DEAR SIR,—In several of the later issues of the T. A. I have seen such enticing references to the exceedingly profitable growth and curing of the well-known Sumatra tobacco, at Deli, that it has made me very curious to know more about it; will you therefore be kind enough to answer me the following questions, and if possible to let me have a copy of the handbook relating to the place which I fancy I have seen referred to in your paper. 1. How far the tobacco district is from the nearest available seaport, and whether transportation is easy and relatively cheap?

2. The probable cost, in detail, of opening up an estate, for the purpose of growing tobacco, say of from 50 to 100 acres, whether the crops begin to pay during the first 12 months, and the usual clearance above working cost per acre per annum?

3. The labour question—Malays are probably employed? Whence obtainable and whether hard to obtain, what the average wages are, and whether such wages include rations?

4. Whether the land is cultivated by horse plough or hand fork?

5. Whether the necessary agricultural implements must be imported or are obtainable on the spot?

6. Whether the land is drained artificially or naturally.

7. The direct route from London, via Colombo or Singapore.

Faithfully yours.

O. MITFORD SURGEON.

Mr. Sugess will be booked for a copy of our Manual "All about Tobacco" in which he will find many of his requirements met; but we reprint his letter in order to attract the attention of our Correspondent (A. F.) in Sumatra who may notice the questions.—Ed. T. A.]

THE EAST BORNEO PLANTING Co., LIMITED.

The following report has been circulated among the shareholders of this Company, the first meeting of which is to be held at the Hongkong Hotel on the 26th inst.:-

Sandakan, 18th October, 1888.

E. M. L. E. Abrahamson & Co., Managing Agents of the East Borneo Planting Co., Limited, Singapore.

DEAR SIRS,—Herewith I have the honour to inform you that, after my inspection of the land situated on the Kinabatangan River commencing at Kampong Melapi and belonging to your company, I am convinced that the soil of said land is suitable for tobacco, and if the rainy seasons occur at the proper time there may be expected a good tobacco crop on your estates there.

During the five years I was planting in Deli on the same kind of soil as I find on your land, I had very good success on it, the soil consists of 'humus' about two inches thick, with whitish clay below it. It is very convenient that steam launches can come up the Kinabatangan River and up to the place I am opening for your Company, as that the great expense of making roads to the sea has not to be incurred.

I believe that the population, which is not very large, may, by good treatment, become of great assistance in cutting jungle, making ataps, &c.

It seems that the place is healthy enough for the coolies, as there is good drinking water to be had on the place and the land is high and dry.

In conclusion I may add that with the large labour force already on the estate we should be ready to plant as soon as the season sets in and be ready to receive the Chinese coolies in the middle of January, 1889. I remain, Dear Sirs, Yours faithfully, Signed T. VAN ETTRE, Secretary, Manager East Borneo Planting Co., Limited's Estate.—*Strains Times.*

SUMATRA TOBACCO CROP.

Review of the imports and proceeds of Sumatra Tobacco from the beginning of the cultivation:—

Unsold:—At Amsterdam, 6,659 bales; at Rotterdam, 1,082 bales; at Bremen, 271 bales. At Amsterdam 401 bales are expected.—*London and China Express.*

HIGH AND LOW-GRADE CINCHONA.

The editorial remarks in our issue of November 10 regarding the buyers of high and low-class cinchona bark at recent London auctions have apparently been appreciated in various ways by different purchasers. Messrs. Zimmer & Co., of Frankfort-on-Maine, for instance, upon the receipt of our journal containing the article in question, sent us a complimentary telegram, conveying their thanks for what they termed our "able and conscientious article." Mr. Thomas Whiffen, on the other hand, asserts that our figures, so far as his firm is concerned, appear to him incorrect, inasmuch as he purchased a much greater number of packages than we gave him credit for. Mr. Whiffen has handed us, by way of *preuves de conviction*, his contracts of the last two auctions, from which it appears that on November 6 he purchased one hundred and

* In the imported quantity of 1884 are included 12,328 bales lost by the Teucer.

† In the imported quantity of 1886 are included 388 bales lost by the Ober.

nineteen, and on October 23 forty-six packages. These figures coincide almost exactly with the record in our own catalogues, and the contracts further prove the substantial accuracy of the tables published in our article, as they show that we were correct in saying that Mr. Whiffen bought on November 6 seventeen packages of bark at prices ranging from 8d. per lb. upwards. What Mr. Whiffen appears to have overlooked is that in our tables we took no account of all barks sold at rates varying from 2d. to 8d. per lb., of which the bulk of his own purchases on that occasion consisted. We willingly point out, what every frequenter of the bark sales knows that Mr. Whiffen generally buys a very large proportion of high-class bark, notably of the Bolivian calisayas, which contain from five, six, or more per cent. of quinine, and that he rarely touches those low-grade parcels which swell the total of others firms' purchases to abnormal proportions. It should also be considered that the agents for the American and French works, who usually buy a large quantity of bark, represent not one or two but several firms, and that Messrs. F. W. Heilgers & Co. and Widenmann, Broicher & Co. buy each for two factories, the former for the Mannheim and Amsterdam and the latter for the Frankfort-on-Maine and Stuttgart works. And if we divide the quantity of cinchona purchased by the English makers at this week's auctions by the total number of factories represented by the seven manufacturers and agents present at the sales, we find that our English quinine makers must have acquired fully their share in alkaloidal value of the bark sold. We have prepared from our catalogues the subjoined table, showing the distribution of the bark disposed of at this week's auctions to the principal buyers:—

BUYERS	per lb.							Total
	Under 2d.	2d. to 4d.	4d. to 6d.	6d. to 8d.	8d. to 10d.	10d. to 1s.	Over 1s.	
Amer., French, &c.	—	37	78	15	387	40	75	632
B. & S. & Amsterdam	—	66	132	104	72	33	12	419
Auerbach ...	6	97	108	32	—	—	—	243
Brunswick ...	16	26	114	17	—	—	—	173
Th. s. Whiffen ...	—	—	81	9	5	—	—	129
Jobst & Zimmer	—	42	3	17	32	12	—	106
Howards & Sons	—	22	20	5	—	42	—	89
Sundry ...	—	22	32	4	—	—	—	58
Total ...	22	312	568	203	496	127	121	1,849

This table may be regarded as practically correct, and any deviation, which, for reasons indicated before, may exist in it can only be so slight as to leave the result substantially unchanged. The first column shows the number of packages purchased by the quinine makers at less than 2d. per lb.; the next, that acquired at from 2d. to less than 4d. per lb., and so on. As the average unit value at the auctions is placed at 2d. per lb., the first column may be roughly taken to represent bark averaging $\frac{1}{2}$ per cent., the second $\frac{1}{3}$ per cent., the third $\frac{2}{5}$ per cent., and so on, while the last column indicates barks ranging from 1s. to 1s. 5d. per lb., and therefore probably containing from 6 to 7 $\frac{1}{2}$ per cent. of quinine. The figures prove that the average alkaloidal standard of the cinchona sold at Tuesday's auctions was much above the recent average at London sales, and may probably be put down (allowing for the small weight of the packages of high-grade South American barks) at about 34 per cent. This high standard is caused by the comparatively small supply of Ceylon bark and the large proportion of rich South American and Indian barks sold on this occasion.—*Chemist and Druggist.*

PRESERVING EGGS.

[We do not know whether eggs ever have any cheap sea-on here, such as justifies their preserving in the East, but the following from the *Indiana Farmer*, may interest somebody.—ED. RURAL.]

It is necessary when packing eggs that they be fresh, and great care should be exercised in gathering them each day, to have them fresh and free from cracks. It will be useless for those not having a cool place to keep them to pack eggs.

There are several processes for packing eggs for keeping from 6 to 18 months. Cold storage is practised largely by shippers, and it may be interesting to all readers to know that eggs will keep a long time in a uniform low temperature without any artificial helps, but not many can avail themselves of this method, so I will confine myself to methods which may be practised on any scale.

THE SALT METHOD.

This method is known to most house-wives, and eggs packed in salt and kept in a cool place will keep six months and perhaps longer.

Place a layer of salt in any kind of a clean vessel, then a layer of eggs—small end down—another layer of salt sufficient to cover the eggs, and so on until the vessel is full, having on top a layer of salt.

THE LIME METHOD.

Perhaps the lime process is the one most used, and is probably the best process for keeping eggs a long time, as it will keep them 18 months, it is said, though I have never had occasion to keep any that long, and don't think any one else will have. Some just use lime, water and salt, but I will give a recipe which cost some people a large amount of money—so much that it seems too incredible to mention, although it is from a reliable source. Take 12 pounds of unslacked lime and take enough water out of 24 gallons to slack it, if the whole of the 24 is too much. When slacked put in the remainder of the water and four pounds of salt. Let it stand a few days, stirring several times each day, after which let it settle and then dip off the liquid. No matter if it is milky—it is better so—but do not have too many settlings in it. Then take five ounces each of baking soda, cream of tartar, saltpeter and borax, and one ounce of alum, dissolved in a gallon of boiling water, and pour it into the lime water after the ingredients are all dissolved. Pack the eggs and pour the liquid over them, or have the liquid in a barrel and put the eggs in as gathered, but be careful not to crack any of them. Always have the liquid over the eggs—leaving none exposed to the air.

When you want to ship them take them out and wipe off any sediment that may have collected, and pack them according to the distance and means of shipping.

THE SULPHUR PROCESS

Put the eggs in a light vessel, or what is better, put them in a basket which can be hung in a tight box. Put sulphur in an iron vessel, and put it in the bottom of the box; set in on fire, hang the basket over it and cover tightly, and let the sulphur burn for half an hour, then pack the eggs in oats, small ends down. If the oats be smoked also so much the better. This is called the "Ozone method" and is used in preserving everything that will decay. The reason it is so called is because a few years ago certain parties in Cincinnati so named it, and sold a pound of sulphur for \$2 as ozone. They were arrested as frauds, not because the process is a fraud, but because they sold the sulphur as ozone. A man told me recently that he had eaten peaches that had been submitted to this process six months before. It was at a friend's house, and she had prepared the peaches as for eating, by cooking them in halves and then smoking with sulphur, after which she packed them in jars and took them out whenever wanted. The evaporated fruit which we buy has all been submitted to the sulphur process. This is perfectly harmless and is worth a great deal to any one. If you buy fresh meat in warm weather and have any fears that it will not keep, smoke it with sulphur and it will not spoil. Sometimes there is a slight odor of sulphur for a few days, but it will pass away.

THE ACID PROCESS.

Dissolve salicylic acid in boiling water at the rate of one teaspoonful of acid to the gallon of water.

I say "at the rate" because it is not necessary to boil all the water, but only a sufficient amount to dissolve the acid. All the remainder of the water may be added cold. This solution is to be poured over the eggs in whatever vessel they are packed, and the vessel kept covered with blotting paper saturated with glycerine. This solution is harmless and one of the most pleasant and effective disinfectants known.

DRY EARTH PROCESS.

A correspondent in Illinois, says: "Last summer I was induced to try packing down eggs for winter use. I had tried liming them, but a limed egg is not altogether to my taste. Last summer I took clean, swart kegs, set them in a cool, dry place with a barrel of powdered dry earth close at hand. In the kegs I placed a layer of this earth, then a layer of eggs, small end down, and so on until the kegs were filled. These eggs were quite good six months after packing. I advise turning the boxes containing dry packed eggs frequently, to keep the yolks from settling to the shells. The object in packing eggs with small ends down is to obviate this and perhaps it effectually does so.

There are many other methods of preserving eggs. Anything which excludes the air will preserve them, if they are kept in a cool place. Some grease the eggs with lard, but I should think that they would get rancid if kept long, and they are also tedious to clean if wanted for sale and always show that they have been greased. A very nice process, but tedious, is to take one part of white wax to two of spermaceti and melt them together. Rub each egg with fine rice starch—perhaps pulverized corn starch would do—then wrap it in strong tissue paper, putting the small end down, and twisting the paper at the end like you see lemons wrapped sometimes, leaving an inch or so of the paper to lift the egg up. Dip each egg thus wrapped into the melted wax, and when cool pack them in sand or sawdust. It will pay the farmer's wife who lives near a good market to pack eggs in this way, because the starch prevents the wax from touching the shell, and she can sell the eggs at the highest market price, because they would not show that they had been packed, and she could sell them in quantities small enough to disarm the suspicion that they had been packed, and there would be no cheat about it if all the eggs were good.

This method took the second prize at a show at Birmingham, England, for eggs that had been kept six months, and the eggs had to be sent to the secretary in time, so there could be no cheating. They were adjudged to be nearly as good as those that took first prize, and the first prize eggs had been packed in salt.

In packing eggs in anything but liquid, never allow the eggs to touch one another, and when using acid do not use a metallic vessel.

In using the wax process I should think it better to dip the eggs in water before putting them in the starch as this would cause the starch to stick better while wrapping the paper around them.

—Rural Cultivator.

TEA A GOOD CORDIAL.—Over 150 years ago Thomas Short, M. D., gave to the world a dissertation upon tea, explaining its nature and properties. Among the many virtues accorded the famous leaf he declares tea to be a good cordial. "As *Tea* cleanses and strengthens the Vessels, restores the natural Consistency of our continued Food, and preserves or restores a due Circulation, where in all the Functns are made to cease, their respective Strainers, and therefore a good Cordial, opens the Heart, revives and increases the Spirits, makes the Body light and lively, dispels the Clouds and that Drowsiness which hangs over the Eyes, a good Cordial for an loaded Vessel of the Brain, whereby the animal Spirits, being either not separated, or shut up in their Cell, and not propelled by the very Pulsation of the Arteries upon the small Nerves, the Muscles flag and fall back, are lazy and inactive."—*American Gazette*.

A DESTRUCTIVE SCALE INSECT, ITS RAVAGES AND ITS PARASITE, are these noticed in the *Queenlander*:—By the last mail arrived in South Australia Mr. Albert Koebele, Assistant-Entomologist to the United States Department of Agriculture, deputed by that body to visit Australia and inquire into the history and habits of the *Icerya Purchasii* and its parasites, as well as to pick up information generally concerning all kinds of coccide and other pests affecting the industrial products of the colonists. The *Icerya Purchasii*, it may be remembered, was supposed to have been introduced at the Cape of Good Hope some few years back, and within a very short time it increased so enormously that the insects utterly destroyed all the orange-trees in that colony, from which trees previously the colonists had derived a very considerable revenue. Not only did it attack the orange-trees, but many other plants also, and nothing could be done to resist its ravages. Since the ruin of the orange orchards of the Cape of Good Hope the *Icerya Purchasii* has appeared in the Southern States of California, and at Santa Clara, where it first appeared, the trees are in a dreadful state. They are so loaded with the insects as to appear a white mass, visible at a long distance, and all over the States the *Icerya* is spreading so alarmingly that it is only a question of a very short time when the trees will be all dead unless the natural enemy of the insect can be introduced. It is due to Mr. Frazer S. Crawford of this Colony (says the *Adelaide Observer*) that the discovery was made of this enemy, which proved to be a minute two-winged fly, which deposits its eggs within the body of the *Icerya*. The eggs produce maggots which live upon the juices of their host, ultimately change into chrysalides, and finally emerge as flies which again attack fresh coccids. Mr. Koebele has been successful in obtaining chrysalides of the fly, and is making arrangements for forwarding a succession of consignments to California.—*Queenlander*.

A FRENCH AGRICULTURAL CHEMIST, and a practical one as well, claims to have found out a new artificial manure in fluete of lime. For three years he experimented with it on wheat, maize, potatoes, clover, &c., comparing the results with similar treatment on the same plants with phosphates and potash. He is decidedly of opinion that fluorine is necessary to organic health. It is certain that fluorine is always found associated with the higher organic life, perhaps it is even important to healthy organic life. If so, have we not neglected to take this into consideration. If either an animal or plant is well fed on certain necessary food, and starved for want of only one, it is very likely that illness or decay supervene. It is absolutely certain that fluates are necessary to higher animal organisms. They are all-important in the formation of good natural teeth—to begin with. And everybody will agree that good teeth are desirable—natural, of course, in preference. Without them the mastication is deficient, and the overworked stomach gives way to dyspepsia. Therefore, any natural chemical substance which constructs good teeth should be partaken of. But we cannot eat fluete of lime. We must allow plants first to partake of it and then partake of the plants. That is the only and legitimate way of getting it into the human system, and eventually of concentrating it into the human teeth and hair. Perhaps the reason most of our young men are getting prematurely bald is because of the want of fluorine in their diet (it cannot be because of study). It is a shocking thought. Moreover, baldness acts on their good nature. Doubtless one reason why some young men keep their hats on in a public meeting or at a lecture (even when ladies are present) is because they are bald headed. Treat your own teeth, and watch your hair, the result will be very remarkable.—Dr. Taylor in *Australian*.

CINCHONA BARK AND QUININE.

Not reassuring to Ceylon owners of cinchona trees for the bark of which they expect high prices, is the article we quote from the *Chemist and Druggist*, in which quinine at one shilling per ounce is anticipated! We fear the vaticinations regarding Java as becoming ere long the great bark producer of the world, that bark being of superior quality, may be accepted as correct. The alkaloidal value of the Ceylon bark is, doubtless, largely diminished by the large proportion of poor twig bark which our planters persist in exporting. But Java and Bolivia grow better kinds than those which have been so largely cultivated in Ceylon and India, as is evident from the comparisons made. The yield of quinine sulphate in the various barks is stated to be:—

Java	416	per cent.
Ceylon	2 $\frac{1}{4}$	"
India	2 $\frac{1}{2}$	"
Bolivia	4 $\frac{1}{2}$	"

As the climate and soil of Java and Bolivia seem specially suited for the production of the best species of cinchonas, there seems no encouragement to Ceylon planters to persevere in the competition for the supply of the bark market. Our contributions to it, hitherto so enormous, are likely to become "small by degrees and beautifully less," while those from Java, chiefly *ledgeriana*, go on increasing. What we have specially to guard against is the repetition in the case of tea of the process of production in excess of demand which swamped the quinine market.

CHINA AND JAPAN TEA EXPORTS 1888-1889: GOOD PROSPECTS FOR CEYLON PLANTERS.

Our planting readers will remember that when we last wrote on this topic we estimated the export to Great Britain for the current season at 105 millions of pounds, against the London estimate of 100 millions. We have received the China and Japan statistics to the end of the year, and a consideration of the figures satisfies us that we overestimated the probable supply. They unmistakably point to the season's export to the United Kingdom being under 100 millions instead of over that figure: it will probably be 96 or 97 million lb. By the subjoined returns it will be seen that the export to the end of the year is only 93,916,735 lb. against 111,479,462 lb., a deficiency of 17 $\frac{1}{2}$ millions. Last season 11 millions of pounds were shipped between the 31st Dec. 1887, and 31st May of last year, the latter date being the end of the season; but no such quantity can be shipped this year during the same period, as the stocks at all the shipping ports are reduced to insignificant proportions. This season's deficiency comprises 2 $\frac{1}{2}$ millions from Canton and Macao, 10 millions from Foochow, and about 5 millions from Shanghai and Hankow. Considering the large decrease in the exports last year as compared with the previous one, the falling-off in the China supply is remarkable and very encouraging to Ceylon producers. For it is evident, that during the first half of this year, at any rate, there is every probability of the supply of tea to the United Kingdom not being equal to the deliveries up to the 31st May:

Export from China and Japan to		lb.
	United Kingdom	...1888-9 93,916,735
"	"	...1887-8 111,479,462
"	"	...1886-7 138,713,929
"	"	to America ...1888-9 55,576,373
"	"	...1887-8 53,773,077
"	"	...1886-7 60,125,753
"	"	to Australasia...1888-9 23,993,924
"	"	...1887 8 23,043,186
"	"	...1886-7 19,453,498

The increase to the Australian Colonies is certainly not a satisfactory feature to Indian and Ceylon planters who are anxious to win the Southern Colonists from the "posts and rails" of inferior teas chiefly imported at present. In our own case, the exports to Australia are slowly but surely improving in quantity, as the following figures will show:—

Exports from Ceylon to Australia.			
1st Oct. 1886 to 10th Jany. 1887	=	49,082	lb.
Do. 1887	"	1888	= 106,311 "
Do. 1888	"	1889	= 363,403 "

But this is the day of small things; we want to see exports by the million lb. a month to Adelaide, Melbourne and Sydney from Colombo; and if as "old Colonist" says there is an "unlimited" demand for Ceylon teas at 1s the lb. in bond at Melbourne, there ought very soon to be a rapid increase in our shipments.

ESTIMATES OF CROPS FOR SEASON 1888-89.

In the *Overland Observer* of 3rd October last year, at the opening of the current season, we gave our estimates of the total Exports for 1888-9 as follows:—

Tea	32,000,000 lb.
Cinchona Bark	9,000,000 lb.
Cocoa	17,000 cwt.
Coffee (less than)	100,000 cwt.
Cardamoms	250,000 lb.

Our contemporary as the result of recent inquiries and with the advantage of referring to the exports for one-quarter of the season which has expired, as a guide, arrives at the following estimates:—

(Local "Times" Jan. 11th.)	
Tea	34,000,000 lb.
Cinchona Bark	9,000,000 lb.
Cocoa	14,000 cwt.
Coffee	80,000 cwt.
Cardamoms	220,000 lb.

It must be confessed that this is a singularly close approximation to the information we afforded over three months ago.

Since October, we have been instituting an elaborate inquiry, district by district, more particularly with reference to cinchona bark, and we have received a large amount of valuable information which will shortly be discussed. From remote districts, some of the returns only reached us a few days ago. It is too soon, therefore, to revise our October estimates, but as advised at present, we scarcely think that they need much alteration unless it be that we should bring Cardamoms down to 200,000 lb. But the result of our inquiry in respect of "bark" cannot fail to be interesting, even if not conclusive as to the quantity remaining in the country.

RAINFALL AND TEA YIELD ON AN ESTATE NEAR NANUOYA, BETWEEN 5,700 AND 5,800 FEET ABOVE SEA-LEVEL.

The averages established by six years' measurement of the rainfall at Abbotsford upper bungalow (which the railway levels show to be considerably under the figure of 5,800 derived from aneroid observations) are, in round numbers 92 inches, of rain.

Year	May	Rainy days	June	Rainy days	July	Rainy days	August	Rainy days
1883...	11-61	11	7-93	22	16-77	25	15-00	29

The heaviest rain we have ever had on Abbotsford was on the 24th, 25th, and 26th June last year, when 7-55, 5-86, and 3-12 respectively fell, or a total of 16-53 in three days.

FROM A LONDON CORRESPONDENT ON THE TEA TRADE.

The tea trade has of late years made rapid strides, and, with the increasing supplies from the new grounds of Ceylon, seems likely to further extend. We hear often what beautiful tea comes from Ceylon, but it seems that little of it gets further than Mincing Lane. Complaints are continually heard from the public that good tea generally, but especially pure fine China tea, no matter what price is paid, cannot be procured excepting perhaps at a very few establishments, where the proprietors covet reputation more than exorbitant profits. One sees on all sides "Pure Ceylon," "Pure Indian" teas advertised in the shop windows from 1s 4d to 2s per lb, but if samples of these teas are procured and examined, it will be discovered that in very many cases, neither the so-called "Ceylon" or "Indian" samples will represent what they are professed to be, but that the majority of them will contain a small percentage of Ceylon or Indian teas and a large admixture of very ordinary China tea.

The reason of this is plain enough—the class of China tea mostly used here has the last few years so fallen off in quality that the average price has also declined to a very low standard. Ceylon and Indian Teas, the latter especially, are dearer, so by an admixture of low priced China Tea, a larger profit is obtainable by the grocer. Ceylon Teas, from their fine soft, rich mellowness have become universally popular, and are much asked for, but from the free adulteration of the genuine article, the public do not get a fair chance of judging them.

Comparatively very little China Tea over 1s per lb. has been sold the last year or two for home trade, and in public auctions for the last five months we

gather from a circular of Messrs. Hawes & Co., that out of a total of 313,000 packages Congous (red and black leaf), 72,000 packages have sold at or under the low figure of 5d per lb. The bulk of the better pure China Congous (by pure, we mean teas free from burn and not tarry) at from 9d to 1s 6d per lb., and the fine and choice Congous at from 1s 6d to 2s per lb. have been shipped, the home trade demand, chiefly running on teas for price, viz. 3½d to 1s per lb.

Ceylon and Indian teas are almost entirely sold by auction; the average price of the former for last season being about 11d to 1s 1d per lb. and of the latter about 10d. to 11d. per lb. the bulk of which goes into home consumption. It will be apparent, therefore, that at the retail prices generally charged for any kind of tea, say from 1s 6d, to 3s per lb. pure good teas of either description Ceylon, Indian, or China, ought to be supplied, or good blends, leaving very handsome profits to all parties. This, however, is not the case as the public find to their cost. The brokers and wholesale dealers receive little of the plunder—the former their commissions of one or half per cent., and the latter an average profit of ¼d to 3d per lb. according to the quality or scarcity of the article. The large profits fall to the grocers and small retailers whose gains average from 2d to 1s per lb. or more, depending on the neighbourhood and class of customers they serve. Why should such wholesale deception be allowed in an article of such universal consumption as tea? Why do not the authorities protect the consumers of tea under the Food Adulteration Act, as well as the consumers of butter, cocoa, coffee, and other produce? Where blended teas are sold, whether in packet, or loose over the counter—the wrapper should clearly state it to be a blend or otherwise—whether of China, Ceylon, Indian, or Java it would not matter—but if the public wish to judge for themselves the several qualities of the above growths they should be able to do so, and not when they ask for a pound of really fine China or Ceylon tea receive a packet containing a very common mixture.

The authorities, we presume, have power to inquire into these public frauds, and it is surprising that the public prosecutor has not moved in the matter before. It would be easy for him to procure samples which are sold distinctly under certain headings, such as "Choice Moning," "Pure Darjeeling," "Pure Ceylon Souchong," "Rich Saryune," &c., and employ an expert from Mincing-lane to report on them, and where deceptions are found to exist prosecution should follow. Teas of good average quality of either growth can be sold pure for the moderate retail price of 2s per lb. and fine to choice teas for 2s 6d per lb and upwards, but the public unfortunately encourage cheap blends and the use of common sorts, by demanding teas for price, say from 1s 2d to 1s 8d per lb. Good useful blends should be procurable for 1s 9d to 2s per lb, but no choice pure teas of any growth can be retailed, with fair profits to all concerned, under 2s 6d per lb and upwards.

We rarely see "Pure China Congou" advertised. Fine and choice China teas are mostly bought for Russia, and the little remaining here naturally commands high prices. To retail these teas pure at present prices would leave only a small profit; the grocers therefore prefer a judicious mixture of Indian and Ceylon; with fair ordinary China teas making a flavory liquor, which they can sell as Indian, Ceylon, or China, or as a blend, and make a large profit. Very little fine China is sold now, although continually being asked for, but other teas substituted. Invalids wish to buy it on account of the fine delicate flavour, and from its being known to contain much less tannin than teas of other countries, it is more digestible and is strongly recommended in preference to Indian teas by most medical men of high standing.

We trust that the attention of the public prosecutor may be awakened to the matter, and the public may hope to obtain—if they order and pay for either China, Indian, or Ceylon tea, to get the genuine article.—"Ceylon Advertiser."

STATISTICS OF TEA :

REMARKABLE ADVANCE IN THE CONSUMPTION OF THE CEYLON PRODUCT.

Messrs. Gow, Wilson & Stanton, having no actual sales to report in their Circular of 28th December, summed up the quantity brought to auction in the expired portion of season 1888-89 (the tea season runs from June to May) as compared with figures for the same period in 1887-88. The increase in the three extra-China kinds has been very considerable, more especially in the case of Ceylon. Of Indian kinds the packages this season numbered 638,045 against 589,092, an increase of 48,953. Of Java there were 29,524 packages against 19,621, an increase of 9,903. The relative increase in Javas exceeded that of Indians, but the advance in Ceylons casts both into the shade, the figures being 204,336 packages against 122,700, an increase of not less than 81,626. The tea consumed in Britain in similar periods rose in the case of Indians from 37 per cent of the whole in 1886 and 44 in 1887 to 45 in 1888. It will be observed that instead of a rise of 4 percentages between 1886 and 1887, the increase on 1887 is this season only 1 per cent. The contrast in the advance of Ceylon kinds is wonderful. The consumption in this case rose by leaps and bounds from 4 to 6 per cent of the whole, and then from 6 to 12. The latter figure means that nearly one-eighth of all the tea taken for consumption in the United Kingdom in the latter half of 1888, was the produce of Ceylon. In this period Indians and Ceylons together constituted 57 per cent of the whole consumption, while China went down from 59 per cent three years ago to 43 per cent in 1888. Increased consumption of Indian and Ceylon teas, as a compensation for lowered prices, would be much more satisfactory, however, if the figures for deliveries in the periods between June and November did not show the almost stationary character of consumption of tea generally in Britain, in those months. If we were to take the figures for deliveries in the six months, June-November of 1888, as a true indication of the rate of consumption of tea during the subsequent months of the year, we should be forced to the conclusion that for the present it has reached its limit. The figures for the six months of 1886 were 115,646,000 lb.; in 1887 there was a decline to 103,504,000; while 1888 showed only 115,610,000 lb., or 36,000 lb. less than in the 5 months of 1886. It was only the greatly reduced import of China, down to 69,751,000 lb. against 104,225,000 in the 6 months of 1886, that prevented an increase in stocks. In those there has been actually a slight decrease, which is the satisfactory element in the figures. In total imports the decrease was from 148,550,000 lb. in 1886 to 135,290,000 in the six months of last year. Looking at the rate of increase in previous seasons, we may hope that the deliveries in the latter portion of season 1888-89 may show a considerable increase on the first six months. For the three full seasons ending May 1885-86, 1886-87, and 1887-88, the advance in deliveries was represented by such figures as 207,850,000 lb., 221,140,000, and 218,200,000. It would seem as if the deliveries of 1886-87 were slightly in excess of demand, judging by the falling-off in 1887-88. The average of the two last seasons, however, is nearly 220,000,000 lb., against only 207,850,000 three years previously. This looks well for the future. The monthly deliveries of Indian in the present season rose from only 5,600,000 lb. in June to 8,926,000 in October and 8,642,000 in November. The imports of Indians in the latter months had been very large, no less than

15,563,000 lb. in October and 11,437,000 in November. The stocks of India had increased from 20,149,000 lb. in June to no less than 33,595,000 in November.

For the three seasons 1885-86 to 1887-88 imports of Ceylon tea had increased from 5,059,000 lb to 8,060,000 and up to 14,705,000. The deliveries were in good proportion:—3,933,000 lb., 7,744,000, and 12,578,000 lb. The stock of Ceylon at the end of May 1888 was 4,617,000 lb. In June it had gone up to 5,163,000, and in August the figure rose to 5,233,000 lb. but it is satisfactory to see that by end of November the figure had decreased to 4,622,000. The increase in deliveries of Ceylon in proportion to import was, therefore, considerable. The largest import of Ceylon tea in any one month since the commencement of the enterprise was 2,412,000 lb. in August, 1888, each of the two previous months having shown figures exceeding the two millions. The highest monthly delivery of Ceylon tea as yet was 2,266,000 lb. in July 1888, August following with 2,116,000. For the 6 months June to November 1888, the deliveries of Ceylon tea were 11,625,000, or less than a million short of the whole quantity for the previous 12 months, so that it does not seem unreasonable to calculate on at least 25 millions of pounds, up to 30 millions? for the season ending May next, if the taste and demand for our teas develop in the near future as they have done in the near past. We are producing at such a rate, however,—India and other countries also progressing, that it is evident efforts to open and cultivate new markets for what is now our staple export product, ought not to be slackened, but rather put forth with more vigour, and persistency than ever. We are gradually gaining a footing in Australia, and to some extent in Canada, but the United States market has been but very partially opened to our pure and delicate-flavoured teas.

The Circular of 4th January 1889, since received, does not materially alter the figures, only 4,508 packages of Ceylon tea having been sold, at so low an average as 10 $\frac{3}{4}$ d. per lb., the average for 1888 having been 11 $\frac{1}{2}$ d. Let us hope that as the year advances a better demand with improved prices may set in. Looking at deliveries of Ceylon tea in the last 7 months of 1888, equal to 12,833,000 lb., we may fairly expect, a monthly consumption of 2 $\frac{1}{2}$ millions of pounds at least in 1889.

DRUG TRADE REPORT.

LONDON, Dec. 27.

The shipments of bark from government and private plantations in Java in October were 365,855 Amst. lb. bringing up the total since July 1st to 1,430,967 lb. against 1,646,379 lb. in the same period of 1887.

THE DUTCH MARKET.

AMSTERDAM, Dec. 22.

CINCHONA.—The aggregate offered at the ten periodical auctions in 1888 amounted to 18,216 packages, of which 4,458 packages were bark grown in the Government plantations, Java; 13,571 in private plantations, Java; 162 Ceylon bark, and 26 Sumatra bark; containing an average of 43 per cent quinine (calculated). Adding to the above 13,571 packages what has been imported in this month, the estimate by an issue of December 31st 1887, of 10,000 packages as the probable total importation of private cinchona bark in this year is confirmed, or, rather, surpassed by 300 to 400 packages. You will remember that there was a London broker who called that estimate exaggerated. In the winter, it is not likely to leave the probable importation of private bark in 1889 was estimated at 20,000 packages. There is reason to suppose that this estimate also will be found correct; whilst the reduction in quinine will certainly not decrease.—*Journal and Dec. 22.*

MORE ABOUT CEMENT.

A short time back we discussed in this journal the question of the practicability of superseding our large import of Portland cement by local manufacture. What we wrote with respect to this matter attracted the attention of a friend now at home, who took an opportunity of asking Mr. Leake,—who is prominently connected with the Tunnel Cement Works, his views regarding it. It is news to us to learn that correspondence had already passed between Mr. Leake and parties in this island in which this topic was discussed; and it is singular to learn that the result of the discussion showed that the main difficulty which would appear to quite prevent local competition with the home production of cement, is an economic one.

In our first article, to which we have above referred, we wrote that it was a fair presumption that the chief basis of all artificial cements—viz. chalk—being absent from this and other tropical countries, was the main reason why their manufacture had not been attempted locally. We find this presumption, however, to hold good, but in part only. It does not seem to be contested, that coral lime, which is an almost pure carbonate, might form an efficient substitute for chalk as the basis of such manufacture, but figures showing the cost of the burning such lime supplied to Mr. Leake conclusively demonstrated that it could not be made to compete in the matter of cheapness with the use of chalk. Now Mr. Leake's experience with the manufacture of cement in England has been exceptionally great. The outturn of the Tunnel Cement Works is very large, and its works are so located as to be able to obtain their supply of chalk under very favourable conditions. Mr. Leake told our friend that from the hill above his works this material could be almost thrown down into the kilns. No cost for its transport had therefore to be incurred, while the further fact that the works are by the riverside, so that barges can bring up the clay and take away the prepared cement to and from the factory, furnishes a great additional facility for very exceptionally cheap manufacture. The competition in the production of Portland cement in England is so great that it is only in places where great facilities such as we have named exist that prices can be kept so low as to ensure a free market. In estimating the chances for the manufacture of cement in this island and in other tropical countries competing successfully with that of Great Britain, we find, therefore, that at the outset those chances would be heavily handicapped. The only set-off we could anticipate to counterbalance in any degree this disability would be the saving that could be made on the sea transport of the cement and that which might fairly be claimed for the lessened liability to the deterioration to which it is known cement is exposed from long keeping and change of climate. When we come to consider all the circumstances, we fear such savings could hardly make up to us for the striking advantages possessed by English manufacturers. These have their raw material piled above their kilns in huge masses which can be thrown down in enormous quantities at the mouths of the kilns almost, with the expenditure of a minimum of labour. The stick coral, from which most of our lime—at least upon the coast—is burned, has to be laboriously collected over what is—relatively to the English supply ground—an exceedingly wide area, and all of it, when collected, has to be carried either by water or by coolies to the burning places. Although exceedingly light, stick coral is very bulky, and it can readily be seen how difficult it would be,

quantity for quantity of yield, for such a material to compete successfully as to cost with the vast chalk supplies of Europe even if the items of collection and carriage had alone to be dealt with. When we have to add to these items the further one of relative cost of fuel, the difficulties in the way of making cement in Ceylon to compete with our present source of supply became still more crushingly increased.

Year by year our stores of timber available for fuel are decreasing and have to be drawn from annually increasing distances. It is not probable that, even at the present time, the cost of this item of fuel for preparing the cement in this country could bear a favourable comparison with that of the coal used at works situated as are the Tunnel Cement Works, when it can be laid down probably for something like ten shillings or twelve shillings the ton. Both as regards the main raw material therefore and the fuel for burning it, we must see that Ceylon, in any endeavour to compete in the production of cement, must be "out of the running." It has been urged, however, that the cost of packing the article for export would be saved to the local manufacturer; but cement is such a delicate substance, and parts with its strength so readily if exposed to air, that it would probably be incumbent on producers here to pack it almost as carefully for a day's journey as it is necessary to do for an ocean voyage. We felt much interest in this subject when it was first mentioned to us, as it seemed that it might be practicable to add the manufacture of cement to the list of those industries which we would desire to see undertaken in Ceylon. But facts are stubborn things, and so long as Europe possesses chalk and coal in their present abundance, so long will it be certain that we must regard it as impossible that we could locally prepare cement here at anything like the cost at which it can be obtained from home. It is one of those cases in which economic conditions upset all theory, however at first sight apparently sound.

Many centuries ago the natives of Ceylon were able to make and use very good cement in the constructions of tank spills and sluices, and of anicuts across rivers like the *tekkam* on the Aruvaru, above the Giant's Tank. But Portland cement was then unknown. It is now produced so cheaply, carried across the ocean at such moderate rates of freight, and is of such surpassingly good quality, that no question arose as to its being the best material to use for the construction of a new spill when the Government of Ceylon resolved to restore the great KALAWEWA irrigation work, the spill being the key of the whole enterprise. We gave Mr. John Hughes a specimen of concrete from the tekam to analyse, so that we shall hear something from the chemist about its constituents and quality. We have little doubt that the ancient builders in the North-Central and Northern Provinces were sagacious enough to prefer the "fat" lime resulting from burnt coral to the product of the ancient dolomite rocks, largely vitiated as the latter are with magnesia.

NOTES ON PRODUCE AND FINANCE.

Members of the tea trade in the United States are on the alert as to the coming Indian and Ceylon tea "boom" in America. Several dealers have recently arrived in London from New York, with a view, as one graphically puts it, of "sniffing around." Unless the syndicate which has the matter in hand sets about work speedily, the Americans themselves will save them the trouble. This would be quite a happy way out of the difficulty.

The guarantee fund of £2,000, required in connection with the scheme for selling Indian tea at the Paris Exhibition, has been more than subscribed; in fact, we believe that the sum guaranteed reached £3,000. After this, who shall say there is no enterprise among tea garden proprietors. We shall now look for the establishment of a home for decayed planters and possibly an orphan asylum.

We hear a great deal about Natal tea and its wonderful future, and not long since we inspected a packet of tea which was called "African," but which was unmistakably Java. One would think that all the sugar planters of Natal had suddenly gone wild over tea to hear some people talk. At any rate, the Mining Lane Market has nothing to fear just yet from a glut of tea from Natal, for the Natalians will find a very good market in South Africa if they make good tea.

At meeting of the Brahmapoetra Tea Company Limited, to be held on Jan. 2 next, a dividend of 5 per cent. on the whole capital of the company, on account of the profits of the company's business during the year 1888, will be declared.—*H. & C. Mail*, Dec. 28th.

PURPULINE TRIED IN CEYLON SOME YEARS AGO.

Learning that some years ago Messrs. Delmege, Reid & Co. got out some "purpuline"—no doubt allied to "London purple"—we endeavoured to trace its history with the following results:—

(From Mr. A. Forsyth of Messrs. Delmege, Reid & Co.)

Colombo, 17th Jan. 1889. — We had some "purpuline" some years ago. Some was sold in April 1881 to Mr. James Irvine, in July 1881 to Messrs. George Steuart & Co., and in June 1882 to Messrs. Lee, Hedges & Co. What the results were I never heard. It was sent out as a remedy by for leaf-disease in coffee, and was highly cracked up its makers. As far as I recollect it was said to be good for all pests.

(From Mr. Hedges of Messrs. Lee, Hedges & Co.)

The purpuline we purchased in 1882 was sent to Mr. Grant of Pitaratmalle estate, Haputale. I am not able to state as a fact that it proved useless as a remedy for leaf-disease or bug; but I am morally certain that it did, otherwise Mr. Grant would have reported any favorable result of his experience to us.

(From Mr. Grigson of Messrs. Geo. Steuart & Co.)

Colombo, 17th Jan. 1889. — The purpuline referred to was sent up to *New Nilambe* to be used as an antidote to white ants which were attacking the young cacao plants. That was in July 1881, and the following month the agency of the estate passed from us into the hands of Messrs. Lee, Hedges & Co. We have therefore no records to show what effect the purpuline had. Messrs. Lee, Hedges & Co. will probably be able to give you the required information.

Nothing was ever heard of benefit derived on Nilambe. Nevertheless, we must remember that it was the leaf fungus at that time which it was expected might be overcome. Now it is "green bug" and "London Purple" is clearly an insecticide.

PEPPER-VINE GROWING IN CEYLON.

Of course, now that European planters are giving their attention to the matter, not in one district, but in several districts from sea-level to an altitude of 2,000 or more feet, all obstacles in connection with an extended cultivation of pepper will be certainly overcome. In addition to Mr. Martin at Ambalangoda, Mr. Blackett in Dolosbage has a good deal of pepper successfully fruiting, and he will be sending his first sample hundredweight away this year. It must not be forgotten that the Tropical Botanic Garden (Hemurata-oda) has for some time, been offering cuttings of good kinds at reasonable rates.

Remembering what a lively scene of pepper culture the Kegalla and adjoining districts must have been a hundred years and even two centuries ago, it is difficult to understand how the industry was ever allowed to collapse. "Wild pepper" we are told is growing everywhere; but if we are to believe Dutch official reports, undoubtedly Ceylon produced first-class pepper at one time. A correspondent who takes a different view says:—

"Pepper has failed so far, though tried at Udugama, under the best auspices. I think you are mistaken as to the Dutch export; you must have overlooked the fact stated in a paper published in your 'Literary Supplement' that most of what went from Ceylon came from India, besides did not the word 'peppers' include much besides what we know as pepper?"

But here is what we take to be a reliable statement as embodied in the Agricultural Review in our Handbook, and we do not see how the authorities quoted can be gainsaid:—

"In 1650, it was reported that 'Pepper grown in Ceylon was sold at a higher price than that produced elsewhere.' Governor van Imhoff, in 1740, considered pepper 'a far more important article' than cardamoms, and he added that 'unlike coffee (!) it is not probable that the demand will be lessened by a change of opinion as to its salubrity, or by its being overgrown in other places, as all grounds are not able to produce it.' In 1739, the Dutch exported 465,000 lb. of pepper, the greater portion from the Kandyan provinces, where the harvest began in Dec. and ended in April. Bertolacci blames the indolence of the natives for not greatly extending the cultivation of the pepper vine, which will grow on almost any soil, and has everywhere forest-trees to spread over. The fruit itself, when gathered, requires no further care than having it well dried. In 1813, the export of pepper was 190½ candies, valued at about £12,000, and the average for seven years was then 200 candies, or about 1,000 cwt. The site of the former Dutch pepper gardens at Madampe has long been under coconuts. Bennett, in 1843, declared that the District of Kalutara alone ought to produce more pepper than the whole of the island did."

We trust Mr. Price will look up the old Kandians of his district and get them to resume the cultivation; we suspect that so long as it was a case of Rajakariya—so many thousands of lb. of pepper to be delivered annually "willy-nilly"—the people looked after their vines and the industry flourished; but when they had no longer a forced tax in pepper to pay, they allowed the culture to collapse.

COFFEE AND "LONDON PURPLE."

A proprietor writes:—"I think there is something in this 'London Purple.' Anyway, anyone trying to grow coffee again from, say, Coorg seed might, by using London Purple in the nurseries and again in the planted-out fields, be able to reap some profit from old K. C. The long-tried old coffee may perhaps never be made to bear again to a profit, but is the same result to be expected from new and vigorous seed aided by such a cheap ally as L. P.? 40 bushels coffee per acre, at R15 per bushel, is tempting enough surely to anyone who cares to make a small experiment."

THE TEA WITHERING PROBLEM SOLVED.

The one remaining problem connected with tea manufacture on scientific principles, as distinguished from the primitive Chinese system, which has so far not received the attention its importance justified, has been that of rendering the planter independent of those meteorological conditions which frequently baffle his best efforts to wither his leaf as it should be withered. Properly withered leaf is so important a factor in the production of good tea, that it may be

termed one of the essentials of tea manufacture. Imperfectly withered leaf can never be made into good tea, and as the production of good tea now-a-days makes all the difference between dividends and no dividends, the importance of being able to ensure perfect withering is obvious. Hitherto, when rain has fallen unceasingly for days—we might say weeks—at a time, the planter has found himself with the Hobson's choice of two alternatives before him—either he must injure his reputation by making unsatisfactory tea, or he must, as has happened frequently, throw away large quantities of leaf, which represent a loss in out-turn, in the Garden's returns. Under these circumstances, the process of evolution in the perfecting of machinery &c., to replace old processes inherited from the Chinese, has been peculiarly slow in the important matter of withering as compared with the eminently satisfactory advance made in other departments of manufacture, rolling, drying, and sieving, to wit. We have much pleasure, therefore, in at last being able to proclaim the welcome news that good withering in all weathers has now been brought within the command of all in an extremely simple way. The trouble has been, of course, to remove the excessive moisture in and upon the leaf, under saturated conditions of atmosphere, without applying artificial heat, to the injury of the leaf. With the external air in a saturated condition, and added to that, so stagnant as to lack all perceptible motion, it has been practically impossible to remove the moisture upon and in the leaf, and in the air of the withering room, in the proper time. If the temperature of the air in the withering room can be raised above that of the outside air of course, its capacity for holding moisture will be increased, and a certain amount of evaporation from the wet leaf will take place in the room, which would not occur in the saturated air outside. The natural expansion of the air inside is not found sufficient however, to create a sufficiently rapid change of air by which to carry off the excess moisture and the process is too slow for satisfactory results, hence a large garden has required more space above the engine and "dryers" than can be supplied in the usual factory. Consequently, outside withering-houses have to be used to supplement the space available in the tea-house proper; and the leaf has to be drawn from these and spread a second time, in the tea house, as the space in the latter is emptied, thus involving much labour and an amount of handling to the leaf which is prejudicial to the quality of the tea produced. In utilising the waste heat of the engine and "dryers" on the ground floor by passing this heat up into the withering floor, and then in rapidly removing the moisture evaporated from the leaf by this heat, has been found the solution of all the difficulties at once, with a consequent control of perfect withering, and a very great reduction of withering accommodation, of labour, and of handling. The Blackman Ventilating Company, Limited, has for some time past been giving attention to this matter, and is now provided with the results of actual experience, which will be of so much interest to our readers, as making a new departure in tea manufacture, that we do not hesitate to quote extracts from a recent letter received by the Blackman Ventilating Company, Limited, from Captain E. T. Skinner, of Silcoorie. These are as follows:—"I am delighted to be able to inform you that my fans have turned out entirely successful. I am now entirely independent of the weather, for in the very worst weather, viz.—when the leaf is brought into the factory soaking wet, and the sun is hidden for days, I am able with the greatest ease, to wither 100 maunds of leaf in three and a half to four hours. In fine weather I can wither more than double that amount in the same time. In all cases the wither is equal to the best cold and natural wither. You will easily understand this when I tell you that the leaf gets withered in a temperature of from 86 deg. to 94 deg. The fans are so placed that I am able to use both sides of them. By utilising the heat generated in the factory by the boiler, and tea driers, in very hot weather, the temperature of the tea-house is reduced by 12 deg.

to 14 deg. In the very worst weather the heat so generated is ample for withering purposes. The hot air is withdrawn from the tea house and made to circulate rapidly over and under the leaf. A great number of planters in the district have seen my arrangement of your fans, and all pronounced it a thorough success. I never now wither in the sun and never use half the withering accommodation I formerly required."

Coming from so capable an authority such testimony as the above speaks sufficiently of itself as to the unqualified success of this system.

It only remains to point out a few details connected with the method of working the system. The withering floor is filled with withering trays, as is already usual in many districts. It is opened almost right across the building, at the end on the left of the drawing, to allow the heated air to be drawn up to the withering floor, and so as to distribute the supply over almost the whole width of the floor. The tray shelves should run across the building, with gangways down each side, as by this means there will be no Royal road for the air to travel too directly to the fan placed in the middle of the floor, at a distance from the hot-air entry. The air will thus be obliged to find its way through the series of trays, as the flooring of the gangway is carried to the end of the building (thus closing only that part of the floor at the end up which the hot air travels), the current of air can be checked from too free a passage down the gangways. The Blackman fan "thrusters" as well as "sucks" air, so it draws the air through about two-thirds of the trays and forces it through the remaining third. The draught thus occasioned not only assists evaporation, but removes the evaporated moisture from the house. In very wide houses, it may be desirable to have two or three smaller fans abreast of each other in place of one large fan in the centre in order to ensure an even distribution of the current. The great assistance to be obtained from these fans will be evident by taking, for example, the case of the 48 in. fan. This fan will require 2 horse power to drive it at its maximum. It can, however, move 30,000 cubic feet of air in one minute. This means that if there were no trays to resist the passage of the air, this fan could move the air contained in a room 125 ft. long by 30 ft. wide by 8 ft. high in one minute! The fan can be driven by a rope or belt passed up through the floor below the fan, from a driving drum on the ordinary shaft. Owing to the resistance offered by the trays, two such fans would probably be found necessary in a house of the above dimensions. The fans of this size weigh 3 cwt. 1 qr. 24 lb. each, or, packed for shipment, 5 cwt. 3 qr. 20 lb. and in cases measure 5 ft. 5 in. square by 1 ft. 5 in. By the addition of a simple form of stove, these fans can also be applied to outside withering houses, if power to drive them can be obtained. In order to prevent improper draughts entering the tea-house, all windows, &c., can be stopped in a very simple way by oiled thin canvas stretched and tacked on to frames to fit in the windows. These will be found to admit as much light as some forms of glazing, and are much cheaper. Owing to the heat being removed by the fan, these windows will be no longer required for ventilation.—*Indian Tea Gazette.*

SWEET CASSAVA:

(*Jatropha manihot* or *Aipi*.)

By H. W. WILEY.

About the middle of March, this year, I received from Mr. R. H. Burr of Bartow, Fla., a package of cassava roots. These roots reached the department in fine condition, being apparently as fresh as the day they were taken from the soil. After careful sampling and cleaning, a sufficient quantity of the roots was cut into thin slices and thoroughly dried. In a definite weighed portion, sampled as carefully as possible, the percentage of moisture was determined. The dried and powdered roots were preserved for future analysis. Owing to a press of other matter,

this analysis was not made until the latter part of July, and the first of August this year. Mr. Burr, in forwarding the roots, sent the following information concerning them:—

“The roots do not last long after digging, drying up or rotting. Since this variety of cassava is not the bitter or poisonous kind, it is generally known in Florida as the sweet cassava. The roots are fed to all kinds of stock in a fresh state, and are greatly relished. It has been sufficiently tasted here to show its great value as a stock food. The yield under favorable conditions is astonishing. I have recently dug one plant of one year's growth, which weighed 50 pounds, being at the rate of more than 1500 bushels to the acre. Eight hundred to 1000 bushels per acre can be confidently reckoned on.”

The roots received by us were long and slender and of various sizes; some of them were quite two feet long, and weighed several pounds. The bark, which contains the poisonous principle if any be present, was carefully scraped off and has been preserved for subsequent examination. The analysis of the sample, calculated to dry substance, is given in the following table:—

Serial No	5547	
Ash	1.94	per cent.
Oil (petroleum ether extract) ...	1.27	”
Ether extract (glucosides, alcohols, organic acids, etc.)74	”
Alcohol extract (amids, sugars, resins, etc.)	17.43	”
Crude fibre	4.03	”
Starch	71.85	”
Albuminoids (calculated from nitrogen)	3.47	”
	100.73	”

In regard to the method of analysis, little need be said; it was carried on in accordance with the well-established rules of plant analysis, as laid down by Dragendorff. The first extraction of petroleum ether gave the fat or oil alone, and the subsequent extraction with sulphuric ether gave the glucosides, alcohols and organic acids. That portion of nitrogen existing as amide has been estimated in the alcoholic extract. The total nitrogen was also estimated and entered as albuminoids; a small portion of the nitrogen has thus been counted twice in the total results which add up a little over 100. A characteristic feature of the cassava root is shown in the large amount of substance present, soluble in alcohol. The amount of starch also compares fairly well with the best varieties of potatoes. On account of the large quantity of sugars present, the cassava root could be more economically used for the manufacture of glucose than for starch; there is no doubt, however, of the fact that a fine article of starch food can be made from the cassava root growing in this country.

In addition to the fresh root above noted, two samples of the dried root or cassava meal have also been examined. No. 5,922 was sent to us, described as pulverized manihot root or cassava flour. The root is first peeled, chopped into thin slices, dried in the sun two days and pulverized. It was prepared by Prof. W. H. Kern, of Bartow, Fla. No 5,923 was labeled pulverized cassava, with the starch, or a portion of it, and glucose washed out, the remaining pulp dried in the sun, prepared by Prof. Kern.

Prof. Kern sent a letter with the samples from which the following extracts are made:—

“Allow me to say that owing to the prodigious yield per acre of what we here know as cassava, and its alleged value as a feed and food plant, and for its yield of starch and glucose, it is attracting a very great deal of attention here now. The plant here grown is different from the manihot root of South and Central America; our root contains no poisonous elements which need to be dissipated by heat. It is customary here for many persons to make their own starch from it. The root, which must remain in the ground until one is ready to use it, is dug, washed, and its two inner and outer peelings removed; it is then grated and the pulp washed, the water poured

off in a vessel and allowed to stand when the pure starch settles in the bottom. The clear water is again drawn off and the starch allowed to dry. The pulp, after having the starch washed out, may be used at once in making puddings by the addition of milk, eggs, etc. This washed pulp may be sun dried and thus kept, forming valuable meal or flour from which nice bread may be made. Necessitated as we are in South Florida to buy all our wheat flour, anything which acts as a substitute, either in whole or in part, is of great value to us.”

The analyses of two samples of flour are given in the following table:—

Serial No.	5922		5923	
Water	10.56	per cent.	11.86	per cent.
Ash	1.86	”	1.13	”
Oil and fat	1.50	”	.86	”
Glucosides, alcohols and organic acids.64	”	.43	”
Amids, sugars, resins ..	13.69	”	4.50	”
Dextrine, gum, etc., by difference	2.85	”	5.63	”
Crude fiber	2.96	”	4.15	”
Nitrogenous bodies ...	1.31	”	1.31	”
Starch	64.63	”	70.13	”

From the above analyses it is seen that the cassava can never take the place of the flour made from cereals, as a food material, on account of the small portion of nitrogenous matter which it contains. It seems to me, however, that it might very well take the place of potatoes, and its value as a food should not be under estimated.

Mr. S. W. Carson, of Midland, Fla., has made some very valuable contributions to the literature of the native cassava. From a letter of his to the *Florida Farmer and Fruit Grower* of April 11th, 1888, I make the following quotations:—

“As before stated, I regard the rolling pine lands, containing some willow oak, to be the best for cassava, and the southern countries to be best suited to it. Let the soil be well prepared by plowing and harrowing, rows checked about four feet apart, one piece laid in each hill. I think they should never be closer together than four feet, and five would be better. Cassava has been known to grow for three years in this country. It will continue to grow until the cold kills it, then by breaking off the stems when they are red, the stubble will sprout up in the spring. As to the seeds of the cassava they will ripen in about one year. If puddings, custards, etc., are desired, the roots must be peeled and grated; salt, sugar, etc., may be used according to taste. The Spaniards make bread of it simply by grating the root, and adding salt and a little soda. Now there is no doubt in my mind but that thirty tons of cassava root per acre can be produced. When I think of the tapioca, glucose and starch there are in it, and how abundantly it can be turned into bacon and lard, milk and butter, mutton and beef, I feel confident that it will pay better than any other plant in the world.”

Mr. J. H. Moore, of Keuka, Fla., in a letter to the same paper of November 24, 1887, describes some of the uses of cassava. From his letter I make the following extract:—

“Cut the stalks about one inch above the ground, just before frost; after cutting, the stalks should be left to dry in a cool place a few weeks, and then placed in a trench and covered until time for planting. Some save the stalks by keeping them in a dry cool place until February and then plant. The roots should be dug as used; they will not keep in good condition out of the ground more than three or four days. It is perhaps the best feed we can raise for hogs; it is also a fine feed for poultry. We often bake it like sweet potatoes, and also slice and fry it like Irish potatoes.”

M. Saxe has addressed a letter to the National Society of Agriculture of France, concerning the cassava which he calls “*Manihot Utilissima*.” He is of the opinion that the poisonous varieties are different botanically from the innocuous. Manihot is the bread of tropical regions. The innocuous variety is cultivated

in Bolivia, and the botanists there call it "manihot aipi." The plant grows from one to two metres in height, with straight and naked stalks, since they only develop leaves at their extremities; the only care given to them in their cultivation is to keep them free from weeds. The roots, to the number of five to nine, are of the size of the closed hand. The following analysis of the roots of the manihot aipi is given:—

Water...	70.29	per cent.
Starch...	14.40	"
Sugar, salts and malic acid...	1.01	"
Fibrin and yellow coloring matter08	"
Crude fiber...	3.16	"
Ash...	10.82	"

From the above it is seen that the roots of the tropical plant are quite different from those produced in our own country. In regard to the distribution of the two varieties, M. Sacc makes the following observation:—

"In Cuba I have seen only the poisonous variety. The same is true of Brazil, where I have not seen the manihot aipi except in the Swiss colony, Port o Real. As to the product of the two varieties, it is the same; the stalks which are the size of the finger, are from one to two metres in height. I have not been able to analyze the leaves of this interesting vegetable, but as they are much sought after by cattle, they are probably very nutritious."

The above quotation from M. Sacc's paper I have taken from the *Revue Agricole*, (ii, 6, pp. 81, 82.) published at Port Louis Maurice.

The name cassava should be applied properly only to the purified starch derived from the roots of the plant. The plant is known under the botanical names, *Jamipha manihot*, *Manihot utilisissima*, *Jatropha manihot*, *Manihot aipi* and *Jatropha Laeflingii*; it is also called the mandioc plant. The fleshy root of this plant yields the greatest portion of the daily food of the natives of tropical America, and its starch is known in this country under the name of tapioca. Manihot is a woody or shrubby plant growing from fleshy tuberous roots, the stems being smooth, and the leaves generally long-stalked. The leaves of the poisonous variety usually have seven branches palmately divided; the leaves of the sweet variety are usually only five parted. In the "Treasury of Botany," page 718, the following remarks are made concerning these two varieties:—

"It is quite clear that while the root of one is bitter, and a virulent poison, that of the other is sweet and wholesome, and is commonly eaten cooked as a vegetable. Both of them, especially the bitter, are most extensively cultivated over the greater part of tropical America, and yield an abundance of wholesome and nutritious food; the poison of the bitter kind being got rid of during the process of preparation it undergoes. The poisonous expressed juice, if allowed to settle, deposits a large quantity of starch known as Brazilian arrow-root or tapioca meal, from which the tapioca of the shops is prepared, by simply torrefying the moist starch upon hot plates, the heat causing the starch grains to swell and burst and become agglutinated together. A sauce called *cassareep* used for flavoring soups and other dishes, particularly the West Indian dish known as pepper-pot is also prepared from this juice by concentrating and rendering it harmless by boiling. Another of the products of cassava is an intoxicating beverage called *piwarrie*, but the manner of preparing it is not calculated to render it tempting to Europeans. It is made by the women who chew cassava cakes and throw the masticated materials into a wooden bowl where it is allowed to ferment for some days, and then boiled. It is said to have an agreeable taste."

From the above analyses of cassava root, descriptions of its uses, and the amount of it that can be produced per acre, it is evident that it is destined to become a valuable agricultural product of the sub-tropical portions of our country.—U. S. Department of Agriculture, Washington, D. C., Sep. 5, 1888.—*Agricultural Science*.

UPON ROOT EXCRETIONS.

(By H. MOLISCH: *K. K. zool. bot. Gesell.*, Wien, 1887.)

Roots excrete, as we know, acid substances capable of attacking different mineral bodies. The researches of the author embraced to a considerable extent the chemical power of roots; they show in fact that not only some minerals, but also organic bodies are attacked by them, some much more than others, resulting in very great chemical changes.

1st. The product secreted by roots is a reducer and oxidizer.

2nd. It blues tincture of galls, oxidizes tannins and humus like substances, and favors in consequence the decomposition of humus.

3rd. It transforms cane sugar in sugar reduction, and acts in a feeble manner like diastase.

4th. Roots corroded an ivory plate.

5th. They frequently acted like fungi in changing the organic substance in the soil by means of excretions and decomposition.

6th. It has been claimed that excreting substance simply impregnates the cellular membranes, without passing through and from them. It is not so, however, as little drops were seen on the surface of roots.—*Agricultural Science*.

A RIVAL TO TEA AND COFFEE.—A well-known planter has introduced in the Nilgiris a rival to tea and coffee in the Brazilian tree which yields the substance known as Guarana. Guarana consists of the seeds of a tree known to Botanists as the Paulinas Scorbutis, which is said to be very abundant in its own habitat. The tree produces a fruit about the size of a walnut, containing five or six seeds. The seeds are roasted, mixed with water and dried. Before being used they require grinding, when they fall into a kind of powder. The active principle is an alkaloid identical with that found in tea and coffee, but there is twice as much of it in Guarana as there is in tea. The effects are similar to those of tea and coffee.—*Indian Tea Gazette*.

[All of which may be largely qualified by the absence of the pleasant flavour of tea in the nut.—Ed. T. A.]

COTTON SPINNING IN ENGLAND AND OTHER COUNTRIES.—The Austrian *Handels-Museum* gives the following interesting figures respecting the position of British cotton manufacturers as compared with that of the rest of the world. The figures relate to 1887. The number of spindles in England is 42,740,000; in the rest of Europe, 23,180,000; in America, 13,500,000; in India, 2,420,000; total, 81,840,000. The quantity of cotton consumed is in England 1,514,521,000 lb. weight; in the rest of Europe, 1,459,119,000 lb.; in America, 944,758,000 lb.; in India, 300,000,000 lb. Thus England has more than half the spindles in the world, and uses more than half the cotton worked by them, while English spinning is unrivalled in the excellence of its production and in the cheapness of its price.—*O. Mail*, Dec. 28th.

TOBACCO IN CEYLON.—An enterprising colonist—whose name we had not previously seen mentioned in connection with this industry—sends us an "Account Sales" to embody in our manual, "All about Tobacco," as practical encouragement to intending Ceylon planters. He writes as follows:—
"I see you are publishing 'All about Tobacco.' Put enclosed memo accounts sale in. Everything is of use. We are going in for this cultivation in earnest, and I hope you will give us every encouragement and advocate the Ceylon Tobacco Company getting a large grant from Government when they prove their bonafides."

Most certainly at the proper time, a local Company will deserve official encouragement if the same was extended so readily to a foreign Syndicate. The Account Sales will find a place in the forthcoming volume.

DRUG TRADE REPORT.

LONDON, Jan. 3rd.

COCAINE-MAKING IN CEYLON.—It would seem that there is some idea of commencing the manufacture of cocaine in Colombo, Ceylon. At present the matter seems quite in embryo, but Ceylon planters who are in a position to supply leaves are asked to communicate with a gentleman in Colombo, whose object it is to extract the alkaloid. A sample of the parcel of Java leaves of fine appearance, to which we referred some time ago, yielded, when analysed by us, only 0.4 per cent. of the alkaloid.

CARDAMOMS.—From the beginning of the season up to Dec. 6th only 28,970 lb had been shipped from Ceylon, against 52,440 lb in 1887, and 38,757 lb in 1886 during the corresponding periods.

CINCHONA.—The shipments from Ceylon in the period between October 1st and December 6th have been:—In 1888, 2,377,239 lb; in 1887, 1,506,606 lb; in 1886, 2,750,858 lbs. The first London public sales to be held on Jan. 15th are likely to be very heavy, though at present only 972 packages Ceylon, 319 Java, 50 East Indian, and 3 Fiji bark have been declared.

QUININE.—Last week the market closed very weak and without business, at 3½d to 1s 3¼d per oz. nominally for German bulk in second hands. This week some holders have been pressing for sale rather anxiously, and yesterday the agents for the Brunswick factory are said to have sold 10,000 oz., Feb.-March delivery, at 1s 3rd per oz. Today there are sellers, but no buyers, at 1s 3rd per oz. spot. The other markets are holding aloof.

VANILLA.—There are at present 120 tins advertised for sale next Thursday. Advices from Madagascar state that in the Mahanoro district the plants have commenced flowering very early this year, and that to all appearance the crop this season will be twice as large as last year. Mauritius letters speak of a good demand for the new crop in that island. The estimate for the present crop ranges from 31,000 lb to 36,000 lb.—*Chemist and Druggist.*

PRODUCE AS SECURITY FOR BANKERS' ADVANCES.

A paper on this subject was read on Wednesday evening, before the Institute of Bankers, by Mr. G. B. Gallaher. Speaking as one who had a considerable and very satisfactory experience of the practical working of this class of business, Mr. Gallaher described the precautionary steps which should always be taken, in order that a loan on produce might be as safe as if made upon any other class of security. In the term "produce" he would include tea, coffee, spices, indigo, silk, metals (excepting gold and silver), turpentine, mineral and seed oils, sugar, galls, shellac, foreign corn, &c. A banker must have a general idea of the "normal" value of merchandise, or he might be incurring great risk in making an advance, even with a large margin. It was not sufficient in making an advance on metals, for example that the banker could turn to a price current, and fix the quotations of certain descriptions, but he must have followed the market for some considerable time. He would advise them not to grant loans upon any commodity which they were not sure would always be in demand at some price, and instanced lac-dye as a case in which an article, at one time largely dealt in, was completely superseded by new discoveries. Besides the special knowledge required by a banker if he made advances to any large extent upon merchandise, one great objection which might be urged against this class of security was, that produce was not a liquid asset; that it was not readily convertible into money; that in times of unbusiness the money so advanced was locked up, and, in the event of a commercial crisis, could only be realised at a

considerable sacrifice. Was not this true of hundreds of different kinds of securities, which were now readily taken, while produce was refused? Where, in a commercial crisis, would they obtain cash for the large bundles of foreign stocks which were to be found in the safes of even the most wisely-conducted banking establishment? He did not deny that produce was of the two the more difficult security to realise in ordinary times, but he would ask, whether one thousand pounds worth of tea would not be more easily convertible into money in a time of panic than some Stocks he could mention that might be worth one thousand pounds a few weeks previous to the panic. In his opinion, if a trustworthy customer were to say to his banker, "I have a thousand pounds worth of goods lying in the docks which I can hypothecate to you for an advance," no security could be safer; and no dishonoured bill would ever yield so large a dividend in the pound, provided ordinary care were taken. They could test the actual value of such goods by asking the applicant to exhibit invoices or contracts, by requiring him to obtain a broker's valuation, or by actually sampling the goods themselves, and obtaining an independent valuation by a broker or dealer in the article. In making advances upon produce the greatest danger the banker had to guard himself against was the wilful dishonesty of a customer. English law assumed a man to be innocent until he was proved guilty; but the converse rule should be the guide in making advances. They should assume that the applicant was dishonest, unless they were perfectly satisfied that he was honest; they would, consequently, look into the security so thoroughly that, whether he was honest or not, the repayment of the loss would be almost without doubt, and, if a loss were made, it would be the banker's misfortune, and not his fault.—*H. & C. Mail, Jan. 4th.*

PLANTING NOTES FROM SOUTHERN INDIA.

(From the *South of India Observer*, Jan. 3rd.)

The question of manure to planters is always one of primary importance. We are informed that on some of the estates on the Nilgiris there has been tried for the last year or two a manure called Mockford's Black Guano, with satisfactory results. Planters are often at their wits' end to obtain a suitable manure, and the one now under notice appears to deserve a trial, being specially adapted to the cultivation of coffee. Upon one estate we know of, the best coffee is cultivated with a manure skilfully adapted to its peculiar wants, and the Nilgiri and Wynaad planter cannot do better than try any and every kind of stuff until he finds the right means to get the heaviest crops off his land.

The Nilgiri tea planters are inconvenienced for want of coolies, and they complain that Government officials often take their labourers away. We can hardly believe this. It may be that officious subordinates and peons impress coolies unknown to their masters; but that any official would use coercion to obtain labor is we think improbable. However we give the complaint below as furnished us.

Our correspondent writes:—"I believe a suggestion which some planters have made to Government is the very reasonable one that Government officials should not press the labour of workers in the tea plantations, which, as a rule, with all the machinery they can get, are scarcely more than *half worked*, which of itself accounts in a great measure for the low yield of tea per acre on the Nilgiris compared with other hill districts. The other day the Manager of one of the leading tea estates informed me that he had just had notice of his coolies withdrawn from his tea bushes to carry the goods and chattels of a Briton who, having little to do at home, was taking a tour through the dis-

trict with his rifle; the said estate has not *one-half* of the hands it requires even in this season when hands are most plentiful, so it may be imagined how welcome the traveller was to the coolies! It is to be hoped that Lord Connemara will give a willing ear to the "suggestion" alluded to, as I fear from all I hear that if this is looked at through the coloured medium which some officials will try to insinuate, the "suggestion" might as well be left alone."

A planter writes:—"I don't think you Ootyites are aware of the ravages leaf disease is making in many of the coffee districts. Crops are on the trees no doubt, but are they to ripen? Perhaps a taste may grow among the lovers of chicory for the diseased coffee beans. If so I think Wynaad will be able this year to meet the demand. Wynaad does not seem to be singular however in having floods, Crops damaged by blight and too much rain, cattle epidemics (foot and mouth) are prevalent on the Nilambur side just now. And this when the greater part of India is suffering from a drought which may be serious.

It is strange that we have heard of no practical results from the cultivation of rubber trees by planters of this district and Nilambur, where several flourishing plantations exist. It is stated that the belt of land around the globe, five hundred miles south of the equator, abounds in trees producing the gum of the India rubber. They can be tapped for twenty successive seasons without injury, and the trees stand so close that one man can gather the sap of eighty in a day, each tree yielding on an average three tablespoonfuls a day. Forty-three thousand of these trees have been counted in a tract of country a mile long by eight wide. There are in America and Europe more than one hundred and fifty manufactories of India rubber articles, employing some five hundred operatives each, and consuming more than 10,000,000 pounds of gum a year, and the business is considered to be still in its infancy.

"W" writes:—"Rain at the end of November generally causes a great many of the ripe berries to split and after a short time to fall or at any rate dry so much as to be very difficult to pulp. This year, however, we have very little coffee ripe at present in South Wynaad: on many places there will not be very much at any time in this season! Leaf disease is still going on, but it is not doing the trees nearly as much harm as it did last year. What a pity it is some of your correspondents don't give us their ideas as to the best course to pursue with the trees when they are affected—as it seems useless to hope for any prevention. To me it seems neither pruning, nor mauling, nor that leaving alone, make much difference. With regard to the first, perhaps the trees prune themselves enough, and only require handling, at any rate, I should be loth to cut off the little green wood and few leaves they have left after a bad attack, in the hope of stimulating. As to the second, I never knew a basket of good cattle manure do any harm. Labour generally speaking, is very abundant as is usual in bad seasons. A great deal of work is being done on the roads, and some bad hills are being cut down, which will make cart traffic easier. There is rather an unusual amount of sickness about, and we hear strange and dreadful rumours of dengue having reappeared at Calicut. If the garbling people get it, how shall we get our crops cured and shipped."

THE DRUG MARKET IN 1888.

(From a Review by Messrs. Reynolds & Sellers,
Mincing Lane, E.C.)

CASCARILLA BARK.—Although the high prices ruling last year have not been maintained, the supplies have not been at all excessive, and generally met a good market. Fine silvery quill has brought up to 41s., whilst good has found buyers at 32s 6d. to 34; holders lately have been asking more money. Within the last few days fresh arrivals of over 200 packages have come to hand, which will be probably offered early in the new year.

QUININE.—Sales and re-sales throughout the year have been on a larger magnitude than ever before

recorded, the principal reason being that the article is now under the canopy of speculators. It would be superfluous to estimate the quantity which has changed hands; continental sales reported ranging from 1,000 to 200,000 oz. The opening price of 2s advanced within the first few days of January to 2s 1½d which was the topmost figure of the year. In September 10,000 oz. "Auerbach" offered in public sale only realized 1s 3d to 1s 4d although 1d to 1½d advance on these prices was paid soon afterwards. Even a letter to daily paper calling the attention of those interested in diamond, gold, silver, copper, and other mines to the favourable position of this article had not the desired effect, and the downward movement so far has not been arrested, the recent sales being about as low as any throughout the year.

LONDON DRUG STATISTICS.

The following figures refer to the stocks of drugs, &c., in the London docks and warehouses on December 31st, 1888, and to the deliveries and imports into London during the year 1888 as compared with 1887:—

OLD BOOTS AND SHOES are now being gathered together. Hitherto they have literally littered the land. But it is found that the leather can be boiled down, or, failing that, ground down. The latter makes capital manure, being rich in nitrogen. So I am saving up my old boots now instead of giving them away—sometimes with a foot inside.—Dr. Taylor in *Australasian*.

A NEW FIBRE FROM THE COTTON PLANT.—A manufacturing firm in New York has sent to the Department of Agriculture specimens of a new fibre they are making from the stalk of the cotton plant. The samples received strongly resemble hemp, and seem to be adapted to all the uses that hemp is put to. A few fibres of it twisted together in the hand show remarkable tensile strength, although no exact comparative tests with other fibres have yet been made. A collection of the fibres of hemp, flax, jute, ramie, etc., from all parts of the world is being made by the Department and a new instrument has been invented by which it is expected that the tensile strength of each will be ascertained with great accuracy. If the cotton plant turns out to furnish as valuable a fibre as now seems possible, an important new source of profit will be afforded the cotton planters of the Southern States upon their crops.—*Science*.

pluck comes forward, and proposes to the minister for the Colonies to develop the resources of an island like Ceram, he is told that his plans cannot receive the sanction of the Government. From Bachan little is heard, just as little in fact as of either new plans or the putting into execution of those previously formed for investigations in the Kei and Tenimber islands. It is years since Rozenfain was presented in pamphlets as the gold mine of the future; but no steps have yet been taken for working it. *Rau* since the departure of the English, is hardly known even by name. New Guinea seems to have a black mark against it, ever since Fort Dubus twice lost half of its garrison from malaria. Several of the missionaries at Geobonik Bay lost their lives in the attempt to form a Settlement; and the men-of-war in those waters, on the rare occasions that they do appear, have half their crews on the sick list.

