the help of the scavengers' carts allowed by Government. The bazaars are kept in decent order. There are several parts of the cantonment which would be improved by pulling down the walls of the unoccupied and deserted huts, filling up the pits, and levelling the ground. The native houses near the station, are very ruinous and not ventilated. There are no dung-heaps or cess pits within them. No nuisance is experienced in barracks from wind blowing over the native dwellings. 20. Cattle are slaughtered for the troops near the regimental bazaar. The regulations for the slaughter places are, that they shall be inspected at least twice a week, and the channels sprinkled with lime. The offal, &c., is sold to the ryots and others; nothing is left undisposed of. No complaint has been made of any offensive smell arising from the condition of the slaughter places. 21. With regard to the arrangements for stabling or picketing the bazaar cattle and those of the camp followers generally;—each house owner keeps his cattle in his house or courtyard adjoining it. A scavenger removes the sweepings of each house every morning, and deposits them in the outskirts at some distance from the station. 22. There are no stables for the artillery horses; they are picketed outside the barrack square about 100 yards from the barracks; no dung heaps are allowed to accumulate, the manure being made into bratties. The picketing grounds for both cavalry and artillery are convenient for the men; that of the cavalry is near their hospital, the artillery at half a mile or more from their hospital. The horses are picketed in parallel lines on clear, open, well drained ground. 23. There is no separate building for married men's quarters; a portion of the barracks has been given over for the soldiers' families, and there is sufficient room for them, as the strength of the regiment now stands. The artillery non-commissioned married officers have good quarters. The men live in huts of an inferior description built of mud, thatched, in the patchery, adjoining the barracks. None of the married people occupy barrack rooms with the single men.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.* *Officers' Quarters.*	1. The officers' houses, at least the greater portion of them, are in very bad repair, the roofs harbouring vermin; they are badly built of the worst materials; sun-dried bricks, porous tiles, and green wood. Few, if any, resist heavy rain; they generally leak very much; they are hot and low roofed, and much crowded. Large numbers of these houses belong to the same proprietor, and as the tenant is without remedy, it is difficult to get the slightest necessary repairs executed by the landlord; they are insufficient in number, and far inferior to officers' houses in most cantonments, and the rents are exorbitant. House owners should be amenable to house boards as at other stations.
IV. Health of the Troops.	1. The station and district are healthy, as also are the native population. 2. The chief diseases are bowel complaints and fevers. 3. The healthiness of the native population is to be attributed to the simple and unstimulating nature of the mode of living. 4. The regiment was stationed at Burmah before coming to this station for two years and two months, and on quitting Burmah in April 1858, was in good health. Diseases of the bowels and fevers were more prevalent during the monsoons, and showed 602 admissions in 26 months' residence there. Left wing arrived at Trichinopoly on 29th December 1857, and the right wing 27th April 1858, in good health. The prevalent diseases since arriving have been diseases of the stomach and bowels, fever of various types, and venereal disease. The artillery barracks are adjoined on one side by paddy fields, and on another by the Wycondah channel, which is dried up part of the year; these barracks are consequently more unhealthy than those occupied by the European infantry. 5. Troops are never camped out. 6. As to hill stations, there is no fact better established than that acclimation is preventive of disease in this country. 7, 8. It was particularly observed by the Deputy Inspector-General during the severe campaigns in Central India, that old acclimated soldiers did not suffer half so much as Queen's troops recently arrived; it therefore appears desirable that troops, only as they become feeble and appear to suffer from the heat of the low lands, should be sent to sanitaria on the hills, and on becoming robust, should resume their duties on the plains. Hill stations are in this way of great value, not as permanent residences. In short, the service should be in the plains, with occasional resort to the hills. 9. All organic and inflammatory diseases are increased by removal to the hills. Mere weakness, however caused, chiefly benefited. 10. The precautions necessary to guard the men at hill stations are good diet and warm clothing. It is particularly necessary to avoid overcrowding the barracks. 11. 12. The latter part of the cold and the whole of the hot season are best adapted for residence in hill stations. The shortest period of residence to obtain the full benefit of such change is twelve months. Too long a residence would render troops unfit for duty on the plains. 13. The special precautions required on leaving hill stations are not to throw off warm clothing too soon, and to avoid exposure to the sun. 14. Service in the plains, with short periods of change to hill stations, has been found by experience to be most conducive to the health of the troops in India. Frequent change of station is decidedly beneficial. 15. No sufficient information as to the barrack and hospital accommodation at hill stations. 16. The most suitable elevation for hill stations in this latitude would appear to be 6,000 feet. 17. There is no higher ground near the station which could be advantageously occupied as a hill station better than the Neilgherries, distant 160 miles; the road is pretty good and would admit of troops being sent up in bullock transits; the expense is the chief obstacle. The hills are 7,000 feet high, the climate is inferior to that of the Australian colonies. A sanitarium is already established there for European troops at Wellington, near Coonoor. 18. Regur or black cotton ground, which consists of decomposed trap, is decidedly productive of fever; this was seen all over Bundlecund, where it prevails. 19. The best age for soldiers proceeding to India is between 22 and 25 years. The best period for landing in India would depend on which coast troops are landed, and whether any march would have to be made inland after reaching India; the best time is usually considered to be the end of the hot season, by which they would be gradually introduced to the next hot weather. On first landing the men for the infantry are sent to the European infantry depôt at Arcot, where there are barracks for their accommodation. Clothing is issued to them agreeably to regulations, and they are then instructed in their drill and duty till ordered off to join their regiments. The precautions for preserving the health of troops on arriving in India are,—avoidance of a too sudden alteration from ship rations to fresh rations and excess in the supply of vegetables. Restriction to barracks from 8 a.m. to 5 or 6 p.m.; light drills, loose clothing, woollen clothing at night upon duty and during the rains, &c. Diminished sun glare in barracks. 20. Troops should be sent direct from the home depôt to India, for the sooner the men fall into the Oriental mode of life and habits the better. Life on the hills gives no insight into that of the plains, nor would residence there acclimatize men for life and work in the latter. On arrival the regiment should be sent to a station and there left for five years, camping the men annually, in the cold season, in the neighbourhood of the station, for three or four weeks, ground being frequently broken. This would overcome the dulness of barrack life, &c. No extra expense need be incurred. The barrack and other establishments to be engaged should stipulate to accompany the regiment on such excursions free of batta. 21. Short marches early in the morning is the usual and best mode of transport of troops from the port to the interior. 22. The number of years a British soldier should serve in India is 15. 23. The mode of conducting medical invaliding committees is very free from objection. 24. The time of departure of invalids from India for home depends from which coast they depart, and by what route they proceed. They should be sent to England at the beginning of the summer.
Diseases.	1. There are regular inspection parades weekly for the discovery of incipient diseases. 2. There is no scorbutus among the troops. 3. The cause of hepatic disease is often the high temperature, and more frequently the use of spirituous drinks (hydrocarbons), but all scrofulous habits are predisposed to inflamed and enlarged liver in India. This has been abundantly seen. Those who in England would

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	be phthisical will get abscess of the liver in India; such men should be sent to a hill station and avoid drink. The proportion of hepatic disease is 1 to 34 of other diseases. The causes of it are exposure to the sun, drink, damp, and sudden reductions in temperature. It is frequently found connected with dysentery, and occasionally supervenes after a well-cured case. Avoidance of the above causes would prevent its frequency. 4. Dracunculus is very rare among Europeans. 5. The proportion of venereal disease to the total sick is one-fourth to one-fifth, and the average period that men are away from duty is 20 days. The remedy is marriage, with an allowance to the wife during widowhood and to each child. Lock hospitals are of little use, as they frequently become instruments of tyranny or revenge. The disease is communicable long before the sufferer is aware of its existence. In a European corps of between 600 and 700 strong there were, during the year, nearly half that number of venereal diseases. Lock hospitals might be rendered of great value, that is, if all the women of the town were often examined at their huts by an experienced nurse, and diseased ones brought into hospital. 6. The troops suffer from fever and dysentery. Intermittent fever is the type most common. *Cholera* comes in with the north-east wind, almost every year attacking natives more than Europeans. *Small Pox* chiefly prevails in the hot weather. *Rheumatism* is not prevalent, owing to the very equal temperature. No knowledge of the proportion which admissions and deaths from these diseases bear to the total. Information can be had of the Principal Inspector-General of Hospitals. 7. *Itch and Leprosy*, amongst natives, are the more frequent diseases. They prevail all the year round. The sanitary condition of the native houses is bad, and very favourable for the propagation of skin diseases. The predisposing cause of these diseases is the want of ablution generally. 8. The most fertile source of disease amongst soldiers is bad spirituous liquors, not obtained in the canteen. 9, 10. Quinine has not been tried at the station as a prophylactic against malarial diseases. No recommendation to make for the prevention or mitigation of epidemic diseases at the station.
V. INTEMPERANCE.	1. The soldiers at the station are usually temperate. In the artillery, from six to eight per cent. of the men undergo confinement during the month for drunkenness. There are only five confirmed drunkards in the regiment. None at present in the artillery. 2. The proportion of admissions into hospital from intemperance is— Directly, 70 - Indirectly, 41 - Total admissions, 111. Diseases caused directly and indirectly from intemperance show 12⅓ per cent. to total admissions for all diseases during the past 11 months.

Table showing the effects of total abstinence, temperance, and drunkenness on the amount of sickness, mortality, and crime from 1st April 1859 to 29th February 1860, being 11 months.

Diseases.	Non-Commissioned Officers, Privates, and Musicians.								Awarded Punishment by	Non-Commissioned Officers, Privates, and Musicians.

N.B.—The heading temperate includes only men who have not been brought to court-martial for drunkenness.

Drunkenness is always punished as an offence.

3. Distilled spirits are sold both at the canteen and the bazaar. The spirits sold in the canteen are of the best quality; the amount consumed is less than one dram each man per diem; that sold in the bazaar is execrable; spirits are not issued as a portion of the soldier's ration, but the men are allowed to draw two drams of arrack per diem from the canteen on payment. None is issued before half past one o'clock p.m. The same remarks apply on the march and in the field. The quality is the best, and never exceeds two drams per day. The men are not in the habit of taking a dram before morning parade. Spirit is never given as a ration to convalescents. Ginger beer is the only other drink sold in the canteen.
4. Consumption of spirit is injurious to health and detrimental both to the efficiency and discipline of the corps.

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	5. It would be decidedly advantageous to health to abolish spirituous liquors as part of rations, where supplied as such, and their sale in the canteen and bazaars. No spirits should be permitted to be sold within a circle of 10 miles of barracks. 6. Spirits act as an irritant poison and wine and malt liquors act as cordials, and uniformly benefit the digestive functions unless any idiosyncrasy be present. 7, 8. Tea and coffee only are much used at the station, and about 10 dozen of ginger beer daily in the Artillery Company. Tea, coffee, &c., are infinitely more advantageous to health than malt liquors, and their substitution would be highly beneficial. 9, 10. It would be beneficial to abolish spirituous liquors in toto. I know no more baneful compound than that sold in the bazaars as arrack; for this any drink might be substituted with advantage. I would restrict the sale of it, and give every inducement to the men to take malt liquors in preference. 11. The canteen and bazaar regulations are, according to the G.O.C.C., 17 August 1855. The canteen regulations are obeyed in every particular. The quantities issued are:—Spirits, 2 drams per diem, but no beer or wine; or spirits 1 dram with 1 quart of beer, or 2 drams of wine, or wine 4 drams but no beer or spirits.
VI. Diet.	1. The ration for Queen's British troops and the Indian European troops is the same. Bread 1 lb. Beef 1 lb., supplied 5 times per week. Mutton 1 lb. supplied 2 times per week. Rice 4 oz. Sugar 2 ½oz. Tea 5-7ths of an oz. supplied 5 times per week. Coffee 1 oz. 2-7ths supplied 2 times per week. Salt 1 oz. Vegetables 1 lb. Firewood 3 lb. The periodical changes are those of vegetables procured at the different seasons of the year. The Quartermaster sees that the rations issued by the Commissariat, are of the exact quantity, and of the first quality; the Orderly officer of the day inspects them every morning before they are issued, as well as after they are cooked, and reports to the Commanding Officer that he has done so; and it is the duty of Company officers to see that their men get the full quantity of rations to which they are entitled. 2. A complete ration, including vegetables, is provided for the troops, but no fruit. The stoppage for one day's rations is three annas, four pice. The proportion of vegetables to every man is 2 ozs. of onions, 8 ozs. of potatoes, and 6 ozs. of other kinds of vegetables that may be in season. 3. Every article is of good quality and sufficient in quantity. No improvement is required. The cooking is superintended by the mess man, and every means taken by the orderly corporal and messman to prevent rations being improperly disposed of. 4. Frying pans and boilers in the proportion of one to every 25 men are supplied by Government for cooking. The kitchens attached to the barracks are clean, light, and well ventilated, and are well supplied with water. The artillery kitchen is clean but dark; there is a good water supply. The introduction of pumps would be an improvement. The rations are never served in joints, they are generally boiled and stewed with vegetables. The utensils supplied by Government admit of very little variation in the cookery. The cooking is good; tea and coffee are properly prepared. Tea and coffee is prepared for the men before a march, and arrangement is always made for refreshment of this kind half way on the march. 5. A piece of ground contiguous to the barracks has been allotted and is cultivated as a garden by the men; it affords them healthy and pleasant occupation during their leisure hours, and they benefit by the produce. Government liberally authorizes the gratuitous issue of garden implements, and every encouragement is given to the men to employ themselves in this way. For the regulations vide G.O.C.C, 22nd November 1856, No. 93.
VII. Dress, Accoutrements, and Duties.	1. The soldier's dress consists of a tunic or shell jacket, woollen cloth trousers, shako or forage cap, and great coat during the cold and wet months of the year; khakee as summer clothing with helmet during the hot months. The accoutrements consist of cross-belt and pouch with bayonet belt. The present dress is suitable to the climate. On the hills warm woollen clothing should always be worn, and generally flannel next the skin; worsted socks and strong boots to resist the wet. The helmet and the present warm and light clothing of the army is calculated to diminish the effect of sun, heat, cold, wet, night air, or malaria, &c. The introduction of a serge dress in place of the shell jacket would be a great improvement. The present guard dress is shell jacket and woollen cloth trousers during the cold and wet seasons, and khakee clothing during the warm and sultry months. The men on guard are never exposed to the sun when it can possibly be avoided, they are protected by the guard rooms, verandahs, and sentry boxes.
Duties.	1. It is advisable that the men should be drilled at home. During the drilling of recruits in this country they have frequently to stand still for minutes together, and the sun then has great influence, causing them occasionally to faint. Fevers are often ascribed to this cause. 2. The following is the usual routine of soldiers' duties. Inspection in light and heavy marching order; guard mounting; brigade exercise; battalion field exercise; field training; light infantry exercise; guard and sentry duties; picket and outpost duties; escalading; target practice; route marches and gun drill. The amount of drill excepting for recruits is rarely more than once a day or 4 days in the week. The duration about 1 hour in the cool of the morning. The men do not appear to suffer in health from drill. The best hours for drills and parades is between 5.30 and 7 a.m., and for marches between 2 and 7 a.m. For regulations, see general orders regarding marches. The average number of nights the men have in bed during the week is 3; the regiments being chiefly composed of recruits at drill. 3. The most remote guard from the barracks is about two miles distant. Guards are relieved once in 24 hours; sentries every two hours. The roll calls by day are—5 a.m.; breakfast roll call 8 a.m.; 1 p.m. dinner; 5 p.m.; 8 p.m.; and at night one check roll at an uncertain hour, when the men are not disturbed, but counted by the orderly serjeant in their cots. Every precaution is taken to guard against the ill effects of night guards by suitable clothing.
VIII. Recreation and Instruction.	1. The following are the means of recreation and instruction:—There is a ball court and a skittle ground. There is an army school, but at present there is no trained schoolmaster or mistress. Arrangements are being made regimentally for the performance of these duties. There is both a garrison and a regimental library; the former is not lighted at night, but the

TRICHINOPOLY. MADRAS.

References to Subjects and Queries.	Replies.
VIII. Recreation and Instruction—*cont.*	latter is sufficiently so. There are coffee rooms. There is a soldiers' garden, managed by a committee of officers and sub-committee selected from the men, who work in the gardens. There are no workshops except an armourer's shop, nor any theatre or gymnasia. The means of recreation, &c., are to a considerable extent sufficient to keep the men occupied during the wet season and heat of the day, but there is great room for improvement. During the hot weather the men are restricted to barracks from 9 a.m. to 4 p.m., which, doubtless, is beneficial to health. 2. The encouragement of trades amongst the men, by having workshops attached to the barracks, would afford useful employment, and relieve the monotony of barrack life. Many men, such as shoemakers, tailors, mechanics, &c., would, I think, go steadily to work at their trade if they had a shop to go to. 3. A soldiers' savings bank is already established, and is advantageous. 4. There is little or no shade from trees in the vicinity of the barracks, but there are verandahs the whole length of the inner face of the barrack-rooms in which the men can take exercise during the day, when the weather is not very hot. The artillery barracks have not sufficient shade from verandahs.
IX. MILITARY PRISONS.	1. The cells of this, one of the hottest stations in India, are very small, and built upon masses of rock, which must be intolerably hot, and most injurious to the soldiers' health.
X. FIELD SERVICE.	1, 2. There are no local regulations for field medical service. The medical officer in the British army is always consulted as to the encamping ground &c., and it should be so in the Indian army. 3. The camp regulations for the preservation of health as laid down in the quartermaster general's regulations, are calculated to preserve the health of the troops. 4. The arrangements for field ambulances are merely doolies carried by six bearers, for each sick man, an excellent, but expensive carriage; also hospital sick carts on 2 wheels, drawn by bullocks for convalescents or men too weak to march, not a very easy or pleasant carriage.
XI. STATISTICS OF SICKNESS AND MORTALITY.	1. To be obtained from the Director-General of the Presidency.
XII. HOSPITALS.	1, 2. The garrison hospital is a private house. The European regimental hospital is detached from the barracks, 314 yards distant. It is in a line with and between officers' houses. The cavalry hospital is 66 yards from the horse lines. Shengcolum hospital is on open ground. Pootoor hospital is close to the bazaar of the regiment, but has an open space around it. All are situated in tolerably open positions. A wall, 9 feet high, surrounds the European regimental hospital, and one 8 feet high surrounds Shengcolum hospital. All the sites are well chosen; the European hospital stands on the highest ground in the station. There are no nuisances near the hospitals. 3. The water supply is just sufficient, and for the service of the hospital good. 4. The sewage is removed in casks by scavengers to a distance from the station. 5. The height of the lowest wards of the garrison hospital from the ground is 1 foot; those of the cavalry hospital 1½ feet; of the European hospital ½ foot; of the detached ward 2½ feet; of Pootoor hospital 2 feet, and of Shengcolum hospital 3 feet 8 inches. The wards are all paved with granite. The soil is very porous, and absorbs all drainage. A small trench conveys some of the rain fall into the nearest road trench, but there is no guttering. The garrison hospital is built of brick in mud; plastered. There are no ventilators. The walls are thick. It has a verandah 8 feet broad on one side. The cavalry hospitals are built of brick in chunam, with a ridge ventilator. Verandahs on both sides 9 feet wide. The European hospital of brick in chunam with gable ventilators. Verandah on both sides 10 feet wide. Pootoor hospital of brick in chunam. There are no ventilators or verandahs. This hospital has a terraced roof; the others are tiled. The walls are thick. Shengcolum hospital is built of brick in chunam with gable ventilators. It has a verandah on both sides 8 feet 7 inches. The European hospital faces east and has blinds. Verandahs are never used for the accommodation of the sick. Hospitals in India usually consist of one flat. The following table gives the accommodation :—

	Wards.	Dimensions of Wards.				Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.		Number.	Height.	Width.
		Feet.	Feet.	Feet.	Feet.	Feet.

Garrison Hospital (very old)	1	33	18	17	10,098	1½	2	6	4
39th Regiment N.I. Hospital	—	59	20	17¾	20,945	1½	2	4	3½
		24	16	12½	4,800	1½	2	4	3½
		24	16	12½	4,800	1½	3	4	3½
13th Regiment N.I. Hospital	1	80	16	13 1/12	17,813	1½	12	3½	3
15th Regiment N.I. Hospital	1	80	16	13 1/12	17,813	1½	12	3½	3

All the hospitals are well placed as regards the prevailing winds, except the garrison hospital, which being a private house is surrounded by other houses. All the windows open inwards, and appear suitable in arrangement and construction.

6. The means of ventilation are by doors and windows and upper fan-lights. The wards are well ventilated. Bamboo blinds are used in the European hospital.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	7. Kuskus tatties, constructed of a double framework of plaited bamboo, with a kind of scented grass between, strongly bound with bamboos, and made circular in form, are used in the European hospital, but not elsewhere; these are kept wet with water, which renders the air cool and refreshing. 8. There are no means of warming the wards. There are no precise intervals for cleansing and whitewashing the walls; it is done about once a year, or oftener if necessary. 9. The garrison hospital has no privy. Night-stools are provided in serious cases in all hospitals. The privy of the cavalry hospital is a small tiled building, 20 feet from the hospital; it has no seats, merely a cover. The same at Pootoor and Shengcolum. The European hospital has a privy provided with seats, attached by a covered passage. They are regularly washed and kept pure by burning salt therein. They are cleansed by scavengers more or less frequently in the day. The arrangements admit of improvement. 10. The lavatories are attached to the end wards, and are sufficient for the purpose. 11. Portable baths are employed for warm baths when necessary, and a shower bath is likely to be attached to the hospital. 12. Washermen are engaged to cleanse the dirty linen; they take it away and bring it back when cleaned. 13. The storage is sufficient and dry. 14. A frame of wood on four legs, webbed together with tape, is used for a bedstead. The bedding is good. No improvement is suggested. 15. There is one kitchen at the back of all the present wards of the European hospital. When the female ward is completed it will be between it and the male wards. The food is cooked in large copper (tinned) vessels. The means for cooking are complete and sufficient, and the cooking can be varied as the medical officer may direct. 16. The diet table, &c. is according to regulation. 17. The attendants in number and office are according to general regulations, and are sufficient. The medical officer can always obtain extra aid if required. 18. The hospital is very healthy. No epidemic or hospital gangrene has occurred. 19. A female ward was required. It was sanctioned about 18 months ago, and may be completed in six months more. 20. Convalescents take air and exercise in doolies and sick carts; only those nearly well in the latter. They usually go to the brigade practice ground. The hospital enclosure being too small for the purpose, those who require walking exercise take it in front of the hospital guard-house on the regimental parade ground. 21. Soldiers' sick wives and children are now received into hospital, and attended to as regularly as the soldiers. A ward, one of the old ones, has been fitted up for them. Better arrangements are in progress. 22. The following are the special local hospital regulations :— *Orders for the Hospital Sentry.* "1. Take charge of the guard-room and arms. 2. Search all bundles and baskets by whomsoever carried. 3. Nothing is allowed into the hospital, except it is passed in by the hospital serjeant. 4. No bandies are allowed into the hospital compound, except the scavengers' bandy. 5. No one is allowed into hospital during the visits of the medical officer, except on duty. 6. Visiting hours for friends are from 8 to 9 a.m., and 4 to 5 p.m., from November 1st to April 1st; and 7 to 8 a.m., and 5 to 6 p.m. from 1st April to 1st November. 7. The hospital gate will be closed and locked at gun-fire every night, and no one (sick excepted) will be allowed to pass in, nor anyone to pass out, unless the assistant-apothecary personally direct the sentry to allow the party to proceed out." (Signed) C. G. E. Ford, Surgeon, Trichinopoly, Dec. 23, 1859. 2nd European Light Infantry. 23. The hospital is wholly under the control of the medical officer. Every requisition of his is immediately attended to, and his wishes complied with, if possible. Every hospital comfort necessary or desirable is immediately supplied at his request. 24. There is no convalescent ward, but a portion of a ward is set apart for those who wish to read the books and papers placed there. There would be no advantage in having a convalescent ward if it were a part of the hospital.
XIII. Burial of the Dead.	1. The burial ground is a clear open space at the south-west edge of the cantonment. The prevailing wind is westerly. 2. Its area is about an acre. The soil is red, gravelly, and dry. Decomposition is not likely to take place rapidly. The ground is carefully kept. 3, 4. The graveyard is very rarely offensive, so seldom that precautions have not been necessary. The space left between the graves is usually 2 feet, and the depth for adults 4 to 5 feet, and for children 3¼ to 4 feet, according to the nature of the soil. The ground is very rocky and hard; graves are never re-opened. There is no rule about the time of interment, but the nature of the climate has made it a necessity to inter within 24 hours after death, at all times. 5, 6, 7. The dead of the camp followers or bazaar people are buried or burnt by their own people, paupers by the police. No injury accrues to the public health by the present practice. No improvement is suggested.

(Signed) P. T. Cherry, Colonel, 1st Reg. Light Cavalry, President Sanitary Committee.
R. Budd, Major-General commanding Trichinopoly and Sn. Dn.
W. C. Palmer, Lieutenant Acting District Engineer, Trinchinopoly.
J. Dorward, Surgeon-Major, Garrison Surgeon, Trichinopoly.

13th June 1860.

(Many of the replies in this Report are signed by individual members of the Committee, Dr. Davidson, Deputy-Inspector General of Hospitals, and others.)

References to Subjects and Queries.	Replies.
I. Topography.	1. The country surrounding the station is a flat plain, extending in every direction for many miles. It is intersected by the rivers Kanhan and Pench, which join and form the northern boundary of the cantonment. The soil is black; dry in the hot and cold seasons, and retaining much moisture in the rains. There are numerous ravines and nullahs, but there are no tanks within six miles of the station. Numerous groves of mangoes and other trees, however, exist in the immediate vicinity. No jungle.
	2. The elevation of the station above the sea is about 900 feet, Seetabuldee being 939 feet; but in most parts, the station lies on nearly the lowest level of the adjacent country, being on the right bank of the river. The highest point, which is about 500 yards west of the church, and which is from 30 to 60 feet higher than the river bank and general level of the cantonment, is not built upon. This rising ground is dry and open, very eligible for military building purposes, and has been approved of as a site for dragoon barracks by his Excellency Sir Patrick Grant. The only doubtful point regarding it is whether water would be readily found, to settle which experiments have not yet been made.
	3. The nearest mountains or table land are those of Chindwarra, 75 miles north-west, and Seonie, 67 miles north of Kamptee, the height of each of which is about 1,100 feet above the station. There is another range of mountains with table land known as the Mattwerr hills, 36 miles north-west of Chindwarra, and 2,150 feet above Kamptee, which are recommended as a sanitarium for European troops. By a direct road this sanitarium would probably be within 100 miles of Kamptee.
	4. The nearest water is the river Kanhan, and the nearest tank is six miles west of the church at Surady. A large and deep nullah runs between the military part of the station and the Sudder bazaar; another runs into the Kanhan at the back of the commissariat godown, where there is also a tract of marshy land. At seasons which occur perhaps once in eight or ten years, when very heavy freshets come down the Kanhan river the water flows up the nullah and over the low ground between the artillery lines and the commissariat godown, also over a tract of low ground on the river bank at the north side of the European bazaar. It has been known even to flood the bazaar itself. The overflow only lasts a day or two. There is a great extent of broken ground in the vicinity of the station, and very many deep nullahs in all directions.
	5. The station is thickly planted with trees and hedges, there are also gardens, nevertheless, in most parts the exposure to wind is sufficiently free. The native bazaars, particularly the European bazaars, are far too densely built over. No regular plan would seem to have been formed for them, with the exception of a good main street. The outskirts of these bazaars are a perfect labyrinth of wretched huts. The temperature of the station is doubtless very much raised by reflected sun heat, and by the smoke of many fires for cooking. The station is exposed to every wind which happens to blow. The hot land winds are very distressing in May, and until the rains set in in June. The distance of the station, in a straight line from the sea, being 400 miles, no mention of the sea breeze need be made.
	6. The surrounding country is cultivated with dry grain. There is no irrigation, except for gardens, which are numerous in the immediate neighbourhood of the station itself, but this does not affect the health of the troops. There is no cultivation of rice or indigo. Hemp is, however, cultivated without the station limits, but the steeping of it, which is the only noxious condition of its cultivation, is not allowed within the station limits.
	7. The large city of Nagpore is within 10 miles of the cantonment. No other large town is near the station, but the native population of the station is immense, being not less than 70,000.
	8. The soil of the plain upon which Kamptee stands is principally black. It is formed of decomposed trap and gneiss, more or less tenacious and retentive of moisture, and much pervaded by nodules of limestone. Red and white sandstone are found near the surface in many places, especially on the left bank of the Kanhan river. Limestone also exists in beds near the surface. The cantonment was formed about 40 years ago, the ground having been previously occupied.
	9. Water is found at various depths; during the dry season at from 25 to 50 feet, and during the wet season at from 15 to 40 feet below the surface.
	10. The black soil is very retentive of moisture. The heavy rain-falls mostly drain away into the river. The soil as it dries after the rains opens out into deep cracks and holes, from which no doubt exhalations from the moister subsoil arise. The water does not lie on the surface long; evaporation is of course great. No drainage from any high ground passes into the subsoil of the station; the water from such higher levels, when in excess of what can be retained by the soil being carried off in nullahs to the river.
	11. The water for drinking purposes and for public cattle, as also for gardens, is obtained from wells; that for private herds of cattle, and for washing, from the river. There are no tanks in the station or the immediate neighbourhood to cause malaria.
	12. There are several hundred wells, the water in which is of various quality according to the well, but is mostly good, pure, and inodorous. The river water is turbid in the rains, and in the dry season foul and polluted with the refuse and filth of the bazaar. For the past 10 years there has always been a good supply of water in Kamptee, and no ill effects have arisen from imbibing it. Water for irrigation is raised by bullock draught, cords, and buckets. No

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	better supply could be obtained unless by damming up the Kanhan river in a high level above Kamptee, and thus to lead a constant supply of water through the station by means of channels. 13. There are no other topographical points bearing on the health of the station. 14. New stations are selected by decision of Government, based upon reports of mixed military and medical committees; no better plan can be suggested.
II. Climate.	1, 2. The instruments available for meteorological purposes are thermometers, barometer, hygrometers, and pluviometers. Monthly meteorological tables and returns are forwarded to the medical board; they only pass through the office of the chief medical officer of the command, en route to Madras; copies are not kept in Kamptee. The tables may be obtained on application to the medical board. 3. The climate partakes of both heat and cold. The year is divided into three seasons, cold, hot, and rainy, transitions of which are regulated, and may be calculated at certain periods. The cold season commences about 20th October, December and January being the coldest months, the temperature at the time being 68° in the house, and as low as 38° at sunrise outside. The hot season is from the middle of March till the 20th June, the thermometer ranging in the house from 85° to 98°. The rainy season, preceded by great atmospherical disturbances, and finally distressing sultriness, which often induces languor, restlessnes, and general malaise, with a sensation of great exhaustion, feelings which depend probably upon electrical influences, as they vanish almost immediately upon a changed condition of the atmosphere occurring. There is a considerable diurnal range of temperature in the cold season, which is extremely prejudicial to weak constitutions, and to such as have been debilitated by disease or other causes, unless great attention be paid to precautionary measures, such as appropriate clothing, regularity in diet and habits, and taking regular exercise in the open air morning and evening. There are usually heavy dews, which are highly beneficial for agricultural purposes; and in the early part of the season fogs prevail, more particularly along the ravines and nullahs, where moisture exists to a greater extent than in the open plains. The mean temperature at this time may be stated at 68° in the house, the lowest observed outside has been 36° Fahrenheit, and the highest 110° from noon to 3 p. m. The rainy season is generally the most unhealthy. Cholera, however, prevails in March and April, as also in July and August, and fevers and diseases of the bowls at the same period. 4. There is a range of hills about 100 miles distant, about 3,600 feet above the sea, whereon are several localities where troops might be stationed with advantage. 5. The following are the stations at which I have served, with remarks on their comparative salubrity; (1), Masulipatam, unhealthy; (2), Vizianagram, healthy; (3), Burmah, healthy; (4), Western coast, indifferent; (5), Vellore, not unhealthy; (6), Samulcottah, indifferent; (7), French rocks, healthy; (8), Trichinopoly, healthy; (9), Bangalore, healthy; (10), Kamptee, healthy.
III. Sanitary Condition of Station.	1, 2, 3. A map of the adjacent country, with plans of the station and barracks, are forwarded. 4. Table of Barrack Accommodation. Date of construction of barracks, between 1820 and 1844; 10 ranges, all built at different periods. Total number of rooms or huts, Infantry 10 ranges of barracks, Artillery 3 ranges. Total regulation number of non-commissioned officers and men, Infantry, 1,056, Artillery 340.

III. Sanitary Condition of Station—*cont.*	5. The windows are on opposite sides in the outer walls of the verandahs, and are unglazed. There are no Venetians, only shutters. There is a verandah on both sides from end to end of the barracks, 10 feet wide and 16 and 10 feet high. They are never occupied as sleeping quarters, either by the soldiers or others. There are neither jalousies or jhilmils to barracks. 6. The bedsteads used in barracks consist of three boards laid on two wooden trestles about 18 inches high; there are no cots. The bedding consists of a quilted mattress, stuffed with cotton, sheets and blankets. In huts of the native army the soldier makes his own arrange-

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	ments. Clean straw is provided by the Commissariat for European soldiers in tents, but none is supplied to native soldiers. The height of barrack cots above the floor varies from 2 ft. 2 in. in old pattern, to 1 ft. 6 in. in the new. The hospital cots, both wooden and iron, are 1 ft. 6 in. in height. 7. The European tent is an oblong rectangular poled tent with outer walls only, but with a double fly and two doors. The dimensions are as follows:—Area of ground within walls 21 ft. by 15 ft.=315 square feet of area; height of walls 5 feet; height of poles to top of inner fly 9 ft. 3 in.; between flies 1 ft. 6 in. They are to accommodate 25 men in ordinary marches and 20 men on field service. Area per man on ordinary service 12½ ft.; on field service 16 ft.; cubic contents for each man on ordinary service 88 ft.; in field service 110 ft. The Native tent is a 2-poled tent, with a ridge pole, fly, and walls all in one, in shape oblong, rounded at the ends, with one door. The tent rises in the shape of a cone from the ground on all sides to the ridge pole. The dimensions are as follows:—Extreme length 22 ft.; extreme breadth 12 ft.; height of pole 9 ft. 3 in.; total area 240 sq. ft.; total cubic contents 1,080 ft. They accommodate 25 men each in ordinary marches, and 20 men on field service; area for each man on ordinary service 9½ sq. ft., and on field service 12 sq. ft.; cubic contents for each man on ordinary service 43 ft., and on field service 54 cubic ft. 8. In the European barracks at Kamptee the ventilation is most faulty and deficient. They are provided with ridge ventilators of a partial description, viz., 3 openings in the roof of each barrack, which contains 80 or more men. There is no ventilation for tents or huts, and guard rooms have seldom anything except doors and windows. The ventilation is certainly not sufficient when the barracks are full. Punkahs are hung in each barrack, under which stand the soldiers' cots. An allowance of 20 rs. per month per company is granted by Government to pay coolies who pull the punkahs night and day. This allowance is continued throughout the year, although only required from March to September. Kuskus tatties are furnished by the Commissariat, and fitted into the windows. These are kept watered all the day at the expense of Government. 9. The barracks are built of brick and lime on stone foundations, and have tiled roofs. Tents are made of 3 plies of strong cloth, the inner one being blue. The huts of the native soldier are principally mud walls, and tiled roofs of a very thin and fragile material. 10. The flooring of the barracks are flag stones. The floors are raised above the ground several feet, but there is no means provided for free passage of air beneath. 11. The materials of the barracks are proper enough, but their construction is faulty according to the present improved notions of European barracks. From 80 to 100 men are massed under the same roof for all purposes of eating and sleeping, which is highly objectionable, when for many months of the year the men are confined to their barracks for 20 out of 24 hours. The barracks at Kamptee are too low. The windows ought to be glazed and and Venetians also. The barracks are kept in repair by the Engineer department. There is always great delay in the execution of either repairs, alterations, or improvements. A sanitary committee, of which the brigadier commanding is president, is answerable for the state of the cantonment. The walls and ceilings of barracks are whitewashed generally once a year, but can be done whenever required. 12. Lavatories are built and being built for each troop and company. They are supplied with water from adjoining wells by water carriers. There are no swimming baths, they will be built in due course, having been sanctioned by Supreme Government. No proper means of drainage have yet been constructed; the water is conducted along channels from each wash-house to openings in the wall of the barrack yard, and from thence it flows away as it best can. 13. The cooking of the soldiers' food is well done by native cooks in the cook-houses adjoining the barracks, and sufficient water is supplied from wells by water-carriers. The refuse water is got rid of in the same manner as described for the wash-houses. A complete system of drainage for all the barracks has been estimated for, and will be constructed as soon as possible. No washing of linen takes place in barracks, native washermen performing the work at the river side. 14. The contents of the privies are not drained, but carried off by filth and urine carts supplied by Government, to a considerable distance outside the station. 15. The privies have no proper ventilation, two or three small oval holes at the gable ends to admit light, being all the ventilation they have. They are most objectionable in their present state. Each barrack is lighted at night by six globe lamps hanging from the roof. There is one lamp in each privy. 16. No arrangement exists for draining the barracks. Beyond the means before described there is no drainage. I am not aware that any dampness exists in any public building in this cantonment. There is no drainage to the European barracks, and the water left by the rains, and which does not find its way through the openings in the barrack yard wall, is allowed to stagnate, evaporate, or sink into the subsoil. The holes outside the barrack yard, which receive the refuse from the cook-houses, are emptied twice a day by native coolies kept for that purpose. These holes are only dug in the earth, and consequently are a mass of mud and filth. The cesspits are mere holes dug in the earth about 3 feet deep, and 3½ feet square. The distance of the wells from these pits varies from 30 to 60 yards. They are about 60 yards from the nearest end of any of the barracks, and the hospital is more than a mile away; they are emptied twice a day. There are no foul ditches as far as it can be prevented by the active interference of the police, but with a native population of some 70,000 souls, there must be an immense deal of filth around and about, but every means are taken to prevent it. 17. A conservancy establishment of scavenger carts and sweepers is kept up for the surface cleansing of the cantonment, and one cart is allotted to each corps to keep the lines clean. The cleansing is performed daily, each cart working eight hours. It is supervised by the assistant quartermaster-general. The filth and refuse is carried in carts and in buckets to filth-pits which are dug in convenient places in the outskirts of the station, and are filled up and closed in succession; when filled, fresh pits are dug as fast as required. 18. The surface of the cantonment is kept free of vegetation. The rank grass is eaten down by cattle in the rainy and cold season. In the hot season there is no grass or vegetation to be kept down. There are no old walls, &c., to interfere with the ventilation of the station or bazaar, the cantonment being kept free from all such objections.

References to Subjects and Queries.	REPLIES.
III. Sanitary Condition of Station—*cont.*	19. There are closed drains in the principal streets of the baazar, and watercourses and drains elsewhere, running into a large nullah. The ventilation of the baazar is imperfect in some places, but crowding is not permitted now. There are 220 wells in the bazaar, and water is also obtainable from the river. There are no tanks: there are 17 public latrines for men, and 17 for women. There is a sweeper to each street to preserve cleanliness, and for some time scavenger carts have been in use. Butchers and others, whose trades cause filth to accumulate, are obliged to keep mehters, and are strictly supervised. All filth is thrown into pits in the streets of the cantonment. Persons committing nuisances are closely watched and taken up daily. A fixed establishment ought to be allotted for sanitary police purposes. Owing to the faulty manner in which, many years ago, houses of a poor kind were allowed in some places to be huddled together without order, and owing to the irregular nature of the ground, intersected by nullahs, making the houses difficult of access, it is not easy to maintain cleanliness around them as might be wished. All cattle refuse is removed outside the cantonment daily. Cesspits, where accessible, are cleansed every 48 hours, and persons allowing dung-heaps are punished. The European bazaar, which contains some 10,000 natives of all sorts, is situated about 500 yards from the European infantry barrack, in a north-easterly direction; when the wind blows from that quarter, and should there be any infectious disease in that locality, it is possible it might be detrimental to the soldiers, but otherwise no particular nuisance is experienced from wind blowing over the native dwellings. The former inconvenience could only be prevented by removing the bazaar from its present locality. 20. Animals for the use of the soldiers are slaughtered at a distance of about 800 yards from the nearest point of the nearest barracks, and no nuisance has ever been experienced, that I am aware of, from the position of the slaughtering places. 21. There is no stabling or picketing ground for the horses of bazaar residents or camp followers; owners keep their cattle in stables attached to their residencies, and cleanliness is enforced in these as in all other conservancy matters. 22. The artillery and cavalry stables, for sick horses, consist only of open buildings divided by a wall 10 feet high down the centre. The hospital is nearly a mile distant from these buildings, and they are a considerable distance from the barracks. The dung-heaps are arranged on one flank of the horse lines, and are purchased and conveyed away by villagers for cultivation purposes. The horse and foot artillery picketing grounds are arranged so as to admit of the horses being picketed by divisions, the former about 1,200, and the latter about 800 yards from the hospital. 23. The quarters for the married men of the European infantry regiment at Kamptee are most objectionable in every respect, but they are only of a temporary nature. The same may be said of the married mens' quarters for horse and foot artillery. No married people occupy barrack rooms.
Officers' Quarters.	1. There are no public quarters for officers; they reside in small detached houses in rear of their respective regiments; no improvement in them is required. Remark by the Commander-in-Chief—"For my observations on the condition of the "public buildings at Kamptee, and the alterations and improvements I consider necessary, "see my Inspection Tour Report of February 1859. Frequent representations were sub- "sequently made with respect to the continued faulty state of the buildings and cantonment "generally, but no result has followed. (Signed) P. G."
IV. HEALTH OF THE TROOPS.	1. The station itself and the adjoining native population may be generally considered healthy. 2. The principal diseases among the natives are fever, small-pox, cholera, and diseases of the stomach and bowels. Spleen disease is not prevalent. 3. Irregularity in diet and indulgence in bang and liquor are the chief causes of disease among those who suffer more than others. 4. The A Troop Horse Artillery previous to its arrival at Kamptee had been on field service in Bundlecund for 2 years; it arrived here in 1860. Its state of health when in the field was very good; the prevailing diseases being fever, and diseases of the stomach and bowels. The same class of diseases have since been prevalent here. The Madras Foot Artillery have been in Burmah and St. Thomas' Mount previous to being stationed here. They arrived at this station in 1857. The troops while in Burmah and at the Mount suffered chiefly from fever, diseases of the stomach and bowels, and rheumatic affections; since their arrival at Kamptee they have suffered from fever, diseases of the stomach, and venereal diseases. The present accommodation of the men is much on a par, and sickness does not prevail more in one portion of the station than another; when sickness does occur it will be found chiefly among the native inhabitants in the bazaars. 5. The troops at the station are never camped out. 6, 7, 8. I have never been in charge of troops at hill stations, but hill sanitaria are decidedly advisable. 9, 10. Troops on going to hill stations are liable to occasional fever, and to enable them to derive benefit from such residence, attention should be paid to their diet, clothing, shelter, duties, and exercises. 11. I cannot speak from experience as to the seasons best adapted for residence at hill stations, but it is generally believed to be from November to May inclusive. The shortest period to obtain benefit from such residence is from one to two years. 12. I should consider that there was no period of residence beyond which injury is ikely to be inflicted on the health of the troops on returning to service in the plains. 13. There are no particular precautions required for protecting the health of troops on returning to service in the plains. The same precautions should, however, be observed on leaving hill stations as are observed on troops first landing in India. 14. I should consider it advisable to locate soldiers serving in India on the hills with short periods of service in the plains. Frequent changes of station in the plains also is beneficial to the health and spirits of troops. 15. No experience of the barrack accommodation at hill stations or sanitaria. 16. The elevations most suitable as sites for hill stations are between 4,000 and 7,000 feet above the sea. 17. Mathoor and Chekuldee, about 3,600 feet above sea level, could be advantageously occupied as hill stations. They are both about 100 miles from Kamptee.

IV. Health of the Troops —*cont.*	18. There is no particular class of surface and subsoil more healthy or unhealthy than others for stations. Gravelly soils may perhaps be considered the best, as more easy of drainage and less likely to generate malaria. 19. The best time of life for strong athletic men to proceed to India is about 20 years of age, though older soldiers on first landing in India thrive well. Troops should land in India in the cold season. On arriving there they are usually marched at once to the barracks at Poonamalee or Saint Thomas' Mount, and exposed as little as possible, but the clothing is often not suited to the climate. Drills take place in the mornings and evenings; marches commence from 2 to 3 o'clock in the morning, and terminate about 7 or 8 a.m. Every possible precaution should be taken to guard unacclimatized soldiers, on first landing, against exposure in the high temperature of the tropics. The barrack accommodation should be ample, not less than 1,500 cubic feet of space for each individual; the clothing should be clean and adapted to the particular season; the men should have suitable rooms for washing and bathing; the food should be good and nutritious, with a proper proportion of vegetables; animal food should be taken only once a day; beer should be the only liquor allowed, and should this not be procurable, good spirits sufficiently diluted might be substituted; no pure or raw spirits should ever be allowed; drills and parades should be of short duration, and in the cool of the mornings and evenings. 20. I consider that troops landing from the Mediterranean, Cape, and Mauritius, are better prepared for the Indian climate than those coming direct from England. On landing all means should be adopted to initiate them gradually to the heat of the plains of India, and for this purpose hill stations are desirable in the first instance. 21. Troops are transported from the port to the interior by land. The marches should be short, and they should commence a little before daylight. Great care should be taken in the selection of encamping grounds, which should be high and dry. 22. A British soldier should serve in India from 12 to 18 years. 23. The manner of conducting the business of medical boards as regards invaliding does not avoid a conflict of opinion, because appeals are often made by officers commanding regiments to military committees. Those committees, from the want of the required professional knowledge, cannot possibly form a correct opinion on the various cases brought before them, it is, consequently, often opposed to the opinion of the medical board. 24. Invalids should leave India for home in the cold weather, so as to arrive in England in the early part of the summer.
Diseases.	1. There are weekly inspection parades for the discovery of incipient diseases at the station. 2. Three cases of a scorbutic nature occurred in the artillery in September 1859, attributable to the supply of vegetables being insufficient and the quality inferior. A better description of vegetable is much required; during the hot and rainy months the supply is most inadequate. This has been repeatedly reported. 3. In the artillery the proportion of hepatic disease during the last three years has been $\frac{1}{36}$ to the whole admissions. Its causes are high atmospherical temperature, exposure to the sun's rays, improper food, and the abuse of spirituous liquors. Malaria must also be considered a cause, as likewise bad ventilation of barracks. It is not frequently the consequence of other diseases. The prophylactic measures are as follows:—proper clothing, cleanliness and frequent ablutions to be enforced, an appropriate diet, including animal food only once a day, no issue of raw spirits. When spirits are issued they should be diluted as in the navy. All parades and drills should be at suitable hours in the mornings and evenings. 4. No cases of dracunculus have occurred at the station. 5. In the artillery, during the last three years, the proportion of venereal affections to the total sick has been $\frac{1}{5}$th. The only precautionary measure which is likely to be of service is the establishment of lock hospitals. They are about to be established. 6. The troops occasionally suffer from epidemic disease, but not to a great extent. I allude to cholera and small-pox. Fever of an endemic or malarious origin is often prevalent; intermittent and remittent are the usual types. The following table shows the admissions to total admissions, and deaths to total deaths from diseases of this class:—

Diseases.	Admissions to Total Admissions.	Deaths to Total Deaths.
Fevers	$\frac{1}{5}$th.	$\frac{1}{17}$th.
Dysentery	$\frac{1}{18}$th.	$\frac{1}{5}$th.
Cholera	$\frac{1}{724}$th.	$\frac{1}{17}$th.
Small-pox	$\frac{1}{2602}$th.	$\frac{1}{17}$th.
Rheumatism	$\frac{1}{38}$th.	$\frac{1}{17}$th.

	7. The most frequent zymotic diseases are intermittent and remittent fever, small-pox, diarrhœa, dysentery, and cholera. These diseases are most prevalent from February to the end of October. The climatic and atmospheric conditions during this period are the extremely high temperature and dryness of the air during the hot months, and the occasional closeness and stillness of the atmosphere. The greatest precautions have been adapted with respect to sanitary measures generally for the bazaar and native dwellings at Kamptee, and with much success. 8, 9, 10. Sentry duty in the night, from the exposure to the influence of malaria, is no doubt the principal cause of fever at Kamptee, and during the period of the prevalence of epidemic disease, the same duty must tend to induce an invasion of the prevailing epidemic. The duties in barracks are not of a description to materially influence the health of soldiers. Prophylactic doses of quinine have not been tried.
V. Intemperance.	1. In the horse and foot artillery the majority of the men are temperate, but a considerable number are intemperate. The British infantry regiment (H.M's. 91st) are far less intemperate, the confirmed drunkards being certainly not 2 per cent. 2. Since December 1858 the proportion of admissions in the hospital of H.M. 91st Regiment at Kamptee have been, from diseases directly caused by intemperance, 1 per

Drunkenness is always punished as an offence, and in the British regiment stationed here the commanding officer never allows captains of companies to dispose of cases of that description.

3. Distilled spirits (arrack) are sold in the canteen and licensed houses in the bazaars, and one to two drams are taken by five-eighths of the men of the artillery daily. Spirit is not part of the ration for the soldier at this station. The quality is excellent, and the full amount allowed to each man in 24 hours is 2 drams in the artillery, and 1 dram per diem in the British infantry. The spirit is supplied by the Commissariat, but it is quite optional to take it. It is not procurable at the canteen before 1 o'clock p.m., and it is never given as a ration to convalescents. No drinks injurious to health, other than intoxicating drinks, are sold at the canteen or bazaars.
4. The present mode of issuing pure spirits to the troops is in my opinion injurious. Spirits properly diluted, and in moderate quantity, are considered conducive to health by the medical officer, but they cannot be conducive to the efficiency or discipline of the corps.
5. There can be no doubt that it would be beneficial to the health of the troops to suppress the sale of pure spirits in canteens and bazaars, and substitute beer, tea, coffee, and at dinner light drinks.
6. Good malt liquor would be decidedly more beneficial to health than any description of spirit, and the introduction of wine would I think be beneficial.
7, 8, 9. Coffee, tea, lemonade, and similar drinks are used to a considerable extent in regimental canteens. These are of course superior to spirits and malt liquors, inasmuch as they are harmless. If spirit cannot be issued otherwise than in a pure state, I am of opinion that it would be beneficial to health to suppress altogether the issue of spirits, and to subsitute beer, tea, and coffee.
10. I have no recommendation to make on these points beyond what is comprised above.
11. The canteen regulations as published in the general orders of the Presidency are strictly obeyed.

VI. DIET.

1. The soldier's ration consists of bread 1 lb., beef or mutton 1 lb.; rice 4 oz.; tea $\frac{5}{7}$ oz., or coffee $1\frac{3}{7}$ oz.; salt 1 oz., and vegetables 1 lb. The rations are issued daily by the Commissariat subordinates to the quartermasters of regiments. If any article is considered objectionable, a board of officers is immediately called, whose decision is final.
2. The men have three meals daily. Breakfast consists of bread, butter, and meat, sometimes eggs, with tea and coffee. Dinner, beef or mutton, rice and bread, and vegetables when procurable. The evening meal is tea or coffee with bread and butter, anything extra is allowed to those who may be disposed to pay for the same. Each man is allowed to have from the canteen daily, if he chooses, 1 pint of beer or porter and 2 drams of arrack, or double that quantity of beer or porter with half of arrack. 1 lb. of vegetables is the daily ration; when not procurable, compensation is allowed to the men.
3. The men are well fed and cared for, and have plenty. The food is good. A regular supply of a variety of vegetables is the chief desideratum. I know of no alteration required in this respect, but a few ounces of cheese 3 times a week, although a luxury, would be much appreciated. The disposing of rations by soldiers has never been heard of.
4. To each company barrack is attached a cook-house containing all the usual apparatus in an Indian cook-room, but an Indian kitchen can never be clean. There is sufficient light and ventilation in them for native cooks, and all the water required is supplied by the water-carriers. Baked, stewed, and curried messes are usually prepared. The food is never either roast or boiled. The cooking is fairly done, and varied according to means; very good tea and coffee are supplied and prepared for the men. In every regiment arrangements exist by which every soldier can have a cup of tea or coffee before parade or march in early morning; many regiments send on a portion of their cooks in front, so as to have coffee prepared midway on line of march, which is very beneficial.

VI. Diet—*cont.*	5. A large piece of ground has lately been made over to the Commissariat department at the station for the formation of a vegetable garden for the use of the British troops. The soldiers have nothing to do with the cultivation of this garden. They have their own gardens independent. This matter is entirely in the hands of the commissariat department, and if successful it will be a great boon, as it is intended to produce every description of European vegetable, which are not cultivated by the natives.
VII. Dress, Accoutrements, and Duties.	1. The soldier's dress consists of a cloth tunic, cloth trousers, shako for artillery, wicker helmet for infantry, and forage cap. The established summer clothing for all arms is the complete suit of khakee and wicker helmet with quilted cover. I consider the present dress quite suitable according to the season. The summer's khakee clothing is very much worn, and the cloth tunic, perhaps, not much more than 2 months in the year. A fixed fast colour for khakee clothing is very desirable; at present no two men are alike. I know nothing better than the light dress and wicker helmet lately introduced, with the cloth tunic, according to season, climate, and station. In wet or cold weather guards always mount with their cloaks to be worn according to requirement. An European sentry is never placed on duty outside during the heat of the day without the protection either of a verandah or a thatched covering, N.B. the khakee is a brown linen dress made loose and easy in every way.
Duties.	1. I think every infantry soldier should be thoroughly drilled before he comes to India. Artillery recruits for horse and foot are drilled at the recruit depôt before being sent up country, and go through the full instruction. The depôt for instruction is an institution admirably adapted for the purpose. 2. The usual routine of a soldier's duties is guard duty about once in 7 days, and drill, exercise, or parade for about an hour or less every morning. I have never heard of the men's health suffering from these duties. The best hours for drills, parades, and marches are, in the cold season, from 6 to 8 a.m., and in the hot season, from 5 to ½ past 6 a.m. Evening drills and parades are not usual, except for recruits, and the hour for such is always fixed according to season, from 1st May to beginning of June no evening drill of any sort is allowed. The general orders on this subject are that no corps is to be under arms between the hours of 8 a.m. and 4 p.m., except on occasions of public ceremony or general assembly of troops. The horse artillery have 3 consecutive nights in bed; the foot artillery 8; the British infantry 7, and the native infantry 5. 3. The parade ground for general guard mounting is nearly a mile from some of the regiments in cantonment, but guards are generally mounted from regimental barracks. All guards are relieved every 24 hours. There are the usual roll calls by day, but there are none at night after ¼ past 8 o'clock. I have never heard of health suffering from the ordinary routine of night duties, and nothing beyond the usual precautions of dress according to season is required.
VIII. Instruction and Recreation.	1. The means of instruction and recreation at the station are as follows:—The artillery have a ball court; none has yet been built for the British infantry, but there are excellent covered skittle alleys for both. Both also have good school-rooms, but the 91st have no schoolmaster. There is a good garrison library; not however open for use at night. Day-rooms are established in both the artillery and H. M. 91st, but the accommodation is inferior. A large piece of ground is allotted to each arm for the purpose of a garden. There are no workshops, theatres, or gymnasia, but in 3 of the barracks of the 91st Regiment excellent theatrical representations are given at intervals. The above are not sufficient by any means to keep the men occupied during the wet season and heat of the day. By regimental arrangement there is restriction from exposure out of barracks when off duty according to the season. During the hot season the men are not allowed outside between the breakfast meal and evening parade at 5 p.m., and such restriction is beneficial to health. At the same time the want of proper amusement makes this restriction very wearisome. 2. The improvements suggested in the means of recreation are, the construction of a sufficient building for the combined purposes of a soldier's shop; coffee rooms; rooms for bagatelle board and other games, and reading-room. This room should be such as to induce the soldier to retire there during the heat of the day to read, write, and amuse himself, and should be lighted of an evening for the same purpose. Places of this description on a small scale are established both in the artillery and H. M. 91st Regiment. 3. Soldiers' savings' banks already exist, and the value of such is proved by the increasing number of depositors. They cannot I think be too much encouraged. 4. There is no shade whatever for exercise, and the long hot days must be most wearisome to the soldiers during the months from 1st March to end of June.
IX. Military Prisons.	1. There is no military prison or prison establishment of any kind at this station. There are a number of small cells erected at a distance of half a mile from the barracks, but there is no house or quarters for the provost officials of any sort. They are incapable of being used, in consequence of the heat and confined space for nearly eight months in the year. Their ventilation is defective, and prejudicial to health, and the space in cubic feet is not more than about 800 in each cell.
X. Field Service.	1. There are no local regulations for field medical service not included in the General Presidency Regulations. 2, 3. The happiest results proceed from the care and discrimination of executive medical officers in their selection of encamping grounds. The hours of march vary; refreshments *en route*, supplies of all kinds being carefully examined in camp, and hygiene generally attended to. 3. The powers of the medical officer are great, and his opinions on all matters of sanitary influence for troops in camp meet with all attention. 4. In the Madras Presidency a field surgeon is appointed, who has the regulation of field hospitals, ambulances, &c. The sick are carried in doolies, and hospitals are occasionally formed in healthy stations when the army may be in advance. Carts are expressly fitted up for the conveyance of stores, and medical supplies are always at hand, carried in chests properly fitted up. A medical storekeeper accompanies the force, who has control of these matters.

XII. Hospitals.

1, 2. The artillery and British infantry hospitals are situated at the north-west extremity of the station near the bank of the Kanhan river. The infantry barracks are a mile distant from their hospitals, and the artillery somewhat less. The nearest bazaar to either hospital is 500 yards. There are walls round the hospitals 7 or 8 feet high, but the foundations are well raised. Ventilation is not obstructed by trees, except to the artillery hospital, which is very partially so. The site of these buildings is somewhat lower than the cantonment, and like all other localities in the station cannot be pronounced free from malaria. The infantry hospital is 100 yards from the bank of the river; the artillery 350 yards. Many ravines or small nullahs run near both hospitals into the river.

3. The supply of water from the well is abundant and good.

4. There is no regular drainage; there is, however, a gutter all round to receive the roof drippings, and the water from the bath-room is conducted outside in the same manner. There is no sewage for the privies.

5. The British infantry hospital consists of three buildings, one long building running nearly north and south, and two smaller ones branching off from either side of the long one at right angles. The wards are raised from 3 to 4 feet above the ground, but there is no perflation of air underneath. There is a gutter round the hospital, to receive the roof water, but it is not carried away, it flows into the hospital enclosure. There is no surface drainage. The walls of the hospital are of brick and are double, the verandah intervening between the inner and outer walls; the walls are sufficiently thick. The roof consists of a double layer of tiles, but it is not sufficiently thick to resist solar heat; it should be of thatch, with tiles over the whole. An inner ceiling has been recently added. The hospital is furnished with a verandah all round 10 feet wide; it has wooden doors and glass windows with jalousies all round. They are sufficient for shelter, but it is to be noted that the jalousies have been placed inside the glass windows instead of on the outside. The verandahs are used as reception rooms, there being no other. The hospital consists of one flat only.

Table of Hospital Accommodation.

Total number of wards, 2.
Total regulation number of beds, 26.

Number of Wards.	Regulation Number of Men in each Ward.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	The hospital is so placed as to receive the full benefit of the prevailing winds. The windows open in the centre outwards. The arrangement is bad, there are means of regulating the ventilation and coolness; the jalousies open inwards. 6. The ventilation is effected by means of the doorways and windows in the verandahs, and by ridge ventilation in the roof, which latter has been recently added, but not, however, sufficiently. Entire ridge ventilation was proposed, but overruled by the chief engineer. The ridge ventilation in the small ward is insufficient. As before stated, the windows in the verandahs have jalousies, which open inwards and are placed inside the glass frames. The doors are of wood, and have no jalousies. 7. A thermantidote was supplied to the hospital for cooling the air during the hot months; but from its small size was quite useless. To cool the hospital efficiently several thermantidotes will be required, one is of no use. 8. There are no means for warming the wards. The walls, floors, and passages of the hospital are limewashed every week. The whole building inside and out can be whitewashed whenever required. 9. The hospital privy is placed behind the hospital at a distance of 24 yards from the nearest ward, and has a covered approach to it. It consists of a room furnished with open seats all round, the excrement remaining under the seats till removed by sweepers. It is not drained, and there is no water supply. It is washed out by hospital sweepers morning and evening, and then limewashed. The excrement is taken away morning and evening in covered carts to a distance of three-quarters of a mile from the hospital and deposited in pits. The privy is offensive; there are no cesspits. 10, 11. A new bathing house is now in course of construction in the hospital enclosure, which will be furnished with troughs, basins, and baths. Previous to this there was no proper lavatory arrangement. 12. All washing is performed by native servants supplied by the Commissariat. It is done outside away from the hospital. 13. There is no store at the hospital. The hospital stores are kept in a building at a distance under charge of the Commissariat department. The only store-room at the hospital is one for the medicines, and there is a part of the hospital verandah partitioned off. It is totally unfit for the purpose. 14. The hospital bedsteads or cots are of wood, with cotton tape bottoms; they are 18 inches from the ground, which is much too small a space. The bedding consists of two quilts of gingham, both lined and one quilted with cotton, one blanket, and two pillows; sheets are not allowed by regulation, except in dysenteric and fever cases. 15. The kitchen is situated behind the hospital opposite to the privy, at a distance of 19 yards from the nearest hospital wards. It is of the rudest construction. The fire-places are simply places in front of the back wall without flues. They are furnished with an oven. Ventilators have lately been put into the roof. The cooking utensils are of copper, and are tinned regularly once a month, which is found to be sufficient. There are no means of roasting meat, it must be baked or stewed. The cooking is well done as far as the means admit. 16. Copies of diet tables, diet rolls, &c., are transmitted. 17. The hospital attendance is as follows:—There is a hospital serjeant whose time is constantly occupied in attending to the discipline of the hospital. He superintends its cleanliness, and that of the patients, and is responsible that the diets are properly administered. There are no European nurses or orderlies allowed for male patients. The servants prescribed by regulation for an European regimental hospital are as follows:—1 European nurse; 1 head conocopoly or purveyor; 1 assistant conocopoly; 1 cook; cook's mate; 1 cooly maistry; 3 coolies for leeching, fomenting, &c.; 8 ward coolies; 3 sweepers; 3 toties; 2 water-carriers; 2 tailors, and 2 washermen. 18. The hospital is not in a good sanitary state, it is subject to malarious influences in common with the rest of the station; it is badly situated, being too low, and at too great a distance from the barracks; it is badly ventilated, and ill constructed. 19. There is no proper surgery or reception room for patients, the verandah is used for these purposes. There is no ward for lunatic patients, nor any ward sufficiently separated for the treatment of contagious diseases. The privy is a disgrace to the 19th century. It should be furnished with covered seats, under which should be placed metal troughs. The kitchen or cook-room should be reconstructed. There is no house near the hospital for the residence of a medical officer. The house nearest to the hospital in the lines of the 91st regiment is three-quarters of a mile distant. An assistant surgeon should reside close to all hospitals in India. 20. There is no provision made for the exercise of convalescents; men who are able to walk are allowed to do so morning and evening in the vicinity of the hospital under proper supervision. Those who are weakly and require change of air are sent out twice a day to the higher ground in a sick cart. This is a rough vehicle and ill calculated for convalescents. There are no shaded walks, or suitably fenced ground with seats. 21. There is no proper hospital for women and children of the European infantry at this station. One of the small sick wards has been used for that purpose, but is objectionable from being too close to the male hospital. Attached to the artillery force there is a separate hospital for women and children, which is sufficient, and the arrangements in every respect satisfactory. 22. There are no special local hospital regulations. 23. The surgeons of regiments have no power whatever to make repairs or improvements in the hospital, even those most urgent. He represents to the commanding officer what is required, and this is passed in regular course to the department of Public Works. The delay in carrying out improvements has been excessive. Surgeons of regiments are not allowed to alter the dietary; but there is but little inconvenience in this, as a suitable diet can always be obtained. The same remarks apply to camp and marches. 24. There are no convalescent wards; they would be of great advantage.
XIII. Burial of the Dead.	1. The burial ground is 1½ miles from the hospital of the European infantry regiment, and about the same distance from the artillery hospital, and beyond any influence from the prevailing winds.

KAMPTEE. MADRAS.

References to Subjects and Queries.	Replies.
XIII. Burial of the Dead —*cont.*	2. Its area is about three acres, the soil is soft, loose sand; there is no drainage. I cannot speak with reference to decomposition; the ground is tolerably well kept. 3. The grave space allowed is 7 feet by 3½, with an interval of 3 and 3½ feet. The graves are 6 feet deep, are never re-opened on any consideration, and one body only is interred in each. There is no fixed period for interment after death, but it takes place as soon as possible, generally from 12 to 18 hours. Hindoo graves are 6 ft. 9 in. by 2 ft. 3 in., with intervals of 4 ft. 6 in. between each. Mahomedan graves are 6 ft. 9 in. by 2 ft., with an interval of 1 ft. 6 in. between each. The depth of Hindoo graves is 4 feet for both sexes; and Mahomedans 3½ feet for males, and 4½ feet for females. One body only is laid in each grave for all castes, and the graves are never re-opened. Interment takes place from 10 to 12 hours after death, but sometimes sooner. 4. The graveyard has been known to be offensive during periods of epidemics. No other precautions are taken to prevent this, beyond having the graves dug further apart, and at different parts of the graveyard. There is no practice known as regards the burial of British troops beyond the usual military funeral. 5. There are three places for this cantonment for burning the bodies of Hindoos—all well outside. There are also three burying places for Hindoos, all at a good distance from the cantonment. The Mahomedans have six burial grounds in and around the cantonment. I am not aware of injury to health from the present practice. No bodies are allowed to be burnt near the cantonment. 7. Proper platform carts should be provided for carrying the corpses of the British soldiers from the hospital to the place of interment. The present plan is I think objectionable, viz., that of placing the coffin on a bier, or in a dooly, and carried to the burial ground by native coolies. Remark by the Commander-in-Chief.—My observations on all the foregoing points in reference to other stations, are equally applicable to Kamptee, and I have nothing to add to them. (Signed) P.G.

    - 78 ditto.
    - 92 Vizagapatam.
- Native Troops -
  - Artillery - 31.
  - Infantry - 847 38th M.N.I.

References to Subjects and Queries.	Replies.
I. TOPOGRAPHY.	(*Note.*) The topographical report on Vizagapatam must be noted under two distinct heads, viz., Vizagapatam and Waltair. The stations, though under one command, are 2½ miles apart, and at each there is a small detachment of European troops. The lines of the native infantry regiment are placed nearly midway between the two, at the north-east end of the town of Vizagapatam. In the fort of Vizagapatam is stationed a company of European veterans, the arsenal, garrison hospital, medical stores, and commissariat establishment and pay office. At Waltair are the telegraph office, residences of the general commanding the division, and all officers belonging to the native infantry regiments, and European detachment of infantry and artillery, also a small bazaar. 1. Both stations are sheltered on the north, south, and west by a low range of hills, distant from 1½ to 6 or 7 miles, and about 500 to 600 feet high. Between Vizagapatam and the hills is a tidal marsh of some considerable extent. Between Waltair and the hills is a cultivated valley, free from jungle and undergrowth. 2. Vizagapatam is about 10 to 15 feet above the sea. Waltair is on sand hills from 150 to 200 feet above the sea, and about 150 feet above the adjacent country. A tidal marsh and back water lies to the west of the town and fort of Vizagapatam. The fort is open to the sea on the east and south east. There is no higher nor healthier ground nearer than Waltair, which is well situated. 3. The nearest mountain range is the "Vindhyan," distant about 50 miles in a straight line. Estimated height from 4,000 to 5,000 feet above the sea. 4. The sea is close to Vizagapatam and Waltair. The marsh and back water before alluded to, near Vizagapatam, and there is a small stream down the cultivated valley, between Waltair and the hills. There is no overflow of water, save from the tide, in the marsh. The sand-hills near Waltair are broken up into deep open ravines, but all clean and dry sand. No effect on health. 5. Both stations are clear and open. Unencumbered by trees, hedges, or gardens. Ventilation not interfered with by vegetation. Prickly-pear is in process of clearance. Vizagapatam town is rendered very hot, and so are the native infantry lines, by reflected heat from the sand-hills, which shut out the sea-breeze. The fort of Vizagapatam and station of Waltair are sheltered from the land winds, but well open to the sea breeze, from which the town of Vizagapatam and the native infantry lines are shut out. The sea breeze is most healthful and refreshing, but the southerly winds are not so. They are found to be relaxing and debilitating in their effects on the constitution.

References to Subjects and Queries.	Replies.

I. Topography—*cont.*

6. The surrounding country is fairly well cultivated.

There are no works of irrigation near either station.

There are a few paddy fields in the valley near Waltair, which have no appreciable effect on the health of the station.

The cultivation of rice is neither prohibited nor restricted. Indigo, hemp, and flax are not cultivated near the station.

7. The town of Vizagapatam lies N.E. of the fort, and close to it. Vizianagrum, 30 miles distant, is the nearest large town.

8. Between the town of Vizagapatam and the hills is a considerable alluvial deposit. The remaining subsoil is sand and gravel. The hills are broken volcanic rocks, with deep sand.

Waltair had not been previously occupied. The fort of Vizagapatam is a very old station, and dates back to the days of the Dutch.

9. Water is scarce. Wells are from 25 to 30 feet deep, where excavations are stopped by hard rock.

In the dry season the wells are frequently dry, and not over-abundant in the rains.

10. The rainfall generally flows away readily, especially about Waltair, except in one spot called the washing green, which is apt to retain both rain water and surface springs. This spot is but little above the level of the sea.

The parade ground of the native infantry regiments is on a level with the swamp at Vizagapatam, and in wet weather is poachy and soaked with water. The hospital is on the same level.

In these localities the water lies on the surface till it evaporates.

The drainage from the hills passes into the valley and swamp; but is rapidly carried off to the sea, and does not pass through the stations.

11. The water supply of the station is derived from wells.

There are three small tanks within the station, the water of which is used for garden purposes and for cattle. The tanks are generally dry from February to June. They contain neither plants nor animals; some animalculæ.

No tank for drinking purposes is used for bathing.

The well water is clear and good. The tank near the native infantry parade ground is very foul and bad. Bad as it is, it is most useful, being near a halting place for bullocks, camels, elephants, &c. A general resort for all travellers. Two good wells are close to it, which supply good drinking water. No foul drainage into this tank, but plenty of leaves. No other nuisance from tanks near the station.

12. The water supply at present is very limited, and not more than meets the present wants of the inhabitants, military, civil, and native. No colour, taste, or smell. It is good, clear, and wholesome.

Water is raised from the wells by rope and hand. It is supposed that an unlimited supply might be brought in iron pipes from hills distant about 4 or 5 miles.

13. The fort and town of Vizagapatam are singularly ill placed in every respect, and yet few places are so free from epidemics. The native houses crowd too near the fort, and if practicable these should all be cleared away, so as to leave an open space of about 100 yards. Both in a military and hygienic point of view, this would be most desirable. These houses abound with prostitutes and illicit sellers of bad arrack.

14. As regards the selections of new stations: The new sanitarium on the hills about 60 miles from this, was selected by a committee of officers:—

Inspector-General of Hospitals,
Superintending Surgeon,
Garrison Surgeon, and
Deputy Assistant Quartermaster-General,

who made every practicable inquiry and examination as to climate, diseases, sanitary condition of villages, and residents on the hills, and on their report the place is under trial. The committee suggest no improvement on this system.

II. Climate.

1. The meteorological instruments at this station are in the jail hospital, and consist of an Aneroid barometer, thermometer, and pluviometer.

2. The following is a meteorological table from January to December 1859:—

Months.	Barometer Mean.	Mean Temperature.	Mean Daily Range.	Mean Maximum.	Mean Min.	Mean Sun Temp.	Rain, Inches.	Winds. Direction.	Days of Sunshine.
January - -	29·91	73·5	4·5	75·5	71·	91·	0·6	N.E. & E.	30
February - -	29·93	76·5	3·5	78·	75·5	90·	1·	N.E. & S.E.	28
March - -	29·87	83·	3·5	85·5	81·	88·	0·65	S. & S.E.	27
April - -	29·80	88·5	6·5	96·5	90·0	102·	0·65	S.E.& S.W.	30
May - -	29·64	87·5	2·5	88·5	86·5	99·	2·05	S.W.	30
June - -	29·58	87·5	3·5	89·	86·5	75·	3·3	S.W.	21
July - -	29·71	85·5	3·5	87·5	84·5	54·	5·25	S.W. & W.	17
August - -	29·72	86·	2·	87·	85·	55·	5·	W.	17
September - -	29·79	85·	2·5	86·5	84·5	61·	6·2	W. & N.E.	19
October - -	29·91	84·	3·5	85·5	82·5	86·	11·	N.E.	27
November - -	30·04	80·	4·	82·	78·	76·	3·	N.E.	25
December - -	30·06	76·	2·	77·	75·	84·	0·10	N.E. & E.	29

Remarks.

January.—The temperature is at the lowest about the 10th, the wind being generally from the N.E., veering towards the east and S.E. The minimum temperature is 60°. Heavy dews. Weather serene. Thunder and lightning almost unknown.

February.—Not so cold as January, though pleasant. Heavy dews and occasional fogs throughout the month. The sky very clear, no rain nor lightning. Wind N.E., with frequent changes to the S.E.

March.—The along-shore, or S.E. wind, sets in during the month, and renders the air damp and sultry. Sky continues clear. Little or no dew.

VIZAGAPATAM, including WALTAIR. MADRAS.

References to Subjects and Queries.	REPLIES.
II. Climate—*cont.*	*April.*—Wind towards the end of the month changes to the S.W., and blows with considerable violence. Dew and rain are almost unknown. *May.*—The S.W. winds continue with heavy gusts throughout the month. Land winds blow for about 3 days in the month, and usually alternate with the sea breeze. *June.*—The S.W. rains begin to set in about the first week, and become more frequent towards the end of the month, and the sky is generally cloudy. *July.*—Rain more abundant than in last month. Wind from the same direction. Large masses of flying cloud seen in every direction. No sea breeze. Lightning and thunder occasionally. *August.*—Wind more westerly and rains are heavier. Thunder and lightning occur more frequently. The heat is much reduced, but calms peculiar to the month are very oppressive. Continues cloudy. *September.*—The wind, rain, and appearance of the weather continue the same as in August, until about the 15th, when the N.E. rains set in partially, and become heavy towards the end of the month. Thunder and lightning are frequent. Oppressive calms still continue. *October.*—North-east rains continue with great force throughout this month. The wind blows very fresh, sometimes amounting to a gale, and veering in every direction. Thunder and lightning occur frequently. The clouds assume a heavy appearance. Becomes cool towards the end of the month. *November.*—Rains cease about the middle of this month. Thunder and lightning seldom occur. The sky assumes a clear and serene appearance, and the weather becomes pleasant. *December.*—Wind still from the N.E. and E. The sky has a clear and tranquil aspect. Rain and lightning are seldom known, but towards the latter end of the month heavy clouds are often seen. 3. The climate is healthy; rather relaxing. In the north-east monsoon it is dry and mild. In the south-west monsoon the air is damp and muggy. Heat is never very great, nor is the cold. Thermometer rarely seen above 92°, and seldom below 70° in the cold season. Land wind almost unknown. Sea breeze very constant. Daily variations of thermometer very slight. European troops should be very healthy as far as regards the climate, if properly clothed, and prevented from indulging to excess in liquor, the great source of disease at this station. Flannel should be always worn, light dress in the hot, and warm woollen costume, of loose make, in the cold and rainy season. Exposure to sun should be avoided, and also to the night air. Late drills objectionable on account of the sun. With the exception of August and September, the whole year may be considered as pretty healthy. In these two months fever of the remittent type frequently prevails. In April and May sunstroke is not uncommon among the Europeans. 4. During the past year a spot on the Vindhyan range, about 60 miles from the station, has been selected as a sanitarium (named Galee Kondah, in Teloogoo "Hill of wind"). The elevation is about 5,000 feet above the sea, with a fine fresh air and cool climate, open to the sea breeze. Thermometer from 10° to 15° lower than at Vizagapatam. The spot is fairly open, and free from jungle, among a range of well-cultivated valleys. Good water. Thus far no fever or other epidemic has appeared among parties sent up to explore, and who have been for some time resident on the hills, but a fair trial has only now commenced. 5. As regards the comparative healthiness of different stations:—Colonel Pooley has served at Kulladgee, Dharwar, Ellore, Burmah in the first war as far as Jandaboo, Musulipatam, Berhampore, Northern Circars, Nagpore, Bangalore, French Rocks, Jubbulpore, Saugor, Nagpore, Vizagapatam, and Singapore. Of these stations Bangalore, French Rocks, Jubbulpore, and Saugor were the most healthy. The worst Nagpore, and, if possible, Singapore worse still. Dr. Smith has only served at Bangalore, and thinks highly of the climate. Captain Blagrave has served at Mercara, Madras, Rangoon, Pegu, Bellary, Kurnool, Berhampore, Russelcondah, Chiencole, Vizagapatam, and Vizianagram. Of the above, Mercara and Vizagapatam appeared the healthiest, the former much the most so.
III. SANITARY CONDITION OF STATION.	1. Map transmitted. 2. There are no covered drains or sewers in the fort or at Waltair. The majority of the drains in the town, under the Municipal Association, are open V-drains. There are no cesspits, dungheaps, &c., allowed in the fort. All refuse is thrown into the sea daily. 3. Plans of barracks. 4. The following table gives the barrack accommodation:—

Barrack Rooms or Huts.	Regulation Number of Men in each Room or Hut.	Dimensions of Rooms or Huts.				Cubic Feet per Man.	Superficial Area in Feet per Man of Floor Space.	Height of Men's Beds above the Floor.	Windows.

III. Sanitary Condition of Station—*cont.*	5. The windows are on opposite sides of the barrack rooms. They are opened and shut by propping up or letting down a piece of matting in Waltair temporary barracks. In the fort the windows are also on opposite sides, and open outwards with iron bars. There is an open verandah 9 feet wide round both barracks. These verandahs are never occupied as sleeping quarters by soldiers or other persons. There are no jalousies or jhilmils. There are shutters outside in the fort which fasten inside, and consequently impede ventilation. 6. The bedsteads at Waltair are all of wood, others have wooden frames with strings interlaced across. Bugs abound in all barracks and infest beds to a great extent, so much so that the men suffer more from them than from heat or bad ventilation. The use of iron bedsteads would almost, if not entirely, free the soldier from this great discomfort. A coat of paint annually would preserve the bedstead from rust, and they would ultimately prove much cheaper. In the fort iron cots are used, and bedding of 1858–59. In tents cots are not used. In damp weather straw is issued on the certificate of the medical officer. The straw is thickly spread on the ground, and on it the men spread their carpets. 7. There are two descriptions of tents used for troops. The dimensions of the one for European soldiers are (within the fly) 21 feet by 15 feet, cubic contents 2,194¾ feet, superficial area 315 feet. Each tent is supposed to hold 25 men. The tent used for the natives is bell-shaped, and holds 25 men; dimensions within 22 feet by 12 feet, cubic contents 1,434 feet, and superficial area 264 feet. 8. The following are the means of ventilation in use:—In the temporary barracks at Waltair the walls do not extend up to the roof. This causes better ventilation than in most other barracks. The officer commanding detachment 2nd European Light Infantry, says, that at Bangalore, Secunderabad, Fort St. George, and Trichinopoly the air at night is exceedingly foul. In the fort barracks no upper ventilation except two Venetian windows, one at each end, east and west. The men prefer the temporary barracks at Waltair to all permanent ones, as being more airy. Tents are ventilated by raising the walls. The ventilation at Waltair is perfectly sufficient to keep the air pure day and night. In the fort not so. The barracks are low and very hot; bomb-proof buildings. There are no means of cooling the air, neither are any requisite at Waltair. In the fort punkahs are used, at a cost to Government of 25 rupees a month. 9. The materials of which barracks and tents are made are as follow:—At Waltair the walls are wattle and dab, with palmirah posts at intervals; brick pillars to verandahs; thatched roof. In the fort, brick, stone, and mortar. Tents are of cotton cloth; four plies thick, inner one blue. 10. At Waltair the flooring is of earth, about 2 feet above the level of the ground. Fort, stone, not raised above the level of the ground. No passage for air beneath. 11. The temporary barracks at Waltair are much liked by the men, and are very suitable to the climate, and very cool and healthy. In the fort, hot and close; objectionable in every way. They should be entirely rebuilt in a more modern form at Waltair, or out of the fort, certainly. Tent material, good. Barracks repairs are executed by the engineers and public works department on a requisition from the deputy assistant quartermaster general, under the orders of the officer commanding the division or brigade. The officer commanding the cantonment is responsible for its general sanitary state, and officers commanding regiments and detachments for the portions under their immediate command. Cleansing and whitewashing is done on the requisition of the commanding officer when requisite. 12. Sketch of wash-houses. 13. Cooking is done at the ordinary cooking brick fire-places, by boilers and frying pans. Water for the purpose is drawn from wells by puckallies. The small quantity of refuse water from kitchens is dried up at once by the sun's rays. Washing is done at washing and drying greens near the sea by the dhobies. Quite sufficient. 14. For privies, tubs are used which are carried away and their contents emptied into the sea daily. 15. These buildings are ventilated on the same plan as the barracks. Barracks and privies at Waltair are lighted at night by oil lamps, on stands about four feet high. In the fort, by globe lamps. 16. The barrack drainage, such as exists, is by means of open surface drains either into the sea or the backwater; the distance in either case being under 200 yards. At Waltair the barracks and outbuildings all stand on high ground with a slope, and the water runs off rapidly. In the fort it sinks into the subsoil. From the privies and urinals, there is no drainage, being in tubs. From the baths by small open drains. At Waltair, no part of the barrack is damp. In the fort, heavy rain when sufficiently continued to soak through, causes a little dampness in the roof of the barracks. At Waltair the drainage is sufficient. In the fort, the fluid is cleared away by the barrack coolies. As far as practicable, chunam is spread over it at intervals. The remainder soaks into the ground or evaporates. There are no cesspits. At Waltair there is a large foul ditch in the bazaar, but not affecting the barracks, being about 500 yards away, used by the natives as a necessary. In the fort, none about the barracks, but one or two bad drains near the hospital. These are being improved by the municipal association. 17. The town is kept clean by the municipal association. The fort is badly off in this respect, and seems to be under no efficient management. Waltair is so open as to require but little cleansing, and what it does require is done under the orders of the magistrate. 18. The surface of the cantonment is being cleared of prickly-pear, the only vegetation that crowds it in some places, and which has been allowed to overgrow it to such an extent as to endanger the health of the troops. There are no old walls or thick hedges which interfere with the ventilation of the station, bazaar, &c., requiring removal. 19. As regards general sanitary condition, the cantonment is so open that no cleansing is required. The bazaar and town are kept clear by the municipal association. The larger streets are fairly swept and clean. Open drains with stone sides and bottom in the form of the letter V are being made, and the drainage carried off in the direction of the tidal marsh. The town sweepings are carried off to some distance in carts. Public cloacæ are in process of erection. The supply of water is from wells, not over abundant; what there is, is good.

III. Sanitary Condition of Station—*cont.*	The houses of the poorer classes, chucklers, fishermen, &c., are too much crowded, but generally speaking the town is good and open. Some huts between the back wall of the hospital and the marsh should be removed. There are large heaps of filth near the fishermen's huts, near the fort, which should be cleared away. The cleansing of the bazaars and town is entirely in the hands of the municipal association. Dung heaps and cesspits among the native houses are in process of removal. The greatest possible nuisance is experienced at times in consequence of the fishermen salting and drying their fish on the beach, and also from the state of the drains in the fort. The former can only be stopped by removing the fishing village from its present position. But as the fishermen are also boatmen, any removal would be attended with great inconvenience to the shipping interest. It will be better to remove the troops from the nuisance than the nuisance from them, and to remove the barracks up to Waltair. 20. Animals are now slaughtered at about two miles from the town, near the sea between Vizagapatam and Waltair. All this is fairly well managed by the municipal association. 21. Camels, elephants, bazaar horses, bullocks and carts, camp in a cocoa-nut tope close to the native infantry lines. All this is too crowded, but there is no other convenient spot near. It is a perfect nuisance to the native infantry regiment. 22. Artillery horses are picketed on open ground at Waltair, clear of the barracks and hospital. 23. No married men occupy barrack rooms. All live in detached houses in the patchery, for which they have to pay rent in the fort. In Waltair temporary barracks, a building divided into separate rooms is set apart for married men, who have also a washhouse and necessary outhouse to themselves. *Officers' Quarters.*—Officers live in detached bungalows, and, except one or two who live in the fort, are very comfortably housed. The bungalows in the fort are close, ill-ventilated, and offensive at night from the drains. Nothing will improve the houses in the fort.
IV. HEALTH OF THE TROOPS.	1. The station is healthy, and the native population are a healthy race. Fever is occasionally prevalent; it is the disease of the district; more common in the interior than on the coast, especially near the hills. 2. The diseases most prevalent among the native population are cholera, small-pox, chicken-pox, fevers of intermittent and remittent types; rheumatic affections, beriberi, lepra, elephantiasis to a great extent in the town of Vizagapatam; elephantiasis of the scrotum and testes, also hydrocele. 3. Fevers appear to depend on the westerly currents of air from the jungles under the hills. 4. The previous stations of the troops have been as follows:— The detachment 2nd E.L.I., Trichinopoly; were there six months; left 27th September 1858. The officer commanding the detachment is not able to state what diseases they suffered from there; were in good health on arriving here in the end of October 1858, and have continued in excellent health since. The men in the fort are veterans, invalids from every station in Southern India. The 38th regiment M.N.I. came here from Singapore, where they had been for three years. They left Singapore in February 1858, and landed the same month; the men, worn and emaciated, having suffered greatly abroad from diarrhœa, atrophy, and ulcers, all indications of a low state of the circulatory and nervous systems; and the diseases they have suffered from here have in a great measure resulted from the effects of a foreign climate. As regards the comparative healthiness of different parts of the station, the fort of Vizagapatam for European veterans and the native infantry lines are both objectionable. 5. The troops at this station are never camped out. 6, 7, 8. (Hill stations.) No experience. 9. As regards diseases, troops, on first going to hill stations, are liable to congestive fevers. The men, at once freed from the restraint of the plains, and the debilitating influences of hot stations, are apt to be constantly out in the sun, and suddenly take a large amount of exercise to which the constitution is not inured, and for which it is not prepared. The appetite is also greatly increased, and often in excess of the power of assimilation, or the demands of the constitution; perspiration is greatly decreased, or altogether stopped, and the kidneys do not at once respond to the sudden demand made on them, and the consequence is congestive fever. 10. The obvious remedy for this state of matters is to limit the amount of exercise and food at first, and keep up a free action on the skin with warm clothing. 11, 12. No experience. 13. Men leaving the hills should on no account be suddenly exposed to the sun or to very long marches. They will feel the debilitating heat of the plains at first. March them at night, do not harass them with guards or hot dress, and avoid stimulants. 14. As regards the advantages of locating troops on hill stations, the loss of European life on the hills will be found to be less than on the plains. There can be no objection, so far as health is concerned, in locating troops on the plains, with an occasional visit to the hills, to restore health lost in the plains. As regards the effects of frequent change of station on the plains, for troops, it is simply ruin to the sepoy in every way, most depressing to their spirits, and harassing. The risk of cholera or any other epidemic on march is very great, and the men on the Madras side are ruined in pocket by constant marches with their families, who always accompany them; and consequently, being half fed, are more accessible to attacks of disease, and succumb to them more readily. It is very painful to see the effects of foreign service or a long march on the health of a native regiment. The men are prematurely aged and broken. The climate of Burmah, the Straits, and China ruins the health of men. A less frequent change of station is desirable. 15. (Nature of barrack and hospital accommodation at hill stations.) No experience. 16. (Best elevation for hill stations.) No experience. 17. Answered under "Climate," No. 4. 18. As regards the healthiness or unhealthiness of particular soils; red soils, gravel, and sand, with a free drainage, are generally healthy; black and saline soils are generally unhealthy. 19. The best age for soldiers proceeding to India is from 19 to 22 years. The best time for their landing in India is the cold season, November to February. On arriving at Madras, artillery recruits are marched to the Mount, nine miles off, in a hot sun. Infantry recruits are sent by rail to Arcot, whence they are drafted into different regiments, and in three or four weeks are marched to their station, where they at once com-

References to Subjects and Queries.	Replies.
IV. Health of the Troops—*cont.*	mence a course of drill. The artillery should by all means be saved the first hot march to the Mount, most trying to young men, just off a long sea voyage, clothed in broad cloth. They should be sent up in transit carts, and for all recruits provide suitable barrack accommodation, temperance rooms, and means of amusement, as backgammon, dominoes, chess, bagatelle, a library, skittles, quoits, and other manly games; a workshop for tradesmen and others, anything to occupy the men and keep them from the canteen at starting in life. 20. As regards intermediate stations before arriving in India, no advantage could be gained by sending troops to such stations, and many disadvantages. They come out with habits of industry, which might be lost. If hill stations are available where the troops are landed, it is better to send them there at once. 21. Answered under paragraph 19. 22. A soldier may serve in India from 15 to 20 years, if after 10 or 12 years' service he had a change to the hills. 23. With reference to the present working of medical boards, these boards agree on important questions. Differences of consequence do not often arise. 24. Invalids should leave India after the cold season, and reach England in May or June.
Diseases.	1. Inspection parades for the discovery of incipient diseases are not usual at this station. Men who have an object, or wish to conceal disease, can do it so easily that these parades are not often useful. 2. Neither scorbutus nor scorbutic disease ever appear at the station. 3. There is very little hepatic disease at the station. A few chronic cases exist among the veterans, but none dependent on or resulting from local causes. 4. Dracunculus is not common at the station. 5. There is not much venereal disease. What there is, is of a mild character, chiefly gonorrhœa. The proportion to the total sick in hospital from all other diseases is 6·244 per cent. It must be borne in mind that a large proportion of the veterans are married men, and that most Madras sepoys are married. The question of lock hospitals is an important one. At most stations the civil dispensaries meet the want, and women of the town for their own sakes would resort to them for cure. The surveillance of these women by the police in India is most objectionable, and liable to the greatest abuse. The police peons for a trifling bribe would let any women off, however diseased, and with these views we see nothing to be gained by the establishment of lock hospitals, seeing that all their requirements are met by the civil dispensaries. 6. No epidemic has prevailed for some years. The only endemic disease, if it may be so called, is *erythismus tropicus*, cases of which are not uncommon from April to June. They chiefly come on at night, from 8 p.m. to midnight, and are not unfrequently the result of unusual exposure to the direct rays of the sun. In most cases there is found more congestion of the lungs than of the brain. *Fevers.*—Fevers are not uncommon, chiefly an aggravated form of quotidian, with some congestion of the brain, which is occasionally fatal. *Dysentery.*—A detachment of H.M. 69th regiment in 12 months lost a good many men from dysentery in 1858. Seven or eight cases out of 200 men in 10 months. The men were new to India, and suffered from toddy and bazaar liquors, also from exposing themselves at night. A detachment of the 2nd European L.I., a Madras regiment, relieved them, and occupied the same barracks and hospital, and not a case of dysentery has been fatal among them. *Cholera.*—No epidemic for 2½ years either in Waltair or Vizagapatam. *Small-pox.*—Occasionally appears in the hot months; the disease is much subdued and modified by the extension of vaccination. *Rheumatism.*—Is common, and chiefly during the presence of the south-westerly monsoon, when the air is loaded with moisture. The following table shows the proportions which the admissions and deaths from these diseases bear to the total admissions and deaths:—

Diseases.	Total Admissions. All causes.	Admissions from each Disease.	Deaths from each Disease.	Per-centage of Admissions to Total Admissions.	Per-centage of Deaths to Total Deaths.
Fevers	—	96	2	8·759	8·333
Small Pox	—	19	1	1·733	4·166
Cholera	—	4	1	·364	4·166
Dysentery	—	23	1	2·098	4·166
Rheumatism	—	166	2	15·145	8·333
All others	—	788	17	—	—
Total	1,096	1,096	24	28·099	29·164

	7. The most frequent zymotic diseases are fevers, cholera, and small-pox. They are most prevalent at the commencement of the hot season. No atmospheric changes remarked which precede or accompany their appearance. As regards the condition of the native population among whom these diseases are most prevalent:—The sanitary state of the bazaars occupied by the dwellings of the lower orders, viz., fishermen, chucklers, and pariahs, is very bad, and, though in process of improvement by the municipal association, is never likely to be good. The houses are crowded, and the habits of the people filthy and offensive. The native troops are located in a most objectionable spot, shut out from all sea breeze, and under a high sand hill to the east or sea board, on which the pauper dead were buried. To the north they are pressed in by a densely populated native village, occupied by potters, oil mills, and chucklers. To the south the halting place for camels, elephants, carts, and travellers. To the west a large and close garden. The means of ingress and egress are through narrow water-courses, in the monsoon often ankle deep, and in case of fire rendering escape difficult. It is a wonder that epidemic disease is not more common. 8, 9. As noted before, epidemic diseases are not common. Small doses of quinine, as a prophylactic, are unnecessary. 10. Epidemic disease at the station would be mitigated by cleanliness, a more abundant water supply, a more free circulation of air through the crowded parts of the bazaars and lines.

VIZAGAPATAM, including WALTAIR. MADRAS.

References to Subjects and Queries.	Replies.
V. INTEMPERANCE.	1. The officers commanding European troops at both stations report the men temperate, with few exceptions. The strength of the detachment 2d European Light Infantry at this time is 77, out of which number there are only three confirmed drunkards. In the European Veterans the proportion of confirmed drunkards is 10 per cent. 2. The proportion of admissions into hospital *directly* caused by intemperance in the detachment of 2d European Light Infantry and European Veterans is from *ebrietas*, 21·630; *delirium tremens*, ·729 per cent. There are no means of showing the proportion of admissions *indirectly* caused by intemperance, or the effect of intemperance on disease, mortality, and crime. Drunkenness *per se* is punished as an offence. 3. Spirits are sold at the canteen, and a worse description of liquor is sold to the men within a few yards of the barracks. That which is sold in the bazaars and about the country is not only bad, but occasionally of a most deleterious nature. No estimate can be formed of the amount consumed per man per diem. It depends not only on their inclination but their means. A dram of arrack and a pint of beer, or two drams of arrack only, daily, is purchaseable from the canteen. Government do not provide the men with spirits as part of their ration, but they are allowed to purchase it at the canteen. Spirits are not sold till midday except on the march and in the field, when those who can afford it take a dram directly they reach their camping ground; a custom that is decidedly injurious to their health, to drink spirits at so early an hour. An issue of coffee on the march is far preferable. Under the order of the medical officer, wine, beer, or spirits may be ordered for convalescents. These are all obtained from the commissariat, and are of good quality. The quantity is at the surgeon's discretion. No drinks other than intoxicating drinks, injurious to health, are sold in the canteen. Deleterious liquors are sold in the native shops. 4. The officer commanding detachment 2d European Light Infantry says that the use of spirits is not necessary, but, if restricted to the quantity a soldier is permitted to purchase in the canteen, he does not consider it is injurious. The surgeon differs altogether from this opinion, and considers it most injurious to the health. The habitual daily two drams ruin the health and habits of the soldier, who thinks that as long as he takes only what the Government allow him he cannot go wrong. The consumption of spirits, under the restrictions contained in the foregoing answer, would have no effect on the efficiency or discipline of the regiment. 5. As to restricting or abolishing the use of spirituous liquors:—The officers commanding European troops at both stations say, they would recommend a continuance of the present custom of allowing men to buy a certain quantity of spirits in the canteen, but it would be most beneficial to abolish the use of it elsewhere. The surgeon is of opinion that the sale of spirits should be altogether discontinued by Government. The men assume that Government considers two drams necessary, or they would not be allowed, and if so, what great harm in a third dram or a fourth, and so it ends in a fit of drunkenness or worse. The habit of spirit drinking which the Government system establishes is what should be avoided. 6. As regards the comparative influence on health of the use of other liquors, the officer commanding detachment 2nd European Light Infantry says, that he does not think the men would purchase wine, and that a moderate allowance of malt liquor is of advantage to the health of most men in India. 7. Coffee is sold within the barrack limits of the Europeans, and is freely purchased. Unquestionably the use of tea and coffee would be beneficial, and the health, efficiency, and discipline would be materially improved by tea and coffee being consumed in preference to spirits and malt liquor, as has been proved when neither spirits nor malt liquor could be procured. 8. It would be beneficial to suppress the sale of spirits by Government altogether, and to substitute a larger sale of beer with tea and coffee; but many of the men are so partial to spirits that, if none could be obtained in the canteen, they would wander all over the country in search of it, and pay anything for it, and they would get bad and unwholesome spirits sold to them. 9. Answered above. 10. The officer commanding the detachment 2nd European Light Infantry says, that he would recommend that the soldiers be compelled to receive the spirits purchased in the canteen diluted with water, as he believes is done in some ships with sailors, and he sees no reason why so excellent a system should not be introduced among soldiers. To this the Committee subscribe, as one step to the total abolition of spirit drinking.
VI. DIET.	1. The ration for European troops of the Indian army at the station is as follows:— Bread - - - - 1 lb. | Tea - - - - $\frac{5}{7}$ oz. Meat - - - - 1 lb. | Coffee - - - - $1\frac{3}{7}$ oz. Rice - - - - 4 oz. | Vegetables - - - 1 lb. Sugar - - - - $2\frac{1}{2}$ oz. Coffee is issued twice a week, and mutton twice. The rations are inspected previous to issue by the officer of the day. 2. A complete ration, including vegetables, but no fruit, is issued daily. The amount of stoppage is 3 annas and 4 pice. The meals are, breakfast at 8 A.M., dinner at 1 P.M., and tea at 5 P.M. Vegetables constitute about a third of the ration. 3. The officers commanding the detachment 2nd European Light Infantry says that the men would like, and he thinks that it would be beneficial, that they should have, when procurable, a larger allowance of vegetables. There is no inclination on the part of the men to sell their rations. 4. The cooking apparatus consists of common brick places for holding the boilers. Frying pans. The kitchens are kept clean, and are sufficiently lighted and well ventilated. The food is both boiled and roasted. The rations are well cooked, and tea and coffee are well prepared. In the 2nd European Light Infantry those men who have money can buy coffee before starting on march. Just before daylight the regiment is halted for a quarter of an hour, when each man receives a pan of coffee and a biscuit gratis. It is paid for by the canteen fund.

References to Subjects and Queries.	Replies.
VI. Diet—*cont.*	5. Soldiers' gardens should be under the control of the commissariat; volunteers of good character being struck off duty as gardeners with a trifling monthly pay, and the whole of the produce of the garden to be divided daily amongst the messes.
VII. Dress, Accoutrements, Duties.	1. The soldier's dress at this station consists of a red jacket or Khakee tunic, cloth or cotton drill trousers, according to the season; pouch and waistbelt. The red jacket is a very inconvenient dress for men on duty. Whilst on sentry it is not so uncomfortable. But when lying down to sleep it is hot, uncomfortable, and too much confined. The Khakee tunic might be worn at all seasons in the plains of India, with the aid of the great coat when requisite. It is most desirable that the men should always have English boots. A single morning drill, if there is much dew on the ground, will almost destroy a pair of country boots. The men wear red jackets in cold weather, with cloth trousers. Linen jackets and trousers in hot weather. If a sentry's post is exposed to sun or rain, it is protected by a pandal. A cloak would be useful in bad weather, and for warmth on the hills, and a cooler and more easy style of dress, advantageous on the plains. The present red cloth jacket is unsuited to India. The men's constitutions become debilitated by the constant drain of excessive perspiration.
Duties.	1. A soldier should complete his drill before leaving England, as recruits have drill three times a day, which is harassing to them. 2. When a soldier joins a battalion, the amount of drill is usually very small, about four mornings in the week for an hour or an hour and an half. He is usually on guard every four days, and has nothing more to do except answering his name at the usual roll-calls, and keeping his arms and accoutrements clean. The men do not suffer in health from such drills, unless kept out late in the sun. No drills, parades, or marches should continue after half-past seven. But there are no general orders on this subject. The number of nights a man has in bed per week is dependent on the station and strength of the regiment, but taking a man's usual service, he has four nights in bed and one out. 3. Guards are mounted within one hundred yards of the barracks. Guards are on duty for 24 hours. Sentries relieved every two hours. Roll-calls for Europeans take place at 5 a.m., at breakfast time, at 9 a.m. for cleaning arms and accoutrements, at dinner time, and at 5 and 8 p.m. A check roll is called during the night, but this does not disturb the men. The regimental orderly serjeant goes through the barrack rooms with the orderly serjeant of the company, and sees that the men are all in their cots. For natives there is roll-call every morning, when there is no drill, and every evening. No additional precautions are requisite.
VIII. Instruction and Recreation.	1. There is no ball court. There is a skittle-ground at Waltair. There is no school at Waltair, but there is a trained schoolmaster at Vizagapatam. There is a library at regimental head-quarters, 2nd European Light Infantry; not with the veterans. There is a garrison library, from which men at Waltair and Vizagapatam get books. There is no day room. There are no soldier's gardens; some were assigned, but they failed to keep them in order; the gardens also failed for want of water. There are no workshops, theatre, or gymnasia. If all these places were kept up, they would be ample. Workshops would be of great service, but none have ever been established. In the fort there is no place of recreation but the canteen. The want of such places is much felt by the men. There is no restriction to the men exposing themselves to sun and rain when off duty. The result to health is often very prejudicial. 2. The means of recreation enumerated above would be ample. 3. The present savings' bank system is sufficient. 4. There is no shade from trees, sheds, verandahs, nor any covered place for men to take exercise or recreation in the day.—A sad want.
IX. Military Prisons.	1. At Waltair there is only one small guard room, which is sufficient and the air free from taint, except on one occasion about Christmas, when there was an unusual number of prisoners. The cells and guard room in the fort are too close and confined, and the arrangements for a privy and cleansing very defective.
X. Field Service.	1. There are no local regulations for field service. 2. Anything with regard to the site of the camping ground, the hours of marching, the quality of the water, &c., which the medical officer considered prejudicial, he would at once report to the commanding officer, and his suggestion would be acted on without delay. 3. The sites of camps are selected by the quartermaster, who proceeds ahead of the regiment for that purpose, subject, of course, to the approval of the commanding officer and the medical officer. The walls of the tents are slightly raised all round to admit of ventilation. If the water is thought bad, it is submitted to the surgeon, who exercises a strict scrutiny in such cases, and mostly finds his advice and opinions received with proper consideration. 4. The Indian army in the field is supplied with doolies and sick-carts, the former are expensive, but a most efficient mode of conveying the sick. The sick-cart (for less severe cases) is a heavy and most uncomfortable conveyance, being without springs; it fatigues more than it aids a sick man. An ambulance on springs in which a man could lie down is much wanted.
XI. Statistics of Sickness and Mortality.	1. No information.
XII. Hospital.	1. The hospital is a private building rented for the purpose. 2. The garrison hospital at Vizagapatam is about 400 yards from the barracks, surrounded by houses on three sides, and open to the marsh on the fourth or western side, from which at times a most unpleasant effluvium arises. The wards for men are in an upper story, and being above surrounding buildings, are open to all winds. The lower wards for women and children are in every way objectionable. The hospital of the native infantry regiment is on the parade, a low spot, nearly on a level with the swamp. The building is in other respects badly placed, and shut out from a free circulation of air, by hedges and gardens on the north and west. The hospital of the European detachment at Waltair is admirably well situated in every way, no jungle or under

VIZAGAPATAM, including WALTAIR. MADRAS.

References to Subjects and Queries. | Replies.

XII. Hospitals—*cont.*

growth of any kind, and perfectly clear, and open to every breeze from the sea. It was lately a private dwelling house, but makes a very good hospital.

3. The water supply in the garrison hospital is abundant for bathing, but all drinking water and water for culinary purposes, is brought from some distance from wells in the town. The hospital and lines of the native infantry are supplied from the same source by puckallies. The hospital at Waltair is supplied with excellent drinking water from one of the best wells in the station, which is in the hospital compound.
4. As regards hospital drainage:—In the garrison hospital at Vizagapatam there is an open stone drain which carries all refuse water into the marsh. At the native infantry hospital all refuse water sinks into the soil, and is evaporated by the sun's rays. The same at Waltair. The nuisance from this is very trifling.
5. The lower rooms of the garrison hospital are very bad, nearly on a level with the marsh, ill ventilated, low, close and dark; the upper wards good and well ventilated. The native infantry hospital has no upper story, and is on a basement raised about four feet. At Waltair the same.

At the garrison hospital, roof water is carried off by an open drain to the marsh. In the native infantry hospital and the European hospital at Waltair, it sinks into the subsoil.

The surface drainage and guttering round the garrison hospital are sufficient.

The hospitals are all built of burnt brick and mud, as are the dwelling houses, with tiled roofs and verandahs, except on the west of the garrison hospital. The native infantry hospital has a 10 feet verandah all round, at the end fitted up as small rooms and a dispensary. At Waltair, a verandah to the east and south.

In the native infantry hospital the verandahs are used for the accommodation of the sick when the hospital is full. Not so in the European hospitals. Patients have free access to them at all times for exercise.

The garrison hospital has an upper story. The other two are on the basement.

The following Table gives the hospital accommodation for European and native troops on the station:—

The upper wards of the garrison hospital get all the winds going, so does the hospital at Waltair. The native infantry hospital is shut out from the sea breeze.

The windows in the garrison hospital have glass and venetians. The native infantry half glazed venetians, defective in the admission of light and air when closed.

At Waltair there are doors with Venetian blinds; glass windows are wanted.

6. All the hospitals can be perfectly ventilated at any moment by opening a sufficient number of doors and windows. No special arrangement is made for ventilation except in the native infantry hospital, where three or four portions of the roof are raised a few inches for this purpose.
7. There are no means of cooling the air admitted into the wards other than punkahs.
8. No means of warming the wards are required at the station.

The walls and ceilings are well cleansed and lime-washed on a requisition from the medical officer.

9. The privies in the European hospital are stools over tubs, carefully removed and cleansed twice a day by toties. Urinals in the same way, a plan that answers well in India, if care

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	be taken that the toties carry off the soil to a sufficient distance, and deposit it where winds cannot convey effluvium to the barracks. At the garrison hospital there is a drain from the privy, flushed with water from the well, and all carried into the marsh and removed by the tide. In the native hospital the privy is kept clean by toties. In all the hospitals bed pans and night chairs are used when necessary. 10, 11. Baths, tubs, and towels are supplied for washing and bathing in a separate room; quite sufficient. 12. Hospital linen is washed and dried by native washermen. 13. Storage is in charge of the commissariat, and generally sufficient. The department is responsible that supplies are issued in good order. 14. The cot frames are of wood laced with tape, or of iron with flat iron bars. Nothing can be better than this style of cot when the frames are of iron. It is easily kept clean and free from bugs. Flat iron instead of tape is not so comfortable as tape. The sepoys cover the iron with planks. Wooden frames are apt to be sadly infested with bugs. 15, 16. The hospital cook-room is similar to that used in all officers' quarters. A regular cook is hired, and the commissariat is responsible for the cooking. Any complaint from the medical officer is attended to. The cooking is generally good. The diets can be varied to any extent, at the will of the medical officer, all that is required being an explanatory memorandum, for the satisfaction of the superintending surgeon, who countersigns all diet rolls, and satisfies himself that the deviation from the ordinary diet is required. In native hospitals men cook their own diets, and when too ill to do so an orderly friend is detailed for the purpose. When sago, arrow-root, or barley water are necessary, they are cooked for the men, and taken as medicines, either with or without brandy and wine. Fowls are occasionally supplied where men are much emaciated and require support. 17. For nursing, a hospital serjeant or havildar is attached to each hospital, who is responsible for the order, cleanliness, &c., of the hospital. Two toties to each native hospital, or more if required, are supplied by the commissariat on indent, sanctioned by the superintending surgeon, who is the judge of the necessity. Orderlies as nurses are supplied on the requisition of the medical officer. The attendance is sufficient. 18. As regards their sanitary condition generally, the garrison hospital, and that of the native infantry, are both badly placed in every way, the garrison hospital especially, yet no epidemic disease has prevailed in either of them; neither hospital gangrene nor pyœmia. 19. The garrison hospital and the barracks for the veterans should be removed to Waltair, and the native infantry lines and hospital to some open ground near Waltair. 20. Convalescents take air and exercise on the sea beach, the best possible place for them, and when too weak to walk so far, they are carried there in a dooly. 21. Wards are set apart for the treatment of sick wives and children of European soldiers, who are attended by a nurse. All cases of confinement are thus attended in hospital, or in their private quarters, at the discretion of the medical officer. The arrangements are satisfactory. 22. There are no special local hospital regulations. 23. The medical officer has the power of representing, through his commanding officer or superintending surgeon, anything he considers objectionable in a sanitary point of view, and if practicable his suggestions are generally attended to. In regard to repairs of buildings, &c., they come under the quartermaster-general's and engineer's departments, and meet with every requisite attention. In regard to change of diet, there is a varied diet table, and additions or alterations, to meet the wants of patients, are made at the suggestion of the surgeon at once, and are afterwards sanctioned by the superintending surgeon; an arrangement which allows perfect freedom to the medical officers, while abuse of the privilege is checked by the required counter-signature, which, if withheld on sufficient grounds, would throw the extra expenditure on the medical officer. The same rule is applicable to camps and to troops on march. The commissariat are generally able to meet at once all ordinary demands. 24. The European hospitals are sufficiently large to allow of convalescents being in a separate room. There is no convalescent hospital, nor is such an establishment required. Native sick convalescents do better with their families to nurse and cook for them, attending at the hospital when ordered to do so.
XIII. Burial of the Dead.	1. The Protestant burial-ground is well placed, half way between Waltair and Vizagapatam, clear of prevailing winds. The Roman Catholics bury on the edge of the swamp. Some native burial grounds have been moved out of the town by the municipal association, particularly a Mahomedan one, at the entrance of the town from Waltair, which was often very offensive. 2. The Protestant burial-ground is walled in, and about 100 square yards in area. Soil dry and sandy. It is well and cleanly kept. 3. There is sufficient space for the dead, and no crowding. The ground is nearly full, and more will be enclosed. Graves are about five feet deep, and no necessity for re-opening them. Persons dying after 9 A.M. are generally buried the next morning at sunrise. If earlier than that, the same evening in hot weather. So again, those that die after sunset are buried the following morning. Interference is not usual with native arrangements on these subjects, unless they become in any way offensive or a nuisance, when of course proper measures are taken. 4. The graveyard is not offensive. 5. The dead of the camp followers or bazaar people are disposed of according to caste. The higher orders of Hindoos burn their dead, the lower orders and Mahomedans bury. 6, 7. No injury accrues to health from the present practice, and there are no suggestions to make on the subject.

I. TOPOGRAPHY.	1. The surrounding country is high and barren in the immediate vicinity of three sides; low and cultivated on the south side. It is sandy and dry, and surrounded by hills. There is jungle on the southern side near the river, which is a quarter of a mile from the station. Several large tanks are in the neighbourhood. 2. The elevation of the station above the sea is 550 feet, and the adjacent country about 30 feet above water level. The nearest water is about 15 feet distant. There is higher and healthier ground within a mile, from 50 to 100 feet above the station, very open and uncultivated, but well adapted for a military camp and exercise ground. 3. The nearest table land is at Palamanair, 50 miles off, and about 1,000 feet higher than this station. 4. The Pallar river, which is distant about a quarter of a mile, is dry three parts of the year. There is no overflow of water in the vicinity. Within 400 yards of the station there is broken ground, converted into a tank in the monsoon, producing rank vegetation and fogs, indicative of malaria. 5. The station is open and exposed to winds, but not encumbered with buildings or higher ground, so as to interfere with ventilation. The temperature of it is only raised by the reflection from the sandy soil. On the land side, the station is exposed to cold and variable winds, and it is beneficially affected by the sea breeze. 6. The surrounding country beyond the immediate neighbourhood is cultivated. There are works of irrigation within a mile, but their action does not affect health. No rice or indigo is cultivated within the limits of the station, nor is the preparation of hemp or flax carried on near it. 7. The village of Ranypett is within 100 yards of the barracks, and the large town of Wallajahnugger distant two miles. 8. The district is slightly elevated above the valley of the Pallar river, surrounded by hills of granite, the surface sandy, and the subsoil chalk and clay. The ground does not appear to have been previously occupied. 9. The depth below the surface at which water is usually found is from 25 to 30 feet in both the dry and wet seasons. 10. The rain flows readily away and is soon absorbed from the surface. There is higher ground about the centre of the cantonment than the surrounding parts, immediately in the line of drainage towards the river, so that the rain never lodges in any considerable quantity at any spot. 11. The water supply is derived from wells. There is a tank within half a mile covering five or six acres. It is generally full. There is no microscope at the station, therefore the nature of the plants and animals in the water cannot be ascertained. No tank is used for drinking purposes. The wells containing drinking water are kept clean. One tank probably produces malaria, and is a nuisance; the best means of prevention would be to keep water in the tank constantly. 12. The wells are sufficient for the present water supply. The water is clear, wholesome, and without smell. Its quality is good and not injurious to health. The quantity sometimes runs short in the hot season. It is raised by leather buckets, and distributed by water carriers. There are no means of better supply. 13. It would be a great improvement if the station was on the neighbouring high ground. 14. New stations are selected by experienced officers in the service, military and medical.
II. CLIMATE.	1, 2. There are no means or instruments for registering meteorological observations. No register has consequently been hitherto kept. 3. The climate is generally a dry heat. In the monsoon and cold weather is subject to fogs on the lower ground, which extend on to the irrigated land. It is not affected by tree-planting, &c. In the hot weather occasional dust storms take place. The troops are generally healthy; no alteration in the usual diet, shelter, or clothing required. Drills, &c., in the open air should not be later than 7 a.m. or before 5½ p.m. The hot weather and the cold weather are the most healthy, immediately before and after the monsoon unhealthy. No disease has prevailed endemically or epidemically during the last 12 months. 4. There is no more healthy district nearer the station than Palamanair, 50 miles off, at a higher elevation of 1,500 feet. It is at all times considerably cooler, and has ample natural drainage. Water is procurable by wells. If thoroughly cleared of jungle, a very eligible site for a station might be obtained. 5. Have served at Secunderabad, where dysentery prevailed, Bellary, Bangalore, Arcot, Fort St. George, Burmah, Oude, Lower Bengal. Of these Bangalore was the most healthy, the remaining stations in India about equal, and Burmah unhealthy.
III. SANITARY CONDITION OF STATION.	1, 2, 3. No replies. 4. Total number of rooms or huts.—Eight. Total regulation number of non-commissioned officers and men.—360 non-commissioned rank and file (Europeans).

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	5. The windows are on opposite sides of the rooms and open inwards. There are verandahs on both sides of the barracks running the length of the whole building, their width is 9 feet 6 inches. The serjeants' rooms are in the verandahs, with this exception they are open and not used as sleeping quarters. There are no jalousies or jhilmils. 6. Wooden cots, iron cots, and patent iron cots covered with canvass, and bedding, blankets, cotton quilts, carpets, and sheets are used. 7. For European soldiers double-poled tents are used in camp, made of canvass, cotton ropes, lined with blue cloth, with double roof, length 14 feet, breadth 14 feet, height 10 feet in the centre, cubic space 78$\frac{2}{5}$ feet per man. Superficial area per man 7 feet $\frac{21}{25}$ths, and 25 men to each tent. 8. There are upper ventilators above the windows in the barracks. The tents have windows and doors. The guard room, one door, two windows, and upper ventilator. The ventilation is sufficient to keep the air pure by night and day. Punkahs suspended from the roof are used for cooling the air of barrack rooms. The cost is about 12 rupees each. The punkah consists generally of a long board suspended horizontally from the roof, within about 7 feet from the ground, having a fringe attached to its lower end. It is pulled by means of ropes from side to side, and so circulates the air. Also by kus-kus mats, which are placed in the doorways and windows, and kept wet, which causes the hot air to become quite cool. 9, 10, 11. The walls of the barracks are built of brick in chunam, and partly clay. Pantile roof, floor of square brick, granite stone. and chunam. The tents are made of canvass, ropes, and bamboos. The floors are not raised from the ground. The materials are good and suitable. The barracks and cantonments are kept in repair by the public works department, when called for by the commanding officer, who is responsible for the sanitary state of the cantonment. The walls and ceilings are cleansed and limewashed when deemed necessary by the commanding officer. 12. There are no baths or lavatories, but the men use tubs filled by water carriers. 13. Ordinary cooking utensils are provided by the commissariat, consisting of iron frying-pans and coppers. The washing is entirely undertaken by native washermen, who receive a shilling a month from each soldier for doing it. 14. Privies are emptied and cleaned by totties, a class of natives whose occupation is of this character. 15. These buildings are ventilated in the roof and lighted by common lamps. The barracks are lighted at night with globe lamps from the roof. 16. There are no sewers. There is a long drain the whole length of the barracks, which carries off the surface drainage below them. The drainage is sufficient for the surface water, but not for the cook-houses, &c. No part of any of the buildings is damp. The fluid refuse partly sinks into the subsoil, and partly is taken away by hand. The cesspits for privies are about 6 feet square. They are not near any tank or well, and are cleaned daily. They are distant about 50 yards from the barracks and 30 from the hospital. There are no foul ditches. 17. Convicts are constantly employed for surface cleansing, which is efficiently done. The refuse, &c., is carried away to a distance and buried. 18. The surface of the cantonment is kept free of vegetation, and nothing interferes with the ventilation of the station. 19. The drainage of the bazaar is sufficient. Ventilation, cleanliness, and crowding, much the same as in others. The water supply is good. There are no latrines. Convicts were formerly employed for cleansing the bazaar. It is now under the civil authority. The native houses are good. Dungheaps are not exposed. No nuisance is experienced in barracks from wind blowing over the native dwellings. 20. Animals are slaughtered about half a mile distant from the station. There are no regulations in force regarding slaughtering places. The offal is carried away daily. No nuisance is experienced. 21. There are no bazaar horses. 22. Cavalry horses are picketed in regular lines fully half a mile from the barracks. There is no cavalry at this station at present. 23. The married people occupy a separate barrack. The rooms are divided by curtains.
Officers' Quarters.	There are no officers' quarters.
V. Health of the Troops.	1. The station, district, and native population are healthy. 2. The ordinary diseases that natives are subject to prevail here; but not to any great extent that I am aware of. Epidemic cholera sometimes breaks out, but not above the average of other districts. 3. The following are the circumstances which bear on the health of the neighbouring population:—Ranypett is situated on the north bank of the Pallar river, and surrounded on three sides by paddy fields, jungle, and low swampy ground, to which might be attributed any epidemic in an unhealthy season; whereas Wallajahnugger, situated on the north side of the cantonment, and on considerably higher ground, is less subject to epidemic influences. 4. The troops at this station are composed of men of the three Madras European regiments, being recruits from England, time-expired men, and invalids, none of whom remain permanently. No statement of their previous state of health is forwarded from their respective regiments. Their general health is good. The barracks occupied are two separate buildings, the lower of which is considered less healthy than the upper, on account of its low situation and some defect in drainage. 5. The troops are not camped out unless cholera prevails. 6 to 13. No knowledge of hill stations, but it is my opinion that they should be selected for the location of troops. 14. Either location on the hill stations, with short periods of service on the plains, or service on the plains with short changes to the hill stations, would be preferable to the present arrangements; but the former would be more beneficial to the troops. Frequent change of station would be beneficial, especially for convalescents. 15. No experience of barrack and hospital accommodation provided at hill stations.

MADRAS.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	16. An elevation of between 2,000 and 3,000 feet above the level of the sea appears from experience to afford sufficient immunity from the most virulent forms of tropical fever, and other diseases incident to tropical climates. 17. A table land of some extent exists within 50 miles of this station at Palamanair, which is considered an eligible location for troops. It is easy of access by road, has an elevation of more than 1,500 feet, with a mild bracing climate agreeable to European constitution. 18. No particular class of surface or subsoil affects the health of the station, which has other objections than soil to make it unhealthy; but any subsoil, whether clay or chalk, if not sufficiently porous to allow the rains to percolate, should be considered as objectionable. 19. The best age for soldiers proceeding to India is from 18 to 20 years. They should arrive in India the month after the monsoon. On arrival from England, troops have the usual barrack accommodation, are clothed according to season, and go through the usual course of instruction drill till they proceed to join their regiments. Suitable clothing, and particularly covering for the head, which would afford protection from the sun, and restriction to quarters during the heat of the day, would preserve the health of recruits. Precaution should be taken to prevent the men from eating country fruits and vegetables in excess. 20. Troops should be sent direct to India, but to the hills immediately on landing. 21. The mode of transport for troops is by railway and bullock coaches, where roads will permit it, otherwise by marches, with tents, that are carried by the commissariat. No additional precautions for the preservation of health are required. 22. The number of years British soldiers should serve in India is ten; but if they have retained their health, there is no objection to their serving for a pension. 23. Conflicting opinions need not arise as to invaliding. 24. Invalids should leave India so as to arrive in England in spring, or early summer.
Diseases.	1. Inspections for the discovery of diseases are made weekly. 2. There has been no scorbutus among the troops. 3. The proportion of cases of hepatic disease, on the total number for the last two years, was 2·85. It generally arises as a primary disease, and more particularly in those of intemperate habits. 4. Dracunculus is almost unknown at this station, even amongst the natives. 5. The proportion of the constantly sick from venereal disease is 19 per cent. for the last two years. In all stations where Europeans are quartered, it would be advantageous to have lock hospitals, and periodical inspections of houses suspected to be brothels. 6. The following is a Table of sufferers from epidemic and endemic diseases :—

Year.	Diseases.	Per-centage of Admissions on Total Admissions.	Per-centage of Deaths on Total Deaths.	Year.	Per-centage of Admissions on Total Admissions.	Per-centage of Deaths on Total Deaths.
1857–58	Fevers	6·5	—	1858–59	11·07	—
	Dysentery	6·5	50·0		5·2	·8
	Cholera	—	—		10·2	84·0
	Small-pox	—	—		—	—
	Rheumatism	1·8	—		5·8	—

1857–58. Total admissions - 107
„ deaths - - 2
1858–59. „ admissions - 343
„ deaths - - 25
Average strength per month for the last two years - - 118

7. Fevers of a typhoid character have lately appeared; but not to any extent amongst the Europeans. Not a single case of dysentery has originated in the station since my arrival a year ago. Diseases are most prevalent after the rains; they are not attributable to climatic or atmospheric conditions. These remarks refer to the Europeans; no data for natives living in the town. There is nothing in the personal habits of the troops or native population predisposing to these diseases.
8. The outbreak of epidemic cholera in the beginning of last year was attributed to the drainage at the barracks being imperfect. The duties of the men are light, and do not predispose to cholera.
9. Quinine has not been tried as a prophylactic against malarial diseases.
10. The disuse of the lower barracks, or the removal of the troops to higher ground, would prevent disease.

INTEMPERANCE.

1. The soldiers are temperate, there are no confirmed drunkards.
2. The admissions into hospital from the 1st April 1859 to 4th March 1860, were 229; of these there were, delirium tremens, 2; ebrietas, 2. The remainder all marked as temperate. Drunkenness is always punished as an offence.
3. Spirits are sold at the regimental canteen under regulations. Arrack of the best quality is supplied by the commissariat. Each man is allowed two drams per diem. Spirit is not allowed as a ration under any circumstances at the station. No liquor is issued till 1 p.m. It is never given as a ration to convalescents. No other than intoxicating drinks is sold at the canteen.
4. The consumption of spirits is injurious, except when malt liquor is not procurable. It is not conducive to the efficiency or discipline of the corps, except when taken with great moderation.
5. If malt liquor could be supplied it would be beneficial to abolish spirits. Beer and porter are conducive to health, and wines in moderation are not injurious.
7. Tea and coffee are much used. Malt liquor, at proper times and in moderation, is beneficial in addition to tea and coffee.
8–10. It would be beneficial to the health of the troops to suppress the spirit ration and substitute beer, and to prohibit the sale of spirituous liquors in the canteens. Such a supply of malt liquor should be in store that the canteens could never be without it.

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	11. Extract from canteen regulations :— The maximum issue to any one man in one day is as follows :— Spirits, 2 drams, but no wine or malt liquor ; or Spirits, 1 dram, with 1 quart malt liquor, or two drams of wine ; Wine, 4 drams, but no spirits or malt liquor. Recruits at drill are not allowed to receive daily more than 1 dram of spirits or 2 drams of wine, or 1 quart of malt liquor. Vendors of arrack in the bazaar are prohibited from selling it, or any spirits, to European soldiers. The canteen regulations are strictly enforced.
VI. Diet.	1. The rations for Queen's British troops and European troops of the Indian army are the same, and consist of, per diem per man,— 1 lb. of bread. 1 lb. of beef or mutton. $\frac{5}{7}$ oz. tea, or $1\frac{3}{7}$ oz. coffee. $2\frac{1}{2}$ oz. sugar. 4 oz. rice. 1 oz. salt. 1 lb. vegetables (when procurable) ; and 3 lbs. firewood. There are no periodical changes. There is a responsible inspection of the ration by the regimental orderly officer of the day and quartermaster. 2. No fruit is supplied, nor is any stoppage made. Soldiers have three meals a day, viz., breakfast, at 8 a.m., half rations ; dinner, at 1 p.m., half rations ; tea, at 5 p.m. The proportion of vegetables is 12 oz. potatoes and 4 oz. of onions. 3. No improvement is suggested in the ration. The rations are handed over to orderly corporals of companies, who are responsible for them. 4. The cooking apparatus consists of iron frying-pans, copper boilers with covers, containing twelve and nine gallons, supplied by the commissariat. The kitchens are clean, light, well ventilated, and sufficiently supplied with water. The food is both boiled and roasted. The cooking is properly done, and sufficiently varied. The men have tea and coffee before a march. 5. Soldiers' gardens, for the cultivation of vegetables, could be advantageously established, if ground and seeds were provided ; it would be a recreation for the men to keep up the garden.
VII. Dress, Accoutrements, and Duties.	1. The dress is as follows :— *Review Order.* Tunic and shako. Enfield rifle and bayonet. 1 cross-belt and pouch (40 rounds). 1 waist-belt and pouch (20 rounds). 1 cap-pouch in tunic (70 caps). *Undress.* Shell jacket, or Khakee tunic. Woollen or khakee trousers, according to season. A sun-proof helmet in hot weather, with khakee clothing. Forage cap, when cloth jacket is used. The present dress is suitable. The boots should be always of English manufacture. The guard dress is either khakee or cloth, according to season. The European sentries are never exposed to the sun. Night sentries have sentry-boxes to stand in when it rains.
Duties.	1. It would be advisable that the men be thoroughly drilled at home. 2. The routine of soldiers' duties is,—parade in the morning after sunrise, answering roll-calls, or guard duty. Recruits have drill for an hour after sunrise, one hour before sunset, and an hour in the forenoon, inside the barracks, under cover. The health of the men does not appear to suffer from drill. The best hours for drill are at sunrise or early dawn, and an hour before sunset. The average number of nights men have in bed is four during the week. 3. Guards are mounted at the gates of the barracks. The men are on duty 24 hours. There are roll-calls by day at réveille, when there is no parade ; at breakfast, dinner, 4 p.m., retreat, and tattoo. Well-behaved men excused roll-calls at retreat ; check roll-calls by day and night when necessary. If the men have a proper proportion of nights in, guard duty does them no harm.
VIII. Instruction and Recreation.	1. The following are the means of recreation :—There is no ball court, but there is a skittle-ground. There is a school with one master. There is no separate library, but plenty of books, which can be read till 8 p.m., when all lights are put out. There are day rooms. There are no soldiers' gardens, workshops, theatre, or gymnasia. The men are sufficiently occupied during the wet season and the heat of the day. The men are restricted to barracks from 9 a.m. to 5 p.m., and the result is beneficial to their health. 2. A fives court and garden would be a great addition to their recreation. 3. A savings' bank is established with very great advantage. 4. There is not sufficient shade in the regular barracks at this station, but there is in the barrack occupied by the European infantry depôt, which is the hospital of the European corps when quartered in the barracks.
IX. Military Prisons.	1. There are no military prisons at this station.
X. Field Service.	1. There are no local regulations for field medical service. 2. Should the camp be proposed to be pitched on ground that the surgeon considers unhealthy it is shifted to other ground. 3. The surgeon should be consulted as to the locality of camping ground before it is fixed on, and unless any military reason should exist to the contrary, his opinion should be acted on. 4. Doolies and sick carts are used for the transport of sick.
XI. Statistics of Sickness and Mortality.	1. No replies.
XII. Hospitals.	1. No sketch. 2. The hospital is 100 yards from the nearest building and half a mile from the horse lines. It is a quarter of a mile from the bazaar, and not crowded by houses. The site is open, freely ventilated, and healthy as to elevation, drainage, absence from malaria, &c. 3. The water supply is abundant and wholesome. 4. The means of removing refuse water and impurities is by hand carriage to a distance of 30 yards from the hospital. 5. There is no perflation of air underneath the wards of the hospital. The roof water is carried away by ordinary channels. Drains are cut in all directions to carry off rain, which answer the purpose. The hospital is built of brick and chunam, with tiled roof, not double.

ARCOT. MADRAS.

References to Subjects and Queries.	REPLIES.
XII. Hospitals—*con.*	The hospital is cool. It is supplied with verandahs 9 feet 6 inches broad, and they afford sufficient shelter from the sun's rays. The verandahs are never used for the accommodation of the sick or convalescent. The building consists of one flat. The following table gives the accommodation :— Total number of wards.—Two in European hospital, and two in native hospital. Total regulation number of beds.—According to the number of patients.

Wards or Hospital Huts, No.	Regulation Number of Sick in each Ward or Hut.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
								Ft. in.			
European Hospital, but at present used as a barrack for the European Infantry Depôt, 6 rooms.	In two wards each 34.	Of two wards each 49½ ft.	Of two wards each 40 ft.	Of two wards each 17 ft.	Of two wards each 67,320.	1,000	Of two wards each $35\frac{5}{17}$ ft.	1 8	Of two wards each 14.	Of 2 wards each 6ft. 4in.	Of two wards each 4ft. 6 in.
	In 4 wards 5 each.	Of 4 wards each 35 ft.	Of 4 wards each 14½ ft.	Of 4 wards each 10 ft.	Of 4 wards each 2,300.	1,000	Of 4 wards each $105\frac{2}{5}$ ft.	1 8	Of 4 wards 13 windows.	Of 4 wards 6ft. 4in.	Of 4 wards 4ft. 6in.
Arcot Hospital, now used for Europeans and natives, formerly the Native Hospital, 2 rooms.	25 Europeans or 30 natives.	Each 44 ft.	Each 39 ft.	Each 14½ ft.	24,882	1,000 for Europeans.	$64\frac{6}{25}$ ft.	1 8	20	4f . 4in.	3ft. 9in.

The hospital is so placed as to receive the full benefit of the prevailing winds. The windows open inside, and are well adapted for ventilation and coolness.

6. The wards are perfectly ventilated by windows and ventilators in the upper part of the wall. There are no jalousies or jhilmils.
7. Punkahs and kus-kus mats, which are watered during the hot winds, keep the air admitted to the wards perfectly cool.
8. Means of warming are not required. The ceilings and walls are cleansed and limewashed when considered necessary.
9. The privies are 30 yards distant, but connected by a covered passage. They are built of brick and chunam, and the roofs tiled. They are cleaned by hand, and are not offensive.
10, 11. Earthen bowls are provided for the sick to wash in, &c. The means of bathing for the sick are not sufficient.
12. Native washermen undertake the whole of the washing and drying of the hospital linen.
13. The storage is sufficient and dry.
14. Bedding is supplied by the commissariat, and consists of painted iron or wooden cot, with tape, a palliasse when marching in the field, two quilts of gingham, both lined and one quilted with cotton, one blanket, and two pillows.
15. The kitchen is sufficient for all practical purposes, and the cooking is properly performed.
16. Copies of diet table, diet rolls, &c. will be provided by the head of the medical department.
17. With reference to attendance on the sick, any patient can have a separate orderly on the requisition of the surgeon.
18, 19. The sanitary condition of the hospital is good; hospital gangrene or pyæmia have not appeared.
20. Sick carts provided by the commissariat, in which convalescents take the air morning and evening, is the only provision for their exercise.
21. Soldiers' wives are treated at their own quarters, there being no accommodation in the hospitals. The present arrangements are satisfactory, the families being so limited in number.
22. There are no special hospital regulations enforced at the station.
23. The medical officer has full powers in matters appertaining to the sanitary state of the hospital, &c., and recommends any alteration that he considers necessary.
24. There are no convalescent wards, nor would such accommodation be of advantage.

XIII. BURIAL OF THE DEAD.

1. The burial-ground is about 600 yards off from the station. It is not to windward.
2. Its length is 144 yards, breadth 98 yards; the height of the walls is 7 feet. The subsoil is clay, well drained; decomposition takes place readily, and the ground is carefully kept.
3. The regulations as to burial are:—Three feet interval, and the grave space 7 feet by 3, the depth is 6 feet. Graves are never re-opened. Interment is compulsory at ordinary times 12 hours after death, and during epidemics immediately after. There is no burial-ground for native troops at this station.
4. The grave-yard is never offensive. British troops are buried according to regulation.
5. The dead of camp followers and bazzar people are removed by men of their own caste.
6, 7. No injury to public health accrues from the present practice, and no improvement in the way of regulation or otherwise can be suggested.

(Signed) THOMAS RAIKES, Major,
Commanding Arcot.
H. L. PRENDERGAST, Captain Engineers.
RICHARD ARNOLD, Assistant Surgeon,
In Medical charge, Arcot.

(No date).

MASULIPATAM.

Accommodation — Queen's Troops Infantry: 28 convalescent rank and file of Her Majesty's 1st Royals and 18th Royal Irish. There is accommodation for 220.
Native Troops Infantry. 800 rank and file of the 12th Regiment Madras Native Infantry.

References to Subjects and Queries.	Replies.
I. Topography.	1. The surrounding country is flat, sandy, and unpicturesque. To the south-east of the station lies a large tract of land, which was formerly covered by the tide at high-water, but has been reclaimed within the last 20 years by means of dykes, and is now nearly dry during the whole year. To the west lies the Sultanagram swamp, from 500 to 1,000 yards in width, full of fresh water (the drainage of the surrounding land) to a depth of from 2 to 3 feet during the monsoon season, and dry in the hot months. There is a good deal of wood, principally palmyra and date palm, but no jungle in the vicinity. Good drinking water is only to be had at particular wells, but brackish water is generally abundant. 2. The station is from 4½ to 8 feet above ordinary high-water; some parts of the station being higher than others. It is on the same level as the country to the north and south, and below all the land to the west; its elevation above the nearest water is 4½ feet. There is no higher or healthier ground adjoining the station. 3. The nearest high land is the Condapillay hills, about 55 miles off at an elevation of about 900 to 1,000 feet about the level of the station. 4. The navigable and irrigable canal between Masulipatam and Bezoarah will pass within three miles of the cantonment. The sea is about four miles distant. During the monsoon the station is closely surrounded by marshes, which speedily evaporate in the hot weather. The vicinity is liable to overflow from the river Kistnah at the time of extraordinary freshes, as in August 1853, but the overflow lasts only a few days. At the time of great hurricanes at sea the tide has been known to come up as far as the station. There are several small water pits, at a low level, about the station; they are not considered to produce any injurious effect. 5. The station is open and freely exposed to winds; it is surrounded by hedges and gardens, but by no higher ground. There is no reflected sun heat from buildings, but in the hot weather there is a great deal from the sandy soil. The station is exposed to the influence of hot land winds, which, beyond a debilitating influence on the system, exert no other injurious effect; the sea breeze, on the contrary, is very refreshing and invigorating. 6. The neighbourhood of the station is only cultivated now in small patches, but all the land will be brought under cultivation as the Kistnah anicut channels reach it. The irrigating channels from the Kistnah anicut will pass close to the station. Artificial irrigation has not yet been brought near here, but experience tends to show that it does not, as a general rule, act injuriously upon health. The cultivation of rice is not prohibited, there are small patches of it grown near the station. Indigo is not cultivated, nor is the preparation of hemp or flax carried on near it. 7. The adjacent native town of Masulipatam probably contains between 50,000 and 60,000 inhabitants. 8. The district consists principally of the delta which has been formed by the river Kistnah, the surface and subsoil in the greater part of it are of black cotton soil. Sand is occasionally found at depths varying from a few feet to several yards. The cantonment and native infantry lines occupy new ground at some distance from the old native town. There are no mineral productions in the district. The following is a short account of the past and present history of the station of Masulipatam; for, as most of the questions refer exclusively to European troops, without it the replies to many of them will not appear explicit. When Masulipatam was first occupied by the British, both the European and native troops were located in the fort. In progress of time the civil servants and staff officers of the garrison built houses in an open sandy plain on the north-east side of the Pettah, or native town; after a season or two, a regiment of native infantry was cantoned in prolongation of these houses; and the usual place of arms, hospital and hutting lines, erected for them. These buildings now form the present station of Masulipatam. The houses alluded to are occupied indiscriminately by civil servants, missionaries, and European officers of the native regiment. No portion of the ground was ever defined as a military station, nor is any portion under military control, save the place of arms and sepoy hutting lines. The fort was exclusively under military control; it was garrisoned by a regiment of Europeans, and one of native infantry, but both were withdrawn years ago, leaving, as before stated, one regiment of native infantry only in the lines on the east side of the native town, and at 3½ miles from the fort. Since the withdrawal of the European regiment, the European barracks and hospital in the fort have been simply kept in repair, and have been occupied for short spaces of time by parties of European soldiers, embarking and disembarking at this place on their way to and from the large cantonment of Secunderabad, and other stations in the Dekkan. Convalescent men are also sent here from those stations for change of air, and occupy the fort barracks and hospital. But by late orders of the Madras Government, Coconadah, a place 115 miles north of Masulipatam, is being made a port of embarkation and disembarkation; the whole of the stores are to be returned, and all public buildings in the fort, including barrack and hospital made over for civil purposes. There is now only in the fort a party of 28 convalescent soldiers, and at the station the 12th Madras Native Infantry, 800 strong. When the above arrangement is completed, convalescents will no longer be sent here; the Native Infantry regiment, it is thought, will remain. 9. Water is found during the dry season from one to three yards below the surface, and from 1 to 2 feet during the rainy season. 10. The rain fall and surface water does not flow readily away for want of proper drainage channels into the natural outlets for it, which are the swamps to the north-west and south-east of the station. A small per-centage is drained off by two little channels, and a good deal sinks into the soil, but the rest lies on the surface in large shallow pools until evaporated.

MASULIPATAM. MADRAS.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	It is principally by the latter means that the rain water is disposed of. There is no drainage from higher ground passing into the sub-soil of the station, it being separated from it by swamps. 11. The water supply is derived at present from wells, but it is proposed to bring the annicut water into the station by channels or pipes, when the canal reaches this place. The water is not stored in open tanks. There are a number of pits about the station, principally made use of by washermen, in which the rain-water lies until evaporated. Four or five of these when full are made use of both for drinking and washing purposes. These remarks do not apply to sepoys, who procure their water from wells in the immediate neighbourhood of the lines; the water is of good quality. The tanks contain neither plants nor animals. When the tanks are full they are used by the natives both for drinking and bathing purposes; drinking water for the Europeans and sepoys is drawn from wells. No care is taken with the water pits or tanks, and they, probably, receive a great deal of foul matter; the wells are not, however, liable to pollution. No nuisance or malaria proceeds from any tanks within or without the station. 12. There is frequently a scarcity of good drinking water in the hot weather, owing to the wells drying up. In general it is clear. Some wells are brackish, but the others have a good taste and smell. In consequence of the want of scientific instruments, its microscopic character and chemical composition cannot be ascertained, but the water in the drinking wells is of very good quality and soft, and not in any way injurious to health. It is raised by buckets and rope, and distributed to the troops by the established water carriers. A very much better supply may easily be provided by pipes, or channels, as soon as the canal now in course of construction reaches the station. 13. With regard to any other topographical points bearing on the health of the troops not included in the above, the short period that has elapsed since the arrival of the regiment at this station, and our consequent imperfect knowledge of it precludes the answering of this query. 14. New stations are selected by the quartermaster general's department, assisted by the medical staff. The only suggestion to offer would be that some deference be always shown to the opinion of those who have been long resident in the locality where it is proposed to form the new station.
II. CLIMATE.	1, 2. There are no means for conducting and registering meteorological observations. The 12th Regiment Native Infantry have been here only three months, and native regiments are never supplied with scientific instruments for those purposes. We are consequently unable to prepare the meteorological table required. 3. The climate has the character of being salubrious. It is dry during the hot season, and the damp, during the monsoon, is not of a penetrating character. The heat is great at times during the hot land winds in April, May, and the early part of June. It is not subject to any great variation of temperature, but the early mornings in the month of February are distinguished by dense fogs, which are dispersed by the sun at about 8 o'clock. There is no tree planting or irrigation in the immediate neighbourhood. During the dry weather the station is subject to severe dust storms, which sweep across the swamp in heavy clouds, so as at times to obscure the atmosphere. The dust consists of impalpable powder, but is not injurious to health. The climate is healthy, and the troops enjoy an immunity from disease particularly of the epidemic class; in fact, its character stands so high that convalescents are sent here for the recovery of their health from the European regiments in the Dekkan. Drill ceases during the hot months. No precautions are required during the cold season. The most unhealthy months of the year are those during the change of the seasons, when ephemeral and slight intermittent fevers prevail. The station, like all others in India, is subject to periodical visitations of cholera and small-pox, but the particular season of their appearance is quite uncertain. 4. The station of Masulipatam is particularly healthy. Lieutenant Beatty, of the Engineers, after an experience of it for nearly five years, states, in a communication, "I do not think that a more healthy place could be found within a very considerable distance." 5. The medical officer (Surgeon Horak, M.D.) has served at the following stations:— 1. Neilgherry Hills, Ootacamund, Kotagherry, and Coonoor; 2. Bangalore; 3. Madras; 4. St. Thomas' Mount; 5. Palaveram; 6. Masulipatam; 7. Quilon; 8. Mangalore; 9. Burmah and China. The stations are classified according to the degrees of salubrity assigned to them by experience. The three stations on the Neilgherries possess a very fine healthy climate, and are used as sanitaria. Bangalore also enjoys the reputation of having a very healthy and comparatively bracing climate, and certainly ranks next to the hills in point of salubrity. The next four stations on the eastern or Coromandel coast are what is termed dry climates, in contradistinction to the moist damp climates of the western coast, to which category Quilon, Mangalore, and Burmah belong. About treble the quantity of rain falls on the western compared to the eastern coast. During the monsoon the rain pours down heavily, and almost incessantly, until the atmosphere becomes so thoroughly charged with moisture that it penetrates and pervades everything, and a sensation akin to a vapour bath is experienced, which exerts a very enervating and exhausting influence on the system. During the cool season the cold is not sufficiently great to produce any bracing or renovating effects, or in any way to repair the exhaustion and debility previously induced by the monsoon, hence after a longer or shorter period of residence, three years being about the average in this description of climate, great prostration of strength and lassitude supervenes, rendering change of climate necessary for their removal. Owing to the dry climate of the eastern coast, on the other hand, the process of exhaustion and prostration of the system proceeds at slower and more tardy pace, and by the adoption of proper prophylactic measures may not be experienced for 10 or 15 years. With the exception of this difference in the character and influence of the two climates on the constitution, I believe them both to be conducive to health. The only climate I have found positively injurious to health has been China, the troops there suffered from the following diseases:—Cholera, yellow, remittent, and intermittent fevers, liver and bowel complaints. On the conclusion of the peace of Nankin the left wing of my regiment, the 41st Madras Native Infantry, was stationed with the headquarters of the 18th Royal Irish, in the island of Koulangsoo, opposite Amoy. The island is about six miles in circumference, composed principally of large blocks of granite, and paddy fields in the declivities, and is divided into two almost equal parts by a range of

References to Subjects and Queries.	Replies.
II. Climate—*cont.*	lofty hills, which traverse its centre. One side, where the ground was high and dry, almost free from artificial irrigation and freely exposed to the influence of the sea breeze, was occupied by the head-quarters 18th Royal Irish, on the other side surrounded by rice fields occupying low ground, and entirely shut out from the sea breeze the left wing 41st Regiment were stationed. The Royal Irish lost a very large number, both of officers and men, from cholera and yellow fever, while not a single case occurred on the 41st side of the island. The poison was generated on the island of Amoy, and wafted across to Koulangsoo, sweeping freely over that part occupied by the 18th. Our immunity from both diseases evidently arose from the intervening range of hills which protected us from malarious influences. Major Allan has served at the following stations:—1. Bangalore; 2. Thyet Myo; 3. Secunderabad; 4. Rangoon; 5. Coimbatore; 6. Vizianagram; 7. Bellary; 8. Masulipatam; 9. Trichinopoly; 10. Ellore; 11. Sawunt Warree; 12. Prome; 13. Goomsoor. The stations are placed in the order in which they are supposed to be relatively healthy, but it is thought that the only sure guide to test the comparative salubrity of cantonments would be medical returns, through a long number of years, showing not only deaths but invalidings also. Perceptions are often deceptive, thus Secunderabad, a temperate climate when compared with Trichinopoly, used not to be a healthier station for the European soldier than the latter, though the heat at Trichinopoly is continuous. On the other hand, it has to be ascertained whether a regiment which loses more men from acute disease in a cooler climate is not often more efficient than one in a hotter place where the deaths are fewer, but where the men are debilitated from constant heat. It cannot be asserted that any one of the stations above recorded is conducive to health, but it can be affirmed that Goomsoor and Prome were positively injurious. They are not now stations.
III. Sanitary Condition of Station.	1, 2, 3. Plans of the station, district, and barracks are transmitted. 4. Table of barrack accommodation. Total number of rooms, 20. Total regulation number of commissioned officers and men, 220.

Barrack Rooms.	Regulation Number of Men in each Room.	Dimensions of Rooms.				Cubic Feet per Man.	Superficial Area in Feet per Man in Floor Space.	Height of Men's Beds above the Floor.	Windows.

For Natives, 2 - -	1	8 3	7 6	15 0	928·1	928·1	61 10	In use with the Native Regiment.			

5. The windows of the barracks are on opposite sides, and open inwards. There is an open terrace verandah on one side to the west, the whole length of each range 13 feet 8 inches in breadth, but it is not occupied as sleeping quarters by soldiers or other persons. There are no jalousies or jhilmils.

6. The old bedsteads consist of two tressels with three planks. A light description of iron cot is also used in the barracks, &c. The latter is the best as it does not harbour vermin. The European soldier has one blanket, one quilt, two sheets, one cotton carpet, and two pillows. The sepoy has a cot provided him when in hospital but no bed clothes.

7. There are two descriptions of tents in common use in the Madras army; the European tent and the native tent. The European tent is a rectangular parallelogram on two poles, having doors opposite, and provided with shell and fly. The walls, stiffened by poles inserted at intervals in the cloth, are fastened by cord loops to the shell. Cubic space per man 3,800 feet, and superficial area per man 12·6 feet. The number of men in each tent is 25. The native tent is an oblong pent in one entire piece on two poles, with one doorway in front. Cubic space 879·29 feet. Superficial area per man 15·54 feet. The tents contain 15 men each.

8. No means exist of ventilating the barracks or guard rooms except by means of the doors and windows. The only mode of ventilating the tents is by the doors, unless the bottom of

References to Subjects and Queries.	REPLIES.
III. Sanitary Condition of Station—*cont.*	the walls is raised, which is often done in camp. The ventilation is sufficient to keep the air pure night and day. No means exist for cooling the air in the barracks at this place. Punkahs are used at most stations for European troops. 9. The barracks are constructed of brick in Chunam. The barracks of European convalescents are terraced, paved with foot square sandstones. The sepoy place of arms is tiled and paved with brick. The sepoy huts are constructed of mud, thatched with palmyra leaf. The tents, both for Europeans and natives, are made of blue and white Vizagapatam cloth (a sort of coarse calico). There are two folds of white and one of blue used, but lately some tents made at this place had four folds, because the cloth was inferior. 10. The floors of the European barracks are constructed of foot square sandstones in lime, raised 1 foot 6 inches above the level of the ground. There is no passage of air beneath. The floors of the sepoy place of arms are paved with brick, and the floors of the huts are of mud. 11. The materials of the barracks are suitable to the climate, but their construction is faulty; yet, as the station has been long discontinued for a regiment of Europeans, this is a matter of no consequence. The huts occupied by the sepoys are very indifferent, but not injurious to health as the men are healthy. It would be a vast improvement if ranges of tiled or terraced huts were built for the sepoys by Government; but this is a question of finance. The material of which tents are made is suitable, but it is a question whether the tents for the European soldiers would not be better if they were made to hold only from 8 to 10 men each, and carryable on a bullock, which the present regulation tent is not. The native tent is very hot. Four plies of cloth instead of three, as at present, would be an improvement. The tents, as a general rule, are too crowded. Repairs to barracks are made by the district engineer, and are quickly executed. This is not a defined military cantonment; the police and sanitary precautions are under the magistrate and collector. The officer commanding the native regiment is, of course, responsible for these points within the limits of the sepoys' huts. The walls and ceilings of the European barracks are cleansed and lime-washed once in two years; those of the native infantry place of arms once in three years. 12. No baths are attached to the barracks. The convalescents at Masulipatam wash in large-sized tubs; they are supplied with water from adjacent wells. The waste water is thrown out in the open and absorbed in the sandy soil of the place. 13. The means of cooking provided in the barrack cook-houses are, copper boilers, frying pans, and a proportion of earthenware dishes. Water is supplied by water-carriers furnished by Government. There is no drainage. The refuse water is thrown out and quickly absorbed by the soil. The cook-room referred to here is for the use of European convalescents, and attached to the barracks in the fort. The linen is carried away by the native washermen to their washing and drying grounds; the conveniences for this purpose are considerable. 14. The privies are attached to the European barracks in the fort; the urinals are large tubs, their contents are carried away by natives hired by the commissariat for that purpose. There are no privies to the native barracks or places of arms. 15. These buildings are ventilated and lighted by means of the doors and windows. The barracks are lighted at night by lamps. 16. There are no drains or sewers attached to the barracks. The rain water disappears quickly by absorption in the sandy soil and by evaporation. The drainage is sufficient from the sandy nature of the soil, for conveying away the surface water. The contents of privies and urinals are carried away. No part of any building used as a barrack or hospital is damp. The drainage of the barracks is partly absorbed and partly evaporated. There are no cess-pools of any description in or about the station. There are no foul ditches within the station. The ditch round the fort, which is fed by the tide, is, at low water, offensive; but it does not seem to affect the health of the residents in the fort. 17. There is no surface cleansing going on. The occupiers of the houses in the station make their own arrangements for the removal of the offal in their own bounds; in the fort there are scavenger's carts which remove the refuse daily. 18. There is little surface vegetation in or about the station. There are no old walls; the hedges, when allowed to grow high, do interfere with the ventilation of the station, but the proprietors and occupants of houses generally keep them low; the trees which attain to a very large size are too numerous, and, to a certain extent, interfere with the free circulation of air; on the other hand, a shade during the hot season is refreshing. 19. The military authorities have no control over the bazaars, but they appear to be kept clean; they are entirely under civil control. With regard to the condition of the native houses near the station, it is the characteristic of all native houses to be dirty, and, if allowed, the inhabitants permit offal to accumulate in the vicinity of them, and thus engender disease; but it is understood the evil is checked as much as possible by the civil authorities. No nuisance is experienced in barracks from wind blowing over the native dwellings. 20. No European regiments being here there are no slaughtering places set apart for the soldiers; the meat is supplied for the convalescents by contract, it is killed in the native town at a distance from the station. No nuisance is experienced from the slaughtering places. Sanitive rules in the native town are under the civil authorities. 21. This being a purely civil station, but at which a regiment of native infantry is quartered, the military authorities have no jurisdiction in the bazaar. The inhabitants have few or no horses, and, except the officers' servants, there are no camp followers. 22. There are no cavalry or artillery stables or picketing grounds, none being quartered here. 23. There are only two married non-commissioned officers who are entitled to quarters; the serjeant-major and quartermaster-serjeant of the native regiment; their quarters are sufficient and good.
Officers' Quarters.	1. The officers' quarters in the fort have not been used for years, and they will never again be occupied. The officers of the native regiments reside in detached houses in the station, they are generally commodious, and situated in large compounds; the ventilation is good, but there is no drainage except by absorption and evaporation. The water which accumulates in the officers' compound during the monsoon, and continues to lodge there in a stagnant state for about two months, should be drained off into the swamp.

References to Subjects and Queries.	Replies.
IV. Health of the Troops.	1. The station district and adjoining native population are generally healthy. 2. Intermittent fevers are prevalent at times among the native population, but they are seldom of sufficient severity to produce organic disease of the spleen. A disease common from the Kistnah river, as far north as Garrighu, is found to exist here, it is called berri-berri, its distinguishing features are numbness and a burning sensation of the body, œdema, great difficulty of breathing, with a peculiar tottering gait, and an invariable quick and weak pulse. The disease is confined to natives, and often runs a rapid and fatal course; the patient generally dies from effusion on the brain or disease of the heart, which often becomes implicated during the course of the disease. 3. The healthiness of the native population depends in a great measure upon the dryness of the climate, and the absence of all malarious influences. Natives of India do not bear wet well. Poverty of diet is often the cause of unhealthiness, but the people in this district seem well off. 4. Six companies of the 12th regiment were stationed at Rangoon from the 10th April 1857 to the 1st October 1859, previous to coming to this station. Four companies were stationed at Hong Kong from the 24th of March 1857 to the 27th December 1859. The former arrived at Masulipatam on the 10th October 1859, and the latter on the 12th January 1860. The health of the men, both at Rangoon and Hong Kong, was bad, they suffered principally from berri berri, fever, and bowel complaints. I attribute their unsatisfactory sanitary condition to the want of proper and adequate nourishing diet; all their pay was remitted to their families, and they lived almost exclusively upon the Government rations, a portion of which they even sold. During the three years the regiment was at Rangoon, the men, who in India from their infancy upwards, had been accustomed to eat meat, suddenly changed their mode of living, and adopted a strictly farinaceous diet, their constitutions became consequently weakened, and they were unable to bear up against the great and sudden vicissitudes of temperature to which these climates are liable. Since their arrival at Masulipatam their health has much improved, and a very small amount of sickness prevails in the regiment. The men's accommodation (lines) at this station is all equally healthy. 5. The troops at this station are not camped out during any portion of the year. 6. I have never been in charge of troops at hill stations. Surgeon Horak was in medical charge of the Neilgherry hills, a sanitarium for officers and their families; he found that the climate, in all cases of debility, whether induced by a prolonged residence in the plains or the result of previous illness, was most beneficial; but where organic disease had once established itself the hills acted most injuriously. The utility of hill stations is, therefore, in his opinion, considerably restricted. 7. No experience with troops at hill stations. 8. I approve of hill stations for troops, provided regiments are sent there soon after their arrival in India, and before they have contracted any latent organic disease by a protracted residence in the plains, which the searching climate of the hills is certain to actively develope, and without an immediate change would cause to end fatally. 9. Diseases are not initiated among troops on the hills, they are developed. 10. The climate of the hills, from the diminished pressure of the atmosphere is very deceptive to the feelings. The sun's rays are as powerful as on the plains, but on account of the modifying circumstances in operation, this is apt to be overlooked. Soldiers should not be allowed to expose themselves to the sun during the two hottest hours of the day; and owing to the sudden variation of temperature they should always be warmly but lightly clad—flannels and light woollens are the best adapted as articles of dress. 11. On the Neilgherry hills the season best adapted for residence is from November to the end of May. The shortest period of residence to obtain the full benefit of such residence is, —for men suffering from debility, and free from organic complications,—not less than two years; three years would be preferable. 12. The longer the period of residence on the hills the better qualified would the troops be for encountering the climate of the plains. 13. The principal precaution necessary on leaving hill stations for service on the plains is to avoid undue exposure to the sun. 14. If European troops could be permanently stationed on the hills it would not only conduce to their efficiency, but considerably diminish the rate of mortality. Short changes to hill stations from the low country, for regiments, I consider injurious for the reasons already given. Frequent change of station in the plains is decidedly beneficial, love of change is inherent in a soldier. 15. No reply to this query. 16. With regard to the elevation most suitable for sites for hill stations. In the latitude of the Neilgherry hills (about 11° N.) at a place called Kulpatty, at an altitude of 5,538 feet above the sea, jungle fever occasionally prevails; and at a place called Billicul, at a similar elevation, where an officer and his family resided, they were all seized with jungle fever and were dangerously ill. I have never known malaria to reach an altitude of 6,000 feet; which is perhaps the lowest safe range in the above latitude. 17. There is no higher ground near the present station which could be advantageously occupied as a hill station. 18. In reference to the best class of surface and subsoil for stations, dry and sandy soils in India have been more free from diseases than any other. 19. No European soldier should be sent to India till his physical powers are fully developed. He should land there in the month of November, which allows time to the men to join the regiments, if up country, during the cool season of the year. Cannot say how troops are disposed of on first landing. The precautions necessary for preserving the health of recruits on their arrival in India, is protection from the sun, and from the deleterious spirits sold in the bazaars. 20. Troops should be sent direct to hill stations on landing; and if possible kept there till required for service on the plains. 21. Troops from this station, if Europeans, proceed by bullock carts to the interior; if natives, they march at about the rate of 10 miles a day, with a halt twice a week. The health of the troops would be increased by carrying out what has already been partially tried, viz.:—having along all the principal military routes, large sheds at each halting place, with floors of planks, or bamboo, raised from the ground; and on occasions of reliefs, marching

MASULIPATAM. MADRAS.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	men in small bodies, never in larger parties than 200,—wear and tear of tents would be thus saved, and risk of cholera diminished. 22. A British soldier should not serve more than 10 years in India. 23. No suggestions to make as to the mode of conducting the business of medical boards as regards invaliding. 24. Invalids departing for home by the Cape of Good Hope route should leave India in January; and in March by the Overland route.
Diseases.	1. Inspection parades are occasionally ordered when cutaneous disease is prevalent; which is common to the sepoy on foreign service, and is caused by low diet and the consequent impoverished condition of the blood. 2. There has been no scorbutus among the troops at this station. 3. Hepatic disease is of rare occurrence among sepoys, when it does occur it is of an idiopathic character and readily yields to treatment. With the European soldier, it is almost invariably the result of alcohol and exposure to the sun. 4. Few cases of dracunculus have occurred in the different native corps with which I have been connected. The disease is generally supposed to arise from bad water. 5. In native regiments venereal diseases are seldom met with; in European corps, however, they are of frequent occurrence, and occasionally assume a malignant type. The only means of diminishing the liability of the soldier to it would be the establishment of lock hospitals. 6. At this station the troops are epidemically affected with intermittent fever of a mild type. No diseases of an endemic character prevail; occasionally the station is visited, like most places in India, with cholera and small-pox. Sporadic cases of dysentery and rheumatism occasionally shew themselves. The 12th Regiment have only been three months at this station, and have lost none by the above diseases. 7, 8. The more frequent zymotic diseases are variola, rubeola, and scarlatina; skin diseases; diseases of the digestive organs, &c., cholera, dysentery, and diarrhœa. They are most prevalent at the changes from wet to dry and from dry to wet weather. No experience of the sanitary condition of the bazaar and native dwellings at the station. As a general rule, the abuse of opium, which is too common, is a great predisposing cause, not only of premature decay of the vital powers, but of the development of disease among the natives. None of the soldier's duties are operative in promoting the prevalence of epidemic disease among sepoys. It generally arises from causes over which the European officer has no control. 9, 10. Small doses of quinine have not been tried at this station in consequence of the absence of malarial disease, but have been employed with marked success as a prophylactic agent during different periods of my service in India. No recommendations to suggest on any of the preceding points.
V. INTEMPERANCE.	1. The station is occupied by the 12th Madras Native Infantry, the soldiers of which are most temperate. There are no confirmed drunkards. 2. There have been no admissions into hospital directly or indirectly caused by intemperance; but sometimes sepoys are admitted into hospital suffering from a powerful stimulant and narcotic poison called bhang. The sepoys seldom or ever indulge in spirituous liquors, and no table can, therefore, be constructed showing the effect of total abstinence, temperance, and drunkenness, on the amount of sickness, mortality, and crime at the station. Drunkenness is always punished as an offence. 3. At this station there is only a detachment of European convalescents sent from Secunderabad for the benefit of their health, there is therefore no canteen. Spirits are sold in the bazaars which are of a most deleterious description, but as this is not a permanent station for Europeans the amount consumed cannot be stated. The spirit is adulterated with the *datura stramonium* and other noxious ingredients, which have a tendency to injure the constitution permanently. Spirits are not part of the soldier's ration, but an addition thereto, which he may take or decline; if taken, two drams a day is the allowance permitted at the station on the march or in the field. The convalescent soldiers at this station are not allowed a dram before parade. Sepoys are of course not allowed spirits. The spirit is the best Colombo arrack. Convalescents not in hospital, and therefore, drawing the regular ration, may take the two drams of spirits a day, or they may have malt liquor if they prefer it. Spirits are only given to convalescents at the recommendation of the medical officer. No drinks, other than intoxicating drinks, are sold in the bazaar which are injurious to health. 4. If the British soldier could be restricted to the regulated allowance of two drams a day spirits would doubtless be beneficial to his health; but in consequence of the facility of procuring intoxicating liquor in this country, to which the allowance operates as an incentive, it is questionable whether its entire suppression would not be the best policy, substituting malt liquor instead. Spirits are not conducive to efficiency or internal discipline. 5. As a general rule, and for the reasons stated, it would be beneficial to abolish the use of spirituous liquors. 6. Beer has a very strengthening and refreshing effect in this country, and nourishes without unduly exciting the system. Wine also in moderation is also an agreeable stimulant, but not so well adapted for the tropics as malt liquor. Spirituous liquors excite the circulation and brain, and taken in large quantities are calculated to induce directly inflammation of the liver and brain. 7. Tea and coffee are part of the soldier's ration issued by the commissariat. Lemonade, soda water, and similar drinks are not procurable at this station. In my opinion the system requires a certain amount of support to enable it to bear up against the enervating effects of a tropical climate. This remark applies particularly to older residents. 8. It would be beneficial to the health of the troops to suppress the spirit ration, and substitute for it beer, tea, coffee, &c. Beer should not be omitted, but substituted for the spirit ration. 9. 10. It would be most beneficial to prohibit the sale of spirituous liquors in the canteens. Recruits often arrive in India with a positive distaste for spirits, but habit soon reconciles them to it, and in a few years the same man dies a confirmed drunkard through it. Only beer, coffee, tea, lemonade, and perhaps sweet wines, should be sold in the canteens.

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	11. There is no canteen at this station. The bazaar is under the civil authorities. There is a rule prohibiting the sale of spirits to the soldiery, but it is, and always will be, most difficult to prevent its evasion.
VI. Diet.	1. The composition of the ration for Queen's British troops and European troops in the Indian army is the same, and consists of— Bread - - - - 1lb. Meat - - - - - 1lb. Rice - - - - - 4oz. Sugar - - - - $2\frac{1}{2}$oz. Tea - - - - - $\frac{5}{7}$oz. Salt - - - - - 1oz. Vegetables - - - - 1lb. Firewood - - - - 3lb. Beef is given five times a week, and mutton twice. The vegetables consist of such description as may be procurable at the different stations of the army according to season. Potatoes are issued twice a week. Coffee may be substituted for tea at the rate of 2lb. of coffee for 1lb. of tea. In the Madras army the rations are inspected daily by the orderly officer previous to issue, if found bad he immediately reports the circumstance to the quartermaster, who has the immediate charge and responsibility of their issue; and should any article be deficient either in quality or quantity he is enjoined to make an immediate report to the Commanding Officer, who causes a committee to assemble and report on them. 2. Whenever European troops in transit embark from or disembark at this station, they are provided with a complete ration with the proportion of vegetables, but no fruit is issued to them. The stoppage is 3 annas 4 pice, equal to 5*d.* English money. When the cost of the ration falls below this sum, the difference is disbursed to the soldier. They have three meals a day; breakfast at $\frac{1}{4}$ to 8, composed of tea, bread, and any other article the soldier gets for himself; dinner at $\frac{1}{4}$ to 1, consisting of mutton or beef, with rice, onions, and vegetables; and an evening meal at 4 p. m., same as breakfast. The vegetables are English potatoes twice a week, and country (sweet) potatoes five times a week. The proportion of vegetables entering into the constitution of a ration is one pound. 3. The bread is the best white and the meat of the best description of grass-fed cattle. No improvements to suggest in the ration. The sepoy, when on foreign service, that is in Pegu, China, the Straits, &c., is rationed by the Government, and it is not an uncommon occurrence for the most penurious to sell (to the great detriment of their efficiency and health,) a portion of their rations; but as each company of a British regiment is divided into messes, this cannot be done by the English soldier. The sepoy, on the contrary, cooks and eats alone, and it is difficult to prevent him selling his ration, if so determined, unless native officers of a similar caste were obliged to inspect the meal, and this could not be always done. 4. Kettles and copper boilers are the means used for cooking. Every sepoy has of course his own cooking utensils and provides his own food, with which no one ever dreams of interfering. All the replies to these questions on diet refer exclusively to European troops. The kitchens are clean, light, well ventilated, and sufficiently supplied with water. The food is boiled. For the convalescent soldiers at this station food is properly done, and is varied according to the taste of the men. Tea and coffee are properly prepared. It is believed soldiers have coffee given to them before a march, but there being no European regiment here the question cannot be answered positively. 5. As this place is not a permanent station for European troops, gardens for the cultivation of vegetables are not required; but it may be here remarked, that potatoes, the favourite esculent of the English soldier, are only grown at a few places in this Presidency, the price at any distance from these localities is beyond the soldiers' means. In every district there are hills of sufficient elevation, it is thought, suitable for the growth of the potato, but the cultivation would have, in the first place, to be commenced by Government. Where successful, it would doubtless be carried on by the cultivators for their own benefit, for the vegetable is becoming of common use among opulent natives.
VII. Dress, Accoutrements, and Duties.	1. The sepoy's dress consists of a scarlet cloth tunic, Oxford mixture woollen trousers, linen trousers, and white linen jackets, and when proceeding on foreign service he has a woollen great coat. The accoutrements are, a shoulder belt, to which the pouch is attached, and a waist belt for the bayonet. He has sandals on his feet. The head dress is a sort of shako, made of basket-work, covered with black wax cloth. The dress of the European and native soldier has lately undergone great improvements; they are now supplied with loose tunics, and the former with a serviceable and light helmet, affording good protection from the sun. The head dress of the Madras sepoy is heavy and clumsy, and interferes with his efficiency; but it has been retained on account of caste prejudices. His musket is also too heavy for his physique; a light fusil is better adapted for his strength. The guard dress consists of the usual uniform, with the addition of a great coat at night to protect him from atmospheric influences, and a sentry box to protect him from rain.
Duties.	1. Troops should be thoroughly drilled at home before being sent to India. 2. The sepoy, at this station, goes on guard once in five days; his turn of duty lasts for 24 hours. He is drilled five mornings in the week for one hour, which exercise has a beneficial influence on health. The best hours for drills, parades, and marches is early in the morning, so that the duty may be got over before the sun acquires any strength, viz., in this latitude by seven o'clock. There are general orders on the subject. Four is the average number of nights the men have in bed during the week. 3. A few guards mount at $3\frac{1}{2}$ miles from the lines; the remainder are close. Guards last 24 hours: 12 by day and 12 by night. There are two roll calls, one at mid-day and one at eight o'clock, p.m. No precautions are requisite at this station as regards the protection of night guards.
VIII. Instruction and Recreation.	1. The questions under this head refer solely to European regiments, and not to native troops. 2. Confinement is much felt by everybody in India, and more so by the British soldier during the hot months, confined as he is to a crowded barrack room, and leads him to dissipation and recklessness. It would ameliorate his condition if large lofty sheds were erected near

References to Subjects and Queries.	Replies.
VIII. Instruction and Recreation—*cont.*	all barracks, under which he could lounge about, smoke, play at single stick, &c., and amuse himself; if to this were added swimming baths for the hot, and gardens for the cold season, they would, it is thought, add to his contentment and consequent health, and therefore be a positive gain to the State. 3. Anything that tends to make the soldier careful must be advantageous, and savings banks would make him so. Many of the sepoys of the 12th Madras Native Infantry, when in Pegu, lodged their savings in the Government savings bank. This was during the mutiny in Bengal: an incontestable proof that they had neither sympathy with the mutineers nor fear for the stability of the Government. 4. There is not at this station sufficient shade for the men to take exercise during the day without injury to their health. If men of European regiments were enabled to do so, it would ameliorate their condition in India immensely.
IX. Military Prisons.	1. There is no military prison at this station.
X. Field Service.	1. There are no local regulations for field medical service not included in the General Presidency Regulations. 2. The medical officer is always consulted and his advice followed in the selection of encamping grounds. 3. The highest and best drained ground and the one most exposed to a free circulation of air is invariably selected for camping. The tents are systematically arranged, the ground in the neighbourhood kept clear, and water supplied from the best wells by the water carriers. The medical officer has a general voice in these matters. In passing towns where epidemics prevail communication with the camp is prevented, and, if possible, a detour made in the march. No improvements to suggest. 4. The arrangements for field hospitals, transport of sick, and hospital supplies, are embodied in the medical code of regulations. The sick are conveyed in carts or doolies (a sort of litter) according to the nature of the man's state. A native regiment is supplied with one dooly per company and one sick cart; the field medicine chest is carried by porters.
XI. Statistics of Sickness and Mortality.	No replies under this head.
XII. Hospitals.	1, 2. The European hospital is situated in the fort, close to the barracks, but as this building is to be appropriated to civil purposes, any further description is unnecessary. The native hospital is situated close to the sepoy place of arms, and adjoining the lines; it is about two miles from the bazaar and houses of the native civil population. The site is open and freely ventilated, and there is no impediment to the free circulation of air, it is generally healthy. 3. The water supply is abundant and of good quality. 4. The refuse water percolates though the sandy soil. 5. The floors of the wards are raised two feet above the surrounding level, but there is no free perflation of air underneath them. The roof-water sinks into the sub-soil, there is no guttering round the hospital. When the rain falls rapidly, the water collects into pools, but gradually removes by evaporation and absorption. The hospital is built of brick and lime; the walls and roofs are single; and the tiles with which the roof is covered, add considerably, by reflected heat, to the temperature of the building. It has verandahs on both sides, six feet in breadth, which afford adequate shelter from the sun's rays. They are not used for the accommodation of sick, convalescents or others, except when epidemics are prevalent and there is an inordinate number of sick. The hospital consists of one flat. Table of hospital accommodation:— The date of construction is not known. Total number of wards,—8 in European hospital. No regulation as to the number of beds per ward.

