METEOROLOGY.

General Remarks.—There is a marked variation in climate between the different parts of Ceylon. In the low-country, with a mean temperature of the order of 80° F., a noticeable feature is the small range of both temperature and pressure. There is, however, wide divergence between the moist conditions in the south-west of the Island, where the average annual rainfall varies from 100 to 200 inches, and the dry zone areas of the north, north-west, and south-east.

2. Inland, with altitudes reaching 8,000 feet, the temperature is cooler, and shows a bigger range. There is a corresponding change in vegetation, and the conditions are altogether more akin to those in the temperate zone.

3. *Rainfall.*—The highest annual rainfall registered in 1920 was at Watawala Railway Station, which had a total of 257·98 inches, and 203 days on which rain fell. The lowest annual rainfall was at Hambantota, which had a total of 31·40 in. in 121 days. The stations with highest and lowest average annual rainfall are, respectively, Carney estate, with 213·80 inches in 224 days, and Marichchukkaddi, with 33·22 inches in 57 days. The longest drought occurred at Puvarasankulam, lasting for 157 days, May 4 to October 7. The longest wet period occurred at Holmwood estate, lasting for 53 days, June 10 to August 1. The annual rainfall at Colombo (Cinnamon Gardens) was 90·73 inches in 189 days. At Kandy 94·29 inches were registered in 205 days, while the annual rainfall at Nuwara Eliya was 89·47 inches in 229 days.

June and November were the two months in which the rainfall was most noticeably above average, but examination of the annual totals shows that this year there is no one phrase that summarizes them all. The areas with more than their average rainfall include roughly the Northern Province, most of the North-Western Province, the western face of the hill country, and the low-country west of it (*i.e.*, parts but not the whole of Western Province, Central Province, and Province of Sabaragamuwa).

Galle and Batticaloa were both above their average, but the greater number of stations in the Southern and Eastern Provinces were not, and both Uva and the North-Central Province can show offsets in both directions.

4. *Temperature.*—The station showing the highest mean shade temperature for the year was Trincomalee, with 83·7° F., and the lowest Nuwara Eliya, with 59·3° F. The figures for Colombo and Kandy were 80·5° F. and 76·2° F., respectively.

The highest shade temperature recorded during the year was 98·5° F. at Trincomalee on June 23. The highest on record is 103·7° F. at Trincomalee on May 12, 1890. The lowest this year was 27·3° F. at Nuwara Eliya (6,000 feet above sea level) on February 23, which is the lowest since 27·1 in 1914 at the same station.

The highest shade temperature at Colombo in 1920 was 93·0° F. on March 26.

The mean daily range, *i.e.*, the difference between the mean of the maximum and the mean of the minimum, was highest at Nuwara Eliya (18·2° F.), and lowest at Galle 8·2° F. At Colombo and Kandy it was 11·4° F. and 15·1° F., respectively. The absolute range for the year, *i.e.*, the difference between the highest and the lowest readings actually recorded at any one station, was greatest at Nuwara Eliya (50·2° F.), and lowest at Galle (20·7° F.).

5. In no case did a station's mean temperature for 1920 differ by more than half a degree from its average derived from previous years. April was the month with the biggest deficit below average, and January and February were the two months in which temperature offsets were, on the whole, most uniformly above normal, though the biggest individual deficit also occurred in the latter, viz., Nuwara Eliya 55·4, or 2·2 below its average of 57·6 for that month, a result for which a number of distinctly cold night temperatures were responsible.

6. The arrangement of the tables differs somewhat from last year as the result of an attempt to condense more information into the same space. Averages up to date of temperature and pressure are included this year, and Table VIII. of last year (the climatic summary) has been omitted, though most of the matter of it has been included elsewhere. This year's temperatures are readily obtainable from Tables II. and III. by combining the offsets from average with those averages.

7. Similarly, maximum and minimum temperatures can be obtained from the mean values (Table II. and V.) and the daily ranges (Tables III. and VI.).

8. The duration of bright sunshine (an important item here) disappears from the Tables, but reappears in Diagram VII., and maps are given for average rainfall as well as for 1920. The composite rainfall map for the months—January–March and October–December—has been omitted, but this enables Diagram No. 1 to be included, the left half of which is of a type that was only discontinued during the war, while the right hand half of it (periods of drought and wet) is a new item.

TABLE X.—High Velocities of Wind at Colombo (Fort) during 1920.

This Table gives the times at which the highest velocities were recorded at Colombo (Fort). In the absence of recent Kew certificates for the instruments concerned, the numerical values below must only be accepted as approximations roughly comparable among themselves, but not precise. In cases where no velocity is given, it is estimated that at least 25 miles per hour was reached.*

RETURN OF PRISONS AND PRISONERS.