Meanwhile neither Germany nor England have been inactive in their territory. They have looked for habitable spots till they found them; they have gone up the rivers in steam-launches, and penetrated far into the interior, they have dug for gold and found it; have imported building-materials from Europe and founded Settlements, they have strengthened their position by other means than signboards and presents of silver-headed walking sticks to the Papuan chiefs; in a word they have taken possession both in New Guinea and North Borneo right under the very nose of the lion of the Netherlands.

Borneo seems, indeed, to be the land of the future. A petty frontier-dispute as to whether the Atas or the Sibuku is to form the boundary between what is nominally Dutch but really English territory will, doubtless, be contrived shortly; with the natural result that the line contended for by England will be accepted. Then it will have to be decided whether tobacco will grow everywhere, and, especially, what sort of tobacco; a vital question indeed for the colony.

Yet, although the result may not be as brilliant as optimists of the present day would have us believe, England is far from leaving her colonies, especially young ones, in the lurch. This can be seen, for instance, on the Malay Peninsula, a country by no means fertile compared with Java or Sumatra. Numberless experiments with different sorts of crops have been made; and, with the exception of pepper, gambier and a few others, nearly all have failed.

Higher up, however, opposite Penang the resources of Province Wellesley have been developed and considerable quantities of sugar are now produced. Assistance has been given to native states, Johore, Perak, Selangor, Sungei Ujong &c., and they are now thriving. Where tobacco would not grow, sugar was planted, or tin mines opened. Let any one who wants to know more of the resources of these districts and their rapid rise, read the description given in Dutch newspapers of Deputy Cremer's journey, and the humiliating parallel drawn by him between the way in which Dutch and English manage the affairs of their respective territories.

TEA DRIERS.

A practical planter with no interest one way or the other, writes:—

"With reference to the *Observer* paragraph re Davidson's Siroccos and Brown's Desiccator, your correspondent says, 'it requires less fuel than any machine I know.' That may be true enough; but, if a steam engine has to be kept working to drive the fanners, how about the fuel consumed thus. The Siroccos require no motive power. With water power Brown's Desiccator is all right."

ENSILAGE EXPERIMENTS IN THE MADRAS PRESIDENCY

are reported to the Madras Government as having been made on a large scale, but with very varying and in

many cases very unfavourable results. Horses, sheep and goats usually refused to eat the silage and sometimes even cows and bullocks would not touch it. The most successful experiment were conducted on the Nilgiris and at Salem, and are thus noticed:—

Nilgiris.—Four silos were made in this district, and were all successful, the silage having been readily eaten by cattle, though the Badagas, who are extremely conservative and very slow to adopt new methods, predicted that it would not be, and afterwards soundly abused their animals for eating what they considered such foul food. The use of silos is, however, well known to planters, and is becoming pretty general on estates. Mr. Lawson, the Government Botanist, has made many silos and has done much to demonstrate the utility of this method of storing grass to Badagas.

Salem.—Nine silos were made in this district, one by the Collector, Mr. McWatters, one by the Sub-Collector, Mr. Dumergue, and the rest by the Forest Department. The grass used by Mr. McWatters was not good and possessed very little nutritive power. The silage was, however, eaten by cattle and by some horses and ponies, but sheep would not touch it. Mr. Dumergue's experiment was eminently successful. His silage was so greedily eaten by cattle and by castrated ponies under treatment that there were more applications for the silage than could be complied with.

The results of the whole were thus summed up:—Of the 78 silos opened, 32 were either wholly or partially successful. This is but a small proportion, but the experiments made in the Kistna district were conducted with such inadequate knowledge and those in the Nellore district were marked by so much want of care that they may be left out of account. If this is done, the result will be that, out of the remaining 53 silos opened, 31 or 58.5 per cent. were more or less successful.

Considering the circumstances in which the experiments were conducted in this Presidency, the results may be considered as, on the whole, satisfactory. In the first place, many of the officers, who were entrusted with the conduct of the experiments, had no special knowledge of the subject, and the instructions printed in G. O., No. 593, dated 9th July 1886, do not appear to have been sufficient to enlighten their ignorance. Some of the officers again were not able to superintend the conduct of the experiments throughout, as they had to quit the station on leave or transfer. The experiments also had in some cases to be entrusted to subordinate officers in remote localities, who were either ignorant or had no interest and could not, therefore, conduct the experiments in a satisfactory manner. Those that were conducted by the superior officers were generally satisfactory, but even in these there were failures, as in the experiments made by Messrs. H. G. Turner and Wolfe-Murray in Vizagapatam, by Mr. T. M. Horsfall in South Arcot, by Mr. Johnson in Chingleput, and Mr. Goodrich in Bellary. In the case of the experiments conducted in Vizagapatam, Mr. Lawson, the Government Botanist, and Mr. R. Sewell, C.S., have obligingly pointed out (Board's Proceedings, No. 494, dated 8th December 1887) that the probable cause of the failure was the omission to see that the earth sank continuously with the sinking of the silage. Mr. Lawson also suggests that the best form of a silo is a long narrow deep trench, say 30' length x 8' width x 12' depth, and that it is better to take a longer time in filling the pits than was taken by most of the officers who conducted the experiment in this Presidency, so that the grass may sink of its own weight, and so that through the air not being at once absolutely excluded, the grass may ferment better and yield a sweeter fodder. Mr. Lawson also suggests the use of the ordinary mamoty with the edge sharpened like an axe for removing the silage which should be cut in steps, so as to expose as small a surface as possible to the action of the air and prevent the rest of the silage from getting mouldy. As regards Mr. Horsfall's failure, Mr. Lawson remarks that, judging from Mr. Horsfall's own description of the

silage produced, the experiment was undoubtedly not a failure but a success. Cattle indeed did not eat it, but Mr. Lawson thinks that they would have eaten it if they had been made to do so. Mr. Lawson also observes that cattle prefer the silage as it is taken out fresh from the pit and that it is better never to dry it in the sun. From some of the reports received by the Board, however, it appears that cattle refused the silage when taken out fresh from the pit, but after exposure to the sun for a short time they ate it greedily. It is perhaps best to offer the silage fresh to cattle, and if they refuse it altogether, then to give it with a small quantity of palmyra jaggery or to expose it to the sun for a few minutes. Much must depend on the tact and resources of the officer conducting the experiment. As regards Mr. Johnson's experiment, he himself observes that the grass was too ripe when he used it, and this circumstance accounts for his failure. Mr. Lawson thinks that Mr. Goodrich's silos were not of the proper dimensions, and the material which he used was too succulent to be harvested alone and that it should have been mixed with some more wry fodder.

Grants have been sanctioned by the Government and the Board for repeating the experiments in the current year, and the Board hope results will be even more satisfactory than they were last year. In the meantime the Board would suggest that Mr. Lawson may be requested to draw up a set of simple instructions, based on approved authorities and the results of the experience gained during the past year. These instructions will be translated and published in the District Gazette and circulated as widely as possible, with a brief account of the experiments now reported upon.

The Government regarded the results attained as, on the whole, very fairly satisfactory, and they added:—

The success which attended the experiments made by Messrs. Nicholson and Dumergue add one or two other officers shows, in the opinion of Government, that it is quite possible, with sufficient attention, to turn out silage of good quality which will be readily eaten by domestic animals. The Government are inclined to think that the want of such attention has, in more than one instance, been the cause of the failures.

The Board should take care that further experiments are entrusted only to officers who are likely to carry them out in a careful and intelligent manner.

It would be interesting if each officer who conducted experiments could give financial results, *i.e.*, the quantity of silage made and the cost of making it.

Mr. Lawson will, as suggested by the Board, be requested to draw up a set of simple instructions.

WYNAAD PLANTERS' ASSOCIATION.

Extracts from proceedings of a general meeting, January 2nd, Mr. Jowitt in the chair:—

SULTAN'S BATTERY RESERVES.—Mr. C. A. Mackenzie drew attention to the magnificent acreage between the Bramagheries and Sultan's Battery, which would probably grow as fine coffee as that in South Coorg, now held as Forest Reserves by Government. Resolved that a committee composed of Messrs. Jowitt, Lamb, C. A. Mackenzie, Walker, and Honorary Secretary be appointed to draw up a memorial to Government pointing out that the rainfall and forest operations could not possibly be injured by throwing open these reserves, while a permanent industry would probably be created, which would afford most congenial employment to large numbers of the over-crowded peasantry of India for whom it is so necessary to find an outlet.

COFFEE ENTERPRISES.—Read the following letter from Messrs. Andrew & Co. Agents for the British India Steam Navigation Co. which it was resolved should be printed:—

COFFEE CROP 1888-89, AND ALL THROUGH SHIPMENTS TO LONDON FOR COMING SEASON.—The Hon. Secy Wynaad Planters' Association, Vayitri.—Dear Sir, —We are prepared to contract for above at the un-

exceptionally rate of 30/ per ton, Bombay tonnage scale, which includes coffee at 14 cwt to the ton, and which is equal to 38/7 per of 18 cwt for coffee, and 37/6 for measurement goods coast scale, but not including tea which is 40/ Bombay scale. The cargo will be transhipped to steamers of the P. & O. S. N. Co. and the advantages offered are, frequent opportunities of shipment and speedy delivery at London at a cheap rate of freight, thus affording a saving in interest and quick returns.

SUGAR AND COFFEE PLANTING IN JAVA.

(From the *L. and O. Express*, Jan. 4th.)

AMSTERDAM, Jan. 2.

According to the annual report of the Colonial Bank for 1887-88, the bank continued its relations with thirty-six agricultural undertakings and granted working capital to twenty-six of them. Of five undertakings the production was received without giving advances. To five undertakings working capital was granted for account of others, and shipments were effected by the bank's agents. To the first sort of undertaking belong 9 for sugar, 10 for coffee, 2 for cinchona and coffee, 2 for indigo, and 2 for wood cutting; to the second sort belong 2 sugar manufactories, 1 coffee land, and 2 Indigo undertakings; and to the third sort 1 coffee land, and 4 indigo undertakings. With 8 of the 9 sugar manufactories the bank was already in relation in former years, and of the ninth the production was received in the course of this year. The bank has 2-5th share in a sugar manufactory, which appeared in the books for fl.200,000, but this amount has been reduced later on by fl.162,518. The result of this undertaking during 1887 were very favourable, 104 piculs of sugar being harvested per bouw at a cost price of fl.690½ per picul. Considering the quantity of the crops of the eight sugar manufactories, the average cost price was fl.6.77 per picul of sugar, or fl.7.42½ for No. 14. The average sale price was fl.8.08½ per picul, or fl.8.74 for No. 14, for showing a profit of fl.1.31½, making on 311,447 piculs sugar (being the production of eight undertakings) fl.409,502. The interest on the capital debt is not included in this calculation. In consequence of the serch disease the crops of three of the undertakings were such smaller. Effective measures are practised, and the directors trust that the consequences of the disease may be limited in this way, that the result of these manufactories may still be remunerative. The coffee estates produced 5,014 piculs washed coffee, and 8,935 piculs in parchment. On two estates there are 186,000 cinchona trees. Disease of the leaves only appeared to a small extent. The profit on interest, commission, and doubtful debtors is fl.603,410, less expenditure fl.194,505, and writing off on one sugar undertaking fl.162,548, balance fl.246,356.

This amount, the directors observe, could be carried to the account for writing off, but this has not been done, as the directors will not allow that the debt is increased by those undertakings which are already under heavy financial burdens, and of which the debt would reach in the books the amount of fl.329,477; being fl.251,167 for sugar and fl.78,310 for coffee. The directors, therefore, have taken fl.83120 from the account for writing off, by which the total amount written off on agricultural undertakings is fl.492,026. The balance of the profit and loss account of the head agency is fl.191,755.

Java securities have all shown a considerable improvement in prices. During the past year some of them, as the Trading Company Handels Vereen Amsterdam paid large dividends, and others did the same, though on a more moderate scale. All of them seem to have favourable prospects, and especially those with which coffee cultivation is the chief business. Several newly-established companies made an appeal on the Money Market which they found there on behalf of undertakings for coffee and cinchona cultivation.

In tobacco shares the year was less advantageous. Excited by the favourable results obtained in Deli numbers of new concessions were asked in Siak and Borneo, so that there were many companies established, some of which, in the former place, were obliged afterwards to stop the cultivation, causing thus a great loss to the eager shareholders.

"LONDON PURPLE" AND "COFFEE BUG": DR. TRIMEN'S OPINION.

In answer to our inquiry the Director of the Royal Botanic Gardens writes as follows:—

One heard a great deal of "London Purple" during the "Colorado Beetle" scare about ten years back, as also of "Paris Green," both, I think, arsenical combinations. No doubt such preparations are deadly to insect life, but it appears to be chiefly against the larger exposed kinds such as caterpillars and beetles that they have been found to be so successful. Our coffee "bugs" are small, very numerous and extremely well protected from external influences of all sorts, and I expect that if any progress in destroying them by such means is made, it will only be by copious and repeated applications, rather undesirable with so very poisonous a substance. If a trial be made of the remedy, a very small plot would be sufficient to show how far it affected "green bug," and such an experimental trial, which would cost a mere trifle, is, I think, worth making.

I hear on good authority that the pest has much lessened quite recently in parts of the Udapussellawa district, and hope this may be the commencement of its practical disappearance which may be expected to occur at any time.

An Uva proprietor has already ordered a small quantity of "London Purple" in order to give it a fair trial. Dr. Trimen's word of encouragement in reference to the probable disappearance of the "green bug" will be much appreciated by the remaining owners of fields of old King Coffee. May the verification of the worthy Doctor's expectation soon arrive.

PEPPER CUTTINGS.

Messrs. J. P. William & Brothers of Henaratgoda write as follows:—

"We send you by this post pepper cuttings of the best Malabar variety from imported plants; you will find that some leaves are 8 by 6 to 8½ by 6½. We have already booked several orders for the next monsoon. We find according to our experience the best tree for pepper support is the Kapok for the lowcountry. Nava, Halamba, and E. Indica also answer well for the purpose."

We submitted the above letter to Mr. W. O. Wambeek, who now writes:—

"Samples of pepper from William & Bros. duly to hand. The leaves have a fine large healthy appearance, and the pepper is a really good kind. The fruit clusters are large and full. I had 3,000 cuttings of this variety from them in October last which were put out and are doing well."

TEA IN JAPAN.

In a recent issue we gave statistics showing that the total produce of tea in Japan during the current year was 24,177,587 kwamme, or 199,465,093 lb. Deducting from this an export of 50 million lb. in round numbers about 150 millions remained for home consumption, or 4 lb per head of the total population of the empire. These figures were taken directly and without verification from the vernacular press, and they naturally attracted attention, being largely in excess of any commonly accepted estimate. The latest official statistics pub-

lished do not carry us to a date more recent than 1884, the production of tea for that year being shown as follows:—

Fu and Ken.		Fu and Ken.	
	1884		1884
Tôkyô	59,270	Yamagata	13,304
Kyôto	470,748	Akita	3,146
Osaka	318,856	Fukui	82,541
Kanagawa	55,491	Ishikawa	64,191
Hyogo	271,778	Toyama	40,947
Nagasaki	57,694	Tottori	24,579
Niigata	154,372	Shimane	105,153
Saitama	285,977	Okayama	106,031
Gumma	7,063	Hiroshima	79,396
Chiba	84,045	Yamaguchi	97,579
Ibaraki	170,330	Wakayama	114,116
Tochigi	13,758	Tokushima	119,084
Mie	520,520	Ehime	94,889
Aichi	136,715	Kôchi	156,136
Shizuoka	722,787	Fukuoka	192,680
Yamanashi	22,420	Oita	64,672
Shiga	233,031	Saga	26,856
Gifu	282,824	Kumamoto	280,417
Nagano	2,512	Miyasaki	199,238
Miyagi	27,219	Kagoshima	222,875
Fukushima	19,288		
Iwate	1,473	Total	6,013,982

According to the above table the total production for 1884 was only 50 million lb. in round numbers. The export for that year was 35½ millions, so that the quantity remaining for home consumption was only 14½ millions, or less than half a pound per head of population. Our oldest information on the subject of tea production does not go farther back than 1878. In that year, according to official statistics, the total quantity grown was 22,782,565 lb. (2,761,523 *kwamme*), whereas the quantity exported was, as we certainly know from Custom House returns, 217,579 piculs, or 29 million lb. The official statistics thus make out that in 1878 Japan sent abroad about 6 million lb. of tea in excess of her total production. It is plain that no reliance can be placed on such figures. If, again, we take the rate of increase in production, indicated by the official statistics between 1878 and 1884, and apply it to the period 1884-88 the production for 1888 should have been about 70 million lb. instead of 199 millions, as stated by the vernacular press. We trust to be able before long to place more accurate and trustworthy statistics before our readers. At present we confine ourselves to noting the difficulty of basing any accurate conclusion on existing data—*Japan Weekly Mail*.

CACAO PLANTING IN CEYLON:

A REVIEW* (CONTINUED).

CACAO PLANTS AND WHITE ANTS—TRANSPLANTING—KE-ROSENE AND PRENYLE AND KERUNA POONAC FOR "POOCHIES"—SHADE: PERMANENT AND TEMPORARY—JAK, ERYTHRINAS—LAND GRANTS AND SYNDICATES—FOREST RESERVES AND THE AUTHORITIES.

Those who have had to do with Cacao cultivation alone know how delicate a plant it is in its earlier stages of growth, and how often one is inclined to throw up the sponge as he sees plant after plant succumb to no ascertainable cause or to the ravages of white-ants. The greatest mortality has to be faced in transplanting. To overcome this the ingenuity of planters has devised many means. Some sow seed in bamboo pots, only possible where bamboos are plentiful, some in little bottomless pots or cylinders with which the plants are put out, and which receive a blow to crack them after the plants are placed in position, so as not to interfere with the development of the stem. When the pots are made of sufficient length to contain the tap-root, these afford the safest means of planting. Mr. Holloway invented a transplanter which was simply a half-cylindrical piece

* Cacao Planting in Ceylon; with Hints as to the Best Varieties to be Cultivated. A Lecture Delivered at Matale, on the 30th June 1888, by Mr. J. H. Barber. *Ceylon Observer Press*.

of cast iron with a short handle and treadle. When planting out, a drain was cut on the lower side of the nursery bed, the transplanter was inserted on the upper side of the lowest plant and driven home. It was then pressed downwards towards the drain, when a half-cylindrical piece of spouting received the plant with a "ball" of earth—tin would do as well. The plants were carried prone to the field, put out, and the piece of iron did duty again. Mr. Barber says he found two tiles tied with a piece of rope the safest and the cheapest nursery pot. Cheapest because the tiles after serving their purpose as pots are utilized for the roofs of buildings; but how about cost of carriage? This however cannot be placed in the balance against the perfect success of the plan, for Mr. Barber says he planted 175 acres in this way "and not a plant was lost." This success is phenomenal,—I had almost written apocryphal. Has any other single planter in the country been as successful with his system?

To white-ants has been accorded the first place of honor, or rather dishonor, as the most formidable enemies of the cacao planter. Many means have been resorted to to circumvent them. Amongst these Mr. Barber mentions kerosene. If kerosene has been found a specific against their attacks in the hill country, all I can say is that the species there must be decidedly more amenable than those I have to deal with, but then the place I write from must have been notorious even in days gone by for their ravages as on the authority of your senior it derives its name from the voracious termite. Phenyle mixed with 100 parts of water, is said to be a reliable and safe application at the rate of 3oz. to the plant. Mark this well ye coconut planters amongst whose enemies white-ants find a place. One recommendation of phenyle is its extreme cheapness, for we are told the cost of it and of application is but 50cts. the acre! The premier place amongst remedies is accorded to kekuna ponaac. The olfactories of white ants seem to be peculiarly sensitive to the offensive smell of this substance. One great recommendation of kekuna ponaac must be that it is a highly fertilizing manurial agent as well. In days gone by I was told that it was the best manure for coffee. The nitrogenous compounds it contains ought to give cacao plants a splendid start.

As regards shade Mr. Barber speaks like the thoughtful and observant man that he is. He does not go with the current and plant originally under shade. Those with observation will readily subscribe to what he says that in the earlier period of growth sunlight is essentially necessary for the formation of a healthy and robust plant. Plant your shade he says after your clearing. The explanation given as to why plants in the open stood the last drought better than those under the shade of the original jungle trees is hardly conclusive. That a large amount of moisture is evaporated from the surface of growing trees by transpiration is well known, but is not all this moisture especially in dry seasons drawn from the subsoil?

A distinction must be drawn between permanent and temporary shade. While the former affects the young plant injuriously till it has developed, I think all planters will agree that light temporary shade is essential for the well-being of the plant during dry seasons. Now that cotton is being tried as a shade for tea during the first year of its growth is it not well to plant it with cacao too, if for no other reason than to shade the soil from the effects of the sun which affects its porosity and induces wash? Cacao planters must wait longer than coffee and tea planters for a return; what if the interval should be made to your return?

Jak, the different *Erythrina* and *Albizia moluccana* are noticed as the permanent shade trees most in use. Each has its advocate. Mr. Barber gives preference to the Caylon representative of the *Leucaena*, the *erabada* used for village fences. I noticed a few years ago that in a field of coffee where the bushes were all languishing, those under the *erabada*, not merely under the shelter of the branches, but growing where the roots seemed to have extended, were growing luxuriantly. The question I asked my-

self then and which I ask of those competent to express an opinion authoritatively now, is "Are the roots of the *erabada* able to favourably affect the mechanical and chemical condition of the soil?" As far as I am concerned, the chief value I attach to jak as a shade tree is owing to its economic worth, though I do not detract from the value of the mould the soil receives from its fallen leaves. Nothing grows vigorously under it, its roots gain the mastery of everything else growing in the neighbourhood. *Albizia moluccana* Mr. Barber says is unsuitable, as it takes the entire possession of the field. Whatever returns plantains may yield when used as a shade tree are entirely swallowed up by the exhaustion of the soil that follows its cultivation and the cost of exterminating it, so it is unceremoniously dismissed from consideration.

To justify my complaint that the importance of some of the subjects raised by Mr. Barber in his essay demanded greater local publicity than was accorded them by publication in the *Tropical Agriculturist*, I have only to instance his weighty remarks on land grants to the German Tobacco Syndicate. Taking for granted that *everyone* engaged in agriculture with any pretensions to education *does* read that valuable publication, there is the general public, our legislators and the press as exponents of the opinion of the public that are interested in this important question, and before whom it would have been prominently brought if the lecture that contained these remarks had received publicity in a daily publication.*

The island is only now recovering from the heavy blow inflicted on it by the fell *Hemileia vastatrix*. Under the circumstances it is the duty of the Government to do all in its power to foster such permanent industries as will tend towards the development of its permanent resources. Cacao cultivation is as much a permanent industry as coconut cultivation, both by reason of the great age cacao trees are known to attain as by its natural inclination to grow in anything but the deepest and freest soil. The island does not abound in this description of soil. It is to be met with only in the valleys lying at the feet of our lower mountain ranges. The acreage available is limited, and cacao planters naturally watch this ever-decreasing area with a very jealous eye. To trench on these small reserves by granting them to aliens on special terms and for a term of cultivation the reverse of permanent is not sound policy. In new colonies where the available supply of land is very nigh unlimited no immediate harm can result from the system practised in tobacco cultivation on a large scale, but with us the harm is almost irreparable.

To make myself understood it will be well to briefly describe the system of tobacco cultivation on a large scale. A large tract of land is opened and planted with this product, a crop harvested, the plot abandoned, and the adjoining plot opened and planted. This annual planting and abandonment proceeds till all the land in hand is gone over. Tobacco is well known as an exhausting crop and not only is the cream of the soil exhausted in the growth of the crop, but also washed out of it by our heavy monsoon rains. Planters engaged in the cultivation of permanent products devise means to conserve their surface soil, which to them is capital. Tobacco cultivation is no new product and requires no special fostering care to help towards its development. It has been in the hands of the natives for a long time past. The land available to them being limited, they carry on its cultivation according to the most approved methods of scientific agriculture, i. e., as far as they have ascertained that knowledge instinctively and by observation. They crop their land and they restore the elements of fertility removed by that crop by manuring it with a substance most readily available. In some parts of the island the manurial agent is cattle manure; in other parts goat manure. When the European practice of tobacco cultivation started the natives brought the backs of the

* But only those who ought to see and read the *T. A.*—that is all interested in local Agriculture—have any concern with Land Grants.—Ed.

Mahaweliganga near its mouth at Trincomalee, I believe the system they employed was to plant coconuts on the land they opened and to plant tobacco as a subsidiary product in much the same way cassava sweet potatoes and dry grain are raised on this side of the island. After two crops of tobacco the adjoining block was opened and planted in the same way.

It is well worthy of the attention of our legislators to cause the passing of an enactment against the alienation of land for the cultivation of tobacco exclusively. I conclude with the remarks of Mr. Barber, put as they are with much force and point, and hope that our legislators and public men will give them their best attention:—

"Talking of chena cultivation and the ruin to land, let me pause here to remark *en passant* that I fear this will be the fate in reserve for the lands taken up extensively for tobacco cultivation if it is cultivated here as in Sumatra, and if timely measures are not adopted by the Foresters and the Legislative Council to conserve our forests for more permanent cultivation. The native tobacco planter in Jaffna,* Negombo, and other places, with the aid of heavy manuring, keeps his land always cultivated. But the planter who asks Government for a 1000 acres is likely to take the cream of the land from, say, a 50-acre block at a time, and pass on to the next block of 50 acres or more, and so on, abandoning the previous clearings and well he may, after paying Government a nominal R10 per acre, and netting the splendid profits that tobacco is said to return.

"But while we congratulate the individual who makes the most of his bargain in the shortest space of time, no one can regard such a system of cultivation as an unmixed blessing to the Colony; which has not after all an unlimited extent of land suitable for cultivation.

"A system such as this, while it blesses the receiver, who flourishes on the accumulated wealth of the forest, hoarded up for him for centuries past, can hardly be said to bless the giver—the Colony, should acre after acre, tract after tract, and district after district be opened up, harvested and abandoned, as the chena cultivators did before. The absence of that permanence in the cultivation of each and every acre of land in the island that is opened out, which is a condition essential to its continued well-being, cannot fail to tell or its prosperity ultimately. Every such clearing will be a blow at the root and foundation of its agricultural permanence."

CEYLON TEA IN AMERICA,

Planters' Association of Ceylon, 21st Jan. 1889.
The Editor, *Ceylon Observer*.

SIR,—I beg to enclose copy of correspondence with Mr. J. McCombie Murray, Philadelphia, Pa., with reference to Dr. Duke's scheme for making known Ceylon tea in America.—Yours faithfully,
A. PHILIP, Secretary.

Planters' Association of Ceylon,
Kandy, 23rd Oct. 1888.

To J. McCombie Murray, Esq., Ceylon Pure Tea and Coffee Company, 60 North Thirteenth Street, Philadelphia, Pa.

Dear Sir,—I duly received your letter of the 17th July, which has been published in the newspapers for general information, and was submitted to the Committee at a recent meeting. The expression of your views has been noted; meantime I annex copy of resolution passed by the Standing Committee of the "Tea Fund" upon a new scheme proposed by Dr. Valentine Duke of Kandy for making Ceylon tea known in America, and I shall be glad to hear from you on the subject as soon as practicable. To enable you to understand matters I enclose copy of Dr. Duke's letter dated 24th September and editorial comments on the scheme that appeared in the *Ceylon Observer* and

* In Jaffna sheep are penned and fed on land cultivated with tobacco.—Ed.

"Times of Ceylon." It is of course now out of the question to give effect to the proposal during the current year, but as future action will doubtless depend a good deal upon the nature of your report, it will, I feel sure, have your best attention. I do not think that there is anything I need add at present, but leave you to reply as fully as you can to the inquiries conveyed in the resolution of the Standing Committee herewith transmitted.—I am, &c.,

(Signed) A. PHILIP, Secretary.

Resolution referred to:—"That Dr. Duke's proposal be forwarded to Mr. J. McCombie Murray, Philadelphia, and that he be asked for his suggestions as to the carrying out of the scheme, and what steps he would take to insure the supplying of any demand that probably may arise from the proposed distribution of tea among the editors of the American newspapers; the Committee of the 'Tea Fund' of the Association stipulates that all inquirers for Ceylon tea be supplied with pure Ceylon tea and not 'The Kootie Blend.'"

Philadelphia, 29th November 1888.

Alexander Philip, Esq., Secretary of the Planters' Association of Ceylon, Kandy.

Dear Sir,—We are in receipt of your esteemed favor of 23rd ultimo and have carefully considered contents. We look upon the idea of presenting the editors of influential newspapers &c. with caddies of Ceylon tea as good in the abstract, but a scheme, which, if carried out, must be worked judiciously. To send small parcels all over "the United States, Canada, and California," as proposed, dropping one here and one there without any attempt to follow the matter up, would be as a few drops of rain in a desert land. It must be borne in mind that not only are editors of influential newspapers busy men and as difficult of access as the President of the United States, but that space in their columns is worth just so much money to them all the way from 25 cents to \$2 a line according to circulation, and it must not be taken for granted that these gentlemen are all so philanthropic by nature as to give much valuable space to extracts from a pamphlet on Ceylon tea. But allowing that they all show their appreciation of the gift by inserting a few extracts—what of that a week after? What result could reasonably be expected? Inasmuch as spasmodic advertizing is looked upon here as money thrown away, we do not advocate any scheme which cannot be followed up in some way.

There is without doubt a brilliancy about Dr. Duke's proposal which is very attractive, but we would suggest an amendment to the effect that your efforts be confined to a more limited sphere than all America. The shot spreads too much, and to our mind the game is out of range. Take New York city and Philadelphia, two of the largest cities in the world. In either of these cities we find business firms spending their millions of dollars in local advertizing; would both those cities combined prove too limited a field for such a scheme*? Before presenting any tea to editors, the people ought to be prepared for any notice that might be taken of Ceylon tea in the local prints. This can best be accomplished by the distribution of a well got up and very attractive illustrated pamphlet mailed to the better class citizens. We wish to place particular emphasis on the word *illustrated*. Americans "catch on" to pictures more than to solid reading matter, which must be short, to the point, and expressed in an interesting way.

Whenever the pamphlets are sent out and the people have had an opportunity of reading them, then we think is the time for Dr. Duke's 5 lb. caddy, and the notices which we would look for in the daily newspapers, medical publications, &c., &c. Nor should he stop at merely sending the tea with a circular. Every person worthy of such attention ought to be personally interviewed. This, as the proposal now stands, is of course impossible, and can only be accomplished by confining attention to one or two cities, but we are very

* We should substitute Chicago, Kansas City and Denver.—Ed.

sure that the gift of one caddy to any influential literary man thus approached would be of more effect than ten caddies sent broadcast over the entire Continent to editors who "know not Joseph," who have not the remotest interest in Ceylon or Ceylon tea, or anything to gain by puffing up the enterprise in which we are all so deeply interested.

Without previous advertising by such a medium as we have suggested, the power and effect of newspaper allusions to Ceylon would be to a great extent lost, the more so if there was no local representative to provide an informing public with the tea they read about. Be we right or be we wrong, however, we do not mean to dissent in the matter, and if it is the desire of the Association, that 1,200 packages of tea be sent all over America as suggested, we are at their service. We have seen Messrs. N. W. Ayer, publishers of a magnificent Directory of American publications of all kinds, and find that it is quite possible, with deep wading, to select 1,200 suitable editors to whom the tea might be sent with prospects of hearing of it again. We have also seen the manager of Adam's Express Company with reference to the cost of sending the caddies to their destinations; and although they can make no contract in the matter we can calculate on the average cost of each package at 30 cents, making \$360 for expressage alone. Charges are scheduled at so much per lb. or part of a lb., and economy can be exercised by attention to this fact when packing the caddies. If the tea is put up in Ceylon it might be well that a letter from the Association should be sent to the head of the Customs explaining the nature of the consignment, otherwise the small caddies might be subjected to rough treatment by sampling. We would advise packing here, as we are supplied with small caddies composed of very light wood and in every way suitable for the purpose.

A special and very oriental wrapper would be much appreciated. Something out of the way. Very Sinhalese! Each caddy would cost from 15 to 20 cents packed and complete in good style. To cost in all, say \$240.—All tea sent to Canada is subject to a duty of 10 per cent. We are now corresponding with a gentleman now principal of a bank in Toronto, but about to retire. He is inclined to take an interest in our tea and push it for us if the business can be carried on upon a satisfactory basis.

Exposition.—We look upon an illustrated and descriptive pamphlet as above all things a most important consideration, and in compiling the same, reading matter must give place in a great measure to illustrations. We are convinced that a Britisher is inclined to take a different view of the case, as we have a much more abundant supply of the good qualities of our staple, that we would fain enlarge on the argument rather than enlarge on profits. Our British Americans are by no means beyond the ordinary newspaper, and although they have tea bags to wash through a long bottle on a table, they are not a tea-drinking people. We therefore suggest that a number of interesting photographs be collected, which, if not found in the photographers' collections, can be ordered. We name the following as subjects:—

Review of Tea Enterprise.—The tea plant, general view of tea estates, kangani Tamil overseer, group of cooly (Indian) labourers, group of cooly (Sinhalese) labourers.

Manufacture of Tea.—Machinery in Ceylon.—The plantations, the rolling process, packing in the factory, the interior of the factory, with view of the ball rolling, the under process of oxidation, firing by sirocco, sifting by machinery, packing for export.

Finance.—Local Market in Ceylon.—Tea, How to Make Tea Profitable.—Tea at A. P. & Co., Ltd., Ltd. Landing caddy by rail at the railway station, shipping at Colombo, photo of planter at the Ceylon, &c., &c.

To these might be added a page of the shipping lights of Ceylon as a water-mark. Such a pamphlet would be an advertisement for an Association, and we think it would appreciate the novelty of the pictures, which would at once catch the interest. The first cost might be rather heavy, but once in print an electrotype

of the whole could be taken and copies ordered as required. The reading matter might be contributed by Messrs. Rutherford, Armstrong, and other ready writers and edited by Mr. John Ferguson.

If Dr. Duke's scheme is carried out, we would suggest that about a dozen of these pamphlets be sent with the tea, with the request that they be distributed among personal friends or influential local men; whether this request would be complied with would be a matter of pure speculation as a matter of course. We have our own and different ideas as to methods for diffusing the knowledge of Ceylon tea by confining our operations to where we can look after the work ourselves and see that it is carried out. The cost of such a pamphlet would be from \$30 to \$50 per mil according to the style in which it is got up and the number of copies ordered.

To stir up New York and Philadelphia, we would require 15,000 for the former and 10,000 for the latter to cost say \$40 per thousand or \$1,000, and \$250 to put them out among the best families. If the number to be put out can be definitely specified, and the distribution guaranteed, the greater part of the cost can be defrayed by soliciting advertisements, but this only if the distribution is local. No advertiser will go into a pamphlet unless there is a certain and reliable guarantee of local distribution.

We have gone into figures on the cost of carrying out the scheme proposed by Dr. Duke, and find that if the tea is put up in caddies on this side, and a few pamphlets accompany caddy, the cost will be not less than \$1,200 inclusive of all charges.

If the distribution is confined to New York and Philadelphia the delivery charges will be reduced to 1-3rd of the cost of delivering all over the country. We, moreover, think that 600 caddies properly looked after and carefully distributed in these two cities would show better results than 1,200 sent to all parts of America. To pack and deliver 600 caddies would cost about \$180, and the recipients would not only be personally interviewed, but inquirers could be supplied with the tea without sending all over America for it. We propose that the 6,000 lb. be sent, but that half only be given away and the balance sold, the value of the tea to be credited of course.

3,000 lb. of tea at 40c. (of a dollar) means \$1,200, or sufficient to cover the cost of 25,000 illustrated pamphlets. For the additional sum of \$1,000 we calculate we can put out these pamphlets, pack and deliver 3,000 lb. of tea in 5 lb. caddies and personally interview every person to whom the tea is sent—a work which would extend over two months:—

Freight on 6,000 lb. tea	...	120
Packing 3,000 lb. of tea in caddies	...	120
Delivery in N. York and Philadelphia	...	60
Mailing or delivery of pamphlets	...	250
Addressing do	...	50
Expenses attendant upon interviewing, &c.	...	1000

The interviewing of 600 editors or influential people of that nature is a work not to be undertaken without due consideration; nevertheless the writer, Mr. Murray, is prepared to go to New York and carry out this scheme there and in Philadelphia, if the Association take into consideration the arduous character of the work and the expenses necessarily incurred. It would take quite two months to get through the business, but we think the time would be well spent, as the writer would be pretty sure of a cordial reception and the goodwill of the person so visited, even if he failed to get an article out of him.

All we require to carry out this scheme is the tea and \$1,200 each; we are prepared to send the green cost as a contract, or to carry out the work on the Association's account and send in accounts monthly. In any case, whether it be Dr. Duke's plan, or our own that the Association decide upon, money will have to be provided in the shape of advances or a letter of credit for \$1000. Advances would of course be sent in every case, and we think that, by employing separate firms, whose business it is to

address and deliver packages or circulars, we can furnish vouchers for all moneys spent in carrying out the scheme.

PERSONAL LETTERS.—A personal letter from the Association must be sent to each person who receives tea, and those would have to be sent to whoever acts as agents on this side to address and mail as required. This letter should state that (here the name of the person authorized should be stated) will call and have an interview with him on the subject of the Ceylon tea enterprize with the view to interest him in the matter, and if possible persuade him to use his influence as a public man &c., &c.

We may mention that it is not always the editors of newspapers who command the news columns, and that a luncheon well attended by reporters or representatives of newspapers is productive of good. Had we the money, we would think our time well and profitably spent in preparing a banquet for the reporters of the press both in Philadelphia and in New York, but we can't afford it. We must now leave our ideas to be criticism of those who read, and leave the Association to act in the matter as it thinks best. Before closing, we may say that inquirers for Ceylon tea have never yet been served with the Kootee blend, but always pure Ceylon tea. We presume the last clause of the resolution means that the tea about to be distributed should be sent out as merely pure Ceylon tea and not as any particular brand of tea, but we would be glad if you could throw a little mere light upon the signification of the clause to which we refer. We could not of course send out any tea under our brand until it became our property, or by the special authority of the Association.

Let everybody be at rest concerning our actions in advancing the cause of Ceylon tea. We long for the day when we can afford to shut our doors on every other kind of tea. Meanwhile, although obliged to handle other teas, we are none the less energetic in striving to get people to use the pure article, and the fact that there is not one grocer of account in Philadelphia, who has not been obliged to call upon us for some Ceylon Kootie tea is significant, inasmuch as it shows that our influence is felt here now, and that it only requires time, perseverance, and a little money to fan the spark into the living flames which will require all the efforts of China and Japan to extinguish.—Yours very truly,

(Signed) J. M. MURRAY & Co.

THE TOBACCO COMPANY of British North Borneo, which we noticed in our last issue, has been registered by Hollams, Son, and Coward, with a capital of £100,000, in £5 shares. The object of this company is to acquire lands in British North Borneo, and the business of planting and curing and manufacturing tobacco and other produce now carried on by a firm or partnership known as the Darvel Bay Tobacco Company, on a portion of the land proposed to be acquired, and to develop and work the said lands and business. The first subscribers are:—J. A. H. Drought, 2, Montagu-place, W., 1 share; L. Fraser, 1, Whittington-avenue, E.C., 1 share; E. Christie, 1, Whittington-avenue, E.C., 1 share; A. Johnstone, 1, Whittington-avenue, E.C., 1 share; J. C. Talsen, 41, Keighton road, Clapton, E., 1 share; J. M. Way, 50, Turner-street, Barking, 1 share; J. Thompson, 2, Milford-terrace, Ashvill road, Leytonstone, E., 1 share. The first directors shall be Eugene Bunge, of Amsterdam; Frank Shaw, of Surbiton; F. G. Davidson, 13, Ennismore-Gardens, S.W.; E. Brown, Lancaster-gate, S.W.; L. J. R. Glass, 1, Whittington-avenue, E.C.; and J. A. H. Drought, 40, Old Broad-street, E.C. Each director shall hold at least £250 in the share capital of the company. The remuneration of the directors shall be £150 per annum, and £300 amongst them for every 5 per cent. dividend declared over 15 per cent per annum.—*L. and C. Express*, Dec. 28th.

CURE FOR WHITE GRUBS.—W. B. Alwood contributes to *Insect life* (i, pp. 48-50) the result of an interesting experiment in applying kerosene emulsion to turf as a remedy for white grubs (*Alorhina nitida*). A plant was treated with emulsion diluted 15 times. The grubs were killed in a most satisfactory manner, and the grass was not injured. Where larvæ were at first very abundant and destroying the sod, the emulsion application quickly ceased the injury.—*Agricultural Science*.

RICE AND KURAKKAN.—Mr. Borron and our readers generally are indebted to Dr. Loos for the long and interesting letter with which he favours us on the subject (see page 529) of the relative value of food grains. We cannot at all understand the statement made in another quarter as to parangi being prevalent (unless as the result of vice) in a seacoast district south of Bentota. The use of putrid fish and bad water cannot be a necessity to people in a seashore district. There is a case on record of the crew of an English vessel wrecked on an island in the South Pacific, subsisting for five or six months on coconuts, with fish occasionally, and flourishing and gaining weight on this diet.

DAVIDSON'S SIROCCOS AND BROWN'S DESICCATOR.—A planter, whose opinion we asked respecting the new down-draught sirocco, replied as follows:—"I am rather prejudiced against siroccos, as their internal arrangements burn out so rapidly that they are a constant source of trouble and expense. Moreover, their first cost is extremely high, the new down-draught one costing something over R2,000,—and, besides, they, as a rule, require a deal of firewood, which is a matter of some importance. Brown's desiccator is my favourite drier, as it is most simple and not so very expensive (R1,100), and it requires less fuel than any machine I know. I have seen several at work, and have never heard a single complaint about them."

WOMEN AND FRUIT-GROWING.—In the course of his article in the *Nineteenth Century* on "The Fruit-Growing Revival," Mr. Morgan (the editor of the *Horticultural Times*) makes the following remarks on fruit-growing as a new field for women's industry:—"A woman is at home in a garden. The physical work connected with dressmaking, telegraphy, typewriting, and all the other departments of labour open to women is much heavier than is required for the bulk of horticultural operations. In growing flowers, for example, the minute care and attention necessary are by no means unfitted for women, while in fruit-growing the same remark applies to a great extent. The healthfulness of horticultural occupations is well known, and even working in hothouses does not, with ordinary care, perceptibly affect gardeners, who are notoriously long-lived men. There is absolutely no reason why the fruit-growing extension movement should not open up an avenue of employment for women; and it is significant that among the applications for admission to the Horticultural College at Swanley were several ladies. "In America there are, according to the statement of a Chicago florists' paper, over 62,000 women engaged in the cultivation of fruit, while some of the most successful 'orchardists of California are of the same sex. From my own observation I find that women are more successful in fruit-growing than men; they have more of the 'divine quality of patience,' as Jeremy Taylor puts it. The most successful fruit-grower I am acquainted with is the wife of a friend; while yet again in bottling and preserving surplus fruit—an important branch of profitable horticulture—women are much more expert than our own sex. There is a great opening for the utilization of female labour in 'the art that doth mend Nature,' and I trust that we shall soon see a training class in horticulture attached to South Kensington and other educational centres."—*Fall Mall Budget*.

THE CEYLON TEA FUND AND THE
SEVERAL EXHIBITIONS PAST
AND TO COME.

The correspondence published in another column between the Planters' Tea Fund Committee and Messrs. Leake and Shand throws some light on several matters which have been puzzling on-lookers both here and in London. For, according to our London Correspondent's Letter of the mail before last, there was a feeling prevalent among the Committee named to represent Ceylon at the Paris Exhibition, that the Planters' Association were not dealing fairly by Mr. J. L. Shand, and that we all out here did not seem to understand and appreciate the obligation under which that gentleman had cast the local Tea interest by his action more especially in reference to this Paris Exhibition. Our correspondent further went on to say that the Ceylon Tea Committee for Paris were so annoyed at the non-response from this end to the very natural request of Mr. Shand that he—in handing over *his* Paris Concession to the Association—should be recouped the money he was out of pocket at Liverpool, that matters had come to a deadlock and that the members thought Mr. Shand might even be justified in taking the £500 which he could readily get for the transfer of his concession.

These remarks in our London Letter have been the subject, we learn, of severe animadversions among the members of the Tea Fund Committee, who consider that they involve a grave misrepresentation of the actual state of affairs. In the first place, it is denied at this end that Mr. Shand's concession for the Paris Exhibition was a *personal* rather than a *representative* one. It is stated that in the correspondence which took place at the time, Mr. Shand applied for and obtained the concession as representing the Ceylon Planters' Association or Tea Industry, and it is considered out here very unlikely that Mr. Shand would have got such a concession had he clearly intimated to the official concerned that he wanted it as a personal one to himself, with power to transfer or sell it to whom he chose, and without any reference to Ceylon or its Tea industry at all. At the time this concession was obtained, we remember it was stated that it was likely to be the only one for tea at the Exhibition and consequently that Ceylon would have a good show; while the great Indian industry would be left out in the cold. Since then, however, it has been made clear that the Indian tea planters have got all they want and that they will not be one whit behind in their exposition. This by the way. What is of more practical importance is to meet the charge formulated by our London Correspondent, on behalf either of Mr. Shand, or of the Paris Exhibition Committee who sympathise with him, that the Tea Fund Committee in Ceylon are not behaving fairly in not at once agreeing to increase their grant of R6,000 so as to make up for any loss incurred at Liverpool. Now, it seems to us as the result of the enquiries made at this end, that the first thing to be done is to have a clear business-like statement drawn out as to the

working and results of the Ceylon Courts at the different Exhibitions where Mr. Shand represented the Tea Industry, including Liverpool, Glasgow and Brussels. There is a widespread and growing feeling of dissatisfaction among the planters that fresh calls should be made on the local fund (at present in a state of insolvency pretty well), before they know fully what has been done with the large sums already voted—large sums that is for a struggling industry and in the face of the falling prices for the local staple.

As our London Correspondent has been instructed to put the matter in the plainest possible terms from the City, or it may be Mr. Shand's, point of view, it is incumbent on us with the information before us to use equally plain unmistakable language in representing the planters. Granted that there was a loss incurred by Messrs. Shand and Haldane at the Liverpool Exhibition—and we should be the first, knowing the good work done there, to press for the recouping of such actual deficiency so soon as a statement is formally presented,—what, it is asked, about the "great profits" which have been dinned into our ears for months together of the Glasgow Court? Are they not to go in liquidation of any part of this deficiency, or are they, notwithstanding the weekly and monthly parade of success, to prove a myth? Still more what about the miserable abortion of a Brussels Exhibition and the R6,000 given for a Ceylon Court there equally with one at Glasgow? Surely in view of the letters which reached us at the time of there being nothing to justify much expenditure at the Belgian capital, there has been a saving on this amount of R6,000 for Brussels which could also go to the credit of any deficiency? At any rate the time has come for a thorough businesslike statement to be drawn up and sent out here as to the working of the Ceylon Courts at all three Exhibitions: Liverpool, Glasgow, and Brussels,—as the very best means of removing all misunderstanding and of promoting good relations for the time to come. If the Ceylon Tea Fund Committee can in any way be called on to make good a deficiency in one case, they certainly have the right to enquire about surpluses in the other instances; and in regard to the Paris Exhibition, it will be well that from the outset, everything should be put on a sound business basis so as to prevent any risk of annoyance or misunderstanding in the future.

THE REPRODUCTION OF PEARL OYSTERS
IN THE TUAMOJU ISLANDS.

Under the above heading, the *Revue Agricole* of Mauritius for December 1888 has a paper, which we translate as follows:—

The *Moniteur* of Tahiti, published by the administration of the French establishments in Oceania, gives some interesting information on the mode of reproduction of pearl oysters in those parts. The Tuamotu islands are under French authority, and there might be developed at very little cost the production of a substance that enters fully into the requirements of industry. The explanation of the sources which produce mother-of-pearl is of extreme interest; the artificial multiplication of the pearl oysters which furnish it. The oysters may be found in places where there is a current or where there is none. It is preferable to put them in places where a current exists, but a few feet distant. A hole is bored in the shell, and a small tube of a very light material is fixed in it, by the aid of a mortar and pestle. A soft mud is then introduced, and a small shell is placed in it, but it has the same drawback as the preceding. A bottom of branched coral is the best, and it is for

this that search must be made; if there is none, it must be created. For this purpose a number of bunches of coral distributed here and there are taken up; they are transported, not being allowed to be out of the water for more than an hour, and with them is paved the place that has been chosen, and which ought not to be more than a meter in depth at low-water. The pieces of coral are good; they take root in the bottom like cuttings of plants. The site chosen must be enclosed with a wall of dry stone, which will remain under water; and in it must be formed divisions in order to place therein the oysters according to age and facilitate their examinations the walls of the divisions serve for distribution round the various bottoms of pieces of coral impassable for the feet, or for boots. The bottom having been prepared, oysters of the size of a small saucer and under must be looked for (many are to be found in places not very deep). The oysters must be removed without tearing the *byssus* by which they are attached. If the piece of stone can be taken as well, it must be done; otherwise the *byssus* must be cut with a knife. The oysters are then placed with the broad end downwards, the mouth upwards, the *byssus* on the side of the current; they are placed thus edge to edge, without being crowded, like the books in a library. Twelve months afterwards, the oyster of the size of a saucer will be as large as a plate. From this time it scarcely increases in size, it rather thickens; three years should suffice for obtaining good mother-of-pearl. However, the growth of the oysters varies with the islands: thus, in those that have one or two passages communicating with the sea, the growth is more rapid than in those where the lake is closed. When the oyster discharges its spat and abandons it to the current, this spat is retained by the dry stones of the wall mentioned above, from which later on new specimens can be taken for laying down. The live corals, on the contrary, which are so favourable for the development of the oyster already formed, not only allow the spat to escape, but also destroy it. It is therefore of the greatest importance to have receptories established in the most favourable conditions.

If the information in the above translated article can be depended on, an economic problem has been solved in the case of the large mother-of-pearl shells, which, in that of the true pearl oyster, has not as yet passed beyond the stage of discouraging experiment. In attempts at the reproduction artificially of the valuable "oyster" of the Gulf of Mannar, the main difficulty seems to have arisen from the fact that this species of bivalve requires a depth of water for its healthy existence, which involves conditions unfavourable to careful culture and watching against the effects of currents, predatory shells and fishes and other adverse influences. In the case of the mother-of-pearl shells of the Pacific, they would seem to flourish in comparatively shallow water, coming rapidly to maturity. If we can quite depend on the statements made, it is interesting and may turn out to be important, to be told that the coral zoophytes can bear to have "cuttings" taken from them, which will bear transplanting, preserving their vitality and flourishing in the new locality to which they are removed. The account given of the artificial culture of the mother-of-pearl shells is so interesting and may have such an important bearing on further experiments towards the artificial reproduction of the true pearl oyster in Ceylon, that we think our Government ought to ask the authorities in Tahiti for full details. Meantime we would attract the attention of the editor of the *Planters' Monthly* published at Honolulu to the subject, with a view to his collecting and publishing any information which may possibly be within his reach in regard to the reproduction of the large nacreous shells for which the demand in the arts of decoration continues so large, while the main deposits have been fished until the yield is often too poor to pay.

THE PARIS EXHIBITION AND CEYLON TEA.

Planters' Association of Ceylon,

Kandy, 23rd Jan. 1889.

The Editor, *Ceylon Observer*.

SIR,—With reference to the minutes of the proceedings of the meeting of the Standing Committee of the "Tea Fund" held on the 19th instant, I beg to enclose copy of correspondence regarding the Paris Exhibition.—Yours faithfully,

A. PHILIP, Secretary.

Planters' Association of Ceylon,

Kandy, 21st Jan. 1889.

Wm. Martin Leake, Esq., Secretary, Ceylon Association in London, 65, Fenchurch Street, London, E.C.

Dear Sir,—I am directed by the Standing Committee of the "Tea Fund" to acknowledge receipt of your letter of the 21st ultimo on the subject of the Paris Exhibition, and to confirm my telegram despatched to you on the 12th instant which read "Paris confirming letters Shand."

I now enclose copy of my letters to Mr. J. L. Shand of the 20th December and 1st instant referred to, which appear to leave at present little to add until receipt of further communications from your Committee. As regards funds the drafts upon the "Tea Fund" up to 31st December last have been so heavy that a little time will be required to collect further considerable subscriptions, but no time will be lost in calling in as much money as possible due on leaf plucked up to the close of the past year. The Standing Committee of the "Tea Fund" did not anticipate that funds for Paris would be required quite so soon in the new year, but no difficulty is anticipated in meeting the views of your Committee by an early date. From Mr. Shand's semi-official letter to the Chairman the position seemed to be somewhat ambiguous, especially as the views expressed were afterwards officially confirmed and a difficulty at once arose in approaching Government for a vote towards what might be challenged as a purely private speculation.

Your letter under reply if correctly understood would however indicate a fair and reasonable proposal to which the Standing Committee of the "Tea Fund" cordially agrees. With regard to increasing the grant from R6,000 to R8,500 steps will at once be taken to ascertain if a grant from Government may be looked for, and, if this is obtained, it would be quite the wish of the Committee to add it to the grant of R6,000 already promised; but under any circumstances it is very necessary that the Association should understand in what way it is proposed to ultimately return profits to the "Tea Fund" for the further prosecution elsewhere of its particular work of making known Ceylon tea throughout the world. The paramount importance of taking up and pushing Ceylon tea on the great American Continent cannot possibly be overestimated nor will the subscribers to the "Tea Fund" here consent to this work being longer delayed or taken up in a halfhearted or poor manner. On these grounds alone your Committee will at once see how very responsible the duties of the "Tea Fund" Committee are and how extremely advisable it is that such mutual arrangements be entered into as regards Paris Exhibition as will in no respect jeopardise the usefulness of the "Fund" nor unduly restrict or defer operations in new fields.—I am, &c.,

(Signed) A. PHILIP, Secretary.

Telegram.

London Kandy

Leake Philip

Paris confirming letters Shand.

(Signed) A. PHILIP, Jan. 12th, 1889.

Planters' Association of Ceylon,

Kandy, 20th Dec. 1888.

J. L. Shand, Esq., 24 Rood Lane, London.

Dear Sir,—Your letters of the 28th Sept. and 23rd Nov. with previous correspondence having been considered at a recent meeting of the Standing Committee

of the "Tea Fund," I beg to annex copy of resolution passed on the subject of the Planters' Association Show-Cases regarding the disposal of which you asked for further instructions. With reference to the last paragraph of your letter of the 23rd Nov. the Committee resolved:—"That the Secretary be instructed to ask Mr. Whittall and Mr. Leake to associate themselves with Mr. Shand in carrying out arrangements for the Tea Room at the Paris Exhibition"; and I have since transmitted a copy of this resolution to Mr. Whittall and to Mr. Leake, asking them if they can kindly consent to act. The native servants, Joseph Francisco, Simon Peter, and Charles Simon, have returned to Ceylon, and have made quite a series of demands by telegrams and letters for wages alleged to be due to them by your Committee for their services at the Exhibitions. I accordingly enclose for your information copy of letters &c. I have addressed to the servants and also to Mr. Arthur S. Reeves which explain the position. By my letter of the 24th April last I transmitted copy of the original agreements made by Mr. Bois on behalf of your Committee with the servants, and in the absence of any certified accounts or request from you in the matter I can of course do nothing more, especially as I observe that your Committee had the right in certain events to determine the contract of service at once. I shall be glad to have all necessary particulars with information as to how you would wish the accounts to be adjusted.

Acknowledging further Mr. Haldane's letters of the 11th and 18th Oct. and 15th Nov., I am, &c.,

(Signed) A. PHILIP, Secretary.

RESOLUTION REFERRED TO.—"That Mr. Shand be informed that the Planters' Association Show-Cases may now be sold to the best advantage on account of the Association."

5th December 1888.

The Secretary of the Planters' Association of Ceylon has received the letter signed Joseph Francisco, Glasgow; Simon Peter, Brussels; Charles Simon, Glasgow; also a telegram from Simon Peter, and has to tell the writers that until he hears from Mr. J. L. Shand, which he has not up to date, he cannot say if any further payment should be made in Ceylon.

Simon Peter is further informed that the Secretary, Planters' Association, has not received a receipt for £20 paid to his wife Eliza on the 3rd November last; this should be sent at once. The register books &c. will of course be duly returned whenever Mr. Philip knows that all accounts, &c., have been finally settled.

(Signed) A. PHILIP.

From Alexander Philip, Secretary Planters' Association, Kandy.

To Colombo, Joseph Francisco.

See letter sent by post to Simon Peter. Nothing to add.

(Signed) A. PHILIP.

Planters' Association of Ceylon, Kandy, 18th Dec. 1888.
Arthur S. Reeves, Esq., Sheen.

Dear Sir,—I am in receipt of your letter of the 15th instant, and in reply beg to say that up to date I have no information whatever from Mr. J. L. Shand regarding the pay due Charles Simon, or any of the other servants employed at the Glasgow Exhibition, &c. The vote of £6,000 to the Glasgow Exhibition having been expended in full, I naturally hesitate to pay anything more on that account to Mr. Shand's debit without having some request or authority from him with statement showing the wages due to the servants. No character belonging to Charles Simon appears to have been sent to my care, unless indeed the "Simon" referred to in a slip from a Mr. Whitworth, Poole, and from Mr. Shand, Liverpool, are those alluded to. I am sorry to appear to keep the servants waiting for any balance of pay due to them, but think they should have obtained from Mr. Shand an order for payment together with a certificate of the date of their discharge. I will write to Mr. Shand on the subject without delay.—I am, &c.,

(Signed) A. PHILIP, Secretary.

Planters' Association of Ceylon, Kandy, 1st Jan. 1889.

J. L. Shand, Esq., 24 Road Lane, London.

Dear Sir,—Confirming my letter of the 20th ultimo, avail of outgoing mail today to write at the request of the Chairman to ask you kindly to furnish me for the information of the "Tea Fund" Committee with a memorandum of your requirements as regards native servants, decorations &c., for the Planters' Association Ceylon Tea-room at the forthcoming Paris Universal Exhibition in 1889.

The "Tea Fund" Committee notes that by your letter dated 12th July 1888 to Mr. H. Trueman Wood it is intimated that you undertake on behalf of the Planters' Association to pay him as Honorary Secretary British Section at the Paris Exhibition 1,200 francs rent for every million visitors in consideration of his handing over the building set aside as a tea room; you add further that if these conditions are conceded, you will see to the equipment of the tea-room in characteristic Ceylon style, and will bring over native servants as waiters.

The Standing Committee would desire to know as early as possible in what way you wish assistance rendered here.

As regards funds the Committee is prepared in terms of my letter of the 27th July last to place at your disposal the six thousand rupees (£6,000) voted at whatever dates you may name, and this letter authorizes you to draw upon me at three days' sight on receipt of this for say £100 sterling pending your further advices on the subject.

In your letter of the 13th July you mention that you think the venture will be a very paying one to the Association, and in your letter of the 7th August you again express your confidence that at the end of the Exhibition you will be able to return to the Association whatever sum it contributes, or at all events part of it. The Tea Fund Committee is accordingly anxious to know under what scheme or arrangement of accounts it is proposed to work, and how the anticipated profits would be computed and disposed of.

I need not point out that in approaching Government and generally in dealing with funds at the disposal of the Standing Committee of the "Tea Fund" how very necessary it is that there should be no ambiguity as to the position of the Planters' Association in the matter. In the case of the Liverpool Exhibition it was of course understood that it was carried through entirely as an enterprising private speculation though undertaken in the interests of Ceylon tea with the most generous public spirit.

With regard to the Paris Exhibition it is distinctly the impression here that it is proposed to work the Ceylon Tea-room on behalf of the Planters' Association somewhat on the lines of the Glasgow Exhibition, and it is felt that you will readily appreciate the desire of the standing Committee of the "Tea Fund" for definite and full particulars as to your own representative position in relation to the Planters' Association, and to the London Committee. A clear official expression on the subject will be of much importance as enabling the Committee of the "Tea Fund" to act effectively, and to avoid any possible misconception or erroneous impression on either side.

With all the compliments and good wishes of New Year's day, I am, &c., (Signed,) A. PHILIP, Secretary.

INDIAN TEA IN AMERICA.

(By SATIS.)

Your correspondent's letter on the "American Market" in the *I. P. G.* of 30th October, induces a few remarks from an old Assam planter who has had over five years' very successful experience of selling pure Assam teas only in America and Canada to Americans. Your present correspondent need lay no stress on his claim, fully established as it has been by facts well known to be the originator of a scheme for introducing Indian teas pure, and simple, to the masses in the United States, so far back as 1883.

The writer left Assam in 1881 direct for the United States, taking with him a considerable quantity of specially manufactured tea, and determined to see what could be done with it.

I say "specially," because, in full knowledge of the Syndicate's operations and failure with the teas they were attempting to introduce, I manufactured, and sorted it to my own ideas, which were adverse to all previously set forth. For over seven years I have continued to sell *Pure Assam Tea* in America, and do so at this present moment at a price which amply pays me, my agents and the purchasers. Thus success has succeeded. During a residence of five years in the States I had every opportunity of gaining experience of the taste of Americans, as also of watching the futile attempts made by the Syndicate to establish Indian teas on their own merits. To any *experienced planter on the spot*, with his eyes and ears about him, there was no room to doubt the result of such operations, based as they were, upon an entirely wrong system.

I placed my opinions and convictions in print and repeatedly urged in a long series of letters to your contemporary, the *I. T. G.*, the vital need of other methods; in fact, just what I practised myself on a small scale in several States where I had agencies working. I addressed the Calcutta Syndicate, and offered to place my experiences and services at their disposal, and to remain in America to carry out the work fully, and also if needed to come to England temporarily and meet any Committee and lay my views before them. My opinions received the highest confirmation and approval, the Syndicate itself being one of those who supported my views on certain points suggested.

I received several offers from Indian growers to push their teas, but on terms which did not suit my views for many reasons. Over two years ago I returned to England, and by request of two distinct representative authorities placed my convictions and experiences of five years' success on a limited scale before them for contemplated action, and further fully repeated my conviction to many others interested in Indian teas. In two sections at least, my views have been productive of good results, though not in a way likely to benefit Indian growers as a body. Suffice it now to say, that being on the spot here, the contemplated proceedings, in view of the new start, are perfectly familiar to me in their various stages to date. From all one can hear, the prospects of unity are remote, and, of raising the funds needed proportionately so, which is, not to be wondered at by those conversant with current events.

The scheme referred to in your letter as Mr. Allie's is, of course, one of comparatively recent date, and doubtless is worthy of due consideration, but he, like others, presumably became weary of wasting his energies on the desert air. Your correspondent's opinions "P. P." are worthy of acceptance, as they point to a foregone conclusion *i. e.*, failure so far as the American masses are concerned, though doubtless the trade will benefit by having some stock of pure Indian teas to help down the *Impure Chinas* and Japan's "*Invaluable for mixing with China teas*" (?) is the way; the former Syndicate's American advertisements used to put it, till your present correspondent directed attention to it now just *six years ago*. The lines then essayed were wrong, and from your letter under notice also appear to be wrong now; but *non verrous?*

Six years ago it was distinctly pointed out that there was but one course open to insure success, and that course at present has not been adopted. No Americans will ever push British interests, particularly when opposed to their own, but they will make a "cat's-paw" of Indian teas so long as it suits, as was done before when the prospective China-Franco war lowered imports, or if it pays better, perhaps buy up the waste stock at a loss to the Indian planters and re-ship to England at a gain to themselves.—*India Planters' Gazette.*

[The meaning of all this we take to be that "Batis" manufactured India tea so as to resemble Oolongs.—*Ed.*]

THE RAILWAY TO TRAVANCORE.

A correspondent writes to us from Dikoya, Ceylon, under date the 7th instant:—

In looking over an old copy of your paper, that of 29th November, I came across a letter signed "A Native Thinker," in which the writer warns those concerned as to the cost of a railway into Travancore via Ariankao, and points out how much cheaper the route via Arambuli would be. We all know that a Mountain Railway costs more than one across a plain, but I imagine the first question asked about any proposed new railway is: 'Will it pay?' Now, even supposing a railway was built via Cape Comorin, what would it carry? The planters' traffic would still continue to go to Quilon or Colachel, and the native traffic is not one that a railway would develop very much, I have travelled more than once all the way from Tinnevely to Nagercoil, and I did not see much sign of any traffic. The people of the country on both sides the range produce what they require for themselves, and what they can't produce they have for the most part to do without, as money is not very plentiful. Salt, salt-fish and cotton goods would be the main items, and they would hardly keep a railway going, or pay a dividend on it, even if the first cost did not exceed half a lakh per mile.

A railway via Ariankao, on the other hand, would have many sources of traffic in addition to what the one by the south route would have. The timber trade is already very considerable, judging by the strings of carts one meets on the road, loaded with teak, angely and other valuable timbers, and with a railway this traffic would certainly be very much increased. The route for 20 miles lies through one vast forest which is allowed by all who know it to be the finest field for tea-planting in Travancore, and certainly better than anything Ceylon can show. The tea in bearing there is already giving 600 to 800 lb. per acre, which means that every acre would give at least $1\frac{1}{2}$ tons traffic to a railway passing through the district, and if the sircar will part with the land, I have no doubt they could sell the whole of it at a fair price and have perhaps 10,000 acres under tea before the railway was two years at work. Even that small acreage would mean the expenditure by the planters of two millions of rupees by the time it was into bearing and had machinery set up. The circulation of that amount of money, with the addition of about one million rupees a year ever after, would certainly benefit the natives of the country immensely, and would open out new industries and occupations to them that are not in existence at present.

Take again the sawn timber trade. At present only the finest timbers are used, but with cheap transport to the sea at Quilon there is no reason why Travancore should not use up all its soft timber in supplying Ceylon with tea boxes, the demand for which is an ever-increasing quantity. At present a large proportion of them come from Japan, and cost in Colombo about one rupee per chest, and 70 to 75 cts. per half chest. Now the current year's requirements here will be for 32 millions of pounds, say 220,000 chests at R1 .. R220,000 and 200,000 half chests at 75 cts. .. „ 150,000

R370,000

If Travancore could lay these down in Colombo at 90 cts and 65 cts for chests and half chests respectively, they would monopolise the market and give 3 to 4,000 tons traffic in tea boxes to their railway.

It only wants the newest sawing, planing and box-making machinery anywhere along the railway

route to do a roaring trade, and the timber required is what, under present circumstances, practically of no value at all. The wild cotton tree, for instance, makes capital boxes, and is not only plentiful but of no value, and of little use for anything else.* If Japan can lay them down in Colombo at present prices and make it pay, it would be strange if Travancore, with its cheap labour, a railway to Quilon, and cheap dhony freight from there, could not do so at a much lower figure. To encourage this traffic the Government should not charge for soft timber, from which at present they derive no revenue, and to keep up supply of the more valuable sorts they might sell their forests on the condition that, for every 10 acres felled and planted in tea, at least one should be planted with teak on a portion of the property specially reserved for the purpose. This is a condition that could be easily enforced, and would be no great hardship on the planter.

Again, the paper and cotton-spinning mills now being started will require large quantities of the raw material, which has to be carried to them and carried away again in the shape of manufactured goods. I might go on dilating on the towns and villages that would spring up at every station, and the number of traders it would take to supply such a population with the necessaries of life, but this letter has already run to a considerable length and I shall not trespass on the patience of your readers any further. I hope, however, I have said enough to show that there is more hope of traffic in paying quantities by the Northern route than by the Southern, and I would just point to Ceylon, with a similar country and similar climate and industries, its railway costing two lakhs a mile, and yet paying its 10 per cent, and I have next door to me a railway station on what used to be nothing but a swamp, but is now a thriving and growing village bringing in already some Rs.15,000 a year to the lucky proprietors. I should like to see a similar one in the neighbourhood of Culoorty.—*Madras Times*, Jan. 17th.

INDIAN TEA EXPORTS.

Indian Tea Association, Chamber of Commerce, Calcutta, Jan. 12th, 1889.

DEAR SIR,—The General Committee have the pleasure to hand you their usual Monthly Return of shipments of tea from Calcutta, and also a return of exports of Ceylon tea for four years up to the 20th December, 1888.

Exports of Indian Tea from Calcutta:—			
	1885	1887	1886
	lb	lb	lb
Exports to Great Britain in Dec.	11,801,612	10,989,859	10,773,078
Exports to Great Britain from 1st May to 31st Dec.	79,340,409	72,927,160	63,805,388
Exports to Australia and New Zealand in Dec. ...	369,355	226,028	9,880
Exports to Australia and New Zealand from 1st May to 31st Dec.	2,397,100	1,806,584	1,228,718
Exports to America in Dec.	23,819	16,038	11,240
Exports to America from 1st May to 31st Dec. ...	92,644	37,998	78,649
Exports to other places in Dec.	31,244	98,329	164,035
Exports to other places from 1st May to 31st Dec.	635,003	597,942	563,943
Total exports from 1st May to 31st Dec.	82,655,156	75,367,984	65,678,598

—Yours faithfully, G. M. BARTON, Assistant Secy.

* Surely the short fine wood (kapok), now so largely in demand for stuffing mattresses, pillows, &c., is of value.—Ed.

THE TRANSMISSION OF CACAO SEEDS FROM CEYLON TO CACHAR, is thus noticed in the proceedings of A.-H. Society of India:—*Cocoa* (*Theobroma Cacao*). Mr. W. Aitchinson of Cachar sent the following report on 12 pods of cocoa obtained for him from Ceylon, for an experimental plantation he is desirous of making in Sylhet:—"The tin with the cocoa pods arrived here on the 22nd instant, and with the exception of 3 pods which looked fresh as if just plucked from the tree, they were all nearly rotten and white with mould. On open the pods, the seed was also white with mould, but very fresh when broken in two. In some pods the seed had germinated, the roots being about one inch long, but had died back leaving about one-eighth inch which looked fresh, so also the seed. I think these will come away again. In some others the seed was just germinating, and in some there was no sign of breaking away. On the whole I think the seed arrived in very good condition. All were planted on the 23rd and 24th instant. Will let you know when above ground how many seedling there are." The 12 pods having left Heneratgoda, Ceylon, on 20th September, "they were thus one month and two days on the journey."

RHEA.—A notice of Rhea (Ramie) appears in the Kew Bulletin No. 23 for November last. Mr. Morris's Report deals with the different machines tried in Paris, viz., the Delandtsheer, the Barbier, and the American fibre Companies, and also the Favier chemical process, and the results are thus summed up:—"That the results are unsatisfactory and disappointing, and fall far short of the estimates of the inventors, there can be no manner of doubt. It is probable that a fresh series of trials will be inaugurated next year in connexion with the Paris Exhibition of 1889; and if the value of the prizes is increased, there will doubtless appear a larger and better representation of machines and processes." Mr. Morris mentions other machines and processes not brought forward in Paris. Amongst others the following:—"In June last year, Mr. C. Maries of Durbhanga, Bengal, forwarded a series of specimens of Ramie fibre in different stages of preparation to Kew, and asked for an opinion upon them. It appeared he had invented a machine, worked by two men in the field capable of operating upon two or three hundred stems per hour. This machine simply separated the fibre and bark from the wood, the bark was then operated upon by other processes, and eventually it was deprived of gum and mucilage, and worked into a tolerably fair fibre suitable for manipulating by textile manufacturers. This fibre was reported by Messrs. Ide and Christie as 'long, fairly clean Ramie fibre, worth about £28 per ton.' The particulars of Mr. Maries' methods have not been made public; but we understand that a well-known firm of merchants in Calcutta has acquired the patent connected with them, and the system is now in course of being practically tested on a large scale." As frequent application are being received for information connected with Rhea, the above extracts from Mr. Morris's report are given, and the following from the same report may be added as expressing briefly the present position of this product. An eminent firm of brokers recently informed me:—"There is no doubt that Ramie is exciting great interest in many parts of the world, and many people are experimenting with various processes for extracting the fibre cheaply and quickly. We cannot say that any results submitted to us up to the present time are quite satisfactory. The fibre is either imperfectly freed from gummy matter, or the process breaks down in the matter of cost, or owing to the local conditions under which it must be carried on. We consider that no system of preparation which cannot produce the clean, unmoistened fibre under £30 per ton is likely to succeed in establishing this article firmly in the estimation of English textile manufacturers. This opinion expresses very briefly and clearly the conclusion at which I have arrived in connexion with the preparation of Ramie fibre. It is quite possible that some machine or process will eventually solve the problem, but at present the exploitation of it, in spite of years of labour and the expenditure of large sums of money upon it, cannot be said to have yet emerged from the experimental stage."—*Proceedings of A.-H. Society of India*.

Correspondence.

To the Editor.

LONDON PURPLE OR PARIS GREEN: BEWARE OF ITS STRENGTH.

DEAR SIR,—Dr. Trimen's letter in your columns regarding the above reminds me to mention that I received a packing case of either of the above compounds from Messrs. Sigg, Sulzer & Co. when established here about 8 or 9 years ago, just at the time when coffee leaf-disease was raging. I wished to try it on a cacao plantation in the Western Province, where all the cacao plants put in were destroyed by whiteants, hundreds of plants being destroyed nightly. I found that the stuff was so powerful that a solution of it sprinkled round the tree killed the plant outright. A few months back having a large creeping rosebush infested with black bug I put a tablespoonful of it into a bucket of water and sprinkled it all over the leaves; within 12 hours the leaves all withered off, showing that the composition is very powerful. I have still a small quantity left, and will be glad to let anyone have a little to experiment with.

I remember also sprinkling a little of it around a three-year-old breadfruit plant to destroy ants, with the consequence that the fine healthy plant I had died in a short while.—Yours truly, D.

[Did our correspondent get no instructions with his supply? If he sends a small quantity to the *Observer* office, we shall see that an experiment is made.—Ed.]

ARTIFICIAL TEA WITHERING.

13th January 1889.

DEAR SIR,—The other day Mr. Chas. Lepper gave his 'views' in regard to the siroccos new and old of Davidson & Co., and I think it would be well if planters in general would give the public through your columns their experience in new machines for the guidance of those about to purchase.

The object of this letter is to bring more prominently before the public "Greig's" drying machine, which has hardly till now had a fair trial in Ceylon, but working as it has been recently on several estates, the public will be interested to know the results.

For simplicity in construction and ingenuity I think it is far ahead of any other drier capable of doing a large quantity, while the fact that makers of all other recent machines are adopting the forced air draft shows that Mr. Greig had the "right end of the stick" here too.

Apart from the question of drying, the machine appears to be about as perfect a witherer as anything is likely to be, and it is the fact that Queenwood teas are, I believe, entirely or almost entirely *artificially* withered, and that they have fetched the best prices in last week's market that has induced me to call attention to it? (Later on Walla Valley teas also realized very high prices.)

As a witherer, Mr. Wiggin says:—"It can keep pace with three rolling machines with a merely nominal expenditure of firewood," and, if the teas so withered top or nearly top the Colombo market surely this machine requires better treatment at the hands of the public than it has got; and my belief is that it shall take a high place among the tea driers, and be the tea witherer of the future.

Mr. Dickson of Lebanon also wrote: "As a witherer it is a decided success and knowing what a saving of time, space, and trouble it is, I would not be without it." And further says:

"The consumption of fuel is very little: I have withered two fills early in the morning before stoking up, simply from the latent heat in the machine from previous night's work."