Wards.	Regulation Number of Sick in each Ward.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
		Feet.	Feet.	Feet.	Feet.			Ft. in.		Feet.	Ft. in.
European Hospital in Fort, 8.	13	42	17	13	9282	1,000	221	1 8	36	6	4 6
Native Hospital for sepoys, 1.	40	80	18	10	14400	360	36	1 8	10	4	3 0

The hospital is so placed as to receive the full benefit of the prevailing winds. The windows open inwards, and their arrangement and construction is conducive to ventilation and coolness.

6. Ventilation is effected by means of the doors and windows, and is sufficient to keep the air pure. There are no jalousies or jhilmils.

7, 8. There are no artificial means in use for cooling the air of wards or of warming them. The walls and ceiling of the European Hospital are whitewashed once a year, and those of the native hospital once in two years.

9. The privies of the native hospitals consist of a brick and chunam seat with a circular opening, under which an utensil is placed. There are no urinals in use with native hospitals. The contents of the privies are emptied at stated periods, and the filth carried away; they are not offensive.

10, 11. There are no lavatory arrangements in the native hospital, nor are there any bathing conveniences for the sick supplied.

12. The hospital linen is carried away by the regimental washermen. The conveniences for washing and drying are sufficient.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	13. The storage is sufficient and dry. 14. In the native hospitals, iron bedsteads are used; mattresses and pillows are supplied. No improvement can be suggested. 15. The kitchen in native hospitals is used almost exclusively for preparing hot water for decoctions, fomentations, &c. 16, 17. No replies to these queries, as they relate to European regiments. 18, 19. The sanitary condition of the hospital is good. No improvements to suggest. 20, 21. No replies to these queries. 22. There are no local hospital regulations at this station. 23. With regard to the powers of the medical officer as to the sanitary state of the hospital, &c., he is in every respect paramount, except as relates to repairs in buildings, which depends upon the confirmation of superior authority. 24. There are no convalescent wards at the station; they are not required for native troops.
XIII. Burial of the Dead.	1. The burial ground used by British troops is in the fort, at 3½ miles from the station. Other Europeans are generally buried in the graveyard surrounding St. Mary's church, in the station. The burial ground in the fort, and in the station, is favourably situated with regard to the prevailing winds, which pass over the cantonment before reaching the burial grounds. 2. Its area, 34,161 superficial feet. The soil and subsoil is sand and clay. Water is absorbed by the soil, and decomposition readily takes place. The ground is well kept. 3. There is no regulation interval between the graves; the grave space is six feet by three feet, and the depth six feet. They are never re-opened. The hour of interment for Europeans depends on the hour of death. Every man must be examined post mortem. If a man died at early morning, he can be buried in the evening; but if in the middle of the day or afternoon, not till the following morning. During epidemics no unnecessary delay in interment is allowed. The native burial grounds are on the outskirts of the town, there are none in the station. Native interments are not interfered with; during epidemics, they get rid of their dead as quickly as possible. 4. The graveyard is never offensive. 5. The dead of the camp followers and bazaar people are burnt, if Hindoos. The Mahomedans bury their people in an appointed place near the native town. 6, 7. No injury accrues to the public from the present practice. No improvements are suggested.

(Signed) G. Allan, Major, 12th Regiment Native Infantry, Commanding Masulipatam.

16th March 1860. J. A. Horak, M.D., Surgeon, 12th Regiment Native Infantry.

PALAVERAM.

Accommodation — Queen's Troops. Artillery Veteran Company Barrack accommodates 46 men. Native Troops. Infantry, Native Infantry Depôt, generally amounting to 1,500, or accommodation for two Native Infantry Regiments.

References to Subjects and Queries.	Replies.
I. Topography.	1. The surrounding country is generally flat. The cantonment is situated on open ground on the north-west side of two rocky hills, between which there is a narrow gorge. The soil is sandy, with a subsoil of clay, beneath which, at a considerable depth, there is a bed of limestone and granite. During the heavy rains in November and December the cantonment (the south and east side especially) is frequently submerged for days. There is no jungle, but here and there are topes of mango and palmyra and some rows of fine trees. There are a few tanks. 2. The station is about 35 or 40 feet above the sea, and on a dead level with the surrounding country for many miles. In the rainy season the river and tanks overflow; they are then nearly on the same level as the station. The ground rises towards Chingleput and Arcot, both of which are military stations. Arcot was formerly the station of the native infantry depôt, but Palaveram is more convenient to the port of Madras, and therefore better adapted. 3. The Mysore table land is the nearest, and there are no hills of any extent nearer than the Neilgherries. 4. The sea is about 5 or 6 miles distant from the station. There are some large tanks on the land side, and the river Adyar about a mile off. During the rains the tanks and rivers may overflow, but they cause no damage. The water of the rains is speedily removed on their cessation, although the hospitals are under water for two or three days at a time. The station is surrounded by waste ground and paddy fields, but these do not appear to influence health. 5. The station would be open were it not for the two hills on the sea or south side, which in a great measure exclude the sea breeze or only cool wind, whereas it is quite exposed to the land or hot winds. These hills are 500 to 600 feet in height, and covered with large blocks of granite, with a very scanty vegetation. They reflect the sun's direct rays and interfere with ventilation. This is one of the hottest stations in India, and the thermometer is seldom below 80°, but natives appear very healthy in it, and the European veterans do not complain much. The sea breeze is very grateful during December, January, and February. 6. Some lands are employed as rice fields, but the greater part is waste land. There are no works of irrigation near the station. There is no restriction as to the cultivation of rice, but none is grown within the limits of the cantonment. There is no cultivation of indigo, nor is the preparation of hemp or flax carried on near the station. 7. Madras is 12 miles distant from the station. 8. The soil of the district is sandy and is of variable depth. The subsoil contains clay and is mixed with fragments of granite. It has been a military station many years.

PALAVERAM. MADRAS.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	9. Water is found during the dry season about 30 feet below the surface, and during the rainy season at the surface. 10. Some of the rain water may reach the sea, but the greater part is either absorbed into the subsoil or removed by evaporation. There are numerous nullahs, which assist considerably in the drainage. Some of the drainage from the two hills flows into the cantonment. 11. Water for the domestic purposes of the station is derived entirely from wells. There are no tanks of any extent within half a mile of the station. There is a tank about 3 miles in circumference about half a mile distant on the south-west, and one of some 10 or 12 miles circumference 5 miles distant. These never entirely dry up. A small one in the north-east of the cantonment generally dries up in April. The nature of the plants and animals they contain is not known. Tank water is not used for drinking purposes. All the water used for drinking purposes is taken from good wells containing no impurity. No nuisance or malaria proceeds from any tank without the station. 12. The wells at the station yield an abundant supply of water, colourless, tasteless, and inodorous. The chemical composition is not known. Some of the springs are softer and better than others, but generally the water is very good and wholesome. There are a few wells in which the water is brackish, containing lime and chloride of sodium, but these are not used. The water is raised in leathern buckets and distributed by bheesties. 13. The station appears well suited to natives, and their lines being at some distance from the hills are not affected by the reflected heat from which the officers are great sufferers. 14. No knowledge of the amount of inquiry or examination as to topography, &c. previous to the selection of new stations.
II. CLIMATE.	1, 2. There are no means or instruments available at the station for conducting and registering meteorological observations. 3. The climate is generally dry, except during March and April and the autumnal monsoon. The heat is very great all the year, there being no cold season. The coolest time of the 24 hours is about one hour before daylight. The observations of the Madras observatory would apply here, except that the air here is always much closer. Almost all the duties here are taken by natives. December, January, and February are the most healthy months to Europeans, there being no appreciable difference between the other months. By the records of admissions during the last 10 years I find that no particular type of disease prevails at one season more than another. 4. There is no district near the station the climate of which is more conducive to health than that of the station. 5. Not sufficient data to answer the question as to the salubrity of the stations at which the officers had served.
III. SANITARY CONDITION OF STATION.	1, 2, 3. A tracing of the station and adjacent country, &c., is transmitted. 4. Table of barrack accommodation. Date of construction, A.D. 1824. Total number of rooms, 1. Total regulation number of non-commissioned officers and men, 46.

Barrack Rooms.	Regulation Number of Men in each Room.	Dimensions of Rooms or Huts.				Cubic Feet per Man.	Superfical Area in Feet per Man.	Height of Men's Beds above Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
		Ft. in.	Ft.	Ft.	Ft.			Ft. in.		Ft. in.	Ft. in.
1 Long Room -	46	186 9	18	15	50,220	495	33	2 2	20	5 6	5 6
Guard Room -	—	41 0	18	15							
Prison Cell -	—	12 0	18	15							

5. The windows are on opposite sides and open outwards. There is a verandah on both sides, but not at each end; the dimensions of the side verandahs are each 186 feet in length and 8 feet in breadth. They are generally used as sleeping quarters during the hot weather by the occupants of the barracks. There are shutters, but no jalousies or jhilmils.
6. Wooden cots composed of 3 planks on 2 trestles are used in barracks. The bedding is of cotton, with sheets and blanket provided by Government at certain periods. No improvement to suggest.
7. There are no tents in use.
8. The ventilation of the barracks, &c. is effected by means of the doors and windows only, and is sufficient to keep the air pure night and day. The air of the barrack rooms is cooled by punkahs hung down the centre of the barrack, which are pulled at Government expense.
9. The barracks are constructed of brick and chunam, and No. 1 has a double roof, tiled outside. The huts for the native infantry are built of mud; some are thatched and some tiled.
10. The floors are paved with stone flags, and are raised about 3 feet from the ground. There is no passage of air beneath.
11. The materials and construction of the barracks, &c. are suitable for the climate. They are kept in repair by the district engineer, by whom all repairs are immediately executed when pointed out by the commanding officer. The walls and ceiling are cleansed and whitewashed once a year.
12. There are two lavatories in No. 1 barracks, and a separate building contains a plunge bath; both are well supplied with water.
13. The cookhouse attached to No. 1 barrack is 24 feet by 16 feet. It is fitted up in the usual manner; water is supplied by puckallies. There is no means of draining away the refuse water. No conveniences are required for washing and drying linen, all washing being done by natives beyond the station.

References to Subjects and Queries.	Replies.
II. Sanitary Condition of Station—*cont.*	14. There is but one privy attached to the barrack, it is 14 feet by 10 feet. There is no drainage; the ordure is carried away daily by sweepers. There are no urinals. 15. There are no windows in these buildings, but ventilation is affected by honeycomb tile-work. The barracks are lighted by oil lamps suspended from the roof. 16. There are no arrangements for draining and sewering the barracks. The drainage for the two lavatories and plunge bath is allowed to run out and sink into the subsoil. None of the buildings are damp. Rain water is mostly carried away; all other refuse fluids either evaporate or sink into the subsoil. There are no cesspits or foul ditches. 17. The general surface cleansing is performed by the employment of two scavenger carts, supplied by the commissariat contractor; they are not sufficient for the work required, for not only have they to remove the refuse, dirt, leaves, manure, &c., from the bazaar and streets of the cantonment, but also to attend at the barrack, hospital, and patchery. The refuse is uncarted on the plain in rear of the hospital, and is used up in the gardens existing in that neighbourhood. 18. The surface of the cantonment is kept as free as possible from vegetation, yet prickly pear exists in patches, though it has been much thinned of late years. There are no old walls, hedges, &c., to interfere with the ventilation of the station, bazaar, &c. 19. The bazaar is generally well drained, but the drains are not covered in. The water supply is abundant, and the ventilation is good. There is no crowding. Cleanliness is not sufficiently attended to, for the reason given in question 17. It is the duty of the superintendent of police, assisted by the cutwal, duffadar, and police peons, to inspect the bazaar, and punish all infringements of its rules. As regards cleanliness, the employment of an extra scavenger cart would be very beneficial. The general condition of the native houses near the station is clean. There are neither dung-heaps nor cesspits within them. No native dwellings are near the barracks occupied by Europeans. 20. Meat is brought by the commissariat department for the consumption of the European troops from St. Thomas's Mount, distant three miles. 21, 22. There are no bazaar horses. There are no artillery or cavalry stables. 23. The patchery is not sufficiently filled with houses for the accommodation of all the married non-commissioned officers and men of the European veteran artillery company. There are at present 12 families occupying quarters in the barrack of the company.
Officers' Quarters.	1. There are no officers' quarters. The officers reside in rows of bungalows, running nearly east and west; the greater number being on each side of the trunk road from Madras to Trichinopoly.
IV. Health of the Troops.	1. The natives are generally healthy in and around the station. 2. The diseases most prevalent among the native population are, remittent and intermittent fevers, diarrhœa, dysentery, itch, dyspepsia, and syphilis. 3. The healthiness of the neighbouring native population is attributable to the fact that the villagers near this station are principally employed in the cultivation of rice, which appears a healthy occupation, and they are much less exposed to causes productive of disease than natives resident in military stations. They are nearly all Hindoos. 4. This question is not applicable to this station; where the veterans have come from cannot be stated; some probably from every station in Southern India. The N.I. depôt is composed of men returning from active or foreign service, and recruits waiting to join their regiments. No portion of the men's accommodation is more unhealthy than the rest. 5. Troops are never camped out. 6 to 17. No knowledge of hill stations. 18. Sandy soils with clay subsoils are generally the most healthy for stations, especially if not impregnated with iron. They are, however, very hot and disagreeable to European troops in windy weather. 19. When a recruit has ceased growing, and his limbs are firmly set, he is as well adapted for Indian service as he ever can be; he attains this stage about 19 or 20 years of age. The best period for troops to land in India is the three last months of the year; they then have the benefit of two or three cool months before the excessive heat. Recruits should be sent to cool stations (such as Bangalore), until they are taught their duties, and the peculiarities of Indian life. The change in their mode of living is then acquired in a manner less repugnant to their ideas. 20. With regard to whether troops should be sent direct from the home depôts to India, or sent to an intermediate station for a certain time; troops sent direct from England do not appear to suffer more than those coming from intermediate stations, and they generally bear the heat of the first summer better than any succeeding one. Cannot say whether they should be sent to hill districts on landing, to accustom them to the climate. 21. When a Queen's regiment arrives, it is marched to its station by stages, if no railroad exists. Queen's details are marched to their depôt, as also are Indian artillery, but local infantry are sent to their depôt by rail. 22. As regards the number of years a British soldier should serve in India, few are fit for active duty after 20 years' service. The average age of the European veterans here is 42, at which age they generally look old worn-out men. Two years in this part of India does more to age a man than three in England. 23. No suggestions to offer as to the mode of conducting the business of medical boards, with reference to invaliding. 24. Not sufficient experience as to the time of year invalids should leave India for home.
Diseases.	1. There are no regular inspection parades among the Europeans, for the discovery of incipient diseases at this station. Among natives there are weekly inspections at daylight in the morning, principally for the detection of itch. 2. There has been no scorbutus or scorbutic disease among the troops at this station. 3. Among the European veterans hepatic disease is very common, but as they usually have it at the time of being transferred to the non-effective establishment, any tabular statement would manifestly be useless. The men subject to it are what I may call "steady drinkers;" men who always take half a pint of arrack a day, but who do not get drunk. 4. Dracunculus is very uncommon. I cannot find a case in the books as having originated in the station; all in the depôt hospitals are imported from the Straits and Burmah. 5. The Europeans of the artillery veterans are nearly all married men. Venereal disease is exceedingly rare among them. Of the doing duty men of the N. I. depôt, about five

PALAVERAM. MADRAS.

References to Subjects and Queries.	REPLIES.
IV. Health of the Troops —*Diseases—cont.*	per cent. of the admissions are from venereal disease, which might be almost altogether removed by the establishment of lock hospitals. 6. Amongst the troops at the station the prevailing diseases are,— *Fevers*, particularly remittent fever, which is very common. The children of the European veterans suffer especially. *Dysentery* sends a few sick into hospital from the station; by far the larger number of admissions being transfers from foreign service. *Cholera* has never prevailed; only a few sporadic cases having occurred. The same may be said of *small-pox*. *Rheumatism* is very common among the native troops, but from the foreign service sick being always included upon the depôt books with the station sick, no per-centage returns would be fair to the station. The total admissions in the last year in the veteran company is 70, of which number 3 men have died; two from cholera, one from apoplexy. In the depôt hospital there have been in the last 12 months 1,698 admissions, and 65 deaths, 33 of which were from dropsies and bowel complaints. 7. Intermittent and remittent fevers, and bowel complaints, prevail at all times of the year, both among the Europeans and natives. The diseases of the veterans are more to be attributed to their long residence in the tropics, and their mode of life, than to atmospheric phenomena. Their children suffer from croup and hooping-cough, during the months of January and February. Itch is the most universal disease among natives, few being free from it. Beri-beri symptoms are very common among the native troops, but they are generally to be traced to a residence in Burmah or the Straits. Itch is the only disease that can be traced to crowded houses and dirty habits. The bazaars are clean. 8. There has not been an epidemic at this station for many years, and the troops neither march nor take the field. 9, 10. Small doses of quinine have not been tried at this station as a prophylactic against malarial disease. No recommendations to suggest.
V. INTEMPERANCE.	1. The European veterans take on an average about half a pint of arrack daily, and although there are many intemperate men among them, there are no confirmed drunkards. Among the native troops the crime of drunkenness is almost unheard of. 2. Rather more than one-fifth of the admissions during the past year into the European hospital were from diseases " directly " the result of intemperance; but I have not sufficient data to give the " indirect " admissions, or to prepare the statistical table required. Drunkenness is always punished as an offence. 3. Arrack is sold at the canteen to the extent of the regulated allowance to all veterans; nearly all of whom take their two drams daily. It is also sold in the bazaar, but only to natives. As to whether spirit is any part of ration for soldiers, at the station, on the march, or in the field, so much of this question as is applicable to this station is answered in the canteen regulations, a copy of which is appended (Intemperance, 11.) The veterans are so accustomed to their two drams a day that they could not do without it. When a man is discharged from the hospital convalescent he gets his drams unless stopped by the medical officer. No drinks injurious to health other than intoxicating drinks are sold at the canteen or bazaar. 4. In such a relaxing climate stimulants are necessary to health. The wives of the veterans are therefore frequently permitted to draw one dram from the regimental canteen. It is (in moderation) conducive to efficiency and internal discipline. 5. It would be most injurious to abolish the use of spirituous liquors as part of the ration. If the canteens were closed the men would get spirits, through natives, of bad quality. 6. A change of malt liquor or wine from spirituous liquors would be beneficial to health. Here the men who prefer wine or beer have the option of taking it. 7. Coffee, tea, lemonade, &c., are much used at the station. On account of the heat they are quite necessary, but beer and spirits are taken as well. 8. It would be most injudicious at this station to abolish the spirit ration altogether and to substitute for it beer, tea, &c. 9, 10. The veterans being nearly all married men keep their drinks in their own houses. I think that any attempt on the part of military authorities to curtail the allowance of spirits that these men have been accustomed to since their first arrival in the country must fail. But if ice were supplied to the canteens at a cheap rate I am sure it would have a beneficial effect, as hot beer or lemonade are not by any means enticing fluids. Ice is supplied to the European hospitals at many stations for the sick, why should it not be given to keep men out of hospital? 11. The following are the more important of the canteen regulations :— " 3. Men of one corps are not to be admitted into the canteen of another without the sanction of the commanding officer of each corps. " 4. Station and other staff non-commissioned officers who may obtain permission to frequent regimental canteens, being permitted, through the regulations of the service, to draw their arrack from the commissariat department, are not under any circumstances to be allowed any spirits in the canteen. The issue of spirits to men who may be admitted into the canteens of other corps is likewise prohibited. " 5. No person who may appear intoxicated is to be permitted to enter the canteen, nor is any man to be allowed to remain there who is not perfectly sober. " 6. Women are not allowed to enter the canteen. " 7. All canteens are to be open daily for the issue of coffee, tea, cheroots, &c., from gunfire in the morning till 8 a.m., from 10 a.m. till ½ past 12 noon, and from ½ past 1 till ¼ to 8 p.m. (excepting on Sundays, when they will be closed during divine service). Issues of arrack, wine, and malt liquors will be made during the hours specified in the following

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	table, excepting under the provisions of paras. 26, 27, and 29; issues of these articles at any other hours are strictly prohibited.

Articles.	Hours of Issue.	
	Early Issues.	Evening Issues.
For Beer and Porter only	From 10 a. m. till half-past 12 noon.	From 6 till a quarter to 8 p.m.
Beer, Porter, Wine, and Spirits	From half-past 1 till half-past 3 p.m.	

"No man is to be allowed more than one-half of the daily allowance of wine and spirits within the same period of issue.

"The canteen is to be shut one hour before any regimental parade, and a quarter of an hour before any appointed roll calling.

"When the canteen is situated within the precincts of the barracks, it may be kept open until 9 p.m. for the issue of tea and coffee, &c., at the discretion of, and under such restrictions as the commanding officer may consider necessary.

"After the canteen shall have been closed for the night, no person is to be admitted until the following morning, the fixed time for opening it.

"The maximum issue to any one man in one day is as follows:—

Spirits 2 drams, but no malt liquor or wine;
Spirits 1 dram, with 1 quart malt liquor, or 2 drams of wine; or
Wine 4 drams, but no spirits or malt liquor.

"Spirits issued in the canteen are never to be taken from the bar, excepting for non-commissioned officers for the purpose of being made into punch, and the cases provided for by paras. 26 and 29.

"Excepting to the mess tables and for men on duty, the issue of spirits from the canteen to any individual on any pretence whatever is strictly prohibited.

"The measure to be used for the issue of draught malt liquors, is the common pint measure, the cubic contents of which are 28·875 inches.

"One dram of spirits diluted with an equality of water, one quart of malt liquor, or two drams of wine, may be issued to such men as wish it, during dinner in the barracks; hot water is to be provided without charge for those men receiving spirits who may ask for it.

"Staff non-commissioned officers and family men may receive the same allowance of malt liquor or wine, but not spirits, for consumption with their dinners at their own quarters. The abuse of this privilege will involve forfeiture of the indulgence, besides punishment for disobedience of orders.

"Men on duty are prohibited entering the canteen. Those whose canteen liberty may not have been stopped are allowed to receive the authorized quantity of beer, wine, or spirits with their dinner or supper, to be drawn under restrictions, as commanding officers may deem necessary, by orderly corporals on indent form No. 1. The orderly corporal will make liquor over to the non-commissioned officer or corporal of the guard, in whose presence the issues are to be consumed.

"The names of all men who may have been prohibited entering the canteen are to be given to the canteen serjeant by orderly serjeants of companies and troops; they may however be provided at the bar of the canteen with tea, coffee, and cheroots.

"The names of men discharged from hospital as convalescent are also to be given to the canteen serjeant by orderly serjeants of troops and companies; they are not allowed spirits, malt liquor, or wine, except with the written sanction of the medical officer, under counter-signature of the commanding officer.

"No games are to be permitted in the canteen on Sundays.

"Chess and draughts are allowed in the canteen, but no cards or dice; and gambling of every description is strictly prohibited.

"No arrack or country made spirits, except as furnished by the commissariat, will be allowed in canteens; and it is at all times discretionary with the commanding officer to exclude spirits of every description altogether from the canteen, making arrangements regimentally for drawing arrack from the commissariat department for such men as may wish their daily allowance.

"The prices of all articles supplied by the canteen, and the rules for its guidance, are to be hung up in a conspicuous part of the room.

"No supplies of any kind are to be sold in canteens excepting under the orders of the committee.

"Nothing whatever shall on any account be sold or issued from the canteen directly or indirectly to any native, whether a follower of the regiment or otherwise.

"No person employed in the canteen is to be allowed under any pretence to derive profit on the sale of articles by the establishment.

"All liquors or supplies furnished by the canteen are invariably to be paid for on delivery.

"After the accumulation of funds sufficient to meet contingent losses, the savings may be employed, under the direction of the commanding officers, for the benefit of regimental or detachment libraries, mess necessaries, gardens, amusements, in charity to widows and orphans of the regiment, and in aid of the expenses of families on removal from one station to another."

VI. Diet.

1. The daily ration of European troops of the Indian army is,—

Bread, 1 lb.	Salt, 1 oz.
Meat, 1 lb. either beef or mutton.	Tea, $\frac{5}{7}$ oz.
Vegetables, 1 lb.	Coffee, $1\frac{3}{7}$ oz.
Rice, 4 oz.	

PALAVERAM. MADRAS.

References to Subjects and Queries.	Replies.
VI. Diet—*cont.*	N.B.—Beef is supplied five times a week and mutton twice; tea five times and coffee twice during the week. The serjeant and orderly corporal of the day inspect the ration. On the occasion of any complaints a committee is assembled.
	2, 3. No fruit is supplied, but in other respects a complete ration is provided at the usual rate of 3 annas 4 pice per diem. There is no regular mess in the European veteran artillery company. The proportion of vegetables is 1 lb. per diem. No improvement suggested. No arrangement exists for preventing any part of the rations being disposed of by the troops.
	4. The majority of the rations are cooked at home. The cookhouse of No. 1 barrack has already been described (Sanitary Condition of Station, 13.) There being no chimney in the kitchens, they are dirty, dark, badly ventilated; water is supplied by puckallies. The food is both boiled and roasted. Cannot say whether the cooking is properly done or sufficiently varied. The men have tea and coffee, &c. before a march.
	5. Gardens for the cultivation of vegetables by soldiers are already established under the orders of Government.
VII. Dress, Accoutrements and Duties.	1. The component parts of the soldier's dress are, a helmet made of wickerwork covered with calico, cloth tunic, and trousers of the same material. During the cold season they have woollen clothing and cloth caps. The present dress is suitable to the climate and for soldiers' duties by day and night. No improvements to suggest.
Duties.	1. It is advisable, in my opinion, as regards the health of the men, that they should be thoroughly drilled at home, as it would save a deal of sun exposure to the recruit on his arrival in India.
	2. The usual routine of a soldier's duties are, parade twice a week, roll calls daily. The guards here do not come round oftener than once a week. This is a great relaxation after their duties in Fort St. George, for which they are detailed and relieved monthly. The best hours for drills, parades, and marches is before sunrise. The men on an average have six nights in bed during the week.
	3. The barracks are 150 yards from the quarter guard, which is relieved daily. There is a roll call every day at 5 p.m. With reference to the effect of night guard on health, the men of the company are all well-seasoned men.
VIII. Instruction and Recreation.	1, 2. There is no ball court or skittle-grounds, but there is a school with a good 3rd-class schoolmaster; also a very good library and reading room, open every day, but not lighted at night. There is no day room or soldiers' clubs. There are several soldiers' gardens; and ground to the rear of barrack is granted to all soldier applicants. There are no workshops, neither is there a theatre or gymnasia. The reading room is much appreciated by the men during the heat of the day, as well as at other times. There is no restriction on the men as to exposure to sun and rain out of the barracks when off duty. No suggestion to make as to the existing means of recreation and employment.
	3. The institution of soldiers' savings' banks would be very advantageous.
	4. There is a great deal of shade, but not sufficient to enable the men to take exercise during the day.
IX. Military Prisons.	1. There is one prison under the same roof as the canteen and guard. It is not well ventilated and requires windows; there are ventilators at the top of the prison, but very little light can penetrate. There are besides two solitary cells, containing compartments for two prisoners each. They are built on the same plan as all others existing at every station in this presidency.
X. Field Service.	1. There are no special local regulations for field medical service not included in the general Presidency Regulations.
	2, 3, 4. No reply to these queries, the questions not being applicable to this station.
XI. Statistics of Sickness and Mortality.	No information under this head.
XII. Hospitals.	1, 2. The hospitals are situated in one row and (for the treatment of the sick) are two in number—one being for the worst cases of the men returned from foreign service (natives), the other being the European hospital, to which is attached a small room for women and children. These are in the immediate rear of the veteran company patchery. There are no stables. The bazaar is a considerable distance away, as also the houses of the civil population. There are two other hospitals, generally filled by sepoys returned from foreign service, and not requiring treatment. The site of all these buildings is open and well ventilated, but the ground is low and in the rainy season under water, a great deal of the rain falling in the patchery draining down towards the European hospital.
	3. The water supply is abundant and of very good quality.
	4. The drainage is very bad, and from the low position it is very difficult to improve it. The impurities of the hospitals are removed by toties, one being attached to each building. These men carry away all filth and refuse matter to such a distance that no bad smells are observed. This system appears to answer well. The hospitals are all of the same size, shape, and capacity. The description of one is therefore sufficient.
	5. The floor of the building is raised about two feet above the surrounding ground, but fresh air does not freely circulate under it. There is no provision made for conveying away the roof water. Rain water must either evaporate or sink into the subsoil. There is no drainage or guttering sufficient to remove rain-fall rapidly. The hospitals are built of brick, with tiled roofs. The walls are single and of sufficient thickness. The roofs are single; if they were double, the heat would be much less. There is a verandah on each side of the hospitals 70 feet long by 10 feet 10 inches broad. These are sufficient to protect the hospital. In

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	the European hospital the verandahs are never used for the accommodation of sick or others, but in the N. I. (central) hospital they are used for itch cases and some other slight complaints when the ward is full. The hospitals consist of one flat.

Table of barrack accommodation.
Date of construction, 1824.
Total number of wards, 1 to each hospital.

Wards or Hospital Huts.	Regulation Number of Sick in each Ward or Hut.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
For European Artillery Veteran Company, one hospital (one ward); there is also a small room for women and children. For N. I. depôt, one hospital for sick, and two for convalescents; all the same size.	There is no regulation number of sick. Each ward will hold 30 beds easily. In the hospital of the N.I. depôt, the number is sometimes increased to 46. It is then however crowded.	Seventy feet.	Eight feet.	Average height of room, 10 feet. The roof slopes.	22,275 feet.	Never less than 484.	This will depend on the number of beds in use. A bed covers about 24 feet of ground.	Average 20 inches. The wooden cots are higher than the iron ones.			

The hospital is so placed as to receive the full benefit of prevailing winds. The hills before mentioned may interfere a little, but they are at a considerable distance. There are no windows. The jalousies and doors take their place.

6. Free ventilation is kept up by means of three doors and two jalousies on each side, and two doors at each end of the building. The jalousies consist of two Venetian shutters on a framework, 4 feet by 1½.
7. There are no regular means of cooling the air admitted into the wards, but punkahs are kept going during the hot season.
8. There are no means of warming, as it is not required. The walls and ceilings of hospital wards are cleansed and whitewashed once a year, but oftener if deemed necessary by the medical officer.
9. The privy is a brick building with a tiled roof, situated 40 yards from the western side of the hospital and measuring 10 feet by 8. Urinals consist of earthenware vessels. The urine, &c. is carried away by toties. The filth is carried away, it is not offensive.
10. The sick have large tubs in hospital, back verandah, or some of the outhouses for lavatory purposes. Those who are very ill are washed in the ward by the attendants.
11. There is an excellent plunging bath under cover in an outhouse, the water of which is changed as often as required. The means of bathing are ample.
12. The washing and drying of hospital linen is conducted by a dhoby on the hospital establishment.
13. The storage is sufficient and dry.
14. In the native hospital the cots are of two kinds, some iron, some wood-taped, the latter being most convenient for patients with bowel complaints. In the European hospital, they are all of the latter kind, and each is furnished with a quilt, two pillows, and a blanket.
15. The cook-room is situated about 20 yards to the rear of the hospital, and is well provided with coppers, baking-tins, and earthenware vessels. Native cooks are supplied by the commissariat department, and no fault is found with the cooking. Whatever is ordered can be supplied.
16. Diet tables, &c., according to regulation.
17. The provision for attendance on the sick in the European hospital is, one serjeant, one nurse, and five menials, which is sufficient. In the native hospital, one havildar, one naick, twelve orderlies, one dhoby, one toty. The number of orderlies may be increased at any time.
18, 19. The hospital is very healthy. No epidemic diseases ever appeared in either European or native hospitals. No improvements to suggest.
20. Convalescents take exercise near the hospital at daybreak and sunset. There is very little twilight here, and while the sun is up, it is impossible to walk. There are no shaded walks or seats.
21. There is a small ward for women and children, containing six beds, but it is quite insufficient for the 500 women and children living in the patchery; hence, all who cannot attend as out-patients have to be attended at their homes, where they cannot be properly looked after. A new female ward is required.
22. There are no special local hospital regulations not included in the general Presidency Medical Regulations.
23. In matters appertaining to the sanitary state of the hospital, repairs, and buildings, &c. a medical officer has no power to depart from the rules of the service as laid down; but his suggestions to commanding officers and superintending surgeons are generally attended to, if they involve little or no extra expense to the State.
24. There is no hospital for convalescent Europeans. I do not think one would be an advantage. There is one for natives, who having returned from foreign service require no treatment prior to proceeding on sick leave to their native villages.

PALAVERAM. MADRAS.

References to Subjects and Queries.	Replies.
XIII. BURIAL OF THE DEAD.	1. The burial ground used by British troops adjoins the station on the south-west side. The wind blows from that quarter during March and April. The Catholic burial ground is in a similar position, half a mile beyond. 2. There are about 50 yards of ground in each burial ground actually in use, with two or three times as much to spare. The soil is gravelly and very rocky. No graves have ever been opened, so I cannot state how soon decay takes place. Both the grounds are well kept and neat. 3, 4. The grave space allowed is 6 feet by 3½, and the interval between the graves is 5 feet; the depth is from 5 to 6 feet. Graves are never reopened. Interment is compulsory at ordinary times, from 12 to 18 hours after death; during epidemics, within 8 hours. The graves of Mussulmen are scattered all over the country. A rich man is buried in his own compound. Hindoos are buried near the river. Burning of the dead is performed on the other side of the hill and near the river, but neither from this practice, nor any burial ground, is an offensive smell observed. The regulation with regard to the burial of British troops is, that when a man dies before noon the corpse is buried at sunset; when after noon, at sunrise the following morning. No lime is put in the coffin. 5, 6, 7. The dead of the camp followers and bazaar people are disposed of according to caste or religion. The majority are buried near the river. No injury to the public health accrues from the present practice. No improvement to suggest.

(Signed) W. H. BAYNES, Captain, Commanding Palaveram.
ROBERT W. COCKERILL, Assistant Surgeon, 20th Regiment N. I.
ARTHUR S. MOBERLY, Captain, District Engineer of Chingleput.

I. TOPOGRAPHY.	1. The general aspect of the surrounding country is flat on the coast and sandy along the shore, becoming undulating, and more or less hilly towards the Western Ghauts, which are about 30 miles from the coast. Several streams and rivers flow into the sea from the Ghauts along the coast. The country between this and the station is much intersected by back waters, which all have more or less communication with the sea. In the wet season of the year, from April to October, the more flat and low parts of the district are covered with rain water, but the country is not otherwise of a swampy character. There is a great deal of wood, consisting principally of cocoa-nut trees, jack, betel, cachew, and mango. The jungle grass during the wet part of the year is most luxuriant and coarse, but becomes very speedily burnt up from drought in the dry season. 2. The elevation above the level of the sea is from 15 to 20 feet, according to the state of the tide; it is on the same level with the adjacent country. The nearest back water is about 2 miles off, and about the sea level. No healthier or better spot could have been selected; the position of the European barracks being generally unexceptionable in every way. This natural state has been more or less injured by the greater portion of the cantonment being the property of the Beebee of Cannanore, over which the military authorities have limited power as to removing sources of malaria, and preventing the planting of trees. 3. The nearest mountain land is the summit of the Western Ghauts, bordering on the Coorg, Mysore, and Wynad table lands; they are from 30 to 40 miles off, and average from 3,000 to 4,000 feet in height. 4. The nearest water is the sea, the station being close on the coast. The low grounds in the immediate vicinity of the station and throughout the district are covered with water during the rainy season, which extends over a period of six or seven months. Within the limits of the cantonments there are many old quarries, from which laterite stone has been cut, and in which refuse and vegetable matter accumulate. This is certainly more or less prejudicial; it has latterly been put a stop to. 5. The station is, on the whole, open and freely exposed to the sea breezes, but certain parts of the cantonment are so much covered with cocoa-nut and other trees as to render free and perfect ventilation an impossibility, particularly among the native population. The temperature of the station is not raised by the buildings being exposed to reflected sun heat. During November, December, and January a strong land wind blows from shortly after sunset, until the earth has been sufficiently heated by the sun of next day, when a current almost invariably sets in from the sea. The land wind is prejudicial to health. 6. The surrounding country is cultivated. There are no works of irrigation of any extent, and they have not affected the health of the station. The whole country close round the cantonment is more or less covered with rice cultivation, both dry and wet. A few spots in the cantonment are also allowed to be cultivated, as thereby the ground is kept clean and clear of noxious herbs. There is no cultivation of indigo, nor is the preparation of hemp or flax carried on in the district. 7. The town of Cannanore, containing about 14,000 or 15,000 inhabitants, abuts on the eastern boundary of the cantonment.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	8. The district near the cantonment is on laterite rock strata, generally covered with a red gravel to the extent of from 2 to 8 and 10 feet and more; in other places the laterite crops out. This kind of ground runs in ridges, interspersed with deep muddy flat ground. 9. Water is found at from 20 to 40 feet below the surface, according to situation and season. In the wet season the water is almost everywhere close to the surface, and the wells are quite full. In the dry season in many places they run quite dry. 10. There are no surface springs in the vicinity of the station. The rain-fall sinks principally into the subsoil; a considerable portion, however, draining away into the sea. No drainage from higher ground passes into the subsoil of the station. 11. The water supply of the station is derived from wells. There are no tanks within the station or within half a mile, excepting a few very small ones in the native regimental lines, and another small one close to the northern boundary. They are full most part of the year, but dry up in the months of April and May. They are free from plants, and contain frogs and such like, and, perhaps, murrel fish and other small tank-fish. No tanks used for drinking purposes are also used for bathing. The wells are generally free from impurities. There is no nuisance or malaria proceeding from any tanks within or without the station. 12. The supply of water is generally ample in the centre of the cantonment, and along near the sea; but in some seasons there is little or no water in the native infantry lines, and it has then to be brought from a great distance. It is quite free from colour, taste, and smell; it is good and not injurious to health. Puckallies and bullocks are employed for raising and distributing the water to the troops. No better means are available. 13. There are no other topographical points in the station bearing on the health of the troops, not included in the above. 14. The older stations were, generally, I believe, occupied without much inquiry; attention has lately been paid to these points, as well as to the defensive capabilities; but even with every care, after location, cantonments often turn out different from what could have been expected.
II. Climate.	1. In the garrison hospital there are a pluviometer, an aneroid barometer, a thermometer, and also a wet bulb thermometer. In the hospital of Her Majesty's 66th there are a barometer, a thermometer, and an imperfect pluviometer. 2. The following Meteorogical Tables are from the garrison hospital, and are the result of nine years' observation.

From January 1, 1850, to December 31, 1858.

3. The climate at this station is on the whole equable, but occasionally changeable and chilly; during the wet season it is moist and debilitating. Residence on this coast for an extended period is productive among Europeans of great loss of tone and debility generally. The diet ought to be nutritious and mildly stimulating. The clothing ought to vary with the season, but flannel under-clothing is necessary at all times. The drills and exercises ought to take place early in the morning, or late in the afternoon; during the wet season these ought to be had under cover. The most unhealthy months at the station since the arrival of Her Majesty's 66th Regiment have been May, June, July, and August; and the most prevalent diseases at these times have been fevers, bowel complaints, and pulmonic diseases.

4. There is no district near the station the climate of which is more conducive to health than that of the station.

References to Subjects and Queries.	Replies.
II. Climate—*cont.*	5. Brigadier FitzGerald has served at—1, Trichinopoly; 2, Samulcottah; 3, Secunderabad, three times; 4, French Rocks; 5, Bangalore, twice; 6, Cuddapah; 7, Ghooty; 8, Masulipatam, twice; 9, Jubbulpore; 10, Hussungabad; 11, Kamptee, three times; 12, Jaulnah; and 13, Nassick. Nos. 1, 2, 5, and 12, were generally healthy when he was there. No. 3 has, as a rule, been found unhealthy for European troops; whether from the locality of the old barracks or not, he cannot say. He commanded the 3rd European regiment in these barracks for 23 months, and during that period they were very healthy. He was at No. 4 on its formation, when the corps he belonged to was entirely knocked up with fever: he believes it is healthy now. No. 5 is well known. Nos. 6 and 7 are very hot, and subject to periodical attacks of cholera, otherwise healthy. No. 8, pretty healthy, but subject to periodical attacks of sickness. Nos. 9 and 10, feverish. No. 11, 25 years ago, was subject to a very fatal inflammatory description of fever, but is now much improved. Nos. 12 and 13 were very healthy; some years ago, however, the former was subjected to a most deadly attack of cholera.
III. SANITARY CONDITION OF STATION.	1, 2, 3, 4. A general map of the station and surrounding country, plans of the barracks, &c., together with particulars of barrack accommodation will be forwarded. 5. The windows of the barrack-rooms are on both sides, and open down the centre longitudinally. There are verandahs on both sides of the old barracks, 8 ft. 5 in., and on the outside of the new barracks 7 ft. 6 in. broad, except to the east of the new range. The inner verandahs in the new portion of the barracks are occupied as sleeping quarters by 103 men. Some of the windows and doors are glass and panelled, some with glass windows and shutters, and some Venetianed. 6. The bedsteads consist merely of boards and trestles. The bedding consists of a mattress, blanket, and cover, with pillow. The bedsteads are infested with bugs, and Dr. Murray would strongly recommend that iron ones, as in use at home and elsewhere, be substituted. 7. The dimensions of a tent are as follows:—20 ft. long, 14 ft. broad, and 5 ft. 4 in. high. The sloping roof is 20 ft. long, 14 ft. broad, and 5 ft. 2 in. high. The cubic area is 2,216 ft., and the superficial area 280 square feet. These tents are supposed to accommodate 25 on ordinary marches and 20 men on field service; thus giving only from 88 to 110 cubic feet of air per man. 8. Ventilation in barracks is effected by means of doors, windows, and pent-houses in the roofs, and also by ventilators in the walls, regularly arranged along their tops. The guard-rooms are ventilated by doors and windows only. Dr. Murray states the means of ventilation in the barrack rooms do not keep the air pure by night, the windows and doors being necessarily to a great extent shut. There are no means used for cooling the barrack rooms. Punkahs are not used or required in barracks at this station; they have them in the hospitals, but the men don't like them. 9. The barracks are built of laterite stone, plastered. The roofs have teak wood rafters, reapers, and are double-tiled. The tents are constructed of a coarse punjum cotton cloth, made for the purpose—two white, and one blue. There are no huts. 10. The floors are composed of laterite stone, raised from the ground about 4 feet. There is no passage of air beneath. 11. The materials used in the construction of the barracks, &c., are suitable to the climate. They are kept in repair by the department of public works, on the application of the commanding officer of the regiment, through the brigade major. The repairs are not generally quickly executed. The brigadier commanding is answerable for the sanitary state of the cantonment on the reports of the several medical officers. The walls and ceilings of barracks are limewashed once a year: the orders are for their being kept constantly well swept and clean. 12. There are six lavatories attached to the barracks, supplied with water by puckallies. The water runs off into the barrack drains. 13. Sketch and description of barrack cook-houses will be sent. The native dhobies or washermen take the clothes away, and wash them at any stream, and dry them on ropes on the parade, generally. 14. A sketch and description of the privies and urinals will be sent. 15. The privies have chimney ventilators leading from where the tubs are placed, to the outside. They are lighted from the doorways by day, and by tin lamps at night. The barracks are lighted with oil in glass burners, suspended in globe and square glass lamps. 16. The drains from the barracks run on all sides of the buildings, and are generally open—about 1 ft. deep and 1 ft. broad. Here and there they are paved with granite, but are generally constructed of laterite stone, which is very unsuitable, being so porous. The sewers from the privies, as well as from the barracks, lead into covered drains outside the barracks, the outlet of which is into the sea, about 60 yards off. The drainage is insufficient, there not being enough slope to carry it away readily. During the wet season the barracks, cells, and hospitals are all damp in the floors, in consequence of the porous nature of the materials of which they are made. Dr. Murray would recommend wooden flooring instead. The fluid refuse drains off as above described; but the drains are generally badly constructed. There are no cesspits or foul ditches. 17. The cantonment and its vicinity are generally very clean. Scavengers' carts are used to take away the refuse and manure from the different bazaars, which are taken some distance away, and deposited in pits dug for the purpose. 18. Every means available are taken to keep the cantonment clean of all objectionable vegetation and deleterious herbs likely to cause malaria. The back of the bazaar, and for a great distance outside the cantonment, is intersected in every direction with high mud walls, with pathways between. This is the style of division of property in Malabar, and can not be altered, without infringing on the habits of the population, and on private rights. The hospital of the 66th has a high wall on three sides, which interferes with the ventilation; but it has been recommended to be reduced in height, with a railing instead. The sanitary condition of the cantonment bazaar is good and clean. The drainage is very good, and water is abundant. The bazaar is not overcrowded. Some arrangement is required for the erection of public privies and

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	latrines for those who are unable to have private privies. All who have not, ease themselves in open spots outside the cantonment, to the injury of the public health, as well as decency. The arrangement of these matters is at present in a transition state. Formerly, there being no municipal fund, such was done out of the fine fund levied by the superintendent of police. This has lately been forbid, and estimates have been ordered to be sent in for the necessary expenses, but such not having been sanctioned, and probably may not be for a long time, there are at present no funds available for this, and the commanding officer does the best he can. Since this was written, adequate funds have been authorized for the conservancy of the cantonment. The native houses are good; some are tiled, and others thatched with the cocoa-nut leaf. There are dung-heaps and cesspits within the compounds. Moreover, the Tiers without the cantonment bury their dead within their own compound; those within the limits of the cantonment are not permitted to do so. There is no nuisance experienced in barracks from wind blowing over the native dwellings. 20. Dr. Stevens states, the place where animals are slaughtered for the soldiers is just within the limits of the cantonment north of the fort. The offal is thrown into a small back water close by, and is a nuisance to the surrounding houses. Brigadier FitzGerald states he does not know of any more suitable place. It is as far removed as possible from all the barracks and officers' lines. The wind seldom blows from that quarter; and the back water is open to the tide. 21. There are very few horses in the bazaar. Where there are, they are kept in the owners' stables. No inconvenience is experienced. 22. There are no artillery or cavalry stables, or picketing grounds for horses, at this station. 23. No married people occupy barrack rooms with the men. Married men are accommodated with quarters out of barracks, in what is now a village occupied by Christians, half-castes, &c.; this spot was originally the regimental patchery. Separate ranges of married men's quarters are very desirable.
Officers' Quarters.	1. The condition of the officers' quarters is good. Those of the European regiment are situated on a line facing the sea, the houses on each side of the main road. Four or five of these houses are so situated as to be under the immediate influence of the exhalation from the Roman Catholic burial ground, and which is very prejudicial to that neighbourhood. It is in the midst of a densely populated place, called Barnacherry, which is principally inhabited by the families of the European regiment, half-castes, and natives, and a large bazaar. It is strongly recommended that it should be shut up, and no interments permitted to take place. There is a large open drain running through Barnacherry, and throughout the premises belonging to the German Mission, close to the burial ground, taking its course to the sea; this should be arched over.
IV. Health of the Troops.	1. The station is generally healthy; but the town of Cannanore at certain periods of the year is very unhealthy. 2. The prevailing diseases among the native population are cholera, small-pox, dysentery, and diarrhœa. 3. Dr. Stevens attributes the unhealthiness of the town of Cannanore to its being overcrowded, and from the people of the Tier caste burying their dead within their own compounds; also to the numerous places of interment in the midst of the town belonging to the Moptah inhabitants. 4. The last station of Her Majesty's 66th Regiment was England, where it was for 14 months, and left 29th August 1857. The state of health there was good, the principal diseases being venereal. They arrived at this station on 13th December 1857, in good health. The regiment has since suffered principally from fevers, venereal, and bowel complaints; pulmonic, rheumatic, and hepatic diseases. No part of the men's present accommodation is more unhealthy than the rest. 5. The troops are not regularly camped out every year; but portions of the regiment have at different times been encamped for sanitary reasons, with the best results. 6 to 16. No experience of hill stations. 17. There is no higher ground near the station, which could be advantageously occupied as a hill station. 18. Gravelly soil is the most healthy for stations, and black cotton soil and deep clay the most unhealthy. 19. Dr. Murray considers that no soldier should leave England for India until he has served at home for at least three years, or until he be 25 years of age, and has a constitution to some extent established and strengthened. The best period for troops to land in India is at the commencement of the cold weather. Recruits on landing in India should be carefully kept from exposure to the sun. The drills and duties should be as light as possible, consistent with a due regard to the maintenance of discipline. Every facility should be afforded for their amusement and recreation, without exposure; but the utmost attention should be paid to the wholesomeness and proper cooking of their rations, to their personal cleanliness, and a proper supply of wholesome water. If possible, they should be sent to a cool and undoubtedly healthy station, until they have to some extent become habituated to the climate. 20. Dr. Murray believes that if the constitution of the recruit is established, and he shows no symptoms or tendency to disease, he may be sent direct to India without disadvantage. 21, 22, 23. No reply to these queries. 24. Dr. Murray considers that pulmonary and rheumatic cases should leave India for England in or about the month of February, so as to arrive in England in May or June. Invalids labouring under other diseases may leave at any season, as they are likely to derive great advantage from the sea voyage previously to landing in England.
Diseases.	1. There are regular inspection parades once a week in Her Majesty's 66th for the discovery of diseases. 2. There has been no scorbutus or scorbutic disease in Her Majesty's 66th Regiment since their arrival in India, with the exception of two cases of chronic dysentery, which

CANNANORE. MADRAS.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	presented scorbutic symptoms before death; both these cases, however, came into head-quarters from detachments. 3. The proportion of hepatic to other diseases usually under treatment is 4 per cent. The disease is attributable to climate, and has not occurred generally as the consequence of other diseases; it has sometimes been observed in connexion with or as the consequence of dysentery. Avoidance of exposure to the sun, and protecting the body by wearing flannel or woollen under-clothing, I consider the means most likely to diminish the frequency of this disease, combined with habits of temperance and general regularity. 4. No case of dracunculus has occurred in the 66th Regiment. 5. The proportion of the constantly sick from venereal to the total sick from all other diseases, is 33 per cent. The precautions I would suggest for diminishing the sick from these complaints are, the establishment and maintenance of a lock hospital, and the punishment of all prostitutes who are known to have communicated the disease, as well as the regular inspection of all native men in the Government pay. 6. The forms of fever prevailing at this station are the continued and badly-marked remittent types. Intermittent fever also occasionally occurs, but rarely. The forms are all of the asthenic type, and frequently complicated with internal inflammation and congestions, particularly of the lungs and bowels. Dysentery is common during the south-west monsoon, and is generally of a subacute nature. Cholera does not prevail. Small-pox. No case of this disease has occurred in Her Maiesty 66th Regiment at this station. Rheumatism is common during the south-west monsoon, and is generally of a very intractable and obstinate description. The proportion which admissions and deaths from these diseases bear to the total admissions and deaths is as follows:—

Diseases.	Proportion of Admissions.	Proportion of Deaths.
Fevers { Febris Intermit.	0·015	—
Fevers { „ Remit.	0·001	—
Fevers { „ C.C.	0·093	—
Cholera	0·002	0·100
Dysentery	0·078	0·200
Small-pox	—	—
Rheumatism	0·049	—

7. The more frequent zymotic diseases at this station in Her Majesty's 66th Regiment are fevers and dysentery, but neither prevail to a great extent, and they are like diseases generally on the coast, of the asthenic type usually; they are most prevalent from April to November, during the south-west monsoon or wet season. They do not prevail particularly in any locality. The sanitary condition of the bazaar, &c., is good; no habits or conditions among the men of Her Majesty's 66th, or otherwise within the limits of the cantonment, appear to predispose to these diseases.
8. No epidemic disease has occurred in the 66th Regiment at this station.
9. Quinine has not been given as a prophylactic at this station; it has been so given to small detachments of the regiment marching to and from the head-quarters, with good result.
10. No reply to this query.

V. INTEMPERANCE.

1. The soldiers at this station, as a body, are very temperate.
2. The number of admissions into hospital of Her Majesty's 66th Regiment in any way attributable to intemperance is exceedingly small. During the year 1859, out of 1,037 admissions, only 4 can be in any way placed under this head, giving only a proportion of 0·38 per cent. of admissions. Drunkenness is always punished as an offence.
3. Arrack supplied by the commissariat is sold in the regimental canteen to the men. Each man may have 2 drams or 1½ gill daily, but not more, and on the whole not more than half of this amount is consumed daily by the men. No liquor of any description is allowed to be sold in the bazaar to European soldiers. Spirit is not supplied as a ration. It is not a habit with the men to take a dram before morning parade. It is not given as a ration to convalescents. Ginger beer and coffee, as well as porter and ale, are also sold in the canteen.
4. The consumption daily of the amount of arrack allowed is by no means injurious to the health of the men. Brigadier FitzGerald considers the quantity of spirits allowed the men is conducive to their general efficiency.
5. Dr. Murray considers that it would be injurious to the health of the men to stop their allowance of spirit, as he believes they would find means to provide themselves with an inferior description of intoxicating drink.
6. Dr. Murray is of opinion that good malt liquor or good wine, in moderate quantity, is decidedly preferable, in a sanitary point of view, to spirituous liquors; but he does not consider that a small quantity of good spirit is objectionable.
7. Coffee and ginger beer are used to some extent, but malt is the favourite drink among the men. Spirits and malt liquor are both used in such a moderate quantity that no satisfactory comparison can be drawn; they are all good in moderation.
8. There is no ration of spirit, and the men drink beer in preference.
9, 10. Dr. Murray thinks it would be injurious to suppress altogether the sale of spirit; he considers the limitation at present existing in regimental canteen very satisfactory. No recommendations to suggest.
11. Canteen and bazaar regulations annexed. The following are the most important provisions as regards health:—

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	The canteen is open at the following hours for the issue of the following quantities of liquor :— 12 to 1 p.m. - - - - - 1 pint of beer. 2 p.m. to ¼ past 3 p.m. - - 1 dram of arrack, or 1 pint of beer. 6 p.m. to ¼ to 8 p.m. - - - for the same allowance. No man is to receive more than 1 glass of arrack or 1 pint of porter at any one issue, nor can more than three issues be made to any one soldier during the day. No defaulter can enter the canteen on any pretence. In the bazaar no spirituous liquor or intoxicating drug is allowed to be sold to any European soldier without a written licence from the commanding officer, under a penalty not exceeding 50 rupees. Any camp follower, or military pensioner, or soldier's wife, having in their possession spirits without a permit, is liable to a fine of 50 rupees. Natives smuggling spirits or intoxicating drugs within the limits of the cantonment, and selling the same to an European, are liable to imprisonment for one month, or, on the second offence, to corporal punishment, not exceeding 50 lashes.
VI. Diet.	1. The ration for the troops is as follows :—1 lb. bread, first sort; meat, 1 lb., beef five days and mutton two days in the week; $\frac{5}{7}$ oz. tea, or $1\frac{3}{7}$ oz. per day of coffee; $2\frac{1}{2}$ oz. of brown sugar, second sort; 4 oz. of rice, first sort; 1 oz. of salt; 12 oz. of potatoes, 2 oz. of onions, and 2 oz. of country vegetables, according to the season. The inspection usual in Her Majesty's service is daily made of all rations and provisions supplied for the use of the troops. 2. No fruit is included in the ration, nor is such procurable if it were. The pay of the soldier in India is calculated exclusive of rations. The soldier partakes of three meals a day, viz., breakfast at 8, dinner at 1, and evening meal at 4. The breakfast consists of bread and about 1 pints of tea or coffee, with a portion of the meat supplied for dinner. The dinner consists of 16 oz. of vegetables and 4 oz. of rice, with beef or mutton, minus the portion prepared for breakfast, and cooked according to the liking of each individual soldier. The evening meal consists of bread and about $1\frac{1}{2}$ pints of tea or coffee. All the meals are considered ample and good. 3. Dr. Murray thinks that a ration of the best fish might with advantage be given to the men twice or three times a week, excepting during the very hot months, February, March, April, and May, when the fish are soft and not in condition. Brigadier FitzGerald thinks that once a week would be sufficient; only a portion of the regiment could be supplied in one day. He is not aware of any attempt to dispose of the rations. 4. All necessary apparatus, boilers, frying-pans, &c., are kept up by the Commissariat on indent as required. The kitchens are clean and well ventilated, and sufficiently supplied with water. The cooking is properly done and sufficiently varied. Tea and coffee are also supplied. Before a march the men always have coffee, or ginger tea and biscuit, and also when the march is half over. 5. Gardens for the cultivation of vegetables by soldiers would be very desirable when ground with a sufficient supply of water is available close to the barracks. A few already exist. Brigadier FitzGerald considers that when practicable, as above, Government ought to enclose the ground, dig wells, make water-courses, and provide apparatus for raising the water; also erect quarters for the man in charge of the gardens, who receives and takes charge of the tools each day, locking them in a place to be provided for the purpose. All garden tools and implements to be provided by Government, and reported on like any other article of barrack furniture. It would also be desirable that Government should, as far as possible, assist with a few suitable seeds. The garden ground is divided off into lots and numbered. All men wishing to have gardens intimate the same to a committee composed of non-commissioned officers, paying a subscription of 4 or 6 annas a month, according to circumstances. This subscription goes to pay for raising water and the hire of a few coolies for gravel-work, keeping the roads and pathways clean. They are not to be allowed to work in men's gardens. The accounts are kept by one of the committee appointed by the commanding officer; and an officer selected by him also acts as treasurer, and exercises a general superintendence. The above rules worked well in practice in the 3rd Madras European regiment at Secunderabad, when under Brigadier FitzGerald's command.
VII. Dress, Accoutrements, and Duties.	1. The soldier's dress consists of a scarlet cloth tunic, cloth trousers, and a pair of boots, issued biennially, with a wicker helmet. In the alternate years a red serge tunic, cloth trousers, and a pair of boots, are supplied. For the summer or hot season, two suits of khakee clothing, made of cotton material, are supplied, worn generally with a foraging cap covered with khakee, and reckoned part of his regimental necessaries. A great coat is allowed to each soldier every six years. The accoutrements consist of a pouch belt, with moveable buff cap pocket attached, a waist belt, with a moveable frog for the bayonet, a waist plate, and bayonet scabbard, and two pouches to contain respectively 40 and 20 rounds of ammunition; the former (40-round pouch) attached to the pouch belt, but moveable, and hangs behind; and the latter (20-round pouch) attached to the waist belt, also moveable, and hangs on the right side of the soldier in front. The present dresses in use are suitable to the variations in the climate. Dr. Murray thinks that in the wet season the men should all be provided with woollen socks. Brigadier FitzGerald states that no European sentry is exposed to sun or wet when on guard. The dress is according to the season.
Duties.	1. Dr. Murray thinks it would be highly desirable that men should be thoroughly drilled at home before being sent to India. 2. The men of the 66th Regiment do not suffer in health from drill. During the cold season the men are out at exercise once a day for not more than an hour for five days in the week, either morning or evening, as may be found most suitable. Now and then on an emergency they may be out morning and evening; and this is independent of inspections of kit, &c., in barracks. In the hot months they are not out more

References to Subjects and Queries.	Replies.
VII. Dress, Accoutrements, and Duties—*Duties—cont.*	than twice a week, and in the monsoon probably for weeks not at all. The best hours for drills, parades, and marches, speaking generally, are early in the morning, or late in the afternoon. In the monsoon, or wet season, however, Dr. Murray thinks the men should not leave their barrack rooms before day-break. There are general orders extant as to the hours for and direction of drill. The men have at present seven nights in bed. 3. Guards are mounted within a short distance of the barracks. The men are 24 hours on guard. Night guards are not heavy, and have not acted prejudicially on health.
III. INSTRUCTION AND RECREATION.	1. The following are the means of instruction and recreation:—There is one ball court, one skittle ground, a school, and a cantonment library; but there is no reading room for the men, or day room, nor any soldiers' clubs. There are a few soldiers' gardens, but no workshops. A very large and most creditable building has been erected by Her Majesty's 66th Regiment as a theatre. There is no gymnasium. The means of recreation, &c., are not at all sufficient to keep the men occupied during the heat of the day, and during the wet season; indeed, during these times the men have no occupation whatever. The men are not allowed to expose themselves to the sun between 8 a.m. and 4 p.m., and with the best results to health. 2. Dr. Murray would recommend that skittle grounds, workshops, and gymnasia, should be erected, in which the men might find occupation and amusement, protected from sun and rain. Brigadier FitzGerald is certain that any extra expense incurred would be more than repaid by the health of the men, and many such might be made self-supporting. 3. A regimental savings' bank is in operation, and is highly advantageous. 4. The only shade the men have during the day are the verandahs.
IX. MILITARY PRISONS.	1. There are no military prisons, and the cells are unsuitable for the confinement of prisoners for any lengthened period, being built on the level of the ground, and excessively damp during the wet season. They have not sufficient cubic space, being only about 750 cubic feet, and they have no means of communication between the prisoner and the provost serjeant.
X. FIELD SERVICE. XI. STATISTICS OF SICKNESS AND MORTALITY.	No information under these heads.
XII. HOSPITALS.	1. The ground plan and sketch of the elevation of the hospital will be forwarded. 2. The hospital of the 66th Regiment is situated on the cliff, about half a mile north of the barracks. It is remote from the bazaar, and but few native houses are in its vicinity. With the exception of a high wall, which surrounds it on three sides, the site is a most excellent one, and freely exposed and ventilated. It is quite open on the seaward side. It is healthy, and free from all nuisances. 3. The water supply is abundant and wholesome. 4. There is a system of surface drainage for removing all water and other impurities, and the rain water. It escapes over the cliff about 110 yards from the hospital. 5. The lowest wards are raised above the ground only by about 1½ ft., and the highest about 4 ft. There is no perflation of air under the floors. The rain water from the roof partly sinks into the subsoil, but is principally carried away by the surface drains. These drains are connected with the kitchen and all the bath-rooms, and carry away the rain-fall readily over the cliff into the sea. The hospital walls are built of laterite stone, and the roofs are tiled. Both roofs and walls are single; but there is free ventilation by windows, doors, and openings at the top of the walls, and between them and the roof. The hospital is supplied with verandahs on all sides, about 13 ft. wide, which afford good shelter from the sun's rays. There is one small inner verandah attached to the main building of the hospital, which is used for the accommodation of men temporarily detained at the hospital; it accommodates about six beds. All the buildings consist of one flat.

References to Subjects and Queries.	Replies.

The hospital is in the best situation possible, and receives the full benefit of the winds, but for its wall, which, however is, as Dr. Murray understands, going to be done away with, and a rail substituted. The windows open down the centre from top to bottom; they are principally glazed, but some are jalousied, and some are partly wooden; a few open transversely.

6. The only means of ventilation are the doors, windows, and openings at the top of the walls. There is always sufficient breeze to effect a thorough ventilation, except sometimes of a night. There are a few jalousies constructed in the ordinary way.
7. There are no artificial means for cooling the air, except by ordinary punkahs, which are unnecessary in general, and are not liked by the men.
8. There are no means of warming, nor are any required. Hitherto the walls have been limewashed once a year: the floors and lower part of the walls, &c., are frequently limewashed.
9. The privies and urinals of the hospital are situated at a distance apart from the wards, with which they are all connected by covered ways; they consist of roomy apartments, built of the same material as the hospital. There is no drainage for the privies, large tubs are used under the seats for the accommodation of the men, and the soil is always removed at night. Charcoal is used to deodorize them.
10. There is a bath-room attached to each ward, provided with tubs for lavatory purposes, and plentifully supplied with water.
11. The sick have no means of bathing except in tubs in the different bath-rooms.
12. The hospital linen is washed and dried, &c., at a distance from the hospital by a native contractor.
13. The storage is sufficient, but is of course in the wet season not exempt from the general dampness of the coast.
14. The bedsteads used in the hospital are of wood with tape bottoms; and the bedding consists of blankets, sheets, and pillows. There are no mattresses, but a kind of palliasse is used instead. The supply of bedding is ample. Dr. Murray would suggest the adoption of iron bedsteads, as in use at home, in preference to the wooden ones in use here.
15. The hospital kitchen is a separate building, distinct from the other buildings, with which however it is connected by a covered way; the means for cooking are ample, and the cooking vessels are fresh tinned inside once a fortnight. There are means for cooking food in every variety as may be ordered.
16. Diet tables, &c., are forwarded.
17. The sick are attended by coolies and other native servants, and there is also an hospital serjeant, and a nurse for attending sick women and children: there are no regimental hospital orderlies allowed by the regulations of the presidency, but when any patient is very ill, he has the attendance of an orderly man from his company, or if necessary of two orderlies, one to relieve the other.
18. The sanitary condition of the hospital is in every respect satisfactory. No epidemic disease, hospital gangrene, or pyæmia, have appeared during its occupation by the 66th Regiment.

CANNANORE.
MADRAS.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	19. No answer to this query. 20. There are no trees or shaded walks within the hospital enclosure, but there is a large compound in which convalescents may take exercise in the cool of the evening; there is also an hospital cart, in which convalescents are sent out in the evening to the north beach or elsewhere for change; and there is also a dooly available for this purpose. 21. The women and children of the regiment when sick are admitted into the female ward of the hospital, and dieted and treated on the same principle as the men. There is no hospital stoppage for children, and only 1½*d.* a day for women. All the hospital arrangements are quite satisfactory. 22. There are no special hospital regulations not included in the general presidency medical regulations. 23. The powers of the medical officer in matters of diet and medical comforts are absolute. In matters of repairs, &c., his recommendations to the officer commanding the regiment are always considered and attended to. 24. There is a ward in the hospital which is specially set apart for the accommodation of convalescents and of invalids who may have been long under treatment and are awaiting a passage to England. They are not on hospital diet, but are otherwise subject to the hospital regulations, and are constantly under the observation of the medical officers.
XIII. BURIAL OF THE DEAD.	1. The Protestant burial ground in use is in the cantonment; it is the property of Government, and is 900 yards from the barracks. There is another spot enclosed for a new one, but never used, and is 620 yards from the barracks. The Roman Catholic burial ground, the property of the Roman Catholic clergy, is about 400 yards from the barracks, and is very objectionably situated. 2. The old Protestant burial ground contains 8,838, and the new 14,500 superficial square yards; and the Roman Catholic 6,833 square yards. The subsoil in both is gravel, and they are well kept. 3. The space allowed for graves is about 6 or 7 feet long, by 2 broad, and the interval between each grave from 1½ to 2 feet. Six feet is the depth according to orders in the Protestant ground. There is only one instance on record of a grave being re-opened for the interment of a relative. In the Roman Catholic burial ground it is known that graves have been constantly re-opened and the bones removed, but such has been put a stop to. The rule in all cases is, if death takes place during the night or early in the day, interment takes place in the evening, otherwise next morning before 7 a.m. As regards the native troops, the period between death and interment or cremation is even less than the above. No compulsory order is required. 4. The graveyard used by Roman Catholics is situated in the centre of the lines, and is very offensive, being altogether too full and crowded. Dr. Murray considers that further burial in this place ought to be stopped. Brigadier FitzGerald has had a board to report upon this burial ground, with a view to the nuisance being put a stop to if possible. There is still ample space, and until the locality can be changed, means have been adopted to ensure the graves being of a proper depth. It has never appeared that there has been any complaint as regards the Protestant burial ground. 5. The dead of camp followers or bazaar people are buried or burnt at various spots outside the cantonment at a distance of from one to two miles from the European barracks, and something less from the officers' lines and native lines generally. 6. No perceptible injury accrues to the public health from the present practice, except in the case of the Roman Catholic burial ground, already remarked upon. 7. Brigadier FitzGerald has recommended a new site for both the Protestant and Roman Catholic burial grounds in what appears to him the very best, if not the only, locality in or near the cantonment. The spot alluded to is within the limits of the cantonment.

(Signed) JAS. FITZGERALD, Brigadier,
Commanding Malabar and Canara.
JOHN LOVELL, Deputy Inspector-General of
Hospitals, Malabar and Canara.

9th November 1860.

BELLARY.

Accommodation { Queen's Troops { Artillery - - 242; Infantry - - 796 } ; Native Troops { Cavalry - - 394; Infantry - - 1,830 } } Total - - 3,242.

References to Subjects and Queries.	Replies.
I. TOPOGRAPHY.	1. The surrounding country is a gently undulating plain with detached granite rocks. It is in general very flat, dry, and arid. There is no wood or jungle, and water is exceedingly scarce. 2. The elevation of the station above the sea is by the most recent levels 1,500 feet, but these require to be checked. General Cullen's barometrical observations make the elevation 1,600 feet above the sea level. The adjacent country within 4 miles from N.E. to S.E. by the west is elevated about 50 to 70 feet above the station. From S.E. to N.E. the country falls rapidly into the valley of the Hugry. 3. The nearest lake is the Darojee tank, distant 18 miles, about 20 feet higher than the station. The Hugry river passes within 10 miles of the station and is 112 feet below it. It is usually dry. 4. There is no higher or healthier ground adjoining the station. No table land, but within 6 miles of the station there is a range of small hills, and among these there is a peak which rises to about 1,000 feet above the station.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	The vicinity is not liable to overflow of water. There are a few ravines, which serve to carry off the rain. They are not prejudicial to health. 5. The station is perfectly open, and quite free from all obstacles to a complete circulation of air on every side. A few houses near the granite hills referred to suffer from reflected heat, but the station does not. The station is exposed to cold dry easterly or north-easterly winds in November, December, and January; in some years giving rise to intermittents, pulmonic affections, and bowel complaints. It is also exposed to dry warm land winds from February to June, not prejudicial to health. The rest of the year, a pleasant strong westerly wind prevails, but if there is failure of rain, it becomes rather unhealthy. Ophthalmia and rheumatic affections prevail. 6. The surrounding country is generally cultivated according to season. There is no artificial irrigation. There is no rice cultivation near the station, nor of indigo, neither is the preparation of flax or hemp carried on anywhere near it. 7. A large native town adjoins the station. 8. The general surface is black cotton soil, but near the granite hills a stony, red, gravelly soil is met with. The subsoil is calcareous nodules. The ground at present occupied by the station is entirely new. 9. During dry seasons water is hardly to be obtained at any depth. In a good rainy season water rises to within 4 or 5 yards of the surface. 10. The rainfall is absorbed by the soil, and passes readily into the numerous wells of the station. No rainfall lies on the surface. No drainage from any higher level passes into the subsoil of the station. 11. The water supply of the station is derived principally from wells. There are only two tanks in which water is stored, supplied from rainfall. One tank usually has water all the year round, the other has been dry about seven months. They contain neither plants nor animals. Natives are prohibited from bathing in one tank, but that they do so there is very little doubt. The wells used for drinking purposes receive no foul drainage, or leaves or other matter. There is no malaria near the station. The tank on the south side of the fort from being so shallow is liable to dry up, and during that process emits an unpleasant smell. Means can be provided for keeping the tank full. 12. The water is so scattered over the station that it would be difficult to estimate the available quantity. That used for drinking purposes is good as to colour, taste, and smell. Well No. 1, clear, pleasant taste, no salts, has animalcules. Well No. 2, clear, pleasant taste, no salts, has animalcules. Well No. 3, pleasant taste, no salts nor animalcules, but a considerable quantity of decayed vegetable matter. The water is at present raised for use by leathern bags drawn up by bullocks, and emptied into cisterns and channels built for the purpose. There is reason to believe that a never failing supply of water might be brought in from the Issugabudra, the channel from which must be 50 or 60 miles in length. This would be expensive, but any expense is better than the present uncertain supply of water, which depends entirely on the rain of the season, which sometimes fails, as it did in a great measure last year. 13. Plantations and avenues of trees would add to the agreeableness and health of the station. 14. The topographical and sanitary examination of sites is made generally by a mixed committee of military and medical officers.
II.—Climate.	1. The meteorological instruments supplied by Government have always been imperfect or unserviceable. No proper agency for registering observations, consequently those in the following Table are only approximately correct:—

1851 to 1859.

Months.	Barometer Mean.	Mean Temperature.	Mean Daily Range.	Mean Maximum.	Mean Minimum.	Mean Dry Bulb.	Mean Wet Bulb.	Mean Sun Temperature.	Rain, inches.*	Winds.		Days of Sunshine.	Remarks as to Clouds, Dew, Winds, Storms, &c.

* Rainfall on a 19 years' average.

3. The climate is dry and temperature not very high; not being humid the heat is bearable, range not great. No fogs. Dust storms occasionally occur, but the air is usually clear and elastic.

The climate is favourable to the health of troops. During the hot season a diet of less animal food and stimulating drinks desirable. Barrack accommodation and dress now so good as not to need change. The sun is powerful in October and November, and late morning drill or early evening drill should be suspended. From March to July there should be no evening drill, &c. Some years will pass without any particular month or months being unhealthy, but fever—intermittents, and occasionally remittents, and bowel complaints, may be looked for from October till January. In the hot months ephemeral or continued fever of short duration. The rainy season healthy.

References to Subjects and Queries.	REPLIES.
II. Climate—*cont.*	4. There is no district near the station the climate of which would be more conducive to health. 5. As regards the comparative healthiness of different stations at which the medical officer has served, the following is the result of Superintending Surgeon Eyre's experience in a professional career of near 32 years:— Belgaum 1830.—European troops there suffered severely from dysentery, both officers and men. Secunderabad 1832–3–1842.—European epidemic dysentery prevailed, but except from this disease it is in other respects a healthy station. Jaulnah.—Remarkably healthy. Nagpore.—Very healthy. Bellary.—The healthiest of all.
III. SANITARY CONDITION OF STATION.	1, 2, 3. Maps and plans attached. 4. *Table of Barrack Accommodation.* Total number of rooms or huts: Date of construction—commenced 1843, completed 1858. 9 Ranges of Barracks all of the same construction; besides these, 1 Range for guard room (officers and men). 1 „ School room, non-commissioned officers' quarters, and serjeants' mess room. 1 Range for orderly room, store room, serjeant major and quartermaster serjeants' quarters. 1 Range for canteen and coffee room. Total regulation number of non-commissioned officers and men—1,084.

Prison Cell - - -	1 Man	10	8	11½	920	920	80	The Cell has 3 compartments, entrance passage, privy, and cell. Measurement of cell only given.			

5. The barracks are not provided with windows. The doors being half Venetian and half panel, serve the purpose of light and air at the same time. They are on opposite sides. There is a double verandah all round (each 12 feet wide). The outer verandah is never occupied for sleeping purposes by soldiers or other persons.

6. The beds are merely planks resting on wooden trestles; the bedding consists of,—
1 cotton settringer (the size of cot).
2 cotton upper sheets.
1 quilt double chintz to contain 4 seers of cotton.
1 good blanket to measure, when double, 7 feet by 4 feet.

It would be a great improvement if the frames of the cots were iron, with moveable planks between, which could be removed for the purpose of destroying bugs, which abound in all barracks here.

7. The tents in use are two poled.

Height of poles - - - - - -	10 ft. 3 in.
Length of tent - - - - - -	21 ft.
Breadth - - - - - - -	15 ft.
Walls - - - - - - - -	5 ft. high.

The tents are made of three folds of cotton cloth throughout. They have two flies, but only one kanat. There are 25 men to a tent on ordinary marches, but only 20 on field service.

Cubic space - -	2,190 feet	per man	83.6 feet.
Superficial area - -	315 „		12.6 „

8. The barracks are ventilated by means of openings or ventilators in the side walls, nearly at the top, and plenty at doors. The ventilators are opened or shut at pleasure by means

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	of a rope attached to the glass frames, which move on a pivot; besides, the fanlights above the doors are moveable at pleasure. The same system prevails in all guard-rooms and barracks. The tents are amply ventilated by the kanats being raised; besides this, being composed of many parts, there are openings at the junction of these parts which allow ventilation. The barracks are well ventilated, and the air is always pure. No particular means are adopted for cooling the air, but the heat is rendered bearable by the constant agitation of the air by punkahs. The construction of these is simple, being merely a frame of wood covered with cloth, and suspended from the ceiling. 9, 10, 11. The barracks are constructed of stone. The floors are of granite slabs, raised above the level of the ground about 2½ feet, but there is no under ventilation. The material and construction are the best possible and suitable for the climate. With regard to repairs, the barracks and public buildings are under the charge of the Quartermaster-General of the division, and any trifling repairs pointed out by him are carried out without delay by the Public Works Department. In cases of repairs involving a large outlay, the sanction of Army head quarters is requisite. The roads in the cantonment are kept in repair by the prisoners under the orders of the civil authorities. The general sanitary state of the cantonment is supervised by the Superintending Surgeon. The barracks are whitewashed once every year inside. The exterior is only blue washed once in two years, if necessary. 12. There is one lavatory to each range of barracks (9 for men, and 3 for women), one small plunge bath for women, and one large for men, at a distance from the barracks. The lavatories are supplied with water by a channel running from the well which supplies these barracks. They are drained into cisterns, whence the water is removed. The plunge bath is supplied with water from a well attached to it. 13. The cooks are paid by the men, and cooking utensils are provided by Government. Means of supplying water to the cookhouses are abundant, but the drainage is defective. Washing of linen is carried on by washermen at a distance from the cantonment. 14. The contents of the privies are removed entirely twice a day, and thrown away at a distance of two miles from the barracks, on a wide open plain, far from any habitations. 15. The privies have ventilators besides doors. The ventilation might be improved by ground ventilation. Each privy is furnished with a tin oil lamp fastened against the wall. The barracks are lighted by globe oil lamps hung from the ceiling down the centre of the buildings. 16. The barrack drainage is the mere natural drainage of the ground on which the barracks are built. The drainage of the lavatories has been already described. There is none other. No inconvenience has been found from the present state of the drainage. There is no dampness whatever in any part of the barrack or hospital. There is no fluid refuse from the barracks. There are no cesspits nor foul ditches. 17. The surface cleansing is well executed by sweepers and carts, carrying away all refuse to a distance from the barracks and cantonment. 18. There is no excess of surface vegetation, nor anything to interfere with the external ventilation. 19. The sanitary condition of the bazaar is good. The drainage and ventilation have been lately much improved. Much yet to be done. Water supply deficient. Cleanliness well attended to. Two latrines lately built for women. Two more greatly required. The conservancy establishment of the bazaar consists of five scavengers' carts with bullocks, eight sweepers, and four coolies. There are two public privies for females, kept clean by two totties. Two more privies are required. The soil is removed from the village to a distance of half a mile and buried. From the irregular way in which the streets have been built, their confined and crowded state prevents a free circulation of air. The streets should be widened. The main or natural drains or nullahs running through the bazaar should be built up, with stone sides to prevent the water spreading amongst the houses on the banks. Many of the native houses are good, some are mere hovels. In the better class of houses there is generally a cesspool covered in, in order to prevent the women going out for the purposes of nature. This must be injurious to health. There is no nuisance experienced in barracks from native houses. 20. The place for slaughtering cattle for troops is about three-quarters of a mile from the barracks, and a quarter from the bazaar. The offal is carried a further distance of half a mile. No nuisance is experienced. 21. There are few horses in the bazaar. The cattle belonging to the inhabitants are now kept in the yards of their houses. The dung being a valuable article of fuel is collected. The straw and refuse is cleared away daily by the scavengers' carts. Pigstyes are not allowed in the pettah; arrangements are being made for the removal of buffaloes, and the few horses outside the bazaar. 22. There are no stables for the artillery and cavalry except for sick horses. The horses are picketed in the open air. There is no dungheap. The manure is conveyed away by gowlies who purchase it. The horse lines or pickets are north of the men's hutting lines, the nearest points being from 180 feet to 200 feet distance. 23. There is ample accommodation for married people in separate rooms. No married people occupy barrack rooms with the men.
IV. Health of the Troops.	1. Health of the station usually very good. Cholera occasionally, but much diminished from former years. Fever at times, not malarious. Districts adjoining the station healthy. 2. The most prevalent diseases among the native population is fever at setting in of rains, and during N.E. wind, mild. Ophthalmia prevails in the rains. Guinea worm rather common. No spleen disease. 3. The healthiness of the station is attributable to a dry atmosphere and no superabundance of vegetable matter.

BELLARY. MADRAS.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	4. The following are the stations, with their influence on health, at which the troops were before coming to Bellary:—D troop, Horse Artillery, at Kamptee; at the station 10 years. Date of leaving it, 20th January 1860. Their health good then; suffered chiefly from disease of the liver and bowels, and venereal. Health good on arrival at this station, 26th March 1860. Been very healthy since arrival.—C Company, 1st Battalion of Artillery, at Bangalore, at the station 18 months. Date of leaving it, 1st November 1855. General health good then; suffered chiefly from fever and venereal. Health good on arrival at this station, 20th November 1855. Since arrival, have chiefly suffered from fever and venereal. No part of the present accommodation for troops at this station is more unhealthy than the rest. 5. The troops are not camped out. 6 to 13. No experience of hill stations, or of their adaptation to European troops. 14. At so healthy a station as Bellary, I do not see the advantage of locating the whole regiment at a hill station. But a tour of residence each year would be desirable for mind and body, and this might be easily effected on the Ramandroog. I do not think a frequent change called for, neither should a regiment be too long, beyond three years, at a station. The change alluded to above would render this less called for. 15. There has been sufficient hospital accommodation at the Ramandroog for the number hitherto sent, but the barrack accommodation is deficient. Much hospital accommodation should not be required where a careful selection of the cases sent is made. 16, 17, 18. No personal experience as to best elevations for health. About 3,000 feet appear most suitable. 19. With regard to the best age for sending soldiers to India, they should not be growing youths, but young men; the minimum age 21, but if a few years beyond, the better. They should arrive in India in November. 20. As regards the benefits of intermediate stations, statistics prove that troops that have been intermediately at the Cape lose fewer men in India than when they have come out direct from England. To diminish the dangers of the earlier years of service, troops should not be stationed on first arrival on the Coromandel (with the exception of Vizagapatam) or Malabar coasts; but I see no objection to the inland stations of Bangalore, Bellary, Trichinopoly, Secunderabad, particularly the two first. 21. The usual mode of transport inland is by rail, where such is available. Regiments usually march. Small detachments by bullock transit when procurable. 22. As regards length of service in India, the sanitary condition of the soldier has been lately so much improved in Southern India that there is no reason why he should not serve as long in this country as in any other part of the world. 23. As regards the constitution of medical boards, there may be difference of opinion. But the majority must decide in each case. 24. Invalids should leave India for home early in the year.
Diseases.	1. Inspections for the discovery of disease are made weekly in the 74th Highlanders. 2. There has been no scorbutus for many years past. 3. There have been 124 cases of hepatitis, acute and chronic, out of 3,313 = 3·77 per cent. of all other diseases during five years. But this is beyond the actual number, because an individual may be admitted several times, and this would count as so many cases. Besides many are returned chronic hepatitis for want of a designation for mere derangement of the liver. I do not regard hepatitis as the consequence of other diseases, though it may be associated with them, particularly dysentery. Certain individuals are subject to it; often the intemperate. Less spirits, or better, none, would be the best prophylactic. 4. Dracunculus seldom occurs among Europeans at this or any other station I have been at. 5. Venereal diseases have occurred in the proportion of 40 per cent. of the constantly sick for many years past at Bellary. The best remedy, marriage; a present cost with an eventual great saving to the State. It would be very advantageous to have lock hospitals, provided they were efficiently worked. They could be usefully and economically connected with civil hospitals now established at all large military stations. The per-centage of cases of venereal disease has been considerably reduced within the last few months by health police arrangements. 6. The epidemic and endemic diseases at the station are:— *Intermittents* in the cold season; sometimes remittents, not severe; ephemeral or short continued fever in the hot season. *Dysentery* has not of late been epidemic, nor is the disease generally malignant in character. *Cholera* takes place every three or four years, but the number attacked is few compared to former years, although the deaths to attacks are more. *Small-pox* is sporadic now and then. *Rheumatism* frequent, often complicated with syphilis. The following Table shows the proportion of admissions and deaths from these diseases to the total admissions and deaths for five years—1854–5 to 1858–9.

Diseases.	Admissions per cent. to total admissions.	Deaths per cent. to total deaths.
Fevers, Intermittent	8·61	0·0
„ Remittent	1·88	0·0
„ Continued	1·77	6·88
Bowel complaints	5·17	20·41
Cholera	0·74	17·24
Small-pox	0·0	0·0
Rheumatism	5·91	0·0

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	7. Fevers are most frequent during the cold and hot seasons. The atmospheric conditions which accompany them are dry easterly winds from November to February. Hot sun in the day, cold and sometimes dewy nights, when intermittents prevail. High and try temperature when ephemeral and continued fevers prevail. Fever also prevails among the inhabitants of the town in the cold season and at the setting in of the rains, attributable to the effect on the skin, not to particular localities or malarial emanations, also to clothing of the natives, insufficient to protect them from cold and damp, and poor diet among the lower classes. 8. No answer. 9. Quinine has not been tried as a prophylactic, there being no malarial diseases at this station. 10. (No recommendations as to prevention of epidemic diseases.) The only epidemic of late years has been cholera.
V. Intemperance.	1. No replies. 2. Drunkenness is always punished as an offence. 3. Distilled spirits are sold in the canteens to soldiers; in the bazaars to natives only. Spirit forms no part of the soldier's rations. The issue of a dram before morning parade is prohibited. Spirit is never given as a ration to convalescents. 4. As to health and discipline, the less spirit consumed the better for health, and anything that leads to drunkenness is fatal to discipline. 5. It would be highly advantageous, I believe, to abolish altogether the use of spirits from the canteen and bazaars, restricting their use to particular occasions. The habit for spirits is maintained by the authorized use of them. 6. Malt liquor or wine, even if exceeded in, must be less hurtful than spirits. Taken in moderation, the former is preservative of health, and is now issued regularly to the European troops. 7. Coffee, tea, lemonade, soda water, and similar drinks are much used, except soda water, which is too expensive. 8–10. It would be very beneficial to suppress altogether the use and sale of spirituous liquors in the canteens, and to permit only beer, coffee, tea, lemonade, &c., to be sold to the troops. 11. The bazaar regulation is that no spirits or intoxicating liquors of any kind shall be sold to the European soldier, which is very generally observed.
VI. Diet.	1. The following is the ration of—

	Queen's troops.	European troops of the Indian Army.	
Bread	1 lb.	1 lb.	
Meat	1 lb.	1 lb.	mutton 2 days, beef 5 days per week.
Rice	4 oz.	4 oz.	
Tea or coffee	$\frac{7}{8}$ oz.	tea $\frac{5}{7}$ oz.	
Sugar	$2\frac{1}{2}$ oz.	$2\frac{1}{2}$ oz	
Salt	1 oz.	1 oz.	
Potatoes	$\frac{1}{2}$ lb.	—	
Vegetables (onions, pumpkins, carrots)	$\frac{1}{2}$ lb.	1 lb.	varying according the season.
Firewood		3 lbs.	

The meat ration is prepared as the soldier wishes, either in curry, stew, boiled, or fried. No periodical changes have been made, nor are any requisite. The ration is inspected by the regimental authorities.

2. The soldier's ration is ample and excellent. The usual vegetables at Bellary are $\frac{3}{4}$ lb. of potatoes and $\frac{1}{4}$ lb. of pumpkins and onions mixed.
3. No improvement in the ration is required.
4. Cooking is done in the ordinary Indian cookhouse with native cooks. The cookhouses are light and well ventilated, and have a sufficient supply of water. Smoke soon blackens the walls. The cooking is sufficiently varied. On march, tea and coffee are usually supplied half way. This is a regimental arrangement.
5. Soldiers' gardens for the cultivation of vegetables under regimental management would be advantageous near the station.

VII. Dress, Accoutrements, and Duties.	1. In cold and rainy seasons the soldier's dress consists of woollen. In the hot, of cotton. Accoutrements the same all the year round. The dress is suitable to the climate both for day and night duties, with the exception that the 74th, being a Highland regiment, wear woollen trousers all the year round, which appears to be objectionable. At all seasons the men go on guard with their great coats.
Duties.	1. With reference to the propriety of drilling men before their arrival in India, every man on joining a regiment for the first time must be drilled. 2. The guard and parade duties are both very light, and can scarcely be prejudicial to the health of the soldier. The soldier is seldom kept under arms beyond one hour, and that four times a-week. The best hours for drills, parades, and marches are in the early morning. In marching troops should reach their ground soon after sunrise. The 74th Highlanders have 5 nights per week in bed; native soldiers, $3\frac{1}{2}$ nights per week. 3. Guards are mounted at various distances from barracks. The men are on duty for twenty-four hours. Roll calls depend on commanding officers and the state of a regiment. Night duty is so light that it cannot be prejudicial to health.
VIII. Instruction and Recreation.	1, 2. The following are the means of recreation:—A ball court is under construction. There are schools and skittle grounds. A library and reading room will shortly be constructed. There is also a theatre. There are no day rooms or soldiers' clubs. No soldiers' gardens, workshops, nor gymnasia, although all would be very desirable. A covered place for recreation both for the wet season and during the heat of the day is also very desirable. There is no restriction on the men exposing themselves to sun or rain when off duty. More trees for shade should be planted. 3. Soldiers' saving banks have been already introduced with great advantage.

References to Subjects and Queries.	REPLIES.
IX. MILITARY PRISON.	1. There is no military prison. Prison rooms and cells attached to regiments are properly ventilated. Overcrowding can scarcely be allowed in a well-ordered regiment.
X. FIELD SERVICE.	1, 2. There are no local regulations for medical field service not included in the general Presidency regulations. 3. On all matters connected with the preservation of the health of the troops, such as selecting camping grounds, sanitary regulations, ventilation, water supply, &c., it is the duty of the medical officer to advise his commanding officer. 4. The transport of sick, of hospital supplies, &c., is done by doolies and sick carts. Much need of improvement in the latter. In general everything connected with field hospitals is most efficient in this country.
XI. STATISTICS OF SICKNESS AND MORTALITY.	No information.
XII. HOSPITALS.	1. A new hospital is under construction at this station. 2. It is 166 yards from the barracks, 230 yards from the stables, and about a mile distant from the civil population. The site is very open, and there is nothing to interfere with the ventilation. The site is very healthy, as regards elevation, natural drainage, absence of malaria, &c. 3. The water supply is wholesome, but not very abundant. 4. There are no drainage arrangements. This is a matter yet in consideration. 5. The lowest wards are raised three feet above the ground. No perflation beneath the floors. No provision is made for conveying away the roof water. The natural slope of the ground admits of free drainage. The hospital is built of granite stone and Chunam-terraced roof single; walls single, and sufficiently thick to keep the building cool. There are double verandahs all round, each 12 feet broad, sheltered from sun's rays. They are not intended to be used either for sick or convalescents. The hospital is two stories high. The following Table gives the accommodation. Date of construction, commenced in August 1857, and still progressing. Total number of wards, 9. Total regulation number of beds, 174.

Wards.	Regulation Number of Beds per Ward	Dimensions of Wards. Length.	Breadth.	Height.	Cubic Contents.	Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Bed above the Floor.	Windows. Number.	Height.	Width.

									1	5	4

The hospital is so placed as to receive the full benefit of prevailing winds. The windows open in the ordinary manner on hinges. The building is well ventilated by large doors. The larger wards have doors only, which will ensure ventilation and coolness.
6. The means of ventilation are quite sufficient. There are the usual Venetian blinds.
7. Punkahs are used for cooling the air.
8. There are two fire-places for warming the wards.
9. The privies are in detached buildings about 45 feet from the hospital. The communication is by ventilated corridors. There is no drainage. Everything is carried away, and if properly attended to, ought not to be offensive.
10. The lavatory arrangements are under consideration.
11. Bath rooms have been provided with the necessary apparatus.
Ward walls and ceilings are lime-washed when necessary.
12. The hospital linen is washed and dried away from the hospital.
13. The storage is under construction.
14. The iron cot is ordered for all hospitals, and not yet fully supplied.
15. A kitchen for the hospital is under construction, but the means and apparatus are entirely Indian and of the simplest kind.
16, 17. Diets, attendance, &c. according to regulations.
24. There are no separate wards for convalescents, a separate ward and separate messing would be very advantageous.

XIII. BURIAL OF THE DEAD.	1. The burial ground is about $1\frac{1}{2}$ miles from the European infantry barrack. The distance is very inconvenient. That for Roman Catholics is about a mile distant. 2. Area of ground, 4 acres, nearly, for Protestants; $2\frac{1}{4}$ acres for Catholics. There are no fixed rules as to size of grave space. Graves are dug six feet deep, and never re-opened. Burial takes place usually within 24 hours; in some cases sooner. 4. The grave-yard is never offensive. 5, 6, 7. The native dead are burned or buried. No injury to health occurs from the practice. Natives do not like to be interfered with in the disposal of their dead.

J. C. COFFIN, Major-General commanding Ceded Districts and Bellary.
E. W. EYRE, Superintending Surgeon, C. Vts.
JNO. F. FISHER, Captain, Madras Engineers.

12th May 1860.

JAULNAH.

Accommodation:

- Queen's Troops:
  - Artillery, Horse—1 Troop - - - 115
  - Infantry—No Barracks, 3 Companies of H.M. 18th Royal Irish Non-commissioned Officers and Men occupy private dwelling houses - - - 312
- Native Troops:
  - Cavalry—1 Regiment - - - 377 Three squadrons, but place of arms for 4 squadrons.
  - Infantry—2 Regiments - - - 1,640

References to Subjects and Queries.	Replies.
I. Topography.	1. The country surrounding the station is hilly, but not mountainous. Close to the cantonment it is undulating, and intersected by ravines. It is entirely devoid of wood or jungle, a few trees are only found in officers' compounds and gardens, and along the bazaar roads. There is no standing water in the vicinity. A small river flows near the cantonment, and there is a large tank three miles away.
	2. The elevation of the station above the sea is 1,652 feet, and it is lower generally than the surrounding country. The nearest nullah is the Seo, which falls into the Koondulka river close by. The elevation of the lines above the Seo nullah is about 50 feet. There is no marsh near the station. It is surrounded by low hills, their elevation being about 180 or 200 feet. No advantage would be gained by a removal of the station, especially as there would be very great difficulty in procuring water.
	3. There are irregular hills, as above mentioned, at an average distance of about 2 miles, which enclose the station in an amphitheatre. The nearest high table land is that of Roza, 55 miles by road from this station. This range is about 1,153 feet above Jaulnah, and 2,805 feet above the sea. Booldana, a small village situated on the elevated table land on the Adjunta and Lackenwarra range of hills, about 4 miles from Darulghaut, and about 60 from Jaulnah, is highly spoken of for its mild, dry temperature and pure air, and is said to be well adapted for a sanitarium. The height of this place is not known, but it is supposed to be higher than the table land of Roza. Its distance from Jaulnah is about 60 miles in a northerly direction. Should it be proposed to establish a sanitarium in the neighbourhood of Jaulnah, both these spots should be visited, and examined by competent persons.
	4. The Seo nullah and Koondulka river flow close to the station, and the old Jaulnah tank is distant about 3 miles. The country is not subject to an overflow of water. During the rainy months the nullah and river come down suddenly, and are impassable for a few hours together, but they do not submerge the surrounding country. There is broken ground and ravines, but no water pits. No bad effect on the health of the station is produced by them.
	5. The station is open, and freely exposed to winds. Not a tree or shrub is to be seen beyond the gardens round the houses. Care is taken to keep the hedges cut down to 4 feet, and the lower branches of trees lopped off to within 6 feet from the ground. These do not in any way interfere with the free circulation of air. The buildings are not near enough to each other to be affected by reflected sun heat. It is not exposed to cold or variable winds. The land or dry westerly winds blow during the months of March, April, May, and June, and many consider this the healthiest season. The station is too far from the sea for the breeze from it to reach it.
	6. Beyond three or four large gardens there is no cultivation on the cantonment side, but beyond the Koondulka river, near old Jaulnah, there is some trifling cultivation. There are no works of irrigation near the station. No rice is cultivated, the ground being totally unfit for anything of the sort. There is no indigo, but there are a few acres of hemp a mile and a half from the cantonment.
	7. Khaderabad, a large walled town, adjoins the military cantonment and bazaar. Beyond the river Koondulka, at a distance of 1½ mile from the lines, is old Jaulnah.
	8. The hills are chiefly composed of trap rock, which in many places is in a decomposed state, covered with layers of red gravel or lateritious soil containing lime. The subsoil is generally black cotton subsoil. The surface is barren. The station has been formed for many years, and the ground was not previously occupied.
	9. Water is usually found during the dry season at a depth of 30 or 40 feet, certain at 60. During the rainy season in an average monsoon the wells are generally quite full.
	10. The rain water (there being no water from surface springs) flows off readily and does not lie on the surface anywhere. The numerous small nullahs and ravines which intersect the country form a natural drainage and carry off the water. No drainage from higher ground necessarily passes into the subsoil of the station.
	11. The water from the river and nullah is generally used by the natives. The European and native troops have a good supply from wells which are found in every compound and in the bazaar. It is not collected nor stored in tanks. The tank at old Jaulnah has generally water in it throughout the year. In the dry season there is often a scarcity of water, the wells becoming dry; water is then chiefly obtained by excavating holes in the sands in the bed of rivers and nullahs. Wells might no doubt be sunk in places where there would be ample water at all seasons. There are no plants found in the tank and only a few fish. No water is used both for drinking and bathing. The wells are not liable to pollution, and no nuisance or malaria proceeds from the tank.
	12. The water supply is obtained from the Seo nullah, the Koondulka river, and from wells. The river and tank water is good and wholesome. In many wells it is brackish and saline, but in others it is excellent. It is devoid of smell. Lime and nitre are contained in the water of most of the wells, especially the latter. It is generally hard and clear. Microscopic investigations have never been made. The water for drinking is good and not injurious to health. The supply is generally sufficient, but in the dry weather there is often a scarcity. It is raised by manual labour and by bullocks. The wells generally require deepen-

I. Topography—*cont.*	ing from 15 to 20 feet according to situation, which if done there would always be an abundant supply of water obtainable. 13. The health of the station is excellent. Any additional troops, especially European, would necessarily be located on the higher ground to the north-east of the present lines. 14. We are not aware of any new station having been formed for many years, but conclude that the position would only be decided on a report made to his Excellency the Commander-in-Chief by a committee formed of the senior officer at the place, an officer of the quartermaster-general's department, the senior medical officer, and engineer, or other competent persons.
II. CLIMATE.	1. There are no instruments at present for conducting meteorological observations. 2. No materials for a meteorological table are to be found, the records having been removed when the station was abolished. 3. The climate is generally salubrious; dry and cold, yet liable to great sudden variations of temperature. Fogs and damp are rare. The air is pure, rarely containing dust or any other extraneous matter. Its influence on health is salutary. The usual diet is sufficient and good; the barracks good, and the clothing is required to be suitable according to the change of seasons, consisting of flannel and cloth in the cold, and flannel and cotton in the hot months. Drills should be regular, never exceeding one hour's duration, and in the hot weather only in the morning, to terminate at half-past 6 at latest. By the returns, December and January are the most healthy months; August, September, October, and November, generally the reverse. During the unhealthy months, fever, dysentery, diarrhœa, and rheumatism are the prevalent diseases. 4. No neighbouring station, so far as we are aware, possesses a character superior to that of Jaulnah. The high land near Roza and Booldana, already mentioned, would no doubt be found suitable as a sanitarium. 5. The stations at which I have served are Madras, St. Thomas's Mount, Poonamallee, Vellore, Nellore, Bangalore, Secunderabad, Mangalore, Masulipatam, Samulcattoh, Vizianagram, Cuttack, Moulmein, the Straits, Aden. We consider the Straits, Moulmein, and Bangalore the most salubrious stations for Europeans. Many of the others where European troops are stationed, though very hot during the hot season, are none of them positively injurious to health.
III. SANITARY CONDITION OF STATION.	1, 2, 3. Maps and plans. The detachment of the 18th Royal Irish occupy bungalows built as quarters for officers. The men of the native cavalry and native infantry reside in small huts erected by themselves, their arms alone being kept in the place of arms or barracks. 4. The following table shows the barrack accommodation. Date of construction, not known. Total number of rooms or huts, 10.

Barrack Rooms.	Regulation Number of Men in each Room.	Dimensions of Rooms.				Cubic Feet per Man.	Superficial Area in Feet per Man of Floor Space.	Height of Men's Beds above the Floor.	Windows.

5. In the Horse Artillery barracks the windows are placed opposite the doors, being all on one side. They are in two leaves, open inwards, and are glazed. Between the doors there are also windows, as shown in the plan. There are verandahs on both sides, along the front and rear. The former, which is open, is 10 feet wide, and the latter, which is closed, 8 feet, having windows only. The verandah is not used as a sleeping quarter, except in very hot weather, when the nights are oppressive, and some of the men bring their bedding out to obtain relief from the heat inside. In the back enclosed verandah the mess tables stand, and the men take their meals there. There are no jalousies or jhilmils.

6. The cots have been hastily made up for immediate use on the re-occupation of the station last year. They are common roughly-made frames of jungle wood, with netting of coir rope. New ones are about being constructed and iron cots supplied. The bedding consists of a carpet, quilt, blanket, and sheets.

7. The tents used by Europeans consist of two flies and one kanat or wall, supported by two poles, on which rests the ridge pole, with openings front and rear. The length is 20 feet, breadth 15 feet, height to the ridge of the inner fly, 10 feet; height of the kanat, 5 feet; space between the inner and outer fly, 1½ feet; cubic space of air per man, 90 feet; superficial area per man, 12 feet. Number of men in each tent, 25. The tents in use with the native infantry consist of a fly supported on two poles and a ridge pole; opening in front for entrance; no kanats; length 22 feet; breadth 13 feet; extreme height, 9 feet, sloping down to 1 foot; cubic space per man, 57 feet; superficial, 11 feet.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	8. Ventilation is by doors, windows, ridge ventilators, and fanlights placed between the slope of the roof and that of the verandah front and rear. The ventilation is good and generally quite sufficient in the Horse Artillery barracks, but the patchery inhabited by the families and the huts of the Native Infantry and cavalry are very deficient, but this suits a native, as he objects to free ventilation. Punkahs are allowed to the European barracks, as also kuskus tatties during the hot weather, which being watered render the buildings cool. The structure of these two articles are too well known to require describing in a sketch. 9. The Horse Artillery barracks are constructed as follows:—Basement, stone in chunam; walls, brick in chunam; plastered interior and exterior; roof, teak wood, couples and collar pieces, and tiles; doors, of teak, opening with two leaves 7 feet by $3\frac{1}{2}$; windows glazed. 10. The floors are raised 3 feet above the ground, of stone slabs in chunam. There are no air passages beneath. 11. The materials used in construction are suitable for the climate. These buildings are not on the standard plan, being now built some years. All the improvements one can think of or suggest are included in the standard plans, which are to be followed on all future occasions. The officer commanding is responsible for the state of the cantonment. Under his directions it is kept in order, and the repairs are made to the barracks and public buildings by the department of public works. No delay takes place in their execution when necessary. The barracks are cleansed and whitewashed as often as is found necessary. 12. There are two lavatories to the Horse Artillery barracks. The wash-houses and baths are supplied with water by puckalies. These buildings are deficient in size and commodiousness, and are capable of improvement. A plunge bath would be a great convenience and comfort. 13. There is a cook-room to each range of barracks, also a small one for the married men: a new one is required nearer their quarters. The usual means of cooking in India are provided. Water is brought by puckalies, and the refuse water is carried off by a closed drain into the main drain. This is susceptible of improvement. Clothes and linen are washed by regular paid washermen. Conveniences for the purpose are not therefore required. 14. The night-soil, &c., is removed twice a day by men employed for the purpose. The privies are furnished with wooden seats, and buckets or chatties are the receptacles for the filth. 15. They are ventilated by spiracles in the walls and ridge ventilators, and lighted by small windows and lanterns at night. The barracks have globe lamps. 16. A masonry drain surrounds the barrack; the smaller ones for the lavatories, baths, and cook-rooms empty themselves into it. The main drain is carried to the extreme verge of the barrack limits, passes under the public road, and empties itself on a piece of waste ground, about 150 yards from the barracks. It would be an improvement to prolong the drain to a distance of 900 feet, the ground gradually falling towards a nullah. The dimensions of this drain is two feet by two. The drain is sufficient. The privies and urinals are supplied with cesspools, which are fitted with tubs. These are emptied twice a day and carried to a distance. No part of the barrack or hospital is damp. There are no foul ditches. 17. Scavengers' carts remove all filth and dirt daily, and the cantonment is kept perfectly clean. The refuse, manure, &c., are carried to a distance and taken away for gardens. 18. The surface of the cantonment is kept free from vegetation. No old walls, hedges, or anything of the sort is allowed to exist. 19. The ground on which the bazaar stands slopes down gradually to the nullah at the back of the cantonment; the surface drainage of the streets, &c., is consequently good. There is a good wide street running from one end of the bazaar to the other. The ventilation in this part is good, and improvements are in progress to open out many of the narrow side streets, and to form good wide roads. The place is at present crowded, but new roads are being formed. The supply of water is confined to the wells in the bazaar, and the water of the Seo nullah. The place is clean, the inhabitants, like all other Indian places, going to a distance for the purposes of nature. Every house owner is obliged to keep the portion of the road in front of his house in order, by having it swept once a day. The sweepings are removed by a cart kept by the police. The native houses generally are in good order, and of substantial materials, but there are a good many in a most wretched condition. There are no dung-heaps, and the natives are so well aware of the value of manure, that it is speedily removed. There are no cesspools outside the houses; as to whether there are any *within* them I am not prepared to say; as the liquid refuse is trifling, their existence as a general rule is unlikely. There is no nuisance, that we are aware of, from winds blowing over native dwellings, but the patchery, adjacent to the south range of barracks, apparently shuts out a great deal of air, as that range is excessively hot and close at times, when the opposite one is comparatively airy. The European patchery is much too close to this range too. The patcheries, and more especially that occupied by the married Europeans, should be removed to a greater distance. 20. Animals are slaughtered at a considerable distance from the barracks, but slaughter-houses and butchers' shops have been the chief nuisances in the bazaar, and though the offal is removed there is often much stench near these places. Arrangements are being gradually made for the removal of all these objectionable places beyond the precincts of the bazaar. 21. Owing to the expense of forage but few horses or ponies are kept in the bazaar. Those who have them keep them in their own houses and yards. They are not, however, objectionable, as the dung is at once removed for manure or burnt, and no accumulation is allowed to take place. 22. There are no stables except those for sick horses. The horses are picketed in the open air. The sick stables are about 300 yards from the barracks, and consist of a range of stalls supported in the middle by a row of pillars, with a wall on one side, with ventilators or openings in the wall, and a row of arches in front. They have also ridge ventilators. The accommodation is for 12 horses, besides 4 loose boxes, a casting shed, farriers' room, and two small surgeries. The dung-heap is in a line with this building, and at 300 and 500 yards from the barracks and hospital respectively. The manure is sold and carried away periodically by the inhabitants of the neighbouring villages. The above refers to the Horse Artillery stables; those of the cavalry are something similar, but more extensive. They are situated about 300 yards from the native cavalry hospital, and 800 or more from the men's huts. The horses of both artillery and cavalry are picketed in ranges or lines of troops facing each

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	other, with a wide road running between each range. Each troop is separated from the others by a low mud wall, and a similar wall encloses the whole. The horses of the artillery are at about 80 yards from one end of the barracks and 200 from the hospital. 23. There are not sufficient quarters for the married men drawing the Government allowance. Those who have not quarters reside in the patchery, but no married people occupy the barrack rooms with the men. The patchery is private property, and consists of the most miserable hovels, badly situated, devoid of ventilation, and unfit for Europeans to live in.
Officers' Quarters.	1. The officers occupy private houses, which are generally good and healthy. Some might be improved as regards ventilation by having ridge ventilators. The drainage is good, the ground sloping naturally down to the river. I have no improvements to suggest.
V. HEALTH OF THE TROOPS.	1. The station and the adjacent native population are healthy. 2. The most prevalent diseases are fevers, intermittent and remittent. Spleen diseases are rare. 3. The healthiness of the native population is to be attributed to the salubrity of the climate and of the district, and their general industrial prosperity. 4. The Horse Artillery at this station came from Secunderabad, where it arrived in January 1858, and left again on field service in November 1858, and arrived at Jaulnah in March 1859. The health of the troops at Secunderabad was not so good as as at the previous station, Trichinopoly, the men having suffered from fevers, diarrhœa, dysentery, and liver. There was a good deal of sickness on the arrival of the troops here from field service, but they have improved here. Fevers are rather more frequent, but liver and bowel complaints less frequent than at Secunderabad. The three companies of the 18th Royal Irish were at Assurghur, Poona, and Ahmednuggur, then on field service, and arrived here in March 1859. Their health before coming was generally good, but suffering at times from fevers and venereal. The 2nd Cavalry was at Sholapore for two years and two months, and left it on the 21st April 1859. Whilst there the regiment was healthy; the diseases from which the men suffered at all were fevers, ephemeral, quotidian, or intermittent, rheumatism, phlegmon, and contusions. They arrived at Jaulnah on the 6th May 1859 in a healthy state, and have since been remarkably healthy; the principal diseases have been fevers, intermittent and quotidian, rheumatism, and contusions. The 9th Regiment N.I. was last stationed at Secunderabad for about 10 months, and left it on the 15th November 1858, when the men were healthy, but during their sojourn there they had been sickly, suffering chiefly from intermittent fevers of the quotidian type, diarrhœa, and rheumatism. On arriving here on the 13th March 1859 the men were generally in good health. Since that, though generally healthy, they have suffered chiefly from ephemeral and quotidian fevers, rheumatism, purulent ophthalmia, and syphilis. The Native Infantry show a higher average of sickness than any other corps or detachment, which is partly to be attributed to the deficient ventilation of their huts and lines, and partly to the great amount of guard and sentry duties, especially at night, performed by them. 5. The men are never camped out, but I consider that it would be beneficial to their health if it were occasionally done. 6. We have never been in charge of troops at hill stations. 7. We have no experience as to the effect of hill stations on health after returning to the plains. 8. There can be no doubt, we think, that hill stations are preferable for troops. 9. There are no diseases that we are aware of peculiar to hill stations. 10. The diet, clothing, and exercise ordered must be suitable to the climate of the particular hill station. 11. The hot season is best adapted for a residence at the hills, say from April till August inclusive. For newly arrived troops a residence of two years on the hills is desirable; for acclimatized troops, 6 months. 12. There is no period of residence at the hills, beyond which injury to health is likely to be inflicted on returning to the plains. 13. The precautions to be observed on returning from the hills are simply light clothing and a less generous diet. 14. As a general rule we certainly consider it advisable that the European troops should spend the hot season on the hills and the cold season on the plains. A too frequent change of stations on the plains is not advisable. 15. We cannot offer an opinion as to the sufficiency of accommodation, never having been at any hill station or sanitarium. 16. I do not know at what elevation suitable sites may be obtained. 17. The only place near Jaulnah which might perhaps be advantageously occupied in consequence of the height is *Roza*. It is 55 miles distant from this place by road, in a north-west direction, and its height is 2,800 feet above the level of the sea. The access is easy, and the climate several degrees cooler than that of Arungabad or Jaulnah. During the greater part of the year Booldana, in a northerly direction, is said to be a healthy cool spot. Its distance from Jaulnah is about 60 miles; the elevation is not known, but is supposed to be equal, if not higher, than Roza. It is the head quarters of the deputy commissioner of West Berar in the Assigund District. Supplies would therefore be obtained with more facility than at Roza. 18. We are not aware that any surface or subsoils are more healthy or unhealthy than others. 19. The best age for soldiers proceeding to India is from 19 to 23, and from November to February is the best time for them to land. When a regiment arrives in India it must depend on the station it is to go to whether it proceeds by sea or land. If it lands at the Presidency it must be encamped. Recruits proceed to the depôt, and are sent to join their respective corps as may be found convenient, either by sea or land. The precautions to be observed are simply restriction to barracks from 10 a.m. to 5 p.m., encouraging bathing, regular exercise, and temperance in every respect. 20. We are of opinion that two years residence at any one of the intermediate stations between England and India, such as the Cape of Good Hope or Mauritius, is advisable. The troops on landing should be sent to a hill station. 21. The troops from the port march by land, if proceeding into the interior; if to a station on the coast, by steamers. The marches should be short, and terminate at 7 a.m., when the tents should be up and pitched, and the men got under cover and have their breakfasts as soon after as possible.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	22. A British soldier should serve in India from 12 to 15 years. 23. We have no suggestions to offer as to the mode of conducting medical boards, &c. 24. January and February are the best time of the year for invalids returning home.
Diseases.	1. There are regular inspection parades for the discovery of disease once a week. Different regiments have different times for inspection. 2. There is no scorbutic disease, nor has there been any. 3. The proportion of cases of hepatic disease are 9 or 10 per cent. per annum, caused by intemperance and general unnecessary exposure to the climate. It is not generally the result of other diseases. The best precautionary measure would be stopping the sale of intoxicating liquors. 4. There are no cases of dracunculus known to originate here. Those at any time in hospital have been engendered at other places. 5. The proportion of venereal cases is 10 per cent. The best means of preventing the liability of the soldier to this disease would be the frequent inspection of the prostitutes, and the establishment of lock hospitals. 6. Troops are found to suffer from epidemic and endemic diseases when prevalent. Fevers, intermittent and remittent. Dysentery, more generally dysenteric diarrhœa. Cholera, the collapsed type chiefly. Small-pox, varying in severity. Rheumatism, acute and chronic. The detachment of the 18th Royal Irish left the station before furnishing the information called for. For the year ending 31st March 1860, the proportions were as follows :—

Corps.	Fevers.		Dysentery.		Cholera.		Small-pox.		Rheumatism.	
	Admissions.	Deaths.	Admissions.	Deaths.	Admissions.	Deaths.	Admissions.	Deaths.	Admissions.	Deaths.
B. Troop M.H.A. -	1 in 4	—	1 in $2\frac{1}{3}$	—	1 in 122	—	—	—	1 in $16\frac{1}{4}$	—
9th Regt. M.N.I. -	1 in 4	1 in 15	1 in $4\frac{1}{2}$	1 in 15	1 in $52\frac{2}{3}$	1 in $7\frac{1}{2}$	1 in 66	1 in 15	1 in $12\frac{1}{2}$	—

	7. Of the eruptive fevers, small-pox is the only one that is met with. Of the fevers, the remittent and intermittent are the most prevalent, the latter chiefly; cholera sometimes prevails as an epidemic, formerly the outbreaks were frequent and extensively fatal, but of late years they have been more rare and less severe, though occasionally still causing a considerable mortality. The hot and wet seasons are the periods when zymotic diseases are most prevalent. In the former, small-pox and cholera generally prevail, but it may also occur in the wet and cold weather. During and after the wet season, fevers are intermittent and remittent. They are preceded or accompanied by a close and hot state of the atmosphere. Disease is not more prevalent in any one portion of the station or bazaar than in another. Intemperance and exposure to sun and rain, or partaking too freely of unripe fruit or crude vegetables, predispose to these diseases. 8. The duties and habits of European troops, both in cantonment and in the field, no doubt exercise an injurious influence on the system, and predispose to epidemical disease. 9. Quinine has not been tried as a prophylactic. 10. We have not had sufficient experience at this station in regard to epidemic disease, but would recommend that all means be used to keep the place and cantonment clean and well drained, all nullahs clear, and compounds free from rank vegetation, and hedges and trees cut low.
V. Intemperance.	1. The soldiers at the station are temperate on the whole. None of the men at present can be called confirmed drunkards in the troop of Horse Artillery, but about 14 in the detachment of the Royal Irish. Those of the Artillery who would have come under this denomination took their discharge last year. 2. There are no records as to the proportion of admissions to hospital caused directly or indirectly by intemperance. The following Table is for the B. troop, Horse Artillery. Drunkenness is punished as an offence.

B. Troop Madras Horse Artillery.

Return showing the Total Number and Ratio of Admissions and Deaths from each Class of Diseases for the Year ending 31st March 1860, with the same for each separate Month, arranged under three Classes, of "Teetotalers," "Temperate," and "Intemperate;" with the Monthly and Annual Average Strength of the Troops, and the Monthly and Daily Average of Sick, not including Commissioned Officers.

V. Intemperance—*cont.*	3. Distilled spirits are sold both at the canteen and bazaar. In the Artillery canteen no man is allowed to have more than 2 drams of spirits per diem, and in the 18th Royal Irish only 1 dram is allowed at present. About one-fourth of the men do not take their allowance. Spirit is no part of the soldier's ration. It is issued on payment at the canteen. The arrack issued to canteens is of the very best description. Each man is allowed to purchase 2 drams a day at 1 anna per dram, or 1 dram of arrack and a quart of malt liquor at 3 annas per quart. The men are not allowed to take a dram before morning parade. From 3 to 6 oz. of good wholesome arrack is given as a ration to convalescents, if deemed necessary by the medical officer. No drinks injurious to health are sold in the canteen, but in the bazaar drinks of various descriptions which are injurious to health and adulterated spirits are vended.
	4. Spirits are conducive to health if taken in moderation, and when requisite. Convalescents only get it by order of the medical officer. The use of spirits as at present, is both detrimental to the efficiency and discipline of a corps.
	5. It would be beneficial to abolish the sale of spirits in canteens, and more particularly by the contractors in the bazaar, who though strictly prohibited from selling it to soldiers, or to parties to be carried away, yet manage to have it sold to soldiers indirectly.
	6. Malt liquors and wine are preferable to spirituous liquor, being more conducive to health and less likely to cause disease.
	7. Tea, coffee, lemonade, &c., are much used, but particularly coffee. As compared with spirits they are most beneficial to health, efficiency, and discipline, but a moderate supply of malt liquor is of advantage to the soldier in this climate.
	8. It would be decidedly advantageous to suppress the spirit ration and substitute for it beer, tea, &c. By spirit ration is meant what the soldier can purchase at the canteen, though but a portion of his ration.
	9. It would certainly be beneficial to permit only beer, tea, coffee, &c., to be sold to the troops.
	10. Our opinions are embodied in the preceding remarks, and we have nothing further to suggest as recommendations.
	11. The sale of all spirituous liquors and intoxicating drugs in the bazaar is under the control of Government, the abkarry contract being let or sold once a year. The regulations are the same at all stations within the Madras Presidency. Those for the prevention of smuggling will be found in Regulation VII. of 1832. All sale of liquor to Europeans is prohibited and prevented as far as possible, but cases sometimes occur in which Europeans by various contrivances manage to obtain liquors through the intervention of natives. These latter when detected are severely punished. The canteen regulations, which are strictly acted up to, are laid down in G. O. C.C., dated 17th August 1855.
VI. DIET.	1. The rations of all European troops are as follows:—Bread 1 lb., meat 1 lb., beef or mutton, rice 4 ozs., sugar 2½ ozs., tea $\frac{5}{7}$ oz., salt 1 oz., vegetables 1 lb.; firewood 3 lbs. The only item which varies is the vegetable ration. As a general rule about 12 ozs. of potatoes and 4 ozs. of onions, green or any other vegetable in season, constitute the ration, but the proportion of potatoes varies according to the season, and the supply in the market. The rations are inspected daily by the orderly officer of the day, and frequently by officers of companies and the commanding officer.
	2. A complete ration includes vegetables, but no fruit. The stoppage is 3 annas 4 pice a day from each man's pay. When rations are not supplied the amount is refunded, and when the actual cost to Government does not come up to the above sum the difference is repaid to the men. They have three meals a day, consisting of tea or coffee, and bread for breakfast, at 8; dinner, beef or mutton, and vegetables, at 1; and tea and bread, at 4.30 for the infantry, and 6 or ½ past 6 for the artillery.
	3. The rations are good and sufficient, and there does not appear any change called for. The sale of rations is prohibited, and the mess orderlies, to whom the rations are entrusted, make it their business to see that they are not misappropriated either by the men or the cooks.
	4. There are cook-rooms with raised places for fire attached to the barracks. Native cooks are employed, and the apparatus used is that common to this country, generally large and small copper boilers, iron frying pans, &c. The kitchens are kept clean, but they have not much light and are not freely ventilated. Water is supplied throughout the day as required by puckalies, and is kept in chatties for use. The food is either boiled or roasted, as the men wish, sometimes stewed, and often curried. It is properly done and sufficiently varied, and tea and coffee are properly prepared. On march, if it be a short one, the men have coffee before starting, if a long one, they get it half way.

References to Subjects and Queries.	Replies.
VI. Diet—*cont.*	5. Gardens could generally be kept up advantageously by Europeans. The men of the Horse Artillery have less time for it than others. In the first instance seeds ought to be given to the men, and the produce of their gardens purchased by the commissariat department for the men's rations as far as may be required. The rest they might sell to the public, a vegetable bazaar being established near the garden or other convenient spot.
VII. Dress, Accoutrements, and Duties.	1. No deviation is allowed at this station from the dress and accoutrements of the soldiers as laid down in the regulations. The cloth clothing in the cold season, and the khakee in the hot weather are well adapted for the climate, and the dress, &c., is suitable for the soldier's duties. The helmet for the Artillery, and the shako for the Infantry in full dress are not adapted for the climate. The article called a turban, worn by both Cavalry and Infantry (Native) is unsightly and most inconvenient. It is strongly recommended that the men, both on hills and in plains, wear flannel shirts or belts, and worsted socks. A light helmet is being introduced in place of the forage cap, which is well adapted for the country. The same of felt, protected with steel plates for active service in the field, would be found advantageous for the Horse Artillery. The guard dress varies according to season; during the hot season the khakee dress, and helmet covered with the same, and in the cold weather, shell jackets or serge tunics, with cloth trousers and forage caps. Great coats are worn during the cold weather when necessary, and during the rains. Sentry boxes or verandahs afford shelter from the sun and rain.
Duties.	1. It would be very advantageous if the men came out from home thoroughly drilled; their being drilled at any intermediate station does not appear to be so. 2. The usual routine of a soldier's duty is drill, parades, roll call, and guard duties. An hour is the duration of the drill. Horse Artillery and cavalry have stables, &c., after this, and stables in the evening. European infantry drill in the morning for an hour, and sometimes the same in the evening. Native infantry the same, but rarely out in the evening except for roll call. The health of the men does not suffer thereby. The best hour for drills, &c., is in the morning immediately after daylight, and in the evenings from half-past 5, to half-past 6, according to the season. For marches, troops ought to start at such time as to ensure the encamping ground by 7 a.m. The Horse Artillery men have about five nights in the week in bed; the European infantry five or six; the native cavalry five; and the native infantry four. 3. Guards are mounted at a convenient distance from the barracks. They last twenty-four hours, each man mounting sentry for two hours at a time, or eight out of the twenty-four. In the Horse Artillery there are four roll calls; one for marching to stables, one for dinner, one at 5 for evening stables, and one at 8 p.m. European infantry, one for breakfast, one for dinner, and one at tattoo, and at any hour for defaulters. The cavalry has no roll call, parades, stables and watering parades answer the purpose. In the native infantry, where there are no parades there are roll calls morning and evening, and at 8 at night if ordered by the commanding officer. The night guards do not apparently affect the health of the men.
VIII. Instruction and Recreation.	1. The means of recreation and instruction at the station consist of a ball court, skittle ground for the Horse Artillery, a garrison library, and Horse Artillery library, the latter lighted till 9 p.m. There are no schools, day rooms, gardens, workshops, theatre, or gymnasia. There is not by any means sufficient occupation for the men in the wet season, or during the heat of the day; but the 18th Royal Irish are forbidden to go out between 10 a.m. and 4 p.m. Being out does not appear to affect health. 2. Topes of trees should be planted at a short distance from the barracks, that the men might amuse themselves under their shade when the sun is hot. A large airy shed, open on all sides, but capable of being secured on the sides from which the land winds and rains come, with a good skittle alley in one part and bars, &c., for gymnastic exercises, would be a great advantage. There ought to be a good plunge bath in the vicinity for the comfort of the men and to teach them to swim. 3. There are Government savings' banks, which are found most beneficial. 4. There are no shaded places for exercise. Trees ought to be planted, not too near the barracks to exclude air. Sheds should be put up also as above stated.
IX. Military Prisons.	1. There is no military prison at this station. The cells are sufficiently large and the ventilation fair.
X. Field Service.	1. There are no local regulations for field medical service. 2. The powers of the medical officers in regard to marches, camping, &c. are limited. 3. Encamping grounds are selected by officers of the quartermaster-general's department. Medical officers should be consulted more than they are on sanitary points connected with them. 4. All arrangements for the guidance of medical officers, whether in cantonment or in the field, are laid down in general orders and the medical code.
XI. Statistics of Sickness and Mortality.	1. No information.
XII. Hospitals.	1. Plans. 2. The hospital adjoins the Horse Artillery barrack, is situated at the south-west angle and surrounded by a wall. The building is about 300 yards from the Horse Artillery stables. The general bazaar is at a considerable distance; being a military station, there is no civil population here. A line of officers' houses run on the opposite side of the road, but the situation of the hospital is open and airy, and the ventilation good. The barracks are near it, but there are no high walls or trees. The site is in all respects unobjectionable. 3. Water is brought to the hospital by puckalies. 4. The impurities are carried away daily by the sweepers to a distance. The surplus water from rain or the men bathing runs into a drain and is carried off by the fall of the ground to the nullah. 5. The building is of one story only. The basement is of stone, in chunam, raised 3 feet from the ground; it is solid and there are no openings for air to penetrate underneath the floors. The roof water runs off into open drains which empty themselves into the main ditch out-

JAULNAH. MADRAS.

References to Subjects and Queries.	REPLIES.
XII. Hospitals—*cont.*	side and is carried to the nullah; the surface drainage is carried off in the same way. The ground on which the building stands is high, and the water is rapidly carried off. The walls are brick, in chunam. Basement, stone in chunam. The roof is of teak wood, couples and collar pieces, and tiled with flat and pan tiles. The roof is not double. The walls are the usual thickness, more is not required, the rooms being lofty and the whole building surrounded by a verandah. There is an open verandah, both in front and rear of the sick ward, 10 feet wide. They afford good shelter, particularly as they have curtains to lower down when necessary. The verandahs at the external end of the building have been enclosed to form rooms for a ward for natives, dispensary, &c. The verandahs are sometimes used for the accommodation of sick and convalescents, but no other parties. The hospital consists of one flat. The following table shows the hospital accommodation.

Total number of wards generally, 2.
Regulation number of beds varies, as shown below.

Wards.	Regulation Number of Sick in each Ward.	Dimensions of Wards.				Cubic Feet per Man.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
Horse Artillery.		Feet.	Feet.	Feet.	Feet.			Feet.		Feet.	Feet.
Ward No. 1	21	60	21	17	21,420	1,000	60	$2\frac{1}{2}$	8	4	3

Native Infantry Hospital.											
Main Ward	19	86	16	14	19,264	1,000	72	$2\frac{1}{2}$	7	4	3
Small do.	6	$30\frac{1}{2}$	16	14	6,832	1,000	81	$2\frac{1}{2}$	3	4	3
9th Regt. N.I. Hospital.											
Two Wards	26	86	16	14	19,264	740	53	$2\frac{1}{2}$	6	4	3
	10	$30\frac{1}{2}$	16	14	6,832	683	49	$2\frac{1}{2}$	3	4	3
2nd Light Cavalry.											
One Room	36	118	16	14	26,412	$733\frac{3}{4}$	53	$2\frac{1}{2}$	8	4	3

Both the hospitals are so placed as to receive the full benefit of the prevailing winds. The windows open inwards and are so arranged and constructed as to be conducive both to ventilation and coolness.

6. Ventilation is carried out by doors, windows, side and ridge ventilators, and are sufficient for the purposes required. There are no jalousies or jhilmils, but there are curtains of gunny in the verandahs.
7. Punkahs and kuskus tatties are used to agitate the air and cool that entering the wards. These things are too well known to require description.
8. There are no means of warming. The hospitals are cleansed and limewashed as often as may be found necessary.
9. A description of the privies, &c., belonging to the Horse Artillery are attached to the plan of the hospital. They are perfectly drained. Any water which is required is brought by the puckallies. The night-soil is invariably carried away, and there are no cesspools. They are as sweet as such places can be. Lime is freely used to purify the floors, &c.
10. There is a small bathing room and tubs supplied, but the conveniences for bathing are defective.
11. The European hospitals have water or bathing rooms, but not sufficiently supplied with conveniences.
12. Dirty hospital clothing is taken away, washed, and brought back by washermen employed by Government for the purpose.
13. The stores are not kept in the hospital, but in a separate building, under the commissariat department. The building attached to the Horse Artillery hospital is used as a female ward, and the stores are kept with the cantonment stores.
14. Iron bedsteads and wooden cots are supplied, the latter laced with coir rope or broad tape. The palliasses are stuffed with straw, and pillows with the same and cotton.
15. The cook-room attached to the Horse Artillery hospital is 15 feet by 10. Along the side facing the door a bank of earth is thrown up about 3 feet high and $2\frac{1}{2}$ broad, and on this bank raised divisions of brick are formed for resting the usual cooking pots and pans over the fire. The smoke escapes through an opening in the roof. The cook-room is within the hospital enclosure, as shown in the plan. The means and native cooks are found sufficient, and the cooking is properly done.
16. Tables appended.
17. The attendance for the troop of Horse Artillery is 1 hospital serjeant, 2 hospital orderlies, 1 first and 1 second class cooly, 1 cornicopoly, 1 tailor, 1 puckaly, 1 cook, 1 toty, 1 sweeper, and 1 female nurse for the sick women and children. Extra orderlies can always be obtained on the medical officer's requisition to attend on bedridden patients.
18. The sanitary condition of the hospitals is good. No epidemic disease has originated in them.
19. We recommend that there should be large surgeries, store-rooms, bath-rooms, and privies, and a building erected in the immediate neighbourhood of the hospitals for the residence of the medical subordinates; that the full complement of medical subordinates should always be kept up as laid down in the regulations of the service, such being seldom the case; and that every hospital should be surrounded by a wall for the purpose of keeping the hospital clear of stragglers.
20. The convalescents take exercise daily when considered necessary, under the charge of a non-commissioned officer. There is no conveyance, no ground fenced off, and no shady walks or seats for their use.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	21. At most stations there is a detached female ward; here there is none, and a small adjoining building to the men's hospital is used for this purpose. 22. No special local hospital regulations exist. 23. The repairs of the hospital buildings must be applied for through the commanding officer. All sanitary measures, diet, medical comforts, &c. are under the entire control of the medical officer. 24. There are no convalescent wards, but such would be advantageous.
XIII. Burial of the Dead.	1. The Protestant burial ground is 3,060 feet from the nearest barrack occupied by Europeans. The Roman Catholic burial ground is situated in the bazaar, and surrounded by native huts. 2. The area of the Protestant ground is 7 acres 1 rood. The principal Roman Catholic one is about 3 acres. The soil of the former on the surface is black soil, then a stratum of grauwacke, and generally, when the bottom of the grave is reached, basalt rock. There is no artificial drainage, but the water runs off from the natural slope of the soil. The Protestant burial ground is carefully kept, but not the Roman Catholic one, or the other native grounds. We have no means of ascertaining how soon decomposition takes place. 3. In the Christian burial grounds the space taken for each grave is about 7 feet by 3, with a space of about 5 feet between the graves. The depth of graves is 5½ feet, and they are never re-opened except on some rare occasions, when a child, for instance, has been buried in the same grave with its parent. There are no regulations regarding the time that must elapse between death and interment. Among the Christian part of the community burial never takes place in less than 12 hours or more than 24 hours after death. The same usage prevails during epidemics. With regard to the burial grounds used by the native troops or camp followers, the graves are about a foot shallower than those of Christians, but about the same length and breadth. The space between is generally less. Each grave contains but one body, and is never re-opened. Many Hindoos, but not all, burn their dead. 4. The graveyards are never offensive, and no precautions are necessary to prevent nuisance. There are no regulations on the subject of burial of British troops, the mode of interment in their case being the same as that in use in Christian communities. 5. The dead of camp followers and bazaar people are disposed of in the same manner as native troops as above stated. 6. No injury to health accrues from the present practice. 7. We can suggest no improvement in the practice now prevailing.

(Signed) W. C. Macleod, Brigadier, Commanding Jaulnah.
Joseph M. Jackson, Surgeon, 2nd Regt. Light Cavalry Senior Surgeon, Jaulnah.
H. H. Foord, Lieut., Executive Engineer, Jaulnah Division.

I. Topography.	1. The country surrounding the station is an open plain studded with topes of trees, and abounding in paddy fields, and tanks of water here and there for the purpose of irrigation. It is flat, dry, and sandy. There is not much jungle. 2. The station is on a level with the adjacent country, and not more than two feet above the sea level. There are several tanks of water in the cantonment, and the adjacent country abounds in them. There is no higher or healthier ground adjoining the station. 3. There are hills of unknown height about 40 miles distant. 4. The nearest lake is three miles from the station. A great portion of the surrounding country is under water during the monsoon months, between October and January, on account of the very small elevation of the country above the sea level. There is little broken ground near the station; there are no ravines or water-pits. 5. The station is open and freely exposed to the winds. The temperature is not raised by reflected sun heat. It is exposed to variable winds and to land and sea breezes. 6. The country around is cultivated. There are no works of irrigation. Rice is cultivated within the cantonments nearly up to the barracks. Indigo is also cultivated near the station. No injury to health in consequence. 7. There are several small native villages within two miles of the cantonment, but no city or town nearer than Madras, 13 miles distant. 8. (Nature of surface and subsoil not stated.) 9. Water is found at a depth of 12 feet from the surface in the dry season and 4 feet from the surface in the wet season. 10. The rainfall sinks into a pervious subsoil, and so drains off, except when tanks are made to collect it. 11. Water for culinary and drinking purposes is derived from wells. There are several small water-tanks not so used within half a mile distant. These tanks are generally full or half full; there are fish in them. The wells and tanks are not liable to pollution from leaves or other foul matter or drainage falling into them. No tanks for drinking are used for bathing.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	The ditch round the fort is a very great nuisance and gives rise to mephitic exhalations during the dry season. It was recommended to be filled up three years ago, but it has not yet been done. 12. The water supply for the station is unlimited in quantity and good in quality, pure and free from smell. It contains alkaline carbonates in small quantities. It is raised and distributed for use by chatties (country earthen pots). 13, 14. (Not replied to).
II. CLIMATE.	1. The meteorological instruments at the station consist of a barometer, thermometer, and pluviometer. 2. The following table gives the monthly means of the years 1855 to 1859 :—*

Months.	Barometer.	Mean Maximum.	Mean Minimum.	Rain.	Winds.

3. The climate generally is considered healthy. Sea breeze daily. Ophthalmia and fevers are prevalent during the hot land winds, and catarrhal affections during the wet cold season, but the health of the troops is little affected thereby. The diet, clothing, and drills are suitable to the climate. The most healthy months are January, February, March, April, and May. The most unhealthy are June, July, August, and September. The prevailing diseases during the unhealthy months are bowel complaints and diseases of the liver; these are, however, generally relapses among sick sent to the station for change on account of those diseases. Very few cases of them originate at the station.
4. There is no district near the station the climate of which is more conducive to health than that of the station.
5. I have served at Trichinopoly, Jackatalla, on the Neilgherry hills, and Poonamallee, but was not long enough on the two former stations to have an opinion as to their healthiness.

III. SANITARY CONDITION OF THE STATION.

1, 2, 3. Map of station.
4. The following table gives the barrack accommodation. (It is calculated from imperfect data furnished in the return. There appears to be some error in the dimensions as shown by the incredibly small amount of space allowed per man) :—
Total number of rooms or huts, 2 long continuous rooms, forming a square.
Total regulation number of non-commissioned officers and men, 600.

Barrack Rooms.	Regulation Number of Men per Room.	Dimensions of Rooms.				Cubic Feet per Man.	Superficial Area in Feet per Man.	Height of Men's Beds above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
		Ft. in.	Ft. in.	Ft. in.	Ft.			Ft. in.		Ft.	Ft.
1 - -	300	103 9	24 3	13 3	33,637	112	8 6	1 6	71	4	4
1 - -	300	103 9	24 3	13 3	33,637	112	8 6	1 6	71	4	4

Cells, 4 - -	1	8 0	8 0	7 2	460	460	64 0	—	4	1	1

5. The barrack windows are on opposite sides and open like doors. There is a verandah on one side about seven feet wide, which is frequently used as sleeping quarters, it is said, when the barracks are crowded and the nights hot. There are no jalousies or jhilmils.
6, 7. The bedsteads are wooden cots with cotton web bottoms. When necessary, the ordinary field tents for Europeans are pitched. The number per tent is supposed to be 10 men.
8. The ventilation of barrack-rooms, &c. is imperfect, by small openings in the roofs, and is by no means sufficient to keep the air pure by day and night. Punkahs are allowed occasionally to cool the air. No other means.
9. The barracks are pucka built.
10. The floors are of large square bricks, not raised, but on the same level as the surrounding ground.

* In the table, of which the above is an abstract, the totals of the monthly observations are given, and these have been divided by 5 to give the monthly means.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	11. The present buildings are deemed in every w y unsuited for occupation by European troops, and have been condemned accordingly. Repairs are done by the engineer department. Limewashing is done on requisition, and is reported not to have been done for 12 months past. 12. There are two bath-houses, one for men, one for women; also tubs; and at each corner of the barracks there is a stone trough, which is sufficient for all purposes of ablution, supplied from wells; and the tubs filled by puckalies. 13. There are two cook-houses at each end of the barracks; cooks and utensils provided; ample supply of water. No drainage. There are no suitable means of washing or drying linen. 14. The urinals are emptied when required; the privies before daylight each morning, the contents being carried to a distance to a place appointed. 15. The barracks are lighted at night by globe lamps suspended from the roof. 16. There is no sewerage. This subject has been before the authorities. The drainage is certainly not sufficient. The east wing of the barracks is damp, owing to want of drainage. All the fluid refuse soaks into the subsoil where it falls. A foul ditch surrounds the fort, which encloses the hospital. It has been recommended to be filled up over and over again, but no attention has been paid to the subject. 17. The surface cleansing is properly attended to within the cantonment and is efficiently done. The refuse, chiefly decayed leaves and berries, is removed daily, carried to some distance from the cantonment, and then deposited. 18. The surface of the cantonment is covered with short grass, but no weeds or decayed vegetable matter exist. There are no thick hedges, old walls, &c. to interfere with the ventilation of the station. 19. The native huts near the station are dirty and unwholesome as are native huts. The vicinity of the native dwellings contains nuisances, which, when to windward, are detrimental to the occupants of the barracks. To remedy this the natives should be put under the surveillance of a strict sanitary police. 20. Animals for the use of the soldiers are slaughtered at Madras. There is a slaughtering place for the use of the bazaar at a proper distance. The offal is used for manure, and no nuisance therefrom is experienced at the station. 21, 22. There is no stabling here. The halting ground for troops on the march is half a mile from the cantonment, and there the horses are picketed. The ground is dry and clean, and the manure is soon removed by the people. 23. There are no quarters for married men, and the married people occupy barrack-rooms with the men, but separated by tatties.
Officers' Quarters.	1. There are no officers' quarters. Officers doing temporary duty live in private houses or bungalows, which are very scarce and bad. It is suggested that new barracks be built, and that suitable bungalows be built for officers.
IV. Health of the Troops.	1. The district in which the station is situated and the adjoining native population are healthy. 2. The most prevalent diseases among the native population are small-pox and cholera. 3. I attribute the prevalence of the above diseases among native inhabitants to overcrowding and filth. 4. This being a depôt for drafts from England, convalescents, and sick, the garrison is a very mixed one. There is no portion of the men's accommodation unhealthy. 5. The troops at this station are never camped out except when there is want of room in barracks from the arrival of detachments, and that is, generally speaking, only for a short time. No injury to health has followed from men being camped out. 6, 7, 8. Certainly, hill stations are preferable for troops. 9 to 16. No replies. 17. There is no higher ground near this station which could be occupied as a hill station. 18. No reply. 19. The best age for soldiers proceeding to India is 22 years. They should land in the cold season. On landing, troops are placed in barracks with as much attention, room, and accommodation as possible; clothing is supplied, and their drills and duties commence. 20. No reply. 21. Troops proceed to the interior partly by rail, partly by transit. 22. Troops should serve 10 years in India, not more. 23. As regards medical boards, I have personally, and from my experience, no objection to the system now in force regarding invaliding of sick men. 24. The best time for invalids leaving India for home is in May and June, except in certain cases.
Diseases.	1. There are weekly inspections for the discovery of incipient disease. 2. There has never been scorbutic disease at this station. 3. The proportion of cases of hepatic disease usually under treatment is about 1 in 12. Cause attributable to climatic influences chiefly, aggravated in many cases by intemperance. 4. Dracunculus is seldom met with at this station. I have only seen two cases of it in five years. They occurred in sepoys from up-country stations. 5. The proportion of venereal disease to the total sick is small. The best precaution is legalizing prostitution. With a good system of sanitary police, lock hospitals are highly desirable. 6. The zymotic diseases prevalent at this station are chiefly endemic. They are *common, continued*, and *remittent fevers*. Cases of *dysentery* are generally relapses of chronic cases sent to the station for change. *Malignant cholera* has not occurred among the troops since I have had medical charge, upwards of five years, but a few sporadic cases have occurred among the most drunken pensioners.

Poonamallee, Madras.	References to Subjects and Queries.	Replies.
	IV. Health of the Troops —*Diseases—cont.*	I have never met with any case of *small-pox* among the troops, although the disease is very common among the natives. *Rheumatism*, as met with here, is invariably in a chronic form among the troops, and generally the result of syphilitic disease. The proportion of admissions to hospital from the above diseases to the total admissions is 1 in 5 (20 per cent.), and the proportion of deaths from them is 1 in 3 (33 per cent.) 7, 8, 9, 10. No replies.
	V. Intemperance.	1. There is a good deal of intemperance, the temptation of arrack and women being great. Of late one-third of the garrison has been composed of women. It is sometimes necessary to try men by court-martial upon a charge of habitual drunkenness. 2. Out of the admissions into hospital, 1 in 51 is directly caused by intemperance, and 1 in 124 is the indirect consequence of intemperance. Drunkenness *per se* is punished as an offence. 3. Distilled spirits are sold both at the canteens and bazaars. The quality at the canteen is good, at the bazaar bad. Each man is allowed two drams at the canteen, but can obtain more in the cantonment. Spirits constitute no part of the ration. The old soldiers all take a dram before breakfast. It is greatly to be desired that the young ones should be discouraged from so pernicious a habit. Spirits are not given as a ration to convalescents. Ginger beer is sold in barracks, and the sellers are encouraged to sell it. 4. Spirits in moderation are conducive to health and good order; in excess, destructive to discipline and also to health. 5. It would be beneficial to health to restrict the sale of arrack in the canteen and encourage the sale of beer, and to abolish the sale of all spirits in the bazaar and cantonment. 6. I consider malt liquor in this climate necessary, and am of opinion that it is conducive to health. On the other hand I consider spirituous liquors injurious to health, as they are invariably abused by the men who use them. 7. Tea, coffee, &c. are plentifully used at the station. The influence of tea, coffee, beer, &c. is very beneficial on discipline, as compared with spirits. 8, 9, 10. It would be well for the discipline of the soldier to suppress altogether the sale of spirits, and to substitute beer and porter, and to permit these, with tea, coffee, lemonade, &c., to be sold to the troops. 11. The following are the chief points in the minor canteen rules :— 1. Canteen open from 6 to 8 a.m. to issue tea, coffee, cheroots; again from 12 to 1, to issue liquor for men's dinners, viz., one dram spirits or one pint ale or porter, not to be given to the men till they sit down to dinner. Women may draw one pint malt liquor, as above. 2. Canteen open from 5 p.m., till tattoo, to issue per man one dram of arrack, brandy, or gin, or two drams of wine; or in addition to any one of them, one bottle or quart of malt. If there be no malt, one or two drams of wine. 3. Spirits to be drunk at the bar, but if mixed with two parts water, they may be drunk at the canteen table. 4. No man to give his allowance to another man. There are other disciplinary regulations.
	VI. Diet.	1. The ration for European troops consists of bread, meat, tea or coffee, vegetables, (potatoes, onions, pumpkins, &c.). The ration is inspected every morning by an orderly officer, and, if found unwholesome, is condemned by a committee of officers. 2. A complete ration is provided at the rate of three annas, four pice per man. Three meals are issued daily. At 8 a.m., bread, tea, or coffee, and half the daily ration of meat. At 1 p.m., the remainder of meat, either curried, stewed, fried, or in soup, rice, potatoes, &c. At 4 p.m., tea, with eggs or plantains, &c. About one-fourth of the ration consists of vegetables. 3. If the provisions supplied are of the first quality, there is no need of improvement in the ration. The rations cannot well be disposed of by the troops, as in a raw state they are under the charge of a messman and native cooks. 4. The cooking arrangements consists of a large brick-built room, copper boilers, frying pans, earthenware chatties, &c. The food is either roasted or boiled, at the wish of the soldier. The cooking is sufficiently varied, and tea and coffee are properly prepared. Troops invariably have coffee before the march commences, or half way *en route*. 5. Soldiers' gardens could not be advantageously introduced at Poonamallee at present, as the men are not permanently stationed here, and would feel no pleasure in cultivating that which they may not enjoy.
	VII. Dress, Accoutrements, and Duties.	1. The soldiers' dress consists of tunic and shell jacket, cloth or white trousers, with cap and white cap cover. Khakee clothing, wicker helmet. The dress is suitable to the climate and duties. The cloth clothing is suitable in the rainy season, and the Khakee clothing in the hot season. The guard dress is the same as worn on parade. The guards have their great coats for night, or for wet days, and the guard-room and sentry-boxes to protect them from sun or wet. 2. The duties consist of parades, drills, and guard mounting. Drill three or four days in the week, morning and evening, an hour each time. Men do not appear to suffer in health from drill. The best times for parades and drills are from 5 a.m. to 6 or 7 a.m., and from 5½ p.m. to 6½ p.m. Marches from 1 or 2 a.m. to 6 a.m. The men have three or four nights a week in bed. 3. The furthest guard mounted is 200 yards from barracks. Guards last 24 hours. There are four roll calls by day, none at night. The men do not appear to suffer in health from night guards.

References to Subjects and Queries.	Replies.
VIII. Instruction and Recreation.	1. There are ball courts, skittle grounds, and schools. There is a garrison library opened twice a week to issue books. There are no day-rooms, soldiers' gardens, workshops, theatre, or gymnasium. A temporary theatre is occasionally fitted up. There are sufficient means, if the men choose, to employ themselves. The men are returned to barracks from 8 a.m. till 5 p.m. 2. The soldier has his parades and marching-out parade for exercise. There is a fives court and alley. The Commander-in-Chief authorized an outlay from the canteen fund to supply cricket bats and balls. 3. The present system of savings' banks is very advantageous. 4. There is no shade for the men to take exercise, with the exception of a very fine and extensive avenue of trees, which affords a pleasant walk and shade at all times close to the barracks.
IX. Military Prisons.	1. The prison cells are too small and ill ventilated. The arrangement for a water-closet in the cells is objectionable.
X. Field Service.	1, 2. The medical officer may suggest or recommend measures as regards the conduct of the line of march, camping, &c. 3, 4. No replies.
XI. Statistics of Sickness and Mortality.	No returns.
XII. Hospitals.	1. No plan of hospital. 2. The hospital is about 450 yards south-east of the barracks, and to the north-west of the bazaar. It is surrounded by a fort wall, which excludes the air in a great measure; also by a fort ditch of dirty stagnant water, with shelving banks of mud. 3. The wells supply enough of good water. 4. There are, practically, no means of drainage. 5. The buildings are in an oblong square. The floors are on the same level as the ground, and are simply bricked over. There is no provision for carrying away the roof water. There is no regular surface drainage nor guttering. The buildings are one story high, built of brick, single walls and single roofs, tiled. There are verandahs seven feet wide on both sides; they do not afford sufficient protection; they are used by convalescents for walking exercise. The following is the ward accommodation :—

Wards.	Regulation Number of Men per Ward.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area per Bed.	Height of Bed above Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
3	20	63	16	10	10,080	504	50	1½	None.		
1	16	54	16	10	8,640	540	54	1½			
1	8	24	16	10	3,840	480	48	1½			
2	4	15	16	10	2,400	600	60	1½			
		18	16	10	2,880	720	72	1½			

The hospital is not so placed as to receive the full benefit of prevailing winds. It is shut out from the air on all sides by the fort wall which encloses it.
The windows open like doors on hinges; there is no glass.
6. The ventilation is imperfect. There are no jalousies or jhilmils.
7. The air is cooled by punkahs pulled for certain hours of the day.
8. The last time the ceilings and walls were limewashed was 12 months ago.
9. The hospital privies are small puckah buildings, with removable wooden boxes to receive the soil. They require the use of water and lime to keep them from being offensive.
10. The lavatory arrangements are not at all sufficient as to space or appliances.
11. The bathing arrangements consist of hip baths and some basins, but space and means are incomplete.
12. The hospital linen is washed at a distance by paid servants; means adequate.
13. The storage is not sufficient, but dry.
14. The bedsteads are wooden cots, with cotton web supports. Other articles of bedding sufficient.
15. Like all the buildings, the kitchens are much too small. Frying pans, kettles, and iron pots alone are supplied. No kitchen ranges or means of roasting or baking.
16. Diet tables.
17. Provision for attendance on the sick consists of 1 hospital serjeant and 8 native attendants, or one for every 10 sick men. Such attendance is but indifferent and unsuited for European sick. European nursing, in part at least, would be very desirable.
18, 19. The hospital is by no means suited for the treatment of European sick; it is on the ground level; the building is too small, the ventilation imperfect, and sewerage wanting.
20. The provision for exercising convalescents consists of carriage by doolies and sick carts morning and evening, besides walking exercise in a shaded walk.
21. A portion of one of the wings of the hospital is used for accommodating sick wives and children of soldiers, but more cubic space and more accommodation are necessary.
22. In so far as regards the powers of medical officers as to hospitals, the medical officer can suggest or recommend measures; those in authority may disregard such suggestions (this refers to repairs, drainage, room, &c.) The medical officer has full control over the internal economy, and can regulate all diets, and give medical comforts at discretion.
23. There are no convalescent wards, but the necessity for such is apparent.

References to Subjects and Queries.	Replies.
XIII. Burial of the Dead.	1. The British burial ground is 200 yards from the barracks and 400 yards from the hospital. No particular winds blow over it. 2. The ground is 531½ feet long by 240 broad. The subsoil is sandy. No drainage within the walls. 3. The grave space is irregular, as the ground is very large. Depth of graves about 4 feet. Very seldom re-opened. At ordinary times burial takes place from 12 to 24 hours after death. During epidemics 12 hours after death. 4. The grave-yard is never offensive. If a soldier dies in the evening, he is buried the following morning, with the usual military honours according to rank. 5, 6, 7. (Burial of natives.) No replies.

(Signed) John Impett, Colonel-Commandant.

24th May 1860. J. D. Lapsley, Depôt Surgeon.

DOWLAISHWERAM.

Accommodation { Queen's Troops, Sappers and miners. / Native Troops, Sappers and miners.

References to Subjects and Queries.	Replies.
I. Topography.	1. The station is situated on a series of low hills, composed of waste sandstone, the surrounding country being comparatively low, flat, and sandy. Towards the river the soil is black, but at a greater distance from it changes to a red sand. It is excessively dry, except where it is flooded by irrigation from the Godavery. To the north and south the country is interspersed with a few small hills. There is no wood or high jungle, nor any great extent of water in the immediate vicinity, but the Godavery flows within 1½ miles of the station. 2. The station is elevated 100 feet above the sea, and about 60 feet above the adjacent country. There is a plateau within half a mile of the station, separated from it by low ground, and of only a few feet greater elevation than the station. It is, however, too limited in extent to be applied to any military purpose. 3. There is no mountainous country within 30 miles, but at this distance there is a hill about 2,500 feet in altitude. About two years ago an attempt was made to establish a small sanitarium there, and by direction of his Excellency the Commander-in-Chief a company of sappers was sent to clear the plateau, but the men were so completely disorganised by fever that the attempt was abandoned. This plateau forms a portion of a range which in the latitude of Vizagapatam rise to a height of 5,000 feet and upwards. 4. The nearest water to the station is the Godavery river about 1½ miles distant. The Samulcottah and Coconada canals are within the same distance. No nullah or marsh exists in the vicinity of Dowlaishweram, nor is the adjacent ground liable to overflow. There is no broken ground from which the water does not speedily drain off. 5. The station is too much exposed to the wind, and does not possess a sufficiency of trees or vegetation of any kind. There is no higher ground or any elevation whatsoever to interfere with a perfect circulation of air through the cantonment. The temperature of the station is not raised by the buildings, being exposed to reflected sun heat, but it is decidedly elevated by the radiation from the sandstone of which the low hills are composed. The station is not exposed to cold and variable winds, but it is to the land winds during May and June, tempered however by the sea breezes in the evening. They have no perceptible effect on health. 6. The country is highly cultivated on the river side, but towards the east there is little or none at all. The Godavery annicut and irrigation works are within 1½ miles of the station, but have no prejudicial effect on health. There is no cultivation of rice, indigo, hemp, or flax in or near the station, but within two or three miles rice is largely cultivated without any restriction. 7. The town of Dowlaishweram is within one mile of the station, and Rajahmundry is four miles distant. 8. The geological structure of the hill on which the station stands is coarse red sandstone, the soil of the surrounding district being alluvial. The station stands on new ground. 9. Water is found during the dry weather from 30 to 60 feet below the surface, and from 20 to 30 feet in the rainy season. 10. The rain-fall and surface water flows off very rapidly. The natural drainage could scarcely be improved. No drainage from any high ground passes into the subsoil of the station. 11. The water supply is obtained for the most part from wells, the drinking water altogether so; water for other purposes being partly procured from the rain-fall. Only one small tank for storing water exists in the station, the surface of which is 12 yards square. This is generally full of water during the greater part of the year (restrictions being placed upon its use), but it is usually dry during May and June. This tank having been recently made is free of vegetation as yet. It is never used for bathing purposes, nor is it liable to pollution from any source; neither has it ever been the cause of nuisance or malaria. 12. The water supply consists principally of that derived from two wells, that from the barrack square well is slightly milky, and has a chalky taste, but smells good. It is a new well. The water, however, is rapidly improving, although at present it is hard, containing lime in excess and some chloride of sodium. The water from the other well is unexceptionably good in every respect. It is soft, clear, and good, and not injurious to health. The amount of water is not sufficient for the wants of the station. It is raised and distributed in the usual way by bheesties and puckallies.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	13. There are no other topographical points bearing on the health of the station to be remarked on. 14. New stations are selected by a committee, comprising the chief military authority, senior surgeon, engineer, and the commissariat officer. I would suggest that in establishing new stations a small body of troops should be first located there for one year by way of testing, beyond possibility of doubt, the salubrity of the site. It has not unfrequently occurred that a site has been selected by a committee, the whole of the buildings sufficient for a large force erected, and when, shortly after the place has been inhabited, it has proved to the last degree unhealthy, and has been consequently abandoned at a heavy cost to Government. In the present imperfect state of sanitary science actual experiment appears the only safe guide in selecting new stations.
II. Climate.	1. There are no means or instruments available at the station for meteorological purposes. 2. There have been no meteorological tables kept until this year. There are no barometers, rain gauges, or wet and dry bulb thermometers supplied to the station, only an ordinary thermometer. 3. The climate here, all things considered, is good for native troops. April, May, and June are very hot, the thermometer reaching 108° in the shade, which, after the opening of the monsoon, is considerably modified. The monsoon lasts from the middle of June till the end of September. October, November, December, January, and February are sensibly colder, especially at night. Except during the monsoon the climate may be called a dry one, not very variable, and free from fog and damp. During the hot season the hot winds blow with violence, tempered in the evening by the sea breeze. The health of the troops is good, and their diet, shelter, and clothing are all suitable, but there might be some advantage in the curtailment of the morning outdoor occupation of the Europeans in the hot weather. The most unhealthy months are just after the commencement of and towards the end of the monsoon, July and September, during which period quotidian and tertian fevers are the prevailing diseases. 4. There is no healthier district near, which is more conducive to health than that in which the station is situated. 5. The following are the stations at which I have served with a statement of their salubrity or insalubrity:—Bangalore, most salubrious; Palghat, not unhealthy; Coimbatore, salubrious; Umballa and Lahore, healthy during the cold season, but fever is prevalent during the hot weather; Simla, most salubrious; Dowlaishweram, healthy for natives, but too hot for Europeans; Wellington, very healthy; Calicut, tolerably healthy; Mulliapooram, unhealthy, much dysentery prevailing amongst Europeans; Oude, all over a most salubrious country: Nagode, unhealthy; Banda is the most unhealthy place, perhaps, in India, and the hottest; Saugor, very fine, but much fever: Kamptee, very hot, much fever and cholera; Rangoon is very hot, but not unhealthy; Pegu, healthy; and Tongoo very healthy.
III. Sanitary Condition of Station.	1, 2, 3. A map of the surrounding country, showing the position of the public buildings, &c., and a plan of the barracks, &c. are transmitted. 4. Table of Barrack accommodation. Date of construction, 1858.

5. The windows are on opposite sides, and open outwards. There is a verandah on both sides extending nearly the whole length behind, but in front broken by the mess room, which is built in, and occupies a portion of the space. I have found, on inquiry, that the verandah was often slept in, but this is a matter of chance, there being ample room in the dormitory, There are also jhilmils painted green, which are well constructed and in good condition.
6. The cots used by the men in barracks are the plain wooden sort, made by placing planks on two trestles, the bedding consisting of one gudrie, a blanket, a sudringee, and a pair of sheets. The bedding, I think, ample, but I should recommend in preference to the cot now in use those made with fine string.

III. Sanitary Condition of Station—*cont.*	7. The tents used in camp for Europeans are 21 feet long by 15 feet broad, each pole being 10 feet 3 inches high. The walls are 5 feet high, and the tents are constructed to hold 20 men. The cubic space for each tent is 2,401 feet, and the superficial area per man 16 square feet. The tents used for natives are two-poled, without walls, 22 feet long by 12 feet broad, the poles 9 feet long, and each tent holds 20 men. The cubic space of each tent is 2,376 feet, and the superficial area per man 10 square feet. 8. The means of ventilation for the barracks seem ample. There are 14 windows, and doors, and a ventilator in the roof above in that occupied by the Europeans. I should think these quite sufficient to keep the air pure by night and day. Punkahs are also used, of the ordinary description, to cool the air of the rooms. 9. The foundations of the barracks are of stone, the superstructure being of brick, the whole laid in mud and plastered externally and internally with lime. The tents are constructed of canvass of the usual description employed in India; and the native huts are built of mud, roofed in with palmyra leaves. 10. The barrack floor is constructed of square stone pavement, raised about 18 inches above the level of the ground, but admits of no passage of air underneath. 11. The materials used in the construction of barracks, huts, and tents are perfectly suited to the climate, and no improvement is required except, perhaps, that the barracks should have been built with mortar instead of mud. The public buildings and cantonments are kept in repair by district engineer, on the requisition of the officer commanding the station, sanctioned by the general of the division. The officer commanding the station is responsible for its sanitary condition. The barracks have not been whitewashed since March 1859, more than a year ago, when the building was first given over to be dwelt in. 12. There is a bath-room close to the barracks for the men, and also a plunge bath for them; but the water for these is very deficient at present. 13. There are no means of cooking provided. It is left entirely to the natives, who are left to their own devices, as elsewhere throughout India. The water is supplied to them by the bheesties in the usual way. There is no drainage to the cooking places. The linen is washed by the native dhobies. 14. There are no drains to the privies and urinals, the refuse being removed daily by native sweepers. 15. These buildings are ventilated by a narrow interstice running the entire length of the building, on both sides of the ridge. They are lighted by common oil lamps at night. 16. There are no artificial drains to the barracks, the natural drainage being so good that water never lies. The drainage is good with regard to getting rid of surface water, but there is no proper drainage for cook-houses and urinals. No part of any of the buildings used as barracks or hospital is damp. The drainage of the barracks not being sufficient the fluid refuse sinks into the subsoil. No cess-pits exist here. There are no foul ditches near the station, but at the distance of a mile there is a canal used for draining the refuse of a sugar factory, from which the foulest effluvia arise. 17. The surface cleansing is performed daily by native sweepers, and the refuse disposed of in any secluded place that may be found. 18. The surface of the cantonment is too sterile to require any precaution to keep it free from vegetation. There are no old walls, thick hedges, &c., to interfere with the proper ventilation of the station. 19. The bazaar is a very small one, and is kept perfectly clean and healthy. It is under the orders of the cutwal and his peons, who are quite sufficient to ensure its being kept in a proper sanitary condition. There are no native houses within a mile of the station, and these present the usual aspect of all native towns, from whence there is always a palpable noxious effluvium. I am not aware of any dung heaps or cess-pits existing within them. The dung of cattle is never allowed to collect, but is invariably carried away for fuel. No nuisance is experienced in barracks from wind blowing over the native dwellings. 20. The animals for the soldiers' food are slaughtered about a mile from the station. The only shambles are outside the station, and not subject to any regulations, but no inconvenience is experienced from them. 21, 22. There are no stables or picketing grounds at the station. 23. There are not sufficient quarters for the non-commissioned officers; many are obliged to live in huts, close to the native lines, of a description scarcely fit for Europeans, especially in the hot season.
Officers' Quarters.	1. There are no quarters properly so called. There are only three bungalows, the property of private individuals. These are excellent in every respect, but the officers are put to the greatest discomfort for the want of proper quarters. Many more should be built.
IV. HEALTH OF THE TROOPS.	1. This query having reference to the healthiness of the native population and the district adjoining the station, admits of two answers; first, as applicable to Europeans; and secondly, as to the natives. The station itself cannot be pronounced unhealthy, but as the occupations of the Europeans require them to be much out of doors, it is not a suitable climate for sappers and miners. The cantonment itself is not unhealthy, but the surrounding district is fruitful of malaria, and the adjoining native population are much subject to fever. 2. The most prevalent diseases are intermittent fever, small-pox, cholera, syphilis to a very great extent, and spleen. 3. Fever amongst the natives is attributable to the large expanse of swampy ground near the river and the canals of irrigation; syphilis to the very defective police and absence of proper sanitary arrangements for its suppression. 4. The troops were at Gallicondah and China previous to coming to this station. No portion of the men's present accommodation is more unhealthy than the rest. 5. The troops are never camped out. 6. I was doing duty with H.M.'s 74th Highlanders at Jackatalla (now Wellington) on the Neilgherries, for nearly a year. My opinion was that that station, with certain exceptions, was equal, if not superior, to any climate I ever experienced in England. The exceptions are in such men as suffer from chronic dysentery and chronic liver complaints; they do not, from the sudden change of temperature, contrasted with the plains, do well at Jackatalla. The change should be gradual.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	7. From my observation, I should say that troops coming from the hills would not be more liable to attacks of disease on returning to the plains. I should say less so, and I found my opinion, firstly, on the thought that men whose constitutions have been braced and nerved in a genial climate would be more impervious to the ordinary influence of contagion, malaria, &c.—more able to resist deleterious causes; secondly, on the experience I have had in marching with troops on two occasions, once to Cannanore and once to Calicut, on both which occasions the men were remarkably well and free from sickness.
	8. I strongly approve of selecting hill stations for troops. I think it would be almost equivalent to doubling our army. I imagine a regiment on the hills would be found, from the spirits and health of officers and men, to be almost equal to two regiments on the plains; certainly one and a half.
	9. Troops going to hill stations are sometimes liable to be attacked with diarrhœa, the functions of the skin being so suddenly checked; and, as I said before, former cases of dysentery and liver complaint are subject to relapses.
	10. The only precautions which occur to me to provide against these attacks are increased clothing, especially flannel, closed houses with fire-places, and plenty of outdoor exercise during the day.
	11. From August to May is the best season for residence in hill stations, after which the south-west monsoon sets in with great violence. We have no data on which to found an opinion as to the shortest period of residence which would enable troops to obtain the full benefit of the hill climate.
	12. I presume there is no period of residence in hill stations beyond which injury would be likely to be inflicted on the health of troops returning to service in the plains.
	13. I am not aware of any special precautions required to be adopted on leaving hill stations for the plains beyond the two previously alluded to. No more than the ordinary precautions were taken that I remember.
	14. I should decidedly recommend the location of troops on the hills. As far as my own experience goes, I should say change of stations on the plains is not commendable more frequently than once in four years. Frequent change often ruins officers and men, and by depressing the spirits, injures the health. I am presuming, of course, all stations to be equally healthy.
	15. Magnificent barracks are in course of construction at Wellington, and are, I believe, nearly completed.
	16. I have no experience to speak with reference to most suitable elevation as sites for hill stations.
	17. There is no higher ground near the station which could be advantageously occupied as a hill station.
	18. I have found the dark loamy soil, commonly called "cotton soil," unhealthy for stations. In such localities the troops are subject to fever, *e.g.*, Saugor. The red gravelly or sandstone formation seems to me to be the healthiest.
	19. The best time of life for a soldier to proceed to India is at 25 years of age, and he should land there between October and March. I cannot speak from experience as to the manner in which troops are disposed of as regards barrack accommodation, &c., on first landing, but I should recommend their being sent so hill stations for a year, as being a more gradual way of acclimatizing them. I would have the recruit depôt on the hills in the Madras Presidency; landing the troops at Calicut, and marching them on by the Sisparra ghat.
	20. If troops were sent to the hills, there would be no objection to their being sent from the home depôts to India at once.
	21. I cannot speak as to the mode of transport adopted for the conveyance of soldiers from the port to the interior, as I have never marched with fresh landed troops.
	22. The number of years a British soldier should serve in India will depend upon how his health has been economised. If as at present he is obliged to serve without intermission in the plains, I should say about ten years was the maximum.
	23. With regard to the manner of conducting the business of medical boards, I have never, during my experience, seen any unseemly difference of opinion in reference to invaliding. No suggestion occurs to me on this subject.
	24. Invalids should leave India for home rather late in the cold weather so as to reach home in spring or early summer.
Diseases.	1. There are regular inspection parades once a fortnight for the discovery of incipient diseases at this station.
	2. There have been no scorbutic diseases among the troops while here.
	3. The proportion of cases of hepatic diseases usually under treatment depends on the number of Europeans at head-quarters. The usual cause of the disease is climatic influence, here the cases seen, have been idiopathic amongst fresh landed men. The prophylactic measures suggested are less employment in the sun during the day.
	4. Dracunculus is rare. Of the five admissions during the past year all the patients had been on foreign service, and no doubt contracted the malady there, in Bundelcund especially.
	5. The proportion of venereal cases to the total admissions into hospital from all other diseases was rather more than one-tenth. In order to prevent the disease medical supervision ought to be held over all bazaars adjacent to troops. The establishment of lock hospitals would be also advantageous.
	6. The troops at the station suffer from the following diseases of the epidemic or endemic class:—
	Fevers.—The most frequent form of fever is the intermittent, which is endemic in the surrounding population.
	Dysentery.—Is very rare here.
	Cholera.—Is endemic in the surrounding districts. The camp itself has been singularly exempt, even when the disease has been raging all around.