Replies to the Questions, compiled from the Returns of the respective Superintendents.

QUESTION I.

If the prison is on the separate system, is the separation complete? And if not, what is the separation enforced by day and night, respectively?

All the penal stage prisoners of the Island, if sentenced to over a month, are passed through one of the following jails:—Welikada, Kandy, Jaffna, Anuradhapura, Galle, and Batticaloa.

In these jails the penal stage prisoners are worked on the separate system. They are confined in separate cells, and are worked in stalls. They are marched from their cells to the stalls in single file three paces apart, and are not allowed to speak or communicate with each other at all. Prisoners not in penal stage are not worked on the separate system.

QUESTION II.

If not on the separate system, what provision is there for the supervision of the prisoners while in association ?

The males are supervised by male officers of various grades, and the females by matrons, in all jails.

QUESTIONS III. AND IV.

How many cells are there ; and how many associated wards ? Taking the *average* number of prisoners in jail, how many cubic feet of space are there for each prisoner during the hours of sleep ?

The quality of the water from the town supply is pure and good ; the river water serves the purpose of ablution, &c. There are twenty-four bathrooms in connection with the various wards of the asylum, supplied with hot and cold water, according to the requirements of the patients. The dry-earth system is in use in well-constructed latrines, in which metal pails are placed as receptacles for the excreta, and a quantity of coir fibre dust reserved for the purpose of deodorization. The latrines admit of the utmost cleanliness and ventilation, and are constantly whitewashed and disinfected. The sewage is removed twice a day and incinerated in the "Silchar Cinerator" at a distance from the wards.

Ingiriya.—Unlimited. A stream on a hill in the Crown reserve forest half a mile away has been dammed up, from which the water is being led into a reservoir in the hospital. Very good. HARBOURS.

QUESTIONS.

At bar or entrance, what is—

(1) The minimum width ?
(2) The minimum navigable depth, low water ordinary spring tide ?

(*Note.*—If between the entrance and the deep sea there are bars or shoals where a lesser depth occurs than the minimum indicated above, a list of such obstructions and of the depths over them (low water ordinary spring tide) should be given.)

2. In the approach channel from bar or entrance to berthing accommodation, what is—

(1) The minimum and maximum width ?
(2) The minimum and maximum depth, low water ordinary spring tide ?

3. What is—

(1) The rise and fall of tides—
(*a*) Ordinary springs ?
(*b*) Ordinary neaps ?
(2) The rise of ordinary neaps above low water ordinary spring tide ?

4. What is the maximum available depth of water—

(*a*) At piers or wharves low water ordinary spring tide ?
(*b*) In the case of enclosed docks in the entrance locks, if any, and at dock quays, high water ordinary neap tide ?

5. What are the respective lengths of piers, wharves, or (in the case of enclosed docks) dock quays, where the maximum depth of water, referred to in Question 4, exists ?
What percentage does the total of these lengths bear to the total accommodation at the port ?

6. What are the dimensions (length, loaded draught, and beam at that draught) of the largest vessels which, under existing circumstances, can be—

(*a*) Berthed alongside any pier or wharf (low water ordinary spring tide) ?
(*b*) In the case of enclosed docks—
(1) Admitted direct to ?; or
(2) Admitted through the entrance lock of any important dock or docks, high water ordinary neap tide ?

7. What are the dimensions (length, breadth, and depth over sill high water ordinary neap tide) of the largest dry dock or floating dock in the port ?

8. Are operations in progress to increase the depth of water—

(*a*) At the entrance and in the approach channel ?
(*b*) In the case of enclosed docks at the entrance lock, if any, of any important dock or docks ?
(*c*) At the principal berths to 40 feet at low water ordinary spring tide (in the case of the berths at enclosed docks, high water ordinary neap tide), and is accommodation being provided for vessels 1,000 feet in length and of 100 feet beam ?

If not, to what extent is deepening being effected, and for vessels of what dimensions (length, draught, and beam at that draught) is accommodation being provided or in contemplation ?

4. No enclosed docks. All vessels lie out under the shelter of the breakwaters, and are loaded or discharged from lighters. Practically all of the western half of the harbour within the limits of dredging has a minimum depth of 31 feet below low water ordinary spring tide, but the greater portion of this is 33 feet deep. The eastern half has a minimum depth of 27 feet, but a considerable portion is 30 feet in depth or more. The deepening of the harbour to 33 feet below low water ordinary spring tide over certain areas which are at present above that level is now in progress.

The proposal to dredge 250 acres of the north-western portion of the harbour to 36 feet, at a cost of £190,000, has been sanctioned, and a commencement will be made with this work when the dredger, which is now on order, is received.