I know as a matter of fact that the patentee of perhaps the most successful drier of the present day passed a high encomium on the machine which is as good a certificate as one could wish for, and think that if Mr. Greig would exhibit it to an unbiassed committee of public men, he would do a good service to the colony at large and himself too I hope.—Yours faithfully, L. D.

P. S.—Lately when lecturing Hughes pointed out that tea should be fermented in a warmed room at a regular temperature, and I am inclined to believe that this machine makes good tea greatly, owing to its giving it an equal fermentation during withering at an exactly regulated temperature.—L. D.

[People have been prejudiced against Mr. Greig's machines by the unmeasured language in which their maker described their capabilities; but if all that is stated above, especially in regard to withering, can be sustained by public trial, we think that trial ought to take place,—say at the approaching Agri-Horticultural Exhibition at Kandy?—Ed.]

FOOD-STUFFS: KURAKKAN AND GINGELLY OIL: CURIOUS PARTICULARS.

Kotmale, 21st January 1889.

SIR,—*Kurakkan* is the staple food of the poorer classes in the Madura district. The vast majority of the coolies who come down from the Zemindary of Ramnad live on *kurakkan*. It is there known as *képpai*.* In Jaffna too, the peasants live on *kurakkan*, but not exclusively. But neither in Madura nor Jaffna is *parangi* caused by *kurakkan*. Although it is a nutritious and sustaining food for labourers, peasants and hard-working people, it is not wholesome to those who lead easy lives. To the latter, rice is the best food. It is a sort of biscuit most fit for invalids and the sick. Practically the rice we eat is boiled twice before it is eaten. Raw rice is more sustaining than the double-distilled rice eaten by the people here. In Wynaad the Canarese coolies live on raw rice; but this diet did not agree with the Tamil coolies who went there. Brahmins use raw rice largely. The use of raw rice must be encouraged.†

Mr. Borron has with great keenness pointed out the value of sesamum. This is the first time I saw a European praising it. No Tamil would use for culinary purposes any other oil but gingelly, if he can afford it.

For growing the hair as well as for polishing and blackening it, I do not know whether there is any other oil in the world which can compete with the modest gingelly. If it be bottled, labelled, puffed up and advertized, it will fetch the same value as the nobler Macassar. A large portion of the Tamils in Jaffna and South India use gingelly oil with rice as butter is used with bread. It is considered by some medical men as an efficient substitute for cod-liver oil. It has for the last 2,000 years supplied the place of turpentine in the Tamil land. In former days Jaffnese who trained their boys for feats of strength fed them with sweetened gingelly ponac, the oil not being exposed. The Tamil *Materia Medica* says of gingelly that it confers youth, meaning thereby that it is very nutritious or fattening. *Uvuntu* or blue gram is another nutritious foodstuff.

Some Indian gipsies told me that when they travelled through the Wannu they were offered large quantities of buffalo curds and buffalo ghee, which they invariably refused. When I asked them the reason, they

* This explains the "Keppaikad" of our Travancore correspondent.—Ed.

† We suppose our correspondent means rice which has not been deprived of the husk by the process of scalding.—Ed.

told me that if they should use buffalo curds, butter and ghee in the *Wanni*, they are sure to get boils, sores and other cutaneous eruptions. Although buffalo curds, &c., is a *kiranti* food, the use of it in healthy localities will not be attended with the same consequences as in the *Wanni*.

TIRUNELVELI N. V. CINNATTAMBI.

[Our correspondent is much mistaken in supposing that Europeans have not appreciated gingelly and the fine emollient oil yielded by the seeds. Of the latter enormous quantities are exported from India to Europe, and the oil expressed from them is largely used as a substitute for, or an adulterant of, olive oil. Gingelly poonac is largely imported from India into Ceylon as cattle food. Like most oil-yielding plants, gingelly rapidly exhausts the soil in which it is grown.—What our correspondent calls "uluntu or blue gram" we have always known as "Oolondoo" or green gram. It is a small pea, the soup of which is reckoned by the natives a cure for fever. The idea that foods partaken of in some localities produce bad effects, while similar foods can be eaten with not only impunity but benefit in other places, is curious, and ought to be tested. We have all read of the "date boils" of Bagdad, and we have heard of "mango boils" in Ceylon, the climate and particular season probably and not the fruits being at fault.—ED.]

PESSIMISTIC UTTERANCES ABOUT TEA.

Jan. 21st, 1889.

DEAR SIR,—The note of warning which you sounded in your issue of the 17th instant, "That tea may not be brought to the disaster which has overtaken cinchona, by excessive production," comes, it is to be feared, too late; too late, even indeed, could it have been ever hoped more effectual than if addressed to the man in the moon.

In the full face of lessons from the past and in the face of prices falling steadily, year by year, month by month, and week by week, prodigious extensions continue in the north, in the south, in the east, in the west, in good land, in mana grass, upon the topmost hills and at the edges of the paddy-fields, down in the depths;—until at last the shrub is being contemptuously compared with *LANTANA*.

It is not happy to contemplate the possible or probable—probable or possible—result of this kind of thing, before two years have elapsed. The "shutting up" of China is entirely problematical; but even were she shut up, is it to be imagined for one moment that the great consumers, the "masses," will not decline, in these days of over-population and poverty, to pay more for their tea, whencesoever it comes, than they have done in the past, because, forsooth, there will always be buyers of *fancy* Ceylon teas up to about 15,000,000 lb.?

Ceylon is now playing her last card, and that too, with a heavy necklace of debt for railways; hence, should disaster be brought about by the thoughtless, the remedy will have to be heroic—such as in the case of plague—no humberging half measure will suffice.

At all costs (no matter the result) the *compulsory* destruction by axe and fire of many acres will become *imperative*; mere abandonment would not do. Coffee when abandoned died; but tea lives and thrives as comfortably as a chena bush, and with rising prices the abandoned stuff would once again be rushed to the utter destruction, once more of the latter.

BE WARNED.

[The very quotation made from our column by this writer shows that we are by no means insensible to the danger of over-production causing sup-

ply to exceed demand with the inevitable result of lowered prices. Prices indeed have gone down year by year as our crops have increased, until, instead of an average of 1s 3d per lb. which prevailed for Ceylon tea a few years ago, it looks as if 1889 would see the descent to 10d or even 9d. This is certainly not the time to discourage the efforts made by our local and home Committees to extend consumption of our staple product. But there is a difference between caution and despair such as our correspondent expresses. In the case of coffee there were constant rebounds from low prices to high, as the result of the increased consumption produced by low prices. Similar results may be expected in the case of Ceylon tea. If prices go down below the remunerative level, of course much of the poor-yielding places will be abandoned, but we cannot ask, we certainly cannot compel, people to cut down and burn their bushes as our correspondent suggests. There is the warning, and let it have its due effect, as well as the belief, well founded, we believe, that if peace can be preserved, the consumption of tea is destined to a very large increase amongst the nations of the world.—ED.]

TEA.—Elaborate arrangements have been made for bringing tea to the notice of visitors at the French International Exhibition this year. An "Oriental Palace" designed by Mr. Purdon Clarke, is in course of construction in the exhibition grounds, for the display of Indian articles of manufacture and consumption, and the exclusive right of sale of Indian tea in the building is to be granted to the Indian Tea Districts Association. For this purpose a verandah about 140 feet long by 12 feet wide, and all the central portions of the building, except what is required for officers, will be absolutely at the disposal of the Association. The 'palace' will be an attractive feature of the Exhibition.—*Indian Agriculturist*, Jan. 5th.

FOR INDIARUBBER PLANTERS.—When calling on Messrs. Thomas Christy & Co. lately I saw a number of cases fitted with specially prepared cans for carrying about in the forests for collecting the milk of certain trees and plants. Some of the samples have been lately experimented upon for rubber purposes, and were found to produce some remarkable results, and to exhibit highly valuable properties. Further details will shortly be given in this Journal. Messrs. Christy are also receiving large orders for their "Fibrite" cans and buckets, which are answering admirably for various purposes, as they resist the action of acids, oils, spirits, &c. I understand that they are shortly to be made in the form of bowls with handles.—*Indiarubber Journal*.

THE FORMATION OF PETROLEUM.—The theory is held by Professor Mendeleef that petroleum is produced by water, which penetrates the earth's crust, and comes in contact with glowing carbides of metals, especially those of iron. The water is decomposed into its constituent gases, the oxygen uniting with the iron, while the hydrogen takes up the carbon, and ascends to a higher region, where part of it is condensed into mineral oil, and part remains as natural gas, to escape wherever and whenever it can find an outlet. If this assumption is correct, and a sufficient store of metallic carbides is contained in the earth's interior, petroleum may continue to be formed almost indefinitely and yield a supply of fuel long after coal has become exhausted. Professor Mendeleef supports his views by producing artificial petroleum in a manner similar to that by which he believes the natural product is made.—*Indian Engineer*, Jan. 2nd.

SECURING WOOD TO CONCRETE.—Herr Ludolf, a German Engineer, has patented the following method of securing wood flooring to concrete:—Two or three days after the cement has been laid down, and whilst it is still damp, thick sheets of jute are nailed to the floor with wrought-iron nails, 2 inches long and 4 inches apart. After the floor has completely dried, the parqueting or herring-bone parquetry is fastened down by means of the well-known paste of cheese and lime.—*Indian Engineer*, Jan. 2nd.

THE FIRST CONSIGNMENT OF CINCHONA BARK shipped to Europe for sale from the Nilgiris, and consequently from South India, was despatched from the Neddittuttam plantations in July 1871 when 3,188½ lb. were shipped. In January 1872, 4,146 lb. more were shipped for home; but the first consignment of large bulk placed in the Home Market from the Nilgiris was in 1873, when 25,000 lb. of bark were despatched to England. These shipments realised for old mossed *Succirubra* bark 2s. 3d. per lb. for pharmaceutical preparations and 2s. 7d. per lb. for extract of quinine; for small mossed bark 2s. 6d. and for unmossed bark 2s. 10d. per lb.—*South of India Observer*, Jan. 5th. [Prices about three times as high were obtained for some of the first consignments of bark from Ceylon.—Ed.]

A PROPOSED TEA TRUST.—The mania for forming monopolies is evidently not at an end, for we understand, according to the *Calcutta Capital*, that several gentlemen of means and standing are endeavouring to form a large tea trust. The stocks of the various tea companies at present quoted on the Exchange are always considered unsatisfactory as regards variations of price, and yet there are many concerns offering excellent returns to investors who, if they could feel that there was a fair chance of getting their money back should they desire to realise, would doubtless embark money in such; but a study of the recorded transactions shows that many stocks have not been operated in for years, if at all. A tea trust, by spreading its money judiciously over a number of concerns, would get a very good return on the capital invested, and, if the Company floats, a substantial rise in several low-priced dividend-paying concerns may be expected, although it is to be hoped that we may not be flooded with monopolies, all of which tend to place a heavier burden on the consumer.—*Public Opinion*.

COCA.—At the meeting of the Linnean Society, December 20th, a paper was read by Mr. D. Morris on the characteristics of plants included under *Erythroxylon coca*, Lamarck, with a description of a new variety, which he proposed to name from its origin *E. novo-granatense*. He pointed out that the well-known coca plant had been noticed by botanists and travellers for the last three hundred years, and that although Clusius was generally regarded as the earliest writer on it, he had been anticipated by Nicholas Monardes in his 'Historia Medicinal,' published at Seville in 1590, and translated by Clusius, who printed it in a condensed form in his 'Exoticorum Libri Decem' in 1605. The plant was first described as a species by Lamarck, in the 'Encyclopédie Méthodique' in 1786, from specimens brought by De Jussieu from Peru. Until lately the leaves had been used merely as a nervous stimulant, like opium in China and betel in the East Indies, but had latterly come into prominence as the source of cocaine, a valuable alkaloid possessing anæsthetic properties in contact with the mucous membrane. There were several climatic forms more or less distinct, and after describing the typical plant Mr. Morris pointed out the characters by which *E. novo-granatense* might be distinguished.—The paper was ably criticised by Messrs. J. G. Baker, Rolfe, and T. Christy.—*Athenæum*.

ARTIFICIAL COFFEE BEANS are on the market. They consist of the roasted meal of various cereals massed with dextrin or some such substance. Two factories are said to exist in Cologne which offer the machinery and plant with formulae for 108l.; the apparatus turns out from 10 cwt. to 12 cwt. of coffee per day at about 1l. a cwt. The factitious "berry" can only be recognised with great difficulty if the artificial coffee is mixed with genuine its detection is believed to be almost impossible.—*Chemist and Druggist*, Jan. 5th.

A REMARKABLE FRENCH PATENT has been issued for preserving seeds and plants from the action of parasites. The same application is believed to hasten the germination of the seeds. To protect the latter when placed in the ground they are steeped in antiseptic and fertilising liquids. Young plants may advantageously be watered by the same. The best liquid is stated to be composed as follows:—Acetate of aluminium, 15 parts; acetate of lead, 70 parts; carbonate of lime, 15 parts. These are dissolved and mixed in water, and then used as stated above.—Dr. Taylor in *Australasian*.

THE STORING OF OXYGEN.—One of the industries now followed in London is that of separating and storing oxygen from the atmosphere. The curious industry has an application in the maturing of spirits and the improvement of beer. This is far from being the only application of pure oxygen, for which the price is good, but it is notable, and no doubt distillers and bonders will give heed to the discovery. It is said that the oxygen, in contact with spirits, accomplishes in a few days what is done by from three to five years by nature. The oxygen gets rid of the fusel oil quickly, and as this is the most injurious property of spirits, the consumer has an interest in the matter as well as the producer. A maturing effect is also produced on beer by admixture with oxygen, and obviously this gas is of high value for the whole tribe of effervescing mineral waters.—*Court Journal*. [This may be of use in Ceylon, by-and-bye.—Ed.]

PEPPER CULTIVATION.—Mr. Prior Palmer's letter (page 529) is interesting as showing that trees of the variety of *Erythrina indica*, which the Dutch called *dadap*, are used in the Eastern Archipelago as supports for pepper vines, a use for which we should take them to be better suited than as shade trees for coffee. The *madre de cacao* tree, however, which Mr. Fraser of Wariapola obtained from Trinidad and cultivates as shade for his cacao, is a far superior tree in beauty of stem and branches and luxuriance of foliage to the shabby *dadap* trees we saw in Java. Adverting to Mr. Martin's letter anent the Malabar pepper cultivated by him, we quote the report by Mr. W. O. Wambeek, of Eilandhu estate, Henaratgoda, on the specimens which Mr. Martin sent us:—

"The pepper cuttings from Eden estate you sent were received this morning. The case contained about half-a-dozen cuttings with fruit, and I think they were more meant as specimens of the variety than for planting out. Although they are slightly dried up, I will put them out in a nice shady place close to my bungalow, and will give them my personal attention. By the leaves I conclude they are the Malabar of a better variety than what I previously procured. I have beds ready with water close by, which could be utilized if you order any cuttings of this variety, and if they were planted out now in beds, carefully watered and shaded, they would be fit for transplanting for the S.-W. rains, and would come up better than putting out simple cuttings at that time as they would then be with root and throwing out new shoots. The largest leaf in the case is 9" x 6".

A thousand cuttings have been consequently ordered, which we trust may turn out well and yield thousands of cuttings in their turn.

CEYLON TEA AT GLASGOW AND BRUSSELS EXHIBITIONS.

Kandy, 28th January 1889.

The Editor, *Ceylon Observer*.

Sir,—With reference to the minutes of proceedings of the meeting of the Standing Committee of the "Tea Fund" held at Kandy on 19th instant, I beg to enclose copy of correspondence with Mr. J. L. Shand regarding Glasgow and Brussels Exhibitions.—I am, sir, yours faithfully,
A. PHILIP, Secretary.

21 Rood Lane, London, E.C., 14th Dec. 1888.

The Secretary, Planters' Association of Ceylon, Kandy.

Dear Sir,—I had hoped to be able to send you final reports before this of the Brussels and Glasgow Exhibitions, but delay in closing Exhibition accounts seems inevitable. In Glasgow we have still got the show cases and the tea house on our hands, and a law suit in appeal, and in Brussels Mr. Lee Bapty has not yet sent me completed accounts. I hope, however, we shall be able to forward you both accounts soon.

I have been drawn upon by Messrs. Aitken, Spence & Co. at 3 a/s for £51 9 7. I did not know they had any claim against us. Our expenditure in Glasgow has been heavy, and I would ask you to send me by return any balance you may have in hand on the Brussels vote. We shall require all the money we can lay our hands upon to close accounts, and I am specially desirous not to call upon the London guarantors. A sum of £200 was agreed to be given to my firm account, Glasgow, for services rendered, but we have drawn nothing except actual outlay account, Brussels, and I think as the latter vote has not been exhausted and the former is more than exhausted, it will only be just and right to all concerned to apportion the bonus to my firm between the two Exhibitions. I think all exhibits about which we have had instructions have been duly and I hope safely returned to their destinations, and I take this opportunity of informing Mr. Preudenberg that his coconut collection was sent off to Leipzig. Unfortunately Messrs. G. A. Dick and J. L. Dewar sent me instructions regarding their exhibits too late to carry them out. As soon as the Exhibition closed all unclaimed samples were mixed up and sold for the benefit of the court. I do not think I have yet thanked Messrs. Webb Bros. and Mr. Barber for their kind contributions of tea seed, which both arrived in excellent order.

As regards Paris, I am glad to see Mr. Leake has at my request appointed a Committee. It is time to be up and doing, and my request that your Association should appoint a London Committee to confer with me does not seem to have found favour. I have got the very best site in the Exhibition, and I am very anxious that the appearance made should be worthy of Ceylon. A tea-room, and a tea-room only, I think I have already given you to understand. In the last Ceylon paper I had a letter written to you by Mr. Haldane from Glasgow appeared, and contiguous to it what is probably an extract from a Glasgow halfpenny evening paper, but which certainly appears as if it were actually part of Mr. Haldane's letter, so much so that one of your papers refers to it as such. The connection is evidently accidental, but those who know Mr. Haldane know that he is incapable of writing in such a strain, and I take this opportunity of informing those who may not know him that the composition was some of his.

With all good wishes for a prosperous New Year and sincere hope that Ceylon and Ceylon in London may soon be loked together to mutual advantage, faithfully yours,
(Signed) J. L. SHAND.

24 Rood Lane, London, E. C., 14th Jan. 1889.

The Secretary, Planters' Association of Ceylon, Kandy.

Dear Sir,—I had hoped to have been able before this to send you final accounts from the Glasgow and Brussels Exhibitions, but I am not yet in a position to do so. The tea-house standing at Glasgow has not yet been sold, and there are small things, which have to be realized before we can close accounts. As regards Brussels, though I have incessantly asked for report

and accounts, Mr. Bapty writes to me that he is not yet in a position to render final accounts, and I now enclose memo. which I have only just been able to get of advances made in Brussels to native servants. If they have not been settled with, the amounts may perhaps be recovered; but, if as I hope they have long ago been settled, the amount must be debited to Mr. Bapty, whose office staff is responsible for the delay; of course the result from the Brussels Exhibition directly has been small, but still there has been a result, because we have had several applications from men in business there in connection with Ceylon tea, the worst of it is these applications are so small that they are hardly worth attending to. Enclosed card shows that attention is being drawn to Ceylon tea in Brussels but the Exhibition so completely failed to attract that the result has certainly been disappointing.

There are several charges besides my firm's charges, such as printing labels, &c., &c., which have to be shared between Brussels and Glasgow, so I hope you will arrange to send us the balance you have in hand of the £12,000, and allow us to use on account Glasgow any balance we may have on account Brussels. I trust this will commend itself to the Association as being reasonable and fair and that time may not be lost in authorising me to do so.

About Paris I am awaiting until I can get others authorised to act with me, though it is high time we were at work, but on this subject you will have heard from your London representative the excellent site I have secured. The great opportunity and the zeal displayed by so many in London who so largely contribute to the tea fund in Ceylon prompt me to hope that the Association will see its way to increase the grant, as I suppose it will be the only Exhibition taken up this year. I fully expect to be able in this case to return some of the money to the Tea Fund, but of course we cannot be certain of this. Meanwhile I am inundated with all sorts of proposals of possibilities and impossibilities, and I want to be strengthened by the co-operation of a Committee. I want also to send as soon as possible to Ceylon for tea for Paris, as we shall save considerably by importing directly.—Faithfully yours,
(Signed) J. L. SHAND.

THE DE CEYLAN.

Le Thé de Ceylan, qui a aujourd'hui complètement détournée le thé de Chine, jouit de la grande faveur des vrais amateurs; il est le seul dont fasse usage l'aristocratie anglaise.

Fr. 125

Kandy, 28th January 1889.

J. L. Shand, Esq., 24, Rood Lane, London.

Dear Sir,—I am directed by the Standing Committee of the "Tea Fund" to acknowledge receipt of your letters of the 14th December and 4th January on the subject of the Glasgow and Brussels Exhibitions and to point out that there appears to be some misunderstanding as to the arrangements made for the payment of the expenditure sanctioned on account of Brussels Exhibition, which it is desirable should be removed so as to permit of a final adjustment of accounts. The resolution of the subject forwarded to Mr. Reid on the 18th November 1887 you will remember was as follows:—"Brussels Exhibition.—That the Glasgow Tea Committee be asked to endeavour to organize an Exhibition of Ceylon Tea at the Brussels Exhibition, the sum at the disposal of the Committee would be about £6,000."

I annex extracts from your letters of the 16th and 24th February giving details of the proposals submitted by you and agreed to it was believed by the Commissioner General for the British Empire section. These were duly confirmed by my letter of 5th September in the following terms:—"As requested, I enclose a demand draft on London in your favour for a further sum of £100 sterling, and I annex a memo showing the disbursements made here up to date on account of Brussels Exhibition on the basis of your letters of the 27th January, 16th and 24th February."

On that basis the Standing Committee of the "Tea Fund" has been working, and while it has no objection whatever to paying over to your goodself the balance of the original vote of R6,000 on account of Brussels Exhibition, it seems to the Committee that the statements made in the extracts of letters alluded to should be reconciled as a matter of business. From the applications made by the native servants on their return here it seems probable that a considerable sum may still be due to them as wages; accordingly as the available balance is R618'33 a draft for the equivalent of R400 equal to £27 8 11 sterling at exchange of Rs 4d 15-32 per rupee is transmitted to you herewith. After a final settlement with the servants, whatever balance, if any, remains at credit of the Brussels vote shall be remitted later on to your debit.

The Committee having now further authorised the sale of the show cases, coffee barrels, &c. the proceeds of these should, it is hoped still further place you in funds on account of the Association.

As regards the reference made to Mr. Haldane's letter of the 18th October regarding the Glasgow Exhibition, while I do not think anyone probably thought Mr. Haldane was the author of the newspaper extract alluded to, it is right also to say that the paragraph was forwarded with his letter precisely in the same way as the paragraph attached to his previous report of the 11th October, and that it was sent to the newspapers here in the usual way without comment. The paragraph was doubtless intended to amuse, and it certainly did no harm, I think, to any one, one way or the other.—I am, dear sir, yours faithfully,

A. PHILIP, Secretary.

Extract of Letter from Mr. J. L. Shand dated 16th February.

"The doubt which has weighed with me all along has been whether it was worth while paying a considerable sum to have a tea-house at Brussels; but, now that I have seen something of the probable site of the Exhibition and heard of the concourse of all nations which will flock to Brussels in the summer, I think it will prove a good investment for Ceylon. The terms which I have proposed to the Commissioner-General for the British Empire section, who has the whole thing in his hands, and without whom it is impossible for a Britisher to get a footing of any sort in the Exhibition, are that he should set aside a suitable space and fit up, in as far as possible characteristic style, a Ceylon tea-room in which tea, coffee, cocoa, and chocolate are to be sold in cup and packet under the control of a Ceylon Committee, and supplied by them upon the best wholesale terms and at prices to be fixed by them; that all profit arising from such sales shall be at the disposal of the Commissioner-General, to whom the Association shall vote the sum of £300, part of which, not exceeding £160, is to be expended by the Committee upon bringing over, keeping in Brussels, and taking back to Ceylon three native servants; but, should these expenses not reach £160, the Commissioner shall receive the difference between this sum and the actual expenditure and the balance of the grant, namely, £140, shall be paid to the Commissioner, £70 on the 1st of August, and £70 at the close of the Exhibition. Mr. Reid and also I believe Mr. Cargill approve of this plan, which has the advantage of securing identity of interest between the Commissioner and the Association, and which will I hope be attended with good results for both, I have also asked that we may have a small space in which we may exhibit tea, coffee and cacao in various stages

Extract of letter from Mr. J. L. Shand, dated 24th February.

"I wrote to you last week and received your message. If cannot sell tea cup, withdraw Brussels, wire reply," to which I replied at once 'Cup sales Brussels arranged.' I told you in my last that I had proposed to the Commissioner-General for the British Empire section that the Association should spend a sum not exceeding £160 in bringing over, keeping during the Exhibition, and taking back to Ceylon three native servants, and that the Commissioner should receive the difference between the sum spent upon native servants and £300, £70 of which will be paid on 1st August, and the balance at the close of the Exhibition. That for this consideration the Commissioner should fit up a room in which Ceylon tea, coffee, and cacao, and chocolate should be sold at prices to be fixed between him and the Committee both in cup and packet, that all tea, coffee, &c., &c., shall be purchased by the Committee upon the best wholesale terms, and that the Committee shall have full control over all the arrangements of the tea-room and that the Commissioner should have all profit arising from such transactions. To summarize: the Planters' Association pays £300 for the advertisement, it being clearly understood that its liability to the Commissioner is limited to this, and from what I saw at Brussels, which has been confirmed by much, I have since heard as to the way France, Germany, Austro-Hungary, Russia, and other nations are coming forward, I think it is an opportunity. You will have to arrange on your side for shipping (3) three native servants, and if you can pick up men with a smattering of French, which most of the servants who have been in Mauritius or in Pondicherry possess, it will be a great advantage. They should be shipped so as to be in Brussels by 1st of May: perhaps they could be got direct to Rotterdam or Antwerp, and if you let me know in good time, I will see that all preparations are made for receiving and housing them."

TEA AND COFFEE CONSUMPTION IN THE UNITED KINGDOM.

The following table gives a statement of the quantities of tea, coffee, cocoa, and foreign Colonial spirits retained in the United Kingdom for consumption in 1878-79 and 1887-88 respectively, with the average amount consumed of each article per head of the population:—

	1878-79.		1887-88.	
	Population, 33,943,773.		Population, 37,091,564.	
	Average		Average	
	Quantit's. pr head of		Quantit's. pr head of	
	Populat'n.		Populat'n.	
Tea, lb....	166,461,307	4'90	184,458,385	4'97
Coffee, lb...	33,334,450	'98	2,9988,995	'80
Cocoa, lb...	10,239,965	'30	17,024,744	'45
Spirits, gals.	10,332,428	'30	8,131,478	'21

—American Grocer, Dec. 91th.

[While it is satisfactory to see that the consumption of spirits in the decade has largely diminished, from '30 gallons per capita to only '21, the increase in non-alcoholic stimulants is not so great as might be expected. Coffee, indeed, has continued to revive, and tea is not yet quite up to the round 5 lb. per capita although very close to it. The increase in cocoa is marked,—from '30 to '45 per capita.—Ed.]

FORESTS AND RAINFALL IN THE NILGIRIS.

It is said that the estate or forest which is now supplying wood to the Murree Brewery, will only be able to do so for the next eighteen months, but we shudder when we think of the condition the numberless fuel supplying plantations we see around us will assume at the expiration of that time. The Australian trees grow not by the foot, but by the yard per annum, and the lateral branches keep pac

with the parent stock. The sholas too, the natural forests of the Nilgiris, will have had their own increasing and multiplying. One effect will be that the rainfall of Ootacamund will have so vastly increased not alone the heavy showers, but the auxiliary drib, dribs, that the station will become perfectly uninhabitable. Were it possible for the government to compel state railways to take their wood for sleepers from the Nilgiris, there would be the prospect of our vegetation being thinned, but that possibility does not even loom in the distance, so that the project will have to be allowed to sleep. This feature of the question resolves itself into the enquiry, shall we pamper our wood to the discomfort of residents, and the unpopularity of this splendid retreat to visitors?—*South of India Observer*, Jan. 15th.

[This is madness on the other side. All the planted trees on the Nilgiris won't alter the rainfall an inch.—ED.]

REVIEW OF THE TEA TRADE.

The following review is extracted from the circular of Messrs. Wm. Connal & Co., dated Glasgow, 31st Dec. 1888. This firm is the biggest broking house in Glasgow and what they say of our staple should be read with interest.

TEA.—The history of the tea trade for the past year, is but a continuance on very similar lines, of that of recent years; China growths becoming of less and less, and Indian of more and more importance. The interest which in former days attached to the early arrivals of first crop China teas, may almost be said to have passed away. Still, the actual quantity of fine China that is consumed, is by no means unimportant, and if the Chinese would bestir themselves, to supply really good old-fashioned black leaf, at prices more on a par with Indian, it would be greatly to the advantage of China herself, as well as to the British tea drinker.

The first of the new black leaf crop arrived from Hankow on the 23rd June, per the "Moyunc." The first of the new reds, on the 10th July, per the "Glenegle."

In both, the quality proved to have been greatly lowered by the extraordinary floods from which China had suffered so disastrously; tarry flavour and dull infused leaf being widely prevalent; but any chops free from these faults commanded ready sale, at very remunerative prices. The total supplies, even including tarry descriptions, proving moderate, were taken by the dealers with satisfactory results to importers. The prices of black leaf have been more than maintained, but fine to finest Keisows have met rather a slow sale, and in some cases dealers have only been able to place their purchases at a loss. The quality of common descriptions of Congou, both red and black, has been affected much as the higher grades, and they have not yielded such good results to the importer, although realising prices, which, as compared to Indians must be considered high. The good profits on the early shipments of fine, having often, during the currency of the season, been more than counterbalanced, by losses on commoner descriptions.

Scented teas, especially from Foochow, have been of good quality, and the early arrivals realised comparatively high prices. Later demand has rather slackened, and now very useful blending teas are to be obtained on terms, which make them worth special attention.

The market has been practically cleared of low old season Congous, such as, early in the year, were sold as low as 3/4 and 4/4 per lb. At present, nothing can be had down from China under 3d; a low figure, when it is remembered that 1/4 of that is for export duty. Fine class of tea, however, has little prospect for the home consumer, as it practically is all re-exported.

The production of tea, both in India and Ceylon, goes on steadily increasing, and consumption as steadily keeps pace. In November it was at the

rate of no less than 125,000,000 lb. per annum, and so long as prices keep at the present very moderate level, demand will continue to keep pace with the supply. It is a matter of surprise that these growths find their way so slowly into countries such as Russia, which, where fine tea is appreciated and so largely used, they must ultimately do so, and when the time arrives, the British consumer will have to pay higher prices, just as it happened when Russia came to compete for the finest sea borne leaf from China, and being willing to pay full prices, the Russian market has now the virtual monopoly.

Ceylon growths, although exceedingly good and useful additions to supply, are too often deficient in the thorough good well-cured character of the best Indians. They fall off rapidly in flavour, and in this respect are inferior, and must be used with much caution. This, doubtless, is mainly a question of manufacture, and with more experience this is likely to be remedied.

By the Board of Trade returns for the twelve months ending 30th November, the import into the United Kingdom has been 218,372,028 lb., against 225,550,650 lb. in 1887, and 228,682,077 in 1886. Of these quantities, 110,292,645 lb., against 99,054,214 lb. in 1887, and 79,583,263 lb. in 1886, have been from British India.

The home consumption for the same period, has been 186,848,752 lb., against 183,392,461 lb. in 1887, and 177,719,013 lb. in 1886. The export has been 38,636,906 lb., against 34,561,737 lb. in 1887, and 44,682,204 lb. in 1886. The stock in bond in the United Kingdom on 30th November, was 101,190,030 lb. against 109,259,160 lb. in 1887, and 102,725,041 lb. in 1886.

The export from China to the middle of December, by the latest telegraphic advices, was 96,000,000 lb. against 110,000,000 lb. in 1887. The total import for the season into the United Kingdom from China, is estimated at 99,000,000 lb., against 117,000,000 lb.; from India at 92,000,000 lb.; from Ceylon, 25,000,000 to 26,000,000 lb.; and from Java at about 4,000,000 lb.

ABOUT TEA.

Numerous inquiries reach this office for a work on tea, and this, notwithstanding the fact that the *American Grocer* has published hundreds of articles covering every imaginable phase of the subject. But we are aware that a new class of subscribers spring up every year, and hence there is a demand for information on all trade topics new to them, but which has previously been published. We desire to meet the wants of the trade regarding practical information in relation to tea, and therefore request every reader of the paper who is interested in the article, to write us and outline the nature of the information that he particularly desires. The character of the tea used in different sections of the country varies, and if subscribers will respond promptly to our request we shall have a great deal of light thrown upon the character and wants of the tea trade and be in a much better position to meet the demands for a popular treatise than we otherwise would. [We hope the above paragraph in the *American Grocer* will attract the attention of Mr. MacCombie Murray and lead him to state the case for pure and delicate Ceylon tea.—ED.]

VISIT TO THE EXPERIMENTAL FARM AT AKMIMANA, GALLE.

(From a Correspondent.)

Jan. 21st, 1889.

On Saturday we paid a visit to the agricultural farm at Akmimana, about four miles from Galle. The chief articles cultivated here are paddy, dal, and arrowroot. The fields on which the paddy is raised belong to the Kachcheri Mudaliyar (Mr. E. B. Gooneratne), and they are situated quite close to a dwelling-house, also belonging to him, which is quite a historic build-

ing, having been used in the Dutch times as a Court-house and a resthouse. It is still called by the native Sinhalese the *tunayama*. It is like all Dutch buildings a substantially built house. We passed the paddy-fields on which the experiments in cultivation are being made on our way to the bungalow, and were greatly pleased to see the striking difference between them and the fields surrounding them. In about a fortnight's time the crop will be ready for reaping. It is thus somewhat late, as the surrounding crops are already being reaped. Both in the fields sown broadcast and in those which were planted out, the plants looked a good deal more hardy and vigorous, and the yield promises to be much greater than in the surrounding fields. We shall look with interest to the report of the teacher (Mr. Samaranayaka), which will doubtless be furnished as soon as the crop is secured. We understand that Mr. Samaranayaka will shortly be removed to another station, the work in this place having been done. The dal trees appeared to be about twelve or fifteen feet high in only eight months' time, and were already in bearing. The native name for it is *parupu*, and we believe it will succeed very well in this Province. About the arrowroot we are not competent to pronounce any opinion, but from what we saw we think that it too might be grown successfully on good soil. There is another experimental garden much closer to Galle, at Dangedara. This we have not yet seen. The teacher, Mr. Hoole, has just been transferred to the Rev. S. Langdon's Industrial School at Bandarawela. We hail with delight these agricultural experiments. As to their ultimate success in inculcating true ideas into the conservative Sinhalese villager, we have no doubt. We trust all district Mudaliyars will aid the Government in making the people under their charge adopt all such new methods as can be safely and inexpensively adopted.

♦

JARRAH AND IRONBARK TREES:
SOME OF THE LEADING TIMBER TREES OF
AUSTRALIA, SUITABLE FOR CULTIVATION
IN CEYLON.

A correspondent writes as follows:—

Kotagala, 25th Jan. 1889.

To the Editor,

DEAR SIR,—Can you kindly inform me whether the "Ironbark" gum and "Jarrah" trees of Australia are identical? If not whether there is any essential difference in the value and usefulness of their respective timbers.

N.

To which we reply that the trees are *not* identical. The jarrah (*E. marginata*) stands alone as the acknowledged king of the one hundred and fifty or so species of the *Eucalypti*. Only one species (which specially abounds in Western Australia*) is ever spoken of as jarrah or Australian mahogany, whereas the settlers use the term "ironbark" for several species, distinguished for their rough exteriors protecting stems of specially fine timber. The species of roughest bark and best pretensions to the name of ironbark is *Eucalyptus leucocylon*, common in several of the colonies. But, on a par with it as regards excellence of timber is the New South Wales ironbark, *Eucalyptus siderophloia*.

* The jarrah grows among ironstone in Western Australia, so thickly strewn that the country looks as if covered with "slag" from an iron furnace.

While jarrah, for size, beauty and utility of timber is generally ranked first of the Australian trees, ironbark competes with it in many respects and is superior in some. Both are valuable for ship-building, etty piles, cart and carriage building, for house-building, for nearly every purpose in truth to which good, strong, lasting timber can be put. The two timbers when subjected to breaking strain compared thus:—Jarrah, average breaking weight 726 lb.; average specific strength 1,982. The average weight per cubic foot (seasoned for at least 12 months) was 54.36 lb. In breaking weight the ironbark, species *E. leucocylon*, proved far superior to jarrah, having resisted up to 951.67 lb., while its average specific strength was rated at 2,598. A specimen tested by Baron von Mueller, indeed, showed so high an average specific strength as 3,063. Three specimens of the New South Wales ironbark, *E. siderophloia*, showed an average breaking weight still higher, up to 1,045.6 lb. and an average specific strength of 2,854. The average weight per cubic foot was 71.50 lb. Close up to the very highest figure for the strength of ironbark comes the Australian tree most commonly cultivated in Ceylon, the blue gum, *Eucalyptus globulus*. Its average specific strength, in the case of two specimens, was found to be 3,036; the average breaking weight being 1,112.1 lb.; and the weight per cubic foot 65.18. It is clear, therefore, that no stronger timber can be used than mature (say 15 to 20 years old) and well seasoned blue gum. Its tendency to crack and warp in seasoning seems to be overcome in Australia and so, it doubtless can be here. Moulmein teak was nowhere when compared in strength and weight with blue gum. The figures for teak were average specific strength 1,946; average breaking weight 713.1; weight per cubic foot 37.54. There are other qualities than mere strength and specific gravity, however, which place jarrah and teak in the forefront of timbers, with oak and mahogany.

But "transverse strength" is a very important factor in the relative value of timbers, and judged by this test we find that the very first place in a careful set of experiments is occupied by the timber of the wattle (acacia) indicated by the Australians with the contradictory names of "black wood" and "light wood," the heart wood being really black and almost as dense as ebony. Like all the acacias introduced from Australia to Ceylon, the one in question (*A. melanocylon*) sends up shoots from its roots, so that a few trees planted soon become a grove, which can be periodically thinned, the best trees being left for timber, the transverse strength of which is represented by 1,236 lb. That is, the samples in this and all other cases quoted below were 7 feet in length by 1½ inches square; the distance between the bearings was 6 feet; and the weight was gradually applied in the centre till the samples broke. No wonder if the timber which in this trial resisted up to 1,236 lb. is by the Australians reckoned one of their best, or that the tree is spared when all others are destroyed in converting woodland into pasturage. Blue gum comes next, and is first of all the *Eucalypti*, having resisted up to 1,201 lb. "Ironbark" came third with 1,174 lb. "Gum top stringy bark" broke at 876 lb. and jarrah at 829.7 lb. We have given the highest figures in each case, for different specimens gave different results. Blue gum and iron bark are largely used in the construction of Australian railway rolling stock, and from experiments made by the Victorian railway authorities so lately as 1887, we are able to quote some interesting facts. Red gum and iron bar sleepers in the ground from 1864 to 1886 an "Box" sleepers 1862 to 1886, were taken out "

first-class order." With reference, therefore, to the Ceylon railways of the future, rolling stock and supplies of lasting sleepers, there is, we submit, encouragement for the cultivation of the Australian timber trees in Ceylon. From the later experiments of the railway authorities it was found that a specimen of red gum, *E. rostrata*, (pretty common in Ceylon, a more beautiful tree than blue gum, with clean stem and drooping foliage, growing well near water), 8 feet, 6½ inches in length, nearly 3 inches in depth and breadth, and weighing 31½ lb., resisted breakage until (distance between supports 8 feet) cwt. 12-2-15 were placed on it. But one specimen of blue gum actually bore a strain of cwt. 26-0-22. The length was the same as the red gum specimen, but the depth and breadth, respectively, were 3½ and 3 inches. Stringybark, which has been introduced into Ceylon, and of which very large and handsome specimens exist on Abbotsford, bore a strain of cwt. 17-1-1, same length, but 2½ breadth and depth. Still more severe tests were applied to some red gum which weighed 62-60 per cube foot. Specimens 11 inches deep, 7½ inches thick, and 14 feet 8 inches, between bearings, gave, in one case an ultimate deflection of 2¾ inches before it gave way to a weight of tons 9-19-1-14, or not far short of 10 tons; the other 3½ inches deflection with a breaking weight of tons 12-18-3-17, or not much below 13 tons.

These technical details tell their own tale to those who know anything of carpenter work and building, and it is, besides, absolutely true that some of the best timber trees of Australia, the blue and red gums, the blackwood (*A. melanoxylon*) and *Grevillea robusta*, for instance, grow much more rapidly and come to maturity at a far earlier period in Ceylon than they do in their native habitat. The blue gum, in favourable positions, yields good timber at 10 years old, improving rapidly up to 15 and being fairly mature at 20.—We may have something to add on this interesting subject.

THE COOLY DISTRICTS OF SOUTHERN INDIA.

It will be interesting to our readers to have before them at one view the extent in square miles and the density of population of the districts in Southern India whence Ceylon mainly derives its supply of cooly labour. We take the figures from the extract on page 485, in which the material condition of the population in the various districts of the Madras Presidency is referred to. That condition is on a scale low enough to render emigration to Ceylon, the Straits and other places where the attraction of rupees in return for labour is held out, certain for many years to come. The districts and figures are as follows:—

DISTRICTS.	AREA IN SQ. M.	POPULATION.
Madura	8,401	2,168,000
Tanjore	3,694	2,130,000
Tinnevely	5,381	1,700,000
Trichinopoly	3,561	1,215,000
Total	20,947	7,213,000

Population per square mile 344 against 109 in Ceylon. Here on an area nearly a fifth less than that of Ceylon, a population equal to very nearly 2½ that of our island is crowded, most part of the people poor far below the standard in most parts of Ceylon. Such improvement as has of late years taken place in the districts indicated, as well as in the native state of Travancore (whence also a considerable contingent of our labour comes), is largely due to the influence of a profitable labour market in Ceylon.

SIMAL WOOD IN TEA BOXES.

From the *Proceedings of the A.-H. Society of India*)
 Allusion was made at the last meeting to samples of wood supposed to be *Simal* which had been taken from Tea boxes and sent to Mr. Fisher, Officiating Director of the Forest School, Dehra. Mr. Fisher favoured the Society with the following report:—"I have to acknowledge receipt of your letters of the 10th and 13th instant, and of the specimen of wood referred to, and have already telegraphed to you my opinion about it. I have also heard from the Commisariat, Store and Shipping Officer, Cooutta, probably on the same subject, namely, whether the wood is suitable for Tea boxes, and what is its species. But the specimens referred to by the latter as sent by rail, have not yet reached me, although certain wood specimens, sent by mistake to my address at Roorkee, and without any instructions, have come to hand. I have done my best to identify the wood, by comparison with the specimens in the Forests School Museum; but these are chiefly the numbered specimens given toward the end of Gamble's Manual of Indian timbers, and are not, by any means a complete collection of Indian woods. The specimen greatly resembles *Simal* (*Bombax Malabaricum*), but according to Gamble, this wood never has a brownish, heartwood which occurs in your specimen, and none of our *Simal* wood have such a heartwood. I note that you give the Indian name of the wood as *Kaura*, but are uncertain whether it comes from Moumein or Assam. The wood is certainly not that of *Hoirrhena antidysenterica*, locally named *Kaura* which is largely used in Sabaranpore for carving the plates, ornamental brackets, etc., and sold at the Railway Station there. *Kaura* is therefore, probably, the name of some wood in another vernacular than Hindi. You refer to slightly unpleasant smell. This bad quite disappeared since the wood has become dried from exposure; and I would here suggest that, provided any wood is thoroughly dried, it is not likely to have an injurious effect on the lead lining of Tea boxes,—such injury being generally due to green wood being used containing some acrid juice. I think that the wood is that of some Malvaceous species; and I have published a note on the subject in the "Indian Forester, as our Museum, if complete, would afford a ready means of identifying any doubtful kind of wood, and would thus be much more useful to the public than it is at present. If Forest Officers and others would kindly send me, from time to time, well authenticated specimens of Indian timbers, not given in Gamble's numbered list, our Museum might gradually contain a complete collection of Indian woods. I append copy of a note about the wood by a First Student from Ceylon who has been a Tea planter there."

In the note appended to Mr. Fisher's letter, Mr. Fatham (Fatham—Ed. L. R.) identifies the wood with that of *Vateria indica*, a wood known to be bad for building purposes but now in demand for Tea boxes. Mr. Fatham mentions that he is informed that large shipments of this wood have recently been made to Indian ports. If the wood is of a quality to resemble the samples sent to Mr. Fisher, it can hardly be considered fit for Tea boxes. The Society is greatly indebted to Mr. Fisher for the trouble he has taken; there does not appear to be any other place in India where there are organised arrangements for identifying timbers from samples, and Mr. Fisher's aid is, therefore, of great value, and is enhanced by the courteous and ready attention he gives to the references made to him.

THE CULTIVATION OF USEFUL PLANTS IN HAINAN.

A very interesting report on agriculture in Hainan (China) during the year 1887 has recently been issued from the Foreign Office. The report deals in detail with the principal articles of culture, especially food plants, and is of a most practical and useful nature. Naturally it commences with a consideration of Rice.

which is described as being grown in low muddy ground near water, so that the fields can be watered if the rainfall is insufficient. The weeds and stubble of the last crop are ploughed up, and when, after about ten days, these are rotted away, the fields are watered either by rain or by hand. After being made smooth the young plants are planted out. Three months after planting the Rice blossoms, and in four months it is fit for cutting. The mode of sowing is as follows:—"The grain is soaked for several days, and then sown in the finest soil. The first crop is ready for planting out in twenty days, and the second is about a month, when shoots are dug out with a trowel, a handful at a time together with the earth, and planted in the fields about 9 inches apart. In the second crop the shoots, which are allowed to grow much longer than in the first, are cut off at the top when planted out." The fields are very freely manured just before the blossoming period, and thoroughly irrigated. "Threshing is done in the fields. A large tub is taken, with an instrument like a ladder of four rungs inside it, against which the grain is beaten, being taken up in bundles with both hands and threshed against it. Another plan is to take the paddy into the village and beat it out with flails. About 80 lb. of Rice grain is used for sowing 1 acre, and this yields, on an average, about 4000 lb. on the first crop, and 5000 lb on the second. In the most favourable years as much as 8000 lb per acre has been harvested, but this is the limit. In bad years, again, the yield may be next to nothing."

SESAMUM (SESAMUM INDICUM).

This plant is grown best on high dry ground—excess of moisture is very detrimental to it. It does not require watering—the dew alone is sufficient to nourish it. In making the beds, therefore, the centres should be higher than the sides, so that the water may run off. In the first month of every year it is sown broadcast, not in lines, nor does it matter whether thickly or sparingly sown. In about ten days it begins to shoot, and in two and a half months it blooms, and at the expiration of another two and a half months it is ready for harvesting. The entire plants, roots and all, are carefully taken out of the ground, put on a cement floor, and threshed with a flail. Two kinds are known—one with black, and the other with white seeds. Sesamum does not generally require manure, but in the poorest soils ashes and ox-manure may be used.

GROUND NUTS (ARACHIS HYPOGÆA).

This plant is best grown in a soil of coarse sand and mud. They should be set deep, and the ground pressed down firmly over them. The ground is ploughed about April, and trenches dug about 10 inches apart, into which ashes, lime, and rubbish are thrown. The seeds are sown about 10 inches apart, and, as each is put in, the sides of the trench are turned over it with the foot, and stamped down firm. About every ten days the ground is weeded, and in about two months the plants are sufficiently grown to be sprinkled with liquid manure. In four months they come into flower; the flower-stalk then bends over, and as the flower falls off, the flower-stalk buries itself in the ground, and produces the pods, which ripen about the end of October, bearing the well-known seeds known as Ground-nuts. The harvest, however, takes place at a later date, when the seeds yield more oil, and a better price can be obtained for it. Ground-nuts are harvested by ploughing them up with an ox-plough, when the stalks and seeds clinging to the plough are gathered into heaps. For the remainder which are still left in the ground two men lift the earth with a large Bamboo sieve. The pods are perfectly dried in the sun until the thin skin which covers the seed can be broken by rubbing, when they can be stored. Great care has to be taken to thoroughly dry the seeds to prevent their germination, in which case they are useless. The residue of the seeds after the expression of the oil is made into cakes, which are used for manuring the land.

COCONUT (COCOS NUCIFERA).

The Coconut does best near salt water. The ground is ploughed up and the weeds removed, and Coconuts which have already sprouted are put in several feet apart. Salt is put in with them, but no manure. They bear fruit after ten years. If they do not flourish salt is again put to the roots. For the first few years after planting sweet Potatoes are sown on the ground, but when the trees grow tall and the foliage shades the ground, this cultivation is given up, and cattle are turned out to feed on the ground. Each tree bears from seventy to eighty nuts per annum.

INDIGO.

This plant, it is stated, can be grown on the hill-sides and in the poorest soil. It does not appear, however, whether the plant referred to is *Indigofera* or *Polygonum*, from which some of the Chinese indigo is prepared. About July or August the plants attain a height of 2 feet, when they are taken up, root and all, and put into the vat, and soaked together with stone lime. This is stirred several times a day, and in ten days it is drawn off as liquid indigo.—J. R. J.—*Gardeners' Chronicle*.

FICUS ROXBURGHII.—This species of *Ficus* was named by the late Dr. Wallich in honour of the illustrious Roxburgh, for many years the Superintendent, and to a large extent the founder of the Botanic Garden at Calcutta, and the father of Indian botany. *Ficus Roxburghii* is a native of the lower and outer Himalayas from Nepal to Bhotan, being found at elevations of from 1000 to 3000 feet. It is a tree from 15 to 25 feet in height, and with a wide spreading head. The leaves are large, measuring from 1 to 1½ foot in length, and from 12 to 15 inches in breadth. The most striking feature in the tree is, however, the great abundance of its handsome russet-red Figs. These Figs in shape and size much resemble Dutch turnips. They are carried in enormous bunches on the stem, especially near its base, and smaller bunches on the main branches. The mass of Figs borne at the collar of the stem on this singular tree at the time when it was photographed, weighed, as Dr. King informs us, about a hundredweight. It must, when in full perfection, have presented a remarkable spectacle, and one which would have produced a sensation at a fruit show in this country. The fruit, however, although eaten by the unfastidious Indian labourer, is quite unpalatable to a European being insipid and sloppy.—*Gardeners' Chronicle*.

COFFEE.—The Department of Agriculture, in its last annual report, says it has for nearly a quarter of a century made yearly distributions of coffee plants, sending them to the warmest localities in the United States, but the returns have not been of a nature to warrant further continuance of the distribution of these plants so far as relates to the object in view of establishing a profitable industry. It is true that several years ago a small quantity of ripened berries were produced on the coffee plants growing near the Manatee River, but it was understood that these plants were in a very well-sheltered position, and received additional protection during the severest weather in winter. Subsequently these trees were frozen to the ground by a cold of unusual severity for that locality. It is quite certain that coffee cannot become a profitable crop at Sanford, Fla., where a lowering of temperature down to or below the point of freezing occurs almost every winter. Although the freezing point may not be reached, yet occasional low temperatures in the fall or early winter months retards the ripening of the fruit, even when the plant is apparently uninjured. A tropical climate means something more than mere exemption from frost. Experienced coffee-growers state that the culture is not commercially profitable in a climate where the thermometer falls below 50 deg. F. at any time during the year. The plant will survive a much lower temperature than the above, but the above estimate refers to the value of the crop.—*American Grocer*.

BRITISH AND DUTCH GOVERNMENT IN THE FAR EAST.—On page 345 will be found an extract affording an instructive contrast on this subject. One of the most striking illustrations of the effects of the different policies, is, that under the ægis of British protection a large body of Dutch planters are developing the resources of North Borneo!

"NEW BULLETIN."—The November number is occupied with articles concerning Lagos rubber (*Ficus Vogelii*), Liberian Coffee (*Coffea liberica*), various food grains of India, including the huskless Barley of North-west India. It appears that three varieties of huskless Barley are cultivated in Tibet—the white, the dull green, and the dark brown. Respecting Ramie fibre, the Assistant Director reports the result of recent trials made in Paris of machinery adapted to clean the fibre and free it from gummy matter. Unfortunately the results were not satisfactory, and "the exploitation of Ramie (*Boehmeria nivea*), in spite of years of labour and the expenditure of large sums of money upon it, cannot be said to have yet emerged from the experimental stage."—*Gardeners' Chronicle*.

PAPAYA AS A REMEDY FOR GUINEAWORM.—From the Proceedings of the Indian A.-H. Society we quote as follows:—Read the following extract from a letter from Lt.-Col. H. W. H. Cox, dated Coimbatore, 10th May 1888:—"When I was at Perambalur (Trichinopoly District), last August, the Hospital Assistant (P. Mutakumara Pillai, I think) in charge of the Dispensary there told me that he had treated guineaworm (very common in that part of the country) very successfully with the leaves of the Popay, *Carica papaya*. An ounce of the leaf is pounded in a mortar with 60 grains of opium and 60 grains of common salt, and the paste then formed is applied to the part. Of course the worm has to be wound out in the usual manner, but the Hospital Assistant assured me that it always came out more quickly and easily when treated in this way. From what is known of the qualities of the plant it seems to me probable that he is right."

FINE INDIAN MANGOES are thus noticed in the Proceedings of the Madras A.-H. Society.—Read the following letter from G. M. Woodrow, Esq., dated College of Science, 26th May, 1888:—"Can you pay railway carriage for a few little-known but valuable grafted mango plants. One variety called Pakria, which is of the highest class for flavor, without fibre, and of a bright golden colour, I think I have propagated for the first time. The original tree is near Poona. Your correspondents having been writing many curious notions all the year round, I hope much if that would be desirable. 'Variety gives zest!' is not more trite than true. If desirable I think there would be little difficulty in attaining ripe mangoes throughout the year, but I long, for people wish for mangoes during damp or cold weather. At present, those who are willing to pay for them have a wide choice. We have at Poona a fine variety called 'Ashoka,' which ripens in August, and when I visited the Coimbatore market at Bombay, in November and in January last, there were fine looking mangoes displayed on the stalls in company with oranges from Malta, apples from Australia, and dates from the Persian Gulf. I hope to be able to get out my book within a few weeks, as the plates prepared from photographs I sent home, have arrived. It is over 600 pages. If you can send me a few mangoes, or other fruits to describe in the next edition, I will be grateful." Recorded with many thanks, and resolved that Mr. Woodrow's kind offer of a few grafts of the "Pakria" mango be accepted.

THE WEATHER PLANT.—We have had so many inquiries about this, and our friends have sent us so many forwarded letters referring to it, that we think it right to state that the plant in question belongs to the same family as the extraordinary Glassberry and the Blue Rose. All plants, to be precise all prophyta, is sensitive to physical impressions, in some instances more so than others. That the plant

in question should be able to forecast the state of the weather and give presage of earthquakes is no thing compared to what is narrated in old books as to the sensitiveness, if we remember right, of some species of *Oxalis* the leaves of which closed at the approach of the wicked and vicious, but remained unaffected in the presence of the pure and virtuous. The Weather Plant is no other than the well-known *Abrus precatorius*, sometimes called the Paternoster Pea, the seeds of which are like small beans but of a brilliant scarlet, with a patch of black at one end. They are used for beads and rosaries (whence the name), and also for diamond weights, the weight of the Koh-i-noor having been ascertained by their means. The pinnate leaves of the plant are, no doubt, sensitive to light, heat, electricity, or any other force that would alter the tension of their protoplasm. The statement that an observatory has discarded both aneroid and mercurial barometers in favour of the Weather Plant as an indicator of forthcoming weather is one of those statements that we should receive with an open mind, so that what passed into one ear might speedily escape by the other! When we receive information from some other source than newspaper gossip we shall be bound to accord the matter more consideration.—*Gardeners' Chronicle*.

KURAKKAN BEER.—Amongst the uses made of kurakkan in Ceylon, the idea never seems to have occurred to anyone of fermenting the grain into a substitute for "toddy" or beer. We obtained our first knowledge of this use of the grain when we visited Darjiling. We there learned that the millet we call kurakkan is known in Northern and Eastern India as Murwa. We noticed that the Bhootas carried a joint of bamboo slung across their shoulders and that they frequently applied this bamboo to their mouths, getting "jolly" as the process was repeated. On inquiry we learned that the bamboo contained home made beer of the simplest manufacture,—merely water poured on crushed Murwa grains and allowed to ferment. In a very interesting notice, in the *Pioneer*, of "Sikkim as a Pleasure Ground," this beer is described as "Murwa," in a passage which we quote:—

At about 10 miles from Darjeeling a *ghat* is crossed, and after a gentle descent of 1,500 feet there bursts upon the view a tennis-court, a parade-ground, neatly-made huts, watered streets, a band playing and other marks of a British settlement. This is Pedong, the present head-quarters of the Sikkim Field Force: and a very pretty place it is, with a perfect climate during the winter. During the summer and rains it may not be quite so pleasant, for terrible accounts are given of the insinuating leech and voracious "pipsa" that make life a burden; but certainly in December and January Pedong is charming, and a far better place to be quartered in than many an Indian station. Ladies grace it with their presence, and it is easy to have a worse time than sitting in the porch of a house that is a combination of Swiss chalet and an Indian wigwam, drinking "murwa" and listening to the strains of the "Pioneers" band. "Murwa," it may be as well to explain, is the national drink of Sikkim, and in the words of the cookery book, "Now we will tell you how it is made." The seed of a kind of red millet is first carefully cleaned, wetted with some sort of yeast, spread out and allowed to ferment slightly. When it is ready, a section of green bamboo, cut off at a joint, about a foot long and four inches in diameter, is filled with it, and a thin bamboo "straw" is passed down through the centre. Boiling water is then poured in, and it is drunk like a sherry-cobbler through the straw. It is certainly not unpleasant to the taste, and the more you drink the more you like it. Like Hippocrene it is wholesome, refreshing and good for babies, and no Lama ever travels about without an attendant carrying his stock of "murwa." It is not intoxicating—at least not in quantities that the ordinary human frame is capable of holding.

ROTHAMSTED AND ITS WORK.—The *Pall Mall Gazette*, under date November 22, has a portrait of Sir J. B. Lawes, Bart, and gives a short *resumé* of the work that is being carried on at Rothamsted, and says:—"Whoever seeks to learn of the marvellous workings of plant-life in all its forms must look for inspiration and guidance to the world-famous laboratory at the little Hertfordshire town" (Harpenden).—*Gardeners' Chronicle*.

"BLACKMAN'S SYSTEM OF TEA MAKING" is evidently coming to the front rapidly. We are reprinting a long paper in the *Tropical Agriculturist* on its working on certain Assam estates, and the following paragraphs from a planter's letter in the *Indian Planters' Gazette* are worthy of attention:—

The Beheading Estate has ordered the Blackman system of Tea Withering, and many others I hear are considering the advisability of doing so. There can be little doubt that it will become universally popular, as all planters at home who have gone into the matter have been convinced in its favour with out one dissentient.

The Blackman authorities mentioned to me that they find it impossible to estimate the size and number of air propellers in several application they have had, owing to managers not sending the length and breath of the withering room in which it is proposed to apply the system, together with the proposed height of the tiers of the withering trays. One great advantage of this system, that of utilizing present buildings, renders this information, of course, necessary.

EEL WORMS.—Much destruction is done to Cucumbers by the lodgment in the roots of minute worms. It is not only the Cucumbers that are affected but many other plants, while the leaves of cereals, of Carnations, and even of Orchids, are affected by creatures of this description. Dr. Charlton Bastian some years since published an elaborate treatise on the species and varieties; and certain Dutch naturalists have taken up the work. Dr. J. Ritzema Bos is the latest of these, and he has just published a treatise in French on the "Anquillule de la Tige" (*Tytenatrix devastatrix*), and on the disease it produces. This worm occurs in the stems and leaves of various plants, but never in the roots. It is curious but satisfactory to read that decomposing organic matter, such as farmyard manure, acts injuriously on the creatures. A 1 per cent. solution of carbolic acid kills the creatures, as also certain other acids and caustic potash, all used at a strength of 1 per cent. Dr. Bos treats in succession of the disease in Barley, Onions, and Hyacinths.—*Gardeners' Chronicle*.

SHELL DUST.—What is the chemical difference between shells and bones? The latter are at least classed as amongst our most valuable of manures, and probably give phosphates in as great proportion as any material available for manure production. There is considerable similarity between shells and bones, but the chief point so far as their respective manurial properties is, what identity is their between them in such relation? I ask this question because I note in your report of the recent meeting of the Royal Horticultural Society's committee, that you consider calcined shells or shell-dust so produced to be little better than lime. My estimate of the manurial properties of this substance is based upon the experience of others who, in employing it for ordinary garden crops, but especially for Asparagus, Seakale, Potatoes, &c., have found it to be valuable. The material, if but lime, is certainly far heavier relatively, probably three times as heavy, thus showing that it contains matter other than ordinary lime. The shell-dust was not sent me for sale or in any trading aspect, but solely to show what sort of stuff it was, especially as it enjoyed the reputation of being such excellent artificial manure. I appended a price solely because the sender, in reply to a query put by me, stated that such figure was about the cost of production. The shells have to be gathered from the seashore, and are calcined in a kiln constructed by the manufacturer, who is a sea pilot, and conducts this manufacture for his own and neighbours' purposes, when his vocation admits of his

being ashore. He is also an enthusiastic gardener. A desirable course would be obtaining a chemical test of the value of the dust as manure, especially when compared with bone-dust.—A. DEAN.—*Gardeners' Chronicle*.

THE CORK INDUSTRY IN SPAIN.—The British Consul at Barcelona, in a report just published, states that during the past year there has been much improvement in the cork industry, because there has been an extraordinary demand for the superior kinds of corks for champagne. The export of corks to England, the Continent, and the United States, has been greater than in former years. Gerona is the most important centre of the cork industry in Spain, and an idea of the magnitude of the manufacture may be gathered from the following figures:—In 1885 the export of cork in pieces amounted to 15,883 cwt., while the number of corks exported was 1,137,217,000, representing a total value of about £600,000. In 1886 this increased to 19,635 cwt. of pieces, 16,357 squares, and 1,194,902,000 corks, of a total value of £710,000. The corks are made with diminutive machines of the simplest kind. Hundreds of factories are scattered over the province of Gerona, the town of Palamos alone having forty. In some places the Cork trees have been suffering from the invasion of a pest which threatened to destroy them. A voracious caterpillar, or worm, appeared by millions in the Cork forests, and in a very short time stripped the trees of all the leaves from the tips of the branches to the trunks. These worms are now in their turn attacked and devoured by another insect, a species of beetle of a dark green colour, and armed with a horn with which it cuts the worms up. Another insect in the form of a crab (*cangrejo*) pursues the worms and destroys them. Moreover, when the caterpillar has passed through its metamorphosis, and the butterflies have deposited their eggs, another insect, until now unknown, attacks and pierces the bags containing the new germs, and destroys them. It is hoped that by means of these three agencies the complete extinction of the destructive caterpillars may be accomplished.—*Gardeners' Chronicle*.

FIRM SOIL FOR FRUIT TREES.—We have noticed in many of the best fruit districts throughout England (especially Kent, Oxfordshire, and Worcestershire), that in positions where trees had unlimited space to grow (often on farm buildings and houses in streets) the fruit was of much excellence and little pruning was required. But on examination of the roots we found that in every case the soil was almost firm as a rock—had not been disturbed for many years, and in numerous cases there was a gravel path or cartroad over them. We always believe in allowing a root run in proportion to the dimensions of the branches; but at the same time have many proofs to which we could refer, that large trees can remain healthy for many years and bear excellent crops of fruit, also in limited spaces. The best Jargonelle Pears we ever saw were grown on a tradesman's house, with an aspect to the west and which had only a few feet outwards for the roots to subsist in—and the traffic to the dwelling-house was over them. The finest Apricots we have ever seen are grown in Oxfordshire, and many of the trees have subsisted in the pathways to dwelling-houses; and we know where some are doing remarkably well under the causeway of streets. In the West of England (in Bath district) Figs are to be found, year by year, bearing immense crops of the finest fruit ever seen, where the roots are encased in soil which has never been exposed to the light of day during the memory of the oldest inhabitants, and it is firm like concrete. In Essex and Suffolk (a country in which our friend, Mr. Sheppard, has done a deal of grand gardening), we have seen vineries which have been loaded year after year with bunches of white Grapes outside (chiefly on dwelling-houses), and scarcely a yard of ground in which the roots could extend outwards, and that had been trampled as a path for many years. We have always had strong faith in firm soil for fruit trees.—M. T. N. B.—*Gardeners' Chronicle*.

LIBERIAN COFFEE.

In answer to the queries of our correspondent "Ebor,*" who writes from Southern India, we have to say, that, except as qualified by its more limited cultivation, Liberian coffee in Ceylon was as bitter a disappointment as the Cinchona enterprise has proved. One of the qualities which chiefly recommended it to European planters, was its being essentially a lowcountry plant, calculated to flourish in a zone where the Arabian species could not be profitably cultivated, although the latter grew around native cottages and huts where fertilizing matter was abundant. We believe instances were mentioned of specimen bushes being grown at as high an elevation as 2,000 feet in the genial climate of Haputale, but we are not aware that a Liberian coffee plantation was ever attempted above 1,000, or, at the utmost 1,500 feet above sea-level. By far the larger number of the experiments were under 500 feet. We do not, therefore, believe, that the plant could be successfully cultivated at 3,000 to 4,000 feet, however exceptionally mild the climate might be at such an elevation. In by far the larger portion of Ceylon,—in all the northern districts of the hillcountry,—an altitude of 4,500 feet was the limit beyond which even *Coffea arabica* did not succeed. The second question of our correspondent "Ebor" is answered above. As we do not believe that the plant would flourish at 3,000 to 4,000 feet, it is superfluous to deal with probable crop. In a suitable climate about 4 or 5 cwt of clean coffee might be expected in the fourth year, but the difficulty and expense of the puping and cleaning processes proved in Ceylon to be very high from the enormous proportion of skin to fruit in the cherries, many of which, too, refused to ripen, and so gave inferior beans.

There was talk of a Cape Coast variety better than the Liberian, but it was never seen here, to our knowledge. The Liberian, amongst fine trees, always produced a proportion of others with long, elastic stems which were useless. The enterprise, however,—into which the writer of this article entered enthusiastically, paying R500 for 1,000 plants and large sums for seed,—might have proved a fair success but for the existence in the island of leaf disease. We always cherished and expressed the hope that the large leathery foliage of the Liberian coffee would resist the fungus. On the contrary,—and this was the final reason why we extirpated our Liberian bushes and substituted tea,—just in proportion to the enormous size of the leaves was the virulence of the disease. The vegetation was coloured deep orange with the spores of *Hemileia vastatrix*, and a larger proportion than ever of the berries then failed to ripen.

A rainfall of 70 inches well distributed would probably suffice, under circumstances otherwise favourable; but the rainfall of the native habitat of the plant is 150 inches. Liberian coffee generally bore the selling rate to Arabian of not more than £70 to £90 in consequence of its alleged coarser quality. But Mincing Lane fights shy of new products, and prejudice might have been ultimately overcome, had the other objections of disproportionate waste of matter, non-ripening berries and virulent leaf disease not stood in the way of persevering effort.

If any trial is made seed ought to be got direct from Liberia or from some place (neither Ceylon nor Java), where the leaf fungus does not prevail. In North Borneo and the Straits plantations of Liberian coffee still exist and they are occasionally written about as if they promised to be a good investment. But if, as seems probable, leaf disease in, however, slight a form is present, or will appear we fear disappointment such as has occurred in Ceylon is but a question of time.

With our light we answer the final query in the negative.

It may be interesting to see how the exports of Liberian coffee from Ceylon have fallen off of late years:—

EXPORTS OF LIBERIAN COFFEE FROM CEYLON.

1881	242	cwt.
1882	1,270	"
1883	1,827	"
1884	3,412	"
1885	5,326	"
1886	3,854	"
1887	3,419	"
1888	1,818	"

From the *Perak Government Gazette* of Jan. 11th, we make an extract which has a bearing on our subject:—

COFFEE CULTIVATION IN THE PROTECTED MALAYAN STATES.

The subjoined extract from page 171 of these reports, on the subject of Coffee Cultivation in the Native States, will be of local interest:—"Coffee does not appear to be grown in the British Settlements of Singapore, Penang and Malacca, except in gardens, and on a very small scale, but in the three Native States of Perak, Sungei Ujong, and Selangor, taken under our protection in 1874, its cultivation has been introduced, and some interesting exhibits from Perak testify to the adaptability of the soil and climate for its production. In Perak, where mountain ranges, reaching 7,000 feet, occupy a large portion of a well-watered country, a considerable acreage above 1,000 feet elevation is reported to be suitable for coffee cultivation, whilst the Liberian sort thrives on the lower slopes and the plains. In Selangor planting has only been introduced during the last few years, whilst in Sungei Ujong estates have been established on the slopes of the Berumbun range, which rises to a height of 3,000 to 4,000 feet and the cultivation of Liberian has been introduced on the low lands. Of the fourteen exhibits from Perak, five are from the Experimental Hill Gardens opened by Government: the sample marked *Hill Garden* is strong and full flavoured, and worth 90s; those marked *Waterloo* and *Hermitage* have probably suffered somewhat in drying, being coarse and musty in the cup, and worth 70s to 76s. Such kinds, if properly prepared on the spot, or in London, should the necessary appliances not exist at the plantations, and if perfectly sweet and clean, would supply an extremely good quality, suitable for home consumption as well as export, the coffee being, for size, colour, and general appearance, on a par with good Ceylon plantation. The climate, soil, and rainfall are all that can be wished on the Perak hills, but the great drawback hitherto has been the cost of labour which, however, has now been arranged satisfactorily, and the difficulty of transport. One sample of large pale berries, very smooth, but out of condition and mildewed, would be worth 60s. if sound; two of Liberian—viz., London Estate, in Sungei Ujong, and Waterloo, were very coarse, and worth 53s. to 55s., and three of ordinary Liberian quality, 48s. to 52s. per cwt.; the remainder consisted of parchment and cherry.

"The growth of Liberian is not to be encouraged for the reasons stated above, under the head of Ceylon.

"Samples of Bali, Bonthyne, and Phrippine coffee exhibited in the division of Straits Settlements, were probably not British grown, but the produce of some of the Dutch islands in the neighbourhood of the Straits."

* See page 515.—Ed.

The difficulties of transport alluded to in the above extract will soon be a thing of the past. Much has already been done in the matter of good metalled roads, and a sum of \$631,639 has been taken in the Estimates of the current year for "Roads and Bridges." The further development of the railway system is also kept in view, and an instalment of 25 miles of the opposed Kinta-Teluk Anson line is now being taken in hand. As further bearing on the subject we append the following extract from the local "Advertiser" for January (which reaches us this afternoon), although the information has already appeared in another form:—

The Liberian coffee, being a native of the comparatively low hills of West Tropical Africa, is suited to hotter conditions than the Arabian coffee, and it can be successfully cultivated in districts quite unsuited to the latter. In this lies the chief merit of the new coffee.

As a commercial article Liberian coffee has not hitherto proved so valuable as was at one time supposed, and the cultivation, though widely distributed, has not become general in any part of the world. There are, doubtless, good reasons for this. It has been found, for instance, that the "cherries" of Liberian coffee do not become soft and pulpy when ripe, but remain hard and fibrous. Hence it has been found difficult to husk the beans, as the machinery found suitable for preparing Arabian coffee is not applicable to the Liberian coffee. Again, the "parchment" skin in the latter is tough and woody, and the labour and percentage of waste entailed in "cleaning" is increased, while the actual market value is less. Probably, also, in the cultivation of Liberian coffee the localities selected for plantations have, in many cases, been subject to prolonged droughts, whereas the species evidently prefers a warm, moist climate, with abundant rains well distributed through the year.

Should the present high price of coffee be maintained it is not unlikely that the cultivation of Liberian coffee will prove sufficiently remunerative to warrant further attention being paid to it.

We understand that in Java the Liberian coffee cherries are fermented before they are pulped. It is claimed that this process enables the coffee to be cleaned much more readily, and that the coffee ultimately produced is brighter in colour and of better quality.

This, if verified, is a fact of some importance to the growers of Liberian coffee.

We have been led to make the foregoing remarks and review the present position of Liberian coffee owing to a very fine sample of this coffee which lately reached us from Malacca, and upon which is based the following correspondence:—

Mr. R. DERRY, Forest Department, Malacca, to ROYAL GARDENS, KEW.

Malacca, July 30th 1888.—I am sending you per steamship "Ajax" (Ocean Steamship Company) a small case containing two samples of Malacca-grown Liberian coffee. One sample has the parchment cleaned and the other left on. So far, no Malacca coffee can be shipped to Europe. I should be glad to learn the value of the samples sent, and whether Malacca coffee would be likely to meet with a market at home. Messrs. LEWIS AND PEAT to ROYAL GARDENS, KEW.

5, Mincing Lane, E. O., September 15th, 1888.—We are favoured with yours of the 12th instant with samples of coffee, which we find as follows:—No. 1, very good, bold, clean Liberian, well prepared and the best we have seen, value about 75s per cwt.; No. 2, in parchment, very hard and apparently overdried, colour and quality of bean very inferior to No. 1, probably owing to being overdried, value about 30s, 35s per cwt., if cleaned 55s, 60s per cwt. This coffee could be cleaned in London by the process described in our letter of the 17th April, but if we doubt if a machine that is used for ordinary coffees such as East Indian or West Indian would clean such hard coffee as No. 2 sample. We shall be able to give you more information later, as we have just received

a consignment of similar coffee in the parchment from Johore, and it will have to be cleaned and sold, and we shall have much pleasure in giving you the result.

October 5th, 1888.

Referring to ours of the 15th ultimo, *re* Liberian parchment coffee, Malacca, we beg to say the London cleaning of the same has not proved nearly so satisfactory in the result as the sample sent to us by you and cleaned abroad, upon which we reported, as ours turned out musty and very rough. We attribute the failure to the fact that the coffee was not properly dried, and that the parchment of this coarse coffee gets very hard and difficult to clean when left long before cleaning. We certainly think if such results can be attained on the other side, as shown by your sample from the Tan Hun Guan estate at Durian Tungal [Malacca] it would be folly to send the coffee home here in parchment. Our shipment consisted of 110 bags in the parchment and weighed 122 cwt. The out-turn after cleaning gave:—

35 bags bold which sold at 68s per cwt.		
9 " medium	"	60s "
5 " peas	"	70s "
2 " triage	"	45s "

The loss in weight was 34 cent, which we consider excessive.

LEWIS & PEAT.

The large per-centage which the parchment of Liberian coffee bears to the clean beans, a fact which we have already noted, is fully borne out in the above trial.

CEYLON UP-COUNTRY PLANTING REPORT :

THE SATISFACTORY DIVIDEND OF THE YATIYANTOTA TEA COMPANY INDICATIVE OF THE SUCCESS OF THE TEA INDUSTRY—THE ENTERPRISING V. A.'S—NEWS OF RUBBER—PEPPER AN ADMIRABLE AUXILIARY FOR SHADE—THE FORTHCOMING MANUAL ON THE SPICES—TAL-GASWELA TEA COMPANY—FEEDING TO PRIESTS—TRYING WEATHER AND SICKNESS AMONGST COOLIES IN CONSEQUENCE.