DOWLAISHWERAM. MADRAS.

References to Subjects and Queries.	Replies.
IV. Health of the Troops—*Diseases—cont.*	*Small-pox.*—Is not known in the camp, as far as can be ascertained, and not more frequent than ordinary around. *Rheumatism.*—Is not frequent. A few cases only of lumbago occasionally occur. The following is the proportion of admissions and deaths from these diseases to the total admisions and deaths :—

Diseases.	Admissions.	Deaths.
Fevers - -	$\frac{1}{2}$ or 33	2 in 100
Cholera - -	2 in 300	1 recorded.
Small-pox - -	None since the corps has been here.	
Dysentery - -	$\frac{1}{10}$ or 1	—

7. There are no data on which to answer this query as to the nosological character of zymotic diseases, as none of the class have raged in this station.
8. There have been no epidemics to supply data to show how far the soldiers' habits, on the march or in barracks predispose them to such attacks.
9. There has been no necessity to try quinine at this station as a prophylactic against malarial disease.
10. We have no recommendations to offer on the subject of the prevention or mitigation of malarial disease.

V. INTEMPERANCE.

1. Any of the Europeans who show a disposition to drink are at once remanded to their regiments. The remainder are of necessity temperate. Native sappers from the nature of their work are more inclined to drink than the native soldiers generally, but cases of intemperance are not numerous. There are no confirmed drunkards.
2. The number of Europeans is so limited that sufficient data cannot be obtained to prepare a statistical table of the effect of total abstinence, temperance, and drunkenness on the amount of sickness, mortality, and crime at the station, nor are we sufficiently acquainted with the habits of the natives to enable us to frame one for that portion of the corps. Drunkenness is always punished as an offence.
3. There is no canteen here, but spirits are issued daily by the commissariat clerk. The men take their dram at noon, and it does not seem to have any perceptible effect on health. Spirit is never given to convalescents except in extreme cases.
4. It is doubtful whether the consumption of spirit is conducive or injurious to health, it would depend upon circumstances. It is decidedly conducive to efficiency under heavy and severe privations.
5. We think it would be injurious entirely to abolish the use of spirituous liquors as a ration, but we would strongly recommend its sale being entirely prohibited in the bazaars.
6. Good sound malt liquor is decidedly beneficial to health in India. Spirit as a rule should be avoided.
7. Tea, coffee, lemonade, &c. are not more used than ordinarily. The first two are used by Europeans of all classes here, as well as throughout India, to a very great extent, but we cannot speak as to their influence on health, &c.
8. We are of opinion that malt liquors, if sound, are much preferable as a ration to spirits, but if spirits were altogether suppressed it might occasionally be found very inconvenient.
9. It would be beneficial in the event of prohibiting the sale of spirituous liquors in the canteens to permit only beer, coffee, tea, lemonade, &c. to be sold to the troops.
10. We think the present regulation as regards European soldiers in this country very good.
11. There are no canteen or bazaar regulations at this station.

VI. DIET.

1. The ration for European troops in the Indian army consists of 1 lb. of bread, 1 lb. of meat (mutton twice a week); tea, $\frac{5}{7}$oz., or coffee every third day, $1\frac{3}{7}$ oz.; sugar, $2\frac{1}{2}$ oz.; rice, 4 oz.; vegetables, 1 lb.; salt, 1 oz.; firewood, 3 lbs. The quartermaster examines the rations, &c., and in the event of their being bad, a regimental committee, of which the surgeon is a member, is assembled, who condemn them if they consider them unwholesome.
2. A complete ration is issued each day, the daily stoppage for which is three annas and four pie. Three meals per diem are taken, viz., breakfast at 9 a.m., dinner at 2.30 p.m., and tea at 6 p.m. About one-third of the ration consists of vegetables.
3. There might be greater pains taken at all stations where European troops are located to form vegetable gardens, and to cultivate orange, lime, and mangoe-trees, a thing much neglected. There are no arrangements made for preventing the disposal of the rations by the troops.
4. There are no means or apparatus provided for cooking the food. It is dressed by the native cooks entirely after their own fashion, as it is universally throughout the country. The kitchens are clean, light, and tolerably well ventilated, but are insufficiently supplied with water. The food is both boiled and roasted, and the cooking is properly done and sufficiently varied. No complaints have ever been made on this subject. In reference to whether tea, coffee, or other refreshments are served out on the march, no remark can be made, as no march of troops from head-quarters has taken place for a long time.
5. The establishment of soldiers' gardens under the supervision of a regimental committee would be decidedly advantageous.

VII. DRESS, ACCOUTREMENTS, AND DUTIES.

1. The soldiers' dress at this station consists, in the cooler months of (for natives) a red cloth tunic, blue cloth trousers, black kerchief puggrey, socks, and boots. The accoutrements are,—waist-belt, with sword scabbard, pouch-belt, and pouch and carbine. In the hot months they wear white nugreka's cotton trousers, black kerchief puggrey, and socks, boots, and accoutrements as above. The Europeans wear in the cool months a red cloth tunic, blue cloth trousers, socks, boots, and forage cap. The accoutrements are the same as those for natives, with the exception that they are supplied with a minie rifle

References to Subjects and Queries.	Replies.
VII. Dress, Accoutrements, and Duties—*cont.*	instead of a carabine. In the hot months they wear khakee, tunic, trousers, and wicker helmet. The dress is suitable both to the climate and the soldiers' duties, and no improvements are required. European guards are never placed in exposed situations when on duty, either by day or night. The natives have their cloaks for wet weather.
Duties.	1. Troops should be thoroughly drilled at home before being sent to India, or else at the depôt if sent to the hills, as drill very much interferes with the men's studies in surveying, architectural course, &c. &c. 2. In the cold weather natives drill every morning for one hour, with the exception of one day besides Sunday in the week, and they work from 8 to 12 and 1 to 5 daily. Europeans are surveying in the morning from 5.30 to 8, and during the mid-day hours are occupied in school, plotting, survey, drawing, &c. &c. The natives benefit greatly by constant and regular work and drill, and are consequently in better spirits and health than regiments of the line generally. The best hours for drill, parades, &c. are from 5 a.m. to not later than 8 a.m. There are general orders on this subject. The men have six nights in bed during the week, but this varies according to the number of companies at head-quarters. The Europeans are seldom placed on guard duties. 3. Guards are mounted at 200 yards distance from the barracks. They are relieved daily at 6 a.m., the sentries being relieved every two hours. There are only two roll calls, viz., on Fridays and Sundays, the days on which there is no drill or work. The men being occupied during the rest of the week renders them uncalled for. Night guards do not apparently affect the soldiers' health.
VIII. Instruction and Recreation.	1. No ball courts, soldiers' clubs, gardens, or theatre; a skittle ground is in course of erection from regimental resources. There is also a library and reading room for Europeans, which is lighted at night. Besides this there are two smiths' and carpenters' workshops, and a brick shed for brick-making, tile-making, and pot-making. This station is very badly off for the means of instruction and recreation. A raquet court is very much needed. No restriction is placedon the men with regard to exposure to the sun and rain when off duty. 2. The construction of a gymnasium and raquet court would greatly improve the existing means of recreation. 3. The establishment of soldiers' savings banks would be very advantageous. 4. There is no shade whatever provided in the shape of trees, sheds, or verandahs to enable the men to take exercise without injury during the day.
IX. Military Prisons.	1. The military prisons are in every respect efficient.
X. Field Service.	1. There are no special field medical regulations in force at this station. 2. The medical officer attached to this committee found during the last campaign every facility and encouragement given by the officers under whom he served to carry out any suggestions made by him concerning choice of ground for encamping, time of marching, rations, &c. but this seems to depend more on the courtesy and good sense of the commanding officer than on any constituted power of the medical officer. Some well-defined rules, bringing the medical officer more *en rapport* with the commanding officer for sanitary purposes would seem advisable, if none have already been issued. 3. The ground for encamping is generally selected by the quartermaster, aided, if necessary, by the medical officer, and this arrangement is generally found to answer well. We have never seen any sanitary regulations published for general information of a camp. Care is always taken as far as we have seen, to pitch a camp on an open, well-ventilated piece of ground, and if possible, on ground not lately encamped upon. The water-supply, of course, depends on the nature of the country, and especially in the neighbourhood of an enemy, may be somewhat precarious. Latrines should always be dug to leeward, and not too far from the camp. The medical officer's powers, as far as we are aware, are not clearly defined, but depend more or less on the courtesy of the commanding officers. It would be better if rules were published defining his authority. 4. Copies of the regulations in force in reference to field hospitals, ambulances, &c., are not at hand, wherewith to supply the necessary information on this subject.
XI. Statistics of Sickness and Mortality.	No information is supplied under this head.
XII. Hospitals.	1, 2. The hospital forms one side of a square, of which the three remaining sides are formed by the non-commissioned officers' quarters, barracks, and store-rooms. It is a great distance, being upwards of a mile from any bazaar or houses of the civil population. The site is open and freely ventilated. There is, however, rising ground in the immediate vicinity, which, though it affords some protection from the hot winds, renders the building damp in the monsoon. A large nullah has been dug to obviate this, but with only questionable success. 3. The water-supply is wholesome, but not abundant. More wells should be dug, and a larger number of bheesties and puckallies employed. 4. Except the nullah alluded to, there is no drainage for the hospital. The surface drainage seems ample, except during the monsoon. Other impurities (as throughout India) are removed daily by toties, and thrown upon the ground some distance from the hospital, whence they are speedily carried away by the natural scavengers of the country. 5. The wards are raised 2 feet above the ground, but do not admit of free perflation of air underneath the floors. The roof-water sinks into the subsoil, or is carried off by the slope of the ground around. There is no artificial drainage, save the nullah alluded to. The hospital is built of brick and stone, with tiled roof, the roof and walls being single. For coolness, a thatched roof is always preferable we think, in this country, but it has the great disadvantage of inflammability. There are verandahs on both sides of the building 13 feet wide, affording ample shelter. These are never used, except as promenades. The hospital consists of one flat only.

DOWLAISHWERAM. MADRAS.

XII. Hospitals—*cont.*

TABLE of HOSPITAL ACCOMMODATION.

Date of construction - - - - - - - 1859
Total number of wards - - - - - - - 3
Total regulation number of beds - - - - { Would admit 40 comfortably in all three wards.

Wards.	Regulation Number of Sick in each Ward.	Dimensions of Wards.				Height of Patients' Beds above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.		Number.	Height.	Width.
		Ft.	Ft.	Ft.		Ft.		Ft.	Ft. in.
No. I. Ward -	—	75	20	20	30,000	2	8	5	4 4
No. II. Ward -	None fixed, it has always been far from full.	20	20	20	8,000	2	4	5	4 4
No. III. Ward -	—	20	20	20	8,000	2	4	5	4 4

The hospital is not situated so as quite to receive the full benefit of the prevailing winds, but if it were placed so as to receive the full benefit of the sea breeze, it would be disadvantageously situated with regard to the sun. The windows open by doors; they are provided with jhilmils, and their arrangement and construction is conducive to ventilation and coolness.

6. The means of ventilation in use in the wards are the doors and windows, which can always be kept open in India. The hospital is large, airy, and well-ventilated. The jhilmils are of the ordinary description.
7. No reply to this query.
8. There are no means of warming the wards, nor are any needed. The walls and ceilings of wards ought to be whitewashed once a year, and cleaned very frequently.
9. There are no privies properly so called, The Europeans employ commodes in the bath rooms, the natives simply going outside, except when very sick, and then proper appurtenances are found for them.
10. There is a large open bath room, such as is usual in India, for lavatory purposes which is found ample for the necessities of the patients.
11. There are tubs placed in the bath room for bathing the sick. The addition of a shower bath, however, would be found very desirable.
12. The linen is washed by the commissariat department, the means being ample for the requirements of the hospital.
13. There is no storage in the hospital.
14. The cots used in the hospital are iron frames with sacking bottoms laced with cords to the frames, which latter can be doubled up. The bedding is brought by the patients themselves.
15. The hospital kitchen is a small building situated on the western side of the hospital, Cooking is performed by native servants in chatties, and these answer pretty well.
16. Copies of diet tables, diet rolls, &c. are transmitted.
17. The hospital attendance consists of a dresser and hospital havildar, and in case of serious sickness an orderly is told off to any patient who may require one. The attendance is not sufficient. A proper complement of subordinates is one assistant apothecary, and one second dresser to a native regiment, which we never have here, although having in addition to natives some 40 Europeans with their wives and families.
18. The sanitary condition of the hospital is good. No epidemic has yet appeared in the wards.
19. The following deficiencies in the hospital arrangements are pointed out. Sufficient medical subordinates are never obtainable. The number allowed by regulation is an assistant apothecary and in addition to the dresser; the former, however, is never provided.
20. Dooly exercise is the only means of exercising convalescents here, there being no grounds or seats set apart for the sick.
21. There being only a few families of the non-commissioned officers here, these receive attendance in their own quarters. This arrangement is satisfactory.
22. There are no local hospital regulations in force here.
23. The powers of the medical officer are ample as regards the sanitary state of the hospital. Any suggestion made to the commanding officer is as far as my experience goes immediately attended to. The arrangements with regard to diet, medical comforts, &c. are entirely under the medical officer subject to the supervision of the deputy inspector general of the division. These remarks hold good equally on the march.
25. There are no convalescent wards or hospital.

XIII. BURIAL OF THE DEAD.

1. The burial ground is distant from the station quarter of a mile nearly west, the prevailing winds being south-west and north-east. The station is in no way inconvenienced by its vicinity.
2. It has been very lately constructed, and as yet scarcely any interments have taken place within it.
3. The graves, which are to be neatly arranged in order and as near to each other as convenient, are six feet deep, and no monuments are to be erected, the dimensions of which exceed nine feet long, and four and half feet wide. Interments take place at ordinary times within 24 hours, and during epidemics immediately. Natives are buried within 12 hours after death. Their graves are generally from five to six feet deep and three feet broad.

References to Subjects and Queries.	Replies.
XIII. Burial of the Dead —*cont.*	4. The grave yard is never offensive. 5. The dead of camp followers and bazaar people are disposed of in the same manner as native troops. 6. No injury accrues to the public health from the present practice, and no improvement in the way of burial is required.

(Signed) H. T. Rogers, 2nd Captain Engineers, Commanding Dowlaishweram.
M. C. Furnell Assistant Surgeon, D. D. Sappers and Miners.

24th August 1861.

WELLINGTON.

Accommodation { Queen's Troops, Infantry - - 907
Native Troops, Infantry - - 77

References to Subjects and Queries.	Replies.
I. Topography.	1. The Neilgherries rise abruptly from the lower country around them, and are bounded on all sides by short precipitous spurs, the remains of a former great escarpment which, in the course of ages, has been thus broken up by the unceasing action of the numerous streams of water pouring down from their surface. The surrounding country is mountainous. There is a scarcity of wood, few jungles, but an abundance of water. 2. The elevation of the station above the sea is 6,000 feet, and 5,000 feet above the adjacent country. The nearest nullah is the Waterloo stream, which drains the eastern side of Dodabetta, the highest mountain on the Neilgherries. There is no higher and healthier ground adjoining the station. 3. There are several pieces of table land within 9 miles of the station. The highest mountain is Dodabetta, which is 2,000 feet above the level of the station. 4. The nearest water is the Bowani and Moyoar rivers, at the foot of the hills, about 15 miles from the station. The vicinity is not liable to overflow. There are several ravines in the immediate locality of the barracks. There is a constant flow of water, and, although there are trees and other vegetable productions, these are frequently cleared, and no injury to health arises. 5. The station is open and freely exposed to winds. The temperature of the station is not raised by reflected sun heat. The winds are from the land, principally from the N.E. and S.W.; they are not injurious to health. 6. The cultivation of the surrounding country is very sparse, and chiefly consists of stunted barley, wheat, cooralie, and a kind of millet. There are no works of irrigation near the station. No rice or indigo is cultivated on the hills, nor is the preparation of hemp or flax carried on near. 7. There is no city, town, or native population, in the vicinity of the station. 8. According to Mr. H. F. Blankford's geological survey, the rocks constituting the Neilgherry hills belong with a few exceptions to the schistose or foliated class; the other rocks consist of alluvial deposits, a few basaltic dykes, and some veins of quartz. The surface soil and subsoil is a red ferruginous clay, evidently arising from a decomposition of gneiss. The station occupies new ground; the only population ever near the station being about a dozen or two of the hill tribes, who removed beyond the cantonment limits on the formation of the station. 9. There is no well at the station. 10. From the hilly nature of the country, intersected by several valleys, the rain-fall or water from surface springs flows readily away. No drainage from higher ground passes into the subsoil of the station. 11. The water-supply of the station is derived from springs, and is brought into the cantonment by artificial channels. An artificial reservoir for supplying the barracks with water is in course of construction; there are no tanks. The country abounds in all sorts of wild animals, and all European plants, shrubs, flowers, vegetables, and even the oak tree, grow well here. 12, 13. The water-supply is about 9 cubic feet per second, and the quality very good. There is nothing peculiar in its chemical composition; it is soft. Cannot state its microscopic characters; but it is abundant, and not injurious to health. It is to be distributed by pipes from a reservoir, with a head of 70 feet above the lower story of the barracks. There are no other topographical points not included in previous replies. 14. With regard to the amount of inquiry or examination, in the selection of new stations, it is difficult to answer, but I believe this site was selected by the Commander-in-Chief and Quartermaster-General.

WELLINGTON. MADRAS.

II. CLIMATE.

1. The mountain barometer and thermometer are in constant use at this station. The other meteorological instruments have been originally supplied for the purpose of observations, but are now entirely useless, from the want of being repaired.
2. Table of Meteorological Observations, from January 1, 1859, to December 31, 1859.

Months.	Barom. Mean.	Mean Temp.	Mean Daily Range.	Mean Maximum.	Mean Minimum.	Winds. Direction.	Winds. Force.	Days of Sunshine.	Remarks.
January -	24·320	64	64	68	60	S.E.			Frosty.
February -	·334	63	63	66	60	S.W.			Little rain, chiefly mornings.
March -	·335	67	67	71	63	S.W.			Rain.
April -	·400	64	64	67	62	S.E.	Out		Much rain.
May - -	·335	69	69	73	65	S.E.		Not	Dittô.
June - -	·344	68	68	73	65	S.W.	of		Monsoon, S.W.
July - -	·325	67·7	67·7	73·8	62	S.W.		kept.	Ditto.
August -	·369	69·55	69·55	74·6	64·5	S.W.	order.		Ditto.
September -	·333	62	62	75	59	S.W.			Ditto, S.W.
October -	·312	69·35	69·35	74·1	64·6	N.E.			Monsoon, N.E.
November -	·307	65·5	65·5	68·2	63·7	N.E.			Ditto, N.E.
December -	·332	69·5	69·5	74·5	64·5	S.E.			Frosty.

I cannot answer for the correctness of the barometer, as I fear it is out of order.

3. The climate is excellent and the changes are gradual; but from my experience of nine months, I cannot attribute sickness to this cause. During the first month subsequent to the arrival of the battalion at this station, they suffered much from fever of a low type. This I attribute to the want of drainage in the barrack square at the time. This, however, has been attended to, and the disease has generally disappeared. Where there is no organic disease, the climate is everything that can be desired. The diet is very good, consisting of beef, mutton, and an assortment of vegetables; beef is more frequently issued than mutton, from the difficulty of procuring the latter. The shelter and clothing is as good as could be desired, cloth trousers and tunic are worn in the cold weather and serge in the warm weather. The drill and duties are very light, and there is a gymnasium, skittle ground, and a racquet court; the men also frequently play cricket, and, in fact, everything has been done to employ the leisure hours with regard to healthy amusement. March, April, and May were very unhealthy months at this station; but I do not consider this as a criterion, as, in my opinion, much of the sickness was in consequence of the want of proper drainage, more particularly in the barrack square. This was frequently an immense swamp, and since this essential has been attended to, I cannot assign any disease to the station, nor could I positively state that disease is more prevalent in one month than another.
4. It would be impossible to find a district more conducive to health than that of the station. There are supposed to be three sanitary stations in these hills, viz., Ootacamund, Jackatalla, Coonoor, of which Jackatalla is the convalescent depôt and station for the regiment; the former and latter are principally resorted to by sick officers. The former is the highest station, being 7,416 feet above the level of the sea. Coonoor is 6,000 feet and Jackatalla 6,100 feet above sea-level, and this is certainly the most desirable station at all times.
5. With regard to the stations at which I have served, and their comparative salubrity, I have only been India two years, and served 15 months at Bangalore. This, although a healthy station, could not be compared to this station, and although disease of the liver was very common at that station, still I do not consider it unhealthy, and certainly not injurious.

III. SANITARY CONDITION OF STATION.

1, 2, 3. A map of the adjacent country, with tracings of the ground plan of the station and barracks forwarded.

4. TABLE of Barrack Accommodation.

Date of construction, commenced on the 18th June 1852. Total number of rooms or huts, 16 at present, 20 when completed.

Barrack Rooms or Huts.	Regulation Number of Men in each Room or Hut.	Dimensions of Rooms. Length.	Breadth.	Height.	Cubic Contents.	Cubic Feet per Man.	Superficial Area in Feet per Man of Floor Space.	Height of Men's Beds above the Floor.	Windows. Number.	Height.	Width.

III. Sanitary Condition of Station—*cont.*	5. The windows and doors open into the verandahs on the inside of the quadrangle. The doorways lead from the main rooms into the back verandahs, which are enclosed, and furnished with windows. All doors and windows open inwards. There is an open verandah on one side and a closed dining verandah on the other, 12 feet wide, 354 feet 6 inches long, and 16 feet high. The enclosed verandahs are used as mess rooms, but not as a sleeping apartment. All doors and windows are glazed, the climate requiring it. 6. In barracks the bedsteads consist of planks and wooden tressels; iron cots are better. In the hospital tape cots or charpoys are used. 7. No reply to this query. 8. Ventilating windows are supplied to all the main barrack and hospital rooms, with ventilators 6 inches by 6 inches, provided with tin gratings just above the flooring lines. The guard rooms are ventilated in the same manner. The ventilation is quite sufficient and well arranged. These barracks require warming, but not cooling. Fire-places are provided everywhere, and there are two in each principal room. 9. The walls of the barracks are built of brick and mortar, plastered inside and out. The roof is constructed of teakwood trusses, and covered with flat and pan tiles. The verandahs are terraced. 10. The flooring is of granite, asphalte, and akwood. The floors are raised 1 foot 6 inches above the level of the ground, and a free current of air is constantly passing beneath. 11. The materials used in the construction of the barracks are suitable for the climate. The barracks and cantonments are kept in repair by the Engineers. The Officer commanding the station is responsible for the general sanitary state of the cantonment. The walls and ceiling of the barracks are cleansed and limewashed once in 12 months. 12. A plunge bath 70 feet by 20 by 6, is built close to the barracks, with water flowing continually through it; it can be emptied and cleaned at pleasure.

III. Sanitary Condition of Station—*cont.*	13. Plan of the cook room forwarded. A project for the drainage of the cook room is under consideration. The washing is all performed by native dhobies in a running stream.
	14. A sketch of the privies and urinals is forwarded. A project for the general sewerage of the station has been forwarded to Government for sanction. Sewers are to be flushed twice or more frequently daily. The water supply is ample for this purpose.
	15. The ventilation of these buildings is ample. The barracks are lighted by oil lamps burning in glass globes.
	16. Projects for the system of sewerage by pipes have been submitted to Government for sanction. A masonry drainage service for conveying away readily and efficiently all surface water, and drainage is being constructed. No part of the barracks or hospital is damp. As a temporary measure the whole of the night soil and refuse from the barracks is conveyed in covered carts twice daily to cesspits situated about a mile from the barracks outside the cantonments. There is no well or water near the cesspits. There are no foul ditches. The cesspits are the only nuisance.
	17. An estimate for the monthly cost of keeping up an establishment for cleansing the surface of the cantonment has been forwarded to Government.
	18. The surface of the cantonment is kept free from vegetation. There are no old walls, thick hedges, &c. interfering with the ventilation of the station.
	19. The bazaar is well situated and well drained. The water-supply is plentiful. Sweepers are employed in the bazaar for preserving cleanliness. An estimate has been sent in for scavenger carts. The houses being as yet few, it is clear and healthy. The native houses are generally in good condition and free from dung heaps. No nuisance is experienced in barracks from wind blowing over the native dwellings.
	20. There are no fixed slaughter-houses, the site varies yearly as different individuals have the contract. No nuisance is experienced from them.
	21, 22. No reply to these queries.
	23. The quarters for married non-commissioned officers and men are ample.
Officers' Quarters.	1. There are no officers' quarters. Quarters should be built for officers consisting of separate bungalows.
IV. HEALTH OF THE TROOPS.	1, 2. The station is very healthy, and also the district generally, and the adjoining native population suffer very little from sickness, except upon their first arrival from the low country, when they suffer much from intermittent fever and spleen disease, caused by their sleeping on the ground; those who sleep on charpoys are not affected. The burghers and todas, the hill tribes, are generally very healthy.
	3. The healthiness of the native population is attributable to their rude way of living and general abstemiousness.
	4. The troops were at Bangalore nearly 15 months before coming to the present station, and left in March 1859. They were generally healthy; but disease of the liver was prevalent. The battalion also suffered much from venereal disease, and a few cases of cholera. A detachment of over 300 men was quartered at Bellary, and they generally suffered from intermittent fever and venereal, most of whom are even now constant attendants at hospital. In consequence of transit being furnished in removing the men and the daily use of quinine no sickness recurred. The whole of the battalion arrived here about the end of March, soon after which much fever occurred; but latterly it has been very healthy, and it would be difficult to specify any particular disease, except admissions from syphilis consecutiva. No portion of the men's present accommodation is more unhealthy than the rest.
	5. Troops are not camped out, nor would it be desirable, as the station is too cold.
	6. This is the first time I have been in charge of troops at a hill station, but from my short experience and observations I think hill stations very desirable for men not subject to organic disease. Hepatitis, splenitis, rheumatism, morbus cordis, dysentery, and diarrhœa, phthisis p.t., and syphilis cons., all deteriorate. Convalescents from fever, and men in a weakly state without organic disease, gain flesh and strength rapidly.
	7. No experience as to whether troops resident for some time on hill stations are more or less subject to febrile or other diseases on returning to the plains, but should think it would certainly diminish the liability to such attacks.
	8. I approve of selecting hill stations for troops, and would strongly recommend the adoption of such a plan whenever practicable, by sending troops to such stations immediately on their arrival in this country.
	9. No knowledge of any diseases peculiar to hill stations with which troops are liable to be attacked on going to them.
	10. There are no precautions particularly necessary. Cap covers are always worn during the heat of the day. February and March are very hot, and the sun very powerful between the hours of 9 a.m. and 4 p.m.
	11. The hot months in the low country are always chosen by those who are able to procure leave. One season is as good as another in the hills for regiments stationed for any length of time, precaution of course being taken not to remove troops in the monsoon. To obtain full benefit to their health, troops should reside in the hill stations for a period of not less than two or three years; the latter is to be preferred.
	12. There is no period of residence in the hill stations likely to inflict injury on troops returning to the plains.
	13. The precautions necessary for troops leaving hill stations for the plain are the same as those adopted on being quartered at a hot station; I think it would be advisable to administer quinine daily for ten days or a fortnight.
	14. To preserve the health of troops, I should prefer locating them for a short period on the plains, alternated with short periods of service on hill stations. Troops should not

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	be changed too frequently. European regiments are always quartered in large cantonments, and I do not think the men's spirits suffer in the plains. It would be advisable, in case of an epidemic occurring, to remove a regiment as soon as possible. 15. Nothing appears to have been omitted in the barrack and hospital accommodation at this hill station. 16. No experience to show at what range of elevation above the level of the sea are the most suitable sites for hill stations. Jackatalla is 6,100 feet above the sea-level. 17. There are two places near this station well suited for hill stations:—Ootacamund, about nine miles distant in a north-westerly direction,—it is 7,416 feet above the level of the sea, and easy of access: still I do not think it is desirable, as it is much colder. Kotagerry, about 10 miles off in an easterly direction, is quite as well suited for a hill station; but it would be necessary that it should be limited, as wood and water are scarce. Its elevation is 6,571 feet above the level of the sea. 18. No experience as to the class of surface and subsoil healthiest for stations, but I should think a gravelly soil would at all times be desirable. 19. Soldiers should proceed to India before the age of 20, and should land there in the months of November and December. With regard to the disposal of troops on landing, it is difficult to answer; upon my arrival, the only accommodation available in Madras was the Governor's banqueting hall, where the head-quarters, numbering nearly 500, remained two days, and then marched to the depôt at Poonamallee, about 11 miles; the march was completed by seven o'clock in the morning. The men landed in thick quilted white cap covers, serge trousers, and cloth tunics, but little duty was required of them. I think every precaution is taken to preserve the health of recruits, the men not being allowed to roam about in the heat of the day. When on duty they either walk about under covered verandahs, or stand in sentry boxes, well protected from the sun. 20. It would be desirable to send troops to an intermediate station, either St. Helena, or better perhaps to the Cape, as there they would be available to garrison the colony, without keeping up a large local force. When practicable, it would be desirable to send troops on landing to hill stations, and I think in a short time it could easily be accomplished, as the railroads will pass within a very short distance of them. 21. Within the last few years, the troops have been sent from one station to another, when practicable, in transits, and this appears to be the general desire of the Government. Much sickness is thus avoided, more particularly cholera. Troops are marched when other modes of transit are not available. 22. The number of years a British soldier should serve in India must depend upon circumstances. When disease of a severe nature has attacked a soldier, the sooner he is removed the better; but with care and attention, arriving young, regularity of diet, and a good constitution, and being thoroughly acclimatized, many soldiers, after 20 years' service, are not more broken down than after serving in the colonies. 23. In many instances I have observed conflict of opinion as regards invaliding, in the mode of conducting the business of medical boards; for instance, a local board assembles to decide whether it is necessary to send men before a general invaliding committee, and frequently were it not for the intervention of the Deputy Inspector-General of H. M.'s hospitals, men would be retained, after being considered fit subjects for removal to England by the regimental surgeon; this is, in my opinion, in consequence of the two services being separated. A depôt at the Cape for Indian invalids would be very desirable. A short sojourn at this station would in many cases so recruit a man as to render him fit for garrison duty, and he would consequently rejoin his corps in a far less space of time. 24. In most instances no particular time should be fixed for the departure of invalids for home; this should be left to the local medical authorities. Men suffering from phthisis pulmonalis or rheumatism should not leave so as to arrive in the cold season, proving the advantage of the Cape as a convalescent depôt. I would not scruple to remove men to this station at any time.
Diseases.	1. There are regular inspection parades for the discovery of incipient diseases every Saturday morning, the time being fixed by the Commanding Officer. 2. A few cases of scorbutus have occurred, but they are not attributable to the station. By my recommendation the whole battalion have an allowance of lime juice the first month in every quarter, and much benefit results from this. The few cases of scurvy that have occurred were principally amongst men of broken down constitution from syphilis, and in the form of scorbuto-syphilitic ulcers; change to a warmer station was always had recourse to. 3. Since the battalion has arrived at this station few fresh cases of hepatic diseases have occurred; those that have taken place may be attributed to too free indulgence in stimulants. In the low country the sudden transition from a temperate to a warm climate must be looked upon as the general cause. The disease has not been frequent in the battalion, and I cannot recommend any prophylactic measures which would diminish its frequency. 4. No cases of dracunculus have occurred at this station, or at Bangalore, and from inquiries I am inclined to think it is very uncommon among Europeans in this Presidency. It is supposed to be endemic at Matunga near Bombay. 5. The proportion of venereal diseases to the total sick in hospital has been 57 per cent. Since the formation of the battalion in 1855 this disease has been quite a scourge, first at the Curragh camp, then in Dublin, and upon its arrival at Bangalore; the per-centage since December 1857 has been 49½. This may be accounted for by the youth of the men, among which class it is more common than among old soldiers, the latter finding more pleasure in intemperance. I think a good plan to check this disease would be to stop the pay during the time they were under treatment, or to increase the hospital stoppages; most certainly lock hospitals would be very advantageous under the control of Government, and would, in a great measure, lessen this disease among the troops. Even

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	supposing this were an expensive measure, still in the long run, it would be a great saving, as more men are rendered useless and eventually invalided from this disease than any other. 6. Neither epidemic nor endemic diseases have been found to occur in this battalion either at Bangalore or at this station. *Fevers.*—Remittent fever was very common during the months of March, April, May, and June. This was in consequence of want of drainage, but since this essential has been attended to, the disease is not frequent. This form of fever appears to be the most common at almost every station. *Dysentery.*—Some cases have been under treatment, but this disease has not appeared as an epidemic. *Cholera* is not known at this station, neither amongst the natives nor Europeans. One case was under treatment since the battalion arrived, but its origin was traced to the low country, premonitory symptoms having appeared on the line of march. *Small-pox.*—No case has occurred among the troops at this station. Vaccination has been carefully attended to. Government vaccinators are employed in visiting every station for the purpose of performing the operation on the natives. *Rheumatism* is not common; few cases have been under treatment, they are very unmanageable at this station, and generally require removal to a warmer place. The proportion of admissions and deaths from these diseases to the total of admissions and deaths is as follows:—Fevers, admissions, 12 per cent.; deaths, 38 per cent. The per-centage appears very great; the reason has been already stated, and since the cause has been removed the disease is very rare and seldom fatal. Admissions from dysentery, $2\frac{1}{4}$ per cent.; deaths, none. Cholera, 0·14 per cent. admissions; deaths, 7 per cent. No deaths from this disease have occurred at this station, they occurred in the detachment at Bellary, but during the year. Admissions from rheumatism, $4\frac{1}{2}$ per cent.; no deaths. No case of small-pox has occurred. 7. No experience of the character of the zymotic diseases, none having attacked the battalion. No season has been marked as favouring these diseases at this station. No knowledge of the climate and atmospheric conditions which precede or accompany their appearance. Every precaution is taken in the immediate vicinity of the station to prevent any accumulation of refuse or decomposed vegetable substances. I believe zymotic diseases are unknown amongst the natives at this station; at the present time it is not thickly populated. I have visited the native bazaar on more than one occasion, and cannot say that I discovered any disagreeable effluvia arising therefrom. The natives residing in the vicinity of the station appear generally healthy, and I am not aware they are subject to disease. 8. Epidemic disease has hitherto been unknown in this station: the duties are very light, the barracks are well ventilated, and the men have had no marches or exposure on the field. 9, 10. Quinine has been used in small quantities when the battalion or a detachment has been removed from one station to another by transit, to prevent disease. My experience in treating material disease would induce me to give large doses of quinine. No recommendations to suggest.
V. INTEMPERANCE.	1. The soldiers at the station are temperate; there are very few confirmed drunkards, the proportion being $1\frac{1}{2}$ per cent. 2. There has been no admission into hospital directly or indirectly from diseases caused by intemperance during the year. Drunkenness is always punished as an offence. 3. Distilled spirits are sold in the canteen, and also in the bazaar under police regulations to natives only. The quality of the canteen liquor is good, and the consumption by each man per diem is on an average $\frac{8}{9}$ths of a dram of spirits, and rather less than one pint of malt liquor. Spirit is no part of the ration for soldiers either at the station, on march, or in the field. It is not procurable until the afternoon. It is not given as a ration to convalescents; but when considered necessary by the medical officer, a man receives a pint of porter or ale. No deleterious drinks other than intoxicating drinks are sold in the canteen or bazaar. 4. The consumption of spirits is decidedly not conducive to health, but it would depend on the quantity taken whether they caused an injurious effect. The quantity permitted does not affect efficiency or discipline. 5. The battalion has not suffered in health from intemperance. The men generally prefer beer or porter from the canteen to spirits. The police restrictions are very stringent with regard to the sale of liquor in the bazaar. 6. Malt liquor is preferable in every respect to spirits. The beer issued from the canteen contains a due proportion of hops, is English, and not too strong. I therefore look upon it as a tonic. Wine, unless procured direct from the Cape, would be too expensive for the men to drink, and when a cheap wine is sold, it is generally sour, producing heartburn and general indigestion. Spirits are stimulating and not nutritious, and taken without water, which is the general practice with the soldiers, must necessarily be injurious. Prescribed under the guidance of medical men to the sick, they are of much service. 7. Coffee, tea, and ginger beer are much used at the station. Coffee, tea, &c. are quite sufficient for persons in a good state of health; but in a relaxing climate, a moderate quantity of wine or malt liquor should be taken. 8. Beer or porter are preferable in all respects to spirits, and are beneficial both to the healthy and convalescent soldier, when taken in moderation. Tea and coffee are proper beverages with the morning and evening meals. Coffee is also a very proper beverage for troops when marching.

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	9. It would be very desirable to prohibit the sale of spirituous liquors in the canteens, and to permit only tea, coffee, beer, lemonade, &c., to be sold to the troops, if it could always be put in practice. 10. I think that if the Government was to contract with the wine growers at the Cape, light wines might be supplied to the troops at a very moderate rate, and I am inclined to believe that wine and malt liquor being constantly kept in a regimental canteen, they would satisfy the desires of every soldier, and eventually cause them to forsake spirits. 11. Memorandum of the canteen regulations :— "The regimental canteen is open daily for the issue of liquors to the men of the battalion at the following hours : "From 2 till 3 p.m., arrack, 1 dram per man. "From 5.30 till 6.30 p.m., porter or beer, 1 pint per man. "From 6.30 till 7.45 p.m., arrack, 1 dram per man. "Note.—The soldiers of the battalion are permitted 1 pint of porter or beer per man with their dinners." The bazaar regulations are that no intoxicating liquor is to be sold either to European soldiers or women.
VI. Diet.	1. The ration for Queen's troops and European troops in the Indian army is the same, and consists of 1 lb. of beef per diem, 5 days in the week, and 2 days mutton, 1 lb. bread, 4 oz. rice, 12 oz. potatoes, 4 oz. vegetables, $\frac{5}{7}$ oz. tea, $2\frac{1}{2}$ oz. sugar, 1 oz. salt, 3 lbs. firewood. The rations are inspected daily by the Quartermaster of the regiment, the Orderly Officer, and at uncertain periods by the Commissariat Officer. A complete ration is provided as above, but no fruit. The stoppage is five annas per diem. The soldiers have 3 meals daily, viz., at 8 a.m., 1 p.m., and 4 p.m. The proportion of vegetables entering into the constitution of the ration is 12 oz. potatoes and 4 oz. of cabbage, turnips, carrots, &c. 3. Mutton should be provided more frequently, and I would recommend that once a week salt meat and dried peas should be issued. A corporal is detailed daily from each company to superintend the cooking. 4. The means and apparatus for cooking available at the station, are copper kettles, tinned when required, open fire-places, and 3 lbs. of wood for fuel per man. The kitchens are clean, light, well ventilated, and sufficiently supplied with water. The food is boiled, fried, or baked, but never roasted. The cooking is properly done and sufficiently varied. Coffee is provided before a march. 5. Gardens for the cultivation of vegetables by soldiers could be advantageously established near the station. A certain portion of ground should be allotted to each company, and seeds and tools provided by Government.
VII. Dress, Accoutrements, and Duties.	1. The soldiers' dress and accoutrements are the same as in England with the addition of cap covers and a serge frock in lieu of the shell jacket. The dress is suitable to the climate, and for soldiers' duties by day and night, and at different seasons. I consider the present dress worn in this country well adapted for the purpose required. The guard dress is the same as in England, with white cap cover, great coats and sentry boxes as protection from the wet.
Duties.	1. Soldiers should be thoroughly drilled at home before coming to India. 2. The routine of a soldier's duties is parade at 6 a.m., drill at 6 a.m. and 4.30 p.m., lasting 1 hour at each time. The men of the battalion have never suffered from drill or any other duty they have had to perform. The best hour for drill is dependent on the season, so as to avoid sun and rain. There are no general orders respecting these, excepting those in paras. 6 and 7, p. 152 of General Regulations of the Madras Army. The men average rather more than 6 nights in bed. 3. The greatest distance from the barracks at which guards are mounted is $1\frac{1}{4}$ miles, they are relieved every 24 hours. The night guards have never affected the battalion; they are very light, and every man on night duty wears his great coat from 12 o'clock midnight till sunrise. There are frequent roll calls by day, and check roll calls at uncertain hours by night.
VIII. Instruction and Recreation.	1, 2. The means of recreation and instruction are as follow: there is one ball or racquet-court, four skittle-grounds, and a regimental school. A library and reading-room are in course of construction. There is one coffee-room, and a soldiers' garden is in course of formation. There are none but regimental workshops; but there is, however, a theatre and gymnasia. They are sufficient to keep the men occupied during the wet season and the heat of the day. The men are not allowed to go out of the barracks, during the heat of the day without cap covers, nor are they allowed unnecessarily to expose themselves to the rain. No improvements to suggest. 3. A Government Savings' Bank already exists, which is of great advantage to the soldiers. 4. There is sufficient shade from trees, &c., to enable the men to take exercise without injury to health, during the day.
IX. Military Prisons.	1. A military prison is in course of construction.
X. Field Service.	1. Copies of Marching Instructions forwarded. See Appendix. 2. With regard to the powers of medical officers, as to the conduct of the line of march of troops, &c., the only march I have made with the battalion was upon first landing in December 1857; this was 11 miles from Madras to Poonamallee; the officer in command attended to every recommendation in a sanitary point of view. 3. My experience has not been sufficient to state how far the Commanding Officer would attend to the regulations contained in the Marching Instructions, for the preservation of the health of troops, as to the selection of camping grounds, &c. It would be my duty to point them out, and to report any deviation to higher authority.

WELLINGTON. MADRAS.

References to Subjects and Queries.	Replies.
X. Field Service—*cont.*	4. Every facility is granted for field hospitals, and the transport of sick, &c., and every precaution taken. The hospital establishment is provided by the Commissariat department, which in the line of march is under the superintendence of a purveyor, who is under the orders of the medical man in charge. Doolies and sick carts in a fair proportion are allowed, sufficient to answer all purposes; but in cases of emergency, these could be provided, through the Hospital Purveyor, if necessary, even when marching. Hospital supplies are carried by Coolies, and are always in immediate readiness for use. Hospital diets are the same as if the battalion was in quarters. Hospital servants march with the column.
XI. STATISTICS OF SICKNESS AND MORTALITY.	No information under this head.
XII. HOSPITALS.	1, 2. A ground plan and sketch of the hospital is transmitted. The site of the hospital is open, and there are no buildings, high walls, &c., to interfere with the ventilation. It is generally healthy as to ventilation, drainage, absence of malaria, foul ground, or other nuisances. 3. The water is supplied by pipes, and is plentiful and good. 4. The hospital is situated on a spur of the barrack plateau hill, and is well drained. The sewage is emptied into the Waterloo stream, at a distance of 600 yards from the privies attached to the buildings. The sewers are flushed several times daily. 5. There is free ventilation below the floors of the wards. Drains are provided for carrying away the roof water. The drainage is quite sufficient to carry away the rain-fall rapidly. The hospital is built of bricks and mortar; on the inside of the building there is an enclosed verandah, 12 feet wide; and on the outer side they are protected by an open verandah of the same width. They afford sufficient shelter from the sun's rays. Each ward is provided with two fire-places. The verandahs are compelled to be used occasionally for the accommodation of sick, convalescents, or others, in consequence of their being no special ward. The building consists of one story. TABLE of Hospital Accommodation. The date of construction is the same as the barracks. There are 10 large wards, and the total regulation number of beds is 22 in each ward.

Wards or Hospital Huts, No.	Regulation Number of Sick in each Ward or Hut.	Dimensions of Wards. Length.	Breadth.	Height.	Cubic Contents.	Cubic Feet per Man.	Superficial Area in Feet per Bed.	Height of Patients' Bed above the Floor.	Windows. Number.	Height.	Width.
		Ft. In.	Ft.	Ft.				Ft. In.			
4 Wards - -	22	79 6	21	20	33,390	1,513 4/22	75 12/22	1 3	5	5	4

	22	60 0	21	20	25,200	1,145 14/22	57 6/22	1 3	4	5	4
	22	68 0	21	20	28,560	1,297 4/22	64 20/22	1 3	4	5	4
Special Ward - - 1	—	21 0	10	20	4,200	—	—	1 3	3	5	4
Women's Ward - 1	—	27 6	21	20	11,550	—	—	—	3	5	4

The hospital is so placed as to receive the full benefit of the prevailing winds. The windows open inwards, and their arrangement and construction are conducive to ventilation and coolness. The wards are provided with ventilating windows 3 ft. by 2 ft., and ventilating holes, &c., &c., above and below the flooring lines, which is sufficient to keep the wards at all times sweet. The windows and doors are all glazed. There are no jalousies or jhilmils.

7, 8. There are no means for cooling the air admitted into the wards; but they are warmed by means of two fire-places in each ward. The walls and ceilings of the wards are cleansed and whitewashed once in six months, or oftener if required.

9. The privies are properly drained and not offensive.

10. The lavatory arrangements of the hospital are good and sufficient.

11. A small bath room is attached to each ward sufficient for all ordinary purposes. There is also a good-sized washhouse for the sick, who are sufficiently well to walk about. These are supplied with water troughs, containing chatties of burnt clay, and the refuse water runs into a drain; there are also several bathing tubs in the building. Puckalies or water carriers are daily employed.

12. The hospital linen is not washed on the premises, there is a contract for this, and there is always a sufficient quantity of clean clothes and bedding.

13. The building used as a purveyor's store is very dry, but perfectly inadequate for the strength of a large regiment. There is a small and compact building consisting of two rooms purposely erected for a purveyor's store, and used for the convalescent depôt patients, sufficiently large for this purpose and very dry.

14. The bedsteads used in hospital are a solid framework of teak wood, and plaited with broad cotton tape about 2½ inches wide; these are very comfortable and cleanly, as the tape can at any time be removed and the framework washed. The mattress is simply a paillasse filled with straw, which is difficult to procure at this station, and therefore they are very thin, but no inconvenience is felt. There are also sheets, blankets, pillowcases, and quilted covers. I think it would be an improvement to have iron bedsteads with sacking bottoms. Coir mattresses would not only be a great comfort, but also in the long run a saving to Government.

15. There are two kitchens, situated at one end of the hospital square, and removed from the wards, which are on each side, and completely separated from the hospital. They have each a large fire-place, running from one end to the other, and places built with brick to receive the wood and cooking utensils. These means are sufficient. The diets in

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	most instances are properly cooked, and can be varied at all times; still, I think iron ranges would be very desirable. Peat will be obtainable in any quantity at no great distance from this station. 16. No reply to this query. 17. There is a hospital serjeant, whose duty is principally to see that the wards are kept perfectly clean, that the patients are regular, and that the hospital servants perform their offices properly. A return of a full hospital establishment in this country is here given. Some slight difference to the present time has been made at this station in employing five European orderlies, who are deducted from the native strength. The plan has answered admirably.

Hospital.	European Nurse.	Head Compounder.	Assistant do.	Cook.	Do.'s Mate.	Coolymaistry.	Coolies for Leeching, &c.	Ward Coolies.	Cooly Women.	Sweepers.	Toties.	Puckalies.	Tailors.	Washermen.
Her Majesty's 3rd Battalion, 60th Rifles -	1	1	1	1	1	1	3	8	1	3	3	2	2	2

18. The construction of the hospital is well adapted for its purposes, and its sanitary condition is perfect. It is situated on an elevated piece of ground open in every direction, and has wide passages from one end of the building to the other, and leading from the wards to the privies, which latter buildings are kept clean and free from effluvia by means of a powerful stream of water passing through them. No hospital gangrene or pyæmia has appeared.
19. The present accommodation should be increased. 84 beds only can be made, and the strength of the battalion has been 1,200. There should be separate wards for treating certain diseases, such as ophthalmia and itch. There is no place for the treatment of an insane patient.
20. Convalescents who are able to take exercise walk out daily for a certain time. There is plenty of ground around the hospital, but it has never been enclosed. When this has been completed, it would be desirable to have some trees planted and seats set apart for the use of the sick.
21. There is a female ward, with nurses' quarters attached to the hospital, and the soldiers' wives and children are at all times admitted when sick, and never treated at their own quarters. The accommodation is very small for the strength of the regiment, but complete with bath rooms, &c. A separate building should be erected in the hospital environs, more capacious than the present female ward and nurses' quarters; this would greatly enlarge the hospital and give three other wards for the treatment before mentioned in No. 19.
22. Not aware of any special local hospital regulations, not included in the general Presidency Medical Regulations.
23. The Medical Officer has the power of suggesting anything necessary with regard to sanitary state of hospitals, but the power of deciding is vested in the General; repairs are always attended to. Change of diet and medical comforts are left entirely to the direction of the Medical Officers. The diet roll is forwarded at the end of each month to the Superintending Surgeon of the division.
24. There are no convalescent wards, although desirable they are not essentially necessary. Men are never discharged from hospital until considered in a fit state to partake of their ordinary barrack diet. Their duty is not imposed on them until they have attained sufficient strength. They are walked out once or twice daily with a non-commissioned officer, but not allowed to enter the canteen without a pass from the Medical Officer.

XIII. Burial of the Dead.

1. The burial ground used by British troops is three-fourths of a mile from the barracks. Neither of the prevailing winds from the burial ground blows towards the cantonment.
2. Its area is 12,000 square yards, the drainage is good. Decomposition does not take place rapidly in consequence of the dryness of the ground.
3. The grave space allowed is 18 square feet, and the interval between the graves is from 3 to 4 feet. Their depth is 6 feet at least, and they are never re-opened.
   Interment is not compulsory at any fixed period after death; but it generally takes place within 24 or 36 hours. This would be left to the discretion of the Medical Officer in charge. No native soldier has died since I have had charge of this station.
4. The graveyard is never offensive.
   Burials take place at 7 a.m. and 5 p.m. generally.
5, 6, 7. The dead of camp followers and bazaar people are buried. No injury accrues to the public health from the present practice. No improvements to suggest in the burial or disposal of the dead.

(Signed) B. G. Ward, President, Commanding Station.
G. W. P. Sparrow, M.D., Surgeon, 60th Rifles.

W. T. F. Farewell, Captain, Special Executive Engineer.

WELLINGTON.

MADRAS.

APPENDIX.

MARCHING INSTRUCTIONS.

Office of Deputy Inspector-General,
Her Majesty's Hospitals,
SIR, Madras, September 30, 1857.

As the officer who is to have command of will be furnished by the Deputy Adjutant-General of Her Majesty's Forces with some instructions, having in view the preservation of the health of the men on the march, and as you have been nominated to the medical charge, I have to direct your attention to the following additional points for your guidance, which, in conjunction and with the authority of your Commanding Officer, you will endeavour to carry out as strictly as circumstances will permit.

1st. You will endeavour to procure from the Commissariat tarpaulins for the men to lie on, and as much straw as is allowed. I have recommended blankets also, which you will indent for. They are now issued to every Queen's soldier in the Presidency.

2nd. Each morning before starting, and in the evening, if you think it advisable, you will give the men a couple of grains of quinine,* if there is any diarrhœa or predisposition, accompanying it with 10 or 15 drops of laudanum; quinine should be continued, for a week or 10 days, afterwards occasionally to be given, particularly in jungly districts. The men will also get their half a pint of coffee or tea, or ginger tea, before and during the march.

3rd. On arrival at camping ground, care must be taken that the tents are pitched on the driest, most elevated, and favourable spots, previously chosen by the Medical Officer and Quartermaster in advance, each tent to be fumigated with the fumes of coffee, which can be easily done by throwing powdered coffee on a red-hot iron, or burning it in an open chattie. This should never be neglected where it is supposed any disease or fever exists on the road. Besides this, in a very jungly country fires must be lighted on the spot selected for each tent, and fires also ignited to windward of the camp. In choosing the camping ground, care must be taken, as far as possible, to avoid the vicinity of villages, swamps, and tanks, at all events, to choose ground as far as can be from and to windward of them.

4th. Every soldier on the march must be obliged to wear his cholera belt and flannel waistcoat, of each of which he ought to have three. After the tents are pitched the non-commissioned officer of each should see that the men change their flannel and stockings, which should be hung up and dried. If men on a march are obliged to be exposed to the sun, I would recommend their having a handkerchief, doubled, tied round their head, under their caps, and occasionally wetted.

5th. A place to leeward of the camp must be set apart for the men to use as privies, if a camp is likely to be detained more than one day, a regular latrine, or several, ought to be established, and unless a supply of lime is procurable, they must be filled up each day and new ones made. Strongly recommend your Commanding Officer not to permit men to leave the camp under any pretence whatever. No fruit should be allowed to be purchased except under the authority of a Medical Officer.

6th. Every means must be taken to insure personal cleanliness, bathing should not only be permitted, but encouraged; if a bathing place is not obtainable, the men should be induced to wash themselves all over once a day.

7th. If possible, native women should not be allowed to accompany a body of soldiers on a march; this you will recommend to your Commanding Officer and endeavour to have orders issued to prevent their coming into camp or congregating in the neighbourhood of camps.

8th. When the Medical Officer has decided on the ground for camping, and found the best water, he will hand the latter over to the Quartermaster, who must place a sentry over it, to prevent its being defiled in any way. Great care must be taken to prevent the men drinking any water that has not been examined by the Medical Officer, and when it is known that none along a line of march is fit for use, additional puckalies and bheesties should be allowed, and advantage taken, where pure water is obtainable, to fill the skins, or, if in a place where chatties are procurable, to have the water carried by coolies in them.

9th. In case of cholera or any serious illness occurring among the soldiers, the camp should be moved at once to higher ground and to windward, an immediate message (telegraphic, if possible) sent to the Deputy Adjutant-General, the Deputy Inspector-General, and to the nearest station, to obtain assistance, so that Medical Officers, doolies, required articles of medical comforts, or medicines unexpectedly wanted, should be supplied with the least possible delay.

10th. Should cholera prevail, the greatest attention must be paid to have all excretions carried some distance away to leeward, and buried.

11th. Weakly men should be marched in the rear, under the charge of a non-commissioned officer, having their arms carried for them, which will be a means of preventing this description of soldiers from filling the doolies, and embarrassing the means of carriage.

12th. Several Medical Officers in charge of corps having adopted the plan of sending forward their sick in the afternoon of the day preceding the march of the main body, and reported favourably of the practice, the same is recommended to be adopted whenever convenient, or when the Medical Officer considers it advisable, as the sick thus get better rest at night, and are not disturbed at the early hour in the morning when the others march, and have the opportunity of taking their medicines at the most appropriate time.

13th. When cholera, or any other epidemic disease makes its appearance, the nature of the locality where it originates, and the state of the weather at the time should be particularly noticed, with any other circumstance which may appear connected with its production. "Vide Book of Medical Regulations on the point, page "57, and para. 27 to 35."

14th. All casualties during the march are to be reported according to the annexed form, and in the event of any unusual sickness, or other untoward event occurring en route, the Medical Officer will immediately inform the Deputy Inspector-General of it, and transmit a daily state of the sick, with such observations as he may deem satisfactory.

15th. A marching journal is to be kept by the Medical Officer in charge, of occurrences and observations (as per annexed example), which is to be transmitted to the Deputy Inspector of Hospitals at the termination of the march.

16th. It is required also that a diary be kept of the cases, noting symptoms, &c.

I have the honour to be, &c.
(Signed) J. E. WILLIAMS,
Deputy Inspector-General,
H.M. Hospitals.

True Copy,
GEO. W. P. SPARROW, M.D.,
Surgeon, 3rd Battalion, 60th Rifles.

* It is found three grains given in the evening in a little arrack answers very well, and is more easily administered to the soldier at that time than in the morning.

EXAMPLE.

Diary of Occurrences and Observation on the March.

13th December 1857 (*the place of starting to be here mentioned*). Commenced our march from Poonamallee at 3 o'clock, and reached at quarter past 8 a.m., distance 13 miles. The men seemed rather fatigued. They had half a pint of coffee, with a crust of bread before starting; (*or, as the case may be,*) supplies good. Thermometer at 3 a.m. 77°; on arrival at 8 a.m. 82°; at midday 88°. Morning stormy; midday cloudy; afternoon clear. Two cases of fever and 3 of dysentery admitted. No cholera. The sick left at 4 o'clock the preceding day, and arrived at 8 p.m., without casualty (*or as the case may be*).

Daily Return of Sick.

14th December (*Name of place*). Recommenced our march at 4 o'clock a.m., and arrived at (*name of place*), at half-past 8, distance 10½ miles. The men did not seem fatigued: had half a pint of warm coffee before starting (*as the case may be*). The encamping ground high, but wet from rain, which fell while we were on the march. Men provided with straw to sleep upon (*or not*). Small-pox, cholera, bowel complaint, or fever prevailing among the inhabitants of the district (*or not*). Carriage sufficient (*or deficient*).

RAMANDROOG.

Hill Station, Queen's Troops - - - 50

References to Subjects and Queries.	Replies.
I. Topography.	1. The country surrounding the station is dry and hilly, covered with jungle and tropical vegetation. The water supply is scanty. No stagnant water exists in the neighbourhood. 2. The elevation of the station above the sea is, by the aneroid, 3,300 feet; above the adjacent country, 1,000 feet; and about 300 feet above the large tank. There is no higher or healthier ground adjoining the station. 3. The station is situated on a table land. 4. The nearest river is the Toongabudda, which is about 20 miles off; the vicinity of the station is not liable to overflow. There are ravines in the hilly formation of the station, but they are quite healthy. 5. The station is open and freely ventilated, and the temperature has never been observed to have been raised by reflected sun-heat. It is much exposed to winds from all quarters, but they are not prejudicial to health. 6. No cultivation of any description is carried on, either in the surrounding country, or in the neighbourhood of the station, nor do any works of irrigation exist near. 7. There is a native bazaar about a quarter of a mile from the station. 8. The station, as before mentioned, is situated on table land of a hilly range, the soil and sub-soil of which is hard rock. 9. No water has ever been found below the surface on which the cantonment is situated. 10. From the formation of the table land the rain water readily passes off, and never remains long on the surface. No drainage from any higher ground passes into the subsoil of the station. 11. The water supply is derived principally from a large tank, but there are springs at some distance below the hill top, whence in the season a good supply of pure water is obtained. Water is stored in a tank below the top of the hill, more than a mile distant from the station. It is generally full. There are a few common weeds growing on the margin of the tank, but there are no animals in it. I regret to say that it is used for bathing purposes as well as for drinking. The tank receives its water from the drainage of the adjacent country, and of course is the receptacle for everything the waters may carry down. No nuisance or malaria, however, proceeds from this source.

RAMANDROOG. MADRAS.

References to Subjects and Queries.	REPLIES.

I. Topography—*cont.*

12. The amount of the available water supply, its chemical composition, or microscopic character are not known with anything like accuracy; but the supply has always been found sufficient, and its qualities excellent. It is distributed by bullocks carrying leather bags. No better water supply is available.

13. The station is remarkably healthy, and there are no other topographical points bearing on its sanitary condition to be remarked upon beyond the foregoing replies.

14. I am not aware of the mode of proceeding in the selection of new stations; but I believe in India political considerations have prevailed over all others in selecting stations for troops.

II. Climate.

1. The instruments available at the station for conducting and registering meteorological observations are a dry and wet bulb thermometer and a pluviometer.

2. Table of meteorological observations from 1st January 1856 to 31st December 1860.

Months.	Barometer, Mean.	Mean Temperature.	Mean Daily Range.	Mean Maximum.	Mean Minimum.	Mean Dry Bulb.	Mean Wet Bulb.	Mean Sun Temperature.	Rain, Inches.	Winds. Direction.

November		69	8	75	66	69	65	84	1 4	N.E.
December		68	8	72	64	72	64	82	0 7	N.E.

* For four years only, from January 1857 to December 1860.

3. The climate is salubrious, the thermometer never rising higher than 84° in the shade. Hot winds are never observed here, even in the hottest months, viz., March and April. During the rainy season, June, July, and August, the hill is covered with a thick mist, till about 10 a.m., which returns about 8 p.m. September and October are very pleasant months, but during November and December the weather is decidedly cold, a very strong wind blowing during the night and early part of the morning. There is no canal irrigation. From the middle of March till June all convalescents are better here than in the plains, no matter from what diseases they have suffered. During the cold and rainy season, there are some diseases very apt to be aggravated, such as rheumatism, chronic and acute, hepatitis, consecutive syphilis, and pulmonary affections. The clothing is varied for different men; being all convalescents, some men require their winter clothing, while others can wear their light clothing. The healthy months include those from September to January; from April to August being unhealthy. Fevers, rheumatism, hepatic and pulmonary affections are among the prevailing diseases, during the latter months, which do not deserve the name of "unhealthy."

4. My experience is of such short duration, that I cannot say from actual knowledge whether there is any district near the station possessing a more healthy climate than Ramandroog.

5. I have had little or no experience of stations in India, so as to speak of their comparative salubrity, my service having been in America, West Indies, Mediterranean, &c., &c.

III. Sanitary Condition of Station.

1, 2, 3. A ground plan and elevation of the barracks are transmitted.

4. Table of barrack accommodation:—

Date of construction, completed 1853–59.

Total number of rooms or huts - - - - - 10
Total regulation number of non-commissioned officers and men - 50

5. The windows open inwards. There is a verandah all round the barrack, the front being enclosed. The front verandah is often occupied as sleeping quarters.

6. The bedsteads used are wooden, which are very bad, as the buildings are swarmed with bugs. Iron would be much more preferable.

7. No tents are used at the station.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	8. The means of ventilation are— 1. By ventilators near the ceiling, which can be opened and shut by ropes at will. 2. The windows. 3. The doors, of which the upper half are venetians. This in the wet and windy weather is a great disadvantage, as the damp air cannot be shut out. I would recommend that there be half glass doors inside the other doors, so that they could be shut in cold and wet weather without obstructing the light. They are so made at Trimulgherry barrack, Secunderabad, the outer half venetians there opening outwards, and the inner half glass opening inwards. It would be well to retain the venetians, as during the hot months they are useful as means of ventilation. 4. By a fire-place in each room. Ground ventilation is, however, much required. No artificial means are used for cooling the air of the barrack room. 9, 10. The barracks are constructed of stone, as also are the floors which are raised above the ground level, but have no perflation of air underneath. 11. The materials used in the construction of the barracks are suitable to the climate. The public buildings and cantonments are kept in repair by the district engineer under charge of the quartermaster-general's department. The officer commanding is responsible for the general sanitary state of the cantonment. The walls and ceilings of barracks are white-washed annually, about the commencement of the year. 12. The men's wash-houses being built on the edge of the hill, permit of easy drainage from their position. They are supplied with water by puckallies. There is no bath-house, the want of which is much felt. 13. The cook-houses are supplied with water by puckallies. The drainage is effected in a similar manner to that of the wash-houses. The linen is taken down to the low country to be washed, and this is one of the great drawbacks to this station, very great difficulty and inconvenience being felt at the depôt from it. 14, 15. The privies and urinals are built on the edge of the hill, which acts as a natural drain. These buildings, as well as the barracks, are lighted at night with oil in lamps, suspended from the ceiling. 16. The barracks being built close to the summit of the hills no drains are required, the natural drainage being sufficient for carrying away readily all surface water, &c. No part of any building used as a barrack or hospital is damp. The fluid refuse of the barracks is taken down the hill. There are no cesspools. No foul ditches exist near the station. 17. The surface cleansing of the cantonment is performed by the lascars daily. 18. The surface of the cantonment is kept free of vegetation. There are no old walls, thick hedges, &c. to interfere with the ventilation of the station. 19. There is no military bazaar, though one is much required, as everything required by the soldier has now to be purchased by him at an exorbitant rate. The civil bazaar is crowded, and not kept as clean as it might be, nor the hill generally. The bazaar is entirely under the civil authorities. It is about half a mile from the government buildings. No nuisances experienced in barracks from wind blowing over the native dwellings. 20. Animals are slaughtered below the barracks, so low that no inconvenience is experienced; but I believe the Rajah of Loondoor is very much averse to beef being killed on the hill. 21, 22. No replies to these queries. 23. The accommodation for married non-commissioned officers and men is sufficient for the present number.
Officers' Quarters.	There are no officers' quarters.
IV. Health of the Troops.	1. The station itself is very healthy, and is the resort of all who are able to come during the hot months. The native population is also healthy. In the plains, in the surrounding districts, cholera sometimes rages in the native villages, but never reaches the station itself. 2. Cholera is, I believe, the most frequent disease among the natives in the district, but I have not attended any case. I have seldom any natives to treat, and am, therefore, unable to give any opinion regarding spleen disease. Those native patients I have seen have been isolated cases of amaurosis, ovarian tumour, &c. 3. The natives are healthy on this hill, which is probably owing to the small population here, and the absence of extremes of heat and cold. 4. I am unable to state at what stations the troops were previous to coming here, as almost every two or three men come from a different station, and have also been different lengths of time at their previous stations. The principal stations from which men are sent here are Bellary and Secunderabad. I have not observed any difference in the healthiness of the men's present accommodation. 5. The troops are never camped out here. 6. This is a hill station, though of comparatively slight elevation above the neighbouring plain, and the only one at which I have been stationed. My experience is that it is good for every class of disease except, perhaps, bowel affections. During the cold damp weather (but only during that time) men convalescent from dysentery and diarrhœa suffered relapses, and were sent to the plains in consequence. They were mostly young soldiers belonging to the 1st Battalion 1st Royals; convalescent from fever, hepatitis, syphilis, sympathetic bubo, &c., all improved. This opinion regards convalescents only, there being none others here. 7. I have not been sufficiently long in India to form a decided opinion as to whether troops who have been resident for some time on the hills are more or less liable to attacks of febrile or other diseases on returning to the plains. 8. From my limited experience as regards the subsequent liability of troops to disease on the plains, I can only express a qualified opinion that hill stations are the best. 9. There are no diseases, that I am aware of, peculiar to hill stations, to which troops are liable. I know nothing of other hill stations. 10. I am unable to say what precautions as to diet, clothing, &c. the men should take to guard against attacks of disease, and to enable them to derive the full benefit of a residence in hill districts.

IV. Health of the Troops —*cont.*	11. With regard to the best seasons for residence in such stations, this station can be occupied the whole year round with advantage to health. If the period is necessarily limited, I think the months of March, April, May, June, and July the best, as it is then hottest in the plains. The shortest period of residence should be from one year to 18 months, as convalescents do not thoroughly recover their natural stamina and health under one year. 12. I do not think that there is any period of residence beyond which injury is likely to be inflicted on the health of the troops on returning to service in the plains; but I have little more than one year's experience of India on which to form an opinion. 13. I am not aware of any special precautions required for protecting the health of troops on leaving hill stations for the plains, except the self-evident ones of light clothing, and as little exposure to the sun as possible. 14. I am of opinion that to locate troops at hill stations, about 4,000 feet above the sea, would preserve them in a very effective state, but my experience is so slight that I only speak from analogy. I think frequent change of station in the plains is decidedly beneficial to health. 15. I know nothing of the barrack and hospital accommodation at other hill stations. 16. I have no experience to show what ranges of elevation are most suitable as sites for hill stations. 17. There is no higher ground near this station which could be advantageously occupied as a hill station. I have been to the opposite range of hills bounding the Sundoor valley on the east. They are about the same height, but there is a very small supply of water. The distance from summit to summit of the two ranges is about seven miles. 18. I am unable to form an opinion from inexperience of the particular classes of surface and subsoil most healthy for stations. 19. Soldiers proceeding to India should be from 21 to 26 years of age, and should land there about the commencement of the cold season. I don't know how troops are disposed of on first landing. I did not come out with troops, and have not been stationed at a port. On first landing I would provide them with good barracks, and keep them in healthy stations, when possible I would not expose them to the sun or to fatigue. I would also prevent the abuse of ardent spirits, and provide them with books, racket courts, &c. 20. I do not see the slightest use in sending troops to intermediate stations previous to sending them to India. With regard to sending them in the first instance to hill stations, my experience is slight, but I remember a lot of recruits joining the 1st Madras Fusiliers in April 1859. During that hot weather I (Dr. Houston) was attached to that regiment, and I do not think the recruits were so much in hospital as older soldiers. I very much doubt whether the early years of service are the most dangerous, and I know of no extraordinary means of preventing sickness among recruits. The rules to be observed by all Europeans are temperance, moderate exercise, avoidance of fatigue and exposure to the sun, cleanliness, &c. 21. Water transport is, I think, the best for troops going to the interior, but there is little of it known to me. Transits are the only other means I know of, and should, I think, be used when possible for Europeans. If it is necessary to march, the marches should be short, and the men should not be moved in large masses, as cholera is then to be feared. Hot coffee should be issued to the men before moving off the ground, and as soon after the new ground is taken up as possible. 22. A British soldier's service in India should not exceed 12 years. From 10 to 12 years is the proper period. 23. I have no information to afford in reference to the manner of conducting the business of medical boards either at stations or at the presidencies, or whether it is such as to avoid conflict of opinion as regards invaliding. 24. The best time of year for invalids to leave India for home is at the end of January.
Diseases.	1. There is an inspection by the medical officer for the discovery of incipient diseases once every week at seven o'clock a.m.; the same on the march, with extra ones in cases where ophthalmia or other contagious diseases are suspected. 2. There is no scorbutic disease here. 3. It is impossible to reply to this question regarding the proportion of cases of hepatic disease usually under treatment, and the cause to which it is attributable, as the strength here varies greatly, and the men all come here sick or just recovered. The disease does not occur here, though men who have had it in the plains have relapses. The causes of the disease are many and varied, but I cannot speak with authority on the subject. I know of nothing except temperance in eating and drinking likely to make it less frequent. 4. I have not seen a single case of dracunculus among Europeans. 5. Last year in the hospital of the 1st Madras Fusiliers at least half the sickness was from the venereal disease. At this station no case has occurred of primary affections in my six months experience. The establishment of lock hospitals is urgently called for in the large stations, and I see no other means of protecting the health of the soldier. 6. The only diseases of the epidemic or endemic form that the soldiers suffer from here are— *Fevers*—An occasional attack of ephemeral fever at the commencement of the hot season. This is comparatively rare. *Dysentery*—In the wet season men convalescent from dysentery, &c. sometimes suffer relapses. This may be considered endemic. (*Vide* "Hospitals," 18.) *Cholera* is never seen here. *Small-pox*—None ever seen. *Rheumatism* never occurs as the result of local influence. Those who suffer from it are mostly convalescents from syphilis. The men who are here suffer from diseases contracted elsewhere, and are not much affected by any of these diseases here. If they come here with such diseases and do not immediately recover they are transferred. No deaths from any disease have occurred for more than six months.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	7. It is impossible for me to give any answer to this question touching the nosological character of the more frequent zymotic diseases, the time when such diseases are most prevalent, the climatic and atmospheric conditions which precede or accompany their appearance, the sanitary condition of the station, &c., where such diseases are prevalent. The number of people under observation is so very small, and the diseases have so little to do with this station, that no answer can be of the slightest value. 8. No epidemic has occurred here in my experience, I have no knowledge of any connexion between the soldiers' habits and the prevalence of epidemic disease, nor have I observed that soldiers are an ill-conducted class either on the march or at the station. 9. Quinine has not been tried at this station, as there is no malarial disease as a rule. On the march of the Bellary column from Bellary to Secunderabad in November 1858, and on their return in February 1859, every man of the 74th Highlanders had three grains of quinine in a half-dram of arrack each morning when the parade was formed. A proportionate amount of arrack was taken in a vessel belonging to each company to the hospital tent at night, and the quantity of quinine (according to the number of men in each company) was placed in this by the apothecary, and dissolved in the spirit. On the warning for parade being sounded in the morning an orderly corporal fetched the mixture or rather solution, and with a tin measure served out the proper quantity to each man. The whole proceeding did not take 10 minutes, and there was no fever, or only a few isolated cases on either march, out of about 500 men, and for about 120 miles north of Kurnool the way lies almost entirely through a jungly country. This was done at the recommendation of Surgeon Macbeth, 74th Highlanders, and is my personal experience, as I was with the regiment the whole time.
V. Intemperance.	1. As a rule there is no intemperance here; cases do occur, but rarely; there are no confirmed drunkards. 2. Directly, there have been no admissions into hospital from diseases caused by intemperance. Indirectly it is impossible to say whether intemperance at regimental head-quarters may not have been a cause of bringing on the disease for which a man is sent here, and owing to a relapse of which disease he may be admitted into this hospital. No return showing the effect of total abstinence, temperance, and drunkenness on the amount of sickness, mortality, and crime at this station, as there is no drunkenness here, and all the men come here sick. Drunkenness *per se* is punished as an offence. 3. Arrack is sold in the canteen, but not in the bazaar. The quality is good, and the amount consumed per diem is, taking the average, each,—for serjeants, $3\frac{5}{7}$ drams, out of three serjeants; for privates, $1\frac{1}{7}$ drams, out of 30 privates. Some men take no arrack, others draw their full amount of two drams. Serjeants are allowed as much as they require, and as all serjeants here take it, the average is rather high. It is not the habit of the men to take a dram before morning parade, nor does spirit form part of the ration, the men have to pay for it. It is never given to convalescents. No drinks other than intoxicating drinks are sold in the canteen. 4. It depends entirely upon the previous habits of the individual whether the consumption of spirits is conducive or injurious to health. In moderation it is not injurious in my opinion, but I would not advise men to commence the use of spirits who had been hitherto unaccustomed to them, and on the other hand it would be very injurious to deprive a man accustomed to them, of their moderate use. Too much spirit is subversive of efficiency and internal discipline. 5. We think it advisable to restrict the quantity of spirits per diem at present purchasable by the soldier at the canteen, and to abolish the sale of them in the bazaar, which is the rule at this station. 6. We are of opinion that the use of malt liquor is preferable to the use of spirits, but would not on that account abolish the sale of spirits, only restrict it within reasonable limits. We do not think wine preferable to malt liquor. 7. Coffee is taken every morning by the men before they go out. Lemonade is occasionally procurable at the station, but soda water is not. I imagine neither spirits nor malt taken in moderation is prejudicial to health or discipline. 8. We think it best to give the soldier his choice of a restricted quantity of beer or spirits daily. Tea or coffee already forms part of the ration. 9. It would be beneficial to prohibit the sale of spirituous liquors in the bazaar, if necessary. 10. I would recommend that a regular canteen be allowed, as the men are badly off in the way of any amusements. 11. There is no regular canteen here. The men get their ration of spirits or beer between 11 and $11\frac{1}{2}$ a.m. and 3 to $3\frac{1}{2}$ p.m. daily, Sundays excepted, when they get it after morning church, the evening issues being as on other days.
VI. Diet.	1. The ration for Queen's British troops and for European troops in the Indian army is the same, and consists of 1 lb. of meat, 1 lb. of bread, 1 lb. of vegetables, 4 oz. of rice, 1 oz. of salt, $\frac{5}{7}$ oz. of tea, and $2\frac{1}{2}$ oz. of sugar. A responsible inspection is made of the constituents of the ration by an officer daily. 2. A complete ration including vegetables is provided daily, the stoppage for which is four annas. They have three meals a day, viz., breakfast at 8 a.m., dinner at 1 p.m., and tea at 4 p.m. The proportion of vegetables is generally 12 oz. of potatoes, and 4 oz. of onions. 3. I have not been here long enough to form any opinion as to whether the ration could be improved, but at present the married people sent up here are very badly off, as it is impossible for them at the exorbitant prices charged to exist without getting into debt. A provost serjeant and assistant have orders to prevent any sale of rations. 4. The cooking is performed by natives, who are supplied with copper boilers (tinned inside), and frying pans by the Government; they supply their own earthern pots. The present kitchen is far too small; it is kept clean by the cooks under the superintendence of an orderly, and they are inspected by an officer. Whether the food is boiled or roasted is left to the option of the men, no complaint has been made of the cooking. The morning coffee is prepared by one of the married soldiers, and is supplied to the men before morning parade. 5. A garden has been purchased for the station, but it will be impossible to keep it up unless an allowance is given by Government, the men being here for so short a period that they will not take any interest in it. The garden might be turned to good account and

RAMANDROOG. MADRAS.

Reference to Subjects and Queries.	Replies.
VI. Diet—*cont.*	supply the depôt with various kinds of vegetables, provided an allowance was given to keep it up, and work it or set it going for a couple of years. At present the soldier derives no benefit from it.
VII. Dress, Accoutrements, and Duties.	1. The soldier's dress at this station is as follows:—A red cloth jacket, a red cloth tunic, 1 pair of cloth trousers, 2 pairs of regimental boots, 1 forage cap, 1 dress cap or shako, 6 pairs of white trousers, or in the 74th Highlanders thin trews, or in the Artillery thin serge, 4 white jackets or tunics, in the 1st Royals and the Artillery and in the Highlanders, 2 khakee summer frocks and 1 red serge tunic or frock, 1 white calico shirt, 2 colored calico shirts, 3 pairs of worsted socks, 4 pairs of cotton socks, 2 flannel waistcoats, 2 flannel cholera belts, 2 cap covers, 1 pair of braces, and 1 great coat. The arms and accoutrements are left with the men's different corps, but there are 15 sets which were sent here at the time of the mutiny. Each consists of 1 cross belt, 1 waist belt with frogs, 1 bayonet scabbard, 1 pouch for rounds, 1 pouch for caps, and 1 musket with a bayonet. The present guard dress I leave to be decided by the medical officer from time to time. He has to send to me his suggestion on the subject, which I have found the best plan. A verandah is the protection from sun and wet for the sentry at the guard room, the only sentry I am enabled to have.
Duties.	1. I imagine it would be desirable that all troops for every purpose be drilled at home before coming out to India. 2. Route marching, except on medical inspection days and cleaning barrack days, is the usual routine of parade, as it is found that the men receive more benefit from the Droog by this parade than drill, which could only be carried on in a small squad. The duration is from 1½ to 2 hours daily. The best hour for morning drill is, in the summer, 6 a.m., and during the winter, 7 a.m.; for evening drill, summer and winter, 4½ p.m. The average number of nights the men have in bed during the week cannot be fairly given, as in the winter the hill is almost empty. 3. The guard-room is about 100 yards from the barracks; guard lasts for 24 hours; roll-calls take place at uncertain hours during the day and night.
VIII. Instruction and Recreation.	1. The following are the means of instruction and recreation at the station:—A ball court and skittle-ground are being constructed; there is a schoolmaster lent from the 74th Highlanders; a library and reading-room is very much wanted, and has been already recommended, as also is a day room or soldiers' club. There is a soldiers' garden, but no means of keeping it up; workshops and a gymnasium are very much wanted, the latter has been already recommended. There is no theatre. A reading-room is much wanted here, as also a workshop, which might be turned to good account, the men having nothing to kill time. The reading-room would also do for a church, as at this station, during the season, all the visitors attend Divine service, which is performed in a very miserable thatched mud building. During the monsoon the place is very damp, and must be injurious to health. 2. I have already recommended a gymnasium and reading-room. Provided a canteen was sanctioned in time, sufficient means might be gained to provide different amusements for the men. I have commenced already quoits, football, trap, bat, and ball, and have prepared ground for cricket; I also recommend workshops. 3. Savings banks are kept up at the head-quarters of their regiments for the men stationed here. 4. There is sufficient shade from trees, &c., to enable the men to take exercise without injury to health during the day, but they are fast disappearing, and I have brought the subject under the notice of the civil authorities.
IX. Military Prisons.	1. There is one solitary cell, at this station, in good order.
XII. Hospitals.	1, 2. The hospital runs parallel to the barracks. It is to the north, in which direction both barracks and hospital face. There are no stables. It is a considerable distance from the bazaar, and not at all interfered with or influenced by it. No native houses except in the bazaar, and the European houses are dotted over the hill at considerable distances from the hospital and from each other, nor is there anything to impede the most perfect ventilation. The site is very healthy, both as to elevation and drainage (the latter from the sloping structure of the hill), and also as to the absence of malaria. 3. The water supply is abundant and wholesome. 4. There are no means of drainage, except the sloping structure of the hill. At present the baths, &c., are emptied by natives carrying the tubs out and upsetting them at a little distance from the building. Most of this water is carried away, but no doubt a small quantity sinks into the subsoil, but not sufficient to exert any injurious influence on the health of the patients. 5. The wards are paved with granite, and raised an average of 2 feet by a layer of stones, earth, gravel, &c. There is no perflation of air underneath the floors. The roof-water is carried off by spouts, and is carried away by the natural sloping structure of the hill. A small quantity may sink into the subsoil. There is no surface drainage or guttering round the hospital, except the natural slope of the hill. This is sufficient to carry away the rain-fall rapidly. There are verandahs on both sides of the building, sufficient to afford shelter from the sun's rays; never used for the sick, although convalescents sit in them morning and evening. The hospital consists of one flat. No table of hospital accommodation is transmitted. The hospital is so placed as to receive the full benefit of the prevailing winds. The windows open inwards, the upper portion being fixed, and their construction is conducive to ventilation and coolness. 6. The means of ventilation are:—1st., by ventilators near the ceiling, which can be opened and shut at will by ropes; 2, the windows; 3, the doors, of which the upper half are venetian; this, in the wet and windy weather, is a great disadvantage, as the damp air cannot be shut out, and the wards are, on account of the stone floor, all liable to be damp and chilly, and exercise a bad influence in cases of bowel complaints. I would recommend that there be half-glass doors inside the other doors, that could be shut in cold and wet weather, without obstructing the light. They are so made at Trimulgherry barracks,

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	Secunderabad—the outer half venetians, opening outwards, and the inner half glass, opening inwards. It would be well to retain the venetians, as in the hot weather they are useful as means of ventilation; and, 4, a fire-place in each ward. These are quite sufficient to keep the wards free from odour and closeness. 7. There are no means of cooling the air, nor are any necessary here. In the hot months there is often a cool breeze during the day, and every night about ½ past 7, a westerly breeze sets in. 8. There is one fire-place in each ward, and wood fire for warming them. The floors are cleansed and whitewashed once a week, and the inside walls and ceilings once a year. The outside of the building is never whitewashed at all. 9. There are no privies or urinals connected with the hospital, though they have lately been recommended to be built by the deputy inspector-general of H.M.'s hospitals. At present there are nightstools placed in a little room adjoining each ward. This would be very offensive were there many men in hospital, but as there are generally very few (so many being convalescents) it is not so at present. Privies will become a necessity when the barracks are enlarged and a greater number of men sent up. The soil is removed and the stools are cleansed by natives. 10. The present lavatory arrangements are two shallow earthenware dishes placed on a form in the room above mentioned, there being as a rule only two or three men in hospital; as only men requiring active treatment are taken in there, the arrangements are sufficient, but decidedly inconvenient. 11. There are two tubs in the same room for bathing purposes, and hot water has to be carried from the cook room. After being used the tubs are carried out by natives, and the water thrown away. In the damp and cold weather this room is very chilly and there are no means of warming it. The deputy inspector-general of H.M.'s hospital has recommended bath rooms, lavatories, and privies to be built. 12. The linen is washed by natives at the tank. This is the usual method in India and is sufficient. 13. The storage is insufficient by one half, and not dry. There are no proper stores, but a small room at one end of the building is appropriated to that purpose. 14. The bedsteads in use in the hospital are low cots with tapes; the bedding consisting of cotton quilts and blankets. 15. The hospital kitchen is a portion of the barrack kitchen. There is one native cook, the natives are very ingenious in cooking with a very meagre supply of utensils, so that at present the apparatus is sufficient. The deputy inspector-general of H.M.'s hospitals has recommended a cook-room to be built behind the building, which with the privies and lavatories will be at a little distance enclosed in a kind of back yard. When more men are sent up, no doubt further arrangements will be carried out. The diet can be sufficiently varied. 16. Copies of the diet tables, diet rolls, &c., are transmitted. 17. The hospital establishment is, besides the medical officer, one assistant apothecary to carry out the treatment ordered by the medical officer, and dispense the medicines, and at this station to assist in correspondence, making up returns, &c.; one hospital serjeant to carry out the discipline of the hospital, and assist in making out returns, &c.; 2 hospital coolies to attend on the patients, one toty to cleanse the stools, &c., six dooly bearers to carry out patients to take the air, &c. Besides these an orderly soldier from the sick man's company or depôt can always be obtained in case of necessity to attend a serious case. These means are sufficient. 18. The hospital is a particularly healthy one, not at all liable to epidemics, and Lieut.-Col. Archer, who has commanded the station for the last four years, states that cholera never appears; any cases that have happened have been in individuals who have lately come from the plains, where cholera may have been raging; they may suffer from it and die, but it never spreads. The only affection at all approaching the character of an epidemic is that, in the cold damp weather, men who are convalescent from dysentery and other bowel affections are liable to relapses. This is my experience during the winter season of the year. Several men were sent to the plains who were almost all young soldiers belonging to the 1st battalion, 1st Royals, stationed at Secunderabad, where dysentery had been epidemic, and who had only lately come to India. Men convalescent from fever, &c., rapidly recover their strength, and sympathetic bubo also, which has been during the last two seasons, at the fall of the year, almost epidemic in the 74th Highlanders at Bellary, disappears almost without treatment. 19. No reply to this query. 20. The whole establishment is composed of convalescents, and there are plenty of shady walks about the hills for them to take exercise in, but no place or seats specially set apart for that purpose. 21. There is no provision at present for the treatment of soldiers' sick wives and children, as until the married men's quarters were constructed lately, very few women or children were ever sent here. A hospital for women and children at the east end of the present hospital, and joining it, is recommended and sanctioned; at present they must be treated in their own quarters. The present arrangements are sufficient, but when the married men's quarters are fully completed the women's hospital will become a necessity. 22. No reply to this query. 23. With regard to change of diet and medical comforts within his hospital, the medical officer has the entire control, subject to his own superior medical officers. In reference to the sanitary state of the hospital and the repairs of buildings, he can recommend only the carrying out of the recommendation depending entirely on the will of the commanding officer. The practical working of this is that the carrying of it out, and perhaps the making of such recommendation may depend a good deal on the relation existing between the medical and commanding officers. 24. In reference to the necessity for convalescent wards, it may be again stated that the whole establishment is a convalescent depôt, and only men requiring active treatment are taken into hospital.

XIII. Burial of the Dead.	1. The distance of the burial-ground from the barrack is about 200 yards, and it is badly placed as regards winds. 2. Its area is about half an acre, and it is with great difficulty one can get sufficient depth, never without blasting. The graveyard is badly placed as regards position and soil. A much better position in every respect might be found a short distance down the hill at a point not inconvenient. 3. The space between each grave is two feet, and the depth depends on the soil. They have never yet been re-opened. Interment is compulsory at ordinary times within 24 hours. 4. Very few interments in the graveyard. British soldiers are buried by the officer commanding. 5. The dead of camp followers or bazaar people are buried on the side of the hill. 6. No injury accrues to the public health from the present practice that I am aware of. 7. It would be a great improvement to form the burial-ground lower down the hill, where more soil is procurable, as at present it is on a rock.

(The replies having reference to the health of troops and hospitals are signed by Assistant-Surgeon Chester, 74th Highlanders, and partly by Assistant-Surgeon Houston, Madras establishment.)

July 29, 1861.

(Signed) F. Wells, Major Commanding Depôt, Ramandroog.

I. Topography.	1. The country surrounding the station is dreary towards the south and east. To the north and round (by west) to the south-west it is bounded by fine ranges of hills. Throughout the eastern talooks it is flat and dry, but the northern and western sections of the district are hilly. There is no jungle in the vicinity of the station, and no wood of natural growth, with the exception of the borassus flabelliformis, and acacia arabica. The station and native town, however, are crowded with trees that have been planted to the number of about 4,000. The most common are varieties of the Ficoid family and Azadirachata Indica. They afford shade, modify temperature, and add to the salubrity of the station. 2. The height of the station above the sea is 100 feet. It is on a level with the adjacent country. The nearest water is the river Kistnah, distant about 20 miles, and a canal, about six miles, supplied with water from the river, There is higher ground behind the jail or to the north-west of the station, a open level space about four square miles in extent; it is all under dry cultivation, and at an elevation of from 20 to 30 feet above the level of the station, with a gentle slope towards the south and west. Water of excellent quality is found there in abundance at a depth of 40 feet, and as it is sheltered on all sides by lofty trees, it would be an admirable locality for the lines of a native corps. 3. The nearest mountain is one of the range called Kondaveed, rising about 1,000 feet above the level of the station, and is distant about 12 miles. 4. The sea is distant about 35 miles. The vicinity of the station is not liable to inundation. There is no broken ground, ravines, or water pits in the neighbourhood affecting the public health. 5. The entire station with the exception of one small suburban village is freely exposed to the winds, and although crowded with trees, these are all lofty, so that free external ventilation exists. In the native town too the streets are wider and the houses less crowded than usual, but from their faulty construction fresh air is entirely shut out from the inhabitants. The increase of temperature by reflected sun heat is obviated by the presence of so many large trees. Sometimes during the months of November and December intensely cold winds from the north or north-west set in, and continue for five or six days, which induce in Europeans severe colds, and in the native population smart attacks of simple continued fever. The sea breeze blows pretty constantly every evening during the hotter months of the year, with a most pleasant and salutary effect. Land winds blow at times with great strength. 6. The whole of the surrounding country is under cultivation. The canal from the Kistnah river approaches to within six miles of the station, and when completed will be still nearer. Its water has been of immense benefit for purposes of cultivation, and has yielded a healthy supply for drinking in villages when wells were insufficient. Since the canal became available for purposes of irrigation, and large tracks of previously arid country have been flooded with water, the heat during the hot months would seem to have been less disagreeable. Rice is not cultivated in the neighbourhood of the station; neither indigo nor hemp is cultivated or prepared near the station. 7. The bungalows of the officers in the station are built on an open space surrounded on three sides by the native town. The sepoy lines are located in a corner of the bazaar, and the guard room, garrison, hospital, and arsenal are situated in the centre of the bazaar. 8. The surface soil of the larger portion of the district is black soil, resting on a subsoil of decomposed gneiss rock; below that, at a depth of from 10 to 20 feet, a hard gneiss rock is reached. Lime also is found in various parts of the district in the common shape of small irregular nodules mixed with gravel and sand. Marble of various colours, clay, slate, and

References to Subjects and Queries.	Replies.

I. Topography—*cont.*

iron ore are found in the western talooks of the district. The characteristic systems of the entire district, however, are the gneiss and mica schist. The station stands on a red soil, chiefly composed of the decomposed gneiss. Its site has been occupied by native population from time immemorial.

9. Water is usually found during the dry season at a depth from 40 to 60 feet below the surface, and during the rainy season about 20 feet below the surface.

10. There are no surface springs in the district, and the rainfall partly flows away, and is partly absorbed by the porous ground in the neighbourhood of the station, and is thus drained off. The drainage from the adjacent higher ground does not pass into the subsoil of the station.

11. The water supply is derived from wells and tanks; the majority of the wells, however, are in a great measure dependent upon the tanks for the supply of water, and they again are dependent upon the rainfall; the water is partly stored in tanks, which are open. After the rainfall the extent of tank service in the station will be about one square mile. In the bazaar a reservoir for water was dug by Government some years ago; it is about 40 feet square by 60 feet deep, being dependent on springs for its supply, and there are in general from 20 to 9 feet of water in it. The tanks are generally dry during the months of March, April, and May. They contain the usual amount of infusoria, but very few aquatic plants proper. When dry their beds to some extent become covered with dry land grasses and weeds. All the tanks are used more or less for bathing purposes, and the "red tank" which feeds numerous reservoirs and wells is much frequented by dhobies. The wells are not liable to pollution from leaves or other matter falling into them, but the tanks form receptacles for many impurities, and some foul drainage. None of them constitute a nuisance or give off malaria.

12. The supply of water is never superfluous, and it is frequently insufficient, so that water has, in dry years, to be brought in casks from a distance. In color it is clear, with no perceptible taste, and no smell; the water of some of the wells, however, contains saline particles, which become encrusted on the sides of the glass during evaporation. The water of the "black tank" holds in solution a small quantity of the nitrate of potass. The water of these has a saline taste. There are no means of performing an accurate chemical analysis, but a microscopic examination of the water has been made, and the quality found to be good and not injurious to health, but decidedly insufficient in quantity. It is raised for domestic purposes by manual labour in leather buckets; a constant and abundant supply might, at a trifling cost, be brought in by means of a small aqueduct from the canal already referred to. Many of the natives are most anxious that this should be done.

13. Guntoor is within the influence of both monsoons, so that the heat of the earlier months of the hot season on this coast is very much moderated by occasional falls of rain.

14. The responsibility in the selection of new stations seems to be too much divided and amongst different departments, and the enquiries as to topography, climate diseases, &c., at times too limited to afford the requisite information. The selection of a site for a new station should be entrusted to a board or committee of officers, all men of considerable service and tried experience, one military, one engineer, and one medical officer would form an efficient board. A subordinate of the medical department might then be posted on the selected site for at least one year, to keep an accurate meteorological register, and record of diseases most prevalent amongst the native inhabitants; if these should prove satisfactory, then building operations should commence. As, however, this test would be often insufficient, it would be advisable to post one or two companies of a corps in huts or tents on the new site for the space of one year, subsequent to the preliminary observations before commencing the more expensive building operations; there should also be an officer of health attached to the quartermaster general's department fully supplied with sanitary statistics with regard to every locality in the Presidency.

II. Climate.

1. The means and instruments at the station available for conducting and registering meteorological observations are, a barometer and dry bulb thermometer, and a rain gauge in the charge of the medical officer. During the past six months a wet bulb thermometer has been added.

Table of Meteorological Observations for five years, from 1st January 1855 to the 31st December 1859 inclusive.

GUNTOOR. MADRAS.

References to Subjects and Queries.	Replies.
II. Climate—*cont.*	3. The climate of Guntoor may be stated to be dry, warm, and not subject to sudden variations of temperature. Fogs occasionally prevail towards the end of December or in the beginning of January. The air is quite free from dust or other impurity. The climate would seem to have a most beneficial effect on convalescents from malarious fever, beriberi, &c. Prisoners suffering from beriberi are constantly being transferred from Masulipatum to the jail here, and after a short residence become quite well. This would therefore form one of the best places for the location of a native corps that could be selected along the coast. The detachment of the 2nd N. V. battalion stationed here has always enjoyed excellent health. From the following return it will be seen that the most healthy months are July, August, September, October, and November. It would seem, therefore, that sickness succeeds the first heavy falls of and continues throughout and after the cessation of the rains.

The table gives the average number of sick of Det. 2 N.V. Batt. admitted monthly into garrison hospital during five years, Jan. 1855 to Dec. 1859, inclusive.

Months.	Average Admissions Monthly.	
January	7 4/5	Average strength 304.
February	10 1/5	
March	9	
April	9 4/5	
May	9	
June	8 1/5	
July	10 4/5	
August	12 1/5	
September	15 4/5	
October	15 3/4	
November	11	
December	9 1/5	

The most healthy months are December, January, February, March, April, and May (the dry months of the year), the prevailing diseases during the unhealthy months, are intermittent fever, rheumatism, dropsy, and bowel complaints; this statement refers to the civil population also.

4. I am not aware of any district near the station the climate of which is more conducive to health than that of the station.

5. The following are the stations at which I have served, with observations on their comparative salubrity:—St. Thomas Mount, extremely hot and relaxing to the European constitution. Kirkee, Bombay, cool and healthy, but fresh arrivals subject to diarrhœa, hepatitis, and fever. Poona, Bombay, much the same as Kirkee, and in both dysentery also is a not uncommon and frequently fatal disease. Masulipitam, hot and decidedly unhealthy for European troops. Trimulgherry Barracks, Secunderabad, variations of temperature sudden and extreme; hepatitis, dysentery and fever very common and fatal. Bolarum, Hyderabad, variations of temperature considerable, but far more healthy than the neighbouring cantonment of Secunderabad; hepatitis common amongst officers. Bombay, hot and relaxing, the town barracks being most unhealthy, and quite unfit for the reception of Europeans; Colaba barracks are more healthy, but very hot, and often scourged with cholera.

III. SANITARY CONDITION OF STATION.

1 to 23. No information under this head.

Officers' Quarters.

1. The officers' quarters are in fair condition, roomy, and in a satisfactory state as regards drainage and ventilation.

IV. HEALTH OF THE TROOPS.

1. The native population of the station and the surrounding district are healthy; the jail is the healthiest in the presidency. The Palnaud, a remote portion of the district, is unhealthy during a few months of the year.

2. The most prevalent diseases amongst the native population are febris intermittens, and remittens, diarrhœa, rheumatism, anasarca, syphilis, primitiva et consecutiva, variola, cholera, and morbi cutis.

3. The healthiness of the neighbouring population is attributable to absence of miasma, plenty of work, liberal remuneration, and plenty of wholesome water and food.

4 to 17. No reply to these queries.

18. It may be stated generally that European troops seem to suffer from bowel complaints in granitic districts, but whether this is dependent on that physical confirmation of the surface of the country, which is characteristic of primitive districts, or on the nature of the soil, no statistics hitherto published enable us to speak with precision.

19. Soldiers proceeding to India should be from 20 to 25 years of age, and should land there in October, November, and December for the Madras Presidency.

20, 21. No reply to these queries.

22. Regiments, as a rule, ought not to remain for more than ten consecutive years on the plains of India, for although many of the men may, after such a period retain their health and strength, yet the corps, as a whole, will have lost much of its physical energy, and been decimated by disease.

23. No reply to this query.

24. Invalids proceeding home by the Cape should leave India during the months of February and March.

Diseases.

1, 2. No reply to these queries.

3. Cases of hepatic disease are extremely rare amongst native soldiers.

4. Dracunculus is a rare disease among the civil population. I am not aware that a single case of it has been admitted from amongst the sepoys of the 2nd N. V. battalion in Guntoor.

5. Out of an average annual strength of 314 there have been 72 admissions into hospital during the year 1858–59, from all diseases, in the detachment, and of these admissions two were on account of venereal diseases; the proportion, therefore, which those sick from venereal complaints bear to the total sick in hospital from all other diseases is about 2·77 per cent.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	6. The troops at the station suffer from the following diseases :—(1.) Quotidian and intermittent fevers; the proportion of admissions from these diseases to total admissions during 1858–59 has been 34·71 per cent. (2.) Dysentery; the proportion of admissions from this disease to total treated during 1858–59 has been 1·38 per cent. Cholera and small pox rarely occur, but the proportion of admissions from rheumatism during 1858–59 has been 15·13 per cent. The admissions for these diseases have been in the proportion of 51·38 per cent. to total admissions during the year. 7. The cases of fever have been invariably quotidian, and of a very mild character; dysentery is never frequent nor formidable. Cholera is, under all circumstances, so uniform in its character that it requires no remarks. Variola; this disease is common amongst the civil population and in general confluent, or semi-confluent. Rheumatism is in general chronic, but of a very obstinate character. Venereal complaints are frequent and disastrous amongst the civil population. Fever is most common immediately before or about the beginning of cold months; cholera prevails in general in May, June, and July; rheumatism is most frequent during the rains; variola is in general seen early in the hot season; an elevated temperature seems to have a fostering influence on variola and cholera, and cold are inductive of rheumatism. The lanes and streets of the town are kept remarkably clean, but in the houses there is a want of ventilation and cleanliness. The scarcity of water in the station prevents, in some measure, the native population from performing ablution to the extent necessary for the due maintenance of a healthy skin. 8, 9, 10. No reply to these queries.
V. Intemperance.	No information under this head.
VI. Diet.	1 to 3. No reply to these queries. 4. The food is always boiled by the native troops, the men or their wives preparing it for themselves. There are no kitchens. The men do not use coffee or tea, but take conjee before a march. 5. Gardens for the cultivation of vegetables by the soldiers could not be advantageously established near the station.
VII. Dress, Accoutrements, and Duties.	1. 2. The usual routine of soldiers' duties are the guards, from which the men do not suffer The men have five nights in bed during the week. 3. Guards are mounted at 200 yards distance from the barracks, and last for 24 hours. There is one roll call at half-past five p.m. daily; but there are none at night. The health is not affected by night guards or night duty.
VIII. Instruction and Recreation.	1. There no means of instruction or recreation at the station, and no restriction is placed on the men with regard to exposure out of barracks off duty, as the men at the station are all natives. 2. No suggestions can be made as to any means of recreation or employment for native troops. 3. In this detachment the men do not lodge money in the Savings Bank. I cannot therefore form an opinion as to whether their institution would be advantageous or not. 4. There is sufficient shade for the natives to take exercise without injury to health during the day.
XII. Hospitals.	1, 2. The garrison hospital of Guntoor is situated near the centre of the bazaar, with an open space of small extent immediately in front of it. The civil dispensary is situate quite close to the hospital, which is surrounded on all sides by buildings, walls, &c., which interfere with the ventilation. The site is not higher than that of the surrounding buildings, but there is sufficient slope to carry off the rain-fall. It is not obnoxious to malaria, but nuisances in the neighbourhood are common enough. 3. The water has to be brought from a distance on the back of a bullock: it is quite wholesome. A well sunk in the neighbourhood to the depth of 50 or 60 feet would afford a constant supply. 4. There is no sewer leading from the hospital, the drainage being entirely surface drainage. Refuse water and ordure have to be carried to a distance. 5. The verandahs are never used for the accommodation of sick or any others. The winds are in a great measure shut out by surrounding buildings. The windows are fitted with solid wooden shutters, the very worst arrangement that could be adopted in a hospital, as natives are fond of shutting out every breath of fresh air. 6, 7. No reply to these queries. 8. The walls of the wards are whitewashed once a year, or oftener if necessary. 9 to 13. No reply to these queries. 14. The cots used in the hospital are made of iron. 15, 16. No answer to these questions. 17. One standing orderly is allowed for the hospital, and if any patient is in a helpless condition, he is permitted to have an orderly comrade. 18. The hospital is in a satisfactory condition, and is very rarely visited by epidemic disease, and then never, except such disease is prevalent outside. 19, 20. No reply to these queries. 21. When requisite the families of sepoys are attended in their own houses. 22, 23, 24. No answers to these questions.
XIII. Burial of the Dead.	1, 2, 3, 4. No reply to these queries. 5. The dead of bazaar people are disposed of according to caste. Some are burned, and others buried. 6. The practice of burying amongst the houses of the town is decidedly prejudicial to health. 7. All existing Mahomedan burial grounds within the limits of the town should be closed in future, and new places at a little distance from the town substituted.

No date or signatures.

Kurnool. Madras.

KURNOOL.

Accommodation.—Native troops, infantry, one regiment, 741.

References to Subjects and Queries.	Replies.
I. Topography.	1. The country surrounding the station is black and brown. It is flat, stony, and dry, with a range of hills to the south-east. There is very little wood and no jungle in the vicinity of it. It is situated between two rivers, the Tumboodra to the north, and the Hendry to the south. The former has water in it the whole year, but the latter is nearly dry, excepting for a short period during that term. 2. The height of the station above the sea is 800 feet, but it is somewhat below the level of the adjacent country. The ground rises immediately around the station, especially to the south-south-east and south-west, and the village of Sonderapand would offer an advantageous position for military purposes. 3. The range of small hills about four miles to the east are, I should say, between four and five hundred feet above Kurnool; the slopes run up into peaks or ridges, but there is no table land. They may be pronounced uninhabitable. 4. The nearest waters are the rivers Tumboodra and Hendry, which run close to the station: but the vicinity is not liable to overflow. There is no broken ground, ravines, or water pits near the station. 5. The station is open and freely exposed to the wind, but the walls and buildings being all built of stone and granite, the temperature is greatly raised by the reflected sun heat. The chief winds that blow over the camp are those from the north-east, east, west, and south-west, which are land winds; they have no prejudicial effect on the health of the station, which is good. 6. The surrounding country is cultivated during part of the year, but no works of irrigation at present exist, although some are about to be commenced. There is no cultivation of rice or indigo, nor is the preparation of flax carried on near the station. 7. The native town and station are the same, and the native population is about 30,000. 8. The geological structure of the district is slate and granite, with a superficial layer, varying mostly from a few inches to two feet, of either black mould or clay resting on it. The station occupies old ground. 9. Water is found during the dry season at a depth of 31 feet below the surface, and during the rainy season at a depth of 16 feet. 10. The station being situated on a ridge between two rivers, close to their junction, the surface water flows readily off. The depth of soil varies from one to three feet, and below that is laminated slate, limestone, and then granite. No well can be depended upon to afford a supply of water during the hot weather, unless it is carried below the bed of the river to which it is nearest. No drainage from higher ground passes into the subsoil on two sides of the station, nor is it affected by the drainage of the third side. 11. The water supply of the station is obtained from the two rivers and wells. That obtained from the river Hendry is at all times pure and excellent. There are no tanks. 12. The supply of water is plentiful, and that of the Hendry and from the wells supplied by it is clear, inodorous, and well tasted. It is raised by Pacottahs when the river is full, and distributed by watermen in leathern bags carried by bullocks, the people supplying themselves by means of vessels. When the river is dry, the water is readily obtained by digging holes in the sand. 13. No reply to this query. 14. The sites of stations cannot always be selected with a single view to topography, climate, diseases, &c., as it may be necessary to locate troops, more especially natives, in places for various causes known to be extremely unhealthy.
II. Climate.	1. The instruments available for conducting meteorological observations are a barometer, a dry and wet bulb thermometer, and a pluviometer. 2. Table of meteorological observations for three years, taken from January 1857 to December 1859.

3. The climate is generally hot and dry, but salubrious and pleasant during the rainy season, or throughout the year, excepting the hot months of March, April, and May. The ordinary shelter and clothing are the only precautions required, the whole of the year being generally very healthy.

References to Subjects and Queries.	Replies.
II. Climate—*cont.*	4. The only place in the Kurnool district adapted for Europeans are the Nullaymallay hills, the highest peak of which is 3,500 feet above the sea, and water can be found at an elevation of 3,200 feet. The temperature is about 15° lower than in the plains; fever is not known, although there are extensive jungles. These hills are about 60 miles from Kurnool, and, in a strategical point of view, for the location of British troops, their position is most favourable. 5. I have served at the following stations:— Viziagapatam, the cantonment Waltair—very healthy. Singapore—very healthy. Malacca—very healthy. Cuddapah—fevers prevail. Chingleput—healthy. Rangoon—pretty healthy for Europeans, but decidedly unhealthy for the natives of India.
III. Sanitary Condition of Station.	1, 2. No reply to these queries. 2 to 6. There are no European troops here, and native troops do not reside in barracks. 7. Tents for Europeans are square, double poled, with two flys, and those for natives are double poled, with a ridge between them, and have but one fly, sloping downwards from the ridge to within a foot of the ground, and closed in by a curtain.

8. No reply to this query.
9. The Sepoy lines at this station are constructed of stone in mud walls, and a roof composed of wood scantling and bamboos, covered over with an impervious clay. This kind of roof is, I think, peculiar to Kurnool. The cavalry lines are built in the same way. Tents are made of common country cloth, lined with the same material, dyed a dark blue colour.
10. The floors of the lines are usually of rammed earth, raised a little above the ground. To add to the comfort of the dwelling, one of the females of the family plasters it over with cow dung every morning.
11. I believe the materials used in construction are suitable according to native ideas. It would be difficult to make them build their houses in a different way. The public buildings are kept in repair by the District Engineer. The Senior Medical Officer in the station is *ex officio* Sanitary Officer. The public buildings are whitewashed once a year.
12, 13. There are no men's lavatories or cook-houses, and linen is washed and dried in the rivers.
14, 15. There are no privies or urinals at Kurnool, with the exception of one urinal in the gaol, which is simply a trough and a tub. The tub is emptied every morning, and the contents conveyed away in buckets. It is not lighted at night at all nor are the lines, unless done by private individuals.
16. The lines being situated on a ridge, sloping off on either side, they are sufficiently drained by a few ditches, about 3 feet wide by 3 feet deep, which quickly disposes of the surface water. The barrack and hospital are dry. There are no foul ditches, but the native houses in the fort and town have each a necessary, very few of which, if any, are ever cleaned. The old fort ditches are the resort of many natives for the purposes of nature, but they are never cleaned.

KURNOOL. MADRAS.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	17. The general state of the surface cleansing within the cantonment and its vicinity is very bad. The privies in each native Mussulman's house are never cleaned, there being no conservancy establishment in the town or station. 18. The surface of the cantonment is kept free of vegetation. The ventilation of the station, bazaar, &c., is greatly interfered with by old walls, &c., which could be advantageously removed, especially the wall round the fort adjoining the south gate. 19. The drainage of the bazaar is bad. There is a great want of cleanliness, and it is much crowded. No latrines exist, nor are there any regulations for preserving due cleanliness. The native houses are small, close, and confined. Out of a population of 30,000 souls, 20,000 are supposed to be Mussulmen. Every Mahomedan house contains a cess-pit and dung heap, which is never cleaned or removed. No nuisance is experienced in the lines from wind blowing over the native dwellings. 20. No regulations are enforced regarding slaughtering places. The natives kill animals wherever they like, and they never clean the place afterwards. 21. The natives picket their horses, tattoos, &c., where they like, very often in the street. No regulations existing on the subject. Buffaloes, &c., roaming about the station undisturbed day and night. 22. The stables of the Kurnool Irregular Horse are built of slate bedded in mud, and covered with the mud roof already described. The lines are about a mile from the town, where the men keep their families. I never saw any lights in the lines at night, but there is abundance of light and ventilation during the day. The manure is sold, and there are no dung heaps. The men and native officers are obliged to be in their lines by 10 at night. The horses are picketed in rows of stables; both are the private property of the native officers. 23. There are no married men's quarters.
Officers' Quarters.	There are no officers' quarters. The officers rent anything in the shape of a house they can get.
IV. HEALTH OF THE TROOPS.	1. The station, district, and adjoining native population are healthy. 2. The prevailing diseases among the native population are fever and rheumatic affections. Cholera occurred as an epidemic last year, but this station is not particularly subject to it nor to spleen disease. 3. The healthiness of the native population is attributable to the dry even climate, and to their being in a sufficiently prosperous condition. 4. The troops were previously at Madras, where the regiment remained one year after their return from Burmah. They have suffered since from fever and rheumatic affections, and last year from cholera, which occurred as an epidemic. No portion of the men's accommodation is more unhealthy than the rest. 3. The troops are never camped out. 6, 7, 8. I have never been in charge of troops at hill stations, but I decidedly approve of their selection for the location of troops. 9. It depends upon the topography of the hill station, what are its peculiar diseases; if it is not cleared of jungle, fever and dysentery may be expected among the troops on going to it. 10. For Europeans, precautions as to clothing, shelter, diet, &c., are necessary to enable them to obtain benefit from residence in hill stations. For the natives I believe the plains are preferable. 11 to 13. No experience at hill stations. 14. Frequent change of station on the plains is not beneficial to the health and spirits of troops. 15, 16. No replies to these queries. 17. There is no higher ground near the station which could be advantageously occupied as a hill station except a hill range distant about 40 miles to the east, viz., the Nullamallays, which might be so. It is not easy of approach, and the climate has not been sufficiently tested. 18. No experience of the classes of surface and subsoil, more healthy or unhealthy than others for stations. 19. Soldiers proceeding to India should be from 20 to 25 years of age, and should land there in November, the beginning of the cold season. Recruits should not be much worked or exposed to the sun on landing; their minds should be kept employed, and they should be prevented from frequenting the bazaar and toddy shop. 20. Troops for India had better be sent to an intermediate station, and on landing in India in this presidency should be sent to Bangalore. 21. The mode of transport of troops from the port to the interior is by railway or by ordinary marches. 22. A British soldier should serve in India 15 years. 23. No reply to this query. 24. Invalids should leave India for home in the middle of January, so as to arrive in May.
Diseases.	1. All the recruits and recruit boys are paraded weekly for medical inspection. 2, 3. There has been no scorbutus among the troops at the station nor any case of hepatic disease. 4. Some cases of dracunculus have occurred and are attributable to drinking the water of the river Tumboodra, it occurs independent of any other disease. The means of prevention are to drink pure wholesome spring water, or when not procurable, to boil the water first and filter it afterwards. 5. The only means for diminishing venereal diseases is by rendering men liable to punishment for contracting them, as the Government loses his services for the time through the effects of his own imprudence, and moreover his efficiency as an able-bodied effective soldier is thereby often permanently affected. A man concealing such disease should be more severely punished, as much will depend upon its coming immediately under the eye of the medical officer. As respects native troops I do not consider Lock Hospitals necessary. 6. The troops suffer from the following diseases:— *Fevers.*—Chiefly of the quotidian intermittent type. *Dysentery.*—Some cases have occurred.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	*Cholera* occurs occasionally as an epidemic, as at other stations. In 1854 and 1859 it occurred in a virulent form. *Small-pox.*—Some cases have occurred. *Rheumatism.*—The men suffer from this disease both in the acute and chronic form. Three-fourths of the admissions occurred under one or other of these diseases, and eight-tenths of the total deaths also occurred from these causes. 7, 8. No reply to these queries. 9. Small doses of quinine have not been tried at this station as a prophylactic against malarial diseases. 10. The station is, I believe, healthy. The native houses are very confined, the habits of the natives, especially amongst the dense Mussulman population, preclude preventive measures. They are also exceedingly filthy as regards drainage and the accumulation of excrementitious matter about their houses. This is prejudicial to the general health of the station, the authorities might consider it necessary to interfere with it.
V. Intemperance.	1. It is very rarely the native soldier ever gets drunk, as they very seldom use intoxicating drinks. No other information is conveyed under this head.
VI. Diet.	No rations are issued in Kurnool, there being no European troops.
VII. Dress, Accoutrements, and Duties.	1. The soldier's dress consists of a red tunic, black linen or woollen trousers, and a head dress made of wicker covered with black varnish; the accoutrements are a waist-belt, shoulder belt, 40, and 20 round pouches, musket and bayonet. The dress is as suitable as any other for native soldiers. Native prejudices admit of little improvement being attempted in regard to their dress, particularly the head-dress now in use, for which they are not willing to substitute any other.
Duties.	1. European soldiers would be better drilled at home, or at an intermediate station before being sent to India. 2. The routine of a soldier's duties are guards and orderlies, detachments, drill five days in the week early in the morning for about one hour. The native soldiers do not suffer in health from drill. The best hour for drill is early in the morning; but there are general orders regarding marches. The average number of nights the men have in bed during the week is three. 3. The guards mount about a ¼ of a mile from the Sepoys lines at the station. There are no night roll calls, but once a day there is a roll call, except when prevented by other duties.
VIII. Instruction and Recreation.	1. There are no means of instruction and recreation at this station for native troops. No restriction is placed upon native soldiers in reference to exposure to sun and rain when off duty. 2, 3, 4. These queries are not applicable to native troops.
IX. Military Prisons.	1. There are 2 solitary cells which answer the purpose for which they are intended very well.
X. Field Service.	1. No local regulations for field medical service not included in the general presidency regulations exist. 2. Commanding officers always consult the medical officers in charge regarding the encamping grounds, &c. 3, 4. There is no sanitary establishment attached to troops on the line of march.
XI. Statistics of Sickness and Mortality.	No information under this head.
XII. Hospitals.	1. The hospital is a large commodious building originally intended for Europeans, it is about 200 yards from the place of arms, far removed from any stables, and about 100 yards from any native houses. Being situated in the fort it is not very open but is well ventilated, and probably quite airy enough for natives. It is more healthily situated than other buildings in the fort, and there are no nuisances in its vicinity. 3. The water supply is brought from the Toombadra, about 180 yards distant. 4. The drainage water, &c., runs off freely from the hospital site into the Toombadra. 5. There is no perflation of air under the floors of the wards. The roof water falls on the subsoil and drains into the Toombadra, and the surface drainage and gutterage is quite sufficient. The hospital is built of stone in Chunam, it has a pent roof with flat and pantiles. It is quite cool enough for natives. The building has an enclosed verandah on each side, but they are never used for the accommodation of sick or others. The hospital consists of one flat. Table of hospital accommodation :— Total number of wards, 6; verandahs, 3; and a surgery. Total number of beds, 60.

XII. Hospitals—*cont.*	The hospital is not so placed as to receive the full benefit of prevailing winds, but will get enough for natives. The windows are Venetian, opening and shutting by means of hinges, and fastened by bolts. The hospital is also provided with ventilators above, that swing on an axis. These means are quite sufficient to keep the wards free of odour or closeness. 7, 8. There are no artificial means for cooling or warming the air. The walls and ceilings of the wards are whitewashed once a year. 9. The privy consists of a small spot of ground about six feet square, surrounded by four walls. It is not drained, but cleared every morning; and is not offensive, unless upon approaching very near it. 10–12. There are no lavatory or bathing arrangements for the sick, or any means for washing and drying hospital linen. 13. There is no storage at the hospital. 14. Some of the cots in the wards are of iron, and some are wooden boards upon tressels; but no improvement is required in them for native soldiers. 15. The kitchen is a small building in the rear of the hospital arranged after the native fashion of cook-houses. The native soldiers either cook their own meals, or it is done for them by their friends, and never interfered with, save to restrict them, when necessary, to certain diets. 16. Native soldiers are not dieted; they provide their own food. 17. The hospital attendants for native troops is one hospital havildar; and orderly comrades are allowed to such patients as the surgeon may deem necessary. The attendance is quite sufficient. 18, 19, 20. No reply to these queries. 21. The families of the native soldiers are not treated by the regimental medical officers, except at their own request; and they are then visited in their own lines. Native soldiers prefer to have their families treated by their own native doctors. 22. There are no special local hospital regulations. 23, 24. No replies to these queries.
XIII. Burial of the Dead.	1, 2. The British burial ground is situate in the middle of the station. The subsoil is very rocky, rendering it extremely difficult to dig a grave of sufficient depth. 3. No regulations exist as to the grave space or the interval between the graves. They are six feet deep, and never re-open, and not more than one body is interred in the same grave. Interment is compulsory, at ordinary times, within 24 hours after death; and during epidemics almost immediately. 4. The grave yard is not generally offensive; but during seasons of epidemics, when deaths are frequent, it has been so. Quicklime is used to prevent nuisance when necessary. 5. The dead of the camp followers and bazaar people are interred in a burial ground about half a mile from the station. 6, 7. Injury to the public health does not generally accrue from the present practice; no improvements can be suggested in the way of regulation, or otherwise, in the disposal or burial of the dead.

(Signed) John Galwey, Lieutenant-Colonel,
Commanding at Kurnool.
James Ratton, Surgeon.
T. Beckley, Lieutenant, District Engineer.

31st July 1860.

MERCARA.

Accommodation:—Native Troops, Infantry, 1 Regiment.

References to Subjects and Queries.	Replies.
I. Topography.	1. The general aspect of the surrounding country is hilly. Some of the hills are covered with wood, some are naturally bare, while others have been cleared and are planted with young coffee trees. There are many streams, several of which have been dammed up, and small tanks formed. There is a small square tank in the valley, immediately below the fort, and a large well inside the fort, together with numerous wells in the regimental lines. 2. The elevation of the station above the sea is said to be 4,500 feet, and about 1,200 feet above the table land of Mysore. I have no instruments, either public or private, to enable me to ascertain the exact height. The average height of the station barometer at 10 a.m. since my arrival here has been 26·6 inches, and the thermometer 72°. There are higher hills on every side of the fort, and several of them command it at short distances. The fort is healthy, and the hills in the neighbourhood have no particular advantage over that on which the fort is built, excepting for defence. On the neighbouring hills there is a want of water. 3. There is higher ground three-quarters of a mile from the station, and raised about 150 feet above it. 4. The sea is between 40 and 50 miles off as the crow flies, and about 70 by the road. There is a considerable river, about five miles from the fort, which flows into the Cauvery four miles on this side of Fraserpett. Smaller streams abound on all sides, but are not liable to overflow in the neighbourhood of the station. There are ravines near the station, but I do not consider them prejudicial to health. 5. The ground in the immediate neighbourhood of the fort falls on all sides, and the fort is itself airy and well ventilated. This is the hot season, and I have never seen the thermometer in the house higher than 75° Fahrenheit, seldom so high, and the mornings are generally cold in the shade even at this season. There are no buildings near to affect the tempe-

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	rature. The station is exposed to every wind that blows. The sea-breeze is distinctly felt, and is beneficial to health. The east wind is dreaded as parching and destroying young trees, but I have not heard of its being unhealthy.
	6. The hills are here and there being cleared for coffee planting. Almost every valley is artificially irrigated by the Coorgs for rice fields, but this is not likely to make the place unhealthy. There is no prohibition as to the cultivation of rice, nor is any needed. Neither indigo, hemp, nor flax is grown here.
	7. There is no large city or town in the vicinity of the station. Mercara consists of two parallel streets of about half a mile long. The houses are tiled and thatched, and many of them only occupied on the day of the weekly market, their owners habitually residing in the country. The population is about a thousand.
	8. The fort of Mercara is old, and the present palace has been occupied for more than 50 years. There is no regular station, but there are a few houses built within the last few years by the superintendent of Coorg, the clergyman, and some planters. The sepoy huts were built on new ground near the fort when Coorg was annexed.
	9. Water is usually found, in the dry season, in the fort well, at a depth of 40 feet. In the regimental lines immediately below the fort the springs well out from the sides of the valley, and when they overflow run into a stream flowing through its centre. I have had no experience of the rainy season as yet.
	10. The rain-fall, or water from surface springs, flows readily away. No drainage from elsewhere can affect the fort, and the lines are naturally drained into the stream flowing through the centre, which itself flows rapidly away.
	11. The water supply of the station is derived from the numerous streams and wells already referred to. There is but one little tank in the neighbourhood, about 20 feet square. It contains neither plants nor animals and is not used for bathing. Small mud walls are now being built round the well-heads to prevent leaves and other matter falling into them. There is no nuisance from tanks.
	12. The water supply available at this station is unbounded. The water is pure, clear, and pleasant to the taste, but I cannot state its chemical composition. The water is drawn from the well in the fort by a bucket and rope by those who require it. No better supply is required.
	13. I have no other topographical points bearing on the health of the station to notice. The place is always considered very healthy, but my experience of it, as yet, is limited to two months.
	14. New stations are selected by committees held by order or in the presence of sometimes the commander-in-chief and sometimes the officer commanding the division, assisted by medical officers as advisers. This practice has obtained only of late years. Many of the old stations were selected by some officer in command on the spot at the time. The sites of the old stations, in my opinion, are, for the most part, ill chosen. I can suggest no better mode than the present one for conducting this service.
II. Climate.	1. The only instruments, the property of Government, available at this station for meteorological observations are, a Newman's portable barometer, a standard thermometer, and a rain gauge.
	2. There are no meteorological registers here, and I have been at Mercara but two months.
	3. The climate of Mercara is excellent. This is the hottest season of the year. The thermometer (a well tested one) occasionally falls to 62° Fahrenheit just before sunrise in the open air, and rises as high as 76° during the day in the shade. 76° is the very highest, and it is rarely up to 75°. For six months of the year it rains heavily, and fires are needed for comfort; but the roads are dusty whenever rain is long withheld. The soil of the country naturally is, where not forest, covered with grass. The place is generally healthy, though there have been slight cases of diarrhœa among the troops. The men live in small thatched huts, most of them very unsuited for the monsoon months, when the climate is wet and cold; the men are, however, unable to remedy this. They only get two rupees hutting money, and on this pay, from the great rise in the prices of the necessaries of life of late years, it is as much as they can do to live. They live principally on rice, dried fish, and vegetables, being rarely able to afford to eat meat. Their clothing is good but insufficient, as they only get one woollen garment, tunic or trousers, annually, and they takee very opportunity, when they can afford it, of buying second-hand woollen clothing. Their drill is not injurious to health. The natives of the country consider the present season (April and May) to be the most unhealthy. Bowel complaints and fevers are the most prevalent ailments, but epidemics are almost unknown. The villages and towns are very small, the people preferring to live in detached cottages on their own farms, and this may account for disease not spreading.
	4. Mercara is considered the healthiest place in Coorg, being open and free from the immediate neighbourhood of jungle.
	5. The following are the stations at which I have served: Penang, Malacca, Singapore, Trichinopoly, Vellore, Kamptee, Secunderabad, Cuddapah, Bellary, Sholapore, Jaulnah, Madras, Rangoon, and lastly Mercara. The climate in the Straits is not unhealthy for Europeans, though relaxing, but the sepoys there, as well as at Rangoon, were not healthy; they suffered from dysentery, ulcers, and beri-beri. All the other stations, according to my experience, were at times healthy, at other times very much the reverse, and at all of them excepting Mercara I have known very severe visitations of cholera. Cuddapah and Sholapore I consider as most trying to Europeans; Secunderabad, Jaulnah, Madras, and Mercara the most favourable, especially the last-named place. The only objection to it is, the long and very heavy rains, which sometimes enforce confinement to the house for many days together.
III. Sanitary Condition of Station.	1, 2, 3. There is no engineer officer or draughtsman at Mercara.
	4. The native troops live in huts, their own property. There is but one small barrack for Europeans (now vacant), formerly occupied by a detachment of artillery. The barrack rooms are 93 feet by 21 feet wide, with verandahs 10 feet wide. There are no Europeans, excepting the two staff serjeants, now at Mercara.

MERCARA. MADRAS.

III. Sanitary Condition of Station—*cont.*	TABLE of BARRACK ACCOMMODATION. Date of construction, 1841. Total number of rooms:—1 barrack room, 4 serjeants' quarters, 1 cook-room, and 2 privies. Total regulation number of non-commissioned officers, 4; of men, 24.

Barrack Room.	Regulation Number of Men in Room.	Dimensions of Room.				Cubic Feet per Man.	Superficial Area in Feet per Man of Floor Space.	Height of Men's Beds above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents in Feet.				Number.	Height.	Width.
1	24	Ft. 93	Ft. 21	Ft. In. 17 6	—	—	—	Ft. 2 Beds are in the Native Hospital.	7 and 6 doors.	Ft. In. 4 11	Ft. In. 4 3

5. The windows are on both sides of the barrack room, and there is a verandah on each side 10 feet 6 inches wide. The barrack room is unoccupied. The windows are of glass.
6. With respect to beds, bedding, &c., there is no Government property in use here, excepting in the hospital. The native soldier provides for himself as he can in every way.
7. The tents are of double cotton cloth, supported by two bamboo poles and a bamboo ridge pole. The length between the poles is 9 feet 6 inches; length on the ground, 22 feet; breadth at widest part, 13 feet; and height under ridge pole, 10 feet.
8. Ventilation is effected by the ordinary doors and windows, and this is sufficient to keep the air pure by night as well as by day. Artificial ventilation, such as by punkahs, is never needed, the climate being cool all the year round.
9. The artillery barrack room is of brick and chunam, with tiled roof; as are the barracks of the 25th Native Infantry. The term barrack, as applied to a native corps, means the building in which the arms are kept, not to the dwelling of the soldiers.
10. At Mercara the floors of the barracks are of wood, raised about one foot above the ground, but there is no passage of air beneath.
11. The barracks are constructed of brick and chunam, and the tents of double cotton cloth. These materials are good and suited to the climate. The men's huts are built of mud, and if rain is long continued, with wind, and the wall unprotected by matting outside, the hut often falls. I have no doubt that the sepoys would be less liable to illness than they now are if better housed. I can only suggest the expensive remedy of having brick and chunam lines built for them by Government, such as (with a few modifications) the regiment occupied at Perambore, Madras. The barracks and cantonment are kept in repair by the Department of Public Works. Repairs are not speedily executed, and it is with difficulty, and only after repeated application, I can get anything done. I consider myself responsible for the general sanitary state of the cantonment as commanding officer. There is only a native overseer of the Department of Public Works, and there is a difficulty in procuring bricklayers.
12, 13. There are no lavatories or cook-houses at Mercara. The sepoys employ dhobies, one to each company, who wash their clothes in the ordinary native way, beating them against stones by the side of a tank or stream.
14. There are no privies or urinals at present at this station; but I have applied for sanction to build three public necessaries in the lines for the use of the men and women of the corps. This sanction, however, I have not as yet received.
15. There is no artificial ventilation required in the barracks (place of arms), which is shut up at night; but there is a light in the guard-room.
16. There are no arrangements for draining and sewering the barrack. All refuse water flows readily away from in and about the fort. No part of any of the buildings is damp. The refuse, fluid and solid, from the hospital privy flows into a cesspool, at present under repair, and the only one in the place. From all other buildings the refuse is carried away by toties or sweepers twice a day. The hospital cesspool is 5 feet square, and is not near any tank or well. It is within 15 feet of the hospital, and open as it now is, while under repair, I consider the smell injurious to the health of the patients. I have written to hurry the work. It is intended to be covered over permanently. There are no foul ditches near the station.
17. The surface cleansing of the cantonment is not efficiently done, nor have I at present the means of satisfactorily removing the rubbish, &c., which so constantly accumulates. I have applied for two scavenger carts with coolies, but I have not yet received the sanction for their entertainment.
18. There is only a short close turf in the immediate neighbourhood of the cantonment; and no old walls, thick hedges, &c., exist to interfere with the ventilation of the station, bazaar, &c.
19. The bazaar is well ventilated, drained, and kept clean. There is an abundance of water, and it is not unduly crowded. The regimental cutwal and peons are held responsible for the cleanliness of the bazaar. Each shopkeeper keeps the street in front of his house clean. The natives near the station keep their cottages very neat and clean, and the town of Mercara is especially so. No nuisance is experienced in the cantonment from wind blowing over the native dwellings.
20. Sheep are killed a quarter of a mile from the fort, close to Mercara town. No regulations are required, the number being so small, and no nuisance is ever experienced from this cause. Beef is killed at Fraserpett, 20 miles from Mercara, and only one animal in two months. A condition was made at the time of the annexation of Coorg, that cows should not be killed in the country. Why, I know not, as the Coorgs will eat anything they can get. They do not themselves kill cows, but appear indifferent on the score of the beef brought from Fraserpett to Mercara.
21. There are only the horses of the officers of the regiment and a very few ponies here.
22. There are no artillery or cavalry stables, or ground for picketing horses, at Mercara.
23. The only quarters for married non-commissioned officers are those of the two staff serjeants attached to the 25th Regiment. These quarters are good and sufficient.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.* *Officers' Quarters.*	1. There are no officers' quarters at Mercara, as most of the officers reside in the old palace of the ex-rajah. No improvements to suggest.
IV. Health of the Troops.	1. The station, district, and native population are healthy. 2. Epidemics are scarcely known here. Fever and bowel complaints chiefly prevail. 3. I attribute the healthiness of the neighbouring native population to good air, good water, and the cool and equable temperature of the station. 4. The troops before arriving at this station were at Madras for 2 years and 6 months, and commenced to march to Mercara on the 23rd February 1860. The corps was generally healthy while at Madras, and the principal diseases were fever, diarrhœa, rheumatism, and skin disease. The regiment reached Mercara on the 20th March 1860, generally in good health. Fever and diarrhœa have been the diseases most prevalent since their arrival. No part of the men's present accommodation is more healthy than the rest. 5. Troops at this station are not camped out. 6, 7. I have not before been at a hill station with troops, so cannot answer these queries. 8. I have had no opportunity as yet of forming an exact opinion, but judging from my own feelings, as well as from the preference (when once acclimatized) which native servants evince for hill stations, I should highly approve of them as stations for troops. There are a number of pensioners (natives) who once belonged to regiments stationed here, now settled in and about Mercara. These men are in no way originally belonging to Coorg, but those I have asked about it say they like the climate, and find themselves enabled to do more work here than they could in the plains. 9. Troops often suffer from bowel complaints more or less severe on first going to hill stations, as well as from coughs, colds, and fevers. 10. The natives should be better clothed, fed, and housed than they can at present afford to be. When off duty they wear their native dress, generally of cotton cloth, unless some second-hand woollen garment has been purchased cheaply. Their exercises are never prejudicial to health. 11. Here the rainy season from the end of May up to September is the least agreeable, but it is considered healthy. The least healthy months, according to the native opinion, are May and September, the beginning and end of the monsoon. I should say that a residence of not less than one year would be the shortest to enable troops to receive the benefit of hill stations. 12. There is no period of service in the hills beyond which injury is likely to be inflicted on the health of the troops, on returning to service in the plains. 13. I do not think that any special precautions are required for preserving health on leaving hill stations for the plains. 14. In my opinion (and from personal experience, for I have been more than once on the hills though not with troops) I should say the troops would be much stronger and better able for occasional work in the plains if permanently located on the hills. A short visit to the hills is not of much use. Frequent change of station in the plains is, I think, beneficial, but changes are dreaded by the native troops, on account of the great expense they incur in providing carriage for their families. 15. The only barracks at hill stations which I have seen are the Wellington (Jackatalla) barracks; but they were not at the time finished. 16. From 4,000 to 6,000 feet above the sea is the elevation most suitable for sites for hill stations. 17. There is an abundance of available ground in this neighbourhood for hill stations, but all about the same height. The hills in the vicinity have no table land of any extent; some are 6,000 feet above the sea. The station would not, I think, be a favourite one with convalescents on account of the long continued rainy season, six months in duration, and very gloomy as well as wet. 18. I have always considered, from my experience, a reddish gravelly soil to be healthy, and the black cotton soil the reverse. 19. I consider the best age for soldiers to proceed to India to be from 18 and 19 years and upwards to 25, and the best period for them to land there, November. They have then moderately cool weather up to March, and are in these months gradually broken in for the endurance of the hot season. 20 to 23. No replies to these queries. 24. Invalids leaving India for home should, if proceeding by sea, leave in December, but if by overland route in March. They should not arrive at home until the spring was somewhat advanced.
Diseases.	1. There are no regular medical inspection parades at this station. 2. No case of scorbutus has occurred among the troops at this station. 3. Cases of hepatic disease are very rare at Mercara. 4. Dracunculus is said to be unknown in Coorg. Some cases were admitted into hospital on the march previous to, and three more since arrival here. The cause of this disease is unknown. Probably it arises from washing in the muddy nearly dried up tanks on the road from Madras. 5. The proportion which venereal diseases bear to the total sick in hospital is about 3 to 20. 6. The troops at this station suffer from fever (intermittent), diarrhœa, and rheumatism, but there have been no deaths since the regiment arrived here, *i.e.*, on the 26th March 1860. 7 to 10. No experience to enable me to answer these queries.
V. Intemperance.	1. The soldiers at this station are usually temperate. Some of the sepoys occasionally drink, and if found out are punished. Drinking is less prevalent here than it was at Madras or in Burmah. There are no confirmed drunkards at present here. Advantage was taken of the late reduction in the native army to get rid as far as possible of the men inclined to drinking. 2. Drunkenness is always punished as an offence. 3. Distilled spirits are sold in the bazaar in shops licensed by the Abkaree contractor. There is no canteen in native corps. 4 to 11. No replies to these queries.
VI. Diet.	No information under this head; the questions applying to European troops.

MERCARA. MADRAS.

References to Subjects and Queries.	Replies.
VII. DRESS, ACCOUTREMENTS, AND DUTIES.	1. The soldiers' dress and accoutrements are as follow:—Tunic and trousers of woollen cloth, varnished wicker turban, sandals, white stock, haversack, cross and waist belts, pouch, and cap pouch. Of these the accoutrements, tunic, and trousers are supplied to the sepoy by Government, and he provides himself with all the other articles, as well as with his undress clothes. They are made according to a pattern by the quartermaster, and the amount stopped from his pay by instalments. Woollen clothes are suitable for the climate of this station for the greater part of the year. The sepoy cannot afford to buy a sufficiently warm mufti dress; a woollen boat cloak of regimental pattern is supplied to him, for which he has to pay. For the plains the sepoy should have a loose khakee dress, blouse and baggy trousers tightened at the ankle, with a cloth turban. Their present woollen clothes are sufficient for all night work in South India, hill or plain. The sepoys do not like boots for ordinary use, and they say they hurt their feet, as they cannot afford to keep a supply of stockings. They wear their tunic and black trousers, cloth or woollen, when on guard. If possible, they are posted under shelter, but are often necessarily in the open air. There is always a sentry-box or verandah in case of rain.
Duties.	1. No answer to this query. 2. Drill goes on at all seasons, but there is less during the rains and the very hottest weather. Drills generally take place in the morning, occasionally in the evening, and rarely for more than an hour or an hour and a half at a time. It does not affect health injuriously. Morning is the best time for drills to take place. The average number of nights the men have in bed at this station is four at present. 3. Guards are mounted in the Palace Square close to the barracks, and are relieved every 24 hours; the sentries every 2 hours. There is only one roll call at this station daily at 5 p.m. I cannot say that night duties particularly affect the health, though they may occasionally induce slight colds and fevers.
VIII. INSTRUCTION AND RECREATION.	No information under this head.
IX. MILITARY PRISONS.	1. There is no military prison, but a prisoners' room at the main guard, and two cells, which are sufficiently good.
X. FIELD SERVICE.	1. I have not heard of any special local regulations for field medical service not included in the general presidency regulations. 2. With regard to the conduct of the line of march, camping, &c. &c., the quartermaster of a native corps goes on in advance and selects the ground; but should either the medical or commanding officer object to it, it is changed. 3. High sloping ground on gravelly soil is selected if possible for camping grounds, due regard being had to the water supply available. Running streams are preferred, and the water is supplied to the tents by puckallies. Ground which has been irrigated, low ground, and black cotton soil, are avoided as far as possible. Should the medical officer not be satisfied he suggests removal or any other remedy. 4. For the transport of sick and hospital supplies on a line of march doolies and sick carts are supplied to native corps according to the strength of the regiment. The sick cart at present in use is a most uncomfortable conveyance. The hospital supplies are carried by coolies and bearers.
XI. STATISTICS OF SICKNESS AND MORTALITY.	No information under this head is afforded.
XII. HOSPITALS.	1. There is no engineer officer or draughtsman at this station. 2. The hospital is outside the fort on the south side, and about 20 yards from it. It is on a ledge slightly lower than the fort, and the sepoy lines are in front of it lower still. The town of Mercara is on the north side of the fort, about a quarter of a mile from the hospital. The hospital is sheltered from the north wind by the fort, but is open to every other wind that blows. It is freely ventilated, and the site generally is healthy as regards elevation, drainage, &c. 3. The supply of water is abundant and wholesome. 4. Close to the hospital privy a large cesspool has been built (not finished yet) of brick and chunam, with a covered drain into it for all impurities. This is to be permanently covered, but I cannot say how it will answer. Ordinary surface water drains off immediately, the ground sloping off to three sides. 5. The lowest ward is raised about six inches from the ground, but there is no perflation of air beneath the floors. The roof water readily flows off the site of the building, and the surface drainage and guttering round the hospital is quite sufficient for carrying away the rainfall rapidly. The hospital is built of brick and chunam, the walls and roof are single, and it is always cool. It is supplied with verandahs on both sides 10 feet wide, and these afford sufficient shelter from the sun's rays, but are never used for the accommodation of sick, convalescents, or others. The hospital is a building on a ground-floor.

XII. Hospitals—*cont.*	The breadth of the verandah is 10 feet 3 inches. The distance of the privy from the hospital is 15 feet. The hospital is open to all winds but the north. The windows are sufficiently numerous for light, ventilation, and coolness. 6. No artificial means of ventilation are required, such as punkahs or thermantidotes. The jhilmils are of the ordinary Venetian construction. 7. There are no means in use for cooling the air admitted into the wards. 8. There is a fire-place at each end of each ward. The walls and ceilings of the wards are cleansed and limewashed annually, or whenever the medical or commanding officers apply to have it done. 9. The privy is on the east side of the hospital, and close to it. It is too small, and under the same roof is a small room said to be a cook-room for the patients, but which I have forbidden to be used as such; the smell from the privy in the latter room is most offensive. Both rooms should be used as privies, as there is a cook-room at the west side of the hospital. Water is daily thrown into the privies, which drains into the cesspool. This latter at present being under repair is very offensive. 10, 11. There is no special lavatory for native sick. The patients wash in the open air according to their custom, or are permitted to return to their own huts for the purposes of ablution. There are, however, several bathing tubs for the use of the sick. 12. The washing and drying of the hospital linen is done by dhobies. 13. The storage is sufficient and dry. 14. The bedsteads used in the hospital are made of wood with tape supports. 15 to 24. No replies to these queries.
XIII. Burial of the Dead.	1. The burial-ground used for the British troops is half a mile south of the palace, and to leeward of the prevailing winds. 2. Its area is 85 yards by 45 yards. The ground is carefully kept, and the place is well drained. Its soil is of a reddish gravelly clay. 3. Only the European residents who may die here are buried in the cemetery. The graves are very few in number, and I am not aware of any regulations regarding grave space, &c. In India generally interment takes place within 24 hours after death; but here such early interment might not be necessary. There are several native grave-yards at various distances from each other, but I am not aware of any regulations being in force respecting them. 4. The grave-yard for the British troops is never offensive. No one has been buried in it since I have been here. 5. The dead of camp followers are either burnt or buried, according to caste. 6, 7. No injury accrues to the public health from the present practice, nor are any improvements to be suggested in the mode of disposal of the dead.

(Signed) George Halpin, Lieut.-Colonel,
Commanding 25th Regiment Native Infantry
and Mercara.

H. Goodall, Surgeon, in Medical Charge of
25th Regiment Native Infantry.

There is no Engineer officer at Mercara.

12th May 1860.

SAMULCOTTAH.

Accommodation.—Native Troops. Infantry, 1st extra Regiment.

References to Subjects and Queries.	Replies.
I. Topography.	1. To the north of the station there is a fertile valley, varying from 8 to 12 miles in width bounded by a hill range; to the east, a broad flat (about 8 miles) bounded by the sea; to the south, the delta of the Godavery, and to the west, low jungly hills. The surrounding country is varied in character, as above. To the north-east and south it is, for the most part of the year, under water or swamp. To the west it is very dry, and the land is poor, without much sand or dust. There is abundance of wood with fine trees in the valley to the north, without any dense or uncleared jungle, but scarcely any wood to the east and south, which, towards the west, is of a stunted shrubby character. The irrigation canals of Godavery are on the south side, and a small river, supplying the country, to the north and east. 2. The station is situated on rising ground, the lines of the regiment and families of other regiments being from 20 to 40 feet above the lowest ground in the station. The lower end of the cantonment has an elevation of nearly 50 feet above the sea, and of 20 to 30 feet above the adjacent country to the north-east and south. The nearest river has a branch which runs near the lower end of the cantonment, and bounds it on the east; but this is dry for eight or nine months of the year. The Samulcottah and Cocanada canal is distant one mile to the south-east. There is higher and healthier ground within 1½ miles of the station. An easy, gradual ascent leads to a small table of land, above one mile in circumference, and elevated more than 100 feet above Samulcottah; it is well adapted for military purposes. This ground is stony and dry, contains any required quantity of stone for building, possesses one small tank which never dries up, while another could easily be made which would contain an inexhaustible supply of water (about 12,000,000 gallons). The air is 3° or 4° cooler a.m. and p.m. than in the cantonment, and good roads could easily be made to the country below, to which there is gradual descent all around. 3. The range of hills to the north is distant about 12 miles (direct). The hills vary much in elevation; the highest is near Dhumaverim, and rises about 1,600 feet above Samulcottah.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	4. The nearest river is that which waters the valley to the north, above two miles distant, and a small branch, filled only in the rains, runs near the lower end of the station. The sea (Bay of Bengal) at its nearest is distant fully six miles. There is no overflow of the country in the vicinity of the station further than that purposely allowed for irrigation. The land so irrigated is never dry, except towards the close of the hot weather. There are no broken ground, ravines, water-pits, &c., dangerous to or affecting the health of the station.
	5. The station is freely exposed to the winds; but unfortunately a large native town, with bazaars and enclosures for hundreds of cattle, &c. &c., has been allowed to grow up on its south and south-east aspects, and the regimental and garrison lines have been built on the south-west, so that the prevailing winds carry impurity and contamination into the chief parts of the cantonments for nine months of the year. The temperature of the station is only slightly raised by the buildings being exposed to reflected sun heat. The station is not exposed to cold or variable winds, the coldest being the north, which is seldom felt. The north-east and east sea-breezes prevail from 1st October to January, the south-east and south winds from January to May, and land winds south-west and west by south from May to September. All these winds are healthy, but from the impurities and contaminations before mentioned.
	6. The surrounding country for the most part is well cultivated on the north, south, and east sides, but barren for the most part on the west. There is the irrigation from the Godavery on the south and south-east aspects. The river above spoken of supplies the country to the north and east. This irrigation is close to the station, except on the south side, where the country is stony and dry to the distance of three or four miles. No appreciable effect on the health of the station, as far as can be observed, is produced by this irrigation; but the climate is cooler in consequence. The cultivation of rice in the surrounding country is not, I believe, at all prohibited. Indigo is not cultivated, nor the preparation of hemp or flax carried on near the station.
	7. The native town is supposed to contain a population of about 8,000 or 10,000. It is divided into two chief portions (Samulcottah and Bemarum), and extends from the south and south-east borders of the station to the canal.
	8. The super soil of the upper part of the station and high ground consists of a thick yellowish brown clay mixed with small pebbles and the debris of rocks. This varies from four to eight feet in depth, and beneath is a stratum of hard somewhat friable stone, from two to eight feet in thickness, which rests on a bed of clay-stone about three feet thick (and this on yellowish sandstone). The soil of the adjacent country to the north-east and south is the alluvial, brought by the Godavery and the smaller river from hills on the north side, and near the coast it becomes very sandy and barren. The station is built on the site of an old fort.
	9. In the lower part of the cantonment water is found at a depth of from 12 to 20 feet in the dry season, and rises to the surface in the wells during the rainy season. The further up the hill, the greater of course the depth to be sunk.
	10. The rain-fall and water from surface springs flow readily away, not sinking at all into the subsoil. The water lies on the surface on the high ground before mentioned, in holes scooped out or natural hollows, and the only loss is by evaporation or by the drinking of animals. That flow of water which descends from the higher ground adjacent runs through the cantonment rapidly, leaving the ground dry within half an hour of a heavy rain.
	11. The water supply of the station is derived chiefly from a tank lying between the lines and the officers' houses, and which is fed mainly by rains. This percolates into many of the wells, and so affords good drinking water. The sepoys use the water directly from this tank, which is the only one which does not dry up, not being used for irrigation purposes. It has a surface, at ordinary depth or fullness, of about 28,500 square yards. This tank is more or less full as the monsoons of south-west or north-east are heavy or light. In 1857 after a heavy fall in October, it was full; in 1859 it was never half full, and now (March 1860 it is very low. The said tank contains fish and gradually increasing vegetation, but of their nature I cannot speak. No tank used for drinking purposes is also used for bathing. A considerable quantity of leaves are blown into the tank from the trees around. One of the chief feeders of the tank runs down through the regimental lines, and must always bring considerable quantities of impurity with it. Just without the cantonment, bordering the regimental and garrison lines on their south and east face respectively, is a large belt of prickly pear very high, and cut out into open places used as privies. This is a very great nuisance, of large extent, and likely to be provocative of cholera or typhus. The prickly pear should all be cut down and the ground cleared. No nuisance arises from any tank.
	12. The water of the tank above mentioned, used by the sepoys, &c., is soft and insipid, with a flavour and taste of decaying vegetation (not strong), and tolerably clear in the dry season, but very muddy after the rains. The water of the bowries or wells in the cantonment near the officers' houses is harder water, though not hard, free of taste and smell, and perfectly clear except after very heavy rains. Some of the wells are not used for drinking or cooking purposes, as they contain apparently much saltpetre and other salts. There are no means, apparatus, or proper tests available at this station for giving a correct analysis either as regards the quality or quantity of the water. The water contains chloride of sodium, and small quantities of nitrate of potass, and probably of other nitrates. No peculiarities are observable under a microscopic power of 20,000. The quality of the water is not injurious to health (for India, good), and it is generally very abundant. It is raised from the wells by the ordinary leather bucket or palmyra leaf. The supply for the tank could be obtained pure by using covered aqueducts of brick through the lines from the high ground above, not allowing any drainage to enter these, and could be kept pure by cleaning the banks of the tank, by clearing out its present bed, and by sinking deep bowries from the latter in various parts.
	13. No reply to this query.
	14. I have no personal experience as to the amount or kind of inquiry made before new stations are finally selected.
II. CLIMATE.	1. Thermometers belonging to the medical officer were used in part of 1857–58-59, but are all broken. A rain gauge, still in use, was received from the collector of the district in July 1858. No other meteorological instruments are available at this station.

References to Subjects and Queries.	Replies.
II. Climate—*cont.*	2. From the absence of a complete set of meteorological instruments, and perfect means of conducting and registering observations, the following table must be taken as approximative only, but very nearly so.

Table of Meteorological Observations from December 12th, 1857, to March 25th, 1859.

Months.	Barometer Mean.	Mean Temperature.	Mean Daily Range.	Mean Maximum.	Mean Minimum.	Maximum Dry Bulb, Day.	Mean Wet Bulb.	Mean Sun Temperature.	Rain, Inches.	Winds.		Days of Sunshine.	Remarks.
										Direction.	Force.		
		°	°	°	°	°							
January -	—	70	21	78	55	80	—	—	None.	N.E., E., S.E.	Moderate.	31	Heavy dew early morning and evening; almost no clouds.
February -	—	76	25	82·5	60	84	—	—	None.	E. & S.E.	Do.	28	Do. do.
March -	—	80	21	88	65	87	—	—	1·0	S.E., S., & S.W.	Do.	29	No dew; very little cloud usually.
April -	—	85	20	92	75	94	—	—	2·5	Do.	Do.	22	Sea breezes occasionally from E.; land winds occasionally from W.; no dew; seldom storms.
May - -	—	85	18	95	80	96	—	—	1·0	S., S.W., W.	Moderate and strong.	24	Do. squalls occasionally from N.W., with clouds of dust and falls of rain; thunder.
June - -	—	80	15	90	78	92	—	—	6·1	S.W., W.	High winds and monsoon.	18	No loud thunder; heavy showers.
July - -	—	79	10	85	78	86	—	—	10·0	Do.	Moderate.	14	Do.; no very heavy falls.
August -	—	79	8	85	77	87	—	—	6·45	Do.	Do.	17	Do. do.; more sunshine generally than in July.
September	—	77	9·5	85	76	85	—	—	5·55	Shifting.	Moderate and calms.	21	Very calm month generally, with often light drizzling rains.
October -	—	73	9	83	74	84	—	—	9·73	N., N.E.	Monsoon and gales.	25	Heavy rains and storms of wind with N.E. monsoon.
November	—	69	13	80	63	81	—	—	None.	N.E.	Moderate.	30	Fine clear weather; cool.
December -	—	68	20	78	53	78	—	—	0·5	N.E.	Do.	28	Do. do.

3. I am of opinion that Samulcottah has (for the plains of India) a most healthy climate, moderately dry for eight months of the year, and moderately damp for the remaining four months. Unless for a few days before the south-west monsoon, there is no excessive heat, and for four months (from November to March) the temperature is delightful. There was hot wind in 1858 for nearly four weeks, but none in 1856, 1857, or 1859. The only impurity that affects the station is that named in Question 5, "Topography," and this does not affect the high ground above the cantonment at all. The health of the troops is, on the whole, very good, and the few Europeans here are quite healthy. One child of the latter, four weeks old, has died, but from a cause not connected with the climate, and this is the only death among about 50 Europeans since the arrival of the 1st extra regiment here in December 1857. The least healthy months appear to be September and October, for Europeans, and November and December for the natives. Boils, slight rheumatic affections, and diarrhœa attacking the former, and colds, rheumatism, diarrhœa, dysentery, and ague seizing upon the natives in the cold months.

4. There is no more eligible place near this station, except the high ground before mentioned in Query 2, "Topography." Its advantages have been briefly enumerated, and, in addition, one may be mentioned connected with its choice as a site for a depôt for European soldiers, viz., it is within one mile of the canal which could afford conveyance for any number of men in a few hours, to Cocanada, where is the only port on this side of India at which troops can be embarked or disembarked for emergent service in any ordinary state of the weather. No reason exists against the adoption of this site for such a depôt.

5. The following is a list of stations at which I have served:—Madras, Bangalore, Bellary, Labuan, French rocks, Ellicpore, Masulipatam, and Samulcottah, in the order written. I consider Labuan and Ellicpore stations, of these named, the only unhealthy ones. Labuan was deadly from 1846 to 1851, and was then chiefly unhealthy from a never-failing, dangerous fever in event of exposure to its causes. The island now, I believe, is more healthy. In 1850 the deaths to strength of troops were 10 per cent.; in 1851 (my term of service), about 3 per cent. Ellicpore is only unhealthy from the beginning of the south-west monsoon in June till towards the end of November, but is, during that period, productive of diarrhœa, dysentery, &c., and the worst form of remittent fever. Bangalore and Samulcottah I look upon as those most conducive to health.

III. Sanitary Condition of Station.

1, 2. Plans of the station and surrounding country are transmitted.
3, 4. There are no barracks at Samulcottah, merely a place of arms.
5 to 13. These questions are applicable solely to stations for European troops.
14, 15. There are no privies or urinals in general use with native regiments.
16. There are no foul ditches near the station.
17. No reply to this query.
18. The surface of the cantonment is kept generally free of vegetation; but there is a quantity of prickly pear on the south and south-east sides of the station, which might be removed with advantage.
19. There is no bazaar of any importance here, nor any native houses sufficiently near to interfere with the sanitary condition of the station.

References to Subjects and Queries.	REPLIES.
III. Sanitary Condition of Station—*cont.*	20. Animals for the use of the troops are slaughtered at a short distance from the native lines; but no nuisance is experienced therefrom. 21, 22. There are neither artillery nor cavalry located at this station. 23. No reply to this query.
Officers' Quarters.	There are no public quarters at this station.
IV. HEALTH OF THE TROOPS.	1. The station, district, and adjoining native population are very healthy. 2. The most prevalent diseases among the native population are small-pox, syphilis, and, at certain seasons, fever, chiefly of the intermittent type. Spleen disease occurs but seldom, in fact, I have not seen a case. 3. The healthiness of Samulcottah and its neighbourhood is chiefly to be attributed to the well-cleared, well-cultivated country around, the almost entire absence of malarious marshes or swamps, the perfect ventilation from the fresh sea-breezes, and the very generally well-to-do state of the labouring population, who have abundant employment and double the pay they could secure a few years ago. 4. This first extra regiment was raised partly at Masulipatam, where the 400 or 450 men composing it resided for about three months prior to coming to Samulcottah. They left Masulipatam on the 8th and 12th of November 1857, in wings, arriving here (viâ Coconada by steam) in two days. The men have suffered very little from sickness at any time and are very healthy now. There is no portion of the men's present accommodation more healthy than the rest. 5. The troops at this station have not been camped out. 6. I have been in charge of troops at Bangalore, which place is very healthy and well adapted for European soldiers; but from the coolness of the climate, the men take liberties and expose themselves, &c., the sufferings consequent on which irregularities are often erroneously ascribed to location and climate. 7. I have had no opportunities for observing whether troops who have been resident for some time on hill stations are more or less liable to attacks of febrile and other diseases on their return to the plains. 8. From my experience I think hill stations best adapted for Europeans, and stations of moderate elevation for natives. 9. There are diseases peculiar to hill stations, according to elevation. Europeans going from the plains of India to heights of above 5,000 feet are, if not very careful in clothing, &c., liable to diarrhœa, liver diseases, and other abdominal complaints; natives to diarrhœa, dysentery, bronchitis, rheumatism, and fever. 10. In hill stations in India precautions as regards diet, clothing, shelter, &c., should be as carefully attended to as in England, and more so after the men have had a hot season or two in the plains. The advantages, then, of a residence in hill stations to health are incalculable. 11. From my experience I am of opinion that the seasons best adapted for residence of troops in hill stations are,—first, from March till June; second, in certain stations (these not too humid) from July till November. After convalescence from illness on the plains, a period of two months is the shortest likely to be advantageous in restoring strength. After a long tour of duty in the plains, the men, Europeans, being debilitated and depressed, should be allowed to remain in a good hill station, two years, if possible, at least. 12. There is no period of residence in hill stations beyond which injury is likely to be inflicted on the health of troops on their return to service in the plains. 13. The precautions to be observed are not so great as on troops first landing in India. The great dangers to be avoided are, over-eating and over-drinking, especially of stimulants. 14. It is little to be doubted that, if European troops could be located "on hill stations with only short periods of service in the plains," they would be as healthy as at home, and as fit for active exertion. "Short periods of change to hill stations" are, however, greatly conducive to maintenance of strength, and exert an invigorating check on the perpetual waste of the plains of India. Frequent change of station in the plains is beneficial to health if these changes embrace moderate distances and avoid all unnecessary expense, otherwise the gain scarcely compensates for the fretfulness and irritation created in both Europeans and natives. 15. No answer to this question. 16. I have had no experience of ranges of elevation above 4,600 feet. From 1,800 to 4,500 feet of elevation give abundance of healthy sites for European troops in India, if the ground be properly cleared and all appreciable causes of disease be removed. 17. There is no higher ground near the station except that before mentioned. There is a hill called Bison Hill, about 2,000 feet above the sea, which has been spoken of as a sanitarium, near Rajahmundry, on the banks of the Godavery, but its effect upon health is as yet an experiment. 18. I have found a hard stony surface soil absorbing very little moisture, and allowing water rapidly to drain off, associated with a healthy unmalarious climate;—and a gaping porous black soil, rich in nitrates, existing with and apparently giving rise to a climate fruitful in malaria, fevers, diarrhœa, dysentery, &c. 19. I consider that from 20 to 24 years is the best age for soldiers to proceed to India, and they should land there from the beginning of November till the end of the year, or beginning of February. I would recommend that recruits on first landing in India be sent at once to learn their duties in a cool hill station, be kept as much as possible from temptation to drinking and other vices, encouraged to pursue their trade, or learn one in hours of leisure, and taught to avoid all unnecessary exposure to the sun, sleeping in draughts, sitting in wet clothes, under a punkah, near a wet tattie, &c. 20. I think it very desirable that troops destined for service in India should be sent first to the Cape of Good Hope, if only for a year or two. 21. The mode of transport to almost every station (inland) in this Presidency is by marching. The construction of good permanent roads, in the absence of railways and canals, to and between all stations, is of paramount importance.

IV. Health of the Troops—*cont.*	22. A British soldier should not, if possible, serve longer in India than 10 or 12 years, if he is to prove an active useful soldier in any other country; the "morale," as well as the "physique," almost invariably undergoing progressive demoralization in the enervating atmosphere of India. 23. I think that the expressed opinion of a medical committee up country, as regards invaliding &c., should be considered final; and so all unnecessary delay, and all avoidable danger to the patients' health at the Presidencies, be removed. There is not often conflict of opinion at the station where any individual has resided, as his case is well known and understood, the reasons for invaliding (on sick certificate) being generally obvious to each member of the committee. 24. Invalids proceeding home by the Cape route should leave India in January, February, or March.
Diseases.	1. There is an inspection parade once a week for the sons of sepoys on foreign service, and on the pension establishment, over whom there was no other sufficient control, and who were found (in 1858) to be in a very filthy diseased state, unfit even for the light duties they were doing. There is now little disease, except among some late comers. 2. Scorbutic disease was what chiefly affected the above, and seemed to be brought on mainly from the continual use, as food, of dried and stinking fish, here very abundant. This disease attacks also some of the younger sepoys, who live in the same way; but it is speedily cured in hospital. The proportion which it bears to other diseases is very variable. I believe the disease to be caused entirely by the feeding on this foul fish, as those who do not partake of it do not suffer. 3. I have had only one case of hepatitis at this station in an European, brought on by exposure to night air in a boat after over-fatigue and excessive perspiration the day previous. Hepatitis sometimes follows peritonitis and dysentery; but is more often idiopathic, and is caused generally by chills when heated, or more gradually by too high living. Healthy, regular exercise, in addition to the measures shortly recommended in "Query 19, Health of Troops," will be most conducive to the warding off of this often insidious disease. 4. Dracunculus is observed chiefly in certain localities in each Presidency, and in those districts seems to commence chiefly, if not solely, from bathing and wading in the water of certain tanks. I have had two tedious cases of the disease here (natives) both in men who had immediately before been stationed together near Secunderabad. 5. I cannot give the proportion which the sick in hospital from venereal disease bear to the total sick from all other diseases for European corps. As in native corps, it varies according to the station, and the number of married men in each regiment. As preventive precautions, constant and profitable employment for the mind, as well as for the body, everything that tends to elevate the hopes and desires of the soldier, and the greater encouragement of marriage to European privates. 6. The following are the diseases from which the troops at this station suffer:— *Fevers.*—From continued fever, remittent and intermittent; but chiefly from the last of these. *Dysentery.*—Chiefly at the commencement of the cold weather. *Cholera.*—We have had only two cases of cholera among the followers in the garrison, and three in an adjacent village. All recovered but one, which was brought in extremis. *Small-pox.*—Very little prevails at this station. The men were all vaccinated in 1858, after which there were 19 cases, 15 very slight, and all modified. All recovered very favourably. *Rheumatism.*—The men suffer considerably from rheumatic attacks, sometimes very severe, and often obstinate. The following shows the proportions which admissions and deaths from the above diseases bear to the total admissions and deaths. Admissions in garrison hospital - - - - - 117 Total admissions in hospital in 1859; strength of regiment, 1,200 - 671 Total deaths - - - - - - 3 The admissions from fever were 194; from small-pox, 19; from rheumatism, 43; and from dysentery, 4; but no death from any of these diseases occurred. Of the three deaths one occurred from mercurial fever, contracted under native advice for cure of syphilis, one from beriberi, and one from pneumonia, arising during convalescence from a severe fever. Of garrison patients, strength varying from 200 to 400, admissions from fever, dysentery, small-pox, and rheumatism, were 17, 4, 1, and 6, respectively, but no deaths occurred. 7. There are no diseases peculiar to the district which present particular features of interest. It may be observed that small-pox is chiefly prevalent during the hot weather from March to May, and that fevers are most numerous after the rains in September and October. 8. No reply to this query. 9. Small doses of quinine as a prophylactic against malarial disease are not required at this station. 10. Vaccination is not carried out as it ought to be in the villages and neighbourhood. Vaccinators (native) are appointed to each district, or several to one district; but these are often careless, and without proper supervision almost never to be depended upon. The civil surgeon of Rajahmundry is, nominally, superintendent of vaccination, but has in reality no power; and if he had, the nature of his varied duties would make the superintendence of a district impossible. The only hope of preventing or mitigating the ravages of small-pox among the native population, and warding off contagion from our several stations, is to have a staff of properly-qualified vaccinators, responsible to and under the orders of an active superintendent of a district, or a division of the army, whose duty it would be to visit every station or village where a vaccinator resided, and personally to inquire into and examine the reported results.
V. Intemperance. VI. Diet.	No information on these heads, the questions referring solely to European troops.

SAMULCOTTAH. MADRAS.

VII. DRESS, ACCOUTREMENTS, AND DUTIES.	1. The soldiers' dress consists of the following articles:—tunic, and woollen trousers in the cold season, and on sentry a cloak in addition at night. In hot weather a light tunic and black cotton trousers; boots at all times. The usual native pugree as a head-piece. Since the introduction of the tunic I consider the soldier is well and suitably clothed; but I should recommend the more general use of boots in the native army, against which there is no prejudice. The only other difficulty is the head-dress, against which there appears to be no remedy.
XII. HOSPITALS.	1. Plan of the hospital is transmitted. 2. The garrison and regimental hospitals, under one roof, very low and ill-adapted in every way, are situated at the lower end of the cantonment, north side, and close to the officers' houses (on one side). The hospitals are not near the bazaar and houses of the native population, which are all on the south side. The site is open, well ventilated, and generally healthy, but in the event of Europeans being stationed here, and a new hospital built, it should be with the barracks on the high ground. 3. The water supply is abundant and wholesome, and is at no great distance. 4. All impurities are removed from the neighbourhood of the hospital by the toties of the establishment. 5. The walls of the hospitals are not eight feet high; the roof is a sloping tiled one, but there is no ceiling; the floor is on the ground, and is not raised in any way. The roof-water runs rapidly off towards the water-course below, and does not settle nor sink into the subsoil. The surface drainage and guttering round about the hospital is sufficient for carrying away the rain-fall rapidly. The roof and walls of the hospitals are single, and the latter are built of country brick. There is a space for ventilation between the walls and the roof, but the latter is not sufficient to keep the hospital cool. There is a verandah, about five feet wide, on one side of the hospital, and a pandall (made with posts and leaves) on the other three sides, the former affording protection from the sun. The verandah is never used for the accommodation of sick, convalescents, or others. The hospital consists of one flat.

TABLE OF HOSPITAL ACCOMMODATION.

The hospital, considering the present site of the cantonment, is as well placed as it can be to receive the full benefit of prevailing winds. The windows are made of wood, and open inwards. They should be glazed; for if shut, there is darkness, and no ventilation; and if all open, they give free admission to the hot air.

6. The only means of ventilation are those above mentioned.

7. No answer to this question.

8. The walls and ceilings of the hospital wards are cleansed and limewashed once a month.

9. The privy is a small room, under the same roof as the dead-house. It is cleaned out by the toties of the hospital.

10, 11. There are no lavatory arrangements, and there is only one tub under the pandall on the east side for bathing the sick. It is exposed to the view and to the weather; I have recommended that it be enclosed. The means of bathing are neither sufficient nor convenient, and almost preclude the use of baths.

12. The washing and drying of hospital linen is done by the native dhobies or washermen.

13. A small centre room serves as a surgery, a store for medicine, and all other purposes. It is not sufficient in any way, nor is it dry in the monsoons.

14. The bedsteads used in hospital are of two kinds, iron and wood, with tape supports, both of which are sufficient for the purposes of a native hospital.

15. The kitchen, which is behind the hospital, is a continuation of the dead-house and privy, and is used only for boiling water, preparation of arrowroot, &c. The natives have their food cooked and brought to them.

16. No diet rolls, diet tables, or other returns are used for natives.

17. An assistant apothecary is the only attendant on the sick. The provision is not sufficient, but none other is just now available.

18 to 22. No replies to these queries.

23. The medical officer must apply for repairs, &c., through the officer commanding the station, but he has complete power over change of diet and medical comforts, so far as is allowed by the scale laid down and provided.

24. No reply to this query.

XIII. Burial of the Dead.	1 to 4. The burial ground is a short distance north east of the hospital, and has only been opened once in five years for an European, and that the case of an infant. No graveyard in the place has ever proved offensive. 5, 6. The dead of camp followers and bazaar people are either burnt or buried, according to caste, under the superintendence of relatives, or a party detailed for the purpose. No injury that I ever heard of has accrued to the public health from the present practice.

(Signed) W. Dacres Stanley, Captain,
Commanding 1st Extra Regiment.