28th Jan. 1889.

The dividend which the YATIYANTOTA TEA COMPANY intends to pay is very fine, and is the most hopeful thing in regard to our rising industry that we have heard of for a long time. The Company has all along been recognized as one owned and "run" by V. A.'s principally; and it has been felt that if the accumulated wisdom of these exalted souls,—whose presence and company like angels' visits we enjoy only for a short space at a time; but during that time, what words of wisdom drop from their lips—if they could make tea pay, the foundations of the enterprise must be of the broadest and the deepest. I am ashamed to confess it, but there was certainly a feeling in the air, that when the V. A.'s went in on their own account to grow tea, an awful catastrophe was anticipated. But now that they have come out of it so well, whether by luck or good guiding will, I fear, be a divided opinion, we can all rejoice and look forward at the very least for a V. A.'s dividend of 22%. And yet there are some mean cantankerous souls about, who seem to think that we will have to be content with a great deal less. This idea I unhesitatingly classify as preposterous, and not likely to have any kind of general support from the ruck of planters. Our *esprit de corps* demands this: not up to the V. A.'s! Is there a man amongst us who would think so meanly of himself?

Now that the V. A.'s have shown what their stuff really is—earning 22 per cent of a dividend to "their own cheek"—the proprietors of the estates they visit will be looking for the same anyhow; and if not, then why not? That should be rather an appalling thought for our fortunate friends;

and yet the discoverers of "virgin subsoil" will, I fear not, find a way out of it somehow. I don't think that there is anything in the heavens above, or in the earth beneath, which a Ceylon V. A. would not be able to explain, or at least attempt to, if he were asked to report thereon. Their resource is infinite.

We don't hear much of RUBBER nowadays. It was a shortlived meteor in that sky which has spangled with so many new constellations, and never rose much above the horizon. Perhaps we expected too much—and that too soon—and what we had to do was to wait; anyhow the early tapping did not lead to anything hopeful, and rubber was quickly voted into the limbo of sells. But it is not going to remain there always, it would seem; for a careful experiment on a Pará rubber tree in the lowcountry has resulted in a pound and a half of rubber being secured from the one tree during the course of a year. The rubber of such quality is said to be worth 1s 6d a lb. in London. It is anticipated as the trees increase in age, so also there will be an increase in outturn.

PEPPER, which is an old acquaintance, is in the running to be a new favourite. When you have the proper tree to grow it on, it does not give much trouble, and is an admirable auxiliary in a cacao garden or anywhere else where shade is needed. I don't know if R15 a bushel is a big figure or not for such a spice, but I have heard of a first crop having been disposed of at that figure in the Central Province, and the grower is perfectly satisfied. Those who intend to cultivate it, and who think of starting with seed, should know that beginning at that end means five years to wait for returns, whereas by cuttings three years is the time. There is also a great deal in the tree on which it is grown, and those who have a right to speak with authority say, let the tree be deciduous. Nothing better than dadap, which loses much its leaves in the hot weather, and exposes the vine to the tropical winter. Then, when the monsoon rains come in there is a fine rush of blossom, and a good crop. On the jak, pepper does well, but for want of the wintering is too apt to run into leaf.* Like most plants in Ceylon it responds wonderfully to manure, and repays the outlay thereon in a speedy and handsome way. Keeping the vine down to eight feet, makes the gathering of the spice simple and easy.

In the above I may be anticipating in a small way your Spice Manual, but the information may in the meantime be of use to some of your readers, until in the fulness of time another of the standard Planting Manuals is issued.

The *Tropical Agriculturist* is not the periodical you would go to for light reading, yet at times you do fall in with the amusing. An example of this is to be found in the last number, January, in the report of the "Kohun Valley Tea Association, Limited." This Company, the directors assure the shareholders, is "proceeding satisfactorily"; and when you turn to the profit and loss account you have an insight into this satisfactory progression. It shows the profit on rice to be almost equal to the profit on the cheap tea. There is an artlessness about the way this is put, which is very refreshing.

The TALAGWELA TEA COMPANY are adding another 200 acres to the acreage already planted. The new land is said to be undulating, and the forest even heavier than what was on the first 200 acres that were tilled. The prospects of this Company I hear, are good, and the cheap labour which

* Does that apply so much to the lowcountry, as to altitudes varying from 1,000 to 2,500 feet?—Ed.

abounds in the villages about is giving an immense haul in the way of cheap working.

Passing the other day a new building, with a PANDAL in the front of it, which was emblazoned in a very conspicuous way, with the royal arms, I stopped to inquire what was going on, and if the Lieut.-Governor or the Government Agent were expected; but I was told it was the opening of a new Buddhist temple, and that the gay show was got up in honour of the feeding of the priests, of whom some seventy in number had arrived, and were at that moment being fed. The lion and the unicorn were poor, poor specimens of these noble animals!—ashamed doubtless of this new connection with Buddhism.

The weather is seasonable, and as yet the cold wind has not been so trying as last season. Rain showers are about, but nothing very satisfying has fallen, and we would willingly take more. There is a good deal of sickness about among coolies—fevers, colds, and such like, which will disappear when the cold wind ceases. PEPPERCORN.

CEYLON TEA AT THE MELBOURNE EXHIBITION.

Planters' Association of Ceylon, Kandy, 29th Jan. 1889. The Editor, *Ceylon Observer*.

SIR,—In terms of the resolution of the Standing Committee of the "Tea Fund" passed at a meeting on the 19th instant, I beg to enclose the correspondence referred to regarding the Ceylon tea-house at the Melbourne Centennial Exhibition.—Yours faithfully,
A. PHILIP, Secretary.

The Ceylon Court, Melbourne Exhibition, Nov. 9th, 1888. The Secretary, Planters' Association, Kandy, Ceylon.

Dear Sir,—I have this morning received your favour of October 15th, giving me copy of resolutions by Standing Committee of the Tea Fund, after considering my letters of 27th August and 7th September.

1st Resolution:—"That the Standing Committee of the Tea Fund confirms the Secretary's letter of the 29th September to Mr. Hugh McKenzie annexing memorandum of disbursements made in Ceylon on account of the Melbourne Exhibition, and points out that the total vote granted to Melbourne Exhibition is R6,000 as stated in the Secretary's letter dated 25th February 1888," for which I thank you. 2nd Resolution:—"That the Committee does not see its way to authorize Mr. McKenzie to sell the tea consigned to him for free distribution," and asking me to furnish a statement of disbursements.

Full particulars of disbursements will be forwarded by the mail of 16th, and in the meantime I enclose an approximate estimate of the financial position to the close of the present month (November). With regard to my selling the tea, there seems to be some misunderstanding, arising probably from the vagueness of my letter of 7th September. It probably appears to you that I am disposing of the tea by auction, or otherwise, not arising directly from the principle of exhibiting: as to my authority for selling, if you refer to your letter of 19th November 1887, you will see that you say "Chiefly by its sale in the cup, and in packets." Again in your letter of February 25th you say: "You desire to leave us complete discretion to carry out the undertaking as we think fit;" and the whole tenor of the last paragraph is to the effect that I should sell if possible; that you wish me to sell in therefore clear, and you say nothing whatever of free distribution except as a disagreeable alternative. The method pursued is this: in the cup of tea is given free, as the Commissioners insist upon it, but to any guests who express a liking for the tea, and a wish to procure some of it, we sell in packets of 5 lb. and 10 lb. at 2s per lb. For this purpose we have hired a store-room close to the Exhibition, where the tea chests are subdivided as necessary. The enclosed memo. will show you that the sum you have in hand will, as near as possible, meet the deficit on this side to the close of the present month. Should you not have already forwarded the

tea for which I have asked, it will be unnecessary to do so, unless you are prepared to spend more than R6,000 over the Exhibition, as the profit arising from sale will not meet expenses, and the undertaking must be closed at the end of November. Should the tea have already been shipped I will dispose of it to the utmost advantage. There is no doubt that our teas are finding many friends through our efforts here, and it would be a very shortsighted policy to withdraw so early.

It is for your Committee to decide, and it will be necessary that you acquaint me with your decision by wire before the end of this month. I may add that the expenses here, for superintendence, wages, sugar, gas, milk, &c., amount to about £50 per month.—Yours faithfully,
(Signed) H. McKENZIE.

Melbourne, November 13th.

The Secretary, Planters' Association, Kandy, Ceylon.

Dear Sir,—I take advantage of the German mail closing today, to forward you a memo. of disbursements, made by me on account of your Committee, in the Ceylon Court, to the 10th instant, as desired by the resolution of the Tea Fund Committee, conveyed in your letter of October 15th.

You will observe that the total expenditure amounts to £316 5s 4d, and as stated in my letter of the 9th instant, I conclude that the balance in your hands for the Melbourne Exhibition, as shown in your memo. received, will be about sufficient to carry in through here to the end of the present month, at which time I shall be expecting instructions from you by telegraph.

With reference to tea sales, conducted as explained to you in my letter of 9th inst., I have to advise that I have sold tea to the value of £84 of which £62 10s has been received and the balance outstanding.

The tea now in use in the tea-room is that bought from the Ceylon Tea Growers' Association through Mr. Foulker their agent, the remainder of that received from your Committee, being reserved for further use, when tea of an equal quality is to hand from you, which I trust will be despatched as soon as possible, after you have received my letter of 9th inst., explaining the method adopted in selling, provided the Court is not to be closed at the end of the month. In any case I wish to be advised as to the disposal of exhibits, photos, &c., as to whether they are to be disposed of for the benefit of the fund, or in what way disposed of, as, your having disapproved of my selling the tea. I prefer not taking upon myself the responsibility of winding up without definite instructions, informing you only that according to the regulations neither the kiosk nor exhibits can be removed until the day of closing, at present fixed for January 31st.—Yours faithfully,
(Signed) H. McKENZIE.

13th November 1888. (Signed) H. McKENZIE.

Planters' Association of Ceylon, Kandy, 17th Nov. 1888.
Hugh Mackenzie, Esq., Ceylon Court, Melbourne Centennial Exhibition, Melbourne.

Dear Sir,—Since writing to you on the 15th ultimo, I have the pleasure to advise the shipment of further cases of tea, cardamons, and tea plants forwarded through the courteous good offices of Mr. Hugh Fraser.

Messrs. W. L. H. Skeen & Co. have also been good enough to send as exhibits from the Planter's Association two cases of photographs, 12 of which are views of Ceylon, Kandy, Breakwater, &c. &c.; the other 12 are native character subjects.

I have to advise a payment of R30 to the wife of J. Migal, native servant at the Exhibition, in terms of agreement on account of his pay to the debit of the Exhibition vote.

There has not been a meeting of the Standing Committee of the "Tea Fund" after the receipt of your letter of the 5th October, telegram of the 13th and letter of the 19th October, but the Chairman having taken the responsibility, a further shipment of 500 lb of tea was arranged for as before through Messrs. J. M. Robertson & Co. to be supplemented by another 500 lb of tea in view of your latest writings on the subject. For your information and guidance I beg to quote as follows from a letter dated 16th November received from Messrs. J. M. Robertson & Co.:

"In reply to your enquiry we have not yet shipped the 500 lb referred to in ours of the 1st instant, though we have made arrangements for purchasing it packed in 20 lb boxes. We understand from your letter that your Committee wish us to purchase an additional 500 lb and making a total of 1,000 lb which will be paid for by the 'Tea Fund,' and we should be obliged if you would confirm this.

"As regards the purchase of a still further lot of 1,000 lb, we have already advised Mr. Kelly that if we have to reimburse ourselves for this by drawing on Mr. Mackenzie for invoice cost, we much regret that it will not suit us to effect the purchase. Hitherto we have hardly regarded the purchases made at the request of the Planters' Association for Melbourne and elsewhere as business transactions, as we have only charged actual disbursement incurred on the understanding that the Association pays our invoices on presentation, and we have been glad to render what assistance we could towards furthering the object the Association has in view. But if Mr. Mackenzie wishes us to ship tea to him on his own account, we must look upon the matter from a purely business point of view, and we could only undertake the business provided Mr. Mackenzie can furnish us with a confirmed bank credit or make other satisfactory financial arrangements. As regards what Mr. Mackenzie says about the quality of the first two lots of tea sent to Melbourne, we can only say that they both came from the same estate, were valued here at the same price, and were in fact as nearly as possible a match. It is of course extremely difficult to buy small lots of tea at different times to match exactly."—I am, &c., (Signed) A. PHILIP, Secretary.

P.S.—I am to inform you that the vote for Melbourne Exhibition is now all expended and that on the Chairman's own responsibility the additional 500 lb. of tea has been arranged for. He hopes, however, that as you are selling the tea you will be well in funds. Should you wish a continuance of regular tea shipments, it will of course be necessary now to act on the lines laid down by Messrs. J. M. Robertson & Co. (Initialed) A. P.

To (station) Kandy. From (station) Melbourne.
To (person) Philip, Kandy.
Dealers deprecate closing, 29, 11, 26.
Kandy, 29th November 1888.

Melbourne, December 7th, 1888.

The Secretary, Planters' Association, Kandy, Ceylon.

Dear Sir,—Your cablegram of December 1st reached me on 3rd, advising further shipments of tea, and concluding that you, before despatching it, were in receipt of my letter of the November 9th, I infer that your Committee approve of my selling tea to guests in the Ceylon Court, in the method described, and am continuing to do so: awaiting your further advices by mail.

The attendance at the court daily, satisfactorily increases, and from what I gather outside I have every reason to believe that the result will tend materially to increase the demand for Ceylon teas in the Colonial markets.

Since writing the above, yours of November 17th has come to hand, and from its perusal in connection with your telegram of 1st instant, I understand that no Committee meeting have been held to consider my letter of November 9th, you were not in a position to advise me further than of the shipment of the tea, and I await their decision by cable on its consideration, as requested by me.—Yours faithfully,

(Signed) H. MCKENZIE.

Planters' Association of Ceylon,

Kandy, 11th December 1888.

Hugh Mackenzie, Esq., Ceylon Court, Melbourne Exhibition, Melbourne.

Dear Sir,—I have to acknowledge receipt of your letters of the 9th and 13th November, also telegram of the 29th November, which having had the consideration of the Standing Committee of the "Tea Fund," I now beg to annex for your information and guidance copy of resolution passed on the subject. In terms of this resolution I have asked the New Oriental Bank Corporation, Limited, to wire £100 sterling for disbursements by you on account of the Melbourne Exhibition, and in addition to the 1,000 lb. tea shipped per S. S. "Massilia" and S. S. "Salor." I have asked Messrs. J. M. Robertson & Co. to arrange for the purchase and shipment with as little delay as possible of another 1,000 lb. tea. At foot I annex copy of telegrams despatched by me to your address. You will observe that the Standing Committee have voted a further sum of £100 sterling towards the Melbourne Exhibition so as to enable you to keep the Ceylon tea-house open until the close of the Exhibition, and that the Committee look to you to repay the cost of the extra tea shipped by bankers' draft. If you will find that more tea is required I understand that you will wire for it arranging at same time through the bank to place in funds to pay for it.—I am, &c.,

(Signed) A. PHILIP, Secretary.

RESOLUTION REFERRED TO.

"That in addition to the vote of R6,000 already made a further sum of £100 sterling be granted to the Melbourne Exhibition, and that this sum be remitted at once to Mr. H. Mackenzie; also that 2,000 lb. of Ceylon tea be purchased if necessary, and shipped to him for sale, the value to be repaid through Mr. Mackenzie by Bank draft."

Telegrams referred to.

Melbourne—Mackenzie. Kandy—Philip.
Centennial—Melbourne. 500 pounds tea shipped; 500 follow next mail.—
(Signed) A. Philip.—1st Dec. 1888.

Melbourne—Mackenzie.

Centennial—Melbourne.

Kandy—Philip.

"Remitted £100, shipping thousand for sale."
(Signed) A. Philip.—10th Dec. 1888.

Melbourne, December 13th, 1888.

The Secretary of the Planters' Association, Kandy, Ceylon.

Dear Sir,—Since writing you on 7th instant I am in receipt of your cable of 10th instant, and also have received from the O. B. O. the £100 alluded to. Anticipating that after receipt of my letter of November 9th your Committee would wish me to continue the Court open as before, I have kept it open, on the same conditions since the end of November, and after Monday next propose opening it for an hour every evening, as well as during the afternoon, and to continue to do so during the holidays, and to the end of January should the attendance at that hour prove satisfactory.

Awaiting your advices by mail, especially as to the disposal of the exhibits at the closing of the Exhibition.—I am, &c.,
(Signed) H. MCKENZIE.

Planters' Association of Ceylon, Kandy, 17th Jan. 1889.

Hugh Mackenzie, Esq., Ceylon Court, Melbourne Exhibition, Melbourne.

Dear Sir.—Since the receipt of your letters of the 7th and 13th ultimo, there has been no meeting of the Standing Committee of the "Tea Fund," but replying to your request for instructions, I write now to ask you to dispose of all exhibits, photographs, &c., sent by the Association to best advantage for credit of the Exhibition account except of course any that may have been only lent. If necessary I will supplement my present letter after the next meeting of the Committee.—I am, &c.,

(Signed) A. PHILIP, Secretary.

Melbourne, January 3rd, 1889.

The Secretary, Planters' Association, Kandy, Ceylon.

Dear Sir,—I am in receipt of yours of December 11th covering resolution of the Standing Committee of the "Tea Fund," after their considering my letters of November 9th and 13th, and confirming your telegram already acknowledged. The 1,000 lb tea alluded to has been received per "Massilia" and "Salor," and today I hear from Messrs. J. M. Robertson & Co. that the remainder ordered by you has also been forwarded, and of which I shall take charge in a few days, but cannot help regretting that the two latter shipments were packed in the same sizes as the former, that is in 20 lb. boxes.—Yours faithfully,

(Signed) H. MCKENZIE.

YATIYANTOTA TEA CO., LIMITED.

At the annual ordinary general meeting of this Company held in Colombo on Wednesday, 30th January, the report of the directors and accounts for the past year were submitted and adopted, and a dividend of 22 per cent on the paid up capital was declared. Mr. W. D. Gibbon was re-elected a director, and, it being considered advisable that two directors resident in Colombo should be on the board, Mr. W. H. G. Duncan was also appointed. At the formation of the Company it was arranged that during the years embraced in an estimate extending to 31st Dec. last, the office-bearers should receive a nominal remuneration. That period having expired, a resolution was brought forward and carried, that the remuneration should be increased to £2,000 a year.

A vote of thanks to the office-bearers for 1888 and the chairman of the meeting (Mr. C. Young) closed the proceedings.

We quote from the report as follows:—

The Directors have pleasure in submitting to the Shareholders the Accounts of the Company for the past year. Whilst the expenditure has been less than was anticipated, the crop has exceeded the estimate

of 100,000 lb. made Tea by 6,310 lb. All the tea has been sold in the Island at an average net price of 57 cents per lb. After writing off the balance at debit of Profit and Loss account on 31st December 1887 (R5,995.20) and making ample provision for depreciation of Buildings and Machinery, the sum of R19,920.15 remains available for dividend. The directors propose to apply R19,800 of this amount in paying a dividend of 22 per cent on the paid-up Capital and to carry forward to next year the balance of R120.15, which it is hoped will be satisfactory to shareholders. The property owned by the Company comprises 404 acres of Tea in bearing and 363 acres of Forest (including the Abamalla land), which with Buildings and Machinery stand in the books at R94,838.81. In the original memorandum of the Company it was estimated that on an outlay of R75,000,—400 acres would be brought into bearing by 1st January 1889, of which 100 acres were to have been planted in 1887. As compared with this Estimate the actual cost, as mentioned above, is R94,838.81, against which would fall to be deducted the sum of R19,920.15 at credit of Profit and Loss account, leaving R74,918.66, whilst the position of the Company has been improved by the planting having been completed a year earlier than was anticipated and by the addition of 211 acres of land. It is not proposed to open more land this year, but it is estimated that R5,376 will be required for additional Withering accommodation, Machinery, Cooly lines and other "Capital" Expenditure. The estimated crop in 1889 is put down at 140,000 lb. tea against an estimated outlay on the estate of R34,624.

THE CEYLON TOBACCO COMPANY LIMITED.—Since this scheme was first started, it has undergone considerable expansion, and what was once but a modest attempt at introducing the cultivation of tobacco on a small scale in the Matale district, has taken the shape of a large limited liability company, with a capital of R500,000, almost the whole of which is already subscribed. The company do not apparently intend to confine their operations to Matale, for the originators of the scheme hope to be in a position to acquire 400 acres of land under Kanthalai tank, which can be obtained on favorable terms. The land is situated 25 miles from Trincomalee, on the main road, and is said to be eminently suitable for growing tobacco, while every portion of it irrigable. We believe that an application has been made to the Government for 10,000 acres of fine land adjoining, and hopes are entertained that the Company will be able to acquire it on favorable terms. Indeed, the Government, with wise discretion, is likely to accede to the request made them. Until this matter can be decided the Company propose to commence operations at once on 150 acres on Bandarawella estate. Ceylon planters are to be employed for clearing and planting work, which no other planters so thoroughly understand, but the difficult and little understood operations of curing are to be entrusted to skilled Java or Sumatra planters specially engaged for the work. The Provisional Directors of the Company are the Hon. T. N. Christie, Mr. H. K. Rutherford, Mr. C. S. Armstrong, and Mr. James Hill; while the Managing Director and Secretary is Mr. Hugh Fraser—a management which it is hardly possible to strengthen in any way.—Local "Times."

Correspondence.

To the Editor.

LIBERIAN COFFEE.

January 22nd, 1889.

Sir,—Would you kindly favour me with replies to the following:—

1. Can this product be successfully cultivated at an elevation of from 3,000 to 4,000 feet in a warm locality?
 2. What average crop may be expected after the fourth year, with good cultivation, planting 8' by 7'?
 3. What is the best variety to plant, and will it stand leaf-disease?
 4. Is a rainfall of about 70 inches sufficient?
 5. When *C. arabica* sells for £90 in London, what price would *C. liberica* bring? If less, why so?
 6. Is it necessary to import seed from Africa in consequence of deterioration of the plant when removed from its native habitat?
 7. Generally considered, is it a good investment?
- I am, sir, yours faithfully, EBOR.

PIONEERING WITH TEA AND CARDAMOMS

IN MEDAMAHANUWARA DISTRICT.

Delpotonoya Estate, Teldeniya, 29th Jan. 1889.

DEAR SIR,—I notice in your last *Overland Observer* that you have given Mr. E. S. Anderson the credit of being the pioneer of tea and cardamom cultivation in the Medamahanuwarra district. It is not so; my friend, the late Mr. A. H. Macartney was the first to plant tea and cardamoms in the district, and it was he who introduced the Mysore variety of cardamoms into Ceylon, if I mistake not. Though, like most pioneers, I fear he did not benefit much by his enterprise, others have benefited largely, and I think it only fair therefore that the credit should be given to whom it is due.

Mr. Anderson has extended the cultivation of cardamoms in the district very successfully, but is not by any means the pioneer: I am sure he would be very unwilling to receive the credit due to another, and would have corrected you, had he been in the island to do so himself.—I am, yours faithfully, SPENCER SHILLEY.

[If Mr. Shelley reads our paragraph again, he will see that there is no mention of the "Medamahanuwarra" district, and that we spoke of Mr. Anderson as "a pioneer in cardamoms, tea and other products,"—that is one of the pioneers. We certainly did not mean to say he was the first to try new products in Rendala or Medamahanuwarra; but it is interesting to be reminded of Mr. Macartney being the earliest to introduce tea and cardamoms in that neighbourhood.—Ed.]

A CEYLON TEA GROWERS' ASSOCIATION.

Narangalla, Aranayaka, Jan. 31st, 1889.

Sir, I enclose specimen of circular addressed to the Chairman, Hon. Secretaries of District Associations, to others in unassociated districts, and to members of Colombo firms, &c.—Yours obediently, HARRY WHITHAM.

Sir,—It is proposed to form a Tea Growers' Association or Company, for the purpose of pushing the sale of Ceylon tea in America.

Will you kindly undertake to carry the matter before your District, and get the names of subscribers to the general idea, with the extent to which they will take share?

The details of the scheme will naturally be given by a general meeting of subscribers, and the subsequent working by a Board of Directors.

It is hoped that a capital of not less than £25,000 may be raised, and it is suggested that the total liability on each share should not exceed £50, in order that no one engaged in tea planting may be debarred from taking one share at least.—Yours obediently, (Signed) H. K. RUTHERFORD, HARRY WHITHAM.

January 26th, 1889.

GREEN BUG ON COFFEE AND CINCHONA IN UDAPUSSELLAWA; RAINFALL.

Gampaha, 28th Jan. 1889.

DEAR "OBSERVER,"—In answer to your question "Does coffee under shade in Udapussellawa suffer from green bug?" In the first place we have no shade coffee so to speak: a few patches under original forest trees, have been but slightly affected; but then the nearest coffee adjoining in the open is almost exempt from it. I have not seen, nor do I know of, any coffee that could be said to be under shade of *Cinchona officinalis*. If it were close enough to give shade, coffee would not live long, and when it is only planted through the coffee it cannot be properly called shade, and in such cases I have not seen the coffee less affected. A patch here under rather dense shade of *Cinchona succirubra* was so bad, it had to be cut clean out, and even the cinchona took up the bug after the coffee was removed. Certainly a considerable acreage of cinchona ledgeriana planted in coffee got it so bad, it had all to be taken out to save the bark, the trees being quite killed out. This pest, green bug, seems to defy all theory as to its propagation and progress; here it seemed first to have come on the air from Matale or Medamahanuwarra or carried by birds or some other agency; and although it was first detected on sheltered coffee facing the south, it was soon found on exposed ridges facing the north; then it seemed to be carried to other parts by sticking to coolies' cumbies, &c., and individual trees by roadsides were soon very common, when all of a sudden patches of good coffee in the middle of fields would be found quite infested. These were treated for a time by syringing with kerosene in water, and dusted with fresh lime; in some parts with sulphur: the latter seemed most effectual, and for the time being seemed to quite stop its progress, but after a month they were bad again, and it had run through such an extent of coffee it was impracticable to follow it up. It got very bad in September and October; then the cold wet N.E. monsoon all but killed it out, till the fine warm days of March and April set it going again, and by August it was worse than ever. On the whole it was not so virulent this past season, and at present it is hard to find a living bug; the last

I have seen was on *Cinchona succirubra* where the coffee had been cut out. We have some patches of coffee that had it badly in 1887; got clear of it in the N.-E. monsoon and were scarcely touched past season; but as a rule it has stuck most tenaciously to trees once affected until many are killed or left in a hopeless state. As to what I think of it now; from former experience, I would rather not risk an opinion; but certainly at present there seems a prospect of its leaving us, that it has exhausted its fecundity and run its course, or from some natural cause got so weakened as to be comparatively harmless. Would that some scientist could tell us if its generations are nearly run out, with little chance of new ones; but I fear they are hermaphrodite. I am much pleased however to see that such an authority as Dr. Trimen has hopes that the bug may have nearly run its course, as, should it leave the coffee now, it will be a fine thing for those who have retained the old King; he will be well worth all the care we can bestow on him. Some have the idea that manuring is only fostering and keeping on the bug, and I don't mean to say it will stop it, but I find, although some of our best coffee has been badly attacked, what has been lately manured has withstood it better and throws off the effect sooner than what is unmanured. Another thing is attention to pruning and handling, free air through the branches, and all suckers and small centre shoots carefully removed, as these are usually the favourite food of the bug. From the effects of leaf disease and bug the sap connection between root and branch has been so much weakened and intercepted that many roots have died, and this accounts in great measure for so many primaries and branches dying back, but should bug stop its course and we get some healthy foliage, the trees would soon recover their vigour. Although our average is much reduced we have still got coffee bearing its 7 cwt. per acre and looking as well as ever. Let us hope we are near the end of this dire scourge, and that we shall see a considerable remnant left flourishing to cheer the heart and gladden the eye of the worthy men who have done so much for Ceylon.

We have had a most wonderful planting season, only 21 days since 12th Oct. no rain measured, but not all dry. Rainfall for past year to 31st Dec. 100.13 inches and 13½ inches for Jan. to date. Heaviest rainfall 21st and 22nd Dec. mornings 7.13 and 9.15 in. respectively. This was too much for our steep free hillsides, and caused much wash and many slips.—Yours,
J. BAGRA.

HOPFENBAU UND HOPFENBEHANDLUNG.—By O. Fruwirth. Pages 184, figs. 32. Berlin, 1888. Paul Parey. In response to a prize offer of 1,000 marks, by the editor of the *Allegemeine Brauer und Hopfenzeitung* of Nürnberg, Herr C. Fruwirth, an agriculturist of Vienna, has prepared a very thorough essay on the subject of hop culture and treatment, which has just been issued as a number of the "Thaer" library. It is a monograph upon the subject, practically and scientifically discussing the hop-plant in its botanical, agricultural, economical and commercial relations. Some interesting statements are made showing how varieties have been modified by change of environment. A comparison of the German, English and American products is presented. Detailed descriptions of the different methods of cultivation, fertilization, pruning, trellising, harvesting and curing are given with illustrations; there is a short chapter on the chemistry of the hop and its active principles; and finally a discussion of its commercial features. The whole makes a very complete and successful handbook which cannot fail to be a useful help to the practical hop-grower. Unfortunately for American readers it is published in German.—*Agricultural Science.*

THE TROPICAL AGRICULTURIST MONTHLY.

Vol. VIII.]

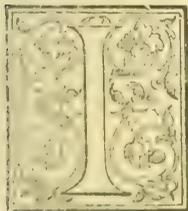

COLOMBO, MARCH 1ST, 1889.

[No. 9.]

LETTERS FROM JAMAICA:—NO. 27.

THE BENEFICIAL INFLUENCE OF THE RAINFALL—SCANTY CROPS CONSEQUENT ON THE DRY WEATHER EXPERIENCED AND PROMISE OF GOOD YIELD FOR THE CURRENT YEAR—EXPOSURE OF THE MISTAKE OF THE FRENCH BOTANIST TO THE FUNGUS IN THE COFFEE COUNTRIES IN THE WORLD—SUCCESSFUL AGRICULTURAL SHOW IN JAMAICA—THE VICINITY OF KINGSTON AND ITS CHARMING SCENERY—THE APPROACHING DEPARTURE OF SIR HENRY NORMAN TO QUEENSLAND, AND THE CONSEQUENT REGRET FELT THROUGHOUT JAMAICA.

The Editor "Ceylon Observer."

LAST addressed you in October when we were expecting our *October rains* (or monsoon), and, as is ever the case, in fear and trembling lest they should be too heavy and cause a lot of damage by wash and landslips. I am thankful to say that the rains have been moderate and genial; they have much benefited the country without doing any harm; in fact there may be parts of the island where a larger fall would probably have been desirable.

As regards *crops*, those of the settlers, as I led you to expect, have, as a rule, been short in consequence of the very dry weather experienced from the end of November 1887 to the middle of April last, but the higher elevations benefiting from this continuous fine weather, gave very average crops last season, and now promise well for the coming spring crop of 1889. But Blue Mountain coffee *proper* is never more than a few thousand cwt. at any time and does not in any way influence the general market, over maintaining its high character and consequently its high price. The estates on which it is grown might almost be reckoned on the fingers of a man's hands; they are under twenty in number, and some of them produce very scanty crops, most of the coffee having died out from neglect or abandonment.

The editor of the *St. James's Budget* had not the courtesy to publish my letter to that paper, in which I exposed the mistake of the French botanist Mr. Raoul, who was stated in that paper to have visited the principal coffee markets of the world, and to have said he had scarcely met with an estate that was not seriously affected with *Hemileia vastatrix* and that, in consequence, before very long coffee would be fetching four times its present value. I showed he could not have visited Brazil, Central America, or the West Indies, or he would not have made such an alarming statement, as Brazil itself had capabilities of nearly supplying the European and American markets if all continues well and emancipation does not affect crops to any large extent. I am of opinion that when a journalist has unwittingly been led into publishing an error in his paper, he should be the very first to acknowledge, and rectify his "misinformation."

I have just returned from the Agricultural Show held yearly on a cattle run, named "Cumberland Pen," about 10 miles by road out of Kingston, and six or seven by rail: it is the property of Mr. Verley, partner in the bakery manufactory of Verley & Robinson. During the Jubilee illuminations the letters "V. R." were very frequently to be met with, and the common people believed it was meant for Verley & Robinson. Anyhow Mr. Verley very kindly places his pen at the disposal of the Committee, and moreover does the host to a large number of favoured guests. The rail passes through the property and there is a platform for passengers; but hearing of the crush last year, after the Show was over, I elected to drive down; hired a well-horsed double buggy and had the pleasure of escorting two ladies who like myself had never visited such a Show in Jamaica.

The first part of the drive out of Kingston is very tame: first, one passes the May Pen Cemetery; then after a few miles the scenery changes and one passes through well timbered land and under immense cotton trees of fantastic shapes. Once off the main road to Spanish Town, one enters upon lovely park-like scenery, splendid trees—cotton and tamarind, the logwood, reminding one strongly of the English hawthorn, bamboos, ferns, etc., etc. A remarkable feature is the drive to Cumberland Pen is the fording of the "Rio Cobre" which, at times of flood is dangerous, and always exciting, fortunately it was not bad this year; still on the return journey we were glad to avail ourselves of the assistance of a rick-rail who had collected on the bank in order to earn an honest penny in "putting their shoulders to the wheel."

Cumberland Pen is very park-like, spread over with large trees which give a pleasant shade and

under which the cattle graze. Some parts are cultivated with guineagrass, irrigated from the Rio Cobre canal: such grass being sent to Kingston for sale. As to the Show itself. There is a very passable grandstand and a small ring for the riding, driving and hurdle competitions. Several very handsome turnouts were exhibited, also some very fine horses and cattle, ponies, mules and other live stock, including sheep, dogs and cats were very well represented. As for the agricultural produce, it was exhibited on a high narrow platform. The exhibits were very badly and untidily arranged and could not be viewed to the best advantage. Sugar, rum, coffee, pimento, cocoa, annatto, fruits and vegetable were fairly represented. The Show was very well attended; it is always a gala day for Kingston and the island generally: planters and pen-keepers congregated from all parts of the island, as also to be present at the races held soon after.

We are about to lose our Governor, Sir Henry Norman, about one year before his customary time is up: he has been appointed Governor of Queensland. At first he prayed to be allowed to remain in Jamaica until his six years were completed, as he was desirous to stay with us till the newly-elected Council members had been elected and the new Council was at work, for we are shortly to have a general election under the enlarged franchise; but it having been signified that Her Majesty wished he should go to Queensland he, of course, obeyed and is to quit our shores on the 2nd January.

Sir Henry has been a very popular Governor, except perhaps amongst the *haut-ton* of Half Way Tree (the fashionable suburbs of Kingston), who resented the Governor's tolerance to the colored members of Jamaica society, and for having them to his house as friends and guests. As a *bona fide* Governor he has been most popular, and deservedly so, and all the community will regret his having to move to another sphere of usefulness; probably many a *Quashie* would say of him, as I heard one of the churchwardens of Olofton Church had said to their pastor who was going away to another parish, "Oh, parson, you should not leave us; we were hoping that we should bury you." This, of course, was meant as a high compliment. As my letter is somewhat short I enclose an extract from the local *Gleaner*. It is an article by one Mrs. Kemp, of Ewings, Caymans Estate; it is a very correct description of the manners and customs of Mr. and Mrs. Quashie, especially in that part of the Island in which that lady resides. I am sure it will interest and amuse your readers.

W. S.

WHY NOT A TEA SYNDICATE.

Our last issue contained a highly interesting communication from a London tea expert, one not only well acquainted with the trade, but of some experience in regard to the Ceylon article. His remarks on the changes that have come over the tea trade, wholesale and retail, owing to the appearance of large and yearly increasing quantities of British grown leaf, are much to the purpose, and will, no doubt, be read with attention by all interested in the industry.

So far as Ceylon growers are concerned, they do not look with disfavour on the large profits realised by the retailers, because the more gain to them the greater their inducements to push the article into consumption. Nor do they question the right of the retail dealer to sell any blend he chooses to offer his customers, but that to which they do object is the selling of blends incorrectly and improperly described on the packet. The writer of the interesting article to which we have alluded thinks the Public Prosecutor should step forward and take proceedings in all infringements of the

Trade Marks Act. The task has already been taken in hand by the Ceylon Association recently formed in London and though the first prosecution collapsed, owing to a break in the chain of evidence, it will undoubtedly be productive of good.

We are glad to see the new Association taking up this work, but to our mind a Tea syndicate is required for more extended action than the new body contemplates by its prospectus. There are salt syndicates, tallow syndicates, and copper syndicates for mutual help and mutual defence, and why not a tea syndicate? If for no other purpose it would be invaluable as a means of gradually regulating the bulk of tea to be thrown on the market by public auction, a matter in which there is much need for co-operation. Only brokers, perhaps, are fully sensible of the serious losses often incurred by "rushing" new landings of tea, when by a little mutual arrangement the market might be kept more evenly supplied, according to the trade requirements of the Week. We may be told that the project cannot be worked. Perhaps not just now, but we feel confident that the time will come when some plan of this sort will be a necessity, and will be found practicable.—"Ceylon Advertiser."

TOBACCO IN AMERICA.

One of the important points in the Senate tariff bill is the protection it proposes to the growers of tobacco. Great complaint is made that under the present law Sumatra tobacco grown by the cheapest labor in the world is brought in to compete with the brand of tobacco most largely grown in the North, that used for wrapper. The Senate law proposes a duty on this, if not stemmed, of 75 cents per pound, and if stemmed, a duty of \$1 per pound. Quite as important is the provision that if this leaf tobacco is imported mixed with other tobacco is paying a low rate of duty the whole shall pay the higher rate. This will stop what in practice has proved a great abuse. The duty on fillers tobacco is reduced so that Havana tobacco for fillers to cigars may be imported with advantage. This will assist the tobacco grower and the cigar manufacturer.—*American Farmer*.

DRUG TRADE REPORT.

LONDON, January 10th.

BAEL FRUIT.—Ten cases dried quarters sold at the low rate of 1d per lb; but for another lot of 10 bags of mouldy fragments only $\frac{3}{4}$ d per lb could be obtained.

CALUMBA.—The quantity offered today was restricted to 100 bags of grey, medium to bold, slightly wormy root which was bought in at 25s to 30s per cwt.

CARDAMOMS sold at extreme prices today, the advance being about 3d to 4d on some lots. There were 138 cases offered, including several lots of fine quality, but nearly two-thirds of this supply was withdrawn, although buyers offered high prices for some lots. Ceylon Malabar, grey medium, dull appearance, sound sold at 1s 11d. Mysore, good pale medium to bold plump 2s 10d to 3s, smaller ditto 2s 5d. For good yellow medium to bold long 2s 6d was refused. Seed brought 1s 11d. Wild Ceylon 1s 7d to 1s 8d per lb. A new feature in this article was introduced by the sale of about 1,280 lb. of cardamoms grown in New Zealand, and imported here from Lyttelton, in the central part of that island. These cardamoms were apparently grown from Malabar seed, and of good quality, but badly cured and harvested. They were round, small to medium size, not very well bleached, badly clipped, and mostly damaged. From 1s to 1s 4d per lb was paid for the better lots, 8d to 9d for mouldy, thin, and shelly, and 1s 6d for seed. The shipments of cardamoms from Ceylon show a great falling-off this season. They have been, in the periods between October 1st and December 13th: 1888, 35,386 lb; 1887, 76,777 lb; 1886, 39,153 lb.

CINCHONA.—Flat Calisaya bark continues to be imported here in very heavy quantities, and there seems little doubt that sooner or later the market must decline. At the auction today about 180 packages of this variety were shown and only two sold at 1s 8d per lb for good bright sound. A few bales damaged "cultivated flat" Calisaya brought 10½d per lb. Ordinary grey Guayaquil realised 5d to 8½d per lb. Lima is partly held at 8d per lb., much beyond the value. For other varieties extremely high rates continue to be paid: Loxa, good bright fresh mossy to very small broken quill from 2s to 1s per lb; Huanoco 1s 1d to 1s 3d per lb. The shipments from Ceylon in the period between October 1st and December 13th have been:—1888, 3,023,319 lb; 1887, 1,803,726 lb; 1886, 2,954,055 lb. Up to the present the following quantities are advertised for sale next Tuesday:—Ceylon bark 2,014; East Indian 160; Java 319; South American 355; and Fiji, 3 packages; total 2,851 packages.

COCA LEAVES.—The 11 boxes crushed Java leaves of good appearance, of which we published the analysis in a recent report, were today disposed of at 7d per lb; and 3 packages small very badly-cured leaves, also from Java were withdrawn. Of South American leaves 10 bales were shown. For good bright green Bolivian 1s 1d was refused, the price being 1s 6d per lb; while a somewhat damaged parcel found abuyer at 1s per lb.

CROTON SEED.—Five Robbins East Indian seed of ordinary quantity brought 15s per cwt.

KOLA NUTS.—One box of good dried West Indian seeds sold dearly at 10d per lb; for a small and wormy lot 8½d per lb is asked.

MATE (PARAGUAY TEA).—An 80-lb cask of very good quality catalogued as "matico," is held for 1s per lb. The drug is hardly ever seen in the open market here.

NUX VOMICA.—At today's auctions 216 packages were offered, all of the inferior variety. The price for small, fairly silky seed from Bombay and Calcutta is 8s. Twenty-seven bags, partly damaged and small seed imported from Saigon (French Indo-China, sold at 6s 3d per cwt.

COCONUT OIL.—On the spot a moderate business is being done at £27 for good Ceylon in pipes £28 to £29 for good to fine Cochin, and £27 for Mauritius.

PALM OIL.—Fine Lagos remains exceedingly steady at £28 10s.

ESSENTIAL OILS.—Citronella dull, at ½d to 15-16ths d. per oz. on the spot. The Ceylon exports are again very large this season. Nutmeg oil, "Fisher's," is quoted at 7½d per oz.

QUININE.—Some slight improvement became apparent soon after the close of our last report, and sales of German bulk, including B & S at 1s 3½d to 1s 3¾d per oz for January-February and later delivery were reported. This business was followed during the present week by further transactions in B & S bulk, spot and February-April delivery at 1s 3½d, and Auerbach, April delivery at 1s 3¾d per oz., and Whiffen's, in second hand, at 1s 4d per oz. Today the German makers quote 1s 4d per oz., and do not seem anxious to book orders, but we think 1s 3¾d would still buy in second hand.

VANILLA.—The first shipments of new season's Mauritius beans were offered today, and sold with good competition at an advance of 1s 6d to 2s 6d per lb; for small chocolate, slightly crystallised 3 to 7½ inch 5s 9d to 13s; good fresh 7½ to 9, 11s to 18s 6d; ordinary brownish 5s to 9s; common dry 2s to 4s 6d.—*Cheapest and Dearest.*

BLACKMAN'S TEA WITHERER.

In Mr. Armstrong's paper on the *manufacture* of tea, read before the Maskeliya Planters' Association in August 1885, he there suggested the use of the Blackman's air propeller to draw up the hot air from the driers to the withering loft to aid in withering leaf in wet weather. Ceylon should not lose the credit of having made the suggestion first.—*Cor.*

MATALE COFFEE.

(From a Correspondent.)

Although "Matale" is a word of only six letters it comprises a very large district, and its weather is about as varied as its products. It is quite a mistake to suppose that a correspondent writing from the town of Matale, or Matale West, can give you a report of the weather experienced at this season of the year, as being that of Matale district. It is perhaps equally uncertain to report on the Matale coffee unless the correspondent has had the advantage of visiting or getting reports from the various divisions of the district.

With reference to the weather and its pranks, permit one illustration. Last week two visitors from Matale West were surprised to find we had been having so much rain; they left in the morning during a storm of wind and rain and had gone about two miles only, when they got out of it, and had fine weather for the rest of their journey, while the whole of that day was wet and windy here.

In support of the paragraph sent you the other day, in which mention was made that coffee seemed to be regaining strength, &c., allow me to add for the information of "Planter," that an old Matale planter who knows this portion of the district well, on seeing the coffee, remarked it was astonishing how well it was looking, full of spike, and only wanted dry weather to bring out and set the blossom. It may be and doubtless is too far gone to expect a revival of the old product, but it is surely not too much to expect to hear the rattle of the pulper as it removes the beans from the cherry gathered in the north end of Matale East.

CEYLON TEA AT THE EXHIBITIONS AND IN AMERICA.

(From a Planting Correspondent.)

I think you gave the home people a very proper rub up in your Thursday's article. It is too absurd of Messrs. Leake and Shand complaining of want of sympathy and information from this side. If there is one thing more than another which our Secretary prides himself on, it is prompt attention to matters requiring explanation &c. Mr. Shand is to blame for not giving details of the expenditure on the home side. We have a large expenditure on Brussels for which we get no return or precious little, and what is unexpended on our vote of R6,000 is required for Glasgow deficiency from which we were led to expect such a lot of benefit, and even profit. Then now Paris: "Look sharp," writes Mr. Shand, "or I'll treat with others for my corner of the Paris Exhibition." If the Ceylon Tea Fund Committee don't look sharp they will find themselves in for a big expenditure there. Now all this prevents our dealing with pushing our tea in America where they do drink tea. Let Dr. Duke's plan be tried in its entirety. Mr. McCombie Murray undertakes to do it exactly as Dr. Duke wants it done for \$1,200 including cost of pamphlets. The 6,000 lb. of tea would cost 2,000

Say \$3,200 or R8,000. I believe more would come of that than the French and Brussels Exhibitions, which will cost R10,000 at the very least.

If, however, we prefer Mr. McCombie Murray's elaborate plan of working New York and Philadelphia by interviews, pamphlets, &c., the cost will be \$1,000 Cost of 6,000 lb. tea and duty, for I see the freight is included 2,000

Total.. \$3,000

or, say, R7,500.

You say Ceylon cannot afford it. We have spent R25,000 quite in pushing tea in Great Britain. R10,000 would not be a large sum to push tea in America.

[We meant both schemes; most certainly Dr. Duke's proposal has a first claim, provided special attention is given by Mr. Murray to the Central and Western States.—Ed.]

PADDY CULTIVATION.

Your remarks upon the impolicy of continuing to treat paddy cultivation as if it afforded the most profitable, instead of its being one of the least remunerative, of any agricultural pursuit in Ceylon have been read with much appreciation. It is, of course, most difficult to change the customs of a people which have prevailed from time immemorial; but what you have written is likely, we believe, to awaken the Colonial Office to a sense of there being something more than weak in the representations by which it has hitherto been induced to acquiesce in the large expenditure annually incurred to foster the extension of what is, or ought to be, a stationery industry in Ceylon. Except in a few remote districts to which the cost of carriage of coast rice would make its consumption almost prohibitory, there exists no *raison d'être* for further endeavor to misdirect the energies of the natives of Ceylon. You lay much stress on the cultivation of the palmyra palm among the industries which you think might be usefully added to that of paddy growing. The chief difficulty as to the adoption of this cultivation seems to myself—who, for many years, resided among groves of such palms—to be the length of time required for them to come into profitable bearing. The man who plants them must do so for a succeeding generation.* The virtue of self-denial, of thought for those who have to come afterwards, was, it is to be feared, much more inculcated and practised in days gone by than it is likely to be now, when the growth of population and facilities for ready movement to other fields of settlement have broken up the old conservative attachment to locality of birth. But the palmyra palm is a tree of so many useful purposes that it would be a thousand pities if it were allowed to die out in Ceylon. Your Forest Department might, we think, usefully direct its attention to the planting of wide areas of these trees, and it is certain that the Government of a future day would reap vast benefits from the adoption of such a course, for it—the Government—"goes on for ever, ever," while family ties and associations daily grow less strong and less binding to the soil. "Let posterity take care of itself" is now the universal motto, and the tendency now is rather to obtain the price for the palms as timber rather than to preserve them or extend their growth for the benefit of successors.—*London Cor.*

NORTH BORNEO NEWS.

(From the *North Borneo Herald*, Jan. 1st.)

PLANTING.—The great feature of the year is the wonderful impetus given to tobacco planting in the Territory, and the consequent rush of applications in the Land Department. The whole of the available land in Marudu Bay has been taken

* Not at all: where well cultivated, 10 years should see a return; but we spoke of official encouragement.—Ed.

up by various companies while large acreages have been located on the Sugut, Labuk, Kinabatangan and Segama Rivers, as also in the vicinity of Lahad Dato in Darvel Bay. So far, with two exceptions the Tobacco industry is in the hands of Dutch planters attracted to this Colony by the excellence of its climate and soil and the extreme facilities for the acquisition of land, facilities unknown in the countries administered by the Netherlands India authorities. So far the planting industry is almost entirely confined to Tobacco, with the exception of Mr. Christian's Liberian Coffee Estate near Kudat; but we understand it is the intention of the East Borneo Company to experiment in pepper planting on their estates on the Kinabatangan River. Mr. Mitchelson well known as a pepper planter in Johore is managing for the Company up the Kinabatangan in conjunction with Mr. Schuit late of the Rotterdam Borneo Company in Marudu Bay. Splendid specimens of leaf are reported from Banguay, Ranow, Mr. Stephen's estate in Darvel Bay and other places. One of the largest Companies floated during the year is the London Borneo Company inaugurated in London by Count Geloos d'Elsloo which bids fair to be one of the most powerful planting Companies in the Territory.

TIMBER.—Messrs. E. E. Abrahamson and Company have formed their timber business into a company entitled the China-Borneo Company Limited. Mr. E. E. Abrahamson will be the resident Manager in Sandakan. The Company was formed in Hongkong with a powerful Directorate and the Shares were most rapidly taken up. An event during the year was the opening of the large Saw Mill and plant belonging to the British Borneo Trading and Planting Company, a full account of which was given in our July number. The Resident Manager is Mr. F. R. Boulbee, M.I.C.E. The Company possess one steam launch for towing purposes.

COAL.—Thanks to the energy of Mr. Henry Walker, the Commissioner of Lands, it seems probable we are about to develop a payable Coal seam within two miles of the town of Sandakan. Samples of this coal have been brought to town and compared with Muara Coal, the experts unanimously giving the Sandakan specimens the preference.

COMMUNICATION.—Facilities for communication with Singapore have increased wonderfully. Mr. Bogaart on behalf of Messrs. W. Mansfield and Company has contracted with the Company for a coastal service and a through steamer from Singapore via North Borneo ports to Hongkong and back. The large steamer "Memnon" is at present running the Hongkong route and the "Mercury" which is commanded by Captain C. Griffin is running the coast trade. The Hongkong direct route has already proved a great boon to the country and will greatly facilitate the supply of coolies for the tobacco estates. In addition to these steamers we still have the "Paknam," "Hong Ann," "Spaniel" and "Royalist" running while Messrs. Behn Meyer and Company have sent two steamers on occasional trips, the "Parana" and "Provincia."

IMMIGRATION.—The number of Immigrants arriving in the Colony was 4,930 against 1,756, during 1887. The number of Departures 1,703 against 1,098, in 1887.

SHIPPING.—The aggregate Tonnage inwards and outwards from Sandakan amounts to 85,398 tons, against 63,987 in 1887.

PROGRESS.—The following return of the Revenue and Expenditure and Trade of the Territory since 1883, with an Estimate for 1889 will we trust be considered satisfactory by our readers whom in conclusion we wish a Happy and Prosperous New Year;—

"pays the grower, his Agents, and himself handsomely (the grower of course least)." What is done, and has been done by him for over two years, could be done by others on a grander scale, for hundreds drink pure Assam daily in certain sections operated in, swear by it, and pay for it, and well too. In one city alone his three Agents and two grocers all sell "Assam," and make a good clear profit. Yet with this I am repeatedly told "Indian teas are so dear that people can't afford them." Whereas experience has taught that the poorer and most economical class are the very ones who do buy and appreciate "Assams" the most.—*Indian Planters' Gazette*, Jan. 8th.

THE PUSHING OF INDIAN TEA.

(By the "PERIPATETIC PLANTER.")

The "Associated Indian Tea Planters, Limited," held their meeting, at which they were introduced to Mr. McGregor of New York; and it was, I understand, decided to draw up an Agreement with that gentleman for the "representation" of Indian teas in America. So there are more preliminaries yet, it appears, to be gone through before this vast mountain brings forth its mouse. Meanwhile, big rats are breeding galore, over there, to eat up this mouse's portion, ere it arrives.

The arrangements already referred to for placing Indian teas at the Paris Exhibition, have been completed, and the £2,000 have been subscribed. Mr. Walker, the Agent in charge, will start a depot in Paris simultaneously, for the sale of Indian tea over there. The I. T. D. A., or subscribers to the guarantee fund, had it proposed to them that Indian coffee should also be represented at their stalls, &c.; to this, however, the more conservative members objected, and the proposal was not accepted. The subscribers have reserved a right to take over the Paris depot at a valuation hereafter, if they so please; it is not however, thought likely that they will exert this power, but that they will be only too pleased if they receive back their £2,000 intact.—*Indian Planters' Gazette*, Jan. 8th.

COFFEE, TOBACCO AND PEPPER IN CEYLON.

Renewed interest in COFFEE and COFFEE PLANTING is becoming a sign of the times. Our neighbours in Southern India show us a good example, for with the wonderfully steady crops from the Mysore and Coorg coffee plantations *under shade*, they feel strong encouragement in other districts to go on with old king coffee. From Wynaad even, we have reports of grand appearances "in spike"; while we have also inquiries directed to us by gentlemen who are anxious over the way to try their luck again with "Liberian coffee." Our answer to the planter who has asked our opinion in respect of this disappointing variety will be found in another column and is very much the same as *Punch's* advice to those about to marry,—"*Don't.*"

There is more to be said for the cultivation of Arabian coffee under shade wherever a soil and climate similar to that of Mysore can be secured. Uva is the district affording these most nearly in Ceylon and in view of the Haputale railway extension now under construction, we are very hopeful of seeing experiments in gardens, and clearings say up to 100 acres, attempted in the forest and chena reserves of that province.

Meantime as regards our remaining coffee fields in Uva, Udapussellawa, and parts of Dimbula and Dikoya, there is still great hope that "green bug" may disappear leaving the coffee to do some good yet under careful treatment. From some parts of Uva, we are bound to say that the opinions supplied to us by planters are of a very gloomy, desponding character; but these are counterbalanced by those of other planters who declare that bug has nearly disappeared from their fields and that

it looks as if Dr. Trimen's hope of a sudden collapse of this pest would be fulfilled. There is no doubt that everyone owning decent fields of coffee will endeavour to do them justice in view of this prospect, as also of the full assurance of very fine prices for their berries. There is no chance now of coffee being in excess supply, whatever may be said of tea.

The cultivation of TOBACCO, too, is likely to be undertaken energetically, under the auspices of a local Limited Company, mainly supported by planters of tried sagacity and prudence. A capital of £500,000 has been already subscribed, it is understood, and with Messrs. Rutherford, Christie, Armstrong and other gentlemen of their stamp on the directorate, successful results are generally looked for.

Still more widespread is the interest taken in PEPPER cultivation, since we have agitated for its revival among the natives and for its more general adoption by European colonists. We are very anxious to see Ceylon export a large and annually increasing quantity of pepper, for which there is certain to be a good market and we have reason to believe that the coming south-west monsoon will see an appreciable area planted with pepper vine cuttings in different districts. There is one great advantage in planting pepper, namely, that it is not likely to be overdone—considering that the demand is in excess of supply—which can hardly be said of tea.

HOW WATER WAS OBTAINED IN "THIRST-LAND."

At the meeting of the Geographical Society, a paper was read by Mr. F. S. Arnot, entitled "Journey from Natal to Bihe and Benguela, and thence across the central plateau of Africa to the sources of the Zambesi and Congo." The reader of the paper was led to make his expedition, which was that of a missionary character, from witnessing as a child a distribution of prizes in 1864 by Dr. Livingstone on his return from the Zambesi exploration. Mr. Arnot started from Natal in 1881, and made for the Transvaal with very slender resources. This, it appears, was not an unmixed evil, as he owed escape to that fact from some of the troubles that befall travellers furnished with a large stock of goods. This method of proceeding, however, was accompanied by many inconveniences. The travellers had to traverse the "thirst land" on Livingstone's route, and the only means of obtaining water was that adopted by the wandering bushmen of the Masaroa race. How Mr. Arnot obtained water may best be described in his own words: "A few wandering bushmen of the Masaroa race, however, came to our relief, and to their kindness we doubtless owed our lives. Digging pits in the sand, they sank long reeds to the bottom of these, and with an unusual power of suction, acquired by long practice, they slowly drew up the water from the sand, discharging it from their mouths into tortoise shells, and so great was our thirst that we eagerly drank the frothy liquid. Morning and evening we were sustained by a little of this turbid fluid." Mr. Arnot's oblique journey across Africa corresponded on the whole with that of Major Serpa Pinto. Mr. Arnot's object in going to Africa was to establish a healthy missionary station in the interior, and it was accomplished after seven years. Although he travelled without a white, or even a black companion, he never received any ill-treatment. Guns were carried by some of the party, but only for hunting purposes.

ANNUAL TEA REPORT FOR 1888.

LONDON, Jan. 23rd, 1889.

In reviewing the course of the Tea Trade for the past year, the most satisfactory feature to notice is the increased Delivery compared with 1887, the total quantity amounting to 222 million lb.: Home Consumption showing an excess of 3½ millions, and the Export 3 millions. Another matter of considerable importance is the larger supply of Ceylon Teas, and the appreciation of the quality by the public, the Import and Consumption having nearly doubled during the year.

CHINA.—Notwithstanding 24 millions decrease in the Export last season, all common to fair grades continued to decline in value, and, before the arrival of the new crop by the end of June, had reached an extremely low point. The new Teas opened at very full rates, owing to the absence of any good Tea of the previous season remaining on the Market. The quality was pronounced inferior, attributable, perhaps, to the bad weather during the time of plucking. The Russian buyers in China held aloof from purchasing on account of this inferiority, which eventually led to large orders coming direct here, and further stimulating prices of Black Leaf Congous, the market becoming almost cleared of all desirable parcels of medium to finest grades. Foochow descriptions did not participate, and although a small portion of the first crop sold at paying rates to Importers, the general result has been unsatisfactory. Common classes have somewhat rallied from the lowest point, but still are selling under cost of production.

INDIAN AND CEYLON.—The year has been again marked by a further growth in supply and expansion of consumption, the Import of Indian being 7 millions larger, and the deliveries 3½ millions heavier than in 1887, while from Ceylon the receipts have increased 9½ millions and the deliveries 8 millions, British-grown tea thus furnishing 105 millions towards the 184 millions taken for home consumption in the United Kingdom. An active market in the Spring was followed by dulness in the middle months and a heavy depreciation in the value of all grades over 1s. per lb., which lasted until the Autumn trade demand set in, when values for the finest sorts began to recover, the advance being stimulated by the small proportion of choice tea found in any of the various crops. Setting the abundant yield and reduced cost of manufacture against dearer freights, higher warehouse rates, and a steadily lower average sale price,—the Industry continues to occupy a strong position, and promises to yield a good result to growers both in India and Ceylon. Systematic action is now being taken on behalf of producers to bring the merits of British-grown tea more directly under the notice of the important markets of the United States and Canada; and it is anticipated that, as in the Australian Colonies, where consumption is steadily growing, so also in America the improved demand now visible may develop into trade of some dimensions.

JAVA.—Imports show an increase, and improved quality has led to their receiving more attention from the Home Trade, values now standing close to currencies for Indian. Wm. Jas. & H. THOMPSON.

TEA IN AMERICA.

At a time when India and Ceylon are making efforts to secure a slice at any rate of the tea trade of the United States, it is interesting to learn a few particulars of that trade. The total receipts of tea into the United States for the season 1887 amounted in value to 16,771,802 dols., of which 12,368,063 dols., or 68,462,268 lb. passed through the port of New York, or three-fourths of the whole. Of this 292,786 lb., valued at 75,638 dol., out of a total of 497,169 lbs., or nearly three-fourths of the total of exports, was from New York. The receipts from Japan were 16,493,000 lb., and three-fourths of the year's supply came on the Pacific coast, which was an increase over the previous year. The course of trade is increasing in this direction, while the improved

steamer service on the Pacific and transcontinental railway facilities are gradually making this the probable route of the future. Japan tea is, in round numbers, about one-half of the United States tea consumption which has risen from 37,843,612 lb. in 1868 to 89,831,221 in 1887,* being the lowest and highest years of the twenty. The Japan houses have all agents in New York, and these seek out the leading customers in the large cities, and consign to them direct instead of them buying in New York. In this way the direct trade between New York and Japan, especially by sea, is being largely reduced in volume. Of the total Japan trade, which amounted in the above year to 17,114,181 dols. imports, and 3,338,562 dols. exports, only 4,464,315 dols. imports and 1,458,455 dols. exports were entered via New York, being only one-fourth of the whole.

There is an article in the current number of the *gentleman* on the "Russian Tea Trade." It is signed "T. Brush," and deals with the subject at some length. In it the writer says:—Although Russia is a long way behind England as a tea-consuming country, still the tea trade is a most important branch of its commerce, and has a history fully as interesting as that of England. There is a great difference between the two countries in the style of tea used and in the method of its use. Indian and Ceylon teas have quite revolutionised the English market, but the character of the Russian tea market has remained almost the same since the commencement of its history. Some few parcels of Indian tea have found their way into Russia, and have been very highly spoken of. Their quality and strength have been so much appreciated that the semi-official *Kavkaz* says:—"What hinders us even now obtaining our tea from India, where it is prepared by machinery, and not as in China, by an objectionable use of the feet? Even if we were to conquer India, nobody would give us tea for nothing, and our countrymen would have to pay all the same for this national beverage." At the present time, however, China tea is alone used in general consumption; and as the taste of the Russian nation has been educated to this style of tea, it will be many years, perhaps never before Indians and Ceylons become important factors in the Russian trade.—*H. & C. Mail*, Jan. 11th.

OUR MANCHURIAN SILKWORMS.

(Continued from page 411.)

THE OAK-SILK INDUSTRY.—It used to be a traveller's tale that silk grew on trees, and the ancients pictured it to themselves as one of the pretty sights of nature. In reality there is not much to see in an oak shrub laden with cocoons. The genius of the spinner is occupied in great measure with the art of concealment. Sometimes a cocoon will be enclosed between two leaves as large as one's hands, so that a passer-by has no suspicion of its existence. At other times quite a ball is made of smaller leaves, and the cocoon is equally invisible. The spinner, of course, needs a base of operations, and can spin if it gets one or two convenient tags by which to form an outline in rough; but it glories in abundance and variety. It becomes an interesting study to compare a few bushes, and to see the power of adaptation to circumstances in the formation of the cocoons. Difficulties arise alike from dearth as from excess of material for extraneous support. On one occasion I saw no less than three twigs bound together by the suspending lines, while quite a group of leaves had to be dexterously manipulated so as not to obstruct the work of the spinner; nay, it was gratifying to notice the touches of instinct, one might say genius, by which hindrances were worked into helps. On another occasion, the cocoon of arrival was in the way, and had to be slewed about with silk ropes to see that it maintained its relative position. The suspending lines are the first consideration, as dealing here

* Britain with little more than one-half the population consumes more than twice the quantity, but then the great beverage in the United States is coffee.—Ed.

with harder material there is no occasion for the long lines of the Ailanthus worm. Yet our spinner is not content to begin with the base of the leaf pedicle. The lines being at least one rung of leaves above the point of suspension, and thus cover the twig over a space of one or two inches, being very slender to being with but thickening towards the lower leaf pedicle, and then presenting the appearance of a stout cord from the leaf pedicle to the cocoon. The next work is with the leaf wrappings, and the formation of a nest as it were for the cocoon. The worm then gets into position and begins the cocoon proper. To follow it into its invisible world, we know that after the cocoon is formed there begins a period of lively commotion, in which the occupant is undergoing another change,—is, we might say, forming the shell in which it lies in its chrysalis state. So vigorous is this movement, especially when the cocoon is held in the warm hand, that an inexperienced native told me one day that one of the specimens put in his care had a most lively moth in it which was battling to get through; he argued it must be the wings which flapped so against the sides of the cocoon. The fact is this period of commotion must be past before the moth is formed. It takes from fifteen to twenty days to perfect the change from spinner to moth, though in exceptional circumstances the moth might appear in ten or twelve days. Being in want of specimens this year, I have tested the question whether moths can be got straight-way from the autumn cocoons, regardless of the fact that they ought not to appear till spring. It may be safely said they are not to be got *ad libitum*. In the spring, but more particularly in the midsummer season, everything seems to come right to a day—the moths are panting to be out, there is no restraining them. Of the autumn cocoons it can only be said if you don't keep them in a cool place some of the moths may appear when you don't want them; and, if you nurse the cocoons carefully on a warm *K'ang*, you may be lucky enough to get a few specimens of moths if you desire to force an appearance. There seems to be no certainty in regard to autumn moths, save that they prefer to remain in their cocoons. But there are "early birds" strong specimens, which are easily tempted forth, and I have up to date obtained seven such, and have the hopes of more, though it would seem as if the difficulty increased as October advances. To my mind, if it once pass the twenty days, it will want a tropical heat or the first blush of spring to call them to activity. The proper terms for the appearance of moths are March and August. About the 20th of March, pains are taken to hasten the ecoloration. A warm *K'ang* and a sunny exposure, or even a charcoal burner in cold seasons, are the only means resorted to. When the moths are too early, or the season exceptionally late, care must be taken with the eggs to see they are kept in a cool place. When immediate hatching is desirable the usual period is from ten to twelve days. The autumn moths should appear with the beginning of the summer heat. Alike in spring and autumn early comers are prized. Generally there is a great rush of first comers, and then a dropping fire which may last for fifteen or twenty days. But in summer, more particularly, these late comers are not wanted, anything after ten days from the first comer is doubtful, and in good husbandry would be thrown away. In some places there is a careful inspection of moths with a view to a healthy stock. Thus a long soft body, or belly, which "wiggle-waggles" is bad—wanted a firm round body, or, as the Chinaman says, belly. Again, where the excretion is bad the moth is rejected. The fluid should be of a dull whitish colour, but a high or a mixed colour is a sure indication of disease. Another sign of evil omen is when the fundament shows black. It is supposed there is an immediate connection between this and the disease which I translated "diarrhoea" in last paper. Perhaps a description of some of the moths I have seen may be of use for purposes of comparison. Not to describe from memory I limit myself to a few of the autumn moths above

referred to, and which are before me in their original freshness while I write. One, a large, perfect specimen, a female, said to be the common variety as seen in our parts, appeared without any prompting on the 5th October. The antennae are yellow, half an inch in length, and very slender. The head is yellow with black-brown eyes which show very large, the head itself having a triangular look like some of the ancient visors one has seen figured in tournament times. The body is very hairy, especially on the space between the wings. The colour is a dark orange shading into redness under the belly. The greenish rings of the body sometimes shine through. The length of the body is one and a half inches when quite fresh, the girth at thickest being the same as the length; the span of the wings is five inches. The ground colour of the wings has a dash more of red in it than the body. Red appears also in three distinct groups of characteristic marks, viz., (1) over the *Attacus* eyes; (2) in certain veinings or bars across the wings; (3) and in a certain wash of colour all over the upper parts of the wings. A transverse bar divides the wings into two unequal parts, the space above the bar being the larger or over two-thirds of the whole. This red, then, scarcely appears in the lower space at all, which is characterised by a uniform colour difficult to describe. It is yellow, but it has that singular suspicion of green shining through it which seems to give such a peculiar shade to the brown of the Ailanthus worm. If the reddish tint appears in this lower border at all it is only in certain lights, and even then in the upper wing segment only. Looking at the upper and under surface of the wings the ground colour all through would seem to be this shade of yellow, which yet cannot be called yellow unless one be allowed to say it has a dash of green, or, as a friend suggests, *olive*, shining through it. The *Attacus* eyes are more distinctly marked in the lower wing segments than in the upper. The oval begins above by a broad red curve which is about one-fourth of the whole circle, and which is continued in a fine black line for the remaining three-fourths. On the right hand side, however, the black line always begins heavy. Inside of the red the second circle begins above with white, the under segment being continued in bright yellow—this being a very fine line. Inside of this again is a broader band of slightly reddish hue, very light as compared with the outer red segment, which is continued in a band slightly narrow of the same colour as the wing border. Inside of this last of all is a lively crescent of golden yellow framing the lower half of the transparency. In the upper wing segments the arrangement and the colours are the same, only the outer one-third segment of red is very fine, as the black line which continues it. The transverse bar which divides the wing as above described, and the sinewy nerve of the upper wings show the same colours, which perhaps are fairly described as darker and lighter shades of lavender. The wing nerve is as if a very light shade of lavender were powdered over a dark lavender ground. The transverse bar across the wings consists of an upper line of dark lavender bordered by a line of light lavender shading into white. The most strongly marked red lines are on the upper wing segments, going from the body in a zig-zag to the upper nerve of wing; and in a less distinct but much broader band which goes from the body right across both wing segments in a line with the upper half of the *Attacus* eyes. These are even more clearly marked on the under surface of the wing, showing there as wavy lines, the upper and narrower one retaining its dark shade of red, and the lower one toning down to a dark orange. The lavender of transverse bar shines clearly through on this side in the shape of small lavender patches, eight to each wing segment. Unfortunately, I have no male with which to compare this specimen. It may be accepted as a fact that the male moth always differs from the female in the colour of the transverse bar on the wings. If I am correct in describing the colour in this instance as lavender, the colour in the male would show rather some shade of red going into crimson. Mr. Fauvel speaks of rose or roseate for the *Shantung* variety. But rose can-

not possibly describe the shade as we have it here. From what I have seen, the shade of colour on the upper, *i.e.*, the darker, line of transverse bar, in the case of males, will always follow the dark crimson shade, which after all is perhaps the proper term for the colour of the outer curve over the Attacus eyes. This specimen is one of four females, which may be said to be for all practicable purposes absolutely alike. If there was any distinction it arose in one specimen, from the appearance of the so-called red colours invading and shining through the lower border of the wing, *i.e.*, under the transverse bar, and this in both wing segments, though to a less degree in the under one. Another set of moths, brought out in the same way towards the end of September and beginning of October, seemed to present some strikingly different features, and I was in hopes I had secured the moth of the yellow worm referred to in the preceding paper. From a similar promiscuous set of cocoons gathered last year over the same district I obtained three distinct varieties, two of which have been pronounced to be new species. One of them was a yellow moth, but I did not keep duplicates, and have no detailed description. The moths I have now to describe are not distinguished from the above red-tinted ones by the natives. The worm, as far as they know, is the ordinary green worm. Nor does the cocoon at all resemble the large and beautifully formed cocoons spun by the golden yellow worms, which also refuse to give up their moths, though they have been nursed and coaxed to the utmost. All that can be said is that these moths look yellow as compared with the four above described. The red veinings and red wash, so to say, are all the same as in the above. So is the transverse bar on the wings, so is the general appearance of the under surface of the wings. But the first look of the moth always makes one describe it as yellow. The body is quite yellow, and free from any suspicion of darker shading. The general ground colour of the wings is paler, and, save for one patch in each upper wing, is altogether free from that dash of red I have spoken of in the others, but which reminds some of "rust," of "copper," of "terra-cotta"—all of which terms I have heard used and dissented from, terra-cotta being especially objected to as not dark enough. Of this sort I have two males and a female. In the female the transverse bar on the wings seems indisputably lavender, and differs widely from that of the males, which show that contested colour springing from red as its base, which forms the upper curve over the Attacus eyes, and which, after all, is a rich shade of crimson. Weather experts will consider these as separate varieties remains to be seen. It is noteworthy that two sets of Walnut Moths seem to be distinguished in the same way as these, the one being the fac-simile of the other, save for this singular wash of red—which in the Walnut Moth may be accurately described as "rust," just as one sees it in very old rusty iron.—JOHN MACINTYRE. Hai-ch'eng, 11th October, 1888.—*Chinese Times*.

NEW PRODUCTS IN FIJI.

Here is something encouraging as well to large and small planters as to the Colony generally, and should at once set at rest any doubt which may exist as to markets being found for the fibrous material in which Fiji is so rich. By a late mail, the Governor has been apprised by the head of a wealthy firm whom his Excellency met in England, but the head quarters of whose business are in Victoria, asking whether the Colony could furnish from ten to per annum of paper-making material. We understand that the Governor proposes to take special measures for bringing this important question before the Chambers of Commerce and the Agricultural Association. Now is the time of all others when Suva should best itself and demonstrate that it has some commercial

men in its midst. The Chamber should be resuscitated. Plenty work can be found for those of its members who aspire to rank above the grade of mere huckstering dealers. People should show that they can rise to the level of the position; and that, opportunity offering, they are equal to the demand legitimately made upon them to assist in the advancement of the Colony to which they owe their own progress and elevation.

We are informed that the Governor hopes to have by the end of the year about eight hundred young cocoa plants ready for distribution to such persons as may desire to begin the cultivation of this product, and who possess suitable soil and situation for that purpose. The varieties are the purest strains from Trinidad, selected by Mr. Prestoe, director of the Botanic Gardens there, by request of Lord Kimberley when Secretary of State for the Colonies. They comprise "Oundamar," "Verdilio," "Mixed Forestero," "Longpointed Forestero," "Fine grooved Prolific Yellow," "Sangre Toro" and "Forestero." A considerable quantity of "Hevea" or Para rubber can also be availed of. In addition to the above, an excellent crop of the celebrated and valuable Dolly (Sumatra) Tobacco seed has just been gathered, and his Excellency will be glad to send some to those who may desire to utilize it. Great attention is being given to this variety in Ceylon and elsewhere. All applications for these should be made to the Secretary of the Agricultural and Industrial Association. The cocoa plants will be securely planted in boxes for which applicants will have to pay five shillings each. It will be interesting to learn the number of practical men who will avail themselves of these means of adding to the value of the industries of the Colony.—*Fiji Times*.

CULTIVATION OF SESAMUM AND GROUND-NUTS IN CHINA.

Sesamum is best grown on high dry ground, and is most in danger from excess of moisture; it does not require watering, and dew alone is sufficient moisture to nourish it. In making beds, therefore, the centres should be higher than the sides, so as to allow the water to run off. In the first month of every year it is sown broadcast, not in lines, and whether thickly or sparsely is immaterial. In about ten days it puts forth shoots, in two months and a half it blooms, and in another two months and a half it is fit for harvesting. At harvest time the latest seeds are not yet ripe, but the harvest cannot wait, or the other pods would fall off, and the seeds drop out on the ground. The plants, root and all, are carefully taken out of the ground, put on a cement floor, and threshed with a flail. There are two kinds, black and white. Sesamum does not require manure generally, but in the worst soil ashes and ox manure may be used. About 27 ounces sown to an acre yield about 550 lb.

Ground-nuts are best grown in a soil of coarse sand and mud. They should be set deep, and the ground pressed down firmly over them. The ground is ploughed about April, and trenches dug about 10 inches apart, into which ashes, lime, and rubbish are thrown. The seeds are sown 10 inches apart, and as each is put in the sides of the trench are turned over it with the foot stamped down firm. Every ten days or so the ground is weeded, and in about two months the sprouts are sufficiently long, and are sprinkled with liquid manure. In four months they come into flower: the flower-stalk then bends over, and as the flower falls off, the flower-stalk buries itself in the ground, and produces seeds, ground nuts, which become ripe about the Shuang-chiang festival (October 23). When the harvest, however, takes place after this date more oil can be got, and a better price obtained for it. Ground nuts are harvested by ploughing them up with an ox-plough, when the stalks and seeds clinging to the plough are gathered into a heap. For the remainder which are still left in the ground two men sift the earth with a large bamboo

sieve. The pods are dried perfectly dry in the sun, until the thin skin which covers the seed can be broken by rubbing, when they can be stored. If they are not quite dry they shoot again, and are useless. Oil is pressed from ground-nuts; and the refuse made into ground-nut cakes; 40 lb. sown to an acre yield about 666 lb.—*Consular Report.*

THE BRITISH AGRICULTURAL RETURNS FOR 1885.

NURSERIES, WOODS, PLANTATIONS, &c.—In the "Editorial Summary" it is stated under this head that in land used by nurserymen for the growth of trees, shrubs, &c., the returns show a slight decrease from the acreage of 1887. The land used by nurserymen in England amounts to 10,496 acres compared with 10,669 in 1887; Wales foots up 292 against 277 acres; and Scotland, 1,477 acres against 1,532 last year. Possibly that decrease is only temporary, owing to the rapid development of our larger cities and towns, and the rooting up of old concerns. Next year's figures will very likely tell a different tale. Of the average of woods and plantations a special return has been obtained for this year. The last return was made in 1880, in which certain corrections, due to subsequent inquiries, were made and inserted in the returns published in 1881. Since that date the acreage appears to have increased in Great Britain from 2,458,300 acres to 2,560,700 acres, or nearly 4·2 per cent. In many of the northern counties and in Scotland large additions are recorded. The increase in England has been nearly 52,300 acres; in Wales, 4,300 acres; and in Scotland 45,400. The total increase in Great Britain has been about 102,400 acres.

SMALL FRUIT CULTURE.—Under this heading we note that the extent of land returned as under the culture of small fruit, such as Gooseberries, Currants, Strawberries, &c., whether in orchards or in market gardens, amounts this year to 36,700 acres. In many countries the collecting officers report that the practice among farmers of appropriating land to the growth both of fruit and vegetables has further extended in order to meet the demand for them; and though the additional quantities of land may, as regards individual occupiers, be relatively small, in the aggregate they become considerable. It is stated in a report from the county of Norfolk that from only one small station on the Eastern and Midland Railway nearly 100 tons of fruit are sent weekly to Manchester and other towns in the North of England at certain periods of the year; and this is cited as a single illustration only of what is being done throughout that county.

ORCHARDS, MARKET GARDENS, &c.—A decrease is recorded this year of 3,056 acres in the area of orchards in Great Britain, it being now 199,178 acres; but the smaller extent shown must be considered in connection with the newly ascertained acreage of small fruit, the apparent deficiency having doubtless arisen from part of the land which should last year have been returned as growing small fruit having then in some cases been placed in the orchard column of the schedule sent out to occupiers, &c. The acreage now returned may, it is confidently believed, be taken to represent more accurately than in any preceding year, the actual area so covered; the land under grass, or upon which small fruit is grown, or which is left fallow in orchard, as may happen to be the case, being included under these several heads in the returns.—*Gardeners' Chronicle.*

TOBACCO CULTURE: DELI AND NORTH BORNEO,

(Exchanges to 17th November.)

The rising fortunes of British North Borneo, and the rapid advance of tobacco cultivation there, have naturally aroused keen interest in Deli, hitherto so pre-eminent in the supply of that article. The *Deli Courant* has taken up the matter, and has sought to gain information at the fountain from a gentleman

who knows both countries well, and can speak dispassionately and authoritatively on the merits of the question. He spent several months in British North Borneo, and noted down his observation in a journal. The following extracts will give the gist of his experiences.

THE COUNTRY.

The territory of the B. N. B. Company takes in the north-east portion of Borneo with a coast line from Brunei Bay on the north to Santa Lucia or Sibuko Bay on the east. Its area is estimated at 31,000 square miles, but the boundaries have nowhere been accurately marked out. The Dutch Government lays claim to the S. E. portion of the dominion in the hands of the Company, and so far has made it good for the time being. The whole territory resembles a peninsula. It takes in the north-eastern mountain chain of Borneo with its branches and spurs, and the alluvial land lying between. The huge mountain mass of Kina Balu rises in the midst, visible to a long distance at sea. These mountains, viewed from the coast, present, for the most part, a gloomy appearance, slender trees with few leaves rise up from the steep, red, sandy hills.

THE HILLS.

Many hill tops are covered with lalang grass others with scrubby bush, some being quite bare. Three to four ridges of hills stretch out to the north of Kina Balu. The alluvial plains are very few in number. Great trouble was met with in finding ground for half a dozen more or less promising estates in Maruda Bay. Many small rivers fall into the sea in this portion of the coast after a short course. They generally run north, and are almost unknown, but it is believed they run through very narrow valleys liable to heavy floods from the high mountains close by. The mouths of these rivers present difficulties to navigation for the greater part of the year.

THE EAST TERRITORY.

The easterly portion of the Company's territory is flatter. Four ridges of hills separate the valleys of the five principal rivers of the north, namely, the Paitan, Sugut, Labuk, Kinabatangan, and Segameh. All these rivers run east. The Paitan and Labuk fall into days bearing the same name. Further south is Sandakan Bay. South of the Segameh river, one comes upon Darvel Bay. The rest of the east coast down to Sibuko river is almost unknown. The Company refuses to grant land in Santa Lucia Bay on the ground of the boundary difficulties with the Dutch Government.

THE TEACHINGS OF EXPERIENCE.

Experience gained in a whole range of estates has shown that the land on the Paitan river is too sandy and too liable to overflow for profitable cultivation. The land on the Sugut river is mostly of white clay mixed with white sand, a kind of soil which had yielded good results at Maruda Bay. The Sugut tobacco companies have thus a bright prospect before them. The Labuk soil seems to be good, judging from the specimens available.

SANDAKAN BAY.

A large portion of the country around Sandakan Bay consists of steep sandstone hills unsuitable for any kind of cultivation. The few alluvial flats are only a few thousands of acres in extent, and have mostly fallen into the hands of planters, timber dealers, or land speculators. The Kinabatangan soil mainly consists of soft white clay with a covering of humus. The same observation applies to the Segamah soil. Of two estates on Darvel Bay, one is said to be a total failure. It is asserted that the yield, though of good quality, amounted to only 100 piculs from upwards of 50 fields. The other estate, Lahat Datu by name, presented a promising appearance in September last.

THE RAINFALL.

Very little is known about the rainfall and its distribution in B. N. Borneo, owing to the observations not extending over a sufficient number of years to admit of correct generalisation. The usual monsoon theories there did not hold good this year.—*Straits Times.*

Mr. JAMES LABOUCHERE, the chairman of the Tambracherry Estates Company, Limited, says bark has been a great disappointment this year, and it is now selling at a price which no one contemplated. There is no certain indication of improvement in the next few months, but at present the price pays no one to plant or grow. The quinine value of the cinchona sent home is gradually increasing; the price of coffee is "a great disappointment"; and "mining," the original purpose of the company, there is no prospect of renewing."—*Times of India*.

NEW USES FOR MEXICAN FIBRE.—It is stated in the October number of the *Brushmaker*, that Mexican fibre, or Ixtle, (*Agave heteracantha*), which has of late been so largely used for scrubbing and nail-brushes, has, for many years pasts, been also used in the manufacture of corsets, principally in Norfolk, Suffolk, and Essex, especially in the very large factory at Havorhill in Essex. It is also said to be woven into cloth suitable for window-blinds, screens, &c., and in hot climates, when it is used to keep the doors and windows open at night, these blinds would be very useful. Quite recently the fibre has found favour in unexpected quarters, as it is now being very largely used in the manufacture of artificial flowers. Notwithstanding these uses, and others which may yet be found for it, the great demand for it is still for brushmaking—a demand that is increasing both in this country and in every part of Europe.—*Gardeners' Chronicle*.

THE PRODUCE OF CORK IN SPAIN.—The Cork trade in Spain seems to be in a flourishing state. The exportation to other parts of the Continent, as well as to England and America, was greater last year than it has been for several years past. It is stated that there has been the greatest demand for the superior kinds of corks, such as those for champagne bottles. Gerona is the most important centre in Spain for the production of cork, hundred of cork manufactories being scattered over the province. In the town of Palamos alone there are forty, and the exportation thence is considerable. From St Fehn de Guixols (Gerona), it is reported that the Cork trees have been suffering from the attacks of a pest which threatened to destroy them. A voracious caterpillar or worm has, it is reported, been attacking the Cork forests in millions during the past year or two. In a very short space of time it stripped the trees of all their leaves from the tips of the branches to the trunks. These worms are now in their turn said to be attacked and devoured "by another insect, a species of beetle of a dark green colour, and armed with a horn, with which it cuts the worms up. Another insect, in the form of a crab (*Changas*), pursues the worms, and destroys them, and thirdly, when the caterpillar has passed through its metamorphosis, and the butterflies have deposited their eggs, another insect, until now unknown, attacks and pierces the bags containing the new genus, and destroys them; all of which will contribute, no doubt, to the complete extinction of these destructive caterpillars."—*Gardeners' Chronicle*.

SEEDLINGS OF SUGAR CANE.—The Sugar-cane has been cultivated for so long a period that its native country is unknown. Bentham states that "we have no authentic record of any really wild station for the common Sugar-cane." Further, according to the *Kew Botanical Magazine* for December, the Sugar-cane so rarely produces mature seeds that no one appears to have ever seen them. In botanical works the subject is often mentioned, but apparently only to restate the fact that observers in all countries "have never seen the seed of the Sugar-cane." The authorities at Kew have been working at this subject for several years. It was felt that if a Sugar-cane producing ripe seeds could be found, a most interesting and important line of inquiry would be opened for improving the saccharine qualities of the Sugar-cane in the same way as that so successfully adopted with regard to the Beet. Hitherto the Sugar-cane has

been produced under cultivation solely by means of buds and suckers. The improvement of the cane has therefore been restricted to chance variations occurring at wide intervals, and probably escaping altogether the observation of the planter. Now all this is likely to be changed. It appears that at Barbados seedlings of Sugar-canes have been successfully raised by Professor Harrison, and among these seedlings are several different kinds indicating hybridity of a definite sort, such as would be expected to arise from the crossing of different varieties. It is to be hoped this subject will be fully and clearly followed up as a definite field of investigation. In any case the possibility of improving so important and valuable a plant as the Sugar-cane possess general interest.—*Gardeners' Chronicle*.

WYNAAD NOTES.—The New Year cannot be said to have opened particularly brightly for those whose interests are connected with Coffee or Cinchona. On all sides the cry of "short crops" reaches us. The estimates have in almost every case been far above the results, although those estimates were pretty generally much below our usual average; seven or eight tons perhaps off places which might fairly give twenty or thirty. But, as far as I can gather, we, in Wynaad, are really not worse off, if so badly, as some of our Planting brethren. Failure of crop is the rumour from the Hills, the Duchterlonny Valley, and from Coorg, and, as if this disappointment were insufficient to damp our courage, "leaf" is breaking out with disastrous vigor in almost every district. Our sole small spark of comfort rests on the present apparently steady tone of the coffee market, and the undoubtedly healthy appearance of the estates wherever the leaf disease has not cropped up. There is a really splendid show of wood, and the spike, as far as we can at present judge, promises to be good; of course, it all depends upon the blossoming showers, and we have a most anxious heart-sickening time before us until our fate is decided. The low market for bark makes it hardly worth the harvesting, but, in spite of this discouragement, great quantities have been shipped from Wynaad this year,—a somewhat painful expedient with which to make up deficiency of coffee crop. Our next most severe trial has been a terrible epidemic amongst our cattle, which has fairly resisted our most strenuous efforts to treat it. It is difficult to say what the disease actually is. But it seems to be a sort of complication of ills. It quite puzzled the Government Cattle Doctor, who took great interest in the matter, and even our own remedy, usually so effective, *i.e.*, liquid from the boiled-down meat of diseased animals, was quite useless. The symptoms were those of rinderpest, and also of pleura pneumonia, but the action of the disease was extraordinarily rapid. Animals, grazing comfortably in the morning, were dead before night, whilst those apparently well when penned at night would be found lying dead in the morning. It is supposed that the infection has been introduced from Mysore, principally by sheep. But it is, no doubt, mainly due to the utter carelessness of our cattle men, who for the smallest bribe will allow strange cattle to feed on the pasture with the herds in their own charge. The losses, in consequence, have been very severe, and we now hear of cases in which bullocks coming up for crop have been seized, and died on the road. Our coolies are being paid off on all sides much earlier than usual, as the crops are pretty nearly all finished, and strict economy is the order of the day. I am delighted to hear that sundry coffee thieves have been captured red handed; if they have been convicted is quite another affair. Probably not, the tender-heartedness of officials over these children of nature with a yearning for coffee berries, is quite phenomenal, and a never-ceasing riddle to those from whom the coffee has been stolen. Possibly there are two sides to the question, and we, on account of our private sufferings, are prone to see forcibly but one of them. Any way it's a sort of comfort to know that the police on these occasions have not lacked in energy.—*Malaya Post*, Jan. 21st.

THE BRITISH TEA TRADE OF 1888 AND THE OUTLOOK FOR THE FUTURE.

We call attention to the Annual Report on the Tea Market of Messrs. Stenning, Inskipp & Co., which will be found on our back page. From this and other sources we gather that last year the imports of China tea into Britain were 105½ millions of lb. against 116½ in 1887, a decrease of 11 millions. The import of Indian was 92 millions against 85 millions, an increase of 7 millions. Ceylon tea was imported to the extent of 20½ millions against 11½, an increase of no less than 9½ millions. Java, Japan, &c., showed 4 millions imports, against 3, an increase of 1 million. The total imports of all kinds reached 222 millions, against 215, an increase of only 7 millions. Very curiously, the deliveries (for export as well as for home consumption,) last year are represented by exactly the same figures as the imports 222 millions, of which 184 were for home consumption and 38 for export. The total deliveries were 6 millions more than in 1887, the excess being 3½ millions for home consumption and 2½ for export. The deliveries of China tea were 113 millions, against 119½, a decrease of 6½ millions. The deliveries of Indian were 87 millions, against 83½, an increase of 3½ millions. In the case of Ceylon the deliveries were 18 millions, against 10, an increase of no less than 8 millions. Java, Japan, &c., showed 4 millions, against 3. Stocks of tea at the end of the year were 108 millions, against 106, an increase of only 2 millions. Stocks of China had gone down from 62½ millions to 59½; Indian had increased from 35½ to 42; Ceylon had risen to 5½ millions from 3½; while Java, Japan, &c., showed 1 million, against the same figures for stocks in 1887.—Let us hope that instead of a consumption of 184 millions of lb. in 1888, Britain will soon use 200 millions of pounds, the deliveries for exportation rising from 38 millions to 50 millions of pounds. Such an advance will be necessary at an early date to take off the extra supply from Ceylon and India while arresting the downward tendency of prices. The rise in home consumption in 12 years has been from 151 millions in 1877 to 184½ in 1888; but, whereas 123 millions were China and only 28 Indian and Ceylon tea twelve years ago, 1888 showed 105½ millions Indian and Ceylon, against only 78½ of China. The percentage of India and Ceylon rose in the 12 years from 18½ to 57½. China tea is being ousted, but what we desiderate is a largely increased consumption of tea in Britain and in the world generally. In the past five years the increase in consumption in Britain has been somewhat under 3 millions of pounds per annum. The increase of 1888 over 1887 was 3½ millions, which is so far encouraging, although it is largely due to lowered prices; but if consumption does not advance at a much more rapid rate in Britain, and if other nations do not become much more largely tea drinkers than they are at present, the outlook will be dark not merely for China, but for India and Ceylon. We hear on all sides, however, that on the Continent of Europe a taste for tea is advancing, especially furthered as it is by the adoption of the English institution of "Afternoon Tea."—The rate of consumption of tea per caput in Britain is 5 lb. per annum. If the Continental nations would use only 2 lb. per head, we should have nothing to fear from over-production.

Since writing the above, a local authority has sent us his opinion as follows:—

"In the present very general pessimist opinion

respecting the course of the tea market, it is worth while to inquire whether the statistics warrant it. There is no accounting for temporary fluctuations of the market, owing to the number of causes brought to bear upon it, and planters must in future be content with the year's averages and not the weekly ones.

It will be seen by the following figures that if the deliveries of tea generally in the U. K. do not exceed for the six months ending the 1st of June next, there will be an excess in the supply of just one per cent:—

Import of tea into London from 1st June	lb.	
to 31st December 1888	...	173,363,388
Deliveries of tea	do	do
		130,943,991
		lb. 43,420,397
Estimated import into London from 1st		
January to 31st May 1889	...	50,000,000
		93,420,317
Total supply to 31st May		
If the deliveries do not exceed those of last		
year between the 1st January and 31st		
May 1889, they will be	...	91,362,311
		Excess
	...	lb. 2,068,086

But as the deliveries for the 6 months ending the 31st Dec. are 4 millions of pounds over those of the preceding year, there is every probability that the excess production of 1 per cent will be converted into a deficiency, because it is almost a certainty that the estimated supply from China, India and Ceylon will not exceed the figures formerly given. It is probable that stocks may increase and deliveries fall off until the next Budget is introduced in anticipation of a reduction in the duties which the Chancellor of the Exchequer has in a way promised to entertain, if the increased expenditure on the national defences does not swallow up all the surplus. I am inclined to think that he will make posterity pay for the national defence by devoting the sinking fund of the National Debt, to provide the necessary expenditure. If he does this, then the tea duty will certainly be reduced to 4d per lb. with other relaxations of taxation. But this will do Indian and Ceylon tea planters little good, as it will reduce protection against low China teas."

A NEW DEPARTURE IN THE SALE ROOM.

One of the reforms in the Indian tea trade suggested by "Negotiator" in the recent correspondence which has appeared in our columns on this subject, was initiated yesterday. Messrs. W. J. & H. Thompson offered for sale 846 packages of Indian tea under new conditions, the catalogue containing the announcement that "the ship mark and chest numbers will be given to the buyer only after the auction." Of course, the meaning of this is obvious. As Mr. Thompson, the selling broker, no doubt inferred in the few words with which he opened the sale, an impression prevails in the trade that the publicity hitherto given to chest and ship marks on tea enables subsequent buyers to trace the first transaction to the detriment of the original buyer. If we may judge by the cheers at the commencement and close of the sale, the new idea "caught on." The sale was a good one, and apparently the producer lost nothing by the change. It remains to be seen whether the new form of sale will be generally adopted, and how far this departure, which seems popular enough in the sale room, will please the planter and the merchant. We print a letter from a correspondent who thinks that the large wholesale dealers will benefit by the change at the expense of the small dealers, and that the producer may possibly suffer in consequence. We trust these fears are chimerical. There does not seem any harm in the new departure at present, and its development will be watched with interest.—*H. & C. Mail*, Jan. 18th.

REVIEW OF THE CEYLON TEA TRADE FOR 1888.

(Steaming, Inskipp & Co.'s Indian & Ceylon Tea Market Review for 1888.)

LONDON, 9 GREAT TOWER STREET, JAN. 1889.

PRESENT PRICES.—Compared with the position of a year ago, dusts are 2d and broken teas $\frac{3}{4}$ d to 1d dearer, but souchongs and pekoe souchongs are slightly cheaper. medium pekoes and broken pekoes show the greatest variation, pekoes being 1d to 2d and broken pekoes 2 1 to 3d cheaper. Fine and finest are about 1d to 2d cheaper; but really choice liquoring parcels are on a level with values ruling at the end of 1887.

THE SEASON.—So far results are disappointing to many owners of gardens, more especially of those which, from causes probably beyond the control of the manager, do not turn out tea at a sufficiently reduced cost to compensate for the lower prices. On the other hand, a large number of estates more favourably situated, and yielding a larger outturn of fair quality, are still able to work to a good profit, though a diminished one compared with former years.

It seems to us that the safest course would be to keep to a moderately fine system of plucking, so as to avoid poor liquors, even at the expense of lessening, somewhat, the production, and thus aim at quality as well as quantity the general leaning now appearing to be too much towards quantity. Growers in India must keep in mind that, as Oeylon is not only likely to largely increase its output for many years to come, but is producing a good article, and one which is making great way in the estimation of consumers, there should be no relaxing of effort in the direction of quality if Indian tea is to maintain its supremacy.

The low point to which the average value of Indian tea has now fallen is due to several causes, namely: competition with Ceylon, pressure of supplies, and a falling off in quality. The first and last of these causes have just been referred to. The second point is one which is receiving anxious consideration from all concerned, but at present no practical solution of the problem how to more evenly distribute supplies over the season is forthcoming.

RESULTS OF PURCHASES.—So far, Teas bought in Calcutta have left disappointing results to importers, especially those coming under the category of medium and fine, but the extent of the heavy and continuous fall here could not have been foreseen. A few invoices of common grades, however, have left a profit. Some of the heaviest losses have been made in Darjeeling descriptions which on arrival have been found wanting in the full characteristic flavour of this district, while really good flavoured teas have covered cost and in some cases left a substantial profit.

VALUES COMPARED WITH CHINA.—A point which has attracted much notice during the year, and more especially in the autumn, when new China Teas were selling at high rates, is the extraordinary difference in value between them and teas of Indian growth. The latter at 8d to 10d being from 3d to 6d per lb. cheaper than the former. As time goes on any existing prejudice in favour of China will no doubt give way, and should the China imports continue to fall off, both in quantity and quality, a reaction in favour of British grown Tea may be established. But it may be assumed that the Chinese will endeavour to avert this by making a better class of tea than that of recent years.

COMPELTIION OF CEYLON.—The largely-increased supplies from Ceylon have had a very marked and depreciating effect on values of the medium and fine grades of Indian growth. Besides adding greatly to the total weight of tea, the continuous arrivals, more particularly in the spring and early summer, deprive buyers of that period of rest from public sales during which, in former years, they were enabled to substantially reduce their accumulated stock, and thus clear the way, so to speak, for the next new crop. The rapidly increasing supply from Ceylon must be reckoned with in the future.

SOLENESS.—The increasing demand for Tea for press, and the relatively low rates paid for medium grades

of Pekoe and Broken Pekoe, especially the former, would seem to call for some change in the present system of Sorting. The market for a long time past has been over weighted with medium Teas, the Pekoes in the great majority of cases being only Pekoo Souchong in appearance, and sometimes not throwing so good a liquor as the Pekoe Souchong of the same invoice. It is a question for managers to consider whether in order to better meet the requirements of the trade, they should not reduce somewhat the proportion of these descriptions by sorting a little differently and producing a fair percentage of true Pekoe and Broken Pekoe, and also improving the quality of the Pekoe Souchong. Broken Pekoes should be made as leafy as possible, and be quite free from Dust and coarse leaf. Attention should also be given to the production of a blackish leafy Broken Tea, a class which, if good in liquor, will probably command a large sale in future, owing to the comparative dearthness of China Tea; breaks of from 100 to 200 chests would not be too large. The present very large consumption for good Souchong kinds seems likely to continue.

Finest descriptions may be expected to be saleable to a fair extent, but with the keen competition existing amongst retailers to sell cheaply, it is obvious that the demand for high priced Teas can be but limited.

On some gardens, we believe, it has been found possible to pluck the fine and coarse leaf separately, and where the labour force is sufficient to admit of this, the system is, no doubt, attended with great advantage. The foregoing remarks do not apply so much to true flavoured Darjeelings.

AMERICAN MARKET.—Steps have been taken with a view to more thoroughly introducing Indian Teas, whereby an additional outlet for the increasing production will be secured.

FIGURES.—INDIAN—Imports in 1888		
	were	7,000,000
	Deliveries	4,000,000

	Deliveries	6,000,000
	Stocks	6,000,000

} lb. more than in 1887
 } lb. less than in 1887

BULKING IN INDIA.—This process has been thoroughly done in many quarters but not in others. As we long ago pointed out, bulking should not be undertaken unless it can be so thoroughly done as to insure perfect uniformity of quality; an equal quantity of tea moreover must be given with each chest; nor would it be worth while to risk loss of quality through binning prior to bulking. The chief advantages of bulking in India are as follows:—

- 1st.—Saving of time in bringing tea to market.
- 2nd.—Saving of Warehouse charges to the extent of about 1s a chest.
- 3rd.—Prevention of risk of damage to leaf through bulking here.
- 4th.—Less liability to loss in weight, test packages only being weighed.
- 5th.—The superior condition in which the packages reach the buyer.

WEIGHING NET.—This system has made fair progress but there is still a want of accuracy in some quarters, the variations often much exceeding the limit of 2lbs either way, i.e., above or below; and frequent instances of great irregularity in invoice weights have occurred, so much so, that buyers are agitating for a return to the old system of weighing each packages gross and tare. It is to be hoped that no such retrograde step will be found necessary.

WEIGHING INDIAN TEA.—The following are the amended regulations which came into force November, 1885.

The weight of Indian Tea for duty may, if desired by the Importers, be ascertained under the following regulations:—

- 1.—The packages on arrival to be weighed to ascertain the gross weight of each package.

2.—The importers to give with each entry a statement that the teas in each break have been bulked in India, and that the chests of each break contain even net weights.

3.—In order to test the accuracy of this statement, 10 per cent of each break to be turned out and weighed net, but in no case are less than three chests to be turned out.

4.—If the variation in weight of the test packages, from each other, be found to exceed 2 lb., the whole parcel is to be tared. For instance, if the test packages weigh net 79, 80 and 81 lb respectively, the variations would not exceed two pounds, but if one package be found to weigh 79 lb and any other 82 lb or more, then the whole break to be tared: unless the importer and surveyor consider that an average tare can equitably be given, in which case the tarers must not vary more than two pounds, as in the case of net weights.

5.—Duty is to be charged on the average weight of the packages weighed net, provided that, when the average of the packages weighed net amounts to so many pounds and a half or more, the half or more will be charged as a full pound; when the fraction is less than a half, it may be disregarded.

6.—All Indian teas bulked in this country are to be weighed gross, and each chest tared.

LOSS IN WEIGHT.—Much dissatisfaction has arisen from time to time on this point. The gross weight of the package should always be a few ounces—say four or five, over an even number of pounds. The empty package complete, with lead, nails, bands, &c., should be, on the contrary, just below an even number of pounds—say by about four ounces; in weighing here the gross weight is reduced to the even number of pounds, whilst the tare is increased to an even number of pounds. This method applies to teas not bulked at the garden, also to Calcutta bought teas.

With regard to garden bulked teas to pass the test for weighing net, as before remarked, it is imperatively necessary to put an equal quantity into each packages of the break, and this quantity should be an ounce or two over the desired weight of contents—viz., if the packages are invoiced to contain 100 lb tea, each, not less than 100 lb 2 oz. should be weighed in: test packages, proving here a fraction under 100 lb will be reckoned as 99 lb only, or a loss of 1 lb on each chest of the break. We fear when great pressure prevails at the London warehouses, some laxity as to weighing takes place, but the loss thereby incurred can be but small, compared with what may be caused by neglect of the foregoing precautions at the garden in weighing and filing the packages.

WEIGHT OF PACKAGES.—When a gross weight of 123 lb is exceeded there is an additional charge of 5d per chest up to 159 lb the following scale of charges fully explains this and deserves attention:—

Management rate per package, subject, to an uniform discount of 20 per cent:—

Gross ...	160 to 199 lb	130 to 159 lb	90 to 129 lb
do ...	80 to 89 lb	60 to 79 lb	45 to 59 lb
do ...	35 to 44 lb	17 to 34 lb	Under 16 lb
	2s 9d	2s 3d	1s 10d
	1s 8d	1s 5d	1s 2d
	1s	7d	4d

MARKS ON CHESTS.—Nothing is wanted, or is of any service here beyond (1st) garden mark, (2nd) description of tea, (3rd) garden numbers, and (4th) bulked (if such be the case). Gross, tare or net, are not of the least use, and should be discontinued.

SIZE OF BREAKS.—We are glad to report a continuance of the improvement in this respect, and hope the increase in their size may be still further extended, and that no relaxation in the efforts to produce large breaks will be allowed by owners of gardens, especially as the forthcoming heavy import cannot be readily dealt with unless in large breaks which alone get properly tasted and valued by buyers.

HOME CONSUMPTION OF INDIAN, CEYLON AND CHINA.

CEYLON.—The improving enquiry for Indian growths extended to Ceylons at the commencement of the year. The quality was not satisfactory, and the few fine lots sold at good rates. During February the imports were still inferior, and the demand became slow, except for a very few fine teas; this continued until the middle of March when larger and better supplies attracted more competition at improved prices. On the resumption of business after the Easter holidays in April, common and medium grades; sold at higher rates; the quality, too, was better. In May large arrivals took place, and, being inferior, values became irregular and lower; this position remained unaltered well into June with prices still falling; towards the end of the month the low rates attracted attention, and the market went higher. Broken Pekoes were at very low and uncertain values. Heavy sales took place in July, common were well supported, fine were scarce and became a little dearer. The reduced offerings in August consisted of better teas and values rose, but towards the end of the month and early in September auctions were large and prices fell; a little later a better enquiry sprung up which was more marked at the close. With moderate supplies and better quality in October the market further strengthened until the end of the month when a slacker tone prevailed for teas without noticeable quality. Early in November the dullness prevailing in Indians caused a slight decline, which, however, was arrested for a few days, but on heavy auctions taking place values for medium qualities went lower, especially for Broken Pekoes. During December the selection was not attractive, and business closed for the year with rates lower, except for a few parcels with good liquors.

The quality on the whole cannot be considered satisfactory; the proportion of really good liquoring invoices has been smaller, but the enquiry having been strengthened by the scarcity of medium and fine China tea (the character of which Ceylons more nearly approach than Indians) prevented prices from falling during the greater portion of the year.

Complaints are general that Ceylons teas do not "keep" well, and that after a few weeks they lose much of their freshness and flavour. We trust this may cause planters to seek a remedy, or this matter will be a serious one when supplies become as large as is anticipated.

Although the average price has shown a decided fall in the year it is much over that obtained for Indian teas.

1888 ...	303,284 packages,	average 0s 11¼d per lb.
1887 ...	182,955 do	do 1s 0¾d "

THE STORAGE OF TEA IN BOND.

In the Queen's Bench Division of the High Court of Justice on Monday, the case of Barlow, and Brother v. The Proprietors of the City Bonded Tea Warehouses was concluded, before Mr. Justice Field and a special jury. The plaintiffs, Messrs. Thomas Barlow and Brother, are merchants of Manchester and London, with houses in India and China, and the action was brought to recover £257 for deterioration and damage sustained by a parcel of 261 packages of first arrival 1888 new season's tea, which was stored with the defendants on its arrival in London from Hankow on the 25th of June last. A counterpart parcel of the tea which arrived by the same vessel was also warehoused by the defendants, but in a different room to the tea in question, and sustained no damage. The plaintiffs' case was that the second parcel of tea was sold to a considerable extent on the first day at 1s 6d a pound, and an offer of 1s 5d per lb. for the first parcel was refused. The tea remained with the defendants until the 22nd of August, when the selling broker took further samples, and it was discovered the tea had a foreign smell, which was described as a "winey" smell, and said by the plaintiffs to be due to impregnation with the fumes of wines or spirits stored in a vault below, and admitted into the tea warehouse through the ventilators. The tea was sold by auction on account of whom it might concern, and the plaintiffs claimed for the difference between the amount realised and the amount they realised for the duplicate parcel of the same tea. The defence was a denial of negligence, and a contention that the altered condition of the tea on August 22nd was due to a process going on in the tea ever since its despatch from China, caused by bad curing, careless packing, or bad weather at the time of packing. It was denied that the fumes of wines or spirits could have impregnated the tea, as none were about, and there was three feet of concrete between the tea warehouse and the basement. The ventilators, defendants said, were never opened while the tea was there. A number of the most eminent tea brokers in London were called on both sides. In the result the jury returned a verdict for the defendants, and his lordship gave judgment for the defendant with costs.—*H. & C. Mail*, Jan. 18th.

THE HAKGALA BOTANICAL GARDENS.

(By a Visitor.)
 With the kindly assistance of Mr. Nock, the Superintendent, and Mr. Alwis, his assistant, I was able to make a few notes, when on my visit to the Hakgala Gardens, and they are at your service. That "globe trotters" have been attracted to the place, is evident from the long list of names in the visitors' book. On the sixth of this month the Earl of Antrim and the Hon. J. Scott Montayer, and on the 9th Messrs. Arthur Appleby and G. de Laurister, visited the gardens, and the two renowned botanists, Messrs. Potter of Cambridge and Eugene Demarcay. The plants in the gardens represent 130 orders, 800 general, and 2,000 species and varieties. I was shown, in Mr. Nock's office room, the *Chenopodium*, which was brought from the Andes in South America. During the potato famine in Britain a large quantity of this tuber was imported into England for the relief of the famine-stricken people. It is a small tuber, with a green leathery pericarp, in shape it tends to be more or less elliptical than rounded as a potato; it is rather waxy when eaten, and so may not prove palatable to Europeans. Mr. Nock is endeavouring to distribute it among the natives, who, if they should take to it, will find it an excellent substitute for the potato. In the hothouses, as an enter, are seven varieties of English grape vine plants; then the *Centropus tenanissima*, a native of tropical America, the fibre of which is the most important. I am informed that a reward of £1,000 or £2,000 has been offered to anyone who will invent a machine to manufacture this fibre. The seed is from Java, and attracted by its taste, its leaves when heated yield the odour of musk. Outside the hothouse has a very interesting plant which was brought many years ago by Mr. Tilly, of Dumona.

in a cigar box from some part of the world, and now it has multiplied into thousands. It makes a splendid border for flower beds. *Begonias* seem to thrive remarkably well at Hakgala. One large leaf measured 26 inches across. The plant that struck me as the greatest curiosity, and at which I wondered most was the *Aspidium (Polystichum) anomalum*. It is an ordinary looking fern, but its spores are situated on the upper surface of the fronds and not on the under surface, as is the rule with all cryptogams: that was the anomalous thing about it. Another fern presented a sight worth looking at, and the *Adiantum gracillimum* can boast of being the finest of the maidenhair ferns. The *Abyssinian banana** grows very rapidly: a plant 15 months old attains the size of the largest native plantain; its leaves are very broad, and grow to the length of about 7 feet. The fruit is not eaten, but oil, which is used for machinery, is extracted from the seed. The next object was the Japan pine tree, about 30 years old, the wood of which makes good tea-boxes. Mr. Deane, I was told, uses this wood for his boxes. Another curiosity was a tree-fern with tree branches. A branched fern is as rare as the branched coconut trees which are met with in the Negombo and Galle districts. Of the old cinchona trees, there are only a few now left. One was shown me with its moss-grown stem of about 50 to 60 feet in height. Of the roses there are no less than 130 varieties. We were fortunate, however, of having a sight of the *wedding flower*, which flowers in Ceylon, I believe, only at the Hakgala Gardens. It is a beautiful white flower, borne upon a branched peduncle; it contains staminal bracts, and resembles the eucharis lily very much in form and beauty. The orchard, however, made up for all disappointments. The plum trees were in full bearing. Mr. Nock has successfully experimented in grafting branches of the good plum on to the common, and the result has been a good crop. There were a few pears, but not a single apple. The superintendent is not satisfied with the present size and condition of his orchard, and a new patch of land is being prepared for a new supply of plants, which he was expecting to arrive on the day of my visit, consisting of 24 varieties of fruit-plants. An improvement has been made in the cultivation of a *herbaceous garden*, which gives to the gardens a more scientific value. 30 to 40 long beds have been prepared, and these contain between 50 to 58 natural orders.

We spent a very pleasant day in the gardens, and I take this opportunity of thanking its kind and able superintendent, and his obliging assistant, for making our short stay both pleasant and instructive.

INDIARUBBER PAVEMENT.—The authorities of the city of Basle intend re-paving their principal thoroughfares, and are now considering the material best suited for the purpose. In one street a trial was given to wood pavement, but somehow it does not give satisfaction. The decision therefore turns upon asphalt or Indiarubber. The latter was invented by the German engineer Busse, in Linden, near Hanover, and was first practically used, about fifteen months ago, for paving the roadway over the Goethe bridge in Hanover, which required about 1,000 square metres of material. This first experiment proved so successful, that during the present year another street in Hanover was paved with Indiarubber, to the extent of 1,500 square metres. Berlin is already considering the advisability of availing itself of the same pavement, and has given it a fair trial by laying it down over a considerable distance near the Lutzow bank, which example is being followed by Hamburg. The Indiarubber pavement is said to combine great elasticity with the hardness of stone, to be completely noiseless and to suffer neither from cold nor hot weather. Moreover, it is not slippery like asphalt, and is more durable.—*Indiarubber and Guttapercha Journal*.

* From actual measurement the plant is as follows:—Height to top of leaves 20 feet, circumference round the bole at base 8 feet. The head contains 21 leaves, and several of these are 15 feet long and 3 feet broad. The plant was only 6 inches high when planted out 18 months ago.—W, N.

OUR COFFEE planters are threatened with further rivalry: California is, it seems, "going in" for coffee growing. The country is said to be peculiarly favourable to the growth of the berry. A former president of Costa Rica, with a party of his countrymen, have purchased a tract of land near San Rafael, with the intention of forming a colony there: among other employments designed to be followed by the colonists is the cultivation of coffee.—*South of India Observer*, Jan. 5th.

PEACHES.—An enterprising planter of Coonoor, who has a number of choice Delaware peach trees on his estate, the fruit of which are exceedingly delicious, contemplates sending a consignment to Madras to be sold in the open market. We have no doubt that our brethren, sweltering in the heat of the capital city will be glad to assuage their thirst with the luscious fruit, and that rupees will drop into the pockets of the planter.—*South of India Observer*, Jan. 5th.

VINES.—At last there is good news for vigneron. The man who can effectually settle the phylloxera pest is as likely to make a fortune as if he got rid of Australian rabbits. Endless remedies have been advocated, but none of them can be said to have been effectual. A French chemist, M. Willot, now comes forward with a very simple remedy. He says that the phylloxera are killed by a solution of common salt, even though they are capable of resisting morphine, strychnine, curare, &c. It is well worth trying, only the chemist does not tell us whether salt would have an injurious effect upon the vines.—*Australasian*, Jan. 12th.

A PATENT FOR PREPARING TEA.—Patent has an Australian interest. You are a people of tea-drinkers. The "billy" can ought to be one of the charges on the national Australian shield in the distant future, when all the colonies are federated, and have arranged to live peaceably and neighbourly together. Tea ought to be an infusion, whereas many people make it a decoction. In other words they cook it. This extracts not only the theine—which is good and exhilarating—but the tannin, which is about as bad a thing as can be taken into the human stomach, particularly if you are partaking of animal food at the time. The patent in question is a new method of preparing tea, so as to avoid the tannin, and the process consists in neutralising the letter by spraying over the tea a solution of a suitable alkali.—*Australasian*, Jan. 12th. [Without a certain proportion of tannin tea would be "fusionless"; it is the excess of tannin brought out by boiling or long standing of water on the leaves which is injurious.—Ed.]

CEYLON TEA IN LONDON.—This is how "Peripatetic Planter," writing from London, in December, to the *Indian Planters' Gazette*, criticises our Ceylon staple:—

The heavy offerings of Ceylons appear to have been too much for the market under present circumstances, and prices have tumbled all along the line, except for lots with the special Ceylon character, which latter seems to be becoming rapidly anything but a characteristic of Ceylons. There is a marked weakness among teas between 10d. and 1s 3d, even at a penny decline on last week's rates. Teas for price are $\frac{1}{2}$ d lower than last week. Though the finer grades are in small supply, the biddings for these have not been satisfactory. There has seldom been a more marked instance than this week's offerings, of teas being sacrificed on account of the particular date of the offerings. The general quality of the Ceylons offered was superior, as a rule, to much that has been brought forward of late, and in many cases it was voted "very desirable"; and yet the vision of X'mas ahead was two heavy a weight on buyers' spirits to tempt them to bid up to value.

COFFEE PIONEERING IN CEYLON:

THE BAMBARABOTUWA LANDS.
AN OLD COLONIST TO THE FRONT.

We had a call today from Mr. John Dent Young of Rosita, Dimbula, and formerly for some 27 years of the P. W. D., and who still retains all his bright intelligence with a wonderful degree of activity considering all he has passed through. A walk of 30 miles, albeit in the Dimbula climate, in a single day, is no small feat for a man of Mr. Young's age, considering that nearly all his life has been spent in the tropics, and a great part of it in trying unhealthy divisions of the island.

Mr. Young has had to come to Colombo on the present occasion through a fear that the Agent of the new Province and the Forest Department were bent on including the Bambarabotuwa forest-land—which he cut out and purchased on behalf of constituents, 15 or more years ago—in the Crown Reserve Forest forming in that division of Adam's Peak. The *Gazette* notice seemed, to say the least, "vera suspicious" in its language; but a visit to the Surveyor-General's Office showed clearly that the lands purchased by Mr. Young and others in the "forties" are carefully marked on the official plans as private property and cannot be included in any survey as Crown reserve. So far, good. In one case, we believe, a block of land at Gilimale belonging to the late W. G. Forbes, of the Civil Service, is to be taken up by the Crown, his representative to get in exchange an equal area of good land elsewhere. This enables a Crown boundary to be rounded off.

There is every chance of the Bambarabotuwa lands being found well suited for tea cultivation. Agar's Land and Dik Mukalane estates show how well the staple succeeds in that neighborhood.

Mr. Young's reminiscences of his promising work in the "Forties" is full of interest to the planters of the present day. How difficult it must be for the occupants of comfortable bungalows, or railway or even road travellers from Nawalapitiya upwards, to learn of Mr. Young and two other Europeans commencing their exploration for land, by starting from the Kandyan headman's house in Kotmale valley and for ten days to a fortnight afterwards, never being out of forest, save when they climbed a hill or emerged on a patana, nor seeing a sign of life until after wandering through Lower Dimbula, all up Dikoya and Bogawantalawa and back over Horton Plains, they finally emerged at Wilson's Bungalow! From the top of Kotagala, they looked over the wilderness of the Peak, and one of the company a Rifle Officer and Surveyor, exclaimed to Mr. Young, "You can have as much of this as you please for 5s an acre." But although much taken with the Bogawantalawa forest and soil, as Major Rogers said to Mr. Young afterwards at Badulla:—"I know it well, have often been there, very fine but unapproachable, you might as well think of planting coffee on so many acres of the Indian Ocean!" The Major himself had begun planting on Kahagalla and Haputale estates above Haputale Pass, and he directed Mr. Young to look out for land in that neighborhood, but for the same reason of distance from road and labour, as operated in the case of Mr. C. Shand, Mr. Young travelled on until above Balangoda he came on forest valleys that he thought more accessible. Here he cut out boundaries for 700 acres, then 2,000 acres; and with Robert Dawson 2,000 more acres, and all was purchased without competition at 5s an acre. He then thought him of getting for himself and principals a big slice over the hills towards Dikoya, but the Government just then raised the price to £1 an acre, and his capitalists would not pay that. He

began planting coffee, and cutting a road which eventually extended over 20 miles and which still exists as a good bridle-path if the wooden bridges were repaired. (There was no grant-in-aid system in those days.) The coffee grew apace, but very soon the grub made themselves manifest and to such deadly purpose as Mr. Young has never since seen or heard of in any other district. He fought with the enemy as long as he could, but trees without feeding roots could not bear profitable crops, even if the prices had not fallen and the bad times which brought widespread disaster arrived.

Among his visitors while at work under the shadow of Adam's Peak range, was the other Sabaragamuwa pioneer, Mr. Charles Shand, who was busy opening his land on the opposite Rakwana range; and it was while journeying with Mr. Young in the Bambarabotuwa forests, getting wet and hot, and again rashly bathing and sitting, exposed afterwards, that Mr. Shand got his first and last attack of rattling dysentery—such as, we have heard old medicos describe, was common enough in the pioneering days, but is never seen now. Mr. Shand had to be carried in to Ratnapura where—with the aid of a friend's medicine chest fortunately just arrived from home,—he speedily recovered his usual good health. The Bambarabotuwa forest-land has never been touched since Mr. John Dent Young retired from the coffee experiment on 200 acres about 40 years ago.

We had a look at the region in 1872, when "Old Colonist" pointed out the scene of Young's and Crawell's early labours, during our famous trip from Galle to Morawak Korale, Kolonna, Rakwana, Balangoda, on round the Uva districts and Dimbula. It is quite possible that ere long Bambarabotuwa may become the scene of active work again.

THE GREATEST HEIGHT OF A COCONUT PALM.

In our letters on the Bentota Railway Extension we referred to the great height of some of the coconut palms cut down, and mentioning 110 feet and upwards as having been measured by Mr. Cantrell, we asked if anyone had ever measured a tree of greater length. That challenge has, so far, met with no response, and we infer therefore that there is no authentic case of a taller palm in Ceylon. We have to announce that the record has just been beaten: Mr. Paton Gray, the Assistant Engineer, having measured a giant of 117 feet.

COFFEE IN WYNAAD.

We have received the following from a correspondent in South Wynaad:—"Spike is coming on nicely, and the white ants are swarming, which is a hopeful sign of coming rain. The leaf disease has almost disappeared, and, thank goodness! has not done us much harm. You could almost count on your fingers the estates that have really suffered anything, and they are all coming round again though when they had borne heavy crops the year before, and so had but little new wood, it was a severe pull on them of course. Although the weather is so hot and dry, the trees, both young and old, keep on growing and putting out new wood and blossom. When we have rain every estate will be white in forty-eight hours after the first shower. There is opening still going on, chiefly in this district, but some in North Wynaad also; nearly all the openings are by old planters and proprietors, which is a far more healthy sign than if they were mere speculations. I don't think the crops this year will be much more than a good average; young coffee seems likely to bear heavily, but the old trees don't appear inclined to distress themselves. Good average crops, at present prices, will pay very nicely. I can assure you and as stocks seem low

at Home, and this year's supply is a short one, we hope the prices will keep up to next season too. An average of 85s for ordinary kinds, and 77s for triage allows a margin for profit! We are not getting much work out of Public Works Department just now, funds are said to be short. I hear that several basketfuls of earth have been thrown down at the approach to the Koonoath bridge, so that a bandy can get on or off it without jumping. Can yet any of your correspondents tell me where, on the hills, good tea seed, of Assam or hybrid trees, be procured? There is lots of China tea seed about, but the habit of the plant is not suitable to climate."—*South of India Observer*. [*Couleur de rose* we suspect about coffee.—Ed. T. A.]

THE CEYLON-AMERICAN TEA ASSOCIATION.

Mr. Whitham is good enough to send us the original circulars and to write to us in explanation of his tea scheme for America. It seems to be a right movement. Mr. Whitham says:—

"As far as my own idea goes, there is no intention of superseding the Tea Fund which might, on the contrary, help the Association or Company very much by acting as its avant courier to a certain extent. There is a much better chance of getting a good scheme if we leave it for a general meeting to decide what it's to be. I don't believe in holding out hopes of a dividend which may possibly not arrive for some years, and, as an investment or speculation, there are many things I would sooner go in for. But we must sell a lot of our tea in America, and check the downward course of prices, or half our factories will be shut up in a year or two. Tea averaging 9d or even 9½d can only be made to pay in a few places."

The circular letters originally written, which it is well to publish for general information, are as follows:—

TO THE PLANTERS OF DOLOSABAGE.

Gentlemen,—Everyone seems agreed as to the necessity for some steps to be taken to fully introduce our teas into the markets of the United States and Canada, but no one seems prepared to say exactly what should be done towards that end.

The idea of a Company was mooted some time ago, but has so far come to nothing, more, I believe, from individual unwillingness to take the initiative than from general objection to the scheme.

It is very clear that no sufficient impression can be made in America by private and individual enterprise, even if largely assisted by grants from the Tea Fund. What is wanted for the campaign is a Company or Association, which ought to include every tea grower in Ceylon, whether proprietor or superintendent. It is not my place to say what should be the exact aims and scope of such an Association. These must be settled by the subscribers or shareholders themselves. The scheme only requires starting, and will develop itself as it goes on from the collective ideas and experience of all who take part in it. And, as few districts are at present producing more tea than Dolosabage, it might well be the first to set the ball rolling.

I do not ask you to commit yourselves at present to any actual undertaking. If you will put your names down as supporters of the general idea, and state to what extent you are prepared to take shares in a Company as constituted by yourselves and other subscribers, I shall send the list when complete to Mr. Rutherford, with whom I had a long conversation on the subject some weeks ago, who is quite prepared to help in the matter, and who too, no doubt, on receipt of a well-filled Dolosabage list, will get some one to start a similar one in every district in the island. My only suggestion is that the total liability on each share should not exceed fifty rupees, in order that no one engaged in planting may be debarred from taking one at least.—I am gentlemen, yours obediently,
HARRY WHITHAM.

Narangalla, Aranyaka, Jan. 8th, 1889.

Nuwara Eliya, 10th January 1889.

My dear Whitham,—I willingly subscribe to your scheme for a Ceylon Tea Growers' Company working

in America, and I am quite at one with you in thinking it is about the only way we will introduce our teas into that country. Such a Company ought to have the support of every proprietor and superintendent in Ceylon.

I think it is quite enough for our present purpose simply to get subscribers' names to the general idea of a Ceylon Tea Growers' Company for the purpose of pushing Ceylon tea in America.

The details of working the scheme must be settled by a general meeting of subscribers or by a Board of Directors. The capital should not be less than R300,000. If each of the 600 estates enrolled in the tea fund scheme invested R500 in the undertaking, the money would be found.

Please put my name down for R1,000. As I am going home in March, and will be away for about 8 months, I am sorry I will not be here to assist in your deliberations, but it cannot be in better hands than your own. I will be very pleased to do what I can in support of the scheme in England.

If your district meeting takes this matter up I would suggest printed circulars be sent out to each district, with the names of those who have already subscribed printed on the list, so as to give a start to the scheme.—Yours truly,
H. K. RUTHERFORD.

COCONUT AND CINNAMON PLANTING IN THE WESTERN PROVINCE, CEYLON.

COCONUTS AND CINNAMON: SHORT CROPS—AVERAGE LIFE OF COCONUT TREES—EFFECT ON THE COCONUT TREE OF TODDY-DRAWING—TAPPING v. FRUIT-YIELDING—INTERESTING ANALYSES.

Siyane Korale,

I very much fear that the drought in the year we are about to enter on will be a severe one. Except on lowly flats on which coconut trees seem to benefit more than suffer during periods of rainlessness, crops of next year are likely to be short in numbers and in weight. From all I hear cinnamon crops too will be short everywhere this year. Not a very great calamity however, as the balance is likely to be restored in better prices for the spice. There are two marked periods during which the bushes grow, in July-August and in December-January. The bushes are then decked with all the glories of a leaf bud, ranging in color from a light rose pink to a crimson red: * this is the period of the greatest vegetable activity. This year like the last the principal bud in July-August was a comparative failure and the cinnamon bushes have in consequence made very little growth.

In the interesting notices on the coconut palms occurring on the Bentota extension and in its neighbourhood, you incidentally ask for reliable information on the average life of coconut trees. This it is not quite possible to obtain, I believe; but was not the seacoast from Galle to Colombo planted with coconuts during the Dutch period? In the review of agriculture in the "Directory and Handbook" for 1878 it is said that Governor VanImhoff in 1740 "proposed surveying and distributing" the land between Kalutara and Colombo in limited blocks to "persons who are inclined to plant these with coconuts and to pay Government duties," so that the trees on this portion of the coast must be considerably over a century old even if allowance be made for a reasonable interval between Imhoff's proposal and its fulfilment. Simmonds says on the authority of the "Agricultural Gazette of India" that trees growing in fertile soils will live for a century. The natives of Ceylon limit the age of the tree to the same period, I believe. Porter in his "Tropical Agriculturist" limits the age of the tree from 80 to 85 years, but on what authority it is not stated. C. A. L. on "The Coconut Tree in the West Coast of India" says that a coconut tree on attaining the age of 70 years is cut down for its wood, while if it is allowed to grow on it will live for a century. Marshall says that a coconut tree bears fruit till it is 60 years

* In some cases the flush varies from purest white to ruby red, and no language can exaggerate the beauty of an expanse of cinnamon clothed in its spring or summer tints.—Ed.

old and dies at from 90 to 100. In order that credit may not accrue to me for great research on this subject, I may say that I copied all this information from "All About the Coconut Palm" compiled and published by the Messrs. Ferguson.

When paying a visit to the late Mr. Charles de Breard about 7 years ago in company with Mr. Frank Foenander, he pointed out to us a tree which he said was then 120 years old and was mentioned in the original title deeds of the property as growing on the boundary of it. His successor, Mr. Edward de Breard will be able to give information of the age of this tree after consulting the title deeds if it will be of any interest. At the time I saw it, the tree was bearing heavily owing no doubt to its proximity to the stables from which it received all the liquid excrements of the horses. The fertility of this tree is proof of coconut trees not being affected prejudicially by cultivation as to their longevity, an opinion for which you give credit to a well-known correspondent of yours, but which has not been called in question by anyone as far as I know. What has been repeatedly urged in your columns is that stimulating young plants into early bearing by the application of phosphatic manures is inconsistent with longevity. As to the height of the coconut palm, all the authorities I have quoted above give 100 ft. as an extreme height; thirty nuts per annum is certainly a high general average of yield for each tree.

In your article under notice you have raised a question which has puzzled me a good deal, and which I shall be glad to see authoritatively elucidated—the effect on the coconut tree of toddy-drawing. You say "at first sight it might seem that the constant abstraction of the juice would be the more exhausting process (than fruit-bearing), but we are bound to state that in the dense groves of the special arack region near Kalutara, although fruits were few and far between, the trees themselves looked fresh and flourishing." What I cannot understand is why toddy drawing should be a more exhausting process than fruit-bearing? It is well-known that as fruit matures, it requires a greater quantity of mineral matter for its development than in its immature state. Coconuts can be no exception to the rule. In the process of toddy-drawing the trees are spared the woes and throes of a prolonged period of growing and maturing fruit, and yield the substances that go to form the fruit without further elaborating them. As far as I think, toddy-drawing will be more exhausting than fruit-bearing *only* if the process separates trees to yield more mineral matter in the toddy they yield than in an average fruit crop. This can be decided only by a competent chemist, and I unfortunately am not able to solve it. It is well-known that trees after a period of toddy-yielding bear fruit heavily. Why is this? According to my thinking it is owing to the rest they enjoyed—comparatively of course.* I must confess, however, that the weight of authority is against my opinion. Sumner is contradictory surely when he says in one paragraph that young trees as soon as they show spathe should be tapped for toddy for one season only, as the process helps the sap to flow freely and makes the fruit bunches more numerous, that toddy drawing for a few months is supposed to check the tendency in young trees of dropping their nuts, and that in some places trees are never allowed to bear fruit, but are made to yield toddy always; and in the next paragraph "overdrawing of toddy will cause luxuriant trees to dwindle away and acquire sickly habits," and that trees that have been tapped for 6 months should have a rest of 5 years before they be made to yield toddy again. If yielding toddy is an exhausting process, surely the first call upon a young tree should not be to yield toddy, and if it is exhausting, how comes it that young trees that have been made to yield toddy are said to bear heavily, and to give up the bad habit of dropping immature nuts? Porter says that "Toddly is drawn during 6 or 8 months of the

year, and the tree is allowed to recover its strength during the dry season." "C. A. L." quoted before says: "The first extraction is usually made when the tree is about 8 years old, and the issue, with daily attention, continues regularly 20 to 25 years," and here follows a contradiction "though young trees are only tapped as the constant bleeding tends to weaken them after some time." As I said before the weight of authorities is against my opinion, but no reasons are adduced in support of the bare assertion of the authorities I have quoted, and I will be pardoned if I fail to be convinced by them.

For the determination of this question of tapping vs. fruit yielding, I subjoin analyses of both products, so that you may call in the aid of a competent chemist, say Mr. Cochran, to decide which is the more exhausting. A coconut tree is supposed to yield on an average 258 litres* of toddy per annum.

ANALYSIS OF TODDY.

	Grammes†
Sugar	1460
Gum	56
Oil	04
Albumine	12
Chloride of sodium, acetate and sulphate of potash, phosphate of soda and of lime, silic.	26
Water	8442

A Jaffna planter in years gone by reduced M. Lepine's figures to lb. Troy and tabulated the amount of mineral matter drawn annually by an acre of 75 trees yielding 80 nuts per annum. The yield is excessive as an average and will be nearer the actual average if divided by 3. I however give his figures and leave the reduction to be made by whoever is going to make the investigation:—

	Peduncle	Spathe	Husk	Shell	Kernel	Water	Total

CEYLON FOR THE YOUNGER SON ?

PROSPECTS OF INVESTMENT :

"Good-bye John, good-bye ; mak' money—honestly if ye can—but mak' it." Such is the advice attributed to the typical Northerner on sending his hopeful out to seek his fortune. Ideas of investing money vary considerably ; but there can be no question that many men prefer investing other people's money, and calling property their own.

Enormous mischief has been done in Ceylon by working on borrowed money, and there is little or no doubt that many a man was sucked down by interest on mortgages during the coffee crisis, who, had he confined his operations to his own capital, might, and in many cases would, have pulled through, notwithstanding leaf disease, bug and low prices. Twelve years ago a proprietor told me that he was confident of the security of his position, because he based all his calculations on crops of 3 cwt. per acre, and the price of coffee at 70s per cwt. Coffee was then at 100s and 3 cwt. per acre was considered a low estimate. Leaf disease got stronger, coffee got weaker, seasons were unfavourable ; 3 cwt. was never obtained, prices fell, and you might whistle for 70s. Meantime interest on mortgages was accumulating, and the end was grief ! This case is only one of a thousand. But, you say, may not the same thing happen in tea ? No, sir, no ! but before giving reasons for the difference between the two cultivations, let me give an example or two which have come within my own experience, showing what was considered "prosperity" in the old coffee days. I was condoling with a man on being "sold up," *i. e.*, his mortgagees had foreclosed on him, and were taking over his places. "Yes," he said, "confound them ! I did not owe them enough money. I only owed £30 an acre, so they can afford to sell me up ; but look at my neighbour, he owes between £70 and £80 an acre, and they *daren't* take his place 'ver. Ah ! I was too easy with them when I *could* borrow money." Here was a man whose idea was to "carry on" on other people's money, no matter how big the amount of his indebtedness. As to ever paying off his mortgages and having his property clear, how many old-fashioned coffee proprietors ever dreamt of such a consummation ? I trow not many. Yet another case. In company with another planter, I was discussing a man who had toiled for many years, and was now living quietly on a nice little property which was absolutely his own, his dreams never disturbed by "interest on mortgages." "Well," said my friend, "I never could understand that man ; what would I have given for his opportunities ! Credit, sir ? He might have had the largest credit of any man in Ceylon, if he had only chosen, but he never would borrow." This last was said quite mournfully. *Now nous avons changé tout cela.* Money is still lent and borrowed, but not in the same happy-go-lucky style, and your agent generally looks askance when asked for a block loan, though willing enough to advance money against crops.

Now, before going further, let me state why I so confidently affirmed that tea would not suffer as coffee has done. The cultivation of the two plants is entirely different. Coffee was dependent for a crop on two, or at most three, months in the year. If, during the blossoming season, the weather was unpropitious, the labour of a whole year was thrown away, the crop was bound to be a short one, and the only thing to be done was to keep your estate in good order, and hope for a better season "next year" ; and how often has "next year" proved delusive ! The tea crop, on the contrary, goes the whole year round ; and from the yield of one month a near estimate can be formed for the next, and so on from month to month throughout the year, the expenditure being checked or extended according to circumstances. It will, then, be seen that a great proportion of the year's expenditure on a coffee estate was laid out *in hope*, whereas in tea we have visible monthly returns to guide us, and money can be drawn against *actual* instead of *prospective* crop. Risk of indebtedness is thus avoided, and a man can tell his position any day in the year, instead of having to wait in fear and trembling for his agent's account which, in coffee, was never rendered until long after crop was

over. Again, in coffee there were so many charges to be paid between the time the produce left the estate and the time it was put on the market, and no means existing for telling within a reasonable margin how much these charges might amount to. In tea, the control of all expenditure is in the hands of the resident proprietor, or manager, as the case may be, and he can foretell to a cent what the charges will be between the estate and the market. But, after all, the main security is that it is a *leaf* and not a *fruit* crop. Coffee ran luxuriantly to leaf long after it had given up yielding fruit. The Indian tea *seed* crop failed almost entirely a short time ago, but their *leaf* crop was not affected ! and—best hope of all—we are informed that the best China brands come from their oldest gardens, some of which are reported to be over 100 years old. And in Ceylon, who can foretell our future ? What are our seasons ? Two springs and two summers ! Who, then, can wonder at the yields we have obtained, and shall continue to obtain ?

I will now quote from the best authority on Ceylon, viz., Mr. John Ferguson's book, "Ceylon in the Jubilee Year." Mr. Ferguson says :—"For well-inclined young men of the right stamp, not afraid of hard work, Ceylon still presents an opening as planters of tea, cinchona, cacao, etc., provided the indispensable capital is available." Again, "Nowhere in the whole wide world can young men learn so thoroughly the mysteries of coffee, tea, cinchona planting, etc., or be so well equipped as tropical agriculturists as in Ceylon" ; and, further on, "There is a wide extent of forest land well suited for tea, and, when sold by Government, it may be had for £2 or £3, and sometimes for £1 per acre, crown title freehold." Here, I think, Mr. Ferguson prices the land too low. The upset price is R10 (nominally £1) per acre ; but the enormous increase of our teas, both in quantity and quality, has so stimulated the demand for land that for good blocks at Government land sales the competition is severe, and capitalists ought to be prepared to pay at least £5 per acre.

The land having been bought, I will quote from another authority, Mr. Rutherford's "Ceylon Tea-planters' Note-book." His estimate is that paying R50 per acre for jungle land, after six years' careful work there should be "capital R300 per acre, giving a profit, when in bearing, of 20 cents per pound, at 600 lb. per acre—R120 per acre profit, or 40 per cent on capital account, without interest."

This, *although it has been beaten*, is in my opinion too sanguine to be laid down as a return to be generally looked for throughout Ceylon. In the case of well-worked low-country properties, there is no reason why the above result should not be attained ; but up-country land cannot be expected to give such large returns, though a residence in the almost perfect climate of the hills of the Central Province of Ceylon more than compensates for the smaller yield. And now a warning. Do not be in too great a hurry to invest. Take your time and look about you. Heaps of young fellows in the coffee days were so anxious to be proprietors, that they jumped at whatever was in the market, and regretted their bargain ever after. Learn your work thoroughly, and do it well. I have often heard a youngster grumble because his chief has sent him slaving after the coolies up and down the hills all day, while the chief himself spends a good portion of the day in the bungalow. Doubtless my own assistants have said the same of me. The youngster pictures his chief reclining in a long arm-chair, smoking a pipe, and enjoying a novel. Foolish youth ! Have you ever seen your boss's tappal book ? Eight, and sometimes twelve or more letters a-day. All these must be answered ; your own stupid blunders in the accounts must be corrected ; and, worst of all, the expenditure must not exceed the estimate. You know nothing of all this, and day after day your chief is in his office going into figures—a far more wearying thing than working the coolies—and trying how this or that item of expenditure can be reduced so as to

* We have changed £ to R for rupees in this paragraph. The use of the £ made land on which £300 an acre was expended yield £120 per acre p. a. !—Ed. T. A.

show the desired profit at the end of the year. The result of his labours in the office is his orders for your work in the field. He uses his head that he may direct your heels; so never dare to call your boss lazy again! The most successful planter I ever knew used to work out his expenditure *daily*, and as a consequence always worked *cheaply*.

Perhaps the intending investor in Ceylon is doubtful as to the chances of Ceylon tea in the face of competition from India and China. I think I can satisfy him on that score. The combined competition of India and Ceylon last year caused the China import into England to decrease 25,000,000 lb., as compared with the previous year; and this year a further decrease of 20,000,000 lb. is anticipated. In course of time, at this rate, China tea will practically fall out of consumption, and the market will be held by India and Ceylon. We in Ceylon have always the advantage over India, that we can put our produce in the market cheaper than the Indian planters can. But, for the comfort of the consumers, it should be mentioned that there is no prospect of prices rising—first, in consequence of the increased and increasing production, both in India and Ceylon, and secondly, because of the rivalry between the two countries. Both, however, have a grand future before them, while the ladies at home will always be able to rely upon a good cup of Ceylon tea. **CEYLON TEA PLANTER.**

—*Land and Water*, Dec. 20th.

DRUG TRADE REPORT.

LONDON, January 17th.

CINCHONA.—The first bark auctions of the new year were held on Tuesday, a very heavy quantity being catalogued for the occasion, viz.:—

	Packages	Packages
Ceylon bark	2,805	of which 2,002 were sold
East India bark	125	59
Java bark	246	246
South American bark	1,137	191
Fiji bark	3	3
Total	4,616	2,504

The assortment offered consisted almost entirely of low and medium class barks, the South American varieties especially being almost exclusively made up of old Cupress and Carthagenas, which were nearly all bought in. The bulk of the Java bark also was of inferior quality. The large quantity of light South American packages accounts for the fact that, though the number offered was so large, the aggregate weight of the bark was less than at the preceding sale.

The auctions opened very flatly, and with a manifest reluctance on the part of buyers to operate; gradually some improvement became noticeable, especially when sellers showed a good disposition to realise, but towards the close the interest flagged again. There is a general agreement that the auctions resulted in a heavy decline, which is variously estimated at from 10 to 15 per cent, but the smaller figure appears nearest the mark. The unit is now placed at 1 1/2d. per lb. The following are the approximate quantities of bark purchased by the principal buyers at the auctions —

	Lb.
Agents for the Auerbach works	214,645
" the Brunswick works	115,176
" the American, French, &c. works	81,271
Messrs. Howards & Sons	53,211
Agents for the Frankfurt and Stuttgart works	44,330
Mr. Thomas Whiffen	19,071
Agents for the Mannheim & Amsterdam works	5,236
Sundry buyers	32,390
Total quantity sold	568,533
Bought in or withdrawn	341,968

Total quantity catalogued ... 910,501
It is, of course, understood that the proportion of bark purchased is no criterion whatever to the amount of quinine represented by it.

The following were the prices paid:—

CEYLON BARK: Original Officialis, shavings, damaged, down to 1 1/2d and 1 3/4d; sound 2 1/2d to 5 1/2d; for ordinary to good from 7 1/2d up to 9 1/2d for fine rich; root 2d to 6d. Succirubra root 2d; dnst 1 1/2d; ordinary and dusty chips 2d to 3d; fair 1d. Hybrid, &c., chips 2d to 5 1/2d; shavings 3d to 3 1/2d; root 5 1/2d per lb. Renewed Officialis, ordinary to good chips and shavings 4d to 7d; a few rich lots 8d to 9 1/2d. Succirubra, ordinary to good rich shavings and chips 2d to 7d; fine up to 9d. Hybrid, &c. 6 1/2d to 8d per lb.

EAST INDIAN BARK: Crown, small good fair bright shavings and quilly chips 2d to 4 1/2d; renewed dusty shavings 4 1/2d to 7 1/2d. Ledger, good but dusty shavings 7 1/2d; chips 7 1/2d to 8d per lb.

JAVA BARK.—Officialis, bright chips mixed with quill 5d; bold mixed root 6 1/2d. Ledgeriana, good rich root 1 1/2d; common dust and ground branch 1/2d to 1 1/2d; root 1 1/2d to 2 1/2d; good quilly mixed branch chips 5 1/2d. Succirubra, weak to fairly good druggists' quill, all more or less damaged 3d to 7 1/2 per lb.

SOUTH AMERICAN BARK.—Of 172 packages cultivated Bolivian Calisaya, 40 serons sold at 8d to 10d for small split to good boldish silvery druggists' quill, and at 1s 2d per lb for an exceptionally fine silvery parcel. Cathagena (imported via Guayaquil), rather bold but partly damaged 3d to 4 1/2d; for a lot of very bold pieces 10d per lb is asked. Forty-six packages Soft Columbia and 34 Hard Pitayo of old import were bought in, while for old Cuprea from 2d to 5d is asked.

FIJI BARK.—The first bark imported from this island was sold yesterday. The consignment consisted of 164 lb only, in three bags. The bark was of a Calisaya character, and brought the following prices:—Good but thin silvery yellow quill said to analyse the equivalent of 1.73 to 1.75 per cent q.s. at 4 1/2d; weak twigs and chips (1.60 per cent q.s.) 3d per lb. A German firm bought the bark.

Via Lisbon we received this week 78 packages, presumably from San Thomé in Western Africa.

COCA LEAVES.—Reported cheaper from New York with a rather heavy stock of light green Truxillo at 9d "c.i.f." for quantities, and 1s per lb for Huanoco. The Hamburg market for coca leaves, which was a very considerable one two or three years ago, has lost much of its importance in 1889, as the German cocaine makers now all prefer to buy the South American cocaine direct from the makers there, who have now brought up the standard of their make to 99.25 per cent.

CUBES.—During the year 1888 1,095 bales cubes were imported into Holland, while 200 bales were left in stock from 1887. During the year the deliveries amounted to 1,105, leaving an unsold stock of 190 bales. The reports of shortage of the coming crop are again confirmed. The cultivation does not appear to be prosecuted on any large scale in Java, and the wild berries, owing to the high prices obtainable at present, are gathered before they have sufficiently matured. The small shrivelled berries are generally preferred on the Dutch market, though some buyers will only take the bold fruit, which is entirely rejected by others.

ESSENTIAL OILS.—Citronella remains very quiet at 1 1/2d to 15th-16ths d. per oz. for native brands.

QUININE.—There has been a good deal of speculative business this week at low prices, some 40,000 oz. being sold on the spot at 1s 3d for Zimmer, Jobst, and Fabrica Lombarda, and 1s 3 1/2d to 1s 3 3/4d for B & S bulk. But this was all done by second-hand holders, the agents for the manufacturers refusing to quote a price at present. We have seen a statement this week in which the present London stock of quinine is estimated at about 2,000,000 oz., most of which is known to be held by speculators.

THE AMSTERDAM CINCHONA AUCTIONS

Today, 17th January 1889.

AMSTERDAM, January 17th

At today's auctions, out of 2,974 packages of Java bark offered, 2,519 were sold at fairly steady prices, considering the fall at the London sale this week, the unit being on the average 10c per half-kilo, or 1 1/4-5ths d.

per lb. Druggists' barks in good bold sivery to small broken quills and chips sold at 12c to 110c par half-kilo. (equal to 2d to 1s 8d per lb.); druggists' root bark at 12c to 22c per half-kilo. (equal to 2d to 4d per lb.) For manufacturing barks of all varieties, good rich quills, chips, and shavings, the prices ranged from 7c to 79c per half-kilo., or 1½d to 1s 2½d per lb., and for manufacturers' root from 14c to 72c per half-kilo. (equal to 1½d to 1s 1d per lb.) The principal buyers were the Brunswick Factory and the Amsterdam Quinine Works.

The auctions held today at Amsterdam contained 2,575 bales and 399 cases Java cinchona, weighing together about 230 tons, of which about 185 tons are manufacturers' bark and 45 tons druggists' bark. The average test of the former was 4.3 per cent, and the quantity of sulphate of quinine in the bark about 315,000 oz. Eight tons contained 1 to 2 per cent sulphate of quinine; 27 tons, 2 to 3 per cent; 51 tons, 3 to 4 per cent; 40 tons, 4 to 5 per cent; 34 tons, 5 to 6 per cent; 6 tons, 6 to 7 per cent; 16 tons, 7 to 8 per cent; 2½ tons, 9 to 10 (9.38) per cent. The above-named 399 cases and 2,575 bales were divided as follows:—Legeriana, quills 4 cases; broken quills and chips 1,622 bales; root 484 bales. Officialis, broken quills and chips 126 bales; root 3 bales. Hybrid, broken quills and chips 81 bales; root 1 bale. Succirubra, quills 376 cases; broken quills and chips 14 cases and 167 bales; root 82 bales. Schukraft, quills 5 cases; broken quills and chips 9 bales.—*Chemist and Druggist.*

EXPORTS FROM JAVA.

(From the *Manchester Guardian* of 15th Jan. 1889.)

TEA.		
1887-88	3,427,781	kilos.
1886-87	3,329,004	"
1885-86	2,607,613	"
1884-85	2,998,967	"
CINCHONA BARK.		
	Government.	Private.
1887-88	575,986 bales.	2,916,927 bales.
1886-87	660,433 "	1,569,842 "
1885-86	457,267 "	1,673,889 "
1884-85	419,460 "	776,510 "
COFFEE.		
1887-88	514,907	piculs.
1884-85	1,308,480	"

[I send you particulars of Java exports. Tea export is only 200,000 lb. ahead of last year, and only increased one million pounds (1,000,000 lb.) since 1884-85. I think a kilo is about 2 lb.: is it not? (2 1-5th lb. avoirdupois.)

The bark export is a different pair of boots: 1,400,000 private bales 1887-88 over the quantity in 1886-87. It is true the Government bark export is 90,000 bales less, but the private plantations seem to be going ahead very fast. Then their bark is so much better than ours.

Coffee.—Poor old coffee in Java just as in Ceylon

Fall of ... 793,573 piculs in 3 years.—*Cor.*]

TEA IN RUSSIA.

In the Consular report for 1887 on the trade of St. Petersburg, Mr. John Michell writes:—

There was a greater supply of tea at the Nijni Novgorod fair than in 1886. The prices of teas brought overland through Siberia were considerably higher—from 5 r. to 10 r. for the lower qualities, and from 10 r. to 15 r. per box for the higher kinds of sea-borne teas; but Canton and Hankow teas were not in equal request, and their sale showed a decrease of 10 per cent. as compared with 1886. This is ascribed to the bad qualities of the sea-borne tea, among which, according to local opinion, but there is but little of the superior kinds so highly esteemed in Russia to be found.—*H. and C. Mail.*

A NEW FIBRE FROM THE COTTON PLANT.—A manufacturing firm in New York has sent to the Department of Agriculture specimens of a new fibre they are making from the stalk of the cotton plant. The samples received strongly resemble hemp, and seem to be adapted to all the uses that hemp is put to. A few fibres of it twisted together in the hand show remarkable tensile strength, although no exact comparative tests with other fibres have yet been made. A collection of the fibres of hemp, flax, jute, ramie, etc., from all parts of the world is being made by the Department, and a new instrument has been invented by which it is expected that the tensile strength of each will be ascertained with great accuracy. If the cotton plant turns out to furnish as valuable a fibre as now seems possible, an important new source of profit will be afforded the cotton planters of the Southern States upon their crops.—*Science.*

TO SIAM AND MALAYA IN THE DUKE OF SUTHERLAND'S YACHT "SANS PEUR" by Mrs. Florence Caddy. (Hurst & Blackett.)—In a review of this work in the *Athenæum* of 12th Jan. we find the following reference:—

"In fact, the two most interesting passages in Mrs. Caddy's work are those in which the doings of the Italian army at Massowah and Dr. Trimen's botanical labours in Ceylon are respectively described."