I. Topography.	1. Chains of hills, irregularly parallel to each other and running chiefly in a north-west and south-east direction, form a large basin of alluvial soil, in the north-east extremity of which the cantonment, bazaars, and fort are placed. Much of this land, from the great number of tanks in the vicinity, is adapted for paddy cultivation. Near the bases of the hills the soil is sandy and dry; but as it slopes in a westward direction to the tank, damp, and in some localities swampy. The country is well adapted for the growth of wood; but it cannot be called jungly in the proper sense of that term. 2. The elevation of this station above the sea is 675 feet; but there is very little difference between the level of the station and that of the surrounding country. It is 35 feet above the Palaur river. One hill in the higher range was explored some time ago, but found ineligible as a sanitarium, from want of table land on the summit, and the scarcity or rather absence of water. 3. The nearest hill is about three quarters of a mile from the cantonment, and has an elevation of 780 feet above the plain. 4. The river Palaur, which is the nearest water, is one mile distant from the station. That part of the lines of the native regiments which runs westward, was subject to overflow from a nullah in the neighbourhood during the rains. To remedy this a bund was thrown across the nullah; but the rain-fall from higher parts of the lines, being thus intercepted, the whole became damp from saturation. The latest decision come to has been to demolish the huts and rebuild them on other ground. The ground is much broken in the vicinity; and that the whole locality is below the average as to its sanitary condition, seems to be proved by the noted unhealthiness of the houses in this quarter in seasons of epidemic visitations. 5. The external ventilation of the station is interfered with from the faultiness of the site, which had evidently been selected on military and not sanitary grounds. The internal ventilation is, of course, more easily remedied or adjusted. The general temperature of the station is raised materially, during the hot months, by the radiation of heat from the surrounding rocky hills. The prevailing winds in February were northerly; since March S.E. winds prevail more, they are hot during the day, but occasionally cold towards early morning, thereby causing a tendency to catarrhal complaints during the hot weather. The sea breeze occasionally towards the afternoon is strong; but is generally light or altogether failing, or is replaced by long shore winds, *i.e.*, direct north and south. 6. The surrounding country is generally cultivated. There is one irrigation tank on the south side of the station one mile distant, and another on the west side at a distance of two miles. Rice cultivation is carried on nearly on every side of the station and at no great distance. There is or used to be an indigo factory close to the native lines, the effluvia from which must be most unpleasant to those who live near. This in Europe would constitute a nuisance, and be considered objectionable on the score of injury to health, the same reasoning must apply, with still greater force, in a hot country. 7. The native town and bazaars are extensive and densely populated. 8. The soil is alluvium, overlying primitive rock in a greater or lesser degree of disintegration; and this soil varies in thickness from a few inches to 5 or 6 feet. It appears probable from the nature of the whole locality and its adaptation for the erection of forts in the hills, and in the plain, that the ground generally must have been peopled from a very early period of Indian History. 9. Water is generally found at a depth of 10 feet below the surface level; and in the driest season at a depth of about 12 feet. 10. The surface drainage of the hills in the immediate vicinity of the station is conveyed into the fort ditch, and the surplus water passed out through channels, provided for that purpose, to the paddy fields lying westward of the cantonment. In India water is too important an element to be wasted. There are no stagnant pools near the station. 11. The water supply is derived from wells and an open tank, which latter has a constant supply of water, varying in depth according to the season. The tank water is used solely for drinking purposes; and no bathing is permitted in it. The tank is provided with a

VELLORE. MADRAS.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	check dam and reservoir, which collect and return any impurities that would otherwise flow into it from its supply channel. The wells are free from all noxious matters. No nuisance or malaria proceeds from any tank within or without the station.
	12. The drinking water of the station is colourless and inodorous; but in most of the wells it is brackish, from the large quantity of saline ingredients in the soil. There is abundance of soft water for lavatory purposes; but unless new comers have been previously warned drinking the harder water is apt to cause diarrhœa, &c., from the amount of its saline constituents. Water is too near the surface to require any mechanical contrivance for raising it.
	13. No reply to this query.
	14. New stations are selected by mixed committees of military and medical officers, convened by general order of Government. These important matters have hitherto been left too much to chance, or the inquiries have been conducted rather with a view to military occupation, fitness, or financial means at the time, than on any recognised sanitary principle. It appears desirable that a peculiar fitness (by previous study or opportunity) for such inquiries should be sought for in the members of such committees, a point very frequently overlooked, or set aside altogether in favour of the claims of rank and seniority in the surface.
II. CLIMATE.	1. 2. Up to the present time no regular meteorological observations have been made.
	3. All tropical climates are (*ceteris paribus*) materially influenced by the atmospherical disturbances present at the time. This is generally considered a hot but healthy station for both Europeans and natives, especially for the latter, as being exempted from the great vicissitudes of temperature experienced higher up the country during the height of the hot and cold seasons. The air cannot be considered as rendered impure by dust or other admixtures.
	4. No reply to this query.
	5. Colonel Bayley has served nearly 40 years. He has been stationed at Nagpore for 9 years, Bangalore twice, Secunderabad, Asseerghur Dhoolia, Mulligaum, Belgaum, Paulghautcherry, Cannanore twice, and French Rocks. At none of these stations, during his sojourn, was there any extraordinary amount of sickness among the troops, European or native, except in the year 1859, at Bangalore, when his regiment, the 20th Madras Native Infantry, suffered severely from fever, a visitation to which the native troops there are occasionally liable.
III. SANITARY CONDITION OF STATION.	1, 2, 3. General plan of Vellore, with plans of the cantonments and barracks are transmitted.
	4. No reply to this query.
	5. The windows of the artillery barracks are on opposite sides, and open outwards. The barracks have no verandahs.
	6. The ordinary barrack iron cot is used in the barracks here.
	7. No reply to this query.
	8. There is no provision made for ventilation save by the doors and windows; and there is no measure whatever taken for cooling the air of the barrack rooms.
	9, 10. The walls of the barracks are built of brick and chunam, with a tiled roof, supported on jungle wood rafters and bamboos. The flooring is constructed of tiles and cement, and is raised 6 inches from the level of this ground.
	11. It is recommended that the barrack walls be raised 4 feet and that there should be a verandah both to the front and rear of the building, roofed with flat and pan-tiles, and that provision be made for the thorough ventilation of the building. All barrack and cantonment repairs are executed, when needed, by the Engineer's Departments on the requisition of the commanding officer. The walls and ceilings of the barracks are cleansed and whitewashed thrice during each year; but more frequently if considered desirable by the commanding officer.
	12. There are no lavatories in use in the barracks.
	13.
	14, 15, 16. No replies to these queries. No stagnant water near the station.
	17. The local prisoners are employed to attend to the drains, roads, &c. in the cantonment and its vicinity, an operation which they perform efficiently. Night soil, manure, &c., is carted away by night to a distance from the station. As a general rule the drainage is exceedingly defective.
	18. The surface of the cantonment is kept free from vegetation; and there are no old walls, thick hedges, &c., interfering with the ventilation of the station. There are some native huts, however, that it is strongly recommended should be removed forthwith; they interfere very much with the ventilation of the officers' quarters and occasionally the stench from them is abominable.
	19. The bazaar is well drained. There are no latrines, and cleanliness is carefully attended to. The natives, generally very attentive to personal cleanliness, appear perfectly indifferent to the condition of their houses, few of which are without those hot beds of disease, dung-heaps and cesspits. Wind blowing over the native houses causes a nuisance in barracks. The drainage from the mehals, in which the State prisoners reside, is a constant source of annoyance to the European troops in garrison. This latter nuisance is caused by the filthy habits of the followers of the State prisoners.
	20. There is no public slaughtering place in the station; the butchers slaughter such animals as may be required within their own precincts. No nuisance is experienced from this plan.
	21, 22, 23. No replies to these queries.
Officers Quarters.	1. There are no quarters for officers here. The officers' houses are situated between the native town and the lines of the native troops, much too near to both. The compounds are small and closely crowded together, and the ventilation and drainage are bad. A number of native huts have been built near the officers' houses, which it is desirable should be levelled, as also a number of wretched huts on the bund of the tank, between the native lines, and the officers' houses. These huts interfere sadly with the ventilation, which in this notoriously unhealthy part of the station should be as free as possible.

References to Subjects and Queries.	Replies.
IV. Health of the Troops.	1. The station and district generally may be considered healthy. 2. Like most other places in the southern part of India, Vellore, and the surrounding districts have occasionally suffered from visitations of epidemic disease; but there has been no outbreak of the kind for some years. Spleen disease is not prevalent, so far as can be ascertained. 3. The fertility of the country and consequent well being and comfort of the people, proximity to the sea, the saving of fatigue on journeys by the establishment of the rail, the abundance of water in most seasons, the shade afforded by trees, and the total absence of jungle may each and all in a certain degree serve to account for the general good health of the population. Fevers may, of course, be expected to prevail after the drying up of the paddy fields; but, so far as I can learn, these are of simple types, with few serious complications. 4. The 20th regiment Native Infantry had been stationed at Bangalore. The regiment had suffered much from fever, in part attributable to former residence at French Rocks, near Seringapatam, a fever of the same type, and prevailing to the same extent as that which assailed the 15th regiment Native Infantry at Bangalore in 1848, after a march through the same part of the country from Cannanore. The 20th regiment, as might have been expected, though healthy on arrival, has had many of its men suffer from relapses of fever; but the type has been either ephemeral or quotidian without previous rigor, or serious complication. 5 to 8. No replies to these queries. 9. Experience has shown that most of the lower hill stations in Bengal have proved unhealthy at some seasons, as predisposing to diarrhœa of a low, exhausting, and untractable kind. This is not the case with the Neilgherries, and, excepting for certain forms of diseases as laid down in the medical code, they may be considered suitable to all classes of patients. The minor ranges in the Madras Presidency do not appear liable to this serious objection as sanitaria, judging for example by the Ramandroog in the ceded districts, which although of no great altitudes, has been found beneficial to the health of convalescents of the European regiments and artillery, from the adjoining military station Bellary. 10 to 13. No replies to these queries. 14. Our hill sanitaria (as Jackatalla) are admirably adapted for the recovery of convalescents or for a longer or shorter period of residence for young or ill-developed soldiers, unable to stand up against the fatigue of initiatory drill in the plains. But once acclimatized I incline to the opinion that service on the plains would, under the improved condition of the European soldiers, as to barrack accommodation, means of ventilation, &c. &c., tend more to general efficiency for all work, than continuous residence on the hills with short periods of emergent service on the plains. This opinion seems to be borne out by the observed fact, that those who have resided for years in our hill climates, bear the heat and fatigue worse than others who have not been so fortunate, for a considerable period after the return to the plains. This point, however, must be decided by future experience. Frequent changes of station, as far as the relief of a whole regiment is concerned, are to be deprecated, as tending to the production of debt, and discontent among the men, and inconvenience to officers and their families, unless it can be shown, that the health of the troops (regiment, &c.) has suffered from over-lengthened residence at a hot or sickly station. Care must of course be taken that no individual case be made to suffer by want of necessary change to other stations. 15. No reply to this query. 16. Mere altitude, although a very important element in the selection of a sanitarium is not the only point to be attended to, but local circumstances, frequently hidden or obscure as active agents of disease, must also be taken into account. As a proof of this I may cite the instance of the great Hill of Penang, so called, although its height is only 2,700 feet above sea level. The whole chain, of which this is the summit, is encircled at the base by forest jungle, or towards the sea by mangrove bushes. Most of the hills to the south, where the latter vegetation prevails, possess a most deadly climate, although very little lower than the great hill. This has one of the finest climates in the world, while, strangely enough, most of the hills lower than this and far below the level of the southern range, are quite healthy; others rising above these again are the reverse, and though in the same chain (experience of 6 years' residence on the island). 17, 18. No replies for these queries. 19. Troops should land in India soon after the commencement of the cold weather. 20. On landing young half grown lads should be sent to the hills in the first instance, and gradually acclimatized; and the remainder to an intermediate climate, such as Bangalore if possible. 21, 22. No replies to these queries. 23. I would suggest that medical boards, pension, and invalid committees should, if possible, be held at the larger stations of the army, where there can be no paucity of medical officers and at stated periods of the year, so as to avoid all hurry and confusion in the preparation of the necessary documents. 24. Invalids proceeding home from India should leave so as not to arrive at their destination before the month of May at soonest.
Dis[illegible]s.	1, 2, 3. No replies to these queries. 4. Dracunculus does not appear to be a prevalent disease at this station. 5. I have long been of opinion that the greater proportion of so called rheumatic complaints among the native troops are due to a venereal taint, never acknowledged or treated professionally, but cured for the time by empirical measures, such as mercury in large or small doses, &c. &c. Those who have charge of dispensaries for civil patients and paupers are cognizant of the great amount of venereal disease which prevails in all Indian stations. Unless some efficient system of early detection (such as the French) were adopted, Lock

VELLORE. MADRAS.

IV. Health of the Troops —*Diseases—cont.*	Hospitals, although desirable in some respects, would soon come to be looked on, as convenient places for cure in the same way as the civil dispensaries now are; but little would be gained in the way of prevention. 6. The troops at the station are the European veteran battalion, the 20th regiment of native infantry and the 27th regiment native infantry, the former are very healthy. Fever of the ephemeral, quotidian, tertian, and in rare cases quartan types are occasionally prevalent. Few cases of disentery have occured; but no cases of cholera this year. There have been many sporadic cases of small pox; but it has not prevailed epidemically. Rheumatism is the most prevalent of all diseases among the native troops, and is not unfrequently simulated. 7, 8. Zymotic diseases, embracing those already mentioned, and including others of similar natures, not having prevailed at the station for a very considerable period, nothing can be adduced bearing on the solution or elucidation of the subject of these diseases. 9. Men known to be subject to fever are encouraged to resort at any time to the hospital (although not actually reporting sick) for bark and quinine; the natives generally are well aware of the prophylactic virtues of the latter drug. 10. Epidemic influences, although not dependent on or caused by local circumstances, strictly speaking are yet so controllable as to duration, virulence, &c. &c., by sanitary measures, that too great attention cannot be paid to the observance of every possible precaution against fetid accumulations, obstruction of ventilation, scarcity of food, &c. &c. Local sanitary measures, tending to these objects, are now in progress in the cantonment and station generally.
V. INTEMPERANCE.	1 to 5. No replies to these queries. 6, 7. The introduction of the lighter wines of France, Australia, or the Cape, at cheap rates as well as malt liquor, would be an incalculable boon to the soldier and a saving to the state. The taste for toddy, and arrack (not easily acquired by young soldiers) would thus die away, and good liquor supply the place of bad. All experience shows that some amount of stimulant must and will be had recourse to in hot climates by both officers and soldiers, and the purer these liquors are the better for the general health and efficiency of the troops. It is not, at the same time, deniable that temperance soldiers are equally if not more effective; but these will always form the minority, it is to be feared, in British armies. 8. The abolition of spirits would tend greatly to the decrease of hepatic and other complaints. Wine (of a light kind) in moderation might be made to supply this. As an instance I may mention, as a fact, that English and other labourers in South Australia now prefer their home-made wines to all others, and even to beer, while spirits are going rapidly out. These colonies will shortly be in a position to export first class wines in large quantities. In many parts of India, as at Kunawur, &c., in the Himalayas, similar wines might be produced at a low cost, it being a grape bearing country. 9 to 11. No replies to these queries.
XII. HOSPITALS.	1, 2, The hospital is distant from the barracks about 300 yards and altogether distinct from the bazaar and private residences. It is nearly surrounded by buildings having a greater elevation than itself; on this account the ventilation is very imperfect. 3, 4. No replies to these questions. 5. The height of the lowest wards above the ground is 18 inches. No provision is made for the free perflation of air beneath the floor. The rain-fall is conveyed away into the ditch of the fort. The hospital has single walls, built of brick and chunam, roofed with tiles and supported on bamboos. The radiation of heat from the arsenal walls is very great. There is a verandah on one side 8 ft. 6 in. wide; it is too small ever to be used for the accommodation of sick, convalescents, and others. The hospital consists of one flat. No winds, save eddying currents, can touch the hospital. The windows open outwards; but they are too small (3 ft. by 2 ft.), for any practical use in ventilating or cooling the atmosphere. 6. Ventilation is effected by the doors and windows only. 7, 24. No replies to these questions.
XIII. BURIAL OF THE DEAD.	1 to 7. The burial ground has a situation centrical between the station and the native town. Its area is 17,368 square yards. The ground is carefully kept. No other information is given under this head.

2nd Assist., District Engineer,
North Arcot.

30th March 1860.

VIZIANAGRUM.

Accommodation. Native troops, Infantry, 37th and 46th Reg., N. I.

References to Subjects and Queries.	Replies.
I. Topography.	1. The country surrounding the station presents generally an undulating appearance, being hilly towards the north-west and north as far as Cheepropilly, a large village 16 miles north of Vizianagrum. The remaining portion or the country round the cantonment is flat, and generally open with much waste land. There are a number of tanks in the vicinity, many of which cover from 10 to 15 square chains.
	2. There are no means of ascertaining the elevation of the station; but the ground about 2½ miles south of the cantonment is much higher, and better adapted in every way for a station than the present site.
	3. There is a hill, lately occupied as a sanatarium, situated about 40 miles from the station, named Galleepareevatum, the level of which is about one mile above the sea. The level above the station is not known.
	4. The nearest flowing water is a large river, about 200 feet in breadth, situated about 12 miles from the cantonment, near the town of Conadah. On the east side of the station, however, there is a large tank at a distance of 200 yards. The vicinity of the station is low and subject to inundations in heavy rains. There are many ravines near; but what their effect on health is, I am unable to say.
	5. The station is situated on high ground unencumbered with trees, and the adjacent ground being principally open and uncultivated, the ventilation is free and good. The temperature is not raised by the buildings being exposed to reflected sun heat. The station is exposed to cold sea breezes and land winds; and when the latter prevails from the north-west, it is productive of colds, and a mild description of fever.
	6. The surrounding country is principally cultivated. There are no works of irrigation of any great extent, and none nearer than 4 miles. Artificial irrigation is not generally thought to have any bad effect on the health of the station. Rice cultivation is not prohibited, it is grown in abundance to the north of the cantonment; but prohibited within the limits of the station. Indigo and hemp are cultivated throughout the district, but not sufficiently near to be of any nuisance.
	7. The town of Vizianagrum is distant from the cantonment about one mile; and Bimlipatam, formerly a Dutch settlement, is situated about 16 miles distant to the south-east.
	8. I am unable to give the geological structure, surface and subsoil of the district, but the station stands on ground which was never before occupied by a population.
	9. Water is generally found during the dry season at a depth of 25 to 30 feet below the surface and about 15 feet below during the rainy season.
	10. The station being on ground considerably higher than that adjacent to it, the whole of the rain-fall, or nearly so, as well as the drainage is carried off into the low land.
	11. The water supplied is derived chiefly from wells during the hot season, at which time the supply is rather scanty; but an abundance of good water can be procured from the tanks during the rainy and cold season. There is a great deal of water stored in tanks, but not usually for drinking purposes, many of these tanks cover an area of from one quarter to one half a square mile when full. There are very few tanks within the limit of the cantonment. They are from a distance of one half to one mile. Tank water is used by the natives for drinking and all purposes, such as washing clothes, bathing, &c., and is of good quality. The tanks are almost all entirely dependent on the rain-fall for the water which they contain, as very few have springs. The nature of the plants and animals they contain is unknown; but, generally speaking, some little vegetation enters the tank. Many of them receive the drainage of the high ground, most of which is very foul, and the margins of the principal portion are used as public privies, consequently the water must be polluted, and no doubt causes many of the diseases which have prevailed. I am not of opinion that any malaria arises from any of the tanks adjacent to the station sufficient to be of any injury to the cantonment or lines; but I would suggest that public privies should be erected in or near the town of Vizianagrum, and properly flushed now and again,—say once, twice, or thrice a week.
	12. The supply of water is good; but the quality is generally bad. Good clear palatable water, free from smell, has to be brought from some distance. Its chemical and microscopic conditions have not been ascertained, there being no means for that purpose at hand. Leathern buckets and ropes are generally used to raise the water; and I do not think any better water could be procured than that now used at the station.
	13. I am not aware of any other topographical points bearing on the health of the station, not included in the foregoing replies.
	14. I am unable to suggest anything in reference to the mode of selecting new stations.
II. Climate.	1. There are no means or instruments available at the station for conducting and registering meteorological observations.
	2, 3, 4. No reply to these queries.
	5. I have served at Jubbulpore, Kamptee, Jaulah, Secunderabad, Palaveram, Trichinopoly, Bangalore, Palamcottah, Quilon, Penang, Thyetmyo, and Tonghoo in Burmah, and should consider the climate of the stations in Burmah as salubrious and conducive to the health of Europeans as any I have been at; but not so for native troops, which I consider mainly owing to their diet, and the hospitals not being at all adapted to afford sufficient warmth for an invalid in the cold season, and from their having no blanket or any warm covering of their own to keep them warm; and I would strongly recommend that each sepoy serving in Burmah should be furnished with a thick Mysore cumbly, which I have no doubt would be found most conducive to health. I have come to this conclusion from the fact that the servants who go over to Burmah, and are moderately cared for and kept from sleeping on the ground, enjoy good health. Another cause of much sickness in the wet season is from guards, particularly those that mount at night, having to go a considerable distance in heavy rain, and consequently are thoroughly drenched before they reach their posts, and

References to Subjects and Queries.	Replies.
II. Climate—*cont.*	and have to remain in their wet clothes all night. The only remedy I would suggest for this would be to allow such guards to march to their posts any time after 2 o'clock p.m., when there might be a break in the weather, and that each guard-house have bamboo sleeping places, raised about three feet from the ground, sufficient for the men to lie down on. The climate of Trichinopoly as a station, both for European and native troops, I consider to be as salubrious and conducive to health as any station I have served at. Secunderabad, for Europeans, I have considered the reverse of this, at least it was so during the 5 years, at two different periods, that I was there. This was many years ago and the unhealthiness was considered attributable to the sites that the European barracks were on. I do not recollect that any of the other stations I have been at were injurious to the health of Europeans or natives.
III. SANITARY CONDITION OF STATION.	1, 2. No reply to these queries. 3. A ground plan of the barracks occupied by the 37th regiment grenadiers and 46th regiment native infantry, is transmitted. 4. No reply to this question. 5. In the military hospitals there are windows all round, and they open from the inside. There is a verandah on all sides of each barrack with the exception of the west end, which is enclosed and used as a prison room. The verandahs are never used as sleeping quarters by soldiers or other persons. There are no jalousies or jhilmils. 6. There are no bedsteads or bedding in use in the barracks. 7. The native tent is constructed of three cloths, the two outer being white, and the inner one blue, supported by two upright poles, passing through a ridge pole. The height of the tent is from 10 to 12 feet; and it is 28 feet long by 15 feet broad. It is fastened down by 25 pegs, and has a fly door in front supported by four poles and two stays. 8. The ventilation of the barrack is very inferior, there being no windows, but doors only at an interval of every 12 feet, and when these are opened at early morning the heat of the interior is immense. The ventilation is insufficient to keep the air pure by night as well as day. No means are used for cooling barrack rooms of native corps. 9, 10. No reply to these queries. 11. All military public buildings in the cantonment are kept in repair by the engineers department; and the repairs are executed as speedily as possible. The general sanitary state of this cantonment is under the officer commanding. There is no fixed time for white-washing and cleansing the walls and ceilings of barrack rooms, but it is done whenever considered necessary. 12 to 15. No reply to these queries. 16. No part of any building used as a barrack or hospital is damp. There are no foul ditches near the station. 17. No reply. 18. The surface of the cantonment is kept free from vegetation. There are no old walls, thick hedges, &c., interfering with the ventilation of the station, &c. 19. No nuisance is experienced in barracks from wind blowing over native dwellings. 20 to 23. No reply to these queries.
Officers' Quarters.	No information under this head.
IV. HEALTH OF THE TROOPS.	1. The station of Vizianagrum, and the district in which it is situated, are generally considered healthy. 2. Fevers, beriberi, and rheumatic affections are the most common complaints among the native population. Epidemic diseases are not prevalent. 3. My residence at this station being only of little more than 2 months' standing, I have not sufficient personal knowledge of the locality to speak of the unhealthiness or healthiness of the neighbouring native population. 4. The 46th and 37th regiments at present stationed here were previously on service in Pegu, and both corps were more or less affected in that province with the endemic diseases, prevalent there, viz., fevers, beriberi, burning sensation at the soles of the feet, rheumatism, anasarca, atrophy, and bowel complaints. The two regiments served about 3 years each in Pegu, and the 47th Native Infantry arrived here from that country in April 1858, and the 37th grenadiers in January last; many of the men of both corps being at the time of their arrival in a very debilitated and emaciated state, resulting from their having suffered from the prevailing diseases of that climate. 5. The 37th regiment grenadiers are temporarily encamped on the parade ground until their lines now in progress are completed, but no case of disease can be traced to this source. 6 to 16. Never having been in charge of troops at hill stations, I am unable to afford any information from personal experience regarding the sanitary state, &c., of troops at such stations. 17 to 24. No reply to these queries.
Diseases.	1. There are regular inspection parades once a week for the discovery of incipient diseases amongst the recruits of the 37th regiment of grenadiers at this station. 2, 3, 4. Neither scorbutic disease, hepatic disease, nor dracunculus have, as far as I am aware, been prevalent at this station. No case of either exists at present. 5. The proportion of venereal cases appears to be somewhat large, and I am inclined to recommend the re-establishing of lock hospitals as a precaution for lessening the liability of the soldier, European or Native, to this disease. 6. The troops at this station do not appear to suffer much from diseases in an epidemic form. The principal diseases are,— Fever of the intermittent type, this is the most prevalent form and is at times endemic. *Dysentery* occasionally occurs but not in an epidemic form. *Cholera* sporadic cases only generally occur. *Small Pox* has been lately somewhat prevalent in the town, but no fatal case has occurred among the troops. 7 to 10. No replies to any of these questions.

References to Subjects and Queries.	Replies.
XIII. Burial of the Dead.	1. The burial ground is situated at the south end of the cantonment in the officers' lines, and the prevailing south and south-west winds pass right through the whole of the officers' lines. 2. Its area is 8,448 square feet and the soil is composed partly of dark and red earth and partly of gravel. There is no drainage, the surface being flat, but the ground is always kept with great care becoming its sacred purpose. 3. All burials take place at sun-rise or sun-set. The graves are dug five feet deep and three wide, the length being according to circumstances, they are two feet apart. When the surface of the ground shows by the external marks of graves and head stones, that there is no more space for interment, the ground is considered full. Graves are never re-opened for interment, except by mistake, when they are immediately closed up again, or by family request, the previous sanction of the chaplain having been obtained for so doing. Interment takes place, both at ordinary times, and during epidemics, within 24 hours. There are no burial grounds set apart for native troops by government, they are buried according to the usage of the several castes. 5. The grave yard is not offensive. The British soldier is interred according to the rites of the Church of which he is a member. Roman Catholics have their burial ground granted by Government, but Protestant dissenters have a small portion of ground (not consecrated) set apart for their use in the church of England burial ground by order of Government. 5. The dead of camp followers and bazar people are disposed of according to caste. 6. No injury at present accrues to the public health from the present practice. 7. Burial grounds should at all times be situated away and clear from cantonments. A room 12 yards by 6 should be built at the outer entry of the burial ground gate for the protection of funerals from inclement weather and also to afford a place of retirement for the chaplain.

Department Public Works.
A. Pinson, Colonel,
Commanding Vizianagrum.

26th May 1860.

FRENCH ROCKS.

Accommodation.—Native Infantry.—One regiment.

References to Subjects and Queries.	Replies.
I. Topography.	1. The general aspect of the surrounding country is undulating, dry, and open, scattered with low ranges of hills. There is but little or no jungle; a large water tank is, however, in the neighbourhood. 2. The elevation of the station above the sea is 2,560 feet, but it is on a level with the adjacent country. There is no higher or healthier ground near the station. 3. The station is situated on the table-land of Mysore; there are no mountains or high hills in the immediate neighbourhood. 4. The nearest water is at the distance of a quarter of a mile, and consists of a large tank, one side of which is shallow and marshy, but not to any great extent. The vicinity is not liable to overflow. There are a few small ravines, which do not appear to have any effect on the health of the station. 5. The station is open and exposed to the wind. There are trees and hedges in the station, but there are very few around it. No old walls, thick hedges, &c. exist in the station, nor is it so encumbered by houses as to interfere with ventilation. The buildings are not exposed to reflected sun heat. The station is exposed to variable winds, but not to the sea breeze, being too far from the coast for it to have any perceptible influence on health. 6. The surrounding country is cultivated, but the only work of irrigation near the station is the lake or tank about a quarter of a mile distant. Artificial irrigation is not observed to affect the health of the station. The cultivation of rice is prohibited within about a mile from the station. There is no cultivation of indigo or preparation of hemp or flax carried on near the station. 7. There is no large city or town nearer the station than Seringapatam, which is six miles distant. 8. The surface soil of the district is light and sandy, with a rocky subsoil. The ground of the station has not been occupied by population before the formation of the station, but was, 40 years back, cultivated with grain. 9. Water is found during the dry season at about 20 feet below the surface, and during the rainy season at a depth of 12 or 15 feet, but not in all situations. 10. The rain-fall flows readily away and is easily drained off; it does not lie for any length of time on the surface. No drainage from higher ground passes into the subsoil of the station. 11. The water supply of the station is obtained from sunken wells and the tank. It is stored until required for irrigation in the tank, which is about a quarter of a square mile in extent. The tank generally pretty full, never dry. It contains various fish and the usual water plants, and the water in it is principally used for bathing. Neither the tank nor any of the wells are liable to pollution from any source. Slight malaria proceeds from the tank, especially after the rains, which could be prevented by drainage.

FRENCH ROCKS. MADRAS.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	12. There is an abundance of water, pretty clear and tasteless in quality. The well water is hard, but that from the tank is soft and good. There is a dam and sluice at the tank. The water from the wells is drawn by buckets.
	13. There are no other topographical points bearing on health that we are aware of.
	14. Cannot say what preliminary examinations or inquiries are made previous to the selection of new stations.
II. CLIMATE.	1. A weathercock, rain-gauge, barometer, and thermometer are the only instruments available at the station for conducting and registering meteorological observations.
	2. There are no meteorological observations on record.
	3. The climate is good, being dry during eight months in the year, and somewhat moist during the monsoon. It is not very variable, pretty free from fog and damp, and not affected by irrigation. There are occasional dust storms, which last but a short time. The usual diet only is required, but warm clothing is necessary during the cold weather. Drills and exercises take place in the mornings and evenings. The most unhealthy months are November and December, during which time intermittent fever is the prevailing disease.
	4. There is no district near the station the climate of which is more conducive to health than that of the station.
	5. I have served at many of the stations of the Madras Presidency garrisoned by native troops. None of them appeared to be positively injurious.
III. SANITARY CONDITION OF STATION.	1, 2. A plan of the station is forwarded.
	3 to 6. No reply to these queries.
	7. The tents used in camp are pitched on two uprights and a ridge pole; the fly sloping to the ground without a perpendicular part; the dimensions from pole to pole being 10 feet. They contain 25 men each, and the full length of each tent is 27 feet, the breadth being 11½ feet, and the height 9 feet.
	8. The ventilation of the huts is effected entirely by the doors; that of the guard-rooms by windows. The latter are well ventilated, but the ventilation of the huts is (theoretically) insufficient.
	9. The barracks are constructed of brick and mortar, the tents of cotton cloth, and huts of earth, with thatched or tiled roofs.
	10. Not applicable to native barracks.
	11. The materials and construction of the barracks, tents, and huts are all suitable to the climate. The barracks and cantonments are kept in repair by the Public Works Department, and the repairs are generally quickly executed. The commanding officer is responsible for the sanitary state of the cantonment. The walls and ceilings of barracks are cleansed and whitewashed once a year.
	12, 13. There are no lavatories, cook-houses, or conveniences for washing and drying linen.
	14. There are at present no privies except those in the hospital.
	15. The barracks do not require to be lighted at night.
	16. There are no foul ditches.
	17. Scavengers remove the refuse and night soil every morning by contract. It is used as manure by the neighbouring ryots.
	18. The surface of the cantonment is kept free from vegetation, and there are no old walls, thick hedges, &c. to interfere with the ventilation of the station or bazaar.
	19. The drainage of the bazaar is good; the ventilation free, and the water supply good. It is not crowded. The bazaar, being a native one, is under the immediate control of the adjutant, guided by the general regulations; these afford comfort and efficiency. There are no other native houses near the station. No nuisance is experienced in barracks from wind blowing over the native dwellings.
	20. The few animals required are slaughtered at a considerable distance from the station, and no nuisance is experienced from it.
	21 to 23. These queries are not applicable to this station.
Officers' Quarters.	1. There are no public quarters for officers; they reside in private bungalows, which are in good condition in every respect. No improvement is required.
IV. HEALTH OF THE TROOPS.	1, 2, 3. Intermittent fever is common amongst the native population; otherwise the station and district are generally healthy, except during the months of November, December, and January, the cold season. The intermittent fever is attributed in the station to the close vicinity of the tank, and in Seringapatam to a broad shallow part of the river Cauvery.
	4. The troops previous to coming to this station were at Rangoon for three years, and left there on the 24th March 1860. Their state of health there was not good, the chief diseases being beriberi, intermittents, and diarrhœa. The regiment arrived at this station on 29th April 1860 in good health, from the sickly men having been transferred to the general hospital, or to their villages. They have not suffered much from any disease since arrival, but the commonest have been rheumatism and intermittents. No part of the men's present accommodation is more or less healthy than the rest.
	5. The troops at the station are not camped out.
	6, 7, 8. I have had no experience with troops at hill stations, but I decidedly approve of their selection for troops.
	9. On first arrival at hill stations, I believe troops are liable to be attacked with bowel complaints.
	10. Every precaution is necessary in regard to diet, clothing, shelter, duties, &c., to enable the men to obtain the greatest benefit from such residence.
	11. At most hill stations the rainy season is considered the healthiest. The shortest period to obtain the full benefit of residence in such stations must depend on the circumstances of each individual, but in general a year is required.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	12. There is no period of residence beyond which injury is likely to be inflicted on the health of the troops on returning to service on the plains. 13. The special precautions required on going to hill stations are,—to be careful in diet, and avoid exposure to the sun, night dew, and land winds. 14. It would be most conducive to the health of troops serving in India to locate them on hill stations, with short periods of service in the plains, provided the changes are not too frequent. If moved at the proper season, frequent change of station on plains is beneficial to the health and spirits of troops. 15. Cannot say if the barrack accommodation and sanitaria provided at hill stations be sufficient. 16. From 4,000 to 6,000 feet above the sea would be the most suitable elevation as sites for hill stations. 17. There is no higher ground near the station which could be advantageously occupied as a hill station. 18. A dry cultivated surface not surrounded by jungle is the most healthy for stations. 19. Soldiers proceeding to India should be from 20 to 25 years of age, and should land there at the beginning of the cold season. Recruits on landing should avoid indulgence in liquor and exposure to the sun, and should also be sparing in the use of fruit. 20. Troops should, if practicable, be sent to an intermediate station before being sent to India, and on landing should be sent to hill stations. 21. The present modes of transport of troops into the interior are by marching, rail, or water, when available, and bullock transit. When the mode is by marching, long marches and exposure to the night air or sun should be avoided, and great care should be taken in the selection of camp ground. Troops should have the best bedding available, and, above all things, avoid spirituous liquors. Coffee should be given on the march. 22. A British soldier should serve 20 years in India, but a good deal would depend on constitution. 23. Conflict of opinion sometimes exists in medical boards in reference to invaliding, but we are not prepared to offer any suggestion on the subject. 24. Invalids should leave India for home so as to arrive in England in the mild weather.
Diseases.	1. There are regular weekly inspection parades held at the station for the discovery of incipient diseases. 2. There has been no case of scorbutus among the troops at the station. 3. Usually there is no hepatic case under treatment, as such disease is rare among natives, and there are but few Europeans at the station. The principal cause of this disease is evidently the climate, though cold following continued heat, excess in eating or drinking, and want of exercise assist in its development. It is sometimes the consequence of dysentery, more commonly not. We know of no prophylactic measures other than the common and often ineffectual ones of avoiding the avoidable causes. 4. Dracunculus is still more rare than hepatic disease. 5. The proportion of venereal cases is one to five from all other diseases calculated for one month. The forcible removal of prostitutes to dispensaries has been found to diminish the number of venereal cases. The institution of Lock hospitals would, we believe, be advantageous to the army, though objectionable on other grounds. 6. The following table shows the diseases of epidemic or endemic class which the troops have suffered from, with the proportion of admissions and deaths from those diseases to the total admissions and deaths :—

Diseases.	Admissions for One Month.	Deaths for One Month.	Total Admissions for One Month.	Total Deaths for One Month.
Fevers { Intermittent	1	—	10	—
Fevers { Ephemeral	1	—	30	—
Dysentery, cholera. (No case has occurred since arrival)	—	—	—	—
Small Pox. (Two cases have occurred, both after vaccination)	1	1	15	1
Rheumatism (is very common)	1	—	5	—

	7. The only zymotic diseases that have occurred have been a few cases of small-pox, showing a large proportion of fatal cases, probably from the milder cases not being known of. I have been too short a time at the station to know what the seasons are at which such diseases are prevalent, or the climatic or atmospheric conditions which precede or accompany their appearance, nor can I speak as to the sanitary condition of the bazaar, where these diseases are most prevalent. Among the native population the circumstances most evidently predisposing to small-pox are their indifference to vaccination, which they view as an useless attempt at interfering with fate, and, more rarely, their positive objection to it as the mark of a Nazarene. 8. It is not known how far the nature of a soldier's duties or occupations predisposes him to epidemic disease. 9. Quinine has not been tried as a prophylactic against malarial disease. 10. No recommendations are offered on any of the preceding points, as my experience is so limited.
V. Intemperance.	1. The soldiers at the station are temperate, and no confirmed drunkards are found among them.

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	2. There is scarcely ever an admission into hospital, directly or indirectly, from diseases caused by intemperance. Drunkenness *per se* is punished as an offence. 3. Distilled spirits (arrack) are sold in the bazaar, but the quantity consumed by each man *per diem* is not ascertainable among native troops. Spirit forms no part of the soldiers' ration either at the station, on march, or in the field, and the men do not take a dram before morning parade. It is occasionally given to convalescents; it is variable in quality and amount. No drinks injurious to health, other than intoxicating drinks, are sold in the bazaar. 4. The consumption of spirits in moderation is conducive to health. They have no effect on discipline unless taken in excess, and they are then injurious. 5. Restriction in the use of spirituous liquors would be beneficial, but not so their abolition. 6. As a general rule, malt liquors or wines are preferable to spirits. 7 to 10. Tea, coffee, lemonade, &c. are not used at the station. The questions under these numbers refer to European troops, but I would suggest that tea, coffee, beer, and lemonade should be more used than at present, to the comparative exclusion of spirituous liquors. 11. By the bazaar regulations every encouragement must be given to the connexions of the men to settle as shopkeepers in the regimental bazaar, which is under the immediate control of the adjutant, and individuals available as coolies are allowed to reside within the boundaries. All bazaar residents are subject to trial and punishment by military courts, and to expulsion at the pleasure of the commanding officer. The dookans are all registered, and no person is allowed to establish one or reside in the bazaar without previous sanction from the commanding officer.
VI. Diet.	No information under this head.
VII. Dress, Accoutrements, and Duties.	1. The soldiers' dress consists of cloth tunic and trousers,—the latter cotton in hot weather,—basket-work turban covered with oil skin, and native sandals. The accoutrements are musket, belts, and pouch. The dress is quite suitable for the climate and soldiers' duties at all seasons, with the exception of the turban. Warm clothing should be worn at hill stations, and light clothing on the plains, and the "solah" helmets at all stations. The soldiers should have flannel waistbands on the hills, and also on the plains, where there is a tendency to diarrhœa or cholera, and cloaks on night duty. At this station sepoys on guard are protected by sentry boxes and verandahs occasionally.
Duties.	1. Soldiers should be thoroughly drilled at home, or at some intermediate station before being sent to India. 2. At this station the duties are light, and consist of guard duty once in seven days, and drill one hour in the morning, and occasionally an hour in the evening. The men do not suffer in health from drill. The best hours for drills, parades, and marches are early morning. By general order there is route marching once a month. The men on an average have seven nights in bed during the week. 3. Guards are mounted close to the barracks. They mount at six in the morning and are relieved at six the next morning. Roll calls take place daily at sunset, and in the morning when there is no parade. Night guards are apt to be injurious, particularly in wet or damp weather; for this duty the men should be warmly clothed, and further protected if possible.
VIII. Instruction and Recreation.	1, 2. There is an English and vernacular school at the station, but no other means of instruction or recreation. No restriction is placed on natives in reference to exposure to the sun and rain out of barracks when off duty. No improvements are suggested. 3. The institution of soldiers' savings' banks would be decidedly advantageous. 4. There is plenty of shade from trees to enable the men to take exercise without injury, but there is none from sheds or verandahs.
IX. Military Prisons.	1. There are no defects in the construction of the solitary cells at this station.
X. Field Service.	1. There are no local regulations for field medical service not included in the General Presidency Regulations. 2. The powers of the medical officers, in reference to the conduct of the line of march, &c., are limited to recommendations. 3. Camping grounds are selected on elevated and dry ground, at some distance from a village, and, if possible, on that which has never been previously occupied. Water is brought to the camps in water bags, carried by bullocks. 4. The number of tents required for the field hospital is supplied of the same kind as used by the force to which the sick belong. Sick and hospital supplies are transported by bearers and on bullock carts.
XII. Hospitals.	1, 2. The ground slopes slightly downwards from the hospital to the barrack buildings. It is a considerable distance from the bazaar, the sepahis lines and some open ground intervening between them. The site of the hospital is open, freely ventilated, and healthy as to drainage and elevation, but is probably not free from malaria. 3. The water supply is abundant and wholesome. 4. The outlet for the privy sewage (and there is none other) is immediately outside the enclosure surrounding the hospitals. 5. The height of the lowest wards above the ground is 3 feet. No provision is made for conveying away the roof water, but there are some open trenches around the hospital, which is sufficient for carrying away the rain-fall rapidly. The hospital is built of brick and chunam. The roof and walls are single, but of sufficient thickness to keep the building cool. There is a verandah on each side of the hospital, 10 feet broad. They are never used for the accommodation of sick, convalescents or others. The building consists of one flat.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	Table of Hospital Accommodation. Date of construction, A.D. 1830. Total number of wards - - - - - - 1 Total regulation number of beds not fixed, can accommodate - - 40

Wards, Number.	Regulation Number of Sick in each Ward.	Dimensions of Ward.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
		Feet.	Feet.	Feet.	Feet.		Sq. feet.	Inches.		Inches.	Inches.
1	—	140	20	12	33,600	840	70	16	8	45	28

The hospital receives the full benefit of the prevailing winds. The windows open like a door, in two pieces. Their arrangement is good, but the doors are the great means of ventilation.

6. The ventilation of the wards is effected by means of the doors and windows, and also by some needless openings in the roof. There are no jalousies or jhilmils.

7, 8. There is no apparatus for cooling or warming the wards. The walls are cleansed, &c., once a year, and the floor of the ward twice a month. There is no ceiling.

9. The privy is simply a small separate house in one corner of the hospital enclosure, containing earthen pots, and having no door, but a doorway screened by a wall. It is properly drained and watered, but is not placed over a cesspit. It is not offensive outside.

10. There are no lavatory arrangements for the sick.

11. A few tubs, of different shapes, are provided for bathing the sick, which can be used as hip-baths, full-length baths, &c.

12. There is no hospital linen. Quilts, &c. are washed by the commissariat.

13. The storage is sufficient and dry.

14. The bedsteads used in hospital are wooden frames, with cotton tape stretched across, than which nothing could be better.

15. The kitchen is a small house in one corner of the enclosure, provided with earthen fire-places.

16. No diet tables are used. The statistical forms are those common to native troops throughout the Presidency.

17. One or two hospital orderlies, and a special orderly for any man who may require one, is all the attendance provided for the sick.

18. The sanitary condition of the hospital is good at present. We do not know that any epidemic disease, hospital gangrene, or pyæmia have appeared in the hospital, as distinguished from the station.

19. There are no deficiencies or sanitary defects which require improvement.

20. No provision for exercising convalescents is required.

21. Soldiers' sick wives and children can be treated at their homes if they wish it, but they seldom do. This arrangement is satisfactory.

22. There are no special local hospital regulations enforced at the station not included in the General Presidency Medical Regulations.

23. Requisitions for the repairs of hospital are attended to. The medical officer has no power over the diet.

24. There is no convalescent hospital or wards for convalescents, and none are required.

XIII. Burial of the Dead.

1. The cantonment burial-ground is well situated. It is a short distance from the officers' quarters, and to windward during the south-west monsoon.

2. Its area is about an acre. The soil is sandy and dry, and the ground is carefully kept.

3. The grave space is 7 by 3, with an interval between each of from 10 to 20 feet. The depth of graves is from 5 to 6 feet, and not more than one body is ever buried in the same grave. Interment is compulsory at ordinary times and during epidemics within 24 hours. Most of the native population burn the bodies of their dead. Mahomedans and a few others have their own burial-grounds at a distance from the cantonment.

4. The grave-yard is never offensive.

5. The dead of camp followers, or bazaar people, are burned or buried at a distance from the camp.

6, 7. No injury accrues to the public health from the present practice, and no improvement can be suggested in reference to the burial or disposal of the dead.

QUILON.

Accommodation.—Native Troops—Infantry—Total of all ranks, 1,042.

Reference to Subjects and Queries.	Replies.
I. Topography.	1. The general aspect of the country surrounding the station is flat and sandy. It is well wooded, and there is a fine sheet of water, the back water, and also a canal. 2. The station is slightly elevated above the sea, but is on the same level as the adjacent country. There is no higher or healthier ground in the vicinity of the station. 3. The nearest mountains to the station are the Wurrakally Hills, about 12 miles distant, in the direction of Trevandrum. 4. The sea is between 200 or 300 yards distant from the station, and the back water comes up close to it; there is also a canal running through the town and part of the station. During a very heavy monsoon the parade ground is sometimes overflowed, but it does not continue so beyond a few days. There is one water-pit within civil limits, but I am not aware, after every inquiry, that it has any injurious effect on the health of the station. However, as it is generally considered a nuisance, I purpose applying for its being filled up. 5. The station is open and well exposed to sea and land winds, the latter, however, causing rheumatism and neuralgia. The temperature of the station is not raised by exposure to reflected sun heat. 6. The surrounding country is tolerably well cultivated, but there are no works of irrigation near the station. Rice is not cultivated within the limits of the cantonment, but there is, however, a great deal of paddy cultivation to the north of cantonment and in close proximity to it, which does not, however, appear to affect the health of the people. Indigo is not cultivated, nor is the preparation of hemp or flax carried on near the station. 7. The large town of Quilon is in the vicinity of the station. 8. The surface and subsoil of the district are chiefly sand, with occasional breaks of laterite, From all I can learn, I have reason to suppose that the space now occupied by the cantonment was never occupied by any population before the present station was formed. 9. Water is usually found at a depth of from 15 to 20 feet during the dry season, but close up to the surface during the rains. 10. The rain-fall and water from surface springs are quickly absorbed. There is no higher ground near the station. 11. The water supply of the station is derived from wells only; there are no tanks. The well water, the only drinking water in the cantonment and native town, is not liable to pollution from leaves or other impurities falling into it. 12. Water is abundant and good, but there are no means of ascertaining its chemical composition. It is always drawn from the wells in buckets or by chatties. 13. I am not aware of any other topographical points bearing on the health of the station. 14. I cannot say what is the nature of the inquiries, &c. which are made previous to the selection of stations.
II. Climate.	1, 2. There are no instruments for conducting meteorological observations, and no table appears to have been kept here. 3. During the rains the weather is close and muggy, during the dry weather parching, but free from dust. There is one canal from this to Quilon, and great part of the way to Trevandrum. The mango jack, and cassarina grow well and luxuriantly. The troops are very healthy, and the diet suits the native, but would not do for the use of European soldiers as the bazaars, &c. are now managed. Light clothing is very necessary, in consequence of the enervating effect of the climate. Drill should be carried on in the mornings, from 5½ to 7 o'clock, the evenings being close and stifling. January, February, and March are considered most unhealthy months on account of the strong land winds that prevail. The remaining months are healthy, particularly those in which we have the monsoon, viz., from the 15th May to the 15th October. 4. I am not aware that there is any district near, the climate of which is more conducive to health than that of the station. 5. The following is a list of stations at which I have served:—Masulipatam, twice; Jaulnah; Palaveram, twice; Secunderabad, three times; Vizianagrum; Vizagapatam; Berhampore; Malacca; Vellore; Bangalore; Kolapore; Samulcottah; Rangoon; Tonghoo; Mangalore, and Quilon. At all the above stations, during the time the 8th Regiment served at each, they were very healthy, and neither officers nor men suffered from any epidemic or in any way.
III. Sanitary Condition of Station.	1, 2, 3. There is no engineer officer here, he being at this time located at Trichinopoly. No tracings of the country, stations, &c. have consequently been transmitted, as he only periodically visits this station, but has in his office a complete plan of the station. 4. There are 11 prison cells of the usual dimensions, 8 of which, however, are in a ruinous state and quite unfit for any purpose. 5. All the barracks and other public buildings are, with the exception of those occupied by the 45th Regiment, in an almost ruinous condition, without doors or windows, and as it appears they are not likely to be again ever required, are permitted to go to decay. The barracks or place of arms of the 45th Regiment Native Infantry has a verandah on either side, the whole length of the building, but these are never occupied as sleeping quarters. There are no jalousies or jhilmils. 6. No bedsteads are used in barracks. 7. The usual tents are issued to native regiments. 8. There are no means of ventilation, except when the doors are kept open, nor any means of cooling the air admitted. 9, 10. The barracks appear to be built of laterite and chunam; the floors are bricked. The sepoys' huts are constructed of bamboos, leaves, and grass. The floors are of mud, and raised about two feet above the level of the ground. 11. The materials appear to be suitable for the climate. The barracks and cantonments are kept in repair by the engineer officer located at Trichinopoly, who periodically visits the station.

Reference to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	The medical officer, together with the commanding officer, is responsible for the sanitary state of the station. The walls and ceilings of the barracks are cleansed and limewashed once a year. 12, 13. There are no lavatories, cook-houses, or means of cooking provided at the station, nor any conveniences for washing and drying the linen in cantonment; but the dhobies employed by the troops go some short distance to wash and dry the clothes. 14, 15. There are no privies or urinals. 16. The natural drainage is sufficient to carry away superfluous water during the monsoon. There are no drains. No part of any building used as a barrack or hospital is damp. There are no cesspits or foul ditches in the cantonment. 17. The officers keep their own compounds clean, and the lines are kept so by the men of the regiment, and cantonment by the scavenger carts allowed by Government. 18. The surface of the cantonment is kept free of vegetation, and there are no thick hedges, old walls, &c. interfering with the ventilation of the station. It would, however, have been of material benefit to the cantonment to pull down and remove the old barracks and other public buildings not now used, and which are falling to ruins, as it has several times occurred that the carcases of animals which have died from starvation and disease have been found in them, and on one occasion the body of a wretchedly diseased old woman, who appeared to have died of starvation, was discovered. 19. The civil bazaar, although well ventilated, being a broad street, is very dirty, and requires that the refuse, such as bad fish, &c., should be removed once at least every 24 hours. The bazaars are cleaned daily by the owners of the Dorkans, and the system established and regularly kept up appears sufficient for all purposes. The native huts are wretched in the extreme, being composed of nothing but bamboos, leaves, and grass, both for roofing and walls, mud for the purpose of wall building not being available. They are also very much huddled together, and cleanliness is not much attended to. No nuisance is experienced in barracks from wind blowing over the native dwellings. 20. Three or four sheep are killed daily in the cantonment, about 300 yards from the lines, and all offal is immediately removed. Bullocks are killed at a short distance from the cantonment, but no nuisance is experienced in the station from the condition of the slaughtering places. 21, 22. There are no bazaar horses, cavalry stables, or picketing grounds at Quilon. 23. There are no quarters of any kind whatever for married non-commissioned officers or men.
Officers' Quarters.	1. The officers' houses are all well situated, most of them being close to the sea. No drainage is required, as the water soaks into the sandy soil around them at once. No improvements are suggested.
IV. Health of the Troops.	1. The station, district, and adjoining native population are healthy. 2. The most prevalent diseases are skin diseases, and these are greatly to be attributed to the want of proper vegetable diet and the large quantities of fish consumed by the inhabitants. 3. The healthiness of the neighbouring native population is attributable to the prevalence of the sea breezes. 4. The troops were at Madras before coming to the present station, from 21st April 1858 to March 1859, and there the men suffered chiefly from beri-beri and general debility contracted in Burmah. They arrived here on 9th March 1859, much improved in health, and since then it has suffered principally from itch, boils, and intermittent fever of a mild type. No portion of the men's accommodation is more unhealthy than the rest. 5. The troops are never camped out. 6, 7. No experience of hill stations. 8. I decidedly approve of the selection of hill stations, particularly for European troops. 9, 10. Never been in charge of troops at hill stations, 11. The hot season is best adapted for residence in hill stations, and one year is the shortest period to obtain the benefit of such residence. 12. No experience with troops at hill stations. 13. The special precautions required for the preservation of health of troops on leaving hill stations for the plains is the provision of light clothing and ample protection from heat by high and well-ventilated buildings. 14. Troops should be located as much as possible on hill stations during their service in India. I do not think frequent change of station on the plains is beneficial to the health and spirits of troops. 15, 16. No experience of hill stations. 17. There is not sufficient table-land on the hills about 15 miles distant, and which are visible from the cantonment, to enable them to be used as a sanitarium or hill station for troops, and the rain there is incessant, except for two or three months in the year. 18. I consider a sandy or laterite soil the most healthy for stations. 19. Soldiers proceeding to India should be from 18 to 20 years of age, and those destined for the Madras Presidency should land there from November to the end of January. Recruits landing in India should be kept as much as possible from exposure to sun, and from frequenting arrack and toddy shops on landing. 20. Troops should be sent direct from home depôts to India, and on arriving there should be sent at once to hill stations if possible. 21. Transit if available, travelling only by night and having the water intended for drinking boiled at halting stations the previous evening are good precautions for preserving health on the route from the port of debarkation to the interior. 22. A British soldier should serve 20 years in India. 23. Difference of opinion may sometimes exist between medical boards as regards invaliding, but I cannot suggest anything on the subject. 24. Invalids should leave India for home in the month of March.
Diseases.	1. There are weekly inspection parades for the discovery of incipient diseases. 2. There has been no scorbutus or scorbutic disease among the troops at the station. 3. There has been no case of hepatitis for a very considerable time. 4. Since joining I have not seen any cases of dracunculus; there have, however, been a few cases admitted into hospital since the arrival of the regiment here.

Reference to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	5. Venereal disease bears about the same proportion as dracunculus to the total sick in hospital, and there can be no doubt that a well-regulated lock hospital would prove beneficial to the troops and inhabitants of the town. 6. The troops at the station have suffered from— *Fevers.*—Principally intermittent of a mild type. *Dysentery.*—A few cases of a mild nature. *Cholera.*—Never been known here amongst the troops. A few cases have occurred occasionally amongst the fishermen. *Small-pox.*—Occasionally an epidemic occurs. *Rheumatism.*—Rather prevalent. There have been no deaths from any of the above diseases since the regiment arrived at this station. 7. There is nothing particular in the nosological character of the zymotic diseases that have been under treatment at this station. They are most frequent in the hot weather, and are preceded or accompanied by the hot winds. The general bazaar might, I think, be kept cleaner. The refuse of the stale dried fish particularly should be removed once in 24 hours. The native troops I consider generally healthy, as also the inhabitants of the town. 8. The duties the troops have here do not predispose to disease. 9. There has been no occasion for the exhibition of quinine as a prophylactic against malarial diseases at this station. 10. I have no recommendations to make on any of the preceding points, excepting that stated in paragraph 7, on the sanitary condition of the bazaar.
V. INTEMPERANCE.	1. The soldiers are usually very temperate. There is only one confirmed drunkard, a drummer. 2. There has been so very little intemperance at the station that no table showing the effect of total abstinence, temperance, and drunkenness, on the amount of sickness, mortality, and crime, can be prepared. Drunkenness is always punished as an offence. 3. There are no canteens, but arrack is sold in the general bazaar. I am not aware of the quantity consumed by each man, but I should not think much, as there are but few cases of drunkenness. Spirit is no part of the soldier's rations at the station, on march, or in the field. Arrack, of apparently good quality, has been given to weakly men in hospital, to the amount of one measure per diem. Except toddy, I am not aware that any other drinks injurious to health are sold in the bazaar. 4. A moderate consumption of spirits is, I consider, conducive to health and internal discipline and efficiency. 5. It would be decidedly beneficial to restrict the use of spirituous liquors as a part of the ration. 6. Malt liquor is good for the troops, and much superior to wine; nevertheless, a glass of spirits is beneficial. 7. I am not aware whether tea, coffee, lemonade, and similar drinks are much used at the station. 8, 9, 10. I do not think it would be beneficial to the health of the troops to suppress altogether the spirit ration for soldiers or convalescents, or to prohibit the sale of spirituous liquors in the canteens, and to substitute for it beer, tea, &c. No recommendations to suggest. 11. There are no bazaar regulations in force here.
VI DIET.	1 to 4. These queries do not apply to native troops. 5. Soldiers' gardens could not be established here advantageously. The soil being very sandy does not suit without going to great expense in carting good soil from a distance.
VII. DRESS, ACCOUTREMENTS, AND DUTIES.	1. The soldier's dress at the station is the usual dress of the native troops. The present dress is too warm for a tropical climate, and the turbans in use with native troops are heat conductors, and consequently bad head-dresses, affording litttle or no protection, and are unseemly.
Duties.	1. The men should be thoroughly drilled at home before being sent to India. 2. The routine of a soldier's duties at the station are guards and one hour's drill in the mornings five times a week. The troops do not suffer at all in health from drills. The best hours for drills are from 5½ to 7 a.m. Marches should commence at 4 in the morning, so as to arrive at the encamping ground before 7 o'clock. The average number of nights the men have had in bed during the week for some considerable time past has been about 4½ per week, and sometimes less. 3. Guards are mounted close by the barracks. There are roll calls every afternoon at 5 o'clock. Night guards have no prejudicial effect upon the health of the men.
VIII. INSTRUCTION AND RECREATION.	1, 2. The only means of recreation and instruction at the station are a very good racket court and two native and one English regimental schools. 3. I think the institution of soldiers' savings' banks would be advantageous. 4. There is lots of shade from the large trees planted on each side of the cantonment roads and in the vicinity of the men's lines to enable them to take exercise during the day without injury to health.
IX. MILITARY PRISONS.	1. There are no military prisons, but there are several solitary cells; with the exception of three, they cannot be occupied, as they are so completely out of repair.
X. FIELD SERVICE.	1. There are no copies of regulations for field medical service at the station. 2. Any suggestion of the medical officer, as regards the conduct of the line of march of troops, bivouacking, camping, &c. is at all times attended to. 3. The sites chosen for camping grounds are as much as possible elevated and dry, and the opinion of the medical officer is generally taken upon these subjects. 4. For a native regiment one dooly per company, and two sick carts are provided for the sick on march. On arriving at the station these are returned into store and borne on the returns of the station.

Reference to Subjects and Queries.	Replies.
XI. Statistics of Sickness and Mortality.	1. There are no records at the station to provide the information under this head. The mortality of the native infantry regiment serving here at present for the last year has been only four deaths.
XII. Hospitals.	1, 2. The hospital is built on a mound, about eight feet above the level of the parade ground, the only mound in the station. It is well situated and sufficiently near to the place of arms and the men's lines. It is a considerable distance from the general bazaar. The site is very open, well ventilated, and there are no obstructions in the neighbourhood. It is generally healthy as to elevation, drainage, and freedom from malaria from all causes. 3. The water supply is ample and of very good quality. 4. A deep drain behind the hospital carries away all refuse water and impurities. 5. There is only one ward having an enclosed verandah with glazed windows in front and rear. The roof water sinks into the subsoil, and the drainage and guttering round the building is quite sufficient. The hospital appears to be built of laterite, with a brick floor, with a single roof, and there are several ventilators in the upper part of the ward walls. The walls are sufficiently thick to keep the hospital cool. The verandahs afford sufficient shelter from the sun, and being about 10 feet broad, they are used for convalescents and itch cases when the hospital becomes crowded. The building consists of one flat only.

Table of Hospital Accommodation.

Wards, Number.	Regulation Number of Sick in each Ward.	Dimensions of Ward.			Cubic Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.			Number.	Height.	Width.
1	30	Yds. 27	Ft. in. 16 6	Ft. 14	620	Ft. in. 1 3	30	In. 22·5 8·4	In. 43 37

	The hospital receives the full benefit of the prevailing winds. The windows open inwards and are conducive to ventilation and coolness. 6. The ventilation of the wards is effected by means of ventilators in the wall. The jalousies and jhilmils are of the ordinary construction. 7. The wards are cooled by means of ventilators, which are opened and shut by a pulley. 8. There are no artificial means for warming the wards. The walls and ceilings of the hospital are cleansed and limewashed once a year. 9. There are no waterclosets or urinals. The hospital privy is cleaned regularly by the two hospital toties. There are no cesspits near at hand, nor any offensive smells. 10, 11. There are no lavatory arrangements, but a large tub is furnished for the sick to bathe in. 12. The regimental dhobies arrange the washing and drying of the hospital linen. 13. The storage is sufficient and dry. 14. Iron cots are used in the hospital, which answer admirably. I can suggest no improvement. 15. There are no kitchens at the hospital. 16, 17. There are no diet tables or diet rolls in use at the station. Hospital orderlies are allowed for the sick when required. 18. The sanitary condition of the hospital is good and no epidemics have occurred in it. 19. No deficiencies or sanitary defects have come under my notice. 20. The convalescents walk up and down before the hospital, and there is ample ground in front for the same. 21. No reply to this query. 22. There are no special hospital regulations not included in the General Presidency Medical Regulations. 23. The medical officer has full power in all matters appertaining to the sanitary state of his hospital, &c. 24. There are no convalescent wards or hospital at this station.
XIII. Burial of the Dead.	1. The burial ground is near the station, but to the eastward of it. Only two Europeans have died here during the last three years; these and four East Indians are all that are buried in the churchyard. 2. The soil is sandy and dry, and I am not aware whether decomposition takes place readily or not. Drainage is not required, the ground being slightly elevated and kept clean. It is 200 yards by 190. 3. The graves are 7 feet long, 2½ broad, with an interval of 7½ feet between each; the graves are 10 feet deep, and none have ever been re-opened. Interment takes place at ordinary times within 24 hours; no epidemic is known here. 4. The burial ground is never offensive. There are no British troops stationed here. 5. The dead of bazaar people are disposed of according to castes; Mussulmans bury their dead some distance beyond the precincts of the town; the Hindoos and other castes burn theirs. 6, 7. No injury to the public health accrues from the present practice. I have no improvements to suggest in the present manner of the disposal of the dead.

. TOPOGRAPHY.	1. The country surrounding the station is very open, except on the west, where it is hilly and dry; it is flat and dry towards the other points. There is plenty of water in the tanks around, and the country is jungly to the westward. 2. The station is elevated 112 feet above the level of the sea, 76 feet above the lowest ground adjacent, and 6 feet above the nearest water. There is higher but not healthier ground about three-quarters of a mile from the station. It is 15 feet higher than the present cantonment; but its superficial area is not sufficient for buildings of any extent. 3. The nearest mountain is 8 miles distant. Its height above the sea is 2,712 feet, or 2,600 feet higher than the station. 4. The nearest river is 850 yards distant. Tank water is obtainable at a distance of 200 yards. The sea is 8 miles, and the nearest marsh or tumpah 3 miles distant. The vicinity is not liable to overflow of water. There are some water pits and broken ground about half a mile from the station, the effluvia arising from which are prejudicial to health. 5. The station is open and freely exposed to the winds, except on the west, and in no way encumbered with trees, &c., &c., so as to interfere with free ventilation either external or internal. The temperature of the buildings is not raised by exposure to reflected sun heat. The station is exposed to variable winds; to cold winds from November to February, to hot winds from March to June, to south-west winds from June to September, and to north-east winds from end of September to October. They are not prejudicial to health. 6. The country surrounding the station is highly cultivated. There are several small works of irrigation at a distance of from half a mile and upwards from the station; but no particular effect on health from these has been observed. There is no prohibition to the cultivation of rice, and it is in some places cultivated close to the public road, and within a few yards of officers' houses. Indigo is not cultivated, nor the preparation of hemp or flax carried on near the station. 7. The town of Bapoor lies between the barracks and the sepoys' lines; its inhabitants are Ooriahs. The town of Berhampore is about half a mile from the barracks. 8. The subsoil of the station is composed of siliceous rocks and gravel, and the surface is a light loam. The station occupies new ground never before occupied. 9. Water is usually found at a depth of 50 feet below the surface in the dry season, and from 20 to 30 feet during the rainy season. 10. The rain-fall of water from surface springs runs off into the tanks and paddy fields around. No drainage passes into the subsoil of the station. 11. The water-supply of the station is derived from wells and tanks, and is stored in open and closed tanks. The extent of tank water within the station is 33,000 square yards, and within half a mile 62,000 square yards, giving a total of 95,000 square yards. These tanks are sometimes dry during the hot seasons. The animals found in the tanks are, various kinds of small fish, leeches, prawns, a few univalve molluscs, and some small gelatinous bodies of very low organization. The plants which most abound are the æschynomene paludosa, trelumbium speciosum, species of nymphæaceæ, convolvulaceæ, alismaceæ, naiadaceæ, and pistaceæ, and among the cryptogamia species of marsileaceæ, characeæ, &c. The tanks are generally used both for drinking and bathing purposes. Only a few tanks are liable to pollution from leaves and other impurities falling into them, and one or two of the small ones within the station become very offensive in the hot season. They are not necessary, and to prevent nuisance and malaria should be either deepened or filled in. 12. The amount of tank water available for the station is 33,000 square yards, besides numerous large well-constructed wells. A great deal of the tank water is bad for drinking purposes, and has a greenish colour and peculiar smell. The water obtained from the wells, generally speaking, is not good, although clear and free from any smell, being in some places brackish, and having in others a peculiar earthy taste. It is hard, and the amount is insufficient in hot weather. The brackish water is injurious to health. The water is taken away for domestic purposes in chatties and leathern bags. A good reservoir could be made near the hills at the westward, so that water could be obtainable at all seasons. 13. No other points bearing on the health of the station suggest themselves. 14. I am not aware of the steps taken prior to the selection of a new station, and am therefore unable to offer any suggestion as to the manner in which this service should be conducted.
II. CLIMATE.	1. The only meteorological instruments at this station are a pluviometer and an aneroid barometer, which have been only lately received. 3. The climate is variable. It may be considered a dry one from March to the middle of June, the heat from April to the latter part of June being very great. In July and August the climate is variable. September, October, and November are damp months. January and February, cold and foggy. There are occasional dust storms which do not, however, render the air impure. The health of the troops suffers from damp during the rainy season, and drilling the men on wet ground has been found to be most prejudicial to health. Warm clothing is necessary during the rainy and cold seasons. The time of drill is also changed to a later hour in the morning. During the year 1858–59, April, May, and June, were the most unhealthy months, and December, January, and February the most healthy. Fever, cholera, and beriberi were the most frequent diseases during the unhealthy months. But such is not generally the case, as the damp months September, October, and November are the most unhealthy, and fever and beriberi the most prevalent diseases. February, March, April, and May are the most healthy months. 4. I am not aware of any district near the station, the climate of which is more conducive to health than this. 5. The following is a list of stations at which I have served:—Palamcottah, Cannanore, Bellary, Kurnool, Vizianagram, Burmah, Cuttact, and Sumbalpore. The troops suffered severely from fever and dysentery at Bellary, Burmah, and Sumbalpore. I consider Kurnool an unhealthy station, but at Palamcottah, Cannanore, Vizianagrum, and Cuttact the troops enjoyed average health.

5. Windows are built in the barracks generally on one side only, they are open ones with wooden bars. Verandahs also are only on one side, they are 3½ × 13 to 30 feet in length, according to whether it is a subadar or other rank. The verandahs of sepoys' quarters are sometimes during the hot season occupied as sleeping quarters by them. There are no jalousies or jhilmils.
6. Sepoys use the common native cots in their huts; but when in tents they sleep on the ground.
7. The tents are made of canvass three layers thick. They are very small, being only 25½ feet long., 15 feet broad, and 9¼ high, supported by two poles, the ends forming an exact cone, and the sides a triangle. The cubic space is 1,273 feet, and the superficial 333½ feet, which gives for 25 men 50⅔ and 13½ respectively. This calculation is made when the small fly is extended outwards as far as possible.
8. The means of ventilation are doors and windows only, and these in tents or huts are certainly insufficient. There are no barrack-rooms at this station.
9, 10. The only barracks at the station are places of arms. Tents are made of canvass, and huts are constructed of mud walls and tiled roofs. The floors are made of earth, and smeared with cow-dung, and are slightly raised; but there is no passage of air beneath.
11. The tents should be larger, and the huts of a better description, with windows, and higher. The repairs to barracks, &c., are executed by the department of public works. The officer commanding the station is responsible for the general sanitary state of it. The walls and ceilings of barracks are cleansed and lime-washed whenever required.
12, 13. There are neither lavatories, cook-houses, or conveniences for washing and drying linen at this station.
14, 15. There are neither privies nor urinals at present; but the erection of some is in contemplation.
16. The barracks being merely places of arms are not drained. No part of any building is used as a barrack or hospital. There are foul ditches in the native town of Berhampore, about one mile from the cantonment.
17. The surface cleansing of the cantonment is inefficiently done, there being no means at present provided, and the refuse manure, &c., being in many instances deposited in front of the native houses.
18. The surface of the cantonment is kept free of vegetation. The Ooriah village before mentioned as lying between the barracks and sepoys' lines, considerably interferes with the ventilation of the latter, but there are no old walls or hedges.
19. The bazaar is drained and ventilated, and there is a good supply of water; but it is not used for drinking. There are no latrines, and the place is dirty and crowded. There are no regulations at present for preserving cleanliness in the bazaar, and no sanitary police; it would be most desirable that such be appointed. The general condition of the native houses is poor, and there are dung-heaps in and about many of them. No nuisance is experienced in the sepoys' lines from wind blowing over the native dwellings.
20. Animals are slaughtered about half a mile from the station at a place appointed, and the offal is disposed of to persons of very low caste. Nuisance is experienced by the neighbouring residents, but not in the station itself, the only means of preventing it would be the erection of a slaughtering-house.
21, 22, 23. No answer to the question.

Officers' Quarters.

1. The officers' quarters at this station are not very good, but they are drained and well ventilated. They would be greatly improved by the prohibition of the cultivation of rice in their immediate proximity.

IV. Health of the Troops.

1. The station and district generally speaking is healthy, but the adjoining native population sometimes suffers severely from epidemics of cholera and small-pox.
2. The principal diseases which occur among the native population are beriberi, rheumatism, syphilis, and fever. Small-pox and cholera occur generally once a year epidemically, spleen disease is not at all prevalent.
3. The healthiness of the native population would be much improved if the houses were better ventilated, kept cleaner, less crowded together, and the number of occupants to each house reduced. The streets also require to be wider and kept cleaner, and means might be adopted for removing the heaps of various kinds of filth which are accumulated in the streets to some appointed locality beyond the town.

BERHAMPORE.
MADRAS.

References to Subjects and Queries.	REPLIES.
IV. Health of the Troops —*cont.*	4. The regiment left Burmah in 1854, having been stationed there for two years, and having suffered greatly from fever, dysentery, and rheumatism. The state of their health on arriving here was much impaired by their residence in Burmah. The regiment arrived here in 1854, and the diseases from which the men have suffered since that time have been fever, beriberi, and rheumatism. All parts of the lines are equally healthy. 5. The troops are never camped out, except in cases of sickness. 6. I have never had charge of troops at hill stations. 7 to 16. No answer to these questions. 17. There is no higher ground near this station which could be used as a hill station. 18. No reply to this question. 19. I consider the best age for soldiers to proceed to India to be from 22 to 25 years of age. 20 to 24. No replies to these queries.
Diseases.	1. There is only a weekly inspection of recruits at this station for the discovery of incipient diseases. 2, 3, 4. There has been no scorbutus at this station, and cases of hepatic disease among native troops are exceedingly rare. Dracunculus does not occur at this station. 5. The proportion which those sick from venereal diseases bear to the total sick is about 10 per cent., and this disease almost always occurs among recruits; the weekly inspection of these suffices as far as possible for the discovery of incipient disease. A well regulated lock hospital would be advantageous. 6. The following are the diseases from which the troops at this station suffer:— *Fevers.*—The troops suffer constantly from fever. Quotidian intermittent fever is the prevailing form, and next to that ephemeral fever, small-pox and chicken-pox. *Dysentery* seldom affects the troops, and is generally speaking mild in its attack. *Cholera* generally occurs once a year epidemically, and affects the troops as well as the neighbouring population. *Small-pox.*—The troops do not suffer much from this disease. *Rheumatism.*—The troops suffer from chronic rheumatism, but very often it has been acquired elsewhere. The proportion which admissions from the above diseases bear to the total admissions is not quite 1 to 3; but the proportion which the deaths from these diseases bear to the total deaths is a fraction over 1 to 3. 7. The more frequent zymotic diseases are feb. quotidiana intermittens, feb. ephemera, cholera epidemica, variola simplex, varicella. Quotidian intermittent fever is prevalent during both the hot and damp months. Cholera occurs during the hot months. Small-pox and chicken-pox indifferently. These diseases are preceded by no particular climatic or atmospheric conditions, with the exception of cholera, which most frequently occurs during the hot weather, and during highly electrical states of the atmosphere. Cholera appears to occur as frequently in those localities which may be considered as most cleanly as in those of a contrary description; whereas the other diseases prevail most in those parts where there is overcrowding of dwellings, and the general sanitary condition is bad. The extensive use of bang and opium, ultimately leading to a debilitated state of health, insufficient and impoverishing food often badly cooked, the use of unripe fruit, and the overcrowding of huts where there are large families rendering the atmosphere impure, all tend to predispose to disease. 8. The nature of the sepoys' duties in garrison does not seem to influence the prevalence of epidemic disease. On the march the practice of eating cooked rice in a cold and stale state, the drinking of water procured from the nearest point, and which is frequently unwholesome, their being without food for many hours in consequence of the non-arrival of the bandies, together with the fatigue of marching, influence the prevalence of disease. 9. The prophylactic value of quinine against malaria has not been tried at this station. 10. It has been frequently observed that cholera has been brought into the station by pilgrims returning from Juggernauth, that disease at the time raging there. Could these people be prevented from entering the station by any arrangement, the incursion of the disease might to a certain extent be prevented. As regards the mitigation of epidemic disease, the great point to attend to is the complete sanitary condition of the station.
IX. MILITARY PRISONS.	1. The cells at this station are well constructed, and answer the purpose for which they are intended.
XII. HOSPITALS.	1. A plan of the hospital is transmitted. 2. The hospital is half a mile from the barracks, situated out of the limits of the cantonment, and in the vicinity of a few houses occupied by civilians. There is no bazaar near it; but there are a few houses on the east side of the hospital, which interfere with its ventilation. The site is healthy in every respect. 3. The water-supply is sufficient, and is considered good by the sepoys. It is, however, obtained from a tank, which is used for washing as well as for drinking purposes. 4. The refuse water and other impurities from the hospital are removed by means of a common drain, from which no effluvia arise. 5. The floors of the lowest wards of the hospital are raised above the ground 1½ feet; but there is no perflation of air beneath them. The roof-water and rain-fall flow into side channels, which are on the public road, at 40 yards distance from the hospital, and which are sufficient to carry them away. The roof of the hospital is double, with ventilation between; the walls are of brick and chunam. The hospital is sufficiently cool, with verandahs on both sides of the breadth of six feet, which afford sufficient shelter from the sun's rays. The verandahs, during the cool part of the day, are used by those able to walk about. The hospital consists of one flat only.

XII. Hospital—*cont.*

Table of Hospital Accommodation.

Date of construction—unknown.
Total number of wards - - - - - 2
Total regulation number of beds - - - - 49

Number of Wards.	Regulation Number of Sick in each Ward.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
		Feet. In.	Feet. In.	Feet. In.	Feet.		Square feet.	Feet. In.		Feet.	Feet.
1	25	78 6	19 6	16 3	24,875	995	61¼	1 8	8	4	3
1	24	77 0	19 6	16 3	24,399	1,016½	62½	1 8	8	4	3

The hospital receives the full benefit of prevailing winds, except on the east side, where there are some scattered houses. The windows open inside, and in addition there are jalousies which open on the outside.

6. There are no special means of ventilation, but the amount afforded by the double roof, doors, and windows is sufficient. The lower part of the jalousies is panelled, and the upper part has venetians of the usual pattern.

7, 8. There are no artificial means either for cooling or warming the air admitted into the wards. The walls and ceilings of the hospital wards are cleansed and limewashed when required.

9. A plan of the privies is transmitted. They are 36 feet from the hospital, and are constructed of brick and chunam, with tiled roofs. They are kept clean by sweepers, and are not offensive.

10, 11. There is no lavatory attached to the hospital; but a large bathing tub, a hip-bath, and a foot-tub are allowed for the use of the sick, and, generally speaking, they are sufficient.

12. One dhobie is attached to the hospital, to look after the cleanliness of the linen.

13. The storage is sufficient and dry.

14. Some of the hospital cots are made of wood, and others of iron. The bedding consists of one paillasse, one quilt, and one pillow, with pillow case, to each patient. All the bedsteads should be of iron.

15. There is no kitchen for the use of patients, but there is one for hospital purposes.

16. Copies of the present forms in use for keeping the statistics of sickness, mortality, and invaliding in the corps are transmitted.

17. One hospital havildar is in attendance, and, when it is considered necessary, an orderly is allowed to attend upon a patient.

18. The hospital is clean, well ventilated, and healthily situated. No epidemic disease, hospital gangrene, or pyæmia has ever appeared in the wards.

19. I have no improvements to suggest.

20. The convalescents take exercise in the verandahs during the cool of the day, and are occasionally allowed convalescent leave to their houses.

21. This question is not applicable to native troops.

22. There are no special local hospital regulations not included in the General Presidency Medical Regulations.

23. The medical officer has entire control over the sanitary state, &c. of his hospital.

24. There are no wards or hospital for convalescents at this station. If a sepoy requires some time to recover from a disease, he is sent on sick certificate to his native village or some advantageous place. If they require a short period of convalescent leave, they are allowed it in the lines, but they have to come to hospital either daily or as directed, to see if they are making any improvement.

XIII. Burial of the Dead.

1, 2. The burial ground is distant 884 yards from the station, and to the south-west—the direction of the prevailing wind. Its area is 1,936 square yards; its soil light loam, and subsoil gravel.

3. Rules for out-station cemeteries (M. G. O., 5th May 1857) provide that lines 10 feet apart, parallel with the paths, should be marked out, within which all graves should be dug, care being taken that the graves are as near together as may be conveniently practicable. The depth of the graves is at least five feet. Graves have occasionally been reopened for laying the foundation of tombs over them, but never for other interments, nor would there be occasion for any such practice at Berhampore. If a death occurs at a very early hour in the morning, interment would, usually, take place about sunset of the same day; if about noon, interment would not take place till about sunrise of the next day; and if at an advanced hour of the evening, burial would probably have to be deferred until about sunset of the next day.

4. The grave yard is never offensive.

5. All natives are (according to caste) either burnt or buried.

6, 7. Injury to the public health does no doubt accrue from the present practices. Bodies being often buried within two feet of the surface, wild animals consequently disinter them, and the effluvia from these must necessarily be injurious. The graves should be ordered to be dug deeper, certainly not less than four feet (?).

(Signed) Arthur Wyndham, Major,
5th regiment N.I., commanding Berhampore.
G. H. Alexander, M.D.,
Assistant Surgeon D.D. 5th regiment M.N.I.
J. E. Hopkins, Sub-Conductor,
Executive Agent, D.P.W.

May 5, 1860.

HURRYHUR.
MADRAS.

HURRYHUR.

Accommodation. Native troops. Infantry, 16th regiment Madras Native Infantry.

References to Subjects and Queries.	Replies.
I. Topography.	1. The country surrounding the station is for the most part a champágn country, with a few surrounding villages sparsely scattered here and there. There are very few trees except in the immediate vicinity of these villages. The country is for the most part flat, with a decided and rather steep slope towards the river on the west (with a gradual rise beyond it), and towards the cultivated ground on the north. There is at a varying distance on the north, commencing about 3 miles off, an irregular succession of low hills, seeming to pursue no particular or uniform range. On the east and south the country is for the most part level and open, with hills appearing on the horizon. At a distance of 3 miles in a south-easterly direction are three detached hills about ½ a mile apart, assuming a range E.S.E. & W.N.W., the most easterly being about 300 feet high, and the others about 150 or 200. On the S.W., at a distance of about 25 miles, is seen a range of hills lying S.E. and N.W. The soil generally is dry. There is very little wood, jungle, or water, in the vicinity of the station, save in the immediate neighbourhood of the river, and a few tanks, not one of which is within two miles of the station. 2. The elevation of the station is 1,831 feet above the level of the sea, but can hardly be said to be elevated above the adjacent country, save as regards the before-mentioned slope. The highest part is probably about 50 or 60 feet above the water level of the river at this season (January). The river after the month of June, and between that and October, has its level raised probably not less than 20, and may occasionally be 30 or more feet higher than it is now, for a day or two. I know of no higher or healthier ground adjoining the station. 3. The nearest table lands are: the Babadbooder hills and Mercara, lying south by west from this station, both at a considerable distance. The former is of inconsiderable extent, but believed to be very salubrious, and is over 4,000 feet above the sea. The latter is very salubrious, of large extent, and considerable elevation (4,506 feet), on the Western Ghauts; it is visited by much rain during the south-west monsoon. Davaroydroog and Nundidroog lie to the S.S.E., distant about 140 miles, but are of inconsiderable extent, and are both visited in hot weather by such as can find accommodation on them. The latter is 1,500 feet above the plain, or 4,856 feet above the sea. Ramandroog, on the Ramee Mullay hills, lies N.E. by E., and is about 200 miles distant. It is 3,100 feet above the sea, but of considerable extent. The Neilgherry hills, much more distant, and lying S. by E., I need only advert to, *en passant*, as they are so well known. 4. The station is distant about ¾ of a mile from the right bank of the Toverbuddra river. The lower ground to the N.W. is occasionally, but rarely, subjected to overflow, except in unusually long-continued or heavy falls of rain during the S.W. monsoon. This, however, lasts at most for 2 or 3 days only, as from the continuous slope towards the river it subsides with the subsidence of the body of water in the river bed. There are no ravines or broken ground in the close vicinity of the station, but there are, here and there, ravines running to the west into the river. They do not seem in any way calculated to affect the health of the station. 5. The station is sufficiently open to all the usually prevailing winds, and there seems to be no redundant growth of trees or hedges sufficient to interfere with free external or internal ventilation. As regards the sepoys' lines, it would have been better had they been constructed with wider streets, and had the men not been allowed, from time to time, to build other than the original huts within the enclosure originally allowed for each sepoy's hut. As regards the bazaar lines, many interlopers have from time to time occupied and built houses on ground which should have been left open on the west, and thus the access of wind from that quarter is prevented to the sepoys' lines. From the nature of the soil of the station, there is comparatively little reflected sun heat to operate in raising the temperature of the station. The winds generally are neither cold nor variable, and the more prevalent are from the N.E. and S.W. at the seasons respectively constituting the corresponding monsoons. There are occasionally westerly winds towards the after part of the day, which are generally agreeable, and are usually looked upon as sea breezes. The north-east and east winds, which usually blow in the early part of the year, are mostly hot and dry, and rather prejudicial to health, where people heedlessly expose themselves to their direct influence. 6. All the surrounding country which admits of it profitably is under cultivation. The immediate vicinity of the station is closely cropped with indree, cotton, millet, or dhall. The cultivation is permitted to be carried on in rather too close proximity to the men's lines and bazaar lines on the south and west. The men are in the habit of going into these fields for the relief of nature, and while such practice is allowed, there should be some considerable space of intervening ground free from cultivation, whereas, in the direction designated, there is none. There are no works of irrigation in the immediate vicinity of the station. There is no rice cultivated within some miles of the station that I am aware of, but I do not know that there is any prohibitory order. No indigo is grown near here, nor hemp with a view to the preparation of "jute." The linseed planted is cultivated within a few miles for the oil prepared from its seeds, but no flax is prepared from its stalks. There is no nuisance experienced from this. 7. The town of Hurryhur is situated 2 miles to the south west of the cantonment; its population is by no means numerous. 8. The surface soil is for the most part "regur," or "black cotton," resting on red stiff gravelly earth (with a clayey matrix) which here and there constitutes the surface soil (in the more elevated parts) and is in some parts very stony and barren. Beneath there are found syenite and granite rocks here and thero outcropping on the surface. 9. Water is usually found about 40 or 50 feet below the surface, whether in the dry or rainy season. The greater number of the wells furnish water, which is considered unwholesome from the earthy salts with which it is impregnated, and which also make it hard and unfit for washing purposes where soap is used.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	10. The rain fall of the surrounding district seems readily to flow away. The subsoil seems comparatively impervious; consequently, wherever any hollow exists, water lies on the surface until it evaporates; but as before stated, from the cantonment being situated on ground sloping off especially to west and north, there is no lodgment in its immediate vicinity of any consequence at any time. No drainage from higher ground passes into the subsoil of the station. 11. The water for drinking purposes is almost exclusively procured from the river. There are two very fine wells in close proximity to the hospital; but the water is not used for drinking, only for cooking and washing purposes. There are several wells in the compounds of officers' houses, and a few in the lines, some of which furnish water to a limited amount, considered fit for drinking. The tank nearest the station is two miles distant, to the east, and on a somewhat lower level; it is not a source of nuisance. 12. The supply procurable from the river seems unlimited, as even were its bed to all seeming dry, it would be easily obtained at a foot or two at most, by digging. It is, except when at flood, transparent, tasteless, colourless, and inodorous. During the rains it becomes tinged with varying depths of yellow or brown; but this subsides readily on standing, and becomes fit for use after boiling or pouring it through the rough filter in common use in every house in India. It may be inferred that its composition is that of ordinary pure water. It is perfectly soft, devoid of microscopic characters, of good quality, by no means injurious to health, and is sufficient in quantity. The men have the water of the river brought in chatties by the females of their establishments, or employ servants for that purpose. Officers employ "puckallies," who bring it up to cantonment in leathern bags on bullocks. The experimental results of sinking wells are so unfavourable to a reasonable expectation of getting pure water for drinking purposes, that it is doubtful if better water could be obtained than that from the river. 13. No answer to this question. 14. I am not aware of the existence of any definite orders or rules for guidance in reference to the service of selecting sites for new stations, unless the issue to each medical officer on entering the service of the small manual (on Medical Topography) under order of Supreme Government, 22d February 1836 be viewed in such light. Never having been employed on such duty, I know not the amount or kind of inquiry or examination usually looked for, but I am under the impression that usually the report of an engineer officer as to the capabilities of the place is first called for, and, if his report be favourable, that a mixed committee (having one or more medical officers with others) is appointed to examine into the merits or capabilities of the site as already reported on by the engineer officer. I am aware that recently one of the duties of the Inspector-General of Hospitals is supposed to be the making himself familiar with (and reporting on) the topographical and other peculiarities of elevated table lands, as to their adaptability for sanitaria, or for the location of bodies of Europeans. I have not seen or heard of any rules for his guidance, or any that may have been adopted or devised by himself for that purpose. I know also that before the abolition of the medical board inquiries of the kind above adverted to were set on foot in reference to the station of Secunderabad, the barracks having been condemned by some medical officers of Her Majesty's British troops, and the selection of a sanitarium on the eastern coast; but I have not seen published any memoranda of proceedings recommended or adopted on those occasions. The Ramandroog sanitarium was selected as such after the report of a medical committee convened in 1846 to investigate and report on its suitability.
II. Climate.	1. From a comparatively recent period (I have no record of it anterior to June 1857) there has been an aneroid here. In January 1859 thermometrical observations were commenced, and last November only a wet bulb thermometer was furnished in addition to the other; there is also one of Newman's rain guages, but these are the only meteorological instruments at this station. 2. The few means and limited period of observation preclude the formation of a table of much value.

Table of meteorological observations from June 1857 to January 1860:—

Months.	Barometer Mean.	Mean Temperature.	Mean Dry Bulb.	Mean Wet Bulb.	Mean Sun Temperature.	Rain.	Winds. Direction.	Remarks.
		°	°	°	°	Inches.		
January - -	27·840	74	74	63	102	—	N., E.

* There must have been some mistake in recording the observations for these four months.

3. It seems mainly in its features to be a dry climate, with a considerable diurnal range of temperature, especially in the cold months of the year. In all essential respects, however, the atmosphere seems to be pure. Neither has the regiment, nor have I, been here long enough to justify a decided opinion as to the actual influence of the climate on their health, but I should think that with care it must be beneficial to troops coming from the relaxing climate of the coast. In the cold months they require warmer clothing and good shelter. The only precautions necessary as to drill are not to begin too early in the cold months, nor at any time to keep the troops out too late in the morning sun. Cloth trousers and boat cloaks become essentially necessary for night duties, and the former for early parades. From my own experience I cannot pronounce an opinion as to the most unhealthy months at this station, and the residence of the regiment here is too short for observation. From

References to Subjects and Queries.	REPLIES.
II. Climate—*cont.*	the hospital records of the twelvemonths during which the regiment has been stationed here, the following months in the order named seem to have been the most unhealthy :—January, November, June, October, May, February, and September, and the most prevalent disease has been fever, with cholera in the months of January and June. 4. I do not know of any district near the station the climate of which is more conducive to health than that of this station. 5. The following is a list of stations at which I have served, with my remarks on their comparative salubrity :—I have done duty at Madras, Belgaum, Vingorla, Secunderabad, Seetabuldee (Kamptee), Quilon, Cuddapah, French Rocks, Bangalore, and Hurryhur. I arrived at Madras in June 1840, and served at the General Hospital till November of that year. I suffered much in my own health in acclimation, but others my comrades did not in the same degree. Leaving Madras in November 1840, I proceeded viâ Bangalore, Hurryhur, and Dharwar, to Belgaum, where I arrived in January 1841, and served with left wing H.M. 4th (King's Own) Regiment. In the early part of that year, during the south-west monsoon, I went on field service with portions of that regiment to Neepanee and Baddmee. At the close of this year I went to Vingorla (for about four months) in charge of invalids of that corps, about to proceed thence for England, and I returned to take charge of the wing. My duties were principally with the corps of which I had occasionally medical charge, and eventually left Belgaum in charge of it. This corps suffered much in health in the climate of Belgaum. There were many deaths from fever with cerebral complication, from dysentery and from diseases of the liver. I feel more inclined to think intemperance the prime cause of these attacks than mere climate; yet I believe the men were not sufficiently controlled in their movements, consequently they exposed themselves too much to the sun, whilst, on the other hand, sufficient interest was not taken in their welfare to provide for them amusement or recreation of kinds calculated to lessen their disposition to wander abroad. With due care and ordinary precaution as to suitable dress in the monsoon, and avoidance of undue exposure to sun, I consider the climate of Belgaum very good. I marched from Belgaum, in medical charge of left wing of H.M. 4th (King's Own) Regiment, in latter end of October 1842; our original destination was Kamptee, but, after having got within ten days' march of it, our march was countermanded, and, after three weeks' halt on the north of the Wurdah, we started south for Secunderabad. We arrived in middle of March. In this long march the men were under canvass for nearly five months. Their excellent health formed a strong contrast with that of the previous five months. During the march one death alone occurred (from cholera). In cantonment the deaths monthly were (as nearly as I can now recollect) 3 to 6 or 7. I was stationed in Secunderabad till latter end of October 1843, during which time I suffered much in health, from suppuration of enlarged cervical glands and general rheumatism. The regiment (H.M.'s 4th King's Own) suffered severely in health in that station; many deaths from hepatic abscess, dysentery, and diarrhœa. In addition to more or less of similar influences, above adverted to as having probable existence in Belgaum, I believe the construction of the barracks, and its site (both since abandoned, but long before condemned) had much to do with their bad state of health. The site was, in my view, a powerful instrument to mischief. I entertained the impression that the wells of water were contaminated by the burial ground, situated in close proximity and on higher ground. Troops in other parts of the station enjoyed good health, and I believe it is, generally speaking, a healthy station. In October 1843 I left Secunderabad, and proceeded viâ the Neermul jungle to Kamptee, which place I reached in latter end of November. Soon after my arrival I was attacked by fever, in all probability contracted on my journey. This degenerated into a most obstinate and severe intermittent, of very irregular character, and eventually, in the month of April, I was attacked by severe inflammation of right knee joint, by which I was confined to bed for five months, during which my life was despaired of, if my limb were spared. I was compelled to return to Europe on sick certificate. I embarked at Bombay on 1st December 1844. It was thought I should have to undergo amputation above the knee. My own sickness and its sequlæ were contracted *in transitu* to Kamptee; but during my residence at Seetabuldee the deaths, especially from fever, among Europeans, both men and officers, were very numerous. So far as I can judge, the principal causes are the great diurnal range of temperature, and the great power of the midday sun at that station. I am inclined to think the bed of the river Kannar, which skirts one side of the cantonment in its entire length, is a more fruitful source of malaria than is generally attributed to it. I embarked at Gravesend, on my return to India, in good health, with an anchylosed knee joint, in charge of recruits, on 1st May 1847. The principal portion of these recruits consisted of those from the famine districts in Ireland. I arrived at Madras in August (19th). On 12th September 1847 I left Madras by sea for Quilon, where I arrived on 19th September, and did duty in that station with 16th Regiment Madras Native Infantry till May 1850. I consider that station a very healthy one. Natives on that coast generally suffer much from cutaneous disease, which I believe attributable in large degree to the large consumption of carelessly dried salted fish. My next station, Cuddapah, was reached by me on 1st June 1850, the journey being performed partly by sea to Madras, and thence by land. During my stay in that station, my own proper duties were civil, but, during my protracted stay (seven years) I had the opportunity of seeing the effect of its climate on four native regiments, of one of which I had the charge for nearly a year, in addition to my own duties. The climate appeared to agree very well with the men of three of those regiments, and especially with those of the 37th Grenadiers. The men of the 52nd Regiment Native Infantry formed the exception, and, although the having charge of them enabled me to enter fully into enquiry, I was unable to arrive at an explanation of their suffering in health so much more than other regiments. It is true while they were there the lines were destroyed, or nearly so, by a flood, and they had to form new lines; and it may be that this was sufficient to account for it. I could assign no other reason. There was also some difference in the health of the European officers of those regiments. Of those belonging to one there were many passionately fond of "Shikar," who lost no opportunity of being out in pursuit of that recreation. The officers of the next regiment

II. Climate—*cont.*	were not generally so fond of out-of-doors amusements, and they suffered more in health, as I thought in consequence. The officers of the regiment that next came had some improvements made in their houses, which, in some degree, perhaps had a favourable effect on their health, and the last regiment adverted to had the benefit of similar houses. As a general rule, however, most of those who could afford to do so, or who had the opportunity, were in the habit of getting away from the station during the very hot months. For the marked peculiarity of the station at that season is the excessively hot arid atmosphere, with the perfectly still motionless condition of it all night, rendering it almost impossible to sleep unless under a punkah or thermantidote, or what was, in the absence of either, tried for a limited period of time, in my own case, the having water copiously and frequently thrown over the flooring of the bed room, to lower temperature and lessen dryness of the atmosphere. As regards the effect on the covenanted members of the civil service, some of them were always able to pass the hot months on the neighbouring hill at Mudnapully, and of the others large houses, courts, or cutcherries, cooled by wetted kuskus tatties, and the use of punkahs, or thermantidotes, enabled them to bear up against the climate of the hot season better than the officers in the limited houses of the cantonment could be expected to do. A marked peculiarity, in regard to the station of Cuddapah, almost I believe from time immemorial, was the frequent occurrence of epidemics of cholera, by which the inhabitants of the town and the prisoners in gaol were attacked, and the like frequent recurrence of it in the regiments stationed there. In this latter class I strongly suspect it was most frequently contracted by people who had been in the town, and, having once appeared in the lines, it spread there, as elsewhere, by a process allied to the fermenting, or other not yet fully ascertained or determined. Its frequency in the goal and town, so far as my own experience allows me to form a judgment, was, I believe, very largely, in fact principally, due to want of proper sanitary arrangements, and probably actual defiance of all such measures. Prior to my arrival steps had been taken to open up the town and form good roads through it. This and the forming better drains, and enforcing cleanliness of them as far as possible, were being kept constantly under consideration, both in the town and in the gaol, after my arrival. Cholera for the last three years of my stay in that station was hardly known, except as a sporadic case, or where pilgrims, from Nigrutty or elsewhere, seemed to have contracted the disease at that place, or *en route* from it. It might be almost said to have disappeared from the gaol, and this attributable mainly, I think, to greater attention to the quality of food issued, and the other points above adverted to. One (the last) outbreak has been indelibly impressed on my memory. I succeeded, after careful searching out for its possible cause, in discovering that a large accumulation of refuse of all kinds had been allowed to form for months in rear of the gaol. I had pointed out the necessity of clearing this away and preventing formation of any such accumulation for future, and been informed that its removal would occupy a period of three weeks. Meanwhile the river suddenly and unexpectedly came down, and, after some difficulty, I succeeded in getting permission to cast the whole heap into the river at once, as the quickest, safest, and most useful way of getting rid of it (most useful as, by means of an anicut, it would be carried into a large tank below the town). Such was the dreadful effluvium which spread abroad from it during its removal, that the collector could not sit in his cutcherry that day, but the whole was got rid of, by dint of energy, in *six hours*. Cholera ceased almost immediately, and was hardly known in the gaol again. Intermittent fever is unusually prevalent occasionally in Cuddapah. Much of this due perhaps to the peculiar mode of manuring indigo ground, and not a little to the almost universal habit of keeping all the refuse filth close to every house, till the season comes for spreading it abroad on the field, instead of the daily or periodical removal of it outside the villages. My own duties abroad, occasionally very extensively so, involved much unavoidable exposure at all seasons. The effect was very trying to a constitution naturally strong, yet I never left it in the hot season, but remained continuously at duty till beginning of 1857, when I was attacked by remittent fever, which necessitated a temporary absence on sick certificate to Bangalore. I left Cuddapah in beginning of April 1857, and arrived in Bangalore the same month, and staid there till July, but found the climate most unsuitable to me, after so long a stay in Cuddapah, so gladly proceeded to French Rocks in latter end of July. I remained at the French Rocks till December of the same year with the 20th Madras Native Infantry. With the exception of an attack of epidemic cholera, preceded by one of small-pox (both of which had subsided before my arrival), the only peculiarity noticeable in the state of health of that regiment was the apparently unusual proclivity to attacks of intermittent fever. This I believe attributable to the close proximity of a large shallow tank coming down rather closely on the left flank of the sepoys' lines, with insufficient means of screening them from the wind blowing over the tank, and carrying malarious atmosphere through them. Where the men and their families were in the habit of drawing water out of the shallow parts of the tank—where, from the daily receding of the water under the influence of evaporation, vegetable matter was left exposed to insolation and decay, and in this way the water itself might become impregnated—while the persons going for it were continually breathing the atmosphere contaminated by gaseous exhalations from the decaying vegetable matter. In December 1857 I left French Rocks, returning to Bangalore at end of the month with the 20th regiment Madras Native Infantry. Here, from its arrival, the regiment began to suffer much from fever. It might have been partly due to their having recently only come from the moist, mild, enervating climate of Cannanore, combined with an unusually large increase of duty necessarily attaching to their being the only native regiment then in Bangalore. To lessen the amount of labour, ball practice parades were left off, and eventually nearly all parades. Still fever gained rapidly, and eventually nearly two hundred men at a time were in hospital with it. With a view to determine how much the state of their lines might have to do with its causation, a minute examination of the house and enclosure of each sepoy was made. They were found not to be in so good a sanitary condition as could be considered desirable, from

HURRYHUR, MADRAS.

II. Climate—*cont.*	overcrowding, insufficient ventilation, insufficient sewerage and cleanliness, but yet this alone would not seem, as compared with a similar state of things in a regiment near them, sufficient to account for it. Their health continued for many months thus bad, and at length a change of station was recommended to Nellore, and has recently been carried into effect. I left Bangalore in June 1859, on removal to the 16th regiment Madras Native Infantry, stationed at Hurryhur, where I arrived in same month, and need say no more here regarding this station, as notes regarding it are forwarded herewith elsewhere. HENRY PETER RICE, M.D., Hurryhur, 1860. Surgeon, 16th Regiment M.N.I.
III. SANITARY CONDITION OF STATION.	1, 2. It is impossible to transmit a general map and plans of this station and the surrounding country, as there is no one from the Engineer or Public Works Department on the spot available for the purpose. 3. The construction of the barracks is similar to that of the hospital, differing only in having no top ventilation and the verandah being deeper, continuously enclosed round its south end, not at all at the other, and having no enclosed area in its rear. 4. The building used as a "Place of arms" for native regiments is usually designated by sepoys "The barrack," but correctly speaking it is not a barrack. The following table shows the prison cells' accommodation, &c. at this station.

Number of Prison Cells.	Regulation Number of Men in each Cell.	Dimensions of Cells.				Cubic Feet per Man.	Superficial Area in Feet per Man of Floor Space.	Height of Men's Beds above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
Two solitary	1	Inner Chamber. Feet. 8	Feet. In. 8 2	Feet. In. 16 6	1522	1522	$94\frac{10}{12}$	—	4, and 1 door. 1 folding door.	4 feet	$1\frac{1}{2}$ feet.
		Outer Chamber. Feet. In. 3 1	Feet. In. 9 7	Feet. 12							

5. There are no windows except to the guard room, native officers' rooms, prison, and solitary cells. In the first of these they are placed on adjacent sides, in the second and third on one side, and in the last on all four sides. The principal part of the barrack building is used as a place of arms, and has 14 doors. There is a verandah of $9\frac{3}{4}$ feet wide all round, but this is enclosed at the south extremity, and for about 40 feet on the west, and 20 feet on the east front, for use as native officers' room, guard room, and prison. There are no jalousies or jhilmils to the place of arms proper, only slab doors.
6. No bedsteads are allowed for native troops except in hospital.
7. The tents are made of stout cotton cloth—threefold—the innermost, indigo dyed. They are 22 feet long, 12 broad, and between 11 and 12 feet high. This would give a cubic space and superficial area per man respectively of 60 cubic and $10\frac{1}{2}$ square feet; but they have more, because some of the number of men allowed for each tent are absent on duty, and on ordinary marches, and others are probably sleeping with their families.
8. No means of ventilation are used for the quarters, &c. of the native army.
9. The walls of huts are usually built of well kneaded mud or clay, or of sunburnt bricks. The roofs in some lines are thatched with straw, grass, cocoa-nut, or palmyra leaves, in others they are covered in with tiles. Occasionally the roofs are terraced or "dhaba" with well beaten tempered clay.
10. Usually the floors of the huts are raised above the ground, but it in few instances exceeds two or three inches, there is no fixed rule. They are for the most part made of well tempered clay, but the floor of the place of arms (or barrack) is flagged with stone. There is no passage of air underneath.
11. As regards the general plan of construction of native lines, they should have a larger plot of ground allotted to them so as to admit of wider streets, and a larger enclosure being allowed to each of the huts, as the number of followers attached to the men involves the necessity of building other structures in their several enclosures which prevents generally free circulation of air, while it crowds too many people into spaces too limited for their accommodation. Barracks and important works in the cantonment are kept in repair by the Department of Public Works, and the repairs are usually tolerably quickly executed. Medical officers have generally considered it their duty to see to the sanitary state of their own part of the cantonment and its vicinity; but prior to the issue of G. O. C. C. of 26th August, 1856, and 3rd November, 1856, by Lord Clyde, such was not officially considered to be their duty. Regimental quartermasters were, as still, held responsible for their respective lines being kept clean. Being only used as a place of arms, the barrack walls are cleansed and limewashed once in two years.
12. There are no lavatories at this station for the use of native regiments.
13. There are no means of cooking. The washing and drying of the linen is done by native dhobies, whose services seem fully adequate to what is required of them.
14, 15. There are no privies or urinals at the station. It has been before suggested by me, that such conveniences should, where available space was procurable, be erected in all native lines; and the question has been again more recently adverted to in paragraph IV. of letter No. 2,777 of deputy quartermaster-general of Fort St. George's, under date 24th November 1859.
16. The men of native regiments all live in lines, and the sewerage of all of these that I have seen is most defective. The main drains should be lined or cased with brick or stone, and means and appliances provided for flushing them at suitable times, to ensure their being preserved in a cleanly condition. The drainage such as it is usually found to be, and is

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	at this station, may be said to be "Nil." I know of no part of any building used as a barrack or hospital that is damp. The fluid refuse of the barracks flows for a limited distance into the drains, and is then chiefly disposed of by evaporation, for the nature of the subsoil admits of little subsidence into it. There are no cesspits or foul ditches near the station. 17. Six sweepers are daily employed in the lines for the purpose of surface cleansing. The men or their followers generally throw refuse outside their houses early every morning, and this is collected and carried away to about half a mile from the cantonment into the fields by the sweepers. 18. The surface of the cantonment is kept free from excessive and redundant vegetation, and there are no old walls, thick hedges, &c, interfering with the ventilation of the station or bazaar. 19. The bazaar is generally in much the same state as the men's lines, except that it is somewhat more open in itself, and therefore better ventilated. Four sweepers are kept daily employed at the expense of the shopkeepers in the bazaar to keep it clean. Generally speaking it is the custom of the natives of India to keep dungheaps close to their houses. The cowkeepers at this station occupy a part of the bazaar lines, but their part of the station is very open, consequently I do not think much harm can accrue from it, but it should be prevented there as elsewhere. In other respects their houses seem in a cleanly condition. No nuisance is experienced in barracks from wind blowing over the native dwellings. 20. Sheep and goats are slaughtered in a small open space on the south side of the bazaar. The number slaughtered is from twelve to twenty per diem, and but little offal is left from day to day. All that is fit for human food is bought for that purpose, and such as may not be, the pariah dogs soon dispose of, and the mere garbage or contents of the bowels is thrown into the fields; no nuisance is experienced. The beef butcher, whose business is very limited, is allowed to slaughter on his own premises; on the express condition that he carefully removes without delay all offensive materials. 21, 22. No answer to the queries. 23. Staff serjeants are the only non-commissioned officers here. Their quarters seem to be sufficient for them.
Officers' Quarters.	There are no public officers' quarters at this station.
IV. Health of Troops.	1. The station, district, and surrounding population seem to be for the most part healthy. 2. There appear to be occasional epidemic attacks of cholera, but in no very severe degree. I have no knowledge of the existence of spleen disease as common here. 3. Grain and other articles of food are tolerably cheap, the country is open, the people tolerably well off, and all these circumstances contribute to their general healthiness. 4. The 16th regiment of Madras native infantry arrived at Mangalore from Aden on the 16th April, 1855, and stayed there till 20th December, 1858, or $3\frac{3}{4}$ years. Its health while there seems to have been good, considering the nature of the station, and the previous effect on their health of the climate of that (Aden) from which they came. The annexed table will show this, while it will also show the ratio of the principal diseases from which they have previously suffered, and do now. The outbreaks of cholera—two the last year—seem to have been inexplicable and unusual in this station. I have not observed that any one portion of the men's present accommodation at this station is more unhealthy than the rest.

Abstract View of the State of Health of the 16th Regiment M.N.I. for the Period and at the Stations herein-below specified.

	The regiment arrived at Hurryhur on 7th January 1859, and the Returns immediately above comprise the period from 31st March 1858 to 1st April 1859. Below I append the exposition of the state of health from 31st December 1858 to 1st January 1860.																				
	1859-60	572	45	869	28	25	3	140	1	23	5	33	—	49	—	40	—	54	3	66	32

	5. It is not the practice at this station for troops to be camped out. 6. I have never been in charge of troops at hill stations, nor have I had an opportunity of obtaining personal experience on such stations. 7, 8, 9. No personal experience of hill stations. 10. The precautions I would recommend to be observed by troops at hill stations are moderation in the use of vegetables in their diet, and the use of such clothing as is chiefly woollen. Out-of-door duties by day require more shelter or thought for it than where the necessity seems more palpable—in the lower country; but on these matters I have had no opportunity of personal experience.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	11. I have had no experience to enable me to judge of the seasons best adapted for a residence in the hill stations, but I should think that the shortest period which would enable troops to benefit by such residence would be a year or 18 months. 12. No answer to this question. 13. With respect to the precautions to be observed for protecting the health of troops on leaving hill stations for the plains, I am unable, from want of personal experience, to venture other than theoretical opinions, or I must borrow those formed by others, who no doubt will furnish the results of their experience. 14. Looking to the consideration of this question in the largest point of view, and to the possible necessity at any future time for protracted field service in the plains, I should think it unwise to adopt, at any rate extensively, the plan of locating troops in hill stations with short periods of service in the plains. On the contrary, though I have not the results of observation of troops so situated to give in support of my view, yet I should think that locating them in the plains, with short periods of change to the hills, would be at least equally conducive to their health, while it would keep them in a condition generally better able to bear any sudden call for field service in the plains, whether for short periods or otherwise. My long residence in one of the hottest stations in the south of India inclines me to venture this opinion. It is now 17 years since I was connected with an European regiment; but, looking to my experience then gained during a protracted march with the left wing of Her Majesty's 4th (King's Own) regiment (from October 1842 till March 1843), and the good health and spirits enjoyed by the men on that occasion, also to the desirability of lessening the monotony of the same scenery day after day, month after month, I think that frequent change of station on the plains, for European troops, is highly calculated to have a beneficial effect on the health of the European soldier, and no less on that of the European officer. With regard to native troops, however, I have some reason, however, for thinking otherwise, excepting as regards the colder stations, which are *per se* inimical to their health, or the larger stations, where the price of food is often too large for their pay. A march entails so much expense on the sepoy from the necessity of procuring carriage—often at a great outlay—for the followers, that I think the more protracted stay in stations would be beneficial to his health and spirits; but in such cases every facility should be afforded to European officers of obtaining occasional leave of absence from their regiments. 15, 16. No answer to these questions. 17. I know of no higher ground near this station that could be advantageously occupied as a hill station. 18. This question, relative to the particular classes of surface and subsoil best suited for stations, has not engaged so much of my attention hitherto as to justify my answering it in a detailed or positive manner. In a general way I may note that it has occurred to me that those stations were the most unhealthy where primitive or "igneous" rocks approached nearest to the surface, or, where conjoined with this, the soil or subsoil was of a more or less impervious nature from being calcareous, or more or less clayey; while, on the contrary, *cæteris paribus*, those where the underlying rocks were of the aqueous order, such as the various sandstone, argillaceous, or calcareous rocks or stratiform deposits, with any character of soil or subsoil, excepting the more modern alluvial deposits, were comparatively more healthy. 19. Soldiers should not proceed to India prior to 19, nor after 25 or 26, years of age, and should land there from July till October. I have no experience to say how troops are disposed of on first landing in India, as, on the disembarkation of the troops in charge of which I left England in 1847, they were at once removed from my charge. From my own experience I cannot say what precautions should be adopted for preserving the health of recruits on first landing in India. 20. From what I observed in Her Majesty's 4th (King's Own) regiment, 17 years ago, it seems to me that previous service in Australia is a very good preliminary proceeding. So far as my knowledge of the climate of Bangalore enables me to form an opinion, I should think troops being sent there (if kept under supervision by experienced officers, to exercise the necessary control over their movements) preferable to sending them to the Nielgherries —for the Madras presidency. I would make it a general depôt for all British troops on their first arrival. 21. I have no personal knowledge of the mode of transport of troops from the port to the interior usually adopted. 22. As a general rule, I do not think any man should be made to serve more than 10 years continuously at a time in India. 23. I think, as regards the conducting of medical boards, there should be perfect liberty of expression of opinion, though it may differ from that of any or those of all the other members (senior or other), and, so far as my own experience—now rather large—enables me to form an opinion, it has always been so without detriment either to the state or to the individual concerned. In other respects the modes of procedure open to adoption are calculated to induce conflict of opinion, viz., 1st, inasmuch as the regimental medical officer must include in the roll of men whom he considers on medical grounds unfit for service those also whom the commanding officer considers unfit, although the medical officer sees no ground to justify concurrence in such an opinion. Again, the commanding officer has the right of calling for a board of field officers to support his appeal against the opinion of the medical board who may adjudge any given man or number of men fit for service, notwithstanding his previous expression of opinion as to their unfitness. I see no ground to suggest any change, as the present system seems calculated to protect alike individual interests and those of the state. 24. Invalids should leave India for home so as to arrive in the latter end of spring or the beginning of autumn.
Diseases.	1. There are inspections of the young recruits once a week in this regiment, but it is not general in the native army, nor do I think an adequate advantage is gained by it, as it is calculated to diminish what little self-respect some of them may have. 2. No case of scorbutus has occurred at this station. 3. The occurrence of hepatic diseases among native troops may rather be considered as merely accidental than as *per se* incidental to climate; natives do occasionally suffer from them, but the proportion is small in reference to the sum total of diseases. Natives are apt to

References to Subjects and Queries.	Replies.

IV. Health of the Troops —*Diseases—cont.*

suffer from engorgement of the liver no less than of the spleen in obstinate intermittents, and the adoption of a line of treatment thus indicated is often necessary for the arrest of intermittents. In the course of 20 years' service I have met with five fatal cases of abscess of the liver among natives. On examination of the records of this regiment, I find that in a total of 4,400 sick during nine years (1850–9) there were 51 admissions from disease of the liver, and that six proved fatal, one of abscess, and one of jaundice, while stationed at Aden, also one of jaundice and another of abscess after the regiment left Aden: whereas in the three following years there were only two fatal cases. The ratio of hepatic to all other cases is, for this regiment, 1·165 per cent.; the ratio of fatal hepatic cases to all admissions ·136 per cent.; and the ratio of deaths from hepatic diseases to admissions from the same is 11·764 per cent. I am inclined to think, on examination of the records of other native regiments, the disease and fatal cases from it would not be found to bear so high a ratio.

4. Dracunculus seems to be specially endemic in certain localities, contracted through the immersion for a greater or less length of time of the bare extremities in water infested by the animals, the ova of which, or one or more of the young, probably enter the softened cuticle, and eventually become fully developed in the cellular tissue. As a rule, it seems to be found in the lower extremity below the knee, and I have seen a few cases above, only one however have I extracted from the scrotum. Occasionally it is found to obtain a residence in the upper extremity, and I have heard of a case in which the extremity of the nose was the seat. The prophylactic measures to be recommended are self-evident; viz., to avoid recourse to such pools or tanks as these animals are known to be found in. Out of the 4,400 admissions in nine years, there were only eight from dracunculus or a per-centage of ·181. No cases of this disease were known at Aden.

5. Out of 4,400 cases under treatment during nine successive years in this regiment there were 275 of venereal affections, being a per-centage of 6·250. I am doubtful whether the establishment of lock hospitals would be advantageous as regards the native army. I think, however, it might be otherwise for the European portion of the army.

6. The following are the diseases from which the troops at this station suffer :—

Fevers.—From the Table transmitted (in reply to Question 4, Division Health of the Troops,) it will be seen in the last line, that the regiment has suffered very little more from fevers in one year here than it did in the years 1856–7, at Mangalore. Natives usually suffer more from fevers in the higher and drier stations, with more variable temperature, and such will probably be the case in this station. The majority of fevers assume the intermittent form, and usually the quotidian type.

Dysentery.—The troops seem to suffer less from dysentery here than at the last station. In the official year 1856–7 (from March to April) there were 28 cases; in 1857–8 there were 31 cases, and in 1858–9, there were 16 cases. During the last twelve months (the residence here of the regiment since the commencement of the year 1859), there have been only 12 admissions. They get in this station better and cheaper grain than they did in the last. In that they probably consumed much of badly prepared unwholesome dried salt fish, instead of which they can here get as cheaply or nearly so, sheep's or goat's flesh.

Cholera.—There has been no cholera in this regiment since 1854, till it came into this district in 1859. There was an epidemic attack in January, and another in June of that year, which did not entirely leave till September. In the Mysore district generally it commonly prevails, but is said not to be very prevalent here.

Small-Pox.—No epidemic of small-pox has yet been experienced, vaccination is kept up in the regiment as a preventive measure.

Rheumatism.—Rheumatic affections do not seem to exist in unusual amount here.

The following Table shows the proportion which admissions and deaths from these diseases bear to the total admissions and deaths.

Period of Observation.	Diseases.	Proportion of Admissions to Total Admissions.	Proportion of Deaths to Total Deaths.
		per Cent.	per Cent.
12 months, from 1st January 1859 to 31st December 1859.	Fever	24·476	0·450
	Dysentery	3·671	6·666
	Cholera	11·537	71·133
	Small pox	1·223	none.
	Rheumatism	5·769	none.
9 years, from 31st March 1850 to 1st April 1859.	Cholera	1·022	19·444

7. The nosological character of the more frequent zymotic diseases is as follows :—

1. Cholera is usually characterized by excessive prostration of vital power in all its manifestations, by more or less of purging of rice-water evacuations (occasionally with a reddish tinge of greater or less depth) and vomitings; though sometimes neither of these present themselves from first to last; suppression of all the true secretions (especially the biliary and urinary), cold extremities, with shrunken skin and features, a feeble almost obliterated voice, deafness, a complete *insouciance* of what is going on around, intellect seems to remain, cramps occasionally, though often none, and intense almost unquenchable thirst.

2. Small-pox is not often seen in its genuine form, but is mostly modified, the "pseudo-pustule" wanting the true central depression, and seldom leaving anything like a "pit" in its site when desquamation takes place. The premonitory fever is seldom well marked.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	3. Measles.—Is generally well marked as regards the catarrhal symptoms, and sometimes severe pulmonary complication supervenes. The skin affection is by no means well marked, it seems seldom to pass into the true exanthemetous form, a thickly aggregated papular eruption only making its appearance. 4. Fevers.—The principal notable feature is their marked tendency to the intermittent form in natives. Of 964 cases treated in the course of nine years, the ephemeral type constituted 35·67 per cent., while the intermittents were 60·12 per cent. A large proportion of those called ephemeral may probably, in reality, be looked upon as intermittents cut short by treatment. 5. Rheumatism, in many of its forms, presents symptoms affording strong grounds for presumption that it owes much to syphilitic poison lurking in the system, for its causation in a very considerable proportion of the admissions. It is difficult to procure sufficiently precise data in support of this view, from the facilities enjoyed by natives of having recourse to native treatment for primary disease. These diseases have seemed to me to occur at any or all seasons indifferently, and I have not noticed that any uniform or determinate condition of climate or atmosphere has preceded or accompanied their appearance. It has not occurred to me to find that these diseases attach themselves to any given portions, specially or exclusively of station, bazaar, or native dwellings, &c., and in fact, when the sanitary condition of all parts is mainly and essentially the same, it can hardly be expected to be otherwise. In cantonments, where officers live in private bungalows, and where, consequently, the sanitary condition can, and ought to be in a better state, the number of cases are comparatively few. Among natives I am inclined to attribute much more of influence in the causation, and keeping up of epidemic cholera, to the carelessness and filthiness of the grain merchants and purveyors of other articles of food, than to any deficiency in drainage, water supply, ventilation, &c., &c., referred to in this question. I attribute much of evil influence to the low order of true personal cleanliness, both as to clothing and in every other respect, among the native population generally, and the class of persons from whom food is usually obtained in particular. 8. I have not observed any marked influence on the prevalence of epidemic disease through the nature of the soldiers' duties, either in barracks, on the march, or in the field. I have only marched once with native troops; but I have been on the march three times with European troops. One of these marches was a protracted one of five months; but the men were so well looked after, that I think their habits on the march can little, if at all, have disposed them to such attacks. 9. Small doses of quinine as a prophylactic against malarial diseases have not been generally tried at this station; but personally I have so used it, and as I believe with advantage. 10. With reference to cholera; where native troops are concerned, I think the bazaar should be completely under European surveillance and control, that an occasional thorough inspection of their premises should be officially made, to see that the articles sold by them are of unquestionably good quality, and duly kept in a cleanly way; that all food considered unfit for consumption should be confiscated and then and there burned; while the person keeping or exposing it for sale should be severely fined, and the process adopted should be speedy, summary, and without appeal. Any marked defect in the sanitary condition of their premises, if not remedied after due warning, should also be punishable by fine levied on the spot. It would, I believe, be found that cholera often begins in the bazaar, and spreads thence.
V. INTEMPERANCE	1. This question as to the temperance or intemperance of troops at this station, is not so easy to answer definitely for natives as for Europeans, for the former are not nearly so much under surveillance, and might consequently go to bed drunk, sleep off its effects by morning, or should he be then still unfit for duty, his condition might not be readily or unerringly assignable to such a cause. The European living in barracks can hardly go to bed drunk without its being known. He can hardly use "liquor" in his barrack room without its being known, whereas the sepoy in his own hut lives in a state of comparative privacy. There are no means existing to give the proportion of confirmed drunkards at this station. 2. There are no records in existence as regards native troops, to enable me to answer this question, with respect to admissions into hospital from diseases caused directly or indirectly by intemperance. Drunkenness is always punished as an offence, but is not so prominently noticed as a crime in the case of natives as in that of Europeans; in all probability because not so easily recognisable or susceptible of proof. 3. The sale of spirits in the regimental bazaar at this town is prohibited; but they are easily procurable in the neighbourhood. The natives however do not have recourse to alcoholic drinks exclusively. Opium and various preparations of hemp and dhatura are easily procurable in the bazaar. Spirit forms no part of the ration for convalescents, nor are rations in India given to native troops. No drinks other than intoxicating drinks are sold in the bazaar. 4. The daily habitual consumption of spirits I incline to think, has an injurious tendency on the health, and is not at all conducive to the efficiency or the internal discipline of the corps. 5. It would, I think, be beneficial to restrict the use of spirit within reasonable limits. Its issue ought to be abolished as part of the ration; but it might not be proper to prohibit its sale in the canteen or bazaar (where the amount consumed can be known), as this might result in the men going elsewhere and getting a noxious spirit, in an unlimited quantity. 6. I am of opinion that sound wholesome malt liquor is much less likely to be prejudicial, and would, I think, be preferable to such wines as could or should be issued in a tropical country. 7. There is no coffee, tea, nor lemonade, &c. at this station, but I am inclined to think that as a general principle those who use these beverages, instead of spirits or malt liquors, are likely to enjoy better health, and therefore, to be more efficient, while also, more amenable to proper discipline than the habitual (and especially the excessive) consumer of spirits or malt liquor.

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	8. I think it would be beneficial to the health of troops to suppress altogether the spirit ration. There might possibly be exceptional cases or occasions in which a medical officer would sanction, were it thought desirable to refer to him, departure from the rule as a temporary measure; but there would still be the ground for fear that a man habituated to spirits for a long time past would then seek it elsewhere, irrespective of quality. 9. I think it would be beneficial to prohibit the sale of spirits, and permit only the sale of beer, coffee, tea, &c.; but with well-marked limitations for special subjects or occasions. 10, 11. No reply to these questions.
VI. Diet.	No information under this head.
VII. Dress, Accoutrements, and	1. The soldier's dress consists of the following articles:—Full dress or review order. Tunic, white trousers, turban, and pulputty, pair of sandals, gulputty (stock), and ungreka (worn under the tunic). Heavy marching order. Coatee, cloth trousers, turban and cover, pair of sandals, gulputty, ungreka, haversack, and knapsack, complete with boat cloak. Drill costume. Coatee, black cotton trousers, roll-call cap, pair of sandals, gulputty, and ungreka. The accoutrements consist of:—Musket, bayonet, ramrod, waist-belt, non-commissioned rank and file, belt-pouch, non-commissioned rank and file, sling musket, frog-buff bayonet, pouch, musket, 48 rounds, pouch percussion-caps, scabbard, bayonet. The weight of the musket and bayonet is 9 lbs., of the accoutrements 5 lbs., and of the pouch with six rounds 3 lbs. 2 oz., with 60 rounds 6 lbs. 8 oz. The pouch alone weighs 2 lbs. 12 oz., and each cartridge 1 oz. The present dress for native troops is, I think, made too tightly fitting to the frame. I would totally discard the red colour for all arms, and have the outer garment hanging loosely over the chest and body from the shoulders. I would, as far as possible, avoid belts to gird the frame; everything save the cartridge-box and bayonet as far as possible should hang on or from the shoulders. Whether by day or night such clothing would on the one hand be cooler, and on the other warmer and more comfortable than tightly-fitting garments. The only difficulty might be in the proper disposition of the fully-equipped cartridge-box on native service; but for this, and every other article save the boat-cloak (to be fastened on as now by loop-straps crossing in front of each shoulder), I think one belt alone necessary, viz., a broad waist-belt, not girding the waist tightly, but rather sitting as it were on the hips. I think the adoption of something like the general style of dress of the "Zouave" would probably be more consonant with the comfort and inclinations of the native force than the assimilation of their dress to that of the European. As regards head dress, I would suggest for Europeans, instead of the wicker helmet lately ordered, one made of "rumdah" (as made up in Dharwar, Bombay) for protection from heat or cold on the hills or plains; a simple waterproof cover might be kept in the crown of it for use, as occasion required. For under clothing I would suggest the general adoption of flannel; for body clothing, the total rejection of scarlet, and adoption of khakee (of cotton drill, or coarse brown holland) for drill purposes and all ordinary duties; adoption of a cloth tunic for full dress, general guards, or field service, its colour to resemble that in use in the Bavarian army, or some tinge of khakee. Socks of woollen to be used at such seasons, as dew or rain fall would expose the feet to damp; or on the line of march loose trousers and leather gaiters; all necessary belts to be of simply browned leather. Natives might wear the khakee if supplied with a simply-made flannel jacket or vest to wear under the thinner one. They would not object, either, to a felt helmet, I am disposed to think; but, as before stated, I am of opinion that a Zouave style of dress would best meet their wishes and requirements. At present they wear on guard the drill dress, and for wet weather they have a boat cloak; their topee, being waterproof, needs no protection. Sentries in exposed places have a sentry box; but under ordinary circumstances no special protection from heat is needed by, or provided for them.
Duties.	1. Looking at this question in a medical point of view, I see no necessity, under ordinary requirements of the service, for the arrival of troops in India with a thorough knowledge of drill, while it appears to me that men are better situated for the process of gradual acclimation, during the time employed in teaching them their drill, than they would be if they landed in a condition that would justify the putting them immediately on the roster for general duties with their older comrades. 2. The following is the routine of the soldier's duties:—In the drill season, from September to March, drill five times a week (for recruits morning and evening), independent of the routine of garrison duties and roll calls. Drill generally lasts about 1½ hours, and the men do not appear to suffer in health from it. The best times for drills and parades are about the hours of sunrise and sunset. The best time to commence a march seems to be about one or two hours before sunrise, according to the length of march. Orders on the subject of "marches" are published in "General Regulations," at pp. 330, *et seq.* The men at this station have from five to six nights in bed during the week. 3. Guards are all mounted within one, or at the most, two furlongs of the barracks; guards last 24 hours. Sentries are relieved every two hours. There is a roll call at 7.30 a.m., daily, for "arms' cleaning," and in the evening one at 5.30, or 6 p.m., according to the season. No prejudicial effect seems to result from the routine of night guards; and the usual precautions suffice.
VIII. Instruction and Recreation.	No information under this head.
IX. Military Prisons.	1. The cells for solitary confinement at this station (as I believe is also the case throughout the division), are, in one respect, defectively constructed. They consist of a square mass of substantial masonry, terrace-roofed, with ventilation through four large openings, near the roof on the four walls, and a small central shaft. They are entered by a smaller and somewhat similar structure of the same depth, nearly half its breadth and two-thirds its height, also terraced-roofed. This latter room is usually provided with some receptacle, open for fœcal or urinary deposits, but the odour from such evacuations naturally pervades the larger sleeping apartment, as from its probably heavier nature it is not likely to be readily displaced by air entering from above. Some contrivance should be added to this outer apartment to permit these evacuations being at once deposited on the outside of the cell, and thus, by a closing trap door, obviate the annoyance, at least of their odour pervading the whole interior.

References to Subjects and Queries.	Replies.
X. FIELD SERVICE.	1. No reply to this query. 2. The powers of medical officers seem to be, as regards the conduct of the line of march, &c., comparatively inoperative under ordinary circumstances; as generally interference by them would probably be held to be justifiable only when they see any likelihood of ill results ensuing on the carrying out of orders regimentally issued on these topics. Usually a line of march is arranged, and a "route" forwarded by an officer of the quartermaster-general's department, (without reference as I believe to the medical department), the camping grounds are also specially designated by that department. Practically no deviation is usual from an order so received, but commanding officers are vested with discretionary powers to alter these as circumstances may seem to require, and possibly would not do so without the knowledge and concurrence of the medical officer. Usually commanding officers listen to suggestions of medical officers on the propriety or necessity of avoiding given halting places. Such, however, has not always been done. Consequently, an order was issued some five or six years ago, by his Excellency the Commander-in-Chief, directing attention to the necessity of attending to such suggestions. The place assigned to the medical officer on the line of march is the rear of the column, consequently he has no opportunity of ascertaining the nature of the encamping ground before arrival of the column, and therefore, the camp would not perhaps be changed for light reasons, or such as seemed to be so to others. In European regiments, when practicable, a medical officer goes in advance of the column with the sick, and assists the quarter-master in selecting the ground. It might be advisable to allow the medical officer of the native infantry corps, to go forward when the column has moved on, to enable him to get in sufficiently early before its arrival, to see and form an opinion of the nature of the ground proposed to be taken up. All the ordinary contingencies of a march might be well enough attended to by a medical subordinate. 3. The practical operation of camp regulations, &c., is supposed to be especially under the conduct of regimental quartermasters, who are considered responsible for the sanitary arrangements, &c., on the line of march as they are in cantonment. The powers of the medical officer in these matters are merely nominal, consisting in representations of what in his judgment requires attention, and remonstrances proving of no avail reference to higher authority. 4. Nearly all arrangements for field hospitals, ambulances, &c., are made by the quartermaster general's department, by which office a code of regulations is issued for general guidance. The necessary indents on that department are made out, and forwarded by the quartermaster of the regiment, with the exception of such extra carriage as is provided for by the medical regulations, from which an extract is appended.

EXTRACT FROM CODE OF MEDICAL REGULATIONS, MADRAS.

"The carriage of all hospital stores, including medicines and instruments, will be provided for by the commissariat, at the expense of Government, upon indents countersigned by the superintending surgeon or in his absence by the officer commanding. Duplicates of these indents shall be forwarded by the superintending surgeon to the medical board; and the responsibility will rest upon the indenting officer, until his requisition has received the sanction of that authority. The duplicate indent, when sanctioned shall be returned to the the superintending surgeon for the purpose of being delivered to the commissariat officer, and will be the proper voucher for the supply.

	Ft.	In.
Length -	3	9
Breadth -	1	6
Depth -	1	6

Whenever it becomes necessary to indent for boxes for the carriage of medicines on carts, boxes of dimensions of a six dozen chest as noted in the margin, with padlocks and hinges shall invariably be indented for as being more easily procurable.

"All regiments, European and native, will be provided at the public expense with field medicine chests for the conveyance of the European medicines, &c., when marching or on active service; and detachments either of European or native troops marching from station to station will be supplied with portable medicine boxes Nos. 1 and 2.

"Indents for carts or coolies for the carriage of medicines, &c., submitted to the medical board for sanction must be prepared agreeable to the following form, and superintending surgeons are prohibited from forwarding indents which are not in strict accordance with the form here laid down.

To Captain

Assistant Commissary General.

SIR,

Please to order the following supply for the carriage of medicines, &c., for the use of the Regiment N.I., proceeding from to effective strength.

Description of Carriage wanted.	Number or Quantity.	Required for the Conveyance of	Sanctioned by Superintending Surgeon.	Remarks.

Station A.B. Surgeon.

Date C.D. Superintending Surgeon.

N.B.—Any further explanations that may be deemed necessary should be entered in the column of remarks, or at the foot of the indent.

References to Subjects and Queries.	Replies.
X. Field Service—*cont.*	"Detachments either of European or native troops, moving from station to station will be supplied with medicines for the march, from the depôts of medical stores at the presidency and out-stations, packed in portable medicine boxes, agreeable to a scale fixed by the medical board, and furnished to the medical and deputy medical storekeepers. "Coolies shall be provided for the carriage of medicines, with all parties of European or native troops, moving from station to station, less than complete corps, but which are sufficiently large to be under the charge of a medical officer in the following proportions, viz., with all detachments consisting of—

Europeans.	Natives.	Coolies.
25 to 75	50 to 150	1
75 to 250	150 to 400	2
250 to 350		3

The above coolies to be supplied in the same manner and under the same forms as prescribed for the carriage of the portable medicine chests attached to corps in the regulations for the quarter-master general's department.

"In detachments, either European or native, less than the above, where the assistance of a medical attendant may be necessary, one cooly for the carriage of medicines shall be supplied.

"When detachments march from the presidency or other stations where public depôts of medicines are maintained, the medical storekeeper at the former, and the deputy medical storekeepers at the latter, are to be charged with the duty of indenting for the carriage authorized by the paragraphs 28, 29, and 30. At other places the duty is to be performed by the surgeon or assistant surgeon proceeding in charge of the detachment, or, in cases where medical attendants of inferior rank only are ordered, by the garrison or other surgeon who may have been in previous charge of the troops about to march.

"Indents for coolies for detachments of regiments should bear upon them the particular duty of each cooly employed, and the nature and weight of carriage conveyed by him.

"On the arrival of detachments at their respective destinations, the boxes with the remains of the supply of medicines will be delivered over to the medical or deputy medical storekeeper, as the case may be, or, at stations where there is no depôt of medical stores, to the senior medical officer present. These medicines to be brought on the hospital books of the medical officers, by whom they are received and accounted for under the head 'Received by Transfer from Detachments."

A true extract.

James Peterkin, M.D.,
Surgeon of the 16th regiment of Madras N.I.

XI. Statistics of Sickness and Mortality.

No information under this head is given.

XII. Hospitals.

1. A plan of the hospital at this station is transmitted.

2. The hospital is situated in the rear (west) of the sepoys' lines, with an open space of about 100 feet intervening. The bazaar is to the rear (west) of the hospital, stretching away from it on either flank; but there is an open square in the immediate rear of the hospital, used as a market place for supplies brought in from the surrounding country once a week. The site of the hospital is sufficiently open and ventilated, and, although buildings have been erected somewhat too closely on either flank, there are open spaces in front and rear of it, the former 966 feet long and 127 feet broad, and the latter 238 feet long and 236 feet broad. The site is generally healthy, being on the highest part of the space in which it is situated. The surface water from rain-fall runs off on all sides, though there is no special drainage for that purpose. There are no nuisances from marshes, foul ground, water pits, &c., experienced at this station.

3. The water supply is abundant and wholesome, and for drinking purposes is procured by puckallies from the river. There are close at hand, one on either flank to its front, in the space between it and the lines, two fine "bowries," well supplied with water for cleansing purposes, but, being saline, it is not fit for drinking.

4. Refuse water and other fluid impurities are allowed to flow into the cesspit attached to the hospital privy. Solid impurities are swept up and removed daily to some distance from the lines. The cesspit is in the immediate rear of the hospital enclosure, and has no external outlet.

5. The several wards are all on the ground-floor, which is raised a foot and a half from the level of the area in front, and two feet above that in rear of the hospital. There are no underground openings or ventiducts. No provision for the conveying away of roof water is necessary, as the ground slopes away on all sides, and the water runs off without sinking into the subsoil. There is no surface drainage or guttering round the hospital. The walls and pillars of the hospital are built of brick and chunam, the roof of teak wood tiled, the floor of stone flags, and the compound wall brick and clay, plastered with chunam. The walls and roof are single, with verandahs sufficient to keep out excessive heat. There is a verandah all round the hospital, eight feet and a quarter deep, which at the four corners is enclosed to form a surgery, store room, bath room, and dissecting room; the last two occasionally used for contagious cases or others when the number of sick is large. The verandah affords sufficient shelter from the sun's rays to the central ward. The two small corner rooms adverted to are the only parts of the verandah used for sick, &c. The building is all on the ground-floor.

XII. Hospitals—*cont.*

The principal winds are easterly or westerly, and sweep across the hospital, necessitating occasionally the closing of all the doors on one side when blowing strongly. This is inconvenient, as there are no windows to the central ward. There are only glass windows to the surgery and store room. These, while conducive in some degree to ventilation, contribute in no wise to the cooling, as they are too low to let out upper currents of heated air.

6. The numerous doors, with the openings in the ridge of the roof, are sufficient for the ventilation of the wards. The upper halves of the doors are constructed after the fashion of Venetian blinds, of a succession of horizontal flaps, preventing the passage of air or light when allowed to fall vertically over each other, but admitting their passage from below horizontally, or from above downwards, according to the degree in which they are made to revolve horizontally on their axes. The windows of the bath and dissecting rooms are constructed in a similar way.

7, 8. There are no artificial means for cooling or warming the air admitted into the wards. There are no prescribed periods for limewashing the walls and ceilings of the hospital; but it is done as often as the medical officer may deem expedient either for cleanliness of aspect or with reference to any recent epidemic disease.

9. The privy is an oblong partially double roofed, pent tiled building of brick and chunam 12 feet by 8 feet, and 9 feet high, with openings at the upper part of each gable end. The central part of the roof is elevated about a foot above the general level of the ends, to admit of more complete top ventilation. At the back part of the floor (which inclines well from before backwards, and is flagged with stone) is a long wooden bench perforated with openings, beneath each of which is placed an earthen vessel for the reception of stools. Urine is passed at once into the channel at one end, communicating with the cesspit. The use of a cesspit where it is avoidable is objectionable, but the situation of the hospital renders one necessary. The solid matter is carried away daily, and the free washing of the privy floor into the cesspit seems to prevent its being very offensive.

10. With natives there are no special lavatory arrangements. As much water as the sick require is furnished to them, and occasionally convalescents are allowed to go to their houses for a short time to bathe. Bathing with natives is usually synonymous with presumed restoration to health, and the process of washing which of their own accord usually satisfies them while in hospital, is of the most superficial and unsatisfactory nature to the views of an European.

11. Natives object to bathing except in their own way, consequently it is seldom resorted to except as a remedial measure. For that purpose there is a wooden bathing tub, and a bath of brick and chunam which are sufficient. Hip and foot baths of wood are also available.

12. The washing of the linen is done by the hospital dhobie at the river, half a mile distant. The means are sufficient for the demand.

13. The storage is sufficient, and dry.

14. The bedsteads are wooden frames painted white, and laced with broad tapes to support the bedding, which consists of a blue indigo dyed mattress, filled with straw, when necessary a quilted cotton counterpane, and a pillow stuffed with straw and a pillow case. In such cases as require it woollen "cumblies" are available as extra warm coverings.

15. Natives prepare their own diets, or have it prepared by a relative. The kitchen of a native hospital is consequently almost exclusively used for the preparation of poultices, &c.

16. Copies of diet tables are forwarded.

17. The hospital attendants are, a standing hospital havildar to maintain discipline, &c., and also a daily orderly private. All those sick who require it have orderlies to attend on them as long as such aid is indispensable. The system operates very well, and seems to be sufficient for the purpose.

18. The general sanitary condition of the hospital is good. A peculiar form of ulcer, though not in its intrinsic nature at all serious, prevailed some months ago. I strove in vain to arrive at the probable cause of it, thinking probably it might be due to some carelessness in dressing wounds, but notwithstanding all my endeavours to elucidate the true cause, I could not satisfy myself on that point. It has long since ceased to exist, or has become inoperative.

19. It would I think be a great improvement in every way to the hospital if the first, third, and fifth doors in front and rear were dispensed with, and in their stead glazed windows placed as high up in the walls as possible. In this way by filling up the lower parts of the doorways space would be given for six more beds, while light and ventilation might at all times be increased.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	20. Convalescents are sent out with a non-commissioned officer, if such be in hospital, or in charge of the oldest or steadiest private. The time and place for their walking exercise being prescribed, they only go out morning and evening when shaded walks and seats are not required. 21. It is supposed to be the special duty of native dressers, under the general superintendence and knowledge of the medical officer, to attend to the native "Followers." Occasionally severe or dangerous cases are visited by the medical officer, or admitted into hospital. Such cases are usually kept in the room called the dissecting room (seldom used for such a purpose), and their own relatives are allowed to attend on them. There is also a large supplementary temporary building which was erected some months ago for the reception of cases of cholera. These arrangements are sufficient. 22. No reply to this query. 23. With regard to repairs of building, &c., in the hospital, the medical officer has in general only to make known to the officer commanding the regiment what is necessary, and it receives early, if not immediate attention. For hospital comforts he requires the sanction of the superintending surgeon, and then procures them through the commissariat, excepting such as are provided periodically on monthly indents. The scale of hospital comforts ought to be increased for native sick; the medical officer often having to supply bread, meat, soup, and milk, which are not allowed by the present regulations, at his own expense, or that of officers willing to aid him in doing so. 24. No wards or hospitals for convalescents exist, nor do they appear necessary.
XIII. Burial of the Dead.	1. The burial ground used for British troops is at the north-east corner of the cantonment, and between 200 and 300 yards from the nearest officers' quarters. It is, consequently, during the prevalence of the north-east monsoon to the windward of the cantonment; at most other times it is to the leeward. The station being seldom occupied by British troops, the principal persons buried there are European officers of native regiments, or an occasional native Protestant Christian. The ground has never been consecrated. 2. Its area is between 30 and 40 yards square. Its soil is gravel, aggregated by a stiff clayey matrix, and beneath it probably decomposing syenite. The ground is enclosed by a good wall, and carefully kept, but there is no drainage. I should think that decomposition takes place but slowly from the dry nature of the soil. 3. There are no regulations as to grave space. The ground is about half filled. Graves are generally four or five feet deep, and are never reopened. In tropical countries decomposition takes place so rapidly that interment takes place, if possible, not later than 12 hours after death. 4. The grave-yard is never offensive. 5. Mussulmans have a burial ground on the bank of the river, half a mile to the west of the south flank of the cantonment. Hindoos are either burnt or buried in the bed of the river, in the rear of the north flank of the lines, but lower down the river. There is a small Roman Catholic burial ground, about a furlong from the regimental lines, on its south flank or in the south-west corner of the cantonment. 6, 7. No injury accrues to the public health from the present practice, nor are any improvements in the manner of disposal after death to be suggested.

(Signed) James Peterkin, M.D., Surgeon, 16th Regiment M.N.I.
G. Carr, Lieutenant-Col. Commanding Station of Hurryhur.

MANGALORE.

Accommodation—Native Troops. { Artillery - - One-third Company. / Infantry - - 8th and 51st Regiment M.N.I.

References to Subjects and Queries.	Replies.
I. Topography.	1. The surrounding country is undulating, wooded, hilly, and dry, with wet cultivation in the valleys; there are cocoa-nut plantations and two rivers within three miles. 2. The elevation of the station above the sea is about 40 feet, and about from 70 to 100 feet below the mean elevation of the adjacent country. There is higher and healthier ground near the station, a portion of which has been allotted for the lines of a second regiment. The country generally, though higher than the cantonment, is of an undulating and broken character, much intersected by streams and cultivated valleys. 3. The nearest mountain or table land is about 50 miles to the Mysore country in a direct line, and 80 miles by the nearest road. The Mysore table land is about 2,500 feet above the sea. 4. The nearest water is the sea at Mangalore harbour distant about a quarter of a mile from the station; there are also two rivers, one on the north, the other on the south, within 3 miles. The vicinity is not liable to overflow. There is no broken ground, ravines, or water pits near. 5. The station is tolerably open to the sea, but shut in on the land by cocoa-nut plantations and higher ground. The temperature of the station is not raised by the buildings being exposed to reflected sun heat. The station is exposed to land and sea breezes. 6. All the valleys are richly cultivated. There are no works of irrigation. The cultivation of rice is not prohibited. Indigo is not cultivated, nor is the preparation of hemp or flax carried on near the station. 7. The town of Mangalore is within a quarter of a mile.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	8. The heights are of varied geological structure capped with laterite, with narrow valleys of rich alluvium. The present cantonment stands upon ground probably occupied by native population in former times. 9. Water is usually found at a depth of 20 or 25 feet below the surface during the dry season, and 10 or 12 feet during the rainy season. 10. The rainfall or water from surface springs flows readily away. There is no adjacent higher ground, the drainage from which must necessarily pass into the subsoil of the station. 11. The water supply is derived from wells, and is not stored in open tanks. There are no tanks. 12. The water is good and abundant, but its chemical composition has not been ascertained, and is raised by hand. 13. There are no other topographical points bearing on the health of the station not included in the foregoing replies. 14. New stations are selected by the Commander-in-Chief and his Quartermaster-General's Department in communication with the medical authorities and the Engineer's Department.
II. CLIMATE.	1. There are no means or instruments available at the military station for conducting and registering meteorological observations. 3. I have no observations to offer with regard to the character of the climate, or as to its influence upon the health of the troops. 4. The site chosen for a new cantonment is more conducive to health than that of the present one. 5. The stations at which I have served are Palamcottah, Quilon, Trichinopoly, Paulyhurst, Cannanore, Secunderabad, Sholapore, Kulladghee, Madras, Penang, Vellore, Mangalore. To the best of my recollection the latter station is the most trying to native troops. The climate is debilitating.
III. SANITARY CONDITION OF STATION.	3. There are no European troops or barracks at this station. 17. Hitherto surface cleansing has been performed solely by the heavy rains falling from May to September, but authority has now been granted to the officer commanding the station to entertain scavengers' carts, and sweepers. 18. The surface of the cantonment is kept free from vegetation, and there are no old walls, thick hedges, &c., interfering with the ventilation of the station, bazaar, &c. 19. Save 5 or 6 stalls, the bazaars are in the adjacent native town. Within the military cantonment the ground is patrolled, to prevent nuisances. No camp followers are resident therein (save the relations of sepoys living in regimental lines), except the small proportion of the officers' servants, who sleep in their master's compounds. There are no public latrines, but directions to apply for sanction to erect such have just been given by Government. The condition of the native houses generally is good and clean. 20. No nuisance is experienced from the condition of the slaughtering places. 21. There are no horses in the station. 22. There are no artillery or cavalry stables, or picketing grounds. 23. No reply to this query.
Officers' Quarters.	1. The condition of the officers' quarters is generally good and well drained. I have no improvements to suggest with regard to them.
IV. HEALTH OF THE TROOPS.	1. The station, generally speaking, is healthy, and the adjoining native population is generally healthy. 2. The most frequent disease is fever, frequently attended with enlargement of the spleen. 3. I know of no particular circumstance to which the healthiness or unhealthiness of the neighbouring native population is to be attributed. 4. The last station at which the detachment of artillery were located was St. Thomas's Mount, but the time they were resident there is not known. Left it and arrived at Mangalore in 1858. The last station of 8th Regiment Native Infantry was Tongoo, where they remained for three years, which place they left, arriving in Mangalore in November and December 1858. The state of health and chief diseases of Tongoo were,—stomach and bowel diseases, fevers, ulcers, and rheumatism, with dropsy. The chief diseases at Mangalore were—mild fevers, rheumatism, diarrhœa, ulcers, and catarrhal complaints. The last station of 51st Regiment Native Infantry was Palamcotta, where they remained a year and half; left it and arrived at Mangalore in December 1858, the state of health and chief diseases being, health generally good, suffering from fever, dysentery, and diarrhœa. The chief diseases at Mangalore being fever, dysentery, and diarrhœa. 5. The troops at the station are not camped out. 6. I have not been in charge of troops at hill stations. 7. I have had no means of observing the liability of troops residing at hill stations to febrile and other diseases on returning to the plains. 8. I approve of good elevated sites for stations for troops. 9. I am not aware of any diseases to which troops are liable to be attacked on going to hill stations. 10. A flannel cummerbund should invariably be worn on proceeding from the plains to hill stations. 11. The best seasons adapted for residence at hill stations are immediately before and after the commencement of the monsoon; and the shortest period of residence to benefit the health of troops should be not less than from 1 year to 18 months. 12. No experience of hill stations. 13. Care should be taken not to allow troops leaving hill stations for the plains to be exposed to the night air; diet should also be particularly attended to. 14. European troops should, as far as the service admits, be located on hill stations. When required for service in the plains they would, in my opinion, be better able to undergo fatigue and exposure. I consider an occasional change of station on the plains most beneficial to all. 15. As well as I remember the barracks at Jackatalla are sufficient for the health and comfort of the troops. 16. No experience at hill stations.

References to Subjects and Queries.	Replies.
IV. Health of Troops—*cont.*	17. There is no higher ground near the station which could be advantageously occupied as a hill station, except Mercara in Cavoy. 18. Cannot say what is the most suitable soil for stations. 19. The best age for soldiers proceeding to India would be from 18 to 20 years, and the best period for landing is in what is usually termed the cold season. 20. I think it would be a good plan to send young soldiers as soon as possible after landing to some hill district. I cannot, however, speak from experience. 21. The mode of transport of troops is by marching them early in the morning from one encamping ground to another. I know of no other precautions than are at present adopted for preserving the health and comfort of the troops on the route. Railways are making progress, and will no doubt effect a great saving of health and life. On some lines of road the European troops are moved in bullock carriages. Troops of all classes should on the march reach their ground half an hour after sunrise. 22. If a British soldier is temperate in his habits, he can well serve 20 years in India. There are of course exceptional cases. 23. No suggestions to make regarding medical boards. 24. Invalids should leave India so as to arrive in England at the commencement of Midsummer.
Diseases.	1. There are no regular inspection parades for the discovery of incipient diseases at this station. 2. There is not nor has there been scorbutic disease among the troops at the present station. 3. Hepatic disease is very uncommon among native troops. 4. Dracunculus is rare here. 5. The proportion of the constantly sick from venereal diseases to the total sick in the hospital is one per cent. I could not suggest any additional precautions with natives. It is not worth while establishing lock hospitals for native troops. 6. Troops at the station suffer not unfrequently from:— *Fevers* of a quotidian type. *Dysentery.*—Rare. *Cholera.*—Uncertain. *Small-pox.*—Troops here are generally free from small-pox, even when that disease is prevalent around. *Rheumatism.*—Native troops are very liable to rheumatism; especially during the land winds. The proportions which admissions and deaths from these diseases bear to the total admissions and deaths, are as follow; viz.:—

Average for year ending 31st January 1860.

	Admissions.	Deaths.
Fevers	27½ per 100	1 in 4
Dysentery	5 „	None
Cholera	None	None
Small-pox	None	None
Rheumatism	17¾ per 100	None

	7. No experience in the nosological character of the more frequent zymotic diseases. There is no bazaar or native huts in the station, but many close to it. 8. The prevalence of epidemic disease is influenced by the crowding, and insufficient diet of the families on the march, which predisposes to epidemic diseases, such as cholera, &c. 9. Quinine has not been tried as a prophylactic against malarial diseases. 10. More cleanliness would tend to prevent or mitigate epidemic disease at the station.
V. Intemperance.	1. There are no European soldiers at the station. The sepoys are generally sober, and there are no confirmed drunkards. 2. Drunkenness is very rare among native troops; it is punished when it occurs as an offence. 3. Distilled spirits are sold in the bazaar. The quality and quantity consumed is not known there being no Europeans. There are no other drinks sold at the canteen or bazaar other than intoxicating drinks, which are injurious to health. 4. It is not conducive to the efficiency and internal discipline of the corps. 5. We think it would be highly beneficial to the health of the troops to restrict or abolish the sale of spirits in the canteens or bazaars. 6. Malt liquors or wines are generally not requisite to maintain good health; the use of spirits is under all circumstances positively injurious to health. 7. Coffee, tea, lemonade, soda water, and similar drinks have a beneficial effect on the health, and are more favorable (when used in moderation and proper quantities) to efficiency and discipline than malt liquors and wine, and decidedly more so than spirits. 8. We think it would be beneficial to the health of European troops to suppress altogether the spirit ration whether for soldiers or convalescents, and to substitute for it beer, tea, or coffee, &c. 9. We think it would be beneficial to prohibit the sale of spirituous liquors in the canteens. 10. I have no recommendations to make on these points, other than in the foregoing replies. 11. There are no canteen or bazaar regulations on these subjects.
X. Military Prisons.	1. The cells for native troops at this station are bad, low, very confined, and ill ventilated.
X. Field Service.	1. There are no regulations for field medical service not included in the General Presidency Regulations. 2. The practical working powers of the medical officers depend in a great measure upon the commanding officers. 3. I cannot suggest any change in the practical operation of the regulations for preservation of the health of the troops as to the selection of camping grounds and general sanitary regulations. 4. Regulations adopted in the Presidency for field hospitals, ambulances, transport of sick, and of hospital supplies, can be supplied by the Quartermaster-General's Department.
XI. Statistics of Sickness and Mortality.	No information under this head is afforded.

Reference to Subjects and Queries.	Replies.
XII. HOSPITALS.	2. There are no European barracks or stables for troop horses in the station. A large number of public cattle are kept at one spot within the station, fully 400 yards from the hospital and not in the direction of any prevailing wind. The hospital is within 80 yards of a bazaar, where fish and vegetables are sold. The site of the hospital is freely ventilated; in the rear, and close to the hospital, are low native huts and tall trees. The remaining three sides are open and freely ventilated. It is is quite free from all nuisances depending on water or marsh. 3. The water supply is abundant and wholesome. 4. Refuse water and other impurities are removed by means of a sink and closed drain, the latter having its outlet much below the level of the hospital at about 120 yards off. 5. Both wards are on a level of four feet from the ground, and there is no ventilation under the floors, which are of masonry. Roof water runs off of itself. Percolation hardly takes place at all on a laterite ridge such as the hospital stands on. The surface drainage is left to nature and is sufficient to carry off the heaviest rainfall with rapidity. The hospital is built of laterite stone, in mortar. The roofs and walls are single, but thick enough to keep the interior cool. A verandah runs along the whole range of walls inside and outside the building. It is 10 feet broad and amply sufficient, and the sick and convalescent have free access thereto. The hospital consists of one flat only. Total number of wards, 2. Total number of beds, 56.

Number of Wards or Hospital Huts.	Regulation Number of Sick in each Ward or Hut.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height of Opening.	Width of Opening.

										Doors.	
									3	7	4

	The hospital receives the full benefit of prevailing winds. The windows open outwards and their arrangement and construction are conducive to ventilation and coolness. 6. The wards are ventilated by the windows and doors, which is sufficient. Jhilmils are constructed in the body of the shutter from top to bottom. 7. There are no means in use for cooling the air admitted into the ward. 8. No means for warming necessary. The walls and ceilings of the wards are cleansed and lime-washed once a year, but oftener if required by the medical officer. 9. There is one privy to each ward in the corners inside the hospital yard. They open into a covered drain. Lime is thrown down, and the drain is flushed with water every morning. They are not offensive since openings have been pierced in the walls and a dormer ventilator placed in the roof of each. 10. There are no lavatories. 11. The means of bathing for the sick is a large wooden tub,—one to each ward—which is sufficient and convenient. 12. The washing and drying of the hospital is done by means of the dhoby. 13. There is no storage for linen. 14. All hospital cots should be iron and of light configuration. There are a few such in hospital, but the greater number are of the old wooden muster, and there is no bedding. 15. There is a convenient cook room forming the rear of the hospital range, used only for medical preparations, as there are no European troops in garrison. 16. The diet tables, diet rolls and all other returns, required for working the internal economy of the hospital, are the same as those laid down for the army in general. 17. The attendance on the sick is supplied by a hospital havildar in each ward, detailed from the effective strength of the garrison,—orderlies are detailed on requisition from the medical officer—and is sufficient 18. The sanitary condition of the hospital is good; no epidemic disease, gangrene or pyæmia, has ever made its appearance. 19. I can suggest no improvements. 20. Convalescents are allowed to go to their houses, parading once a day at hospital. 21. Native regiments do not come under the provision for treatment of soldiers' sick wives and children, and no improvement is necessary in the present arrangements. 22. There are no regulations enforced at the station which are not included in the General Presidency Medical Regulations. 23. The medical officer may recommend anything he thinks fit, both as regards diet and medical comforts. 24. There are no convalescent wards or hospital at the station.
XIII. BURIAL OF THE DEAD.	1. The burial ground used by British troops is close to the station on the land-wind side. 2. The area is 5,000 square yards. Soil and sub-soil: hard laterite. Drainage: perfect. The rate of decomposition is unknown and the ground is carefully kept. 3. The grave space allowed is eight feet from end to end, and the graves range side by side as near as practicable. The depth is four and a half to five feet, and the graves are never re-opened. There is no regulation as to period of interment after death, but it generally takes place the same afternoon or the succeeding morning. The same remark applies to native troops. 4. The European grave yard is never offensive, it is enclosed by a wall. 5. The dead of the camp-followers or bazaar people are disposed of by burial.

References to Subjects and Queries.	Replies.
XIII. Burial of the Dead —*cont.*	6. The native graves are shallow, and the grave yards—Roman Catholic, Hindoo, and Mussulman—in contact with the native town; some are in the heart of it, which, no doubt, affects health. 7. I would suggest that native burial grounds should be removed further from the population.

(Signed) Th. T. Pears, Colonel, Madras Engineers, District Engineer of South Canara.
J. M. Madden, Lieutenant-Colonel, Commanding Mangalore.
B. S. Chimmo, Surgeon, Madras Army, Senior Medical Officer in Garrison.

29th February 1860.

Accommodation:—Native Troops - Infantry - { 160 Rank and File, with Commissioned and Non-commissioned Officers in proportion.

References to Subjects and Queries.	Replies.
I. Topography.	1. The surrounding country is low and sandy, and covered with cocoa-nut topes. It is flat and surrounded with water. 2. The elevation of the station above the sea is about 4 feet. There is no higher or healthier ground, in British territory, adjoining the station. 3. The nearest high ground is about 30 miles distant from the station. The hills rise to a height of 6,000 feet above the level of the sea. 4. The station is surrounded with water, the sea being on one side and the backwater on the other. The vicinity is not liable to overflow of water. Near the station is the old fort ditch, which is in a swampy state and ought to be filled up. 5. The station is open, but inside the fort the old rampart rather impedes the ventilation. The temperature of the station is decidedly raised by the exposure of the buildings to reflected sun heat. The station is exposed to cold and variable winds from the land side during the dry season, beginning in November about 7 p.m. and gradually becoming later until in February its commencement is about 2 a.m. During the continuance of these winds rheumatism, elephantiasis, and fever are very prevalent. The sea breeze is also unhealthy, which is probably due to the elements of malaria having been carried out to sea and returned with the sea breeze. 6. The surrounding country is cultivated, being covered with plantations of cocoa-nut trees. There are no works of irrigation near the station. There is no cultivation of rice, although no prohibition exists, nor of indigo, neither is the preparation of hemp or flax carried on near the station. 7. There is a native town about 2 miles across the water at Ernacotum. 8. The surface and soil of the district is sandy. The ground on which the station stands was formerly occupied by the Dutch or Portuguese, but to what extent their native town extended beyond the fortification I am unable to state. 9. During the dry season water is found from 4 to 6 feet below the surface, and from 3 to 5 feet during the rainy season. 10. The rain-fall and water sinks into the pervious sandy soil. 11. The water supply of the station is derived in part from wells, which from the unclean state of the privies have become unfit for use. That for drinking purposes is brought daily from Alwaye, 18 miles off. There is one tank, which is used by the sepoys; it is generally well supplied with water. The plants and animals contained in the tank are those which usually exist in tanks filled during the monsoon and left to themselves in the dry weather. The water in the tank is used for drinking purposes and also for bathing. With regard to the pollution of the water in the tank, it depends upon the season of the year. During the monsoon the water is good, but in the dry season it often becomes impure from stagnation and vegetation. No nuisance or malaria apparently proceeds from the tank. 12. Water may be had at the station in any quantity but its quality is not good. It is brackish and injurious to health. Those who do not get water from Alwaye obtain it from the sepoy tank or from the wells. 13. No reply. 14. Cannot say by whom or after what amount of examination new stations are selected. No new station should be permanently occupied until after one year's trial at least by competent persons.
II. Climate.	1. The meteorological instruments at the station are one thermometer and an aneroid barometer which is unserviceable. There is also a pluviometer. 2. No meteorological table transmitted. 3. The climate is variable; the breeze from the land, owing to its coming over a large expanse of water, is moist and chilly. It is occasionally very sultry. The climate appears to occasion rheumatic affections amongst those troops exposed to the night air.

COCHIN.
MADRAS.

II. Climate—*cont.*

The following comparative table of deaths amongst the civil population for each month is based on an average of the years 1855–56–57 and part of 1859–60, and will show the most healthy and the most unhealthy months at the station. The population is about 11,326.

Deaths, Average.	Jan.	Feb.	March.	April.	May.	June.	July.	August.	Sept.	October.	Nov.	Dec.
Non-epidemics - -	25¾	26¾	28⅔	24⅔	30⅓	26½	35	36⅔	32¼	30	23¾	27½
Epidemics - - -	14¼	11¾	15⅓	6	5⅓	2⅔	3⅓	2	26	11	7¾	11
All causes - - -	40	38½	54	30⅔	35⅔	29	38⅔	38⅔	58¼	41	31½	38½

The epidemics in 1855–56–57 were small-pox; in 1859–60, cholera. The prevailing diseases in the unhealthy months are those of the bowels.

4. If Cochin were kept moderately clean it is very improbable a more healthy place could be found near the station.

5. The stations at which I have served are Rangoon and Burmah, Bangalore, the Mount, Poonamalee, Jackatalla, Bellary, Bolarum, and Aurungabad. The two last are by far the most healthy. Rangoon and Burmah are very moist, which conjoined with great heat affected the liver and bowels. At Bangalore, native troops predisposed to fever suffer severely. The Mount and Poonamalee are pretty healthy. Jackatalla is a good station for men who do not drink.

III. Sanitary Condition of Station.

1, 2, 3. No map or plan of the station is transmitted. A ground plan of the barracks is sent.

4 to 8. No replies to these queries.

9. The barracks are constructed of laterite in chuman, with tiled roofs. The huts are constructed of bamboo mats with cudjan roofs. The base is filled with hard material and coated with chunam 1½ inches thick; the floors are raised about 2 feet above the level of the ground. No air passes underneath.

11. The barracks and cantonment are kept in repair by the Fiscal of Cochin. All public buildings are limewashed once a year.

12, 13. No reply as to lavatories, &c., and barrack cook-houses. The sepoys wash their clothes in the sepoy tank, and dry them at its sides.

14, 15, 16. No replies to these queries.

There is a very foul ditch caused by the engineer's department having removed the old rampart, to obtain the stones for the purpose of mending the roads. A ditch has been thus made, which is employed as a public privy.

17. Within what is called the fort, the road and parade is kept pretty clean; but the old rampart, the sides of the road, and every odd corner, are in the most disgusting condition; cleansing is hardly attempted. The refuse should be removed to the sea beach.

18. The surface of the cantonment is only kept free of vegetation by the cattle, which are allowed to roam all over it, and sometimes the convicts cut down the larger weeds. The remains of the old rampart on the land side, which is the receptacle of all kinds of filth, impedes the sea breeze from coming to the sepoy lines, and should be levelled.

19. The sanitary condition of the bazaar is as bad as it could possibly be; cleanliness is unknown, and there is no drainage. The streets are used as privies without hindrance. No regulation for preserving cleanliness is attempted. The suggestions of the civil surgeon to the joint magistrates meet with no attention whatever. Either the opinion of the medical officer should be taken, or reasons for the contrary course placed on record. The native houses are in a filthy condition, especially those of the Moptahs; their compounds are used as receptacles for filth. A small village of native Protestants was most injudiciously permitted to be erected between the sea and the sepoy lines. It is a most unhealthy row of houses, and in a bad situation. It would be a great benefit if they were removed and erected elsewhere, further from Cochin.

20. Animals are slaughtered in the bazaar. No regulations are in force on the subject. The offal used to be thrown down in a moist ditch, close to the Civil Government Dispensary. All animals should be slaughtered on the sea beach, and the offal buried there.

21, 22, 23. No replies to these queries.

Officers' Quarters.

1. No reply under this head.

IV. Health of Troops.

1. The station, district, and native population are generally healthy.

2. The disease most prevalent among the native population is elephantiasis Arabum, or Cochin leg, which fatal disease generally terminates by dropsy. Spleen disease is unknown.

3. Unhealthiness amongst the native population is attributable to their filthy habits and deficient sanitary police.

4. The troops at this station were previously stationed at Madras, where they had been for some months. No portion of the men's accommodation at Cochin is more unhealthy than the rest.

5. Troops are never camped out.

6. With regard to hill stations, I have done duty at Jackatalla with H. M.'s 74th. They suffered from dysentery, which appeared to me to be due to drinking freely, and being crowded in barracks.

7. No experience as to whether long residence on hill stations renders troops more or less liable to febrile and other diseases on returning to the plains.

8. I decidedly approve of hill stations for the generality of European troops, but there are many exceptions.

9. The diseases to which troops are liable on going to hill stations are diarrhœa, and less frequently dysentery and hepatitis, whilst rheumatism, phthisis, and secondary syphilis appear to be severe there.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	10. No reply. 11. The best season for residence on hill stations is the cold dry months, and the shortest period of residence to enable troops to receive the benefit of it, is from 10 to 12 months. 12. If Europeans from cold climates suffer less from disease in India than soldiers who have been long in the tropics, I should not be inclined to believe that a prolonged residence on the hills would be detrimental to subsequent service on the plains. 14. My own experience, from having served with troops in the hills, is, that European troops from cold climates do not stand fatigue like seasoned Europeans, and consequently, service on the plains, with short periods of change to hill stations, would be most conducive to the health of troops, should they have to go on service in the plains. Frequent change of service on the plains causes great dissatisfaction from the expense it entails, and thus depresses the spirits and tells upon the health. 15. No reply to this query. 16. No experience of the elevation above the sea most suitable for hill stations. 17. There is no higher ground in British territory, which could be advantageously occupied as a hill station nearer than the Neilgherries. 18. The most unhealthy soil for stations is the black cotton soil. 19. The best age for soldiers proceeding to India is from 22 to 28 years. They should land in India after the hot season has subsided. They should be sent at once to their regiments or to hill depôts. 20. Troops should be sent direct from the home depôts to India. I have done duty with two of Her Majesty's regiments from the Cape, and they appeared as liable to disease as men direct from Europe. On landing, troops should be sent to hill depôts, if such were established. 21. Troops are transported from the port to the interior by rail for a short distance, but generally by marching stage by stage. 22. The number of years a British soldier should serve in India is about 10. 23. In the conduct of the business of the medical boards I have never known a conflict of opinion as regarded invaliding. In pensioning sepoys the present plan is most unsatisfactory; they commence, if not promoted, skulking into hospital after about 15 years' service, and so on, till they get pensioned. A better plan would be to send all into the invalid battalions unless they have served 40 years or lost a limb, and never pension a man direct from his corps or division. All pensioners should be yearly examined in the first two years to see if they get well. 24. No experience as to the best time of year for the departure of invalids leaving India for home.
Diseases.	1. A regular inspection parade takes place when itch is very prevalent, every Tuesday at 5 p.m. 2. There has been no scorbutus among the troops. 3. Hepatic disease is very rare; no admissions for it among the troops for several years. 4. Dracunculus does not exist in this part of India. Sepoys affected with it have come to Cochin from infected localities; but in them it invariably disappears after 12 months' residence. 5. Venereal diseases have occurred to the extent of about 1·7 per cent. of the total sick. Lock hospitals properly managed would be a great boon and save many from being permanently disqualified for the service. 6. During the year ending 1st April 1859, 20 cases of fever are registered by my predecessor as having occurred; viz. ephemeral, 7; quotidian, 8; common continued, 5. These last I have never personally seen amongst natives in Cochin. *Dysentery.*—Two cases in the year. *Cholera.*—Two cases have occurred since 1st April 1859. *Small-pox.*—None. *Rheumatism.*—Nine cases. The proportion of admissions from these diseases to the total admissions and deaths are—

Diseases.	Admissions.	Deaths.	Per cent. of Admissions to Total.
Fevers	20	0	17·0
Dysentery	2	0	1·7
Cholera	0	0	0·0
Small-pox	0	0	0·0
Rheumatism	9	0	7·7

	7. The most frequent zymotic diseases are small-pox and cholera. The former is most prevalent during the cold dry months of January, February, and March, and the latter from August to January. The climatic and atmospheric conditions which precede and accompany these diseases are various. The most low and dirty parts are the most affected by these diseases, where crowded dwellings with filth of all sorts around them abound, and no sanitary precautions worth mentioning are attempted. The troops are cleanly, but the dirty habits of the civil population, their addiction to spirits and fermented liquor, opium eating, and consumption of semi-putrid fish, only makes it wonderful that the mortality is not ten-fold what it is. 8. The prevalence of epidemic disease is not at all influenced by the nature of the soldiers' duties, &c. 9. No experience of small doses of quinine as a prophylactic in malarious diseases, never having seen it tried on large bodies of men, but have given small doses of camphor and quinine as a prophylactic in those disease s with satisfactory results.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	10. Cleanliness would prevent or mitigate epidemic disease at this station. The natives are allowed to attend to the calls of nature wherever they may happen to be. Large holes exist by the side of the roads, and rubbish is thrown down everywhere, causing the atmosphere at times to be excessively foul. The East Indians and old Dutch inhabitants should not be permitted to have closed privies as at present, and the drains should be taken care of and kept clean.
V. INTEMPERANCE.	1. The soldiers at the station are temperate. 2. Unable to state the proportion of admissions into hospital from diseases caused by intemperance. Drunkenness is always punished as an offence. 3. There are no canteens in Cochin. Distilled spirits are sold in the bazaars. 4. Spirits are necessary to recovery in some instances, when taken in moderation; but as generally drank by the troops, are the cause of much sickness. Their abolition would be a gain in every way. 5. It would be beneficial to restrict or abolish the spirit ration, provided the soldier could not obtain an inferior spirit in the bazaar; as it is, doing so would probably send him to the native dealers, where he would buy a most deleterious description of spirit. 6. Malt liquors are much more conducive to health than wines, and wines more so than spirits. 7 to 11. No replies to these queries.
X. FIELD SERVICE.	1, 2. With regard to the practical working of the powers of medical officers in reference to the conduct of the line of march, &c., if the commandant pleases, he can adopt and carry out the recommendations of the medical officer. Some commandants send the senior medical officer forward with the quartermaster, to choose the ground. Other commandants detach a few men the night before. 3. The medical officer should, in conjunction with the quartermaster, select the site of camping grounds; the hospital should be to the leeward of the camp, and the tents faced N. and S., to prevent the morning and evening sun from shining in under the kanats of the men's tents. Twenty-five men is too many for the present tents. The tentage for the hospital department is insufficient. The medical officer's powers are laid down in the regulations. The power of the commandant is supreme. 4. The ward coolies are quite insufficient in number for field hospitals, if cholera breaks out; besides which they are apt to abscond. There is a distinct staff attached to the field hospital, under a senior surgeon. The sick are transported in doolies or sick carts.
XI. SICKNESS AND MORTALITY.	No reply under this head.
XII. HOSPITALS.	1. Ground plan of hospital transmitted. 3. The water supply is abundant and wholesome. 4. There are no means of drainage employed to remove the refuse water and impurities. 5. The height of the lowest wards above the ground is $1\frac{1}{2}$ feet. No air passes underneath the floor. The roof water sinks into the subsoil. The verandahs are never used for the accommodation of the sick, convalescents, or others. The hospital is placed so as to receive the benefit of the prevailing winds. 6, 7. No replies to these queries. 8. There are no means of warming the wards. Since my arrival in Cochin 14 months since, I have been unable to get the hospital whitewashed; twice or three times the division has been applied to. It should be done twice a year at least. The wards are cleansed and whitewashed as often as it is necessary. 9. There is no drainage to the privies, nor water supply. One small opening exists through the wall, and urine passing through sinks into the ground outside; the place is frequently very offensive. 10. No reply. 11. Two tubs are used for bathing the sick, and, if properly repaired, would be sufficient. 12. The hospital linen is taken away by the cornicopoly, who gets it cleaned. The present means for that purpose are sufficient. 13. The storage is sufficient, and dry. 14. There are five cots in the hospital. 15. Reference to plan. 16. No reply. 17. The provision for attendance on the sick is as follows:—one hospital orderly and a sweeper. If a sepoy is unable to cook his own food, or requires the attendance of a person to himself, one of his comrades is told off for that purpose. The present plan appears to work well. 18. The position of the hospital is unobjectionable, and no epidemic diseases have broken out in it. 19. The repairs of the hospital are as yet untouched; the building, if left as it is, will probably before long be a ruin. Even whitewashing is not regularly done. The privies are merely one small room, with no place in which the excrements can go to be cleared away, whilst the urine merely flows outside, and sinks into the soil. 20. Convalescents can take exercise outside the hospital, in the parade ground under the trees. 21. The families of sepoys may come into the hospital; if too ill to do so, the medical subordinate goes to the lines to see them, and according to his report, the medical officer goes or not to their hut. No complaints have been made of the present arrangements, and they appear to be satisfactory. 22. The only hospital regulations enforced are those in the medical code in use. 23. The medical officer's powers in matters pertaining to the hospital are confined to complaints to the commandant of the station, for transmission to the division. He cannot repair the building. He can alter the diet, should any European patients be in hospital. He can also order sago, arrowroot, wine, or other medical comforts for sepoys, and they are supplied by the cornicopoly. 24. There are no convalescent wards, nor are they requisite.