Further on we find that

"when describing Johore and the hospitalities enjoyed there the author observes: 'By all this it will be seen that Johore under its present Sultan affords a good field for enterprise to natives as well as Europeans.' It must not, however, be supposed that Europeans of the operative classes are meant—the climate is too hot for them; but there seems certainly some reason to think that Johore is one of the places where young men of a somewhat higher station, if possessed of industry and a little capital, might find an opening." We read the statement made on the succeeding page that guttah percha was first brought into use from Johore with surprise. 'Percha,' we had thought, was the Malay name for Sumatra, and guttah Percha we had understood to mean the gum from Sumatra, not Johore."

DOSING TREES WITH MEDICINE.—Referring to the popular idea that sulphur placed in holes bored in the trunks of trees will be dissolved and carried by the sap to the foliage in such quantities as to render it offensive to insects, a recent *Bulletin* of the Massachusetts Agricultural College Experimental Station says that it has been found upon cutting down trees which have been plugged with sulphur that the material remains unchanged for many years. It is added that while we are spending so much effort to prevent injury to our trees from borers we certainly ought not to make holes in them many times larger than those made by any known species of insect. In order to ascertain whether sulphur in soluble form can be introduced into a tree so as to affect the fungus growths causing rusts, blights, and mildews, some large rose bushes, badly mildewed, were treated with saturated solutions of potassium sulphide, hydrogen sulphide, and ammonium sulphide. The liquid was forced into holes bored into the main stem with a small gimlet, and the orifice was plugged with grafting wax. At first a slight improvement in the amount of mildew upon the leaves was noticed, but in September all the bushes but one were dead, presumably from the effect of the holes. Until further trials are made, this experiment indicates that while there may be some promise that antiseptics introduced into the sap circulation may prevent the growth of fungi, some safer means of introducing solutions must be found. From the nature of the case it is hardly possible that any substance can be introduced into the circulation in sufficient quantities to affect insect life. Professor Maynard, who prepared the *Bulletin*, suggests that an inspection be made next season of the elms in Boston which were bored and filled with chemicals last spring to make the leaves distasteful to beetles. Careful weighing would determine how much of the powder had escaped from the hole, and analysis could detect the presence of any excess of sulphur in the leaves.—*Home Paper.*

THE HAMBURG MARKET is at present regularly supplied with African tobacco, coming from the Cameroons plantations at the West coast, and from Messrs. O'Swald and Co.'s Zanzibar plantations from the East coast. The produce of Cameroon is more actively demanded, the Zanzibar tobacco has a bad smell and taste, while the Cameroon's produce burns badly. In spite of this latter fact, the Cameroon produce has been paid with m.3 per lb., while the Zanzibar tobacco could realise but m.1.20 per lb.—*L. & C. Express*, Jan. 18th.

COTTON AND COAL IN INDIA are thus noticed in the *Indian, Colonial and Foreign Engineer and Builder* :—

Thirty years ago Indian cotton manufactures were at their lowest ebb; but it was not the manufacture itself, but the mode of conducting it that had become obsolete. The day of the hand-loom of India had passed away, but the industry was to arise in a new form. In 1854 a mill for the manufacture of cotton yarn and cloth was erected in Bombay, and by 1884 there were upwards of one hundred cotton and jute mills working in India, with 22,000 looms, 2,000,000 spindles, employing more than 110,000 people. This enormously rapid development, however, but the commencement of an industry of which the ultimate extent is impossible to forecast. The prosperity of industries consuming great quantities of power must depend largely upon the fuel-producing capacities of the country. In India coal mining is now being developed, and the difficulties in applying Indian coal have now been so far mastered that 95 per cent of the coal used in Bengal for its railway system and for its steam industries is raised in the country. It must not be thought that the jute and cotton industries will alone continue to improve; fresh industries will arise, and other commodities will be put upon the market. With growing improvements in the uses of fuels for obtaining power, and with the increasing capital which must follow upon increasing commerce, the actual progress of the next thirty years should be far greater than that of the past thirty. The capabilities of India as a producing country, in the widest sense of the term, may be regarded as immeasurable, their development being only limited by the means of conveyance and distribution available to those by whom her industries are directed.

LANIANA BUSHES KILLED BY KEROSENE.—From the *Honolulu Planters' Monthly* we quote as follows:—

The invasion of the laniana bush has become a matter for very serious consideration. In Kona, Hawaii, on some parts of Maui, in this island and on Kauai, it has grown very largely, and the impervious nature of its dense jungle renders it a formidable foe to both agriculturist and grazier. The seeds are spread by various birds, and take root in the thinnest soil; many rocky wastes have been covered with it, and in this respect, could it be kept within bounds, it might be a plant of some service in forming soil and giving shade to permit small undergrowth. But as a forcible occupant of usable and grazing land it is very undesirable. The young seedlings can readily be pulled up if they can be reached, but the roots are tough and woody, and full of vitality. The only successful plan so far, adopted for destroying the roots, other than the costly one of hauling them up, is reported by Messrs. Lowrie of Maui, and Gay and Robinson of Kauai. The latter gentlemen say as follows:—“Laniana is destroying a great deal of the pasture land of this island and threatens in time to cover every spot of uncultivated land. For the last two years we have had a gang of Chinamen digging it up by the roots, which costs us at the rate of \$2,000 per year. We are in hopes of preventing its increase; it is not likely that we will be able to thoroughly eradicate it, as it will always be spread by the birds. We have found that a little kerosene oil put on a large bush which has been cut will prevent its growing again.” Mr. Lowrie says:—“The small bushes we pull up, but the larger ones we saw of close to the ground and poured the oil on the stump. The result is good; every little bush is destroyed; and I wish others would try this remedy and clear the country of this pest.”

TOBACCO COMPANIES seem to be all the rage in London at present, and more especially for the cultivation of this product in North Borneo. There are three Companies afloat with large amounts of capital, and there is besides an “Anglo-Dutch” Company started to work in Sumatra with a capital of £100,000.

A PRODUCE OF AFRICAN AGRICULTURE, viz., tobacco, has repeatedly been brought to our market, but with different success. The tobacco from the German settlements at the west coast of Cameroons is of valuable quality, and well adapted for cigar manufacture; last arrivals realised m. 3 per lb.; the tobacco from the plantings at Zanzibar has not found much favour, although its appearance is good; the intrinsic value of that produce being of no importance, while the taste is disagreeable, the future of that product is not said to be favourable, in spite of the care with which the packings are made up.—*L. & C. Express*, Jan. 11th.

COTTON CULTIVATION IN THE NORTH OF CEYLON.—We learn that His Honor Sir Edward Walker was surprised during his Jaffna trip to learn how great a hold of the people the cotton industry had got. Not only is the shrub grown, but cotton gins to separate the seeds seemed to be common. It must be remembered that not only the growing but the spinning and weaving of cotton were quite extensive industries 40 and 50 years ago in the North and East of the Island. There were then many thousands of looms in the Northern and Eastern Provinces, and when the senior of this journal was Sub-Collector at Point Pedro he made a report to Mr. Dyke, showing how imported thread was superseding that locally made. From experiments made at that time in Jaffna by the Messrs. Whitehouse and Hardy he became very sceptical about cotton growing in Ceylon, but a ready local market for the crop makes all the difference in the world.

MILLET AS A FODDER PLANT.—In the report of the Hawaiian Planters' Labor and Supply Company, we find the following notice of a plant which ought to be tried as fodder in Ceylon:—

An excellent substitute for imported hay has been found in the grass known under the common name of millet. The botanical name is *Panicum Spectabile*, called in California “Evergreen Millet,” known in the Southern States as Johnson Grass, sometimes called “False Guinea Grass,” which is *Panicum Maximum*. A book entitled “Select Extra Tropical Plants,” by Baron Fred. Von Mueller, page 246, contains the following:—“*Panicum Spectabile*, the *Copiam* of Angola from West Africa, transferred to many other tropical countries. A rather succulent, very fattening grass, attaining the height of about four feet. It may be assumed that at present about 300 well defined species of *Panicum* are known, chiefly tropical and sub-tropical; very few extending naturally to Europe or the United States of North America, Japan or the southern part of Australia. Though mostly from the hot zones, these grasses endure a cooler climate in many instances, and some of them would prove great acquisitions, particularly the perennial species. Numerous good kinds occur spontaneously in Queensland and North Australia. *Panicum* is the genus richest in species among grasses.” Authorities upon the millets say that not less than 400,000,000 of the human race obtain their chief sustenance from the seed of these nutritious grasses. This article (evergreen millet) was introduced a few years since by His Honor Justice McCall, and has proved to be well adapted to our soil and climate. A cutting of millet lately made on the premises of J. Lee McCall, now occupied by the Woodland Dairy and Stock Company, gives about two and one-half tons to the acre—a growth of two months. Two crops can be taken off in the year. It proved to be an excellent article of feed. No doubt thousands of tons of this grass might be raised in these islands every year.

THE ANDAMAN ISLANDS.

Colonel T. Cadell, V. C., Chief Commissioner of the Andaman Islands, delivered a lecture on Jan. 15th on "Andamans and Andamanese" to the members of the Royal Scottish Geographical Society in the Freemasons' Hall, Edinburgh. In the course of his lecture, Colonel Cadell said that it was beyond his ability to describe the lovely scenery through which one passed when sailing among the Andaman Islands, covered as they were with luxuriant vegetation down to the water's edge. It was like fairyland; the water deep and clear as crystal; on either side, within a stone's throw, magnificent forest trees reaching to a height of 200 feet, the stems of some straight and white, like gigantic silver rods, with umbrella-like tops; others clothed from foot to summit with creepers in beautiful festoons; palms, rattans, and canes of many varieties interspersed among the forest trees, creating striking contrasts of form and colouring, while beneath the vessel were inconceivably beautiful coral gardens. The most gorgeous combination of vegetable and animal life afforded but a poor sub-aerial representation of these submarine gardens. Year after year in his cruises among the islands he saw a perceptible diminution in the number of the people, the principal causes of which were apparently syphilis and pneumonia. Hardly one woman in a dozen bore children, and the mortality was very great among the few children that were born. It was undoubtedly a moribund race, and probably none of them would be found alive some twenty or thirty years hence, except perhaps in Little Andaman, where the inhabitants had been kept free from the dire effects of contact with civilisation. They were merry little people, and it was very saddening to live among them and realise that they were so fast dying out. One could not imagine how taking they were. Every one who had to do with them fell in love with them. Contact with civilisation had not improved the morality of the natives. In their natural state they were truthful and honest, generous and self-denying. He had watched them sitting over their fires cooking their evening meal, and it was quite pleasant to notice the absence of greed and the politeness with which they picked off the tit-bits and thrust them into each other's mouths. The forest and sea abundantly supplied their wants, and it was therefore not surprising that the attempts to induce them to take to cultivation had been quite unsuccessful, highly though they appreciated the rice and Indian corn which were occasionally supplied to them. All was grist that came to their mill in the shape of food. The forest supplied them with edible roots and fruits. Bats, rats, flying foxes, iguanas, sea snakes, molluscs, wild pig, fish, turtle, and, last though not least, the larvæ of beetles, formed welcome additions to their larder. He remembered one morning landing by chance at an encampment of theirs under the shade of a gigantic forest tree. On one fire was the shell of a turtle acting as its own pot, in which was simmering the green fat delicious to more educated palates; on another its flesh was being boiled together with some splendid fish; on a third a wild pig was being roasted, its drippings falling on wild yams, and a jar of honey stood close by—all delicacies fit for an alderman's table. The penal settlement at Port Blair, on the east coast of South Andaman, was probably the largest in the world, the number of convicts detained there generally numbering about 12,000. About three-fourths of them were under sentence of transportation for life, and the remainder for terms of seven years and upwards. About 65 per cent. were Hindoos, 25 per cent. Mahomedans, and the rest chiefly Buddhists from Burma. They came from all parts of India and Burma, the refuse of 250 millions of people, and in the diversities of castes and nationalities and languages among them lay a great safeguard, as it prevented any likelihood of combination.—*O. Mail*, Jan. 18th.

COFFEE AND "GREEN BUG."—An old planter advising a friend who also still holds by coffee writes:—"I say manure if you can find the money. The pest will go. Green bug is not so much to be dreaded as *Hemileia vastatrix* which no longer gives me or my coffee any trouble."

CEYLON TEA IN AMERICA.—Mr. McCombie Murray goes ahead too much altogether, in his proposals, for the purses of the poor Ceylon planters; and though personally flattered by the part he allots to us in his scheme, we feel we must all "bide a wee" for an attack so elaborate and costly.

A CORAL OR PETRIFIED TREE some 6 to 7 feet high and over 10 feet in circumference can be seen under the care of the clerk at Mount Lavinia station. It was brought ashore at Dehiwala; and with its delicate branches and twigs all glazed over, and root embedded in coral lime with oyster and other shells attached, it is one of the most perfect specimens of the kind we have seen. It ought to be secured for the Colombo Museum.

PEPPER CULTIVATION.—We call attention to some very useful practical hints given by our correspondent "Peppercorn" in his spicy as well as instructive contribution in another page. We have a couple of letters besides, from other planters, on the same subject in type. So far from interfering with our Manual, every such bit of information is welcome as an additional item worthy of record in the volume. "In the multitude of counsellors there is safety," and certainly we want to have the results of a diversity of experience.

THE CHOOMSALI TEA COMPANY, Limited, is registered with a capital of £20,000 in £5 shares. The stated object is to acquire and take over as and from January 1st, from the present owners the gardens, plantations, factories, lands, and property situate in the district of Gauhati, in the province of Assam, and known as Choomsali, Mudgooria, Bosisiti, and Benderjan tea gardens, collectively worked as the Choomsali estate, with their dependencies, machinery, implements, utensils, live and dead stock, and all other property of whatever kind thereunto respectively belonging, at the price of £20,000, to be paid to the vendors, £13,335 in cash and the balance in paid up shares. It is provided that the number of directors shall not be less than three nor more than five, and the qualification of a director shall be the holding in his own right of at least £500 in the capital of the company. The remuneration of the directors is to be at the rate of £125 per annum, and whenever the company declare a dividend exceeding 10 per cent the directors are to be entitled to an additional £50 for every one per cent beyond 10 per cent.—*London Cor.*, *Times of India*.

HARD AND SOFT PALM OIL.—The staples of trade in the Benin river, in Western Africa, are palm oil and palm kernels. From 1872 to 1881 trade was stopped in kernels. The stoppage, says the *O. P. & D. Rep.*, was associated with the death of an old king of Benin, from which the people were led to believe that if they allowed the kernel trade their "big men" would die. The busy season in the trade is from April to July. On the Benin side of the river, that is the right bank, soft oil is the staple; whilst on the left bank, and eastward, hard oil is obtained, the difference of manufacture being that one—the hard oil—is the result of the cold process as regards manufacture, while soft oil is obtained by the boiling process. Palm oil is packed in casks holding from 225 to 240 gallons. Hard oil is not acceptable in the German markets; it has to be sold in England. The soft oil is said to be as good, if not the same, as Lagos oil; yet it rarely commands the same price. Kernels are bought by cask measures of half a ton each, used for the purpose. Hamburg offers no present sale for Benin hard oil; nor will Benin soft oil, although said to be equal to that of Lagos, fetch as much as the latter.—*Chemist & Druggist*, Jan. 5th.

THE HYBRIDISATION OF CINCHONAS.

To the Editor, "Pharmaceutical Journal."

Sir,—The paper on the above subject, kindly read for me by Dr. Thresh at the Bath meeting of the Pharmaceutical Conference, met with some criticism, which requires a brief reply. The object of the paper was to point out, what does not seem to have been done before, that in each of the two species of cinchona, *succirubra* and *officinalis*, there is a characteristic arrangement of alkaloids, and that these characteristics are blended in the hybrids. Such an arrangement cannot be intelligibly represented by quoting the actual analysis of the barks with their varying totals, but only by giving the centesimal composition of the alkaloids, for whether the totals be high or low, the peculiarity of the arrangement is to a great extent preserved in each species. The fifty crown barks were nearly all taken under the supervision of the Director or myself from what are known as *pukka* *officinalis* trees, growing on the Nilgiris, away from the *succirubra*; barks of the richer species, as *angustifolia*, were purposely omitted, and it must be remembered that mossed and renewed barks are eliminated from the table. I must, therefore, ask Mr. Hodgkin to withdraw his statement that my crown barks were taken from hybrid trees, I thought the nomenclature of hybrids was now well understood by those who have anything to do with cinchona; since it is not, I may explain that "*robusta*" is a term applied in Ceylon to all forms between *officinalis* and *succirubra*, while on the Nilgiris two forms are specified as *pubescens* and *magnifolia*, and I prefer using these older terms given originally by Mr. McIvor.

I cannot answer for the Indian Government, but the Government of Madras has no desire to grow worthless barks. The useless varieties, such as *paludiana*, *micrantha* and *nitida*, once cultivated so largely, are now exterminated; the whole of Doda-beta plantation, some 300 acres in extent, is under crown bark, a kind Dr. Paul himself recommends. At Naduvatam the *succirubra* trees are giving way to hybrids raised from analysed seed of trees giving about 5 per cent. of sulphate of quinine in their bark. The ledger and its hybrid will not grow on the Government plantation, and much time has been wasted attempting its propagation. The hybrid of red and crown species not only gives a large outturn of bark per tree, but it also stands renewal better than other cinchonas. With such trees in the estates we do not consider the cultivation to have failed in producing barks fit for the manufacture of quinine.—D. HOOPER, Ootacamund.

THE MADRAS AGRICULTURAL DEPARTMENT

is to be the subject of inquiry. In an official paper we read

His Excellency the Governor in Council thinks it expedient that a comprehensive inquiry should be instituted into the constitution and operations of the Agricultural Department with the view of ascertaining what practical good it has done and is doing, and what good such a Department might do under other conditions. He has accordingly resolved to appoint a Committee consisting of the following official and non-official gentlemen, the latter having signified their willingness to give their services for the investigation:—

Official.—W. Wilson, Esq., Chairman; J. Grose, Esq.; F. A. Nicholson, Esq., Secretary.

Non-official.—Rajah Sir P. Mathaya Row, K.C.S.I.; Honble P. Chentala Row, C.S.I.; J. Adam, Esq.; Rai Bahadur A. Sabapathi Mudaliar Avargal.

The Committee's inquiries should be directed to the following points, and the Government trust that they will be able to submit their report within a period of three months:—

1. What benefit has accrued or is likely to accrue to the cultivating classes from the Agricultural Department as at present constituted?

2. What improvement it has effected or is likely to effect in seeds, implements, breeds of cattle, sheep and horses and methods of cultivation throughout the Presidency?

3. What inducements does it hold out to ryots to improve their stock and mode of agriculture?

4. Its operations in regard to cattle disease, and the benefits resulting from those operations.

5. The operations in connection with, and the benefits derived from the stock farm administered by the Department—with financial results.

6. Whether the breeding of stock can be properly or economically carried on by Government.

7. The duties of the officers employed under the Department.

8. The best means of increasing the efficiency of the Department, having special reference to the benefit of the agricultural community.

9. The course of study pursued at the College of Agriculture.

10. The class of students at the College and the conditions under which they come to it.

11. Whether the students engage in agriculture after leaving the College?

12. Whether the College ought to remain under the control of the Director of Public Instruction?

13. Whether the Agricultural Department ought to continue to be administered by the Board of Revenue?

14. Whether the Agricultural Department ought to be restricted to matters connected with Agriculture?

ROYAL GARDENS, KEW.

(From the Bulletin of Miscellaneous Information.)

JOB'S TEARS.

(*Coix Lachryma*, L. var. *stenocarpa*.)

The round shining fruits of a grass widely distributed in tropical countries are familiarly known as Job's Tears. The fruits when young are supposed to have some resemblance to heavy drops of tears, and hence the fanciful name they bear. The plant, a native of the East Indies and Japan, belongs to the tribe *Maydeæ* of the natural order, Gramineæ. It is a tall growing grass, now commonly found in damp places in the tropics of both hemispheres. In many countries it is regarded as a troublesome weed and a source of annoyance, especially in rice fields. As far as we are aware, the fruit possesses no nutritive qualities, and, except in one instance which has come under the notice of Mr. C. B. Clarke, F.R.S., in the Naga Hills, Assam, it is not cultivated as a grain nor used in the wild state. The stem is stout, erect and smooth in all its parts. In favourable situations it often attains a height of three to five feet. The leaves are broad and flattish, about a foot long, with a distinct midrib. The flowers are monoecious, male and female in different parts of the same panicle. The female flowers are one or more in number at the bottom of each branch of the panicle. They are enclosed in a hard bottle-shaped or round white or grey involucre, from which the long stigmas protrude. The male flowers are in the upper spikelets, numerous and two-flowered. After flowering, the simple branches of the panicle break away above the female spikelets, so that when the fruit is ripe, the male spikelets have entirely disappeared.

The globular Job's Tears as commonly found in the tropics are used for necklaces, and in various ways as articles of ornamentation. The usual colour is white, but they are sometimes found slightly tinged with pink, and sometimes grey, or almost black.

The present variety of Job's Tears with long cylindrical involucre was brought into notice at the late Colonial and Indian Exhibition, 1886. In the ethnological collections in the Indian Court the clothing of Karens (a semi-aboriginal tribe inhabiting certain districts of Lower Burma) was prettily ornamented with these cylindrical involucre, and attracted considerable attention. As these were not represented in the Kew museum, application was made to the India Office for a small sample, which, at the request of Lord Cross, was lately forwarded to Kew by the Chief Commissioner of Burma. The involucre in this sample vary from five to nine lines in length.

They are usually more or less fusiform, tapering at the ends to about one line in diameter. The mean thickest part is about $1\frac{1}{2}$ line in diameter. For herbarium specimens of the plant yielding these fruits, we are indebted to Dr. George Watt, Scientific Assistant to the Director of Agriculture, Calcutta. There is a form with shorter involucre collected at Mergui by Mr. Griffith. In a note attached to pl. 1,764, in the *Icones Plantarum*, Vol. VIII., Professor Oliver states that the Kew Herbarium possesses, in addition to the packet of involucre from the India Office, a letter from Mr. R. Burce, of Balipara, Assam, to Mr. H. C. Read, of the British Museum, saying that the involucre are known to the Assamese and the Meris, and called by them the cowr-monee or crow bead, from the fondness of these birds for the berry."

In an office memorandum, dated Simla, 22nd December 1887, Dr. Watts states, that "the grain (of this variety of Job's Tears) is not likely to prove of any great economic value as a source of food, but it stands an admirable chance of being largely used in Europe in the construction of artificial flowers, laces, bugle trimmings, and other purposes for which glass beads are being used. If capable of being dyed a deep black colour, there might be a very extensive demand, since such beads would be infinitely more durable than glass. During the Exhibition, several gentlemen, especially from France, inquired after seeds suitable for the above purposes. The writer was not able at the time to furnish them with samples of the cylindrical form of Coix now under consideration, but showed them the ordinary spherical form. They seemed to think there was some prospect even of the common spherical form coming into use, but objected to its large size. This led the writer to show them the Karen garments with the cylindrical form of seeds used as decorations. This they were highly pleased with. In hopes of still further developing the matter, the writer drew Mr. Thiselton Dyer's attention to them, with the result that the present inquiry has now been instituted."

We are enabled, by permission of the Bentham Trustees, to add a plate of this variety of Job's Tears, from the current issue of the *Icones Plantarum* [Vol. VIII., pt. 3, pl. 1,764.]

RAMIE OR RHEEA.

(*Boehmeria nivea* var. *tenacissima*.)

The plant known under the several names of China Grass, Ramie, or Rhea, belongs to the natural order, *Urticaceae*, and hence it is not a grass at all, but a species of nettle, somewhat resembling in appearance and habit of growth the common nettle of Europe.

The China Grass plant, first known and long cultivated by the Chinese under the name of Tchou Ma, is the *Boehmeria nivea* of botanists. The specific name, *nivea*, was given to it on account of the white appearance on the under-side of the leaves. A plant called in Assam, Rhea, and in the Malay Islands, Ramie, was believed by Roxburgh to be distinct from the Tchou Ma of the Chinese, and it was named by this botanist *Boehmeria (Urtica) tenacissima*. In this plant there is an absence of the white-felted appearance on the under-side of the leaves, so characteristic of the China Grass plant, but in all other respects the two plants are identical in their botanical characters.

For purposes of classification, the Tchou Ma, or China Grass plant, *Boehmeria nivea*, may be accepted as the typical species, and the Rhea or Ramie retained as a geographical variety of it, under the name of *Boehmeria nivea* var. *tenacissima*. This latter is sometimes known as the Green-leaved China Grass, a name which may be conveniently retained for it.

The fibre yielded by these plants has been long recognised as pre-eminent amongst vegetable fibres for strength, fineness, and lustre. Hence numerous attempts have been made to cultivate them, and to prepare the fibre in large quantities for commercial purposes. The plants are exceedingly easy of cultivation and thrive in all soils, but preference should be given to those of a light loamy character. It is essential

that the climate be moist and stimulating, in order to produce abundant and frequent crops of stems. The plants may be raised from seed, but the more ready method is by root or stem cuttings. The roots being perennial, the stools become stronger and more vigorous every year, and from these, fresh sets are easily obtained for extending the cultivation.

Numerous attempts have been made during the last 10 years to extract the valuable fibre which exists in this plant. The experimental processes hitherto employed may be briefly classed as either mechanical or chemical. In the first, it has been sought to extract the fibre from the green stems, by means of rapidly revolving beaters attached to a drum driven by steam power. In some cases, water is used to wash the fibre while under the beaters. The chief difficulty experienced in this method, is the small quantity of fibre cleaned per day. This has enhanced the cost to such an extent, as to render the process practically unremunerative. In the chemical processes, the Ramie stems are treated green or dry. The object sought is to treat the stems either under great pressure with steam or with chemicals, so as to dissolve the gum in which the individual fibres are immersed. After being thus treated, the fibres are easily detached from the stems by hand or by machinery, are sent to market in the form of ribbons. The question of cost is here also very important, and it is felt, under present circumstances, that China Grass can only be satisfactorily grown and prepared where there is an abundance of cheap labour.

It is a fact universally known, that the fibre of the China Grass is one of the finest and strongest known. If a process could be devised that would extract and clean the fibre at a cheap rate, the results would prove of the greatest possible interest to all our tropical colonies. The China Grass plant can be grown as easily as the sugar cane, but in spite of many years of continuous effort, the problem how to prepare the fibre on a large scale, and place it in the market at remunerative rates, is apparently still unsolved.*

We gather from the numerous applications made to Kew for information, that interest is still maintained in the China Grass or Ramie, and under these circumstances it is felt to be desirable to place on record the latest facts that have been gleaned respecting the present position of the industry.

ROYAL GARDENS, KEW, TO FOREIGN OFFICE.

Royal Gardens, Kew, April 16, 1888.

Sir,—I am desired by Mr. Thiselton Dyer to inform you that considerable interest is being taken in British Colonies in the culture of the Ramie plant, known as Rhea and China Grass (*Boehmeria nivea*).

2. Hitherto the industry has not assumed large proportions anywhere, owing to the want of a thoroughly suitable machine to prepare the fibre.

3. In the Foreign Office Report, for the year 1887, on the agriculture of the Barcelona district [No. 275, Annual Series, 1888], Mr. Consul Woodbridge states, that in the province of Cataluña, "Machines are already in use, capable of decorticating the [Ramie] fibre on a profitable scale."

4. Mr. Thiselton Dyer is of opinion that it is very desirable to obtain from Mr. Woodbridge the names of the makers of the machines which appear to have successfully solved the problem of decorticating Ramie stems. Any particulars he could add as regards the cost of the machines, the power necessary to drive them, and the out-turn of clean fibre per day, would prove of the greatest possible interest to planters in our tropical countries. I have, &c.

Sir T. Villiers Lister, K. C. M. G. (Signed) D. MORRIS.

Mr. Consul WOODBRIDGE to the Marquis of SALISBURY.

Barcelona, April 25, 1888.

MY LORD MARQUIS,—I have the honour to acknowledge the receipt of Sir James Fergusson's des-

* This is true and strangely true, considering the boasted progress of science. Even in the United States we suspect the difficulty has not been overcome.—ED. T. A.

patch, of the 19th instant, on the subject of the machines used in Oataluña for decorticating the stalks of the Ramie plant; and I am directed to report to your Lordship the names of the makers of the machines, and to give any further particulars which might prove of interest to planters in British tropical colonies.

Although the Ramie plant has been cultivated for many years in the north of Cataluña, it is only within the last two years that, through the invention of a decorticating machine by a Monsieur Favier, member of the "Société La Ramie Française," it has been brought before the public. M. Favier has a factory, called the "Fabrica Favier," at Torroella de Montgri, in Gerona, in the vicinity of the Ramie plantations, where his decorticating machines are at work.

These machines are used to decorticate the stalks in a dry state, after having been cut and exposed to the powerful rays of the sun for 48 hours, as experiments and practice show that the operation on the green Ramie is impracticable.

It appears that M. Favier has been the first to solve the problem of decorticating Ramie with success; and, according to Professor Obiols, his machine leaves nothing to be desired; and of this invention the "Centralblatt," of Berlin, in its number of January 23, 1883, says:—"Although the use of the Ramie, as a textile plant, dates from time immemorial, the separation of the fibre from the stalk has been found hitherto so surrounded with difficulties that no hope existed of any considerable extension in its use; however, since M. Favier has discovered a machine for the purpose of separating the fibre, a real revolution has been produced in the industrial world, and the cultivation of the Ramie plant has taken extraordinary proportions."

Another decorticating machine, similar to the Favier one, has, however, been invented by a Monsieur Billion, of Marseilles, who obtained a patent for it in Spain, but, being considered by M. Favier as a piracy, the latter prosecuted M. Billion, who eventually came out triumphant; and, although this machine has not been used in Spain, some persons consider it to be superior to the Favier one.

Full descriptions are given of these machines in Professor Obiols' pamphlet (in Spanish), and can be purchased for a few pesetas.

The Billion machine can produce 300 kilogrammes of fibre a day, showing an advantage over the Favier one.

The Favier machine is not for sale to the public, the inventor preferring to establish factories near the plantations and purchase the produce from the agriculturists, and decorticate and manufacture threads, &c., himself, as the "Société La Ramie Française" is doing at Torroella. Neither, I believe is the Billion machine to be acquired for money.

There is another machine, known as the "Agramadera (flax dresser) Kaulek," invented by M. Kaulek, of Paris. Its size is a cubic metre, and it requires half a horse-power to put it in motion, and can be worked by the arm, by a windmill, or by steam. It is portable, weighs 350 kilos., and its price is 2,000 fr. (80%). It has been known to produce 175 kilos. of commercial Ramie, in ribbons, in 10 hours.

Another machine has been invented in Barcelona by Don Demetrio Prieto, for extracting fibre from textile plants, and many of his machines are in use, with success, in Mexico. The inventor is about to introduce certain modifications in this machine, in order to adapt it to the decortication of the Ramie plant.

The personnel required to work the Favier machine, and the cost per diem (in Cataluña), are as follows—

	Pesetas c.
Two men to separate the extremities of the stalks	0 75
One man to introduce the stalks ...	1 50
One man to remove the fibre ...	1 50
One man to supply the stalks to the introducer	0 75
	5 25

or about 4s. per day for each machine; and for, say, a 1,000 kilos. of dry stalks the proportional out-turn would be as follows:—

- 50 kilos. of extremities, or 5 per cent. of the whole weight.
- 190 kilos. of fibre, or 20 per cent. of the whole weight.
- 370 kilos. of wood.
- 100 kilos. of pellicles, and
- 90 kilos. of loss.

Yet the wood, extremities, and pellicles may all be utilised.

Taking the working of 20 of Favier's machines, which would require about 10 horse-power of steam, the expenses and profits result as follows:—

Cost of installation, 120,000 pesetas, or francs, each machine costing 6,000 fr., with the necessary capital of 60,000 fr.

Actual cost of stalks of Ramie (in Spain), 100 pesetas per 1,000 kilos.; and each machine decorticating 216 kilos. per day.

<i>Expenses.</i>		Pesetas	c.
4,320 kilos. of stalks	432	00	
Labour	108	00	
Incidental expenses	122	00	
Total	662	00	
<i>Products.</i>		Pesetas	c.
5 per cent. of extremities	10	80	
20 per cent. of decorticated stalks, or 864 kilos. of fibre	864	00	
57 per cent. of wood	61	50	
10 per cent. of pellicles	17	20	
9 per cent. of loss.			
Total	953	50	
Total products	953	50	
Total Expenses	662	00	
Clear profit per day	291	50	

or 117,150 pesetas per annum of 300 days of labour, which represent approximately 48 per cent. of the capital.

The Favier machine has the advantage of extracting the fibre and making the threads clear of gum, for in the raw Ramie which comes from China and India, there is so much gum that it is most difficult to cleanse. These machines, as I said before, are not yet within the reach of agriculturists, that of M. Favier being used by the inventor, and that of M. Billion having ceased to work in Spain.

I have, &c.
(Signed) FRANK WOOLDRIDGE.

BOTANICAL STATION AT LAGOS.

In the *New Bulletin* for the months of June and July 1887, there were discussed the details of a scheme of botanical stations for the West India Islands. These botanical stations are intended to supplement the operations of the botanic gardens already established in the larger islands, and are simple and inexpensive agencies, chiefly devoted to the work of raising and distributing useful economic plants, and to cultivating experimentally on a small scale such vegetable products as offer the most convenient and suitable means for improving local industries. Botanical stations, as distinct from botanical gardens, are intended to be supervised by working gardeners, native or European, who have been specially trained in the details of nursery work in the tropics.

Profiting by the experience gained in the West Indies, it has been sought to extend the system of botanic stations to the West African Colonies, which hitherto have been without a local botanical agency of any kind.

The prosperity of these colonies has chiefly depended on palm oil, ground nuts, and various forest products, more or less of a precarious character. These are just now in a depressed state, and hence it is felt that some effort should be made to encourage the growth of coffee, cacao, maize, indigo, rice, cotton, ginger, india-rubber, coconuts, tobacco, and any other plants suited to the soil and climate.

Captain Moloney, C.M.G., the present Governor of the Colony of Lagos, has given considerable attention to West African products. He has been in correspondence with Kew for many years, and contributed numerous specimens to the museums, as well as dried plants for purposes of determination. Recently, Captain Moloney has published a work on the forest products and economic plants of West Africa, which is a valuable summary of information relating to the flora of tropical Africa.*

The principal West African Colonies are the Gambia, Sierra Leone, Gold Coast, and Lagos. The extent of these Colonies may be estimated from the fact that the coast line of the Gold Coast Colony alone is 350 miles, and that the total area of the British Protectorate is from 24,000 to 30,000 square miles. The staple products of this Colony are palm oil and palm kernels, but among other exports are copra (from the coconut palm), guinea grains, gum copal, camwood, and benised. If once the natives inhabiting magnificent lands in this Colony were taught to cultivate economic plants in a systematic manner for purposes of export, the material wealth of the Gold Coast might be enormously increased.

Sierra Leone is a settlement with a coast line of about 180 miles, and an area of about 3,000 square miles. Agriculture is generally neglected, and the inhabitants are mainly supported by the trade which passes through the Colony from the interior. An effort has been made to establish a botanical station and model farm near Kreetown in connexion with a botanical society, of which the Hon. S. Lewis is secretary. The finances of the Colony appear not to justify direct action being taken by the Government, but it is evident that, without official support, the aid of a skilled gardener, and regular supplies of seeds and plants, the results attained will not have an appreciable effect upon the welfare of the settlement.

The Gambia is a comparatively small settlement, the total area being about 89 square miles. The chief exports are ground-nuts, rice, maize, palm kernels, and india-rubber.

The Colony and Protectorate of Lagos contains an area of about 1,071 square miles, and an estimated population of 100,000. It was separated from the Gold Coast Government in 1886, and erected into a separate Colony with Captain Moloney as the first Governor.

Lagos has unrivalled water communication with the interior, and a very extensive trade has therefore grown up, amounting to nearly a million and a quarter sterling annually. The exports are palm oil and kernels, gum copal, cotton and guinea grains. This Colony possessing excellent soil on the mainland, and good communication with the interior, offers every inducement to the extension of native cultures.

The first botanical station on the West Coast of Africa could not be better placed than at Lagos nor entrusted to more sympathetic hands than those of Captain Moloney. On the occasion of the latter's visit to this country last year, he prepared a memorandum on the subject for the approval of the Secretary of State. This memorandum was based on that already adopted for the West Indian Colonies, but modified to suit the special circumstances of West Africa.

[Then follows the Memorandum.]

At the request of the Secretary of State, the selection of a suitable man to take charge of the botanical station at Lagos was entrusted to Kew. The difficulty as regards the climate of West Africa and its unsuitability for laborious service on the part of a European gardener was sloved by obtaining a creole gardener trained by the botanical department of Jamaica. Mr. James MacNair, the man appointed, had been in charge of the Hope Nurseries at Jamaica for seven years, and was highly recom-

mended for his experience and knowledge of economic plants and the details of tropical agriculture. On his way from Jamaica to West Africa, he spent some time at Kew, and took out with him a Wardian case of plants and numerous packets of seeds with which to start operations at Lagos. In March of this year a further supply of seeds comprising 200 packages, obtained from the botanical gardens of Calcutta, Ceylon, and Jamaica was forwarded from Kew to Lagos.

As indicating the nature of the duties in which Mr. MacNair is engaged at Lagos, the following extract from a letter received from him on the 12th January last, will be read with interest:—

"I beg to say that a great many of the seeds from Jamaica and Kew, which I brought over with me, are doing well. I have them potted up in bamboo pots. I shall be very glad to get a further supply of all kinds of fruit and timber trees of the West Indies, such as Mahogany, Cedar, Juniper, &c. I am glad to inform you that I have succeeded in getting a few seeds of the No. 11 Mango and Black Mango, which I took with me from Jamaica to grow, and shall be able soon to propagate plants from them by grafts. I find that the Guinea Grass is very scarce; there are a few roots scattered about the country, but of a coarse kind, like the St. Mary's Grass of Jamaica, but not known in the country as a fodder for stock. Also the Guinea Corn is a very poor kind. I would like much to have some good seeds. The plants from Kew, which I have established in their permanent places, are doing well. They look quite healthy, especially the Logwood, Annatto, Divi-Divi, *Theobroma Cacao*, &c. I am still staying in the town of Lagos, the station-house being not yet completed."

Again, on the 6th March last, Mr. MacNair wrote as follows:—

"I have been engaged during the last two months making a road from the entrance to the Superintendent's house, seven feet in width, and planted out with a border of Bahama grass, three feet in width, and making up a couple of beds round the house for flowering and ornamental plants, which will give the place a neat appearance. The nursery is well sheltered with large fig trees, and in addition, I have put up a shed covered with palm leaves for protecting the younger plants. Our fence at present is a temporary one, made of palm leaves, but I expect soon to have a good fence put up. I have recommended a barbed-wire fence. My supply of water is no enough for irrigation purposes, and only just enough for watering plants. The river water cannot be used, as it is too salt, except in the rainy seasons, when it is fresh. The Governor has supplied me with a large quantity of Liberian coffee seeds, which have grown very nicely. I am now potting them, and except to get over 15,000 plants, which the Governor intends to distribute amongst the principal native men of the country. I have planted out a few of all the different fruit trees which I have in stock, also a few Liberian coffee and cacao, about the place as an experiment. The plants from Kew are all in good condition, and doing well. The logwood is fully two feet in height, and I am now taking cuttings from it. Our quarterly report is not ready for this mail, and will not be for a couple of weeks.....I have got a good supply of botanical books on hand; also the *Kew Bulletin*, sent me by the Governor, which I am making use of. The wish of the Government is to encourage the growth of indigenous trees and plants of marketable value, so that they may serve as a visible means of instruction to the natives of the country."

MEDICINE FOR TREES.—Dosing trees with medicine is the latest novelty. Sulphur is placed in holes bored in the trunks of trees. This is dissolved and carried by the sap to the foliage in such quantities as to render it offensive to insects.—*Indian Agriculturist*. [The statement that the sulphur is really carried into the circulation of the tree requires proof.—*Ed. T. A.*]

* Sketch of the Forestry of West Africa, with Particular Reference to its Principal Commercial Products. By Alfred Moloney, C. M. G., of the Government of the Colony of Lagos. (London: Sampson Low, Marston, Searle and Rivington, 1887).

TEA CONSUMPTION, AND THE PROSPECTS OF PLANTERS:

IS THE IMPERIAL DUTY LIKELY TO BE REDUCED TO 4D BY MR. GOSCHEN?

A Colombo merchant calls our attention to a remark of Messrs. I. A. Rucker & Bencraft in their Market Report of Jan. 10th to the effect that "some-times we almost feel we have reached the end of our tether as regards consuming power," and thinks that it is important such an opinion should be duly considered in Ceylon. He adds:—"there should be no mincing of the position in Ceylon, unpalatable though it may be." Most certainly there has been no shutting of our columns against unpalatable facts. We think we have put every side of the tea question very fully before our readers, and although we by no means accept the opinion of the Mincing Lane Brokers as correct or final, it is one that ought to be duly weighed especially by capitalists who feel inclined to extend the area now planted with tea.

And here, we may notice a remark made by Anglo-Indian tea-planting authorities, to the effect that Ceylon with 180,000 to 200,000 acres under tea may, at least be considered to have reached its maximum, as there was no more land available to plant. Never was a greater mistake! The gentlemen who—laying this "flattering unction to their souls"—would fain extend cultivation in Assam ought to be told that there is land in Ceylon sufficient to DOUBLE the present area of cultivation provided only that the margin of profit can be maintained at a rate to encourage the investment. Assam men should also know that large tea concerns in Ceylon now estimate the cost of their crop as low as 25 cents per lb. laid down at the shipping port, that is 4 annas, or we suppose at about 6½d per lb. in London. This, of course, is exceptionally favourable; but we suppose there are owners of a considerable area planted on virgin soil who are confidently aiming at keeping down outlay and charges to 7d or at most 8d delivered in London, and with large crops of leaf, there is a margin (one penny to twopence per lb.) sufficient, we suspect, to induce a certain area of planting of forestland every season. Unless, therefore, Anglo-Indian capitalists interested in Assam can compete at above rates, *they had better not plant any more!* It is quite true as noticed by a London merchant ("Mercator") elsewhere, that hitherto a very large proportion of the tea planted in Ceylon has been on old coffee land, and it is certain that all this will not pay if the average for our teas falls to 9d or below; but in our last Directory we counted that even in private hands there were still as many as 100,000 acres reserve fit for tea.

Now as to Consumption, we do not see why in the case of the United Kingdom, we should not look for an increase until the same rate per head is attained as has already been reached in the Australian Colonies. This would mean an enormous increase. For Australasia, we have now about 8 lb. per head per annum of tea consumed; in the United Kingdom, the rate is still under 5 lb. per head. Why should it not go on progressively to 6, 7, and 8 lb. per head?—especially if coffee is to become a scarce and dear article, and great prophylactic and temperance agencies, even increasing the popularity of the tea.

That cheer but not inebriate.

All this apart from the reasonable hope that in America especially, we ought to see the consumption

of tea annually increase while the Indian and Ceylon pure product both there and throughout Australasia, takes the place of the inferior and often adulterated, and "faced" China and Japanese article.

Returning, however, to the United Kingdom, there is another element to be counted on in considering the question of an increased consumption. It was referred to by a contributor the other day, and we have had the subject for some time under our attention. We refer to the possibility of a reduction of the imperial Customs tea-duty in March-April from 6d to 4d per lb. It will be remembered that Mr. Picton, the member for Leicester, in the last Budget discussion, moved to leave out "Clause 2 which imposes a duty of 6d per lb. on tea." This was a thoroughly radical proposition towards a free breakfast-table. In the debate which followed, after Messrs. Picton, Vincent, Gray, and Illingworth, Sir Geo. Campbell and others had spoken, the Chancellor of the Exchequer, in the course of a long reply, distinctly indicated his strong desire to reduce the duty on tea, although he could not consent to its total abolition; and Mr. Gladstone while declining to support Mr. Picton's amendment—"he had never given a vote which would reduce the income of the country below the expenditure and he never would"—said that if the proposal were to reduce the duty from 6d to 4d, it would have his ready support.

There is therefore a good deal of reason for the anticipation that the next imperial budget will provide for such a reduction. True, there is a great call for extra expenditure on Defences; but there are other means of providing for such special outlay and Mr. Goschen, we feel sure, will be strongly inclined to fulfil the implied promise in his speech last year. And it should be noted that the anticipation of such a result may possibly have an unsettling effect on the London Tea market during March.

It is argued however, that a reduction of the British tea duty would likely benefit the cheap China teas more in proportion, than the dearer produce of India and Ceylon. The higher the duty, the more are the cheaper teas supposed to be handicapped. We cannot accept this view as altogether correct, or anticipate that the benefit to China teas would be more than temporary; for, the cheaper the price of tea generally, becomes, the more likely the working-classes are to ask for a really good article; and when once the taste for India or Ceylon tea is acquired, the hold of the poor China stuff will be gone for ever. At any rate, there is the plain inference that a reduction of the duty to 4d per lb. would mean an immense impetus to consumption in the United Kingdom, so that the total figures per annum, in place of being 184 million lb. as in 1888, would probably soon reach 250 million lb. We may well look forward therefore with special interest to Mr. Goschen's next budget in the hope that it may contain good news for all interested in tea.

NEXT SEASON'S TEA.

The following letter appears in the A. C. O. News:

To the Editor of the "North-China Daily News."

Dear Sir,—As there appears to be some danger of over-optimistic views being taken by both foreigners and natives (but especially the latter) as to the prospect for the next crop of Black Tea, I should be glad if you will kindly afford me space to give at least a report as possible upon the exceptional circumstances which have caused the trade to be practically during the past season. I find that not only natives, but home importers are beginning to believe that

the China tea trade is in a healthy state, and enquiries from home people who have not imported a leaf for some years as to probable prospects, lead me to think that mischief is brewing unless a clear statement of facts is grasped by every one.

The abnormal conditions of the past season were:—

First:—The astonishingly small crop of first-crop teas, say 300,000 $\frac{1}{2}$ chts. (equalling nearly 19,000,000 lb.) short of the previous season's yield from the north of China alone, which fact was telegraphed and made the most of by every one interested in the article.

Second:—The positive deficit of really fine pure-flavoured Teas in the crop, and consequent demand for them at extreme prices on account of their scarceness.

Third:—The closure of the Shanghai market for a whole month, which kept back supplies from the consuming markets. Last but not least, the totally unexpected rise in the value of the Russian rouble, which caused a demand for export in London that could not have taken place under any other circumstances.

These points have been used to eminent success by importers during the past season, and resulted in the London quotations being maintained for a long period at fully 2d per lb. higher than they were the previous season, but not one of these favourable circumstances is likely to occur again this year. What we have to look forward to is the complete reverse of our last season's experience.

Before going further I would point out that although the First crop showed such a remarkable deficit, the Second and Third crops have been so large as to make the total yield of black tea from the north of China within a very few millions of that of the previous year when the first crop was enormous. This proves conclusively the wonderful elasticity of the trade and the consequent danger of the consuming markets being glutted unless a very decided check to production is given early in the next season. I might also mention that since the Russian demand in London has ceased prices there have fallen fully 20 per cent. for all teas under 1/0 per lb., and many Teas costing Tls. 15 *a* 24 here are losing 3 to 5 taels a picul. Deliveries too have decreased to the lowest point known say 5 million pounds of China congou for the month of December.

Preparations are already on foot for making one of the largest first crops on record. In the Keemèn districts alone some 20 new curing honghs have been arranged for. In Ningchow there is not a curing hong to be had, and in Kiukiang all available places have been secured some time since. I have no accurate information from the Hankow districts, but the best-informed natives assure me that they will not be behind their Kiukiang competitors in their efforts. This is sufficiently alarming, and results will probably be disastrous unless we can impress upon the natives the absolute necessity of improving the article. The commonest tea shipped could be and should be much above the present standard. That China tea and especially good China tea has still a strong hold upon the tastes of all consumers is an undoubted fact, but it must be good to hold its own against Ceylon and India. The perishable nature of the raw leaf prevents foreigners from taking the curing into their own hands at a distance from the producing districts, as silk is done in the lately established filatures, but something may be done by continually impressing on the native the necessity of improving his teas. Their aim should be to make small chops, and make them well, rather than bring to market the gigantic quantities of ill-conditioned stuff which now often pass as a chop, and which give dissatisfaction to every one. The climate of China is not so bad, but that careful storage of leaf and proper manipulation would overcome all difficulties.

The Chinese have the finest raw leaf in the world to work on, and it is only their own cupidity and denseness that prevents them from making the finest tea in the world. The ordinary profits are so small that a native would sooner make 1,000 piculs on the chance

of gaining a quarter of a tael a picul on it, than make a small chop and make it as well as it is possible to do. Of course a year like last year when they made Tls. 7 to Tls. 20 a picul profit on large chops will militate against their making small good chops this season, but we may warn them, however without prophesying that ruin stares them in the face unless they make their teas very very good. A large first crop badly made will do more harm to makers and shippers of China tea than can be repaired in two or three favourable seasons.—Yours faithfully,
G. T.
Shanghai, 22nd January.

TEA IN INDIA.

Punkabaree Tea Company.—The report of the directors shows that the outturn was 716 maunds against an estimate of 700 maunds and a crop in 1887 of 634 maunds. The average price realised was As. 9 $\frac{1}{2}$ against As. 9-1-79 last year, and the profit is R3,010. After paying a dividend of 5 per cent in September there is a sum of R1,375 at credit, which is carried forward.

Mohurgong Tea Company.—The managing agent's report shows that the outturn was 1,285 maunds against an estimate of 1,200 maunds and a crop in 1887 of 1,183 maunds. The average price realised was As. 7 $\frac{1}{2}$ against As. 8-1 last year. The profit made was R12,219, making with the amount brought forward an available surplus of R12,434. An *ad interim* dividend of 5 per cent has exhausted R3,000, and it is now proposed to pay a final dividend of 2 $\frac{1}{2}$ per cent and to carry R434 forward. The area under tea is 221 acres.

Sington Tea Company.—The director's report shows a net profit of R14,340, and adding the balance from 1887 a credit of R18,084. An *ad interim* dividend of 4 per cent paid in October absorbed R6,000, and a further dividend of 6 per cent is recommended, carrying forward R2,084. The total outturn was 114,777 lb against an estimate of 104,000 lb and crop in 1887 of 114,372 lb. The average price realised was As. 9-7 $\frac{1}{2}$ per lb against As. 9-2 $\frac{1}{2}$ last year. The estimates for the current season are for 1,500 maunds, the area under cultivation is 435 acres.—*Pioneer*, Feb. 5th.

TOBACCO COMPANIES.

The Anglo-Dutch Tobacco Company (Limited) is a further new tobacco undertaking, with a capital of £100,000 in 100,000 shares of £1 each, of which the first issue is £60,000. Of these 15,750 shares will, it is stated, be allotted to the vendors; 24,250 shares have already been applied for by the directors and their friends, and will be allotted in full upon the terms of the prospectus, and the balance (20,000 shares) are now offered for subscription. The Union Bank of Scotland (Limited) and the Hong Kong and Shanghai Banking Corporation are authorised to receive applications. This company has been formed to purchase the Lobo Pakam and Potoembookan estates, of about 26,000 acres, situated in the province of Serdang, Sumatra, and to carry on and extend the cultivation of tobacco upon these estates. Eighteen thousand acres are virgin soil. The price to be paid is £15,750 in cash and a like amount in shares (as stated above), but these do not appear to be deferred and the profit on them contingent on the payment of divisions on the other capital.

The prospectus of another tobacco company in North Borneo has been issued during the week. The Sandakan (British North Borneo) Tobacco Company (Limited) has been formed for the purpose of planting and raising tobacco and pepper on an extensive tract of land situated on the Kinabatangan River, Sandakan Bay, North Borneo, 20,000 acres in extent. The capital is £100,000, in 20,000 shares of £5 each. The purchase money is £18,000 in cash and £12,000 in shares. The land has been selected by Mr. W. Flint though the special aptitude of that gentleman, who keeps a store in Sandakan, is not stated. It is esti-

mated that by planting 500 acres a profit of 25 per cent will be made in the first year. On an unfounded report that Colonel North of nitrate fame was in some way connected with the company, the shares were rushed to a premium of about 1½ before the application lists were closed. We are somewhat surprised at the title given the company, seeing that its land does not abut at all on Sandakan Bay. The prospectus states that the land is on the Kinabatangan River, which does not flow into the bay, but finds its outlet to the sea farther to the south-east. In fact, it is separated from the bay by a range of hills which form the watershed for the streams and rivers discharging into Sandakan Bay on the one side, and the Kinabatangan on the other. However, this is a detail which does not deter any one when a rush is on as at the present moment.

The prospectus of the Suanlambah Borneo Tobacco Company, Limited, has been issued. The capital is £100,000 divided into 14,000 ordinary shares of £5 each, 5,990 deferred shares of like amount, and 10 Founder's shares of £5 each. The two latter descriptions are given in part payment to the vendor, but the deferred shares receive no dividend unless 10 per cent is paid on the ordinary shares until 400 per cent has been paid, when they rank equally. The founders shares receive no benefit until cumulative divisions of 100 per cent have been paid, but thereafter are entitled to a quarter of the profits after providing for a reserve fund. The company is formed to take over 14,452 acres of land which are virtually freehold, on a portion of which tobacco has been already grown, and given good results, from the British Borneo Trading and Planting Company. The price to be paid is £40,000, of which £10,000 is in cash and £30,000 in shares. This is the proper method of payment. Good water facilities are stated to exist.—*L. and C. Express*, Jan. 18th.

STAPLE FOOD AND JAIL DIET.

To the Editor, Madras Mail.

Sir,—I desire to avail myself of the opportunity afforded by the death of the late Mr. Kunjen Menon and suggest the desirability of a slight change in the food supplied to native inmates of jails. Rice, as is well-known, is the staple food of the vast majority of Hindus, while it is only the lowest classes, and very poor Sudras, and these especially in the Telugu and Canarese countries, who live on ragi and rye. To the latter rice is a luxury that satisfieth not; but to the former ragi is a most unsavoury food and a fruitful source of disease. A sudden change of food often tells seriously on even robust constitutions. Some time ago I made a preaching tour in a neighbouring Taluk, and with greater valour than discretion threw myself entirely on the bounty of my countrymen. They treated me with the greatest kindness, but on the third of my tour diarrhoea set in, and was fast developing into dysentery when I had to hasten back to Madras. In this case it was not a change from rice to ragi food, but merely from one quality of rice to another. Now in all jails convicts of European extraction are allowed bread, which is very proper, that being their staple food, without any exception. But, as shown above, both rice and ragi are staple food for distinct classes of the native population, and the ends of justice would be amply met by giving rice to the rice-eater, and ragi to the ragi-eater. But I believe this is not done in South Indian jails. All the native inmates from the highest to the lowest, are (except once a week when curry and rice is served) daily treated to a coarse preparation of ragi, called *ragi*, or *ragi*, which, though agreeable to many, must yet be unwholesome to others to whom rice has for a whole lifetime been the chief means of subsistence. I once had the privilege of visiting the Central Jail at Vellore, and witnessed the preparation of this formidable food, resembling bricks actually cast in water, and it is amply horrible to think that a man of Kunjen Menon's habits and ways of life should have been condemned to devour these 'bricks' for any

length of time. The punitive element in jail life should not be carried to such an extent as a sudden change of staple foods involving serious, and it may be fatal injury to the health of individuals condemned by the laws of the land.

Perambore, 24th Jan.

JNO. NAGAM.

[What is said about rice and ragi (kurakkan) is interesting with reference to the recent discussion here, but the element of depression, and let us hope remorse for his misdeeds, must be taken into account as hastening the death of the ex-judicial native. It is quite characteristic, that even the native Christian preacher writes as if the late sub-judge of Tellicherry was merely "unfortunate."—*Ed. T. A.*]

SHOWS AND SHOWS.

A planter writes:—"I think you might publish the enclosed *re* flower shows *re* Kandy Agri-Horticultural." Aberdeen—The Use and Abuse of Flower Shows.—At the monthly meeting of the North of Scotland Horticultural Association, held in the Christian Institute on Wednesday, a paper was read by Mr. William Ogston, Peterhead, on "The Use and Abuse of Flower Shows." Mr. James Cooker, president, occupied the chair, and introduced the lecturer. Mr. Ogston said his remarks were to be applicable not so much to such societies as the Royal Horticultural as to those parochial societies which recently, with mushroom growth, had sprung up in the north, and especially in Aberdeenshire. He had no faith in the principle which actuated people to exhibit at these shows solely for the greed of gain. The greatest abuse of flower shows seemed to be the practice of exhibiting plants and flowers which were not *bona fide* the property of the exhibitor, and the rules at present in force in most associations made it difficult to detect impostors. He thought that Horticultural Associations should extend their operations and encourage more general attention to Horticulture before they embarked in undertakings which were foreign to the ostensible reason for their existence. He had no particular objection to poultry, rabbits, and even darned stockings forming part of a flower show any more than he had to horses, cattle, and pigs, but a pig and a pansy in competition for public approbation was a somewhat incongruous combination. He suggested several ways in which the science of Horticulture might be popularised, one of them being that nurserymen should not parade too much before the untutored mind those five-syllable botanical names, which created the impression that horticulture was such an occult science that it required a University training to master it. He advocates more encouragement being given to scholars in the collection of wild flowers, etc., and suggested that Horticultural Associations should give prizes for the best kept and most attractive cottage gardens in their district, the inspection to be periodically, in order that their beauty might be kept up during the whole season. He could suggest no direct cure for the abuses incident to flower shows, but was of opinion that as only unscrupulous persons would resort to these sinister practices, societies should make the possibility of gain less easy, and in this way remove the *raison d'être*. This could be done by substituting largely for prize money a system of merit tickets, and paying the prize-winners a sum calculated on the basis of the number of prizes won rather than on each prize. Societies which were unable in themselves to provide a respectable show—a show where there was something to see and from which something could be learned, as against an exhibition of a few boxes of badly grown plants—should amalgamate for show purposes with adjoining district societies and hold annual shows on the rotatory principle having in these combination shows parish competitions if need be. He also advocated making the subject of horticulture an all-the-year-round pastime, by societies holding stated meetings through the winter for the discussion of horticultural subjects. Some of the suggestions followed, the suggestions in the paper being generally

rally approved of, and the paper was commended to the earnest consideration of all horticultural societies. A vote of thanks was accorded to Mr. Ogston. Afterwards Mr. James Grant, Crimonmogate, who has within the last few years made himself a name as a successful grower of chrysanthemums, and has taken some of the leading prizes at the Dundee show read a paper on the cultivation of that valuable flower. Mr. Grant was cordially thanked for the information he imparted, and it was agreed to print both papers in the Society's "Transactions."—*Aberdeen Free Press*, Jan. 13th, 1889.

COTTON IN CEYLON.

Having received a parcel of some Tinnevely seed from the Hon. Mr. Mitchell, I dibbled it in rows towards the end of June 1888 in a piece of good average chena that had lately been cleared. The seeds were sown about a foot apart and the rows were about nine feet distant. There were a few light showers after planting and then a three months' drought set in, during which the cotton was roughly weeded twice. The plants came up well and began to show signs of blossom in about two months. During the wet north-east monsoon they went on fruiting freely, but because of the wet, and the smallness of the bolls and having other work to do, I only gathered a little and neglected the rest. It turned out very fair cotton but had a heavy percentage of seed. The plants attained a height of about three feet and under, and unless supporting one another by growing very close together, they had a tendency to fall over. When growing very close the bushes did not seem to suffer, but were very troublesome to pick; in that way, however, they kept down weeds. Field rats were much addicted to eating the seed. In December I cut down the bushes close to the ground. Since then they have grown suckers freely, and which now about the middle of February are beginning to blossom. A few seeds got washed down on the hard dry road, but they grew nearly as freely as the others. A few seeds were also thrown out with other rubbish on to a corner of the barbacue, and though nothing has ever been done to them they now form a fine clump, about four feet high, and have and are still fruiting freely.

There is no doubt this is a very hardy, quick, heavybearing kind, needing little rain or cultivation, and should be closely planted, but it is troublesome to pick and to clean.

From Messrs. Law & Co. I received a little Sea Island cotton seed, which, in November, I planted out about ten feet by ten feet at stake in an average chena clearing. The succeeding two months were very showery. The plants are growing more slowly and are evidently more delicate, and have suffered a little by being eaten off by grubs. This kind would need more careful weeding for at least the first half-year. Now in the middle of February on a few of the well-grown plants I have seen the beginnings of a blossom.

From experience I can give no further information regarding this kind of cotton.

The cotton found growing locally about Matale, Colombo, and elsewhere, seems to be a variety of the Sea Island. When full-grown it appears to be a very large bush, hardy and bearing well while the cotton is easily picked and cleaned, and of good quality. It bears during the greater part of the year.

As a field for the encouragement of native cotton cultivation probably no more suitable locality could be found than the vast tract of land stretching northwards from Matale to Jaffna and Mannar. In this region there is an immense extent of waste land with a suitable climate and a soil if anything

rather above the average of the lowcountry. The railway has its present terminus at Matale, but a cheap extension northward must come some day. Meanwhile there is the great north road having its connections with Trincomalee, Jaffna, Mannar and Puttalam, and many district roads if not quite fit for tavalams could easily and cheaply be made so.

I believe Government is willing to do all it can for the encouragement of the cultivation in this part of the country and its nearness to India makes it very suitable for a vast Indian immigration. Coolies could go and settle down there to their cotton fields in thousands, and from thence surplus labour could be obtained for our tea estates whenever required. The local rice demands of the population that would thus spring up would stimulate rice extension and find a use for our large irrigation works. For the present I would recommend:—

1st.—That Government should address the Madras authorities on the subject.

2nd.—That chena lands should be leased out at a nominal rental.

3rd.—That principal district roads should be converted into gravel cart road and minor ones be made suitable for tavalams.

4th.—That new products be carried at third class railway rates.

A. G. K. BORRON.

SALT FACTORY AT COCONADA.—Government has sanctioned the application of Messrs Hall Wilson & Co., for the opening of a Salt Factory at Coconada, for the manufacture and export of salt to Calcutta, to compete with Liverpool salt. The lease of the waste land required for the works is to run for twenty years, renewable on the termination of the lease.—*M. Mail*, Feb. 1st.

CANADA.—A telegram from Winnipeg states that 600,000 acres of land were conveyed to 4,000 actual settlers in Manitoba last year, the population being thus increased by 17,000 souls. There are prospects of a larger growth of the population this year. The Evangelical Alliance of Canada have forwarded to Ottawa a long petition addressed to the Governor-General in Council, praying his Excellency to disallow the Jesuit Estates Act, passed by the Quebec Legislature last season.—*O. Mail*, Jan. 18th.

INDIAN TEA NOTES.—The weather has been cold in Cachar. Durrung has experienced fine weather. Charali, 21st January.—Weather dry, cold and windy. Rain much wanted for nurseries. Ranchi 24th January.—We had a sort of summer shower today—hardly enough to lay the dust. Dehra, Dun, 22nd Jan.—Rain is wanted badly. The days are much warmer than they were last week. Seasonable weather is the news from Sylhet, Goalpara, Kamroop, Nowgong, Sibsaugor and Luckimpore. Darjeeling, 25th Jan.—First rainfall for the year on the 24th, 0.27. Temperature much lower. Up till now having been above normal. Pruning well advanced throughout the district.—*Planters' Gazette*.

COTTON PULP.—According to the *Scientific American* several samples of pulp made from the hulls and stalks on the cotton plant have lately been on view at Atlanta, Georgia. The pulp is a white as snow, and it is said it can be converted into the finest writing paper. The ligneous substances of the hulls and stalks are removed by a new process. Fifty per cent of the fibres are extracted from the hull, which has hitherto been used either for fuel in the mills or for fertilising purposes, and 38 per cent is obtained from the stalks, which are generally allowed to rot in the fields. If the process proves successful, the value of these comparatively useless products will be increased tenfold.—*Fiji Times*, Dec. 5th.

PLANTING IN THE LOWCOUNTRY OF CEYLON.

SCENERY FROM THE RAILWAY—NATIVE WEATHER PROPHETS—VARIOUS NEW PRODUCTS AND THEIR ENEMIES—VALUE OF THE JAK TREE—ORANGE AND OTHER FRUIT TREES—COTTON AND ITS FOES—SIROCCO OR CHULAS—PEPPER—HAL TEA BOXES.

That heading to my notice of the shadows of the monarch Peak and his myrmidon mountains might lead readers to suppose that the sunrise and shadow phenomena were witnessed where my post-card was deposited. Such was not the case. Starting from the main (Colombo) station at 6 a.m. on Friday last, the sun was so far up the horizon by the time the train reached Henaratgoda, that only the ordinary terrestrial shadows of objects were possible. It was only a few minutes past 6 and when the train was a little beyond the Maradana junction that the semi-circle of shadows projected on the upper atmosphere was witnessed. Like many other things of beauty it was an evanescent joy. The ascending sun, to use popular language, would soon dissipate the shadows, in ordinary course, but the railway, as is the perverse fashion of railways, whisked us away beyond view of what we admired so much while there was only an interval of rosy dawn between the mountains and their shadows on the upper haze. What increased the beauty and impressiveness of the striking sight was the fact that while the pyramidal shadow of the Peak stood up perpendicularly in the centre, the shadows of the flanking hills on both sides went off, apparently, at descending angles until some of them appeared to stretch out almost horizontally. The idea of a whole system of volcanoes in action was due to the resemblance to reflected flame of the red light of dawn, while the shadows projected on the haze suggested volumes of smoke. "What a picture the wonderful scene would make," was our reflection, but we mentally added, what would be true of a representation of this sky effect as of others, "No one would believe the picture; they would charge the artist with exaggeration." But truth, even in meteorology, is often stranger than fiction.

The morning was crisply cool, but as the day advanced the temperature became hotter and hotter, until, by the time we looked out on the mountain system from the red granite rocks of Eilandhu, we saw its features of sharp peaks, massive mountains and rocky ridges only through a veil of diffused and shimmering haze. As a contrast to the distinctly pencilled dark-blue of the mountains against the sky in other conditions of the atmosphere, Friday's misty view, suggestive of mystery in the higher regions of the earth's surface, was interesting and impressive. After a heavy plump of rain at the commencement of the year a spell of hot, dry weather has prevailed, which has raised apprehensions of another season of drought, third in succession if it really occurs. But rain cannot be long delayed, for on Friday afternoon the sky clouded over and the cobalt blue colour which indicates saturation with moisture of the atmosphere became apparent. I was told that the natives predicted rain in twenty days,—one day short of three weeks. I was irreverent enough to scoff at this style of prediction as little better than the reply to a question so often put by English employers of native servants: "Appu, do you think it will rain to day?" "Sometimes it will; sometimes it won't." I believe it will rain long before the three weeks are rounded off, although certainly the bearing characteristics of the climate in this region, from ten to thirty miles inland from Colombo, is the length of the periods

during which moisture remains suspended in the atmosphere, refusing to visit the thirsty earth. The actual rainfall is ample, from 110 to 120 inches, but it too often falls in torrents for a week, between intervals of drought prolonged to weeks and sometimes months. This it is which makes planting with supplying and re-supplying so much more difficult in the low country than in the high, while fever often adds to the troubles of the planter and his labourers. The white-ants, too, are ubiquitous and sometimes destructive. The tea plants suffer not so much from direct attacks on them as from the eating up of the ferns used to shade young seedlings and supplies. But young coconut plants, or rather the nuts from which they spring and, up to a certain stage derive their sustenance, are objects of direct and pertinacious attack. One of the best remedies seems to be ashes, and this substance taken from the furnaces of the tea factory not only circumvents the termites but has a most marked fertilizing effect on the coconut plants. Had I known what I now know, prudence would have dictated a commencement with coconuts instead of putting them in amongst the tea after that plant had become a fair success; unlike its predecessors, Liberian coffee, cacao, cassava, and indiarubber. But as a publicist I recognized the duty of initiating experiments and recording the results, which I have faithfully done, and, like Beau Brummel and the cravats, I can say of the plants named, "These are our failures."

Liberian coffee was a victim to *Hemiteia vastatrix* beside giving only the equivalent of a pennyworth of bread (beans) to an intolerable quantity of sack (external covering); cacao was blown and eaten out of existence by wind and insects (little beetles breeding in the pods); cassava roots would not sell at a price to pay carriage to Colombo; and indiarubber trees here, as elsewhere, did not yield gum enough to pay for the gathering.* By the way, some large survivors of the rubber groves near the bungalow showed in a curious manner the operations of the white-ants. At certain seasons these trees, which are deciduous, become ragged in the surface bark. This rough outer bark the white-ants had disposed of, leaving the trees with the inner bark showing in patches light-coloured and polished. In like manner, felled trees of hard wood may be seen on the ground occasionally, white and polished like prepared specimens of bone, the white ants having eaten away all bark and decayed matter. Besides tea, which is an assured success now—300 to 400 lb. per acre in the face of failures from drought of plants and supplies—pepper has been added to the category of the survival of the fittest, and we hope ultimately to have our numerous and fantastic rocks, "the Necropolis," "the Castle," "the Fort," &c., covered with this product, although shade is in the first stages as necessary for pepper plants as for tea. We have to calculate on the dying off from prolonged hot weather of a considerable proportion of the cuttings, and the same fate will probably follow seedlings when we have them fit for "planting out." A good many seedlings are up in the nurseries, and I hope they will survive, so as to prove that growing pepper from seed, though a slow method of cultivation, is a fairly sure one.

It is this element of slowness in giving returns which has deterred so many Europeans—especially from engaging in the coconut enterprise. The same reason, no doubt, acts with the absence of equipment, as growing forest trees for timber and firewood. But, looking

* Not old enough?—Ed.

at the wonderful growth in six to ten years of jak trees scattered over Eilandhu, I believe, that better even than coconuts as an inheritance for my family would have been 100 acres of jak trees, planted when I began clearing about 8 x 8. This valuable tree yields not only fruit but forage for animals, while for general purposes of house- and boat-building and furniture it produces our most useful timber,—timber which is becoming scarce and dear; for the natives, naturally enough, object to cutting down a jak tree until it is beyond the fruit-bearing stage. Any young man, able and willing to wait ten to fifteen years for returns, would, I believe, do well, with a couple of hundreds of acres of jak, wa and lunumidella trees in the lowcountry and a similar or larger extent of Australian eucalypts, acacias and grevilleas in the higher mountain altitudes. Our danger now from tea is the very rapidity with which it yields returns. The region I visited yesterday, although it grows many products, from the mighty talipot palm to the minute-grained *amu* of the millet field, is, *par excellence*, the region of coconuts; and my neighbour of "Comillah" (a reminiscence of Eastern Bengal, near where the head-hunting aborigines are now giving trouble) is the happy possessor of some hundreds of acres rapidly advancing to the age of full bearing. But we were naturally more interested in his plants and trees imported from India. A very fine mahogany which flourishes in the bungalow grounds proves that the climate and soil are suitable for this prince of timber-yielding trees. Our readers know that Sylhet oranges have been here a great success, although Dr. Stork has discovered that the success would have been more pronounced had the holes for the plants been deeper and wider. Ground for orange orchards indeed should be trenched 4 feet deep. Lichee plants flourish exceedingly, but do not fruit. The loquats and lichees are indeed not successes generally in Ceylon. Experiments were being tried with half-a-dozen varieties of cotton. The poorest wool is the short-stapled Tinnevely kind; New Orleans is good, but the best of all, in Dr. Stork's experience, is what he introduced from India as Fiji cotton. It looks like what we used to call Pernambuco cotton in Jaffna, where we reckoned Bourbon cotton the best. One great point seems to be to hit on the proper seasons for sowing the seed. The difficulty in Jaffna about 47 years ago was that the boles ripened, so that the cotton was battered by the rains of the north-east monsoon. The yield per acre, too, was small. I sincerely trust the experiments now making will be more successful than those of the Messrs. Whitehouse and Hardy were in 1842-43. There was an insect enemy in the shape of a little reddish beetle. There was then no local demand, except for the native looms, which were largely supplied with imported thread.

The success of cotton cultivation on a large scale in Ceylon would have the subsidiary advantage of securing a plentiful supply of good cattle feed in the shape of the seed. Some of the cotton wool produced and prepared at Comillah was utilized in an unexpected manner by a "tailor bird," which had sewn (actually stitched) large croton leaves together, putting the cotton wool inside for a soft warm nest in which an egg had been laid. We made closer acquaintance with a weaver bird, one of those that build long pendulous nests which they enter from below. One of these birds which had been caught young was amongst the numerous pets of the household, hopping about the drawing-room table with the utmost confidence and instinctively attempting to abstract pieces of thread and cloth from a lady's workbasket. Still tamer and more confident were several dear little

"paddy birds" which stood fearlessly on the outstretched fingers even of the stranger guests. This beautiful sight (the tameness of the birds was not shocking to me as it was to Alexander Selkirk) was the more pleasant, because on my own place war had been declared against and death, by means of a shot gun, dealt amongst some of "the tribes on our frontier" in the shape of crows and squirrels. Their crime was a raid on our fine large pineapples growing on plants the progeny of some originally introduced by Dr. Stork. The crows peck at the pineapples as they do at everything else, and although *Corvus impudens* is a good scavenger, we did not mourn so much over his kind as over the dead specimens of the lively "little mime and thief" immortalized by Miss Jewsbury. This long-tailed, active, vocal, arboreal rodent is, we know, omnivorous, for we saw specimens eating white-ants with gusto. That fact did not prejudice us against them. But what could we say when it was proved to us by the marks of their claws that they had scooped out and eaten the interiors of some of our best pineapples, leaving only the deceptive shell intact? We did not, in view of scooped out pineapples, intercede for the squirrels any more than we did for the crows, but that animal nature should be as depraved as human (men thieves have carried off pineapples bodily) "gave us pause." Of this I will take advantage to close these discursive notes, after bearing a tribute to the little bullock hackeries which convey us seven miles from the station to Eilandhu in two hours, and expressing the hope that if there is a new railway time-table it will embrace the stopping of the express train at Henaratgoda. There are many coconut estates in the neighbourhood, but above all there are the Tropical Gardens of Government, which many would like to visit if railway arrangements permitted.

The change in Eilandhu factory by the substitution of a handsome sirocco for *chulas* was pleasant to the eye as well as to the sense of feeling. The heat previously was almost unbearable. The two sets of trays were doing good work, the coolies being on a level with the top part of the machinery, which was sunk in a well-made pit. The thermometer attached to the sirocco indicated 230 degrees, which an experienced companion said was, in his opinion, too high by 10 degrees. This planter had appreciated Brown's Desiccator by supplying his own factory with one. "But," he said, "it needs power to work the fan, and the reason why so much fuel is burnt in the sirocco and the internal parts destroyed is, that planters heat it up to 270. The proper figure is 220 degrees." I think it right to record this opinion.

N. B.—Offers for pepper in store (a few bushels) have gone up from R7 to R12½ per bushel. Surely even this latter figure is low for a commodity so useful and so generally used? 2nd *N. B.*—That native carpenters are at work near the Henaratgoda station turning out *hal* tea boxes at prices lower than those sold in Colombo, whether locally made or imported. It will be curious if Sinhalese carpenters, with hand saws, chisels and adzes, are able successfully to compete with American machinery applied to the forests of Japan. The circumstances must be favourable to enable them to do so. F.