XIII. Burial of the Dead.	1. The burial ground in general use is about a mile from the town, and well situated with regard to the prevailing wind. The old burial ground (now closed, except in the case of one or two registered vaults) is within the fort, and the prevailing sea breeze passes over it before reaching most of the houses. 2. Its area is 144 by 136 feet. The subsoil is sea sand; the rain rapidly sinks in. I presume decomposition is rapid. The ground is properly enclosed with neat stone walls, and gate, with lock and key. 3. The grave space allowed is 6 or 7 feet by 2 feet, in the case of common graves; greater width where stone monuments are erected. The ordinary interval is about 2 feet The depth is 5 or 6 feet, the loose nature of the soil, and the certainty of coming to water in abundance at most seasons of the year, rendering it difficult to go to a greater depth. The graves are not usually re-opened, the Protestant population being small. Interment usually takes place 24 hours after death. 4. I am not aware of the new ground ever being offensive to any one. 5. With reference to the dead of camp followers and bazaar people, if they have friends, they bury them in their own burial places; if not, they are carried by the police to an island, about 1¼ miles from Cochin, and interred there. 6. No injury to the public health accrues from the present practice.

March 20, 1860.

(Signed) W. Barwise, Captain, Commanding Cochin.
Francis Day, Civil Surgeon.

CUDDAPAH.

Accommodation—Native Troops, Infantry, One complete regiment of Native Infantry.

References to Subjects and Queries.	Replies.
I. Topography.	1. The station is entirely surrounded by a chain of mountains which rise abruptly from the plains, the sides of which are for the most part covered with jungle; are dry and smoothly excavated. There is not much wood in the vicinity of Cuddapah, there being only a few large mango, peepul, and tamarind trees. During the dry weather the supply of water is deficient. 2. The station is elevated about 507 feet above the level of the sea, but it is about on the same level with the adjacent country. Yerramullah, an elevated platform forming part of a range called the Palcondah hills, is a higher and healthier situation than that of the station. These hills are about 17 miles distant east from Cuddapah, and 1,800 feet above the town of that name. 3. The mountains to the north-east and south are from three to six miles off, and from 1,000 to 1,500 feet above the level of the station. 4. Two nullahs, having their source in the south-west range of hills, are the nearest water. One of these runs immediately in front of the cantonment; the other, called the river Boga, is larger, and sweeps along the west of the town. The chief river is the Pemaur, which receives two rivers within the district. It is distant from Cuddapah nine miles. Tanks abound in the district. The Ralla river sometimes overflows its banks during the south-west monsoon. Ravines and water-pits exist in the neighbourhood of the station with an injurious effect on health. 5. The station is open and freely exposed to winds, and not at all subjected to high temperature by reflected sun heat. It is, however, exposed to the land winds, the effect of which is injurious. 6. The plains environing the station are cultivated and irrigated by the numerous tanks in the vicinity of the cantonments. Artificial irrigation is observed to affect the health of the station when indigo is grown. The cultivation of rice is not prohibited, and it is grown close up to the station. One crop of rice is averaged within the year to two of indigo, the latter yielding the highest profit. The indigo grown near the station has a most injurious effect on health, generating malaria, which is attributed to the nature of the manure employed, viz., green boughs of trees, &c. 7. The large town of Cuddapah is close to the station. 8. The soil of the plains to the north and west of the cantonment is of rich black cotton loam, but in the vicinity of the hills and valley of Cuddapah it is overlaid with alluvial deposit, the débris of the neighbouring rocks being light sandy, and in some places intermixed with an adhesive reddish earth. The eastern and western range of mountains consist chiefly of gneiss overlaid with sandstone and sienite, the beds being intersected with veins of greenstone. The principal rock in the southern ranges is granite with gneiss and mica slate more or less in a state of decomposition. In other parts the formation is sandstone; it usually rests on limestone, and is non-fossiliferous. 9. Water is usually found during the dry season at a depth of 30 feet, and during the rainy season at five feet below the surface. 10. The rain-fall and surface water sink into the pervious subsoil, what remains on the surface very soon evaporating. The drainage from the adjacent higher ground passes into the subsoil of the station. 11. The water supply of the station is derived from the river, wells, and from a few tanks or pits which receive the rain-water. They are dry for the most part, except during the rainy season, and when they become low they are used by the natives for the deposit of every description of filth, the water being liable to every kind of pollution. There are plenty of tanks in the native town, surrounded by prickly pear, which, when decomposing, is a great source of malaria. The best means of prevention would be by not allowing the natives to use such tanks for depositing their excrement in, and cutting down or removing the prickly pear to a distance. 12. The water supply throughout the district is deficient, and is strongly impregnated with the saline matters of the soil. These become concentrated by evaporation in the hot weather, so that river water is generally used by the major part of the native population.

CUDDAPAH. MADRAS.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	13. The hills on the north, east, and south being within three to six miles of the station have a most injurious effect by greatly increasing the heat of the station. 14. All new stations should be tested by quartering a few companies of a native regiment for some months previously on the spot. Its range of temperature should be ascertained, as well as its topography, and the supply and nature of the water as well as the prevailing diseases of the locality.
II. CLIMATE.	1. The instruments available at the station for meteorological observations are a thermometer, dry and wet bulb, and a barometer. 2. TABLE of Meteorological Observations from 1st January 1859 to 31st December 1859.

Months.	Barometer, Mean.	Mean Temperature.	Mean Daily Range.	Mean Maximum.	Mean Minimum.	Mean Dry Bulb.	Mean Wet Bulb.	Mean Sun Temperature.	Rain, Inches.	Winds. Direction.	Winds. Force.	Days of Sunshine.	Remarks as to Cloud, Dew, Wind, Storms, &c.
Jan. -	29·658		7	78	74	77	72	98	—	East.	Calm.	31	
Feb. -	29·858		13¾	82	74	80½	71	95	—	Do.	Do.	28

Nov. -	29·710		5	77	73	77	74	90	9·80	Do.	High winds.	8	22 days cloudy—rained
Dec. -	29·761		8	77	73	76	72	85	—	N.	Calm.	29	2 days cloudy—no rain.

3. The climate is intensely hot during the day, with great closeness and stagnation of air at night. The mean temperature in the shade during the year is 81½°, the maximum being 98° and the minimum 65°, average daily range within doors from 15° to 20°. The difference of annual extremes is 33°. It has its cool, hot and dry, and hot and humid seasons. Malarious diseases are most frequent from the commencement of the rainy season till the drying up of the ground, in consequence of the extreme heat, so that from February till the end of May malarious diseases are not frequent. This place is quite unfit to be occupied by troops, being, in fact, the worst station in India. There are plenty of places on the surrounding hills which would be more suitable for a station. The most unhealthy months are those in which the ground is moist and capable of affording constant evaporation from the surface under intense heat. This lasts from the end of June till the end of January, which period includes the monsoon weather, the filling and drying up of nullahs, rivers, &c., when the vegetable and animal deposits in them are exposed to the rays of the sun, and prove a source of miasma. From February till the end of May the soil is dry and burnt up; the source of malaria is then dried up, and intermittent fevers are less frequent.
4. Maddenpully, about 70 miles distant, possesses a climate more conducive to health than that of the station.
5. No reply to this query.

III. SANITARY CONDITION OF THE STATION.

1 to 17. No reply to these queries.
18. There are some old walls, &c. existing which interfere with the health of the town, and such is the case in every native town, unoccupied houses being used as places for the deposit of filth.
19. In the bazaar improvements are being made, such as the removal of old walls, the prickly pear, &c., but it is still in a bad condition. The native houses in the town are in a wretched condition, dung-heaps and cesspits being found within them.
20 to end. No further information under this head.

IV. HEALTH OF THE TROOPS.

1. The station and adjoining districts are very unhealthy.
2. The natives suffer a good deal from intermittent fevers, and a few have diseased spleens.
3. The unhealthiness of the neighbouring native population is attributed to the low situation of the town of Cuddapah, and to the large quantity of wet cultivation in and around it.
4. The troops here were formerly stationed at Arcot, where they had been for nearly six months, and marched from thence for Cuddapah on the 23rd June 1858. The health of the men while at Arcot was good, and they arrived at Cuddapah in a healthy condition. They have, however, suffered a good deal from intermittent fever since. No instance has appeared of any portion of the men's present accommodation proving more unhealthy than the rest.
5. The troops are never camped out at this station.
6, 7, 8. I have had no personal experience of hill stations, but the benefit of selecting such for troops cannot be doubted.
9, 10. Men on first going to hill stations are subject to fevers and dysentery. After a residence in the plains they should avoid exposure in the first instance, and wear clothing suitable to the temperature.
11 to 14. It would be most beneficial to the health of troops to locate them on hill stations, with short periods of service on the plains. Frequent change of stations on the plains would not be beneficial to the health and spirits of the soldiers or to convalescents.
15, 16. No experience to reply to these queries in reference to hill stations.
17. There is some higher ground in the vicinity of the station which could be advantageously occupied.
18. I cannot speak from experience as to the class of soil or subsoil which would prove more healthy or unhealthy for stations.
19. Soldiers proceeding to India should be from 18 to 23 years of age, and should land there during the cold season. I have no experience to show how troops are disposed of on first landing, but in order to preserve their health they should be sent to a cool station.
20. Whether troops are sent direct to India from the home depôts or to an intermediate station for a time is a matter of no importance, provided they are sent to a cool station on arrival and exposure avoided. They should be sent to the hill districts and gradually accustomed to the climates.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	21. I cannot say what is the usual mode adopted for transporting troops from the port to the interior. 22. The number of years a British soldier should serve in India is from 20 to 25, as a general rule, so as to be effective for active service. 23. No reply to this query. 24. Invalids should leave India so as to arrive in England at the commencement of the summer, and thus avoid the extreme change of temperature from India to the winter of England.
Diseases.	1. No inspection parades for the discovery of incipient diseases are necessary at this station. 2. No case of scorbutic disease has occurred at this station. The disease is attributable to bad living and the absence of fresh vegetables. 3. In a native corps there are very few cases of hepatic disease. 4. There have been very few cases of dracunculus at this hospital, but it is very common in the gaol and native town. 5. Very few cases of venereal disease occur in a native corps. 6. Table of Admissions into the Hospital, 3rd Extra Regiment N.I., from the 7th July 1858 till the 7th March 1860.

Diseases.	Admissions.	Deaths.
Fevers — Feb. Ephemera	29	—
Fevers — ,, Quotidian Intermittent	1,342	5
Fevers — ,, Tertian Intermittent	274	—
Dysentery	21	1
Cholera	15	3
Small-pox	10	—
Rheumatism	61	—

	7. The nosological character of the more frequent zymotic diseases is, class pyrexiæ; order febris. They are most prevalent in the wet and cold seasons after the heavy rains, when the vegetable matter in the beds of rivers, tanks, indigo factories, and the manure employed for the growth of indigo is not too wet to undergo decomposition. Fever is endemic in the native town. The native dwellings are much crowded together. The causes which predispose the natives to these diseases are bad food, want of cleanliness, and crowding together in small huts. 8. No reply to this query. 9. Small doses of quinine have not been tried at this station as a prophylactic against malarial diseases. 10. The only remark I have to make is that the place is not suited for a military station.
V. Intemperance.	1, 2. The necessary information to form a statistical table showing the effect of total abstinence, temperance, and drunkenness, on the amount of sickness, mortality, and crime at the station, is not obtainable. 3. It is a habit among Europeans to take a dram before morning parade. The effect is most pernicious, not only as being productive of drunkenness, but also as tending to produce hepatic disease, dysentery, &c., especially as regards recruits. Spirit is given under the direction of the medical officer to convalescents; it is good in quality. The amount given is variable in quantity. 4. The consumption of spirits in the morning is most injurious. When judiciously given to convalescents it is beneficial, as it is also for troops marching through a country where the water is bad; but malt liquor is far preferable. 5. The use of spirituous liquors as part of the ration for European troops should be abolished, and malt liquor supplied instead. 6. Malt liquor and wines in moderation are beneficial, but spirits are most injurious. 7. The use of tea, coffee, lemonade, &c. is excellent in their influence on health, efficiency, and discipline. Spirits should not be issued to the men. 8. As regards Europeans, it would be most beneficial to suppress altogether the spirit ration; beer, however, is necessary. In reference to convalescents, no absolute rule can apply to them. To those recovering from dysentery and diarrhœa, for instance, malt liquors would often be injurious, whereas a judicious allowance of spirits would be beneficial then. 9, 10. It would be advantageous to abolish the sale of spirituous liquors in the canteens, and to permit only beer, coffee, tea, lemonade, &c. to be sold there within certain limits; a limited supply would be beneficial. 11. No reply to this query.
X. Field Service.	1, 2. Medical officers have very little influence as regards the conduct of the line of march of troops, camping, bivouacking, &c. In the campaign of 1857–58, flat paddy-fields, with rising ground on either side, I always found were chosen as the site of our encampment ground, so that the first shower of rain covered the surface of the ground with water; in many instances it was more than six inches deep during the monsoon. 3. Except in the monsoon, ordinary ground may be chosen where the supply of water is abundant and good. During the monsoon the site of the encampment ground should not be surrounded by rising ground. 4. No reply to this query.
XI. Statistics of Sickness and Mortality.	No information under this head.
XII. Hospitals.	1, 2. The position of the hospital is to the west of the town, which is distant about a mile, and south of the cantonment, bazaar, and native houses. The site is open and well ventilated, but Cuddapah is full of malaria. The hospital is not very far from the river. 3. The water supply is abundant and wholesome. 4. All impurities are removed from the hospital by toties. 5. The wards are not raised above the level of the ground. There is no provision made for carrying off the roof-water, but there is a trench round the hospital at a distance from it, and foul water runs off by this, as also does the rain-water. The hospital is built with brick,

	Small 12	17 7	Do.	Do.	504	4	Do.	Do.	2	Do.	Do.

6, 7. No reply to these queries.
8. No means for producing artificial warmth are required in Cuddapah. In the north-west provinces and in Oude stoves are used for this purpose.
9 to 15. No replies to these queries.
16. The native sick provide their own rations, any article of food considered injurious by the medical officer being prohibited, and extras ordered at his direction.
17. The sick natives are attended by any comrade they may select, besides which there is one hospital serjeant and two orderlies to a hospital.
18. The sanitary condition of the hospital is good, and no instance of gangrene or pyæmia have appeared in it. Fever prevails epidemically at the station during the wet and cold seasons.
19. No reply to this query.
20. No arrangements are made for the exercise of convalescents among the native sick.
21. In European regiments the soldiers' sick wives and children are generally attended in hospital by the medical officer in charge. In native regiments, as a general rule, they are attended by the apothecary, or, if there be no apothecary, by the hospital dresser. The medical officer attends in dangerous cases.
22. No reply to this query.
23. The medical officer, as a general rule, has every power in matters appertaining to the sanitary state of the hospital, repairs of buildings, change of diet, &c., as far as the exigencies of the service will admit.
24. There are no convalescent wards for native sick, such not being absolutely necessary for them.

XIII. BURIAL OF THE DEAD. — No information under this head.

(Signed) J. G. MACDOWELL, Lieut.
T. G. HOWELL, Assistant Surgeon.
G. HEMERY, Captain, Madras Engineers.

PALAMCOTTAH.

Accommodation.—Native Troops Infantry { Havildars 51 / Naiques 50, and / Privates 700

References to Subjects and Queries.	Replies.
I. TOPOGRAPHY.	1. The cantonment of Palamcottah, comprising a portion of the Old Fort, is situate about two miles to the S.E. of the river Tambrapoorney. It lies in latitude 8° 42′ north, and longitude 77° 47′ east. The country to the S. and E. of the station is composed of light red soil, is well drained, and cultivated mostly in dry grain. To the N. and W. is an extensive sheet of rice cultivation irrigated by a channel running parallel to the river. The cultivation is carried to the margin of the river bank. Two crops are yearly raised, and the country may be said to be under water for nine or perhaps ten months of the year. To the S. and E. low hills, composed chiefly of pure quartz rock, rise up from the plain, which is in parts sandy. The soil may be described as a sandy loam overlaying a species of mouldering gneiss rock. Close to the banks of the Tambrapoorney there are several thick topes. The sandy plain W.S. and E. is dotted with clumps of the palmyra, for the growth of which the soil is well adapted. Good water is procurable from the canal, running to the N. of the Fort, and when the canal is dry, water of tolerably good quality is to be had in the numerous wells which have been sunk in all directions. 2. The station is about 120 feet above the level of the sea, and may be said to be situated on an extensive plain; it is above the adjacent country. The portion of the cantonment outside the Fort is situated on rather higher ground than that of the Fort itself. No better position appears available. 3. The nearest mountains are between 20 and 25 miles distant from the station, but there is very little table land to be found on them. The peaks of the hills rise to a considerable

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	height, one called the Agusteer peak, supposed at one time to be inaccessible, has been found by the barometer to be 6,200 feet above sea level. The Travancore Rajah has established an observatory on the extreme summit of this hill, where a series of valuable observations have been taken for several years past. 4. The nearest water is that of the canal, running parallel to the river. The station is about 30 miles W. of the sea coast. The vicinity is not liable to overflow except on the occasion of extraordinary freshes, and then only to the north of the river. The ground around the station, although slightly broken up in parts, resulting from the sinking of pits for gravel, is not sufficiently so to cause the lodgment of any quantity of water. 5. The interior of the Fort is not badly ventilated, but a great improvement would doubtless take place in the health of the inhabitants, were the Fort walls, which are high, levelled. The cantonment outside the Fort is particularly well ventilated. The temperature of the interior of the Fort is usually hotter than that of the cantonment outside. This results partly from the ventilation not being so free, and from the houses being more crowded. The station being situated so near to the apex of the peninsula is exposed to winds which are, except during the very hottest months, moderately cool. The S.W. wind which sets in towards the close of May, passes over an extensive sheet of cultivation, and is thus rendered pleasantly cool, although disagreeable at times on account of its violence. The winds from N.E. round to S.W. may be called sea breezes. 6. The country to the north of the station is rich in rice cultivation; sugar, betel, and other grains requiring water being also raised. The ground to the E. and S. is sown with gram and other dry grains. The principal work of irrigation is a canal derived from the Tambrapoorney river; it is about 20 miles bong and irrigates a large extent of land. It runs in a semi-circular direction round the W., N.E., and E. sides of the station, the nearest point to the cantonment being about half a mile distant. Several small tanks exist also in different directions. The irrigation being kept up chiefly by minor channels taken from the main canal, the water in which is continually fresh, no ill effects to the health of the station appear to result from artificial irrigation. After the second crop has been reaped (generally towards the middle of March) the fields dry up so very quickly that malaria appears to have no time to generate. No prohibition whatever is made regarding the proximity of rice cultivation, every available piece of ground is brought under irrigation, and although the houses of a large portion of the European community are, as it were, surrounded by rice fields, no ill effects have been noticed. No indigo plantations exist near the station. Flax is occasionally grown by means of artificial irrigation, in small patches bordering the river, and at some distance from the cantonment. 7. The nearest town to Palamcottah is Tinnevelly, one of the largest and most important of the native towns in the district to which it gives its name. 8. The fort of Palamcottah is built on a barely covered rock, generally described as mouldering gneiss although in parts the out-cropping rock is hard and compact. The soil of which the plain is composed (a light red sandy loam) would appear to have been formed by the partial disintegration of the neighbouring hills, which are now chiefly composed of hard imperishable quartz. 9. Well-water is found in the dryest seasons at a depth of from 15 to 20 feet; but during the rainy season the water rises to within 2 or 3 feet of the surface. 10. The country is generally well drained; the rainfall is either caught in tanks, or flows into and is carried off by the irrigating canal to the north of the station. There is no higher ground the drainage from which passes into the subsoil of the station. 11. The water supply is derived chiefly from wells, but the water from the irrigating canal is extensively used, and is preferred by the natives on account of its being generally purer than well water, much of the latter being slightly brackish, and impregnated with lime and magnesia. Water is procured also from small tanks scattered about in various directions. The rain-fed tanks near the station generally hold water for a space of from four to five months. They are free from weeds, and abound with small fish, which are eagerly sought after by the natives. The natives generally wash their clothes and bodies first in the tanks, and then secure chatties of the same water for drinking and other purposes. The water in the tanks being generally drawn off for the irrigation of rice, &c., is not liable to stagnate, and hence the generation of malaria appears to be prevented. No malaria proceeds from any tank. 12. The best drinking water is procurable from wells bordering the irrigating canal, the water of which, itself derived from perennial mountain streams, percolates through the soil to the well cavity, and is sweet and wholesome. That procurable from wells sunk through the gneiss rock, and at some distance from the canal, is generally more or less brackish, owing to the subsoil containing carbonate of lime, magnesia, and other salts. The water from the canal and tanks is simply taken in chatties; that from wells is drawn by means of picottahs. 13. There appear to be no other topographical points worthy of notice. 14. No reply to this query.
II. Climate.	1. The instruments available for conducting and registering meteorological observations are an aneroid barometer, a thermometer, and a pluviometer. 2. Table of meteorological observations from 1st January 1855 to 31st December 1859 inclusive.

Months.	Barometer Mean.	Mean Temperature.	Mean Daily Range.	Mean Maximum.	Mean Minimum.	Mean Dry Bulb.	Mean Wet Bulb.	Mean Sun Temperature.	Rain, Inches.	Winds. Direction.	Winds. Force.	Days of Sunshine.	Remarks as to Clouds, Winds, Dews, Storms, &c.
January -	29·569	82°	8·86	86·2	76·°	—	—	104°2	4·075	N.E.	Moderate.		
February -	29·560	84·5	8·4	90·4	76·6	—	—	104·	1·180	Do.	Do.		
March -	29·686	87·4	9·12	92·6	81·6	—	—	106·8	5·165	N.E. & S.E.	Do.	—	Wind S.E., principally in the afternoon.
April -	29·416	88·8	12·76	94·2	84·2	—	—	107·4	20·145	S.E.	Very moderate.	—	The wind, though principally from S.E., very variable.
May	29·354	84·96	9·74	94·	84·4	—	—	108·2	9·240	N.W.	Moderate.	—	At times the wind is high towards the end of the month.

December	29·465	82·62	8·1	85·8	77·2	—	—	103·	8·220	N.E.	Do.		

References to Subjects and Queries.	Replies.
II. Climate—*cont.*	3. The climate is a very dry and healthy one; the thermometrical heat is high, and the daily range not great. High winds prevail generally from the end of May to the end of August, raising a considerable dust, but not apparently with any injurious effect. The most unhealthy months are at the commencement of the north-east monsoon, when cholera generally shows itself in an epidemic form, and also dysentery and diarrhœa in November and December. The months of March and April are the hottest time at the station when fevers of the intermittent and ephemeral type prevail. 4. There is no district near the station the climate of which is more conducive to health. 5. No reply to this query.
III. Sanitary Condition of Station.	1, 2, 3, 4. A map of the surrounding country, with a plan of the station, is transmitted. There are no barracks; the sepoys are hutted in lines. All the drains are open, and have a free escape. The drainage is admirable, the whole station being situated on ground sloping from 1 in 30 to 1 in 100 to the north-west. 5 to 8. These queries are not applicable to native troops. 9. The huts are constructed of mud wall with tiled roofs. 10. Not applicable to native troops. 11. A sanitary committee is responsible for the sanitary state of the cantonment, and an establishment is kept up by government. The hospital and place of arms are whitewashed whenever necessary. 12 to 15. No reply to these queries. 16. No part of the hospital is damp. The cesspits are more than 300 yards from this building. There are no foul ditches. 17. The surface cleansing of the cantonment is performed effectually by an establishment kept for the purpose. 18. The surface of the cantonment is kept free from vegetation. The fort walls interfere greatly with the ventilation of the fort, but they are being gradually pulled down. 19. The sanitary condition of the bazaar, which is small, is efficient and good. Its cleansing is efficiently attended to and performed by an establishment kept for the purpose. The native houses are of very inferior construction, and rubbish heaps are frequently kept within their yards. 20. Very few animals are slaughtered at the station, the number being about 10 sheep a day, and 4 oxen a month. No nuisance is experienced from the slaughtering places. 21. No reply to this query. 22. There are no cavalry or artillery stables at this station, neither are there any picketing grounds. 23. Not applicable to native troops.
Officers' Quarters.	1. The sanitary condition of the officers' quarters is very good. The cantonment is on a slope, and drains itself into the surrounding tanks. No improvements are suggested.
IV. Health of the Troops.	1. The station, district, and adjoining native population may be pronounced as decidedly healthy. 2. The most prevalent diseases are fevers of an intermittent and ephemeral type during the hot months of March and April, and cholera and bowel complaints at the commencement of the north-east monsoon. 3. The healthiness of the neighbouring native population is attributable to the ground on which the fort is situated, being high, the soil dry, and the drainage efficient. The population also is not crowded. 4, 5. No reply to these queries. 6 to 16. No experience of hill stations. 17. With regard to whether there is any higher ground which could be advantageously occupied as a hill station, such stations are not necessary for native troops. 18. Gravelly and light soils, with a substratum of sand, are generally the most healthy. 19. The best period of life for soldiers to proceed to India is at 18 years of age, and they should land there in the cold season, from November to February. Freedom from exposure to the sun and from temptation to drinking are the best means of preserving the health of recruits on first landing. 20. Cannot say whether troops should be sent direct from the home depôts to India or sent to an intermediate station for a certain time; or whether they should be sent to hill districts on first landing, or how disposed of. 21. No reply to this query. 22. The period of service of a British soldier in India should be 10 or 12 years. 23. No experience of the manner in which the business of medical boards is conducted either at stations or at the presidencies. 24. Invalids leaving India for home should not depart later than the end of February or the beginning of March.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*—*Diseases.*	1. There are no regular inspection parades for the discovery of incipient diseases at the station. 2. There has been no scorbutus at this station. 3, 4, 5. No data exist upon which to form an opinion either as to the proportion of hepatic disease, dracunculus, or venereal disease. 6. The following diseases of endemic or epidemic class are those which the troops at the station suffer from:— *Fevers* of the ephemeral and intermittent type occur during the hot months of March and April. *Dysentery*, *Cholera* } Occur during the north-east monsoon. *Small-pox* has never occurred to my knowledge in an epidemic form among the troops stationed here. *Rheumatism* is not, I believe, particularly prevalent. No data are available to determine what is the proportion of admissions and deaths from these diseases to the total admissions and deaths. 7. The only zymotic diseases known at this station, as far as my experience goes, are cholera, variola, and very rarely rubeola, which are prevalent in the cold season at the commencement of the north-east monsoon, when there is a considerable moisture in the atmosphere from rain fall and a diminution of temperature. These diseases are not more prevalent in one part of the station than another, and I am aware of no particular habits and conditions among the troops or native population which predispose to these diseases. 8. Cannot say to what extent the prevalence of epidemic disease is influenced by the nature o the soldiers' duties and occupations in barrack, or habits on the march or in the field. 9. With regard to whether quinine has been tried as a prophylactic against malarial diseases at the station, malarial diseases are not prevalent here. 10. No reply to this query.
V. Intemperance. VI. Diet.	Queries under these heads do not apply to native troops.
VII. Dress, Accoutrements, and Duties.	1. The soldiers' dress at this station is decidedly not suited to the climate. The dress of a native soldier should be loose like that usually adopted by themselves, and not tightly fitting or of thick cloth.
Duties.	1. This query does not apply to native troops. 2. The best hours for drills, parades, and marches are in the morning. They should not last after seven o'clock. 3. No reply to this query.
XII. Hospitals.	1, 2. The site of the hospital is open and freely ventilated, and there are no walls, trees, or buildings interfering with ventilation. It is healthy in every respect. 3. There is an abundant supply of good wholesome water, procurable from a well immediately outside the hospital compound. 4. The drainage is simple, carrying off all refuse water readily to the neighbouring tank, to the north of the cantonment. 5. The surface drainage and guttering round the hospital is sufficient for carrying away the rainfall rapidly. The hospital is built of brick and chunam, and is a cool and pleasant building. It is supplied with verandahs, which afford sufficient shelter from the sun's rays. The hospital accommodation is so extensive that the verandahs are not required for the accommodation of sick, convalescents, or others. The building consists of one flat, and is so placed as to receive the full benefit of the prevailing winds. The windows open horizontally, and have both glass and venetians, and answer all the purposes needed for ventilation and coolness. 6. The doors and windows are sufficiently large and numerous to keep the wards at all times free of odour and closeness, besides which there are ventilators in the upper parts of the walls near the junction of the roof, supplied with weather boards, which can be opened or shut at pleasure. The jalousies or jhilmils are in the usual style adopted in India. 7, 8. There are no means of cooling or warming the wards. The walls and ceilings of wards are cleansed and lime-washed once every six months. 9. The privies are built of brick and chunam. They are thoroughly cleansed daily, and are not placed over cess-pits. They are not offensive. 10. This query is not applicable to native troops. There is, however, one bath for the sick in case of emergency. 11, 12. Not applicable to native troops. 13. The storage is sufficient and dry. 14. The cots are made of iron, and the bedding consists of a straw paillasse and quilts and cumblies. 15, 16. Do not apply to native troops. 17. Orderlies are allowed to attend on the sick on the doctor's application. 18. The sanitary condition of the hospital is excellent. No epidemic disease, hospital gangrene, or pyæmia have appeared in the wards. 19. There are no deficiencies or sanitary defects which require improvement. 20. There is no special provision made for convalescents. 21, 22, 23. No reply to these queries. 24. There are no convalescent wards or hospital, and such provision is not required, as there is only a native regiment here.
XIII. Burial of the Dead.	1, 2, 3, 4. No reply to these queries. 5. The dead of bazaar people are burnt or buried according to caste. 6, 7. No reply to these queries.

(Signed) W. K. Babington, Lieutenant-Colonel, Commanding Palamcottah.
Geo. V. Winscom, Captain Engineers, District Engineer, Tinnevelly.
Fred. L. Clementson, Zillah Surgeon, Tinnevelly.

	Infantry	Non-commissioned Officers and Men	3,600

References to Subjects and Queries.	Replies.
I. Topography.	1. The country to the south and west of the station is flat, covered with jungle, swampy, and intersected with numerous creeks flowing into the Irrawaddy and Pegu rivers. On the north it is undulating, with forest trees and thick underwood. In this direction it is, generally, sandy and dry. The whole country for miles round is covered with forest trees and low jungle. During the monsoon the country is under water. 2. The height of the station above the sea varies from the sea level to about 80 feet, and its height above the adjacent country varies to the extent of about 70 feet. There is a freshwater lake or tank about a quarter of a mile to the east of the station. It is the only one of any size in the vicinity. The river Irrawaddy flows past about the same distance to the westward. There are numerous creeks and nullahs in the surrounding country, but none of sufficient size to require special notice. There is no higher or healthier ground adjoining the station. The cantonment is situated on a spur of a hill, on the highest point of which is the Great Shoey Dagon Pagoda, the base of which is almost 100 feet higher than the cantonment, and is admirably calculated for defensive military purposes. 3. There are no mountains or table land within sight of the station or within 100 miles. 4. The nearest water of any size is the lake or tank already mentioned, about a quarter of a mile distant, and the Irrawaddy river at about the same distance. The vicinity of the station is not liable to overflow from the river, but during the monsoon, from May to October, it is under water from the heavy rains, which soon runs off or dries up. In the course of a month or six weeks after the rains the country is dry. The surrounding ground is broken, and there are ravines, but there are no water pits except a few near the artillery barracks, and the committee is not aware that they have produced any injurious effect on the health of the troops, although it is most desirable that the said pits should be filled up, as it is believed that their existence is one cause of beri-beri. 5. The station is open and freely exposed to all winds. There is nothing calculated to affect, materially, the free external or internal ventilation of the station. The temperature is not raised by reflected sun heat. There are no ungenially cold, variable, or land winds. The sea breeze blows freely at certain seasons, and is most conducive to health. 6. There are patches of cultivation here and there, generally the surrounding country may be said to be cultivated. There are no works of irrigation in Burmah. The lake to the eastward of the station may be used for the purpose to a very limited extent, but not so as to produce any effect on the health of the station. No description of grain is allowed to be grown in military limits. Rice is grown to a considerable extent on the western bank of the Irrawaddy, distant four or five miles; and it is also grown to the eastward and south of the station about the same distance. The Committee is not aware that indigo, hemp, or flax are grown in or near the station. 7. The nearest town is Rangoon, which is close to the station, and on the same side of the river Irrawaddy, along the bank of which it extends six or seven miles. The population is composed partly of Burmese and partly of natives of India, with a few Europeans. 8. The surface and subsoil in the vicinity of Rangoon consist of a series of clay and sandstone, with a large development of laterite. This rock is met with on the spurs and ridges which terminate the Zoornah range of hills at this place, the Great Shoey Pagoda being erected on the highest spot to the north-east of the station. The plain below consists of clays and sandstones, each occasionally predominating, the former being sometimes of a very aluminous kind like pipe-clay. The surface soil is always clayey and alluvial, but at varying depths the subsoil becomes gritty or gravelly, from the admixture of nodules of a brick red and dark brown colour. These nodules are more numerous as we descend, and at length give the rock a conglomerate alluvial character, resembling a nodular clay ironstone, constituting, in fact, the laterite before alluded to. The alluvial soil of the cantonment has, by analysis, been found to contain 50 to 70 per cent. of alumina; such being the case, it may be concluded that drainage by percolation must be insufficient. Generally speaking, as the ground of the cantonment slopes to the south and west with considerable gradients, the water is readily carried off, and the roads soon become dry after rain. But in some of the lower parts of the cantonment, where the surface soil is of a very retentive character, much artificial drainage and improvement are required. 9. The depth at which water is found varies at different parts, but on an average water is usually found during the dry season from 25 to 30 feet below the surface; during the rainy season from 15 to 20 feet. 10. There are no surface springs, but the rain-fall flows very readily away or sinks into the porous subsoil, and is drained off, and does not ooze out again; this as regards the station. In the surrounding flat country much remains on the surface, and is dried up during the hot months. There is no higher ground, the drainage from which must necessarily pass into the subsoil of the station. 11. The water supply is derived from wells and one or two tanks. The dhoby or washermen's tank and the Scots tank to the north of the Great Pagoda might be used for the like purpose. It is most desirable, considering its site, that the latter should be reserved for this purpose. From the use made of it by the commissariat it is, at present, utterly useless for drinking water, and is becoming less so every year. There is an extensive sheet of water east of the cantonment; there are other smaller tanks (ponds) within the boundary of the cantonment. Drinking water is usually obtained from wells not from tanks. The low swamp between the 41st lines and its mess-house might, with great advantage, be dug out and formed into a reservoir or tank for water. This measure is particularly recommended as a sanitary precaution.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	The tanks are never dry and are brimful during the rains. There are fish of different kinds in them, and there is a water plant in them (name unknown to the committee) which prevents the water becoming decomposed, and keeps it always sweet and wholesome. There is a small tank near the 41st mess-house adjoining the Prome road (east), that is always dry during hot weather. There is a luxuriant creeper spreading over the surface of many of the tanks, which has the property of keeping the water at all times pure and sweet. No tank used for supplying drinking water is also used for bathing, and none of the tanks are liable to pollution from leaves, drainage, &c., getting into them. The committee is not aware of any nuisance or malaria proceeding from the tanks.
	12. The amount of water supply is ample, with the exception of the hot months, when the supply in the wells becomes scanty. The water is of most excellent quality, as regards colour, taste, and smell. When drawn it is of a whitish colour, particularly at the commencement of the rains, when it is very dirty, but soon deposits a sediment and becomes comparatively clear; after filtering it becomes perfectly so, it being then very pure and tasteless. The water is soft and contains very little lime and no animalculæ, and the sanitary officer considers it by no means injurious to health if filtered. It is raised and distributed by bheesties or water-carriers. The committee is not aware that any better means could be devised, unless some machinery were introduced.
	13. The committee is not aware of any other topographical point requiring notice besides the above.
	14. As regards the present procedure in selecting new stations, sufficient attention has not hitherto been paid to the important considerations of topography, climate, diseases, &c. Generally cantonments have been placed on low ground, as being more convenient for water supply, which is highly objectionable. In the selection of a site for a cantonment a board of experienced officers should be appointed to make the necessary sanitary inquiries, and, if possible, a previous trial of the spot should be made by troops before erecting permanent buildings.
II. Climate.	1. The meteorological instruments at present available at the station are thermometers, barometers, hygrometers, and rain gauges, but no adequate means or instruments have hitherto existed in this province, and no records embracing all the necessary observations have been kept. Complete sets of instruments have, however, been lately received, and are to be put up and scientifically observed. Properly instructed persons and a suitable department are needed for this purpose.
	2. The following table gives the result of eight months' observations.

Months.	Barometer Mean.	Mean Temperature.	Mean Daily Range.	Mean Maximum.	Mean Minimum.	Mean Dry Bulb.	Mean Wet Bulb.	Rain.*	Winds.		Remarks.
									Direction.	Force.	
1852.	In.	°	°	°	°	°	°	Inches.			
November	30·06	81·09	14·04	88·11	74·07	81·79	74·80	—	N.E.	Moderate	Generally clear.
December	30·094	76·70	18·00	85·7	67·70	78·13	69·33	0·21	E. & N.E.	„	Fine and clear.
1853.											
January -	—	77·22	22·22	88·33	66·11	77·78	67·82	—	N.E.	„	Fogs frequent.
February -	—	77·45	28·90	91·9	63·01	78·93	69·85	—	Variable	—	Fogs frequent.
March -	—	82·90	23·45	94·63	71·17	83·73	75·93	0·15	—	Light -	Fine, with occasional thunder and lightning and gusts of wind.

June -	29·745	80·106	6·40	83·37	76·95	80·72	78·29	15·01	S.W.	Strong -	Cloudy, with rain.

* About 80 inches usually fall during the monsoon.

3. The climate is dry from the middle of October until the middle of May. Heavy dews and mists prevail during January, February, and March. The day heat is excessive from March till May, but a refreshing sea breeze generally sets in about 4 p.m.; nights and mornings cool. Thermometer usually varies about 20° during the 24 hours.

An extensive forest with much underwood on the north side. The river Irrawaddy and several creeks on the south and west. Cantonment very dusty in dry weather owing to long drought and the bad materials (only kind procurable) of which the metalled roads are made.

Rangoon is found to be healthy for Europeans, but not so for native troops, owing principally, it is considered, to the want of nourishing meat diet. Throughout the year light woollen clothing should be worn by both Europeans and natives. The shelter afforded by the present wooden barracks is insufficient (executive engineer says "is ample"), and some of the barracks of the natives are not sufficiently raised from the ground. As a general rule, all drills and exercise in this climate should take place before 7 o'clock a.m., and should not exceed one hour. Night duties should be restricted as much as possible, and a man should not be brought on guard duty oftener than once in four days.

The hot months, from March till May, are considered the healthiest. The wet months and those immediately preceding are the most unhealthy. During the wet season bowel complaints are prevalent among Europeans, and during the wet and cold season fever and beri-beri prevail among the natives. The sanitary officer is of opinion that when the monsoon is copious, that is, of normal amount, the wet season would appear to be healthier than

References to Subjects and Queries. | REPLIES.

II. Climate—*cont.*

either the cold or hot season, there being no evaporation, and great equability of temperature. In his opinion the drying up of the numerous shallow ponds or tanks causes fever, bowel complaints, and beri-beri.

4. Thyet Myo, about 200 miles up the Irrawaddy river, is reported to be a healthy and desirable station for European troops, especially on their first arrival from Europe. It is 160 feet above the level of the sea. Its surface and subsoils are a series of sandstone and gravel to the depth of 25 feet or more, beneath which is a retentive stratum of calcareous clay. The surface is undulating and drainage good. The water supply is excellent, and is found at a depth of 25 to 35 feet. Its climate is many degrees cooler than that of Rangoon, the thermometer ranging from 45° in the cold months to 104° in the shade in the hottest weather. It is reached by water in 8 days. (*Vide* Appendix to this Report.)

5. As regards the comparative healthiness of stations. It appears that stations situated in valleys, on low ground, or near stagnant water, are unhealthy, while those on high table land are generally the healthiest, but there are other circumstances relating to the subsoil and surrounding country which also require to be considered.

The following table, showing the relative salubrity of a few of the principal stations as regards European troops, is taken from various reliable sources.

Stations.	Periods.	Deaths per 1,000 of Strength per Annum.
Bangalore	10 years, 1829 to 1838	28·03
Cannanore	10 years, 1829 to 1838	37·69
Trichinopoly	10 years, 1829 to 1838	39·34
Masulipatam	10 years, 1829 to 1838	51·00
Secunderabad	10 years, 1829 to 1838	71·68
Rawul Pindi	6 years ending 1854–5	27·60
Jullundur	9 „ ending 1854–5	28·06
Dugshai	5 „ ending 1854–5	29·8
Sholapore	20 years ending 1849	22·25
Kolapore	20 years ending 1849	20·5
Thyet Myo	2 years, 1858–9	29·75*

* Including 6 deaths by cholera in 1859. Deducting these, the mortality would be 19·6 per 1,000.

III. SANITARY CONDITION OF THE STATION.

1, 2, 3. Maps and plans of station, &c. The country to the south and west, on the other side the river, has not yet been surveyed. Every road in the cantonment has a ditch or drain cut on each side of it, and by these ditches the cantonment is drained. There are no covered sewers. The general slope of the cantonment is to the south towards the Rangoon river, which receives the drainage.

4. The following table shows the barrack accommodation :—

Date of construction, 1852–53–54.

Barrack Rooms.	Regulation Number of Men in each Room.	Dimensions of Rooms. Length.	Breadth.	Height.	Cubic Contents.	Cubic Feet per Man.	Superficial Area in Feet per Man.	Height of Beds above the Floor.	Windows. Number.	Height.	Width.

5. The windows are on opposite sides of the barrack rooms, and open inwards like doors. There is no verandah, as this term is used in India, but the roof on both sides of the building is carried out about 10 feet beyond the outer wall, and forms what is usually called a "pandall," the floor of which is the ground, and much lower than the floor of the building itself. This pandall is never used as a sleeping quarter by soldiers or others. There are no jalousies or jhilmils in the barracks of the European troops. The windows are glazed. In those for the native troops they are plank or mat.

6. The artillery bedsteads are of wood, those of H.M.'s 68th Light Infantry are partly wood and partly rattan. The latter are preferred by the men, and recommended by the committee. The bedding consists of a small cotton carpet, a quilted quilt, and a blanket. No bedsteads are allowed to native troops in barracks, nor bedding, they provide the latter themselves.

7. European tents are 21 feet long by 15 feet broad, 5 feet high at the sides, and 10¼ feet in the centre, giving 315 superficial feet, and 2,441 cubic feet of space. They are intended for 25 men, giving to each man 12½ superficial, and 97½ cubic feet. A native tent is 22 feet

References to Subjects and Queries.	Replies.
III. Sanitary Condition of the Station—*cont.*	long, with an average breadth of 11 feet; height in centre 8 feet, and at sides 1¾ feet; it holds 25 men. The tents are made of thick white cotton cloth, doubled or trebled, and lined with blue cotton cloth. The European tent has a double fly, with a distance of a foot and a half between the flies. 8. Barracks and guard-rooms in Burmah are ventilated by doors and windows, and also by a narrow opening of from 4 to 6 inches all along the top of the side walls. This ventilation is, generally speaking, sufficient, but it might be improved by having ridge ventilation along the top of the roof. Tents are ventilated by doors and windows, and when necessary, by lifting up the sides; but the new mode of ventilating tents recently adopted in England should be introduced into this country. The air in barrack-rooms is cooled by punkahs, formed of a framework of wood 16 feet long by 3 feet wide, covered with cloth, suspended from the roof by ropes, and pulled by men, so as to oscillate like a pendulum. The air is thus set in motion, producing the same effect as is caused by a fan. There are generally five such punkahs in a barrack-room; cost of the five about 200 rupees. 9. Barracks and huts in Burmah are built of wood and bamboo mats, with thatched roofs; tents are of cotton cloth. 10. Floors are generally of plank, some few of bamboo; they are raised from 2 to 8 feet above the level of the ground, allowing a free passage for air underneath. 11. Wooden barracks are not well suited to the climate, being damp in wet weather, and not affording sufficient protection in the hot season. Substantial masonry barracks raised on arches or pillars are recommended by the Special Committee, to be constructed of two stories, so as to admit of the lower part being used as exercising ground, ball court, skittle alley, &c. (I differ from the committee in their answer to this question. I consider that wooden barracks with shingled roof and boarded ceiling are greatly to be preferred to masonry barracks. The former are undoubtedly cooler at night, and from an experience of nearly five years, I should say, are certainly not damp, whilst they are not liable to destruction by earthquakes, which are not unfrequent in Burmah. (Signed) Jas. Bell, Major-General, Commanding Pegu Division). The barracks and cantonment are kept in repair by the Public Works Department. Repairs are executed as quickly as circumstances will admit of. The sanitary officer, who is the senior medical officer, is held responsible for the sanitary state of the cantonment.* Masonry buildings are whitewashed once a year, hospitals oftener if necessary. 12. There are lavatories, but no baths. (Sketch appended.) 13. Food is cooked in metal boilers and saucepans, and occasionally in earthen vessels. The method is most simple. Fires are lighted on the ground, or on a raised brick platform or fireplace running round the cookhouse, the boilers being placed on stones or bricks put round three sides of the fire. Native cooks generally superintend the cooking of soldiers' food. Water carriers bring the water required. Refuse matter is carried away to a distance by the cooks and sweepers. Linen is taken away by dhobies, who wash it in the neighbouring tanks. The conveniences are quite sufficient. 14. In the privy arrangements the ordure is received into wooden boxes lined with zinc, and these are daily carted to a distance, and the contents there emptied. 15. Barracks are lighted at night by oil lamps suspended from the roof in glass globes. Glazed windows are required. 16. The drainage is by open drains dug so as to carry off the rain water, &c. Where the barracks are on high ground the water runs off readily. The drainage is not sufficient in some parts where the ground is low. In low parts the water is allowed to stand and evaporate. The buildings used as barracks or hospitals are damp during the monsoon. The marshy ground near the 41st Regiment's lines is about 200 yards from the hospital and barrack. There are no foul ditches. 17. Surface cleansing within the cantonment is done to some extent either by removal to a distance or burning of refuse substances. It is not efficiently done. 18. During and after the rains there is much vegetation on the surface of the cantonment, but it is easily removed periodically. More might be done in this respect than is done, but upon the whole the station is kept pretty free from vegetation. The committee is not aware of the existence of any old walls, hedges, or other obstructions to ventilation. 19. As regards the sanitary condition of the bazaar. The bazaar has good open drainage. The ventilation is good, and the water supply abundant. It is kept very clean. There are private latrines, but no public ones; they are not offensive. The bazaar is not crowded. The conservancy of the station is under the jurisdiction of the cantonment magistrate, who has ample powers, under specific regulations, to ensure its sanitary condition. The committee has no suggestion to offer on this point; but although beside the questions under consideration, the committee would take the liberty of offering an opinion that, as a question of military organization and expediency, it would be desirable that the officer exercising this jurisdiction should be under the military authorities only, and not be, as he is, partly under the military and partly under the local civil authorities, as such joint jurisdiction is calculated to lead to clashing between the two authorities. The native houses near the station may be said to be in a dirty state. The military authorities have no jurisdiction beyond military limits and cannot interfere. Some other and better arrangements are required in regard to the removal and places of deposit of night-soil. This is now deposited at a spot to the eastward of the Great Pagoda, on the road leading to the artillery practice ground, and is most offensive. The atmosphere near is poisoned with the stench. If pits were dug and filled up from time to time it might lessen the evil.

* *Extract from Cantonment Orders.*—"Commanding officers and heads of departments will send in to the brigade office by the 25th May, a report to the effect 'that the localities and lines respectively are cleared of all rubbish, old thatch, &c., and are in a satisfactory sanitary condition.' These reports are to be first sent to the sanitary officer for countersignature, and that officer will satisfy himself that he above order has been properly carried out."

References to Subjects and Queries.	Replies.
III. Sanitary Condition of the Station—*cont.*	None of the barracks except those on the eastern platform of the Great Pagoda are sufficiently near to the place of deposit to cause the wind blowing over it to be much felt. The committee is not aware that any nuisance is experienced from the wind blowing over native dwellings. 20. Cattle for the use of troops are slaughtered within cantonment limits at a place to the eastward of the Great Pagoda. All arrangements connected therewith are made by the commissariat officer. It is not sufficiently near barracks to be a cause of nuisance. Committee have no suggestion to offer; but, as connected with the subject, they would remark that at times, when cattle or elephants die near the cattle sheds the nuisance is great for those who may be taking exercise in that direction. They would suggest whether it would not be advantageous to have sick cattle lines at a greater distance, and that the dead animals should be buried, instead of being kept to decompose on the surface as is now done. 21. The only ponies in the bazaar are those belonging to the hack carriage proprietors, who are, under regulations, obliged to provide proper stabling for them, and to remove the manure, &c. This is properly attended to. There are no horses or ponies belonging to the camp followers, nor are there any picketing grounds for horses or ponies in or near the station. 22. The artillery battery horses are picketed under sheds made of thatch. They are about 300 yards to the north of the barracks, and 500 to the north-east of the hospital. The sheds are open all round; there is one dung-heap to the north of the sheds or stables, and about 200 yards distant. The remainder of the dung is removed daily to a distance in the surrounding jungle. The following are extracts from the Cantonment Regulations:— "i. It is the duty of the executive engineer to attend to the general conservancy of the station, and he is required to draw the attention of the officer commanding to any instance in which the precautionary rules against fire have been neglected. "ii. The conservancy of the Sudder bazaar rests with the officer in charge, and commanding officers and quartermasters of corps and detachments and heads of departments are required to attend to the cleanliness of their own lines or premises. "iii. No nuisances are permitted within the cantonment south of Tiger Alley and Arsenal road, or west of Lake road. "iv. Residents in cantonments are consequently required to have trenches dug within their respective compounds for the use of their dependants. These trenches are to be filled up and renewed as often as deemed necessary by the medical officer in charge of the lines in which the compounds may be situated. "vi. Towards the end of each monsoon all compounds and regimental lines are required to be cleared of all jungle, weeds, and rank vegetation; fences to be repaired, and hedges cut according to regulations. Officers commanding regiments and heads of departments will, on or before the 1st November in each year, report to the brigade majors that this order has been complied with by all under their orders or residing within the lines under their charge." (True extract.) A. S. STEELE, Captain, Brigade Major." 23. There are no quarters specially built and set aside for married non-commissioned officers and men. The married non-commissioned staff have quarters, as is customary in India. The Artillery have what is called a patchery, which the married men occupy. The families of the 68th Light Infantry have not yet joined head-quarters, but some large buildings, formerly used as a detail hospital for natives, have been set apart for them. There are no married families living in the same barrack with the men. The native troops have not their families with them.
Officers' Quarters.	There are no public quarters for officers. They occupy private bungalows in the vicinity of their barracks. The committee is not aware that they are unhealthy, although the ground on which many of the bungalows are situated might be improved by being properly and systematically drained. The committee is of opinion that it would be advantageous if officers were supplied with public quarters, and it is suggested that in European regiments, the adjutant and quartermasters should be in or near the barracks.
IV. HEALTH OF THE TROOPS.	1. The station, the district in which the station is situated, and the adjoining population are very healthy. 2. (No reply to this question.) 3. (No direct reply to this question. But under 2 and 3, both of which relate to the sanitary state of the *native population*, the following information regarding immigrants from India is given.) The natives residing within the limits of the cantonments, who are chiefly from Madras, Calcutta, and Cocanada, appear to be healthier than the troops, which may be attributed to their having better food and no night duty. The unhealthiness that exists among the native troops may be accounted for by the neighbouring swamps and the want of drainage in the lower parts of the cantonment. The men being without their families have no one to cook their rice, which is another cause of their being unhealthy. N.B. by the executive engineer signing these proceedings. "I do not know of any lower "parts of the cantonment which require draining."—(Signed)—E.L. 4. The following are the stations at which the troops served before coming here:— D company, 1st battalion, Madras Artillery, from Secunderabad in 1856; was there 10 years; left 26th January 1856. State of health there, fair; diseases, hepatitis and fever. State of health on arriving at Rangoon, 23rd April 1856, good. Since arrival, suffered from dysentery and hepatitis. D company, 4th battalion, Madras Artillery, from Kamptee in 1856, was there nine years, left 15th October 1855. General health there good; diseases, hepatitis and fever. State of health on arrival at Rangoon, 21st January 1856, good. Since arrival, suffered from hepatitis, dysentery, fever. H.M. 68th Light Infantry; Rangoon, first station in India. State of health on arrival, 23rd March 1858, good; since experienced dysentery, fevers, bowel complaints.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	6th Regiment Madras Native Infantry, from Bangalore in April 1857; there two years, left February 1857. State of health there, very good; diseases, fever and rheumatism. State of health on arrival at Rangoon, good, and for a year afterwards. Suffered during the last year of residence from diarrhœa, rheumatism, beri-beri, fever. Casualties about 65 in Burmah and India during three years' service. Returned to the coast 24th March 1860. Although numerically stronger than the 23rd or 41st Regiments, was far more healthy, attributed to the 6th being in better barracks and well raised from the ground. 23rd Regiment Light Infantry, from Russelcondah in 1858; was there one year 11 days; left 15th March 1858. State of health there, good; diseases, intermittent fever and rheumatism. State of health on arrival at Rangoon in April 1858, good; since arrival has suffered from diarrhœa, rheumatism, beri-beri, fever. 39th Regiment Madras Native Infantry, from Thyet Myo in 1860; was there three years; left 9th February 1860. State of health there very bad for a period from fevers, beri-beri, bowel complaints. State of health on arrival at Rangoon in February 1860, fair; since arrival, suffered from diarrhœa, rheumatism, fever, beri-beri. 41st Regiment Madras Native Infantry, from Secunderabad; was there one year; left 13th March 1858. General health there, good; diseases, intermittent fever, rheumatism. State of health on arrival at Rangoon in April 1858, bad; since arrival suffered from beri-beri, dysentery, rheumatism, fever. The committee is not aware of any portion of the men's accommodation at Rangoon being more unhealthy than the rest. 5. The troops are not camped out here. 6. I was in command at Mercara, a hill station near the western coast of Southern India. The garrison consisted of the 28th Regiment Native Infantry, and about 30 European artillerymen. The climate was found to be highly favourable for all. 7. I have not observed that troops who have been resident at hill stations have been more liable to disease on returning to the plains. 8. I think it would be highly beneficial for European troops to select hill stations. 9. I do not remember any diseases with which troops are liable to be attacked on going to hill stations. 10. Men going to hill stations require to adopt precautions as to warmer clothing, and avoidance of sleeping exposed to the night air. 11. I know of no exceptions as to the times best adapted for residence at hill stations. During the cool season the plains, also, are always agreeable. The period of residence at the hills should not be under two years. 12. There is no period beyond which residence on the hills would produce injury to health. The longer troops are kept on the hills the more they become fitted for service in the plains. 13. I know of no special precautions required for protecting the health of troops on leaving hill stations for the plains. 14. As regards the question of relative periods of residence on the hills and in the plains, I am quite satisfied that troops which had enjoyed the benefit of a bracing climate would be more fit for service in the plains than if they had been all the time under the enervating effects of the burning sun of the plains. The committee is of opinion that troops, European and native, should never remain longer than three years at one station. Frequent change is beneficial to health and discipline. The great objection, however, to this arrangement is the ruinous expense to which the troops would be put for carriage. 15. With reference to the kind of accommodation for sick at hill stations, there was an excellent hospital erected at Mercara, the station already mentioned, and it was no doubt highly advantageous to the recovery of the sick. 16. I have never heard of the Neilgherries or Pulney Hills being visited by any epidemic, though I believe dysentery was present in one of Her Majesty's regiments when first it was stationed at Coonnor. The height of these hills is from 6,000 to 7,000 feet. The Shevaroys near Salem, and Nundoomungalum near Trichinopoly, have both had seasons of unhealthiness, but I have not heard of any such visitation within the last 20 years, or more. They are, the former, I believe, between 5,000 and 6,000 feet, the latter 4,000 feet above the level of the sea. Mercara is, I think, under 3,000 feet, and Ramanuddy near Bellary is not more than 2,300 feet above the level of the sea. I have never heard of either of these places being unhealthy, and from all I know of any of these localities, I should say they are admirably suited for European troops. 17. There is no high ground near the station, but Thyet Myo would, it is considered, be found a more desirable station than the present one. The Major-General does not at all subscribe to this opinion. Thyet Myo is 200 miles off, and only during the cold season can it be said to be more bracing than this place, and for native troops decidedly more unhealthy. 18. As regards soils for stations, those subsoils that admit most readily of percolation are the most healthy. All surfaces into which alumina largely enters retain moisture, and exert an insanitary influence. Surface soils in which oxide of iron abounds, are considered to conduce to epidemic fevers. On the other hand, the most feverish places have been where the soil is black cotton. 19. The best age for soldiers proceeding to India is 20 years; and they should arrive at the beginning of the cold season. Troops are disposed of on landing according to local arrangements, and the precautions must depend entirely on local circumstances. 20. In sending troops to India, it would certainly be advantageous, as far as health is concerned, to acclimatize them at intermediate stations. After landing in India, the balance of evidence is in favour of gradual acclimation by earlier residence at hill stations of moderate elevation. They should certainly be sent to those stations in their respective presidencies, which statistics and experience have proved to be the most healthy. 21. As regards modes of transport, on the Irrawaddy river troops are moved in large flats capable of holding 300 men, and towed by steamers. To the stations on the Sittang river they proceed in country boats, there not being sufficient depth of water in the river for the steamers now in use. Every precaution is taken to protect the health of the troops on the route. 22. A soldier should serve 10 years in India.

RANGOON. BRITISH BURMAH. MADRAS.

References to Subjects and Queries.	REPLIES.
IV. Health of the Troops —*cont.*	23. Medical boards or divided responsibility in any form is objectionable. Where an opinion on a single point is required, the decision of a board would appear to be desirable. A standing medical committee is far preferable to one constantly changed, particularly with a perpetual president. 24. Invalids should leave India for home in January and February.
Diseases.	1. There are disease inspections in some regiments once a week. They are not generally adopted in native corps, unless on particular occasions. 2. There is no scorbutic disease of indigenous origin at this station. Among natives such diseases are caused by the want of a proper nourishing meat diet. 3. The returns do not show the exact proportion of cases of hepatic disease under treatment at Rangoon. The following table embraces the whole Pegu division for 1858–59 :—

——	Per-centage		Died, to Cases treated per Cent.
	Of Total Admissions.	Of Total Deaths.	
Hepatic Diseases - -	2	$11\frac{1}{7}$	$4\frac{5}{9}$

Causes.—Residence in a tropical climate; exposure to the sun's rays; undue excitement of the liver by the use of fermented liquor, especially ardent spirits. The immediate cause of acute inflammation is generally cold, or a chill experienced during sudden alternations of temperature.

The following per-centage of admissions of hepatitis to strength among different classes of soldiers, has been ascertained from the medical returns of six European regiments serving in the Madras Presidency in 1849–50 :—

——	Teetotallers.	Temperate.	Intemperate.
Per-centage to Strength -	5·77	5·766	10·191

The disease cannot be considered the consequence of other diseases. *Prophylactic measures recommended,*—

1. Avoidance of the solar heat in the hotter months of the year.
2. Moderation in diet and drink, especially the disuse of spirits.
3. Precautions against cold or chills, especially after fatigue or at the close of the hot season.
4. Protection of the abdomen by a flannel belt.

4. Guinea worm is not common among Europeans. It appears from the medical returns, 1829–38, that out of the aggregate strength of the Europeans of the Madras Presidency only 1 in about 1,880 admissions was from guinea worm; while among the natives the average was 1 in 562 admissions.

The only prophylactic measures which can be suggested is the avoidance of water, either for the purpose of ablution or drinking, in which the microscope detects the presence of any worm like the tank worm, described as the probable cause of guinea worm.

5. The returns do not show the exact proportion of venereal disease among the troops. Prostitutes in Burmah do not generally reside in the cantonment, and it seems doubtful whether lock hospitals would be of much avail.

6. The European troops suffer in a limited degree from fevers of the ephemeral, intermittent, remittent, and continued types; also from dysentery, of the form usually met with on the continent of India.

The following table gives proportions per cent. to the total admissions into hospital and deaths in 1858–59 :—

Diseases.	Per-centage of Admissions.	Per-centage of Deaths.	Deaths to Cases treated.
Fevers - - -	$16\frac{1}{2}$	$9\frac{1}{12}$	$\frac{8}{11}$ths
Rheumatism - -	$4\frac{4}{5}$	None.	None.
Cholera and Small-pox -	Not appreciable.	—	—

7. Fevers, and some forms of diarrhœa and dysentery may be considered the more common forms of zymotic diseases. The general characteristic of fevers is mildness, and amenability to treatment. Of dysentery and diarrhœa the occasional tendency is to pass on to the ulceration stage, without that intensity of the antecedent symptoms which might be expected. Dysentery and diarrhœa prevail during the rains and immediately after. Fevers prevail most in the hottest months.

As regards the native population, these diseases prevail more generally in the lower part of the cantonment. The cantonment is distant about two miles from Rangoon. The Burmese are naturally a dirty race, and an absence of all cleanly arrangements marks their dwellings. Drainage and water supply bad. Ventilation generally good. Dwellings not crowded, and but little disease among the civil population.

Among predisposing causes are the parsimonious habits of the native troops not admitting of sufficient nourishing food, and meat not forming part of their ration. Among Europeans the use of ardent spirits must no doubt predispose to disease in some cases.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	8. The proportion of disease is greatly influenced by night duties, by monotonous barrack life, and by want of amusement. On the line of march disease is greatly caused by exposure, fatigue, &c., and with native troops by the men having to look after their families. To remedy the latter evil the families should be sent on in advance. 9. In Burmah, malaria is not so rife as to have led to the use of quinine as a prophylactic. 10. The following means of mitigating or preventing disease are recommended :— *First.*—It appears to be of the greatest consequence to the health of Europeans that every practicable restriction should be placed on the use of ardent spirits. *Second.*—Much of the disease that prevails among native troops may be attributed to the separation of the men from their families; the difficulty of procuring animal food; their partaking of imperfectly cooked rice, which in Burmah is pounded without having been previously boiled, as is done in India. *Third.*—A thorough system of conservancy is required in this cantonment. At present ordure from the privies of the whole force is carted away nightly, and strawed broadcast over an extensive area on the N. E. side of the cantonment. The wind blowing from that direction during a great portion of the year, the atmosphere of the cantonment must be sensibly vitiated by the stench that arises. Regimental privies are not so fully deodorized as it is possible to keep them, nor are the barracks or hospitals as efficiently drained as they might be. But improvement in these particulars cannot be hoped for until the sanitary officer is provided with an efficient establishment, and empowered to carry out all necessary measures. *Fourth.*—The dusty condition of the roads of the cantonment must likewise be prejudicial to health.
V. Intemperance.	1. The soldiers at this station are generally temperate. There are no confirmed drunkards in the full meaning of the term. The following table, obtained from the superintending surgeon's department, shows the extent of disease, mortality, and crime among different classes of men :—

Total Strength of Europeans, 2,201, in Pegu Districts, 1858–9.	Teetotallers.	Temperate.	Intemperate.
	16	1,373	962
Of average strength each class admitted per cent.	—	169	135
Of treated died per cent. - - -	—	$1\frac{1}{4}$	$1\frac{1}{2}$
Punished by courts-martial, per cent. - -	—	34	$54\frac{1}{4}$

Drunkenness *per se* is invariably punished as an offence.

3. Distilled spirits are sold in the canteens and bazaar, but not to European soldiers in the latter.
The canteen is the only place where the European soldier can legally obtain spirits, which is of excellent quality. The average consumption per man in the Madras Artillery is $1\frac{2}{5}$ drams per diem. In Her Majesty's 68th Light Infantry, $\frac{1}{2}$ dram per diem.
Spirits form no portion of a soldier's ration in quarters, on the march, or in the field. The soldier can obtain spirits in the canteen on payment to a limited extent, but not before noon. The custom of dram-drinking in the morning does not now exist.
Spirits are never given as a ration to convalescents. No other intoxicating drinks are sold in the canteen, and the committee are not aware that such drinks are sold in the bazaars.

4. The committee consider that the moderate use of good and wholesome spirits is not injurious to health, while at times and under certain circumstances such use might be beneficial, but that the immoderate use of spirits is most injurious to health. It is also assuredly injurious to the efficiency and discipline of a corps.

5. The committee consider that, under existing circumstances, to abolish the sale of spirits in canteens would not be beneficial. The sale of it is sufficiently restricted under existing regulations. The sale of spirits in bazaars to European soldiers is prohibited under heavy penalties.

6. The use of malt liquor and of wines is most beneficial to health as compared with the immoderate use of spirituous liquors.

7. Tea, coffee, &c., are used at the station. Coffee shops with reading rooms have been largely introduced into the army of late years, and with great benefit to health, efficiency, and well-being of the soldier.
The use of such drinks as compared with the immoderate use of any intoxicating drink must necessarily be good, and have a most beneficial influence.

8, 9. If the sale of spirituous liquor were suppressed in the canteens, then the soldier would obtain it elsewhere, and would not substitute for it beer, tea, or coffee. Every means should be adopted to induce the soldier to substitute the one for the other, but the committee do not consider that this end could be obtained by suppressing altogether the sale of spirituous liquors in the canteens. But the gradual suppression of the use of ardent spirits is desirable unless when men are undergoing heavy work or exposure on field service, and when malt liquor cannot be obtained.

10. As regards recommendations, the committee consider that every encouragement should be given, and every aid afforded by Government for the establishment of a good coffee-room, &c.
The soldier should be able to obtain there anything, except intoxicating drinks, and at a moderate price. Such establishments should be as far as practicable from the canteen, and all places of amusement or recreation should be as near the coffee-room as possible. The canteen regulations provide for the establishment of such shops, but as they are dependent on the profits arising from the canteen, it would seem advisable that they should be put on a more desirable footing, and in a measure independent of the canteen.

11. The canteen regulations are contained in a general order, dated 17th August 1855. The rules are full and complete, and answer the purpose admirably.

References to Subjects and Queries.	Replies.
VI. DIET.	1. The ration for Queen's troops and European troops of the Indian army consists of 1 lb. bread, 1 lb. meat, 4 oz. rice, $2\frac{1}{2}$ oz. sugar, $\frac{5}{7}$ oz. tea, 1 oz. salt, 1 lb. vegetables, 3 lbs. firewood. At certain seasons of the year when beef (the only meat ration) is not very good, salt provisions are occasionally issued in lieu of beef; and yams and potatoes when green vegetables are not procurable. It is recommended that potatoes should at all times be issued as part of the soldier's ration, and that when fresh vegetables are not procurable, preserved mixed vegetables be issued instead. The rations are inspected regimentally by the officer of the day and by the quartermaster. 2. A complete ration with a due proportion of vegetables is provided for the troops at this station. Fruit forms no part of the ration. There is no stoppage for the ration. The soldier has three meals a day, breakfast at 8 a.m., dinner at 1 p.m., tea at 4 p.m. Breakfast consists of tea or coffee, bread, and a portion of the meat ration; the dinner consists of this ration; and the tea, of coffee or tea, and bread, with such additions as the soldier himself may feel disposed to provide. There is always 1 lb. of vegetables in the ration whenever procurable. 3. To improve the ration, mutton should be issued occasionally. Salt rations with peas once a week. The Chinese inhabitants of Rangoon rear pigs to a considerable extent. The pork is excellent, and it might occasionally form part of the meat ration. No arrangement necessary for preventing the troops selling their rations. 4. For cooking rations, each company has a cookhouse. Government provides copper boilers, gridirons, frying pans, ladles, choppers, and baskets. The commissariat provide for the regular tinning of the cooking utensils. The cookhouses (they can hardly be called kitchens in the usual meaning of the word) might be better. They are not sufficiently light. The supply of water is ample. The rations are sometimes boiled, sometimes roasted. The cooks are natives, and every thing considered, the cooking is properly done and sufficiently varied. Tea and coffee are prepared in accordance with the wishes of the soldiers. There are no complaints on the subject. It is, however, recommended that the means of roasting and grinding coffee be furnished by Government to the soldiers. In India it is the custom to have coffee for the men on the march. 5. A soldiers' garden, for cultivating vegetables, has been introduced in this station, and is extensively used by the European soldiers. Each applicant is allotted a piece of ground, and he is provided with seeds. These he cultivates himself. The produce is sold to the commissariat officer (under whose charge the garden is) at the rate of 2 as. a pound. The supply of vegetables from this source is considerable, and the quality is excellent.
VII. DRESS, ACCOUTREMENTS, AND DUTIES.	1. Dress consists of helmet or cap, coat or tunic, great coat, trousers, socks, boots, shirt, pouch, bayonet belt. Suggestions for dress, &c., see Appendix B. The dress is suitable to the climate, seasons, and duties. The wicker helmet lately introduced affords no protection. A thick, soft, light, felt helmet, well ventilated, should be substituted. A limited supply of water-proof capes for men going on guard and other duty during heavy rains would be a most useful addition to the present dress, and the committee would strongly recommend a supply of them for all regiments serving in Burmah, where it rains heavily for nearly half the year. The guard dress is in accordance with the season. Light cotton clothing is worn during the day and hot months; cloth or woollen during the wet or cold months. The men are protected on guard from rain and wet by sentry boxes, gun sheds, and verandahs.
Duties.	1. Men should be thoroughly drilled before being sent to India. 2. The usual routine of duties consists of guards, drills, and fatigues. Parades are generally in the morning, and sometimes in the evening; an hour is the usual duration. Short drills three or four times a week must be beneficial to health. The best hours for drills and parades are 6 to 7 a.m. Troops should be moved so as to arrive on the new encamping ground an hour after sunrise. There are no special orders on the subject. The average number of nights the men have in bed were, on the 1st January 1860,—Europeans, four nights a week; natives, three and a half nights. 3. There is one European guard in the town, two miles distant; all the other guards are much within this distance. The guards are relieved daily. There are roll-calls both by day and night. The number and times according to circumstances regimentally determined. Frequent night guards must necessarily be injurious to health. There should be water-proof capes or coats for guard, as already recommended.
VIII. INSTRUCTION AND RECREATION.	1. The following are the means of instruction and recreation at this station :— *A ball court* (in the course of construction). *Several skittle grounds*, and also American bowling alleys. *Schools*, with good schoolmasters. *A garrison library*; a company library, in the Artillery; one in H. M. 68th Regiment, with a reading room. The former is not lighted, the two latter are sufficiently lighted. *Day-rooms* in the Artillery and H. M. 68th Regiment. *A soldiers' garden*, as already mentioned. *Shops* for different trades. H. M. 68th Regiment has applied for tools for a carpenters shop. *Theatres.*—One in public rooms; one in the barracks of H. M. 68th Regiment. No gymnasia. The means of recreation and instruction are considerable, but not sufficient during the wet season and during the heat of the day. In H. M. 68th Regiment the men are restricted from going out in the sun during the hot months from 11 a.m. to 4 p.m. There is no restriction on the Artillery. The restriction must necessarily be good with young soldiers fresh from England; old soldiers, such as the Artillery usually are, do not require restrictions, as experience has taught them the danger of exposure. 2. We would suggest in the way of improvement, lofty open sheds in which could be erected a gymnasium. 3. The existing savings' banks are all that are required on this point. 4. There are no means of affording shelter for the men to take exercise.

References to Subjects and Queries.	Replies.
IX. Military Prisons.	1. There is no military prison at the station. Punishments are carried out regimentally. The means are generally defective, especially in H. M. 68th Light Infantry, but there are brick and mortar cells in the Artillery lines, and also under construction in the 68th lines.
X. Field Service.	1. There are no local regulations for field service. 2. With reference to the powers of medical officers on marches, &c., there has been very little marching in this division. All movements of troops are by water. Medical officers have full power to order anything that is necessary for the comfort of the men generally. Their suggestions are always complied with, and the practical working of such power has always been found to answer. 3. As regards general sanitary arrangements, the regulations of the service are explicit, and as a general rule work well. 4. Each corps has a certain number of hospital tents, according to their strength, also doolies for natives and Europeans, and sick carts for the latter, with the power to engage any further amount of carriage on the march that may be required.
XI. Statistics of Sickness and Mortality.	No information.
XII. Hospitals.	1. Plans and sketches. 2. As regards position, the Artillery hospital is on high ground, 100 yards south-west of the nearest barrack. The 68th Light Infantry hospital is on a high plateau, 180 yards from the nearest barrack. The 23rd Regiment Native Infantry hospital is on low ground, about 150 yards north from the lines. The hospital of the 6th Regiment Native Infantry is on high ground, 100 yards south-east of the nearest barrack. The 41st Regiment Native Infantry hospital is on low ground, surrounded by buildings about 100 yards north of the lines. The two native infantry hospitals are however 40 feet above high-water mark of the river, and above any portion of the town. The ground gradually slopes from the north of cantonments to the river. The several hospitals are about two miles northward from the bazaar and town of Rangoon. The sites are open and freely ventilated, and there are no high walls, buildings, or trees, to interfere with the ventilation, except as above mentioned. The sites of the hospitals of the 23rd Light Infantry and 41st Regiment Native Infantry are low, and require drainage. 3. The water supply is not abundant during the hot season; and filters, which are absolutely necessary, are not in general use. Each hospital should have its own well. 4. The drainage is defective in every instance; the existing drains being merely trenches dug in the natural soil, without sufficient attention to slope or removal of the sewerage water to a distance. Drains of masonry are required round the building. 5. The hospitals are constructed of wood; some covered with thatch, and some with shingles. All are sufficiently raised from the ground on posts, admitting of a free perflation of air underneath the floor. There is no efficient provision for carrying away the roof water, which sinks into the subsoil. The drainage and guttering round the hospital are not sufficient to remove the rain-fall rapidly. The native hospital walls and roofs are single, and do not keep the interiors so cool as would be the case with a double roof. The European hospitals have double roofs. The roofs project, and form verandahs for shelter from the sun, but not available for exercise. The buildings are one story in height. The hospitals were built in 1853, 1854, and 1855. The following table gives the ward accommodation :—

Wards.	Regulation Number of Beds per Ward.	Dimensions of Wards. Length.	Breadth.	Height.	Cubic Contents.	Cubic Feet per Bed.	Superficial Area per Bed.	Height of Bed above Floor.	Windows. Number.	Height.	Width.

The hospital of the 68th Regiment is shut out from the south-west wind by buildings. The Artillery and 6th Regimental hospitals do not receive the advantage of the prevailing winds, as they run north and south instead of east and west. The windows open outwards,

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	and are generally considered sufficiently large and numerous. Those in the Artillery hospital are small and too high above the floor. 6. The ventilation is considered sufficient, but roof ventilation for all the hospitals would be advisable. The only ventilation at present is by windows and doors. There are no jalousies. 7. There are no means of cooling the air. 8. No means of warming are required. Till lately only the hospital of the 68th Light Infantry has been limewashed. This should be renewed once a quarter. The floorings are washed weekly. 9. The privies of the European hospitals are constructed of masonry. Those of the native regiments are of matting, which is most objectionable, as allowing the escape of noxious effluvia. The Europeans have connected covered passages; the natives none. The ordure is received into oblong boxes lined with zinc, carted away nightly, but not to a sufficient distance from cantonments, being allowed to remain on the surface and vitiate the atmosphere. Near the female hospital of the 68th regiment is a privy with a wooden seat over a cesspit, which has never been cleaned out, and is offensive. This should be altered. Although charcoal and lime are liberally used, it is difficult to keep the boxes of the privies clean. The boxes should be frequently fresh painted with coal tar. The latrine arrangements are defective. 10. The lavatory arrangements of the 68th Light Infantry appear fair. Those of the Artillery inefficient, but steps have been taken to remedy this. In neither hospital can warm or hot baths be readily commanded. Shower baths are considered essential, and one has been sanctioned for the Artillery hospital. 11. The bathing accommodation has been totally inefficient, but steps have been taken and sanction obtained for improvements in the Artillery hospital. Hitherto there has been nothing but a tub of water, without basins, soap, or towel. The 68th Regiment has been supplied to some extent, but regular baths are required. 12. The hospital linen is washed by the commissariat department. During the monsoon it is aired over large baskets by means of charcoal fires. 13. The storage is a wooden room beneath the hospital. It is damp and insufficient. A substantial masonry building is required. 14. The bedsteads are wooden cot frames, and rattan bottoms. Some are wooden planks. They have mosquito poles and curtains. The bedding consists of straw mattresses and pillows, quilted coverlid, a blanket or two if necessary, and a pair of sheets if ordered. The straw stuffing is objectionable. Iron cots with coir stuffing should be substituted. 15. The hospital kitchens are masonry buildings, furnished like all Indian cook-rooms, the utensils being of a primitive kind—chatties, frying pans, kettles. There are no boilers, spits, nor gridirons. The cooking is indifferent, and not so varied as is desirable. The cooks are ignorant of the art of cookery. A system of instruction should be established both for hospitals and barracks, and none but certified cooks employed. A cooking range would also be an improvement. 16. Hospital forms. 17. The following is the hospital establishment for a European corps of the full strength:—1 hospital serjeant, 1 writer, 1 purveyor or a cornicopoly, 1 assistant ditto, 1 cook, 1 assistant ditto, 1 cooly maistry, 3 coolies for leechings, &c., 8 ward coolies, 3 sweepers, 3 toties, 2 puckallies, 2 tailors, 2 dhobies, 1 female nurse, 1 cooly woman. With the detachment of Artillery the establishment is smaller, and with native corps it is very inefficient. The sick soldier also obtains the services of a comrade on the requisition of the surgeon. Native servants, as a rule, are very inattentive, and require great supervision, and Europeans are averse to be waited on by them. 18. The sanitary condition of the hospitals has on the whole been good, notwithstanding the drawbacks mentioned. There are no records of hospital gangrene or pyæmia. 19. The following improvements in the hospitals are suggested by the medical officers, and in which the special committee fully concur. Greater comfort in serving up meals; at present tin vessels are used for all purposes; the same tin pot serving as a tea cup, a soup bowl, and drinking cup. Crockery and glass should be substituted for Europeans, with cutlery, which at present the patients bring with them from the barracks. A meat ration is decidedly necessary for natives. 20. The convalescents of European regiments take exercise morning and evening in small carts or doolies, if necessary; they usually resort to the public gardens, which are in close proximity to the European hospitals. Regimental exercising grounds are unnecessary. The public gardens require enlargement and improvement. 21. There are separate detached wards for females and children, and the general arrangements are satisfactory. 22. There are no local hospital regulations. 23. As regards the powers of medical officers, they have no controlling power. The medical officer can only represent, which may be approved of or otherwise by the authorities; but his representations are generally attended to. In the matter of diet there is no difficulty, as the superintending surgeon generally sanctions any extra diet or comfort for which valid reasons can be given. It is desirable, however, that mutton should be available when required. 24. There are no convalescent wards. The medical officer considers that a convalescent hospital might be established with advantage near the mouth of the river. A hulk might be preferable for this purpose.
XIII. BURIAL OF THE DEAD.	1. The British burial ground is about 800 yards from the station. The wind blows in that direction for only a short time during the cold weather. 2. Its area is 22,755 square feet. Soil sandy; drainage, except in the low corner, good. Decomposition is believed to take place readily. The ground is tolerably kept. 3. The grave space is sufficient; graves are 3 or 4 feet apart. Depth 6 feet, width 7 feet. Only one body interred. Graves never re-opened. The time of interment is dependent on circumstances, and never beyond 24 hours after death. Hindoos burn their dead. Mussulmans and others bury theirs. Their burial ground is at a considerable distance from cantonments. Burial or burning takes place a few hours after death. The following is the order on this subject:—"The funerals of deceased soldiers are to take place at sunrise, or at half an hour before sunset, according to circumstances.

References to Subjects and Queries.	Replies.
XIII. Burial of the Dead —*cont.*	The corpse is on no account to be carried into church previous to interment." There is also an order for preserving the ground in proper order. 4. The burial ground is not offensive. 5. The dead of the bazaar people are disposed of in the same manner as those of the native troops. 6, 7. No injury to health accrues from the present practice, and no improvements are required.

APPENDIX A.

Climate of Pegu.

Replies to Queries on Climate addressed by Colonel Croggan, Artillery, President Special Committee.

Meteorological Instruments.	1. Thermometers, barometers, and hygrometers.
Meteorological Observations.	2. Only acquainted with the climate for three years, and have no adequate observations at command.
Climate; Dryness, Moisture, &c. &c.	3. Rain prevails throughout Pegu, though in varying quantities, from May to October, inclusive. Average fall, probably 80 inches. During the remaining six months, there are for about two-thirds heavy dews generally, and frequently morning mists. Towards the close of this period the air becomes very dry, the wet bulb being probably twenty degrees below the other; and a faint approach is made to the hot wind common at this season on the continent of India. A favourable characteristic of this season is the rapidity with which the thermometer falls about sunset. In the coldest season the variability of temperature is marked; in some parts, as at Rangoon, the thermometer, which stands below 60° at sunrise, will rise to 90° by 2 p.m. The actual heat does not appear excessive for a tropical region. Rarely does a thermometer exposed on the northern aspect of a house under the shelter of an open verandah rise above 96°. The thermometer so placed probably rarely falls below 54° in any part of the Pegu province. As for tree-planting, the whole country is nearly a pathless jungle. Canal irrigation, there is none, but two-thirds of the province being the delta of the Irrawaddy, there are abundance of streams, and rice is the staple production of the country. There appears to me no admixture of dust or other noxious matter sufficient to vitiate the atmosphere to any sensible degree.
Healthfulness.	4. Medical returns support the general opinion that for Europeans Pegu is a very healthy country. The porosity of the soil generally is remarkable; and, speaking generally, disease of malarious origin is far from rife in Pegu.
Clothing suitable.	5. Owing to the dampness of the climate for half the year, and its variability for a moiety of the remainder, light woollen clothing may be considered most conducive to health for nine months of the year for outer clothing, and as regards the inmost garment recommendable throughout the year. As regards diet and shelter, I know no special requirements. As regards military exercises, I much deprecate evening drill. Daylight closes in early. The sudden fall of temperature which takes place about sunset has been already noted, whilst two hours before that period the diminution has scarcely begun. The soldier of necessity becomes much heated at parade, and immediately it is over is pretty sure to throw off the greater part of his clothing. These evening drills, in my opinion so objectionable, are chiefly found in the commands of officers recently arrived in India, and as yet unaccustomed to very early rising.
Military Exercises. Evening parades objectionable.	
Comparative Healthfulness of different months.	6. The healthiest months are from February to May, inclusive. The most unhealthy months are June, when the rains are in their first burst, and September and October, when they have reached their maximum, and drying up begins. This limited unhealthy season applies only to Europeans. As regards natives, from their susceptibility, the period from November to the middle of January has to be included therein.
Disease, when most prevalent, and of what character.	7. Among Europeans bowel complaints are the especial product of the wet or unhealthy season. There is also some increase of fever and of unhealthfulness generally; but, as inductive of disease, different seasons are much more strongly marked in the native army, among which, at the close of the rains, and throughout the cold season, fever becomes epidemic, though to a much less extent than in many parts of India at the same period.
No Sanitaria known in vicinity.	8. Rangoon being the lowest point of the delta of the Irrawaddy, it is not likely there is any adjacent district the climate of which, from superior elevation, is more conducive to health; neither have I heard of any so deemed, from the above or for any other reason.
Salem, Madras, Vellore, Trichinopoly, French Rocks, Secunderabad, Kamptee, Jaulnah, Saugor.	9. The stations I have served at previous to coming to Pegu are given in the margin. Salem, as lying in a valley rife with malarious disease, may perhaps, *per se*, be deemed "positively injurious;" but a great abatement thereto is made by the immediate vicinity of the Shevaroy hills, rising from 3,000 to 5,000 feet above the sea; and certainly, for nine or ten months of the year, perfectly healthy. The three next named are probably of equal, and, for Southern India, of average salubrity. In this last respect the same may be said of all the remaining stations. All are on table land of more or less elevation, Saugor being the greatest, and

References to Subjects and Queries.	REPLIES.
	except the French Rocks and Saugor, not far removed from the same latitude—Saugor on the verge of the tropics, being at once the most northerly and the most elevated, and the French Rocks the most southerly station. Europeans are subject to severe fever and bowel complaints in all these stations; but these may yet be deemed "conducive to health" in this country, so far as the greater intensity of the cold season tends that way in the European; and, judged by the average standard of health in India, none can be deemed "positively injurious."

Superintending Surgeon's Office, Rangoon,
27th March 1860.

H. GRAHAM,
Superintending Surgeon.

APPENDIX B.

SUGGESTIONS for the DRESS, CAMP MANAGEMENT, &c. of the ARMY IN INDIA, by MAJOR G. T. HALY, of the MADRAS ARMY.

SECTION I.—HEAD DRESS.

"Puggeree" (cloth) round the Cap most objectionable.

THIS most important article of dress should be light and well ventilated; the plan too often adopted of wearing a "puggeree" (cloth) round the cap is most objectionable, as entailing extra weight, besides engendering heat.

Ventilation and Lightness are the great Desiderata.—Every extra Ounce tells on the Man with killing effect.

The argument advanced that it is worn by the natives is fallacious. Firstly, the native, from his youth upwards, has been accustomed to it and to the climate; secondly, the native only wears a muslin or light cloth turban, invariably either loosely put on or open at the top, and not over an air-tight cap, which makes all the difference.

Description of Helmet.

In the "field service helmet" proposed, and already submitted by me, lightness with ventilation has been the principal aim, as the following description will exemplify, viz.:

Neutral Colour.

Soft thick felt, ventilated by an air tube on the crown, communicating with a broad air-chamber running round the head over the temples, with a false inner band or headpiece to fit the head; the vacuum* thereby caused giving further ventilation, and preventing the direct action of the sun on the head.

SECTION II.—WOOLLEN COAT.

Ventilation and Protection from Heat. White is objectionable, causes a painful Glare, and is too conspicuous.

A loosely-fitting tunic of a neutral colour, with strong pockets from side-seam to front as haversacks, open at the arm-pits for ventilation and to admit of closing by lacing; the back of the tunic to be padded between the shoulders with a loosely-spun felt (or numda cloth) as a protection to the spinal marrow.

SECTION III.—TROUSERS.

Pattern as worn by Sailors.

Trousers strong and loosely made, of the same colour as the tunic, to fit without braces (sailor pattern), braces being highly objectionable, as interfering much with free action, as well as causing heat and adding weight.

SECTION IV.—SHIRTS AND FLANNELS.

Calico and coloured Flannels and ditto Bands.

Strong calico, with the collar fitting loosely round the neck, and a couple of coloured flannel ditto when on actual field service. A flannel waistcoat should be invariably worn next the skin with cotton shirts, as well as flannel drawers in the cold seasons, and worsted socks on all occasions of work, as well as flannel bands.

SECTION V.—NECK-TIES.

Square Silk most useful.—Cotton Handkerchief most refreshing when wetted.

A square black silk neck-tie, to tie in a bow, and go once or twice round the neck, according to the season. A kerchief, besides being cooler or warmer according to pleasure, will be found much more useful in many other ways than a stock; and no soldier should be without a handkerchief, which, besides its many other uses, will be found most refreshing wetted and placed on the head in the hot season, or loosely in the helmet on the line of march, &c., and many a *coup-de-soleil* has been thus prevented.

SECTION VI.—SHOES.

Brown Leather, with Brass or Copper Sparables, lasts longer and is easier to the Foot.—Sambre-skin worn by all Sportsmen.

Ammunition ankle-boots, of brown leather (the black attracting the sun), and a composition of wax, lard, resin, and camphor, will make them water-tight, and preserve and soften the leather. The soles and heels should be studded with brass or copper sparables, the iron ones rusting and eating away the leather and stitching even of new ones during the monsoon. A very good and cheap description of boot for the dry season can be made up in India of sambre (elk) skin; the leather is so soft and pliable as to obviate the necessity of wearing socks. They are well known, and worn by all sportsmen, racket, and cricket players in India.

SECTION VII.—GREAT COATS.

Too heavy and soak the Rain, and thereby cause Sickness.—Weight is as damaging to the Soldier as to the Race Horse.

The present thick woollen great coat is much too heavy for general use in India; a lighter one should therefore be substituted, made of some material that will throw off the rain, and not, as with the present one, soak it in, and thereby not only double its weight but likewise cause much illness, owing to their being worn and slept in when in a wet state, for when once saturated they take hours to dry.*

SECTION VIII.—BEDSTEADS.

Sleeping on the Ground most injurious.

Few things are more injurious to health than sleeping on the ground, particularly during and for some time succeeding the rains; and though it would be impossible to carry cots for an army in the field, yet much can be done in the way of a substitute by raising sleeping places by means of brushwood, straw, &c., and tarpaulins should be laid down in the tents.†

Saving to State.

These can always be carried, and would be found most useful as a covering or protection for the baggage, &c., &c. on the line of march, but on the regular line of route there should be cots kept or raised platforms erected. This great comfort for the men, with certain beneficial results to health, and thereby incalculable saving to the State, can be readily obtained at a mere trifling expense.

SECTION IX.—TENTS.

Ventilation and Punkahs required.

The tent furnished for the European soldier in Indin is perhaps the best in the world, requiring simply ventilation above, on the principle adopted in the present home ordnance tent; and no time should be lost in calling the attention of the authorities in India to this valuable improvement. Punkahs, likewise, would have a most beneficial effect, as the agitation of the air caused by them would effect the double object of cooling the men and causing a free ventilation; further, they would induce the men to keep more in the tents during the heat of the day

* In this vacuum a light wadding is placed but so as not to interfere with the ventilation, for this is the grand secret of a solar head dress.

* I have since invented a cloak which opens out into a blanket, and can be converted into a tent.

† Mosquito curtains are thought by the Chinese indispensable t health; and I believe them to be so in that country.

and at night—most essential objects to be gained, but difficult to obtain, owing to the discomfort of the heated atmosphere of an ill-ventilated and crowded tent.

Section X.—Camp and Encamping Ground.

Elevated, dry, open Position to windward of Town to be selected.

The most open, dry, and elevated spot should be selected for encamping; to windward, and as distant as practicable from the town or village, as well as from any swamp or marshy ground. The practice of encamping, even in the dry season, in paddy (rice) fields is most objectionable, and should be strictly prohibited.

Cleanliness essential.—Impurities to be destroyed by Fire.—Unhealthy Tracts to be passed between Sunrise and Sunset.

Care should be taken to burn all impurities in the vicinity of the camp for even a day's halt; but for a standing camp cleanliness becomes still more essential, and, therefore, in one even of the shortest duration the strictest attention should be given to this important point, and all rank grass or jungle in the vicinity should be destroyed by fire, cutting it and allowing it to lay having a pernicious effect; and in case of any epidemic in a jungle country, fire should be kept burning night and day to windward of the camp. All suspected and unhealthy tracts shall be passed during the day, if practicable.

Section XI.—Water.

Wells to be dug, with other Measures for purifying the Water.—Purifying Effects of Charcoal on Water.—Charcoal and Water Bags.

The necessity for having this necessary of life pure and wholesome is well admitted in all countries, and the natives of India, with some justice, perhaps, attribute most sickness to impure and unwholesome water;* and as filters cannot be carried for a whole army small wells should be dug —two or three feet deep will suffice—in the beds of rivers and vicinity of tanks (ponds). A few baskets of charcoal (always procurable), thrown in at the bottom, and kept down by covering it with sand or clay, will ensure filtration, with a certain degree of purification. Boiling it has likewise a beneficial effect, but not so easily accomplished for bodies of men. Bags of charcoal should likewise be kept in the camp; "puckalie (water) bags," as well as the small ones to contain about two quarts of water with which every man ought to be provided.

Simple Filterers in common use in India.—Earthen Pots.

In standing camps, cantonments, or garrisons, there is a most simple and efficacious mode of forming filterers; one in common practice in all gentlemen's houses throughout India, viz., by placing three chatties (earthen pots) one over the other, the bottom one simply to catch the water, the other two having small holes drilled through the bottom, the centre one three-fourths filled with a mixture of sand and charcoal, the upper one as a reservoir for the water, from which it drops through straws placed in the holes to regulate the dripping; but they are too commonly in use in India to need further description.

Section XII.—Diet.

Exposure on empty Stomachs injurious.—Hot Coffee or other warm Beverage advisable first thing in the Morning.—Spirits, unripe Fruits, &c., prejudicial.

The practice of marching and exposing the men with empty stomachs to the malarious effects of the chilly vapours before dawn is most injurious, the system being then more prone to disease. Hot coffee or other warm beverage with a biscuit or slice of bread should, therefore, be provided and taken by the men ere quitting their tents or barracks. Too much care cannot be taken to prevent the men drinking toddy, eating unripe fruit, or crude vegetables. Drinking spirituous liquors should be discouraged as much as possible, and never served as a ration, or from the canteen, in a raw state; the best preventive against this is to facilitate the procuring of malt liquors.

Meat Rations generally too much.—Vegetables and Fruit occasionally to be substituted.

The present meat ration is well suited for field or hard work, but is by far too much for the idle life led in garrisons. Vegetables and fruit, in lieu of a full ration of meat, would, there is no doubt, at times be conducive to health, and such is the opinion of most medical men, who ought to be empowered to regulate such matters.

Section XIII.—Exercise and Cleanliness.

Exercise in Open Air.

Exercise is most essential, and the men should be sent out morning and evening to walk in *small* parties, under a non-commissioned officer, if thought necessary. But the practice of marching them out in a body, particularly in the hot weather, is both distressing and injurious to health, owing to the clouds of dust raised, and the quantity of it that thereby must be inhaled.

Swimming and Gymnastics.—Swimming Baths.

Swimming and gymnastics of all descriptions should be encouraged; cleanliness of body and clothing is most essential to health; and bathing, at least once a day, should form part of the day's routine in the field. There should be a swimming bath attached to every European barrack for the same purpose.

Section XIV.—Miscellany.

Clasp Knife, with Needle.—Cords for drawing Water.

Every man should carry a clasp knife, with a needle (made on purpose), for mending clothes, shoes, &c., and a small semicircular tin pannikin (made to stand the fire), with a small cord twelve yards long attached to draw water with. This cord would be found most useful in many ways, forming escalading ladders, &c., and can be carried in a hank in the pannikin. The necessity for these is admitted in the native army, forming a portion of the kit of the sepoy, under the denomination of "jumboo and rope."

In the field, great coats should invariably be put and kept on when heated after a march or work of any kind.

Board Ship.*—A few Remarks on Cleanliness and Exercise.

Previous Training required.—Supervision of Officers most necessary.

Shipboard duties and discipline should form part of the training of the army, and ought to be as regularly practised on shore at parades for the purpose as any of the other duties, particularly tying knots, lashing, unlashing, slinging hammocks, &c. There is no situation in which a soldier is placed requiring more foreknowledge both in officers and men, nor one in which the personal care and supervision of the officer is more immediately necessary, or requiring stricter attention to carry out regulations.

Difficulty of Insuring Cleanliness and Exercise.

The difficulty of insuring cleanliness and exercise to troops on board ship is well known to all, yet both can be secured with care and attention to a system adopted by me while in command of troops during two long voyages (each over three months) between India and China.

Mode of Bathing.—Bathing Parade.

The men were paraded every morning (weather permitting), in bathing drawers, when the following order of parade was gone through:—"Prepare for bathing"—both ranks immediately sat or squatted down, the front rank leaning a little forward, men detailed for the purpose passing along in front with buckets of water, *douching* each man as they proceeded, the rear-rank men scrubbing the backs of their fore-rank men, each front-rank men washing the fore-part of his body at the same time. This continues for fifteen minutes, the command "Stand up" was then given to ease their limbs; "Right-about" was given, and the same order of washing was gone through with the rear rank.

This mode not only ensured cleanliness of person, but a certain degree of healthy friction for the body, with more exercise than may at first be supposed.

Washing Decks; good Feeling thereby obtained between Soldier and Sailor.—Watches kept to their Work, with other Modes of obtaining Exercise.—Drill, &c., with Ball Firing.—Suffering of Troops in China from want of Exercise.

The decks (with the exception of the forecastle) should always be washed by the soldiers, both with a view to pro-

* The water up the Yang-tse-Kiang was about the colour and consistency of pea-soup; drank in this state, it must have been most unwholesome; and to this I attribute much of our illness up that river, as it contained much decayed vegetable matter, a large deposit of which was obtained after standing a few hours.

* The whole of this system was fully carried out by me with the greatest success during my late voyage with recruits from England.

mote a good feeling between the soldier and sailor (for nothing is more disliked by sailors than to clean for the soldier), and dry holystoning between decks was likewise frequently practised both as an exercise and keeping the decks sweet and clean without damp. The other methods of obtaining exercise are more numerous than may be supposed, for instance, the watches were kept, not nominally, as every man was kept at his post and alert at his duties, trimming sail, &c., and not, as is too often the case, sleeping through his watch. But beside the regular duties of the ship, the men off duty daily had some work that enforced a certain degree of exercise, such as drawing the water for bathing, washing decks, and for other ship uses; manual and platoon exercise was, weather permitting, daily gone through, including aiming practice, with ball practice once a week; marching, likewise, was performed by passing along and round the decks, with counter-marching by files, and this, by placing lines for the purpose of steadying the men, could be gone through even in rough weather, and for a long voyage nothing is more essential than constant exercise, both as regards the immediate as well as after health of the men; and the want of exercise on the voyage out was one of the causes assigned for the unhealthy state of the troops in China during the expedition of 1842 and 1843.

All European Soldiers shall be trained as Artillerymen.

With a warfare such as is now going on in India, it becomes most essential that every European soldier should be a trained artilleryman, accustomed to move and handle heavy ordnance, which practice could be fully carried out during the voyage, and at the same time give full and manly exercise.

Sleeping between Decks in a crowded and heated Atmosphere to be avoided.—Sleeping on Deck under an Awning to be enforced.

Contrary to the instructions laid down in Her Majesty's Regulations, page 316, par. 41, my experience has shown that much disease is engendered by sleeping below in warm weather, in a crowded and overheated atmosphere, and that sleeping on deck (under an awning) should not only be encouraged but enforced during the warm weather and calms, to the extent of at least half the numbers.

APPENDIX C.

MADRAS ARTILLERY.—HOSPITALS.

References to Subjects and Queries.	REPLIES.
HOSPITALS.	The hospital is situated on the south-western side of a quadrangular area forming the Artillery lines, and which area occupies the north-eastern angle of cantonment.
2. Position of Hospital, &c.	(1.) It (the hospital) lies to the westward of the barrack buildings, distant about 100 yards from the nearest, and about 290 yards from the stables. (2.) It lies about two miles to the northward of the bazaars, and of the houses of the civil population generally, that is, of the *town* of Rangoon. (3.) The site is open and freely ventilated, and there are no buildings, high walls, or trees, which interfere with ventilation. (4.) The site itself, as relates to elevation, capability of drainage, absence of malaria from river banks, marshes, nullahs, and ditches, is good; but water-pits and "foul grounds" exist within the area of the regimental lines, though not perhaps within that of the hospital, the limits of which, however, are not well defined by any fence or enclosure.
3. Water supply.	The water supply is *not* abundant. No water is obtainable within the hospital limits; all has to be brought from a well in the lines of the 6th Regiment. The water itself is wholesome, but at the present season is liable to become turbid from the wells failing. A well should be dug within the hospital compound.
4. Drainage.	No drainage, but a simple ditch round each building, exists. These ditches are constantly becoming obstructed by the banks falling in. The refuse water is led off by a similar channel to low ground, some 20 yards to the south-west of the hospitals, where it sinks into the soil.
5. General structure and arrangement of hospital buildings.	(1.) The ward of each of the hospitals, European (male and female) and native, are raised eight feet from the ground, and there is a free perflation of air underneath the floors. (2.) No provision is made for carrying away the roof water, except by the ditches already mentioned; much of it sinks into the subsoil. (3.) The surface drainage and guttering round the hospital has been already described, and is *not* sufficient to carry off rapidly and effectively the rain-fall.
Materials of which the hospital is built, &c.	(4.) The hospitals are built entirely of wood, with thatched roofs; the walls of none are double. The roof of the male European ward may be said to be double, as it has an interior lining (roofing) of plank; this ceiling, however, has not a single ventilating aperture. The arrangement of roof just described (with the addition of ventilating apertures) will suffice I think to keep the ward as cool as can be expected. The native ward and the female ward do not possess this advantage.
Existence of verandahs.	(5.) No covered, boarded verandahs available for exercise exist. Nothing but a space equivalent to the overhang of the roof exists all round the hospital, which has a breadth of 7½ feet, but is not available for convalescent exercise in wet weather, though affording sufficient shelter to the building from the sun's rays.
Number of flats of which Hospital consists.	(6.) The hospitals consist of only one flat, divided into one ward for the general sick and side rooms for dispensary.
	(7.) The male hospital is not placed so as to derive full benefit from prevailing winds. Its long axis is from north to south. It would have been better to have built it extending from east to west; the native hospital is thus built.
Arrangement and construction of windows, &c.	The windows open outwards, and are glazed; and the only fault I find with them is that they are small, and should extend nearer to the floor. The slope and projection of roof beyond them is such, that sufficient light and air does not enter.
6. Means of ventilation.	No means of ventilation but by doors and windows exist. With the small number of sick usually accommodated, the wards can at all times be kept free from odour or closeness; but if they were called upon to accommodate the full number for which they are supposed to offer accommodation, I do not think the air could be kept pure.
Jalousies and jhilmils.	There are none in either hospital.
7. Artificial means of cooling the air.	No artificial means are in use.
8. Artificial means of warming.	None in use.

References to Subjects and Queries.	Replies.
Cleansing and limewashing wards.	The wards are washed and cleansed once a week. They have not hitherto been limewashed, but I have taken steps to ensure its being done, as I consider it essential to health.
9. Privies, water-closets, urinals.	No water-closets exist. The privies for Europeans and natives are under the same roof, divided by a partition, and are situated about 15 yards from the hospital. The "urinals" consist of a urine tub standing in the privy.
Drainage, water supply, &c., of privies.	The drainage is indifferent, indeed there is no drainage properly so called, for shallow trenches in the soil cannot be called drains. The privies are not placed over cesspits, and are often offensive. The ordure is received into wooden boxes lined with zinc, which are removed and emptied each night. It is difficult to keep them clean and free from odour, though charcoal and lime are liberally used. They might be kept sweeter by being constantly fresh painted with coal tar.
10 and 11. Lavatory arrangements, and bathing for the sick.	The lavatory arrangements may easily be described. They consist of a large tub of water standing in the centre of a damp floor of a room beneath the hospital, without basins, towels, or soap. They are not only not sufficient for the sick, but positively hurtful to them. A lavatory furnished with basins, soap, towels, a shower bath, with conveniences for a hot or warm bath at any moment, ought to exist on the same flat with the wards.
12. Washing and drying hospital linen, &c.	This does not come under my cognizance, the linen is washed by the commissariat department, by contract.
13. Whether the storage is sufficient and dry.	The storage is in a small room on the ground floor, that is, beneath the hospital, and cannot be dry in the wet weather, neither can be considered sufficient or good.
14. Bedsteads and bedding in use.	The bedsteads and cots are of wood, with rattan bottoms, and furnished with poles and mosquito curtains. The bedding consists of mattresses and pillows stuffed with straw, a pailliass or quilted coverlid, a quilt, a blanket, or two if necessary, and a pair of sheets for each cot, when considered necessary. The only improvement which suggests itself to my mind is, the substitution of coir for straw in the mattresses and pillows.
15. Hospital kitchen, cooking, &c.	The kitchen is situated 15 yards to the westward of the hospitals, and is as well furnished as cookrooms in India usually are. Some additional cooking implements might be furnished with advantage. The diets are fairly cooked, and can be sufficiently varied. There is room, however, for great improvement in cooking, and great benefit would be conferred upon the sick, if some rules for plain hospital cooking were drawn up and printed in Tamil for the use of the cooks who should be proved to be well instructed in such duties before being entertained.
16. Diet table, diet roll, statistical forms of sickness, &c., &c.	Forms transmitted.
17. Attendance upon the sick.	The hospital establishment consists of one hospital serjeant and one hospital orderly (European); but the services of the comrades of any European sick are obtained on application:— Besides these individuals, there are the following native attendants attached to the hospital:— 1 cornicopoly in charge of clothing and diet. 5 ward coolies, for attendance on the sick. 1 leech man. 2 surgery coolies. 2 bheesties or water drawers. 3 toties. This attendance suffices for the number of sick usually under treatment. The native soldier also has the services of a comrade as an attendant in all cases requiring it.
18.	A nurse is entertained in the female ward.
General sanitary condition of hospital.	The sanitary condition of the hospital has apparently been fair since its erection, and I can find no record of epidemic disease, hospital gangrene, or pyæmia, having appeared in the wards.
19. Sanitary defects.	Some of these have been already touched upon, and consist of inefficient drainage, insufficient water supply, and the absence of any comfort or convenience for ablution. I would add, also, the absence of comfort in the arrangement of meals for the sick and convalescents. They have to eat off *tin* dishes and drink out of *tin* pots. The improvements necessary are— 1st. A system of pucka drains leading all refuse water and sewage to some distance from the hospital. 2nd. The excavation of a well for the use of the hospital itself. 3rd. The erection of a dead-house away from the hospital. At present it is beneath the building—a highly objectionable arrangement. 4th. A well furnished lavatory, with basins, towels, soap, and a shower bath on the same level as the wards. 5th. The substitution of vessels of earthenware for messing for the tin ones now used. 6th. The whitewashing of the interior of the hospitals, and the addition of a boarded roof or ceiling to the native and female wards. 7th. The introduction of a few plain rules for plain cooking.
20. Provision for exercise for convalescents.	There is no provision for convalescent exercise. The only place available is the space below the hospital, but that must be damp in the wet weather. Hitherto the convalescents have not been allowed the advantages which are at their disposal. I have lately applied for a sick-cart to convey them to the public gardens of an evening, which gardens, being so near to the Artillery lines, afford a pleasant lounge for this class of patients, rendering any *special* convalescent exercising ground scarcely necessary.
21. Provision for treatment of wives and children.	The wives and children of soldiers are admitted when necessary into a ward or detached building set apart for the purpose. Trifling cases are treated as out patients, and medical aid is now afforded them at their own quarters, or in the patchery in special cases. These arrangements are, I think, good and satisfactory.
22. Special local regulations.	I am not aware of the existence of any.

References to Subjects and Queries.	REPLIES.
23. Powers practically vested in medical officers.	Practically, no powers are ceded to the medical officer in questions of this kind; he can only *represent*. His indents upon departments for supply or repair, &c., must be countersigned by the officer commanding his regiment, or by the superintending surgeon; and owing to this, inconvenient and hurtful delay is often experienced in carrying out any necessary sanitary measures. Indeed, even when the representations are admitted and supported by commanding officers, delays occur in higher quarters detrimental to the welfare of the sick. The medical officer, whether he be regimental or garrison, although held responsible for the sanitary condition of his regiment or of the cantonment, as the case may be, has virtually no power to enforce a single suggestion, or carry out a single measure of sanitary reform. In the matter of diet and medical comforts there is no difficulty. The superintending surgeon's sanction is always given to any diet or comfort for which any valid grounds can be shown; and in his absence from the station, the regimental surgeon can order anything he likes, furnishing at the end of the month a memorandum explanatory of any unusual or excessive expenditure.
24. Convalescent wards or hospital.	No convalescent ward exists in the hospital of which I have medical charge, and no convalescent *hospital* for the *station*. The latter would be of great advantage to the sick, and I conceive that the organization of a well found hospital ship to be stationed at the mouth of the river, say off Elephant Point, and to which convalescents, or sick not convalescing favourably in hospitals on shore, could be sent, would be found to answer admirably, by shortening the period of convalescence and by saving many valuable lives.

Date of construction not known.

Total number of wards. { 1 Male, with 2 small side rooms for special cases. / 1 Female, with one verandah room for ditto. / 1 Native.

Total regulation number of beds.—No regulation on the subject.

Wards or Hospital Huts, Number.	Regulation Number of Sick in each Ward.	Dimensions of Wards. Length.	Breadth.	Mean Height.	Cubic Contents.	Cubic Feet per Bed.	Superficial Area in feet per Bed.	Height of Beds above the Floor.	Windows. Number.	Height.	Width.	Remarks.

Rangoon, 12th March 1860.

(Signed) J. L. RANKING, Surgeon in Medical Charge, Artillery, Rangoon.

APPENDIX D.

HOSPITAL OF HER MAJESTY'S 68TH REGIMENT LIGHT INFANTRY.

HOSPITALS.	
	1, 2. The 68th regimental hospital is situated near the southern extremity of the sort of irregular plateau formed by the gradual rise of the ground from the Rangoon river from the east and south, towards the Shoay Dagon Pagoda. 1st. It is to the south of the barracks, and distant about 180 yards from their nearest bungalow. 2nd. It is to the eastward of the regimental bazaar, and distant about 400 yards, while it has the sudder bazaar and the civil population of Rangoon and Pusondoung to the south, at distances varying from half a mile to two miles. On the west, about a mile and a half off, is the village of Kemendine. There are besides in the immediate neighbourhood the huts and sheds of squatters and followers, comprising the lowest and dirtiest class of natives, as dhobies, toties, sweepers, &c.; as, for example, about Dhoby's tank, on the south-east, the huts between Lake road and the barrack site, and those located round and about the Shoay Dagon Pagoda, commissariat cattle lines, &c. 3rd. The site might be said to be good, and nearly as well chosen for the purpose as the nature of the ground allows, but that the three buildings which compose the native detail hospital and division medical stores, erected close to its southern extremity, effectually keep off the sea breeze from that quarter. 4th. The site, if another hospital was thought of, might be better selected, although its elevated position, being nearly as high as the barracks, affords facility for natural drainage. All the low ground immediately around the hospital site, including as it does at greater or lesser distances within its area marshy land, imperfectly made nullahs and drains, together with native dwellings in a noisome condition and not subject to a sanitary police surveillance, these and other nuisances, as the habits of native regiments with regard to latrines, and last, not

References to Subjects and Queries.	Replies.
Hospitals—*cont.*	least, the close proximity of a hospital for native details to windward, all tend to render the site a dangerous one, under existing circumstances, from without. 3. The supply of water to the hospital is sufficient, and is of good quality: but for drinking purposes it would be better if filtered. There are no filters. 4. Shallow open cuttings are made around the hospital buildings in a line with the projecting roof, and these, with a few similar cross-cuttings to meet, take the direction of the cook-houses, which they pass by towards the ravine on the east of the buildings. During the monsoon these open cuttings are flushed with the rain water, which carries with it down the slope the refuse water from the cook-houses, &c. During the six months of dry weather there is no provision made for carrying off the refuse water. 5. There are three buildings used for the treatment of the sick; viz., two large bungalows, of equal size, and one of smaller size, which has been painted green, and is the ophthalmic ward. The two large bungalows are superior in construction; they have a double roof, *i. e.*, an inner ceiling of teak boards, and an ordinary leaf and bamboo roof externally, and with an interval of some 3 feet between it and the inner ceiling. 1st. The height of the ward floors from the ground in each building averages 6 feet, and there is a free perflation of air underneath them. 2nd. The only provision made for carrying away the roof water is that already described when speaking of the refuse water. No doubt a great portion of the rain and roof water finds its way into the subsoil. 3rd. I have nothing further to add regarding the surface drainage, in addition to what has already been said regarding the shallow cuttings; no doubt the provision is not sufficient, although it carries away much of the rain-fall. 4th. The hospital bungalows are raised on pillars of teak wood, some 6 feet from the ground; the sides or walls are of teak planks, $\frac{3}{4}$ inch thick; the roof, as above stated, is double, but the sides are not double-planked; the double roof permits of good ventilation, and if the walls were double-planked it would be a great improvement; the floor is of teak planking, set on in the rough, *i. e.*, without much planeing or close approximation of the adjacent boards; hence there is free ingress for the cool air upwards through the floor, which is single. 5th. The external or Palmyra leaf roof projects downwards and outwards all round the bungalow for some 10 feet, thus forming a verandah on every side, the floor of which is the *ground*. Convalescents can avail themselves of the shelter thus afforded, and seats are provided here and there for their convenience; the hospital sentry makes his rounds also beneath this verandah roof. 6th. There is but one flat. 7th. The hospital is shut out from the south-west monsoon by the three buildings already referred to. The windows open like a glass door on hinges, and towards the outside; they are large enough and numerous enough. 6. Large openings in and along the apex of the inner ceiling in the large bungalows communicate with the external atmosphere, through the interval left between it and the outside roof; a draught is thus indirectly kept up, which facilitates the removal of the lighter air; the numerous openings, also, by means of doors and windows on every side of the building, besides the many open chinks in the floors, render the natural ventilation of the wards very fair, and keeps them, with proper attention to cleanliness, &c., pure and sweet within. There are no jalousies in any of the buildings. 7. Except it be punkahs, there are no artificial means employed for cooling the air admitted into the wards. 8. There are no artificial means for warming the air admitted into wards employed. The walls and ceilings of the wards were thoroughly cleansed and limewashed some five months back; it was then done on the requisition of the surgeon, myself, and doubtless would be so done whenever required. 9. There is one brick-built privy in the centre and eastward of the two large bungalows; it contains a wooden seat, opening over portable wooden boxes lined with zinc, and which receive the soil. These boxes are carted away and cleansed with water and quicklime daily; the boxes are inserted through a sort of trap door in the posterior or eastern wall of the privy, and likewise removed. There is another privy within the hospital enclosure, which belongs specially to the ophthalmic bungalow; it is also to the eastward of the building, and only a little way removed from it, like its fellow of the large bungalows, and, unlike it, built of wood; it contains a wooden seat, with holes, over a cesspit or hole dug in the ground, which hole receives and has received the excreta since it was originally built; it has not been cleaned out, and the smell is offensive. The plan should be altered. 10. Wash-houses built of wood, and raised some 3 feet from the ground, sufficiently supplied with water, tubs, tin basins, soap, and latterly, towels, are within easy access of the large bungalows; one to each. Within the wards a corner room is set apart for the convenience of such sick as cannot with propriety use the wash-house below. But a regular bath-room properly furnished and supplied at pleasure with hot and cold water is an essential to the efficient working of a hospital. A shower bath, too, is not only a desideratum, but an indispensable means of treating certain classes of complaints. I regret to say that a shower bath has not been considered a necessity for a European regimental hospital by Dr. Graham, the superintending surgeon of this division, and, consequently, my repeated and urgent request for one through the officer commanding the regiment has been refused. 11. Without a bath-room properly furnished and fitted up specially as such, the answer to this question must be in the negative. 12. The hospital purveyor is responsible for the washing of the linen, and issuing it, when required, dry. The linen during the monsoon is always more or less damp, but it is aired beneath the hospital in such cases by means of charcoal fires placed beneath bamboo frames, upon which the linen or bedding is placed. 13. The storage is not sufficient, nor does it afford sufficient protection from damp in a climate like Burmah. It is a small wooden structure; the store ought to be a pucka building. 14. The bedsteads now in use are strong wooden frames with strong cane bottoms and light iron fixings wherewith to fasten a mosquito frame. The beds are made of cotton

References to Subjects and Queries.	Replies.
Hospitals—*cont.*	ticking filled with straw; the pillows are now filled with coir; a blanket, cotton coverlid, and a pair of sheets are supplied, and changed whenever ordered by the surgeon; sheets and night-shirts are invariably changed twice a week. The *bedsteads* appear admirably suited for this climate, as there do not appear to be any bugs harboured by them, as in India, where charpoys are preferred for this reason. The straw supplied for the *bedding* is very indifferent, and a hair mattress is the only proper bedding as regards comfort and economy: the curled hair can be weighed, and when necessary can be washed; the expense is only for the first outlay; some of the fibres which have from time to time been proposed as substitutes for curled hair might with advantage be used for bedding, in lieu of the dirty paddy straw obtained in this country. 15. There are two pucka-built kitchens, one close to the southern extremity of the hospital range, and one at its northern extremity; both are to the eastward of the bungalows, and only a few feet from them. The means of cooking are very limited, and consist merely of chatties, frying-pans, and kettles. There is no such thing as a kitchen range or boiler, turnspit for roasting, &c. The cooking of diets is but very indifferently done, and cannot be sufficiently varied under existing arrangements. 16. Copies of forms in use are annexed. 17. The following table will show what a regimental hospital is entitled to in respect to serjeants, nurses, &c.:—

Hospital Serjeant.	Writer.	Purveyor.	Assistant Purveyor.	Cook.	Assistant Cook.	Cooly Maistry.	Coolies for leeching, &c.	Ward Coolies.	Sweepers.	Toties.	Puckalies.	Tailors.	Dhobies.	Female Nurse.	Cooly Woman.
1	1	1	1	1	1	1	3	8	3	3	2	2	2	1	1

The duties of the hospital serjeant are manifold, and occupy all his time; he is entrusted with the entire discipline, dress, and is responsible for the conduct and behaviour of the convalescents and sick, whether out or in hospital.

The native servants, especially those supplied to the hospital here, are not trustworthy, and require the greatest vigilance on the part of the subordinates to ensure any work being done. The complaints here against the hospital ward coolies, toties, and sweepers, by the hospital serjeant and by the senior apothecary, are frequent, for drunkenness, absence without leave, and inattention to the patients, and generally to their duties.

Whenever a man is seriously ill it consequently becomes necessary to apply for the services of a European soldier to wait on him, else he would not receive the care or attention he requires, or is presumed to have.

Under these circumstances I cannot say that the attendance for the sick provided by regulation is of the kind it ought to be, or what *à priori* might be expected from looking merely at the above table, without knowing the working of the system.

18. I think that, on the whole, the sanitary condition of my hospital is good, notwithstanding any drawbacks I have mentioned.

The sick have never been attacked with hospital gangrene or pyæmia within its wards.

Bowel complaints and fevers have appeared from time to time in an epidemic form, according to the season and time of year, induced, I believe, in a great measure by local influences of a remediable nature, but not confined to the immediate vicinity of the hospital.

19. Many suggestions occur to me with respect to this question.

1st. The cantonment should be cleared *far* and *wide* of jungle, and subjected to an extensive and efficient drainage.

All squatters and camp followers should have their places of residence told off for their use, and their huts ought to be erected by the Government on a definite and suitable plan, instead of allowing them to congregate as now in any number and with or without shelter, as the case may be; a strict and efficient police should then enforce cleanliness and order and prevent the clandestine sale of liquors, spirits, fruits, bad meat, fish, &c.

Dhoby's tank should not be used for washing clothes. It might, with some little expense perhaps, be made a suitable swimming bath for the regiment, and *officers* of the cantonment generally.

The dhobies should not be allowed to wash clothes nearer to the hospital than the large Lake, where suitable sheds might be erected under regulations calculated for the purpose.

Roads ought to radiate, as it were, farther into the jungle from the cantonment, and a road for driving round the large Lake should claim attention. While these measures generally are called for for the well-being of the sanitary condition of the hospital and the cantonment, it is quite as essential that the adjoining town of Rangoon and villages of Posendoun and Kemendine should be placed under the surveillance of an efficient sanitary police.

Diseases are there generated in excess, as the mortality of the last quarter will show, which are to all intents and purposes preventible, and might at any moment be wafted northward to our men, and then the tale is soon told; a fine regiment becomes panic-struck, perhaps decimated. With every death the Government loses 150*l.*—it cannot be less, besides a European and a soldier, whose loss can hardly be estimated in India by money.

2nd. The dieting of the sick is capable of much improvement. I would suggest what I have repeatedly done before, that mutton be issued to the sick every day, instead of every second day as now. Mutton is the best flesh for a sick man as a standing dish. It is more manageable for the purposes of division into chops, and best suited for a weak digestion, an almost universal concomitant of disease in this country.

Some alteration in the mode of preparing the diets is also required.

References to Subjects and Queries.	Replies.
Hospitals—*cont.*	If a quarter or two of mutton were occasionally roasted, and served up as for a mess in a joint, it would be a great change on the present regulation plan of boiling, so as to make a proportion of broth, and would afford more nourishment and give zest to the failing appetite. The joint in this case should be cut when on the table, and served out under proper directions, instead of being cut up, as now, by native cooks, whereby I have every reason to know peculation is carried on, and cannot be prevented under the present system. Enough messing articles are not issued for the comfort and convenience of the sick soldier. Everything necessary for enabling him to partake of his meals comfortably, when once well served, should be supplied from the hospital establishment; and he should not be dependent on his own kit for a knife, fork, spoon, &c. The same "tin" that holds his morning milk or tea may be, and generally is, used to carry his mutton broth or chicken soup at noon, again to be used for tea in the evening, or, mayhap, some beer or wine and water, if ordered. It is almost certain to be greasy, which often produces an indifference, if not a loathing for food, when nourishment is of great importance. I would suggest such articles, including common porcelain soup bowls, tea cups, &c., be supplied in sufficient quantity, and in proportion to the size of each ward. As has been above said, the native hospital servants fall far short, at all events in Burmah, of their duty, require close watching and troublesome urging to obtain even moderate work from them. I would suggest that a soldier of experience and established good character should be allowed to take the superintendence of the hospital kitchens, to ensure care and cleanliness in cooking the diets and the extras, and prevent anything like peculation, which I fear will never be avoided without such European supervision. He would receive any particular instructions from the surgeon regarding the cooking of food or extras for particular patients, and see all served hot and comfortable. 20. The convalescents and sick generally take daily exercise morning and evening, either walking or riding in "sick-carts" or in doolies. Indents are made for the quantity and kind of carriage required for the following day upon the commissariat department, and the authority of the major-general sanctions what may be indented for by the surgeon. The exercise is taken on the roads of the cantonment and in the cantonment gardens, which are provided with seats. The senior non-commissioned officer present is responsible for the conduct, &c., of the sick and convalescents while taking exercise. 21. There is no provision whatever for the treatment of the soldiers' sick wives and children. But it is right to state that hitherto there has not been a necessity for such provision, as the families of the men have not as yet arrived in the country, although they are now daily expected. A regular female hospital, with a lying-in ward, is absolutely necessary. 22. I know of no local hospital regulations. 23. The medical officer can only represent matters appertaining to the sanitary state of his hospital. His representation or recommendation may be approved or disapproved of by the authorities, or wholly disregarded. As to diet, it is prescribed by regulation. Any change in the items composing it might be deemed very necessary by the surgeon, but the change could not be effected unless the superintending surgeon recommended it also, as is the case at this station now. I have recommended the issue of mutton to be daily. The superintending surgeon says no, and it is not issued. The surgeon can order anything in the shape of an extra to his patient when it is procurable (mutton is only procurable every second day), as wine, beer, eggs, &c., at his discretion. I have already shown that the surgeon has no power practically as regards the means and appliances for medical treatment. He cannot obtain a shower bath for a regiment of some 1,300 men, because the superintending surgeon does not think it necessary. He cannot procure the medicines for his hospital, except so far as the superintending surgeon thinks fit to sanction them. For example: at this station my requisitions for quinine are always curtailed to a minimum, viz., one pound, a quantity that might be used with the 68th Light Infantry in two days, were it considered necessary by me to administer the medicine as a prophylactic agent. On one occasion there was none of this indispensable drug in the division stores to meet my requisition, and I was obliged to do without it till some was received from Calcutta. At this present time my requisition for iodide of potassium, an indispensable medicine in any hospital, has been returned to me with the remarks, and them only, "none in store." At the same time, my requisition for camels' hair pencils for the treatment of eye diseases was returned to me with the remarks, "not sanctioned." Thus it must appear that the surgeon who *alone* has the treatment, and who is *alone* responsible for the health of his regiment to his commanding officer on the spot, and to the Director-General of the Medical Department in London, is practically without powers, which is the answer to the question. 24. There is no convalescent hospital at this station. There are no wards in my hospital to spare for such a special use. In case of much sickness, indeed always, a separate hospital for convalescents is most desirable. (Signed) Geo. Peacocke, M.D., Staff Surgeon, in Med. Charge 68th Regt. Light Infantry. Rangoon, 2nd February 1860. N.B. I would wish to bring specially to the notice of the committee, and in reply to question No. 23, that the surgeon has not power, it would appear, to reject rations, as bread and meat, which he may consider as objectionable. He can call for a board or regimental committee under such circumstances, and it may happen that, by the decision of such committee, the surgeon's opinion may be dissented from altogether, by which the power of regulating the *quality* of the rations for the sick is virtually taken from the surgeon, who is, in nine cases out of ten, and always ought to be, the best judge of the quality of bread, meat, &c. Such is the local custom, at least, that obtains. G. P.

APPENDIX E.

6TH REGIMENT NATIVE INFANTRY.—HOSPITAL.

References to Subjects and Queries.	Replies.
HOSPITALS.	2. The hospital is situated between the most easterly barrack and the Kemendine road; rather inconveniently near the latter. Distant 150 paces from the nearest barrack. Not near any bazaar. On an open, freely-ventilated site. Not in the neighbourhood of any marsh or other probable source of malaria. 3. The water supply is abundant and wholesome. 4. The drainage is effected by trenches cut in the ground, which itself has a slight natural slope. 5. The lowest and only ward is raised seven feet from the ground, which allows a free passage of air below. There are gutters for the removal of the roof water, but as the soil is soft it must partly sink into it. At one spot, just in front of the gate, the water is apt to collect, but from the same cause (sandy soil) it soon disappears. The hospital is of wood throughout, the floor of planking, the walls of double matting, and the roof of "shingle," lately substituted for thatch. The verandahs on both sides consist of a projection of the roof beyond the walls to a horizontal breadth of nine feet, and are not of a nature to be used as accommodation. The hospital consists of one flat. Date of construction, not known. Total number of wards, 1. Total regulation number of beds, not fixed.

Wards or Hospital Huts, Number.	Regulation Number of Sick in each.	Dimensions of Ward.			Cubic Feet per Patient.	Superficial Area in Feet per Patient.	Height of Patients' Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.				Number.	Height.	Width.
1	—	122 ft.	20 ft.	12 ft.	455½*	32¼*	1 ft. 10 in.	21	4½ ft.	4½ ft.

* These numbers are calculated on the supposition of 75 patients, the largest number that has been in the hospital, and are exclusive of the space in the angle of the roof.

The hospital is open to the wind on all sides.

The windows are of glass, and open outwards in two pieces like folding doors, affording plentiful and manageable ventilation.

6. Included in the last answer.
7. No means of cooling the air used.
8. No means of warming are required. The walls and roof are not limewashed. They are cleaned once a quarter.
9. The privy is an oblong house, containing two fixed wooden troughs, opening out by the back of the house. The greatest number that can use it at one time is eight. There is no drainage, water supply, or cesspit; but the night-soil is daily removed. It is not offensive, except within a short distance at the back.
10, 11, 12. Do not apply to the arrangements of a native hospital. There is a large tub for warm baths.
13. The storage is sufficient and dry.
14. The bedsteads are of rattan work, stretched on a simple wooden frame. The sick can be supplied with coarse blankets, if required, but usually provide better ones of their own.
15. The cookhouse is a simple brick building, roofed with tiles, and containing a few earthen fire-places. Nothing more is required.
16. The only diet roll in use is a list of the men receiving other diet than their rations, mentioning the articles. When a man in hospital is recommended special diet his ordinary rations are not interfered with, so that all special diet becomes at the same time extra diet, forming an evident temptation to a man to exaggerate his complaint. The statistical forms are the usual ones of a native corps, and are given in the code of Medical Regulations (pp. x., xi., xii, xix., xx., xxi., xxiii., xxviii., xxix., xxx., xxxi.), and I believe also in the General Regulations.
17. One havildar and two orderlies are attached to the hospital, and are found sufficient. Any man so ill as to be helpless is usually allowed to name an orderly to attend specially on himself.
18. In good sanitary condition, and has not been subject to epidemics.
19. No improvements to suggest.
20. No shaded walks for convalescents required.
21. Wives and families not with the regiment, except a few East Indians, who are attended, when necessary, at their houses.
22. No local hospital regulations.
23. No repairs have been lately required, but the hospital building has been considerably improved. At this station the medical officer has some power as to change of hospital diet; in camps and on march, none.
24. No convalescent hospital required. A man being discharged before he is fit for duty is quite an exceptional case; and in such case he is usually allowed, on the representation of the medical officer, exemption from duty for a time.

Rangoon, 23rd February 1860.

D. CAMPBELL, M. D.,
Assistant Surgeon, 6th N. I.

APPENDIX F.

23rd Regiment Native Infantry.—Hospital.

Sir, Rangoon, 2nd April 1860.

I have the honour to acknowledge the receipt of your letter of 26th March 1860, with series of questions on the subject of hospitals, and beg to annex a rough ground plan and elevation of the hospital 23rd Regiment Light Infantry at Rangoon.

References to Subjects and Queries.	Replies.
Hospitals.	2. The hospital is situated on the left rear of the lines of the regiment, and at a convenient distance. There is no bazaar near, and the civil inhabitants are at a considerable distance. There are no buildings, walls, or trees to interfere with ventilation, and the site appears to me unobjectionable. My short experience of Rangoon renders me unable to answer question No. 2 more fully. 3. There are four bowries for the supply of water in the lines, which give a sufficient supply of good water during nine months of the year, but at present there is considerable scarcity of water, and it is dirty and muddy, requiring to be filtered by the sepoys before it can be used. The sick sepoys in hospital are dependent for their supply of water on the regimental puckalies. I am of opinion that it would be of advantage if one or more puckalies, as might be required, should form part of the hospital establishment, and be ready at any moment to bring a sufficiency of water for hospital purposes. 4. The hospital is surrounded by a gutter, which carries the water in the rainy season into a large nullah, at a considerable distance from the hospital. The filth of the necessary (urine and fæces) is carried away to a distance by a conservancy cart daily. 5. The large ward of the hospital is raised on piles 7 feet from the ground, and the four small rooms at each corner are 3 feet 7 inches from the surface. The ground part of the hospital has also recently been walled in and converted into a ward, to be used when necessary, but, of course, will not be available in the rains. The roof water falls directly into the gutter surrounding the hospital and is carried off. The gutter I have mentioned is, I am informed, sufficient to carry off the rain water as rapidly as it falls. The hospital is built of piles, planks, tatties, and bamboos; the roof being of bamboos and cocoa-nut leaves. The walls and the roof are single, and the heat during the day in the hot season is very great. A verandah or pandal surrounds the hospital all round, the breadth of which is 10 feet, and which is sufficient to prevent the direct rays of the sun from entering the hospital. This verandah is never used for patients of any description. There are, of course, two flats in the hospital, if the ground part is to be considered a flat. Accompanying this letter will be found the table required. The hospital is so situated as to be open to the wind on all sides. There are 10 glass windows on each side of the large ward, 5 feet in height and 5 feet in breadth. Each window is in two pieces, and opens outwards. The hospital is sufficiently ventilated by these windows and other means. 6. The ventilation of the hospital is carried on by means of the windows, doors, and floor, and appears sufficient to keep the hospital free from odour or closeness. 7. There are no artificial means used for cooling the air entering the hospital. I am of opinion that punkahs would be of great advantage to the sick in native hospitals. Orderlies are frequently employed in bad cases with hand fans, but a few coolies would be sufficient to pull the punkahs for the whole hospital. 8. There are no artificial means of warming the air in use. The walls and ceiling have never been whitewashed. They are swept down occasionally. 9. The privy is an ordinary tatty building 26 feet long by 10 broad, and 7½ feet height, situated at the north-west corner of the hospital compound, at a distance from the hospital of 102 feet. The ordure is removed daily by the toties and a conservancy cart. The privy ought to be a pucka building. 10. There are no lavatory arrangements in use in the hospital. The patients clean themselves in the hospital compound, each after his own manner. 11. There are no baths attached to the hospital. I have often wished to be able to prescribe warm baths to patients with cutaneous diseases (which prevail greatly in Burmah). 12. The hospital bedding, &c. is washed by dhobies, supplied by the commissariat on monthly indent. 13. The store-room is sufficient for the purposes required and dry. 14. The usual number of cots and bed-clothing allowed to native hospitals are in use in the 23rd Light Infantry hospital, viz., 19 barrack cots of wood and rattan work, 7 feet 4 inches long, 2 feet 11 inches broad, and 1 foot 7 inches in height, and the necessary supply for these of pillows, quilts, paillasses, &c. This number of cots is perhaps sufficient in the more healthy stations in India for the whole sick of a regiment, but in Burmah I consider that at least fifty (50) cots should be supplied to a native regiment, with the requisite bedding, &c. 15. A pucka building has just been erected at the east side of hospital compound, 33 feet long, 18 feet broad, and 10 height, as a kitchen for the use of the patients, who all cook their own diet by themselves, or when too sick by orderlies. There is no cooking in the hospital otherwise. Patients, when suffering from pretty severe illness, yet not dangerously ill, always wish to have orderlies to cook for them, and I have found it almost impossible to arrange so that one orderly might cook for several patients, their caste prejudices being so inveterate. Would not a high-caste Hindoo and a Mussulman cook be advantageously attached to the establishment of a native regiment when on foreign and field service, thus obviating the withdrawal from the ranks of numerous trained sepoys for cooking purposes? 16. The patients in a native hospital supply their own diet (except in a few exceptional cases in Burmah); there are no diet tables or diet rolls. Annexed will be found a copy of the monthly return for February 1860, which will show how the statistics of the hospital are kept. A return for the whole year, in almost the same form as the monthly return, is sent annually. 17. A native hospital has usually a havildar or naique, who looks after the cleanliness, and keeps order among the patients. There are no nurses, but each patient, at the discretion of the medical officer, is allowed an orderly comrade when too sick to look after himself. 18. The hospital of the 23rd has never had any epidemic disease prevailing in it that I am aware of.

References to Subjects and Queries.	Replies.
Hospitals—*cont.*	19. I see nothing to improve (with the exceptions previously mentioned—privy, baths, &c.) in the hospital as a native hospital, except that a superior kind of roof would be of advantage, the present bamboo and leaf roof not being thick enough to keep the hospital cool in the hot weather. 20. There is no provision made for convalescents taking exercise. 21. In native regiments, families, when present, receive medicine from the hospital, and are visited by the medical officer or subordinates in their huts when necessary. 22. There are no special local hospital regulations in force at this station that I am aware of, except that the medical officer in Burmah can order extra diet in certain cases to the sick. 23. The medical officer has no power practically to order any repairs, &c., in hospital, or to choose the site for encamping grounds. He communicates with his commanding officer when he considers that anything is required. In Burmah, as mentioned above, he can supplement the diet of the natives provided by themselves with a few articles of extra diet, such as chicken, mutton, milk, and wine, &c., when necessary. 24. I am unable to state whether there are any convalescent wards for convalescent patients at this station; there is none attached to the hospital under my charge, and indeed is not required for natives, their best convalescent ward being a hut in their native country.

I have the honour to be, &c.,
JAMES ADAMSON, Assistant Surgeon,
23rd Regiment Light Infantry.

APPENDIX G.

41ST REGIMENT NATIVE INFANTRY.—HOSPITAL.

References to Subjects and Queries.	Replies.
HOSPITALS.	2. The hospital of the 41st Regiment Native Infantry is situated on open ground about 100 yards or less to the north of the barracks, and to the south of the officers' lines, at a distance of ½ or ¾ of a mile from the town or bazaar; the site is open and freely ventilated, with a few trees in the neighbourhood, but not so many as to impede ventilation. Its situation is sufficiently well drained, but to the north-east, at a distance of 200 yards, is a pond which dries up in the dry weather, and is in my opinion prejudicial to the lines and hospital by causing malaria; this is, however, a moot point. 3. The water supply is tolerably abundant, except at the end of the hot weather, and I believe it to be wholesome; it would, however, be very much improved by filtering. 4. The ground slopes down from the hospital towards the river; there is no sewage, the ordure from the latrine being removed daily in carts. 5. The hospital of the 41st Native Infantry is a wooden building with mat walls and a thatched roof, which is going to be shingled. The roof is 140 feet long by 40 feet broad, but the walls enclose less than half this space, as there is a verandah of protection 10 feet broad round the four sides, leaving a space 120 feet long by 20 broad, with a floor of planks raised 6 feet from the ground. The building faces the south, where there are four doors 7 feet 10 inches high by 4 feet 10, and eight windows 4 feet 10 inches square; there are ten windows of the same size behind, and one door at either end. There was of course free perflation of air under the floor, but I was obliged to get the eastern half of the under portion of the hospital matted in, the upper portion being insufficient to hold all the patients. There is no provision made for carrying off the roof-water, nor is it necessary, as the soil is porous and slopes towards the river. I consider the hospital an excellent one for natives; it is sufficiently cool, and the verandahs afford abundant protection from the sun's rays; it is also a good protection from the cold and damp. Ventilation is ample from the doors, windows, roof, and floor. The windows are each in two portions, and open outside. 6. No particular contrivances are used for ventilation, and there are no jalousies, the windows being glass and the doors panelled. 7. Native hospitals hardly require to be cooled. 8. The walls were once whitewashed, because there were many patients with bad ulcers. 9. There are latrines at a short distance from the hospital, from which the ordure is removed daily in carts. 10, 11, 12, and 13, apply rather to European hospitals. 14. The cots are of teak rattaned, and there are cumblies and coverlets. 15, 16, 17, refer to European hospitals. 18. I consider the sanitary condition of the hospitals at Rangoon to be good. There are occasionally ulcers of the gangrenous kind, but not in my opinion attributable in any way to the construction of the hospitals. 19. The hospital would be improved by having a fence round it. 20 and 21, apply to European hospitals. 22. There are no special regulations that I am aware of in Rangoon. 23. I never had any difficulty in procuring obtainable comforts for the sick, or in getting any repairs or improved sanitary arrangements in hospitals. 24, applies rather to European troops. Total number of wards, 1. Total number of beds.

Wards or Hospital Huts, Number.	Regulation Number of Sick in each Ward or Hut.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.

I. TOPOGRAPHY.	1. The adjacent country is flat, marshy, and jungly. The soil is compact red sand. There are extensive paddy fields under cultivation all round the station. There is some undulating ground near the Sittang river to the east of the cantonments, which is well wooded. Across the river and distant about a mile laterite is found in great quantities, also valuable timber trees, such as teak, padauk eeiu, pengado, sal or eughine, pema, and various others.

I. Topography—*cont.*	2. The cantonment is situated about 300 feet above the level of the sea. It is on a plateau having an elevation of some 30 or 40 feet above the surrounding country. It is bounded on the east by the Sittang river; and during the S.W. monsoon, which commences towards the end of May, and terminates in October, the surrounding country is one universal marsh. There is no ground adjoining the station. sufficiently capacious for a cantonment, which is either higher or healthier. "Report of E. O'Reilly, Esq., late district commissioner at this station. "The want of a position in the vicinity of the station, affording a change of temperature from that of the plains, has long been considered a desideratum, and on former occasions of my ascent of the ranges nearest the valley, the subject has had my attention both in regard to altitude, space on the surface, and means of access; I had hitherto not succeeded in selecting a position adapted for the purpose until my reaching the 'Bangalee' range on my return route; the position, at a height of 500 feet, possesses a broad surface sufficient for the requirements of a building accommodation, is connected with other ranges by a ridge line of easy inclines, is free from jungle vegetation, is distant from Tonghoo about 28 miles, which place is visible from the position, and from the hot springs 8 miles, which occur at the base of the range at a height above the plains of 540 feet; a supply of pure water is obtained at a moderate distance below, and the range of the thermometer 65°–78° during the few days of my stay there. Hence should the hot springs be found to possess restorative properties, and it be desirable to apply them to such purposes, the position of the Bangalee range affords the necessary requirements for the formation of a sanatarium for temporary resort during the periods of extreme heat and humidity of atmosphere of the plains." 3. The nearest range of mountains are distant about 12 miles, the elevation of the highest of which is but 2,000 feet above the level of the sea. The eastern range, distant about 15 miles, varies in elevation from 2,000 to 6,000 feet high; the table land being distant from the station about 28 miles (vide above report). 4. The station is situated on the Sittang river. There are various mountain streams and other creeks which fall into the Sittang river not far distant from the cantonments. There are several jheels within the old town walls of Tonghoo, the ditch of which passes through a portion of the cantonment. The surrounding country is one universal swamp during the monsoon, but more particularly so during the four latter months of its continuance. The rains fill the numerous creeks and ravines not far distant from the cantonments, but with no injurious effect on the health of the troops here. 5. The station is surrounded with dense jungle, but being situate on a plateau, the ventilation is not much affected thereby. There is still some jungle in the cantonment, but it is being rapidly cleared away. The Burmese are in the habit of burning their jungle periodically, which fires endanger the safety of the public buildings. It should be cleared away at least a mile from the cantonment boundary. The temperature of the station is not affected by reflected sun heat, but it is increased by the fires all round the station during the hot months. From November to February cold northerly land winds prevail, the sea is distant about 160 miles due south. During the cold season dysentery cases are aggravated, and during the southerly winds fevers prevail. 6. The greater part of the surrounding country is cultivated with paddy. No works of artificial irrigation exist. There is no cultivation of rice or indigo, nor is the preparation of hemp or flax carried on near the station. 7. The old town of Tonghoo, little more than a mile square, is in the immediate vicinity of the cantonment. Its population is stated to be 3,939 adults, and 2,513 children. 8. No geological survey has yet been made of the district; most of the minerals exist in small quantities. There are lime, laterite, and iron ore in great quantities. The subsoil is generally compact red sand, but very valuable clay for pottery is also found. The cantonment was formerly occupied by Burmese population, but had to be cleared of jungle and brushwood by us. 9. Water is found during the dry season about 30 feet below the surface, and during the rainy season almost at the surface. 10. The rain-fall and surface water flows readily from the station; but in the lower ground adjacent the water lies on the surface till evaporated. There is no higher ground adjacent, the drainage of which passes into the subsoil of the station. 11. The water supply of the station is derived partially from the river, but principally from wells. It is not stored in open tanks. No tanks exist. The wells are protected by a thatched covering from all impurities. 12. The supply of water is ample and very good. In the monsoon, being turbid, it requires filtration. The water is hard, colourless, tasteless, and devoid of odour. Bheesties distribute the water. No better supply can be wished for. 13. The climate of the station is favourable to the European constitution. The native troops suffer in some measure from climate, but there is reason to believe their general health would be improved by the addition to their rations of animal or other solid food. 14. The site of a station is generally at first chosen by the principal military and engineer authorities, and afterwards reported on by a medical committee; the highest ground and the most advantageous for defence in a military point of view, and the most accessible by water, is that which is generally preferred. Jungly ground, never before inhabited, should not have troops located on it till three years after its clearance, as, for example, the unhealthiness of Nunyan and Shoayghine, which were occupied immediately after clearance; the former had to be given up, and the latter is still very unhealthy.

TONGHOO.
MADRAS.

II. CLIMATE.	1. No instruments available at the station for taking meteorological observations. 2. The following table has been compiled from the hospital returns of Her Majesty's 69th Regiment, from January 1859 to December 1859.

Months.	Thermometer.		Thermometer.		Rain, Inches.	Winds.		Remarks.
	Mean Maximum.	Mean Minimum.	Mean Dry Bulb.	Mean Wet Bulb.		Direction.	Force.	
January -	82	57	69½	61	—	N.E.	Moderate	Clear.
February -	90	63	76½	65	—	N.E.	Moderate	Clear.
March -	90	70	80	69	1·90	N.E.	High Winds.	Clear.
April - -	98 17/30	80 15/30	89 17/30	79 9/30	2·40	N.E., S.W.	High Winds.	Clear.
May - -	90 24/31	78 9/31	84 13/31	76 30/31	6·35	S.W.	Monsoon.	Clear, with thunderstorms.
June -	83 26/30	77 18/30	80 23/30	77 17/30	16·83	S.W.	Monsoon.	Clear, do.
July -	84 1/31	76 24/31	80 12/31	77 5/31	11·95	S.W.	Monsoon.	Clear, do.
August -	84 27/31	76 16/31	80 21/31	77 14/31	14·90	S.W.	Monsoon.	Clear.
September -	85 19/30	75 27/30	80 3/30	77	9·30	S.W.	Monsoon.	Clear, occasional thunderstorms.
October -	86 19/31	75 1/31	80 22/31	76 3/31	4·70	S.W., N.E.	Monsoon.	Clear.
November -	83 18/30	68 27/30	76 13/60	71 13/60	1·05	N.E.	Moderate	Clear.
December -	82 5/31	65 29/31	74 3/62	68 13/31	0·05	N.E.	Moderate	Clear.

3, 4. The climate for a tropical one is good; from November to February the nights and mornings are very cold, the thermometer falling down at times to 49° Fahrenheit; during the day it is dry and hot, with heavy dews at night and fogs in the morning. From 1st March to end of May it is very hot and sultry, the thermometer being 105° (?) in the shade; from June to October close and very damp, thermometer 81°. During the hot season the station is enveloped in clouds of dust, owing to there not being any sanctioned modes of watering the roads; the cantonment would be greatly improved if this was done. The European troops are well rationed, but an addition of animal or other solid food to the native ration would be an advantage, nothing of the kind being procurable here in the bazaar. Clothing of serge and other light woollen material appears suitable to this climate; flannel should be worn next the skin. Cholera belts, already supplied, should be invariably worn. Drills are carried on during the dry season, and at such hours as to prevent unnecessary exposure to the sun. The most healthy months are from November to the end of February, the most unhealthy from May to the end of August. The prevailing diseases are fevers and bowel complaints. There is no district near the station which is likely to be more conducive to health.

5. I have served in India, at Bangalore, Kurnool, Hyderabad, Samulcottah, Rajah Mundry, Condapilly, Masulipatam, and Rajapore; in Burmah, at Rangoon, Prome, Nunyan; inland, Padong myo, Thyet-myo, and inland and at Tonghoo; I have also resided for brief periods at Sittang, Shoay ghein, Moulmein, Henzadee, and Ava. In India, Condapilly was the most sickly, and in Burmah, Nunyan, Shoay ghein, and Mendoon inland from Thyet-myo, appear the worst; whilst Tonghoo and Enghma, inland from Prome, appear to be the most healthy.

III. SANITARY CONDITION OF STATION.

1, 2, 3. A plan of the cantonment is forwarded, but it was not thought necessary to include the four miles of the surrounding country, as it is all jungle with a few paddy fields here and there.

4. Table of Barrack Accommodation.

Date of construction of barracks; European infantry, 1857–58; European artillery, 1855.

Total number of rooms or huts; European infantry, 20; European artillery, 4.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	5. Each barrack has on all sides of it glass windows, which open outwards. The European barracks have an open verandah, 12 feet broad, all round them. The artillery and native barracks are not so good, and have smaller verandahs with corner rooms for non-commissioned officers; the verandah is never occupied as sleeping quarters by soldiers or other persons. There are no jalousies or jhilmils. 6. The bedsteads are most uncomfortable, being either of iron or boarded; the former have mattresses allowed for them, but none have been granted for the latter, although they have been applied for upwards of a year; they are most necessary for the health and comfort of the men. 7. The tents are Madras European of the following dimensions, 14 ft. × 21 ft., with 2 standing poles 10 feet 3 inches high to caps inside, and having walls 5 feet high, supported with bamboos, and long enough to form porches to doors front and rear, for which there are 4 small poles; there is also a ridge pole to keep the fly sufficiently off the shell. Superficial area per man, 11 feet 9 inch $\frac{3}{25}$. To contain 25 men each :— Cubic space / Contents in feet } 1,996 nearly. 8. In barracks the means of ventilation are,—by ventilating boards at the top of the floor; by the doors and windows; and by a space left between the roofs and walls. In guard-rooms nearly the same; the ventilation is ample for the purification of the air night and day. There are no means of cooling the air in barrack rooms as yet; punkahs have been applied for. 9. The barracks and all places of abode are built of wood. The natives have barracks with mat walls plastered and whitewashed. 10. The floors are constructed of wood. The floors of the European infantry barracks are raised 7 feet above the ground; those of the artillery and native barracks about 3 feet. There is a free passage of air beneath. 11. The materials used in the construction of the barracks, huts, and tents, are suitable to the climate; they are very salubrious. The public buildings, however, should be either shingled or tiled, as at present they run a great risk of being burnt down. All public buildings and cantonments are kept in repair by the executive engineer, and sanctioned works are speedily executed. The senior surgeon is responsible for the sanitary state of the cantonment. The walls and ceilings of barracks are always kept perfectly clean; they are not whitewashed, being built of wood. 12. There are ten wash-houses for the men, built of wood, one to each company, supplied with water by bheesties. 13. The barrack cook-houses are temporary buildings, and in a very bad and dangerous state; the means of cooking are ample, and the water supply sufficient. The drainage is imperfect. The roofs are thatched, and there is no ventilation ridge for the escape of smoke; one was burnt down a few days ago. The linen is washed by dhobies, kept expressly for that purpose; they are sufficient for the wants of the station. 14. The privies are temporary buildings, and very bad, the soil passes into a cesspool; there are no means of cleaning them out, they are purified by pounded charcoal and lime. Urinals have not yet been erected. 15. The ventilation of these buildings is ample, and the means used for that purpose are the same as those employed in the barracks; they are not lighted at night time. Being a long way off from the barracks they are very inconvenient. The barracks are lighted at night by means of lanterns suspended from the tie beam. 16. The drainage of the barracks is natural; no sewers are required. Each barrack is surrounded by a drain to carry off the rain water falling from the roof; the drainage of the bath houses requires improvement, that of all the other buildings is ample. There are no women's wash-houses yet, the families of the European infantry not having arrived. No part of the barracks or hospital is damp, being well raised off the ground; all water is carried away by the natural drainage to the lower ground beyond the cantonment. There are no cesspits except those attached to the privies, which are about 100 yards distant from the barracks, and not placed near any well. There are no foul ditches. 17. No surface cleansing is required in the cantonment beyond occasional sweeping about the barracks and carting away of the refuse, for which means are placed at the quartermaster's disposal. 18. The surface of the cantonment is not yet free of vegetation. The jungle is being cleared, and a proposition has been made to Government to keep the surface free from undergrowth. The removal of the jungle will improve the ventilation, but if allowed to increase it may seriously affect the health of the troops. There are no old walls, thick hedges, &c. 19. There is at present no cantonment bazaar, but a temporary one will shortly be erected The condition of the Burmese huts in the vicinity of the station is good, those of the native followers, especially those of the artillery living within their lines, are very bad and dangerous; they are also objectionable on the score of health, and ought to be pulled down as soon as possible. Quarters should be built for all native camp followers apart from the rest of the cantonments; their pay being very small they cannot afford to build for themselves, and living in wretched huts get ill. The barracks of European infantry are free from all nuisances, but not so those of the artillery, which are close to the huts, as stated above; were they removed, and a barrack built, the nuisance would at once cease (this barrack has been since built). The commissariat bearers are particularly badly off, drawing only 7 rs. a month. They cannot build; and live anywhere and any how. Numbers are always sick, and numbers die or have to be sent away. 20. The animals for consumption are slaughtered in a slaughter-house, situated on a rising ground, half a mile east of the cantonments: the offal is sold to a Burman, who removes it daily. No nuisance is experienced from the condition of the slaughter-house. 21. There are no bazaar horses. 22. The stables for the artillery horses are most commodious, and are built of wood and thatched. They are well lighted and ventilated, owing to the height of the building and the sides lifting up and down. They are well removed from the barracks and hospital. There are no dung-heaps, the manure being thrown away at a safe distance. The horses are picketed immediately in front and rear of their stables. 23. The quarters for the married men of the artillery are bad, and not sufficiently roomy. No other married men's quarters are yet erected, but their construction has been sanctioned.

References to Subjects and Queries.	Replies.
Officers' Quarters.	1. There are no public quarters for officers, each lives in a building erected at his own expense. Their sanitary condition is good. No improvements are suggested.
IV. HEALTH OF THE TROOPS.	1, 2, 3. The station is healthy; the adjoining native population are liable to intermittent fever, and consequent spleen disease. The presence of fever amongst them is ascribable to the marshy and jungly nature of the surrounding district. 4. The 69th Regiment arrived at Tonghoo from Plymouth on the 24th February 1858. They left the latter station on the 17th November 1857, after a residence there of six months, having returned in May of the same year from 10 years' foreign service, six of which had been passed in the West Indies (Windward Islands); their health in the West Indies was good, but while there they suffered much from three epidemics of yellow fever and one of cholera. Their state of health on arrival at Tonghoo was good, and has remained so ever since. They have chiefly suffered from fevers and bowel complaints, the mortality is trifling. 5. The troops are never camped out. 6 to 13, 15, 16. No experience of hill stations. 14. A frequent change of stations in the plains is beneficial. 17. See E. O'Reilly's, Esq., report (Topography, 2). 18. With regard to the healthiness or unhealthiness of particular classes of surface and sub-soil for stations, no general rule can be laid down, as much depends on local influences. Preference is given to light sandy soil. 19. Soldiers proceeding to India should be about 22 years of age, and should land there about November. The troops on arrival here were at once marched into barracks; their India kit had been previously issued at Madras, and they at once entered on the usual duties of the post. On recruits first landing they should avoid exposure to the sun, and over indulgence of all kinds, and the wearing of flannel waistcoats or cholera belts should be made compulsory. 20. Soldiers should be sent direct from the home depôts to India. In order to diminish the dangers of the earlier years of service, attention should be paid to the season of their arrival; and they might then be sent at once to any healthy station on the plains. 21. Troops are transported to Tonghoo from the coast in native boats, up the Sittang river. During their transport their health is excellent. 22. Ten years is the period a British soldier should serve in India. 23. The manner of conducting the business of the medical boards, as regards invaliding, appears to answer, with the exception of the anomaly, that an appeal from such medical boards may be made to boards composed solely of field officers, which is likely to produce a conflict of opinion. 24. Invalids should leave India for home in February, at the conclusion of the cold season.
Diseases.	1. There are health inspections weekly at the station for the discovery of incipient diseases. 2. Scorbutic disease is unknown at the station. 3. Hepatic disease is infrequent; it rarely occurs in an acute form. 4. Dracunculus is not known as a disease at this station. 5. Venereal disease is of very rare occurrence. The establishment of lock hospitals would be advantageous to the health of the army. 6. No epidemics occur at the station. The prevailing diseases are fever (both intermittent and remittent) and dysentery. Cholera among Europeans is unknown, but sporadic cases occur among the native population. Small-pox occasionally rages as an epidemic among the native population. Rheumatism—occasional severe cases. The mortality for the last two years at the head-quarters of Her Majesty's 69th Regiment has been about one per cent. as regards strength. 7, 8. The more frequent zymotic diseases are remittent fever, ague, rheumatism, dysentery, diarrhœa, secondary syphilis, itch, tape and round worm. Fever and diarrhœa prevail about May, June, July, and August; dysentery, in its more severe form, about November and December. The increase in the number treated under fever and diarrhœa may be ascribed to the close damp weather then prevailing; dysentery, in its aggravated form, to the sudden decrease and change of temperature towards the end of the year. There are no localities particularly obnoxious to this class of diseases, nor can any predisposing causes to them be ascribed to any personal habits or condition of the troops. 9, 10. Small doses of quinine have not been tried as a prophylactic against malarial diseases at this station.
V. INTEMPERANCE.	1. The troops at this station are unusually temperate. There are no confirmed drunkards. 2. The proportion of admissions from diseases occasioned by intemperance is so trifling as to be inappreciable. There are no total abstinence men among the European troops. The sickness, mortality, and crime occasioned by intemperance are so trifling that no statistical table of any value can be drawn out. Drunkenness is always punished as a crime. 3. Distilled spirits are sold both at the canteen and the bazaar, but in the latter under severe police restrictions. Each man can get, on payment, out of the canteen one dram of arrack and a quart of malt liquor, or in lieu thereof two drams of arrack; both are of good quality. Spirit is not given as part of the ration; they have to pay for it at the station, on march, and in the field. The canteen is not open until after parade; soldiers cannot, therefore, obtain a dram before morning parade. It is not beneficial for them. Spirit is never given as a ration to convalescents. No deleterious drinks other than intoxicating drinks are sold at the canteen or bazaar. 4. The quantity of spirits drawn by each man is considered conducive to health and discipline. 5. Spirit is not issued as a ration. Further restriction with regard to it than that already exercised is considered unnecessary. 6. If the canteen should be restricted to the sale of either spirits, wine, or beer solely, beer would be preferable, but the use of spirits is recommended. 7. Tea and coffee are much used at the station, bnt lemonade and soda water are not procurable by the men. With regard to their influence on health, efficiency, &c., total abstinence is not considered beneficial to health. 8, 9, 10. The suppression of the sale of spirits in the canteen is not recommended.

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	11. The canteen regulations are too voluminous to be transcribed here; they are compiled from general orders issued from time to time. The following are the chief canteen regulations :— Hours during which the canteen is open for sale of liquors :— Open at 12 noon for the issue of malt for the guard and mess tables. Open from 1 to 3 o'clock p.m. for malt and spirits. Open from 5½ p.m. to gun-fire for ditto. One serjeant and 1 corporal on duty in the canteen during the above hours. Daily allowance per man :— Malt, 1 imperial quart. } Or 2 drams of arrack. Arrack, 1 dram. }
VI. Diet.	1. The ration for Queen's troops and European troops in the Indian army is the same, and is as follows :—

	lb.	oz.
Bread	1	0
Meat	1	0
Rice	0	4
Sugar	0	2½
Tea	0	0⅝
Salt	0	1
Vegetables	1	0

3 lbs. of firewood is also allowed to each man. 1⅜ ozs. of coffee is sometimes used instead of ⅝ oz. tea to each man.

It is not considered necessary to make any periodical changes in this or any other portion of the rations. The officers of the day and quartermaster inspect the rations.

2. A complete ration, including vegetables, is provided for troops, the stoppage being 3 annas 4 pice per diem. The soldier has breakfast at 8 a.m., dinner at 1 p.m., and supper at 4½ p.m. One pound of vegetables to each man is part of the ration.
3. The rations for the Europeans are ample and good, those for the natives might be improved by the addition of animal or other solid food. No instance of the sale of rations is known. Certain men are detailed to look after the cooks.
4. Cooking is performed in large pots by native cooks. The cook-houses are temporary and very bad; they are kept as clean as such wretched buildings can be. The water supply is sufficient. The food is properly cooked and varied. It is sometimes boiled, and at other times roasted or curried. The men have coffee before a march.
5. Gardens for the cultivation of vegetables by the soldiers could be advantageously established, but the wells would have to be dug.

VII. Dress, Accoutrements, and Duties.	1. The dress and accoutrements of the soldiers at the station are according to regulations. They are suitable to the climate; but an addition of serge trousers in the monsoon would be an improvement. Nothing can be better than the present dress of the 69th. It is khakee during the day, and a serge tunic by night for guards. The guards are protected from the sun and damp by having good guard-rooms surrounded with verandahs, under which the sentry is posted.
Duties.	1. Men should be thoroughly drilled at home before being sent out to India. 2. The usual routine of a soldier's duties is as follows :— The rouse sounds at 5 a.m. *Occupation* :—Cleaning, washing, and getting ready for morning parade at 6¼ a.m. Guard mounting, inspection of arms, &c. until 7 a.m. Breakfast 8 a.m., and afterwards cleaning arms, &c. until 11 a.m. Dinner at 1 p.m., and afterwards mending clothes, &c., and reading in temperance library. School from 9 to 11 a.m., and from 2½ to 3½ p.m. Supper meal at 4 p.m. The best hours for drills in the warm weather are from 5 a.m. to 7 a.m.; in the cold weather, mornings and evenings. The average number of nights the men have in bed is five. 3. Guards are mounted close to their own barracks, and last as a rule for 24 hours. A few are reinforced and mount at retreat beating, and are relieved at reveille. There are roll-calls by day, and occasionally check roll-calls by night. The health of the troops is not affected, apparently, by night guards.
VIII. Instruction and Recreation.	1. The following are the means of recreation and instruction. There are no ball courts or skittle grounds. There is a school conducted by a serjeant of the regiment. A barrack room is used at present as a library and reading room. There are no soldiers' clubs. The men amongst themselves grow a few small vegetables—the artillery have none. There are no workshops, but there is a theatre erected by the men themselves. A small gymnasium has lately been commenced by the executive engineer, but it is not yet sanctioned. A larger one is recommended. Were all the above erected there would be ample amusement for the men, but as yet they have little or none afforded them of any kind. The men are restricted from exposure to the sun and rain out of barracks when off duty and with benefit to health. 2. It is strongly recommended that the men be supplied with the means of playing cricket, with quoits, boxing gloves, and spare ammunition for rifle matches among themselves. 3. A soldiers' savings' bank already exists. 4. There is sufficient space for the men to amuse themselves under their barracks during the day.
IX. Military Prisons.	1. There are no military prisons built yet.
X. Field Service.	1. There are no local regulations for field medical service not included in the general presidency regulations. 2. With regard to the practical working of the powers of the medical officers in reference to the conduct of the line of march, &c. there never has been any marching of troops to or from Tonghoo. Troops are brought here and leave again in boats. 3. No camps exist in the station, and there are no regulations. 4. The arrangements adopted in the presidency for field hospitals are as follows :— Hospitals are furnished in garrison and in the field with supplies and medical comforts by the commissariat department. Each entire European regiment in garrison and in the

TONGHOO. MADRAS.

References to Subjects and Queries.	REPLIES.
X. Field Service—*cont.*	field is allowed a native purveyor and an assistant purveyor, who are attached to the hospital, under the orders of the medical officer, and under the supervision of the commanding officer of the force. The hospitals of European regiments on the line of march and in the field are furnished with sick carts drawn by bullocks, and bearers with doolies and muncheels. A field medicine chest is carried by dooly bearers. The hospitals of native regiments on the line of march and on the field are furnished with sick carts, drawn by bullocks, or in lieu of them by bullocks or tattoos, and doolies and muncheels carried by dooly bearers. Also a field medicine chest carried by dooly bearers. Large supplies of medicines or reserve supplies on the line of march and in the field, either for European or native troops, are carried in bullock bandies. Rules regarding the carriage for European and native hospitals on the line of march and in the field are laid down in the general orders of the Madras presidency in the printed code of regulations, of the quartermaster general's department of the Madras army, and the printed code of medical regulations of the Madras army. All military and medical officers serving in the Madras Presidency are guided by these rules.
XI. STATISTICS OF SICKNESS AND MORTALITY.	1. No information under this head.
XII. HOSPITALS.	1. No regular hospital is yet built for the European infantry, two barracks are used for that purpose. The artillery and native infantry have hospitals similar to their own barracks. 2, 3. Hospitals form the extremity of the barracks, being part of them. The site is well ventilated and healthy. The water supply is abundant and wholesome. 4. There is no refuse water or other impurities near the hospital. The drainage is the same as for the rest of the barracks. 5. The height of the lowest ward above the ground is 7 feet. There is a free perflation of air underneath the floors. There is a drain all round the building which carries off the roof water. The drainage, construction, materials, windows, ventilation, supply of verandahs, &c. is the same as the barracks. The roof and walls are sufficiently thick to keep the hospital cool. The verandahs are never used for the accommodation of sick or others. The building consists of one flat. Table of accommodation:— Date of construction, 1857–58. Total number of wards, 5.* Total regulation number of beds, 83.

Wards or Hospital Hut, No.	Regulation Number of Sick in each Ward or Hut.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
Two blocks of the Barrack Buildings -	42	143	46	17½	115,115	2,302	131	Ft. In. 2 6	24	4	4

* Five wards are returned; three of these are rooms about 15 by 12 feet, built off from the larger rooms.

The part of the barracks used as hospitals, in common with the remainder of those buildings, are not placed so as to receive the full benefit of the prevailing winds, as the barracks are not built as they ought to be, *en echelon*.

6. The ventilation of the wards is sufficient; there are no jalousies or jhilmils.
7. There are no means of cooling the air admitted to the wards. Punkahs will be shortly erected.
8. No means of warming the wards are required. The walls and ceilings are constantly kept clean, they are of wood, and are not whitewashed.
9. The hospital privies are temporary buildings; the refuse is removed twice a day; the accommodation is not good, they are situated close to the hospital, but are not offensive.
10. Temporary wash-houses are built close to the hospital, and are sufficient for the sick.
11. Tubs filled with water are used for bathing the sick, and the means are sufficient for that purpose.
12. Dhobies wash and dry the hospital linen, and are sufficient for the requirements of the hospital.
13. The storage is sufficient and dry.
14. Cots made of wood with rattan or tape bottoms are in use in the hospital, and are considered good.
15. A good cook-house has recently been completed; the walls are of mat, plastered; the roof shingled, with ventilation ridge. There is a good brick range sufficient for all purposes. The ventilation is ample; its position is close to the hospital. The cooking of diets is properly done, and sufficiently varied.
16. Diet rolls, &c., according to regulations.
17. The provision for attendance on the sick is that laid down in the Madras medical code, and is sufficient.
18, 19. The sanitary condition of the hospital is good. There have been no cases of hospital gangrene, pyæmia, or anything of an epidemic character. Nothing to suggest in the way of improvement.
20. The convalescents are plentifully supplied with seats, and have ample space for exercise under the hospital buildings.
21. No arrangement has yet been made for the treatment of soldiers' sick wives and children.
22. There are no special local hospital regulations not included in the general presidency medical regulations.
23. The medical officers have every necessary power in matters appertaining to the sanitary state of the hospital, &c.
24. Soldiers when discharged from hospital are generally allowed to be convalescents in barracks for some days, this is considered preferable to having any distinct convalescent hospital.

References to Subjects and Queries.	Replies.
XIII. Burial of the Dead.	1, 2. The old burial ground has been given up, and a new one chosen well away to leeward of the rest of the inhabited portion of the cantonment; its area is 300 by 200 feet. The subsoil is compact red sand; the drainage is natural. The ground is not yet completed. 3, 4. So few deaths have occurred, and so much space is available, that a large interval is left between the graves; the depth of graves is generally 6 feet. They are never re-opened, and there is never more than one body buried in the same grave. Interment is compulsory 24 hours after death, sometimes less. The Burmese burn their dead; the natives either burn them or bury them a long way off in the jungle. No one has been buried in the new graveyard; British troops are buried according to regulation. 5, 6, 7. The dead of camp followers and bazaar people are generally burnt or buried a long way off in the jungle. No injury to public health accrues from the present practice. No improvements are suggested.

(Signed) J. F. G. Campbell, Brigadier, Commanding Tonghoo.
Huntly Geo. Gordon, M.D., Surgeon 69th Regiment, H.M. Bn., Senior Surgeon.

17th March 1860.

I. Topography.	1. The surrounding country, except in a south-westerly direction, in which the town lies, is all jungle. North, east, and south, hilly; mountains to the east, distant from 15 to 20 miles; north-west, west, and south-west, flat, low, and from June to November, either lake or swamp. Wood, jungle, and water in great quantities. 2. The elevation of the station above the sea is about 125 feet. To the east and south-east, the country is of nearly the same level as the cantonment. In all the other directions, as the country is flooded during the monsoon, and the tide extends many miles above this, the station may be about 80 feet above the general level. In the dry season, the nearest waters are those of the Sittary and Shway Gheen rivers, about equi-distant (three-quarters of a mile) from the station. During the monsoon, the inundations extend to the foot of the high grounds on which the station is built, and about 500 yards from the European barracks. There is no higher or healthier ground adjoining the station. 3. There are mountains about 15 or 20 miles distant, but no table land. The height of these mountains is about 5,000 feet. 4. The nearest waters are the Sittary and Shway Gheen rivers, about three-quarters of a mile from the station. During the monsoon, there are two streams which form the boundary of the cantonment. They flow from June till January. From the end of June till the end of October, the town and country to the westward is flooded. There is no broken ground, nor any ravines or water-pits near the station. 5. The station is perfectly open and quite free from all obstacles to external and internal ventilation. The construction of the houses does not admit of their becoming heated, being made of wood, and by no means crowded. The station being higher than most of the surrounding country, must be exposed to all winds. The sea breeze is occasionally felt. The health of the troops does not seem to be affected by the winds. 6. The surrounding country is uncultivated. There are no works of irrigation near the station. The cultivation of rice is not prohibited within certain limits. Indigo is not cultivated, nor is the preparation of hemp or flax carried on near the station. 7. The town of Shway Gheen lies about a mile from the cantonment. 8. The cantonment stands upon a gravel and laterite formation, the subsoil of the district varies greatly, but is generally covered with dense jungle. The station occupies new ground from which the jungle was cleared. 9. No wells have been sunk. 10. The rain-fall runs off easily, and does not lie on the surface anywhere in the cantonment No drainage from any higher level passes into the subsoil of the station.

SHWAY GHEEN, MARTABAN, PROVINCE BURMAH.

MADRAS.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	11. The water supply of the station is derived from the Shway Gheen river. It is not stored in open tanks, there being none within the vicinity of the station.
	12. The river supplying the station flows perennially, and the water is clear, tasteless, and odourless, the quality is decidedly good, and not injurious to health. Water carts are used for the Europeans. No better arrangements could be made for the water supply.
	13. There is an extent of jungle to the north-west and west, which commences immediately beyond military limits, and extends to the left bank of the Sittary river. This was formerly cut down, but never rooted up. It has now grown up more dense than ever; and as during the monsoon it is a deep swamp, with 10 and 12 feet of water over it, I consider it by no means improbable that this jungle swamp does influence the health of the troops occupying this station.
	14. The conveniences of wood and water being found, the rest of the selection as to topography, climate, diseases, sanitary condition, &c., for new stations, is left to chance. With reference to this country, the Burmans say that Burman mud is wholesome, and Burman hills unhealthy for a location, and there certainly appears some truth in these conclusions. At the same time, provided high ground was procurable in the vicinity, like this on which Shway Gheen stands, I would never suggest that the cantonment should be formed on the bank of a river which is annually flooded.
II. CLIMATE.	1. There are no instruments available at the station for conducting and registering meteorological observations.
	3. The climate is dry only during the months of February (the latter part), March, April, and the early part of May. It is very damp during the rest of the year, and being never very hot nor very cold the variability is not great. Fogs are rare. It is merely from the roads that any dust is raised, but during the dry months above mentioned the air is loaded with smoke and particles of burnt matter, from the jungles being on fire on all sides. But this does not seem to affect the troops in any way. The climate is unhealthy. Diet should be generous. Shelter from the sun, wind, and rain are precautions that should always be attended to. Clothing must be varied according to season. Drill and exercise should invariably take place in the morning, and decidedly at this station they are very objectionable in the evenings. The hot months are the most healthy both for Europeans and natives. The rains and cold months are the most unhealthy. Fevers and diseases of the bowels are the prevailing diseases.
	4. The station of Sittang, distant about 40 miles, appears to be more healthy than this. It is not quite so high above sea level. The drainage is not superior to this. The water is procured from wells. Its being more healthy is unaccountable, as the jungle is more dense than that around here, and approaches very much closer to the station. The high ground is much too limited for adoption, except for a very small force.
	5. The following is a list of stations on which I have served, and their comparative salubrity:— Palaveram, Merkara, Cannanore, Madras, Secunderabad, Samulcottah, Waltair, Vizianagrum, Shway Gheen, Tonghoo, and Rangoon. *Palaveram* is a very healthy station and remarkable for the absence of cholera, which rages around but never enters the cantonment. *Merkara* in Coorg, situated at an elevation of 4,763 feet above sea level, was an extremely healthy station, both for Europeans and natives. *Cannanore*, on the western coast of the peninsula, is a damp but on the whole not an unhealthy station. If during the monsoon, which lasts from June to 15th September, there happen to be several consecutive days without rain, cholera was sure to make its appearance. At *Madras* my corps occupied the Perambore lines, which in those days (1843) were low, swampy, and unhealthy. Cholera was a never-absent disease, and was particularly prevalent during the cold months. My corps has since occupied the Vepery lines at Madras, and these are positively injurious to health; they were condemned 13 years since, yet still the low marshy and unhealthy ground continues to be occupied by a regiment of native infantry. *Secunderabad* was very unhealthy during the time my corps was stationed there, but the locality had a great deal to do with this, though in an unaccountable manner. At *Samulcottah* there were 42 cases of admission on the sick report of European officers, and nearly 3,000 of natives, of a regiment numbering about 12 of the former and 700 of the latter. The mortality also amongst the latter was very great; but this amount of sickness was principally owing to the employment of the corps in the unhealthy jungles of Golcondah. *Waltair* is a healthy station, except during the months of October, November, and December, when fevers are prevalent. The situation of the lines entirely excludes the occupants from the benefits of the sea breeze. *Vizianagrum* is both a healthy and a favourite station, although exceedingly hot. *Shway Gheen.* During my first occupation of this station, in March 1854, the whole of the troops were located inside the stockade, and the jungle was still standing on the ground where the cantonment now stands. The Europeans consisted of two companies of H.M.'s 29th, a detachment of Madras artillery, and a wing of the 36th Regiment Madras native infantry formed the garrison. The Europeans were on the whole healthy, but they occasionally suffered from a fever, which Assistant-Surgeon Macqueen, in medical charge of the station, said was of a type common in some of the districts of France. He termed it a gastric fever. It was very fatal. *Tonghoo*, I found a far more healthy station then either Shway Gheen or Rangoon. *Rangoon.* At this latter place I lost a large proportion of men, considering how short a time my corps was stationed there. In my opinion the natives of India certainly become acclimatized to Burmah, and suffer less and less each succeeding year.
III. SANITARY CONDITION OF STATION.	1. The executive engineer of this district being ill and confined to his bed, most of the questions under this head must remain unanswered.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	4. Table of Barrack Accommodation. Date of construction, 1855 and 1856; and within stockade, 1853. Total number of rooms or huts. { 4 barracks for European infantry. 1 barrack for artillery Total regulation number of N.C. officers and men. { 200 European infantry. 26 European artillery.

Barrack Rooms or Huts.	Regulation Number of Men in each Room or Hut.	Dimensions of Rooms or Huts.				Cubic Feet per Man.	Superficial Area in Feet per Man of Floor Space.	Height of Men's Beds above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents in Feet.				Number.	Height.	Width.
5	50	120	20	14							
1	26	90	20	14							
Guard Room - -	10 natives.	20	20	14							
Prison Cells - -	1	15	15	10							

5. The barrack windows are on opposite sides and open inwards. There are verandahs on one side of the European infantry barracks, and a verandah all round the artillery barracks. The verandah is never occupied for sleeping purposes by soldiers or other persons. There are no jalousies or jhilmils.

6. Trestle bedsteads are used, and the bedding consists of cotton razai and blankets.

7. The troops are not encamped in this country.

8. The ventilation is effected by means of doors and windows, and a ventilating board, one foot broad running along one side of the barracks at the height of the floor; *i.e.*, with its lower edge at the same level as the floor. The air is kept sufficiently pure by these means night and day. No means are used for cooling the air of barrack rooms.

9, 10, 11. The four European infantry barracks are constructed of wood. The walls and floor are planked, and the roof tiled. The one for the European artillery is similar, except the roof, which is thatched. The planked floors are raised about 3½ feet from the ground. The materials cannot be improved upon, but the construction certainly can.

The barracks are kept in repair by the executive engineer. The repairs, unless requiring reference, are quickly executed, The commanding officer is responsible for the sanitary state of the cantonment so far that he calls on the executive engineer for the execution of works required. There are no stated times for the cleansing and whitewashing of the barracks, but it is done when required.

12. There are no baths, washing tubs are used, for which the water is brought in carts. The drainage is open and good.

13. The cook-houses are in a state of dangerous decay; there are 6 coppers and four native cooks to each company. The water is brought in carts, and the drainage is open.

There are no conveniences for washing and drying linen.

14. Cesspools are being sunk for the purpose of removing the contents of the privies and urinals.

15. The barracks are lighted by means of lamps slung from beams.

16. An open drain runs all round the barracks, leading into the road ditch, and this carries off the water into the low ground. There are no sewers or covered drains, but the drainage is quite sufficient. There is no dampness in any part of the barrack or hospital. There are no foul ditches.

17. The surface cleansing is effected by annually burning the grass, &c.

18. The surface of the cantonment is annually freed from vegetation.

There are neither walls nor hedges at this station.

19. There is no military bazaar at this station, nor are there any native houses anywhere near. No nuisance is consequently experienced in barracks from wind blowing over them.

20. The slaughter-house used to be in a position which, although outside the cantonment, was to the windward of it as regards the prevailing wind. It has been removed, and, though within the limits of the station, it is so far (about a mile) from the European barracks, and so situated, namely, in a hollow, that no nuisance whatever is experienced from it.

21, 22. There are no bazaar horses.

23. There is no proper accommodation for married men at this station. Two temporary buildings have been run up, but they are utterly unfit for the purpose required.

Officers' Quarters.

1. At this station officers have built their own houses. They appear to be healthy; the drainage is good, and the ventilation more than sufficient, as must be always the case in wooden buildings with mat walls. No improvements are suggested in them.

IV. Health of the Troops.

1. The station is not considered a healthy one. The district is very thinly populated, except along the banks of the rivers. The native population suffers from fevers in the town of Shway Gheen, but are generally strong and healthy.

2. The prevalent diseases are fevers, small-pox, and cholera, but the latter does not prevail to any great extent, not as in India.

SHWAY GHEEN MARTABAN, PROVINCE BURMAH.

MADRAS.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	3. The healthiness of the native population is to be attributed to their living on the banks of rivers, where there is no malaria. Their unhealthiness, as far as fever is concerned, to their proceeding into the hilly districts for the purposes of traffic. 4. The following are the stations, with their influence on health, at which the troops were before coming to this station:—The detachment H.M.'s 69th Regiment has just arrived from Thounghoo; and that of the Madras artillery from Secunderabad. The Pegu police battalion was raised at Palaveram during the early part of 1858; they embarked on the 6th September of the same year, and arrived here on the 24th of the same month. Very healthy, both at Palaveram and on arrival here, but since then the battalion has suffered much from fever, diarrhœa, and dysentery. No part of the present accommodation for troops is more unhealthy than the rest. 5. The troops are not camped out. 6. With reference to experience of the healthiness of hill stations; I was adjutant of my regiment at Merkara, which being 4,762 feet above sea level, may be termed a hill station. The health of both Europeans and natives was better, and the mortality much less than at any station at which I have been located. 7. No opportunity of judging whether troops long resident on hill stations are more liable to attacks of febrile and other diseases on returning to the plains, but should say decidedly not. 8. Such localities as the Western Ghauts and Neilgherries are decidedly favourable as stations for troops, particularly European troops. 9, 10. Diarrhœa is a very common complaint on first going to the Neilgherries. The best precaution is a flannel belt. 11. The Neilgherries and Western Ghauts are adapted for residence during the whole year. The full benefit of such a residence could not be felt under two years. 12. No experience of the period of residence beyond which injury is likely to be inflicted on the troops on returning to service in the plains. 13. The precautions required in leaving hill stations are to guard against exposure to the sun as much as possible, and to reduce the amount of clothing according to the increase of temperature. 14. Residence at the hill stations to which my experience goes, is much the same as what would be felt, as far as climate is concerned, in the warmer counties of England, and therefore there can be no question that location on the hills would much longer preserve the vigour of the European. But how far a long residence on the hills would render a soldier more apt to contract the diseases of the plains I cannot say. "Short periods," if by that is intended less than two years, would not be beneficial or conducive to the health of troops in general. Doubtless change of station, as well as change of scene, is beneficial to convalescents. 15. No experience of barracks or hospital accommodation at hill stations. 16. The most suitable height for hill stations, even within the tropics, must in a great measure depend upon the degree of latitude. In the Madras presidency I consider about 5,000 or 6,000 feet above sea level the most suitable. 17. Ranges of hills of great height, said to be upwards of 8,000 feet in height, are to the N.E. of this station, but I do not know this of my own knowledge. They must be about 100 miles from this. My informant, the former Deputy Commissioner of Tonghoo, found ice there late in February; these hills should be examined to see if they are fit and could be advantageously occupied as a hill station. 18. With reference to the class of surface and soil for stations, Burmah is decidedly an exception to the general rule—muddy soil, like that of Tonghoo, being healthy, and a gravelly and laterite soil, like Shway Gheen, being unhealthy. 19. In considering the best age at which to send soldiers to India, much depends upon the natural conformation of the man. As a general rule about 19 or 20; they should arrive in October. No knowledge of the disposal of troops on first landing. To preserve the health of recruits on first landing they should be kept out of the arrack shop; as much as possible out of the sun; should have dry feet; and a flannel belt or cummerbund round the stomach. 20. Cannot say whether troops should be sent from home depôts to India, or to an intermediate station for a certain time. Sending them in the first place to a hill station would doubtless be a beneficial measure. 21. Know nothing of the transport of troops to the interior. 22. The British soldier seems to wear out very fast in India, and is considered an old man after 15 years' service. I think a British soldier might serve very well for 20 years, and I would suggest this period being divided thus:—His first 4 years at a hill station, the next 10 years on the plains, and the remaining 6 years on the hills. 23. In matters relating to invaliding, the captain of a man's company, who has seen him for years and knows all about him, is in my opinion a far better judge than a committee which sees him only for five minutes. But how to avoid conflicting opinions seems to me utterly impossible. 24. Invalids proceeding home by sailing vessels should leave in January or February.
Diseases.	1. Inspections for the discovery of diseases take place on Saturdays. 2. There have been no cases of scorbutus or scorbutic disease. 3. About one-fourth have been afflicted with hepatic disease. The causes are variable; generally the consequence of fevers. Not aware of any prophylactic measures which would diminish its frequency. 4. Dracunculus is unknown here. 5. Amongst the European soldiery venereal disease is unknown; amongst natives the proportion is about one-half per cent. There can be no question of the advantage of re-establishing lock hospitals. 6. The epidemic and endemic diseases are,— *Fevers.*—Remittent, intermittent, and continued. *Cholera.*—None. *Small-pox.*—None. *Rheumatism.*—Infrequent.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	Table showing the admissions and deaths from these causes in 1859.

Date of Admissions.	Number.	Diseases.	Number of Deaths.
Total number during the year 1859	188	Fever	22
		Dysentery	2
		Cholera	0
		Small-pox	0
		Rheumatism	0

The total number of deaths during the year, 26. This includes the detachment of H.M. 69th Foot, and European artillery only.

7. The usual characters of intermittent fevers are seen here. Diseases are most prevalent during the wet and cold seasons. The atmospheric condition consequent on the changes of the different seasons precede and accompany their appearance. There are no bazaars. Not aware of any predisposing causes to these diseases.
8. Exposure during night duties is the cause of epidemic diseases among the soldiers.
9. Quinine has been tried as a prophylactic against malarial diseases, but the result was unfavourable.
10. More room should be provided in barracks for European soldiery, also some provision for them to take exercise during the day without exposure to the sun. The jungle surrounding the cantonment should be regularly cleared.

V. Intemperance.

1. The soldiers are temperate. There are no confirmed drunkards.
2. During the past year the admissions into hospital from diseases directly caused by intemperance were 5.

   The detachment H.M.'s 69th has just been relieved, therefore any statistical table would extend to about 15 days' experience. Drunkenness *per se* is punished as an offence.
3. Spirits (arrack) are sold at the canteen. The quality is good; it is supplied by the commissariat department. The probable amount consumed by each man is one dram.

   (1.) In barracks, spirit is no part of the soldier's ration. (2.) On march it is served out as such. (3.) No experience as to its being supplied as a ration in the field. No experience as to its quality and amount. Spirit is never given as a ration to convalescents. No other drinks are sold in the canteen.
4. In regard to health, difference of opinion exists as to the consumption of spirits by soldiers. I am of opinion that spirits are injurious to health. If taken in moderation there is no reason why spirits should not be conducive to discipline.
5. It would be injurious to abolish the use of spirits altogether, but beneficial to restrict it as at present, to a moderate quantum.
6. In my opinion, malt liquor and wines are far more conducive to health than spirits.
7. Coffee, tea, and ginger-beer are much used at the station. Their influence on health and discipline is far better every way than spirits, but I consider if European soldiery are required to undergo hard work, and long and fatiguing marches, malt liquor is requisite to keep up their stamina.
8. No spirit rations are issued to troops on the station.
9. It would be objectionable to prohibit the sale of spirituous liquors entirely at the canteen, because the men would procure a much more deleterious spirit in the bazaar.
10. I consider the present arrangements on these points very good.
11. The following is a copy of the Canteen regulations of H.M.'s 69th Regiment:—

   "(1.) The commissariat will supply liquor to soldiers at the rate of 1 dram of arrack and 1 quart of porter per diem, to each man; or at the option of the man, 1 pint of beer will be issued in lieu of the dram.

   "(2.) The charge for 1 quart of porter will be 3 annas, and for 1 dram of arrack an anna.

   "(3.) The canteen will be open from $1\frac{1}{4}$ till $2\frac{1}{4}$, and from 6 till 8 o'clock p.m., after which hours no liquor will be issued.

   "(4.) The canteen will be under the charge of a serjeant, who will be responsible for the regularity of the canteen, and account for the liquors under his charge. He will be allowed an European assistant.

   "(5.) A non-commissioned officer will be detailed daily, who will receive from the orderly serjeants of companies, at 12 noon daily, a list showing men in hospital, confined to barracks, and on duty, and the latter only shall be allowed 1 quart of beer."

VI. Diet

1. The following is the ration of—

	Queen's troops.	European troops of the Indian Army.
Beef	1 lb.	Not known.
Bread	1 lb.	,,
Vegetables	1 lb.	,,
Rice	4 oz.	,,
Sugar	$2\frac{5}{7}$ oz.	,,
Tea	$\frac{5}{7}$ oz.	,,

And once a week, Coffee, $\frac{3}{4}$ oz. is substituted for tea.

An inspection of the rations is made daily by the orderly officer.

2. A complete ration is provided, the price of which is 3 annas 4 pice. No stoppage is made for this, except that the daily pay of a soldier is about $3\frac{1}{2}d.$ less than his gross pay in England. 1 lb. of vegetables is allowed for each man. There are 3 meals daily; breakfast at 8 a.m., dinner at 1 p.m., supper at 5 p.m.
3. Mutton twice a week would be a pleasant change for the men in lieu of the perpetual beef. The orderly corporal and the orderly man at the cookhouse are responsible that the whole of the rations issued to their company are forthcoming at meal times.
4. There are 4 native cooks to each company, and 6 coppers.

   The cookhouses are dangerously bad. The food is invariably boiled. The cookhouses, for they cannot be called kitchens, are kept clean, but are in a falling state and positively dangerous. On the march, tea, coffee, or other refreshment is provided.

SHWAY GHEEN, MARTABAN, PROVINCE BURMAH.

MADRAS.

References to Subjects and Queries.	Replies.
VI. Diet—*cont.*	5. A portion of ground has been set aside for cultivation since the first marking out of this cantonment in 1854, and has always gone by the name of "The Soldiers' garden," but none of the soldiers have ever turned a spade of earth in it; the reason, no doubt, being that this is merely a detachment, and that they do not remain here long enough to benefit by their labour.
VII. Dress, Accoutrements, and Duties.	1. The dress for European soldiery is,—1 cloth tunic, 1 pair cloth trousers, 1 woollen cap with cloth cover, 1 serge smock frock, 4 pairs of white trousers, 2 khakee jackets, 2 pairs ditto trousers, 3 pairs of worsted socks, 2 pairs of white cotton ditto, 5 white shirts, and 2 coloured ditto, 3 flannel ditto, 2 flannel belts, 1 waist-belt, 1 pouch belt, 1 40-round pouch, 1 20-round pouch, 1 knapsack and straps, 1 canteen and cover. The head dress, which fits too close, is the only objectionable part of a soldier's present dress, and this is to be altered into a wicker helmet, which will, no doubt, be a very great improvement. I think now, the soldier's dress is as nearly perfect as it can be. The present guard dress is khakee during the day, and the serge smock frock at night.
Duties.	1. It is decidedly advisable that the men should be thoroughly drilled at home before being sent to India. 2. The usual routine of soldiers' duties is,—guard once about every five days. One hour's drill in the morning from 6 to 7 a.m. Cleaning of arms and accoutrements in the middle of the day. The men do not appear to suffer in health from drill in the morning, and they certainly seemed to do so when there were evening drills. The best hours for drills or parades are from daylight to 7 a.m. For marches, at such an hour as to complete the march not later than two hours after sunrise during the hot, and three hours during the cold weather. There are general orders on this subject. The men at this station have from five to six nights in bed during the week. 3. The most distant guard is about 500 yards from the barracks. There are three roll calls by day, occasionally check roll calls by night at uncertain hours. I consider the night guards at this station very injurious to health, and all precautions have been taken already by having as few as possible.
VIII. Instruction and Recreation.	1. The means of recreation are as follows:—There are no ball courts, and the skittle-ground, made by the soldiers themselves, is very inferior. There are no schools or schoolmasters; no library or reading room, no day room or clubs, nor are there gardens, workshops, or gymnasia. There always had been a theatre until the arrival of the present detachment of H.M.'s 69th, but it is now pulled down. The means are not sufficient to occupy the soldier during the wet season or the heat of the day. The men of the 69th Foot are not allowed to go out in the sun after 9 a.m., nor before 4 p.m. The artillery, on the contrary, are allowed to go out at any time during the day; the result will be much better seen by reference to the returns of the Madras Fusileers and 2nd European light infantry, who enjoyed the same privilege, and apparently without any ill effects to health. 2. The means suggested for recreation and employment are a good library, two good skittle-grounds, a ball court, gymnasium, and a theatre. 3. Soldiers' savings' banks have already been established for years. 4. There are no trees in this cantonment. No sheds; and the verandahs are not sufficient for the men to take exercise in.
IX. Military Prisons.	1. There is no military prison. The cells are portions of the orderly room boarded off. They are not unhealthy.
X. Field Service.	2, 3. Cannot say what is the practical working of the powers of medical officers in field service. No knowledge of the practical operation of camp regulations for the preservation of the health of the troops. 4. I do not know the arrangements adopted for field hospitals, &c., nor am I able to transmit copies of regulations.
XII. Hospitals.	1. The executive engineer being ill, no ground plan or sketch of the hospital could be procured. 2. It is distant about 150 yards from the nearest European barracks. The bazaar and civil population is far removed. The site is open and freely ventilated, and there are neither buildings, walls, nor trees to interfere with such ventilation. The site is generally healthy as to elevation, drainage, absence of malaria, &c. 3. The water supply is abundant and wholesome. 4. For mere drainage of water open drains are used, but other impurities are removed by the hospital attendants and thrown into the cesspools. 5. There is only one range of wards about four feet from the ground. Beneath the flooring it is perfectly open, and consequently there is a free passage of air. There is an open drain all round the building, from which the water readily runs off to the lower grounds. It is quite sufficient for carrying away the rain-fall. The hospital is built of wood, with tiled roof and wooden ceiling, plank walls (single) and floor. The roof and walls are sufficiently thick to keep the hospital cool. There is a verandah on one side only; on the other side the roof extends in the form of a narrow verandah, and I consider that on this side (the west) some further shelter from the sun's rays should be afforded. The verandah is not used for the accommodation of sick or others. The following table gives the accommodation:—Date of construction, 1856. Total number of wards, 2; *i.e.* the same room divided by a grating. Total regulation number of beds, 32.

Wards.	Regulation Number of Sick in each Ward.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area of Feet per Bed.	Height of Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
								Ft. In.		Ft. In.	Ft. In.
1	22	100	20	19	—	—	—	2 6	17	3 3	3 3
1	8	20	20	19	—	—	—	2 6			

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	The hospital is so placed as to receive the benefit of prevailing winds. The windows open inwards, and a ventilating board one foot in width, opening with hinges at the level of the floor, keep the wards free from odour and closeness. There are no jalousies or jhilmils. 7, 8. There are no means of cooling the air admitted into the wards, nor means of warming the hospital. The walls and ceilings are whitewashed and cleansed upon requisition, but at no stated intervals. 9. The privies are at about 30 yards distance from the hospital; they are placed over cesspools, and are not at all offensive. 10. The lavatory arrangements consist of a bath-room, which is insufficient. 11. A bath-room about 10 feet square is the only means of bathing the sick; this is not sufficient, and a regular bath is required. 12. There are no means of washing and drying the linen attached to the hospital; it is issued as required by the commissariat department. 13. The storage is insufficient, but dry. 14. Cane-bottomed cots, straw bedding, stuffed mattrasses, and rezais and blankets are used in the hospital. No improvement is required. 15. The kitchen is situated about 30 yards from the sick wards. The means of cooking are insufficient, and diet not sufficiently varied. Apparatus for cooking consists of two coppers, one frying-pan, and a few chatties. 16. Diet tables, &c. of detachment Her Majesty's 69th, according to regulations. 17. A lance corporal of Her Majesty's 69th acts as hospital serjeant. There are no nurses. Orderlies are furnished as required. The attendance is sufficient. 18. The sanitary condition of the hospital is bad. No epidemic disease, hospital gangrene or pyæmia have shown themselves in it. 19. The hospital is altogether much too small, too low, and too narrow. A new hospital is the only suggestion that can be made. 20. No provision is made for convalescents taking exercise, nor is there ground suitably fenced, or shaded walks, or seats set apart for their use. 21. No provision is made for the treatment of soldiers' sick wives or children. The present arrangements are extremely unsatisfactory. 22. There are no special local hospital regulations. 23. The medical officer has no further powers than that of representing matters appertaining to the sanitary state of his hospital, and such representation is, of course, immediately attended to, provided it is reasonable. Change of diet and medical comforts are entirely within his own province, and in his own power to order. 24. Convalescents are sent to their barracks. A convalescent ward would be a great advantage.
XIII. Burial of the Dead.	1. The burial-ground is about 300 yards from the nearest European barracks, and nearly to windward of this last barrack. 2. It has a frontage of 120 and depth of 90 yards; soil, gravel; subsoil, hard decomposed rock, with gravel; drainage, good, being on the slope of a hill. Whether decomposition takes place readily or not it is impossible to say, as no bodies have been exhumed. The ground has not been carefully kept until now. 3. There are no regulations as to space between graves. Their depth is from 4 to 6 feet, according to whether rock is met with or not. They are never re-opened again. Interment almost invariably takes place the morning after death. There are no orders on this subject. The native Christians are buried in the same burial-ground as Europeans, other natives about a mile and a half to the northward of the cantonment. 4. The grave-yard has never been offensive. There are no regulations, that I am aware of, regarding the burial of British troops. 5. The dead of the camp followers and bazaar people are buried in the native burial-ground. 6, 7. No injury accrues to the public health from the present practice. No improvement can be suggested for the burial or disposal of the dead.

(Signed) H. W. Blake, Lieutenant-Colonel, Commanding Shway Gheen.
4th April 1860. J. J. Heffernan, Assistant Surgeon.

THYET MYO.

Civil Government that of Bengal, but Garrisoned by Madras Troops.

Accommodation - Queen's Troops - Artillery - - 48
Queen's Troops - Infantry - - 310
Native Troops - Infantry - - 1,834

References to Subjects and Queries.	Replies.
I. Topography.	1. The surrounding country is undulating and covered with low jungle. These are no hills of any altitude. The surface is undulating and generally dry. There is an abundance of wood, jungle, and water. 2. The elevation of the station above the sea and adjacent country is 240 feet. The nearest river is the Irrawaddy. There is no higher or healthier ground adjoining the station. 3. Three miles to the S.S.W. of the station there is a range of small hills from 200 to 400 feet high, covered with jungle. 4. The station is on the banks of the river Irrawaddy, which generally overflows in August, and the vicinity is inundated for from 10 to 12 days. A deep precipitous nullah is the northern boundary of the station, emptying itself into the river. The water carries away much rubbish and filth, and is conducive to health.

THYET MYO. MADRAS.

References to Subjects and Queries. | REPLIES.

I. Topography—*cont.*

5. The station is open where houses are built, but the jungle grows close up to the confines, and therefore it is not freely exposed to winds. The temperature of the station is raised by the buildings, which are almost all built of wood and bamboo mats, being exposed to reflected sun-heat. It is exposed at certain seasons to very cold winds, which may cause disease. There is no sea breeze.
6. The surrounding country is generally uncultivated; some spots reclaimed from the jungle are cultivated. There are no works of irrigation near. The cultivation of rice is not prohibited, but the tracts of ground under cultivation are very small, and some few are on the limits of the cantonment. Indigo is not cultivated, nor is the preparation of hemp or flax carried on near the station.
7. The native town of Thyet Myo is within 200 yards of the station.
8. The geological structure of the station is much varied. In some parts gravel crops up within a foot of the surface; in others, red and black earth. The subsoil consists of gravel, sand, and black mould, but there is no certain rule. The station occupies new ground.
9. Experiments recently made show the depth at which water can be found to be from 12 to 60 feet, irrespective of seasons.
10. The rain-fall does not flow very readily away in consequence of the imperfect drainage. It flows from the higher into the lower part of the cantonment, and sinks into the soil in some places; in others, it lies on the surface until it evaporates. There is no adjacent higher ground, the drainage from which passes into the subsoil of the station.
11. The water supply of the station is derived from the river Irrawaddy. There are no tanks.
12, 13. The supply of water is equal to the requirements of the station. It is a dirty white in colour, but pleasant both to taste and smell. It is soft, and full of animalculæ; its quality is good. It is brought from the river by puckallies. No better water supply could be obtained.
14. No knowledge of the mode of inquiry or examination as to topography, climate, &c. in the selection of new stations.

II. CLIMATE.

1. The meteorological instruments available at the station are an aneroid barometer, a thermometer, a wet bulb, and rain gauge.
2. The following Table shows the result of the observations made from 1st January 1859 to 31st December 1859:—

Months.	Barometer Mean.	Mean Temperature.	Mean Daily Range.	Mean Maximum.	Mean Min.	Mean Dry Bulb.	Mean Wet Bulb.	Mean Sun Temp.	Rain, Inches.	Winds. Direction.	Winds. Force.	Days of Sunshine.	Remarks as to Clouds, Dew, Winds, Storms, &c.
January -	29·851	70·5	36·	88·5	52·5	70·5	57·	No black bulb thermometer for ascertaining this.	—	E. & N.E.	No instrument for measuring this.	—	Clear, Fine, Fogs morning.
February -	29·855	78·5	33·	95·	62·	78·5	59·5		—	N.E.		—	Do. Do.
March -	29·810	82·4	31·7	98·3	66·6	82·4	60·		·25	N. & N.W.		—	Heat, Haze.
April - -	29·760	89·	24·	101·	77·	89·	63·7		·50	W.		—	Do.
May - -	29·700	85·3	25·7	93·2	77·5	85·3	74·8		2·25	W.		—	Cloudy, Monsoon begins about 15th.
June - -	29·590	79·6	9·3	84·2	74·9	79·6	72·		16·52	S.W.		—	Cloudy and Rainy.

Ann. Means and Totals	29·751	80·1	20·	89·7	70·5	80·1	69·4	—	48·02	—	—	—	

3. The character of the climate, as compared with India stations generally, is that of greater moisture of atmosphere and more clouded state of sky, from a monsoon of nearly six months' duration, the immense extent of jungle, &c. It is favourable to the health of Europeans, and very unfavourable to that of the Indian native troops, as is the climate of Burmah generally. The hot months and rains are most unhealthy for the European, and the rains and cold weather for the native of India. The most unhealthy period extends from the month of August to December, attaining its culminating point in November, from its following the close of the monsoon in October.
4. Not aware of any district near the station the climate of which is more conducive to health.
5. No certain data can be given in comparing the salubrity of one station with another. What may have been an eminently unhealthy station 15 years ago is the contrary now, and vice versâ. That which may be healthy for the European may be unhealthy for the native. Cuddapah is, in my opinion, the most injurious to health of all the stations at which I have ever served.

III. SANITARY CONDITION OF THE STATION.

1, 3. There is no general map of the station and adjacent country in the executive engineer's office. The plan of the station is very incomplete; a tracing of it, however, is sent, which gives a sufficiently clear idea of the position of the river, nullahs, &c. All the drains in the cantonment are open, with a free outlet to the river. A ground plan is also sent, showing the general construction of the barracks.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of the Station—*cont.*	4. *Table of Barrack Accommodation:*— Date of construction, 1854, 1855, 1856. Total number of rooms or huts, 24 for Europeans, and 28 for natives. Total regulation number of non-commissioned officers and men; Europeans, 1,000; natives, 2,800.

Barrack Rooms or Huts.	Regulation Number of Men in each Room or Hut.	Dimensions of Rooms or Huts.				Cubic Feet per Man.	Superficial Area in feet per Man of floor space.	Height of Men's beds above the Floor.	Doors and Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
		′	′	Mean.	Feet.			′ ″		Feet.	Feet.
European Barracks -	40	120	20	16′	38,400	960	60	1 9	16	$3\frac{1}{2}$	3
Native Barracks - -	100	140	20	16	44,800	448	28	Sleep on floor.	16	$3\frac{1}{2}$	3
Do. Do. - -	50	70	20	16	22,400	448	28	Do.	14	$3\frac{1}{2}$	3
Guard Room - -	10	30	20	16	9,600	960	60	1 9	8	$3\frac{1}{2}$	3
Prison Cells, 2 - -	1	12	10	12	1,440	1,440	120	1 9	Ventilators all round top of wall, no windows.		

5. The windows are on opposite sides, and open outwards. There is a verandah all round the building, 10 feet broad, two ends of which are enclosed for serjeants' rooms. The verandah is never occupied as sleeping quarters by soldiers or other persons. There are no jalousies or jhilmils.

6. Iron bedsteads, wooden cots, and mattresses, are used in barracks. The iron bedsteads are bad; wooden cots are preferred by the men.

7. The tents for European soldiers are 21 feet long by 15 broad, 5 feet high at the sides, and $10\frac{1}{4}$ in the centre, giving 315 feet superficial, and 2,441 feet cubic space. They are intended for 25 men, giving each man $12\frac{1}{2}$ superficial, and $97\frac{1}{2}$ cubic feet. They are made of thick white cotton cloth, doubled or trebled, and lined with blue cotton cloth. The European tent has a double fly, with a foot and a half between the flies.

8. The barracks are ventilated by means of doors and windows. The boarding of the wall is not carried up to the roof, but a space is left open for ventilation. The ventilation is quite sufficient to keep the air pure by night and day. No means are used for cooling the air of barrack rooms.

9, 10, 11. Barracks are constructed of teak wood; the roofs are thatched; the floors are planked, raised generally four feet from the ground. There is a free passage of air beneath. The materials used in construction are suitable. The barracks should be larger with double verandahs. The barracks and cantonment are kept in repair by the department of public works. Repairs are executed with tolerable rapidity. The officer commanding, senior surgeon, and executive engineer are responsible for the sanitary state of the cantonment. The walls and ceilings of barracks are cleansed and whitewashed whenever considered necessary by the medical officer; generally once a year.

12. The lavatories are temporary buildings. They are rooms 22 feet by 15, with partly planked, partly mat walls, Venetian doors and windows, and brick floor. The water is brought by Puckallies and Bheesties; there are 12 of them. Drainage is effected by means of open channels to the low ground adjacent, which is made use of generally as a garden.

13. The cook-houses are built of wood, with a centre wall of brick. The roofs are planked. Fire-places are constructed along the floor and next to the brick wall. Water is brought from the river or well by bheesties. The drainage of refuse water might be better. Linen is washed in the river by dhobies, and there is plenty of ground for drying it. The conveniences are sufficient for the wants of the station.

14. The privies are brick buildings; they are drained by drains leading to cesspools. The contents are received into iron buckets, one of which is placed under each seat, and all is removed daily to some distance outside the cantonment, and buried. The cesspools are for urine only. No solid matter can find its way into them.

15. Barracks are lighted at night by means of globe lamps, hung from the ceiling.

16. The drainage of the barracks is effected by open drains, which are mere excavations out of the ground. It is all carried into the river, about 100 yards from the barracks nearest to the river, and about 800 from the furthest. The drainage of privies is good, but the general drainage of the other buildings might be much improved. The buildings are, however, only of a temporary nature. No part of any of the barracks is damp. Whatever fluid refuse is not carried off by means of drains, partly evaporates, and partly sinks into the subsoil. There have been no complaints as to the sufficiency of the drainage. Cesspits are only attached to privies, and are distant from the men's quarters 150 to 200 yards. They have never been cleaned since constructed in 1857, nor do they require it. There are no foul ditches.

17. The cantonment is tolerably clear from all obnoxious matters; each regiment, detachment, and department keep their own lines clear. Refuse and manure from bazaars, &c., is carted away to the jungle.

18. The surface of the cantonment is kept tolerably free of vegetation, but requires constant attention. There are no old walls, &c., to interfere with the ventilation of the station, but the jungle should be cleared for 500 yards all round the cantonment.

19. With regard to the drainage of the bazaar, the water flows off readily to lower ground. The streets are at right angles, and sufficiently ventilated. The houses are rather crowded, caused from want of space. Water is procured from the river, and from one well recently made. Each house owner keeps the front of his house clean, and all filth is removed by sweepers. There is a large number of cows in the bazaar, and their removal would be advantageous; but there are many difficulties in carrying this into effect, from the absence of any ground to remove them to. There are no native houses nearer than the native town. No nuisance is experienced from the wind blowing over native dwellings.

20. Animals are slaughtered for the use of soldiers a mile below the cantonment, on the river bank. The offal is carried away by the stream. No nuisance is experienced from the slaughter-sheds.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	21. There are no bazaar horses. 22. There are no cavalry or artillery stables, or picketing grounds. 23. There are no quarters for married non-commissioned officers and men. No married people occupy barrack rooms with the men.
Officers' Quarters.	1. Compounds are too small, and the houses are too close together. There is little privacy, and a constant dread of fire. Nearly one-third of the cantonment has been recently burnt down. The drainage and ventilation are tolerably good, but there should be more space. No improvements are suggested, except what would involve a fresh laying out of the whole cantonments.
IV. HEALTH OF THE TROOPS.	1. The station I consider favourable to health. The district is for the most part covered with jungle, and some parts of it therefore very malarious; but the native population are healthy and robust, and do not exhibit any of the signs of suffering from malarious disease. 2. I am not aware of their suffering from any epidemics except small-pox, or from any particular disease, or from spleen disease. 3. The general healthiness and robustness of the natives, I consider, result from the peculiarly moist but not relaxing climate, enjoyed during a great portion of the year: the wind from an extensive seaboard, which gives the province a semi-insular character. 4. The various regiments come from different stations of the Madras Presidency, and Her Majesty's 68th Light Infantry from Ireland. The native troops have suffered severely from the climate of Burmah, which produces in them fevers, rheumatism, diarrhœa, albuminuria, beriberi, atrophy, &c. No portion of the men's accommodation is more unhealthy than the rest. 5. The troops are not camped out. 6, 7. No experience of the health of troops at hill stations. 8. Hill stations, if well selected, would be decidedly beneficial to the health of the European troops. 9. Increased action of the bowels is generally experienced on proceeding from the plains to hill sanitaria, for which reason they do not seem so favourable for those suffering from chronic diarrhœa or dysentery. 10. With reference to the precautions necessary in hill stations, doubtless flannel and warm clothing generally, with abundant exercise and attention to diet, are of great importance in guarding the system against suffering from the decided change to a hill station, and enabling the valetudinarian to benefit thereby. 11. No experience of the seasons best adapted for residence in hill stations. 12. No injury is likely to be inflicted on the health of troops returning to service in the plains at well selected stations. 13. Not aware of any precautions for the protection of health on leaving hill stations for the plains, other than the general ones adopted on coming suddenly into a tropical from a temperate climate. 14. I am of opinion that the course most adapted to the health of European troops would be to locate them on moderately elevated hill stations, with short periods of service on the plains. Occasional change of station is conducive to the health of the troops. 15. No acquaintance of the barrack or hospital accommodation provided at hill stations or sanitaria. 16. I consider from 300 to 600 feet above the sea to be the range of elevation most suitable for hill stations in the tropics. 17. No higher ground near the station which could be advantageously occupied as a hill station. 18. Black cotton soil I consider especially unfavourable to health, while a gravelly soil with the laterite of Western India, and the red soil of the eastern coast, are perhaps the best in a sanitary view. 19. The soldier should not be sent to India before he is 20 years of age, and thoroughly trained. The troops should land in India in the end of November or beginning of December. No knowledge of the system at present adopted on troops first landing, as regards barrack accommodation, clothing, drills, &c. I think it of the first importance to guard the soldier fresh escaped from the monotony of a long voyage, from the excesses he is then so prone to indulge in. 20. I do not consider there is any particular advantage in sending the troops to an intermediate station, unless perhaps to allow young troops to attain mature vigour of constitution at a healthy station such as the Cape. 21. The communication from the port of debarkation to the interior is entirely by the river Irrawaddy, and troops are conveyed in transports with the greatest comfort and convenience. 22. I consider every soldier would derive benefit from revisiting Europe after a sojourn of 10 years in India. 23. With regard to the manner of conducting the business of medical boards in reference to invaliding, differences of opinion often arise, not between the medical officers themselves, but between them and the commanding officer, and the reason is obvious. A commanding officer brings before the committee a man who from long personal observation he knows to be unfit for service, although his health may be just sufficiently good to enable him to keep out of hospital. This fact weighs well with the committee, and the man having no fixed disease, and his name not appearing in the hospital books, medical officers cannot conscientiously, on medical grounds, invalid such a man. The commanding officer has an appeal to a board of field officers, and I think, under all circumstances, it is as good an arrangement as can be devised. 24. Invalids should leave India for home in February or March.
Diseases.	1. When disease is prevalent in an epidemic form, such as psora, it is usual to have parades for its detection. 2. No scorbutic disease among the troops at this station. 3. Hepatic disease seems unusually prevalent in this province. The largest number of admissions from any single class of disease is from hepatitis. 4. Dracunculus is a purely epidemic affection; the ova being deposited in the skin chiefly of the legs and feet, natives are the principal sufferers, from their habit of going bare legged, and wading in the tanks and streams. To avoid its occurrence the localities in which the parasite exists must be shunned.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	5. About $\frac{1}{7}$ of the admissions into hospital are from venereal disease. The best precautions for diminishing the liability of troops to this disease that suggest themselves, is the general discouragement of vice and debauchery among the men, especially drinking, the fruitful parent of every other vice. 6. The native troops suffer very severely from fever, chiefly of the intermittent quotidian type. Dysentery is of less frequent occurrence than at most Indian stations. Cholera occasionally occurs; last year 4 Europeans and 10 natives died from it. Small-pox prevailed epidemically at the beginning of this year (1860), when many of the Sepoys took the disease. Rheumatism prevails extensively and severely among the native troops especially. Fever.—The ratio of admissions is in the European troops from 250 to 300, and in the native troops 350 to 400 per 1,000 of total admissions. Dysentery.—In Europeans, 150 to 200 per 1,000, in natives about 65 per 1,000. Rheumatism.—In Europeans 36 to 45 per 1,000, in natives 60 to 100 per 1,000. Cholera and small-pox being only of occasional occurrence, formed but a very small fraction of the admissions. 7. The most frequently occurring zymotic disease is fever of the quotidian intermittent type. This disease is most prevalent during and immediately subsequent to the rainy season. During the rains the air is loaded with moisture, and during the months immediately following, with exhalations raised by the sun acting on the ground saturated by the previous rain, and by rank vegetation. The only conditions among the troops peculiarly predisposing to disease are the duties of night guards. Amongst the native population doubtless there is much want of cleanliness and general attention to sanitary points, but as the bazaars are at a distance, this does not affect the health of the troops, whose habits of cleanliness, or the reverse, are attended to by the regimental and brigade authorities. 8. As regards the influence of the soldiers' duties, occupations, and habits, is the occurrence of epidemic diseases, I have no particular remark to make beyond the well-known influence of exhaustion and depression of the vital powers in predisposing to the reception of epidemic disease. 9. No experience of the effect of quinine in small doses as a prophylactic against malarial diseases, but in strongly malarial spots I should certainly be disposed to employ it. 10. In order to prevent or mitigate epidemic disease at the station, the general sanitary condition should be improved by clearing away gradually the surrounding jungle, draining some swampy spots, and maintaining the cleanliness of the station, and freedom from undergrowth; also strenuous efforts should be made to disseminate vaccination.
V. Intemperance.	1. The soldiers at the station are on the whole temperate; about 4 per cent. are confirmed drunkards. 2. Of 562 admissions into the hospital, 4 were *directly* from drunkenness, or ·7 per cent.; and 25, or 4·44 per cent., indirectly from intemperance. Drunkenness is always punished as an offence.

Average Strength, 330.	Total Abstinents, Number, 5.	Temperance, Number, 306.	Drunkards, Number, 19.	Total, 330.	Per cent. from Abstinents.	Per cent. from Temperate.	Per cent. from Drunkards.
Admissions - -	5	531	26	562	93·5	173·52	136·8

Crime - - -	—	—	—	—	—	—	—

3. Colombo or Batavia arrack, 25 below proof, is issued monthly to the canteen at 2 rs. 4 a. per gallon, and retailed to the men at 2 rs. 8 a. The allowance for each man per diem is 2 drams or one dram of arrack, with 1 quart of malt liquor; spirit forms no part of a soldier's ration at the station. They are permitted, as above, to purchase 2 drams daily from the canteen at 1 anna per dram, and in the field or on the march the same quantity at the same rate from the commissariat. It is never given as a ration to convalescents; deleterious drinks are not openly sold in the bazaar or canteen that I am aware of, though they are frequently smuggled in and sold in every cantonment.
4. Spirits are in no case conducive to the health of the troops, but almost always injurious to it, and to the efficiency and internal discipline of the corps.
5. To abolish the sale of spirituous liquors in the canteen would be beneficial to the health of the troops if they could not procure worse liquor elsewhere, but if none was to be bought there they would probably get worse in the bazaars. But in this question is involved the loss which would accrue to the revenue from the abolition of the sale of spirits in the bazaars. In one cantonment 1½ lacs of rupees has been given for the Abkarry contract.
6. Wines and malt liquors are often beneficial to health, seldom injurious in moderation; spirits, on the contrary, are almost always injurious, and in no case conducive to health.
7. Coffee, tea, lemonade, soda water, and similar drinks are moderately used. With regard to health, efficiency, and discipline, these drinks are greatly superior to fermented liquors of any kind.
8. The suppression of the spirit ration would be beneficial if such a measure would stop spirit drinking, and beer or effervescent drinks were substituted for it.
10. I recommend a more close watch over the issue of spirits; that each man who drinks spirits should be specially registered, and that not even a dram should be issued without an entry being made of it, and to whom it is issued; this would involve less extra labour than is at first apparent. A monthly table noting from on one side the date, and from the other the names of the registered spirit drinkers, would be easily kept up. The advantages arising from such a system, both in regard to the assistance it offers to a soldier endeavouring to break himself of the habit, and the insight it would give into the real amount and extent of spirit drinking, and who drinks it, would more than amply compensate for the trouble involved. At present it is impossible to get accurate information as to who drinks much or little, or even who drinks at all.
11. The following are the more important of the canteen regulations:—
"3. No man of another regiment is to be admitted into the canteen without the written

References to Subjects and Queries.	Replies.
V. Intemperance—*cont.*	sanction of his commanding officer, and of the officer commanding the artillery, and no spirits are to be issued under any circumstances to a man of another regiment. 4. The canteen will be open daily on week days from 10 to 12½ a.m., and from 1½ to 3 p.m., and from 6 to ¼ to 8 p.m., but no spirits will be issued at the first period. And on Sundays from 1 to 3 p.m., and from 5 to 6 p.m. 5. The utmost amount of issue to any one man in one day will be 2 drams of arrack, or 1 dram of arrack and 1 quart of porter, but no man is to receive more than 1 dram of arrack at the same period of issue. 6. No liquor is to be taken out of the canteen without the written sanction of the commanding officer; those men who wish to do so may receive not more than half the daily allowance at the dinner table by giving in their names to the orderly corporal, who will draw the amount. 7. No man on duty or under punishment is to enter the canteen, men on convalescent list are allowed to enter the canteen, but not to receive any liquor without the written sanction of the surgeon, countersigned by the commanding officer. 8. No games or singing are permitted in the canteen on Sunday, and all gambling at all times is strictly prohibited." In the bazaar no liquor is sold, and any one found bringing liquor into the cantonment without a pass is handed over to the civil authorities. The regulations are obeyed as far as I am aware.
VI. DIET.	1. The daily ration to European troops is as follows :— Bread, white - 1 lb. Rice 4 oz. Tea 5/7 oz. Coffee 1 2/7 oz. Salt 1 oz. Beef 1 lb. Sugar 2½ oz. Vegetables, alternate days 1 lb. Firewood „ 3 lb. The ordinary tea ration consists of one-third green, and two-thirds black. The vegetable ration consists of such descriptions as may be procurable according to seasons. At this station esculents, such as yams, cocoa, and occasionally potatoes are issued when practicable, as they are more nutritious and preferred by the men to the green vegetables. The rations are issued daily under the superintendence of a warrant or non-commissioned officer of the commissariat department. Before issue they are inspected by a quarter-master and regimental officer of the day, also by orderly corporals of companies, who report to the day officer on the quality of the rations; if any article is considered objectionable a committee is assembled. 2. A complete ration, including vegetables, is issued daily, fruit is not supplied by the State. The regulated stoppage per man per day is 3 annas and 4 pice. There are three meals, the first at 7½ a.m., tea or coffee, bread and meat; the second at noon, bread, meat, and vegetables; the third at 4 p.m., tea and bread; 1 lb. of vegetables is given daily. 3. A greater variety in meat and the mode of cooking it would be an improvement, also a larger proportion of farinaceous diet; at this station beef alone can be procured. I have not heard of any instance of the European soldier selling his rations, or of any arrangement for its prevention. They usually purchase extra articles to add to it. 4. The cook-houses have cooking places built of brick and mortar down the centre; cooking pots furnished by the commissariat department are used to prepare the food; it is cooked by native cook boys. The kitchens are wooden buildings with brick and mud floors, and are kept as clean as practicable. There is a sufficient supply of water. The food is boiled, grilled, or stewed. The cooking, &c., is tolerably well done. Tea, coffee, or other refreshment before a march is a matter of regimental arrangement in many corps. 5. Small plots of ground near the barracks are re-cultivated where vegetables are grown for the soldier's private use, and are as advantageous as any others capable of being established at this station.
VII. DRESS, ACCOUTREMENTS, AND DUTIES.	1. The soldier's dress is composed of flannel waistcoat, cotton shirt, worsted socks, white trousers, white frocks, red serge frocks, blue serge trousers, khakee jackets, red cloth tunic, cloth trousers, blue cloth great coat, dress and undress forage caps with white linen covers, waist belt with pouch and bayonet, shoulder belt with pouch in rear and cap pocket attached to it in front. The present new dresses are well adapted to this climate and for soldier's duties by day and night and at different seasons. I suggest that collars should be re-abolished, as the neck should be perfectly free in this climate. A waterproof cape would be a good thing for the soldiers during the heavy monsoon. The men should guard during the day in white clothing, and change to cloth at sunset, but this varies with the season. The men are protected from the sun by verandahs or trees when on sentry, and put on great coats in wet weather.
Duties.	1. It would be advisable in every respect that the men should be thoroughly drilled at home before being sent to India. 2. The soldiers rise at 5 a.m., and go to bed at 9 p.m.; parades generally take place four times a week from 5½ to 6½ a.m.; men do not suffer in health from drill. The best hours for drills, &c., in the hot season are before the rise and after the decline of the sun; but in the cold, when heavy fogs are frequent, not until an hour after sunrise. The average number of nights the men have in bed during the week is 6. 3. All guards are adjoining the barracks, except two about three-quarters of a mile distant; these are night-guards; they are mounted at sunset, and withdrawn at sunrise. The day-guards last 24 hours. There are roll calls at 4 p.m. and 9 p.m., and oftener as circumstances may require. The men are healthy, and night guards do not *seem* to affect them, but generally speaking the effect of night guard is a diminution of the power to resist morbid diseases in exact proportion to their frequency, and to their influence may be attributed a certain proportion of sickness. In this station I should say this is a predisposing cause of fever.

References to Subjects and Queries.	Replies.
VIII. Instruction and Recreation.	1. The following are the means of recreation and instruction:—There are no ball courts. There is one skittle-ground for each company. There is a school with assistant schoolmaster. A station library will shortly be established. It will not be lighted at night; but there is a coffee-room which is lighted, and may be called a day or club-room. About 1½ acres are under cultivation for soldiers' gardens, under the supervision of the commanding officers. There are no workshops other than a shoemaker's shop. One barrack is turned into a theatre. There is no gymnasium, but one has been sanctioned. I consider these amusements, together with cricket and boating—Government having liberally supplied four 10-oared boats—ample. Hard labour and exposure is not, I consider, detrimental to the European soldier in Burmah. For example—seven men have been employed for months in making bricks under the executive engineer, and though the work is hard the men have enjoyed excellent health. The same may be said of those who play at cricket, as scarcely a man has been in hospital, though much exposed to the sun. There is no restriction as to exposure to sun and rain off duty, nor has any case of disease been traced to the influence of voluntary exposure. I am strongly of opinion that no restriction should be placed on men in this respect, and that every indulgence should be afforded them. 2. There are sufficient means of recreation at this station, but what I would recommend is a system of workshops organized for different trades found amongst soldiers, which would give them profitable employment, and in no wise detract from their efficiency as soldiers. 3. Soldiers' savings' banks exist, and are much used. 4. There is sufficient shade from trees, &c. to enable the men to take exercise without injury to health during the day. Men play at skittles, quoits, cricket, &c., all day in the open air. To this I attribute their general good health. This station is eminently adapted for the enjoyment of life by the soldiers. Between the barracks and the river bank it is only a short distance, and this is green turf with trees here and there. Their boats also add much to their amusement. What with climate and local causes, I have never been at a station offering so many advantages from natural causes to the soldier as Thayet Myo.
IX. Military Prisons.	1. There are no military prisons at this station.
X. Field Service.	1, 2. There are no local regulations for medical field service. 3, 4. No reliable information as to the practical operation of regulations for the preservation of the health of troops in camp, or as to the arrangements adopted for field hospitals, &c.
XII. Hospitals.	1. Ground plan and sketch of the hospital of detachment H.M.'s 68th L.I. sent. 2. The hospital buildings are at one end of the line of barracks, and of the same general construction as them. They are remote from the bazaar and the civil population. They are open and freely ventilated. The sites are healthy and generally free from malarious influences. 3. The water supply is abundant and wholesome. 4. All impurities are removed to a distance from the hospital by sweepers employed for the purpose. 5. The hospital floors are raised generally about three feet above the surface, and there is a free perflation of air beneath, as they are supported by posts merely. The rain flows off the surface readily. The ground slopes from the hospitals, and there are small drains cut to catch the roof water and facilitate its removal. The hospitals are built, some of planks and some of mat walls, with a thin thatch, and are therefore altogether insufficient to prevent the heating power of the sun upon the buildings. The wards have verandahs on all sides, affording sufficient shelter from the sun's rays. During the sickly season the verandahs on one side of the native hospitals are used for the sick, from the great increase of sickness then: they all consist of one floor only. The following Table shows the accommodation:— Date of construction, 1854–5. Total number of wards—2 men's, 1 women's, and 1 smaller extra ward. Total regulation number of beds, 24 in each ward; 48 for men.

Wards.	Regulation Number of Beds per Wards.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet for Bed.	Height of Bed above Floor.	Windows.		
		Length.	Breadth.	Width.	Cubic Contents.				Number.	Height.	Width.
								Feet.		Ft. In.	Feet.
1	24	118·4	20	18·10	33,720	1,405	98 sq. ft.	2	12	3 5	3
2	24	118·4	20	18·10	33,720	1,405	98 „	2	12	3 5	3

Most of the hospitals, except one occupied by native troops, are sufficiently well placed for ventilation. The European hospitals have Venetian windows; those of the native hospitals are of mats, and are opened sufficiently in the day for ventilation.

6. In addition to the doors and windows there is an open space between the roof and the top of the wall, admitting free ventilation in all the hospitals and barracks. The Venetian windows open to the sides like a lattice or French window.
7. No means of cooling the air by tatties or thermantidotes are employed at this station.
8. There are no means of warming the hospitals. The ceilings and walls are whitewashed about every six months, or upon requisition by the medical officer.
9. The privies are small detached buildings, with night chairs and vessels for holding urine. The filth and urine is removed frequently during the day, and the privies are kept clean by the sweepers employed for that purpose.
10. The lavatory arrangements are sufficient.
11. Various kinds of baths are provided for the sick.
12. Washermen are employed to wash the hospital linen at a regular monthly rate of pay.
13. The storage is sufficient for all purposes.
14. The bedsteads in use in the European hospitals are wooden with rattan work.
15. Cook-rooms are attached to all the hospitals, and cooks also for the European hospitals. The cooking is properly done, and can be sufficiently varied.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	16. Diet, &c. according to regulations. 17. A proper staff of ward coolies, leechmen, nurses for female ward, &c., is always kept up for European hospitals, in addition to hospital serjeants and orderly attendants, as required by severe cases. In native hospitals there are only two toties to apply leeches, and do the dirty work of removing filth, &c. 18, 19. The sanitary condition of the hospitals is sufficiently good, except that the hospital of European artillery is constructed of mats in frames instead of planks, and one of the hospitals of the native regiments is badly situated, while the other two native hospitals are too close together. 20. The sick and convalescents are, when requisite, carried out in doolies, or allowed to walk morning and evening. 21. Separate wards with nurses are provided for the soldiers' wives and children. The present arrangements seem ample and satisfactory. 22. There are no regulations enforced beyond the Madras Presidency hospital regulations. 23. The medical officer sends in requisitions for any repairs or sanitary measures needed, which being sanctioned by the brigadier commanding the station, are complied with. Sufficient hospital comforts are always available. 24. There are no convalescent wards. No advantage could accrue from them at this station.
XIII. BURIAL OF THE DEAD.	1. The burial ground is about 500 yards from any house; it is within the limits of the cantonment, and sheltered from all winds by a tope of trees. 2. It is 400 paces square. The soil is red earth and gravel. The water runs off. No knowledge whether decomposition takes place readily. The ground is carefully kept. 3. The grave space is 6½ feet by 3 feet, with an interval of 3 feet; the depth is 6 feet. Graves are never re-opened. The time of interment is in no case compulsory, but as a rule, if a man dies during the day he is buried on the following morning; and if in the morning, he is buried in the evening. The same rule applies to native troops. 4. The graveyard is never offensive. 5. The dead of camp followers and bazaar people are taken to the jungle and either burnt or buried. 6, 7. No injury accrues to public health from the present practice. No improvements are suggested.

(Signed) G. W. OSBORNE, Brigadier, Commanding Thyet Myo.
G. P. DE P. FALCONNET, Lieut.-Engineer, Executive Engineer, Thayet Division.
C. TIMINS, Surgeon, Senior Surgeon, Thyet Myo.
T. C. LONGCROFT, Captain, Major of Brigade.

15th June 1860.

MOULMEIN.

Accommodation:—Native Troops.—Infantry - - - One Regiment Native Infantry.

References to Subjects and Queries.	Replies.
I. TOPOGRAPHY.	1. The cantonments of Moulmein are on two sides nearly surrounded by the broad waters of the Salween, close below its junction with the Gyne and the Attaran. On the south is a native town, prettily situated on the slopes of the hills which dip to the Salween westward, and the Attaran eastward. A ridge of hills, varying from 100 to 300 feet of altitude, and half a mile distant from the Salween, forms the eastern boundary of the station and principal part of the town, all of which, as also the cantonments, are on dry red soil. Swamp and rice fields prevail east of the hills. The station to the west and the town are prettily wooded. Jungle abounds on the hills where not occupied by the residences of the upper classes. An unhealthy dirty ditch, covered with jungle, surrounds the cantonments east and south. Water is everywhere and at all seasons abundant. Vegetation is very rank during the rains, which are very heavy. 2. The cantonment is about 50 feet above the sea. It rises from the river bank north and east to a maximum height at its south-east angle of 150 feet, which point would command the cantonments and the best part of the town. The same ridge of hills which forms the promontory, on which Moulmein is situated, continues it in a north-north-west course, broken only here by the united waters of the Salween, the Gyne, and the Attaran, and rises to the height of 3,000 feet to 4,000 feet, but only in sharp ridges, with but little dry soil at their base, till some distance from the station southwards they run in a similar course, but only obtaining a few hundred feet of elevation, and serve to divide the waters of the northerly running Gyne from those of the southerly going Salween,—a very beautiful range of hills, broken only here and there by easy passes. No place could be healthier than the present station. The low hills would be more airy and agreeable in the hot weather, but water and steep roads are objectionable in a military point of view. As the hills command the town and cantonments, they would require to be occupied in all cases of disturbance, and are now perfectly accessible for artillery. 3. At a distance of two days river sail by boat, and one long march, there is said to be very beautiful table land, varying at from 3,000 to 8,000 feet of elevation. The country is wild, and but little known and peopled, only by sparsely scattered nomadic Karen tribes. Other table lands, more extensive, but only having about 2,000 feet of elevation, exist some four marches southward. 4. The station is surrounded by lakes, marsh, nullahs, &c., and almost all the waters in them are washed by every tide, which at Moulmein has a rise of 20 feet. The rice fields or marshes are only freed from inundation in the dry weather, but the vicinity of the station

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	is not at any season liable to overflow. There are no ravines, water pits, nor any broken ground near the station. 5. The station is now very much covered with jungle and ruinous houses, but these have been ordered to be cleared away. I imagine that the temperature of the station is not raised by the buildings being exposed to reflected sunheat. The cantonments are exposed both to the sea-breeze and the north-easterly wind during the cold season. 6. A great quantity of dense jungle runs along the east face of the low range of hills which bounds the cantonments to the east. There are no works of irrigation near the station. The cultivation of rice is not that I am aware of prohibited, except within the limits of the cantonment; neither is the cultivation of indigo, nor the preparation of hemp or flax, carried on near the station. 7. The town of Moulmein abuts on the boundary pillars of the cantonments. 8. The stones and soils of the district are mostly those of the tertiary group, with deep alluvial basins and plains, broken by long regular lines of sandstone, running about 30° west of north, and dipping eastward. A deep blue clay is generally found about 20 feet below the surface, and yields an abundant supply of fresh water even to the seashore. The character of the dry lands is more or less ferruginous. All stations and towns have been occupied for one or two centuries. 9. Water is usually found at a depth of 20 feet in the dry, and 10 feet in the rainy, season below the surface. 10. The rainfall and water from surface springs flow very readily away; generally speaking, it sinks into a pervious subsoil, and oozes out in the rivers, but does not lie on the surface till it evaporates. There is no drainage from higher ground which passes into the subsoil of the station, as the lie and dip of strata is so very considerable that what sinks into it will be carried deep and in an opposite direction to the station. 11. The water supply of the station is derived from wells. It is not stored in tanks, and I cannot say what plants or animals it contains. 12. Four wells of a moderate hard water of excellent quality supply the station. The water is raised in buckets. 13. There are no other topographical points bearing on the health of the station which are not included in these queries. 14. New stations, whether on hills or plains, are generally selected by a committee of commanding officers and medical men specially selected by Government for their known fitness for such a duty, together with the engineer officer to be entrusted with the building of the station. The service could not be better conducted.
II. Climate.	1. There are no means or instruments, that I am aware of, available at this station for conducting and registering meteorological observations. 2. No table of meteorological observation appears to have been kept here, and the only information I can afford for the year 1860 under this head, is the amount of rain which fell. This is as follows in inches, viz.:—January, 0·10; February and March, none; April, 1·90; May, 6·10; June, 31·90; July, 36·30; August, 32·0; September, 19·00; October, 5·10; November, 0·40; and December, none; thus making 133 inches in the course of the year. The average annual fall of rain is believed to be from 150 to 200 inches. 3. In my opinion the peculiarity of the climate of Moulmein is its excessive moisture, owing to the north-west monsoon lasting from the end of April to that of September, during which time the rains are excessive. The absolute heat is not so great as that of India generally, but from the combination of moisture and heat the temperature of Moulmein during the hot season and the rains is most exhausting to some constitutions. There are fogs, I believe, in the cold season, but I, as yet, have never seen any in the hot weather or during the rains. The damp is greater than I have experienced in Turkey or India. I am not aware of any tree planting in this station, nor do I think it would be needed. Burmah being over wooded, I am unable to say anything about irrigation. I have not seen any dust nor dust storms up to this date, and my residence here only embracing the period of six months, I can consequently say but little on this head. I do not believe that the climate of Moulmein agrees with natives of India, particularly those who come from the southern part, such as the Telinga and Malabar races. The present diet, shelter, and clothing of the native troops are, I think, sufficient. Drill only takes place in the cold season, when the ground becomes firm and dry. The most unhealthy months are those at the commencement and termination of the monsoon, viz. May and September, the prevailing diseases then being, dysentery, diarrhœa, intermittent and remittent fevers, rheumatism, and psoriasis. 4. I understand that at the entrance of the Moulmein river there is a place called Amherst, the climate of which is said to be more conducive to health than that of this station. 5. During my period of service in India (now three years and five months), I have been stationed in Cawnpore, Futtypore, Calpee, Banda, and Secunderabad, and I consider that any prolonged residence in Cawnpore, Calpee, or Banda, must be attended by results positively injurious to the health, particularly of Europeans.
III. Sanitary Condition of Station.	1, 2. There is now only one irregular regiment of native infantry in the station. The soil of the station is not sufficiently strong to answer the purpose of drainage without masonry. The outlets of the drains, sewers, &c., are quite free. There are no cesspools, but a very objectionable fort ditch, which it would cost about 40,000*l.* to fill up. 3, 4. The native infantry barracks are of wood, raised 3 feet above the ground, with doors and windows at every 10 feet. The ventilation is ample. These are the only barracks in use. 5. The windows are on opposite sides of the barracks, and open on hinges. There is a verandah all round 8 feet broad, but this is never occupied as sleeping quarters by the soldiers or any other persons. There are no jalousies or jhilmils. 6. Flanked cots are in use in the barracks for sleeping purposes, but the native soldiers generally prefer the floor. 7. Tents are not used in the station. 8. Every chink of the planks, roof, and floor besides the doors and windows at every 6 feet afford sufficient means of ventilations, and keep the air pure by night as well as by day. There are no means required in this province for cooling the air for barrack-rooms. 9. The barracks are constructed of wood, tents of cloth, and huts of bamboo and grass. 10. The floors, which are of wood, are raised 3 feet above the level of the ground, so that there is a perfectly free passage of air beneath them.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	11. The materials and construction of the barracks, huts, &c., are very suitable for the climate, and no improvement in either of these points would increase their salubrity. The walls and ceilings of the barracks are cleansed and limewashed annually. 12. There are no lavatories, baths, or washing places for the men at this station. 13. A cook-room is attached to every three or four barracks, where the native soldiers cook for themselves on raised fireplaces. 14. A marginal sketch of the privies, &c. sent herewith. 15. The barracks are lighted at night by lanterns suspended from the roof. 16. A deep drain runs round each building, leading into a freely running stream or the main river, and this is found sufficient for conveying away all surface water and drainage. I have no fault to find either with the barracks or hospital on the score of dampness, inasmuch as no place can avoid being saturated with moisture during the monsoon, and so long as the roof remains watertight no more can be expected. There are no cesspits near the station or wells, but the old native fort ditch before mentioned surrounds the cantonments on two sides. 17. The surface cleansing of the cantonments and their vicinity is conducted by officers commanding the corps, with occasional aid from the executive engineer. All the refuse, &c. is removed in hand carts. 18. In consequence of the desertion of the cantonment, the ruinous state of the houses, and the rapid growth of vegetation, the surface has not been kept free, and there are numbers of high and thick hedges, but these have been ordered to be cut and removed. 19. The bazaar is kept very clean, and no improvement on this head is practicable. The native houses are generally clean, and the privies being erected over tidal nullahs, are very seldom offensive. No nuisance is experienced in barracks from wind blowing over the native dwellings. 20. No animals are permitted to be slaughtered within the limits of the cantonments. 21, 22. There are no stables or picketing grounds for artillery, cavalry, or bazaar horses at Moulmein. 23. There are no Europeans at this station.
Officers' Quarters.	1. The sanitary condition of the officers' quarters at this station is good. The necessary orders with reference to the removal of houses in a ruinous state, and to the clearing of compounds have been already issued.
IV. HEALTH OF THE TROOPS.	1, 2, 3. I do not consider the station to be an unhealthy one, but I am unable to say anything about the native population as they have never come under my observation nor treatment. 4. The regiment was at Kamptee for two years and eight months, and left on the 10th of October 1859. The corps seems by the returns to have enjoyed good health whilst there; the principal diseases being fevers of the intermittent and remittent types. The regiment arrived in Moulmein on the 21st January 1860, and since then sickness has been very prevalent amongst the men, the prevailing diseases being diarrhœa, dysentery, febrile affections, rheumatism, psoriasis and ulcers. I do not find any portion of the men's present accommodation more unhealthy than the rest. 5. The troops at this station have not been camped out since March 1861, when I took medical charge of them. 6, 7, 8. I have never been in charge of troops in the hills; but from the little I know of hill stations, I think that they are well suited for Europeans. 9, 10. No replies to these queries. 11. As far as I am enabled to judge, I do not think that a residence in the hills of less duration than 18 months or two years would suffice to enable troops to derive the full benefit of such residence to their health. 12. I cannot state confidently, but I think that a very prolonged residence in a hill station might unfit troops proceeding on duty in the plains, in the same way as a long residence in a temperate climate might unfit them for their stay in a tropical one. 13. I think troops should not be removed from the hills to the plains either in the hot season or during the monsoon. 14. As a general rule, I think, that a moderate residence in the hills, with short tours of duty in the plains, the most conducive to the preservation of the health of troops serving in India. The present rule is to let a corps remain three years in a station. I believe it to work well. 15, 16. No experience. 17. I am not aware of any higher ground near this station, which could be advantageously occupied as a hill station. 18. The most unhealthy station which I have as yet known is Banda, in Bundelcund. It is situated in a plain of clay and gravel, interspersed with large hills consisting of water worn granite boulders. 19. I consider 22 or 23 years the best age for soldiers to proceed to India, and the cold season the best period for landing them here. I never did any duty with troops newly landed, having been sent immediately on my arrival in Calcutta in April 1858, on active service in the North-west Provinces; but with freshly arrived troops, I would advise, as a precaution for the preservation of their health, an avoidance of undue exposure to the mid-day sun, employment within doors, and precautionary measures against their visiting bazaars and arrack shops. 20. If soldiers land in India in the cold season, they may get accustomed to the climate even in the plains, but if the hot weather sets in, the newly landed might with benefit be sent to the hills till the next cold season. 21. I have generally known troops on landing to march from the port to the interior, and I think that the present regulations for marching ample in precautions. 22. I deem ten years sufficient for a British soldier to serve in India. 23. I have acted as a member on several invaliding boards, and I think they work well. 24. It would be advisable to send invalids home in February, so that they might arrive in England about the middle of June, or earlier if possible.
Diseases.	1. There are inspection parades for scabies and venereal disease, generally once a week amongst the recruits. 2. I have never seen any scorbutus or scorbutic disease among the troops at this station, but if the disease should show itself, I would advise the exhibition of lime juice.

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*Diseases—cont.*	3. I have only had three cases of hepatic affection in the course of six months, 2 of which were the result of intemperance. The disease is very often caused by exposure to a cold wind when heated by exercise. Any person subject to hepatic disturbances should, in my opinion, avoid cold bathing, stimulants, and exposure to the noon-day sun. Chronic dysentery if unchecked causes abscesses on the liver. 4. I have never seen dracunculus in Burmah, but it is very prevalent in Secunderabad. Whilst I had charge of the 49th regiment Native infantry, as far as I can now remember, the proportion was as high as nine or ten per cent. of total sick, and the cause attributed the water. This I am certain of that the 10th regiment Native infantry stationed in the same place, and of which also I had the medical charge had few, if any, cases of dracunculus amongst them. 5. The proportion which venereal diseases bear to the total sick in hospital from all other diseases is 1 in 9. I am clearly of opinion that the only precautions of any value against this disease are to establish lock hospitals and to institute a strict watch, and health inspections at stated periods over the bazaars and their inhabitants. 6. Since I assumed medical charge of the 32nd regiment of Native Infantry, I have found the most prevalent form of diseases to be, and in proportion, as follows, viz. :— *Fevers.*—Intermittent and remittent - - - 1 in 17 admissions. Dysentery - - - - - - 1 „ 17 „ Cholera - - - - - - 2 „ 17 „ Rheumatism - - - - - - 3 „ 17 „ 7. The most marked nosological character of these diseases, in their asthenic nature, requiring the exhibition, in many cases, of wine and stimulants. They are most prevalent in the commencement and termination of the monsoons. Great heat, combined with an atmosphere overcharged with moisture, precede or accompany their appearance. I have never treated any of the inhabitants of the bazaars, my experience being solely confined to the sepoys, who in this station live in wooden barracks, and not in lines, as is the custom in India; but from what I have seen, I consider the native portion of Moulmein as filthy to a degree. The exposure consequent on their duties, together with the non-nutritious nature of their food, which consists chiefly of rice and dhol, predisposes the sepoys to these diseases. 8. I think that the custom of the sepoys of sleeping on the ground, either in barracks or camps, in a great measure induces epidemic disease. 9. I have never seen small doses of quinine given, either to natives or Europeans, as a prophylactic against malarial diseases. 10. In order to the prevention or mitigation of epidemic disease at this station, I would recommend that cleanliness be enforced in the native parts of the town, a strict supervision of the condition of the barracks, protection, as far as is possible, from the noonday sun, a modification of the uniform to suit it better to the climate, and avoidance of very long parades, particularly in the hot weather.
V. Intemperance.	1. The soldiers at this station are generally temperate, and there are no confirmed drunkards. 2. I have had only two admissions into hospital in six months, resulting indirectly from intemperance. I am unable to give any statistics of the proportion of admissions caused directly or indirectly from intemperance, to the total admissions; but the regiment is a native one, and intemperance is the exception and not the rule. I think that the moderate use of fermented liquors is rather useful than otherwise to Europeans; but at the same time I consider the habit of giving men a dram in the early morning, on the march a bad one: give them rather a cup of coffee and a biscuit. In my own case, I have found it the best plan. Drunkenness is always punished as an offence. 3. No canteen: spirits are sold in the bazaar. Spirit forms no portion of the ration of a native soldier, but the quantity consumed by each man, and its quality, are unknown. The non-commissioned European officers attached to a native regiment are allowed 60 drams per mensem, which is generally drawn by them on indent from the commissariat stores. To the best of my belief, no drinks other than intoxicating drinks are sold in the canteen or bazaar which are injurious to health. 4. As far as natives are concerned, the use of spirits is so trifling that I have never found health injured, or the efficiency and internal discipline of the corps impaired by it. 5. Spirit forms no part of the ration of a native soldier; but, so long as there are licensed shops in the bazaar for the sale of spirits, it is impossible, I think, to restrict the use of it. 6, 7, 8. These queries are only applicable to European soldiers. 9. It would certainly be better to permit only the sale of coffee, tea, &c., in the canteens and bazaars as spirituous liquors are, if taken in any quantity, deadly in an Indian climate. 10. I would advise the prohibition of the sale of spirituous liquors in the canteens; but then the arrack shops should be well looked after, as the men will go there, and, if they must drink spirits, better for them to drink it at a canteen where it is unadulterated, than to poison themselves with bazaar arrack, which often consists of bad spirit, rancid cocoa-nut oil, and sometimes drugged with bhang and chillies. 11. There is no regimental bazaar maintained at this station.
VI. Diet.	All the questions under this head refer to European soldiers; but the native soldiers at this station have excellent cook-rooms, clean and well ventilated; the different castes have a defined portion of the cook-room allotted to them, and bheesties furnish an ample supply of water from the neighbouring wells.
VII. Dress, Accoutrements, and Duties.	1. The dress and accoutrements of the 32nd regiment are according to the regulations on the subject for a native regiment in the Madras army. The men are allowed to convert old coats into jackets, which, with the boat cloak, is used as a guard dress, with cloth or linen trousers, according to the season. The guard accommodation at this station is generally good, and the dress well adapted to the climate.
Duties.	1. Not applicable to native soldiers. 2. From the 15th of May to the 15th of October little or no drill can be carried on at this station on account of the rain. For the other portion of the year there is drill or roll call every morning, and evening drill during November and December (setting up drill). The drills commence as soon after daylight as possible, and from five to six o'clock in the evening, which I consider the best time; they last little more than an hour at a time. The troops enjoy better health during the drill season. They have one holiday in the week.

References to Subjects and Queries.	Replies.
VII. Dress, Accoutrements, and Duties —*Duties.—cont.*	besides Sunday (General Regulations, page 152, para. 6), and five nights in bed during the week. 3. The furthest guard is about one mile from the barracks. Day and night guards last 24 hours, night guards from sunset to sunrise; sentries are relieved every two hours. There is a roll-call by day. At 10 o'clock every night it is ascertained that the men are all present in barracks (absentees are punished), and at a later hour the officer of the day frequently visits the barracks to see whether the men are all then present or not. Night guards at this station I do not consider particularly prejudicial to health. The men are allowed to shelter themselves from rain, and are taught to move about briskly at other times.
VIII. Instruction and Recreation.	The questions under this head are applicable only to European soldiers.
IX. Military Prisons.	1. The solitary cells at this station are properly constructed, and well adapted for the purpose required.
X. Field Service.	1. I am not aware that any local regulations for field medical service exist. 2. I conceive that the opinion of the medical officer, as regards the conduct of the line of march of troops, camping, bivouacking, &c., would seldom or never be at variance with that of the commanding officer, and I am of opinion that in these respects the voice of the medical officer should be attended to as far as possible. 3. Encamping grounds are generally marked by fixed boundaries, but where this is not the case the highest and best ground, with a due regard to the supply of water, is selected by the commanding officer, the medical officer having the power to object to such ground should he see fit. The commanding officer would, I conceive, if possible, attend to the opinion of the medical officer. Horses, cattle, &c., are invariably kept in the rear or on one side of the line of tents of both officers and men. 4. I am unable to answer this question fully, but conceive that one rule, as regards field hospitals, ambulances, and transport of the sick, &c., is applicable to all the regiments in the Madras army.
XI. Statistics of Sickness and Mortality.	No information.
XII. Hospitals.	1, 2. Plan of hospital forwarded. It is placed at about 30 yards in the rear of the barracks, and about half a mile from the bazaar and houses of the civil population generally. The site is open and healthy, and the ventilation free. There are some trees, but they do not interfere with the free passage of air. 3. The water supply, which is derived from a well close by the hospital, is abundant and good. 4. The ground about the hospital is drained by open trenches, which run all round the building, and empty themselves into the ditches on the roadside. The outlet into those ditches is about 18 feet from the hospital. 5. The height of the hospital wards from the ground is four feet two inches, the air having a free passage beneath, as the building is raised on wooden supports. The roof water falls into the before-mentioned drains, by which also the surface drainage is effected. These means are sufficient. The hospital is built of wood; the roof and walls are single, but quite thick enough to keep the wards cool; and the ventilation is ample. There is a verandah on either side of the hospital, nine feet in breadth, and sufficient for shelter, but it is never used for the accommodation of sick, except the wards are full. The hospital consists of one flat. Table of Accommodation. Total number of wards - - - - 3. Total regulation number of beds - - - 30.

Wards, No.	Regulation Number of Sick in each Ward or Hut.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
		Feet.	Feet.	Feet.	Feet.	Feet.	Inches.	Inches.		Feet.	Feet.
3	10	$39\frac{1}{4}$	20	$12\frac{3}{4}$	$14,718\frac{3}{4}$	$1471\frac{3}{4}$	87 by $31\frac{1}{2}$	$18\frac{1}{2}$	6	3	3

The hospital is so placed as to receive the full benefit of the prevailing winds. The windows of the hospital open in the centre, and the ventilation is thorough.
6. The wards are ventilated by the windows and doors, and there is always a free passage of air through them. The jhilmils are the same that are always seen in India.
7, 8. Thermantidotes and tatties are not used in Burmah. There are no means either for cooling or heating the air of the hospital, nor are any such required. The walls and ceilings of the hospital wards are cleansed and limewashed every three months.
9. The privies are distant about 15 yards in the rear of the hospital, and are cleaned out daily. I never heard of cesspits to privies either in India or Burmah. The task of cleaning privies is deputed in Bengal to Mehters, and in Madras to Toties.
10, 11. The native sick always (if able) wash themselves, but when a man is not, one of his own caste does it for him. There is a well in front of the hospital, and plenty of chatties filled with water at the men's disposal.
12. The hospital linen is washed by the commissariat department.
13. The storage is sufficient and dry.
14. The cots are of wood, with bottoms of wood. The sepoy always brings his own bedding (a sutringi) with him into hospital.
15. There is a small kitchen in the rear of the hospital, but it is only used for cooking such extras as are ordered for the sick, such as chickens, mutton, &c. Properly speaking, native sick are not dieted in hospital, but provide their own food, which is cooked in the regimental cookhouses by men of their own caste. The hospital kitchen is a square wooden building, with brick fireplaces raised in the centre, and is ample for what is required.
16. Principal forms of diet tables used in a native hospital are forwarded.
17. Every patient who requires it is provided with an orderly of his own caste. An hospital havildar is appointed monthly.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	18. I am of opinion that the sanitary condition of the present hospital of the 32nd regiment native infantry is good. There have been no cases of hospital gangrene or pyæmia. 19. I have no complaints to make of sanitary defects or deficiencies. 20. There is plenty of ground about the barracks and hospital, in which convalescents may take exercise. The roads are sheltered by trees, but there are no benches. 21. Native troops do not bring their families to Burmah with them. I consider the present hospital arrangements satisfactory. 22. I am not aware of any special local hospital regulations. Every medical officer is guided by what is laid down in the Madras medical code. 23. With respect to the sanitary state of this hospital, repairs to buildings, change of diet, medical comforts, &c., the medical officers have ample powers. They furnish indents for what is required, which indents, on being countersigned by the Deputy Inspector-General of the division, are then passed and acted on. 24. There are no wards or hospitals for convalescents at this station. When a sepoy is put on the convalescent list, he lives in the barracks, and presents himself daily at the hospital for inspection.
XIII. Burial of the Dead.	1, 2. The burial ground for British troops is at the north-east angle of cantonments on the seaside. Its area is about three acres, and is very carefully kept. The drainage is good, and decomposition rapid. 3. There are no regulations as to distance between graves; the directions received at this station from Bengal on the subject of graveyards being to the effect that this and all matters connected with burials shall be left to the discretion of the chaplain. Graves are generally dug about five or six feet deep; they are never re-opened, and one body only is buried in a single grave. There are no rules for interment after death. Epidemics have never prevailed in this station. 4. The graveyard is never offensive. Bodies are generally buried the day after death. 5, 6, 7. The bodies of deceased camp followers and bazaar people are removed by their friends. No injury accrues to the public from the present practices, nor are any improvements to be suggested.

(Signed) H. W. Blake, Lieut.-Colonel,
Commanding Moulmein.
Robert Gordon, Major,
Commanding 32nd Regiment Native Infantry.
J. N. Forlon, Captain,
Executive Engineer T. Provinces.
James T. J. Doyle,
Assistant Surgeon 32nd Regiment Native Infantry.

2nd November 1861.

CUTTACK:—BENGAL CIVIL STATION.

Accommodation—Native Troops. { Artillery - - 1 company.
Infantry - - 1 full regiment.

References to Subjects and Queries.	Replies.
I. Topography.	1. The station is situated on a narrow tongue between the Mahanuddy river and its arm, the Katjooree; its immediate vicinity is flat, but a range of low hills extends north and south, approaching within five miles westward of the station. Beyond these are hills of greater height, covered entirely with jungle. The soil of the station is light alluvium, the rivers which bound it presenting in the dry season vast surfaces of sand. Between the elevated banks of these rivers and the hills is low ground, which here and there is diversified with swamp. The hills above mentioned are thickly overgrown with low jungle, but contain no large timber. The volume of water, whether in the rivers, tanks, or elsewhere, is excessive during flood season, but, though ample for practical purposes, during the remainder of the year does not cover any very large extent. 2. The elevation of the station above the sea varies between 75 and 80 feet, but is, generally speaking, on the same level as the adjacent country. It is 25 to 30 feet above the low water level of the rivers bounding it, but is very little above their high flood level; indeed, parts are below that level, and but for protective works would be inundated during extraordinary floods. About 8 miles from the station, in a north-east direction, is a plateau of laterite ground, 30 or 40 feet higher than the station, but which, owing to the heat given off by the rocky soil, and the difficulty of procuring water, could not be pronounced a more healthy situation for a cantonment. 3. A range of mountains, of which several summits reach the height of 2,000 feet above the station, extends within 20 miles of it. The sides of these mountains are steep and rocky, and they contain little or no table land. Megaseni, in the Nilgurh range, situated about 120 miles N.N.W. from Cuttack, is topped by a table land 3,800 feet above the level of the sea. 4. As stated before, the station is bounded by two arms of a river. It is situated about 50 miles from the coast of the Bay of Bengal. The station itself, and its immediate vicinity, is protected from inundation by embankments and revetments. The neighbouring plains are, however, peculiarly liable to inundation from July to October, and are in ordinary seasons overflowed for short periods during those months. Down the centre of the tongue of land, on part of which the cantonment is situated, lies a flat drainage line, which is a mere swamp during the rainy season, and has been known to produce fever. 5. The station is, generally speaking, fully exposed to the winds, and though interspersed with trees, hedges, gardens, &c., is not so encumbered as to impede ventilation. The buildings are, for the most part, surrounded by trees, but where they are open the reflected heat may,

References to Subjects and Queries.	REPLIES.
I. Topography—*cont.*	to some extent, increase the general temperature of the station. The station is exposed to a land wind during the north-west, and to a sea breeze during the south-west Monsoon. The latter, by modifying the temperature during the hot season, has a salutary effect on the health of the station. The former has been thought to produce the sickness which occasionally occurs during the rains. 6. The neighbourhood is for the most part under cultivation. There are no works of irrigation which in any way affect the health of the station; indeed the district is remarkably devoid of useful works of this character. The cultivation of rice is not prohibited, and in many localities comes up to the very boundary line of the cantonment; but there is no cultivation of indigo or flax. 7. Cuttack, a large town of about 35,000 to 40,000 inhabitants, is situated in the immediate vicinity of the cantonment, occupying one bank of the tongue of land already referred to, the other bank of which is occupied by the cantonment. The extreme width of this tongue is two miles. 8. The district consists of an alluvial delta resting on hills of gneiss, the bases of which are surrounded by platforms of laterite. Cuttack having been the capital of the province of Orissa under former governments, and a very important city, it is probable that the ground covered by the present station was formerly occupied. Indeed the most conspicuous object within the cantonments is the Old Mahratta Fort. 9. Water is usually found at a depth of from 25 to 30 feet below the surface, the rise and fall being chiefly dependent on the rise and fall of surrounding rivers, during the dry and rainy seasons respectively. 10. The drainage water flows off pretty readily, but owing to the permeability of the soil, a considerable quantity must pass off through the subsoil. It does not ooze out near the station, as it finds its way into the adjacent rivers. A portion of it also drains into the numerous tanks which cover the surface where it undergoes evaporation. There is no higher ground adjacent the drainage from which passes into the subsoil of the station. 11. The water supply is derived from the river and wells, and is also stored in open tanks, the larger of which are for the most part full throughout the year. The tanks abound in confervæ, and the usual water plants; most of them contain fish, but there is no peculiarity worth noticing in their fauna or flora. The tanks are generally used without distinction for drinking, bathing, and other purposes, with the exception of those in the cantonment, in the immediate vicinity of the hospital, one of which is used for drinking and the other for bathing. Especial care is taken that these tanks suffer no pollution from leaves or other impurities falling into them; but such precautions are not used with reference to other tanks. A ditch surrounding the fort is believed to produce occasional malaria. The means of removing the nuisance is at present under contemplation. Various tanks not under the military authorities become offensive during the hot season. 12. The water supply is sufficient; that from the river and wells is limpid, and devoid of any offensive qualities. It is hard, owing to the admixture of saline matter, &c., but no analysis having been made, its chemical composition and microscopic character cannot be stated. There is at all seasons a sufficient supply of pure and good water, and no measures are required to increase the supply or improve the quality. 13. No reply to this query. 14. The formation of new cantonments in this district has not for many years occupied the attention of the authorities on any large scale. The station of Sumbulpore was occupied as an important military position without reference to its sanitary conditions, and the amount of sickness has, as might have been expected, been considerable.
II. CLIMATE.	1. A thermometer and rain gauge are supplied by Government for conducting meteorological obvervations; but the only barometer in the station is the private property of the civil surgeon. 2. No reliable record exists in the office of the civil surgeon for any lengthened period from which any trustworthy data could be drawn to prepare a meteorological table. 3. The climate of Cuttack, judging from the health of the residents for a period of nearly six years, may be considered on the whole healthy, the sickness witnessed among Europeans being for the most part traceable to fevers, &c., contracted in the neighbouring hills on duty. For two weeks during the hot weather in May the heat is excessive. The cold weather is very pleasant, the lowest range of the thermometer being between 55° and 60°. No admixtures, such as dust, &c., affecting the atmosphere, are experienced in the vicinity. No extraordinary precautions regarding diet, shelter, clothing, drill and duty are required at this station. The most healthy months are December, January, and February, and the most unhealthy May and June in the dry seasons, and when the pilgrims to Juggernauth are numerous, during which period cholera and small-pox rage, and September and October during the rains when fevers prevail. 4. Pooree or Juggernauth, 53 miles due south on the sea-coast, is more healthy than the station, but only in the hot months, March, April, May, and the first 10 days in June, owing to the south-west monsoon. It is not, however, adapted for a permanent residence, owing to the relaxing nature of the climate. 5. I have served at Pooree and Cuttack, but the latter station is superior in a sanitary view, owing to the reasons above given.
III. SANITARY CONDITION OF STATION.	1. 2. A map of the adjacent country and plan of the station are transmitted. 3, 4, 5. There are no barracks in use at the station; but in the vicinity there is a low range of dome-roofed buildings, formerly occupied by European cavalry, and now made over to the military police. 6. The Madras sepoy sleeps on the bare ground, sometimes with a mat, and his coat between it and him; now and then he provides himself with a country cot—in Burmah and the Straits invariably. 7. The Madras private native tent is a very simple structure; a cross pole on two uprights in the centre, from which fall the folds in oblong form, containing by regulation 25 men and their arms. Their length is 22 feet by 12 feet broad along the ground inside; the height of the upright poles is 10 feet, and length of the cross-pole 10 feet. 8. The tents are open all round below and at the entrance, and cannot be sufficiently shut down in wet weather. Huts and guard-rooms are well ventilated both by day and night. The ventilation of the tents is always sufficient, and at times too great.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	9 to 16. No barracks at Cuttack. The native hospitals are reported by the medical officer to be dry. The station is considered particularly free from foul ditches or other receptacles of noxious matter, with the exception of those noted (Question 11, Topography). 17. Defects in the state of the surface cleansing of the cantonment have been lately considerably removed, and, unless at very great expense, little more could be done. 18. The surface of the cantonment is kept particularly free from vegetation; hedges are kept at the regulation height, and neither these nor brick-walls interfere at all with ventilation. 19. The cantonment bazaar occupies the highest ground in the station, and therefore possesses facilities for drainage. It is thought, however, that the most has not been made of these, and that the sanitary condition, with reference to ventilation and crowding, is not so perfect as it might be. The water supply is abundant. No written bazaar regulations are found existing at this station. Some simple regulations, as far as lies in the power of the commanding officer to frame, will be made for the preservation of cleanliness, the prevention of crowding, and for the general conservancy of the cantonment. Upon the whole, however, the abodes of the natives are as cleanly as may be seen in any Indian town. 20. About 15 sheep are daily killed near the bazaar; this is certainly a nuisance, and a more desirable spot will be selected as soon as possible for a slaughtering place. 21, 22. There are no bazaar horses, nor artillery nor cavalry stables. The Karkhana bullocks have a good shed, and are kept very clean and sweet. The manure is sold. 23. No reply to this query.
Officers' Quarters.	1. The officers' quarters consist of ranges of thatched bungalows, situated in spacious compounds on the high banks of the river. The drainage is natural, and the ventilation free. No improvement in them can be suggested.
IV. Health of the Troops.	1. I am of opinion that the station district and adjoining native population are on the whole healthy; and when cholera and other fatal epidemics appear, they are traceable to the numbers of pilgrims who pass through this district on their road to Juggernauth. 2. The most prevalent diseases among the native population are cholera, elephantiasis, and enlargement of the spleen, dependent on fever. 3. The cheapness of the necessaries of life, proximity to the sea-coast, and abundance of good water throughout the year, make the district healthy. 4. The native infantry regiment at present in this station came from Russelcondah, where they had been about one year and ten months. The regiment left for Cuttack on the 1st December 1859, and arrived on the 19th of that month. The most prevalent diseases at Russelcondah were fevers and rheumatism; but there appears to have been no unusual amount of sickness. On arrival at this station they were in good health, and the principal diseases since that time have been fevers, rheumatism, and bowel complaints. I am not aware of any portion of the accommodation here being more unhealthy than others. 5. The troops are not camped out. 6 to 17. No experience of hill stations. 18. I have not had sufficient experience to say which is the healthiest class of surface and subsoil for stations. 19 to 24. No replies to these queries.
Diseases.	1. Inspection parades for the discovery of incipient diseases are not usual among native troops. 2. No scorbutic disease has been seen by me at this station. 3. Very few cases of hepatic disease come under treatment here, and those which do occur are chiefly secondary to fever, and therefore, the prophylactics adapted to the latter would be best. 4. Dracunculus is not seen at this station. 5. The average of venereal diseases usually under treatment is about 3 per cent. of the total in hospital. It would be highly advantageous in my opinion to have lock hospitals at every military station. 6. At this station diseases of the endemic or epidemic class, with the exception of fever and rheumatism are not frequently met with. Intermittent fevers are most prevalent; dysentery cases are few in number, and small-pox seldom prevails among the troops, as they are generally protected by vaccination. Cholera is rare, only one case having occurred among the troops during the last two years. There are no statistics available from which to furnish the proportion of admissions and deaths from these diseases to the total of admissions and deaths. 7. Intermittent fevers, the only zymotic diseases generally prevalent at this station, present no unusual nosological character. These diseases are usually most prevalent after the commencement of the rains, and in the cold seasons, and are usually preceded and accompanied by cold and dampness of the atmosphere. The sanitary condition of the bazaar is good in every respect, and I am not aware of any personal habits among the troops or native population which appear to predispose to these diseases. 8. This query is chiefly applicable to European troops of which I have no experience. 9. Quinine is not usually used as a prophylactic against malarial disease. 10. Ordinary attention to drainage, cleanliness and other sanitary requirements, appears to be all that is necessary to prevent, or mitigate epidemic disease at the station.
V. Intemperance.	1. The native soldier is very temperate in general; there is not a confirmed drunkard among them, nor among the drummers and band men. 2. A sepoy is occasionally drunk and is punished for it. It must be confessed that when separated from their families across the water, a considerable number of sepoys take to drinking, but not inordinately,—though occasionally brought to a court-martial for drunkenness on or off duty. 3. No shop for the sale of arrack or toddy now exists in the cantonment limits. 4 to 11. These queries are left to men more experienced in European troops to answer. It is of no use to add to the immense quantity of opinions that will be forthcoming from other quarters.
VI. Diet.	No information under this head.

References to Subjects and Queries.	Replies.
VII. DRESS, ACCOUTREMENTS, AND DUTIES.	1. This question has evident reference to European soldiers. The dress of the sepoy cannot be altered for the better, taking all things into consideration. His commanding officer sees that he is clothed suitably to the season of the year, and still according to the regulations. The sepoys' carpet and greatcoat improvise sufficient protection against sudden changes of weather by day or night.
Duties.	1, 2, 3. At this station, as regards drill, the natives are out mostly in the morning, with parades for inspection, &c. in the evening. As respects duty, the sepoy here has four nights at home, and the night guards have no particular effect upon him. The treasury guard is two miles from the lines commanded by a native officer.
VIII. INSTRUCTION AND RECREATION.	1. Cricket is somewhat affected by the sepoys, and much encouraged by some of the European officers. An English school for the sepoys has just been commenced. The master is a certificated one and 2nd master of the Cuttack Government school. 2, 3. No reply to these queries. 4. The native troops are well furnished at this station with sheds for exercise, and shaded by trees.
IX. MILITARY PRISONS.	1. The solitary cells (three in the fort) are clean, well ventilated, with nothing in them to prejudice the health of the sepoys placed in confinement, which is never for more than seven days at a time.
X. FIELD SERVICE.	1. There are no special local regulations for field medical service. 2. Although the medical officer is of the greatest importance on the line of march, and in the field as regards his professional duties, yet his powers do not go far, because in a line of march the course is stereotyped, and there is no room for change. In the field everything depends on the commanding officer. As regards the appearance of epidemics in the camp, the advice of the medical officer may be said to be authority. 3. In India, it is difficult to find any other than the encamping grounds where regiments, year after year, have pitched their tents. These have been selected with the greatest care, by the quartermaster-general's department, with reference to openness, sufficiency of space, and supply of water. The medical officer can do no more than call upon the commanding officer to keep the camp clean; which is enjoined by regulations with ample detail of instructions. 4. No reply to this question.
XI. STATISTICS OF SICKNESS AND MORTALITY.	No information on this subject.
XII. HOSPITALS.	1, 2. The hospital is situated at some distance from the bazaars, on an open and somewhat elevated site. It is freely ventilated, favourably situated as to drainage, and free from sources of malaria. 3. The water supply is abundant and wholesome. 4. The drainage and sewage from a native hospital are small. 5. The ward is raised about 2 feet from the ground; but has no arrangement for the perflation of air beneath the floor. The roof water is carried off and sinks into the subsoil. The drainage is amply sufficient to carry off the fall of rain. The hospital is pucka building, with a thatched roof, which, as well as the walls, is single. They do not admit of ventilation between them; but the walls are sufficiently thick to keep the hospital cool. It is surrounded on all sides by broad verandahs amply sheltered from the sun by bamboo tatties; these are occasionally used for the accommodation of sick and convalescents.

TABLE of Hospital Accommodation.

Date of construction, 1833.
Total number of wards, 1.
Total regulation number of beds, eight per cent. of the strength of the corps: in case the sick exceed this number, the men are allowed to bring their own cots (*vide* D. P. W. Code.)

Wards, Number.	Regulation Number of Sick in Ward.	Dimensions of Ward.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
One long apartment, measuring 118 feet in length and 22¾ feet in width.	Can accommodate 40 comfortably.	118 feet.	22¾ feet.	Between floor and ridge plate 20 feet. No ceiling.	42,762 ft.	1069	92	16 inches	16	7 feet	4 feet

The prevailing winds blow over the hospital. The windows afford fair ventilation and open by an upper and lower compartment.
6. Ventilation is effected by means of the doors of windows which surround the hospital, and also by means of openings in the roof which are sufficient to preserve the purity of the air in the ward. There are no jhilmils.
7, 8. There is no apparatus for cooling or warming the wards. The walls of the hospital are whitewashed twice a year.
9. There is one privy situated close to the hospital on the west side; a pucka building, with openings in the walls for the admission of fresh air. There is proper drainage, and it is flushed with water several times a day, by which means it is kept pure.
10. No lavatory arrangements exist in native hospitals.
11. There is a tank for bathing in front of the hospital, and an abundant supply of water for warm baths when required.
12. The means for washing and drying hospital linen is provided for by the commissariat agent.
13. No storage at this station.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	14. The bedsteads used in hospital are the common wooden charpoy of the country. The bedding is sufficient; but the number of cots allowed is insufficient for the hospital at this station. 15, 16. These questions apply to European hospitals only. 17. There is an hospital havildar for attendance on the sick, and orderlies are supplied by the commanding officer on the requisition of the medical officer. 18. The sanitary condition of the hospital is on the whole good, and no epidemic disease, hospital gangrene, or pyæmia have appeared in the wards. 19, 20. Nothing to suggest in reply to the queries. 21. The sick wives and children of soldiers are attended by the medical officer, whenever Sepoys make the request. 22. Only the Presidency Medical Regulations are enforced as a general rule;—special ones are issued when necessary. 23. Medical officers as a rule have the full co-operation of the commanding officer in regard to matters appertaining to the sanitary state of the hospital, to repairs of buildings, &c. 24. There is no ward or hospital for convalescents; but such provision for convalescent patients would be highly advantageous at all stations.
XIII. Burial of the Dead.	1. The cantonments burial ground for the use of the European community is situated on the bank of the Mahanuddy, half a mile to the westward of the cantonment. The prevailing winds do not, however, blow over this ground in the direction of the station. 2. The area of the burial ground is 62,712 square feet. The soil and subsoil are light alluvium, and the drainage is effected naturally owing to the position on the high river bank. The ground is carefully kept in order, under the superintendence of the chaplain. 3. The usual space allowed for graves is 3 feet by 9 feet; but more is generally taken; the interval between them is 3 feet, and the required depth not less than four feet. Graves are not reopened unless vaulted, and no bodies have been interred above previous interments. There is no compulsion as to time of burial; but it generally takes place at ordinary times within twenty-four hours after death, and during epidemics as soon as preliminaries can be effected. In native burial grounds the corpse is interred within three hours of decease, often sooner, such is the custom of the Mahommedans. 4. The graveyard has never been found offensive. 5. The Hindoos burn their dead at the river far from the cantonment—the Mahommedans bury their dead at once, four or five feet below the surface, in a burial ground within the cantonment, used under the Mahratta government. 6. Notwithstanding that the Mahommedan burial ground has been buried over four or five times, no injury has accrued to the public. They (the Mahommedans) do not disturb ground in which bones can be found. 7. The government and no other authority might regulate burial grounds. All burial grounds should be at a distance; but this cannot easily be effected in the case of Mahommedans. However, the Mahommedan burial ground in the cantonments, and also that appropriated to R. C. native Christians are being closed, and new sites considered for them at a distance.

I. Topography.	1. The country to the south of the station consists of clay hills intersected by ravines, forming a fine natural drainage, while to the north and east is a sandy flat covered with thin vegetable soil, below which is sandstone. The barracks and hospital are built at the edge of the sandstone plateau. The lines themselves comprise a space of cleared ground of about 40 acres, surrounded by jungle and forest, the former of which abounds in the settlement; the other portion of the island being covered with large forest. Some of it is 300 feet high. 2. The elevation of the station above the sea is 108 feet. The ground on which the lines stand is the highest of a series of undulations, which gradually diminish in height until half a mile distant, to the south and south-east, where they terminate at a plain which occupies the remaining extent towards the harbour and bay. The plain varies from 10 feet to 2 feet above the sea bed, and is in some parts submerged at high tides. To the north and west the primeval forest overtops the cantonment from 50 to 200 feet on all sides. A tolerably large river extends down the centre of the island from north to south. The low land forming the northern boundary of the harbour was originally almost entirely swamp, a considerable portion of which has been reclaimed between the lines and harbour, but much yet remains to be done. There is no higher or healthier ground in the immediate neighbourhood of the cantonments than that on which the station stands.

LABUAN.
MADRAS.

References to Subjects and Queries.	REPLIES.
I. Topography—*cont.*	3. The highest ascertained elevation on the island is merely a narrow ridge, 300 feet high, at the north-east end of Labuan. It is distant about six miles from the station. 4. The island of Labuan which is about 30 miles in circumference contains numerous streams flowing to the sea, which overflowing their banks, form numerous swamps in the interior. The harbour to the south and south-east of the lines is distant about 1½ miles by the road. The sea approaches to within a mile and a half to the north and north-east, the intervening space between it and the station being filled with jungle and forest. The vicinity of the station is not liable to overflow. The ravines which exists near the lines have been lately cleared from secondary jungle, and the health of the troops has been thereby materially improved. 5. The station is generally open. The forest referred to approaches to within about 800 yards of the lines to the south and west, but as the forest is very close, and consists of trees averaging 200 feet high, which effectually prevent any dense undergrowth, its proximity is probably an advantage as it does not inconveniently intercept ventilation, yet prevents the approach of malaria from the swamp beyond. The temperature of the station is not raised by the buildings being exposed to reflected sun-heat. The north-east monsoon which blows for three months, and the south-west monsoon which lasts for six months, are the prevailing winds to which the station is exposed. These breezes refresh the European resident, and contribute essentially to the coolness of the climate, but the Indians, from want of proper clothing become chilled by them, and they often cause a recurrence of fever and ague. 6. There are no works of irrigation near the station, and there is no cultivation of either rice or indigo on this side of the island. 7. The town of Labuan, principally inhabited by Chinese and Klings, is situated close to the harbour about two miles from the lines. 8, 9, 10. No replies to these queries. 11. The water supply of the station is derived from wells, no tanks of any description existing in the settlement. 12. The water obtained at the station is good, but in the dry season there is sometimes difficulty in procuring sweet water, as deep wells have not been dug near the lines; good water is, however, procurable at a short distance. [*N.B.* Since the above was written, a deep well has been sunk at the lines, which it is expected will give a never-failing supply of water.] The water at all seasons is wholesome. It is raised from the wells for distribution by buckets. 13, 14. No replies to these queries.
II. CLIMATE.	1. The instruments available for meteorological purposes here are a common thermometer, and a rain gauge at the hospital. 2. The following is a table of meteorological observations and irregular remarks extending over a period of nine years. The partially correct remarks are made from 1st May 1858 to 30th September 1858; the more correct observations being from 1st January 1860 to 30th April in the same year.

Months.	Barometer Mean.	Mean Temperature at Noon.	Mean Daily Range.	Mean Maximum.	Mean Minimum.	Mean Dry Bulb.	Mean Wet Bulb.	Mean Sun Temperature.	Rain, Inches.	Winds. Direction.	Winds. Force.	Days of Sunshine.	Remarks as to Cloud, Dew, Wind, Storms, &c.
Jan. -	None in the station.	82°	10°	87°	77°	All observations have been made here by the dry bulb as just given.	Not used here.		*3·25	N.E.	Moderate occasional high winds during 3 months.	Rain generally falling at night.	An entirely cloudless sky is seldom seen here, although the days of entire observation are comparatively rare—heavy rain generally falls at night, so much as 4 inches have been known to fall in as many hours. The monsoons are steady and strong, frequently interfered with by the land and sea breezes during the early part of the day; towards afternoon the monsoon generally resumes its force; thunder storms are frequent and severe about the season when the monsoons change, and occasionally at other times, attended with heavy squalls of rain and wind, but seldom lasting more than an hour at a time.
Feb. -		83½	9½	88	79				4·75	N.E.			
March		83	14	90	76				3·5	N.E. and variable.			
April		83	12	89	77				12·5	Variable.			
May -		83½	17	92	75				4·0	Variable S.W.			
June -		Mean during the year may be taken at 84°.	Mean during the year may be safely taken at 12°.	Mean maximum during the year may be taken at 88°.	Mean minimum during the year may be taken at 77°.				14·80	S.W.	Brisk monsoon.		
July -									13·4	SW.			
Aug. -									2·43	S.W.	Occasionally high squalls from South.		
Sept. -									6·47	S.W.			
Oct. -									7·22	S.W.			
Nov. -									8·89	Variable N.E.			
Dec. -									17·97	N.E.	Typhoons to the North, seldom more than the "tail end" reaches Labuan.		

* This fall of rain is unusual for January, which in some years has been so dry that water was with some difficulty procurable, but when such has been the case December or some other month has made up the difference, so that the yearly average holds good, viz., 130 to 200 inches a year.

References to Subjects and Queries.	Replies.
II. Climate—*cont.*	3. Like all equatorial regions the climate is moist, and the air for the greater part of the year much saturated with moisture, but while the north-east monsoon blows the air is dry and the general health of the inhabitants and troops materially improve. At all seasons vegetation is rapid and the grass evergreen. The great amount of sickness amongst the troops for the last few years has caused the duties to fall heavy on the remaining few, who were themselves debilitated by the same disease, so that extra drills or duties, except those absolutely necessary, would be injurious at a very unhealthy season when upwards of 70 men were unfit for duty. The guards were obliged to stand for two or three consecutive days without relief. On such occasions, which happily seldom occur, the necessary parade of arms cleaning is all that can be expected. The troops at Labuan receive sea rations, which are forwarded by the Commissariat at Singapore, salt fish has not been received lately, the voyage spoils it; and the compensation received is not sufficient to buy fresh fish daily. The experiment was tried of introducing a breed of goats on the personal responsibility of the Commanding Officer, but on account of the great price and small number procurable it failed to be of much benefit. Warm clothing is most essential to the climate, and it has been found most conducive to health that the men should mount guard in their red jackets; but what is in my opinion most essential is a more substantial ration. If fresh fish was issued to the men daily, and the men enabled to purchase goats at a reasonable price the object would be attained. There can be no doubt that a body of men not hampered by caste prejudices are the best for service at Labuan. The most unhealthy months at this station are July, August and September, the months of November, December, January, and February being the most healthy. The returns for the last eleven years show that no reliance can be placed on any data which affix a healthy or unhealthy character to any particular months. The months which one year have been most healthy have proved directly the reverse in another, but, so far as a rule can be laid down, the period of the south-west moosoon is said to be the most healthy. I should say, however, that any season which affords just enough rain to keep the pools and puddles damp is the most unhealthy, excessive rain or heat being both healthy. Fever is the prevailing disease during the unhealthy months and is attributable to the miasma of the marshes adjacent. 4. I cannot say whether there is any more healthly district than that of the station in the neighbourhood, but I believe a residence at any of the points marked respectively 1, 2, 3, 4 and 5, (on the sketch accompanying the original) in their order of merit would during the season when the wind comes off the sea in the particular directions be perfectly healthy. Four of these districts are entirely uncleared at present, but the extent of forest is small. No. 1 (north) would be best in the north-east monsoon; No. 2 (south-east) in the south-west monsoon, and both would have the full advantage of the land and sea breezes, which blow nearly north-west and south-east. All except No. 5 (south-west) present sandstone cliffs of 30 to 50 feet in height at the sea beach, rising gradually inland. No. 5 rises gradually from the beach to about 80 feet in a central ridge. 5. Assistant Surgeon Fraser was at St. Thomas' Mount for three months, the climate of which is moderately healthy. He was in the Indian navy for two years; at Singapore four months for native troops; Labuan 13 months. This station has been extremely unhealthy as regards the prevalence of fever, but I attribute this entirely to the fact that a large portion of the settlement is covered with dense secondary jungle, decaying (felled) forest trees and swampy ground. Immense improvements have, however, been made within the last three years, and the works this last year appear to have overtaken (so to express it) the deleterious influences; and should they progress as rapidly as I have no doubt they will do, a year or two years more will see the settlement perfectly healthy, the climate being the most salubrious I ever have experienced.
III. Sanitary Condition of the Station.	1, 2, 3. A plan of the cantonments showing the position of the various buildings, &c. is transmitted. 4. Table of Barrack Accommodation.

Date of construction, 1850.

III. Sanitary Condition of the Station—*cont.*	5. There is one small window at each end of each building, and four doors on each side opposite to each other. Verandahs are placed on either side of the barracks, but they are never used as sleeping quarters by soldiers or other persons. The buildings are supplied with properly constructed jalousies and jhilmils. 6. Broad cots are used for sleeping purposes in the barrack. 7. There are no tents in use at Labuan. 8. The barracks, &c., are ventilated by the doors and windows, which are sufficient to keep the air pure by night as well as by day. No artificial means are in use for the purpose of cooling the barrack rooms. 9. The barracks are constructed of attap and boarding. 10. The floors, which are boarded, are raised 5 feet from the ground, and admit of a free passage of air beneath. 11. The materials used in the construction of the barracks, &c., are suitable to the climate. The buildings in the cantonment are kept in repair by the government of Labuan, through the Colonial Surveyor. The Commanding Officer is responsible for the general sanitary state of the cantonment. The barracks have walls of kadjung (leaf of palm); but since the above was written boarding has been fastened round the barrack rooms, and the old walls removed. 12. There are no lavatories or washing places for the men. 13. The cook-houses are under one roof, the building being constructed of attap and bamboo with kadjung roof of attap or leaf of palm. The water for culinary purposes is procured from a well close at hand. There are no places erected for washing and drying linen. Native dhobees or washermen wash the clothes at the streams in the usual Indian fashion, and dry them on clothes lines or bushes. So long as the dhobies are not sick and do their work, the wants of the station are supplied; but often the men are sick, when much inconvenience is then experienced by the troops. 14, 15. There are no privies or urinals attached to the barracks, nor are the latter buildings lighted at night. 16. There are no arrangements for draining or sewering the barracks, except to take off the water from the roof, the natural drainage being sufficient for the purpose. No part of any building used as a barrack or hospital is at all damp. The ditches which existed near the station have been lately cleansed and cleared, and the government are about to thoroughly drain and cleanse the vicinity of the lines; at present, and heretofore, the rain has remained on the surface. 17. The surface cleansing within the cantonments is performed by working parties, who are employed, while the state of the health of the men will permit, to cut down all rank grass and weeds from the parade ground. The latter requires draining in order to permit the growth of good grasses. 18. The surface of the cantonment is kept clear of all vegetation with the exception of grass. It is desirable that cattle should be allowed to graze on the cantonment to keep the grass short. There are no old walls, thick hedges, &c., to interfere with the ventilation of the station. 19. There is no bazaar or native houses at the station. 20. Fowls are killed at the cook-houses, but no nuisance is experienced therefrom. 21, 22. There is no stabling or picketing ground at Labuan. 23. No quarters for married Europeans exist at the station; and natives leave their families in India when on foreign service.
Officers' Quarters.	1. There are no officers' quarters at the station.
IV. HEALTH OF THE TROOPS.	1. Labuan when first settled in by the British, in 1846, was an uninhabited island, covered with a dense forest, and the low country adjoining the harbour was a brackish swamp. Remittent fever of a deadly character prevailed for a long time, gradually becoming milder and assuming an intermittent character, as drainage and clearing progressed, until in 1850-1-2 the station became very healthy. From that time, however, secondary jungle sprung up rapidly, and the large timber which had been cut down in former years became rotten; fever supervened, and increased yearly in severity and extent until in May, June, July, and August 1859 it reached its maximum, since which time the sanitary improvements have overtaken the disease, and give rise to a prospect of the station becoming a healthy one. The native population is healthy. 2. The disease most prevalent amongst the natives is short and mild attacks of intermittent fever, generally accompanied in chronic cases by enlargement of the spleen. In one case (a Chinese) I found the spleen weigh after death 2¾ lbs. (avoirdupois). Fever amongst the Malays is however by no means prevalent, but it is common with all new arrivals, Chinese or Indian. 3. The healthiness of the native population is to be attributed chiefly to the peculiar genial climate, and the almost constant prevalence of a cool breeze, the temperature seldom rising above 83°, nor falling below 76°. The nights are always cool, and the houses, which are all raised on posts from 2 to 4 or 5 feet from the ground, are airy and well ventilated. The floors of these houses are composed either of rough open boards or "lantees" (*i.e.*, stout laths made from the hard nebong palm,) admitting air freely. The frequent extremely heavy showers which carry off the refuse very quickly, also materially contribute to the healthiness of the population, and it may be safely said that life is never shortened by hard work or sedentary employment. The lower class of Chinese inhabiting the greater portion of the town of Labuan are a dirty set of people, and although their houses are for the most part more commodious than those of the Malays, they are not raised nearly so high from the ground as the latter. Quantities of filth also accumulate underneath the former, which the Chinese are very loath to remove when ordered to do so by the police. 4. The troops here were previously stationed at Penang for 18 months, during which time their health was very indifferent. The present detachment arrived here on the 24th April 1859 in an average state of health; several of the troops had had previous attacks of fever, and about four suffered from ill-conditioned ulcers, which, however, soon yielded to treatment. The prevailing diseases among the troops since their arrival have been intermittent and

References to Subjects and Queries.	Replies.
IV. Health of the Troops —*cont.*	remittent fevers. During the process of clearing certain ravines in their vicinity, the artillery barrack and hospital were, in May, June, July, and August last, very unhealthy; but since then, they have been very healthy. A considerable amount of jungle and waste land remains to be cleared, until the completion of which fever must prevail more or less; but when that time arrives, I believe the station will be probably the most salubrious one in the foreign service of the Madras presidency to all persons who do not purposely visit the swamps in the interior of the island which are now separated from the settlement by an extensive forest, thus effectually preventing the spread of malaria. 5. The troops at the station are never camped out. 6, 7, 8. I have no experience personally of hill stations, but, from the opinion of others, and personal connection, I believe hill stations highly desirable for Europeans, but of questionable utility to natives of India, unless recruited from hill districts. Their utility will also in the case of Europeans depend greatly on age, length of previous residence in the plains, and predisposition to certain diseases, as dysentery, diarrhœa, &c., which in old Europeans, resident for many years in the plains, might be aggravated. To the young and vigorous recruit, however, I believe they would ensure a higher range of health than even a residence in England. 9. The diseases peculiar to hill stations with which troops are liable to be attacked on going to them are coup-de-soleil from incautious exposure to the sun, which some are apt to forget is still tropical; and an aggravation of certain diseases contracted on the plains, as some forms of diarrhœa, dysentery, bronchial affections, &c., but even some of these are benefited by hill residence where the constitution is good. 10. Proper and suitable protection to the head, and avoidance of undue exposure to the sun are the precautions necessary to be observed on going to hill stations in the first case, and in the latter, the use of comfortable clothing, especially over the abdomen and vital organs; moderate exercise, and avoidance of night chills when sleeping are essentially necessary. 11 to 15. No experience of hill stations personally. 16. The range of elevation most suitable for hill stations will depend greatly on the proximity to or distance from the sea, as well as on the local amount of exposure to the prevailing winds. At Penang the hill rising 1,250 feet above the level of the sea, has been found extremely beneficial in many cases of tardy convalescence from tropical diseases, and as a restorative in all cases suffering from climate without real disease. 17. There is no higher or healthier ground near the station in the British territory which could be advantageously occupied as a hill station, but there is a splendid range of hills on the Borneo coast, about 30 miles inland. The country is only inhabited by wild tribes, Kyans, Dyaks, &c. No roads exist, but river communication extends to the foot of the ranges, which rise to about 8,000 feet. The climate has been described to me as excellent. 18. I believe the light sandy loam which prevails over the greater part of this settlement to be very healthy for stations, so soon as it is properly cleared and becomes covered with a firm turf of grass, but in a state of nature it is covered with from three to six inches of loose spongy partially decomposed vegetable deposit, principally roots of ferns and rushes, which retaining moisture emit unhealthy exhalations. 19. British soldiers proceeding to India should be from 20 to 26 years of age. Those destined for Madras should land there from the end of August to the beginning of November, and those for Calcutta in October. With regard to the best period of the year for landing in Bombay I have no experience to speak from. 20, 21. A previous residence at some intermediate station, or at an Indian hill station, would be beneficial before coming to India. 22, 23. A soldier of good constitution may serve 25 years in India, but 10 years with a change to a temperate climate would be better. As a rule 12 years of uninterrupted service ought to be the maximum period. 24. Invalids leaving India for home, if they leave by first-class vessels of 1,000 tons and upwards, such as those of Messrs. Green, Smith, Wigram, and Co., should depart from Madras on the 1st February; in smaller vessels at the end of December; the object being to pass the Cape of Good Hope in summer, and arrive in England by the end of April. Many lives are however lost by having to wait until the detachment embarks, which might have been saved by immediate embarkation, without reference to the time of year; but as this might often be impracticable, even if sanctioned, I am of opinion that an hospital ship stationed in the Bay of Bengal, to receive at all times cases recommended for such change of air, would be of incalculable benefit. She might cruise about occasionally and proceed to pick up patients at Madras, the Sand-heads (Calcutta), and Rangoon, avoiding bad weather, which from the known regularity of the atmospheric phenomena in the Bay of Bengal can be confidently achieved. Many cases would thus be cured without sending them to England, and such as were not might be sent in the regular seasons at a time stated. During nearly two years' service in the Indian navy in a vessel constantly carrying sick and effective troops across the bay, I was often struck with the remarkable improvement in many cases, even in a week's voyaging, both in Europeans and natives.
Diseases.	1. No regular inspection parades for the discovery of incipient diseases are held at the station, there being no necessity for them. 2. I am not aware of any case of scorbutus having occurred at this station. 3. Hepatic diseases (as are almost all others except fever) are rare in Labuan. Congestion of the liver occurs in the cold stage of intermittent fever, but rarely becomes serious. As fever disappears with the progress of the sanitary improvements under operation, these cases will become very rare. For several months last year, when I had no quinine, I was obliged to use indigenous remedies of little value, and cases continued to have daily paroxysms of fever, in many instances for six weeks, the liver and spleen becoming seriously implicated; but in cases where quinine is available to cure them in five or six days, such complications are rare and seldom serious. 4. Dracunculus is unknown in Labuan, and, I believe, also in this part of Borneo. 5. Venereal disease is very rare at this station, no case having occurred during the past year. In stations where it does exist I would recommend attention to the very earliest symptoms to be enforced on the men, the non-compliance with which should subject the patient to hospital stoppages during his treatment, but no stoppages should be exacted from such as

IV. Health of the Troops —*Diseases—cont.*	apply for medical aid immediately on the discovery of the disease. The establishment of a lock hospital *for females* would, I believe, be most advantageous; but some coercion or inducement to enter would be requisite in most cases. Free ration and careful seclusion might be sufficient incentive in many instances, but they would have to be invited or ordered to enter. 6. The troops at the station suffer from diseases of the following class :— *Fevers.*—Remittent fever in unhealthy seasons; intermittent fever, more or less severe, all the year round, but principally amongst such as have had previous attacks. It also attacks all new arrivals. *Dysentery* is rare, and generally occurs as a sequel to fever in debilitated subjects. *Cholera* is unknown. *Small-pox* is unknown. Vaccination has been frequently attempted, but never succeeded. *Rheumatism* is much less common than would be expected in so damp a climate, and where it does occur it generally yields to treatment. 7. Fever in unhealthy seasons generally attacks natives from one to three months after their arrival in Labuan, the attack being ushered in by languor or lassitude, pain in the back and limbs, and often rigors, followed by heat of skin, usually lasting from four to six hours, terminating in a perspiration more or less profuse. The type varies from the severe remittent form, with urgent head symptoms, &c., to mild ague, generally quotidian. These attacks usually recur monthly where quinine is not available in the treatment, and even in obstinate cases where it has been used, the disease often re-appears for several months in succession. The intervals between the extremely dry and wet seasons are the most unhealthy, generally at the changing of the monsoons in May and November; but these phenomena are very irregular and uncertain in Labuan, the land and sea breezes from the Bornean coast often modifying both monsoons. The troops live in four roomy and well-ventilated barracks, which are kept clean. The drainage is imperfect on the immediate area on which the buildings are erected, but deep ravines adjoin, and water soon percolates through the loose sandy soil. The water supply is obtained from streams and shallow wells; that from the former is generally coloured brown from passing through the fern roots, but is wholesome. The habit which all natives of India have of denuding themselves of clothing when cooking their food, &c., is, I believe, prejudicial to the health of the men here, where the climate is so much colder than in India; and the wind, especially towards the evening, is positively cold, making even Europeans glad to put on a woollen coat. At such times the native is often exposed with only the smallest possible vestige of clothing, which practice is likely to bring on fever in predisposed subjects. They are warned against it, but it is difficult to make them understand that a practice which they have adopted with impunity in India all their lives can be injurious here. 8. Native commissioned officers and others exempt from duty enjoy a marked immunity from fever; but the soldier, of course, cannot be so exempted, and the night duties, doubtless, furnish most of the fever cases. 9. I have rarely, until lately, been able to procure enough quinine for the sick, so that I had no opportunity of trying it as a prophylactic against malarial diseases; but I am informed that the late Lieut.-Governor took a dose daily, and escaped fever at a time when no other European in the island escaped, and when the cases were often fatal in three days. In my case it has always checked premonitory symptoms where taken early. 10. I would recommend the adoption of a local corps, recruited from the same class of men as the Madras Sappers and Miners, to be sent here, with their wives and families, on whose presence the comfort and health of the Indian soldier generally depends. These men would in from one to two years become perfectly acclimated; and, as the settlement becomes thoroughly cleared and drained, disease will become exceedingly rare. Under the present system men have been so debilitated and worn out with fever as to necessitate their being relieved every 10 or 18 months, with great inconvenience and expense to the service. Peons, coolies, and others, natives of India, are resident on the island for years, and enjoy excellent health, showing the justice of the above opinion. With such a corps of picked men, and with a due supply of quinine, which has been hitherto sparingly available, as it was supplied with reference to the strength of the detachment and not to the number of fever cases, I should not dread a comparison with the hospital return of any foreign service station of the Madras army.
V. INTEMPERANCE.	1. I believe a large number of the present detachment to be addicted to the use of narcotics, and, for natives, a somewhat large amount of drunkenness prevails; but not to a serious extent. There are, however, no confirmed drunkards among them. 2. Since no amount of irregularity or exposure will *per se* produce true intermittent or remittent fever without the presence of malaria, none of the cases admitted to hospital in Labuan can be with certainty attributed to intemperance; but it is obvious that a drunkard or opium eater is a bad subject for fever, especially the severe remittent type, when head symptoms are so serious, and may predispose to its invasion. Drunkenness is always punished as an offence. 3. Spirits are sold at the bazaar and arrack farms, but there are no means of judging of its quality or the amount consumed by each man. Cases of drunkenness are not common except about pay day. Spirit is no part of the soldier's ration here, either at the station, on the march, or in the field. It is never given as a ration to convalescents, although it is sometimes (but very seldom) given medicinally. No drinks other than distilled spirits are sold at the bazaar, but opium and ganjah (cannabis indica) are vended there. 4. The consumption of spirits by troops and convalescents is, as a rule, injurious. 5. It would be beneficial to abolish the spirit ration for soldiers, and to restrict the sale in the canteens and bazaars. 6. The use of good malt liquor to persons taking regular exercise is tolerated by the system, and may sometimes be beneficial, especially to persons habituated to it: but any tendency to hepatic congestions or redundancy of bile is aggravated by its use. Wines, if good, would be comparatively harmless, but being generally spirituous adulterations I consider them bad.

V. Intemperance—*cont.*	7. I have no means of knowing whether tea, coffee, lemonade, soda water, and similar drinks, are much used at the station, but the first four are plentifully procurable, and limes may be had for the plucking. These are all most beneficial in their influence on health, efficiency, and discipline, whereas spirits and malt liquor are often positively injurious. 8. This query does not apply to Labuan. 9. The encouragement to the sale of beer, coffee, tea, lemonade, &c. would probably work beneficially without the absolute prohibition of the sale of spirituous liquors as men naturally desire most what is prohibited, and generally find means to procure it. 10. The only recommendations which I have to make on these points are given in the preceding replies to queries, but as at present constituted the whole of the remarks on this subject are scarcely applicable to Labuan. 11. No bazaar or canteen regulations exist at this station.
VI. Diet.	1. "Sea rations" are issued to natives as per table following. On arrival of the stores at the station the Commanding Officer appoints a committee to examine them, and report on their condition and quality.

Table of Daily Rations for Native Troops (Public and Private Followers) on Foreign Service.

Articles.	Quantity.			Amount.			Remarks.

Total -	—	—	—	0	2	$4\frac{1}{4}$	Total -	0	0	12

	The proportion of vegetables entering into the constitution of a ration is about four-fifths of the whole. 3. The substitution of fresh fish or meat for salt fish to the men at this station would be a great improvement. There are orders prohibiting the disposing of the rations by the troops. 4. There is here a commodious building, subdivided for the different castes, in which the men cook their victuals in their own way. A special cook-house has been erected for the hospital in lieu of the old one pulled down. These kitchens are well ventilated, and are plentifully supplied with water from an adjoining well and the river, except in the dry weather when it is obtained from a greater distance. The men cook their food as they please, and generally have it boiled or stewed with curry. When overworked, owing to a large number being in the hospital, the men have complained of not having time to cook their victuals, there being no one to do it for them. I have known instances of men stating they were without food a whole day, and I have seen rice very imperfectly boiled, which they had to eat. In India this could not occur, as their families would cook their food for them. (Vide answer to No. 15, "Hospitals.") 5. With a permanent local corps, soldiers' gardens might be very advantageously established in the vicinity of the lines, and the labour would be most conducive to the men's health. Seeds should be supplied by Government in the first instance. With detachments, however, frequently removed as at present, it would not be desirable to establish gardens.
VII. Dress, Accoutrements, and Duties.	1. The dress of the soldiers at the station consists of red cloth jacket, black cotton trousers, and pugree, which are suitable for the climate, and for the soldiers' duties by day and night at the different seasons. I have no experience to enable me to state what improvements in the soldiers' dress would diminish the effects of sun-heat, cold, malaria, &c.
Duties.	1, 2. The routine of a soldier's duties here consists of guard-mounting every second day. The men have on an average one night in two in bed during the week. 3. Guards are mounted from 1 to $1\frac{1}{2}$ miles distant from barracks. There is a roll-call at 8 o'clock, p.m.
VIII. Instruction and Recreation.	The queries under this head do not apply to Labuan.
IX. Military Prisons.	1. There is a well-constructed solitary cell in the cantonment, but not being often required, it is used as a store by the Ordnance department; prisoners are kept in the guard-room.
X. Field Service.	1. There are no local medical regulations in Labuan. 2. The medical officer has no power on the line of march in the conduct of the line of march, camping, &c., unless by courtesy. 3, 4. No replies to these queries.
XI. Statistics of Sickness and Mortality.	Not applicable to Labuan.

References to Subjects and Queries.	REPLIES.
XII. HOSPITALS.	1, 2. The hospital is situated on a small hill continuous, on its western side, with the plateau on which the barracks are built, and sloping down on its three remaining sides into deep ravines. The artillery barrack and guard-room is about 150 yards to the westward, and the infantry barracks are about 300 yards further off in the same direction. There is no bazaar in the neighbourhood, and only one private residence—that of the Surveyor-General—about $\frac{1}{8}$th of a mile off to the north. The site has been rendered, during the past year, by the removal of jungle, &c., open and well ventilated; and the hospital, outhouses, cook-house, &c., have been built on the side of the ravine at such a depth that the roofs do not intercept the ventilation, the ridges being on a level with the ground floor of the hospital. The ravines or nullahs were very unhealthy last year, but have been for the most part carefully cleared. What remains to be done is at some little distance to the east, which will be completed shortly; the site will then be as salubrious as possible. 3. Water is brought to the hospital daily by the bheesties. The supply is abundant, and it is wholesome in quality. 4. There is scarcely any refuse water or impurities, but a deep ravine immediately to the rear, about 50 yards off, carries away all the water that does not percolate through the sandy soil. 5. The hospital is a single flat building, the floor being of planks, having brick walls as a groundwork rising two feet above the ground. Openings are left at the intervals in the wall, whereby a free current of air passes under the flooring; gutters are dug all round the hospital for carrying off the water, which falls from the roof, but a good deal must, from the loose nature of the soil, sink into the ground, but producing, however, no inconvenience. The gutters immediately under the eaves communicate with larger drains before and behind, which again carry off the water rapidly into the before-mentioned ravine. The foundation and basement of the buildings consist of brick walls upon which to receive the beams and flooring. The framework and outside walls are of wood having the inner walls and ceilings made of lath and plaster whitewashed. The walls are consequently double with air between, and are admirably adapted for the climate. The roof is of attap, a species of thatch made from the leaves of the palm. There are verandahs 1 ft. 6 ins. deep nearly all round (the corners being occupied by small rooms, dispensary, guard room, store room, &c.,) and afford sufficient protection from the sun; I have been obliged to use the verandahs for the accommodation of the sick when the number of patients were too great for the wards to contain. The hospital consists of one flat divided into two wards, with dispensary and guard room, and two small store or spare rooms.

TABLE of Hospital Accommodation.

Date of Construction. First occupied, 21st October 1854.

Total number of wards - - - 2
Total number of beds - - - 29

Number of Wards.	Regulation Number of Sick in each Ward.	Dimensions of Wards.				Cubic Feet per Man.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
		No. 1 Ward, 17 beds.									
2	The hospital is much larger than the strength of the detachment is entitled to, so that it cannot be said to correspond with any "Regulation." It holds conveniently 30 to 40 sick.	Ft.	Ft.	Ft.in.	Cubic ft.	Ft.		Ft.		Ft. in.	Ft. in.
		38	17	11 10	7,641	450	38	2	12 doors; no windows.	7 6	3 2
		No. 2 Ward, 12 beds.									
		28	17	11 10	65,225$\frac{1}{3}$	470	39$\frac{1}{3}$		A similar door between the wards.		

N.B.—It has frequently happened that the number of patients has far exceeded the number of beds, in which cases the extra men have slept on the floor between each bed and some in the verandahs. Upwards of 60 men have been thus accommodated. When the number has risen above this as many as were well enough were made out-patients, and lived in barracks. On one occasion last year half the artillery barrack was used as a supplemental hospital, the sick list amounting to 87.

The hospital is so placed as to receive the full benefit of the prevailing winds. There are no windows in the building; but in their place are doors, the upper half of which is fitted with jalousies made to open or close as desired. The arrangement is an admirable one and much better than windows.

6. No artificial means of ventilation are required for the wards, the 12 doors, which are only closed when the weather demands it, being ample, and keep the wards at all times freely ventilated. Each aperture in the door panel has 14 pieces of board, fitting into sockets at each end, so as to open and close (overlapping each other closely when shut), the motion being regulated by a central bar of wood attached by hinges or staples to each venetian.

7, 8. The employment of any artificial apparatus for warming or cooling the wards is not adopted at this station. The walls and ceilings of the building have been cleansed and limewashed twice within the year I have been in medical charge.

9. A privy is in course of erection for the use of the hospital about 15 yards from the wards. Hitherto, and at present the wretched system, too common in India, with natives prevails of going to the nearest secluded spot (or at night, any convenient place) for purposes of nature. The new privy will consist of a deep well, sunk into the ground on the edge of the hill, having a communication at the bottom with the side of the ravine from whence, at regular intervals the ordure will be removed in carts; quicklime also will be frequently thrown down the pit so as to obviate any offensive smell.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	10. There are no lavatory arrangements beyond the use of a pail or tub for the sick; caste prejudices rendering the erection of baths nugatory. 11. The only means of bathing here available is to order the patient to go and bathe, which he does in the nearest stream. In the case of a warm bath, he or his orderly, if one is required, pours warm water over his body instead of cold water. In bad cases hot pediluvia and fomentations are supplied in the ward by the hospital attendant. 12. Indents signed by the Medical Officer are sent in to the Commissariat Agent, who gets the hospital clothing, &c. washed, and returns it clean for re-issue. 13. The storage is sufficient. 14. Only a regulated number of beds are allowed for native hospitals, such allowance being based on the numerical strength of the regiment or detachment, but in Labuan the average amount of sick has usually so far exceeded that of even a full regiment that the local government have supplied several beds over and above the authorized complement. Of the beds in use some also belonged to a detachment of European artillery at one time stationed here. Thirteen of the bedsteads are of iron with boarded bottoms over the iron bands. Four are of wood with tape bottoms, the remaining 12 being entirely of wood, and answer every purpose desired. Indents have been sent in this month for new bedding, the old being worn out. It consists of palliasses made of cotton, fashioned exactly like large pillow cases, in which dry grass is put to form a mattrass; this grass is thrown away and changed as often as necessary, and the palliasses washed. A double pillow case, the inner one stuffed with grass, when required, so as to form a pillow, is also supplied, as also a cumblie made of coarse blue or striped cotton, lined with white cotton and quilted. These appear to answer the purpose very well. 15. To the north and about 25 yards distant from the wards a new cook-room has just been completed, built of wood, with attap roof, on a ground-work of brick. The men cook their food in their own chatties and vessels in the native manner. This system is, however, a very bad one, as every patient, unless absolutely unable to move, (in which case he has a friend or orderly of his own caste to do it for him), cooks his food as he chooses, in consequence of which that valuable adjunct to treatment afforded by regular, well-cooked, and suitable diet is almost entirely lost to the medical officer who treats disease in the native. In India this is not nearly so much the case, as the men's wives or relatives supply their wants; but on foreign service it is a most serious evil, for which the only remedy I can suggest is the appointment of high caste men as cooks, which is the practice on board a ship when native troops are embarked. The prejudices of caste would thus be met, as no native could refuse to take food cooked by a man of equal or superior caste to his own, and a little experience of the system would convince them of its advantages; for the native, although generally slow to afford assistance to the sick, is glad enough to avail himself of aid when sick himself. 16. Diet tables, &c., are forwarded. 17. The provision for attendance on the sick is as follows:—A havildar acts as hospital orderly, and is supposed to exercise general supervision, and to see that the internal economy of the hospital goes on properly; and in such cases as require it, an orderly is specially appointed to wait on them. Nursing, however, as understood in England, may be said to be unknown, it being rare (in my experience) to find an orderly who really attends to the patient, or who even understands how to do so properly. In many instances I have had to complain of shameful neglect, and in very rare cases have I had reason to feel that the orderly had done his duty. Owing to the system of caste I cannot suggest any plan for remedying this crying evil, other than the severe punishment of such orderlies as fail to do their duty. 18. With regard to diseases arising from the condition of the hospital. Four cases of fever occurred last year in patients under treatment for ulcer who could scarcely have contracted the disease out of hospital. One in particular was taken from the vessel in which he arrived at the hospital and never left it. I attributed these cases to the exhalations emanating from the adjacent ravines during the process of clearing, as since their completion no new cases have occurred. So soon as the yet uncleared portion of the ravine in the vicinity of the hospital is properly cleared, which it will be as soon as possible, nothing further can be desired as regards the building and its immediate sanitary condition. 19. The deficiencies felt in the medical treatment of sepoys may be summed up as follows:— 1. Want of means to ensure due attention to and nursing of the sick. 2. Want of means to regulate and supply proper diet and cooking. 3. Want of trustworthy military surveillance to prevent irregularities, such as indulgence of narcotics, introduction of unwholesome fruits and other articles of food improper for the sick patients, absenting themselves from hospital without leave, &c. 4. Want of sufficient authority on the part of the medical officer to punish trivial offences, and neglect on the part of the hospital attendants, &c. 20. The hospital havildar has orders to see that patients ordered to do so, take exercise for a certain time near the hospital every evening. Other convalescents are permitted to reside in their barracks and move about the lines, but they must not go beyond them. There are no special provisions made here for the purpose of affording exercise for convalescents such as walks, seats, &c., nor are any such required. 21. There are no soldiers' wives at the station. 22. All cases reported sick, about which there is the slightest doubt, remain one day in hospital for observation, and are detailed to inform the apothecary when attacks of fever come on, so that he may see them, and be certain they have it (*vide* rolls transmitted marked "Local"). 23. The medical officer reports officially to the officer commanding as to repairs or other sanitary matters, orders diet on his own responsibility, and medical comforts to the extent sanctioned by the Director-General, Army Medical Department, any departure from which in excess would involve special correspondence with his secretary or the commissariat officer, and, unless sanctioned, the expense charged to the medical officer. Since the 5th October 1858, the extent to which medical officers can supply such comforts to troops on *foreign service* has been liberal and sufficient in every respect. 24. A hospital for convalescents has been erected this year by H.E. the Governor, on my recommendation, made at a time when a very great amount of sickness prevailed; but since its erection such great and unexpected improvement has taken place in the health of

XII. Hospitals—*cont.*	the troops as to almost obviate the necessity for its use, but as it is now complete (May 1st), I shall remove a few chronic cases, now in hospital, to it. The building is situated on a point of land jutting out into the sea, where it is almost entirely out of the direction of winds which pass over marshy places, the prevailing winds being off the bay.
XIII. Burial of the Dead.	1. The burial ground for British troops is about a quarter of a mile to the eastward of the station, out of the direction of both monsoons and the land and sea breezes. Only four interments have taken place as yet. The old graveyard is close to the sea, at least half a mile from any European habitation, and two and a quarter from the lines. The Chinese still bury in that quarter. 2. The area of the burial ground is about two acres, the soil being a loose silver sand, with just enough vegetable deposit to enable the grass to grow, the subsoil gradually merging into soft sandstone. The drainage is indifferent, the situation being too level, but the ground is fenced in, well cleared of jungle, &c., and well kept. No opportunities have been afforded of judging as to whether decomposition takes place quickly or not. 3. There is no limit as to the space between graves or the depth of graves, but the latter is usually from five to six feet. They are never re-opened, nor can the necessity ever arise for burying two bodies in the same grave. Interments are rarely deferred beyond 24 hours after death; they generally take place within six hours. The native troops are interred by their comrades after their own fashion, usually in the uninhabited jungle within a quarter of a mile of the cantonments. 4. The graveyard is never offensive in any way; on the contrary, it is an advantage, as it is cleared of jungle. 5, 6, 7. The dead of camp followers, &c., are interred by their friends in the same manner as the sepoys. No injury arises to the public health from the present practice, and no improvements are consequently required in the way of regulation or otherwise in the disposal of the dead.

May 1860. J. J. Fraser M.B., Assistant-Surgeon.

"STRAITS SETTLEMENTS."—PENANG.

Accommodation
- Queen's Troops
  - Half an European Company, with a few Families.
  - For a Quarter Company, with many Married Men as now.
- Native Troops
  - Artillery - Two-thirds of a Company.
  - Infantry - Seven or Eight Companies.
  - Head Quarters.

References to Subjects and Queries.	Replies.
I. Topography.	1. The surrounding country is level, with nutmeg plantations enclosed by hedges; a range of hills crosses the plain towards its western extremity north and south. It is sandy, dry, and flat, except towards the range of hills. There is not much wood on the plain except plantations and high hedges, but there is forest wood on the hills three miles from the fort, and one mile from the native infantry cantonment. Good water is everywhere scarce; it is conveyed from the hills to the town, and for the shipping in the port by an iron pipe with reservoirs. But there is a fine stream passing near the native infantry lines, which are supplied by an off-set from it running through them. 2. The elevation of station above the sea is generally but a few feet, and it is on a level with the surrounding country. The native infantry cantonment is about 25 feet above the sea, and a few feet above the canal and nullah. The only higher and healthier ground adjoining the station is the hills which would form an excellent location for Europeans. A good military post could be established on the hill far out of reach of an enemy's ship guns, and if well stored, with occasional communication from the sea, could be held against a superior force in time of an European war (the fort being useless, and only exposing men, treasure, stores, &c., to any enemy from the sea.) There is no much higher ground than this on the plain of the island, with reference to the rest of it, for field work with much command, which latter, however, is what the island requires for effective military defence in case of external attack. 3. There is a little table land on the hill 5 miles from the artillery fort, and 3 miles from the native infantry lines; its height is about 2,500 feet. 4. The sea is contiguous to the artillery fort, and there is a fine stream 200 yards from the native infantry lines. Neither the vicinity of the fort or native infantry lines is liable to overflow of water. To the west of George Town, but far from either of the above places, the level being low, the water percolates in through mangrove banks, and there is flux and reflux. There are no broken grounds or ravines near the station; there are a few wells, but they are not injurious to health. 5. The island would be pleasantly pervaded by the light sea breezes of the latitude, were it not for the plantations and the hedges which obstruct it. But it is now said to be healthier than when there was not so much plantation, probably from the latter retaining the deposit from dew, which makes the climate of the interior very refreshing in the nights and mornings. The temperature of the station is not raised by reflected sunheat, excepting in and about George Town. The station is exposed to the sea breeze only, which is generally light and healthy.

I. Topography—*cont.*

6. There are several nutmeg plantations, and more inland a great deal of rice is cultivated. There are no works of irrigation. The cultivation of rice is not prohibited within certain limits, but generally it does not approach near. There is no cultivation of indigo, nor is the preparation of hemp or flax carried on near the station.
7. George Town is contiguous to the fort (artillery), but is 3 miles off from the native infantry lines.
8. The geological structure of the district is alluvial, with a sandy surface; the subsoil is loam. The ground on which the native infantry lines are situated was never before occupied. It is now cleared of the sepoy huts, and airy barracks have been built; the site is unencumbered.
9. Water is found during the dry season at the depth of a few feet, and in the rainy season near the surface.
10. The rain fall and surface water does not flow readily away, the country being too level, but water sinks into the subsoil quickly after the cessation of the rains. The ditches retain the stagnant water more or less after rains from the dead level, which is rather objectionable. The municipality, however, attend much to this. No drainage from higher ground passes into the subsoil of the station.
11. The best water for the supply of the station is obtained by means of an iron pipe laid from the hill. There are some wells, but the water is not generally good. There is one fine stream of excellent water. There are no tanks for drinking purposes. There are some bathing tanks formed at the head of the native infantry lines by a duct from a stream near them, which afterwards flows through them in smaller streams, which is used for cooking purposes, and for washing clothes and utensils; but drinking water is mostly obtained from wells in the lines. At present different waters are used for drinking, cooking, and washing purposes. The water tanks and wells are not liable to pollution from any source. Malaria sometimes proceeds from the stagnant open draining ditches after heavy rains, the dead level rendering it difficult to keep them run off. The municipality attend to this better of late. Chinese garden cultivation, with deleterious manures (rotten fish, ordure, &c.), was much worse in the neighbourhood till prosecuted by the present commandant in the Recorder's Court, who also agitated the improvement of hedges and ditches with the municipality.
12. The water supply to the native cantonment is unlimited, and is sufficient for an European regiment down in, or near the fort. The water is excellent, and is colourless, inodorous, and without any marked taste. There are no means of obtaining an exact chemical analysis of it, being chiefly rain water. Softness is its predominant character; its quality is good, and not injurious to health. The supply for the troops is ample. No extraordinary means are required for raising and distributing it; no better supply could be obtained. The main and best supply is by 3 miles of iron pipe from the hill to the wharf, with intermediate reservoirs.
13. With regard to other topographical points, perhaps the interposition of the hills across the island north and south, barring off the westerly breezes may be disadvantageous to the native infantry cantonment, which is under the lee of it.
14. With regard to the inquiry and examination previous to the selection of new stations, the present native infantry station was selected long ago. There is no military sanitary station. The hill is capable of being rendered, at a small expense, one of the best stations in India, for a few European troops, and for sick from Singapore and China, but not for more than two companies with officers and establishments. Provisions could be obtained from below at first, and the streams of water should be reservoired.

II. Climate.

1. The instruments available at the station for conducting and registering meteorological observations are a barometer, thermometer, and pluviometers. The registry of the above is discontinued by order.
2. Table of meteorological observations from 1st January to 31st December 1859:—

Month.	Barometer Mean.	Mean Temperature.	Mean Daily Range.	Mean Maximum.	Mean Minimum.	Rain, Inches.
January - -	29·62	79·8	6·0	82·8	76·8	1·80
February - -	29·65	80·9	6·9	84·4	77·5	2·35
March - - -	29·60	83·7	6·4	84·9	78·5	5·70
April - - -	29·55	82·2	6·4	85·4	79·0	6·60
May - - -	29·60	83·2	6·4	84·4	78·0	10·5
June - - -	29·60	82·5	6·4	85·7	79·3	2·25
July - - -	29·55	83·9	6·1	85·0	78·9	4·35
August - -	29·55	83·0	6·0	84·0	78·0	1·6
September - -	29·60	80·3	7·1	83·8	77·5	11·9
October - -	29·50	78·7	5·6	82·5	75·9	22·6
November - -	29·55	79·8	5·9	82·7	77·0	7·0
December - -	29·60	78·3	7·8	82·2	74·4	5·6

3. It rains so frequently, though not constantly, all the year round (September, October, and November being considered the most rainy months) that there is always dew deposit on the great vegetation of the island, and being no dearth of water keeps the nights and mornings always more or less cool and invigorating; this, with the sea air all round and occasional light breezes, renders the climate a decidedly good one in comparison with India generally; the thermometer generally averaging 5 to 10 degrees less. These good effects are somewhat counteracted by the relaxing nature of the climate, owing to a powerful sun always converting its moisture into steam, and to the remarkable absence of motion in the air so near the equator, particularly in the evening, which makes less real heat than in India more felt. But the climate being favourable to healthy action of the liver admits of its evil effects being counteracted by diet. The native soldiery appear to suffer from its untoning effects to an average per cent. which virtually destroys nearly a whole regiment in dead and invalided in a three years' tour. Sentry duty, and the restraint of military clothing and accoutrements with extra labour, and the irregularity attaching to the preparation

II. Climate—*cont.*	and conveyance of food to their comrades on duty, in the absence of their families, as well as for themselves, combined with the almost entire absence of animal food, family separation, so unhabitual to the natives, nostalgia, and the unfavourable effect of the climate on them as compared with Europeans, and even the Indian coolies and convicts, are no doubt the probable causes of this destruction, and apparently can only be effectively dealt with by abandonment of Penang by the native troops. The tree-planting now subsisting affects the climate favourably by retaining dew; formerly there was much jungle, the malaria from which, owing to decomposing vegetation, without free passage of air, as in most Indian jungle tracts, made Penang fever somewhat proverbial. At present fever is almost unknown. There is no impurity from dust, but there is some locally here and there from rotten fish, ordure, urine, &c., in Chinese cultivation, which is, however too limited to affect the climate out of the town, or to be more than an occasional local offence. Shelter from the rain is desirable at all times, though the effects of wettings are not violent here. The great precaution never to be disregarded, is to sleep on a cot or raised flooring or boards, but never on the soil, the damp from which causing fevers, diarrhœa, rheumatism, &c. It may here be mentioned, as making this a somewhat distinguishing peculiarity of this soil and climate, that ponies of the hardiest kind, if not walked about to cool gradually, after heating work, are sure to catch violent fever and inflammatory complaints which destroy them. The men should, while lightly clothed, have the skin so protected as to guard against sudden cooling—thin flannel probably—the wearing of which by Europeans and not by natives possibly causes some part of the difference of the effect of the climate upon them. Beyond this it does not seem to call for any particular precaution as to amount, nature, and times of drill, duties, and exercises, which should never last too long at one time, nor be very violent. The early mornings are cool and refreshing; early rising and exercise should be insisted on. No part of the year is especially unhealthy. There are no prevailing diseases here except small-pox, which may be considered endemic. 4. There is no district near the station, the climate of which is more conducive to health except the hill before referred to. Possibly a location for natives might be adopted on the west side of the island, and where the hill would not keep so much of the sea breeze off as it does where they now are. But want of animal food and other causes, independent of local climate, chiefly affect their health more than the present site, which is good. 5. The commanding officer has served in all the eastern and western coasts, Madras Presidency, Mysore, Deccan, Tenasserim, and Goomsore. I consider the western coast positively injurious to Europeans, and Goomsore of course much more so, and to natives also. The others are highly favourable, the eastern coast being the least so to Europeans. The climate of Penang reminds me very much of the western coast, more particularly of Travancore, but it is healthier in the long run. The following are the stations at which Captain Mitchell has served, Palaveram, Masulipatam, Berhampore, and Russelcondah, in the northern division; Nagode, Dumoh, and Mhow, and Secunderabad, Deccan, and Penang; they are all healthy. The medical officer has served at St. Thomas's Mount, Madras, Jaulnah, Nagpore, Bellary, Hyderabad (Sinde), Soukara, Concan, Kolapore, Trichinopoly, Cochin, Bangalore, Rangoon, Bassein, Hyderadad (Deccan), and Penang; all are healthy, with the exception of Hyderabad (Sinde), when I was stationed there, but which I believe has since been healthy.
III. SANITARY CONDITION OF STATION.	1, 2, 3. A map of the station and adjacent country, and a plan of the station and barracks, are transmitted. There are no water tanks, nullahs, or canals in the station. The ditches are all open, and when stopped up are cleared by the municipal commissioners. There is no military cantonment, properly so speaking, the whole island being for the municipal purposes generally under the Commissioners. The Chinese cultivation is the only nuisance. Pucka privies for the infantry are about to be constructed. 4. Table of barrack accommodation. Date of construction; European barracks, 1817; Native Infantry barracks, 1860. Total number of rooms or huts, European barracks, 16 rooms. Total regulation number of non-commissioned officers and men. Europeans, 1 company; Native Infantry, 600 men; Gulaudauze, 1 company.

III. Sanitary Condition of Station—*cont.*	5. The windows are on opposite sides and open outwards; there is a verandah 6 feet broad all round each barrack, but they are never used as sleeping quarters by soldiers or others; there are neither jalousies nor jhilmils, but the windows open with bars and shutters. 6. The bedsteads in use are wooden, with the bedding as per regulations; they are periodically washed; iron would be better, as it is less likely to harbour vermin. No other alterations to suggest. 7. Tents are seldom used in Penang; they are, however, according to regulation; they are unhealthy from the peculiarity of the soil, which renders some interposition, such as flooring, &c. necessary, as before stated. 8. There are no artificial means of ventilation beyond doors, windows, and ridge ventilators. The ventilation of the native infantry hospital was very defective, and had, no doubt, greatly aggravated bad cases here from originally slight ones. Through the interposition of the commanding officer it has been remodelled. The ventilation is generally sufficient, except at the above hospital, where punkahs are kept working at close periods. That of the European and golundauze barracks is quite sufficient. No tatties or punkahs are used in the barracks or European hospital, the generally cool day, sea breezes, and night air dispensing with them. 9. The barracks are built of brick; those for the Europeans are tiled, and those for the native infantry leafed. The tents are of the usual description; no huts are used now. 10. The European artillery barracks are over the gun-sheds, and the floor is constructed of boards; there is a free passage of air below. The golundauze barrack floor is of chunam, but is not raised above the ground. A defect in the flooring of the native infantry barracks is in its not being under-arched, and as it is, the substratum is not even firm, but sinks, ill admitting of washing; this can easily be remedied. 11. The materials are suitable for the climate; but I think all floors here should be raised on archworks so as to admit a passage of air below, the contact of men or animals with the ground below producing fever and other diseases, so much so that no common pony is allowed to stand but on boarded floors. The barracks and cantonments are kept in repair by the executive engineer; the repairs are performed by convicts and executed as speedily as possible. The municipal board is as yet responsible for the general sanitary state; but when the cantonment just marked out is formed it will come under the Quartermaster-General's regulations in this respect. The floors of the new native infantry barracks are washed every Saturday. Lime-washing has not yet been applied, but is about to be so, entry being scarce complete yet. In the European barracks it has since been applied; they are cleansed and whitewashed annually. 12. Baths have been formed for the native infantry, through which the water continually flows; there are also ditches full of running water in all directions. The Europeans have tubs in a washhouse supplied with water in a well in the same. The golundauze wash from a well. 13. Both European and native soldiers are supplied with cooking places of the ordinary description, in long rows. Dhobies wash for Europeans, and they themselves wash some of their linen in their tubs and dry them on the fort walls. For natives near the native infantry lines there are the usual "Dhoby pett," or washerman's quarters, situated on a large stream, and are quite healthy and open. The washing for the European troops is done in the fort. 14. The privy outside the fort is over the sea, and those inside the fort discharge themselves into a cesspool, which is emptied periodically. 15. These buildings are ventilated by windows. All barracks are lighted by globe lamps, with oil and wick. 16. One long drain with connecting pipes at intervals through the walls carries the drainage of the barracks into the fort ditch, the distance between the barracks and outlet for the drainage being about 30 feet. There are no sewers or drains to the native infantry barracks, they being scarcely wanted. The drainage is sufficient for conveying away all surface water from the men's lavatories, baths, &c. No part of the barracks or hospital is damp. With regard to foul ditches, *see* qy. 10, Topography. 17. Surface cleansing is carried on by the municipal commissioners at present, there being no regular cantonments; it is very inefficiently done. 18. Cantonment is not yet formed; but one has lately been marked out three miles from the fort, where the native infantry are. The future cantonment is in its centre, and where the regiment is, free from over vegetation, and is the airiest and coolest spot in that part of Penang. The boundaries will, however, be a belt of hedges and gardens with trees, which can hardly be removed, though, when the cantonment is formed, these objections can be brought as far as necessary under the Quartermaster-General's regulations. 19. The native infantry bazaar is very small, and under regimental surveillance. It is well drained and ventilated, with a plentiful water supply, &c. There is no regular regimental bazaar here, the Europeans and golundauze having none. The native houses, mostly Chinese, near the station are filthy, being literally dung-heaps and cesspits themselves; all filth is thrown under them, and there are abominable gutters in front. The stenches in the neighbourhood of the native infantry lines and officers' houses are sometimes very bad indeed, owing to the large amount of Chinese cultivation; it has been much mitigated, however, through the efforts of the present commandant. The nuisance could be prevented by forcing every householder to keep all the ground beneath and around his house clean, and by prosecuting every Chinaman for committing a public nuisance, or who makes use of human ordure, urine, or rotten fish for manure, and also by forcing them away from the vicinity of the habitations of civilized people. This would, however, discourage the desired populating of the island chiefly by Chinese. 20. The contractors' slaughter-house is full 1½ mile away from the troops. 21, 22. No bazaar or cavalry horses at the station. 23. There is separate accommodation for married non-commissioned officers and men, which is good and sufficient. Married people do not occupy barrack rooms with the men.

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.* *Officers' Quarters.*	1. There are only two officers' quarters in the fort; they are on the ramparts, and are high, airy, and excellent. There are no officers' quarters, properly so called, in the native infantry lines; the officers occupy up-stairs bungalows belonging to the residents of the place, and similar to those occupied by them. Their sanitary condition is satisfactory on the whole, but the ventilation is somewhat interfered with by the plantations of nutmeg or cocoa-nut trees, which closely surround most of them. This could be improved by clearing away the trees, but these, as well as the houses themselves, are private property.
IV. HEALTH OF THE TROOPS.	1. The station, district, and adjoining native population are healthy. 2. The most prevalent diseases among the native population are small-pox, with outbreaks of epidemic cholera; there have been no cases of spleen disease. 3. There are no circumstances very obviously adverse to the health of the native population. 4. The few European artillery here have been received at broken periods from Madras, Masulipatam, and Singapore. Since their arrival they have chiefly suffered from fevers, diarrhœa, and bronchitis. The detachment native artillery were at Sumbulpore from February 1857 to December 1858; while at that station they chiefly suffered from fevers and rheumatism. They arrived here in April 1859, in good health, and have since chiefly suffered from diarrhœa, dysentery, and dyspepsia. The native infantry were at Secunderabad from 18th February 1857 to 1st December 1857, where they chiefly suffered from fever, diarrhœa, and rheumatism. They arrived here on the 18th, 29th, and 31st January 1858, in good health, and have since chiefly suffered from ulcers, fever, diarrhœa, and rheumatism. Hitherto no one portion of the men's accommodation has appeared more unhealthy than the rest. The native regiment is now moving into new barracks. 5. The European artillery and golundauze are camped out during March and April, yearly, at practice, without any prejudicial effect to their health, but probably with more or less benefit. 6. The commanding officer commanded in the Neilgherries for two years, during great part of which European troops were stationed there. Unless carefully attended to as to exposure, checks after exercise and clothing, the effect was for some time so far prejudicial as greatly to produce diarrhœa and fevers. I cannot speak to the effects of more than a year; but I should say, that while there can be no doubt the same restorative effects must result to European soldiery as to the upper classes, *ceteris paribus*, the great obstacle to hill stations benefiting bodies of European troops is the impracticability of maintaining them altogether under the same cautious observances as individual officers, from their being all in one barrack, for one reason, where a temperature or exposure suiting some may not suit others, and from their being all at more or less liberty to indulge their own inclinations elsewhere, in the way of exercise and exposure, &c., where medical officers have a great difficulty in always restraining gentlemen residents for health from exposing themselves to the injurious effects of the climate. 7. Cannot say whether troops long resident on hill stations are more or less liable to attacks of febrile or other diseases on returning to service on the plain. 8. The commanding officer does not approve of selecting hill stations for troops, except for sick depôts (convalescent), from his experience of troops stationed in the Neilgherries. It does not acclimatize the higher grades, though it greatly favours convalescence in both. 9, 10, 11. No experience of hill stations; but the shortest period of residence which would enable troops to obtain the full benefit of such residence, would be probably not less than twelve months. 12, 13, 14. No experience of hill stations. It would probably be most conducive to the health of troops serving in India to locate them on hill stations, with short periods of service on the plains. Frequent change of station on the plains is beneficial. 15, 16, 17. No experience of hill stations. 18. No particular class of surface and subsoil either more or less healthy than others. 19. A soldier proceeding to India should not be under 20 years of age. The best period of the year for troops to land in India perhaps varies in different Presidencies; but in Madras the best time is November. European troops are never first landed from home at Penang; but recruits landing in India should be kept from exposure and intoxication. 20. Troops should be sent direct from home to India, and land with as large a stock of health as possible. They should avoid exposure and intemperance. 21. No transport from the port to the interior is required here. 22. The number of years a British soldier should serve in India is from 7 to 10 years, if in the plains. 23. It is not desirable to avoid an amicable difference of opinion in the manner of conducting medical boards, as regards individuals brought forward for invaliding. 24. Invalids should leave India for home, so as to land in England late in the spring.
Diseases.	1. There are regular inspection parades there once a week for the discovery of incipient diseases at this station. 2. There has been no scorbutus among the troops at this station. 3. Hepatic disease is rare among the natives. There has been none at this station. The few Europeans stationed here have, on the whole, been free from it. 4. No case of dracunculus has been contracted at this station. 5. The proportion which venereal disease bears to the total sick in the European artillery is 2·912 per cent.; in the native artillery it is 5·434 per cent.; and in the native infantry it is 2·253 per cent. Lock hospitals would be advantageous. 6. The diseases which the troops suffer are chiefly endemic. Fever, chiefly daily intermittent type. Dysentery, in both the acute and chronic form. Cholera. No case has occurred since the arrival of the troops.

IV. Health of the Troops —*Diseases—cont.*

Small-pox always prevails in the island more or less. The troops have been free from it.

Rheumatism, chiefly chronic.

The proportion which admissions and deaths from these diseases bears to the total admissions and deaths is given in the following table:—

Admissions.

Diseases.	European Artillery, per Cent.	Golundauze, per Cent.	Native Infantry, per Cent.
Fevers	5·825	11·956	18·367
Dysentery	0·970	7·728	4·709
Cholera	—	—	0·068
Small-pox	—	—	—
Rheumatism	10·679	10·870	7·986

Proportion of Deaths to Admissions.

Fever	—	4·543	3·345
Dysentery	—	—	8·550
Cholera	—	—	100·000
Small-pox	—	—	—
Rheumatism	—	—	0·854

The above includes only the last 29 months, no records beyond that period being available.

7. The nosological character of the zymotic diseases is for the most part adynamic. These diseases do not seem to prevail in excess at any particular season. The native dwellings are deficient in cleanliness, there being no organized system of drainage; but the country is intersected by ditches through which the constant heavy rains carry all refuse matter into the sea. The water supply is defective: the ventilation is open. The native troops are addicted to the use of narcotic drugs, and also dispose ot their rations. They appear to suffer from nostalgia. There is no particular predisposition to disease among the native population.

8. Epidemic disease is intensified by fatigue, intemperance, and exposure on the part of the soldier.

9. Small doses of quinine have not been tried at this station as a prophylactic against malarial disease.

10. The station is not liable to epidemic disease, as far as can be ascertained.

V. Intemperance.

1, 2. The soldiers at the station are rather intemperate. Drunkenness can scarcely be said to exist among native soldiers. The Europeans are too few at this station to afford any reliable data as to the proportion of confirmed drunkards. Drunkenness is always punished as an offence.

3. Distilled spirits are not sold in the canteen here; they are obtained from the commissariat on payment; they can be had in the bazaar, although prohibited. The quantity allowed per man is two drams of arrack, at 1 anna per dram; the quality is good. Spirit is not, under any circumstances, a part of the rations for soldiers, but they are allowed two drams a day on payment. No dram is taken before morning parade. It is never given as a ration to convalescents, but is sometimes allowed by medical officers on payment. There is no canteen. No deleterious drinks, other than intoxicating drinks, are sold in the bazaar.

4. The consumption of spirits is injurious to men in health, but it is of service in certain cases to convalescents. It is scarcely conducive to efficiency and internal discipline, but only positively otherwise when taken immoderately.

5. It would be beneficial to abolish or restrict the sale of spirits in the canteen and bazaars.

6. Malt liquors or wines would be less injurious to health than spirits.

7. The men are in the habit of using lemonade, coffee and tea. Soda water is expensive and beyond their means. Their influence on health, efficiency, and discipline is beneficial, and they are preferable to spirits and malt liquors.

8, 9, 10. It would be beneficial to suppress altogether the spirit ration for men in health, and to substitute for it beer, tea, or coffee, &c. Spirits carefully administered in some cases of disease are at times of service.

11. There is no canteen. Spirits, &c. are sold in the bazaar, under the Excise Act, for the settlement of Prince of Wales's Island, Singapore, and Malacca, No. 14, of 1851, stated to be strictly enforced.

"XXX. Every spirit farmer, and also every keeper of a registered taking-house or spirit shop, who shall knowingly sell or deliver to any European or native soldier any spirituous liquor or arrack, without having an authority in writing so to do from the commanding officer of such soldier, shall for every such offence forfeit a penalty not exceeding 50 dollars.

"XLI. Every toddy farmer, and every keeper of a registered toddy shop, who shall knowingly sell or deliver any toddy or bhang to any European or native soldier, without having an authority in writing from the commanding officer of such soldier, shall forfeit a penalty not exceeding 50 dollars."