CINNAMON CROPS IN THE NEGOMBO DISTRICT.

KADIRANA, 8th Feb.—Very dry here: no rain since the 8th of last month. The "bud" with blossom, which began to show about the middle of

last month, stopped all peeling, and there is nothing doing but pruning and weeding. Owing to very unsatisfactory seasons for the last two years I anticipate a short crop of both cinnamon and coconuts this year, and a rise in the price of the latter; as for the former I despair of any marked improvement in prices. I am glad to observe by the Customs returns that the quantity of chips exported this year to date is only about half what it was at the same time last year. I wonder what can be the cause of this. Is it that the months of May and June last year were so favourable for peeling, that coarse wood, which in other years would have gone to swell the chips, was made into quill cinnamon? The health of the people is better than it was during December and January, when dysentery in many villages and fever in all prevailed to a serious extent. Colds and coughs are common, and a few cases of fever. A little rain would be welcome, as pastures are looking brown.

A PIONEER COLONIST: COFFEE AND COCONUTS IN THE EARLY DAYS.

We take to ourselves blame for not referring in our *Overland Summary* to the departure from our shores by the P. & O. S. S. "Rosetta" of one of the pioneers of coffee (and coconut) planting and the founder of a mercantile house in Colombo, Mr. Andrew Nicol. Mr. Nicol's career has been as varied and as racy of our planting soil as any one of his compeers in the "forties" and "fifties." His favorite district was Rangala, where he owned, or shared in, at one time, the majority of the coffee plantations in the district, and rich and most productive of the fragrant berry they were in his early days—the days of the "Knuckles bricks," but also of virgin crops and quick as well as big returns for capital invested. Need we say that Mr. Nicol revisited Rangala to find scarcely a coffee plant remaining, at any rate to see a crop which he could carry away in his pockets; while tea and cardamoms—unthought of in the days of old—had given new life to the district. Mr. Nicol in conjunction with his manager and partner, poor Sangster Martin, introduced some of the hardest-headed and most practical Scots, Banff and Aberdeen Shires ever sent to Ceylon; and a curious fact which we were the first to remind them of, as both pioneers met in our presence lately, was, that these Scots after giving a certain term to Mr. Nicol's estates north of Kandy, gradually but surely moved south (after true Scottish fashion) to take service under the then only laird in Rakwana, Mr. C. Shand, and eventually to carve out clearings and fortunes of their own in the forests of the Kolonna Korale. It had never struck Nicol during all these thirty years that he had a claim for "crimping" against his brother planter and merchant! Matale very early shared the attention of Mr. Nicol, along with Rangala. In the once famous Balakaduwa property he had an extensive interest with worthy Ned Mortimer (still to the fore), and to oblige a constituent friend who wanted urgently to sell, he took over Cabroosa Ella estate in Matale East—the estate on which "Young Scotchman"—afterwards "Old Colonist"—was said (by his friends) to have distinguished himself by cutting off all the *primaries* in his idea of pruning! When we lately questioned Mr. Nicol about this yarn, his characteristic answer was, "All I know is that I got off the place, perhaps as the result of this pruning"—growth of crop in the one season to leave a profit equal to the total cost of the place!"

Mr. Nicol had many interesting experiences to relate of the early days and his trips into the lowcountry. One memorable ride through a region then unopened, via Northern Matale East, Laggala and away round by the back of the Knuckles and Nitre Cave, was in the company of Mr. George Christian of Messrs. Murray Robertson & Co., and hard work they had of it, being nearly famished before they got to food and rest. Mr. Nicol as a young man was one of the hardiest and strongest among our proprietary planters, and having engaged in coconut planting in the Batticaloa district, the trip across from Medamahanuwara through the Bintenna and Vedda country—then little traversed by Europeans—became quite a common thing with him. At length he got tired of waiting for the returns from his palms and induced Mr. O'Grady—his manager—to buy the coconut plantations for R35,000 we believe; with the result that they now or of late years, have yielded nearly this amount in annual income.

Mr. Nicol founded in Colombo the firm of Nicol, Cargill & Co.—Mr. S. T. Richmond coming down from Bombay where Mr. Nicol had close connections with the great house of Wm. Nicol & Co., as well as with the corresponding Liverpool House of which Mr. Dyce Nicol, M. P., was the head. Mr. A. C. White became another partner in the Colombo firm, which assumed a leading estate agency position. We need scarcely relate how Mr. Nicol after this became a big Dimbula proprietor—as did also Mr. White, in taking over and dividing between them the properties on which the notorious Francis Hudson (then of Hudson & Chandler) had got advances. Here Mr. John Martin (following Mr. James Wright) took charge at a time when the estates in Dimbula did not count a dozen all told: half being grouped together below the Gap, and the others below Great Western approachable from Nuwara Eliya. When Mr. Nicol went home in the early "sixties," Mr. J. C. Fowlie—who following after Messrs. Shand, Darley and Alexander Gibson had made a fortune in Tinnevely cotton, through the American blockade,—took his place and the firm became Fowlie, Richmond & Co., to which house in due season there came in succession as young enterprising Assistants, now quite old residents in our midst, Messrs. W. Law, R. L. M. Brown and Wm. Somerville.

That after being away for some fifteen or more years, Mr. Nicol should return and "renew his youth" in watching the development of an entirely new planting enterprise in tea, adds to the romance of our history as a Colony. No young planter fresh to the island could take more interest in his tea fields and factory than did Mr. Nicol in everything appertaining to his fine Glassaugh property; and he used to tell with great gusto the story of his sending three samples of his tea to a leading London authority, and adding a fourth from the same tea to make his packet square, and getting a report back very favourable to the three samples, but that the tea in the fourth was *burnt*! Mr. Nicol was for a long time the subject of attack on account of a Rangala Church Subscription of which he had been Treasurer, but about which, it was maintained, no account could be got, after the proposal to build was given up. Of letters innumerable, Mr. Nicol characteristically took no heed; but before leaving the island this time, he voluntarily gave satisfactory explanations of how the subscriptions had been returned chiefly to the representatives of men now dead.

Latterly Mr. Nicol has suffered in health a good deal, being for some months under the care of Dr. Men at Mount Lavinia, the winter preventing

his going home. Returning upcountry in December however, he regained better health, adding to his weight, and now goes to seek a thorough cure at a continental watering place.—Mr. J. R. Hughes (son-in-law of Mr. Nicol) from Galbodde takes charge of Glassaugh, and we are glad to learn that a further bond with the island is likely to be established for the old and enterprising Colonist who is the subject of our reminiscences, in the marriage of another daughter erelong, to a well-known Dimbula planter.

NOTES FROM UVA.

HAPUTALE, 11th February.

Many estates down the Pass are suffering from a virulent attack of green bug and the coffee bushes look woefully bare, the nakedness being increased by a new style of *pruning* tea which I had not seen before, that of cutting down the bushes to within a few inches of the ground and *stripping the stumps* of every leaf remaining on the decapitated tea bushes. Referring to green bug, I noticed that mainly those lowlying estates that were hacked and cut to pieces by "patent pruners" a few years ago into such shapes as cart-wheels and parrot-sticks were the first estates to give in or knock under to the disastrous effects of leaf-disease and green bug; weakened no doubt by *cropping* in every sense of the word. I still maintain that notwithstanding all these calamities of leaf-disease, green bug, and "patent pruners," that coffee is not on its last legs, and that above the Pass and on the Namunakula range there are estates such as Kabragalla, Old Hapootella in this district, and Old Nahavilla and Gowerakelle on the Badulla side, which are living evidence of what I assert. They are among the oldest estates in Uva, planted early in the "Forties" before Major Rogers, the then proprietor of Kahagalla and Hapootella, met with his lamentable end of being struck by lightning at the Pass in 1845; so part of these two estates are over 44 years old, and this old coffee is still to the fore bearing very good and remunerative crops and seem to have very good life in them yet, which, if nourished and well-looked after, will still pay better than tea.

TOBACCO AND TEA IN CEYLON.

Mr. Hugh Leward, who so recently wrote from Rome in a fashion so depreciatory of Ceylon, has again appeared in print with reference to the tobacco and tea industries of your colony. The following letter from him was published by *Colonies and India* during the week:—

TOBACCO AND TEA IN CEYLON.

To the Editor of *The Colonies and India*.

Sir,—In reference to the operations and ill-success of the German Tobacco Company in Ceylon, and the further trial about to be made in the southern district it appears to me they would have had success in either the extreme north of the island (whence I shipped on one occasion 70,000r. worth) or in Dumbara, in the Central Province. But the two best localities for the growth of tobacco are in Sumatra (and North Borneo) and South Florida. Still, I would recommend the company not to abandon the matter in Ceylon until they have tried the two districts I have named—Jaffna Peninsula and Dumbara—since they are there. While on the subject of Ceylon, I would give a word of warning to tea planters to sell the *rubbish* to the natives and export only the decent tea, else the charm Ceylon tea has will be lost irremediably, and the industry shattered. "Quality" must be kept up or "quantity" will be a delusion and snare.—I am, &c.,

Rome, Jan. 18.

HUGH LEDWARD.

We should say that Mr. Ledward's recommendations to your German colonists to try the districts he has named for the growth of tobacco might well be given weight to; but it is well-known that the red soil of the Jaffna peninsula only produces a very coarse tobacco. The late Mr. Dyke himself told me that he had tried the seeds of the finest

varieties he could procure, but that the resultant growth was always of a coarse character, the finer attributes of the tobaccos being wholly sacrificed. Mr. Ledward's reference to "rubbish" in the shape of tea being exported from Ceylon is in no degree supported by experts here, for Mr. Roberts has assured me that any disparaging term applied to Ceylon tea could only be relative, as, to his judgment, all Ceylon tea was good. Surely Mr. Ledward's experience with Ceylon tea for trading purposes must have been exceptionally unfortunate!

CEYLON PLANTING PRODUCTS:

THEIR POSITION AND PROSPECTS.

We have often thought that it would be a good thing for the Government—and for the Colony at large,—if a report were officially called for once a year from the Inspectors of Estates—known generally as Visiting Agents—on the position and prospects of the several products and branches of agriculture which are the subjects of their attention. Of course these gentlemen could not be expected to draw up such annual Reports for the public benefit, without remuneration; but the fee in each case would, we are convinced, be revenue well invested: and probably few more valuable or suggestive papers would be found in the official volume—if they were included therein—than those which the gentlemen referred to, could send in if so inclined and invited. So far as it is possible for him and his staff, the Director of the Royal Botanic Gardens tries to supply a felt requirement, in the very valuable and interesting portion of his Administration Report, dealing with "Economic Products." But it is impossible for Dr. Trimen to gather the same amount of experience of planting products as the gentlemen who are constantly on the move from one end of the country to the other, inspecting, comparing, reporting, estimating, advising, and, as far as is possible, looking into the future of our plantations and their industries.

The subject introduced by "Mercator" and continued today by a couple of Planting Correspondents in our columns, is one we should like to see handled by Inspectors of Estates. They have the means of bringing the greatest variety of experience to bear upon such topics. The rates at which, for instance, tea in the different districts can be produced, or rather delivered in Colombo; the prospects of growth in the old and new districts; and means of inducing a coalition of forces between three or four neighbouring proprietors so as to make one factory serve all, and the most economic fittings for a well-equipped factory, are all subjects on which from a multitude of experienced counselors we ought to gather safety.

One such counsellor recently favoured us with the opinion—a disinterested one—that there was perhaps no finer sheet of tea on an old coffee property in the island than was to be seen over Rothschild, once the famed coffee garden of Pussellawa. He considered that such tea was bound to yield well and give satisfactory returns. For cheap working on an old estate he considered a Maskeliya property—of between 200 and 300 acres—which last year sent its tea (200 lb. an acre) to Colombo at 35 cents per lb., covering all expenditure including salaries, as a fairly good model, with the prospect of further "economies" in working and larger crops, inducing an even lower rate. One of the most difficult tasks of Visiting Agents at present is to bring intending purchasers and would-be sellers of estates to the same mind: we have heard of an Inspector indeed who has valued as many as ten plantations for a capitalist without a sale resulting in any one case. Not only has the proprietor of 200 to 300 acres of tea, too exalted views of his property

sometimes, but when he is reasonable, it may be there is an unaccommodating mortgagee behind to prevent business. As for stopping the planting of tea in Ceylon at this stage of the Colony's existence, most Visiting Agents, we believe, are inclined to liken the attempt to limit the area cultivated—thus far shalt thou go and no farther—to Dame Partington trying to sweep back the Atlantic! As for the chance of another pest sweeping through Ceylon, this time on tea, we are either reminded that tea takes more naturally to our soil and climate, its own native habitat being near to us or that the means of fighting a persistent insect or a fungoid enemy on tea, by a thorough pruning, was never available in the case of coffee.

As to Coffee, there are Visiting Agents—old hands even—who do sincerely believe that "green bug" is on the wane, that there is a chance for a revival of prosperity with an old staple in certain quarters still. One cynical friend says he cannot help believing this if for no other reason than that the doom of coffee under "green bug" has been absolutely and publicly pronounced by a cock-sure ex-merchant and a resident Nuwara Eliya planter, "for," said he, "during the last twenty or thirty years I never yet found either of them right in their assertions or predictions." On the other hand, we cannot disguise an admission made to us in a few instances, namely, that when coffee-bug appears to wane the fungus *Hemileia vastatrix* appears to revive. Is this a common experience? Dikoya coffee is, we believe, now free of bug; but how about leaf-disease? Upper Haputale and Kandapola, and some Badulla estates' coffee in its present state affords much cause for encouragement, while lower Uva estates are suffering. The fine Wariapola estate near Maiale gave 4,700 bushels last year and thousands of bushels are still gathered on not a few other properties in the higher and Uva districts—so that we may be sure such fields will be cherished and cultivated with the utmost care considering the splendid market prospects. But what acreage of coffee may we expect to show in Ceylon five years hence? There is indeed we have new shade clearings opened with Coorg seed and cultivated Mysore fashion throughout Uva. Why not? Mysore coffee crops go on increasing even on old estates under shade, and there is Railway Extension to make Uva very accessible.

"What about Cinchona?" We have for an answer that "the man who only sows an apple-tree seed into cinchona is a fool; for seeds from all trees so sown will grow. We have further a good challenge to the fact that cinchona has been grown, worth looking at, during the past six years, North of Nuwara Eliya or out of Uva! One Inspector says he will gladly travel 50 miles to see any clearing which may prove the exception to this rule. Further he denies that any such can be found in the region referred to. Seed from Java, the Nether, and Jamaica has all been tried, but in vain: the day for growing Cinchona in the Wandy districts is over. Even seed from Bolivia sold at the rate of R400 for ounce has proved a dead failure. On Ragalla, the proprietor says he plants out 100,000 plants every year; but that is within the Uva climate and soil, though even in Uva cinchona clearings do not now equal their original vigour. The more that experience and liberal expenditure and care and attention have been brought to bear on cinchona clearings, the greater has been the failure. The history of the Bambusa cinchona gardens opened by Mr. Trill vividly illustrates this proposition.

There are other Products to notice in connection with the views of Estate Inspectors, but we must stop for today.

A TEA SALE.

Gentle reader in India and Ceylon, you who take such infinite pains to make that delicate-flavoured Pekoe, have you ever been into the Commercial Sale-Rooms, in Mincing Lane, where your tea is sold? If not, it is worth while visiting that hallowed spot on the first opportunity. If a Papuan savage were to visit the Commercial Sale Room while a sale is in progress, he would probably return from civilization to the dark paths of cannibalism with eagerness and a very bad headache. The process of selling tea is a short one. The tea from your particular garden, friend, is disposed of in very quick time; but the sale of somebody's tea goes on each day from, say, 12 until 3 p.m., and broker after broker occupies the pulpit, and buyers come up smiling. The Tower of Babel, there is reason to believe, was not a quiet place. An auction sale of old clothes in Petticoat Lane is not without its murmur of gentle voices waivered o'er Houndsditch; but the noise of a Mincing Lane sale-room is hard to beat. It would give a deaf mute a new sensation, and cause a man with "nerves," who had been brought up in a quiet and well-regulated family, to become a maniac in the shortest time on record.

The *modus operandi* is simple. A catalogue is printed, and the selling broker and the buyer meet in a room not unlike a church vestry or school room, in which there is a pulpit and several desks. The broker ascends the pulpit, the buyers are on the *qui vive* and the fun begins. A stranger, who had strayed into the place by accident, if such a thing were possible, would probably come to one of three conclusions. He might take the place for a chapel of ease, where the parson was not orthodox in the matter of his garb, and the congregation were given to vigorous disputes with him on points of doctrine; he might think he was in a lunatic asylum; or, if he were very imaginative, it would probably suggest itself to his mind that he was present at the opening meeting of a new society, whose object was the propagation and development of apoplexy.

To suddenly discover a cloud of gesticulating gentlemen shouting in unison at another amiable gentleman, who appears to have been guilty of no greater crime than speaking quickly and writing hurriedly, is a perplexing sight to the uninitiated, and requires explanation. These are earnest and enthusiastic members of the tea trade in various stages of commercial motion. A few of them, apparently, ready and anxious to secure certain parcels of tea, though they should perish in the attempt. This although alarming to the stranger, is merely the normal state of things. Those who fly excitedly about are only going through the ordinary ritual of hardy toil engendered of life in Mincing Lane; and they have no desire to break a lance with you. They merely want to have their bids recognised by the selling broker in advance of their contemporaries. They are remarkably good-tempered people and accept the dictum of the selling broker as to the actual purchaser of a much-desired parcel with urbanity. When not engaged in shouting at the top of their voices, they conduct themselves like other citizens. They are not given specially to riotous living nor rowdy behaviour. As there is no unanimity of opinion as to the necessity for any reform in the manner of bidding for teas, it may be presumed that the present method is the only feasible one yet discovered; but it would be interesting to learn the average length of life of those attending these sales, and whether there is such a thing as sale-room sore-throat. One can readily understand that life is not all "beer and skittles" to men whose custom it is to attend the sale-room; and a sceptic is inclined to think that those who grow the produce have a better chance of a healthy life even in the wilds of Assam than those who sell it or buy it in Mincing Lane.—*H. & C. Mail.*

NOTES ON PRODUCE AND FINANCE.

The Government took tea the source of a very large and increasing revenue. The amount of duty derived from tea during 1888 was £1,638,905, being the

largest return ever made in a single year; and, as compared with what was raised in 1888, the gain is indicative of an extraordinary degree of activity and success in the home trade. Coffee is still a rather poor contributor to the national revenue, having furnished only £194,578, as compared with £187,869 in 1887, when the total duty payments were exceedingly light; and there does not seem to be much prospect of any material recovery in the future.

The Japanese tea crops show a considerable increase in this season, a wider area having been devoted to the plant, and the growth having been good. Generally, the weather last year was more favourable than in 1887, though in some districts the crops were damaged. In certain localities tea cultivation has given way to sericulture. The total production of Japan for 1888 is estimated at 193,420,696 lb., showing an increase of about 30,000,000 lb. against 1887. The prices obtained this season have not been so good as in the previous season.—*H. & C. Mail.*

COFFEE AND—COFFEE.

It is often said by captious critics that English people do not know how to make coffee, but according to a recently issued report from the British Council at St. Petersburg we are not only eclipsed by Continental rivals in the art of preparing the fragrant drink, but also in the art of adulterating the raw material. Here we are familiar enough, or rather much too familiar, with chicory as a substitute for coffee, and doubtless most of us have heard of the inventive American who brought out a machine for compressing chicory into the form of coffee berries. In Russia the wary purchaser has to be on the look out for other adulterants, such as burnt beans, roasted barley, and the like. The British Consul tells a story of an Odessa grocer who boldly offered a reward to any one who should discover chicory in the coffee he supplied. As a matter of fact a careful analysis did prove that the so-called coffee contained no chicory; but it proved more, namely, that all produce of the coffee plant was equally conspicuous by its absence. The stuff was really nothing more nor less than roast barley. In a similar way tea, which is usually supposed to be so good in Russia, is very often made the means of fraud. A common trick is to mix the good tea with other leaves which have been once used and then dried, a practice which has obvious advantages to those dealers who would thereby feel themselves at liberty to say that the mixture contained nothing but tea. But the most usual adulterant is the leaves of the common willow herb, which after drying, strongly resemble the true produce of China and India.—*Daily News.*

SALT AS A PROPHYLACTIC.—From careful observations and experiments conducted it has been found that the free use of common salt with animal food is an excellent prophylactic against the cattle plague, especially when given in rice gruel. Cattle thus fed stand a very good chance of recovery, if attacked, while those which are only allowed to graze succumb to the disease in the large majority of cases.—*Indian Agriculturist.*

THE PADDY CROP is nearly ripe for harvesting. It has proved to be neither the success our earlier hopes, nor the failure our later fears had led us to expect. There has been hardly any rain since the beginning of the year; but the crop is not quite the failure it was feared to be. Wherever practicable, the farmers have irrigated their fields. Irrigation in Jaffna is a most costly and troublesome process. Water does not flow from the tanks which are of a lower level than the surrounding fields. It has to be raised by the most laborious and primitive of methods; and it is on the crop which has cost so much in labor and money that the local husbandman has to pay a tax equally with those in more favored localities where an unlimited water supply is provided. The crop, we are glad to say, is almost everywhere better than was expected, that of Poonaryn, which generally suffers from floods, being about the best.—*"Ceylon Patriot,"* Feb. 8th.

ALL the foreigners (English and American) who had some few years back leased extensive lands at Goa for agricultural purposes have abandoned their estates owing to the unsuitability of the soil for the cultivation of coffee, opium, cinchona, &c., and the high rate of taxes demanded by the Portuguese Government and refusal to make roads in the interior, as had been originally promised to the planters.—*Pioneer,* Feb. 8th.

CEYLON TEA AND THEIR KEEPING QUALITIES.—After some months devoted to watching Ceylon teas at home and calling on a large number of the big retail houses for their opinions, Mr. Gordon Grinlinton has come to the conclusion that the great matter in order to secure a good keeping quality for Ceylon teas lies in the final firing before packing, and in the bulking with great care on the plantations, in place of allowing teas to be exposed while being bulked in the London warehouses.

THE SEASON IN MADRAS.—The weekly summary of the provincial reports on the weather and prospects of the crops is as follows:—**Madras.**—For week ending 26th January.—No rain. More rain wanted in Ganjam, Tinnevely, Coimbatore, and Salem. Standing crops generally good, but withering in Coimbatore and parts of Bellary, and suffering from want of water in parts of Ganjam, Vizagapatam, Cuddapah, Chingleput, and from disease in South Arcot. Pasture generally sufficient except in parts of Salem and Coimbatore. Agricultural operations progressing. Prices rising in nine districts, including five northern, falling in six, and stationary elsewhere. General prospect favourable except in Ganjam and Coimbatore.—*Pioneer.*

"TEA" AND DOMESTICITY.—There is a taking air of "domesticity" about the very name of "tea" which seems to make it the right thing that every tea planter should be a married man! Could anything be so attractive to mothers and daughters in England as to learn from the young wooer in answer to a needful enquiry:—"Oh, I'm in tea." It will not do for all and sundry after reading this to pack up and rush home "to see then mothers." Let each do a good spell of hard work first and get the "wattie" and factory—not forgetting the bungalow—into thorough order; and thus arrange for a well-earned holiday westward, if indeed it be necessary to go so far!

HOW TO MAKE CEYLON TEA KNOWN.—A Colombo merchant well says that every planter and resident interested in our staple industry should lay himself out, when travelling beyond the island by whatever line of steamers, to endeavour to make the virtues of Ceylon tea practically known. He says:—

When I went home in the "Bayern" I took two packets of Galboda tea and made it carefully every afternoon for the commander and officers. The commander said he had no idea there was such a lot to know about the way tea should be made. He and other German passengers greatly praised my infusions, and I was glad to see some months later a record that owing to some influence or other the North German Lloyd's steamers were all taking Ceylon tea for their tables. Moreover after showing the Chef, a rather swell Commissaire, how to make tea I made him a present of a packet (in lead) of Galboda on the promise that he would gather his friends together when in Germany and give them a taste of Ceylon tea. In this way Ceylon people passing away home in foreign steamers could do a vast amount of good if they liked to take the trouble.

We trust that all Ceylon men going to Europe, India or Australia will take the hint and as true patriots provide themselves with a few packets of an approved brand of Ceylon tea, to help to promote the good name and prosperity of the colony!

Correspondence.

To the Editor.

LIBERIAN COFFEE IN DUTCH GUIANA,
SOUTH AMERICA.

Voorburg Estate, Surinam, Dutch Guiana,

28th Dec. 1888.

(To the Editors of the Tropical Agriculturist.)

GENTLEMEN,—Being one of the subscribers of your valuable journal, I take the liberty of putting before you a few questions on Liberian coffee machinery.

At present we are planting out on a very large scale the said coffee, which grows in the low impoldered lands of Surinam as luxurious as possible; samples of this coffee grown here have been declared in Holland and Germany as being valuably surpassing in strength and aroma the said coffee from other countries.

You are well aware that the Liberian coffee is much more difficult to clean or to hull than the coffee Arabica, and we are at present rather puzzled which machinery will answer the best to take off the fleshy part, and also the second or so-called parchment husk. In Semler's work we find recommended La Victoria and other machinery but Semler does not say if this kind of machinery will do the work for the Liberian coffee.

If I am not mistaken you have Liberian coffee also in Ceylon, and kindly put before you the following questions:—

1. What machinery is used in Ceylon to clean and to husk Liberian coffee?
2. Is Semler's machine La Victoria which does all the work, cleaning husking, polishing, etc., in Ceylon, at work? And will this machine do for the Liberian coffee?
3. What method of preparing is followed? the dry or the W. T. process for the Liberian coffee? or what is your advice in this matter?
4. Is the coffee dried artificially or naturally? And how are the drogers for the former constructed?

I know that Ceylon is advanced in coffee machinery perhaps more than any other country in the world, and hope you will give me full information with your well-known energy and liberty on such an important a subject as this, and hoping I am not intruding on your kindness and time.—I remain gentlemen, faithfully yours,

F. O. GEFKEN.

[Mr. Gefken will find our latest deliverance on Liberian Coffee in a current T. A. We are ashamed to say we have never heard of Semler, but we know that Messrs. John Walker & Co. of Colombo and Kandy are the foremost manufacturers of coffee-cleaning machinery in the world. On our referring this letter to them they write as below.—Ed.]

13th Feb.

Dear Sirs,—In reply to Mr. Gefken's letter we have pleasure in handing you copy of our circular regarding "Liberian Coffee Pulpers." We send a considerable number of these machines to the Straits Settlements, where this description of coffee is cultivated to a large extent. The machine most in demand is the double disc with sieve at top, and we intend sending Mr. Gefken a photograph of the same. It can be worked either by hand or power. There is very little Liberian coffee grown in Ceylon now, but what is grown is cured by an machinery. We never heard of the "La Victoria" pulper. A separate machine for pressing or "polishing" the coffee after it has been pulped, will be required, and we propose to send your correspondent particulars of the most suitable pulper. Thanking you for drawing our attention to this matter.

JOHN WALKER & CO.

The cultivation of Liberian coffee, both in Ceylon and other Colonies, has led us to devote considerable time and expense in carrying out exhaustive experiments with a view to satisfy the want for a machine that will satisfactorily pulp this coffee. We are therefore desirous to bring to your notice the fact that we have succeeded in making a pulper which we confidently predict will do for Liberian coffee what our other machines have so successfully done for Arabian coffee.

The following are a few of the advantages secured by our Liberian coffee pulpers:—

1st.—They are simple and all the working parts are easily got at.

2nd.—They are substantial; and are not likely to get out of order and can be driven either by hand or by power.

3rd.—They do their work thoroughly and without damage to good coffee.

These pulpers are made in the following sizes to suit requirements:—

1st.—Single machine to pulp about 10 bushels per hour. This pulper is suitable for a young estate. Price £18 sterling.

2nd.—Double machine to be driven by hand or power, fitted with sieve. When driven by hand this pulper will do about 20 bushels per hour; and by power about 30 bushels. Price £50 sterling.

3rd.—Same as No. 2 machine but fitted in addition with buckets for throwing back the skin from the service. Price £62-10 sterling.

4th.—Large machine for power only, to pulp from about 60 to 80 bushels per hour. Price £130 sterling.

THE TEA TRADE AND A LEAF FROM
THE PAST.

The Scottish Trust & Loan Company of Ceylon, Limited,
Ingram House, 165, Fenchurch Street,
London, 11th January 1889.

DEAR SIR,—I forward you a pamphlet on some suggested reforms in the tea trade, and you will perhaps look through it and give us the benefit of your opinion through your editorial remarks, and thus call forth the various opinions of the planters of Ceylon.

It is a subject which the Ceylon Association in London may well take in hand, and I shall bring it before them, and at the same time the Planters' Association might give its views, as the two institutions should work for one purpose.

I beg to tender you my best wishes for the New Year. It is over forty years since I first wrote in the *Observer* in the days of my old friend and neighbour, the late Dr. Elliott, then editor of the *Observer*, who shook his head at my venturing to commence estates in the Wilderness of the Peak, by opening up the Dunbar estate and others, after holding for self and others many thousand acres of what is now Dikoya at 5s to 7s 6d an acre.

Through those then pathless woods of Dimbula and Dikoya have I gone to hunt the elk on the great upland plains which lay beyond, with companions, mighty hunters—gone to their rest—Crawell, "Mookum" Rose, Colonel Hood, Andrew Hunter, and others; and I killed my first elk, I think, in the stream near where Mr. Rollo has now his fine estate of Chaplton.—I am, yours faithfully,

THOMAS DICKSON.

[The pamphlet will receive our attention. Long may Mr. Dickson and other pioneers flourish to recall the "Days of Old."—Ed.]

CEYLON FIBRES WANTED.

The Brantford Cordage Company, Limited,

Brantford, Canada, 11th January 1889.

DEAR SIR,—In conversation with Mr. Biggar, publisher "Canadian Journal Fabrics" Montreal, Canada, he mentioned the fact of a "new fibre" for cordage and twine purposes were being grown in your country, and if I wrote you, inquiring the name or names of those cultivating it, you would no doubt be able to supply them. Any information will be thankfully received, or request samples sent to our address at our expense.

FRED. CHALCRAFT, Brantford, Canada.

[Can Mr. Chalcraft refer to coir yarn? At any rate we best meet his wishes by publishing his letter, leaving some enterprising trader to send on samples of Ceylon fibres available.—Ed.]

THE YIELD OF ORDINARY TEA ON
OLD COFFEE ESTATES IN CEYLON.

London, 18th Jan. 1889.

DEAR SIR,—Ceylon publications deal very fully with the cost of bringing tea gardens into cultivation when planted in forest land, and the returns to be expected at 200, 300, 500, and 550 lb. made tea per acre. As three-fourths of the tea estates in Ceylon were formerly coffee plantations with very varying soils, and in the case of the greater portion of which returns of 550, 500, or even 350 lb. tea per acre will be found unobtainable, and, as the figures of authentication referred to do not bear exactly on tea cultivation under these latter conditions, I write this letter in the hope of drawing forth expressions of opinion in your columns with regard to this matter.

I do not wish to show as a pessimist, or write anything to discourage capital from the colony; but a word of warning as to the extent to which tea is being planted in the island and the profit to be expected, will not be out of place.

I am afraid that, given 200 lb. to 300 lb. tea per acre from former coffee land, and an average of 9d to 10d per lb. (which seems to be what we are coming to) sold in London, the profit is not such as to induce a capitalist to invest his money in a tropical cultivation like tea, with its vicissitudes, wear and tear of mind as well as wear and tear of factory machinery.

You will doubtless have letters from fortunate planters owning exceptionally favoured gardens; but I would like to have the opinion of one or two good visiting agents giving their ideas of what they think will be the average yield per acre over all the tea gardens—once coffee estates—when the whole lot are say, 5 years old, and what the expense should be of putting free on board (not including freight or insurance) tea at a yield of 200, 300, or 350 lb. per acre from an estate with a factory and with no extraneous charges for young tea fields, and with an exchange calculated at 1s 5d per rupee?

Factory charges, I suppose, are pretty well known, and taking all items from delivery of leaf to f.o.b., Colombo, and including tea-makers' salary, cooly labour in factory, cost of chests, lead, solder, hoop-iron, &c., how many factories can do it under 8 cents per lb. and is not the average nearer 10 cents?

The cost of the factory and machinery should at least yield 10 per cent over and above the profit that should come from growing the leaf, but it seems to me that there is little margin left to those who buy leaf at 10 cents to sell the tea made from it at 9d to 10d per lb. in London, and with the quantity coming from India, Ceylon and Java, to say nothing of China, I doubt if a higher price can be calculated on for "tea for price" in the future, than the figures I have named.

The buyer of green leaf at 8, 9 or 10 cents per lb. must work out his own salvation, but let the planter inform us what profit he calculates on obtaining when he sells his leaf at 8, 9 or 10 cents from an average tea estate (formerly coffee) yielding 200 lb. to 350 lb. per acre.

Some recent Indian Tea Company dividends have been announced:—Luckimpore 2½ per cent, Moabund 2½ per cent, Doocars 4 per cent, although the crop of the latter for season 1888 was 1,038,400 lb. against 745,200 lb. for 1887.—I am, yours faithfully,

MERCATOR.

[It is well to look at all sides of a case, and we should readily publish responses to the questions thus raised.—ED.]

TEA-BULKING AND LOSS IN WEIGHT IN
LONDON WAREHOUSES:—A PROTEST
AGAINST STATEMENTS BY PLAN-
TERS AND OTHERS.

London, 25th January 1889.

SIR,—Our clients, the representatives in London of several tea planters, called our attention to your paper of the 18th December, with reference to a letter from one of your correspondents on the subject of "tea bulking" and loss in weight between Ceylon and London, in which he states from information received that teas are plundered in the bonded warehouses. We think, before allowing such a statement to be made in your paper, some better authority should have been given than "a boy from a broker's office in the Lane." After many years' practical experience in the working of teas, we can safely say that the statement made is false, and further can show that it is impossible to plunder importers' tea.

On arrival of the ships in the docks the packages are landed and conveyed either by lighter or covered vans under *Customs lock*. When received in the warehouse (before the lids are removed) they are weighed gross by the *Customs officer* and the gross weight inscribed on each package, and the teas are not allowed in any case to be bulked, before the gross weights are taken, which at once secures the merchants' tea from being plundered; after being inspected by the broker, if found necessary to do so, they are bulked, the empty packages tared and refilled. After refilling they are again brought to the scale, regulated and made up to the full gross weight in the presence of the *Customs Officer*. In the case of netting they are likewise weighed gross before being netted. With regard to the other operations of taking off lids, turning out, &c., great care is taken and the tea immediately returned to the packages, papered (not with brown paper) carefully, and the lead drawn over the paper and then nailed down.

Mention is made about opening the packages with a crowbar: that is not the case, they are opened with a mallet and chisel, and your correspondent will admit that some force must be used to open the packages,* which are securely nailed down in Ceylon. With regard to the loss in weight, which is accounted for by the Customs regulations, who weigh only to the pound, and if the packages are made up in Ceylon to meet the Customs regulations, there would not be any difference between Ceylon and London weights, except the pound draft allowed to the trade, over which we have no control.

We enclose name and address, and shall be pleased to furnish any gentleman connected with estates information on the making up of the packages to meet the regulations of the Customs.—Yours faithfully,

BONDED WAREHOUSE-KEEPERS.

[One obvious criticism on the above narrative is—why are the tin boxes when refilled not soldered down again? Again, we believe a well-known Ceylon planter saw a crowbar very unnecessarily used in the London warehouses, while the men walked on the tea with dirty, heavy, hobnailed boots. Just as we are writing, a Colombo merchant sends us a report of a case (in the *Grocer's Gazette*) where damages were claimed for negligent storage of China tea—so that the Bonded Tea Warehouses are by no means immaculate—Ed.]

TEA LEAF PEST.

Jan. 31st, 1889.

DEAR SIR,—I enclose a few tea leaves affected with some disease, and shall be glad of your opinion on them. I have observed the disease for some time, and should like to know what it is. It is sufficiently serious

in its effects to deserve attention, as the bushes affected lose all their leaves, and are a long time in recovering. I have sent specimens to Dr. Trimen for his opinion.

PRO BONO PUBLICO.

[We shall be glad to learn what Dr. Trimen has to say to our correspondent; we are unable to report on the leaves here, though probably the attack is a mere passing one.—Ed.]

COTTON CULTIVATION IN DOLOSBAGE DISTRICT.

DEAR SIR,—Returning from a trip to Dolosbage, I have visited "Jack Tree Hill" estate, the property of Mr. Blackett, on which may be seen successfully grown several varieties of the cotton bush of commerce (separately planted in fields), parts of which are now bearing ripe pods.

Cotton planting here is beyond the experimental stage and presents a pleasing sight: some bushes are between seven and eight feet in height, and the cotton lint gathered therefrom silky and long in staple as well as strong and good in quality for upcountry-grown cotton. I will not send you a sample, just now, as Mr. Blackett informed me it is his intention to forward about a hundredweight to Colombo, and he is testing the bushes by counting the number of pods or bolls, with a view to estimating whether cotton will pay to cultivate on a larger scale than at present. The conductor told me he had picked 150 (one hundred and thirty) pods or bolls off one bush.

Mr. Blackett will probably write you further, on this interesting subject of cotton growing in Ceylon.

H. GOTTAM.

CEYLON TEA IN AMERICA.

February 9th.

SIR,—Under date of 7th January 1889, Mr. May writes:—"I could hardly be expected to do anything more in regard to references than I did when you were in New York, and as the Association would not take your word I concluded to drop the whole matter of tea for the present."

In a circular that came with his letter I find a notice as follows:—"Owing to the large and rapid growth of our business we were obliged to remove our factory to a more commodious building containing forty rooms which we happened to own in Nyack, and as we shall occupy the entire building we feel confident we can give your orders prompt attention."

I venture to remark that a man who can afford to pay rent of offices at 58, 60 and 62 Broadway, who has also a warehouse at 53 Cedar Street and a huge factory in Nyack, might be a good one to push Ceylon tea in America.—I am, &c.,

R. E. PINEO.

PEPPER CUTTINGS & SEED.

DEAR SIR,—*In re* pepper cuttings & pepper seedlings, I cannot be content with Mr. Martin's opinion, which is evidently founded on theory rather than practice. I don't want to know what "must be," but what is. However, Ceylon has learned too little from India and taught it too much to greatly appreciate what "friends on the Coast" say. So far as my limited experience goes, I have found that when the climate is not of the best for planting, that seedlings are far better and more certain than cuttings, while I have read that though the seedling takes longer to come into bearing, yet when it does so, it continues to bear much longer than will a cutting. I have also read that seedlings are superiorly planted in Europe and other lands thereabout.

Surely Dr. Trimen at Peradeniya could settle the point.—Yours truly,

B.

[Dr. Trimen ought certainly to be able to give valuable information from the experience gained at Henaratgoda and elsewhere. Meantime we believe that the practice in the Straits, Java and Sumatra as well as on the Malabar Coast is to grow the pepper vine from cuttings.—Ed.]

TEA GROWING IN CEYLON ON OLD COFFEE ESTATES.

North of Kandy, 12th Feb. 1889.

SIR,—"Mercator's" letter in yours of 9th instant only describes what is constantly in the thought of every proprietor in and out of the island. Everyone is asking his neighbour (1) "Is tea going to pay to cultivate?" (2) "Are we again to pass through hard times, which we vainly thought were gone for ever?" (3) "Are all our hopes and labours to be brought to naught?"

These questions it will be found difficult to answer favourably to ourselves, for no one really knows what a day may bring forth.

In spite of favourable statistics the market persistently declines, and decline it will still further, while our margin of profit grows smaller every day, and everyone continues to madly open up more land and plant, plant, plant, as if there were no great hereafter. An Assam Co.'s director told me the other day that his company alone had sold enough seed within the last 25 years to reduce the average price of tea to 6d per lb. How much more emphasized his remarks will now be when the sale of the Assam Co.'s seed crop must be covered hundreds of times over by the sale from other gardens in India and Ceylon.

I believe myself that long before Ceylon reaches her maximum output, say in 1894-95, the price of tea will be reduced to 5d. or 6d. per lb. all-round average in London.

Then will follow a rigorous selection of the fittest, the weakest going to the wall, *i. e.* the Bankruptcy Court, and the survivors remaining to find that they can eventually make some money owing to the cheapness of tea having brought it within reach of the teeming millions of poor in all countries, a tremendous increase in consumption being the consequence.

(1) What is your yield per acre and acreage?

(2) What is your average price?

(3) What does your tea cost you to make?

The above 3 simple questions if answered will tell at once what an estate is doing, and no other need be asked.

In re factory expenditure from time leaf enters the door to f.o.b., "Mercator" wants to know "how many factories can do it under 8 cents per lb., and is not the average nearer 10 cents? It must be a poor and far distant factory that can't put its tea f. o. b. for less than 10 cents. I put last year's crop of nearly 200,000 lb. tea f. o. b. from factory door for less than five cents, and can do it again, and as long as my firewood lasts.

Let us take whatever comfort we can get and rest assured that, on a well-managed estate with a good factory and yield of 300 lb. per acre, teas need not cost more than thirty cents per lb. f. o. b., and at this figure Ceylon will take a lot of beating. India will have to look well to her expenditure if she desire to make ends meet satisfactorily. Her old days of palatial bungalows, huge establishments of horses and elephants, overpaid managers and assistants *must* be curtailed, or else her poorer and despised opponent, Ceylon, will give her the lead, not certainly in quantity, but most probably as to profit. Ceylon has passed through the fire of adversity and has learned to be more prudent than she was before. She can't

so again, with a sigh doubtless, but without an effort India has got to learn all this by bitter experience and, in doing so, Ceylon can gain much and lose nothing. Let everyone make up their minds to a desperate battle with the giant, low prices, born of over-production. Let us not go into battle with a faint heart, but gird on the "buckler of determination," take up the "shield of careful management," and grasp the "sword of economy."

May He who watches over our destinies grant us favourable weather during the next decade, and stay the bloody European war with which we are now threatened and Ceylon planters can take "heart of grace." D.

No. 2.—ECONOMIES IN PREPARING TEA.

14th Feb. 1889.

DEAR SIR,—“Mercator” in your issue of 9th in putting the average factory charges at nearer 10 than 8 cents per lb. tea brings up the larger question of economies in tea manufacture, which does not always receive the consideration it demands, and which, in many cases, represents a difference of 2 to 3 cents per lb. in the cost of production.

Rolling and firing machines are to be seen in most factories with any pretension to the name, but there are green roll breakers, green roll sifters, tea sifters and tea cutters, all which tend to reduce to some extent the cost of manufacture, and I might hint to those of an inventive turn of mind that there is still room for additions to the machinery which simplify and cheapen the process of tea-making.

A factory fully equipped with all the newest labour-saving appliances will put the tea outside the building at a cost of from 4 to 5 cents per lb., including teamaker's pay, chests, lead, factory sundries &c. On the other hand a factory starting on a small scale will require from 7 to 8 cents for the same items: the wonder is that so many planters still deny themselves these necessary adjuncts to the factory—when—with the present low prices, every cent saved on the cost of producing the pound of tea is of vital importance. A study of the table on page 51 of Rutherford's Notebook opens one's eyes to the fact that with tea selling in London at 9d, exchange at 1s 5d, and cost of production at 35 cents, the profit to the grower is only 7 cents per lb. I have taken cost of production at 35 cents, but how many estates are there at the present time putting their teas f.o.b. at that figure? and how many sales lately have shown figures under 9d? There is indeed great need for strict economy in factory and field especially on estates composed of old coffee land.

OLD HAND AT TEA.

AGRICULTURAL WORK AT NIKAWERATIYA.

Office of the D.P.I., Colombo, 14th Feb. 1889.

SIR,—I am directed to forward for publication the enclosed copy of a report on the work of the Agricultural Instructor at Nikaweratiya,—I am, &c.

H. W. GREEN, Director.

Result of paddy cultivation by the Agricultural Instructor at Nikaweratiya.

SIR,—I have the honor to report that the following are the results of the cultivation of paddy for the recent harvest by the Agricultural Instructor at Nikaweratiya in the North Western Province:—

(1) SOWING BROADCAST.—1½ acres were sowed with 22-7 bushels of paddy, but without manure, and realised a crop of 80 bushels after using the improved plough. This is equivalent to rather over 53 bushels per acre (or, reckoning by folds) to 35 fold. The neighbours cultivating 2 acres in the native style realised a crop of 5-5-7 bushels per acre. The only difference in the mode of the cultivation was in the use of the improved plough by the Agricultural Instructor, and in its not being used by the natives, no manure was used in either case,

(2) PLANTING OUT.—By “planting out” after using the improved plough, 3 loddas amounting to 14 perches planted with one-fourth of a seer gave 2-6-7 bushels, about 33 bushels to the acre, which is about 364 fold. By “planting out” without using the improved plough the same amount transplanted on 12 1-13 perches gave only 2-7 of a bushel, or 3 5-7 bushels per acre.

(3) The Government Agent reports that the Instructor's cotton is looking very well, but it is not yet cropped.—I am, &c.,

(Signed) H. W. GREEN, Director.

THE CHINA TEA market unfortunately has fallen into much duller times. Though the majority of operators during the season now drawing to a close have—as we pointed out a few weeks since—done better than for the previous few seasons, the position has fallen away again somewhat. Soomoo seems to have given way considerably, and teas of this class have been sold during the week at public auction at 4d per lb. reduction on the rate prevailing last August. Hitherto teas of this description were noted for their make, but, like several other Foochow chops during this season, they have not been up to the usual mark, and dealers who got them from importers are said to have had much trouble in getting them off their hands.—*L. & C. Express.*

PROGRESS IN BRAZIL.—The *Economiste Français* publishes some very interesting figures showing that since the abolition of slavery, there has been a marked increase in the number of immigrants arriving in Brazil, and also points out several facts, such as the increase in the number of banks, which show that the financial condition of the Empire is rapidly improving. In the year 1887, previous to the abolition of slavery, the number of emigrants who landed in Southern Brazil—that is to say, in the temperate zone of the Empire, was 55,986, as against only 25,741 in 1886; but the total for last year at the two ports of Rio de Janeiro and Santos alone was 130,056. These immigrants all found immediate occupation upon the *fazendas* in the provinces of Bahia, Espirito Santo, Rio de Janeiro, San Paulo, Minas Geraes, Parana, Santo Catharina, and Rio Grande, where the coffee plant, the sugar cane, and tobacco plant are grown, and where there is a great abundance of live stock. It may be added that M. de Grelle, the Belgian Minister in Brazil, has addressed a very favourable report to the Belgian Foreign Office as to the condition of his compatriots who have emigrated of late years to Brazil, this report being to the effect that “the Belgians whom I have met with in the great colonial centres assure me that they have no complaint to make as regards their material condition. They dispose of sufficient resources for their subsistence and for the maintenance of their families. They have, moreover, the prospect before them of becoming in a few years' time owners of not less than 25 acres of land and of making a small fortune by the subsequent profits of the ground they till.” The *Economiste Français* goes on to point out that in the three coffee-growing provinces of Brazil—Rio de Janeiro, San Paulo, and Minas Geraes—there are 19 banks, two of which are English and one German, with a subscribed capital of nearly £15,000,000, and that one of these banks last year paid a dividend of 15 per cent., another of 12 per cent., six more of 10 per cent., two of 9 per cent., four of 8 per cent., and three of 6 per cent. Moreover, the paper money, which six months ago was much below par, is now at a premium as compared with gold, and it is anticipated that the new law as to banks of issue, which came into force at the end of last year, will lead to the calling in of paper money and to the establishment of a fixed monetary standard.—*London Times*, Jan. 22nd.

THE CANKER OF THE CINCHONA.

In a communication to the Botanical Society of Hamburg, Dr. O. Warburg describes the nature of the disease known as cancer, which attacks the cinchona plantations of Java. There are two kinds of cancer, one infesting the root, the other the stem. The former is found beneath the bark, immediately below the ground in the form of a white flocculent fungus mycelium, from whence it extends to both stem and root, causing cracking of the bark. The fungus appears to be a rhizomorph, very similar to that of *Agaricus mollus*. The cancer of the stem makes its appearance higher up in the trunk and branches. It is caused by a parasitic fungus, propagated by means of spores, resembling that which causes the cancer of the bark. The diseased trees were also found to be attacked by *Periza Willkommii*, but it was not evident that this fungus was the cause of disease.

The only efficacious remedy suggested by the author is to cut out the diseased parts; also to choose those varieties which seem least liable to the disease. He states that *Cinchona succirubra* shows itself in this respect a more desirable variety than *C. Ledgeriana*.—*Pharmaceutical Journal*.

THE FRENCH VANILLA TRADE.

Bordeaux, which is one of the principal centres of the Vanilla trade, imports, it is stated, over 50,000 lb. annually. Most of the Vanilla imported comes from the French colony of Réunion, where the culture is of comparatively recent date. The annual exports from that island previous to 1845 amounted to only 6 or 8 kilos per annum, while the total exports from the French colonies of Réunion, Mayotti, Tahiti, St. Marie, Madagascar, and Guadeloupe for 1880 were 78,243 kilos, and in 1886, 180,671 kilos. By the local dealers Vanilla is classified into four qualities; the pods of the first or *primiera* measure from 7 to 9 inches long; they possess the characteristic perfume in a greater degree than the other sorts. The Vanilla vine, it is stated, is at times covered with efflorescence of a silvery brilliance, producing a crystallisation similar to that found in the pod, and which in good specimens covers the outside of the pod. This is called Vanilla vine, and is in great demand in the Bordeaux market.

Two different methods prevail for preparing the pods for market, which are described as follows:—The first consists of harvesting the capsules after they have lost their green tint. Woollen sheets are spread upon the ground, and when thoroughly heated by the sun the pods are spread upon the sheets and exposed to the sun for a certain period; they are then put into boxes, covered by a cloth and exposed to the sun. The fruit should assume a coffee colour in twelve or fifteen hours after this last exposure. If this colour is not obtained, the Vanilla is again submitted to the heat of the sun. This process occupies about two months, at the expiration of which the Vanilla is packed in tin boxes containing about fifty pods each, and securely packed.

The second process consists of tying together about a thousand pods and plunging them into boiling-water to blanch them, after which they are exposed to the sun for several hours and then coated with oil or wrapped in oiled cotton to prevent the pod from bursting. During the drying the pod exudes a sticky liquid, the flow of which is promoted by gentle pressure of the pods two or three times a day. In the course of preparation for market the capsule loses about one quarter its original size.

Regarding the trade in Vanilla in the London market for the week ending November 3 last, it is stated that the latest mail reports from Mauritius estimate that the culture of the coming crop in that island will be a small one, and will probably not exceed 21,000 lb.

The present market price in London for Vanilla is very good, ranging from 8s. per pound for common, to 23s. for fine sorts.—*Gardener's Chronicle*.

FIGS IN THE OPEN AIR IN THE EAST OF ENGLAND.

Some of the finest flavoured Figs and the most fruitful Fig trees that I have ever met with in the open air have been in East Anglia. The dry and frequently semi-arid climate, and probably also the saline constituents of the atmosphere, seem to suit the Fig. In regard to the latter, it does not seem to be generally known that the Fig is one of the limited number of trees that thrive well by the sea. Only last summer, cool a summer as it was, very good Figs were ripened within touch of the sea-spray on the east coast, alike on standards, walls, and fences.

The chief conditions of success in Fig culture in the open are a dry base, firm soil, and natural treatment. Without a dry bottom success in the open air is almost impossible; and this is the rock upon which not a few of those only or chiefly conversant with the culture of the Fig under glass, split. With abundance of heat at command, the Fig during its growing and fruiting stages may almost be treated as a semi-aquatic. Its rapid growth, and its spreading and copiously perspiring or elaborating leaves, enable it to utilise or dissipate enormous quantities of water; but in the open air there is little or no fire—that is, heat or motive, or water-using power in the grate, so that as the atmosphere is full of moisture, the plant and its workshop or food warehouse gets water-logged. Nor is this all. Any excess of water still further lowers the temperature, chills the activity, and paralyses the functions of life and growth. A dry base means a warm one, and for such a gross-growing plant as the Fig drought and heat are the two essential conditions of healthy growth and full fertility. The next essential is poor calcareous soil. Poverty is the first point, though chalk seems also important. But better, poor sand, hungry gravel, mere brickbats, mortar rubbish, or hard roadway, than root-runs of fat black vegetable mould or brown loam, enriched with further additions of stable-yard or other stimulating manure. These may force Fig shoots like walking-sticks or fishing-rods, but not those firm short branches from 3 to 9 inches long, studded with from three to seven embryo figlets apiece. No; such fruitful form can only be forced home on our Figs in the open air in England under the constant threat of starvation. Like many another amongst us, the Fig in the open air has to lose to win; it loses full meals of food, to be clothed with fertility; and the latter, under this starving regimen, may be trusted to reproduce itself. That is, however, if the Fig has its own way, or, in other words, is subjected to natural treatment. The genius has not arisen who could do justice in thrilling poetry or telling prose to the miseries of the Fig tree in the open air in our climate, and the tortures it has been subjected to in our frantic efforts to cram, cut, and coddle it into health and fertility. The first two are correlative, if not absolutely cause and effect. The more freely they were crammed, the more savagely they were cut—and so on, and on for ever. And the coddling also became the more inoperative, as the product of cramming and cutting was tenderness, such as could by no possibility face our cold without covering. And so these threefold processes repeated themselves with cast-iron regularity, the only thing always lacking being edible or luscious Figs. At last aridity of base and sterility of root-run were called in to arrest grossness of growth, and the pruning-knives were left to sleep in their cases. There was so little wood made that it seemed a folly to prune off any. Still the coddling and covering went on, with the result of so weakening the embryo fruit and the wood that the fruit too often dropped, and the wood got hardly hit by the late spring frost, when the covering was at last removed. Finally the coddling system was abandoned, and now that the natural system of producing only sufficient wood for fruit-growing purposes, and seeing to it that such wood is sufficiently matured to bear our ordinary winters with impunity, have been adopted, luscious

Figs in the open air in East Anglia, and in other favourable localities in the open air, are almost as common or—as our climate has run of late years—are even more constant than Peaches.—D. T. FISH.—*Gardeners' Chronicle*.

A DELI PLANTER IN BRITISH NORTH BORNEO.

The planter whose experiences in the territories of the British North Borneo Company, as set forth in the *Deli Courant*, have been noticed in our columns, thus sums up his verdict on the evidence before him, so far as it bears upon cultivation there.

THE SOIL.

The soil generally consists of white clay with an intermixture of humus in a thin layer above. On the shores of Maruda Bay and on the Banks of the Sugut river, the soil is somewhat sandy and has need of irrigation. The planters on the spot deem that the rainfall will meet requirements in ordinary years. The Deli planters who have seen the country for themselves generally think highly of the soil. The ground is less heavily timbered than in Deli. Building materials abound on all sides. Where timber fit for posts happens to be scarce, the "Nibong" may be had in any quantity. Nipa for thatch is everywhere available.

CLIMATIC ADVANTAGES.

Notwithstanding the fact that, on many estates, the mortality has been enormously high, the climate is as healthy as in Deli, if not more so. The tobacco grown, which, so far, has been brought to market only in small quantities, seems to suit admirably the wants of customers in Europe. This is said to be especially the case with the Suan Lamba tobacco. The only uncertain element to be reckoned with in planting adventure arises from the little knowledge of how the monsoons set, and how it stands with the rainfall.

LABOUR.

Another element of difficulty lies in the coolie question. Chinese labour may easily be counted upon. In securing it from China or Singapore, the difficulties are hardly any greater than those met with in Deli. There is, however, greater risk of Singapore coolies absconding, especially at Labuan. The greatest hindrances lie in the way of finding suitable native coolies. It is well known what bad characters Singapore Javanese and Malays usually turn out to be. Owing to direct coolie immigration from Java being impracticable under existing conditions, the refuse of China and the Straits will long find a ready market for their labour in Borneo. The Kadyans, a tribe from Brunei territory, and some Brunei Malays settled in Labuan, are preferable to them in every way. The latter seldom enter into contracts for more than 6 or 8 months in duration. They get 8 to 9 dollars per month, and work sometimes only eight hours a day. Years will have to pass away before the native population of North Borneo will feel any inclination to labour on the estates. What has been done in this respect by the Acting Resident on the West Coast calls for the warmest thanks of the planters. The sudden extension of planting enterprise has resulted in a heavy demand for coolies, who prove hard to get, even with the utmost efforts to secure success. There are not even men in the land able to make thatch from the nipa palm, which abounds in the country. As may readily be imagined, the position of the pioneer planters has been greatly affected for the worse by these difficulties, and by the great distances to be traversed at sea, &c.

COFFEE.

We will now glance at the prospects of coffee cultivation. The hills suitable for cultivating are not high enough, and have too hot a climate to agree with Java coffee. Even, however, if coffee did grow luxuriantly there are no men to gather in the crop. In the eastern districts, the country has hardly any inhabitants. The people on the

north coast are either too shy or too hostile towards Europeans to be at all helpful in the next few years. The other planters cannot naturally spare their own coolies, not for a day even. The chances are that most of the coffee crop will remain unplucked. It is only on Maruda Bay that the co-operation of the people may in some degree be reckoned upon.

OTHER ARTICLES.

Sugar and pepper have been experimented with, but no sensible planter will as yet begin with them as mainstay. These articles cannot at present be grown there on a scale to pay expenses. Gambier hemp, and other produce articles have not come into prominence, and have been subjects of experiment only. Success in planting there depends upon prudence and foresight carried out with sound judgment and on intelligent principles.—*Straits Times*.

ROCKS AND SOILS.

Rocks and Soils: their Origin, Composition, and Characteristics. By Horace Edward, Stockbridge, Ph.D., Professor of Chemistry and Geology in the Imperial College of Agriculture, Sapporo, Japan; Chemist to the Hokkaido Cho. (New York: John Wiley and Sons, London: Trübner, 1888.)

Chemist to the Hokkaido Cho! It is not the least striking feature of our time that there should be an Imperial College of Agriculture at Sapporo whose Professors publish researches in New York and London. This is not exactly a novel experience, for events crowd upon us thick and fast in these days; but those of us who can look back forty years must be struck when confronted with the Chemist of the Hokkaido Cho. Dr. Stockbridge is not, be it understood, the alchemist to an Eastern potentate, nor yet one of the astrologers, Chaldeans, or soothsayers of a modern Belshazzar, but an agricultural chemist and geologist discoursing upon rocks and soils, nitrates and microbes, and suggesting processes by which atmospheric nitrogen is fixed in the soil by the action of living organisms. The great Mikado, "virtuous man," has, we know, transplanted full-grown and fully-equipped knowledge from the West to his remote dominions; and so successfully, that it has rooted, and now is become an article for exportation—as witness the volume before us. To some of our readers it may appear unnecessary to dilate upon a fact which springs naturally out of the most recent developments of civilization. We need not now despair of openings for aspiring young chemists under the protection and pay of the King of Dahomey or of Ashantee, or of an Imperial Institute at Khartoum or some other part of the Dark Continent; and truly the missionaries of science are in a fair way to rival those of religion in their ubiquity.

The volume before us is of attractive appearance. It is, however, hard upon the reader who takes it up in order to learn something about rocks and soils to be carried through the entire history of the planet on which his lot is cast. Deeply interesting as are the cosmic questions bearing upon the original nebulous mist, "in glowing gaseous condition," they scarcely affect even scientific agriculture. Besides, it is open to doubt whether an agricultural chemist and geologist is within his province in explaining the differences between white stars, red stars, and habitable planets which have gone through phases thus indicated. Such information belongs to the domain of the astronomer and the physicist, and the agricultural study of rocks and soils should be taken up at a later date of the earth's history. It is not our object to criticize Dr. Stockbridge's book severely, but it appears to us that if he had cut out 100 pages at the beginning, and added 100 pages at the end in harmony with his concluding sections, his work would have been more useful.

The two features of this book which seem to us the most important are, first, Dr. Stockbridge's views as to the "fixation of atmospheric nitrogen independent of ammoniacal condensation and of nitrification."

The compounds thus formed in the soil are, we are told, complex insoluble amides resembling those existing in living organisms, and must have resulted through the vital activity of the micro-organisms present in the soil. If soils have the power of fixing atmospheric nitrogen through the action of living organisms, they possess a means of recruiting fertility independent of plant action, and of so fundamental a nature that, supposing such action to take place, the question of the source of nitrogen and the supply of nitrogen in soils would be set at rest. Another novel view is that propounded with reference to dew-formation. Here, we have a subject which is not very clearly related to that of rocks and soils. So far as the soil is a vehicle of plant nutrition, its conditions as related to moisture are of course important, and it is in this connection that the theory of dew as propounded by Dr. Stockbridge finds a place in his work. It is not necessary here to explain Dr. Wells's explanation of the fall of dew. It is sufficient to state that it is unsatisfactory to our author, who holds that dew on the leaves of plants is (we presume he means occasionally and not universally) derived from the plant itself rather than from condensation from the atmosphere. Dew on growing vegetables is produced by the condensation of the transpired moisture from the plant on its own leaves. This explanation is proved by direct experiment, and we are not disposed to deny its truth. It is probable, and, in fact, more than probable, that plants which are giving off large quantities of water into a cold or overcharged atmosphere should have a portion of their own moisture thrown back upon them. This fact is asserted in Marshall Ward's translation of Sachs's "Physiology of Plants," when he says, "Much of the water we find early in the morning on the margin of the leaves of many field and garden plants in the form of large drops, and which are generally taken for drops of dew, is really water excreted from the plants themselves." That the air is really the cooling medium by which the moisture rising from the warm soil or the growing plant is condensed is no doubt often true. The mist which stretches over the meadows at sundown is moisture condensed in the cool air, and thus becomes precipitated upon vegetation, and not only on vegetation, but upon everything else. Where we think Dr. Stockbridge has overstated his case is when he writes in italics, "*The declaration is true, and that dew is the condensed exhalation of the plant.*" The statement is too general, and the assertion is too much of the character of a supposed new discovery on the part of the author. The real facts of the case are, that dew is produced in some cases from condensed exhalations from the plant, or from condensed moisture rising from the soil; but also from the precipitation of moisture from higher sections of the air during the night; especially when the sky is clear. The collection of water in the form of hoar frost upon leafless trees or lawns, must be derived from the condensation of atmospheric moisture upon the tree, or upon the grass, cooled by radiation; and we have no doubt that grass radiates heat on a moonlight night more rapidly than does bare ground. Dr. Stockbridge lays too much stress on the fact that the earth is warmer than the air when dew is falling. True he asks us to believe it is later to the theory that the earth condenses or can condense atmospheric moisture. The radiating power of the earth is very great, and exceeds that of the air, which, in fact, absorbs and retains much heat which otherwise would be immediately lost in space. Dr. Stockbridge argues that the surface of the earth is invariably warmer than the air at the dew point, but this is not likely to be the case. Even the temperature of grass land is assumed to be always warmer than the air, and hence it is contended that in no instance can the earth or vegetation be the condenser. We are disposed to think that observation will throw more light on this point than such experiments as are quoted or were made by Dr. Stockbridge.

It is probable that dew may be precipitated at times by a colder air on a warmer surface, and at other times by a cold soil or cold expanse of leaf from a warm atmo-

sphere. Whether the leaf of a grass or the air above it acts the part of "the cold pitcher" is not always to be predicated, but in either case dew would be the result. We may point out that, while Dr. Stockbridge is disposed to assert that the soil is always warmer than the air, other authorities are of opinion that the surface, especially of grass, is colder by many degrees than the air. A thermometer laid upon grass would, we believe, recede further and record a lower minimum than one suspended 2 feet above the grass. The freezing of dew on grass during summer nights, which is always an unpleasant sight to gardeners and farmers, appears to be accounted for by radiation of heat from the grass surface, while the substance of the grass cuts off radiated heat from below. The absence of dew under shade also is apparently due to radiation from the earth being checked, and the cooling process of the surface of the earth or its vegetable covering being prevented.

Dr. Stockbridge's book suffers from careless reading of the proofs. This work, the author tells us, he was compelled to depute to others. In one place (p. 183) the word "soil" is evidently used instead of air, thereby reversing the author's obvious meaning, and the word "not" is interpolated, which further confuses the sentence hopelessly. Names of authors quoted are mis-spelt in several cases. The book, especially in the earlier pages, is somewhat bombastic and provincial in its style, and, as we have before stated, many of the earlier pages might have been omitted with advantage. The tone of the writing becomes more modest, precise, and student-like as the author approaches the topics which we are informed upon the title-page he professes.—JOHN WRIGHTSON.—*Nature.*

DIVERSIFIED FARMING.

This phrase has been used so much and printed so often that it often causes a smile calling up disappointments similar to those that succeeded the era of "mineral resources" soon after the war. The truth is, our people will have to get out of the old ruts, for what now goes by the plain name of trucking receives commendation and makes money has been severely ridiculed by the old planters and farmers. In the days of ridicule down South they called it "dude farming," and we make an extract from a humorous speech of Col. W. H. Dudley, of Mississippi, on the subject.

About four years ago I was doing well as a cotton planter. I was raising cotton that cost me ten cents a pound, and was selling it for nine cents. I was getting rich so fast that I concluded I would retire and make way for those who were more needy. About this time I read of a man down at Crystal Springs, Miss., who had sold \$1,000 worth, gross, from an acre planted in tomatoes. My ambition was fired. What one man could do another could. Why not plant 200 acres in tomatoes, make \$200,000 and retire? I was not greedy. I did not want so much money. I thought \$5,000 would be about enough for one year's work. So I settled on five acres as the amount of ground I would plant in tomatoes. I knew I should be near the depot, so I rented my land and moved into Canton, Miss., on the Illinois Central Railroad. As it was a new business, of course it became the town talk. Everybody discovered suddenly that it was a big thing, and promised fortunes to those who went into it. There was soon a tomato craze in the town. Before I planted a seed I found out that everybody was going to plant tomatoes. Some wild man proposed to organize a society. Everybody jumped at the idea. The society was formed with a great burst of enthusiasm. There was high old scuffling and log-rolling for positions. By much maneuvering I sailed in as secretary and raised the dust with an extempore speech of thanks for the unexpected honor conferred upon me. I had worked for it like a ward bumner. Our meetings were frequent and very interesting. Every man was told what he knew and a great deal more. One man told about a vine in a rich spot in his garden which grew up over his kitchen, on up over his two-story residence to the top of an oak tree, but he did not get any tomatoes. It

was voted by the society that rich land would not do for tomatoes. Another man told about a little vine on a poor red spot in his garden from which he had gathered a peck of nice red ones. He did not tell about having buried a dead cow on that spot a year before. It was voted by the society that poor, red ground, the redder the better, to give a fine color, was the kind of soil for tomatoes.

Of course there were many skeptical cusses in our town who snickered at our enterprise and laughed at our society. One old negro politician, in a speech, went so far as to use this language: "What's all dis I hear 'bout raisin vegetables to sell? Now dat will do for dese ha'r-pin-legged dudes 'bout town to be carryin' on dis dude farmin', raisin' Tom Thumb peas and permattuses, but it won't do for de genuwine farmer." It was too good a thing for the boys to miss, so they dubbed us dude farmers and it stuck. But I was not intimidated by jeers or ridicule. I pushed along with my work, built extensive hot-houses, covered my land with cold-frames until it looked like a Bulgarian army was camped upon it. I thought I had better study up a little on gardening, so I got a quantity of books. I had not read more than half through before I learned that I would have to know a great many things. In fact, I would have to become a scientist. I found out I would have to study botany and learn the functions of the stamens and pistils—I supposed to keep the pistils from going off and hurting something; that I would have to study etymology and become personally acquainted with bugs and worms, though I could never see what the Lord made them for, except in the case of crickets and redworms for fish bait. I found out I would have to study biology to know what to buy, cronology to know how to keep the crows off, astrology to know when the moon was in the right place for the seed, geology to know how to guide a mule, and pathology to know how to make the business pay. I crammed like a sophomore trying to grease through a commencement examination.

During the time I was going through these scientific researches I noticed every day a poor man passing my place, driving a dump cart, hauling manure. He was going to "truck-farm," as he vulgarly called it. I was sorry for that man. He was very poor, with a large family—sixteen children, all boys, but fifteen. I thought it would be an act of Christian charity in me to dissuade him. So one day I stopped him and said: "John, is it not rather a hazardous business for you, with your large family, to undertake a scientific occupation like this? Why, my dear fellow, you do, not know the difference between a rhynchopores (*curculio imperialis*) and a trilobite of the early zoic era." He said: "No, I don't. But I tell you what I does know. If you puts plenty of manure on the ground and works it right, it always brings truck." Of course, I reasoned no longer with such gross ignorance.

Well, time flew on. I had a world of beautiful plants. April came at last. I got a regiment of negroes and put them in the field, and such a field. It was a lovely, red, stiff clay, that might have sprouted a pea if the pea had not first opened its eye to see what kind of soil it was in. Toward the last of April I saw a little yellow, sickly bloom. I struck a stick up by it and walked round and round it every day, putting in my botany. Would even go out at night to see if the "sweet influence of the Pleiades" was doing it any good. About the fourth night a remorseless worm came up out of the earth and it was no more. But the amount of entomological satisfaction I had in dissecting that worm fully repaid me. A drouth came on in May. The plants got sick. So did I. By the middle of July I was through with the crop, or rather it was through with me. For my six months' labor I realized the magnificent sum \$1.60.

In that day of tribulation I found out there was the one ology I had not studied, but which I needed more than any—that was theology. If my wife had not been a Methodist I would have "cussed." I heard that many did "cuss," but it was mostly me,

for all had followed my advice and example. There was one man who did not know the difference between a rhynchopores (*curculio imperialis*) and a trilobite of the early zoic era. He made money. But I had one year's experience. I made this entry in my memorandum book: "Tomatoes need rich ground and plenty of water." I determined to try again. The next year I put a ton of cotton-seed meal to the acre, harrowed the ground flat and dammed up every place where the water could be held. I then waited for the rains. They came in the greatest abundance. It was the spring when the people of Cincinnati took to the tree tops to get out of the way of the Ohio River. I was happy. I waded out to see my plants swim. They looked nice for about five days, but when the waters subsided and the sun came out hot they got sick. So did I. When I gathered and shipped the crop I balanced my book and found I had lost \$200. But I had another year's experience. I was getting a little shaky, but I determined to try again. I dared not quit. I stood appalled before the storm of ridicule which I saw gathering in the eyes of the ungodly jesters. If I failed again I would have more time to prepare to skip the town. I made another entry in my memorandum. It was this: "Make a garden of your land; drain well; treat as you would a garden and plant many things."

The third year I moved as cautiously as a kitten in paper shoes. I put one acre in tomatoes, about the same in cucumbers, a smaller area in beans, cantaloupes, Irish potatoes, radishes, spinach, etc. I succeeded beyond my expectations. I found money in every crop. The cucumbers brought about \$150 to the acre; the cantaloupes at the rate of \$250; the beans about \$130, and from the one acre in tomatoes I sold over \$900 gross. They were shipped mostly to Chicago and Minneapolis. I was satisfied now. I need not fly to the frontiers an exile. I had saved my reputation and demonstrated the fact that there was money in dude farming.—*Southern Planter*.

[We reprint the above as an amusing caricature of pretended science in farming. But we add a Paper which shews what books and newspapers have done for farmers.—Ed. T. A.]

AGRICULTURAL READING.

Many of our practical farmers think that time spent in reading newspapers is lost. Even papers devoted to the special work of the farmer are considered of little avail. "Book-farming," if not as much decried as formerly, is still neglected, and many men still think that it takes little education and intelligence to make a farmer. A successful farmer cannot be made by the education of the schools alone but it will also take a long time and much crude thinking to make a successful farmer without education, reading and books. To make a thoroughly well-informed, skillful, successful farmer, requires as much brains and study as the most technical trade or highest profession. The world is full of ignorant, slipshod actors in all occupations, from the pulpit to the field, and each has its share of pretenders and shysters. When, from want of ability or opportunity to get early and systematic agricultural training, the farmer feels, as he ought, his deficiency, the newspaper, and especially the agricultural paper, offers the cheapest and most successful means of securing sufficient agricultural information for a sensible farmer to secure fair success in his business. Continual and careful reading of current agricultural literature and sound thinking and thorough examination of what is read, will enable a reasonably intelligent farmer to gather much of the scientific and practical relating to his farm and crops. The editors of agricultural papers will collect, examine and prepare for their less educated readers all that is absolutely necessary to understand about the land crops and stock of the section where they circulate. In this way, the intelligent, but uneducated farmer may arm himself against deception, and at the same time take advantage of the knowledge gained by others in years of study, prepared by the editor to be received understandingly, and acted upon in his fields and on his crops. We know an unlettered man who was

lamenting the destruction of a fine cabbage crop, by the early caterpillar, when the village newspaper had been publishing for six months a remedy that saved the crop of his more distant neighbors. He did not take the paper, or read it, though it cost but a dollar. The world moves swiftly now; everybody must read or be left, and the farmer must read more than most men, if he would keep up with his occupation in all its branches.

We copy an article on this subject, prepared by Hon. J. W. Lang, member of the Maine Board of Agriculture in 1873, telling what the newspapers had done for the farmers. If the newspapers will take proper interest in this great industry, it will be as true here to-day as it was in Maine then:

WHAT THE NEWSPAPER HAS DONE FOR THE FARMER.

It needs but a glance over the past to see the advance that has been made in farming. Improvements of all sorts meet us wherever we turn. And perhaps in no class of the wide community is the improvement so manifest as in the agricultural masses of the country. As a promoter of knowledge, the newspaper holds no secondary rank. Its weekly visits ever bring something new—some fact in science, some better method of doing things, some experiment or experience teeming with usefulness; and, further than this, its language, its tone, and its spirit, inducing a habit of reading and inquiry, acts beneficially upon the thousands who read and come under its influence. Go back thirty years and see the state of the country when agricultural papers were almost unknown; the status of the rural population, and general information among them. We find the farmer without very many of the comforts he now enjoys, pursuing the time-honored practices of his ancestors, without ambition to excel that now actuates the farmer of to-day. We see him following superstitions that are now exploded, firm in his limited acquirements as the rocks about him, plodding on in old beaten ruts without using efforts to get out of them, content to let "well enough" alone. He was satisfied if his children got little education, enough to read and write and "cipher" respectably, seeing no use for those higher branches he did not understand, and supposed had no use for. All this was perhaps well enough for their day and generation, when muscle was called for to subdue the wilderness and break down the stubborn soil. They served well the purpose of their day. Now, progress, resistless Yankee energy, has urged the former state of things out of the way, and inaugurated a new programme.