References to Subjects and Queries.	Replies.
VI. DIET.	4. The ration for British troops and European troops in the Indian army is the same, and consists of 1 lb. bread, 1 lb. meat, 4 oz. rice, $2\frac{1}{2}$ oz. sugar, $\frac{5}{7}$ oz. tea, 1 oz. salt, 1 lb. vegetables, 3 lb. firewood. No changes are made at this station. The rations are inspected by the officer commanding the artillery detachment at this station. 2, 3. A complete ration, including vegetables, but no fruit, is provided for the troops, the stoppage for which is 3 annas 4 pice per diem. The soldier takes three meals, breakfast at 8 a.m., dinner at 1 p.m., tea or supper at 5 p.m. The proportion of vegetables entering into the constitution of the ration is 1 lb. No improvement suggested. Europeans do not dispose of their rations, no one being allowed to take any portion of them out of barracks. The sale of rations by native troops is a serious evil. I have officially represented it as calling for legislative prohibition. 4. Cook-houses are attached to the barracks, and utensils are supplied by Government; the cooks are paid by the men. The kitchens are clean, light, well ventilated, and sufficiently supplied with water. The food is roasted, boiled, fried, curried, or stewed at the men's option. The cooking is properly done and sufficiently varied. No refreshment is provided before a march, but half-way the men have coffee. 5. Gardens for the cultivation of vegetables could not be established at Penang, there being no ground fit for that purpose.
VII. DRESS, ACCOUTREMENTS, AND DUTIES.	1. The dress and accoutrements for native and European soldiers at the station are as yet those generally in use in the British army; they are certainly not suitable to the climate; nothing could be less so. The dress on the plains in hot weather should be loose, of light material, dark coloured, with a light helmet covered, a cloak for night duty. On the hills a similar dress, of warmer materials, should be worn, also body flannel. The soldier's neck (European and native) is now freed from the deadly stock and Prussian collar. The sepoy wants, more than anything, a rational head-dress, such as his own cloth turban, neatly and uniformly worn, with some cover and regimental number, or else the Kilmarnock bonnet. The present thing is worse than the knapsack was to him. On guard the men have verandahs, sheds, and sentry boxes to protect them from the sun and wet.
Duties.	1. No advantage would accrue from drilling the men at home before being sent to India. The occupation and exercise of learning duties is good for the young soldier at first in India, keeping him from vast evils. From my 40 years' observations of European soldiers in India I cannot concur in the theory that the advantages of their having learnt all their duties at home would be such as to countervail the above vital considerations. Unemployment is the European soldier's bane in India, especially the "griffin" soldiers, and being kept out of harm's way at first, with ample morning and evening open air exercise, must be better for these latter than being at once only sent on sentry duty, to be idle and comparatively without morning and evening exercise in the open air at other times. 2. There are so few troops at this station that there is very little drill. The earlier the hours for drill, parades, and marches the better. On a march, if a soldier sleeps from 7 p.m. till 12 or 1, he can then gently perform any proper march before the sun is up; this is the plan I adopt. The average number of nights the men have in bed during the week is seldom more than 3; latterly it has been less. The troops here are too few for the sentry work. 3. The European guards are mounted at no distance from the barracks; but the natives so far off as to distress them. Guards last 24 hours. I tried to get the native infantry regiment placed nearer to town. The roll calls are at 5 a.m., and 8 p.m. for Europeans, that at 5 p.m. was instituted by my order to keep the men from going about the bazaars from 3 to 6. The roll calls for natives are 2 p.m., 8 and 9 p.m., and 5 a.m. Without their families, the check is required upon their further wearing themselves out here by undue resort to the town, &c. The effect on the health of night guards is no doubt prejudicial, being unnatural, and tells even more on natives than on Europeans. But the duty is unavoidable, and I do not think more precautions could be taken. Two hours is a long tour, but one hour would tell worse on the whole guard.
VIII. INSTRUCTION AND RECREATION.	1. The following are the means of instruction and recreation at the station:—There is a good skittle alley in the fort, and also a good library for Europeans There are no ball courts, schools, soldiers' clubs, day rooms, soldiers' garden, workshops, theatre, or gymnasia. There are too few Europeans for sustaining more means for these purposes than the above, and the native infantry and golundauze have too much to do to require any other. Europeans are restrained from exposure to sun and rain out of barracks when off duty, no doubt with negatively the best results to health. 2. Were there many Europeans here, workshops and boating should be provided. Gymnastics are too heating, followed by insufficient precaution. Gardening is good, but partial. Mental and handicraft employments would be best for Europeans in India. 3. Soldiers' savings' banks are advantageous, and work some good here. 4. There is sufficient shade from trees and other means for Europeans, but not for natives. The Bengal "bells of arms" here are wretched, compared with the Madras places of arms. I have moved for the latter.
IX. MILITARY PRISONS.	1. The solitary cells and prisoners' rooms are roomy and sufficiently ventilated; they are too little numerically used to need suggestion.
X. FIELD SERVICE.	1. There are no local regulations for field medical service not included in the general presidency regulations. 2. The medical officer has no direct power as regards the conduct of the line of march, troops, &c. 3. The most eligible available ground, as far as circumstances will permit, is selected for camping, agreeable to the general regulations. It is kept free from all matter of a nature injurious to health. When troops are halted in the same locality for any length of time, the camp, if practicable, is shifted every 3 or 4 days. The tents are open and well ventilated; water is supplied by bheesties both to the tents and hospital. The

References to Subjects and Queries.	Replies.
X. Field Service—*cont.*	medical officer can only suggest or recommend; he has no power beyond, decision being vested in the commanding officer. There should be a sanitary officer attached to every force in the field, with full power in these matters. 4. I am not aware of the existence of any regulations regarding field hospitals; there used to be a heavy ambulance, quite unfit for field service, attached to regiments on the march. It is reported that a preferable one is about to be substituted. The sick are carried in doolies; the hospital supplies in a field medicine chest and in portable medicine boxes. Other boxes are at times used, when conveyed on carts. All carriages supplied by the commissariat.
XI. Statistics of Sickness and Mortality.	No information under this head.
XII. Hospitals.	1, 2. The European hospital is built over gun-sheds. It is open to the sea face, but has the noisy golundauze barracks immediately in the rear, and has the full benefit of the noise and nauseous odours peculiar to natives and their cooking. The native town also is immediately in rear, and the houses of the civil population are all round in close proximity. There are no stables, and the barracks are in the fort, distant about 200 yards. The golundauze hospital is over the same range of gun-sheds, and I consider the situation extremely bad, even for natives, but much more so for Europeans. The sites of both artillery and native infantry hospitals are, I consider, most excellent, being both open and freely ventilated. There are some nutmeg trees near the golundauze hospital; but they do not interfere with ventilation. The sites are healthy with respect to elevation, drainage, &c. 3. The water supply is abundant and wholesome. 4. The drainage is carried outside the golundauze hospital wall by means of open side and cross drains, and eventually into the sea. 5. The wards of the native infantry hospital are on a basement 2½ feet high, which is filled in, and no current of air passes beneath. The golundauze hospital is on the ground-floor. The European artillery hospital is an upper story. The roof water sinks into the subsoil. The surface drainage and gutterage is quite sufficient to carry away the rain-fall rapidly. The native infantry hospital is constructed of bricks and mortar, and tiled roof with ridge ventilators and windows above. There is a verandah on three sides 10 feet wide, but they are never used for the accommodation of sick, convalescents, or others. The hospital consists of one flat. Table of Hospital Accommodation. The date of the construction of the native artillery and European hospital is not known. The native infantry hospital was erected in 1860. Total number of wards, 5. Total regulation number of beds, 46.

Wards. No.	Regulation Number of Sick in each Ward.	Dimensions of Wards. Length.	Breadth.	Height.	Cubic Contents.	Cubic Feet per Bed.	Superficial Area in Fee per Bed.	Height of Patient's Bed above the Floor.	Windows. Number.	Height.	Width.
		Ft.	Ft.	Ft.				Ft. In.		Ft. In.	Ft. In.
Native Infantry Hospital, 3	14	80	18	19	49,590	1,771	93	2 6	27	2 6	5 0
	7	39	15	19					12	7 0	5 0 ventrs.
	7	39	15	18							
European Artillery, 1	10	38	19	10	7,220	722	72⅓	2 6	5	5 0	3 6
Golundauze, 1	8	27	18	10	4,860	607½	27	2 6	4	5 0	3 6

The artillery hospital is only open on the N.E. side; on the N.W. the wards are, both European and native, attached to gun-sheds, and on the S.W. only a narrow yard and high wall interpose between it and the native artillery barracks. The site of the native regiment hospital is open and detached; it is situated 150 yards to the N.W. of the barracks, and like them is shut out by the range of hills from the sea breeze. They are provided with Venetian windows with hinges, which open outwards.

6. In the European artillery male ward there are windows on all sides. The female ward is indifferently ventilated, the windows on two sides being five feet from the ground, and on the other two sides there are no windows, but four doors, two opening into adjacent rooms which are occasionally used as convalescent wards, one opening into the bath-room, and the fourth on the landing-place at the head of the stairs. The native artillery ward is on the ground floor; it has a single window on the S.E. side, looking into the street, and two on the S.W. opening on the yard. In the native infantry hospital there are 16 doors, 22 windows, and 27 ventilating windows above.

7. There is no apparatus for cooling or warming the wards, none being required. The whitewashing of the wards is performed annually unless required oftener.

9. The hospital has a privy of ordinary construction over a cesspool; it is not offensive.

10. With regard to lavatories in the hospital, it is a matter for the medical officer's arrangement, there being no particular conveniences for this purpose.

11. The European artillery have a bathing room attached to both the male and female wards, which are supplied with water by the bheesties. The supply is sufficient, and the arrangements convenient. The natives are supplied in the same way, but have no bathing rooms.

12. In the European artillery and native hospitals, all foul linen is removed by the washermen, and returned when washed and dried; the means are amply sufficient.

13. The storage is sufficient and dry.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	14. The hospital cots are of wood. The bedding is supplied by the commissariat, and consists of two quilts, one blanket, and two pillows. The cots should be iron; the bedding is good. 15. The kitchen is merely an open shed. It joins the native ward at right angles, and is immediately below, not under, that of the Europeans. Cooking utensils are supplied by the cook himself. The cooking is tolerable; there have been no complaints with regard to it; nothing but beef and poultry are available. 16. Diet tables according to regulation. 17. At this station there is no hospital serjeant, and no nurse, attached to the European artillery hospital; the men, when requisite, have a comrade to attend on them. To the native hospital there is an hospital havildar, who is relieved once a month, and the men have a comrade to attend on them when necessary. There are also two standing orderlies always in attendance. There should be a nurse at least for the European artillery female and children's ward. 18. The artillery hospital is badly situated, and indifferently ventilated; it is, however, undergoing alterations to some extent. No epidemic disease, hospital gangrene, or pyæmia have appeared in the wards for at least the last two years; there are no available records at the station for any period anterior to that time. No native infantry hospital at present exists, but one is building. 19. The artillery hospital was it appears condemned long ago; it has now, however, been determined to repair, and in some measure enlarge it. Such being the case it only remains to recommend an improved system of ventilation. 20. There is no provision whatever made for convalescents taking exercise; nor any fenced ground, shady walks, or seats, for their use. 21. The female ward of the artillery hospital is indifferently ventilated. 22. There are no special local hospital regulations. 23. With reference to the powers of the medical officer, change of diet and the issue of medical comforts are at his discretion, subject to the approval of the superintending surgeon,—or in the Straits of the director-general. With regard to the sanitary state of an hospital, &c., the medical officer can only suggest improvements. 24. There are no convalescent wards; but such accommodation would be an advantage.
XIII. Burial of the Dead.	1, 2, 3. The burial ground is too far from the military station for any ill effects to be felt. The present ground is condemned by a municipal board, and another is under adoption. There is no cantonment or military burial ground at Penang. Native soldiers are burned or buried in various places at a distance. I have had to call for police check upon burning civil dead sometimes too near the native infantry. There are no particular burial rules here, there being no cantonments yet formed. 4 to 7. The general burial ground, has, I believe, been municipally pronounced overcrowded, and is offensive sometimes. Another yard is in course of adoption.

(Signed) Dav. Babington, Colonel, Commanding Troops, Penang.
W. S. Mitchell, Captain,
Officiating Executive Engineer, Penang.
W. H. S. Burn, Surgeon,
22nd Regiment Madras Native Infantry.

31st August 1860.

(The answers, according to the subjects, are initialed by the commanding officer, the medical officer, and the executive engineer.)

SINGAPORE.

Accommodation { European Troops - Artillery - 1 weak Company.
Native Troops - { Artillery - 1 weak Company.
Infantry - 1 Regiment Madras Native Infantry, minus a Detachment of 105 at Labuan.

I. Topography.	1. The country surrounding the station is undulating and the vegetation profuse. It consists of low hills rising from a plain; in some parts it is sandy, but mostly consisting of a dark tenacious clay mixed here and there with vegetable mould, and penetrated in many places by salt tidal swamps. There is a good deal of planting, but the primeval forest is distant about 1½ or 2 miles; there is plenty of water. 2. The elevation of the station above the sea is about 25 to 35 feet, and the adjacent country is not so high as the cantonment, with the exception of the hills. There are two nullahs within a short distance of the place, and there are several perennial streamlets and many wells, mostly of rude construction. The neighbouring hills rise from 100 to 200 feet above the station, probably higher. Bukel Timer, five or six miles off, is about 530 feet. 3. Several of the hills in Johon on the coast nearest to the north side of Singapore, rise to a height of about 1,200 feet. 4. The open sea is more than a mile from the station, but tidal swamps or inlets of the sea extend to the station. The nullahs before alluded to are in the station. The neighbouring

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	low ground is much overflowed at every spring tide. There is little or no broken ground except the tidal swamps, which do not appear to have any prejudicial effect upon health. 5. The station is open and freely exposed to winds; gardens abound and hedges are in many places much too high near the station to admit of free ventilation. Military limits are, however, not yet defined. The temperature of the station is not raised by reflected sun heat. A gentle breeze almost daily moderates the heat; the land or jungle wind is the coldest; the sea breeze being sensibly warmer, and often produces lassitude and sometimes fever. 6. The surrounding country is chiefly planted with spice and fruit trees. Catechu is also extensively cultivated, under the name of gambur. There are no works of irrigation near the station, and no rice is grown on the island. Indigo is not cultivated except in minute quantities, nor are flax or hemp in the island of Singapore. 7. The town of Singapore, with a large mixed population, adjoins the east side of the station. 8. The geological structure of the hills consists mostly of a firm clay soil, containing masses of laterite or ironstone, mixed in some parts with silicious sand. Few of these hills rise above 120 feet. The plains are of a uniform level, covered, for the most part, with a superficial vegetable mould more or less friable, under which there is a dark blue plastic clay, containing numerous remains of shells, all of existing species, also corals. Various cuttings have been made from 20 to 30 feet deep, and in all the subsoil is of the same description. The site of the present station was never previously occupied by natives or others. 9. Water is found near the base of any of the hills, and is readily procured good at the depth of a few feet at any season of the year. 10. For the most part rain water flows readily away, though doubtless the very frequent and heavy rains tend to keep up the supply of water as already described. There is no drainage from higher ground which passes into the subsoil of the station. 11. The water supply is derived from wells and natural streamlets. It is not at present stored in open tanks. Tanks for bathing purposes are much required for the use of the troops, and have often been applied for. One is to be constructed, but two or three are necessary. Sources of impurity are pretty well guarded against here, but all wells used for drinking ought to have a wall round them, which at present many have not. 12. As there is more than one perennial streamlet the supply of water available may be increased indefinitely; the water is generally clear and good, but after heavy rains is tinged with clay. It is soft, good, and abundant, but has not been tested chemically or microscopically. It is raised by buckets and carried by men in leather skins; good pumps are most desirable, and would save much labour. Tanks for bathing purposes are much required and could be easily constructed. 13. From the temperature being so uniform throughout the year Europeans are remarkably exempt from the sudden and severe attacks of disease common in Hindoostan, but owing to the absence of a cold season the climate is not well adapted to men who are much reduced in health and strength. 14. Her Majesty's Government having recently determined that permanent barracks for a European regiment of full strength should be erected, considerable discussion arose as to the most eligible site procurable. Finally the selection became limited to the Balestiers property in an open cleared champaign country, on which sugar-cane had been growing for some years about two miles north-east of the town, and to a range of higher ground with a plateau of from 60 to 80 feet elevation in the Tanglin district about three miles north of the station. Ultimately the preference having been given to the latter locality, all the rules prescribed in the Bengal Code of Public Works, p. 166, were adhered to, and a favourable report was obtained from the committee. In this particular case, where there were many European residents and others from whom the valuable ground had to be purchased, there was no occasion for particular inquiries as to disease and sanitary condition.
II. Climate.	1. At present the only instruments available at the station for conducting meteorological observations are, thermometers, aneroid barometers, and rain gauge. 2. The following are the only observations registered for the year 1859:—

Months.	Mean Temperature.	Rain, inches.	Months.	Mean Temperature.	Rain, inches.
January	80	15·14	July	82½	7·5
February	80¼	9·5	August	81¼	13·15
March	82	7·6	September	82	5·13
April	81	3·17	October	81¼	9·19
May	82¼	3·18	November	80	8·10
June	82¼	6·10	December	81	7·6

	Satisfactory information as to the climate can be gained from Capt. Elliott's able magnetic survey of the Eastern Archipelago, no available means being here at present. 3. The climate is healthy. It is moist, moderately hot, not variable, and is damp from the constant rain and proximity to the sea. Vegetation is rapid; there is little or no irrigation; dust is seldom troublesome, and the only nuisance known to affect the air prejudically is the manufacture of sago, and in the country, the burning of the manure used by Chinese cultivators. The sago nuisance is being gradually got rid of. Provisions of all kinds are very dear, and the Europeans and natives suffer, doubtless, not from the climate, but bad living. The duties are too hard upon the native troops, and they suffer from being exposed to the dews during the nights, being every third day on duty. It has been already observed that there is very little variation in the weather,

SINGAPORE. STRAITS SETTLEMENTS.

References to Subjects and Queries.	Replies.
II. Climate—*cont.*	but occasionally there is rather more continuous rain towards the end and the beginning of the year. When such is the case parties suffer from intermittent fever. 4. Probably the site selected by the committee for the location of the European regiments at Tanglin, distant about three miles from the station, which is situated on higher ground, will be more conducive to health. This is, however, only a supposition, as barracks are only *now* being erected there. 5. The following are the stations on which the different members of the committee have served, placed in the order of their salubrity. Col. Burn has served in Neilgherries, Belgaum, Dharwar, Bangalore, Singapore, Kulladgee, Cuttack, Vellore, Madras, Bellary, Kolapore, French Rocks, Vizianagrum, Masulipatam, Nagpore, China, Chittledroog, Goomsore, Manantoddy. Col. Faber has served in Mhow, Singapore, Penang, Jaulnah, Saugor, Madras, Secunderabad, Negapatam, Tanjore, Trichinopoly, Kamptee, Madura, Manantoddy. Dr. Rose has served in Penang, Singapore, Cawnpore, Jhansi, Dumdum, Chinsurah. Dr. Traill has served in Malacca, Singapore, Vizigapatam, Madras, Labuan, Cuttack, Russelcondah, Hong Kong.
III. SANITARY CONDITION OF STATION.	1. A map of the station is not obtainable at present. 2 and 3. Plans. 4. The following Table shows the barrack accommodation. Date of construction, for Europeans, 1844; for natives, 1859. Total number of rooms, for Europeans, 1; for natives in the four barracks, 4, with end rooms for native non-commissioned officers. Total number of non-commissioned officers and men, Europeans, 60; native, 160 in each hut.

Barrack Rooms or Huts.	Regulation Number of Men in each Room or Hut.	Dimensions of Rooms or Huts.				Cubic Feet per Man.	Superficial Area in Feet per Man of Floor Space.	Height of Men's Beds above the Floor.	Windows.

Native Barracks, 4	160	220	54	16	176,000	1,100	74	2	44	5 9	3 5

5. The windows are on opposite sides, and open outwards. There is no verandah.
6. The cots are wooden ones, and ought to be of iron for the native troops. The Europeans have iron cots.
7. No tents are in use at Singapore, the climate being too damp.
8. The ventilation of the barracks is good. There are also punkahs for the Europeans. The ventilation is quite sufficient in every public building in the station. Punkahs are pulled during the hot weather. The cost of each is about 10 or 14 dollars.
9. The barracks have brick and chunam walls, with tiled roof, for Europeans, and for natives attap roofs.
10. The floors are of tiles, raised about 2 feet. There is no passage for air below.
11. The materials and construction are very suitable to the climate. New barracks are being built for the Europeans; for the natives no improvement is required. The barracks are kept in repair by the engineer department, and the walls and ceilings are cleansed and limewashed once in six months.
12. The only lavatories at present are a few unfinished wells, which are supplied with water by the rains, and may be springs. There should be one good well per company. and drains from each to carry off the water, bathing once or twice a day being essential for health in this climate.
13. The cooking means are bad. The buildings being temporary only, others are being built. There are no means whatever of supplying water, excepting by one of the water carriers or bheesties, two being allowed to a full company, which is quite insufficient. There are no drains whatever for draining off the refuse water from the present temporary buildings. There is no convenience for washing linen but the open air, which is well enough in dry weather. A drying shed would be most useful, and the holes containing water in which they now wash might be greatly improved at very little expense.
14. Privies are now being built, but since troops have been stationed here the men have gone wherever they could find a place, generally in the neighbourhood of Her Majesty's jail, which has never been cleansed or taken away.
15. The barracks are lighted at night with oil, in globe lamps.
16. The four native barracks are on the summit of a small hill, from whence the water runs off; there are no drains constructed. The barrack for the Europeans, on Pearl's Hill, is not well drained; an application has been forwarded to the executive department to have this very essential work performed immediately. The drainage from the temporary cook-houses is very indifferent. New cook-houses and privies are only now being erected. Urinals have never been in use with natives, and for the Europeans chatties and buckets are in use, which are emptied and cleansed by natives. No part of the buildings is damp. The drainage is generally sufficient for the barracks, and

References to Subjects and Queries.	Replies.
III. Sanitary Condition of Station—*cont.*	will be attended to when the new cook-rooms are given over. The fluid refuse runs off, but what may remain occasionally is carried away by servants. There are no cesspits. Water is to be had within 50 or 60 yards from the new cook-rooms. The barracks are swept daily, and thoroughly cleansed once a week, as is also the hospital. The tidal nullah near the new privies is often very offensive, and is distant from the north barrack about 200 to 300 yards. The ditch in rear of the European barracks will be repaired, shortly; it being of earth only, it has become choked up. 17. A few prisoners, under the officiating barrack master, attend to the cleansing of the cantonment, but is not efficiently done, from the paucity of hands. The refuse and manure are carried away by the prisoners in baskets; a hand-cart has, however, been applied for. 18. The neighbourhood of the cantonment is surrounded by thick low brushwood, which ought to be removed. Applications have been submitted, but up to this period have been unattended to. The bazaar might be improved; the roads being very bad all over the station. Applications for having them repaired have been submitted, but have hitherto been very much neglected. The little bridges over the watercourses are all in a dangerous state for want of repair. 19. The bazaar is very small, and at this station is of very little use to the men, all going to the general bazaar. The troops are nearly altogether dependent for supplies on the shops in the town, which are altogether under the control of the municipal authorities. The native houses near the station have all more or less refuse, and dung-heaps near them; it being the custom of the Chinese to have them. No nuisance is experienced in barracks from wind blowing over the native dwellings. 20. Animal food is seldom or never used by the native soldiery. All use it in their own country, but from its excessive dearness in Singapore, none are able to purchase it; goat mutton being nearly 2*s.* a pound, and good mutton 2*s.* 6*d.*; therefore, no animals are slaughtered except for the gentry. 21. The officers only have horses or ponies. These are all kept in stables near their houses; the manure being generally used for garden purposes. 22. There are only eight ponies attached to the mountain train guns. These are kept in stables at some distance from the barracks, and the manure is carted away. There are no picketing grounds. 23. There are only four houses in the cantonment for officers, hence they are compelled to take quarters wherever they are to be had, at an expensive rate. The officer commanding generally occupies the house of an absent merchant, which he is compelled to vacate on the merchant's return. The native soldier has no family with him, and for the few Europeans who have families there is sufficient accommodation.
Officers' Quarters.	1. The four houses before alluded to are in very bad repair, and their owners are unwilling to lay out on them more than is absolutely necessary to prevent their falling into ruins. Houses out of the lines are let far beyond the means of regimental officers, the rents ranging from forty to eighty dollars. No fault is found with their drainage and ventilation. Two of the officers of the European Artillery have good public quarters assigned to them. It would be a real boon if Government were to build suitable quarters for all commissioned ranks, and charge house-rent for them, as officers, from their short stay at Singapore and ignorance of Malays, are unable to build for themselves.
IV. Health of the Troops.	1. The station and district are healthy in a marked degree. 2. Cholera very seldom visits the Straits. Small-pox occasionally occurs, but is seldom very virulent. A tendency to skin diseases is observed; and among the Chinese ulcers of the legs are rather prevalent, attributable in part to their gross feeding, the fattest pork and salted vegetables forming an important part of their diet. Diseases of the spleen seldom occur. 3. I attribute the healthiness of the native population to the good climate and the facilities of earning a livelihood. The troops suffer from being deprived of animal food, and the severe duties they are called upon to perform, as also, absence from their families. 4. The 40th Madras Native Infantry were nearly three years in Cuttack, during which time however they were employed against the rebels at Sumbulpore, when the regiment was prostrated and almost disorganized by jungle fever in a few months from active employment during the unhealthy season of the year. They left Cuttack on the 26th December 1859, and arrived here in rather a weakly state on 22nd January 1860, and being without their families, became depressed and rapidly filled the hospital with cases of diarrhœa, rheumatism, and ulcers, which in many cases proceeded from itch pustules, indicating a very low tone of health. The barracks are very good quarters for the men, but owing to the sudden arrival of the 11th Punjab Regiment, the men are too much crowded at present. 5. They are not camped out, nor would it be advisable in this damp climate. It would be moreover very expensive, as a new tent only lasts a very few months. 6. I have never been in charge of troops at hill stations. 7. I have not observed whether troops are more or less liable to disease on returning to the plains. 8. I approve highly of selecting hill stations for troops. 9 and 10. I am not informed whether there are diseases peculiar to hill stations, nor whether any special precautions are necessary as to diet, clothing, &c. 11. The hot seasons are best adapted for residence in hill stations, and six months at least is the shortest period in which benefit to health can be obtained. 12 and 13. No information. 14. It would appear to be highly desirable to locate troops on hill stations. A residence at the hills during the hot season is most desirable for an officer, and is generally attended with benefit, and therefore would appear to be equally conducive to the health of the soldier. 15 and 16. No information. 17. There is no higher ground near this station of sufficient extent to locate troops on.

SINGAPORE.
STRAITS SETTLEMENTS.

References to Subjects and Queries.	Replies.
IV. Health of the Troops—*cont.*	18. Much difference has not been noticed as to the effect on health of surface or subsoil, provided the climate is good, the site elevated, and the soil not too retentive. A gravelly soil is of course to be preferred. 19. The best age for soldiers proceeding to India is from 18 to 24; and the best period in Madras and Bengal is about the end of October, and in the Straits about the middle of December. We have no experience at Singapore how troops are disposed of on first landing. When a detachment of Europeans or a regiment of natives arrive, they are invariably located in the buildings vacated by the relieved corps or detachment. The precautions to be observed on first landing in India are, avoidance of excessive sun-heat, exposure to the dews at night, indiscriminate eating of fruits, but above all, the drinking of spirits, especially that procurable in the bazaars, which in most stations, but especially at Singapore, are drugged. 20. Stations known to be healthy ought to be selected for Europeans on their first arrival in India, and until they get acclimated, long marches, or indeed any extra fatigue, ought to be avoided. They should be sent to hill stations or others known to be healthy. 21. We have no experience here of the transport of troops from the port to the interior, the barracks being within one to one and a half mile of the place of disembarkation. 22. Soldiers should serve in India from 20 to 25 years. 23. Medical boards are generally conducted with impartiality and sound discretion. No suggestions to make. 24. Invalids should leave India for home about the end of February at the latest, by the Cape route.
Diseases.	1. There are inspection parades once a week for the discovery of incipient disease. 2. There has been no scorbutic disease at Singapore. 3. Amongst the natives hepatic disease is little known. 4. Dracunculus does not occur here, except when an occasional case has been imported from Hindoostan. 5. The proportion of venereal cases amongst natives is about one per cent. Were a local corps formed, so that the men could have their familes with them, this would be diminished. A lock hospital is scarcely necessary at Singapore. 6. Epidemics are scarcely known, and endemic diseases are rare. The troops suffer occasionally from intermittent fever and rheumatism, rarely from anything else. Cholera is scarcely known; small-pox very seldom; rheumatism is rather common. The Director-General's records can alone supply the statistics of disease and death, as the present regiment has only been here a few months, and other regiments carry their records with them when they leave. 7. Small-pox is the only infectious disease observed, and that very rarely. Itch, in an aggravated form, is, however, too common; more so than in most Indian stations. There is no particular season when these diseases are most prevalent. The personal habits of the natives are not cleanly, and this, with the want of proper lavatories, predisposes to itch. 8. Epidemics are not prevalent in this station. 9. Quinine is not necessary as as a prophylactic. 10. No recommendations are necessary as to the prevention of epidemic disease.
V. INTEMPERANCE.	1. The soldiers at the station are temperate. There are one or two confirmed drunkards in the detachment of Europeans, which consists of about 50; there are none amongst the natives. 2. The proportion of diseases occasioned directly or indirectly by intemperance cannot be given, the medical officer with the detachment of Europeans being changed every five or six weeks, and the statistics of the native regiment having been taken away with the relieved regiment. Drunkenness is invariably punished as an offence. 3. Distilled spirits are sold at the canteen and are good; those in the bazaar are of a bad description, often, it is to be feared, drugged. The average amount consumed per man is about a dram per diem. Spirit is no part of the ration, and none are ever issued before noon. It is never given as a ration to convalescents. No other kinds of drink injurious to health are sold in the canteen. 4. The consumption of spirits in moderation is not injurious to health; it is certainly not conducive to efficiency and discipline. 5. There are no spirits issued as rations; and, if not sold in the canteen, many men would purchase inferior liquor in the bazaars. It is to be feared, therefore, that the sale in the canteen cannot now be abolished. 6. There can be no doubt that malt liquor is preferable to spirits; wine is too expensive. 7. Tea and coffee are issued as a ration to the Europeans and are much used by the native soldiery. Every inducement should be given for the men to drink malt liquor, as conducive to health. 8. The suppression of the sale of spirits cannot be done, for after a man is accustomed to spirits he will not be contented without them. 9. Many men would not be contented with beer or any less stimulating beverage than the spirits they have been accustomed to. 10. A good supply of malt liquor should be always available for European troops, to induce them to avoid drinking spirits. 11. Rules for the management of canteens, G. O. 17th August 1855 and G. O. 13th March 1857.
VI. DIET.	1. The ration for British troops consists of 1 lb. of bread, 1 lb. meat, 1 lb. vegetables, 4 oz. rice, $\frac{5}{7}$ oz. tea or $1\frac{3}{7}$ oz. coffee, $2\frac{1}{2}$ oz. sugar, 1 oz. salt, 3 lb. firewood. The rations are inspected by the commanding officer. 2. A complete ration, including 1 lb. vegetables, is issued daily by Government, for for which there is no actual stoppage. There are three meals a day, breakfast at 8, dinner at 1, supper at 6. 3. Europeans in the Straits never have mutton served out to them, it being considered too expensive, but it is most desirable they should have it once or twice a week.

References to Subjects and Queries.	Replies.
VI. Diet—*cont.*	Europeans never sell their rations, and every discouragement is given to prevent the natives doing it. 4. The cooking is performed in copper and iron vessels provided by the Government. The kitchens are the ordinary native buildings, and water is supplied by water carriers. The meat is neither boiled nor roasted, it being generally beef, which is either stewed or curried. The beef is too tough to be roasted; in other respects it is properly prepared. The men have never marched at Singapore, all movements taking place by water. 5. Gardens might be advantageously established both for Europeans and native soldiers, and should be under regimental arrangements.
VII. Dress, Accoutrements, and Duties.	1. There being no cold weather, the khakee is usually worn by the Europeans and by the natives, with the exception of the months of December and January. The khakee is at present cotton; thin woollen would be preferable both for Europeans and natives. I would recommend the woollen khakee of a dark grey colour and the felt helmet for Europeans and natives with a due regard to the prejudices of the latter. Cotton khakee jackets and trousers and wicker helmets is the present dress for Europeans; the white jacket and dark cotton trousers with the Madras regulation pugree for natives.
Duties.	1. It would certainly be advisable that Europeans should be drilled at home, and natives before being sent to the Straits ought to be thoroughly drilled and fit to join the ranks before being sent from India. 2. There are parades or drills five times during the week in the mornings and twice in the afternoons. The best hour for drills is half an hour before and after sunrise and sunset. The orders are that no regiment is to be under arms between 8 a.m. and 4 p.m. Europeans have three out of four nights in bed; natives, two out of three. 3. The European guards are mounted quite close to the barracks. Natives at various distances up to three miles. There are no roll calls after 8 p.m. except as a punishment. Night guards are very prejudicial to health, and on this account it is most desirable men should not be on duty more than once in five or six days.
VIII. Instruction and Recreation.	1. The only means of recreation and instruction at the station are a skittle ground and a library and reading room, which is kept up by the men. A little assistance from Government would be very acceptable. There are no schools, ball courts, day rooms, gardens, workshops, theatre, or gymnasia. There is sufficient to keep the men occupied if so inclined, the library being good. There is no restriction on the men confining them to barracks when off duty, and the plan appears to work well. 2. Gardens are most desirable, also fives' court and cricket. 3. Savings' banks are established, and would be made more use of if the interest were better. 4. There is no shade from trees, verandahs, &c. to enable the men to take exercise during the day.
IX. Military Prisons.	1. There is no military prison at Singapore. There are three cells which might be improved.
X. Field Service.	1 to 4. Not applicable to the station.
XI. Statistics of Sickness and Mortality.	1. Statistics are only to be procured at the office of the Director-General, Medical Department, Madras.
XII. Hospitals.	1 to 4. No replies. 5. Both the hospitals are on hills, and are in consequence naturally well drained, the water falling from the roof into trenches which lead to outlets in the compound wall, whence it is rapidly carried off. Both the hospitals are built of brick and chunam, with tiled roofs and single walls. They are very well ventilated and both are very cool. They are supplied with verandahs on both sides, which afford sufficient shelter from the sun and rain. Convalescents occasionally occupy the verandahs when the sick list is large, but they are further protected by an outer verandah of palm leaf supported on poles, a very useful adjunct to all Indian hospitals. The hospitals consist only of one flat. The following table gives the hospital accommodation:— Date of construction, European, 1845; native, 1831. Total number of wards, 1 European, and 1 native. Total regulation number of beds, 65 in the native hospital, and about half that number in the European.

Wards.	Regulation Number of Sick in each Ward.	Dimensions of Wards.				Cubic Feet per Bed.	Superficial Area in Feet per Bed.	Height of Patient's Bed above the Floor.	Windows.		
		Length.	Breadth.	Height.	Cubic Contents.				Number.	Height.	Width.
		Ft.	Ft.	Ft.	Ft.			Ft.		Ft.	Ft.
Native, 1 - -	65	90	30	15	40,500	623	41	2	10 and 9 doors 9 ft. by 4½ ft.	6	4
European, 1 - -	60	60	35	22	47,300	945	43	2	12 and 4 doors 10 ft. by 5 ft. with 16 ventilators.	10	4½

SINGAPORE. STRAITS SETTLEMENTS.

References to Subjects and Queries.	Replies.
XII. Hospitals—*cont.*	There is no obstruction to the wind from any quarter, but low hills moderate the effect of the sea breeze, which is rather an advantage than otherwise at this station, where the wind from the sea is often hot, if not injurious in some degree. There are no glass windows, but venetians that open like folding doors, and conduce much to ventilation. 6. There are large square openings in the ceiling of the wards, which are excellent means of ventilation in hot climates and ought to be more general, and air has free access above and below the floor, enough to keep the wards free of odour *if not overcrowded.* The jalousies are of venetian, like folding doors. 7. No means of cooling the air are in use at the native hospital. In the European hospital there are punkahs suspended. 8. No means of warming are required. The walls and ceilings are limewashed once in six months, and oftener if required. 9. The privies are sheds built of brick and chunam and tiled. They are situated at the two corners of the compounds, with compartments in which there are perforated seats with buckets. They are properly drained and supplied with water, and are not offensive, means being taken for the removal of all filth. 10 and 11. The lavatory arrangements consist of bathing tubs, besides a bath room containing a fixed bath of masonry, in which the patient can have either hot or cold water. The European soldiers seldom and the native never use washhand basins. 12. Regimental washermen are paid for washing and drying the hospital linen, and are generally found sufficient. 13. The means of storage are sufficient. 14. The bedsteads consist simply of two or three planks, when put together being 6 feet by $2\frac{1}{4}$, and supported by trestles. Each bed for a European has a mattress stuffed with straw or cocoa-nut fibre, and the native has his carpet or cumbly. 15. The cook-houses are in the hospital compound. They have no apparatus beyond what is furnished from the bazaar, which has hitherto been found sufficient. The diet is ordered by the medical officer, and is on a liberal scale for the sick. 16. There are no diet tables, diets being furnished as daily directed by the medical officer. Statistics of sick are not kept here, all reports being sent to the Director-General. The medical officer in charge of the Europeans is generally changed every two or three months, which is against the internal economy working well. 17. There are hospital serjeants for attendance on the sick at all the hospitals, and orderlies are furnished at the requisition of the medical officers. 18. The hospitals are well constructed, but on the arrival of the 40th Madras Native Infantry with numbers of weak men, they soon became overcrowded and hospital gangrene began to show itself, but on immediately removing a number of the sick to a temporary building, the disease rapidly disappeared. 19. No sanitary defects have been observed beyond the want of extra accommodation on emergencies. 20. The convalescents are allowed to walk out on the public roads, which are very dirty and always dusty. Shady walks and seats are unknown at Singapore. 21. The wives and children of soldiers are attended in their own dwellings. Shady walks and seats would be a great boon to the sick; even the esplanade where the bands play has not a single seat. 22. There are no special local hospital regulations. 23. Any reasonable suggestions of the medical officers are invariably complied with. They can also obtain on indent wine, meat, and bread and milk for extreme cases. 24. There is no hospital or ward for convalescents. Such an accommodation would be an advantage to the station. Empty buildings have usually been given for the use of convalescents. At present, from the unexpected arrival of another native regiment, there are none available.
XIII. BURIAL OF THE DEAD.	1. The burial ground used by British troops is about a mile east of the station, which is no inconvenience. Chinese burying grounds abound in every direction, and require to be better controlled. 2. The British burial ground is carefully kept, and being on a hill, is well drained. A new one is under the consideration of the Government, the old one being close under the walls of Fort Canning on the Government Hill. 3. In the burial grounds for Europeans sufficient interval between graves is always allowed, and all natives are buried under municipal arrangements. It has not been necessary to reopen graves for Europeans, and is not practised by the natives. At all times in this country burial takes place a few hours after death, or as soon as arrangements can be made. Natives bury at several places, the nearest being close to the parade ground. 4. The European grave-yard is never offensive, but those of the Chinese are very often so. This is under municipal arrangement, and no complaints have been made for the past year, attention having been called to the nuisance. The Europeans are buried in the Government burying ground, 5. The dead of camp followers and bazaar people are disposed of under municipal regulations. 6. No complaints of injury to the public health have been made to the municipal authorities. 7. We would suggest as an improvement that all the burial grounds should be removed to a distance, many being too near dwelling houses.

REPORT BY PRINCIPAL INSPECTOR-GENERAL PEARSE.

Principal Inspector-General Pearse's Report on the Madras Stations.

Stations.	Replies.
	1. The Principal Inspector-General of Hospitals, Madras Medical Department, has the honour to transmit the following report, in reference to section 14 of the list of queries issued by the Royal Commission appointed to inquire into the sanitary condition of the Indian army.
Topographical Reports.	2. Between the years 1842 and 1845 a series of reports compiled under the direction of the Madras Medical Board, by the then secretary, Dr. Pearse, now Principal Inspector-General, Medical Department, were published by the local Government, comprising a medical topographical account of every station in the presidency occupied by European or native troops. Copies of these reports are herewith forwarded for the information of the Royal Commissioners. Although many alterations and improvements have been carried out in hospitals, barracks, &c., subsequent to the date of these reports, still the topographical descriptions of stations are very complete, and may be consulted with advantage in the framing of a general report on the sanitary condition of the various military stations within the Presidency. Since the date of publication several new stations have been occupied in the province of Pegu, but as a topographical account of each station will reach the Commission through the local military and medical authorities, it will not be necessary to enter into the subject here.
	3. Below will be found lists of all important stations occupied by European and native troops, arranged according to their order of salubrity. It is necessary, however, to offer some general remarks with regard to these tables. They have been compiled for a period of ten years—from 1847 to 1856–7; and during this period the Madras army was not employed in the field, with the exception of a portion thereof engaged in the second Burmese war, in 1852–3. The death-rate of each station does not of course show the actual mortality resulting from disease contracted thereat. Many of the stations show a higher rate of mortality than is attributable to the particular locality, occasioned by casualties amongst invalids transferred from other stations. The cantonment of Saint Thomas's Mount, occupied permanently as the head-quarters of the Madras Artillery, is an example of this. It is considered a healthy station for Europeans, and yet the mortality is very high, consequent on the transfer of sick from foreign service and up-country stations to head-quarters.

No. 1.

Table of Principal Stations occupied by European Troops, arranged according to their Order of Salubrity, calculated on the average of 10 Years, from 1847 to 1856–7.

4. In remarking upon the different stations occupied by European troops, it may not be amiss to begin with the station which shows the lowest death-rate of all, viz., Jaulnah.

JAULNAH.

5. Jaulnah is a considerable town and military station in the Hyderabad country, situated in north latitude 19° 0′ 50″, and east longitude 76°. It has for many years been occupied as a station for a troop of European horse artillery, a native cavalry corps, and one or more of native infantry. The elevation of the cantonment is 1,652 feet above the sea. The climate is that common to the Deccan. The hot season begins in March, and terminates usually in the beginning of June. The thermometer in the middle of the day, at this period of the year, ranges from 90° to 100°, but the mornings are generally fresh and comparatively cool. This is stated to be the healthiest season. The rainy season extends from the middle of June to October, the average rain-fall being 32 inches. The cold season extends over the following months:—November, December, January, February. The variations of temperature are very great at this season, the thermometer often ranging from 40° to 80°, and in the early mornings ice has been known to form on plants or evaporating surfaces. The prevailing winds are northerly or easterly, and are particularly cold and piercing. The Medical Board in 1844 thus remarked on the climate of Jaulnah:—

"The climate is considered to be one of the most salubrious and pleasant in Southern India. During the greater part of the year a fresh invigorating coolness is experienced in the mornings, yet convalescence from serious attacks of disease is almost invariably slow and imperfect, and a change of air, especially to the sea coast, is generally found requisite for the restoration of health."

As before observed, the only European force stationed here was a troop of horse artillery. In the beginning of 1857 the station was abandoned as a military post, but after the breaking out of the mutinies it was again occupied, and the wing of a European regiment was quartered there, in addition to the troop of horse artillery. The barracks and hospital accommodation for the limited number of men comprising a troop of horse artillery are good and ample. The buildings occupy the highest ground in the cantonment, and the natural drainage is good. For the ten years ending 1856–7 the admissions to hospital were 236 per cent. to strength, but the mortality scarcely exceeded one per cent. (*per annum?*). Jaulnah is so far away from any sanitarium that no men seriously ill could be transferred, especially during the rainy season, when the roads in the Nizam's territories are almost impassable.

The low death rate, therefore, cannot be accounted for on any other grounds than the great salubrity of the climate, and its suitability to the European constitution. With such wide variations in temperature, it is but reasonable to expect that colds and slight febrile attacks would be common, and these, in fact, with bruises, contusions, &c., to which all mounted soldiers are liable, appear to have occasioned the large proportion of sickness, compared with the deaths. The climate of Jaulnah appears to suit the native soldier equally as well as the European; the admissions, to strength, being at the rate of 727 per thousand, and the deaths 7·3 per 1,000 (*per annum?*). It will be observed that the mortality from cholera has been slight, both amongst Europeans and natives. In the whole Madras army cholera causes one-fourth of the mortality.

Epidemics of small-pox and cholera occasionally visit the station, but the former must always be looked for in a part of the country where vaccination is almost unknown. The latter is of comparatively rare occurrence. The very agreeable climate of Jaulnah, the extraordinarily low death rate—the lowest, it is believed, of any station in India, and considerably below that of the same class of men in garrison towns at home—would seem to point it out as a desirable spot for the permanent location of a European regiment, should military considerations permit of the suggestion being carried out.

His Excellency the Commander-in-Chief, on his late visit to the station, selected a piece of ground admirably adapted for barracks, and Dr. Macpherson, Inspector General of Hospitals, who accompanied his Excellency, reports most favourably of the site. The 3d Regiment Madras Europeans has lately occupied the station, but there are no proper barracks for their accommodation.

CANNANORE.

5. *Cannanore.*—The town of Cannanore is situated on the western coast in the province of Malabar. For a minute topographical account of the station it is requested that reference may be made to the "Medical Board's Report on the Medical Topography and Statistics of the Provinces of Malabar and Canara" (pp. 2, 15). The salubrity of this place and its appearance as second in the list of healthy stations, appears to depend in a great measure on its remarkable freedom from epidemics of cholera as regards the European and native military forces.

Cholera sometimes prevails amongst the towns-people, whose habits are filthy, and who live in dirty ill-ventilated houses and narrow streets, but it rarely attacks a European or native soldier. The Medical Board stated in 1844, that cholera had never been known to appear in Cannanore until 1838, when it proved very fatal to the poor in the town and cantonment bazaars, which were very filthy, but in the sepoy lines, "which are on open ground, and kept remarkably clean," scarcely a single case of the disease occurred. For the ten years

Stations.	Replies.
Cannanore—*cont.*	to which this report refers, only two deaths occurred from cholera amongst the European troops, and not one in the native force, the aggregate strength being respectively 9,338 of Europeans, and 14,504 of natives. It is a remarkable fact, and which will be noticed more particularly hereafter, that European and native military on the western coast of the provinces of Malabar and Canara enjoy almost an immunity from cholera. The subject was noticed in the annual report on the health of the army, European and native, for the year 1856–7. It is there shown that for a period of 15 years, during which the aggregate strength of the European force was 14,441, only 15 deaths from cholera occurred, and the native troops, numbering in the aggregate 49,389, lost only 61 men from this cause. This immunity of the troops is not easily explained, for the native population generally suffer severely during cholera epidemics. In the latter part of 1859 the disease prevailed throughout the provinces of Malabar and Canara, destroying large numbers of the population. In the gaol of Calicut, a well-ventilated and commodious building, in which 400 prisoners were confined, cholera in a few weeks swept away more than one-fourth of its inmates. A detachment of European infantry, numbering 100, during the same visitation, escaped with the loss of one man. It will be seen that Cannanore does not rank so high in the list of healthy stations if the cholera cases are excluded. The climate is undoubtedly relaxing, and a prolonged residence therein conduces to deterioration of health. Dysentery is a common and often fatal disease. Malarious fevers are infrequent. Venereal diseases are common, and chancres are apt to assume a phagedenic form in weakly or unhealthy men, but as lock hospitals for the reception of diseased women have lately been established, it is hoped that fewer admissions from these diseases will occur at this and other stations occupied by European troops. There is a tendency in almost all cases to assume a scorbutic form after a prolonged residence on the western coast. This was very marked in the case of Her Majesty's 25th regiment, which, after five years residence on the western coast, returned to Madras in 1849, enervated and worn out by the debilitating effects of the climate. Soon after their return the men began to suffer from scorbutic dysentery, and the mortality from this cause alone exceeded the average mortality of European troops at Madras from all diseases. It is noticed, moreover, that no fewer than 12 men died of tubercular phthisis in the same year, most of whom had been from 8 to 10 years in the service, and the medical officer attributed the excessive mortality from this disease to the depressed health induced by five years' residence in the moist warm climate of Malabar. It would therefore appear desirable that the relief of European troops stationed on this coast should always be effected at somewhat shorter intervals than is generally the case, and with this precaution there is no reason to suppose that the residence at Cannanore or other stations in these provinces would permanently impair the efficiency of regiments.
Bellary.	6. *Bellary.*—For a topographical description of this station see the "Medical Board's Report on the Medical Topography of the Ceded Districts." Since the report was written a Sanitarium has been established on an isolated little hill 40 miles north-west of Bellary (Ramandroog), which will, however, be more particularly referred to in the list of Sanitaria for the Madras Presidency, and new and commodious infantry barracks have been built at Bellary to accommodate an entire regiment. But for the occasional outbreak of epidemic cholera in Bellary, the station would stand very high in the sanitary list. It has, however, been visited from time to time very severely by that dreadful scourge of our Indian plains. From the medical board's report above referred to, it is observed that the death rate of Europeans stationed in the ceded districts from 1829 to 1838 was 31 per thousand, and of native troops 16 per thousand. For a later period of 14 years, viz., from 1842 to 1856–7, it was 34 per thousand in European troops, and the native mortality remained exactly the same, viz., 16 per thousand. The diminished value of European life in the later period has been due entirely to losses from epidemic cholera. This will be more easily seen from the following table :—

	Aggregate Strength.	Total Deaths.	Deaths from Cholera.	Per-centage of Cholera Deaths to whole Mortality
From 1829 to 1838 { European	9,000	285	62	21·75
From 1829 to 1838 { Native	35,999	581	283	48·7
From 1842 to 1856–7 { European	10,400	359	201	55·9
From 1842 to 1856–7 { Native	56,437	937	488	52·08

Although the station of Bellary itself does not show the above high rate of cholera mortality, yet for the 10 years to which these remarks and the foregoing tables refer, the cholera deaths were 26·6 per cent. of the whole, a very high rate for any cantonment or station. It is observed that troops passing through the ceded districts often suffer very severely from cholera epidemics. Thus, in 1854, a detachment of recruits for the 3rd Madras European Regiment was attacked when within one stage of Bellary, and in a few hours some 30 or 40 men were prostrated, and the medical officer in charge (the late Dr. Cheyne) was seized with and died of the disease. On this occasion the recruits were panic-struck, and many of them hurried off to the cantonment, where fortunately very few cases occurred after the men had been comfortably settled in barracks. From 1854 until the beginning of 1859 the district remained comparatively free from cholera, in fact, no cases occurred at Bellary; but at the latter period the epidemic was general throughout, and the civil and military stations of Kurnool, Cuddapah, Ghooty, and Bellary suffered severely. It is not easy to account for the greater mortality of troops from cholera in the ceded districts than in other divisions of the army. Various explanations have been attempted, but none of them are satisfactory.

A more minute acquaintance with the laws regulating the progress of this mysterious disease will probably lead, at some future time, to a satisfactory explanation of the facts noted. In the meantime, it would be well to bear in mind the following remarkable statistics of two districts or provinces, differing widely in point of geological formation, elevation, temperature, moisture, rain-fall, &c.

INSPECT.-GEN. PEARSE'S REPORT. MADRAS.

STATIONS.	REPLIES.
Bellary—*cont.*	The per-centage of deaths from cholera to the total mortality for a period of 15 years in the Malabar and Canara provinces was— „ - Europeans - - - 4·6 „ - Natives - - - - 12·4 Ceded districts - Europeans - - - 55·9 „ - Natives - - - - 52·8 If the mortality from cholera is excluded, the deaths in Bellary for the 10 years to which the tables refer amounted only to 13·2 per thousand of Europeans, and 6·1 per thousand of native troops. The station has the great advantage of an isolated hill sanitarium within 40 miles, to which weakly men, or those convalescing from acute disease, are often advantageously transferred. With new barracks, and recent sanitary improvements in the bazaars, which formerly were hotbeds of cholera, and with a railway now in course of formation, by which troops can hereafter be moved to and from the station without exposure to the choleraic poison, often so prevalent in the district, there is every reason to hope that the mortality will be found to be considerably lessened in the returns for the next decennial period.
BANGALORE.	7. This station has for many years been occupied by the head-quarters of the Mysore division of the army. Situated on a high table land, at an elevation of 3,000 feet above the sea, it possesses perhaps the most agreeable climate for Europeans of any station in India. (For a minute description of the topography of Mysore, see Medical Board's report.) Although this admirable climate is highly appreciated by European troops, yet it is found that much sickness often prevails amongst them. There is no doubt that many men, forgetting that they live in a tropical country, expose themselves too much in the daytime, and suffer in consequence from fevers, hepatic affections, dysentery, &c. Cholera has been known to prevail seriously in many parts of the Mysore country of late years, and the troops at Bangalore enjoy no immunity from this disease. The number of admissions to hospital according to strength is lower at Bangalore than at any other station, excepting Wellington (the new military station on the Neilgherries), but as regards the mortality, Bangalore stands fourth on the list. The present barrack accommodation for the European dragoon regiment is not sufficient, but spacious barracks, possessing every advantage in site, ventilation, and sanitary requirements generally, are now in course of erection, and when completed will be second to none in India. A lock hospital, for the reception of women affected with venereal diseases, has been for the last four or five years in operation at this station, and although no coercion is used to bring them to hospital, it is satisfactory to know that these diseases are abating in virulency and frequency. If the European soldier could be kept from imprudences in eating, drinking, and solar exposure, Bangalore would be probably the healthiest, as it is certainly the most agreeable, residence in India.
TRICHINOPOLY.	This is the principal military station and head-quarters of the southern division of the Madras army. It is situated in north latitude 10° 50′, and east longitude 78° 44′, on the southern bank of the river Cauvery. This is perhaps the hottest station in the presidency, the mean temperature for the year being 85°, as ascertained by accurate observation. The temperature ranges between 102°, in the hottest part of the year, and 68°, the minimum in the cold season. The troops at this station generally consist of one regiment of native cavalry, one battalion of artillery, one regiment of European infantry, and two or three of native infantry. It is noticed by the Inspector-General of Hospitals, D. Macpherson, M.D., in his late report on this station, that the wet cultivation which has sprung up of late years in connexion with irrigation works on the Cauvery river, has, to a certain extent, changed the dry arid heat of the atmosphere during the hot months of the year to a temperature much more bearable, and the salubrity of the station appears to have been improved by it. The artillery barracks are spacious and well ventilated, but the European infantry barracks are somewhat deficient in these respects, although the latter have been improved of late years. There is a project now under consideration by the local government to build new barracks, arsenal, magazines, &c., within a fortification, on a site lately selected and approved of by his Excellency the Commander in Chief, as Trichinopoly is a position of great military importance. Although hot, the climate is generally not considered unhealthy, and of late years there has been a manifest improvement in the sanitary condition of European troops in the southern division, for which the only permanent station is Trichinopoly. Thus the death-rate per thousand from 1829 to 1838 was 39. ditto, from 1842 to 1856–7, 29. The later years of the report show a reduced rate of mortality, so that for the period noticed in the tables it amounted to 19·7. During the official year 1858–9, a period subsequent to the foregoing tables, the 2nd Madras European Light Infantry was stationed at Trichinopoly, average strength 699, 10 men only died in hospital, three from cholera, two from disease of the heart, not the result of climate, four from dysentery and hepatic disease, and one from sun stroke. For the whole official year, the death rate in this regiment did not exceed 14 per thousand. Trichinopoly, like most other stations in Southern India, is liable to epidemic outbreaks of cholera, commencing generally after the north-east monsoon rains, which usually fall in October and November. On looking over the monthly returns of the various regiments, European and native, for the 10 years under notice, it is remarkable how regularly the cholera season sets in with the cold north-easterly winds, which blow regularly from November to March in each year. Occasionally a few cases are found in the returns for the hotter months, but these are evidently sporadic. The disease does not prevail in the epidemic form during the hot weather. In Central India, the North-west Provinces, and Bengal, it is usually found that cholera prevails, and causes the highest mortality in the hottest months of the year. In Southern India the reverse of this is the case, and here is another peculiarity, not generally known, connected with this mysterious disease. Why it should spread readily and with rapidity at one time of the year in one place, and at a different period in another place, is strange, and in the present state of our knowledge, inexplicable.

STATIONS.	REPLIES.

SECUNDERABAD.

This important military post in the territories of his Highness the Nizam has for many years past been occupied by a large force of European and native troops.

Prior to the mutinies of 1857, the following number of corps, &c. were located there :—

1 troop Horse artillery.
Head-quarters and 2 batteries of a battalion of European artillery.
1 regiment native cavalry.
1 regiment European infantry.
5 do. native do.

Since the great influx of European troops subsequent to the mutinies, the force at Secunderabad has been as follows :—

2 batteries Royal artillery.
1 battery Madras European artillery.
1 regiment European cavalry.
1 do. native do.
2 do. European infantry.
4 do. native do.
1 company Sappers and Miners.

The medical topography of Hyderabad, and the station of Secunderabad, will be found fully described in the Medical Board's reports previously referred to. Since the date of these reports, many additions and alterations have been effected in the barrack accommodation. The infantry barracks and hospital have undergone many improvements in a sanitary point of view. The surrounding native buildings have been cleared away from the neighbourhood of the hospital, and the ventilation and drainage of the barracks and privies have from time to time been improved. Large sums of money have been spent with the view of rendering these barracks more healthy for European soldiers, but hitherto with only temporary good effects. Great improvements were made in them about 23 or 24 years back, as regards ventilation, drainage, and better protection from heat and glare, and they subsequently proved healthy for some years. Epidemic dysentery and fever, however, again broke out, which led to the Medical Board expressing an opinion in 1844, that the site of the buildings was irremediably bad; their abandonment was recommended, and the new barracks in Trimulgherry were in consequence erected. The garrison, however, having been increased by an additional European regiment, the old barracks continued to be occupied, and contrary to expectation, the 3rd European regiment from 1854 to 1857, during which they were located in these very buildings, was a particularly healthy corps. The men improved in health and appearance, and in the last year of their sojourn at the station the mortality fell as low as 12 per thousand.

In the year 1853 a medical committee, by order of Government, reported on the barracks and condemned them, and fixed upon a site for new buildings. In the end of 1854 the new barracks at Trimulgherry were commenced, and in the beginning of 1857 were occupied by a wing of Her Majesty's 12th Lancers, and subsequently they have afforded accommodation to Her Majesty's 1st battalion 1st Royals, and two batteries of Royal Artillery.

The new barracks and hospital are considered the best, in point of ventilation, cubical contents, situation, &c., of any in the presidency. The water supply is good, but it appears that no special provision has been made for drainage from the privies, cook-rooms, &c., but as the "dry system of conservancy" is most applicable to all Indian cantonments in the plains, the omission is not of very grave importance. Arrangements are now in progress for carrying off spare water and liquid sewage.

The artillery barracks are situated on high ground to the north of the parade ground, one of the best sites which could be found in the neighbourhood. The buildings are not lofty, having arched, bomb-proof roofs, but capable of ventilation by open doors and windows. They are never overcrowded. A remarkable difference in the rates of mortality of the artillery and infantry at Secunderabad has been noticed, and this chiefly from the comparative exemption of the former from the peculiarly bad type of dysentery, which often prevails in the old infantry barracks. On the examination of the returns of sickness and mortality of Europeans stationed at Secunderabad for a period of 20 years, some very curious facts have come to light. It is shown distinctly that the mortality amongst the infantry regiments of Her Majesty's service has *nearly doubled* that of European regiments of the East India Company's service, *occupying the same barracks*, but at different periods. The following simple table has been constructed, with the view of showing this fact in a clear light.

Year.	Queen's Regiments.	Death Rate per Cent. to Strength.	Year.	East India Company's Regiments.	Death Rate per Cent. to Strength.
1838	H. M. 55th Regiment -	7·49	1840	1st Madras Fusiliers - -	4·97
1839	Ditto - - -	5·95	1841	Ditto - - -	3·67
1843	H. M. 4th Regiment - -	10·92	1842	Ditto - - -	4·15
1844	Ditto - - -	6·24	1850–1	2nd European Light Infantry	2·55
1845	Ditto - - -	2·98	1851–2	Ditto - - -	6·27
1846	H. M. 63rd Foot - -	6·71	1852–3	Ditto - - -	0·52
1847	H. M. 84th Regiment -	3·52	1853–4	Ditto - - -	1·33
1848	Ditto - - -	2·64	1854–5	3rd Madras European Regiment.	5·65
1849–50	Ditto - - -	2·63			
1858–9	H. M. 1st Battalion 1st Royals	9·64	1855–6	Ditto - - -	2·11
			1856–7	Ditto - - -	1·23
	Average for 10 Years -	5·87		Average for 10 Years -	3·87

Thus in the 20 years the mortality has been as follows :—

Queen's regiments located in the infantry barracks 58·7 per thousand.
Honourable Company's ditto 38·7 do.
Do. Artillery in artillery barracks 27·6 do.

The occurrence of the lower mortality rate in the artillery is explained by the fact that the men of this corps never suffer to any great extent from attacks of epidemic dysentery, as do

Inspect.-Gen. Pearse's Report. Madras.	Stations.	Replies.
	Secunderabad—*cont.*	the troops located in the infantry barracks. Dysentery is by no means uncommon amongst them in the unhealthy seasons which now and then prevail, but it is generally more amenable to treatment than the same disease in the European infantry. The artillery, however, are not so much exposed to night duties, and are better sheltered than the infantry; they, in fact, have only their own regimental guards to take, and this, as well as their having seasoned men, is doubtless the reason why they suffer less from climatic diseases than the other troops. The marked difference in the rates of mortality of the infantry of Her Majesty's and the Honourable Company's service respectively, is not so easily explained. The men of both services were exposed to unhealthy seasons, and as a rule suffered more in the first year of occupation than at any subsequent period. This is particularly marked in the case of Her Majesty's 4th King's Own 63rd Foot, and 1st battalion Royals in the years 1843, 1846, and 1858–9. Some Queen's corps have maintained a fair ratio of health in these barracks. Her Majesty's 84th, for instance, lost very few men during the three years of its occupation of the barracks. It does not appear that the difference of mortality is attributable to greater overcrowding in one class of regiments than in the other. Her Majesty's 55th regiment lost 7·49 per cent. when the average strength of the corps was only 694. Her Majesty's 84th, on the other hand, with an average strength of 1,100, lost in the year 1848 only 2·64 per cent. Again, the 2nd European light infantry in the year 1851 lost 6·27 per cent. of its average strength, which was 988, but in the following year, the strength remaining nearly the same (964), the regiment lost only five men, or 0·52 per cent. Her Majesty's 1st battalion, 1st Royals, arrived at Secunderabad in the beginning of 1858, about 1,200 strong. The regiment was composed for the greater part of young lads under 20 years of age, with but a few soldiers; it occupied the old infantry barracks, and it is calculated, allowing for men on duty, sick in hospital, and two companies stationed elsewhere, that the ten barrack rooms must have accommodated about 880 men. Deputy Inspector General Cole, in his report for 1858–9, calculates that at this rate each man must have had about 1,200 cubic feet of space. Still with this amount of space, the season being an unhealthy one, the regiment lost nearly 10 per cent. of its strength, chiefly from dysentery of a malignant type, and hepatic abscess. In an endeavour to account for the very marked difference in the rate of mortality in the Queen's regiments and in those of the East India Company, as shown by the foregoing table, something, it is believed, may fairly, and it is hoped without its appearing invidious, be ascribed to the fact that all the medical officers who have been in charge of the East India Company's regiments have been men of great experience in the treatment of Indian diseases, and selected on account of peculiar fitness for these particular charges, and likewise to the circumstance that every medical officer of the Madras service is required to undergo a probationary course of hospital attendance on first arriving in India, for the purpose of becoming acquainted with tropical diseases and those peculiar to the country. Whereas, in the other service, the medical officers have not these advantages, and it sometimes happens that the surgeons of newly arrived regiments who have never served in India, have all their experience of Indian diseases to gain, their men besides being equally unacquainted with the climate, until by dear-bought experience they learn to fall into the ways and habits of the country. The wing of Her Majesty's 12th Lancers, occupying the new barracks at Trimulgherry during the same period suffered severely, though in a less degree than the 1st Royals, from the epidemic. The average strength for the year was 310, and the deaths 25, of which number 21 resulted from dysentery and hepatic abscess, the deaths to strength being 8·06 per cent. The general idea amongst medical and military officers was, that the new barracks would be exempt from the epidemic visitations which have proved so destructive to life in the old locality, but the experience of the last year goes far to show that in certain malarious seasons, no matter where the troops are located, or how favourably they may be placed as regards sanitary requirements, dysentery and hepatic disease will always be fatal to the European soldier at Secunderabad. The new barracks are at present occupied by the 1st Royals and two batteries Royal Artillery, and the old infantry barracks after undergoing many alterations and improvements, are occupied by Her Majesty's 17th Lancers. It remains to be seen whether with the comparatively small body of men of a cavalry corps, the old will be inferior to the new buildings in a sanitary point of view. Compared with most other stations, Secunderabad cannot be considered a healthy residence for Europeans. For a period of 15 years, ending 1856–7, the death rate of the European portion of the Hyderabad Subsidiary Force, the greater portion of which is stationed at Secunderabad, was 34 per thousand, and for the last 10 years of this period, which were comparatively healthy, the deaths at the station of Secunderabad were at the rate of 24 per thousand, as shown in the preceding tables.
	Kamptee.	This station, distant about 10 miles from the capital of the Nagpore province, is occupied by the European and native troops of the Nagpore Subsidiary Force. The force consists of a troop of European Horse Artillery, a battery of foot artillery, an European infantry corps, one regiment of native cavalry, and three of native infantry. The peculiarities of the situation, in a sanitary point of view, are the great extremes of temperature which prevail in the hot and cold seasons. In the hot season, deaths from insolation, or heat asphyxia, are not infrequent amongst the Europeans. Cholera and small-pox epidemics occasionally visit the station. Remittent and intermittent fevers are common, especially after the setting in of the rains. These forms of fever are often obstinate, recurring periodically for years, and rarely leaving the patient while continuing to reside in the malarious locality. It has been observed of late years that these fevers have been more amenable to remedial measures, but this is probably the result of an improved method of treatment. It appears from the Medical Board's topographical description of the station, which will be found in the volumes herewith transmitted, that the death rate at Kamptee from 1829 to 1838 amongst Europeans was 39 per thousand. For the 15 years ending 1856–57, the mortality had somewhat diminished, the death rate being 37 per thousand, and for the last 10 years of this period, as shown in the table, it was only 29. European invalids at Kamptee labour under the great disadvantage of being cut off for many months of the year from the possibility of change to a sanitarium or healthier station. The geographical position which it occupies

Stations.	Replies.
Kamptee—*cont.*	makes a long and tedious land journey necessary to reach either coast, and in the wet or hot seasons it cannot be accomplished without considerable risk or injury to health. The Chiculda range of hills have been resorted to by European officers and their families during the hot months, and as they rise to an elevation of 3,800 feet, the change of temperature is found to be very agreeable, but it has not been practicable hitherto to send the invalids of the force thither. Another range of hills, the Muthoor, near Chindwarra, about 70 miles north-west of Kamptee, has now been visited and reported on by a committee of military and medical officers from the force, who were accompanied by a small party of soldiers, with a view to fixing upon a suitable site for a sanitarium. These hills are easily approached and appear to have a large extent of table land on their summit, supposed to be between 3,000 and 4,000 feet above the sea level. From all that we know at present concerning them they appear to be admirably suited for the Kamptee sanitarium.
Madras.	The European troops stationed at the Presidency town are located in barracks in Fort Saint George. There is accommodation for one regiment of European infantry, and about two companies of artillery belonging to the veteran battalion. Considerable improvements have been made of late years in the barracks, which are two-storied, and now furnished with verandahs all round. It is not very easy to account for the low position of Fort Saint George in the sanitary list. Situated close upon the sea, and enjoying the purifying influence of the sea breeze all the year round, the barracks in the fort ought to be a healthy residence for European troops. They have, however, been faulty in some respects. The lower story being on a level with the ground, and the fort wall and other buildings facing the sea keeping off the sea breeze from the lower rooms. It has been noticed by some of the medical officers of regiments occupying these barracks that a larger proportion of sick came from the companies inhabiting the lower rooms than from the upper story. The sea wall of the fort has lately been lowered, and the ventilation has been considerably improved thereby, even in the lower story. The medical officer of the regiment (43rd) thinks that the strong sea breeze now blowing through the buildings, causes an increase of pectoral disorders in the men. Sporadic cases of cholera occasionally occur in the fort, but the number of deaths from this cause have never been large. In the 10 years under notice, cholera prevailed during 4 of them, and in the year 1854, 9 men died from this disease. In the above period 19 deaths from cholera occurred out of a total of 226 cases treated. In the late severe epidemic of cholera which visited Madras, in 1860, the European troops in barracks almost entirely escaped, and there is no doubt that the improved buildings and the larger amount of space available has had a very satisfactory influence on the health of the corps at present stationed in Madras, viz., Her Majesty's 43rd Light Infantry.
Wellington.	The next station was formerly known as Jackatalla (now called Wellington), on the Neilgherry hills, at an elevation of 5,840 feet above the sea. With reference to the low position of this station in the general list, it may be briefly explained that the period for which the average has been deduced was only three years, that the regiment which occupied the station, Her Majesty's 74th Highlanders, was indifferently housed on its first arrival, and that fevers and bowel complaints were very severe and fatal. The new barracks are now sufficiently complete to accommodate the 3rd battalion, Her Majesty's 60th Rifles, 1,200 strong, and this corps has been very healthy during the two years it has been stationed at Wellington. There is no doubt that further experience will show this station to be very well adapted for the location of European troops, and to preserve them in good health. One great advantage of the situation over all low country stations is the difficulty which the soldiers have of procuring deleterious liquor, or of indulging at all in intoxication. On this account, probably the hill station will not be a popular one with the men.
Saint Thomas' Mount.	The head-quarter station, Saint Thomas' Mount, of the Madras Artillery, situated 8 miles to the south of Fort Saint George, enjoys a similar climate and temperature to Madras. The heavier rate of mortality arises from the transfer of sick men from distant stations to the head-quarters for change of air or invaliding, and not from any preventible source of disease.
Stations in Burmah.	Rangoon, Tonghoo, Thyetmyo. } It will be observed that the Burmese stations show in the accompanying table the heaviest death rate of all. It must be explained that the averages were drawn for a period of five years, which included, moreover, the second Burmese war of 1852–3. At the period referred to none of these military stations existed, and on the first occupation of the Pegu provinces the troops, European and native, suffered very severely from dysentery and fevers. The stations now occupied by European troops have been getting healthier year by year, as the surrounding country has become cleared, and suitable accommodation provided for the men. For the last three years the death rate of Europeans in Burmah has not exceeded 17 per 1,000. There has been very little cholera amongst European troops since 1853. Dysentery and hepatic affections are the principal diseases, but these have diminished greatly of late years. Considering the great improvements which have taken place in the last three or four years, there is every reason to hope that the station in Burmah will be less injurious to the health of European troops than the majority of those in the Madras presidency. Native troops do not thrive well in Burmah, and measures are about to be taken to replace them, so far as possible, by police and local corps.
Existing Sanitaria in the Madras Presidency. 1. *Neilgherry Hills.*	1. Neilgherry Hills, including the Stations of Ootacamund, Coonoor, Kotagherry, and Wellington, the latter containing barrack accommodation for a regiment of 1,200 men, and a convalescent depôt. These sanitaria are so well known and appreciated that they need not be particularly described here. (*Vide* Topographical Report for southern division.)
2. *Ramandroog.*	2. A hill, distant 40 miles in a north-west direction from Bellary, elevation 3,400 feet above the sea. There is barrack and hospital accommodation here for 80 men. Invalids are sent here from Bellary and from Secunderabad, the latter station being about 200 miles distant. Cases of debility after bowel complaint, fevers, &c., usually do very well at this elevation. The locality is free from malaria.

Inspect.-Gen. Pearse's Report. Madras. — Stations.	Replies.
3. *Gallicondah.*	3. A hill region called Gallicondah, in the northern division, about 50 miles west of Vizagapatam, has recently been experimented upon as a sanitarium. The result of the first year's trial in a locality called Harris Valley was not satisfactory, but the failure probably may be attributed to the faulty nature of the situation and construction of the buildings erected for the accommodation of the trial party. It is intended during the approaching hot season to erect better buildings at a somewhat greater elevation, on a hill known as Grant's Range, and to give this a trial before deciding for or against the suitability of the Gallicondah range as a sanitarium. The presidency of Madras is particularly favoured in the number and extent of its hill ranges, suitable for the location of European troops or independent settlers. The chief of these hill ranges, with the peculiar advantages or disadvantages of each, will be here briefly noticed.
4. *Shevaroy Hills.*	4. This hill range is situated about five miles to the east of the town of Salem, and within the Salem collectorate or district; elevation 5,400 feet. They were originally explored in 1822, and visited by several European officers stationed in the adjoining low country; but some fatal cases of fever having occurred amongst the earlier visitors, they ceased to be resorted to by invalids. Of late years Europeans and East Indians have settled on the Shevaroys for the cultivation of coffee, and they, for the most part, enjoy good health. These hills are occasionally unhealthy during the months of May, June, and July; and on this account they have never been recommended as suitable for the location of European troops. The climate is, however, most delightful, and preferred by many persons to that of the Neilgherry Hills; and, railroad communication being now open to Salem, there is no doubt that the number of settlers and visitors will largely increase. Probably with increase of coffee cultivation on the hill slopes the periodical outbreaks of fever may be averted or diminished in severity, and this range may ultimately be found suitable for the location of troops.
5. *Pu'ney Hills.*	5. These hills are situated in the southern division of the presidency, between latitude 10° 10′ and 10° 44′, and longitude 76° 21′ and 77° 22′. Elevation of the higher plateaus about 7,000 feet. Climate very similar to that of the Neilgherries, but milder and less rainy in the south-west monsoon. The collector of the district and a few American missionaries have houses on these hills, and the climate is perfectly suitable for Europeans. At present very few, if any, European settlers have resorted to this range, although the soil and climate are considered to be favourable to the cultivation of tea and coffee. The nearest military station occupied by European troops is Trichinopoly, 80 miles distant.
6. *The Anamullays.*	6. The upper ranges of these hills, which attain an elevation equal to that of the Neilgherries, are entirely uninhabited. The temperature is much the same as that of Ootacamund, but the higher peaks being much exposed to the south-west monsoon, the rains are very heavy for six months of the year. In fact, it is doubtful whether the climate during these months would be at all suitable for the residence of Europeans. The lower ranges, from 3,000 to 4,000 feet above the sea, are visited by the forest department for a few months in each year in search of teak-wood, but they can only be occupied during the rains, being at other seasons very feverish to strangers. The natives of these hills, a race termed "khaders," curiously enough, never suffer from fever, unless they go to the low country. The higher ranges of these hills appear to be well adapted for the growth of tea and coffee; but the difficulty of approach and want of labour on the spot will prevent settlers from occupying them. With so many more favourable situations for European troops in the southern division, these hills will never be required for a sanitarium.
7. Coorg.	7. *The mountain regions of Coorg* are very well adapted for the residence of Europeans, but no European troops are now stationed in that country. Independent settlers are, however, becoming every year more numerous, and the cultivation of coffee is carried out on a large scale in various localities.
8. Mysore.	8. *Mysore.*—Several hill ranges, varying in elevation from 4,000 to 5,000 feet, exist in this country, but it is doubtful whether any of these are so well adapted for European troops as the military station of Bangalore, the climate of which has already been noticed.
9. Nagpore.	9. *The Muthoor range of Hills in Nagpore* appears to be well adapted for a sanitarium for the military station of Kamptee. Plans and estimates for the necessary buildings were lately submitted to the Supreme Government, but it is understood that the experiment cannot at present be proceeded with on account of the expense it would entail.
10. Burmah.	10. *Burmah.*—It is reported that hill ranges exist in the Pegu provinces, and within reasonable distance of some of the stations occupied by European troops. These, however, have not as yet been sufficiently explored, to permit us to arrive at any conclusion as to their salubrity. The papers named below will give in detail most of the particulars required regarding the known hill ranges of this presidency.*
Remarks on printed Queries—Clause 4.	Troops usually arrive from England between the months of July and December, or after the termination of the hot season. Recruits for the artillery and local European regiments are usually landed about 4 P.M., and marched off at once under escort of a European officer with a sufficient number of non-commissioned officers and men to keep them together, either to the artillery barracks at St. Thomas' Mount, distance 8 or 9 miles, or to the European depôt at the same place. Of late a depôt has been established at Arcot, distance 60 miles from Madras, to which place infantry recruits proceed by the railroad. Supper is provided for the men on arrival at the mount, cots, bedding, &c., being all prepared for their use under the usual barrack arrangements. The sick are conveyed either in doolies or sick carts to the artillery or depôt hospitals, and bad cases which cannot be moved to the mount or Arcot are at once admitted into the general hospital at Madras, within half a mile of the beach. Drafts of men for the British regiments are under similar arrangements marched to Poonamallee, distant 14 miles, to the depôt for that branch of the army.

* Proceedings of Government, dated 22nd November 1859, 15th March 1860, and 28th March 1861.—Report on Ramandroog Sanitarium, by Dr. Eyre.

Stations.	Replies.
Remarks on Printed Queries—*cont.*	Regiments on arriving, and intended to garrison Fort St. George, are at once marched into barracks on landing. As a general rule all European soldiers are restricted to barracks from a certain hour in the forenoon, usually from 8 A.M. till 4 P.M., this being a regimental arrangement which rests with commanding officers. The men are not allowed to go at large, and reading or coffee rooms, skittle alleys, &c., are attached to all European barracks for the amusement and recreation of the men. A staff of police peons accompanies detachments of troops marching to the depôts to keep off natives who would otherwise provide them with smuggled spirits, cigars, &c., and without some such arrangement, no doubt, the greater portion of the men would become intoxicated before reaching the end of the march. As it is only an occasional case of drunkenness occurs in those who escape the vigilance of the escort. There can be no doubt but much preventible disease arises from intemperance in European soldiers, the remedies for which undoubtedly are in the hands of the military authorities. They are chiefly the adoption of measures for preventing deleterious liquor being smuggled into barracks, providing wholesome spirits, malt liquor, &c., at the regimental canteens, restriction as to the quantity and encouraging men to habits of temperance by suitable rewards and advancement in the service, and lastly, by providing suitable amusements to lessen the tedium of a barrack life. Under ordinary circumstances, newly arrived drafts remain at the depôts until a sufficient number of men is collected to proceed to join a particular regiment or station; when no emergency exists, the batches of recruits, &c., leave the depôts between the end of October and the early part of the year according to distance. Proceeding from Madras towards Bangalore, and such stations as can be reached by that route, advantage is now taken of the railroad, open for about 120 miles westward of the Presidency. Since the year 1857, a system of moving troops by transit carts, instead of marching, has been adopted with the best results, many lives having no doubt been saved by escaping outbreaks of epidemic cholera, fevers, and other diseases incidental to long marches in India. These arrangements have been carried out between Madras, Bangalore, and the Neilgherries; also between Masulipatam, on the coast, and Secunderabad, and between Tranquebar, on the coast, and Trichinopoly. In other cases the reliefs between the several stations on the coast, such as Cannanore, Vizagapatam, Masulipatam, Madras, Tranquebar, &c., are carried out by means of steamers or transport ships. Recruits are always accompanied on the line of march by experienced non-commissioned officers and soldiers under one or more commissioned officers, and all possible precautions are adopted for preventing liquor being smuggled into camps. The hour of marching is usually about 3 A.M., so as to arrive at the new encamping ground about an hour or so after sunrise. Coffee is now always provided about half way on the line of march, and partaken of during a half hour's halt. Doolies and sick carts are provided for the carriage of the sick and foot-sore men, &c., in the proportion laid down in the quartermaster-general's regulations, and likewise tents in sufficient number according to strength, straw being allowed for the floors on which the men place their carpet or bedding.
Clause 5.	1st. It has long since been shown by Dr. Ballingall, professor of military surgery, University of Edinburgh, that seasoned soldiers are much less obnoxious to the injurious effects of a tropical climate than newly-arrived recruits, and all subsequent experience seems to establish the correctness of Dr. Ballingall's views and statements. Plethoric European young men arriving in India are not only more liable to fall into vices and habits in some measure incidental to their period of life, and contract syphilitic diseases, but suffer from the excitement occasioned by high temperature, without actual exposure, more than seasoned men. I should therefore say that from about 24 to 30 years of age is the best period of life for a soldier to land in India. 2nd. The amount of previous service before arriving in India should, under the view just stated, and supposing a recruit to be enlisted at the age of 18 years, not be less than six years. 3rd. In Southern India there is no doubt but the climate of Bangalore is the most suitable for newly-arrived Europeans. It is intermediate between the extreme heat of the plains and the cold of the hills (Neilgherries). Men become acclimatized and experienced in the many peculiar ways, and the mode of life in India, so different from previous habits. I would therefore prefer having a large depôt sufficient to accommodate the newly-arrived drafts of each year, established at Bangalore, than any other place or station I could name. The experiment of sending a newly-arrived regiment to Wellington on the Neilgherries proved a failure in one (the first) instance in which it was tried, the mortality from dysenteric complaints having been great, partly no doubt owing to suitable accommodation not being then available for the entire of the regiment. Every allowance being made for imperfect arrangements, I am still of opinion, that men passing the first year or two of service in the climate of Mysore would be more efficient for general service in whatever part of India they might be called on to serve, than if they had passed the same time in the Neilgherries or other hill stations. 4th. From the Mysore country the recruits or drafts may at the end of a year or two be sent to any other part of the Presidency where their services are required. As to the length of time a soldier should serve in India, instances are frequent of men being invalided as worn out at as early an age as 34 or 35 years, but many such have arrived in the country much under 20 years, some perhaps not more than 17 or 18; whereas had they arrived at the age of from 24 to 26 they would be in the prime of life and full vigour of manhood at ages when now often invalided as worn out and unfit for further effective service. Under a different system from that which has heretofore obtained, there is, I conceive, no reason to doubt but that most men arriving in India at the age, say, of 25, could serve with perfect efficiency from 12 to 15 years, and then return to their native land still effective soldiers. 5th. As regards the marriage of soldiers, I possess no information which would enable me to express an opinion on the subject.
Clause 6.	The general remarks above recorded as regards the protection of health on landing, transport to the interior, &c., will be found to contain nearly all that is requisite to be said on this subject. But there is one point not alluded to which I think of very great importance. It has been found that recruits joining the different European regiments of the local army very soon become acquainted with the ways and habits of the older soldiers, who, with the one exception of being unable to resist the temptation of drink, know well how to make themselves comfortable either in barracks or in the huts of the married soldiers, and to avoid the

STATIONS.	REPLIES.
Remarks on Printed Queries—*cont.*	injurious effects of unnecessary exposure; whereas newly-arrived European regiments have everything to learn of themselves, and are all alike inexperienced regarding the effects of climate or Indian mode of life, from the colonel to the drum-boy. Medical officers have arrived in India in charge of regiments and drafts of soldiers during the late mutinies who were wholly unacquainted with the diseases of a tropical climate or those peculiar to India, and some had never previously seen a case of acute dysentery, hepatitis, or cholera. Still, though thus inexperienced, and having everything to learn, they were entrusted with the charge of hospitals full of all descriptions of Indian diseases, requiring for their proper management the experience of years. Fortunately the excellent staff of Madras medical subordinates was available in large numbers to do duty with these newly-arrived regiments, and the medical officers of Her Majesty's service have one and all borne ample testimony of the invaluable aid they received from the apothecaries and native dressers of the Madras army during the late field service in Bengal.
Clause 7.	*A List of Hospital Equipments.* 1 painted iron or wooden cot, with tape, and stone troughs. 1 palliasse of straw when marching or in the field. 2 quilts of gingham, both lined, one of them quilted with cotton—*clean once a week.* 1 blanket. 2 pillows. 1 bed-gown—*twice a week.* 1 pair of trousers, ditto. 1 cap of gingham, lined, ditto. 1 white cotton shirt—*every second morning.* 1 flannel banyan. 1 pair flannel drawers. 1 pair short worsted stockings or flannel socks. 1 flannel waist-band. 1 cap lined with flannel. 2 cotton shirts. Proportion of the above kept as stock for every 100 men. 60 shirts. 40 quilts. 30 gowns. 30 caps. 30 banyans. 30 pairs long drawers. 150 towels. 150 suttringees for each regiment of infantry. 100 ditto ditto dragoons.

Office of Principal Inspector-General, Medical Department,
Fort Saint George, 12th April 1861.

GEO. PEARSE, M.D.,
Principal Inspector-General,
Medical Department.

ADDENDA.

1.—MILITARY DEPARTMENT.—PROCEEDINGS OF THE MADRAS GOVERNMENT.

Read the following Papers:—From the ADJUTANT-GENERAL of the ARMY, Fort Saint George, 1st November 1859, No. 1171, to the SECRETARY to GOVERNMENT, Military Department.

I have the honour, by order of the Commander-in-Chief, in forwarding for submission to the Honourable the Governor in Council, the accompanying extracts from Reports by the Inspector-General of Hospitals, on the Pulney, Neilgherry, and Annamullay Hills, with the remarks of the Director-General Medical Department appended thereto, to submit the following observations.

2. *Pulney Hills.*—The Commander-in-Chief quite concurs in the observations of the Director General, as per margin, and for other reasons also, his Excellency would not think of recommending that effect should be given to the suggestions of the Inspector-General for the location of a European corps on the Pulney hills instead of at Trichinopoly.

States that the Pulneys are described as possessing an agreeable and bracing climate, well adapted to preserve the health and efficiency of European troops—that they are only healthy for about nine months of the year; during the remaining three months, viz., from April to June inclusive, decidedly unhealthy, and that he is unable to concur in the recommendation of the Inspector-General for the erection of the proposed barracks for a European regiment on the Pulneys instead of at Trichinopoly for various obvious medical reasons, and as it is not probable that Government would incur the double expense of providing barracks at Trichinopoly as well as the Pulneys, which must be the case if the latter are occupied for removal of the troops during the three unhealthy months, which embrace the hottest part of the year.

3. *Neilgherry Hills.*—As both the Director and Inspector-General see reason to object to the rule for assembling annual committees on sick officers on the Neilgherries, his Excellency thinks that paras. 9 and 10, G. O. G. No. 178, dated 10th August 1847, should be abrogated or modified.

4. *Jackatalla.*—The Commander-in-Chief quite agrees with the Director-General that regulations adapting the dress of the troops to the climate should be issued by officers commanding regiments stationed on the hills, that white jackets and trousers, except worn at mid-day, are unsuited to the climate, and that want of attention to this particular is a fruitful source of disease in persons newly arrived on the hills. His Excellency has accordingly caused a communication on this subject to be addressed to the officer commanding southern division.

5. *Annamullay Hills.*—So far as concerns military purposes, the Annamullay range is quite useless, while we have abundance of ground available on the Neilgherries, the salubrity of which has been proved by the test of experience.

EXTRACTS from a REPORT by the INSPECTOR-GENERAL of HOSPITALS, with REMARKS of the DIRECTOR-GENERAL annexed.

The Pulney Hills.

"The increasing interest taken by Government in all hill stations in India which are adapted as a residence for our English soldiers induced me, when on inspection duty at Madura, to visit the Pulney hills in company with Mr. Colebrook, the Zillah surgeon of the station, who has resided on them at intervals for many years past.

Series No. 2, dated 7th September 1858. Southern Division.

2. "It is now 22 years since Captain Ward of the Surveyor-General's Department first visited and reported on these lofty mountains. *Vide* 'Madras Literary Journal, Volume VI.

3. "Two years after the date of Captain Ward's visit, Dr. Wight, of the Madras Medical Department, reported

on their vegetable products. *Vide* 'Madras Literary Journal,' 1837.

4. "The Society for the Propagation of the Gospel established a mission on the table land of the Pulney hills ten years since, which they denominate 'Mount Zion.' In their Journal for 1851–2 there are a series of interesting letters descriptive of the country and its inhabitants, and of the silent, yet steady, introduction of Christianity amongst them.

5. Mr. T. Clarke, of the civil service, whose family resided on these hills for a long series of years, in his report to Government dated May 1853, treats on the same subject; and Captain Horsley, of the corps of Engineers, in August 1855, drew the attention of the chief engineer to the expediency of improving the communications between these hills and the plains.

6. In the following remarks I propose submitting the results of my personal inquiries, and also such particulars of interest as I have been able to glean of these elevated regions, as yet little frequented or known except to those who reside in their immediate neighbourhood.

7. "Thornton's Gazetteer" gives the latitude of the Vurragherry and Kunnundaven mountains, now commonly called Pulney, from their vicinity to the famous temple of that name, between 10° 10′ and 10° 44′, and the longitude 76° 21′ and 77° 22′.

8. They are distant from Trichinopoly, the head-quarters of the southern division of the army, about 80 miles, and about half that distance from the civil station of Madura. They lie west of Dindigul, south of Pulney, and north of Periacolum. According to Captain Ward, the elevation of the plateau land is 7,000 feet above the level of the surrounding plains, some of the peaks and ridges having a still higher elevation. The superficial area of the hills is calculated at 800 square miles; their length from east to west is 54 miles, and their medium breadth 15 miles.

9. *Passes.*—"The principal passes from the low country are—1st. On the north, from the village Pulney to Poombaray, a hill village to the west, and Veelputty, a hill village to the east. 2nd. On the west from the village Rutteambady to Maravanoor, a hill village to the west. 3rd. On the north-east from the village Periacolum to Kakakanal, a hill village to the west. 4th. On the south-east from the Davedunaputty to Palamalay and Sambanoor to the north-east. The slope by each of these passes seldom exceeds 1 in 12.

10. *Topography.*—"The hills are divided by the hill-people into two distinct portions, viz., the *Mel and Kel Malai*—the high and low, or eastern and western ranges.

11. "To the west, the table land reaches 7,000 feet, and gradually descends to the east, forming distinct plateaus at intervals of about 1,500 and 1,000 and 500 feet, until the plains are reached. The ranges are connected to the Travancore and south-west mountains by an isthmus about eight miles wide, being isolated on every other side. To the south the hills are excessively steep, presenting at their summit a magnificent wall of granite. To the north and east they slope downwards towards the low country in extensive broken ridges, and to the west the hills fall gradually and form at their base the valley of Ungeenad, from which the ground again rises abruptly to the south-west.

12. "The higher lands are free from wood and are covered with grass. The spurs which run down in every direction are intersected with deep ravines covered with dense luxuriant forest, resembling the sholas on the Neilgherries, and affording a greater variety of timber the nearer they approach the open country.

13. "In the heart of these mountains are situated rich and fertile valleys, which, intersected by numerous streams of various magnitude, picturesquely contrast with the bare and rugged heights which surround them, and in some spots present a view in the highest degree sublime."

Streams.—There are upwards of 30 large streams on these hills, which uniting form 11 respectable rivers. From the summits of the higher peaks overtaking the plains, these rivers are seen meandering through dense forests, down deep ravines, and over cultivated valleys, and finally pass down to irrigate the rich districts of Madura and Dindigul.

14. "The chief of these is the Nankosi river, which rises in the Puchamally hills, precipitates itself down to Kotalvilly, in a perpendicular cataract of 150 feet, into a deep basin worked by the force of the fall into the rock below."

15. *Villages.*—"The sites of the villages are generally selected with much taste. The houses are irregular clusters, built of mud and stone, and thatched. They have each a fire-place, and sheds for cattle are attached. The slopes in the vicinity of the villages are formed into terraces, on which are cultivated garlic, mustard, barley, wheat, and a grain similar to oats. As we descend rice fields gradually rise in a succession of terraces, irrigated from above by artificial canals.

16. Mr. T. Clarke, who from his long residence on the Pulney hills is the best authority we possess, states that they may be divided into seven grand divisions, being so many portions of their length and breadth, principally marked off by large and prominent ridges or by rivers running across the hills, as follows:—

1st. *Yettoor*, or the eight villages (sometimes called Manavanoor, from the largest of the eight), at the extreme west is of a parallelogram form. The river Ambravutty, after running a course of a few miles from its source to Munjaputty, where it receives the Tennar, forms the western boundary of these villages, and separates them on that side from Travancore and Coimbatore to the south, the zemindars of Bodmaikanoor and Vadagherry border their limits, and on the north the village of Poombaray with its hamlets intervene between them and Pulney, and on the east the same village divides Yettoor from Vilputty.

2nd. "Poombaray, bounded on the north by Balasamoodrum and the Rethumbody Zemindary, on the south by Yettoor and the Vadagherry Zemindary, on the east by Vilputty, and on the west by Travancore and Coimbatore.

3rd. "Vilputty, separated in the west from Poombaray by the high and marked ridge which forms the Tennavaray peak, and on the north from Cowanjee and other hill villages belonging to the Aycoody Zemindary, by the no less remarkable ridge which runs along the base of the highest point on these hills known as Perumal Malai. The ridge continues on the east side of Perumal Malai, and separates Vilputty from Tandygoody; on the south, Vilputty is bounded by the hill villages appertaining to the Vadagherry Zemindary, and the exterior ridge of the hills.

4th. "*Cowanjee*, embedded in high rocks, is bounded on the north and west by the villages of Balasamoodrum and Aycoody, on the east by Putchaloor and Tandygoody, and on the south by the village of Tandygoody.

5th. "The *Pareyoor Hills* are very extensive, covering an area of about 90 square miles, and are in the form of an isosceles triangle, decreasing to a point on the north side. They are bounded on the south by the Tandygoody hills, on the east by the Andaloor hills and by the Patchamaly range, on the north and west by the villages of Virupatchy on the plains and the villages of Cowanjee.

6th. "*Candimalai*, *Andaloor* and *Manaloor* hills form the eastern boundary of the hills, and are bounded on the north by Pulkanooth and Cunnivady; on the east by Durmattooputty and Ahtoor, on the south by Narasingapooram and Ayempolliem, and on the west by Tandygoody and Patchaloor."

7th. "The Tandygoody hills are bounded on the south by Davadunaputty; on the west by the river Ambavy and Permal Malai, on the north by Pereyoor, and on the east by Manaloor."

17. "Of these divisions, the 4th and 6th belong to the Zemindaries of Ayacoody and Cunnivady; and the 1st, 2nd, and 3rd form the upper range, and the 5th and the 7th the lower range of the hills."

18. *Inhabitants.*—"The inhabitants of these hills are supposed to number about 4,000 of both sexes. The villages have a mixed population. Some, who live by plunder, have a savage and ferocious look, but the majority are a mild and inoffensive people. They are divided into the following tribes:—*Paliars*, *Korravours* (or Mountaineers), *Asariers* and *Chetties*."

19. "There are also a few scattered families of a wild tribe of Polyars, who dwell in the woods, and subsist chiefly on honey, roots, &c. They live in caves or on flat forms erected on trees in the heart of forests. Their habits are very erratic, and they are shy of strangers."

1st. "The Paliars are supposed to be the aborigines of these mountains, and according to their traditions they date their possessions as far back as four or five centuries ago. They are a people perfectly distinct from those of the plains, in habits, feelings, and dialect, being free from many of their prejudices and superstitions."

2nd. "The Korravours profess to be the hereditary masters of the hills, but this is evidently a convenient tradition of their own, for there are other traditions extant, which show that they took possession in violation of the more ancient claims of the Paliars. To judge from appearance, they are a mixed race, descended probably from different castes, whose fathers emigrated from below. They are the chief landed proprietors, and hold the Paliars in a kind of

serfdom, exacting from them every menial species of labour, in return for which they permit them to cultivate land in the most sequestered parts of the mountains, grant them liberty to eat the flesh of dead animals, and to make use of such fruits and herbs as are found in the woods—notwithstanding their degraded position, the Paliars possess a considerable influence as priests and physicians. They alone understand the use of medicinal herbs, and the virtue of their incantations, as well as of their medicines, are highly extolled and deemed equally efficacious."

3rd. "The Asaries are the carpenters and blackmiths of the hills."

4th. "The Chetties are the most recent emigrants from the plains. They deal in the principal products of the hills, lend money on exorbitant interest, and are in fact the capitalists. They are gradually acquiring the whole of the landed property of the mountains, and they keep up a close connection with the Chetties of the low country.

20. *Vegetable Products.*—"There is a vast extent of forest land in the valleys and glens, but a rapidly increasing cultivation, the effect of a proportionate increase of population, has led to the destruction of many valuable forest trees; some trees that still remain are of surpassing height, and conceal from view, by their dense foliage, the little villages which they surround.

21. "Lieutenant Beddome, assistant conservator of forests, who has lately explored those mountains, states that the grass on the plateau on the top is everywhere dotted with beautiful orchaedrous plants, and many others peculiar to a high altitude. The rhododendron, the lime, and the orange are indigenous, and there is an inexhaustible supply of gentiana and other medical plants.

22. "There is every probability that coffee will be extensively cultivated on these mountains, the luxuriance of the shrub and the flavour of the berry grown there, having attracted the attention of the late Madras exhibition.

23. *Wild Animals.*—"Elephants frequent the sholas. There are bison and elk in abundance. Bears are numerous, as are also the tiger and the cheetah. The mountaineers exhibit a great fondness for hunting, and they destroy the tiger by poison—when a tiger kills a bullock, a poisonous compound of roots and herbs mixed with sugar is rubbed into the fleshy part of the carcase—when the tiger returns to his prey, he eagerly devours this portion—the poison produces a powerful thirst, the first draught of water quickens its operation and kills him in a few hours. The death of the animal is then celebrated with public rejoicing.

24. *Climate and Seasons.*—"In referring to the important subject of climate, I can only speak of my personal experience during a limited stay on these hills in the end of the month of March. I had shortly before then made a similar short stay on the Neilgherries, (this being my first visit there also) when *en route* to Calicut; I was therefore well able to contrast the climate of both places. Although a month further advanced in the season at the date of my visit to the Pulneys, the temperature felt lower, the frost having just disappeared, and the air seemed even more exhilarating than it was at Ootacamund in the end of February. In the early part of the day, the wind blew steadily from the north-east, but towards the afternoon it veered round to the south, bringing up the sea breeze. The climate appeared to me quite equal to the Neilgherries, admirably adapted for the unimpaired European constitution and for the valetudinarian.

25. "Four circumstances naturally affect the climate of these hills.

First.—Their elevation.

Second.—Their isolated position.

Third.—Their situation between the east and west coast, the distance being about 60 and 80 miles respectively.

Fourth.—Their position near the line of demarcation of the two monsoons: on this subject, I am favoured by Mr. Magrath, director general of the medical department, with the following observations:—

"Over the peninsula of India, the winds make an *annual tour* as regular almost as clock-work. To commence, say from the eastern coast—they blow direct from the east about the end of February and beginning of March, then from south-east gradually going south, until by the middle of April they blow from south, veering round towards the west; these winds bring up moisture from over the Indian Ocean, and rain falls on the highlands of Ceylon, and extend usually over the southern part of the peninsula. Towards the end of May, the winds blow from the south-west and west, bringing up large banks of clouds towards the western coast, which in the end of that month and beginning of June, burst on the coast; the highlands of the ghauts receiving the great bulk of the fall.

"The rain falls heaviest at the western end of the Neilgherries, on the 'Koondas,' which are the highest parts of the line of ghauts, and in Coorg. On the coast it is lighter towards the south, increasing opposite the Neilgherry range to about 120 inches, which is the average fall at Calicut, and continues about the same up to Mangalore, opposite the higher parts of Coorg, where 180 inches fall, after which it decreases at Bombay; the fall of rain is not more than about 80 inches. It goes on decreasing as it passes into Guzerat, until it is lost altogether, there being no monsoon in Sinde. The rain passes inland from the western coast over the Mysore and the Deccan, and goes northward and eastward. In September and beginning of October, the winds veer round to north and north-east, and then occurs our north-east monsoon with its accompanying rains.

"The south-west monsoon sets in and prevails in Pegu at the same time as on the western coast, and the fall of rain diminishes as it goes inland north and east, just as it does on this peninsula.

26. "It will appear from this, that the Neilgherries on their western side receive very heavy rain, and which extends very much to Ootacamund, whereas the hills to the south-east of the Neilgherries, such as the Pulneys, which are so much more inland, receive a lighter fall at the same time that they share in the earlier rains of April, and again in the latter rains of the north-east monsoon, thereby giving them more the character of the climate of Kandy and Newera Ellia, and a greater freshness throughout the year, and in a measure a freedom from the aridity which prevails on the Neilgherries for three or four months."

27. "I extract the following remarks regarding the seasons from the 'Missionary Journal,' above referred to:—'The coldest season is from October to January. The thermometer then ranges from 35° to 65° at mid-day. The weather continues cold to the end of February, during which time there are thick fogs and occasionally heavy falls of rain. April, May, and June are dry months with heavy night dews. The thermometer during the day rises as high as 80° degrees, and the sun's rays are powerful. From the middle of June the climate is delightful. The occasional showers which fall, replenish the streams and give life and vigour to everything around."

28. "Mr. T. Clarke, an excellent authority on these matters from his long residence on the hills, observes:—

"The year is divided into two seasons, the cold season similar to the autumn of the south of France, may be said to set in from December and terminate in March, whilst the monsoon season, resembling a mild autumn in the south of England, occupies the remaining months.

"With reference to the climate of the higher hills in particular, the following, as far as I am able to learn, may be considered a pretty fair estimate.

"January is uniformly fair, clear, and dry. The nights are very cold, and attended with frost in the valleys. The same remarks will apply to February, except that frost is stronger, and in March it disappears, when the weather becomes milder, and there are a few heavy showers. Towards the close of April, the wind begins to vary from north-east, and finally settles in the south-west, when the air becomes mild and balmy. May is the warmest month, but the heat is often relieved by the fall of rain in torrents, intermingled with hail, ushering in the south-west monsoon, which occurs in the early part of June, and continues with greater or less constancy through July and August, when the weather on the lower hills is comparatively dry and fine. September and October are uncertain months, depending on the state of the south-west monsoon, which if begun early and exhausted, renders the weather fine, warm and pleasant, but if deficient in previous rain, a good deal of mist and drizzle generally prevails. Towards the end of September, the wind again begins to shift round to the north, when the weather becomes suddenly colder, mists and fogs are common throughout the year; some gales of wind occur once or twice a year, generally about the changes of season, but thunder and storms are of rare occurrence. The changes of temperature are sudden.

"On the lower ranges, the village of Tandygoody is situated about 18 miles distant from Vilputty, and about 26 from Poombaray on the eastward. It is about 5,600 feet above the level of the sea. The climate is here much milder than on the upper plateau. The air is moister and the nights less cold. In June, July, and August, the weather is clear, bright and fair, while on the upper hills there is much drizzle or rain. This difference arises from the former place being less subject to the influence of the

south-west monsoon. Less rain falls at this place, and it is often dry here when it rains to the west.

"The Virupatchy villages are situated on a plateau between Tandygoody and the plains. Its elevation varies; the higher villages being from about 5,000 to 2,500 feet above the sea; its temperature is higher than on the west range and Tandygoody."

29. *Geological formation.*—The rocks on the hills are gneiss, over which is generally found a stratum of clay, white and yellow of different tints, the whole covered with a coat of vegetable mould. On the tops and slopes of the hills the soil is seldom found more than a foot or two in thickness, but in the valleys it sinks to a greater depth, and towards the rivers and creeks a rich alluvial soil is found, containing a large portion of silicious sand, mixed with mica. In some parts a ferruginous and calcareous kunker prevails, but the former predominates. Both are in some places on the surface, whilst in others some feet below the black earth.

30. The whole of the elevated lands of the west division is uncultivated. In the valleys, near the villages, cultivation is more extended,—here the red soil is intersected by rivulets and rivers, and in some places by large morasses. The eastern parts are more productive than the western, having a considerably large portion of fine rich loam, and being less exposed.

31. *Salubrity.*—The higher ranges are decidedly salubrious, and the inhabitants are a robust and healthy people. The most unhealthy seasons with them are the cold months, when coughs and colds and occasional fever from exposure are met with. Small-pox of a fatal character has of late carried off many of the natives—with Europeans there is a predisposition to catarrhal affections from April to June. In the lower ranges to the east, from March to July, it is decidedly unhealthy; the inhabitants there suffer much from fevers, enlargement of the spleen being also common.

32. But it were difficult to find a climate more congenial to the feelings, more calculated to preserve health, or to restore the invalid, than this elevated area affords—I believe it calculated to promote recovery in all, save the exceptional cases of diseases of the heart and some affections of the lungs, where the stimulus of the rarefied atmosphere would be injurious.

33. Already, at a place called Kadakarnal, some of the civilians of the district of Madura have built houses, to which their families resort. But these hills deserve to be more frequented by Europeans, who, with their superior knowledge, would speedily introduce comforts, and preserve their constitutions against the diseases incidental to a prolonged residence on the plains.

34. With telegraphs to the summits of our mountains and railways, or even good transit communications to their base, many of our healthy European corps might be located on them; rather with the view to maintain health than to renovate it—and still be as available for duty as if they occupied the posts they do now.

35. It is in contemplation to build barracks for our European soldiers at Trichinopoly; I trust before this step be decided on, the advantages of placing them on this attractive region may be considered. The additional expense incurred would be fully counterbalanced by the favourable results which might be confidently anticipated.

Remarks by the Director-General.

The foregoing report gives a highly interesting account of the Pulney hills, although it does not contain much that is new, or that has not already been known and in part published in the "Madras Literary Journal." *Vide* No. VI.

The Pulneys are described as possessing an agreeable and bracing climate, well adapted to preserve the health and efficiency of European troops. They are, however, only healthy, as far as is known of the parts inhabited, for about nine months of the year. During the remaining three months, *i.e.*, from April to June, both inclusive, they are decidedly unhealthy, and the natives of the lower ranges, (for it does not appear from the report that the higher parts said to reach an elevation of 7,000 feet have any native inhabitants) suffer much from fever and disease of the spleen.

The Inspector-General, notwithstanding, recommends that instead of the proposed barracks for a European regiment to be built at Trichinopoly, barracks should be erected on the Pulney hills.

In this recommendation I am unable to concur, for the following obvious reasons:—

To station a regiment on the Pulneys during the sickly season it is evident would be to destroy its efficiency. For it is a well-established fact that Europeans, or even natives of the low country, suffer more severely from malarious diseases than the acclimated denizens of the mountain ranges and ghauts of Southern India. There is, it may further be remarked, no form of Indian disease of a more obstinate character, or one that undermines the constitution so much, or is so difficult to eradicate, as malarious hill fever. It seems to me, therefore, that unless barrack accommodation should be available at Trichinopoly or elsewhere, to which the troops could be removed for the three unhealthy months, which embrace the hottest part of the year, that it would be setting at defiance all previous experience and knowledge of these hill regions, to select the Pulneys as a site for the new barracks.

As it is not probable that Government would incur the double expense of providing barracks at Trichinopoly as well as on the hills, I do not see how the Inspector-General's proposal can be carried out. This is, however, the less to be regretted, as table land at a higher elevation, and in localities known to be healthy, is available on the Neilgherries to any extent required, should it be found necessary at any time to provide more accommodation for European troops on the hills of Southern India.

Extract from a Report by the Inspector-General of Hospitals, with Remarks of the Director-General annexed.

Neilgherry Hills.

Series No. 3, dated 4th October 1858.

29. "For some years past it has been the practice to hold annual committees on public servants under the Madras Government, who happen to be resident on the hills for a period of upwards of 12 months, with the view to ordering them back to their duties, if sufficiently recovered.

30. "This rule does not affect public servants of the other presidencies resident on the hills on medical certificate, nor does it bear on officers proceeding to England or elsewhere than the hills on sick leave. The latter enjoy full advantage of the leave originally recommended for them by the medical officer who attended on them during the illness which made it necessary for them to proceed on leave, and which a medical board on the spot confirmed. Unless there be some good reason why this rule should not be done away with, I am of opinion it should be abolished; it appears to me to operate injuriously, both to the patient and the public service."

Remarks by the Director-General.

I perfectly agree with the Inspector-General in his remarks, that annual committees on sick officers on the Neilgherries are unnecessary. It is, I know, considered a hardship by sick officers to be obliged to appear before such committees, and I am not aware of any benefit resulting from them, except that one or two invalid officers who had taken up their residence on the hills for years were obliged either to proceed to Europe or join their regiments.

It was the opinion of a medical officer of great experience, Dr. Birch, formerly resident at Ootacamund, that many patients did not begin to derive permanent benefit from the climate of the hills until they had been about a year resident on them, and he recommended his patients always to remain a second year before returning to the low country.

Jackatalla Barracks.

39. "The strictest attention is now required to sanitary matters, while so many people are at work on the buildings, for there is some danger of the place becoming so polluted as to establish a malarious atmospheric taint which may hereafter become an incidental source of disease. Indeed the effects of this neglected conservancy has already begun to exhibit a noxious influence on parties residing there.

40. "The great difficulty at Jackatalla is, the removal of the sewage from the barracks, &c.; four plans have been proposed.

1st. "The formation of one or more lakes in the ravine and valley through which the Coonoor river flows, into which the night soil conveyed by pipes would pass."

2nd. "The removal of the night soil (deodorized by peat charcoal) by means of carts to a distance from the barracks.

3rd. "The removal of the sewage by means of pipes into the Coonoor river, from whence it would be carried onwards by the streams.

4th. "The removal of the sewage by pipes into the ravine but not into the stream, and from thence on by a closed main conduit to a point beyond the station of Coonoor, a distance of two miles, there to discharge its contents into a cascade. The river from this point flows by a steep decline down the ghaut through an uninhabited country, a distance of 12 miles, receiving in its course several tributaries, and finally empties itself into the Bowanee."

41. "To adopt the first plan would be merely to create endemic sources of disease, for the proposed lakes would speedily become cesspools."

42. "The difficulty of removing the night-soil by carts to a sufficient distance, and the dangers of impregnating another position by impure exhalations, are sufficient reasons for not putting the second plan into force."

43. "The third plan would pollute the pure mountain stream, which alone affords a water supply to hundreds of followers in the bazaar of Jackatalla, and to the inhabitants of Coonoor. This plan has been already sanctioned, and to a certain extent carried out."

44. "The fourth of the above plans is without doubt the only perfect system to adopt, consistent with sanitary considerations. By it the night-soil will be received into a closed main conduit by a system of intercepting pipes from the barracks, hospital, sanitarium, depôt, married men's and officers' quarters, and will be forced by the pressure of water from above through a long culvert, to a point beyond the reach of doing injury by contaminating the stream or the atmosphere." *Vide* Minutes of Consultation, No. 1,431, dated 23rd July 1858.

45. "Nothing can be more noxious or offensive than the present system. There have been nearly 3,000 people at work daily at Jackatalla for many months past. There is no permanent officer in command or commissariat officer. There have been no fewer than 15 since May 1854, so that there has been no local responsible supervision; the consequence is that the cantonment and neighbourhood is tainted with a fœcal atmosphere. Go where you will, in the unfinished buildings, in court yards—even in the very rooms, human ordure is found. Already the result of this neglected conservancy is exhibited in low fevers in European children and grown-up people. The coercive interference of Government is therefore required to preserve the character of the station for salubrity."

53. "Some of the convalescents now there, are dressed in their white jackets and trousers, others in their regimentals. I think it would be attended with advantage if a supply of clothing suitable to the climate, such as the ordinary shepherds' plaid or some other pattern of Scotch tweed were at all times kept in store and issued to the men on arrival at this station."

74—3rd. "That latrines be dug to which the natives should be forced to resort, peat charcoal and earth to be thrown into these two or three times a week.

4th. "That immediate measures be adopted for clearing out the privy for Europeans, and,

5th. "Finally, as all these measures are but make-shifts until the great plan for the removal of the sewage by pipes is carried out, that the executive engineer be instructed to procure immediately from England the length of piping already sanctioned, and in the meantime proceed with the construction of the channels so that the piping can be laid down on arrival."

47. "There are other two measures which I would earnestly urge for the consideration of the Director-General, with the view to the hygiene of the station.

First. "The enclosure of the extensive ravine situated to the southward of the barracks, and lying between the barrack hill and that selected for the convalescent depôt (which is at present the most offensive spot in cantonment) with the view to its conversion into a soldiers' orchard and vegetable garden. Captain Campbell the engineer in charge, who takes the warmest interest in the improvement of this important sanitarium, and who has already accomplished so much in the formation of a forest in the neighbourhood, informs me that if vested with authority and furnished with a small monthly sum to expend on the place, from 150 to 170 rupees per mensem for twelve months, he will undertake to convert this piece of waste land into an orchard and garden intersected with paths and fountains.

Second. "That the bazaar now in course of formation contiguous to the barracks should be erected on a distinct plan, with houses as much as possible of an uniform pattern, and with streets so formed as to permit of free ventilation and drainage, in order that we avoid the usual teeming sources of disease, which so closely and fatally encircle our wretched Indian bazaars. The space allotted for the bazaars is too circumscribed; but it is capable of being extended on a piece of waste land situated to the west of its present site."

48. "In the centre of the barrack square two rows of trees with a path between and a fountain in the centre, would induce the soldiers to leave their barracks and take exercise under their shade, where seats would be placed.

49. "In conclusion, I would submit that all sanitary arrangements be vested in the resident engineer, in counsel with the resident medical officer so long as the station is under construction and public works going on; giving the former the means and holding him responsible for the efficient conservancy of the cantonment, and giving him also control over the roads, watercourses, and channels."

Remarks by the Director-General.

The suggestions of the Inspector-General and of the engineer officer for the improvement of the station, and purifying the offensive places of resort for natives, are considered deserving of the consideration of Government.

The plan for carrying off the sewage, para. 44, is well suited to preserve the cleanliness and salubrity of the cantonment.

Regulations regarding the dress of the troops being adapted to the climate, should be issued by officers commanding regiments stationed on the hills. White jackets and trousers (except worn at mid-day) being unsuited to the climate, want of attention to this particular is a fruitful source of disease in persons newly arrived on the hills.

Extract from a Report by the Inspector-General of Hospitals, with Remarks of the Director-General annexed.

Annamullay Hills.

Series No. 4, *dated 9th October* 1858.—Para. 1. "The eastern Ghauts are intersected by several deep valleys, but in only one place are they completely divided. This opening is shaped like a funnel with its narrowest end towards the east, and is almost in a direct line between Trichinopoly and the Travancore country. So soon as the west winds begin to prevail on the coast, a free and full passage is thus granted into the province of Coimbatore, where it exercises a very beneficial influence."

Paulghautcherry.—2. "Until lately a regiment of native infantry and a detachment of artillery garrisoned the Paulghaut pass; now it forms the head-quarters of a sub-collectorate, and the fort, which is placed on a somewhat elevated ridge in the centre of the pass, is occupied by a detachment of native infantry under an European officer."

4. "The hills on each side of this pass present a rugged and bold outline. Running nearly parallel with the sea, is the Annamullay range; and the general direction of the higher ranges, viz., the southern side of the triangle of the Neilgherries and the Annamullays is nearly from west to east, while that of the more important smaller ranges is from north to south; still smaller spurs and partly detached branches run off from these in every direction, and their occasional confused and clustered masses have, from a distance, an exceedingly picturesque appearance."

5. "The sides of these hills are usually covered with jungle, but this is fast disappearing, as is also the belt of wood which formerly extended round their base, in many places from five to ten miles broad, the ground on which it stood having been let to the cultivator for a long period of years on favourable terms."

6. "In many places, although every tree and shrub which formed this dense forest has been removed, the ground still remains a barren waste, and I quite concur in the opinion of Doctor Cleghorn, the conservator of forests (who accompanied me on this tour) that this indiscriminate removal of the trees has already exercised a prejudical effect on the climate of the locality; the soil having now lost the benefit of the moisture which their foliage attracted, and the evaporation which it checked."

7. "On the Annamullay range of hills about twenty miles from the Paulghaut pass, and five or six from the plains, at an elevation of about 3,000 feet above the level of the sea, Lieutenant Beddome, the assistant conservator of forests, has fixed his head quarters. The ascent to this place is through a straggling forest of teak, blackwood, and other jungle trees, many of which are of very large dimen-

sions. The timber on being cleaned or cut into planks, is carted or dragged by elephants to the base of the hill, from whence it is either removed for Government purposes, or sold by auction to the public."

8. "Fever of a very severe character is usually present at the base of the mountain, but at Soonocuddoo and in the forest it is less prevalent. The working season extends from July to January; during the remaining six dry months of the year the forest is altogether abandoned; the fatal character of the fever which then appears in all its intensity, rendering this course necessary."

9. "Fever of a milder type prevails at all seasons, and some valuable lives have already been lost. The strength of the party who work under Lieutenant Beddome, averages with axe-men, elephant attendants, &c., from 400 to 500, among whom are three European overseers and some Indo-Britons."

14. "The forest department only occupies the western and lower portions of the Annamullay mountains. The more lofty, or as these are usually denominated the Delhi range, have hitherto been unexplored. An unsuccessful attempt was made in 1850, by Captain Michael, of the 39th regiment native infantry, to reach the summit, and he arrived at an elevation of 7,000 feet above the sea. In his report he adverted to a valley of some extent about that altitude, and of still higher ranges which he was unable to arrive at, which appeared to rise twelve or fifteen hundred feet beyond this. Considering it a matter of interest as well as of importance to ascertain the extent of this valley, and the capabilities of the hills generally, as a place of residence for Europeans, in company with assistant surgeon Cleghorn, Cornish, and some other friends we commenced the ascent on the 15th September."

15. "We selected this period, as there appeared to be a favourable break in the weather between the passing away of the south-west and the advent of the north-east monsoon."

16. "The night before our ascent we slept at Kotoor, a village six miles from the foot of the hills; to have encamped closer would have been dangerous, fever being always present at the base of these mountains. We reached the Annamullay river at daylight, and crossed it in boats. This is a rapid stream 30 to 40 yards wide, formed by the confluence of the Toracuddoo, Ponachee, and other mountain torrents. About a mile from the river we arrived at the foot of the ghaut leading to the village of Ponachee, passing on the road elephant pits and tiger traps long in disuse. This pass which is a mile in length is too steep and rocky for horses to ascend, so we sent them back to the plains, performing the rest of the journey on foot. Four miles further on we came to the village of Ponachee, containing 15 houses. This spot was ascertained to be 3,000 feet above the level of the sea. Descending from this village, we arrived at the Toracuddoo river, which at this spot is a broad rapid stream three to four feet in depth, and to judge from the water marks on the trees, its depth must at times exceed six feet."

17. "Following up the course of this stream, and about ten miles south from the village of Ponachee, we reached a succession of cascades and a waterfall of considerable magnitude near the foot of two remarkable conical peaks of bare rock which are observed from a great distance in the plains, called the "Ukkah and Thungachy Mullay," or the elder and younger sisters."

18. "The height here proved to be 3,500 feet, the ascent from Ponachee being very gradual. Our course up to this point was south-west, and led through a thin forest of teak and other jungle trees, a good deal of bamboo and open glades with grass five to six feet high. To judge from the appearance of the banks of the Toracuddoo river after it passes Ponachee, it is not improbable that a much easier pass into the hills might be made from the plains by following this stream, thus avoiding the precipitous ascent by which we reached the village, and shortening the distance fully one half."

19. "From the waterfall the ascent was sudden, in many places over steep rocks and through dense sholas; still up the course of the Toracuddoo river, until we arrived at a beautiful undulating valley between the Ukkah and Thungachy Mullay and Payratmullay. In extent this valley is nearly equal to that of Ootacamund, and it varies in elevation from 6,000 to 6,800 feet above the sea."

20. "The general appearance and character of these high lands resemble very much that found on the Neilgherries. Here are the same rounded eminences and dense sholas extending continuously for miles, their edges ceasing abruptly. Conical hills and slopes covered with short rich grass abounding with medicinal plants, such as Ophelia elegans (gentian) and Hymenodyction excelsium (a species of cinchona) and vegetation precisely similar to that found there.

21. "The heavy rain which fell continuously during the period of our stay on these upper regions, evidently the breaking up of the south-west monsoon, the want of shelter, for there are no inhabitants in the higher altitudes, and the difficulty of procuring supplies from the low country, put it out of our power to proceed to the more lofty parts of the range, which is apparently about 12 miles off in a south-eastern direction, from the extreme point we reached, where, from the large streams of water which still descended to the north in cascades and water-falls to form the Toracuddoo river, and the occasional glimpses which we had through the mist, I have little doubt that similar valleys or table land would be found. We, therefore, reluctantly returned to the low country without attaining our object, having been absent eight days.

22. "The best period to prosecute inquiry into the upper ranges of the Annamullay mountains would be after October, or in the hot season. From their position, they are necessarily considerably under the influence of the south-west monsoon, but less so than the Koondahs at Sespoora, and I think it is worthy of inquiry to ascertain whether here also may not be found a climate as bracing and welcome to the enervated constitution of the European invalid as is found to exist on our better-known hill stations.

23. "Three distinct tribes inhabit the Annamullay hills. They are denominated—

Kadars,
Poliars, and
Mulcers.

"The Kadars will perform no menial labour; as their name implies, they are the lords of the hills. They will carry a gun, and are expert at stalking game, but they are deeply offended if they are called coolies. They are a truthful, trustworthy, and obliging tribe, and exercise some influence over the Poliars and Mulcers. Small in stature, their features resemble the African, and they have his curly hair tied by a knot behind, and they file the four front teeth of the upper jaw to a point as a marriage ceremony.

24. "The Poliars are chiefly herdsmen and mechanics, while the Mulcers are cultivators of the soil. None of these tribes reside at a higher elevation than 4,000 to 5,000 feet above the sea.

25. "All deal in the rich produce of these hills, and barter with the people in the plains their cardamums, turmeric, ginger, honey, wax, rosins, millets, soapnuts, gallnuts, &c., &c., for rice, tobacco, &c.

26. "They are very expert in climbing trees and the precipitous face of rocks in search of honey. To accomplish the former, where there are no boughs, they drive short bamboo spikes into the tree, and thus form a ladder, by means of which they ascend the highest forest trees; and they reach the latter by means of chains formed by rings made with rattan, which, being secured to a point above, drops down the face of the rock. We observed some of these chains full 50 and 60 feet in length.

27. "The upper ranges are in undisturbed possession of wild beasts. We saw a herd of bison, elk, and ibex in numbers, and also tracts of wild elephants. The latter I encountered in the lower plateaus towards Poonacuddoor.

28. "I have now completed my report on the chief mountains under this presidency, all of which I have personally inspected. The importance of the subjects treated must be my apology for having dwelt so long on them.

29. "It is evident that the European race must henceforth be dominant in this country. Now that the old confidence between them and the native troops is in some measure destroyed, we can no longer rely upon the latter as our principal defence. The drain upon the youth and vigour of England to support an army which will hold a population of 18,000,000 in subjection by the force of arms alone, would speedily impair our national strength.

30. "I firmly believe that on the mountain regions which I have described, independent of a location of our soldiers there, the establishment of small communities of Englishmen would be attended with the happiest results upon the native mind. It would add at once to our military strength, and, in course of time, it would give us the means, to a certain extent, of recruiting our army."

INSPECT.-GEN. PEARSE'S REPORT. MADRAS.

The following TABLE exhibits as correctly as I have been able to ascertain, the mean temperature of each month, the height and the average fall of rain on the several mountains and hill stations already occupied or brought to notice in India.

	Names of Hills or Hill Stations.	Mean Temperature in January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.	Ascertained Height.	Average fall of Rain per Annum in Inches.	Remarks.

Remarks by the Director-General.

The report on the Annamullay hills is forwarded to the Commander-in-Chief and Government, as forming a part of the general account of the hill ranges of Southern India, which have been visited by the Inspector-General of Hospitals.

There is but little to notice in this paper which can be turned to a practical or profitable account, considering the imperfect knowledge of the more lofty and as yet almost unknown parts of the range.

These hills are surrounded by an extent of forest, at all times feverish; but for six months of the year, including the dry season, so very unhealthy as to be deserted by the conservator of forests and his establishment, on account of the deadly nature of the fever which prevails at such season.

The Annamullay range, it is stated, rises to an elevation at some points of more than 7,000 feet, and the late conservator of forests, Captain Michael, reported that a valley of some extent existed at an elevation of nearly 7,000 feet above the sea level, with still higher ranges in the distance, which he was unable to reach. These ranges the Inspector-General and his party also failed to ascend in an attempt made in September 1858, owing to heavy rains setting in, the want of shelter, and difficulty of obtaining supplies.

As remarked on another occasion, the extent of land available on the Neilgherry hills, either for settlers or for locating troops, their easiness of access, and well-known salubrity, render this failure, except as a matter of general and geographical interest, a cause of no great regret.

A very interesting table is annexed to this report, showing the elevation and temperature of the principal hill stations throughout India, with the average fall of rain, compiled with much labour and research.

ORDER, No. 4,149, 22*nd November* 1859.

* *On the Pulney, Neilgherry, and Annamullay Hills.*

The Governor in Council has perused with much interest the reports* submitted with the foregoing letter, which are highly creditable to Dr. Macpherson's professional zeal and energy.

† *Mins. of Cons. Military Department, No.* 1,266. *dated 4th April* 1859. *Mins. of Cons. Public Works Department, No.* 893, *dated* 15*th, and No.* 923, *dated* 19*th April* 1859.

2. The Governor in Council observes that orders† have already been passed by Government on the principal points remarked upon by the Inspector-General of Hospitals with reference to Jackatalla, through the Quartermaster-General of the Army, to whose department the general subject of these reports appears more properly to belong.

3. With reference, however, to the particular points brought to notice in the Adjutant-General's letter, the Governor in Council proceeds to pass the following orders:—

1st. His Excellency the Commander-in-Chief, the Director-General and the Inspector-General of the Medical Department, are unanimous in recommending the abolition of the annual medical committees on the Neilgherries, which are pronounced by competent medical authority "to operate "prejudicially both to the patients and the public service." The Governor in Council accordingly directs that paras. 9 and 10 of G. O. G. No. 178, of 1847, be cancelled, corresponding alterations being made in the general regulations,‡ and notified in G. O. by the Commander-in-Chief.

‡ *Paras.* 11 *and* 12, *Part II., Section XVIII.*

2d. The subject of clothing adverted to in para. 58 of the Report, as worn by convalescents at the depôt on the hills, appears to have met the attention of the Commander-in-Chief, with whom its disposal properly rests.

4. The foregoing correspondence will be forwarded to the Government of India for transmission to the Right Honourable the Secretary of State for India, with reference to Despatch No. 73, dated 15th December 1858, accompanying letter No. 1,429, of the 24th January 1859, from that Government.

2.—PUBLIC DEPARTMENT.—PROCEEDINGS OF THE MADRAS GOVERNMENT.

Read the following letter from Major DOUGLAS HAMILTON, late on special duty Military Hill Ranges, to T. PYCROFT, Esq., Chief Secretary to Government, Fort St. George, dated Negapatam, 1st March 1860.

1. Having joined my regiment proceeding on service to China, I have the honour, agreeably to instructions received from His Excellency Sir Charles Trevelyan, to report the progress I have made in carrying out the special duty to which I was appointed.

2. I proceeded from Trichinopoly to the Pulney mountains, which I reached on the 9th of October. Soon after my arrival the north-east monsoon set in with unusual severity, lasting till the end of November. This was a great hindrance to my sketching, but by taking advantage of every opportunity that offered, I succeeded in obtaining 18 large drawings, of which three are panoramas.

3. As soon as the monsoon was over and the weather became settled, I proceeded on a tour of the hills, but had only been out four days when I received information that my regiment was under orders for service in China, and that I should be directed to join immediately. I therefore returned to Trichinopoly, but shortly after my arrival the march of the regiment was deferred until the end of February.

4. On his Excellency Sir Charles Trevelyan visiting Trichinopoly, I had the honour to show him the sketches I had made, and his Excellency acceded to my proposition that I should at once return to the Pulneys, and complete the series of views of the upper range. I accordingly returned without delay, but had not been a week on the hills when the news reached me that my regiment had received a "forthwith" order to march to Negapatam for embarkation. I therefore rejoined.

5. Though my second visit to the hills was of so short duration, yet, owing to the fineness of the weather, I was enabled to add considerably to my sketches, and visit several localities I had not previously seen.

6. I have now 26 drawings, four of which are panoramas, and the greater portion of the remainder are of large size. Although the series is not so complete as I could wish, yet, I trust when finished, I shall have, as far as the high range of the Pulneys is concerned, sufficient to carry out the intention of Government in deputing me for this duty.

7. Many of my sketches are unfinished. I am taking them with me to China, and hope to complete them during my leisure hours, when they will be forwarded to Government with a report.

8. As it is so uncertain when I shall find time to complete these drawings, I deem it advisable now to mention some of the results of my observations and inquiries during the time I was on these mountains.

9. I wish particularly to remove an impression that the Pulneys are unhealthy for three months of the year, and consequently not a fit locality for European troops; more especially as this opinion has lately been officially laid before Government by a high authority. The greater portion of the eastern or lower Pulneys, it is true, is most unhealthy during the hot months, but this is decidedly not the case on the western or upper range. Several European families belonging to the American mission have been for years in the habit of residing at Kudaikarnal during these months, and those I met spoke most highly of the salubrity of the climate, as also did Mr. Clarke, the collector of Madura, whose family, I believe, passed two hot seasons in the hills without returning to the plains. Some of the natives at the settlement of Kudaikarnal have resided there continuously for years. One who had been a resident upwards of eight years told me he had never heard of a case of jungle fever contracted at Kudaikarnal.

10. I may mention that though I was not on the Pulneys during the supposed unhealthy months, my servants were much exposed in the monsoon to the inclemency of the weather, yet, with the exception of one case of cold and slight fever, they were perfectly healthy, which I have found by experience would not have been the case at Ootacamund under similar circumstances.

11. As far as I could judge during my sojourn on the hills, I am of opinion that the climate of the settlement of Kudaikarnal is milder and more even than that of Ootacamund, though the average elevation of the houses is within a few feet of that of the Ootacamund lake.

12. The present ghaut, viz., Pereacolum to Kudaikarnal, is the only made one; it is little better than a bridle path; the upper portion is very steep, and during the rains is at times dangerous. It is questionable whether a feasible ghaut for carts could be ever made up this pass, but a ghaut passable for carts could be constructed up the old Daradaunputty pass. From the precipitous nature of the upper part of the mountains, a cart road from any other point would be an exceedingly difficult undertaking.

13. From the formation of many of the vallies on the upper Pulneys, large supplies of water might be advantageously stored.

14. An artificial lake at Kudaikarnal might be constructed at a moderate outlay.

15. Horned cattle thrive well at Kudaikarnal, and at the different hill villages. I have no doubt sheep would thrive equally well if kept at night in a warm building with a boarded floor. Horses are apt to get out of condition, the grass being too rank.

16. The grazing ground on the upper Pulneys is very extensive.

17. The introduction of the Toda buffalo on these hills would be a great benefit to the natives, as also would an improvement in their breed of cattle.

18. There is good coffee ground on the slopes of the mountains of the upper range near Colacurry and in the vallies to the westward.

19. I had not an opportunity of visiting the lower Pulneys, but, from all I could hear, the best coffee ground is in that direction. Mr. de Fondclair has a plantation near Perryoor, the only coffee estate on the Pulneys. The owner informed me that the plantation was in a very flourishing condition.

20. Dr. Cleghorn, the conservator of forests, on his visit to the Pulneys, left some tea seeds to be sown at Kudaikarnal; when I left the hills the plants were an inch or two above ground, and appeared fresh and healthy.

21. The wheat and barley grown on the hills is of very inferior quality. Good English or American seed might be introduced with considerable advantage, but, as Mr. Clarke, the collector of the district, informed me, that on one occasion the hill men, previous to sowing some superior wheat he gave them, *pounded it*, under the impression that if it grew and thrived they would be extra taxed, some precaution may be necessary in introducing better grain amongst the ignorant hill tribes.

22. All European fruits and vegetables that grow on the Neilgherries would succeed either at Kudaikarnal or at Shembayanoor. Excellent potatoes, in small quantities, are now produced, and I have no doubt these mountains could supply the whole of India with this important esculent.

23. The Australian acacias and gum trees in the gardens at Kudaikarnal flourish equally as well as they do at Ootacamund. Should there be any prospect of these mountains attracting European residents, it might be advisable to commence planting these trees at once. A considerable supply of young plants and suckers might even now be obtained from the gardens of the settlement, and as these trees are very rapid in their growth, the deficiency of firewood now existing in the immediate neighbourhood would be remedied.

24. In conclusion, I beg to state that, in my humble opinion, the high range of the Pulney mountains would be a most healthy and suitable location for European troops. There is ample room for barracks and plenty of water near Kudaikarnal, on the undulating plateau to the south-west, between the most western house of the settlement and the precipitous detached cliffs called the "tower rocks." There is indeed a scarcity of wood on the plateau itself, but there are large forests on the slopes of the mountains near at hand, down to which passes might be cut. Peat of good quality is found in the swamps.

25. There was no person on the hills during my visit acquainted with the quality of clay necessary for brick-making, but as it abounds on the Neilgherries, it is in all probability to be found also on the Pulneys.

26. The gentlemen of the American mission have built some of their houses of stone, which is found in abundance in the neighbourhood of the settlement, in blocks from the size of an ordinary brick to that of one or two cubic feet. It is easily squared, and is considered by them a good building material, though it is stated by others to absorb too much moisture, and never to dry thoroughly.

ORDER THEREON, 15th March 1860, No. 372.

The Honourable the Governor in Council has read with interest the brief account above given by Major D. Hamilton of the progress which he has made in carrying out the special duty to which he was appointed by the order of 29th August 1859, No. 1326. It is to be regretted that circumstances should have occurred to interrupt the prosecution of the work, and it is trusted that Major Hamilton may be able to resume it on his return from foreign service.

2. Major Hamilton will be so good as to forward to Government his sketches and report when they have been completed.

3. Resolved that a copy of the report be furnished to the Director-General, Medical Department, in reference to paragraphs 9, 10, and 11.

4. Resolved also that it be communicated to the Military Department, the Revenue Department, and Department of Public Works.

3.—MILITARY DEPARTMENT.—PROCEEDINGS OF THE MADRAS GOVERNMENT.

Read the following letters from the ACTING QUARTERMASTER-GENERAL of the ARMY, Fort Saint George, 18th March 1861, No. 84, to the SECRETARY to GOVERNMENT, Military Department.

I have the honour, by order of the Provincial Commander-in-Chief, to submit the following reply to the order of Government, No. 873, dated 6th instant, respect-

ing the reports on sanitaria called for by the Government of India.

2. On the 28th March 1859, in a letter No. 142, a detailed account of every place in use or desirable for use was submitted to Government; and further, on the 11th April last, in letter No. 112, I communicated to Government all that was in my power at that date.

3. Since then the station proposed for the Nagpore force, namely, Moothoor, has been reported on, but its adoption has been negatived* by the Government of India on the ground of its expense at the present moment. Consequently, Chindwarra, formerly a detachment station for European troops, is now occupied as an invalid station; and in my letter to Government, dated 8th January 1861, No. 9, the officer commanding the Nagpore force solicited that a trifling further outlay might be sanctioned.

* *Proceedings of Government, No.* 3733, *dated* 18*th October* 1860.

4. Gallicondah was reported on, and orders passed by Government as per margin, and steps are now being taken for preparing estimates and plans for buildings on a higher site; the former experiment having failed on account of the injudicious position selected for the barracks.

29*th April* 1859, *No.* 1575.
24*th August* 1860, *No.* 3065.
14*th February* 1861, *No.* 584.

5. There therefore only remains to be determined a sanitarium for Jaulnah. In my letter dated 11th April, Poona and Mahableshwur were both recommended for adoption until a fixed station could be found. Meanwhile the subject of the abandonment of Jaulnah by the troops of this Presidency has been considered, and the prosecution of the inquiry for a sanitarium was discontinued. Chiculdah, however, appears to possess great advantages. Respecting it, the officer commanding Hyderabad subsidiary force states, "Dr. Cole further stated that Chiculdah seems to be the only place within the Hyderabad territories of sufficient elevation to offer the requisite conditions for a sanitarium. Dr. Cole has since, however, proceeded on privilege leave to Bangalore, without having contributed any of the useful information he had promised, but, from information he had obtained from the Assistant Quartermaster-General, I have no hesitation whatever in stating that to whichever place the abandoned cantonment of Jaulnah may be removed, whether Roza or Aurungabad, Chiculdah would form a most excellent sanitarium for the troops from October to June, but that from the excessive damp and fogs prevailing there from June to October, the place is not habitable by Europeans during those months. There is at present a scarcity of water, except close to the fort of Gowel; inside the fort there are enough stones already cut to build the barracks. There is a very good road from Ellichpore for about 10 or 12 miles, after which to the bottom of the ghaut is rather stony. There is no cart road up the ghaut; conveyances are carried up by coolies. To take advantage of this place as a sanitarium for the troops henceforth to be stationed at Aurungabad or Roza, it will be necessary that the road should be put in order, or that the opening of the railway to Oomrowtie, as suggested by Colonel Davidson, be awaited."

6. In conclusion, I am to add that for stations in the south of the peninsula full use is made of Wellington; for Bellary and Secunderabad, Ramandroog is sufficient; for the northern division a site already fixed, on Grant's range, on the Gallicondah hills, is available; for the Nagpore force, Moothoor and Chindwarra; and for Jaulnah, Poona, Mahableshwur, or Chiculdah. These stations suffice. But as long as money is not forthcoming to take advantage of the climate at Moothoor and Gallicondah the troops at Nagpore and Waltair must continue to be destitute of the means of restoration accessible at other stations.

From the PRINCIPAL INSPECTOR-GENERAL, Medical Department, Fort Saint George, 22nd March 1861, No. 53, to the SECRETARY to GOVERNMENT, Military Department, Fort Saint George.

With reference to proceedings of Madras Government, No. 873, dated 6th instant, I have the honour to remark briefly that reports on the hill ranges of this Presidency, named in the margin, by Dr. Macpherson, Inspector-General of Hospitals, have been duly communicated to Government.

Shevaroys.
Pulney.
Anamallay.

2. Government are also in possession of the facts connected with the recent experiments as to the value of the Gallicondah range in the northern division as a sanitarium for Europeans.

3. The Moothoor range of hills in Nagpore were last year visited and reported upon by a committee of officers, and a site chosen for a sanitarium. The Government of India, however, in letter No. 69, of date 2nd October last, decided not to undertake the experiment on account of the expense it would involve.

4. There appears to be no elevated land in the immediate neighbourhood of Jaulnah or Secunderabad suitable for sanitaria, but in all other commands of the army hill ranges exist, some of which are believed to be more or less suitable for European troops.

5. The sanitaria at Wellington and Ramandroog are already well known. The former, now that the railway is approaching completion from the eastern to the western coast, will be more widely available for invalids from the Presidency, or those brought thither by seaboard.

6. Kamptee is almost the only station destitute of access to a hill sanitarium, and it is a subject of regret that the site fixed upon in the Moothoor range cannot for the present be made available.

ORDER, No. 1159, 28th March 1861.

Ordered to be forwarded to the Government of India, with the letter* marginally noted.

* *From the Principal Inspector-General, Medical Department,* 22*nd March* 1861, *No.* 53.

4.—REPORT of the RAMANDROOG SANITARIUM, in the CEDED DISTRICTS, MADRAS PRESIDENCY.—By E. W. EYRE, Esq., Superintending Surgeon.

A range of hills within a short distance of Bellary, that might be made available for a sanitarium for sick soldiers, having become known to the authorities, a medical committee assembled there at the latter end of 1846 to investigate and report on their suitability. From their report I will make some extracts prefatory to the present one.

General Description.—"The hill of Ramanmullay (or Ramandroog) is one of the most elevated of the Sundoor range of hills, and bounds the valley of Sundoor on the west. Its distance from Bellary is considered 37 miles. The road from the village of Yettunhutty leads through the Sundoor pass, the first three or four miles being beautifully wild; the valley now opens out, and through it the road leads to the village of Bovihully, at the bottom of the hill. The approach to the hill from this village is through a low scrubby jungle with a pretty tolerable road; as it ascends the hill it gets very steep and winding, but on the whole is of sufficiently easy access for foot travellers and horses.*

"The platform is of limited extent, being but 1¼ miles in length, and varying in breadth from half to three-quarters of a mile. The general aspect of the surface is undulating, having its higher edge towards the east and sloping gradually toward the west, where in many places it falls precipitously to the plains. The slopes of the hill on both faces are covered with jungle wood of no great size, intersected with numerous wooded ravines. The hill runs nearly N. and by E. and S. and by W. The view towards the W. and N. embraces extensive plains, which in their seasons are covered with abundant crops, dotted with many villages and tanks, and having the meanderings of the Tomboodra seen in the distance. That in the E. and S. looks into the valley of Sundoor."

The barometrical section makes Coomerasawmy, on the same range and about equal height with Ramandroog, 3,400 feet above the sea, and 1,825 feet above Bellary.

Geological Features.—"The rock of which the hill is formed is hornblende, some of the detached pieces of which were found to affect the magnet. On the east, or higher edge of the hill, the rock is seen projecting bare and rugged, but it is broken and disintegrated on its western edge, and the lateritious earth accumulated on it, from the decomposition of the hornblende, is sufficiently abundant to admit of cultivation there. On the northern end of the hill, near the Hospett road, the laterite is most plentiful, and it there almost conceals the underlying rock, which is only here and there seen projecting." * * * * On the western face of the hill the hornblende is stratified, and lower down schistose, and the latter contains a sufficient quantity of iron to render it valuable in the arts, and the villagers

* Captain Walker, of the Engineers, has constructed a road from the foot of the hill to the summit, of so gentle a slope that conveyances can easily ascend; it is four miles in length, and makes the distance from Bellary to the Ramandroog 38 miles.

quarry it there and extract the ore. The soil at the lower part of the platform is considered well adapted for the cultivation of all European vegetables during the season. The trees of any size consist of tamarinds, banians, bur, or Indian fig trees, and mangoes, with a variety of other smaller trees, and during the rains the hill is covered with a profusion of wild flowers and creepers."

Water.—An examination of the water procured from springs on the western side of the hill proved it to be of excellent quality; the supply plentiful, but inconvenience and expense being incurred in bringing it up, the sinking of a well on the summit was considered very desirable. An attempt was made to bore above one of the springs, but the rod broke and there remains. A chalybeate spring was brought to notice by Colonel Henderson, of the Engineers, and some who have used it have thought they derived benefit, but the taste of the water being vapid, and often containing vegetable matter, has not tempted many to drink it.

Climate.—"The general effect produced by the climate has been pronounced by all Europeans to be agreeable to the feelings and most salubrious, giving elasticity and health to the European constitution. The seasons partake of the ordinary divisions in this part of the country, but while the plains are burned up with the hot land winds, no such thing is experienced here. The natives state that the winds are occasionally hot during the hot season, but never uncomfortably so, and to them the hot winds of the plains are unendurable.

"But this statement of the hot winds is not confirmed by the European residents. During the months of March, April and May,—while, at Bellary, the heat is both constant and oppressive, with the thermometer ranging from 96° to 100° in the shade,—it has never been observed to rise higher than 84° in the houses at Ramanmullay during the hottest part of the season, which comprehends the latter end of April and the earlier parts of May. The ordinary heat in these months is about 84° at the maximum in a house, rising a few degrees higher in a tent, and this only for a few hours in the day. During that part of the year, the mornings and evenings are always cool and delightful to the feelings, and all agree in one sentiment, that, even when the temperature rises higher than ordinary, no inconvenience is experienced, as it is generally attended with a delightful cool breeze. Towards evening, in the earlier parts of May, occasional lulls are observed, but they do not last long."

Barracks.—The committee proposed an elevated site for the barracks, but I think a preferable one, as being less exposed, was selected. It was to be of ample dimensions, sufficient to accommodate 25 men, to have a spacious verandah all round, enclosed with glass windows, and a stove was to be provided; a library was recommended, and carpenter's tools to find occupation for the men. A part of the barracks was to be appropriated to a hospital, of sufficient space to accommodate six or eight, for it was well remarked, "that the patients proposed to be sent to Ramanmullay will not often require medical treatment." The medical establishment to consist of a well qualified apothecary, which, under the occasional visits of the superintending surgeon, is considered sufficient." * * * "The men being in the barracks should be dieted as in garrison, and live under military discipline."

"It may not be irrelevant to state that sanataria have been established for many years on the Neilgherry and Mahableshwur hills in Southern India, and at Landour and Darjeeling, Musoorie and Simla, on the lower range of the Himalayas. Mahableshwur is 4,500 feet above the level of the sea, the others mentioned are at elevations varying from 6,000 to 8,000 feet. Ramanmullay 3,000, and the experience acquired at these stations gives some grounds to show the diseases likely to be benefited by a residence at Ramanmullay, only the analogy is not complete, from the lower elevation of this hill."

"The committee consider medical officers, whose duty it may be to select cases, should be reminded of the importance of this duty; that, while some of the diseases which are contracted in the country are cured, or curable by a residence in hill climates, yet, for other diseases, no benefit is derived, and to some the climate proves positively injurious."

The committee summed up by expressing their opinion that the climate of the Ramandroog is favourable for the preservation of health of Europeans, and calculated to restore the energy of such European officers and soldiers as have suffered either from the effects of residence in India, or from disease, more particularly functional. The establishment of a sanitarium was recommended. To the judgment exercised by the committee, ample testimony will be borne in the results obtained during the last ten years.

The Ramandroog from its comparatively low elevation compared with other hill sanitaria, would not lead to great expectations being formed of it by those who regard elevation as the chief object in selecting the site of a sanitarium; but we shall find that, while it possesses decided advantages, it has also claims to preference over more lofty localities. No hill diarrhœa infests it as at the Bengal sanitaria; and while Mahableshwur cannot be occupied during the rains, Ramandroog may be throughout the year. It is not from mere elevation that salutary effects follow; we must ascribe a large share to other causes, such as purity of atmosphere, which is found on the Droog without the rarity which, on higher elevations, often leads to congestion of the internal organs. A sudden change from the plains to the Droog has never produced any bad effects; indeed, if benefit is promised, it shows itself in a very short time; there is no intermediate stage of seasoning. Added to pure atmosphere, how great must the effect be of a change from the bed of sickness, and that within a hospital, to picturesque scenery, hill and dale, the eye resting upon verdure on every side.

I shall now give the tentative steps that led to the establishment of a Sanitarium for European soldiers; and these I extract from reports made by me when in medical charge of the 1st Madras Fusiliers.

1849.—"At all times but during the rains,* the Ramanmullay would seem to offer a desirable sanitarium to the European regiment stationed at Bellary. A trial was made last year; 18 were sent in April and returned in June. Half the number derived decided benefit, the remainder did not; perhaps their diseases were not adapted to a hill climate. It must be borne in mind, too, that the accommodation provided was but of a temporary, and therefore, indifferent, description in tents; in a more suitable building still further benefit might have resulted. A favourable report was furnished for the information of Government after the return of the party, and an application has been submitted for permission to send more invalids this year. After a second trial the character of Ramandroog as a sanitarium will, I trust, be so fully established as to lead to a permanent establishment there. During eight months of the year it might be resorted to by the sick; they could be transferred there without delay, with little or no fatigue, be always under supervision, and be returned to duty when their health admitted of it. A building to accommodate 35 or 40 would be large enough. I believe such a sanitarium would supersede the necessity of sending many cases of disease to the coast."

1850–51.—"As regards the sanitarium at Ramandroog, I can report satisfactorily: marked benefit was derived in cases mentioned in last year's report as the most eligible, viz., where there was constitutional or acquired debility. The epidemic fever in 1850 furnished just such cases; the men left Bellary 9th December 1850, pale and debilitated; after a fortnight's residence they had made a decided improvement, and after from one to two months' sojourn, returned stout and fresh coloured as though just landed from England. The few cases that derived no benefit did not disappoint; they had very chronic ailments, were constitutionally unhealthy, and there being sent was in the way of trial. Sufficient proof has now been afforded, I conceive, that Ramandroog is a most desirable sanitarium for European troops at Bellary. I am persuaded that many of the cases transferred to the Mount would derive more benefit on this hill.† Besides climate, other advantages may be pointed out: 1st, one, two, or at most three months would be sufficient on the hill.‡

Men sent to the coast are away six months at least, 12 months' absence is common enough, and even 18 months not very uncommon. 2d. The march to Ramandroog is performed easily in three days;§ an officer is in command, who remains with the sick party. The march to the Mount occupies 32 days, is under a non-commissioned officer, who cannot control drinking, and this sufficiently accounts for some of the patients arriving at their destination worse than when they left the regimental hospital. 3d. The sanitarium at Ramandroog permits of a great amount of liberty being allowed, a circumstance which aids in no small measure a salubrious climate to the invalid's recovery. At the coast (St. Thomas' Mount) liberty must necessarily be more restricted. In regard to accommodation, the convalescents have been more favourably circumstanced this year than last, for instead of tents they have occupied a building, indifferently, however, adapted to the requirements. A greater amount of benefit than what has already been obtained, might reasonably be expected if a substantial building constructed to resist the cold and damp, at the same time well lighted and ventilated, was erected."

* This opinion underwent a modification afterwards.
† *Vide* Table in Appendix 2.
‡ For some cases a longer residence is desirable.
§ Four marches would be preferable. 1st, Coortany, 2nd, Yetenhutty, 3rd, Bovihully, 4th, Ramandroog. It would be desirable if the 2d march could be divided as it is a long one, between Coortany and Yetenhutty.

INSPECT.-GEN. PEARSE'S REPORT. MADRAS.

A third party of invalids went to the Droog in the latter part of September 1851, remaining till 30th July 1852, with much benefit to all but cases of pulmonary disease. They returned then in consequence of the regiment leaving Bellary for foreign service.

"When the duty devolved upon me to send sick to the Droog in 1849, I was not aware of the existence of the report of the Committee in 1846, and had therefore to exercise my own discretion in the selection of the cases with a view to test its sanitary effects. By attentively watching the progress of each case, I felt myself warranted in giving the opinion I did in my report to the Medical Board. Several cases were sent by me then which I should now avoid sending. But, while experience points to those who have derived decided benefit and those who have not benefited at all, there remains a class to occupy a doubtful place, of which it cannot be predicted with certainty whether benefit or not will result. There are cases, however, though not coming under the head eligible, which might be sent to the hill as a measure of necessity, to escape the heat of Bellary in April and May. The table appended, No. 1, exhibits a striking feature in regard to the effects of the Droog on disease. It will be seen that this is decidedly favourable or unfavourable for the middle place. "Partial benefit," is in very small proportion to the "Recovered," and "No benefit." The deduction is important as regards the due selection of cases to send. When it is found that all who have been sent on account of debility, constitutional or acquired, nervous palpitation of heart, the effect of the former, and some local diseases, such as ulcers, maintained by a weakly constitution, have recovered, there is ground to maintain that the Droog will fully answer the expectation that was first entertained, provided care is taken to select the cases, and in an increased measure when the building now in progress shall ensure requisite shelter and comfort for the invalids."

In consequence of the favourable reports made, and the warm support afforded by General Steel, then commanding the ceded districts, Government sanctioned the erection of a barrack and a hospital detached; the former to accommodate 80, and the latter 10. Both have ample space and are in every respect commodious. They have fire-places, which are needed in wet boisterous weather. Experience has corrected some errors, and also established the opinions first entertained as to the adaptation of the Droog for a sanitarium. It has been proved that for many cases it may be inhabited throughout the year. The rains are not heavy enough to preclude this; they rarely fall for any length of time continuously, and the water rapidly drains off. Fogs prevail at that season, coming on at sunset and lasting till 9, 11, or 12 o'clock in the day; but though the mist clears off, the sky above is loaded with vapour, so that during the monsoon the sun is rarely visible; but these fogs are not found at all injurious, if active exercise can be taken and there is a due amount of vigour in the constitution to resist the effect of damp; where this is not the case, another season should be chosen for the invalid. September and October are delightful months; the atmosphere is no longer saturated with moisture, but is clear and bracing; and, while occasional showers maintain the verdure that covers the hill, a profusion of wild flowers adds to the beauty of the scenery. During the cold season the easterly winds are at times strong and unpleasant, but the prevailing character of the weather is remarkable equability of temperature, the thermometer ranging but a few degrees throughout the 24 hours. This gives the Droog a great advantage over the low country, where the range, during the cold season, is so great and trying to delicate constitutions. Although, during the hot season, from March till the setting in of the south-west monsoon, which varies from the middle to the end of June, the Droog loses much of its charms in regard to the scenery; it is then that its great benefits to the invalid, and its advantages in maintaining health, are most striking. This is well shown in the case of children; the pale face assumes the rosy hue of health; the appetite that in the plains had been falling off there acquires a keenness that it is pleasurable to witness. At this season a westerly wind blows in the morning, when exercise is much enjoyed. At about 11 a.m. the breeze dies away, and the day becomes warm, at about 3 or 4 o'clock so much so that a punkah is grateful, but it is comparative heat only, for, after what is felt at Bellary, it is not to be regarded. At 7 or 8 p.m. the sound of the westerly wind is heard coming across the plains; soon it reaches the Droog cool and balmy, and under its influence the nights are passed in sound refreshing sleep. It is to be regretted that no full or accurate meteorological observations have been kept from the first occupation of the hill; but the temperature, amount of moisture, and fall of rain are now being registered so as to ensure accurate results. The table appended gives the observations for 12 months. I think it will be found that there is a difference of 10°, at least, between the Droog and Bellary, this from sunrise to sunset. Were the observations taken throughout the 24 hours, there would be a much greater difference; but it is on the Droog as elsewhere, the index of the thermometer is not the test of sensible heat, I mean appreciable by the sensations. I have seen the thermometer stand as high as 90° indoors, but there was a cool westerly breeze blowing, and no heat was felt. In support of the deductions made at the close of my report of 1850, further experience enables me to add that the sanitarium is especially suited to cases of constitutional debility, chiefly found in lads who were ineligible when recruited (and some of whom will never, under the most favourable circumstances, turn out as physically efficient as soldiers should be); also where disease has weakened the general powers, there being no organic lesion present. For debility or morbid sensibility manifesting itself under the form of "nervous heart," the Droog is equally efficacious. For rheumatism, a modified opinion must be given, as this troublesome affection shows itself under very different characters, often associated with other diseases, as syphilis. Rheumatism excited into action, or maintained by atony of the digestive organs, would be benefited; not so the marked rheumatic diathesis. Syphilis, primary or secondary, scrofula, ulcers, or other local affections dependent on depraved habit of body, are ranked in the table under "No benefit," but I would modify this opinion by saying that diseases depending on vitiated blood cannot be expected to be *cured* by a mere residence in the best climate. Time must effect the cure, yet it is of great importance to aid by every means available, and there can be no question that cases of secondary syphilis, scrofula, constitutional ulcers, &c., will be under more favourable circumstances for time to work a cure, on the Droog, than if confined to a hospital in the plains. To expect a perfect cure, as the result of mere residence at any sanitarium in such cases will in most instances meet with disappointment. Some of such cases have ultimately recovered, after prolonged residence, others have not, but have had to be transferred to the presidency for disposal. But there is a third class of diseases to be considered, for which the hill climate proves decidedly injurious. This comprises pulmonary affections of all kinds, and diseases of the liver and bowels, when the morbid process is still in operation. When this has been subdued, then, for the subsequent debility, and the effects of long confinement to hospital, the Droog decidedly benefits.

Not only is judgment needed in selecting the suitable cases; but I consider there should be a selection of the seasons in which to send them. Invalids suffering from general debility, constitutional or acquired by disease, of the effects of high temperature, may be sent at any season; but where a choice can be made the cold season should be selected, and the invalids should remain till the termination of the hot weather, about the middle of June. Cases of chronic rheumatism, particularly if associated with secondary syphilis and scrofula, had better not arrive at the sanitarium before February, and should leave at the end of June.

I would, in conclusion, offer the following remarks:—To preserve the sanitive influence of the Ramandroog, it is essential that the woods should not be cut down, as was done extensively at one time, and still is, though to a less extent. Strip the hill of trees, and a large mass of rock and ironstone would be left, and its salubrious character would depart. It would be well to replace the trees on the plateau that have been cut down; this would cool the surface and obviate glare in the hot season, and break the force of the strong westerly winds. Highly advantageous as sanitaria are for restoring health to the invalid, great care is needed that they do not become detrimental to the morale of the soldier, by fostering idleness, slovenly habits, &c. Hennen thus writes of a convalescent depôt in the Mediterranean:*—"I would recommend the convalescents should be made to perform duties of an easy description, and which would not expose them to the sun or night air. This would both tend directly to improve their health and obviate idleness, which is the greatest enemy to their recovery. As their health becomes re-established, they should be returned to their respective corps by every favourable opportunity." Easy drill, short marches, and any employment, even the construction of roads, the cultivation of gardens, where everything is so favourable for it, a library for such as derive pleasure from reading—these, and other means which an active interest on the part of those concerned would lead them to adopt, greatly promote the sanitary effects of the Ramandroog sanitarium. Nowhere should the "*nimia diligentia medici*" be more avoided than at a sanitarium. The restorative effects of change of climate and of scene should be allowed full scope, yet it is difficult to get young medical practitioners to appreciate this; even amongst the seniors it is not easy to dispossess some minds of the per-

* Medical Topography, Ed. 1830, page 560.

suasion that every deviation from health should be met by a course of physic.

Bellary, 8th June 1858.

Note.—The invalids have latterly been weighed on arrival and departure. Had I fully appreciated the value of this test of health, I should have adopted it from the first establishment of the sanitarium. I am indebted to Dr. A. Thomson, Her Majesty's 58th Regiment, who has written on the subject, for my knowledge of its great use in hospital practice, so obvious that a weighing machine should be found in the receiving room of every hospital.

Table III. gives the result of weighing 20 men.

TABLE I.—Showing the NUMBER of INVALIDS sent to the RAMANDROOG SANITARIUM, their DISEASES and RESULTS, from 1848 to March 1858 inclusive.

PREAMBLE.

During the past three years my duties have led me over the entire area of this Presidency, to inspect our Military Hospitals and Medical Establishments, to inquire into the sanitary condition of our garrisons and cantonments, and to report on everything affecting the health of the army, European and native. I have visited our sanitaria and hill stations, and also examined such elevated ranges contiguous to our military posts as appeared to be suitable for troops, and now, in obedience to the commands received, I proceed to record the result of my inquiries into the different subjects submitted in the foregoing questions.

My observations will appear in the order of my inspection, as shown in the index, which also exhibits the sickness and mortality at the Civil and Military Establishments throughout the Presidency during the twelve months prior to the date of my visit to each station. Some of these will be passed over with a few brief remarks; others, where for instance European troops are located, will be treated more in detail, and finally, in accordance with clause 14 of the Royal Commissioners' queries, I will submit my views on other important subjects which bear essentially on the sanitary condition of the country and the Indian Army; as—

The beneficial effects of change to the soldier in health and sickness, from the arid plains to the coast, to elevated mountain ranges, or to the lower summits of solitary hills; the length of time a soldier should serve on hills and plains; a description of the existing sanitaria in the Madras Presidency, and of places where others might be advantageously established as a residence for the preservation of health, and in convalescence from disease, to the soldier serving in Bengal and Bombay as well as in this Presidency.

The destructive effects of debauchery and of venereal disease on the health of the soldier, and the loss of efficiency resulting therefrom; the precautionary measures necessary to preserve them from these irregularities, and to protect them from epidemic disease; the best age and season for a soldier to land in India; the best mode of disposing of him on landing and during his first years of service.

The importance of the removal of surface filth before it accumulates; observations on barracks, hospitals, and outhouses; defects in their site, aspect, and construction; importance of superficial and deep drainage; remarks on furniture, beds, dress, diets, &c.; necessity for medical inspections, and for the introduction of instruction, trades, and other recreations as part of a soldier's duty in quarters; position and regulation of burial grounds.

The necessity for the introduction of efficient ambulance arrangements for the conveyance of hospital equipments and the transport of troops in health and sickness; simplification, assimilation, and reduction of hospital records and returns; the want of returns to exhibit the sanitary condition of the soldier's family and the civil European population throughout India; remarks on the duties of medical officers, and the qualifications necessary for administrative appointments.

These are the chief points adverted to by the Royal Commissioners. It would be a work of supererogation in me, however, to do more than generalize on the subjects, as special reports are called for from officers resident at each station relative to their respective localities.*

Stations.	Replies.
I. Chingleput.	1. This station is 35 miles south-west of Madras, on the great military road to the southern division of the army. The general aspect of the country surrounding the station is little above the level of the sea. The surface soil is sandy, covered with scrubby jungle, or bare and interspersed with barren hills and detached masses of granite. The town of Chingleput lies about half a mile south-east of the station. It is clean and airy, the Palar river running close to it. An artificial lake, which, when full, is two miles long and one broad, lies within half a mile of the station; but in the dry season, when the water becomes low, a strong odour arises from the decay and decomposition of the weeds on its bed. 2. The collectorate and zillah of the district occupies this station. The troops † consist of a strong native guard over a large body of prisoners incarcerated within the fort. The hospital for the reception of their sick is low, surrounded by walls, shut up on the rear, and entirely without roof ventilation. Here, as at most of our stations throughout the Presidency, civil hospitals and dispensaries have been established by the local community, assisted by a grant in aid from Government, to afford relief to the poor and diseased inhabitants of the station and country around. Government supplies the medicines and provides professional aid to the sick. Some idea of the good effected by these establishments may be formed by referring to the index. But as neither this topic, nor that of jails, form any part of the subject of the present inquiry, I will not swell my report by again referring to them.
II. Cuddalore.	3. The zillah of Cuddalore, the capital of South Arcot, is situated on the coast, 112 miles south of Madras. Its elevation is not more than 5 feet above high-water mark. The soil around is sand, with clay beneath. There are patches of rich cultivation, but no jungle or hills in the neighbourhood. The climate is very equable, relaxing in its effects, but favourable to convalescence from acute attacks. 4. Until lately Cuddalore has been the depôt for European pensioners and invalids from all parts of the Presidency, who were compelled to reside there. But now they go where they please, consequently the number at Cuddalore has been much reduced. Calculated for a period of nine years, the admissions into hospital averaged 60 per cent. on the strength, and the deaths 10 per cent. on the treated. The hospital and the pensioners' lines are situated close to the muddy bank of a river or swamp, which, when not flooded by the tide, emits odours most injurious to health. The hospitals for the European invalids, as well as that for the native guard of sepoys ‡ over the gaol, are without ventilation or conveniences; and, everything considered, Cuddalore appears to me to be a most improper place, in a sanitary point of view, to select as a final resting-place for the old and worn-out soldier.§ 5. I may here observe that, at the French settlement of Pondicherry, a few miles to the east of this station, the diseases of India, dysentery and hepatic affections, are almost unknown. This exemption to diseases so fatal to English residents in India may be attributed to the admirable system of drainage and other complete conservancy arrangements enforced within the town and in its environs.
III. Trichinopoly.	6. This cantonment, the head-quarters of the southern division of the army, is distant from Madras 207 miles. It is placed on an extensive plain, interspersed with numerous insulated masses of rocks, which either rise in irregular shapes to a great height, or are dispersed in large detached tabular masses. The predominating surface rock is the secondary or transition granite, the lower being trap and greenstone. The soil around the cantonment and town is sandy and gravelly, or a rich black loam; where there is a sufficient supply of water

* The foot notes in the Report are by his Excellency Sir Patrick Grant, Commander-in-Chief, who permitted me to submit it to him prior to sending it in officially.

† The military guard has been withdrawn, and the duties are now taken by the police.—P. G.

‡ The duties are now taken by the police, there are no sepoys at Cuddalore. —P. G.

§ The selection is their own entirely.—P. G.

INSPECT.-GEN. MACPHERSON'S REPORT. MADRAS.

STATIONS.	REPLIES.
III. Trichinopoly—*cont.*	it becomes remarkably productive. The climate for eight months of the year is exceedingly sultry. In March, April, and May the country is entirely burnt up. The mean annual temperature is 86°; the greatest heat in the shade is 102°; the lowest, 68°: but when exposed to the sun the thermometer rises to 140° of Fahrenheit. The average fall of rain varies between 30 and 40 inches per annum. 7. It is computed that the native population in the town of Trichinopoly exceeds 100,000 souls. The streets are rather regular and clean, and there is tolerably free ventilation through the dense mass of low, closely-packed huts. But the suburbs of the town and environs of the military cantonment are resorted to by the natives for the purposes of nature. The offensive odours and injury to the public health from this excessive accumulation of surface filth will be apparent to all. Added to this, the burial grounds are close to the public roads, or in crowded parts of the cantonment, and the soil is daily disturbed to deposit bodies, which are now being piled one over the other. This great sanitary error might easily be remedied by the erection of public latrines, by closing the present burial and burning grounds, and selecting other spots at some distance. 8. By means of artificial irrigations from the river Cauvery, the cultivation of rice is brought close up to the station; but this does not appear to exercise a prejudicial effect on the health of the troops. Indeed, it has been observed that a marked change for the better takes place in the climate of Trichinopoly when there is a sufficient supply of water to cover the face of the country, and when the dry sultry atmosphere and intense radiation of heat, the usual characteristics of the station, give place to vegetation. 9. The space occupied by the barracks and officers' houses covers an area of between six and seven miles. The established military force for the station consists of— 1 light field battery.—P. G. 1 company of European artillery. (Reserve).—P. G. 1 regiment of European infantry. 1 regiment of native cavalry. (Which is to be withdrawn).—P. G. 4 regiments of native infantry. (To be reduced to 2 Regts. N.I.)—P. G. The European artillery are quartered on raised ground, in a lofty, well-ventilated building near a good stream of water. There is a mango tope contiguous to the barrack, where the men amuse themselves in the shade. The quarters allowed to the married men and families are defective in size and ventilation, and the hospital for both is too small, having also the great objection of being under the same roof as the barrack. 10. The barracks for the European regiment have long been condemned as habitations for human beings. They form a quadrangle, one portion being tiled and the other bomb-proof. In breadth they vary from 5 to 6 feet, and their height does not exceed 12, having no adequate roof ventilation; in fact they are not equal to the horse stables now constructed. The men are at present closely distributed in temporary well-raised barracks, and it is in contemplation to erect new accommodation for them on the most eligible spot which the vicinity affords. 11. In a military point of view, necessity may render the erection of European barracks for 1,000 men at this station imperative; but, sanitarily considered, I am opposed to the measure. True, the climate of Trichinopoly does not present a marked death rate much in excess of what occurs at other stations. But, independent of the actual mortality, there are other considerations which have to be considered, and the chief of these at this station is the depressing climate, which enfeebles the nervous energy and disposes to relaxation of the muscular fibre, causes which must operate directly and indirectly on the efficiency of the European soldier. I will hereafter show, when I come to treat on hill stations, how this may be remedied by locating a portion of the European force on certain elevated ranges within the division, so as to admit of a wholesome interchange from the plains to the hills, with much advantage to the health of the soldier, and possibly without disturbing existing military arrangements to a great extent. 12. The hospital for the sick of the European regiment is a well-ventilated, commodious, and lofty building capable of accommodating 100 beds. Each ward is provided with punkahs, and there is an air of comfort throughout. A wall 10 feet in height encircles the building within a few yards; this is a great objection, for the powerful heat of the sun is necessarily absorbed by or reflected from it during the day, and it impedes, especially during the night, the free circulation of air within the court. There is a female ward in the centre of the court, which is also objectionable. It is in too close proximity to the men as they pass and repass to the privy. A lavatory and bath-room is urgently required, there being but one bath-room for men, women, and children. 13. Amongst the Europeans of the force, venereal affections form the largest number of admissions into hospital. Thoracic and hepatic affections and bowel disorders being the prevailing diseases. During a period of 15 years prior to 1856–57, 14,221 European soldiers served in this division of the army. The following table exhibits the sickness and mortality amongst them during that period as contrasted with 1857–58, when the number on duty did not exceed 491, from the under-mentioned diseases:—

	Cholera.		Fevers.		Liver.		Diarrhœa and Dysentery.		Venereal.		Rheumatism.		Thoracic Diseases.

Stations.	Replies.
III. Trichinopoly—*cont.*	14. The native portion of the force are accommodated here, as they are at all other stations of the army, in huts built of mud, roofed with straw or tiles. In the construction of these due precautions are taken to form the streets of sufficient width, and open to the prevailing winds. Officers commanding regiments being responsible that proper conservancy arrangements are enforced. The climate of Trichinopoly is very favourable to the health of natives. The native town is seldom altogether free from sporadic cases of cholera. But fever, venereal, and rheumatic affections form the large proportion of their sick.
IV. Tanjore.	15. The town of Tanjore is 33 miles east of Trichinopoly. The district around comprises the delta of the river Cauvery. The climate is considered salubrious, free from miasmatic exhalations, and the inhabitants are reported to attain a great age. The Cauvery usually fills in the months of June and July by the south-west, and again in November by the north-east monsoon. The distribution of water is regulated by anicuts or dams across the river, the water being then conducted by irrigating channels, thus converting what otherwise would have been an arid and barren plain into perhaps the most fertile, rich, and populous district in this Presidency. The military force at this station at the period of my visit consisted of one company of Europeans and one of natives, detached from Trichinopoly and relieved at short intervals of time. The troops were healthy, and the arrangements made for their accommodation were satisfactory in every way.
V. Comboconum.	16. The district around the station is a continuation of the rich delta watered by the Cauvery, and is equal in salubrity to Tanjore. A detachment of sepoys from Trichinopoly garrison the station. They are very healthy. But the jail, which occupies a low sandy piece of ground near the river, is perhaps the most unhealthy jail in the Presidency, although every attention is paid to cleanliness, &c. The fact is, we have here a striking instance of the evil effects directly and distinctly traceable to defects in the site, aspect, and construction of this building. The drainage is bad and cannot be improved; the privies are close to the wells. The space around the cells is too circumscribed by high whitewashed walls, which throw out great reflected heat during the day and retained heat at night; the cells are badly ventilated, and finally the walls and floors have become so polluted by miasmata that the jail pestilence pervades every quarter of the building. Strong healthy men no sooner enter the precincts of the jail than they droop in health. Diarrhœa rapidly runs on to ulceration, anasarca and death; ulcers are common, and the smallest abraded surface assumes an unhealthy action. Since the date of my visit to the place praiseworthy attempts have been made to improve the sanitary condition of the building by scraping the walls, renewing the floors, improving the ventilation, and altering the position of the privies. But the good that resulted was only temporary.
VI. Negapatam.	17. This seaport will ere long become a place of importance as the terminus of the Trichinopoly railway, which passes through the rich district of Tanjore, and not far from the base of the lofty Pulney hills, which in elevation and climate vie with the Neilgherries. At this port troops disembark and proceed to Trichinopoly, which is 100 miles inland. It possesses an equable and moderate temperature, and enjoys considerable immunity from disease. A small detachment of sepoys from Trichinopoly garrison the place.
VII. Tranquebar.	18. Tranquebar was until lately a Danish settlement. A detachment from a native regiment at Trichinopoly now garrisons it. On account of its salubrity and the buildings in the fort appropriate for the purpose, it was at one time in contemplation to make it a coast sanitarium. But although well adapted as a residence for people in health, it has been found to retard rather than promote convalescence after acute attacks.
VIII. Madura.	19. This zillah lies 83 miles south of Trichinopoly. A small detachment of native troops garrison it. The district is subject to periodical visitations of cholera. But the inhabitants are prosperous, and the land, which is watered by both the south-west and north-east monsoons, is highly productive. The native town is a pattern for cleanliness, and the streets are spacious. A chain of mountains taking a south-east course divide the district from Travancore; a continuation of the same chain extends in a north-east direction to within 20 miles of Trichinopoly. I will reserve my observations on these hills until I come to treat on the subject of mountain ranges generally.
IX. Tinnevelly and Palamcottah.	20. The former is the civil and the latter the military station of the district, both being contiguous. The general aspect of the country is a level plain extending for many miles, interspersed with rounded stony hills. The land is fertile and extensively irrigated by cuts from the Tambaravary river, which deposits a quantity of alluvium annually on the rice lands. The soil on the higher grounds is a red sand strongly impregnated with iron, forming a clay which produces good cotton crops. A detachment of European artillery were formerly stationed at Palamcottah, now a regiment of native infantry garrisons it. The barracks and hospital occupied by the artillery are spacious, well-aired, and lofty buildings. The men are very healthy, and a judicious system of conservancy is kept up in the native town.
X. Quilon.	21. Is a military post on the coast within the territories of the Rajah of Travancore. The surface of this country to the east is mountainous, elsewhere it is varied with hill and dale, and well watered. Some of the hills attain an altitude of 4,700 feet, with table land on the summit, and being not far removed from the sea, the climate is admired by those who resort to it. Quilon is famed for its salubrity. Cholera rarely visits it. A prolonged residence at the station relaxes the system; indolent ulcers, cutaneous diseases, and elephantiasis being the prevailing diseases.
XI. Cochin.	22. A detachment of native troops garrison this town, which, in a commercial point of view, is one of the most flourishing on the coast. The climate is never cool or bracing. There is always a degree of moisture in the atmosphere, and the temperature throughout the year is very equable, a continued drought being almost unknown. The maximum thermometer is 85°, and the minimum 78°. Venereal disease in its worst form is the curse of the town.

Inspect.-Gen. Macpherson's Report.

Madras.

Stations.	Replies.
XII. Calicut.	23. A detachment from the European and from a native regiment at Cannanore garrison this place, to overawe a dense population of fanatic Moplahs who inhabit the town and country around. The town is a little above the level of the sea, but by judicious arrangements the surface water does not lodge, but is carried away by stone channels. The great sanitary defect in the place are the burial-grounds in the centre of the dense population; but I will reserve my observations on this subject until I come to treat on the subject of the burial of the dead. Cholera at times makes terrible inroads amongst the population. Bowel disorders terminating in anasarca and cutaneous affections, being the prevailing diseases of this place. The European portion of the garrison are accommodated in commodious private houses.* They have every comfort, and their sanitary state is satisfactory. The native soldiers are also well cared for.
XIII. Malliapoorum.	24. At this outpost, which is 36 miles inland from Calicut, a detachment of Her Majesty's 66th Regiment soldiers are stationed. The men have been very healthy. I found only two men on the sick list; their barracks and hospital occupy an elevated ridge of ground, are well raised, lofty, freely ventilated, and sufficiently commodious. The men have a small library, and the officer in command encourages them to amuse themselves on the skittle and cricket ground, and in private theatricals.
XIV. Tellicherry.	25. A detachment of native infantry garrisons this very picturesque station on the western coast. Low hills clothed with wood and interspersed with valleys approach to within a short distance of the sea, and its salubrious climate is generally acknowledged. The annual fall of rain averages from 120 to 140 inches; the soil is amazingly productive; the low lands yield three crops of rice annually, and on the higher ranges the culture of spices and coffee is rapidly extending. The men of the detachment are in excellent health.
XV. Cannanore.	26. The provinces of Malabar and Canara form part of the Mysore division of the army, and Cannanore is the head-quarter military cantonment. It has a seaport, which is embraced inland by a succession of low hills, composed of a gravelly laterite. On the edges of the cliffs along the sea face, which vary from 30 to 50 feet in height, the officers' houses are placed. A little inland, but fully under the influence of the pure sea breeze, are barracks for one European regiment, and still closer to the sea the regimental hospital is placed; these are commodious buildings, well elevated, and tolerably ventilated. There are quarters for three regiments of native infantry considerably to the north of the European barracks. The surface soil around and in cantonments is entirely composed of the debris of laterite, chiefly of a gravelly nature, forming a shallow covering to the rock itself. From the porous nature of this substratum, water is rapidly absorbed and drained off; the surface, even after heavy rain, speedily becomes dry, and there are no accumulations of stagnant water. The town is situated nearly a mile from the cantonment; it is very populous and very filthy. 27. To Europeans in health the climate of this station, after a lengthened residence, has a most relaxing effect. It is unfavourable to convalescence under all circumstances, and patients but slowly and imperfectly regain their wonted health and strength after an acute attack. The temperature is remarkably equable, the maximum being 88°, and the minimum 68° of Fahrenheit. The ordinary fall of rain is 120 inches, and it is not unusual for 6 inches to fall within the 24 hours. 28. Cannanore stands high in the scale of healthy stations for European troops within this Presidency. Cholera is rare, but diarrhœa and dysentery prevail. Taking a cycle of 15 years prior to 1856–57, the admissions into hospital from these diseases average 22 per cent. on a strength of 14,441. In 1857–58 the average was 19 per cent. on a strength of 722. But syphilitic affections are of all others the most prevalent amongst the European soldiers.† In the first of the above periods 3,666 are registered, or 25·3 per cent. on the strength, and in the second 213 or 29·5 per cent. of strength were treated, independent of a large per-centage of rheumatic affections, concurrent on the primary syphilitic. But I will reserve my observations on this disease until I come to treat of it as it affects the army generally.
XVI. Mangalore.	29. Mangalore is the principal military and civil station in Canara. The native town stands in the immediate vicinity of the sea. The free circulation of air is here impeded by the dense wood and high walls which surround almost every little hut.‡ The ground occupied by the cantonment is indulating, with a gravelly laterite subsoil, resembling much in character that around Cannanore. Immediately beyond cantonment the hills rise to some elevation; at first rugged in aspect, and covered with bare jungle and scanty grass, but finally attaining considerable height. One portion, denominated the Kudray Mook (Horse's nose), attains an elevation of upwards of 4,000 feet, and is resorted to by Europeans during the hot months of March, April, and May. The burst of the south-west monsoon compels them to resort to the plains in June. Two native infantry regiments § garrison the cantonment of Mangalore; its climate does not differ from the other stations on the coast, having a relaxing and depressing influence on long residents.
XVII. Coimbatore.	30. Two companies of native infantry garrison this civil station, which is 20 miles from the foot of the ascent to the Neilgherry mountains. It is 1,480 feet above the level of the sea, and the climate is agreeable and healthy.
XVIII. Salem.	31. The civil station of Salem is garrisoned by a detachment of native infantry. The native town is placed in the lowest part of the district in a saucer-shaped valley. Fever, a prevailing disease throughout the district, is seldom absent from the town. Cholera also appears in epidemic forms. But of late considerable improvement in the sanitary condition of the place has been effected by the removal of surface filth and by judicious drainage.
XIX. Vellore.	32. A detail of European artillery and two regiments of native infantry compose the garrison of this military cantonment, which is 80 miles west of Madras. In close proximity to the station are several rough detached rocky hills, some attain an elevation of 2,000 feet, and are resorted to by the officers of the garrison during the hot season. The soil in the neigh-

* The European detachment is now quartered in the houses transformed into an excellent barrack. The situation is admirable, and the change in every respect a vast improvement.—P. G.

† I may observe here, that on my repeated representation, Government has now sanctioned lock hospitals being established at every station in the Madras Presidency occupied by European troops. Commanding officers have received authority to expel from a cantonment any women suspected of being diseased, who may refuse to submit to be examined.—P. G.

‡ The site of the cantonment has now been changed, on my recommendation, to a fine clear elevated spot, open to the sea and with the freest ventilation.—P. G.

§ To be reduced to one regiment N. I.—P. G.

Stations.	Replies.
XIX. Vellore—*cont.*	bourhood of Vellore is a rich dark brown mould, which is very luxuriant. Formerly this station was not surpassed in salubrity by any in the country, more especially to the native constitution; but it is not so now. Fever is never absent from the station, and cholera is too often endemic; the cause of this is the crowded and overgrown state of the cantonment. Within the last 20 years the population within the military limits has doubled without its area being increased; houses, and high walls, trees, and hedges, now obstruct the free circulation of air, and conceal much surface filth. The hospitals are very inferior, low, badly ventilated and situated.*
XX. Chittoor.	33. A small detachment of native troops garrison this civil station, which is 1,100 feet above the level of the sea, on the borders of the Mysore table land, and bears a good reputation for salubrity.
XXI. Arcot.	34. The military cantonment of Arcot, 70 miles from Madras, placed in an open bleak plain, with here and there inconsiderable bare hills of granite in a decaying state; the subsoil is a whitish gravel, with little or no vegetation for several miles, and no jungle whatever for many miles around. Formerly the force stationed at Arcot was one European and two native cavalry regiments; now it is unoccupied, save by European non-effectives and invalids, and by recruits, who are drafted there on arrival from England. This European infantry depôt occupies the buildings erected for the dragoons in former days. The hospital is a lofty well-aired building, but the construction of the other barracks is defective, and as regards site and aspect all sanitary considerations appear to have been overlooked at the period of their erection. In construction they are not sufficiently raised from the ground, and with one exception they are wanting in elevation, in width, and in ventilation; finally, the position they occupy is the most unsuited, sanitarily considered, that the country around affords. 35. The climate of Arcot is exceedingly oppressive and exhausting. I was stationed there for some years, and I have not in my military career experienced in myself or in my professional attendance on others equal nervous exhaustion and inability to exertion. Cholera of a low and fatal type is endemic in the native town, and when it extends to cantonment, the results are usually most disastrous. I have not in any other part of the Presidency seen a body of European soldiers look so bloodless and cachectic as at Arcot. The fresh recruit and the old soldier, whether in hospital or in barrack, wore the same wan look.† 36. Within comparatively recent times this station has been periodically scourged by cholera. Her Majesty's 13th Dragoons suffered most severely, losing many officers and men. The 25th K. O. B. in like manner were severely visited. The 1st Madras Fusiliers likewise suffered severely, and 18 months ago the depôt of European recruits was nearly decimated by the same disease. The neighbouring station of Arnee has an equally bad reputation, and has been finally abandoned as a military cantonment. These frequent visitations of this most destructive pestilence to the cantonment of Arcot, and its terrible ravages on the enfeebled constitutions of those who garrison it, are powerful reasons for the adoption of a system which is more likely to economize the life of the soldier on first entering on his career in India.
XXII. Poonamallee.	37. This depôt for recruits, time-expired men, unfits, and invalids of Her Majesty's regiments of the line, is 13 miles west of Madras. The cantonment is a little above the level of the sea, the land in the vicinity, though sandy, is much under rice cultivation. The climate is salubrious, and cholera has rarely visited the locality. The barracks for the accommodation of the men are the worst I have seen anywhere; they are almost level with the ground, the walls are only 10 feet high, and the pent tiled roof only five above this; the doors are solid, if closed no fresh air can enter, there is darkness within, and but litle egress for the foul air above. I found the men crowded to an intolerable extent. In the enclosed verandahs as well as in the body of the building, the men lay on boards and trestles, with barely space to pass between each other's beds. Their clothing and kit was placed over their heads, and they partook of their meals where they lay.‡ 38. The hospital is placed within the fort, and it is even a more objectionable building than the barracks. It is low in the roof; great buttresses have been raised at short distances, both outside and inside; the verandahs, and centre walls have been erected inside the sick wards to keep the building from tumbling down. This ward is only 16 feet in breadth, it slopes from the centre to the sides (probably from the sinking of the foundations) to such an extent that the legs of the sick man's cot at the head are obliged to be raised on bricks, so as to place them on a level with the floor on which the foot part rests. The building is utterly devoid of roof ventilation, and the space on which it stands is encircled by the fort walls, the houses attached to the hospital, and by a shallow ditch, overgrown with weeds at one season, and at another by an offensive swamp giving off mephitic exhalations. Heat apoplexy, diarrhœa, dysentery, and hepatitis, are the great diseases of the place. Here also are observed the destructive effects of syphilis on our European army, and the loss to the State consequent thereon. 39. If it be desirable to remove the infantry depôt for the local European army from Arcot to a more unobjectionable situation, humanity demands that the drafts from home for Her Majesty's regiments of the line serving in this Presidency, the sick and wounded, &c., should find also a more favourable locality than Poonamallee. I will reserve the consideration of this subject for a separate section.
XXIII. Palaveram.	40. This military cantonment is the chief depôt for all native sick details from regiments serving beyond sea and out of the Presidency. Atrophy, rheumatism, beriberi, and bowel disorders form the majority of the ailments of the men. The heat of Palaveram is great. But the station is reported healthy, and cholera seldom visits it.
XXIV. Saint Thomas' Mount.	41. The head quarters of the artillery arms of the Madras army occupy the military cantonment of Saint Thomas' Mount. It is only four miles in a direct line from the sea, and eight from Madras. The soil on which the cantonment stands is a red clay or gravel, and although the heat for six or eight months of the year is very oppressive, the station enjoys a favourable reputation for salubrity. The barracks are very good, the hospital is a

* The fort of Vellore is to be dismantled, and the station abandoned as a military quarter. P. G.

† Government has now consented to withdraw the European Recruit Depôt from Arcot to the Mount, a measure urged by me three years ago.—P. G.

‡ This depot is also to be established at the Mount, and full time it is that Poonamalee should be abandoned; the public buildings of every kind are, I really believe, the worst in the world occupied by British soldiers.—P. G.

Stations.	Replies.
XXIV. Saint Thomas' Mount—*cont.*	first-rate building, there are skittle sheds, fives court, and library for the use of the men.* The barracks are provided with punkahs, and during the hot land winds with other appliances to moderate the overpowering heat; yet cases of heat apoplexy are not unfrequent when the thermometer ascends beyond 95°. Fever assuming typhoid symptoms, with much gastric derangement, prevailed amongst the men from July to December 1857; and it is worthy of observation that fevers of this character are on the increase at some of our large military stations. Dysentery and liver complaints, and an unusually large number of venereal cases are the ordinary admissions into hospital at the Mount. Reckoning for a period of 16 years, or from 1842 to 1857–58, out of an aggregate strength of 21,458 Europeans who served within this, the centre division of the army, the following exhibits the admissions and deaths from the under-mentioned diseases :—

—	Admissions.	Deaths.	Treated to Strength per Cent.	Deaths to Strength per Cent.
From dysentery and diarrhœa	4,933	250	54·16	0·21
„ rheumatism and venereal	5,800	42	0·18	0·8
„ cholera	335	191	2·12	0·13
„ fevers	4,460	50	77·14	0·10
„ hepatic affections	1,345	74	13· 9	0·10
„ thoracic diseases	1,291	22	16·40	1·6

In the year 1857–58 the number of fevers treated were 58·6 as compared to 19·8 for the 15 years peceding, that for 1859–60 being only 10·21 per cent. to strength.

XXV. Madras.

42. The European troops at the Presidency have quarters assigned to them in Fort Saint George. Although the mortality is not equal to what we find at other stations of the army, the number of non-effectives from sickness is fully as great. Until lately this was easily accounted for by the crowded state of the men's barracks, and the impure atmosphere around them, from bad drainage, improperly constructed privies, confined space, &c. Now all this is in process of being remedied. A large amount of additional accommodation has been secured to the men; ventilation is to be thoroughly considered; the drainage and the privies are undergoing great improvement; verandahs are being placed all round the barracks, and free admission will be given for the pure sea breeze to permeate all parts of the buildings. When all the improvements are carried out, it is calculated that the upper story of the barracks will accommodate 600 men, affording upwards of 1,200 cubic feet to each man, and the important principle of providing for constant change of air in each space will also receive attention. There will be equally spacious accommodation on the ground floor; but I would strongly urge that this portion of the building should never be occupied by the soldiers as sleeping apartments. From the level nature of the soil and the small rise of tide, the drainage of the fort at best can never be thoroughly controlled, and this alone is an insuperable objection to a large body of men sleeping on the lower basement. I would recommend that the lower rooms be set apart altogether for non-commissioned officers' quarters, orderly rooms, workshops, lavatories, refectories, &c., &c. The great sanitary defect in Madras is its very imperfect drainage, and the difficulty of remedying this defect. But the condition of the fort is being much improved in this respect. A plentiful supply of water is to be introduced, and raised sufficiently high to ensure complete flushing of the drains; the sea rampart has been lowered, and now admits the pure and refreshing sea breeze which prevails eight months of the year; and the present obstructed ventilation within will be rectified by the levelling of walls and buildings.

43. There is still one point, however, which calls for reform, namely, the quarters for the married men. A man with his wife and family occupy an apartment averaging 10 feet by 18, with walls 11 feet in height, having a low pent roof above, and the windows and doors opposite, so that a current is kept up in the small apartment, always a source of danger to health in India, but without which it would be unendurable as a residence. In short, these apartments are quite unsuited for Europeans in a tropical climate.† Prior to their conversion into married men's quarters they were used as stables for the officers of the garrison, partition walls being thrown up to separate them into rooms, and on an average five souls occupy each apartment, some of the females being marriageable. The building forms nearly a square, its dimensions being 50 yards by 70. It has two rows of buildings across its centre, and privies, bathing, and cook-rooms in close proximity. The square is under cover of the ramparts, and many of the dwellings are lower than the surface outside. On sanitary, moral, and social grounds, I may earnestly urge that more ample provision be made for the family men of the garrison, outside the fort, if there be found to be no accommodation within.

44. The sick of the regiment are now treated in the general hospital. This building is half a mile from the fort. In it are treated,—

1st. The sick of the European regiment of the garrison (usually 10 per cent. on the strength), and women and children of the regiment.

2nd. The sick of the European and Eurasian (male and female), of the public departments, of the shipping, and the community of Madras generally.

3rd. The sick of all denominations at the Presidency head-quarters attached to public departments, as below.‡

4th. The sick of detachments of troops, European and native, temporarily residing at Madras.

5th. European and native sick and wounded soldiers returning to the Presidency from service beyond sea.

45. The general hospital at Madras has long been a reproach to the Presidency. Erected as a Dutch factory 135 years ago, it is wanting in ventilation, drainage, and in conveniences of every sort, and it will be apparent from the above that there are too many elements at work to admit of the successful organization and administration of a purely regimental hospital

* Quarters for the married men were greatly wanted at the Mount, and have at last been sanctioned, and are now under construction. I applied for them four years ago.—P. G.

† The unsuitableness of these married quarters was brought prominently to notice four years ago, they have been improved since then, but to make them what they ought to be, they must be entirely rebuilt on a better plan.—P. G.

Stations.	Replies.
XXV. Madras—*cont.*	within its walls. Extensive improvements are about to be carried out on the building, so as to meet the pressing wants of the place, and to render it more suitable for the sick. Advantage will be taken of this favourable opportunity to separate the two establishments, and thus put an end to the conflicting causes which mar the successful administration of both the general and regimental hospital discipline. The building is well situated, and exposed to the prevailing currents of air, and remote from permanent sources of malaria. In this neighbourhood a site might be secured for the erection of quarters for the married men of the regiment. 46. The European artillery of the garrison are quartered in low bomb-proof barracks under one of the bastions. They are of massive thickness, and double-casemated, with a narrow verandah in front, having cook-rooms and latrines in close proximity.* It is customary to call these quarters the coldest in the fort, and to be best liked by the men; but on what principle this is said it is difficult to understand. They are very low in the roof, badly ventilated, and cramped in on all sides. On lately inspecting them at 8 a.m., I found the men off duty, almost in a state of nudity, and the married men were bare to the waist, seated at breakfast with their wives and children; a fact which does not tend to substantiate the general opinion. It is well to have such secure quarters to resort to and afford protection to the garrison in case of siege, but certainly under ordinary circumstances they are not fit abodes for European soldiers. 47. The garrison of Fort Saint George is well supplied with good water, which is brought by pipes a distance of two miles. The extreme purity of the water in this direction is found to depend on a bed of sand in which the streams take their rise. The sand consists chiefly of quartz, and is perfectly white in colour. The extent of the bed is limited, and runs in a line south from the Pulicat Lake to the enclosure where the waterworks are placed, where it appears to terminate. The breadth of the bed in no place exceeds a few hundred yards. In some places it approaches the surface, but its usual depth varies from 10 to 15 feet beneath the surface. Should the bed of sand be passed in sinking wells, an inferior or brackish water is the result. 48. The native portion of the force quartered at Madras occupy lines at convenient localities in the neighbourhood. One set of these lines has been erected by Government, and are made over to each relieving regiment, an arrangement which answers admirably, and one which I should like to see adopted at every station of the army where native troops are quartered. Reckoning for a period of 16 years, or from 1842 to 1858, out of an aggregate strength of 16,065 European soldiers who served at the Presidency, the following exhibits the sickness and mortality from the under-mentioned diseases :—

XXVI. Bangalore.	49. The general aspect of the Mysore country is an undulating table land, varying in elevation from 600 to 3,269 feet above the level of the sea, interspersed with isolated hills, detached ranges, and continuous chains of mountains, some of considerable altitude. The rock forming the base of the whole country is of primitive formation; masses of granite, gneiss, and laterite, usually in vast rounded masses, rising above the table land. The general character of the surface soil is the black cotton, a rich red earth on the heights, and a clayey mould in the valleys. 50. Bangalore is the head quarter station within the division. The force garrisoning it consists of— European horse and foot artillery. 1 regiment of European cavalry. 1 regiment of native cavalry. 1 „ of European infantry. 3 „ of native infantry. The station is 3,000 feet above the sea, and 205 miles distant from Madras, to which it will ere long be connected by a railway. It is considered one of the finest climates in India. Many parts of the Mysore plateau are liable to severe visitations of epidemic fever, but at Bangalore these are almost unknown. The climate is particularly congenial to the European constitution. Disease can always be traced to imprudence in some shape, and convalescence is usually rapid. Thermometrical observations during a series of years afford the following results :— Annual mean temperature in the shade, 76° Fahrenheit. „ „ highest range, ditto, 81° „ „ „ lowest „ ditto, 69° „ „ „ variation in 24 hours, 10° „ 51. Until lately, the barracks at Bangalore for the accommodation of the Europeans of the garrison were very indifferent buildings, both as regards position and construction. Indeed, the beneficial effects of perhaps the finest climate in India were in a great measure lost to the soldier and his family, who laboured under the counterbalancing disadvantage of having to reside in perhaps the worst constructed barracks, and provided with the worst conservancy in India, although the site they occupied was elevated and capable of good drainage. 52. Now a vast and beneficial change for the better is already far advanced towards completion. Most spacious accommodation has already been erected for the artillery on an admirable spot. The hospital is the only building that remains an opprobrium to us here. It is deficient in elevation in basement and roof, in width and ventilation, in conveniences and arrangements, &c. It has in its close proximity the troop horse sick lines and the privy, kitchen, &c. The accommodation is also unsuited and inadequate to the wants of the establishment.

* The quarters are quite infamous.—P. G.

INSPECT.-GEN. MACPHERSON'S REPORT. MADRAS.

STATIONS

XXVI. Bangalore—*cont.*

REPLIES.

53. Splendid barracks are in progress for the accommodation of Her Majesty's dragoon regiment, on the highest and airiest space in the vicinity of the cantonment. These will consist of eight blocks of buildings, each to accommodate 80 men, having four serjeants' quarters attached. Each man will have 144 square feet, or about 3,000 cubic feet of air. The blocks have terraced roofs; the dimensions of the centre wards are 240 ft. in length, 24 in breadth, and 24 in height. An inner verandah 12 feet in breadth runs along each side of these, which serves for a refectory, and beyond this is another verandah, 10 feet in breadth. Privies, urinals, lavatories, cook-houses, &c., will be conveniently situated to each block. The hospital will be constructed on the latest and most approved style. A portion of the buildings are now ready for occupation, but the entire range will not be completed under four years. It is to be hoped that the important matter of surface and deep drainage will not be overlooked, and that an adequate supply of water will be secured for the flushing of these.

54. As the dragoons are enabled to take possession of their barracks the European infantry will enter those now occupied by them. These, too, are being converted into admirable buildings; in fact, are nearly completed. They occupy a space gently sloping to the north, so that all surface water runs off. Formerly the floors were flush with the ground, and the walls did not exceed 12 feet in height. Now the basements are raised, and the walls ascend double their former height, judicious perflation and ventilation being secured throughout the building. Admirable married men's quarters are also lately constructed here. Improvements are also in progress in the hospital; its former contracted and cramped-up space, low basement and roof, rendered the building unwholesome and unendurable to the sick. As much money is now being expended on the building as would have raised a first-class hospital. The space has been extended, and the apartments for the sick are raised and ventilated; but it would have been far better to have rebuilt the new hospital from the foundation* than to have repaired the old structure. A separate hospital for women and children, commodious out-houses for stores, &c., which until now were within the already too contracted space allotted for the sick soldiers, are also to be erected.

55. Large numbers of European pensioners have resorted to Bangalore since the period when the restriction regarding their permanent place of residence has been withdrawn. Including families, their number now exceed 1,100. Plots of ground are secured by them, on which they erect comfortable cottages, and these have already extended into a clean-looking village of considerable extent. I may here state that during the mutiny in Bengal, when it was necessary to send from Madras every available European, these pensioners were all enrolled, and protected this very extensive cantonment. I take the liberty to urge, for the consideration of the Royal Commissioners, that liberal encouragement be held out to European pensioners to take up their abode here. It has been already shown that they are a stay to the State in trouble, and, were free grants of land given them for garden purposes,† they would in course of time produce fruit and vegetables sufficient to supply a ration to the European soldier residing at Madras as well as Bangalore.

56. Bangalore cannot be said to be a healthy station for the native soldier who has just come to reside there. Indeed the same remark is applicable to the whole of the Mysore plateau, so far as the native is concerned. They are prone to attacks of fever, more especially if they have come from beyond sea or from a coast station, and they do not become acclimatized under a residence of two years. During the year ending 30th April 1858, 102 per cent. were treated to strength, and the deaths have been 1·7 per cent. to strength. For the 15 years preceding the per-centage of sick has amounted to 78·3, and the deaths to 1·8 per cent. to strength.

57. Amongst the European troops the death rate during the year 1857–58 has been as low as 0·8 per cent. to strength. From 1842 to 1858, embracing a circle of 16 years, 26,517 soldiers served in the division. The following table exhibits the sickness and mortality amongst them from the under-mentioned diseases:—

Diseases.	Ad.	D.	Admissions.	Deaths.	Treated to Strength per Cent.	Deaths to Strength per Cent.
Fevers			1,403	53	30·11	0·21
Dysentery	2,225	117	3,930	135	33·2	34·12
Diarrhœa	1,705	18				
Rheumatism	2,589	4	11,681	17	96·23	3·06
Venereal	9,092	13				
Thoracic disease			359	157	1·6	0·6
Cholera			1,742	213	13·16	0·9
Hepatic disease			1,735	63	9·10	0·07

It has been observed that the force of disease is greater at Bangalore than at most other stations, especially amongst fresh arrivals, and children who have resided at stations having a much higher temperature. This is in most cases accounted for by carelessness in clothing, a subject which is now becoming better understood. Venereal disease is the great scourge to the soldier here, and in the phagedænic form, which it frequently assumes, it works terrible destruction.

58. The drainage of the cantonment is on the whole good. The extensive ridge it occupies slopes on the sides, and thus all surface filth is removed. But the greater body of this sewage passes into the tank or reservoir of water, which during the dry season affords a supply for not only the cattle of the force, but also to the dense native population.‡ There are also offensive open sewers running down these slopes, obstructed in their progress by walls or cross buildings. These, as well as the tank, emit most fœtid odours during the dry and hot weather.

* A new hospital would have cost over rupees 80,000, the improvement will be completed for from 10 to 15,000.—P. G.

† The whole of Mysore, even the ground on which stands the military cantonment of Bangalore, belongs to the Mysore Rajah, and the British Government cannot appropriate an acre of it without the consent of the Rajah.—P. G.

‡ Aye, and to the European population also. Every obstacle has been thrown in the way of procuring a copious supply of pure wholesome water, but it is hoped they are now in a fair way of being overcome.—P. G.

Stations.	Replies.
XXVII. French Rocks.	59. A regiment of native infantry garrisons this post in the Mysore country. It is five miles from Seringapatam, and was formed when sickness compelled us to abandon the latter city. There are occasional outbursts of fever at the station; but otherwise it is very healthy. Its elevation above the sea is 2,300 feet.
XXVIII. Mysore.	60. This, the capital of the Mysore country, and the seat of the Rajah, was temporarily occupied by European troops at the period of my visit there; but usually a detachment of native infantry only are stationed there. It is 2,513 feet above the level of the sea.
XXIX. Hoonsoor.	61. At this station are the great Government works for the preparation of all army accoutrements. The public cattle-breeding establishments are also placed here. It is garrisoned by a detachment of native soldiers, and does not enjoy a high reputation for salubrity. Fevers are endemic, and cholera not unfrequently scourges the town and district. Its elevation above the sea is 2,970 feet.
XXX. Mercara.	62. This military cantonment is the capital of the Coorg country, and has an elevation above the sea of 4,500 feet. The Bittatoor table land adjoining has a still higher elevation. These grand mountains take their rise abruptly from the Mysore country below, and consist chiefly of a succession of lofty narrow ridges, running parallel with each other in a north-westerly or south-easterly direction. In some parts the hills are gently rounded, and alternate with sloping glades clothed with forest. In other parts the hills are closer, more abrupt, and intersected with deep ravines, covered with low, impenetrable jungle, while in other parts there are a succession of beautiful grassy downs and clumps of trees, resembling park scenery in England. Vegetation everywhere is rich and luxuriant, and altogether the scenery is grand and picturesque. The Tadianamool mountain, 5,781 feet above the sea, is the highest in Coorg. There is considerable extent of table land on these hills, but they can never be converted into sanitaria as a residence for troops throughout the year, being too much under the influence of the south-west monsoon, which continues with little intermission for six months. European colonists are, however, rapidly settling amongst these beautiful mountains, and reside in localities which were heretofore considered uninhabitable from pestilential fevers. The felled virgin forest is destroyed by fire, a proceeding which to a great extent appears to carry away the malaria; and as no vegetation is permitted to obstruct the growth of the coffee, which takes the place of the forest, extensive tracts are thus becoming habitable. 63. The climate of Mercara is very equable. The maximum thermometer in the shade is 79°, and the minimum 52°, the mean being 66° of Fahrenheit. The average annual fall of rain is 160 inches; yet there are no swamps or accumulations of water, for the surface water rapidly drains off into the cultivated valleys which intersect the hills, and from thence into the running streams. The rainy season is considered the most salubrious, and, if the head be well protected from the sun, exercise can be taken in the open air at all seasons with impunity. Catarrhal affections and bowel disorders are the prevailing diseases.
XXXI. Jaulnah.	64. A considerable military station in his Highness the Nizam's territories, 659 miles north of Madras, and about 220 from the sea on the Bombay side. The cantonment is situated on a gently sloping declivity, having a small range of hills, about two miles distant, in front. The surrounding country is hilly, and much intersected by ravines. The geological formation of the hills is chiefly trap rock in a state of decomposition. The surface soil varies from a red gravel of a lateritious character, the ordinary black regur or cotton soil, or tracts of white stony land covered with long grass. The native towns of Jaulnah and Khaderabad are upwards of a mile from cantonment. The streets are narrow, but clean; the houses are tiled, and many of them are of superior construction. A small river forms the boundary of the military limits, and as the natural slope of the ground comprised within these is towards the river, the drainage of all parts of the cantonment is good. 65. The climate of Jaulnah is one of the most salubrious in Southern India. During the greater part of the year a fresh coolness is experienced in the mornings, although the heat of the day from March to June is intense, ranging from 90° to 100°. From July till October the rains prevail. The average annual fall does not exceed 32 inches. During September and October there is a partial cessation of rain. These are the most insalubrious months of the year, from the deleterious exhalations from the soil causing fever. Although the variations of temperature in the 24 hours during the four cold months comprised between November and February are great and sudden, the thermometer ranging between 40° and 80°, it is considered by European residents the perfection of climate, being strengthening and invigorating, and favourable to the health of the troops. 66. For many years the force comprising the garrison of Jaulnah consisted of— European artillery. 1 regiment of native cavalry. 2 „ „ infantry. Now it has been increased by the addition of a regiment of European infantry and a corresponding reduction in the native infantry. The military cantonment is in every respect well chosen, the barrack occupying a gentle acclivity. When I visited the place in company with his Excellency the Commander-in-Chief the greater part of the troops were on field service; but as his Excellency had resolved to strengthen the European portion of the garrison, an unexceptionably situated site was selected for the new barracks, on high ground in the neighbourhood, sloping gently towards ravines on every side, with which the drainage from the barracks could be conveyed with ease to a distance. The cantonment of Jaulnah stands first on the scale of sanitary stations for European troops within this Presidency. In a period of 10 years, from 1847 to 1856–57, the ratio per 1,000 of sick to strength treated was 2,368. The ratio of deaths from all diseases was 10·3, and of deaths from all diseases, excluding cholera, 9·3.
XXXII. Nagpore.	67. Embraces the greatest portion of that part of Central India called Berar. There is perhaps no great native city in India that can be compared to Nagpore in meanness in appearance, in the accumulation of masses of filth and garbage, in the numerous offensive cesspools and open ditches, and in the total absence of drainage and roads. The sickness and mortality in this receptacle of filth is said to be very great, but we have no means of arriving at any correct data on the subject.

STATIONS.	REPLIES.
XXXII. Nagpore—*cont.*	

68. *Seetabuldee* is a military cantonment in the neighbourhood. The entire British force at one time garrisoned this position, but proving unhealthy it was abandoned. Now it affords accommodation to the Nagpore irregular native force, the fortress only being occupied by a detachment of Europeans from the large military station of—

69. *Kamptee*, which is 722 miles from Madras, 733 from Calcutta, 577 from Bombay, and 10 miles eastward of the city of Nagpore. The cantonment occupies an extent of nearly six miles along the right or south bank of the broad river Kunnav. The soil is the common regur or black cotton, interspersed with calcareous nodules. The surrounding country for many miles is flat, destitute of wood, and intersected by ravines, being cultivated only in the cold and rainy seasons. The position occupied by this military cantonment was selected without regard to the most ordinary sanitary considerations; built on the bank of a broad river, the channel of which is exposed the greater part of the year; the ground is intersected by ravines, which during the rains carry down quantities of alluvial debris and swamp the cantonment, and when the rains cease these ravines become receptacles for filth. Thus the physical conditions requisite for the production of malaria are present while any moisture remains on the surface, and also when the streams dry up, in consequence of the abundance of surface filth which accumulates in the exposed channels, and the alternating influence of heat and moisture on this surface.

70. I visited this cantonment in company with his Excellency the Commander-in-Chief. Sir Patrick Grant was quite of opinion that, sanitarily considered, nothing could be worse than the position of the station. Kamptee has long been notorious for a severe form of fever, and until lately the opinion prevailed that the sole cause of this fever was the deleterious principle of malaria evolved from a dense tract of jungle about 20 miles distant. But abundant cause for the production of the malady is now allowed to exist in and around cantonment.

71. An extensive ridge runs to the north-west of cantonment, and slopes in the direction of the river. It is quite free from the objections above detailed, and both sanitary and military considerations (for his Excellency has favoured me with his views on this subject) mark it as the most desirable position for the location of troops. It is on the great road from Nagpore to Kamptee, and is of sufficient elevation to secure a pure atmosphere, excellent drainage, and safe from all that renders the atmosphere noxious on the banks of the river, while a plentiful supply of water can be secured by storing the streams as they descend from the neighbouring heights before coming in contact with the impurities in the low ground below. To extend the cantonment, therefore, as has been proposed, following the course of the Kunnav stream would be merely to perpetuate the evil originally made. I beg earnestly to urge that every opportunity be taken gradually to withdraw the cantonment from the banks of the river and extend it in the direction indicated by his Excellency, and thus while one flank would rest on the river the other would ascend to the high and wholesome position pointed out.

72. The transitions of climate are usually very regular at Kamptee. The cold weather continues from the middle of October till the middle of March; the hot season from this period till June, when the rains come on and continue until October. The diurnal changes of temperature necessitate great attention to the precautionary measure of appropriate clothing. The mean temperature during the cold months is 68°; the minimum known has been 36°, and the maximum 110° in the shade, but in the sun the thermometer has been observed to rise as high as 140° of Fahrenheit. The average fall of rain per annum is 40 inches.

73. The force now garrisoning Kamptee consists of—

1 regiment of native light cavalry.
1 troop European horse artillery.
2 comp. do. foot do.
1 regiment European infantry.
3 regiments of native infantry.

The barracks for the European soldier are deficient in ventilation, and are without verandahs to protect the inmates from the direct rays of the sun, which strike directly on the buildings, and are also reflected from a high whitewashed wall which surrounds them. His Excellency Sir Patrick Grant has urged on Government the immediate necessity of introducing proper ventilation; he has recommended that the roofs be raised, that each barrack be provided with a deep verandah, and that the very objectionable prison-like walls which surround the square be lowered and surmounted by a rail.

74. The position occupied by the married men of the European portion of the force is most objectionable. It is on the bottom of the ridge above referred to, and level with the river's bank; thus it not only becomes flooded during the rains, but remains a swamp for months afterwards, and finally dries up, leaving much surface filth exposed to the sun. The arrangement of the buildings is also objectionable; they occupy a contracted space close on the barrack wall, the cook-rooms and privies being so placed that free perflation is quite out of the question. His Excellency condemned the site and quarters *in toto*, and suggested remedies in which I most fully concur. The introduction of these I beg to express a hope the Royal Commissioners may use their influence to expedite.

75. The number of deaths at Kamptee from apoplexy in former years was enormous. For 10 years prior to 1838 they amounted to 73¾ per cent. of the sick treated. The large majority of these cases would now pass under the name of "Insolation" or "heat apoplexy." Very many still report sick from this cause, but the disease is now more amenable to treatment, partly because it is better understood and partly because the soldier has better accommodation, and more space is allotted to him in barracks than formerly. The following contrasts the death rate amongst the European portion of the force during the past 10 years as compared with that which obtained 20 years ago:—

From 1829 to 1839.		From 1849 to 1859.	
Aggregate strength	9,574	Aggregate strength	3,216
Do. admissions	2,309	Do. admissions	6,212
Do. deaths	377	Do. deaths	72
Average per-centage of deaths to treated	16·32	Average per-centage of deaths to treated	1·15

76. Fevers have also been another source of great mortality to the soldier at Kamptee, and although the aggregate number of admissions from the several types of this disease is smaller than that of former years, there is nevertheless an increase of the more grave forms of the malady, viz., the remittent with cerebral and hepatic determinations, and not unfre-

Stations.	Replies.
XXXII. Nagpore—*cont.*	quently typhoid characters supervening, indicating that the producing cause, whatever this may be, is more intense now than heretofore. The average sickness from all diseases for a period of 15 years, ending 1857, has been 199·9 per cent., while in 1858 the number was 189·6 per cent. The mortality in the former period was 3·7, and in the latter 4·0 per cent. The following table exhibits the sickness and mortality at the station for a period of 16 years from the under-mentioned diseases:—

Period from 1842 to 1857–8. Aggregate strength, 8,786.	Cholera.		Fevers.		Liver.		Diarrhœa.		Dysentery.		Thoracic.		Rheumatism.		Venereal.	
	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.
	71	37	6,161	84	731	29	1,212	26	1,096	58	252	11	1,050	6	1,425	4
Ratio of strength to sick per cent.	0·8		127·7		18·2		27·7		26·12		11·8		19·13		38·7	
Ratio of deaths to strength per cent.	0·4		0·17		0·7		0·3		1·6		1·14		0·7		0·0	

There is little to detail relative to the health of the native portion of the garrison. They reside in their own proper lines along with their families, and are subject in like manner with Europeans to the endemic disease of the station, viz., fever; but they are partial to the place, and, upon the whole, enjoy better health than at many other stations of the army.

XXXIII. Secunderabad.

77. This is the most extensive military station within the Presidency of Madras, and is garrisoned by a force as per note.* It is six miles from the vast native city of Hyderabad, with a population estimated at 200,000. This city is surrounded by a high stone wall covering an area of seven miles. It has narrow ill-paved streets, and so exceedingly foul and offensive that it may be said to be a focus for disease at all seasons of the year. The cantonment is 1,800 feet above the sea. The general surface of the country is irregular and undulating, the greatest elevation of the table land being at Beeder, about 60 miles north of cantonment. On the higher grounds the soil is silicious, with decaying trap and granite rocks in isolated and large masses interspersed on the surface. In the plains and hollows the soil is a rich black loam, producing luxuriant crops.

78. The seasons return with great regularity, and may be classed into the cold, from the middle of November to the middle of February, the hot from this period to the end of May, and the rains from the early part of June till the end of September. Although the heat is at times excessive, the mornings throughout the year are pleasantly cool. The mean temperature of each month is as follows:—

January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.
72	76	84	91	93	88	81	80	79	79	75	72

The average fall of rain per annum is 32 inches. The climate is considered as salubrious as any in India, and possesses a happy medium between the extremes of heat and cold experienced in the upper provinces of Hindostan. The maximum temperature reaches 110°; the minimum has been known down to freezing point. The daily range during the cold months varies from 20° to 30°. It is at this season that extreme caution is so necessary to protect the surface from sudden chills, which are so prone to engender visceral and hepatic derangements.

79. A residence of 14 years in the vicinity of this important military station, and a knowledge of almost every regiment which has visited it in that period, enables me to speak with some confidence on matters relating to hygienic details of the place. The military limits extend in a direct line east and west nearly five miles, one flank resting on an extensive tank, which irrigates a great extent of land running parallel with the station. There is a perpetual flow of water from this tank; what is not consumed in irrigation passes away by the natural drainage of the country, receiving in its course the sewage from the more elevated ground, from the native bazaars and European barracks, polluting the atmosphere in its progress, and finally becoming disembogued in the river a mile to the east of the barracks.

80. The entire area occupied by the cantonment is lower than the adjacent country, and the European infantry barracks are placed on the lowest part of this area. Masses of granite rock, bare from the base to the top and elevated ground, encircles the barracks themselves, except on one side in the direction of the tank. A superficial substratum of soil over rock tends to retain moisture and to make the space the focus of the surrounding drainage; the ground has thus become saturated with organic matter, and besides this there are two extensive grave-yards in close proximity to the buildings.

81. The barracks consist of a square of narrow, ill-ventilated, closely-packed ranges, and a detached range for the flank companies; close on one side of the square, in the direction of the prevailing winds, are privies and cook-rooms. A high prison-like wall surrounds the barracks, and the circulation of air within the enclosure is still further interrupted by blocks of buildings. The emanations from the earth, the fœtor from the privies and sewers, the imperfect perflation from the crowded buildings, and the vitiated atmosphere from the presence of a large body of men in far too circumscribed a space, has hitherto induced a morbific atmosphere, which rendered the soldier susceptible to disease on every change of the weather or other exciting cause.

82. I need not revert to the sad history of these barracks, and how regiment after regiment has been decimated within their walls. It is true that some seasons present a more favourable aspect than others, yet, taken as a whole, I think I am justified in asserting that a more unfortunate proof of the insalubrity of the position and structure of public buildings cannot

Stations.	Replies.
XXXIII. Secunderabad—*cont.*	be presented. Deputy Inspector-General of Hospitals, Dr. Innes, when in charge of Her Majesty's 4th King's Own regiment in 1843, stated, "that the most anxious attention has "failed to discover, and, if possible, obviate, the causes in which this frightful pestilence "(dysentery) has originated, but only negative results were obtained. The men in the "patcherry and barracks, those who performed light duty and those who did not, those "who occupied barrack rooms exposed to the monsoon or sheltered from it, those of tem- "perate or intemperate habits, all suffered alike." 83. The barracks have repeatedly been condemned by Military and Medical Committees, composed of gentlemen of high reputation; but the exigencies of the service rendering it necessary that they should still be occupied, enormous sums of money have been expended on their improvement, with apparently little benefit to the health of the soldier, if we may judge from the terrible outburst of dysentery which carried off 10 per cent. of the 1st Royal regiment of foot during the past year, 1858–59. 84. While the men in these barracks suffer so dreadfully, both the officers of the regiment and the other European residents in cantonment are exempted from the same grave form of disease. The European artillery also, stationed at a distance of a mile and a half from the barracks, suffer comparatively little, although nothing can be more objectionable, sanitarily considered, than the construction of their barracks, but occupying a high and healthy locality, the disease, when it does attack them, usually yields to treatment. 85. That this exemption is not an occasional or accidental one is shown by the subjoined Table, exhibiting in contrast the sanitary condition of the European troops occupying the artillery and infantry barracks from 1837 to 1858, a period of 22 years. The artillery, it will be observed, lost on an average $2\frac{6}{11}$ per cent., and the infantry 5·0 per cent.; and while the artillery had $5\frac{7}{11}$ per cent. constantly sick, the infantry had $7\frac{3}{11}$.

The diseases which usually occasion this destruction to life amongst the European infantry soldiers are acute dysentery, of hœmorrhagic type, and hepatitis; and in some cases it runs its course in a few days. There is little premonitory warning; acute symptoms usher in the disease, and ulceration, sloughing, or hepatic abscess speedily supervene, rapidly destroying the patient.

86. The lines of some of the native portion of the garrison also occupy low and unwholesome localities, as compared with the more elevated ground around. The consequence is, that the average number of non-effectives from sickness exceeds what we usually find in native corps elsewhere. The types of disease which afflict them are fever and its concomitants, as well as bowel disorders, which speedily undermine the system and tend to increase the pension list.

87. In the formation of the cantonment of Secunderabad, therefore, I am compelled to admit that the importance of sanitary science, as bearing on the health and general well-being of troops, whether in the position of the buildings or their architectural structure, has not been sufficiently recognized. The skill of the medical man may relieve, but the removal of the cause must rest with the military authorities.

88. The extreme altitude of the cantonment above the sea, as has already been stated, is 1,800 feet. The positions occupied by the barracks, lines, and bazaar, average 100 feet under this. The height of the neighbouring table land, part of which is occupied by the artillery and part by the new infantry barracks, averages 1,900 feet above the sea, and the ground gradually rises from this for a distance of five miles north to a point where the watershed separates the drainage to the rivers Kistnah and Godavery, and here it attains an elevation of nearly 100 feet higher. His Excellency the Commander-in-Chief, in his recent tour to Secunderabad, personally devoted much consideration to the subject of the old cantonment, which has grown up to such enormous proportions that it covers an area of 20 miles, and necessitates a 10 mile march to some of the corps on an ordinary field day. I think I am correct in stating that, sanitarily and strategetically considered, he is of opinion that nothing could be more unsatisfactory than the present state of matters. Having made himself familiar with the high ground contiguous, he directed a mixed Military and Medical Committee to examine and report on its extent and capabilities. I was a member of the Committee,

Stations.	Replies.
XXXIII. ecunderabad—*cont.*	and we unanimously considered that the space is sufficiently ample for the transfer of all the troops scattered at present over so extensive a field; that as a military post it commanded all the country around; that a sufficient supply of water could be secured, and that, in a sanitary point of view, with judicious arrangements, such as the planting of trees and proper drainage, the site was in all respects admirable. The elevated ridge selected is about five miles in length and one in breadth. It possesses facilities for drainage on both sides, and is in all respects an incomparably better position for a military cantonment than the present locality. I beg respectfully to express my earnest hope that the influence of the Royal Commissioners may be exerted to expedite the views of the Committee, supported as they have been by the Commander-in-Chief.* 89. The new European barracks already occupies this elevated plain. There are 10 ranges for single men, one for each company, all freely ventilated, and calculated to afford a cubic space of 2,500 feet to each man. Serjeants' quarters are placed at the ends of the barracks, and on a gentle slope to the north of the buildings are admirable ranges for married men, each having a court-yard containing cook-room, bath-room, and privy; and the whole so arranged that each company has separate accommodation for single and married men. The hospital is a very superior building of two stories, and can accommodate 140 sick, affording 2,600 cubic feet of air to each man. Female and special wards, apothecaries and nurses apartments, store-rooms, bath-rooms, clothes-rooms, dispensary, and detached privies, communicating by a covered way, being also provided. In short, the whole is replete with every comfort, and are noble structures. 90. The cost of constructing these handsome buildings amounted to 135,000*l.*† Assuming that this money was borrowed at 5 per cent., it would yield 6,750*l.* per annum, or 18*l.* 9*s.* 10*d.* per diem. Taking, therefore, the cost of the barracks and family quarters, and supposing a complete regiment, 947 strong, is always quartered in these buildings, the lodging of each man would cost the State 4¾*d.*, or, if the families are considered in the calculation, the result would be, that each single man is lodged at an expense of 1¾*d.*, and each married man, with his wife (exclusive of children), at 3*d.* for a day of 24 hours, and this with every possible requirement for health, cleanliness, and recreation. 91. In a period of 16 years from 1842 to 1858, in an aggregate strength of 20,529 European troops who served with the Hyderabad subsidiary force, the following were the admissions and deaths from,—

XXXIV. Masulipatam.	92. A civil and military station on the coast, garrisoned by a regiment of native infantry under the officer commanding the northern division of the army. Formerly it formed the depôt for stores proceeding to the upper provinces; but difficulties connected with the port has caused it to be abandoned, and the depôt is now transferred to Coconada. The military cantonment occupies a sandy ridge, elevated a few feet above the sea. In spring tides much of the ground around is under water, and during the monsoon it is little better than a morass, but in the dry weather the swamp dries up by evaporation. A regiment of European infantry at one time garrisoned the fort, but the site has now become malarious in consequence of the low situation, the encroachments of the sea, the silting up of the fort ditch, and the impossible conservancy of the place from the enormous amount of surface filth kept in perpetual agitation by the ebb and flow of the tides, which caused fearful destruction of life and health in the ranks of the last European corps stationed there. Now the only Europeans sent to Masulipatam are a few invalids from Secunderabad, usually convalescents from visceral and hepatic disorders. Necessity alone compels the authorities to select this post for them, as being the nearest point to the coast. A temporary improvement is usually visible in the constitutions of the men, but there are frequent relapses; few of them become invigorated, and their recoveries are seldom enduring. Apart from the insalubrity of the site of the fort, the height of the barracks within, from floor to ceiling, is only 13 feet; the roofs are terraced, having no ventilation; the floors are barely raised above the ground; the windows are merely iron bars, with shutters folding inwards; the free access of air to the buildings is impeded by the high ramparts; and the drainage from the privies, &c., is obstructed beyond remedy by the accumulated mud in the ditch without. I have been thus particular in my description of the place in order to add my humble but earnest support to a measure urged by his Excellency the Commander-in-Chief, to establish a permanent communication by transit to the nearest point whence the invalid can be conveyed by water to Coconada, the newly established "*entrepôt*" for the upper provinces, and thence by water to Waltair, the recognized sea-coast sanitarium, and decidedly the healthiest spot along the Bay of Bengal.
XXXV. Guntoor.	93. Is a small civil station 40 miles from the sea, and garrisoned by a detachment of native invalid soldiers. The ground is flat and open to the coast, and, although the heat of the station be great, it is remarkable for its salubrity. The soil is black cotton.
XXXVI. Nellore.	94. This civil station stands on lateritious soil, and is distant 18 miles from the sea. The district is copiously irrigated, and produces large crops. A detachment of veterans garrison the place. The climate is very equable, but relaxing to the European constitution.
XXXVII. Bezwarra.	95. Great Government works have been in progress at this place for some years. A bund or "anicut" having been constructed across the Kistnah, with the view to direct the water of the river to diverge into canals on each side suitable for traffic and for the irrigation of the country. A detachment of Sappers and Miners form part of the workmen, and although the labourers amounted to many thousands, with the exception of accidents, there has been but little sickness.

* Remark by his Excellency the Commander-in-Chief. See my Inspection Tour Report of February 1859. Dr. Macpherson has described with perfect accuracy the conditions of the cantonment at Secunderabad.—P. G.

† Sixteen lacs was the cost.—P. G.

Inspect.-Gen. Macpherson's Report. Madras. — Stations.	Replies.
XXXVIII. Dowlaishweram.	96. Here also similar extensive Government works have been in progress since 1846, in building an "anicut" across the great river Godavery, in order to extend irrigation and afford the means of communication by water over a delta of many hundred square miles between this spot and the sea. The head-quarters of the Sapper corps are stationed here. Fever is prevalent, but otherwise the locality is healthy.
XXXIX. Rajahmundry.	97. A detachment of native infantry garrisons this civil station, which lies on the left bank of the river Godavery, a few miles above the last-named place. Amongst the natives syphilis prevails to a deplorable extent, but otherwise the character of the place stands high for salubrity.
XL. Samulcottah.	98. A station for a regiment of native infantry about six miles from the sea. The ground on which the cantonment stands has not been well selected. It is quite in a hollow, while high and dry ground is available in immediate proximity to the present site. Fever is endemic amongst the natives, but to Europeans the climate is genial.
XLI. Coconada.	99. This seaport promises to become perhaps the most important in the Bay of Bengal. Already vessels of considerable tonnage pass up the river, and the channel is being dredged and deepened. It is now the port of communication for the transmission of stores to the stations of the Madras army in Central India, by means of the Godavery or the canals in communication with that river and the Kistnah. The town is still in its infancy, but it promises to become a place of considerable commercial magnitude. I beg to urge the necessity for the early introduction into this rising seaport of judicious sanitary rules, while the place is still unformed. Houses should be built with uniformity, and great attention should be paid to surface and deep drainage. Unless some code of regulations be laid down on this important subject, evils are certain to spring up hereafter which it will be difficult to remedy.
XLII. Vizagapatam and Waltair.	100. A force as per note * garrisons Vizagapatam and Waltair. The former is the native town and fort, and the latter the position occupied by the European portion of the force and officers. There is no comparison between the climates at both places. Vizagapatam is hot, confined, and insalubrious, while Waltair is the most pleasurable and genial to the European constitution of any other of our coast stations. The European veterans garrison Vizagapatam. Their hospital is quite unsuited for the purpose to which it is applied. It was not constructed for a hospital, and the whole of its internal arrangements bear testimony to this. Its site also is very objectionable. Immediately in rear of a tidal swamp, from which at certain hours of the day and night the most insupportable odours proceed. Patients in such a wretched building and unwholesome position cannot be expected to derive much benefit from medical treatment. The house has been rented by Government for 18 years, at rupees 64 per month. A sum therefore of rupees 13,824 has been expended on this worthless building. The native troops occupy a position one mile from Vizagapatam; they are very healthy; and two miles further on up the coast is Waltair. The Europeans stationed here are accommodated in temporary buildings, but it is in contemplation to erect permanent barracks for them, and also for invalids of the European force throughout the Madras Presidency, for whom a change to the sea-coast is recommended.† When I come to treat of sanitaria generally I shall have some further observations to make on the best means of extending the benefits of the sea-coast sanitaria to European invalids from all parts of India.
XLIII. Vizianagrum.	101. A station for a brigade of native infantry and artillery, 40 miles north of Vizagapatam. A succession of ranges of mountains rise in close proximity to the station. On the more elevated of these a site has been fixed on for a sanitarium. But a deadly fever is the almost certain result of a night passed in the lower elevations. The climate of Vizianagrum from September to March enjoys a high reputation for salubrity. April, May, and June are intensely hot. The rains then usually fall, and moderate the excessive heat.
XLIV. Chicacole.	102. A regiment of native infantry garrisoned this civil station at the period of my visit to it; but it has since been withdrawn, and its place is taken by a detachment. Chicacole is four miles from the sea, and it enjoys a high reputation for salubrity.
XLV. Russelcondah.	103. This is the most western station in the northern division of the army, and is distant 50 miles from the sea. A regiment of native infantry garrison it. Immediately beyond the station high hills ascend and extend for miles, but none of them possess the elevation or other requisites which would attract European colonists. They are bare, dry, and very unhealthy. Fever is the prevailing disease at the station. The climate is intensely hot in the summer, but during the winter the cold is very piercing.
XLVI. Cuttack.	104. Is the most northern military post for Madras troops on the coast, and distant only 230 miles from Calcutta. The station is very healthy. A regiment of native infantry and a company of native artillery form its garrison.
XLVII. Bellary.	105. The head-quarters of the civil and military departments of the Ceded Districts has a garrison as per note.‡ The aspect of the country is flat, barren, and treeless. Numerous isolated bare granite hills are scattered over it, composed of large boulders, grotesquely heaped up in irregular masses. Most of the open country is a rich black regur soil, which returns rich crops when there is a sufficient fall of rain; but this is very uncertain. The fall of rain is less here than in any other part of India, and the country is subject to severe droughts. Large rivers intersect the district, and measures are now in progress to turn these streams to advantage, by diverting the water from them over the district for the purposes of irrigation and navigation.

Stations.	Replies.
XLVII. Bellary—*cont.*	106. The cantonment is 1,600 feet above the level of the sea. The characteristic peculiarity of the climate is the extreme dryness of the atmosphere, produced by the air passing over so vast an extent of bare surface. For two-thirds of the year the thermometer ranges from 88° to 100° in the shade, but during the winter months it falls to 50° of Fahrenheit. The station occupies about the most elevated spot in the district, and the ground slopes in all directions, so that no water lodges in the neighbourhood. The soil and the greater number of wells are strongly impregnated with muriate of soda and carbonate of lime; but in immediate proximity to these springs one of pure and excellent water is often found, ascribed to the almost vertical strata through which they rise. 107. Until recently the entire European force were accommodated in barracks within the fort; now the artillery alone occupy these, commodious and admirably constructed buildings having been erected on a high and dry plain for the European regiment. It is in contemplation to furnish the artillery with similar accommodation outside the fort,* and also to provide separate quarters for the married men, a measure which is very much needed. On the south side of the fort, about 100 yards from the ramparts, is a tank, which, when full, covers a circumference of about three miles; but from its extreme shallowness the water speedily subsides, and in its half-dried state noxious exhalations issue from it. The exposed bed of the tank is the place of resort for the natives for purposes of nature, and it also receives the refuse drainage from the bazaars. Add to this, some of the supply channels of the tank are overgrown with prickly pear, which conceals filth of every sort. Public latrines and other measures to secure a proper system of conservancy are much wanted at this locality. Cholera may be said to be endemic throughout the Bellary district, and when the malady visits the cantonment it is always found to begin and to end about this place. 108. The hospital now in course of erection for the sick of the European infantry is a magnificent building of two stories. It is calculated to accommodate 140 sick, besides women and children. In the construction of the building I fear that too much regard has been bestowed on appearances, and too little attention paid to the future comfort of the sick. My objections are— 1st. That, if carried out as explained to me by the Engineer officer in charge (who was directed not to swerve from the plan furnished to him), there will not be one spot in the entire building where the sick men can escape a current, for the only ingress for air is by the doors, and as there is no egress provided for the foul atmosphere generated within, save by these doors, some of them must remain open night as well as day.† 2nd. That much space is sacrificed in the inner apartments, by the introduction of spacious open arches in the wall separating this part of the building from the verandah beyond, and that the plan proposed of placing four beds around the circular pillars supporting the roof in the centre of the wards would be injurious to patients under the influence of sudorifics, or suffering from visceral disease, &c., from the constant current to which they would be exposed. In short, the great objections are, that while there is ample space and free admission of air, the means are wanting to guard against currents without checking the supply, and of providing for the ready escape of impure atmosphere generated within the building. 109. From 1842 to 1858, embracing a period of 16 years, the sickness and mortality from the under-mentioned diseases, in an aggregate strength of 10,969 Europeans who served within this division of the army, was as follows :—

Cholera.		Fevers.		Liver.		Diarrhœa.		Dysentery.		Thoracic.		Rheumatism.		Venereal.	
A.	D.	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.	A.	D.

XLVIII. Kurnool.	110. This military cantonment is garrisoned by a regiment of native infantry. The civil establishments of the districts are also located here. The force is chiefly quartered in a deserted fort built on a narrow tongue of land, which separates the confluence of the rivers Hindree and Toomboodra. The station is 900 feet above the sea, and the surface soil is a dark superficial mould, 10 to 20 inches in depth, lying on limestone and trap. As regards sanitary considerations, no position could be worse than the present for the habitation of man. The population of the city may be reckoned at 23,000, all being massed together in a contracted space within the fort, part of which is actually beneath the bed of the adjoining rivers. The officers of the force occupy houses constructed over the bastions of the fort, beneath and around whom, on every side, are the dense population, amongst whom fever, ophthalmia, small-pox, syphilis of a most malignant type, and sporadic cholera are always present; when the latter disease bursts, as it were, from its trammels, it works fearful destruction. The last outbreak (May and June 1859) carried off four Europeans out of the small community, 41 out of the regiment, and 2,000 out of the town. From the peculiarity of the soil above described, the interment of the dead is a very unsatisfactory operation; and the odour proceeding from the cemetery on such occasions is dreadful.‡ The European community have always graves prepared beforehand, ready to receive the first unfortunate victim to the disease which hovers around them. Beyond the immediate confines of this locality there are several positions, in a sanitary point of view free from objection, to which the military garrison might be transferred; especially one, north-east of the town, an elevated ridge of red soil, which his Excellency the Commander-in-Chief selected for the military cantonment.
XLIX. Cuddapah.	111. Has long maintained a bad reputation for salubrity. Hitherto it has been garrisoned by a regiment of native infantry; it is also the head-quarters of the civil establishments of the district. It is placed quite in a cup-like hollow, surrounded by mountains of moderate elevation. There is usually a still oppressive atmosphere within, and the heat is increased by radiation from the neighbouring hills. All this exercises an injurious influence on the

* Barracks for the artillery and married quarters, in the immediate neighbourhood of the European infantry barracks, have been sanctioned, but they are not likely to be completed for years yet from lack of funds.—P. G.

† The plan of the hospital was furnished from Calcutta, with strict injunctions not to deviate from it.—P. G.

‡ I have frequently recommended that Kurnool should be abandoned as a military station.—P. G.

Stations.	Replies.
XLIX. Cuddapah—*cont.*	health of Europeans and natives. Fevers of a severe type are common, and recurring attacks frequent; and cholera is usually an annual visitant. The station is now abandoned as a military cantonment, it being garrisoned by a body of policemen.

112. I have now completed a short description of each civil and military station within the Madras Presidency, and I hope I may be pardoned for the occasional mention I have made of the name of his Excellency the Commander-in-Chief in these observations. Throughout a long and interesting tour made in company with him, his Excellency conferred freely with me on all points having reference to the health and well-being of the troops, and gave me constant opportunities of stating my views on such subjects with freedom. For this I am grateful, both on public and private grounds; and I here record my opinion, that occasional tours of this description on the part of the chief military authority, attended by a competent sanitary adviser, cannot fail greatly to advance the important ends which it is the business of Her Majesty's Sanitary Commissioners to promote.

MOUNTAIN AND SEA-COAST SANITARIA.

Observations on Mountain and Sea-coast Stations and Sanitaria for European Troops. The beneficial Effects of Change to the European Soldier in Health, or in Convalescence from Sickness. Localities suitable for Hill Stations, and Sanitaria within the Madras Presidency.

113. In the following remarks I propose to describe the special peculiarities and characteristic qualities which, in varying degrees, are common to all climates on mountain ranges, and on sea-coast sanitaria; their physiological and therapeutical effects on the animal frame; the general principles which should regulate their practical application to the prevention or treatment of disease, and the precautions necessary to be observed by those who resort to them.

114. With the view to obtain information on the comparative advantages and the physical characters of mountain ranges in general, and their respective merits as residences for Europeans in India, I have, in the course of my professional tours, availed myself of every opportunity personally to inspect the several localities about to be described, and also such other places as came within my reach, both in my own and in the other Presidencies. I may further state, that for many years past I have devoted much consideration to the important subject I am now about to enter on; and I solicit the indulgence of the Royal Commissioners if they consider that I have entered too much into detail on a matter which continues to engage much of my thoughts.

115. 1st. *Physical Characters of Hill Climates.*—If we examine the question of temperature of the hill climates in India the result is very satisfactory, both as regards their coolness and equability. Their mean annual out-door temperature in the shade varies according to elevation from 45° to 75° of Fahrenheit. Their mean daily variation in the 24 hours ranges from 10° to 20° in the open air, while within doors it hardly exceeds half this amount. Their distribution of temperature throughout the year are equally removed from excessive heat or rigorous cold; and they thus secure to us a temperate climate, congenial to the feelings and conducive to health.

116. The following table exhibits the mean temperature of each month, the average fall of rain, and the altitude of the mountain ranges already occupied or brought to notice in India:—

	Names of Hill Stations.		Mean Temperature outside in Shade.											Ascertained greatest Elevation.	Average Fall of Rain in Inches.

The mean annual temperature of the south-west of France is 58°·2.
Ditto ditto south-east of France 58°·8.
Ditto ditto Italy - - 59°·6.
Ditto ditto Cape of Good Hope - 63°·5.
Ditto ditto Madeira - - 64°·5.
Ditto ditto Mediterranean - 67°·5.
And the computed mean temperature of the globe is - 67°·

Stations.	Replies.
Mountain and Sea-coast Sanitaria—*cont.*	Thus it will be observed that within the range of climate indicated in the above table is to be found the estimated mean temperature of the globe, as well as the mean annual heat of the most temperate and healthy climates both in the northern and southern hemispheres.
	117. There is an unequal amount of atmospheric humidity on most hill ranges. On the occupied spots of the Neilgherry plateau, during the rains, there are fogs and occasional heavy falls of rain. At Darjeeling the rains are almost unabated, and the damp excessive. So at Mahableshwur, there the constant down-pours and excessive dampness render these hills uninhabitable for several months every year. During the dry months, on inland hill stations, the rapid cutaneous evaporation, produced by the rarified atmosphere, conveys unpleasant sensations unless brisk exercise be taken; but on elevated ranges, within the influence of the sea breeze, an agreeable softness is communicated to the atmosphere, which being thus equalized, the unpleasant dryness is no longer perceived. This is very perceptible on the Pulney range, which is fully within reach of the sea breeze, both from the Cochin and Tutacorin coasts.
	118. The most important character of a hill climate is the great rarity and lightness of the air, caused by a reduction of the superincumbent pressure, which secures the advantages of a cooler and more elastic, a thinner and more agitated, a purer and more bracing atmosphere than that of the plain below. Thus malaria is rarely met with on these elevated situations, unless generated by defective conservancy on the plateaus of the hills themselves. The thermometer falls one degree for every 200 feet of elevation; the range of temperature attains its minimum at an altitude of between 3,500 and 5,000 feet, and increases at inferior as well as superior situations.
Physiological Effects of Hill Climates.	119. 2nd. I would class mountain climates within the tropics under three distinct heads: *a.* The tonic and soothing, to embrace all elevations below 5,500 feet above sea level. *b.* The tonic and invigorating, to include all ranges from 3,500 to 6,000 feet above the sea. And, *c.* The tonic and exciting, embracing all elevations exceeding 6,000 feet above the marine level. It is a popular belief that the temperature under direct exposure to the sun's rays increases with elevation, but my observations do not enable me to corroborate this.
	120. The action of a hill climate on the European constitution is two-fold; one, the effect of atmospheric temperature, the other, the result of atmospheric pressure. The first effects experienced on a transition from the low country to a hill station by a healthy person, or by an invalid whose system has become debilitated or relaxed by climate, is an increase of appetite, an improvement in the digestive and assimilative functions, an increase of muscular vigor and mental energy. These are the usual invigorating results of a change from a high to a reduced temperature—from a low to an elevated altitude; but in rare instances a great degree of excited action is produced on the vascular system, which in certain conditions, according to circumstances, either aids the tonic influence of the climate, or produces undue vascular excitement, and may derange the balance of the circulation, and induce local plethora. But by proper precautions the system in due time harmonizes with the climate, and these unpleasant effects pass off.
Therapeutical Effects of Hill Climates.	121. 3rd. As an auxiliary agent in the treatment of particular diseases, the hill climates of India exercise a powerful effect. They are of acknowledged value in all functional diseases, as, *a.* Intermittent fevers. *b.* Convalescence from remittent fevers. *c.* Functional disorders of the digestive organs. *d.* Constitutional debility, the result of natural delicacy of constitution or tedious convalescence. *e.* Diarrhœa, dependent on a cachectic or strumous diathesis, unconnected with organic lesion of the intestinal tissues. *f.* Functional hepatic affections, characterized by a torpid action of the secretory function of the liver, or by an irregular or disordered biliary secretion. This class of disorders, which are aggravated by hot seasons in the plains, will, under proper precautions as regards clothing, food, exercise, &c., result in a cool hill station in warding off the exacerbation which would otherwise have been experienced below, and tend to a permanent improvement in the general health. *g.* Incipient phthisis. Although a tropical mountain climate is contra-indicated in the latter stages of pulmonary phthisis, the fact is indisputably established, that it is productive of marked benefit in the incipient stages of the disease, more especially during the hot months. According to Dr. Lombard, the disease is "very frequent" at elevations varying from 1,600 to 1,700 feet above sea level. It is "exceedingly rare" at the height of between 4,000 and 5,000 feet, and "entirely disappears" at an elevation of between 6,000 and 7,000 feet. *h.* Strumous and cachectic affections, especially applicable in cases of young persons of delicate constitution who are born and reared in India, and to those who come to India before their growth has been completed or their constitutions matured. *i.* Nervous and periodical headaches, unconnected with general or cerebral plethora, with organic disease or rheumatic diathesis. *k.* Diseases of infancy and childhood. There are few diseases incidental to childhood in India that do not derive benefit from a residence in a hill climate.
	122. The diseases in which a tropical hill climate are inapplicable or injurious are organic visceral affections, the result of non-inflammatory alteration of structure, or of pre-existing inflammation, whether seated in the brain, heart, lungs, liver, or spleen. A residence on the sea coast, or at salubrious localities within the softening and refreshing influence of the sea breeze, a sea voyage, or an extra-tropical climate, constitute the only safe and efficient remedy for this numerous and important class of visceral diseases which affect the European soldier in India to a large extent. For such persons a rapid change to the coast is especially desirable. It is attended with striking benefit, and should always be had recourse to. When convalescence has been thoroughly established, a change to hill stations, such as the Pulneys, which are fully under the influence of the sea breeze, would have a marked beneficial effect in restoring them again to health.

Stations.	Replies.
Mountain and Sea-coast Sanitaria—*cont.* *Precautions to be observed at Hill Stations.*	123. 4th. Vascular excitement and visceral plethora are experienced by all, more or less, on first attaining an elevated mountain range. This, exerted on a system already excited on first arrival, aided by an increased appetite, renders necessary the adoption of precautions, principally in reference to clothing, exposure, diet, and exercise, in order to counteract any injurious influence that might arise from a climate differing so materially in its constitution from that to which the individual had been habituated. This is themore necessary when the climate is resorted to simply as an auxiliary agent to aid the operation of other remedies in the cure of disease. Vigorous and robust individuals can scarcely use too much or too active exercise. But the invalid whose constitutional energies are below the healthy standard must be careful not to induce undue excitement or fatigue, and always bear in mind that however cool and agreeable the temperature may be, they are still under the influence of a vertical sun, and surrounded by an atmosphere whose rarity admits of more free and unobstructed passage to the solar rays. Clothing suitable to the climate should always be kept in store on hill stations resorted to by troops, to be issued to them on arrival, and deposited in store for the use of the relieving force when they descend into the plains. I have observed convalescents sent to the hills for the benefit of their health, going about in white cotton costume, when the temperature was so low that a woollen dress was barely sufficient to retain the animal heat of the frame without brisk exercise.
Acclimatization of European Troops and Prophylactic Effects of Hill Climates.	124. 5th. There is no climate in the habitable world which is not open to some valid objection, yet in the choice of a residence, with the view to prevent or to mitigate disease, there are governing principles to guide and direct us, viz., the constitution of the individual, and the nature of the malady he labours under. 125. Sir Patrick Grant, in a Minute to Government on the subject of establishing convalescent depôts on hill ranges for European soldiers, states that a searching investigation in the Bengal Presidency, by a committee of highly experienced medical and military officers, established the fact that the ratio of mortality amongst them was fully 50 per cent. less on the hills than it had been in the plains. That very experienced officer, Sir Mark Cubbon, Commissioner of Mysore, who has much personal knowledge of the climates of India, fully concurs with me in the superior advantages of hill stations as a prophylactic remedy; and, further, I have his authority for stating that a general belief prevails amongst all classes of natives of India, that until our European soldiers are in military occupation of our chief mountain ranges, our possession of the country is not secure. 126. Let us now inquire, in how far can hill climates be made generally useful as auxiliary agents for the preservation of health and for the prevention of disease. 127. In deciding upon the proper stations for European troops in India, there are two material points for consideration which may be sometimes opposed to each other, but which it is necessary as far as possible to reconcile, namely, the military, or strategical, and the sanitary. That they are sometimes antagonistic arises from the fact that there are many places upon the plains which it is necessary to hold, at the same time that the climate there is injurious to the health of Europeans. The question to be decided, then, is, how far can we take advantage of the healthy hill ranges existing in various districts, upon which to concentrate our Europeans, without weakening our military provisions? and this in a great degree depends upon the geographical position of the hills, and upon the means of rapid communication into the plains. 128. Before entering into this question, there is one erroneous idea which appears to be entertained by many persons, which it is necessary to dispose of. It is the notion that troops which are quartered in the plains gradually get accustomed to the heat, in fact, become acclimatized, and that therefore the hill stations need only be had recourse to as sanitaria, for places of recovery for sick and delicate soldiers. With regard to the supposed acclimatization, it is to be feared there is little in it. Doubtless many soldiers who come to this country young have acquired prudence by experience, and as their constitutions gain strength by maturity present, as a body, a fine, soldierlike, healthy, appearance. Acclimatization does a little, perhaps, in that way; but in looking at a regiment which has gone through the ordeal of a long residence in the plains, we must, in order to form a right conclusion, ascertain how many of the young, the delicate, the unformed, and possibly reckless youths that were in the ranks, have disappeared, either by death or invaliding. The men we see may be strong, but they are but exceptions; a few hundreds, perhaps, remaining out of thousands, who in a few years have been taken away. But our argument will go much further. There is very good reason for supposing that these very men who look so strong, and who are supposed to be accustomed to the climate, do not and cannot bear the heat as well as a regiment of the same age, and whose other conditions are the same, except that they have not been in a tropical climate. 129. It is of great importance to ascertain this latter fact, because if the supposed acclimatization is a fallacy, if the regiments who are quartered in the plains begin to weaken and to deteriorate in physical condition day by day, gradually but surely, from the beginning, it forms a very strong argument in favour of the necessity of concentrating our European forces, to the extreme limits of military safety, upon the healthy hill ranges; and even if the hill stations have to be established at some distance from the main roads and communications of the country, it would be well worth while for Government to go to some expense in bringing them into contact by branch roads or railways, so as to enable the Europeans to live in a genial climate, with the power of moving at once to any threatened points of disturbance. If every soldier landed in India cost 100*l.*, it is not difficult to perceive that it is good policy to keep him alive, independent of considerations of humanity. The pecuniary saving to the state would speedily repay the expense of a railway to the foot of the hills. 130. On the subject of acclimation, Sir Ranald Martin, F.R.S., gave evidence before the Royal Commission for the Re-organization of the Army as follows:—"The whole range of service in the plains of India is to the British soldier one unbroken course of physical degradation." * * * "A few years of residence in the hot and pestilential plains of India being of itself sufficient to spoil the blood and tissues of the European." Speaking of the necessity of removing the European troops to the mountain ranges, he says:—"It is impossible to overrate the importance of this measure, whether we regard the health and efficiency of the British army in India, its power to garrison and maintain the empire, or the capability of England, by voluntary enlistment, to fill up the muster rolls." He adds, "The eventual saving would be enormous." In answer to another question, he

STATIONS.	REPLIES.
Mountain and Sea-coast Sanitaria—*cont.*	says :—"That the ratio of mortality increases in proportion to the length of residence in India, steadily and certainly." Again he says, "That all the formidable diseases of India are essentially diseases of the plains." Sir Alexander Tulloch produces returns to the Royal Commission to prove that the ratio of mortality steadily and rapidly increases with the age of the men, year by year, in India. In Madras he says the soldiers die annually at the rate of— 26 per 1,000 between 18 and 25 years of age. 59 per 1,000 „ 25 and 33 „ 70 per 1,000 „ 33 and 40 „ 86 per 1,000 „ 40 and 50 „
	131. Again, if young Europeans of delicate constitution who come to India as recruits, at the early age of between 16 and 18, before their growth has been completed, or their constitutions matured, be sent to a station in the plains within the first or second year of their arrival, while they are growing rapidly, they become pale, sickly, and emaciated, they are liable to a variety and succession of ailments which though individually of little severity, tend, by their combination and succession, seriously to impair the constitution and lay the seeds for future disease. Let such persons repair to a mountain station for two years, their constitution will then become matured and consolidated, and sufficiently seasoned to undertake a much larger amount of fatigue duty on the plains than it would otherwise have been.
Hill Stations suitable for European Troops contiguous to the chief Military Posts.	132. 6th. It being, then, an established fact that in point of health a residence on mountain ranges is highly desirable for European soldiers, let us now endeavour to ascertain how far this principle can be practically adopted in the Madras Presidency.
	133. As a general rule, the whole of the lower part of the peninsula held by the Madras army, south of the Kistnah and the Toomboodra, is in a complete state of subjection. There may be races of men in some parts of a turbulent character, but there is not one district whose inhabitants have military organization or means of aggression, and who, therefore, require the constant display of any large controlling force in the plains.
	134. With regard to disposition of the forces generally, we find that the Commander-in-Chief, Sir Patrick Grant, has over and over again recommended the withdrawal of the numerous small detachments hitherto scattered about the country, and their concentration at a few central points. Economy, efficiency, and discipline would all be promoted by such a plan. The Military Finance Commissioners, in their report just printed, strongly advocate the same on economical grounds. Medical men would only urge, in addition, that the concentration be effected upon healthy localities.
	135. The principal stations for European troops in the plains of this Presidency are Madras, Trichinopoly, Cannanore, Bellary, Vizagapatam, Secunderabad, and Nagpore. Contiguous to all of these, except Secunderabad, are easily accessible healthy hill ranges which secure a genial climate at all seasons to the European soldier. It would almost appear that an overruling Providence had specially provided the means of imparting vigor to the constitutions of the people of our nation, hitherto so highly favoured by Him, who are destined, we hope, to introduce a higher civilization into this land.
I. THE SHEVAROY HILLS.	136. *Madras*, as the capital and seat of Government, containing also an arsenal and manufactories for the material of war, will always require a certain proportion of Europeans as a garrison. If good barracks close to the sea were provided for this force, there seems no reason, when railways and other communications are completed, why the head-quarters of artillery and the depôt of Queen's troops at present stationed on those hot plains should not be moved altogether to a cooler climate, as Bangalore.
	137. The Shevaroy Hills are now skirted by the railway which passes across the continent. Troops leaving Madras by rail at 4 p.m. would be able to breakfast at an elevation of nearly 5,000 feet above the sea the following morning. These hills form one boundary of the Salem valley, their greatest altitude is 5,200 feet above the sea, that of Yercand the position on which the European community have erected their residencies is 4,500. Here the surface is broken, rocky, and jungly, and it has been subject to occasional severe visitations of fever, either from inattention to sanitary requirements or to the failure of the regular monsoon. But these visitations are of rare occurrence, the type of the fever is as much under control as that which is usually found to prevail all over our plains, and deaths are rare. The present situation I assert is not well chosen, and no troops should be placed there. The position for a military cantonment ought to be the "Green Hills," five miles west from Yercand. Here the villagers appear to be in the most robust health; the ground is regularly cultivated; there is an abundant supply of good water throughout the year, there is a beautiful plateau of about 200 acres of undulating grass land, and the jungle has entirely disappeared long before this position has been reached. Indeed it is hardly possible to meet with a more desirable site for a military cantonment, having also abundant space in the neighbourhood for a parade.
	138. Nothing can be more delightful to the feelings than the climate throughout the year. But from the property acquired by the residents on their ill-chosen position, they cling to the locality rather than abandon it to take up their residence on a more salubrious site. There are now 104 Europeans and East Indians (54 adults and 50 children) resident on these hills; some of these have not been on the plains for years, and the family of a missionary has been almost constantly on them for 18 years. One cannot but be struck with the healthy rosy complexion of the European ladies and children residing on these hills, to whose constitution the climate is peculiarly adapted.
	139. It would be of infinite advantage to the anæmic European soldier stationed at Madras and its neighbourhood, if military considerations would admit of a portion of them being always located on the summit of these mountains, so as to permit an interchange of a portion of the force from the plains to the hills, and *vice versâ*, at certain periods, irrespective of health or sickness. The experiment as regards these hills, which are certainly subject to fever on the lower elevations, might in the first instance be tried on a small scale. Their proximity to Madras makes them valuable, and it is not probable that fever exists *per se* at an elevation approaching to 5,000 feet on grass hills devoid of jungle.
	140. Ten per cent. is the usual sick in European regiments garrisoning Fort Saint George, and the majority of these come into hospital from fever. People have been accustomed to this

Inspect.-Gen. Macpherson's Report. Madras.	Stations.	Replies.
	I. The Shevaroy Hills—*cont.*	state of matters so long, that it ceases to excite surprise. But if the natural remedy of restoring to an elevated range with the view to vivify the anæmic and bloodless soldier and render him less liable to disease be proposed, there are not wanting men of sound judgment who join in the cry to condemn the locality, because of an occasional outburst of fever, forgetting altogether that the soldier is far more liable to fever and its concomitants and a host of other disorders besides at the station he is garrisoning. That in the one case he is equal to any emergency, and up to any amount of fatigue, but in the other he is so enfeebled by climate, so prone to imbibe disease, that he speedily breaks down on his first march from exposure, or succumbs to his first attack of illness.
		141. In attendance on the Right Honourable Lord Harris I visited the Shevaroy Hills, when his Lordship drew up the following Minute, dated Salem, 12th July 1858. "I have now had the opportunity of visiting the locality on the Shevaroy Hills mentioned in my Minute of the 29th ultimo, and pointed out by Dr. Macpherson as a suitable site for the depôts of Her Majesty's and the Honourable Company's European recruits. "I have no hesitation in giving a favourable opinion of the place, so far as to recommend that the subject be taken into immediate consideration by Government. "The advantages of the position are numerous, 1st, it is within easy access from Madras. Troops might be landed there in the afternoon, and travelling through the night, could be brought to the cantonment by 8 or 9 o'clock next morning. "2. The ground appears well adapted for the purpose, and a considerable space could be obtained without difficulty. "Dr. Macpherson mentions 100 acres, but 200 or 300 could, I should think, be procured. "3. The climate is very agreeable, and the temperature particularly equable, a great desideratum for persons just arrived in the tropics. During the four days of my residence, 8th, 9th, 10th, and 11th, the thermometer did not range in the house above 71°. "4. The water is good and abundant. "5. The soil, subsoil, and underlying rock, specimens of which were procured for me, were considered satisfactory. "6. The height above the sea about 4,600 feet. "But all these points require to be more fully weighed, inasmuch as the climate the Shevaroys has obtained some degree of disrepute. "There is no doubt that the inhabitants, European and natives, were attacked by a very severe fever in the years 1824 and 1854, and I have heard it stated that slight attacks of a similar kind, but much slighter in degree, were experienced in 1834 and 1844, and were it probable that a recurrence of such a malady were to be anticipated, serious doubts might fairly be entertained of the advisability of making any attempt of the nature proposed. "I cannot, however, think that there is any serious objection in this case, maladies of one sort or another will periodically appear in all situations, but they may generally be greatly modified, if not altogether prevented by precautionary measures. "I cannot but think that the Shevaroy Hills would prove most beneficial for a depôt for the families of European regiments on service. "The children of the residents at Yercand enjoy perfect health, and their general appearance, bright colour, and vigorous bodies, lead to a most favorable impression of the climate. "It might be advisable to make a trial in the first instance on a small scale without going to any great expense, but on such a plan as could be enlarged on at pleasure."
		142. In the month of February succeeding, his Excellency the Commander-in-Chief to whom my report on the hills and the Minute above quoted were referred, replied to Government through the channel of the Quartermaster-General as follows:—"I am directed by his Excellency to refer to my letter of 2nd September last, in the latter part of which Sir Patrick Grant recommends that a trial may be given to the Shevaroys as a station for invalids and time-expired men ordered for Europe, and for the families of corps absent on foreign service, a course his Excellency is still of opinion may be adopted."
		143. The railway is about to be opened to the foot of these hills. Ere long, therefore, this delightful locality will be brought within nine hours of Madras, so that the recruit on his arrival from England may land at the railway terminus in the afternoon and breakfast on the hills the following morning. The arrangement which at present obtains is to transport both him and the invalid whose constitution has been shattered on the plains, or from wounds or hard service, to Poonamallee or to Arcot, two of our most enervating stations in the Carnatic, and having the worst barracks in the Presidency. (Vide marginal note by his Excellency the Commander-in-Chief, paragraph 37).
	II. The Pulney Hills. *Topography.*	144. *Trichinopoly*, as has been shown, is the head-quarters of the southern division of the army, and has a considerable European garrison, for whom new barracks are required. It is about the hottest and most debilitating climate in Southern India. The Pulney Hills range from 10° 10′ to 10° 44′ lat., and 76° 21′ to 77° 22′ long., and are under 100 miles from Trichinopoly. The superficial area of the hills is calculated at 800 square miles, their length from east to west is 64 miles, their medium breadth 15 miles, and the elevation of the plateau varies from 6,000 to 7,000 feet above the surrounding plains, and they are 6,000 to 8,000 feet above the sea.
		145. The hills are divided into two distinct portions, the Mel or Western, and the Kel or Eastern ranges. The greatest elevation of table land is towards the west, and it drops in distinct plateaus eastwards at intervals of 1,500, 1,000, and 500 feet, until the plains are reached.
		146. The summit is free from jungle and forest, the surface being clothed with rich grass. The spurs which run down from the summit to the base are intersected with deep ravines and dense luxuriant forests, and amidst the undulating surface of the mountain are rich and fertile valleys, intersected by numerous streams of various magnitude, all picturesquely contrasting with the bare and rugged heights, broken ridges, and magnificent bare walls of rock which surround them, presenting a view in the highest degree sublime.

Stations.	Replies.
II. The Pulney Hills—*cont.* *Rivers.*	147. There are upwards of 30 large streams on these hills, which uniting form 11 respectable rivers. From the summit of the higher peaks ascending above the plateau these rivers are seen meandering through dense sholas down deep ravines, falling over precipices in beautiful cascades, and finally passing down to irrigate the rich districts of Madura and Dindigul.
Villages and Inhabitants.	148. Several villages are scattered over the surface. The houses are irregular clusters, built of mud and wattle, and thatched. All are provided with fire places and sheds for cattle. The slopes in the vicinity of the village are formed into well irrigated and richly cultivated terraces. The adult inhabitants are a well formed and healthy looking race, and the children are vigorous and show no symptoms of spleen affections.
Geological Formation.	149. Gneiss, over which is generally found a stratum of clay overlapped by a thick covering of rich vegetable mould. On the summit and slopes the soil is shallow, but in the valleys it sinks to a greater depth, and in some parts a ferruginous and calcareous kunkur predominates.
Climate and Monsoons.	150. Four circumstances naturally affect the climate of these hills. 1st. Their elevation. 2nd. Their isolated position. 3rd. Their situation between the east and west coasts of the peninsula. 4th. Their position near the line of demarcation of the two monsoons, which make an annual tour, almost as regular as clock-work, over the peninsula of India as follows:—
	151. To commence, say from the eastern coast, they blow direct from the east about the end of February and beginning of March, then from south-east, gradually going south until by the middle of April, they blow from south, veering round towards the west; these winds bring up moisture from over the Indian Ocean, and rain falls on the highlands of Ceylon, and extend usually over the southern parts of the peninsula. Towards the end of May the winds blow from the south-west and west, bringing up large banks of clouds towards the western coast, which in the end of that month and beginning of June, burst on the coast; the highlands of the Ghauts receiving the great bulk of the fall.
	152. The rain falls heaviest at the western end of the Neilgherries, on the "Koondas," which are the highest parts of the line of Ghauts and in Coorg. On the coast it is lighter towards the south, increasing opposite the Neilgherry range to about 120 inches, which is the average fall at Calicut, and continues about the same up to Mangalore, opposite the highest parts of Coorg, where 180 inches fall, after which it decreases, and at Bombay the fall of rain is not more than about 80 inches. It goes on decreasing as it passes into Guzerat until it is lost altogether, there being no monsoon in Sinde. The rain passes inland from the western coast over the Mysore and the Deccan, and goes northward and eastward. In September and beginning of October, the winds veer round to north and north-east, and then occurs our north-east monsoon with its accompanying rains.
	153. The south-west monsoon sets in and prevails in Pegu at the same time as on the western coast, and the fall of rain diminishes as it goes inland north and east, just as it does on this peninsula.
	154. It will appear from this, that the Neilgherries on their western side receive very heavy rain, which extends as far as Ootacamund, whereas the hills to the south-east of the Neilgherries, such as the Pulneys, which are so much more inland, receive a lighter fall, at the same time that they share in the earlier rains of April, and again in the latter rains of the north-east monsoon, thereby giving them more the character of the climate of Kandy and Newera Ellia, and a greater freshness throughout the year, and in a measure a freedom from the aridity which prevails on the Neilgherries for three or four months.
Seasons.	155. The year is divided into two seasons, the cold similar to the autumn of the south of France, sets in in December and terminates in March, the remaining months resemble a mild autumn in the south of England.
	156. January is uniformly fair, clear, and dry. The nights are very cold, and attended with frost in the valleys. The same remark will apply to February, except that frost is stronger, and in March it disappears, when the weather becomes milder, and there are a few heavy showers. Towards the close of April, the wind begins to vary from north-east, and finally settles in the south-west, when the air becomes mild and balmy. May is the warmest month, but the heat is often relieved by the fall of rain in torrents, intermingled with hail, ushering in the south-west monsoon which occurs in the early part of June, and continues with greater or less constancy throughout July and August, when the weather on the lower hills is comparatively dry and fine. September and October are uncertain months, depending on the state of the south-west monsoon which, if begun early and exhausted, renders the weather fine, warm, and pleasant, but if deficient in previous rain, a good deal of mist and drizzle generally prevails. Towards the end of September the wind again begins to shift round to the north, when the weather becomes suddenly colder; mists and fogs are common throughout the year; some gales of wind occur once or twice a year, generally about the changes of season, but thunder and storms are of rare occurrence. The changes of temperature are sudden.
Salubrity.	157. The upper ranges are decidedly salubrious, in the lower the climate is hostile, and then from March till August malarious remittent fevers prevail. But it were difficult to find a climate more congenial to the feelings, more calculated to preserve health, or to restore the invalid, than this elevated area affords. Hardly a day passes without a refreshing sea breeze from either coast, rarified and rendered bracing by the altitude of the position, admirably adapting it to the unimpaired European constitution, and to the valetudinarian. I believe it calculated to promote recovery in all save the exceptional cases detailed in a former chapter. Vide paras. 121, 122.
	158. In support of my own views of the salubrity of the upper ranges of the Pulney Hills, I will now quote an extract from a communication from the Collector of the district, a resident there for several years, in reply to some observations made by the Director, now Principal Inspector-General, on my public report to him for the information of Government. "I conceive the remarks by the Director-General in regard to the salubrity of the upper ranges of the Pulneys wholly opposed to most clearly established facts. Mrs. Clarke and my family resided on these hills from July 1851 to January 1856, when they went to

II.
The Pulney Hills—*cont.*

England for the benefit of education. Mrs. Clarke and the greater part of the children never left the hills from the day they ascended there in 1851, till they came down in 1854, they enjoyed most excellent health and no doctor was ever called in to see them, Mrs. Clarke curing all their ailments; in fact, they enjoyed better health on the Pulneys than they did in England, where I afterwards lost two of diphtheria.

"All who resort to these hills generally go up at the end of February, and remain till the end of October, when Madura (the head-quarters of the district) is bearable. Mr. Hodgson went up with fever in February, and benefited greatly while there. One Sunday in May he had a congregation of 50 including the American missionaries and their families.

"I consider that the Pulneys should be the location of European troops stationed in the southern division. With rail, as is proposed, from the foot to Madura, and thence to Tutecorin on the south, and Trichinopoly on the north, and from Trichinopoly to Negapatam on the east, and to the junction of the Great Western Railway on the west, we could throw a fine healthy active body of English troops into every part of the south where they might be required. They could get down in six hours, and the rail would take them to any part of the division in 12 more."

159. Before it be finally decided to erect barracks for 1000 European soldiers at Trichinopoly, the extremity of the division, I would urge the consideration of the advantages of quartering at any rate, a portion of the force upon those mountains, which are situated near its centre, by which means military and sanitary conditions would be reconciled and probably equal influence would be exerted over the surrounding country. I am confident that any additional expense incurred would be fully counterbalanced by the favourable results which a well-directed system of interchange from the plains to the higher altitudes would produce upon the health of the men. I beg to refer the Royal Commission to Sir Charles Trevelyan's Minute on Madura, dated 8th February 1860, wherein he gives a glowing description of his visit to the hills which form the subject of this article.

III.
The Neilgherry Mountains.

160. The topography and physical character of this well known elevated range of mountains has been so frequently described, and the salubrity of these vast plateaus, which combines, with the advantages of a hill station, those of easy access and a sea voyage, is so well established, that it will be unnecessary for me to dwell on the subject at any length.

161. The Table at paragraph 116 gives the elevation and average temperature of the civil and military stations on these hills; Wellington being the only military cantonment. Here palatial barracks have been constructed for a complete regiment of European infantry at an enormous cost. This is a great mistake, first, because the climate is alone sufficient to ensure good health in an ordinary dwelling-house; and second, because although the Government may be disposed to adopt the plan of hill stations, an extravagant estimate of expenses to be incurred is apt to postpone or prevent the attempt.

162. I am quite of opinion with Sir Ranald Martin, who in his evidence before alluded to, states, "that provided the site be of sufficient elevation, well cleared, drained, and levelled, with a good water supply, the building material need not be of a costly character." Well-constructed huts of wood planking, raised on pillars two feet high, with deep verandas all round, and having space sufficient for 10 or 12 men, would be abundant protection. On the Penang Hill and on the high lands in Java, where the rain is more incessant than on our hills, houses are usually constructed of this material, and they are calculated to last for 15 to 25 years with ordinary repairs.

163. The station of Kotagherry on the Neilgherry Hills (6,100 feet above the sea) is considered the most salubrious on the plateau. Its climate is a happy medium between the other three stations of Ootacamund, Wellington, and Coonoor, and it is considered peculiarly favourable for convalescence from bowel disorders, dependent on functional derangements. Situated on a spur of the range, it overlooks and is easy of access with the plain below. The great trunk railway which crosses the peninsula from Madras to Beypoor, passes within a few miles of the foot of the hill, thus greatly facilitating the communication.

164. On this plateau I would recommend that barracks be erected for European convalescents resorting thither from Bombay, and from lower Bengal. In the former Presidency, there are no hill ranges of sufficient elevation to impart vigour to the convalescent, and even these are uninhabitable for many months every year, during the prevalence of the south-west monsoon. A couple of days would transport him from Bombay to Beypoor, the western terminus of the railway, and from thence to the foot of the Kotagherry pass, is but a few hours' journey.

South of the Ganges.	
In Bengal.	
Calcutta, 2 European Infantry Regiments, average strength	2000
Dum Dum, 1 do. do.	1100
Ditto 1 Company of Artillery	
Barrackpoor, do. do.	1100
Chinsura Depôt	1000
In Behar.	
Hazarbog, 1 European Infantry Regiment	1000
Deyree, do. do.	1000
Dinapore, 2 ditto and Artillery	2100
North of the Ganges.	
Buxar, 1 European Infantry Regiment	1000
Gazeepore, do. do	1000
Benares, 2 ditto and Artillery	2300
Allahabad, 3 do. do.	4000

165. In Lower Bengal, again, the large European force garrisoning the stations, as per margin, are unprovided with sanitaria; the fall of rain at Darjeeling, (10 to 12 feet per annum) the only mountain within moderate distance, renders it inapplicable for a convalescent depôt. Moreover, certain death would be the result of a march through the Terrai, a belt of jungle 50 to 60 miles in length, from Dinagepoor to the foot of the hills, between the months of June and December, which embraces the most trying season of the year. Invalids from all these stations would reach Calcutta, and be transported to Kotagherry with far greater facility and safety than to Darjeeling.

166. Thus, without the establishment of any means of transport beyond what already exists, the sick or wounded soldier may with facility be sent in the one case from Calcutta to Madras, and in the other from Bombay to Beypoor, thence in a few hours by rail without fatigue or delay, to a climate surpassing in salubrity any in the globe, where there is everything to exhilarate the mind and reinvigorate the drooping constitution, or if the nature of his malady be unsuited for a residence on an elevated locality, he can be landed, if from Bengal, at the "sea coast sanitarium" of Waltair, and if from Bombay, at that of "Sedashaghur," the description of which I reserve for a future occasion.

STATIONS.	REPLIES.
III. The Neilgherry Mountains —*cont.*	167. I append below an abstract for the current year of the annual returns of sick of Her Majesty's European regiments which have been received from out-stations up to this period. It will be observed, that although the regiment at Wellington has laboured under some disadvantages, consequent on want of space from the non-completion of the barracks, and the absence of other essential sanitary desiderata, which will ultimately be supplied, that their death-rate is lower than any other of the stations quoted.

168. During a service of 24½ years I have frequently had my attention called to the debilitating effects of the climate at Cannanore on the constitution of Europeans who have resided there for a series of years. The report of the surgeon 74th Highlanders for the past year, now before me, goes to substantiate my views on this point. He observes, "The remarks which I have before made relative to the debilitating, relaxing, and undermining effects of the climate of the western coast (where he was stationed with his regiment three years) have been but too fully and practically illustrated. The great majority of men and officers who served there for from three years and upwards, have either died, been invalided, or sent home sick. One of the great peculiarities of the climate seems to be, that while on the coast men like it, are not often sick, it is when they go to a drier climate that the mischief becomes apparent. I am strongly of opinion that, if possible, no regiment ought to remain on the western coast more than two years during the time of Indian service."

169. If strategetical considerations would admit of holding Malabar and Canara and the western portion of Mysore under control, by stationing a portion of the European force now at Cannanore on the Neilgherry hills, a salutary hygienic interchange of the allotment for this division of the army from the plains to that elevated plateau would be an important sanitary change on the present system of retaining the corps there for a series of years. The railway from the neighbourhood of Cannanore to the foot of these hills affords facilities for putting this plan into force in the space of a few hours' duration.

170. I beg to draw the attention of the Royal Commission to the large number of admissions from fever at Wellington on the Neilgherry plateau. The prevailing type being a low remittent or typhoid; a disease which is admitted to have its origin in a poison produced from refuse animal matter allowed to decompose and taint the air we breathe or the water we drink. In former days this malady was unknown on the hills; but, as before observed, it is now common to the plains also, arising I believe from the same cause.

171. I believe that much mischief is done by the want of proper attention to conservancy during the construction of public buildings, on which thousands of labourers are employed for a period of months and perhaps years, and that the absence of this is now in a great measure the cause of the zymotic affections, which are endemic at this station.

172. When on duty in September 1858 on the Neilgherries with Lord Harris, our late Governor (who eagerly adopted, and so far as his power lay, enforced the introduction of any well-arranged system of sanitary reform brought to his notice) I was compelled to bring to his Lordship's notice the imprudent neglect of prophylactic measures during the construction of these barracks, as follows:—

"The strictest attention is now required to sanitary matters, while so many labourers (3,000) are at work on the buildings, for nothing can be more noxious or offensive than the system at present in force. The cantonment and neighbourhood is tainted with fœcal atmosphere; go where you will, in the unfinished buildings, in court-yards, even in the well-finished rooms, human ordure is found. Already the result of this neglected conservancy is exhibited in low fevers amongst the European children and adults, and there is danger that the place may become so polluted as to establish a malarious atmospheric taint which may hereafter become an incidental source of disease. The coercive interference of Government is therefore required to preserve the character of the station for salubrity."

173. Although measures were forthwith adopted to correct the evils above described, I believe the seeds then sown are now producing baneful fruit. But I will reserve any further observations I have to offer on this head until I treat of barrack accommodation generally.

174. I cannot concur with those who argue against hill stations, because from their isolation and seclusion soldiers dislike them. True there are here greater facilities for separating the men from the debasing effects of drunkenness and low vice which they unfortunately indulge in in the plains. But in so enjoyable and temperate a climate, there can be found employment in abundance as labourers and artizans on public works, in making up their own appointments, in gardening, &c., &c., instead of being permitted, as is too frequently the case, to lie in bed sleeping and dozing all day long, a practice, the *ennui* of which I believe to be second only to the above-named morbific influences on the constitution of our troops.

Inspect.-Gen. Macpherson's Report.	Stations.	Replies.
Madras.	IV. Bangalore.	175. As a sanitarium, from its central position, its elevation 3,000 feet, and the salubrity of its climate, is one of the best and most important positions in the south of India, whether considered in a military or sanitary point of view. Sir Alexander Tulloch, in his evidence before the Reorganization Commission, says, that from returns extending over a number of years, it appears that troops located at Bangalore do not sustain a greater loss than 3 per cent. annually, and a considerable portion of even this number arises from disease contracted at other unfavourable stations. 176. The death-rate at Bangalore from 1842 to 1857 inclusive has only been 2·2 per cent. per annum, and I have every reason to believe, as superior accommodation is provided the soldier, that we have not yet attained our minimum in this respect. Vide Return 1859–60. Appendix C. 177. It would therefore seem advisable that the station should be considered the most important, and be the most numerously garrisoned of any in the country. It does not appear to have a single objection.
	V. Ramandroog Hill.	178. The only remaining station for European troops south of the Kistnah is Bellary, the head-quarters of the Ceded Districts. It is now 12 years since the solitary hill which forms the subject of this chapter was first occupied as a convalescent depôt; 12 years prior to then, when I first did duty at Bellary, a deadly fever was supposed to be the certain result of a visit to the locality. Times are now changed, and experience has taught us that the number and extent of our hill stations may be increased with the utmost advantage to the health and efficiency of all who resort thither. 179. Ramandroog is 38 miles distant from Bellary, and it is one of a broken series of hills denominated the Sundoor range, encircling a rich well watered valley of the same name. The entrance into this valley from Bellary is peculiarly picturesque. To the right and left an unbroken semicircle of mountains approach each other; at a distance they appear to unite in the centre of the arch, but as you approach you find them cleft to their base, and giving passage to a narrow winding mountain torrent, whose bare perpendicular rocky sides tower many hundred feet above you. 180. There is an easy ascent to the summit of the mountain, at its greatest elevation above the sea, viz., 3,400 feet, and 1825 above Bellary there is a cleared platform, one mile and a quarter in length, and about as much more of a like elevation connected to it by a tongue of land, but yet uncleared. The entire hill is hornblende, peculiarly rich in iron ore. Some detached pieces affect the magnet, and beneath the vegetable mould which ages have accumulated on the surface, lumps of pure metal crop out from masses of scoria. A disintegrated lateritious earth has accumulated on the surface of the hill, the decomposition of the hornblende. The extreme porousness of this mass gives immediate passage to surface moisture, so that no water is found until the underlying rock is reached, usually at a depth of about 500 feet from the plateau above, where there is a perennial supply. 181. The average temperature of the Droog somewhat resembles that of Bangalore; but the variation of the thermometer is less, and the climate is much more equable. Throughout the year the temperature is most agreeable to the feelings, imparting elasticity to the constitution, and inviting out-door exercise. From its solitary position, even in the hottest seasons, the air reaches it fresh, rarefied by elevation, not obstructed by high walls, not heated by passing over a large extent of table land, and not rendered impure by emanations from town filth, such as is too often the case at Bangalore. 182. Ramandroog is essentially a convalescent station. On the occasion of my visit I found in the depôt invalids from the Royal Artillery, H.M. 12th Lancers, H.M. 1st Batt. 1st Royals, H.M. 74th Highlanders, H.M. 3rd Batt. 60th Rifles, and H.M. Indian Artillery. Only one death had taken place among the invalids during the 12 months prior to my visit, and the books exhibited only an average daily sick list of $11\frac{3}{4}$ per cent., a rate which does not exceed that of a healthy body of men in the plains. The great advantage of the climate of the Droog is owing to its unvarying and equable temperature, whereby the natural action of the skin and kidneys are neither excited nor checked, and thus congestions of the large organs are avoided. 183. Some of the convalescents whom I met on Ramandroog I had seen nine months before in hospital at Secunderabad, reduced to death's-door from dysentery, and apparently without much hope of recovery; now what a marvellous change for the better; one of them observed in reply to my questions, "I was but a short time here, Sir, when I got an appetite like a horse, and instead of feeling weak as a child scarcely able to crawl, I was continually on my legs, and I am now nearly as stout as ever." 184. This is essentially one of Sir Ranald Martin's "valuable islands in the plains which has sanitary excellencies peculiar to itself." The climate is well adapted for all who are free from organic disease; it supports a slight decline of health, and provides against threatened alterations of structure, although it cannot restore a constitution thoroughly broken down.
	VI. Sanitaria for Secunderabad.	185. The turbulent character of the people of Hyderabad render the presence of a strong European force here indispensable. There are no hill stations near it, and the sea-coast sanitaria are hundreds of miles off. It is no doubt, therefore, a very difficult station to deal with, more especially as it bears at certain seasons a bad reputation for the European soldier. In 1858 the mortality, chiefly from hepatitis and sanguineous or scorbutic dysentery, was— 1st Royals - - $10\frac{1}{5}$ per cent. Lancers - - 5 per cent. Royal Artillery - 5 ,, Madras Artillery $3\frac{1}{6}$,, Military considerations here override medical ones, our only alternative therefore is by the erection of barracks upon the most approved principles, and upon the healthiest spots, by protection against overcrowding, by a liberal supply of vegetables with their food, &c., to guard the health of the troops as far as possible. 186. Convalescents from Secunderabad are now either sent to the Ramandroog Hill, near Bellary, upwards of 300 miles over a difficult road, or they proceed to Masulipatam, the nearest point to the coast, about 200 miles, with the view of taking passage to Madras, or to the sea-coast sanitarium of Waltair; in both cases involving a journey of much fatigue and danger to the invalid. This station is 1,800 feet above the sea. In 1846 I was encamped between the 20th January and 20th March on a solitary hill, called Dungoond, one of Coilcondah range, about 2,600 feet above the sea. It was a common place of resort for the officers and their families, from the oppressive heat of the station of Muctul,

Stations.	Replies.
VI. Sanitaria for Secunderabad —*cont.*	which we then occupied; we always enjoyed the change, and found much relief from the extreme heat below. In 1849 I made a short report to Government on the topography, &c., of the hill, from which the following is an extract:— "The village of Dungoond, from which the hill derives its name, is situated in the Chetapoor Talook, and is, I believe, a jagheer of the Newab Shumshul-oomah of Hyderabad. It is almost an isolated mountain, being connected at its base towards the south-east, to a chain of high land, which forms a continuous ridge with the Aloor and Palmoor group. Towards the north-west the hill terminates at first in an abrupt slope, which soon becomes more gradual until it reaches the river Bema, some 1,500 feet beneath the surface plateau of the mountain, is about four miles long by one broad. "The hill is of trap rock formation, its summit presents a beautiful extent of table land, eight or ten miles in circumference, with neither rising ground or jungle to intercept the view, or the free current of air from one side to the other. The soil on the centre of the plateau is kunker, it is more elevated than the circumference, which is a black loam; there is no stagnation of water on it. Extensive beds of rich iron ore are seen. The slopes on the hill and for miles around on every side are covered with thick jungle. There are three perennial springs on the hills, affording a bountiful supply of excellent water. "The inhabitants residing on the two villages on the summit appear robust and healthy. They cultivate large and rich crops of pulses, &c., and assert that fever is not a disease of the mountain, although they often contract it below. Amongst the European adults and children who resorted to the hill no case of fever occurred. I was particularly impressed with the salubrity of the position, and consider it well adapted for those who begin to exhibit declining health. A thermometer suspended under a tree denoted a lower range at noon, than it did at sunrise in the plains; the lowest range being at sunrise 59°, at 9 a.m. 73°, at noon 82°, at 3 p.m. 78°, and at sunset 72°, while the highest temperature indicated at the same periods of the day was 66°, 79°, 85,° and 84° of Fahrenheit, the greatest variation in the 24 hours being 23°. There was seldom a lull in the wind. "There is nothing in the appearance of the site nor in the surrounding country which would lead one to dread impure exhalations; on the contrary there is every indication of much purity of atmosphere, and the natives assured me that they are never visited with endemic disease. I am of opinion, even should it not realise the expectations I have formed of it, that it may notwithstanding prove an acquisition to the Hyderabad division of the army at certain seasons. It is said to be distant from Secunderabad about 70 miles south-west, and from Sholapore, a military station on the Bombay side, 40 miles." I am not aware that any steps were taken to examine further into the practicability of converting this hill into a sanitarium. The serious difficulties we encounter on this score, at the large military station of Secunderabad, may now induce an inquiry into the subject, as well as expedite the arrangements proposed at paragraph 88.
VII. Sanitaria for Jaulnah.	187. The question of the transfer of the military force at Jaulnah to the neighbourhood of Arunghabad, is now, I understand, under discussion by the authorities. Hitherto of all our stations garrisoned by European troops, Jaulnah has exhibited the smallest death rate. Doubtless sound military reasons exist for this meditated change, and it would not be becoming in me to observe on these. But in the location of troops sanitary considerations are so intimately blended with military, that I may be excused expressing my views on the contemplated measure. 188. I have no hesitation in saying that our past experience of Arunghabad does not speak well for its future salubrity, for an European garrison. Fever is endemic to the spot, and a peculiar annoyance is caused by the high winds, which come in gusts between the gorges of the hills, making the site not only disagreeable but injurious. If on military grounds Arunghabad should be considered a better site than Jaulnah, then the country around Roza should be thought of. But before the great outlay of building barracks anywhere be entered on, the question should be well considered, whether the site should be fixed as suggested; or on the range of table land extending from Luckenwarra to Adjuntah, in the vicinity of Booldana, where the climate is very fine. 189. The table land about Booldana forms the southern wall of the valley, and you look down to the plain beneath, a descent of 700 to 1,000 feet. The atmosphere on the higher regions thus situated is more free from unhealthy influences, and there is a greater difference in the climate than can be accounted for by the mere difference in altitude; moreover, the medical statistics of Booldana itself during the 20 years which our knowledge of it extends, for the hill which passes by that name has long been a resort for Europeans from Jaulnah and Arunghabad, are favourable to its salubrity. 190. There might not be a sufficiency of water for a large body of men on the plateau of Booldana; but the valley of the Paingunga lies a mile from it, and the river of the same name running through it never dries, and the wells all along the valley are always abundantly supplied. But even on the highest plateau, a little expenditure, by running bunds across the gorges of ravines, would store any amount of water for the troops. In determining, therefore, on the future site for a military station, I recommend that the ground somewhere near Booldana should be seriously taken into consideration. Booldana is about 75 miles from Arunghabad, and 60 miles from Jaulnah, in latitude 20° 34′ north, longitude 76° 24′ east, situated on the Luckenwarra and Adjuntah range of hills; its probable elevation being 700 feet above the plain of Berar, which is 1,300 feet above the sea. The average rain fall is 28 inches.
VIII. Chiculdah.	191. This is another range of undulating table land which may be turned into use as a sanitarium for European troops occupying the upper Deccan. The plateau of Chiculdah is one mile in length and three quarters of a mile broad. It is situated in latitude 21° north and longitude 77° east. It is one of the Vindhya, or as some denominate it the Gawilghur range, and is 3,600 feet above marine level. 192. It has long been a favorite spot of resort for ladies, and children, and for invalid officers serving in His Highness the Nizam's country, who can bear testimony to the benefit they derived from a sojourn there. The varied and extensive scenery, and the bracing air which prevails during the hot season, exhilarates the mind and brings immediate relief to the lassitude induced by the suffocating heat usual in the Deccan at this period. The mean temperature of the plateau is 71°; the hottest months, April and May, give a mean of 83° and the coldest, January and February, 59°. The hottest day ever observed the thermometer rose to 96°; the coldest it sunk to 47°. The greatest diurnal range was 22°, the least

Inspect.-Gen. Macpherson's Report. Madras.	Stations.	Replies.
		4°, and the annual fall of rain averages from 45 to 55 inches. Potatoes and other European vegetables thrive well on the summit of these hills.
	IX. Sanitaria for Nagpore and Kamptee.	193. This is the last of the great military cantonments in the Madras Presidency occupied by European troops, which will come under review under this head. Until lately Nagpore had no sanitarium, the usual course being to send the invalid to Madras for change of air, a distance exceeding 700 miles.
		194. Recent inquiries, however, hold out flattering hopes that a very eligible site for European convalescents and others has been discovered on the Puchmurree range of hills, at a place called Muthoor, which lies contiguous to the following 12 stations:—Sehore, distant 114 miles; Saugor, 104 miles; Dumah, 117 miles; Jubulpore, 105 miles; Mundla, 117 miles; Nursingpore, 59 miles; Hoosingabad, 62 miles; Baitool, 50 miles; Sconee, 64 miles; Bundwarra, 102 miles; Kamptee, 83 miles; and Nagpore, 84 miles. The stations of Kamptee, Saugor and Jubbulpore being provided respectively with accommodation for 1,800, 1,200 and 1,000 European soldiers; so that the convalescents of a force of 4,000, amounting probably to 200 men, besides women and children, have now a prospect of reaching a healthy hill station, nearly 3,500 feet above the sea, in a period of a few days.
		195. At a distance of 50 miles from Kamptee, and 30 from Muthoor Hill, is Chindwarra, a civil station in the Nagpore division, 3,000 feet above the sea. The climate here has already proved beneficial to European invalids, and sanguine hopes are entertained that the more elevated plateau will surpass it in salubrity. An intelligent committee of military and medical officers sent there in the hottest season of the year, report most favourably of the Muthoor sanitarium site; a valley 1½ miles long by ¾ of a mile wide, having a good water supply, and a mean temperature during the day, in the month of May of 87°, and of 78° from sun set to sun rise, the average daily temperature being 83° or 11½° lower than Kamptee.
		196. The Committee are of opinion that the Muthoor sanitarium offers very considerable advantages as a station for invalids, and that it is possible it will bear comparison with Ramandroog, which is about the same height above the level of the sea, and has been found one of the most useful sanitaria for invalids generally in all India. It lies in 22° 13′ north latitude, and 78° 40′ east longitude. Unfortunately the state of our finances in India has for the present retarded the construction of buildings on the site, with the view to its occupation.
	X. Sea-coast Sanitaria.	197. At paragraph 122 of this report, I observed on a numerous and important class of diseases which rapidly run to destruction at elevated ranges—an extra tropical climate, a sea voyage, a residence on the coast, or at salubrious localities within the softening and refreshing influence of the sea breeze, constituting the only safe and efficient remedy for them.
		198. The establishment of a sanitarium at Cape Town for coast sick, is likely to be the means of restoring the health of many men of Her Majesty's forces who have suffered within the tropics, embracing as it does a considerable sea voyage, in addition to a sojourn in a temperate climate.
		199. But there are three localities (vide large map) on the line of coast between Calcutta and Bombay, to which I would draw the attention of the Royal Commissioners as suitable sites for sea coast sanitaria for European convalescents and others, for whom the longer sea voyage to the Cape may not be deemed necessary. The first of these is—
	XI. Waltair.	200. The head quarters of the northern division of the Madras army, and a most eligible position on the Bay of Bengal for the formation of an extensive sea coast sanitarium. In form it represents an elbow of land running out into "Lawson's Bay," which is bounded on the south by the "Dolphin's nose," a ridge 450 feet high; and on the north by "Lawson's ridge," of nearly equal elevation. These elevated points approximate inland, assuming a crescentic or horse-shoe figure. The distance between the horns of the crescent exceeds six miles. From the point of the elbow the ground gradually ascends on every side to the centre, a distance of two miles, to an elevation of 210 feet above high-water mark. This high ground comprises an area of about a mile in length, and two in breadth; the distance from the surrounding hills varying from two to four miles.
		201. The peculiar formation of this space secures to it a very equable temperature. The scorching hot winds which prevail in other parts of the division at certain seasons are unknown here, the usual difference in the thermometer at this period being 13°. The daily variation throughout the year averages 4°; the maximum is 90°, and the minimum 70°, the annual fall of rain being 41 inches. Thus, when there is no direct sea breeze, the land wind, broken by the surrounding elevated ranges, reaches the station converted into a sea breeze, untainted by emanations from the soil.
		202. The testimony of those who are acquainted with the locality for years, as well as medical statistics, are strong on the question of its salubrity. Acute disease is almost unknown, and its character for a sanitarium has already been established. The relaxing effects of the west coast are not experienced here.
		203. His Excellency Sir Patrick Grant, in whose company I visited this station, by earnest and unceasing entreaty, has induced the Government of India to sanction some expenditure towards the erection of accommodation on this desirable locality. Sensible of the importance of discovering elevated table land within the influence of the sea breeze, and that a combination of a residence on the coast for invalids suffering from organic disease, and afterwards as convalescents, to recover their strength, on more elevated ranges, offers the best prospect of restoring men to health and rendering them effective—His Excellency has also for many months past caused practical inquiry to be made as to the salubrity of certain portions of the Orissa range approximating the coast, varying in elevation from 3,500 to 4,500 feet above the sea, termed Gallicondah.
		204. I believe that success will result in these inquiries, and that the station of Waltair will become the most desirable one in India, for ere long the sick soldier, suffering from structural disease, can be conveyed from Secunderabad after a land journey of some 50 miles, in comfortable boats on the Kistnah or Godavery, afterwards on the line of canal which will shortly intersect that country to the coast, and thence by steam to the spot; or if from any of the stations in Lower Bengal, once shipped in Calcutta he will in the first instance receive benefit by the sea voyage, and thereafter at Waltair, where he will arrive by steam in 48 hours after embarkation.

Stations.	Replies.
XII. Cape Calimere.	205. No atmosphere is perhaps more salubrious than that of the sea coasts of continents. The cape called Point Calimere, which juts sharply into the sea 28 miles south of Negapatam, possesses an equable and moderate temperature, and enjoys a great immunity from disease. The soil around is sandy; to the west is a salt tidal marsh, which does not appear to affect the salubrity of the place. It is much famed for the coolness of its climate, and for the refreshing and invigorating influence of its pure sea breeze. The place has long been an agreeable resort for invalids and others during the hot months in the interior. Its position, contiguous to the Pulney Hills and adjoining the terminus of the railway now in progress at Negapatam, adds to its importance as a sea coast sanitarium.
XIII. Beitkul Bay, or Sedashaghur.	206. On the western coast, about 48 hours steam from Bombay, between Mangalore and Goa, a spur of the range of Ghauts, in North Canara, averaging a hundred feet in elevation, runs into the sea for upwards of a mile, and, with islets contiguous, forms a noble nearly land-locked bay. The circumference of this bay cannot be less than 10 miles; it has seldom a ripple on the surface, and there is deep water close to the land. A detachment of native troops are located here, and the intelligent medical subordinate in charge informed me that the salubrity of the position is past question, and that during his residence there for six years not one case of cholera occurred, although the disease frequently raged all around. I think the place admirably suited for a sea-coast sanitarium at all seasons, except during the prevalence of the south-west monsoon, more especially for invalids from Bombay.
XIV. Résumé.	207. I have now completed the subject of sanitaria, and I hope I have not been altogether unsuccessful in showing— 1st. That frequent change of air is perhaps the most efficient mode of preserving a high standard of health in India. 2nd. That by the location of a portion of our European troops occasionally on hill plateaus, not only would they be available on emergencies, but their health and efficiency would also be secured. 3rd. That political, financial, hygienic, and, I would add, compassionate considerations demand that our British soldiers should occupy stations favourable to European life; and doubtless the most innocuous known positions are the summits of our mountains. 4th. That every military station of importance in the southern peninsula, except Secunderabad, has in its vicinity healthy hill ranges adapted for the residence of Europeans, and that our military positions would in no degree suffer by quartering portions of our regiments upon them. On the contrary, in a strictly military point of view, the possession of high ground is advantageous, especially if military works are in contemplation. 208. It will of course be necessary that careful examination of the proposed new stations be made, to ascertain that they fulfil the conditions necessary. All I would urge is, that hill ranges do exist in the neighbourhood of the most important military stations; and it is therefore well worth inquiry whether such might not be rendered available as proposed, whereby the present high rate of mortality and invaliding might be reduced. 209. Finally, as regards the disposition of our sanitaria, I have attempted to show— 1st. That the upper ranges of the Shevaroy Hills are available for the freshly-imported recruit, for time-expired men and invalids preparatory to embarkation, and for the introduction of a healthy interchange of a portion of the European force stationed at the Presidency. 2nd. That the Pulney Hills are available for the introduction of a system of interchange for the European force stationed at the head-quarters of the southern division of the army. 3rd. That Wellington, on the Neilgherry Hills, is available for putting into execution the like desirable measure for the force at Bangalore and Cannanore. 4th. Kotagherry, on the same mountain plateau, can be turned to good account for invalids from Bombay and from Lower Bengal. 5th. That Ramandroog, near the head-quarters of the Ceded Districts, although of moderate elevation, has acknowledged superior advantages in itself, which ought to influence us in prosecuting our inquiries into similar elevated ranges, and induce us to extend the beneficial influence of its climate more generally than we now do. 6th. That invalids from Secunderabad can be sent to Ramandroog, should no other mountain be discovered more contiguous to the station. 7th. That Chindwarra and Muthoor are available for the convalescents from Kamptee and other stations in Central India; and 8th. That sea-coast sanitaria are available on the north at Waltair, on the east at Point Calimere, and on the west at Sedashagurh, for invalids from the three Presidencies.
	DISEASES, &c.
I. Venereal Disease.	Destructive effect of venereal disease on the health of the soldier, and the loss of efficiency resulting therefrom:—
	210. This difficult question is now attracting the attention of reflecting men at home, both in its physical and moral bearings, and it becomes us to look at it in the face here, in relation to the health and efficiency of the army generally. 211. From the army statistical reports presented to Parliament two years ago by Her Majesty's Commissioners, we gather that the admissions into hospital from venereal diseases amount to 206 in every 1,000 cavalry, and 277 in every 1,000 infantry of the line; that on an average 688 men out of the home force are always in hospital from this cause alone, and that the money loss to the State from this cause is calculated at nearly 14,500*l.* per annum. This is only a part of the enormous evil, for a large proportion of the sufferers have their constitutions permanently impaired. Other diseases are induced or aggravated by the venereal poison, and the mortality and invaliding are largely affected by it. 212. If we turn to India we find the case no better. At all stations of the army where European troops form part of the garrison an organized system of prostitution is in force. A more respectable class, under the control of a procuress, and a low debased class who acknowledge the control of a male pimp. Soldiers usually visit these women between 2 o'clock p.m. and evening roll-call. They often take a fancy to one particular woman, and by previous arrangement visit her. Some females informed me that between 2 and 8 p.m. they have frequently been visited by 10 and 12 soldiers, and that, too, after they had contracted disease. In course of my inspection cases have come to my notice where

Stations.	Replies.
I. Venereal Disease—*cont.*	soldiers had intercourse with females under treatment, regardless of consequences which they knew must result. A certain number of the debased class attend on guards, and prowl about the barracks when night comes on; and when a regiment proceeds on the march some of them accompany it, encouraged to do so by the soldiers clubbing together for this purpose. 213. It was necessary to enter thus much into detail in order to show how the thoughtless soldiers seek to gratify the strongest of their appetites, reckless of the consequences to themselves and to the State. At Cannanore, and along the western coast generally, I found venereal disease in its worst form, and it was a common occurrence to find the primary and secondary forms of the malady occurring simultaneously. It is partly from this deplorable state of matters that cutaneous affections in their most hideous forms are so common here, on the Malabar coast. 214. H.M. 66th Regiment, garrisoning this station, had 25 per cent. of the strength under treatment for the well-marked Hunterian chancre with indurated base, or that form which, according to our best authors, is essentially the infecting chancre which generates constitutional syphilis. At Trichinopoly the baneful effects of this disease were more evident in the 2d European Light Infantry, its constitutional as well as its primary effects were in active operation. Within 10 months after the arrival of the 1st King's Own Dragoons at Bangalore, there were 170 admissions from syphilis, out of a strength of 520, and in the same period and at the same place I found that the enormous number of 394 had been admitted into hospital with this loathsome disease, out of an average strength of 745, in the 60th Rifles. 215. But I need not multiply instances. The returns in the body of this report show the extent of the disease. At all our stations, civil as well as military, in the progress of my inquiries, I found that syphilis was the curse of the place. I have witnessed it in the child of five years of age and in the old hag of 60. I have traced the history of many who imbibed the disease early in their career, and have arrived at the conclusion that five years was a liberal average within which one-third become broken down and unfit for active service. At Poonamallee, the depôt for Her Majesty's regiments at this Presidency, an opportunity was afforded of seeing syphilis as a cause of invaliding and premature inefficiency in full operation. The great majority of invalids had their constitutions more or less impaired by the destructive poison—a poison, too, which passes down to their posterity, which they imbibe in the public service. 216. We have now to consider the best means of meeting this indisputable evil. We cannot, perhaps, indulge the hope that this terrible disease can be entirely banished from the army, but it is our duty to devise some plan to reduce it to its minimum. The marginal note at paragraph 28 of this report, will show that, through the interference of his Excellency the Commander-in-Chief, active measures towards the introduction of a reform in this matter have already been instituted. But more than this is required. To a large body of our soldiers marriage is forbidden. In time of peace the *ennui* of a soldier's life is great everywhere, but in this country, shut up the greater part of the day, as he has nothing to occupy his mind, he seeks for excitement in every den of vice and debauchery to which he can obtain access. 217. I am of opinion that the system of moral and religious instruction which has of late years been introduced into this country through the educational department, should be extended so as to embrace our European military schools; that healthful and improving employment and recreation, and every possible means, consistent with discipline, should be used to raise the tone of the soldier's mind, and to wean him from habits as destructive to himself as they are hurtful and costly to the state he serves. 218. But I am not so utopian as to believe that we can gain our end entirely, or even mainly, by such means. We must have recourse to other measures. We must have the aid of the magistrate to help us in controlling this "social evil;" and here we are sure to be met with many objections. Interference of this sort is not congenial to British habits, customs, and tastes; it is "inquisitorial and unconstitutional;" it is "contrary to the liberty of the subject." The fastidiousness of our countrymen in matters of this sort is notorious. It has long stood and still stands to some extent in the way of many sanitary and social reforms; but, apart from other considerations, the time has now arrived when the Government must act regardless of such feelings, if they really desire to secure to the State the full measure of service from those alone on whom we rely for support. 219. The best mode of dealing with this, the police part of the question, has occupied my most earnest attention. I have put myself in direct communication with several civil magistrates of experience and ability; and my mind is now fully assured that before one step is taken in this direction, a legislative enactment is required, to have general powers conferred on the local Government to pass rules for the "better prevention of the spread of venereal disease in large towns and in military cantonments." This is a better title than "An Act for the better control of prostitution." The law should, in the first instance, be put into force in all military cantonments and sea-port towns, and penalties should be enacted in all cases of its infraction. 220. For the administration of the law, appoint the commandant or the magistrate of the district, the police officer, the surgeon, and the chief native official at the station as Commissioners; then license and register every brothel and prostitute, and have them open to constant inspection. Respectable nurses, and native dressers, and some well selected peons would do the work of inspection at the brothels; and the surgeon in charge of the lock hospital would receive and arrange the sick in the building with a view to their comfort as well as to their respectability. With good management the utmost success might prevail. The women will thus become in a great measure their own police and spies, and their own sanitary commissioners. I would earnestly press the serious consideration of this subject on the Royal Commissions, for the evil is a shocking one, and it is increasing on our hands.
II. Intemperance.	221. While I believe that the consumption of spirits by the soldier is a fertile source of disease, I am also of opinion that a moderate use of malt liquor or wine is favourable to his health. I would withdraw the spirit ration altogether, remove spirits from the canteen, and restrict the sale of it in the bazaars to soldiers, and substitute in its stead good malt, light wines, tea and coffee.

Stations.	Replies.
III. Health of the Troops.*	222. A gravelly surface and sandy subsoil, or a sandy surface and gravelly subsoil is that best adapted for barracks. A rocky substratum is also good; but a substratum of compact clay retains moisture, is damp and cold, and should be avoided. (Query 18.) 223. Sixteen years is a good age for recruits to enlist in England, to come to India about 17 years. He should land between the middle of August and middle of March. I would certainly recommend his being sent immediately, by rail or other conveyance, to the hills for two years or upwards. He should take with him tweed or other clothing from England for this purpose. There he must be marched about, drilled, made to garden, work at trades, &c.; in short, taught to be industrious, before he be sent out to mix with the idle old soldier. There will then be no need of intermediate depôts. The soldier would thus be gradually accustomed to the climate, and he would not be exposed to the many dangers which beset his path in the early years of his service. (Queries 19 to 20.) 224. If the course I have urged under the head of hill ranges be put in force, I see no reason why a soldier may not be able to continue the full term of service for which he has enlisted in India, without subjecting the state to any additional cost. I think it should be so arranged that invalids should reach England about the middle of spring. The foregoing remarks are equally applicable to all young officers, as well as soldiers, arriving in India. The plan now adopted of transporting men, by bullock transit, from one station to another has greatly diminished mortality. In none of the moves conducted in this way has cholera appeared; formerly, no march was made without it. The effect of exposure and fatigue on young recruits was well exemplified in the large mortality and prostration during the march of the 4th King's Own from Ahmedabad in June last year. (Queries 21 to 23.)
IV. Causes of Disease.	225. It is universally allowed to be a matter beyond further question that visitations of the entire class of zymotic diseases, as typhus, scarlet fever, dysentery, diarrhœa, and cholera, are governed by the same laws. The predisposing causes may be denominated, 1st. Remote. Produced by a disturbance of the electric and magnetic forces of the atmosphere, rendering the animal frame prone to imbibe disease. And, 2nd. Proximate, as the respiration of a vitiated or poisoned atmosphere, noxious effects of bad water and food, excesses either in eating or drinking, &c. The two former being produced by, *a.* Overcrowding or lodging an absolute number of individuals in a given space, without the means of renewing the air. *b.* Privies, cesspools, graveyards, &c., and the noxious influence of putrid animal effluvia, whether these proceed from foul drains and sewers, from slaughter-houses, or animal dung heaps. *c.* Water polluted by percolation into wells of the contents of cesspools, graveyards, drains, &c., contaminated by deleterious gases, and decomposed by organic and other noxious matter, or the original impurity of the supply. *d.* Defective supply of pure water, which is essential to personal cleanliness, and as an article of food. As water forms nine-tenths of the weight of the body, it penetrates into the substance of every organ, and it must be the medium for all the changes effected in the frame. *e.* The use as food of diseased or improperly fed animals. The regulation which provides for an inspection of the soldier's animal food before issue to the men should be extended to an examination of the animal before it is slaughtered.
V. Cholera.	226. There are many circumstances connected with outbursts of this pestilence which are apparent, and others which are, as yet, inexplicable to us. The following, amongst others, have come before me in the course of my inspection tour:— 1st. In the Salem district six miles from Trippatoor, about 100 men, of a nomad tribe, were employed in making a cutting on the line of the railway through disintegrated granite, some 20 feet in depth; suddenly springs of clear and tasteless water were exposed, and almost simultaneously with this, a virulent outbreak of cholera appeared, which carried off 15 of them in 48 hours. The band immediately thereafter dispersed; and although others sunk from the effect of the disease, evidently imbibed on the spot, no fresh seizure took place; nor did the disease spread among the many other hundred workmen who were employed at no great distance. 2nd. A detachment of Her Majesty's 74th Highlanders, when en route from Sholapore to Bellary, in the month of January, at the time in perfect health, marched past (100 yards distant) a camp of native soldiers, who were suffering at the time from cholera; three days afterwards the disease appeared in the detachment and carried off seven men. 3rd. The magistrate of the district of Malabar having reported to Government, that within a limited range of his district 1,539 deaths had taken place out of 1,796 seizures from cholera, I was directed to inquire and report thereon. In passing through the district I satisfied myself that the report by the magistrate was correct; and that on the disease passing away a malignant small-pox epidemic took its place. There was no difficulty here in tracing a cause. It was evident to the eye and to the nose in every town and hamlet I passed through. A baneful practice of intermural burials has been carried on, until the dust of generations has reached the doors of dwelling-houses, and accumulated high above the ground floors of the houses. The corpses are merely sprinkled over with earth; a mat is placed over the face, one end being left above ground for some days to admit of the escape of the gases. In the midst of the necropolis are wells from which the inhabitants receive their water supply. On an average 10 feet of rain falls on this coast per annum. Under these circumstances can we wonder at these outbursts of epidemics, that foul ulcers, inveterate cutaneous diseases, intestinal worms, &c., &c., are always present amongst the inhabitants? 227. In whatever mode malignant cholera passes into the frame, a poisoning of the blood immediately takes place. The profuse discharges from the stomach and bowels I view as the *vis medicatrix naturæ;* death in such cases seldom occurring under 18 to 24 hours. But where the productive causes operate with intense force, as it did in Malabar, we have the cholera *sicca*, where the secretions are arrested and the individual is struck down as if shot dead.

* I have already entered at length into the subjects referred to from query 1 to 17 of this head.

Stations.	Replies.
VI. State of Barracks.	What means can we adopt to render the climate of the plains as little injurious as possible to those whom necessity compels us to keep there?
	228. Every young engineer officer should attend a course of hygiène at the new Military Medical College, Chatham, before he joins his corps. As a rule in the construction of barracks, &c., I am constrained to say that, so far as my experience goes, sanitary considerations are about the last subject that receive their attention.
	229. Before the foundations of a proposed range of buildings are dug, a ground plan for deep and surface drainage should be prepared, and the barracks erected accordingly. The next step should be to provide latrines for the workmen, pits with cross boards and temporary roofs; lime or charcoal, with earth to be thrown into these once or twice a week; and fresh pits to be opened so soon as the accumulations below have risen to three feet from the cross planks. My observations at paragraph 172, exemplifies the evil results occurring on the accumulation of vegetation and surface filth during the erection of great public buildings.
	230. Ranges of barracks should always be built *en echelon*, and furnished with open verandahs on both sides, the upper portions of which should have fixed open venetians or jalousies. The floor of the barrack should always be raised 18 to 24 inches, or, what is still better, on low arches. The cubical space considered requisite for each man is 1,000 feet; but it of course makes all the difference whether this space is arranged perpendicularly or laterally. The present style of barrack building is to make the rooms exceedingly lofty, as at Bangalore, where really the climate is excellent. The consequence is that the lateral dimensions are comparatively contracted, and the men's beds will be in close proximity to each other. This injudicious arrangement is a pity, because expense is incurred without a corresponding benefit. Again, the wings to the barracks, which open into the rooms, and are, in fact, like the aisles of a church, are fitted up for the reception of saddlery and horse equipments, a bad arrangement for India.
	 231. The walls and ceilings of barracks should be thoroughly cleansed every quarter, and whitewashed every half year. Lavatories, kitchens, latrines, and urinals should undergo the process of cleaning every month, and whitewashing every quarter. All solid and liquid refuse of barracks should be removed in carts to a distance. This is the only true way of retaining the position sweet. These apartments should be provided with ingress for air below, and free roof ventilation. Cooking places should be constructed of one long furnace, with chimney at the end, as in the sketch, by which fuel is economized and dirt and smoke prevented. Kitchen ranges after this plan, introduced by Surgeon Duff, of this army, are now coming into general use in private dwelling houses. They should be introduced in all barracks and hospitals.
	232. Military bazaars require as much, or even more, care in their construction and subsequent conservancy as military barracks. Once formed, they grow in size rapidly. Too often the nidus of disease lurks here, to be called forth on any exciting cause. Drainage should be well considered, houses should be constructed on a distinct plan, and made uniform, as well as can be, with streets, so formed as to admit of free ventilation.
	233. The question of the best positions for European soldiers in India is one of vital importance, and can only be satisfactorily decided by minute examination, by competent parties, of the various localities, and by earnest endeavours to reconcile military and sanitary considerations.
VII. Hospitals.	234. In addition to the observations made under the last head, which are all applicable to the subject of this, I may state that the lavatory, urinal, and privy arrangements in our hospitals generally are very defective. The high prison-like wall which we usually find surrounding our hospitals as well as our barracks, should in all instances be removed and give place to a dwarf wall, surmounted by a rail. A day room should be attached to every hospital, provided with chess and draught boards, &c., light reading, tables and couches, to which the convalescent could proceed during the day, instead of passing his whole 24 hours, as he now does, in his bed. This room would also serve as a refectory, or convalescents might have their meals in the verandah. Anything is preferable to the present system of taking his food on his knee, seated on his bed, possibly with dying men around him. An ambulance to enable convalescents to get morning and evening exercise by taking them to the country, where they could get out and walk, ought to be attached to each hospital.
Beds and Bedding.	235. The sooner wooden beds are banished from our hospitals the better. They are objectionable in every way; clumsy, difficult to keep clean, and, worse than all, they harbour vermin. The last is a very serious evil, for it adds to the sufferings of a sick man. I know no sight more piteous than that of a patient suffering under a fractured limb disturbed, fevered, and tormented during a long night by voracious insects crawling about the injured extremity. Every wooden cot should be destroyed, and light iron frames substituted.* There is also great room for improvement in the bedding. The quilts afford a most imperfect protection to the sick soldier from the damp and cold, particularly during the rains and in damp climates. The quilts are not quilted at all; they consist of little more than a piece of blue and white cloth, stitched together. In many hospitals this is all he has below him, with a similar covering for his person. A good mattrass, a blanket, sheets, and pillow slips should be provided for every bed in hospital.
Utensils.	236. The present night chairs are open to great objections. In a large military hospital, during an epidemic of dysentery, it is the present practice to keep in an open verandah, or at the bed-side of the patient, the secretions from the bowels of patients labour-

* I have striven for upwards of four years to obtain iron beds of an improved pattern for the European troops in this Presidency, but with very limited success.—P. G.

Stations.	Replies.
VII. Hospitals—*cont.*	ing under this disease for the inspection of the medical attendant. The objectionable construction of the night chair permits the fetor to escape, so a privy atmosphere of the most pestilential kind pervades the whole place. I have long been assured that evil consequences follow on this practice. I have seen fever patients and others exposed to these emanations, smitten with the prevailing epidemic in its most putrid form; and my opinion has been strengthened by the researches into this question of the late Dr. Budd, who has shown how diseases are propagated in this way. It would be easy to correct the evil, either by receiving the evacuations in a vessel containing a saturated solution of some of the chlorides, by having a room to place them in, or by substituting for the present a more appropriate air-tight vessel.
VIII. Instruction and Recreation.	237. Throughout this report, when an opportunity presented, I have urged the introduction into all our regiments of a system not only of instruction and recreation, but also of trades. To the soldier in times of peace "idleness is certainly the bane of all evil." In the useful arts there is not a regiment which could not furnish tinmen, watch-makers, bookbinders, printers, gun-makers, saddlers, tailors, shoemakers, and various other trades. They could manufacture their own accoutrements, as well as supply the public with many useful articles, and, as gardeners, their own mess, at any rate, would be secured with a sufficient supply of the articles of diet, which they so much stand in need of at every station. The establishment of Government workshops in this manner would be a vast saving to the State. I would also make the soldiers' wives industrious by encouraging them to employ their time as dress-makers, in needle and fancy work, by appointing periods for the sale of these articles, and giving prizes to the most deserving. The arrangements to be under the superintendence of a committee of ladies and gentlemen at the station. 238. In the hot season, one hour's drill in the morning, and occasionally in the evening, for a like period, ought to be sufficient; and at this period marching parades are, perhaps, the least harassing. The usual means of recreation, such as cricket, skittle and ball grounds, gymnasia, theatres, &c., should be encouraged. The institution of savings' banks would be advantageous, and in the neighbourhood of the men's barracks there should be sufficient shade from trees to enable soldiers to take exercise, without injury to health, during the day.
IX. Ambulance.	239. Our present arrangements for the conveyance of hospital equipments and for the transport of troops, in health and sickness, are very faulty. The subject has engaged much of my attention lately, and I have submitted elaborate reports to Government urging the introduction of an entirely new system, which, it is acknowledged by the authorities, would combine efficiency and much economy. I refer the Royal Commissioners to the published printed proceedings of Government, noted in the margin. Wherein will be found in detail the old arrangements, as also those recommended to be adopted by me in this presidency, for field hospitals, ambulances, transport of sick, and hospital supplies. No. 4,450, dated 8th December 1857. No. 992, „ 18th March 1858. No. 3,921, „ 14th September 1858. No. 2,221, „ 15th June 1860.
X. Burial of the Dead.	240. The graveyards in many of our military cantonments are not sufficiently removed from the abodes of the living. At Secunderabad two large graveyards adjoin the European barracks; and there is another in the centre of the cantonment. At the convalescent depôt of Ramandroog the graveyard is placed on the summit of the plateau, about 150 yards from the married men's quarters. The surface is so hard that blasting with powder is necessary before sufficient depth can be secured. The position is highly objectionable. An excellent spot is available down the slope of the hill, to which it ought to be removed. I would recommend that no native burning or burial ground should approach nearer than three miles of a military cantonment; and what is equally, if not more, necessary, that public latrines should be erected contiguous to all native towns and bazaars. At present many of the native burial-grounds border on our cantonments, whose outskirts are also too often promiscuously defiled with human ordure and other offal, which is not only a perfect nuisance, but highly objectionable, as regards the salubrity of our stations.
XI. Returns and Reports.	241. The voluminous returns demanded from all hospital establishments, and the amount of scriptory labour in preparing these, demands reform. A regimental surgeon is obliged to make out five occasional, three daily, three weekly, thirty monthly, one quarterly, two half-yearly, and thirty-five annual returns; and the civil surgeon has others besides; copies of all having to be kept for record in hospital. It would materially facilitate public duty were one class of returns made applicable for the army at home and in India; and if blank printed forms of these were issued to medical officers, corresponding forms being bound up into volumes, to be filled up when copies are to be retained. So far as I am aware, none of our returns exhibit the sickness and mortality of soldiers' wives and children, nor are there mortuary tables of the civil population generally.
XII. Duties of Medical Officers.	242. In no army in the world are young men entrusted with responsibility at so early a period in their career as in this. It follows, therefore, that nowhere ought more vigilance to be exercised than in the selection of those whose duty it is to support and direct them in the discharge of their difficult duties. Their moral as well as their professional qualifications should not be open to question. 243. Every one of us must remember the anxieties we experienced in the early days of our career, when we suddenly found ourselves in the sole charge of a large body of officers and men, whose lives were, without appeal, in our hands, and, if we speak the truth, most of us must confess that we have purchased our experience dearly. 244. I am deeply impressed with the conviction that the principle of selection for the administrative offices in the service should be very rigidly enforced; and I am strongly of opinion that the duty of aiding our young medical officers, by placing over them men capable of guiding and advising them, has been too much neglected. What we require is, a man to whom the young physician can look up, not merely as an official superior, but an experienced counsellor to whom he can resort with confidence in the hour of difficulty. 245. The importance of judicious inspections cannot be overrated. With the area of this vast presidency to inspect, including the Pegue division and our stations in the Straits of Malacca, it will hardly be possible for the Inspector-General of this army to re-visit a station sooner than every third year. I am now completing the third year of my office, during which

STATIONS.	REPLIES.
XII. Duties of Medical Officers —*cont.*	period I have travelled, without ceasing, by land, upwards of 9,000 miles, at the average rate of three miles an hour, and have visited the Straits, but the Pegue division has yet to be inspected. Deputy inspectors of divisions should pay as much attention to detached stations and sanitaria as to the cantonments under their immediate observation, by journeys over the circle of their superintendence at different seasons of the year. It would advance the interest of the service were their appointments made to terminate in five years after election.

CONCLUSION.

246. Having concluded my remarks on the more important subjects referred to in the foregoing list of queries, it only now remains for me to beg the indulgence of the Royal Commissioners for the prolixity of my observations, rendered to some extent necessary by the vast range of topics it was necessary for me to enter upon. I am very sure that the records of this army contain, although, perhaps, in a fragmentary state, all that I have endeavoured to bring into one view; but the observations even of the most experienced professional men in all that relates to the sanitary condition of the army, have not always met with that regard which was due to them, or they have been attended to only when the pressure of some epidemic created a panic.

247. Even in England, the last place where sanitary considerations obtained a hearing was in those influential quarters where rests the highest military authority. The terrible ordeal of the Crimea came and laid bare to the world the defects of our system. At first the whole current of the public indignation was directed against the medical department, but the report of the Royal Commission appeared, and its terrible disclosures shocked the moral sense of the whole nation. They were aware of the wasteful expenditure of life in the Crimean war, but they were unprepared to find that in England, the healthiest country in the world, the occupation of a soldier in times of the profoundest peace stood at the bottom of the list of unhealthy occupations. Her Majesty's Commissioners therein further observed, that the blame did not rest with the medical department, whose officers had never ceased to protest against a system that brought discredit on themselves, enormous losses to the State, and death to its most faithful guardians.

248. I respectfully submit, that it is for us to profit by this great example, and to hasten to amend what is faulty in our system here. By giving a better direction to prevent expenditure, half the evils pointed out may be remedied. If it is anywhere proved that a system now in operation tends to the destruction of health, it then becomes incumbent on those who support it to demonstrate that considerations of the most urgent state necessity demand its continuance. But even then, how much can be done to mitigate the unavoidable evil! For example, what strong military considerations exist for quartering the depôts for European soldiers at the hottest stations within the limits of the Presidency, and one that is most frequently visited by terrible epidemics of cholera? In a word, I solicit attention to what I have advanced with a view to earnest endeavours to prevent disease, to remove its remediable causes, and thus directly to promote the moral and physical well-being of those who have such high claims on the State they serve; and I am well assured that in the end the State will reap a rich reward in the increased health, happiness, and efficiency which will result from such well-directed efforts.

Inspector-General o Hospitals Office,
Madras, 27th December 1860.

DUNCAN MACPHERSON, M.D.,
Inspector-General of Hospitals,
Her Majesty's Madras Army.

N.B.—If deemed necessary, I can hereafter transmit a supplementary report on the Pegue division and the Straits of Malacca.

I.A.

INDEX to the REPLY by INSPECTOR-GENERAL DR. D. MACPHERSON, and TABLE exhibiting the SICKNESS and MORTALITY of the CIVIL and MILITARY ESTABLISHMENTS in the MADRAS PRESIDENCY during TWELVE MONTHS prior to the date of his INSPECTION of the several STATIONS.

I. Topography.	1. Bombay is an island close to the west coast of India. It is partly hilly and in part flat, backed by mountainous land on the main. During the fair weather it is dry, but it is swampy in the low lands during the rains. About half the island is covered with woods, and there is but very little waste ground. Many tanks exist, but no springs are to be found there. Mountainous islands stud the harbour, between which and the western ghauts of India is an intervening strip of low land, called the Konkan, varying from 10 to 30 miles in breadth. 2. The elevation of the station above the sea is about 180 feet at the highest point, much is but a little above the sea at high water. There is some high land adjoining the station, but it is mountainous, without table land or plateau, and of no advantage in a military point of view. 3. The nearest mountain table land is Matheran, about 50 miles distant, and about 2,800 feet above the level of the sea, but it is only four or five miles long, and less in breadth. 4. The station is surrounded by the sea, but there is no lake or river in the vicinity of any consequence. There are estuaries of the sea running into the mainland, which are more or less bordered by marshes. There are also salt water marshes in the adjoining island of Salsette, within a mile or two of Bombay. The vicinity of the station is subject to overflow, and, besides the tides which daily overflow, there are the rains which last from June to September, inclusive, and for the most part during that time deluge the island. The marshes in Salsette are supposed to be a cause of fever in Bombay, from the wind blowing over them to that place in October, but not to any remarkable extent. 5. The station is open and exposed to the winds. The barracks for the Artillery (*i.e.*, Fort George), however, are hemmed in by the fort walls, and confined, and the barracks for the line are in the midst of high buildings in the fort of Bombay. Those at Colaba are freely open to the air. The native lines are not well situated in this respect. The temperature of the station is, in Fort George, where the Artillery are situated, and also in the barracks for the line in the fort of Bombay, much raised by the buildings being exposed to reflected sun heat. With respect to Fort George, this evil has been much mitigated, if not altogether removed, by having the lime-wash of the exterior of the buildings coloured a dark grey. Fort George I consider a tolerably healthy situation. The winds to which the station is exposed are pretty regular, blowing from the sea by day and the land by night in the fair weather. The land winds are the cause of severe rheumatism, fever, &c., to persons exposing themselves to them while asleep. During the rains the wind blows chiefly from the south-west, and are, like the sea breeze of the fair weather, healthy, but damp. 6. The island is for the most part cultivated, so is also the mainland between the mountains. There are tanks for irrigation, besides which there is a large reservoir in the island of Salsette, about 12 miles from the town of Bombay, which supplies it plentifully with water; it is situated in the valley of Vehar, in Salsette. No ill effect on the health of the station has been observed to arise from artificial irrigation. There are no limits placed to the cultivation of rice. Wherever the land suits it is planted, but not nearer than three miles from the fort. Neither indigo, hemp, nor flax are grown in the island. 7. The station is close to the town of Bombay, the population of which is said to be between 400,000 and 600,000 persons. 8. The whole district in its geological formation consists of trap and trap rock, with shell beaches on the shores towards the sea. The ground of the station has been built over for centuries, and the barracks and lines are on part of it. 9. Water is found during the dry season at from 13 to 18 feet below the surface, and during the wet season from 0 to 10 feet. 10. The rainfall and surface water flows steadily away from the hills, but not from the neighbouring plains. It chiefly runs off the surface, the soil being hardly more than 18 feet thick anywhere, and almost all argillaceous; where there are depressions it remains until it evaporates or is removed for purposes of irrigation. There is no drainage from the adjacent higher ground passing into the subsoil of the station. 11. The water supply of the station is derived mostly from wells, but at Colaba, where the well water is scanty and brackish, there are two covered tanks within the lines. The Vehar lake water will shortly be available for ample supply at Colaba. There are tanks all over the island of Bombay more or less, of various sizes, but none in the fort. There is, however, the fort ditch instead. The same also at Fort George, which has also a tank. There is no tank at Colaba, where the other barracks are. The tanks are filled by the rains and gradually become exhausted towards the end of the dry season. These tanks contain here and there water plants, shell fish, and a few little fishes, but for the most part they are kept free from all. The tanks used for bathing purposes in the fort are not used for drinking, but the water from most of them, when taken home, is used for domestic purposes. They are kept as clean as possible, and the first fall of rain is not allowed to enter those most used. No ill effect on health is apparently produced by the tanks of Bombay. 12. The water supply is generally ample, except at Colaba, as before stated, but the quality of the water in the wells varies greatly. It contains for the most part a large quantity of lime and brackish sea salt in addition. That which is drinkable, although not of the best kind, is not unwholesome. The water from the reservoir is almost pure. The means of raising the water is by ropes and buckets, and by Persian wheels at the tanks and wells, whence it is conveyed to the troops by water-carts, puckallies, and bheesties. The whole of the barracks, &c. should be brought into connexion with the Vehar lake main, and all existing tanks kept full by the same to meet possible occasional failure in the main pipe,

BOMBAY.

References to Subjects and Queries.	Replies.
I. Topography—*cont.*	13. There is nothing remarkable either in favour or against the climate of Bombay. It is for the most part very relaxing, but suits many Europeans much better than the dry atmosphere of the interior of the continent—children and persons rather advanced in life, and old residents in India. 14. New stations are generally selected by a committee of military medical officers.
II. CLIMATE.	1. There is an observatory at Bombay for conducting and registering meteorological observations. 2. Table of Meteorological Observations.

TWO YEARS of OBSERVATION, from JANUARY 1858 to DECEMBER 1859.

* Barometer 37½ feet above the mean sea level, and reduced to 32° Fahrenheit.

REMARKS as to CLOUD, DEW, WIND, STORMS, &c.

Winds.—From the beginning of June to the beginning of October the south-west monsoon prevails, and after a short interval of close muggy weather, is succeeded by north-easterly winds, which inconstantly alternate with north-westerly (sea) breezes through the cold season, and on from the beginning of March towards the monsoon, a period which embraces the hot weather. The land winds (north-easterly) are the most injurious to the inhabitants.

Tides.—The rise of the tide is usually 14 feet, and occasionally as high as 17 feet. Bombay is said by McCulloch to be the only port of consequence in India where the rise is sufficient to afford wet and dry docks. The harbour of Bombay is deep and capacious, with a safe though narrow channel, entered from the southward.

Rain.—The annual average fall of rain, which is almost entirely confined to the monsoon, may be put down at 78 inches, and the number of rainy days at 102. The evaporation of Bombay is excessive, and almost equals, it is said, the average fall of rain.

Barometer.—The average range during the whole year is very slight, 0·110 inch or 0·112 inch representing it. Occasionally in the cold months the daily variation is as much as 0·2 inch, and during the monsoon as little as 0·120.

3. The climate of Bombay, from its proximity to the sea, is generally more or less moist, in the rainy seasons particularly so, and with the exception of about three months in the year, viz., December, January, and February, is very debilitating. The streets are watered during the dry season, and the air is tolerably free from dust. The slaughter-houses and public necessaries situated at Boree Bunder, when the wind is from the eastward, affect the purity of the air in places situated close by. The number of sick among the troops in Bombay is usually above the general average. Drill and exercises take place generally in the cold weather. The native troops, from the dearness of provisions, cannot afford to feed themselves and families sufficiently well. The most healthy months are from January to June, the remainder being generally unhealthy; the prevailing diseases during the latter months being fevers and bowel complaints.

4. Malabar Point might with some expense be made a capital sanitarium for European troops, capable of accommodating from 250 to 300 men. Water is scarce, and must be supplied from the Vehar waterworks.

5. I have served at a great many stations, and may say generally that while the table land is good for healthy men, and the hills for those who are simply debilitated from intermittent fever, &c., yet the lower and coast stations are the best for children and old residents in India.

III. SANITARY CONDITION OF STATION.

1, 2, 3. Plans and sections are transmitted of Town barracks, Fort George barracks, Colaba barracks, and the depôt barracks.

III. Sanitary Condition of Station—*cont.*	5. In the town barracks ground floor, on the inner side, are arched doorways, and on the opposite outer walls windows with iron bars and plank outer shutters. On the upper floor there is a similar apportionment of doorways and windows, the latter in the outer wall having Venetian shutters opening outwards. In the Fort George barracks there are no windows, but door or window openings on opposite sides, with upper similar opposite ventilating openings. In the Colaba barracks the windows are on opposite sides and open inwards. On the western side they have glazed shutters, but on the eastern, plank only. In the depôt barracks at Colaba the windows are on opposite sides, having wooden bars and plank shutters, opening outwards. In the town barracks there is a verandah on one side only of the rooms, from $10\frac{5}{12}$ to $11\frac{3}{4}$ ft. in width, running round the quadrangle on the three sides occupied by the barracks. In Fort George barracks verandahs $11\frac{5}{12}$ ft. in width extend the whole length of the building on both sides of the barrack rooms. In the Colaba barracks verandahs 9 feet in width extend the whole length of each barrack on both sides of the rooms. The depôt barracks have no verandahs. The verandahs are never used as sleeping quarters by soldiers, or other persons, unless when there has been an unusually large number of sick. There are no jalousies or jhilmils in any of the barracks, but in the town, Fort George, and Colaba barracks the verandahs have plank shutters, which can be raised or let down as desired. The depôt barracks have fixed mat weather frames over the doors and windows.

III. Sanitary Condition of Station—*cont.*	6. The bedsteads used in barracks are iron cots, the bedding consisting of calico cases stuffed with straw, renewed frequently. No improvements are suggested. 7. No reply to this query. 8. In the town barracks iron cowls are fixed at intervals on the ridges for ventilating purposes. In Fort George barracks the ventilating cowls are of wood. In the barrack rooms also oval ventilating openings at intervals, high up in the walls, communicate with the verandahs. In the Colaba barracks there are lofty continuous ventilators with glazed shutters. In the depôt barracks the cowl ventilators somewhat resemble dormer windows. The means of ventilation are generally found sufficient, at least there are no complaints. The Fort George and town barracks should be provided with continuous ventilators along the ridges, if likely to be crowded with troops. The air of the barrack rooms is cooled by punkahs, those in Fort George are arranged on the most economical plan, so that six punkahs can be pulled easily by one man. 9. Barracks are constructed of stone and lime masonry with lime plaster, the roofs being teak trussed with double tiles. 10. In the town barracks the ground floor is laid with cut stone flags, about 1 foot above the ground, and no passage for air beneath. The upper floor is cut stone flags in rooms, and teak planking in the verandahs. In Fort George barracks the ground floor is laid with cut stone flags, about 4 feet above the ground, with no passage for air beneath, and the upper floor is composed of teak planking throughout. In Colaba there are three barracks with mud floors in the rooms, and cut stone slabs in the verandahs, and the other three are of cut stone slabs throughout. The whole is raised about 1½ feet above the ground level. There is no passage for air beneath. In the depôt barracks the floors are composed of mud raised about 1½ feet above the ground level, and having no passage for air beneath. 11. The materials used in the construction of barracks, huts, and tents are generally suitable for the climate, but at Colaba it is desirable (as lately decided by a committee) that all the barrack room floors should be raised at least 14 feet above the ground, the ground floor below to be used only in the daytime for dining and other purposes. The barracks and cantonments are kept in repair by the garrison engineer, and repairs are executed as circumstances will admit of. The walls and ceilings of barracks are cleansed and lime-washed about once in six months, but this is quite dependent on the barrack master, who might call for its execution if he pleased at shorter intervals. 12. In the town barracks the men's lavatory is 50 ft. by 20 by 10, with double bamboo mat walls and partitions, tiled roof, and cut stone floor. The water is supplied by bheesties, and it is drained by a channel cut in the floor all round the wall, which leads into the urinaries, and thence into the main drain. At Fort George barracks the lavatories are made in the rear and front verandahs with plank partitions, and pore bunder stone floors; the water is brought up by bheesties and put into barrels. The drainage runs into pipes and troughs, and so into the ditch. In the Colaba barracks there are six wash-houses, one for each barrack room, each measuring 53 by 12 feet, in which are placed water barrels for bathing purposes, supplied by bheesties. In the depôt barracks there is one room 22½ by 13 by 10 ft. which is divided in two by a mat partition, one of the rooms is used for bathing purposes, and the other is converted into a urinary. The bathing water is supplied by bheesties. Masonry drains are constructed to carry the waste water into the sea. 13. In the town barracks the cook-house is 45 by 20 by 9½ ft., and contains 27 fire-places, of brick and lime, with irons on a masonry platform 3 feet high and 3 feet wide; the roof is tiled and has an opening for the smoke to escape. The water is brought in by bheesties and put into water casks, the refuse water being conveyed away in a drain to the sea. At Fort George barracks the cook-house is 63 by 21 by 10 ft., and similar to that of the town barracks, and the water is supplied in the same way. The waste water is conveyed into the ditch behind the barracks. In the Colaba barracks there are four cook-houses to the barracks, each 28 ft. by 20 ft. by 7 ft., and the water is supplied by the regimental bheesties. The refuse water is at present thrown on the ground, where it evaporates or sinks in the soil. We are of opinion that cesspools for the refuse water and slops at each cook-house would be an improvement, and if made 3 ft. square and 3 ft. in depth would not be expensive, and could be easily emptied. In the depôt barracks the cook rooms are 34 by 12 by 10 feet and 15 by 12 by 10 feet, and the rest is similar to the above arrangement, excepting with regard to the refuse water, which is received into cesspools. There are regular washing places built on the esplanade for washing linen, with ground for drying, and also on the Byculla flats, three miles from thence. Many washermen take their clothes to wash several miles from Bombay. As far as the station is concerned I consider the washing places on the esplanade are sufficient. 14. In the town barracks the privy consists of plank seats, under which are drains, which can be flushed with water, the soil being thereby conveyed to the sea. Half the height of the walls is of masonry and the other half is composed of wooden railings. The roof is double tiled, there are two urinals attached to the lavatory, which are flushed by the water therefrom. In Fort George barracks the privy is nearly similar to the above in construction and arrangement, except that the railing and urinals are under separate roofs. In the Colaba barracks the privies are constructed on the sea beach, and the sullage therefrom is carried away by the tide, and in the depôt barracks the arrangements are the same as above. 15. The privies and urinals have tiled openings in the roof, which with doors and windows afford sufficient ventilation. The barracks are lighted at night by oil lamps suspended from the roof. 16. In the town barracks the rain water is conveyed away through a masonry drain to the sea, as also is the soil from the privy and urine from the urinals. The length of the whole is 811 feet and the breadth and depth from 1½ to 5 feet, and 1½ to 12 feet respectively, the distance of outlet from the barracks being about 250 feet. There are no cesspits for the reception of the waste water. In the Fort George barracks there are drains to convey the rain water into the ditch 72 ft. by 1½ ft. by 1½ ft., but no drains from the privies, which run into an open ditch washed by the sea, over which they are built. This ditch is always in a foul state, the cleansing by the tide not being sufficient, and there are no cesspits for the reception of the waste water. In the Colaba barracks the arrangements for draining and sewering appear upon the whole to be pretty good. A main drain runs the whole length of the barracks between the two ranges; this drain is covered and 2 feet square with a flat bottom, and at every 50 feet there is a trapdoor to admit of its being cleansed; the drain has also the advantage that the slab stone covering can be easily removed and replaced. I

III. Sanitary Condition of Station—*cont.*	empties itself on the sea beach at about 100 feet from the nearest barrack; into this main the urinals and washhouses all empty themselves of their refuse water, and there are two covered drains of an exactly similar description for the two rear barracks, but only 1 foot square; they empty themselves on the beach, and besides these there are open drains in all directions round the barracks, sufficient to carry off the rain water in the monsoon to the sea beach. There are two masonry covered drains, 1 foot square, one for each barrack, to carry all waste and rain water to the sea beach, about 125 feet from the barracks. The main drain in these barracks requires regular flushing to keep it clean, as for a greater part of its length the fall is slight. There is a small cesspool attached to these barracks for the use of the regimental quarter guard, about 200 feet distant from the nearest well or tank, 80 feet from the barrack room, and 300 feet from the hospital, and was emptied in March last by the engineer department; and in the depôt barracks the drainage is quite sufficient for all the purposes required; the drain from the washhouse empties itself into the drain for married men's barracks, and the waste water of the cook room is received into the cesspool, which is close to it, the dimensions of which are 4 ft. by 4 ft. by 5 ft., but at least 100 ft. distant from the nearest well, and 45 ft. from the nearest barrack; it is cleaned out periodically by the barrack department by having its contents carried away in tubs to the sea-shore. The drainage appears amply sufficient for conveying away both the surface water and the sewerage in all the barracks. All the barracks and hospitals must be more or less damp during the rainy season. All the fluid refuse is carried off into the sea. The main drain is a great nuisance, but it is situated at some distance from the lines. At Byculla the stench at times is scarcely to be endured. 17. The surface cleansing is efficiently done by sweepers, the rubbish being carted away and thrown into the sea, or distributed elsewhere out of the men's way. 18. The cantonment is generally free from vegetation, and there are no old walls, thick hedges, &c. interfering with the ventilation of the station, bazaar, &c. 19. The native town close to the esplanade is very defective in drainage, &c., but water can now be supplied to the bazaar from the Vehar waterworks. There is a municipal commission for regulating and preserving due cleanliness in the bazaar composed at present of the deputy commissioner of police, an officer of the Bombay engineers, and an European inhabitant; the engineer is appointed by Government, and the other two are elected by the bench of magistrates of whom the natives preponderate. The native houses generally are in a filthy condition, and until the municipal commissioners, who are believed to be energetic in remedying this, can effect the object, much ordure will remain within the precincts of the buildings, where it has been accumulating for years; this reply may be taken for all the other questions on the subject. Nuisance is experienced in the town barracks by the wind blowing over the densely-packed houses, also in the Fort George from the butchers' shambles and public necessaries about half a mile to the south, and the latter of which there is no means of remedying, but the town barracks are, it is believed, about to be given up for civil office purposes. 20. The slaughter-house is situated as above mentioned. The disadvantages of the lines of the native regiments, all of which are in this locality, may be here stated. The site is as bad as it can well be; close upon the northern extremity is a densely populated native town, proverbially unhealthy, close at the eastern face is a large fish and meat market, and separated from this by little more than the breadth of the railway, are the butchers' shambles and public necessaries above mentioned. On the south close by are large railway buildings, and what is particularly obnoxious is the washermen's tanks, where enormous quantities of clothing are washed, and where many of the washermen remain day and night. That which might be expected to be the best aspect, the one looking towards Back bay and the open ocean, has most of the sea breeze shut out from it by the bazaars, and there used to be formerly newly dyed cloths spread to dry in the direction, but this nuisance was some years ago, on representations being made, immediately put a stop to. The fact is that the island of Bombay is such a populous and commercial place that Government, it is believed, scarcely know where to turn for an open space of ground. 21, 22. No reply to these queries. 23. In the town barracks there are no separate married men's quarters; the lower story is generally used by the married non-commissioned officers and men. In Fort George barracks there are sufficient quarters in the front and rear verandah-rooms of the lower story for married non-commissioned officers and men. In Colaba barracks and in the depôt barracks sufficient married quarters are provided, and no married people are allowed to occupy any of the barrack rooms with the single men.
Officers' Quarters.	1. The officers' quarters in the town and Fort George barracks are in tolerably good sanitary condition, those of the Colaba and depôt barracks are in excellent sanitary condition; the drainage is effected by covered and open drains communicating with the sea either direct or by the street drains. Ventilation is effected by the doors and windows and no improvements suggest themselves at present.
IV. Health of the Troops.	1. The stations themselves are healthy, but the adjoining native population is crowded, owing to the houses being so close to each other without drainage or free air, and the excess in the number of inmates. 2. The diseases most prevalent are small-pox and measles at times, and cholera at others epidemically; the latter is often present in a sporadic form. 3. The circumstances to which unhealthiness of natives is attributable are filth and almost entire want of free circulation of air. 4. The 4th company 1st battalion of Artillery from Sinde arrived at Kurrachee, 29th December 1853, remained there till the end of 1856, when the company was ordered to Persia, where it was employed from 7th December 1856 till the 27th September 1857. It then returned to Kurrachee and proceeded to Hyderabad, arrived there 27th October 1857, left it again for its present station, Bombay, 23rd October 1858. In Sinde the men appear to have been pretty healthy, the average number of sick being about four or five per month; the prevailing sickness was intermittent fever. On arrival in Bombay (which they reached on the 9th November 1858) many of the men were impaired in health, besides a liability to return of ague, they have suffered very much whilst in Bombay from dysentery. The 2nd Grenadier regiment N.I. was stationed at Ahmedabad before coming to Bombay, was quartered there for 3 years and 2½ months, having left it on the 10th March 1859; the state of health of the