The new paper has been greatly instrumental in this work. There is in human nature a groping for better things. With knowledge of their existence comes a desire to possess, and efforts for possession. So with knowledge of improved methods in farming came their application to practice. Improved breeds of cattle were heralded by the press, their points discussed, and farmers enlightened as to their merits; this led to their introduction. We see no slab-sided, long-eared rail-splitter in the farmer's hog-pen. They have become obsolete through knowledge and possession of better breeds. They do not pay, hence are not kept. The farmer of the present is a snug calculator. He has learned from his paper that farm accounts are beneficial, and has adopted them. They help systematize his business, and from system and order arises thrift. The old "native" breed of cattle have nearly all disappeared, their places been filled with thoroughbreds and grades of the same. The good and bad points of the various breeds have been so thoroughly discussed through the papers that almost every farmer is well posted in regard to them. It has come to such a pass that every paper maintains its agricultural column, even our religious sheets, made, perhaps, more especially for sabbath reading. This general inclination toward farming and farmers, shows the tendencies of the times, and speaks volumes for agricultural progress. Most farmers have some idea of the mineral construction and elements of the soil, the elements contained in plants and fertilizers, which were almost wholly unknown thirty

years ago. They are becoming somewhat acquainted with agricultural chemistry, and better understand how to adapt fertilizers to soils and crops.

The newspaper has discussed these topics, and the farmer has learned them and been led thereby to seek other sources of information. Instead of orchards with fruit fitted for little else than cider, we find now the choicest kinds. Small fruits are cultivated where before unknown, unless they grew wild and uncared for. The better varieties have taken the places of the old, and the garden presents an attraction hitherto unknown. The home has been adorned by shade trees, shrubbery and flowers outside, while inside books and pictures lend their charms. There is something deeper, pleasanter, and better in that family circle at the farmer's fireside than before.

The newspaper, especially the agricultural newspaper, has left the impress of refinement and progress in many a household, and yet its mission is just begun. The future is a broad field in which it will move on to new triumphs, new heights, and new usefulness. We all poorly realize what we owe the newspaper and public journal for the advancement science, agriculture and civilization have made. Take them away—blot them out, and we retrograde more rapidly than we have ever advanced. Let them be well supported, and they will turn in and support us.—*Maine Agricultural Report.*

FORESTS, RAINFALL AND CLIMATE.

The continued cutting down of the forests in this section of the country, and the unusual rainfall of the present season, suggests a few thoughts on the subject of forest influence on rainfall and climate. Surely grave responsibilities rest upon those pretended scientists who can regulate the rainfall, the flow of the rivers and the temperature of the climate by cutting down or setting out trees, as the case may be.

Here in New Hampshire, where, in spite of the fearful warnings and the positive predictions of terrible droughts through the speeches and writings of weather experts, we have cut down and destroyed much timber and wood, yet in September, 1888, we had 1097 inches of rain, and in October it also poured down upon us in immense quantities. At the West, however, strange as it may appear to these scientists and weather regulators, where there has been more forests planted, according to statistics, than there has ever been on any other part of the globe, we have advices of terrible droughts prevailing throughout the Summer of 1888. Last year the West suffered greatly for want of rain, and in September of the same year we people of New England had but '80 of an inch of rainfall.

I have been over the State of New Hampshire to a considerable extent, yet I am ignorant as to whom the guilt should be charged for setting out such a number of trees since September, 1887, as to increase our rainfall in 1888, from the '82 of an inch last year to 1097 inches this year, or 751 inches above the annual average of a term of years. The papers inform us that it is relatively as wet and cold this year in old England as in New England, while it is unusually hot and dry in the South and dry in the West. Ben Jonson wrote something as follows:

Of all the ills which human life endures,

How few are they which kings can cause or cure?

Far otherwise is it in the case of our friends, the tree theorists and weather regulators; to judge by their publications and orations, most of the ills to which human life is heir lies within their jurisdiction. If any one doubts this statement let him turn to the *North American Review* of recent date, and learn from one of these scientists how much of the earth has already been made a desert, and see how soon at the present rate of forest destruction the whole earth will be one vast Sahara. The picture is one of the most appalling desolation, and one which, according to the scientists, may be entirely avoided by growing forest trees.

In theory it seems true that one may shake the solar system by stamping upon the earth. Man may to a greater degree modify the climate and possibly affect the rainfall by his operations in agriculture and forestry, yet I fail to find proof of such supremacy over the subject as many theorists claim.

Let us look at a few sound practical facts with a historical backing. Plymouth Colony, Mass., was settled on the easterly side of what I take to be the largest forest on the globe at the time, and again, by the Atlantic Ocean. According to modern theory, how it should have rained upon the poorly housed heads of our Pilgrim fathers and mothers! What were the facts? The first fast which was recorded in Plymouth Colony was held to pray for rain. Let us quote again from history, to see what effect this vast forest had upon the rainfall in Plymouth Colony.

I give a list herewith of the droughts the colony endured, also a list of the subsequent droughts in the same section of the country, as published in the early records and subsequent papers. Recorded as above, I find the number of successive days without rain in the year 1621 to have been 24; in the Summer of 1630 there were 41 successive days without rain; in the Summer of 1657, 75 days; in 1692, 80 days; in 1674, 45 days; in 1680, 81 days; in 1694, 62 days; in 1705, 40 days; in 1715, 45 days; in 1728, 61 days; in 1730, 92 days; in 1741, 72 days; in 1749, 108 days; in 1755, 42 days; all successive days without rain.

In the Summer of 1762 we have a remarkable record of 123 successive days without rain; in fact, there was no rain from the first of May to the first of September, and many were obliged to send to England to import from that country their supplies of hay and grain to sustain life. In the Summer of 1801 there were 32 successive days without rain; in 1802, 23 days; in 1812, 28 days; in 1856, 24 days; in 1875, 26 days, and in the Summer of 1876 we have a record of 27 successive days without rain.

These facts are certainly very suggestive, and are perhaps as reliable as the fanciful theories evolved in the brains of weather and forestry scientists.—JOHN D. LYMAN, Exeter, N. H., in *American Cultivator*.

[There are good reasons for objecting to the reckless destruction of forest and for planting trees, apart from the pseudo-scientific nonsense about the cutting down of forest diminishing rainfall.—Ed. T. A.]

AUSTRALIA is building a fence of wire netting 8,000 miles long to keep jack rabbits out of Queensland.—*Southern Planter*.

IF SHEEP-RAISING in Queensland, Australia, will justify buying the wire and stretching 8,000 miles of fencing to keep out the jack rabbits, why will it not pay in Virginia, where we only have to deal with the dogs?—*Ibid.* [Of course the marmot-like creature called "the prairie dog" must be meant.—Ed. T. A.]

TAKE in the tools. Don't leave your hoes in the trees and your plough by the side of the road. This carelessness with tools is one of the little leaks that makes it necessary to mortgage the farm.—*Ibid.*

POTATO CULTURE.—The potato will grow on a great variety of soils, but will give the best results as regards quantity and quality if planted in a rich, warm, sandy soil. The ground should be naturally rich, and if a large crop is wanted old stable manure should be used at the rate of ten or fifteen tons to the acre. The method we practised some twelve or fifteen years ago in planting and cultivating the potato has always been successful and is quite simple. We selected a sandy soil, strongly inclining to clay, naturally rich. Old manure was hauled to the lot in winter, at the rate of twenty loads to the acre, and spread evenly over the surface. As soon as the soil could be worked we started the plough, turning the soil to a depth of eight inches and pulverizing it as much as possible. The furrows were set up on edge and not turned top side down. The surface was made fine with an old fashioned harrow, and the potatoes planted in the shallow drills some three feet apart

and the tubers eight inches apart in the rows. The seed was covered two to three inches deep with fine soil. After planting we spread a half inch coat of ashes over the rows, raking the surface thoroughly with a fine steel rake and mixing the ashes with the surface soil. As soon as the plants begin to show here and there we spread a coating of rotten straw over the rows to the depth of an inch and covering the entire row with a stripe of straw about eighteen inches wide. We put a single shovel plough to work, running once only between the rows and throwing the soil as far over the straw as possible. With a long shovel, some eight inches wide, and sunk to a good depth, the soil would be thrown over the entire surface, covering and holding the straw in place. The coat of straw will keep down the weeds, and nothing more need be done until the plants are well up. We then run through the rows again with the single shovel sunk as deep as possible, and continued to cultivate near the plants with a small three shovel plough. Care was taken not to disturb the straw and rake it out from the potato plants. Late in the season only the surface soil was stirred, and in a careful manner, so as not to break the roots. From long experience we find that the potato requires a good deal of sunshine and also a good deal of moisture. A cold, wet season will not suit them, and for the best results we always prefer a warm and rather dry Summer. To get the proper amount of moisture we use the straw mulch. It is quite important to get a strong, healthy growth early in the season.—*Farm, Herd and Home*.

Eggs.—The *N. Y. World* gives the average production and weight of eggs from some of the most important varieties of domestic fowls, as follows:—Light brahmas lay from 80 to 100 eggs per annum averaging about seven to the pound; dark brahmas, about 70 per annum, eight to the pound; Plymouth rocks, 100, eight to the pound; Honduras and black Spanish, 150 per annum, the eggs of the former running eight and of the latter seven to the pound; leghorns, from 150 to 200 per annum, nine to the pound; turkeys lay from 30 to 60 eggs per annum, weighing about six to the pound; and ducks' eggs vary from five to six the pound; according to the species.—*Natal Mercury*.

SCAB ON ORANGE TREES.—In the Cape Colony *Agricultural Journal* Professor MacOwen writes as follows, with reference to scab on orange trees:—"Now for this plague there is nothing to be done but cleaning down with alkaline and soapy syringing. A powerful syringe, or rather force pump, with a portable reservoir, is used to swish every part of the foliage from the inside. After the soap lye has been on the tree for 24 hours in dry, or say 36 hours in cool damp weather, the syringing is repeated with plain water to get rid of both soap and the dead scale insects. If the water is as hot as the hand can bear, say 95°–100°, it will be all the better. By this means, perseveringly kept up, Mr. W. W. Dickson, of Ceres Road, starting with a plantation of neglected trees covered with scale, soon got them all as clean as the palm of my hand, and good growth followed straight away. Now as to the wash. For a first application, supposing scale to be badly developed take 4lb soft soap and a full quart of paraffin oil rub into the soap, little by little, a gallon of hot water, and when emulsified into a uniform oily mass, add the oil the same way. Dilute this down for use with 9 gallons of warm water, and keep thoroughly mixed while using with the force pump. Mr. Dickson used the soapy liquor of the wool-wash, and thus utilised an otherwise useless lye-product. For a subsequent application, the lye may be somewhat weaker. A good force pump mounted on a barrel to hold lye, or the subsequent wash-water, may cost £3 or £4, and is worth every penny of the money. The delivery hose should be mounted on a tube 3½ or 4 ft. long, and the labourer, dressed in a sack with holes for head and arms, gets up inside the spread of the tree, if it be large, and with the pump going swishes the back of the leaves, i. e., take the enemy in the rear. It is next to useless to spray the tree from the outside.—*Natal Mercury*.

TEA IN AMERICA: THE FIRST ANGLO-INDIAN COMPANY.

The prospectus is issued of the Associated Tea Planters, Limited, which has been registered by Sanderson, Holland, and Adkin, with a capital of £50,000 in shares of £1 each.

The object is to establish markets in the United States of America and elsewhere for the sale of tea grown on plantations in the East Indies or elsewhere, and to promote the demand for such tea in those places. The first subscribers are:—R. Lyell, 138, Leadenhall-street, E.C., 1 share; J. B. Boyson, 4, East India-avenue, E.C., 1; J. B. White, Waltham Abbey, 1; W. L. Watson, 34, Leadenhall-street, E.C., 1; W. Roberts, 138, Leadenhall-street, E.C., 1; R. B. Magor, 138, Leadenhall-street, E.C., 1; A. Thompson, 38, Mincing-lane, 1. The number of directors shall not be less than three nor more than five, and the qualification shall be the holding of at least £100 in the capital of the company. The remuneration of the directors for their services shall be £300 per annum.—*L. & C. Express.*

The *Home and Colonial Mail* says:—

The prospectus of the Associated Tea Planters, Limited, an extract from which, together with the names of the directors, was published six weeks since, is now formally issued, and the project for pushing Indian tea in America is fairly before the public. The prospectus states that "The directors have entered into an agreement with Mr. W. Macgregor, a gentleman extensively connected with the tea trade in New York, who has for some time been engaged in specially introducing Indian teas to the public there. He is, therefore, thoroughly qualified to become the agent and representative of this association, and he is so satisfied that, with systematic support from this side, the trade can be rapidly developed, that he is prepared to accept a scale of remuneration based upon the results of the undertaking. Under such an arrangement as this, the Association will begin its operations on the foundation of a going business, with a connection already formed. Special teas, suitable for the trade which it is intended to open out, will be selected on the London market, according to advices received from the agent on the Association; and it is believed that, with an adequate amount of working capital, and by eventually promoting a regular trade through ships or agents, or in any other way that may seem desirable, a large and remunerative business will result." As some of the most active among the London representatives of the Indian tea industry are connected with the project, it commands itself to all those who wish well to Anglo-Indian enterprise. The prospectus of the company appears on page vii.

THE CEYLON TEA FUND.

The following report of the Standing Committee of The Ceylon Tea Fund was presented at the annual general meeting of the Planters' Association of Ceylon on Saturday last:—

Members will remember that at the beginning of the year the Ceylon Chamber of Commerce, who, jointly with this Association, had conferred and arranged for the organization and development of the "Tea Fund" (founded in November 1887) intimated that the Chamber desired to leave the matter entirely in the hands of the Association, but would be glad to know from time to time what was being done. In terms of this request, at the annual general meeting held at Nuvarelaya on the 11th February 1888, you appointed a Standing Committee to manage the "Fund" consisting of Mr. Children and Secretaries of the several District Associations, the members of Committee for Kandy, and your Chairman and Secretary, a few other names being likewise added during the year. Your Standing Committee now begs to submit a short report of progress. Eight meetings have been held. A good deal of the business transacted has had reference to the arrangements for the representation and advertisement of Ceylon tea at Glasgow International Exhibition 1888, Melbourne Centennial

International Exhibition 1888, Brussels International Exhibition 1888, and Paris Universal Exhibition 1889. It may be convenient to offer a few remarks regarding each.

GLASGOW INTERNATIONAL EXHIBITION 1888.

By resolution passed on the 15th November 1887 the sum of rupees six thousand was voted towards the Exhibition. This grant of R6,000 has been paid in full to your Glasgow Exhibition Committee, and your Standing Committee was gratified to find that, through the exertions of Messrs. Reid Cargill, and Shand, several of the leading London firms and companies, interested in Ceylon, subscribed to form a Glasgow Exhibition Guarantee Fund, which by March had reached the sum of £740 sterling. The result of the exertions made was the formation of a very creditable and successful "Ceylon Court" as well as the erection and equipment of a "Ceylon Tea House," at which, from the month of May to Nov. 1888, 134,512 cups of Ceylon tea were sold. A small handbook descriptive of Ceylon and its industries with special reference to tea was also distributed gratuitously, and undoubtedly a good opportunity was availed of, as no fewer than 4,570,229 persons had been admitted to the Exhibition up to 10th October. Ceylon, the Planters' Association of Ceylon, and the Glasgow Committee were honoured by the visit of Her Majesty the Queen, in the Jubilee year of her reign, to your unofficial "Ceylon Court," while it is worthy of special record that the Queen's interest in the Ceylon tea planting enterprise was personally shown by her gracious acceptance of a cup of Ceylon tea courteously offered and by subsequent inquiries regarding it. It will doubtless be matter for your consideration in what way you may yet commemorate your appreciation of the circumstance in connection with your permanent memorial of the Jubilee of Her Majesty Queen Victoria still to be erected. Pending receipt of a detailed report from Mr. J. L. Shand with connected statements of accounts, your Standing Committee feels it cannot usefully add anything to his own words respecting the success of your efforts at the Glasgow International Exhibition. He wrote: "I can only say that, if the Planters' Association and the Tea Fund, and the Ceylon public had spent twenty times the money in Glasgow they might be congratulated on having made a splendid advertisement."

Memo. showing payments made in Ceylon on account of the Glasgow International Exhibition 1888, R6,000.

MELBOURNE CENTENNIAL EXHIBITION 1888.

A sum of rupees six thousand was voted for the representation of Ceylon tea at the Melbourne Exhibition, as it was felt that it presented a great opportunity of bringing Ceylon tea within the knowledge and appreciation of Australians and the vast numbers of visitors of all nationalities that would be drawn together at the time. The greatest difficulty unfortunately was experienced in making preliminary arrangements, as with the exception of Mr. H. Mackenzie none of the gentlemen asked to form themselves into a Melbourne Committee were able to act, and it was not until the end of June that space was secured in the minor Courts for the erection of a Ceylon tea-house. No time was, however, lost in the construction of a suitable kiosk, the building being completed and furnished shortly after the official opening of the Exhibition. The decorations of the Ceylon Court and tea-house consisted chiefly of a large, varied and very fine collection of Ceylon photographs framed in sets of nine fitted into suitable positions in the building. These alone have been a source of great attraction and have been much admired. Mr. Hugh Mackenzie deserves, as he will doubtless receive, your very cordial thanks for his share in making your representation of Ceylon tea at Melbourne Exhibition a success. You will, it is expected, ere long be in possession of his report with statements of expenditure, &c. No mention may be made here of the disbursements made on this side of date aggregate Rs217 11. The notice in each leading Australian newspaper as the *Argo* and the *Advertiser* demonstrate that your efforts and those of your representatives have

been appreciated, and have created interest as well as attention. One sentence from the articles in the *Argus* and *Age* may be noted. The *Argus* states that the invitation of your Committee to try a cup of genuine Ceylon tea free of charge "is a privilege," as may be imagined; "largely made use of, and every afternoon numbers of visitors are to be seen enjoying the refreshments provided for them." The *Age* remarks that your "Ceylon Tea House" is "unique in character, and the place is thronged all the afternoon with persons anxious to avail themselves of the open invitation given. It is novel to many visitors to be waited upon by two natives, one a Sinhalese, the other a Tamil from the Southern portion of Hindustan," adding that "the great novelty is in the tea itself, that there is some fascination about it for a second trial begets a desire for a third and many visitors eventually order cases protesting that they cannot drink the ordinary tea again." Altogether your Standing Committee sent down for use or sale at the Melbourne Exhibition 2,880 lb. of fine Ceylon pekoe tea of its high character and quality; there is no doubt your best thanks are due to Messrs. J. M. Robertson & Co., of Colombo, for much courteous attention to your interests in this important matter as regards selection and shipment. From the Exhibition "Jury Awards" as published in the *Argus* of Tuesday, the 15th January 1889, your Committee extracts the following:—

CEYLON TEAS.

First—Ceylon Planters' Association, Ceylon: and special mention for having the finest collection of teas that the jury have seen.

GREEN COFFEE.

PARCHMENT.

First—J. K. Burnett, Mooloolah, Queensland; C. F. Chubb, Ipswich, Queensland.

Second—Ceylon Planters' Association, Ceylon.

Third—D. Hart, Mosman River, Queensland.

PEABERRY.

First—Ceylon Planters' Association, Ceylon.

GREEN COFFEE.

First—Ceylon Planters' Association, Ceylon.

Memo. showing payments made in Ceylon on account of the Melbourne Centennial Exhibition 1888, R8,617.44.

BRUSSELS EXHIBITION.

The arrangements as regards this Exhibition were somewhat different from those of Glasgow and Melbourne, and members are referred to the recent correspondence published for full particulars. Up to date the actual disbursements made amount to R5,781.67. Briefly stated, a Ceylon tea-house was fitted up opening out on each side to gardens where tables and chairs were provided, a little pamphlet in French was distributed gratuitously giving a short account of Ceylon and its tea industry. Three native servants were sent as attendants, and your thanks are due to Sir Graeme H. D. Elphinstone for the kind trouble he took in connection with them and for his report dated 25th May 1888, which will be printed with the proceedings. Both Mr. Shand and Mr. Haldane also gave interesting accounts of their visit to the Exhibition, but until final reports with accounts are received, it is difficult for your Standing Committee to say much as to the results achieved looked at as a special opportunity and medium for pushing the sale of and making known Ceylon tea on the Continent of Europe.

Memo. showing payments made in Ceylon on account of the Brussels International Exhibition 1888, R5,240.42.

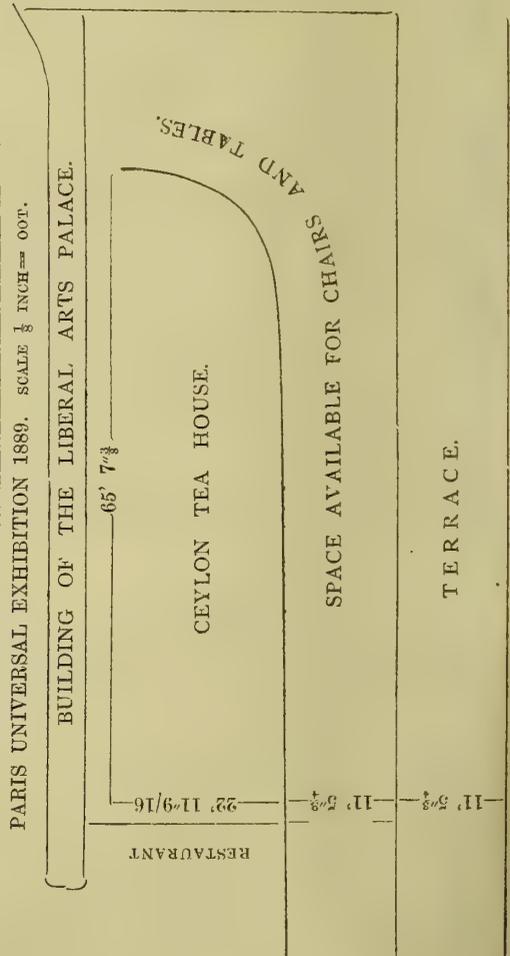

Memo. showing payments made in Ceylon on account of Mr. J. L. Shand, suspense account, R541.25.

PARIS UNIVERSAL EXHIBITION, 1889.

It is the hope of the Standing Committee that an unprecedentedly good opportunity will be afforded by the forthcoming Paris Exhibition for successfully drawing attention to Ceylon tea and making it known not merely throughout the Continent of Europe but in a sense to the whole world, if, as is expected, the Exhibition attracts an enormous concourse of visitors from

all quarters of the globe. Deeply impressed with the importance of having Ceylon tea efficiently represented on this great occasion at Paris, your Standing Committee at once responded to the overtures made through the good offices of Mr. J. L. Shand, and unanimously agreed to a vote of R6,000 from the "Tea Fund" for the purposes and on the conditions indicated. Writing on 7th August last, Mr. J. L. Shand thus mentions the terms of agreement concluded (*vide* letter), and, as regards the site of the Ceylon tea-house, remarks: "We have got the very best site in the whole Exhibition." For further information your Standing Committee invites attention to the correspondence that has taken place and reproduces for your information a tracing of the space allotted at Paris. Some time ago a resolution was passed by your Committee inviting Mr. Whittall and Mr. Leake to associate themselves with Mr. Shand in carrying out arrangements for the tea-room at the Paris Exhibition. Both gentlemen have kindly taken active steps in the matter, and have formed an influential Committee including Sir W. H. Gregory, Sir Roper Lethbridge, Mr. Smither, and themselves, to safeguard the interests represented and to facilitate active preparations in connection with the undertaking.

Memo. showing payments made in Ceylon on account of the Paris Exhibition, R90.96.

CEYLON TEA IN AMERICA.

SHIPMENT OF CEYLON TEA TO MR. J. MCCOMBIE MURRAY, PHILADELPHIA.—In accordance with resolution, through the good offices of Messrs. J. M. Robertson & Co. a shipment of 2,840 lb. of Cey-

lon pekoe tea costing R1,871.54 was made to Mr. Murray, Philadelphia, for free distribution in America in 2 oz. packets on condition that he should report to the Planters' Association how and where the tea was distributed. Your Standing Committee gathered from Mr. Murray's letter to the Association that he proposed to commence by issuing invitations to people in Philadelphia to accept samples of Ceylon tea, and to taste it in the cup. Your Committee appears so far to have received no formal report as to the result of these efforts to make known Ceylon tea, but from later correspondence Mr. Murray indicates having established agencies for the sale of Ceylon tea at New York, with five special agencies in New York State, one in Wisconsin, and two in California. Through these some 12,000 samples had been given away, which it is to be presumed, led to further business.

MR. PINEO'S SCHEME.—The next scheme for pushing Ceylon tea in America, that engaged the attention of your Committee was brought under notice by Mr. R. E. Pineo, and gave rise to considerable discussion. Briefly stated Mr. Pineo informed the Association on behalf of his principal, Mr. S. Elwood May, merchant and manufacturer of New York City, that he, Mr. May, had decided to take up and push the sale of Ceylon tea in America on condition that he was permitted to announce himself as the accredited representative agent of the Planters' Association of Ceylon, and that the Association made him a grant of 6,000 lb. of tea for free distribution in a few of the principal cities of the United States. Your Committee was very desirous of opening up satisfactory relations in America, and unanimously resolved that Mr. Pineo's scheme should receive the immediate support of the "Tea Fund" to the extent of giving him on account of Mr. May 6,000 lb. of tea for free distribution in America on condition that he shipped for sale in America simultaneously with the grant 12,000 lb. of Ceylon tea. Much to the surprise of your Standing Committee, who had made the necessary arrangements to carry out their part of the scheme, Mr. May declined to accept this liberal offer on the alleged ground that a purchase of tea by him would be premature. The next move was again on Mr. May's part, who, in a letter dated 22nd June, said: "I have again looked over this tea question most thoroughly. The main thing to get from the Tea Planters' Association is the accredited agency for the United States," adding that with that he "could readily enlist the largest capitalists," and take "the American public by storm so to speak." On this renewed assurance your Standing Committee transmitted the following resolution through Mr. Pineo to Mr. May: "That, on receiving satisfactory references, the Standing Committee of the 'Ceylon Tea Fund' do report to a general meeting of the Planters' Association of Ceylon in favour of Mr. S. Elwood May obtaining from the Association their accredited agency for pushing the sale of Ceylon tea in the United States of America," and had hoped for a reply. It appears, however, that though duly communicated with by Mr. Pineo no notice whatever has been taken of the matter by Mr. May; your Committee feels sure that though some natural disappointment was felt at the time that the unanimous opinion is that the caution exercised by your Standing Committee has been fully justified.

DR. DUKE'S SCHEME.—Next in order and in importance is Dr. Duke's scheme submitted for the first time at the end of September, and which at once secured general attention. Your Standing Committee gave the matter its careful consideration, having in view the interests with which the Committee is charged and resolved that the proposal should be forwarded to Mr. J. McCombie Murray, Philadelphia, for his suggestions as to the carrying out of the scheme and what steps he would take to supply any demand that might arise from the proposed distribution of Ceylon tea among editors of the American newspapers. This was done, and a letter in reply received from Mr. McCombie Murray has been received. It was read at a meeting of your Standing Committee held last month, and has since been published for general information. The great importance of devising suitable means for pushing the sale of Ceylon tea in America is still urgent, and will continue to receive the earnest

attention of your Committee.

Memo. showing payments made in Ceylon on account of shipment of Ceylon tea to Mr. J. McCombie Murray, Philadelphia, U. S. A., R1,871.54.

CEYLON TEA IN NEW ZEALAND.

Mr. J. Fenton Wingate, a well known Ceylon planter, having intimated his intention of proceeding to New Zealand for a few months, and having offered to take the opportunity to push any samples of Ceylon tea entrusted to him for distribution. Your Standing Committee arranged for the purchase shipment, packing, &c., of 600 lb. of tea costing R495.94 for the purposes indicated. A copy of the resolution passed was transmitted to Mr. Wingate, who in acknowledging it stated that he hoped in due course to give a satisfactory report of his three months in New Zealand. Your Committee has no doubt that ere long you will be placed in possession of Mr. Wingate's views and the results of his mission. In addition to the above several other applications have been considered by your Standing Committee. At the request of Mr. Geo. D. Jamieson, who has shipped large quantities of Ceylon tea to New Zealand, the Committee of the Association gave him 500 copies of the "Tea Pamphlet" (prepared in connection with Colonial and Indian Exhibition) for circulation along with the pure Ceylon tea shipped through him. The money value of the pamphlets may be put at about R60, but as an efficient means of inviting attention to, and making known "Ceylon Tea," its importance is of course out of all position.

Memo. showing payments made in Ceylon on account of shipment of Ceylon tea to Mr. J. Fenton Wingate, New Zealand, R495.94.

GRANT OF TEA FOR FREE DISTRIBUTION AS SAMPLES IN THE ARGENTINE REPUBLIC.

On the application of Mr. T. C. Anderson of Maskeliya who established a good claim by having personally, before the institution of the "Tea Fund," circulated Ceylon tea in small packets to a considerable extent in Montevideo with good results, your Standing Committee resolved to accede to the proposal made and arranged also through the good offices of Messrs. J. M. Robertson & Co., Colombo, for the purchase and shipment on Mr. Anderson's account of 160 lb. of Ceylon tea costing R261.86 for free distribution as samples on the usual conditions as to special reports to the Standing Committee of the "Tea Fund" in reference to the progress and result of his efforts. Your Standing Committee awaits a report from Mr. Anderson, which will doubtless be of considerable value and interest.

Memo. showing payments made in Ceylon on account of shipment of Ceylon tea per Mr. T. C. Anderson to the Argentine Republic R261.86.

PROSECUTIONS IN LONDON BY MR. W. W. MARTIN LEAKE UNDER THE MERCHANDISE MARKS ACT 1887.

You will recollect that in May last Mr. Leake directed your attention to certain fraudulent practices in regard to the sale of "Ceylon Tea" in London, and your Committee authorised him to prosecute the tea dealers referred in his letter dated 18th May and from time to time to take whatever steps might in his opinion be necessary in any similar cases. A sum not exceeding £50 sterling was placed at his disposal, and, as requested by him, £25 sterling has been remitted to Mr. Leake. From the annexed account just received from Mr. Leake it would appear that subject to a probable refund of £7 7s the law expenses incurred amount to £31 1s 5d doubtless chiefly if not wholly incurred in connection with the case Regina v. Ellin, the proceedings in which were fully published in the newspapers lately. It will be matter for future consideration whether you desire to take further action in the same direction.

E. & O. E.

Memo. showing payments made in Ceylon on account of Mr. Wm. Martin Leake, London, 1888, Dec. 20.—To paid cost of demand draft on London for £25 sterling at exchange of 1/4 11-32 being remittance in connection with Merchandize Marks Act prosecutions—R367-11.

CEYLON TEA SYNDICATE.

When the accounts of the "Colonial and Indian Exhibition" (*vide p.* LXXX. selected correspondence, book of proceedings for the year ending 17th Feb. 1888) were made up, a sum of R1,923-43 was paid over to the "Ceylon Tea Syndicate," whose operations, though small, did good work at the time in extending the knowledge of Ceylon tea. By resolution of your Committee it was decided to close the "Tea Syndicate" and to devote the working capital sum above referred to as liquidated towards the expenses of advertising Ceylon tea at the Glasgow International Exhibition. In the meantime the large "Tea Fund" was launched, and your Standing Committee is glad to report that it has received up to 31st December 1888 the whole sum of R1,923-43 from the "Syndicate." There are still a few packets of "Syndicate" tea to be disposed of, and against them some charges to be recovered, but it is possible that a small further contribution may yet be made to the "Tea Fund." In any case it is satisfactory to report that no money loss whatever has attended the "Ceylon Tea Syndicate," and that it has merely been absorbed in the large and more comprehensive "Ceylon Tea Fund" scheme. It should be noted that the "Syndicate" tea wrappers supplied in England were taken over by the "Tea Fund" at cost price, viz. R277-66, and will, it is expected, be utilized to advantage hereafter.

Memo. showing payments made in Ceylon on account of "Tea Wrappers"—R277-66.

SUMMARY.

The principal items of expenditure having been given in the memos. annexed, it remains only to mention that the subscriptions, Government grants, and "Ceylon Tea Syndicate" working capital received up to 31st December 1888 on account of the "Tea Fund," have aggregated with interest R25,074-96. Since that date the sum of R4,653 has been collected on account of leaf plucked during the six months ended 31st Dec. 1888, but it must be kept in view that a considerable number of large subscriptions having been paid in advance last year, the amount still to come in for the preceding six months will not be so large, as it would otherwise appear that it should be. Some estates have, your Standing Committee much regret to say, withdrawn their subscriptions when they are particularly wanted, and when many important engagements have to be fulfilled. Your Committee ventures to urge on all such a consideration of the motto of your Association, *Unitas salus nostra*, and trusts that increased support will be accorded in every possible way to "The Ceylon Tea Fund" by all in any way interested in or connected with the industry.

THE TALGASWELA TEA COMPANY, LIMITED.

At the annual general meeting of this Company this afternoon, the following report of the directors was submitted:—

REPORT FOR THE YEAR 1888.

The directors have pleasure in placing before the shareholders their annual report accompanied by duly audited account of expenditure, and a financial statement of the above Company's position as on 1st January 1889.

Out of a total of 2,017a. 2r. 6p. five hundred and ten acres (510) have been opened and successfully planted

with tea during the past year, and from the Visiting Agents Reports we are pleased to state that the growth of the tea is most satisfactory.

The early planted bushes, it is proposed to top in July so that some tea manufacture may be looked for in October, November, and December of this year.

The raingauge returns for 1888 show 178-20 in. as having fallen on 164 days; this promises well for the production of leaf.

A further addition (200 two hundred acres of very fine land) is now being opened for tea, which will bring the total under cultivation of this product up to seven hundred and ten (710) acres.

After completing the supplies of the large clearings in October it was found that a very large number of plants were left in the nurseries, which had been unusually successful, and it was also found that work of all kinds had been and could be done in the locality for far less than was at first supposed. Under these circumstances your Directors felt that they could safely add a further 200 acres this year to the area under tea, without any increase in the capital to be subscribed by the shareholders, and they trust that this increase of the cultivated acreage will give satisfaction to all interested, and materially strengthen the position of the Company.

An estimate for the current year has been framed for opening the 200 acres already alluded to, as also for erecting a permanent superintendent's bungalow, and carrying on the necessary works on 510 acre, opened in 1888.

After making a liberal allowance for these items, there will be a large available balance for the putting up of factory and other buildings, after the last call of R30 per share is made in 1890.

Yours Directors congratulate the shareholders on having in prospect 710 instead of 500 acres under tea, which it was originally proposed to open, as they consider the large area more calculated to give paying returns.

It is to be regretted that the railway authorities are not in a position to purchase timber from Talgaswela, which could be supplied in large quantities. It is however hoped that later on communication with Bentotte will be established, when a sale may be expected for casks, staves, &c.

Your Directors are now considering the question of a factory which will be needed towards the end of this year. A plan has been decided on and timber is now being cut for it. Before deciding on the future site, your Directors arranged for a visit from Messrs. Walker's engineer, the result of that visit showed that though the water supply at the old mill house site would probably not suffice for all requirements when the 700 acres, or a larger area are in full bearing; still it appeared that for some time it might be expected to yield all the power required, and this however can be supplanted at a future period when necessary by steam in the dry months.

Messrs. Ross and Rollo, retire from the Directorate and offer themselves for re-election.

CINCHONA OR QUININE BARK:

REVIEW OF THE YEAR 1888.

LONDON, 22nd Jan. 1889.

Our supplies of Bark in the year just terminated did not greatly vary from those of the year that preceded it. Importations of cultivated Calisaya were again a little larger: as were also our total receipts from the East, mainly Ceylon and Java. The importations of Central American Quinine Bark (other than Calisaya) have practically ceased for some time. It was long since demonstrated that it could not be cut, gathered, packed, sent to the coast and shipped to the consuming countries at any such price as 1½d or 2d the unit. Our total stock (in pounds) on the 31st December shows a slight accession on the year. But in reference to the great question of supply, it is most import to bear in mind a very novel and material fact. The enormous quantity of German Sulphate of Quinine which has accumulated in second hands, to an extent beyond all precedent, is probably equal to from one third to one half of our total annual supplies of the Bark from

which that Sulphate of Quinine is produced! It is true that so far the bulk of this exceptional quantity has been held with absolute firmness. Never in the whole course of the year did the value of Bark exceed 2½d per unit per lb., very rarely indeed 2½d, and the general range was only 1½d a 2½d. At the close of the year it was 1½d a 2d per unit. Nevertheless, bark was brought upon the market with more or less abundance throughout the year, always in quantities fully equal to requirements, and the auctions in London were constantly supplemented by sale of Java bark, mostly of rich yield, in Holland, where ten sales were held during the year. From time to time parcels of soft Columbian, Cuprea, and such like varieties, of old import, were offered at auction, but only to be withdrawn, or forced off at disastrous prices; sellers being always ready to accept the terms current for Ceylon.

The following is a brief monthly record:—
January.—Market dull with excessive supplies; unit about 2½d.

February.—Very flat at the beginning of the month—some improvement towards the close of it; unit still about 2½d.

March.—An advance of 5 per cent, in the Eastern varieties; the market at the close of the month not quite so firm as at its opening.

April.—All the improvement lost. The unit back to 2d all round.

May.—Tone better: demand equal to supply, and unit up to 2½d.

June.—Less favourable market: reduced demand; unit back to 2d.

July.—Little: the end of the month better than the beginning.

August.—Large trade: the unit of 2d fully maintained.

September.—Again a good extent of business, and prices the turn higher; unit may be quoted 2d a 2½d.

October.—Scarcely so firm or active as the previous month.

November.—Market firm, and previous currency fully maintained, with a fair volume of trade.

December.—This month opened with firmness, but because dull towards the close, and the unit receded to 1½d @ 2d.

As regards the supplies of last year, it will be observed that from Ceylon there has been again a falling off in the "season's" shipments of nearly 2,700,000 lb. (We estimate the percentage of Quinine was about 24 per cent.)

The shipments being	...	11,705,000 lb.	in 1887-8
Against	...	14,440,004 "	in 1886-7
Do.	...	15,365,000 "	in 1885-6
Do.	...	11,678,360 "	in 1884-5
Do.	...	11,500,000 "	in 1883-4
Do.	...	7,000,000 "	in 1882-3
Do.	...	3,100,000 "	in 1881-2

The supplies of Java Bark on the other hand again show an increase upon the receipts of the previous season, present increase being 1,120,700 lb. (We estimate the percentage of Quinine was about 4 per cent.)

In 1882-1883 they were	...	735,351 lb.
1883-1884 "	...	289,158 "
1884-1885 "	...	1,321,569 "
1885-1886 "	...	1,771,420 "
1886-1887 "	...	2,651,719 "
1887-1888 "	...	3,772,451 "

The following are the imports of the last seven years:—

	South American.	Ceylon and India.	Total.
1882 packages	29,300	21,630	117,570
1883 "	56,780	31,630	85,410
1884 "	21,075	37,300	58,375
1885 "	5,200	50,110	55,310
1886 "	10,500	59,700	70,200
1887 "	2,210	60,000	69,800
1888 "	9,010	61,400	70,500

Last year our deliveries again increased our receipts by more than 2,000 packages. The official Java and wharf returns of all medicinal barks actually warehoused between the 1st January and the 31st December render the following:—

	Landed	Delivered	
	pkgs.		
1885 ...	55,343	74,094	18,751 more delivered than imported
1886 ...	70,195	68,986	1,209 less delivered than imported
1887 ...	69,782	72,614	2,832 more do do
1888 ...	70,509	72,758	2,249 do do do

The said docks and wharves return the stock of all sorts of medicinal bark, at the end of each of the last three years, as follows:—

1885	62,117 packages
1886 ...	(stock corrected)	62,350 "
1887	59,232 "
1888	56,754 "

We commenced the past year with the following extraordinary low and unremunerative prices for fine qualities, viz.:—

Calisaya Quill (say 5 per cent Bark)	1s 0d	per lb.
Cuprea	...	0s 6d
Ceylon	...	0s 2½d per unit.

We closed the year at the still further reduced quotations for fine qualities:—

Calisaya Quill (say 5 per cent Bark)	0s 10d	per lb.
Cuprea	...	0s 5d
Ceylon	...	0s 2d per unit.

SULPHATE OF QUININE.—At the commencement of the past year the following were the manufacturers' prices, viz.: English, Howards' 2s 4d; French 2s 2d; German 1s 10d; Italian 1s 11d per oz. Low as were the rates of 1887, they were destined to fall still lower in 1888. They fell 2d per oz. in the first two months of the year: Howards' price down to 2s 2d; German in second hands selling as low as 1s 8d per oz. From this point there was slight and brief recovery. March was weak; and by the end of April prices (after some slight fluctuations) went further back, and German was sold as low as 1s 4d per oz. In May Howards' price was put down to 1s 10d, but the German market became a little stronger. June was very flat with slightly receding prices, and by the end of the month the quotation for German was only 1s 3½d. In May a large business was done in German and prices hardened a little, but by the end of August the improvement was lost and the price of German again fell to 1s 3½d. Howards' price was reduced to 1s 8d and it remained at 1s 7d a 1s 8d to the end of the year. In September there was some speculation; German was dealt in largely and prices recovered to 1s 7d, but by the end of the month had again gone back to 1s 4½d. In October large transactions in German took place, but the price fell to 1s 3d (the lowest price of the year, and indeed of any former period) and then speculative demand caused a rally to 1s 5d per oz. In November German touched 1s 6d, but afterwards gradually, but surely, fell back to 1s 3½d, which price continued to rule through December, the year closing heavily.

Fluctuations in manufacturer's prices were as follows:—

	Highest.	Lowest.
	English...2s 4d per oz. in bulk.	1s 7d per oz. in bulk.
French...2s 2d "	"	1s 8d "
German...1s 10½d "	"	1s 3½d "
Italian...1s 11d "	"	1s 4d "

The following table shows the fluctuations in manufacturers' prices for the month—in bulk; 2d per oz. more in bottles:—

	ENGLISH.		FRENCH.	
	per oz.	2s 2d	per oz.	2s 2d
January	...2s 4d
February	...2s 2d
March	...2s 2d
April	...2s 2d
May	...1s 10d a 1s 11d
June	...1s 10d
July	...1s 9d a 1s 10d
August	...1s 8d a 1s 9d
September	...1s 7d a 1s 8d
October	...1s 7d a 1s 8d
November	...1s 7d a 1s 8d
December	...1s 7d a 1s 8d

LEWIS & PEAT, Brokers.

THE COTTON-GROWING ENTERPRISE.—Mr. Blackett has brought his first samples to Colombo today of the American, Egyptian, and Tinnevely cotton grown in his Dolosbage fields. Of the first-named, the specimens shown are as fine as could be desired and have been valued by practical men as high as 1s per lb.; the Egyptian is not so good; and the Tinnevely is much inferior, though very little of the last has grown, the seed being a failure. Altogether, these samples are extremely interesting as indicating the beginning of a new enterprise which is of much importance to the people over a considerable area. Mr. Blackett deserves the thanks for leading the way as a pioneer in cultivation. Mr. Henry Lee, late M. P. for Southampton, saw the cotton Ceylon is growing today, and pronounced it of splendid quality, and his opinion is that the Cotton Spinning and Weaving Company will be a great success and must pay well. He is a cotton spinner and manufacturer himself.

PLANTING IN BURMA.

(By an ex Ceylon Planter.)

OLD FRIENDS TO THE FRONT—TEA-DRIERS CONDEMNED BY AN OLD TEA TASTER FOR WANT OF THE KEEPING QUALITIES OF TEA CURED BY THEM; AND TEA-ROLLERS RECOMMENDED—PLENTIFUL SUPPLY OF SPLENDID TEA BOXES IN BURMA OF DIFFERENT DIMENSIONS AND TIMBER OF VARIOUS DESCRIPTIONS AVAILABLE FOR SHIPMENT BY BRITISH INDIA STEAMERS—A SUCCESSFUL CROP OF ANNATTO READY FOR PICKING.

Tavoy, Burma, 28th Jan. 1889.

I was much interested in the budget of T. A.'s you sent me just in time at the New Year. I am glad to find some of my old friends to the front, viz. Thomas Mackie, R. B. Lawrance, James H. Barber, and many others, but not a word about the Laird of Logie. I had an old tea planter here and also a tea taster, a man that knows his work and the wants of tea qualities at home. He was down very much on your great tea driers; said they were a delusion and a snare to Ceylon men, and that they did not dry the tea thoroughly, and tea cured by them did not keep, except it was dried over again at home. Tea rollers, he said, were perfection, and sifters best; your expensive driers he would certainly break down and pitch out of the tea-house, as tea ought to be dried to the very letter and those driers did not meet the desired end, and he recommended the old plan for a thorough good standing keeping tea. Take this for what it is worth and go on and prosper. Ceylon men are keen enough to find out this themselves, and I wish them every success.

I see you want tea boxes by the thousand: that is a good sign for Burma. I have got thirty thousand ready seasoned for the last five months, inside measurement 23" by 20" by 18". The wood is perfect for tea-boxes, same kind taken and recommended by Calcutta agents, and the timber out and allowance made for seasoning, so that the boxes are perfect when made up, and the timber is the only thing required for the trade. I am prepared to supply fifty thousand more boxes within five months at the rate of ten thousand per month. Sizes as follows:—

16
 6 24 by 6 by 1/2 } 60 boxes to a ton. Inside
 6 24 by 7 by 1/2 } measurement 23 in. by
 4 18 by 10 by 1/2 } 2 in. by 18. No. 1.

16
 6 24 by 6 by 1/2 } Inside measurement 23 in.
 6 24 by 6 by 1/2 } by 19 in. by 17. 71
 4 14 by 7 by 1/2 } boxes to a ton.
 4 17 by 9 1/2 by 1/2 } No. 2.

16
 6 17 by 6 by 1/2 } Inside measurement. 16 in.
 2 17 by 5 by 1/2 } by 16 in. by 13 1/2. 117
 4 17 by 6 by 1/2 } boxes to a ton.
 4 17 by 6 1/2 by 1/2 }

16
 I have on board packed with hoop iron. British India steamers going direct to Colombo. I wish inquiring friends to let me know by letter what rate they could pay for each size, namely:— 23 by 20 by 18", 23 by 19 by 17", 16" by 16" by 13 1/2". I shall be glad to hear from any of the firms in Colombo and also Mr. Edmund Woodhouse and Messrs. D. Edwards & Co., Hatton, and anyone requiring good, sound and well-seasoned tea boxes. To save time telegraph me direct to Tavoy, and I shall make arrangements to prepare any amount.* Mills in Moulmein and Tavoy, and

* All this is a regular advertisement, and yet "J. D. W." delays his recognition of, and remittance for, the printer.—Ed.

B. I. S. N. steamers going direct for Colombo weekly, can also supply other timber for buildings and sleepers for railways: the very best ironwood (Burmese pingodoo, Sinhalese nagas, Tamil erembu maram): * samples of different kinds of timber can be sent for inspection.

I have a great crop of annatto now on the trees nearly ready for picking, and have got about a ton of produce of sorts ready for London. I am shipping on to Thomas Christy, London, direct this year; sent on my last shipping to W. Martin Leake; he sold my little crop of coffee very well and took great trouble with such a small lot, and my only reason for changing this year is because I am sending on several drugs of sorts, which is scarcely in an old planter's line of business.

J. D. W.

A VISIT TO THE RANI OF SIKKIM: SUCH TEA!

The Calcutta *Englishman* prints a letter from a military correspondent who relates the incidents of a visit to the Rani and Rani of Sikkim. * * * After bowing to one another, it was the Rani who asked us to sit down; in fact, it is she who seems to do everything and who is, I fancy, quite the most important personage in that household. Tea was then brought—such tea! May Heaven defend me from ever drinking it again! Thibetan tea is made out of the coarsest tea-leaves, which are partly fermented and then made into bricks. This is boiled with a lot of butter, salt, and some very pungent spices. I tried to get out of drinking the tea by talking hard, hoping that the Rani would not notice that I was not drinking it; but not a bit of it; she was far too sharp to be taken in like that, and politely suggested that I was not drinking my tea. So, rather than offend her, I went at it like a man and took a good gulp! The worst medicine was a joke to that mouthful! I could not resist it, and made an awful face that fetched them both. The Raja roared, and I thought would never stop laughing. The Raja seemed to appreciate the tea very highly, and simply poured it down. The Rani hardly touched hers, but still would not allow that she did not like it. After this they brought in a plate of salad, everything chopped up very fine; then came a dish of macaroni with highly spiced mince-meat on the top. This was evidently the Raja's favourite dish, for he had several helpings of it.—*L. & C. Express*, Jan. 25th.

THE MARKET FOR CINCHONA BARK AND QUININE IN 1888.

We take the following extracts from the Price List, January 1889 of C. F. Boehringer & Sohne, Waldhof near Mannheim:—

QUININE.—The year 1888 has been remarkable for an exceptionally large consumption of Sulphate of Quinine, in fact we do not remember the demand for actual consumption in the U. S. A. ever being so great and so well sustained as during last summer and autumn. In addition to this, speculation interested itself repeatedly in the article and secured large quantities, with the result that important transactions took place, and we were extremely busy throughout the year. Prices, however, have been very unsatisfactory. The rise in the value of Bark and Quinine which occurred in November and December 1887 induced holders to offer the unusually large quantity of 7,704 packages of bark at the first public auction last year, at which lower prices were established. Quinine dropped from 2s 1d to 1s 8d in the course of January, but warlike rumours on the Continent caused an advance of 2d about the middle of February, and when at the auction of Bark on the 28th of that month higher prices were realized, manufacturers raised their quotation to 2s. During the whole of March,

* Ironwood has been tried in Ceylon and found wanting.—Ed.

Quinine was dull except near the end of the month, when some large sales were made at 1s 9d. From this period a decided downward turn was given to the market by the increased exports from Ceylon. In April prices dropped from 1s 8d to 1s 6d, at which figure business to some extent was done, and gradually declined to 1s 5d to 1s 4d. From May to December prices have varied but little, ranging from 1s 4d to 1s 6d, with a few sales of second-hand lots at 1s 3½d and 1s 3d. During the first days of the new year a somewhat better tone prevailed, and there are now buyers at 1s 3½d in the market but no sellers. The Ceylon exports from 1st October to 31st December which were feared to exceed those of 1887, have remained within the same limits.

Last year has taught again the old lesson that an increase in the exports of Cinchona bark is invariably followed by a decrease in its value. If in the face of this established fact planters continue to send over more bark than is required, they must not wonder at bad returns. Extraordinary eventualities, such as war etc. excepted, the quinine market will be chiefly ruled for some time to come by the exports of bark from Ceylon and Java.

EXPORT FROM JAVA during the season, viz. from 1st July to 30th June:—

1887-88	...	3,492,913	Amsterdam lb.
1886-87	...	2,230,275	"
1885-86	...	1,531,156	"
1884-85	...	1,195,976	"
1883-84	...	1,104,534	"
1882-83	...	420,668	"

EXPORTS FROM THE MALABAR COAST during the season, viz. from 1st July to 30th June:—

1887-88	...	1,070,160	lb.
1886-87	...	272,048	"
1885-86	...	1,070,160	"

On account of its high standard Java Bark is gaining more and more importance. The efforts made by some London merchants and brokers to draw thither a greater part of the shipments from Java have not been successful so far, the quantity offered at the London sales during last year being 900 packages less than in 1887.

The foregoing figures show:—1. An increase in the shipments from Java (though same did not turn out quite as large as anticipated). 2. A decrease in the exports from Ceylon, and in the London stocks. In order to form as clear an idea as possible about the course Quinine is likely to pursue in future, one must take into consideration that a great number of trees in Ceylon has been and is being cut down to make room for tea, and that the consumption of Sulphate of Quinine is steadily growing. On the other hand it ought to be remembered that Java and Bolivia send over increasing quantities of bark, and that large stocks of Quinine are in the hands of speculators in London. Of late there has been some talk again about shilling (25 cents) Quinine. Speaking for ourselves, we fail to see how bark and quinine can be produced at such a price; we are however, always ready to bow before superior knowledge, and if the promoters of this idea will be good enough to show us the way to carry it out we shall feel much obliged. In their calculations these prophets must bear in mind that planters of bark would have to accept fully forty per cent less than they are getting now, in order to enable manufacturers to sell at 1s, without losing money.

CINCHONA DRUGGIST'S BARK.—Genuine flat Calisaya continues scarce and dear at 2s to 2s 6d. Other varieties were offered more freely at 1s 8d to 1s 10d. Some trial shipments of cultivated flat Bolivian Calisaya which came to Hamburg, did not find favour with druggists, though they contained about 4 per cent Sulphate of Quinine, the strips being too thin and badly shaped.—Of SUCCIRUBRA (Red bark), there was always plenty of good to fine quills on hand, and especially at the Amsterdam sales.

LOXA and HUANOCO which are nearly out of use in Germany, are still much sought after by French buyers and command good prices.

FLAT YELLOW BARK MARACAIBO and PUERTO CABELLO obtainable in spring 1887 at 5d has since gone up to

8d to 8½d, and up to the present has maintained this high price which is utterly out of proportion to its intrinsic value. Hamburg is the principal market, and every parcel on arrival found ready buyers, sometimes even before being landed.

TEA NOTES FROM INDIA.—Tea pruning is progressing in Durrung. The weather has been cold in Cachar and Sibsaurgor. Seasonable weather is reported from Sylhet, Goalpara, Kamroop, Durrung, Nowgong, and Luckimpore. DEHRA DUN, 29th Jan.—Since I wrote last we have had 1.14 rainfall, and it is still raining. Rain was much wanted both for the tea and crops. DARJEELING, 2nd Feb.—Heavy fall of rain on to 30th—2.20 in. Very beneficial for nurseries, very cold.—*Indian Planters' Gazette.*

THE EMPLOYMENT OF SUCKER FISH IN TURTLE-FISHING.—Professor A. C. Haddon from Thursday Island, Torres Straits, has been sending some interesting notes to *Nature*. One series of observations had reference to a remarkable fish which largely respire by means of its caudal fin rather than its gills.—But of most general interest is an account of the employment of the sucker-fish in turtle-fishing as follows:—

In the Straits there are two periods of turtle-fishing, the one during October and November, which is the pairing season, and when turtle are easily speared owing to their floating on the surface of the water the other, during the remaining months of the year when the turtle frequent the deeper water and the channels between the reefs. It is then that the sucker-fish—or, as the natives term it, "Gapu,"—is utilized. I have, at present, no means of determining the species of *Echeneis* common in the Straits. I believe it to be *E. naucrata*, as the species here attains a greater length than *E. remora*. When going out turtle-fishing, a Gapu is caught, and the more experienced natives have no great difficulty in procuring one when it is required. A hole is made at the base of the caudal fin by means of a turtle-bone, and the end of a very long piece of string is inserted in the hole and made fast. The end of a second, quite short, piece of string, is passed through the mouth and out by the gills. By means of these two strings the fish is retained, while slung over the sides of the canoe, in the water. When a turtle is sighted deep down in the water, the front piece of string is withdrawn, plenty of slack being allowed for the hind string. The Gapu on perceiving the turtle immediately swims towards it, and attaches itself to the reptile's carapace. A man, with a long rope attached to an upper arm, dives into the water and is guided to the turtle by the line fastened to the Gapu's tail. On reaching the turtle, the man gets on its back, and passes his arms behind and below the fore-flappers, and his legs in front and below the hind-flappers. The man is then rapidly drawn up to the surface of the water bearing the turtle with him. On the arrival of the diver the Gapu usually shifts its position from the carapace to the plastron of the turtle. At the end of the day's fishing the Gapu is eaten. The natives have a great respect for the Gapu, and firmly believe the fish possesses supernatural powers. For example, when there is something the matter with the bow of the canoe, the Gapu is said to attach itself to the neck or the nuchal plate of the turtle; when the lashings of the outrigger to the thwart poles are insecure, the Gapu is believed not to stick fast to the turtle, but to continually shift its position; if the strengthening ties in the centre of the hold of the canoe are faulty, the Gapu is stated to attach itself to the turtle, and then immediately to swim away. More than once I was told, "Gapu savvy all the same as man; I think him half devil." The sucker-fish is not used to haul in the large green turtle. I was repeatedly told that it would be pulled off, as the turtle was too heavy. The above information was gathered from several sources, and checked by means of much questioning.

Can anyone say if a similar practice is followed by any of the Ceylon fishermen?

PROSPECTS AND CONDITIONS OF TEA,
COFFEE, CINCHONA, CACAO AND
OTHER PRODUCTS.

We now resume our notes on this subject, and first we give prominence to the following comments on our editorial on page 612, as full of interest:—

"The tea estate referred to in Maskeliya is 250 acres all more or less in bearing. Estimate of crop this year 50,000 lb., expenditure will be R17,500, or say 35 cents per lb. in Colombo. Kindly note that these figures refer to the present season, not last.

"Dikoya coffee is now very free of bug, but not perfectly so. It was the year before last that Warriapolla did so well, not last year, but it is again to the front this season with a yield of 2,600 bushels of all sorts. The crop the year before last was 4,900 of all sorts not 4,700.

"The observations about cinchona applied to new land, but it may be safely asserted that nowhere on the Kandy side of the country is it possible to grow the fine cinchona we did 10 and 15 years ago. Deterioration of stock is the explanation generally given and accepted, but the fact that imported seed does no better than that of local growth is one which rather upsets this theory.

"I think the Bolivian seed referred to cost R60 per ounce, but I am not quite sure of this; nor am I certain that it all failed."

As regards Cinchona on new and old land, we learn that even in Uva it is scarcely possible to get cinchona trees to flourish a second time on the same land, so that we suppose planting up the same clearing a second time is unheard of north of Kandy?

Before passing away from TEA we may refer to the revival it has afforded at least in one case of a planting district that was supposed to have disappeared finally from the roll long before "Ichabod" had been written generally on coffee in the Kandy districts. We refer to Kaduganawa. "Why has Kaduganawa been struck out of the Association roll?" asked Forrest Harper at the first Planters' meeting after his return. "It has not been struck out—it has gone out!" was the reply. Alas then for poor old Kaduganawa, where Harper worked for years, on Franklands, at the time that the present Acting District Judge of Colombo was the happy proprietor of Roslin. For many years, the word abandoned has been the distinctive mark in the Directory opposite most Kaduganawa properties. But tea has brought a change. We have, for example the well-known extensive Gona Adika property which under Mr. Wm. Macgregor's management, gives promise of becoming a very fine tea estate for the "Gona Adika Tea Co. Limited." So with Mr. A. H. Thomas's good work on Mr. Harper's old diggings, Franklands, where there are now 100 acres of fine tea; again Mr. Shelton Agar is reviving the glory of Alpitty Kandy—where Donald Macgregor lived and laboured so long—and he is trying not only tea but cacao, arcanuts and coconuts. Again Kakunagalla, a property of 300 acres, has just been purchased by Messrs. Nicol of Dimbula and Haputale, who are sure to turn it to good use, while we need scarcely refer to the well-known revival of Sinnapittia, Mercantile, Kirinda, and other properties. There is encouragement to tea planters in Kaduganawa, it seems, from the favourable reports given of teas as yielding a specially strong liquor due to the prevalence of ironstone in the soil. So much for old Kaduganawa *redivivus*.

In discussing the future of "tea" there can be no doubt that the planter who has least capital outlay per acre for average-yielding estates, can stand the battle of competition best. A profit

of a penny a pound is equal to a return of 10 per cent for, we suppose, the majority of Ceylon tea plantations, while the capital outlay on Assam properties being, it is said, over, rather than hundred R500 per acre, the percentage of profit would be much less from the same penny.

Cacao cultivation is described by Visiting Agents as a whole, judging by their Ceylon experience, as about the most uncertain of any of our new products. But is this not generalising from rather too limited an experience. The Dutch writer on Cacao in Dutch Guiana agrees exactly with the above experience up to the tenth year of the tree: he says in effect, nothing can be more unsatisfactory or troublesome to the planter than a "Cacao Walk" up to ten years of age, but then from that point on to a hundred years, few products give less trouble or more regular crops. We trust yet to see the "Cacao Walks" in our own Dumbara, Matale and Uva valleys verify this experience. So far, there have been some woeful disappointments about crops: we hear of one case where after the pods were fully set, indeed well on growing, 1000 cwt. was considered a very safe estimate, but the actual result only gave 290 cwt.!

A curious circumstance is mentioned to us in connection with an experiment in PEPPER vine cultivation on Warriapolla estate, Matale. The crop in many cases was a disappointment; but there was no chance of picking what did mature, for the birds effectually disposed of the berries!—Fortunately, or unfortunately, few places are so highly-favoured with "songsters of the grove" as Warriapolla.

We now turn to CARDAMOMS, and it is the opinion of more than one expert—that is, experienced estate inspector—that this spice has in many cases given a handsomer return than any other tropical product touched during the past ten years. We are assured of 15 acres giving 660 lb. each, or a total crop of 10,600 lb. of cardamoms (worth from 2s to 2s 6d per lb.) and again of 50 acres giving 28,600 lb. The famous Kandanewera crop excited much attention one year when even the pleasant-spoken pessimist of the North was disappointed, in returns beyond his belief, in prices also above his expectation, although finally he found consolation in the anticipation that after so big a crop, short ones must follow! Now-a-days, however, cardamoms clearings do not come on quite so well as some years ago and the Malabar variety is almost entirely discarded in favour of the Mysore kind.

As regards TOBACCO, the question is started as to whether the finer varieties will succeed as freely in Ceylon as is expected. There can be no question of the ready growth of the coarse country variety, but plants from seed from Havana, Virginia &c. are not so easily raised. The Tobacco Company Limited are, it is understood, to employ a practical man of special experience in tobacco in Sumatra or some equally well-known tobacco growing country.

Meantime with reference to the fear that other exotics—for even the coconut palm is not reckoned indigenous!—are going out we are assured that *lantana* is not what it was: in many places it seems dying out in place of flourishing and running over fresh waste ground; then Spanish needle, in many districts such a pest for long years, is almost a thing of the past; and, we suppose, "white weed" is not what it was! All this reminds us of the story told by Dr. Donald Fraser when here the other day: we were reminding him of his ministry in Inverness where we often heard him preach a generation ago, and he referred to an old elder of the High Church there, who was always be-

moaning "the good old times." When leaving for London, the reverend Doctor ventured at last to tackle his elder insisting on knowing wherein the difference lay: "Weel," was the reply, "the Gaelic preaching is no what it was, and the whuskie is no what it was!" And so if it comes to the degradation of lantana and ageratum, we do not feel that there is much cause for grief!

NEW PRODUCTS.

(From the Annual Report of the Badulla Planters' Association, held 13th Feb. 1889.)

COFFEE.—Crops of coffee on most estates during the past year have been very short, and your Committee are not hopeful of the future of this product. The green scale bug continues its ravages, and some of the poor coffee has succumbed to its repeated attacks.

CINCHONA.—This product unlike coffee is suffering from excess of crop throughout the island, the latter causing a glut of bark in the home market and a consequent depression in prices. Your Committee are firmly convinced that the stocks of bark in the country generally are being rapidly exhausted, and even in the Uva districts the output of bark is decreasing year by year. Your Committee are therefore hopeful that exports of this product will very soon show moderate dimensions and that a reaction in prices will occur. Your Committee would strongly urge upon all the advantage of curtailing the harvesting of bark as far as possible, until the home markets are in a more healthy state.

TEA.—Another year's valuable experience has been gained in the cultivation of this product which now occupies so large and rapidly increasing a proportion of our acres, and we are now in a position to lay before you ideas which are the outcome of a more matured experience and a wider range of observation, that your Committee had the opportunity of bringing to bear upon the subject, when called upon to frame their last reports. A more severely trying season than that which comprised the twelve months ending 30th June last, there is not on record; for out of a total rainfall of 120 inches registered in some parts of the district represented by your Association, more than half that quantity appears against December. Were such seasons the rule, instead of the exception, the cultivation of tea would by no means form a tempting investment for capital; but fortunately we have before us a long record of seasons which will bear the strictest scrutiny and whose analysis will work out a vote in favor of tea in Uva, wherever the other conditions of soil &c. are suitable. Notwithstanding the unfavorable season, your Committee are happy in being able to report that tea has successfully passed this most severe of ordeals, in a manner which is alike surprizing and gratifying, furnishing evidence that Uva is likely at no distant date, to occupy that pre-eminence with regard to tea which she has held with coffee in the past. Your Committee has further the pleasure to report that the only prejudicial effect of the unfavorable season, so far as we are able to judge, was that a shorter crop was realized than would otherwise have been the case, but this may be by no means an unqualified evil, for it is highly probable that the strength of the young bushes was very materially conserved, and that they will yield compensatory results later on. Indeed this would seem to be the case, judging by the manner in which pruned and unpruned teas are now flushing. Some very large estimates of made tea for the current year give every promise of being fully realized.

A great amount of useful knowledge with regard to the field and factory treatment of tea has been gained and is being disseminated in that characteristically generous spirit for which the Ceylon planter has so justly earned a title. Of the quality of our produce little needs to be said. The London reports testify to our being able to produce teas second to none in the market.

Altogether your Committee congratulate you on the success of tea, and think they are fully justified in predicting that this cultivation will restore a measure of prosperity to Uva, surpassing even that which she enjoyed in the best days of the coffee industry.

CACAO.—It is satisfactory to note that the appearance of this product continue healthy, and that the teas have been entirely free from *helopeltis* and other pests. The crop gathered has fallen short of that of the preceding year, due mainly to the abnormal season and the continuous drought of January, February and March, but the December blossoms have set successfully and a fair crop is confidently looked for on all estates.

CARDAMOMS have generally given fair returns. The high prices ruling during the year have induced cultivators to increase their average.

LOQUATS AND PEPPER.

A Matale East planter writes:—"By the way, the senior (in 'Notes from Henaratgoda') is mistaken about loquats. In Ceylon, at an elevation of about 3,000, they bear splendidly, but fail below 1,500. [In Dimbula, the late Mr. Heelis got a fine crop once at 4,600 feet above the sea, but that was a rare exception,—a crop once in seven years being about the rule with him.—*Ed. T. A.*] As regards pepper, I once had a rock most magnificently covered with a fine bearing vine, but the dry season two years ago quite killed it out, while those on trees escaped. There is nothing like a dead tree for pepper to secure vigorous growth and crop; but, of course, it does not last. Growing on the ground without support I found the vines had a reluctance to bear."

DANGER OF THE HIDE TRADE OF INDIA (AND CEYLON?) BEING RUINED.

(Madras Official Paper.)

Read—the following letter from Messrs. W. J. Eales and Co., to the Chief Secretary to Government.

We have the honor to report, for information of His Excellency the Governor in Council, that it has recently come to our knowledge that many tanners, both of skins as well as hides, have resorted to the means of weighting their produce by the artificial employment of sugar and of jaggery. As you fully know the leather trade is one of the main industries, and certainly the chief staple exports of this Presidency, and it is with a view of endeavouring to prevent its ruination (which will in all probability happen should this sugar process continue), that we venture to address Government.

We do not for a moment imagine that it is competent for Government to legislate as to how a man should prepare or tan his raw produce, but seeing how much actually depends upon a straightforward use of those customary materials only necessary for tanning, we would respectfully submit that His Excellency in Council might cause some expression of dissatisfaction to be communicated to the various mofussil tanners through the Collectors of the different districts. The districts in which we have and still find sugar being used to a very large extent are the North and South Arcot districts, but we have also noticed that it is being commenced in Bangalore. For the information of Government we annex two certificates from the Chemical Examiner—that marked A is an analysis of a skin from the Ambur or North Arcot district, and B, from a skin tanned in Bangalore. We have no doubt that many other tanners in Trichinopoly, Dindigul, Madura, Salem or other districts are also using the like, as we received by last mail information from one of the largest German manufacturers that a parcel of Salem skins received contained on analysis 20/25 per cent of oil and sugar.

We earnestly request Government to take speedy action so that the trade may not become paralyzed and ruined, which at the moment would really seem to be the case, as foreign manufacturers and dealers will not buy here unless the Natives desist, and that too speedily, from this pernicious and unnatural means of manufacture. We have taken the liberty of addressing you direct as we are not members of the Chamber of Commerce, and considered, further, that no time should be lost in communicating our knowledge to Government.

Order—dated 18th August 1888. The Government regret that they are unable to render any assistance in the matter, except by way of giving publicity to the practice complained of and warning those concerned in the trade of the evil effects likely to arise therefrom. With this object, the Commissioner of Revenue Settlement and the Director of Land Records and Agriculture will be requested to draw up a circular for publication in the District Gazettes and for distribution as a handbill, as was done in the case of the adulteration of indigo.

The Government, however, consider that the most effectual remedy against the evil complained of is for the buyers to refuse skins not properly tanned. When the tanners find that skins weighted with jaggery and oil do not find a ready sale in the market, they will soon be led to give up the practice.

FORESTRY IN THE SOUTHERN CIRCLE MADRAS PRESIDENCY.

We have often drawn attention to the importance of Ceylon forest officers in the northern portions of Ceylon paying attention to the reproduction of the valuable leaf, fruit, sugar, and timber yielding palmyra palms. The following extract shows how these and other trees were objects of attention in Southern India in 1886-87:—

Cultural operations.—The area under cultural operations at the commencement of the year was 2,536 acres and 100 miles of channel banks costing Rs28,460. The area and cost added during the year were acres 436 and Rs4,201, respectively, the result at the close of the year being 2,972 acres and 100 miles of channel banks costing Rs32,661 in all.

133 acres costing Rs148 in South Arcot and 114 acres costing Rs190 in Tinnevely omitted in the previous year's returns owing to the charges having been adjusted under A-VIII (f) are now included in the area and cost added during the year. The actual additions during the year under report therefore consisted of only 38 acres in South Arcot (cost not given but adjusted under VIII (f)), 119 acres in Tinnevely (the cost of the latter, viz., Rs229, was also debited to VIII (f), but shown in Form No. 60 also) and 39 acres caravanam in Malabar (Wynaad).

The cost during the year also includes Rs1,141 paid on account of cost of Persian date-palms imported and Rs784 paid to Mr. Ferguson of Calicut for rubber experiments as per Board's Proceedings, dated 22nd April 1886, Forest No. 124, Mrs.

The 38 acres in South Arcot were ploughed and sown with cashew and babul seeds, but the results were poor owing to the partial failure of north-east monsoon.

In Tinnevely the operations were chiefly confined to the Kudiamalai (or reserved) land in which 20 acres were sown with 75,000 palmyra nuts. Several herds of goats were penned in another 23 acres and fed for five or six days upon the full pods of *Adiantum platanifolium*, and the reproduction from the seed which passed through the stomach of the animals was, the District Forest Officer says, all that could be desired. Some of the seedlings produced died away owing to the unusual drought which ensued, but a sufficient number remains to produce a fully stocked forest.

The palmyra nuts sown have commenced to show their cotyledons above the surface of the soil. The seedlings produced from sowings since 1879 are, in the whole, not satisfactory in quality, but those from sowings previous to that year are not progressing so favorably owing to the unfavorable situation of the sites chosen.

There were small cultural operations in a few other districts also, viz., in Chingleput about 900 plants of mahogany, nagai, sissu and cork were transplanted and 15,000 palmyra seeds sown along the boundary lines (5 miles) of Tirukalikundram reserve. In North Arcot seeds were sown broadcast in some of the fuel and fodder reserves, and in a few others small pits were made and three or four seeds put in each. In Trichinopoly the gaps along the Coleroon paduigas were filled up. In Tanjore about 2,000 pinnai seeds were put down and eighteen jack seedlings and sissu cuttings were planted, besides a few other seedlings of mango, tamarind, &c. In Malabar (Wynaad) 300 lb. of *Ficus elastica* seeds from Assam were sown in the beds in the botanical garden and in the nurseries at Kanot. In the latter 1,100 plants were successfully raised and are on an average 3 feet high. The plants are quite healthy and vigorous. 2,000 mahogany seeds were sown in Kanot and 800 plants raised, but only 400 of these were alive at the close of the year. The site is probably too high and exposed. Mr. Morgan, the District Forest-officer, writes "Both in the case of *Ficus elastica* and mahogany the loss of young plants from insects was very great. Caterpillars attacked the seedlings of the former when in their earlier stages and mowed them down in thousands. These caterpillars were the larvæ of a small grey moth and nocturnal in their habits, only feeding at night and burying themselves by day. They were searched for and destroyed. In the case of mahogany, the young plants were cut down in the seed beds by a gryllus, and thus no less than 400 of those raised were destroyed." Some *Besha Travancorica* bamboo seedlings we raised from seed and planted in the nursery. A few of them were destroyed by white-ants and monkeys and the rest are growing vigorously, the plants being over 3½ feet high. Seventeen cuttings of giant bamboo (*Dendrocalamus Brandisii*) were successfully struck and planted out at Kanot, but only eight have survived. One cutting of the golden Burman bamboo planted out is doing well. A considerable area was sown broadcast with teak seeds in Kanot tuckles (old clearings). In the Periyar range about 32 acres were planted up with cardamoms, but only 50 per cent of the plants put out are now alive.

In Malabar (Nilambur) 1,039 mahogany seedlings were planted in Panangode in addition to those planted with the teak, and 500 seedlings of Burma bamboos (*Cephalostachyum Pergracile* and *Dendrocalamus Longispatus*) were planted along the river banks.

EDUCATING CONSUMERS.

The character of a retail grocer's patronage may be accurately judged by the character of the goods in stock. Cheap goods means a common class of patrons; fine goods, a class that live well and pay well; an average stock, an average class of customers. The grocer should always lead his trade, and constantly endeavor to increase the wants of his patrons by tempting them to use a greater variety of food products. He can do much to bring consumers to appreciate distinctions in flavor and quality, and make them willing to pay for the best. How shall we do it? is the question thousands will ask, and to which no better answer can be given than to show how one of the most successful grocers in Philadelphia makes trade. Here is a sample of how he introduces a new tea to their notice:

THE CHINA TEA FOR AMERICANS.

The almost universal use of tea in England, and the general preference which is given to that beverage over coffee, fill many Americans with astonishment. But there is a cause for it. Instead of the "weak, watery" liquid which the Average American has been taught to regard as tea, our English countrymen have been treated to a beverage whose richness, strength and fragrance have furnished that refreshment and invigoration which

Americans look for in coffee alone. The nearer Americans approach the English in the selection of tea, the greater will be its consumption.

Ceylon tea is remarkable for its purity, its strength, its freedom from artificial coloring, its richness and its fragrance.

But it has been demonstrated that plain Ceylon tea does not please the average American. It is too distinctive. Recognizing this fact, we endeavored to combine the choicest Ceylon flowery pekoe tea with pure and uncolored China and Japan teas in such exact proportions, and of such particular flavors, as would modify the distinctive Ceylon character, so as to please the American taste. After many careful experiments we succeeded. The tea is known as Blank's Ceylon Tea. It is richer, heavier and more fragrant than ordinary teas. It has now been thoroughly tested in many localities and the almost universal verdict is, that "it is perfect."—*American Grocer*, Nov. 7th.

TEA SALES:—THE NEW AND OLD SYSTEM.

THE NEW SYSTEM.—To enable our readers at a distance to understand the position of both sides in the arguments *pro* and *con* what is called the New System of selling tea, we must as briefly as possible state what are the dealers' principal objections to the old method. For many years all brokers' catalogues have been issued with full marks, with the ships' name and date of import, so that anyone who took the trouble to turn up a file of catalogues, could see for himself, or inform any interested party exactly what price was paid for any particular parcel. The dealers have for a long time felt this work to their advantage for various reasons. The advantages of capital, and great experience and judgment in buying teas have, owing to the universal knowledge of the price bid, practically disappeared. The merest tyro in the Lane is able to compete with the best judge of the article, and has not been slow to injure his rival's sale of teas in the country, by informing the buyers for whose custom he was competing, exactly what so-and-so had given for such-and-such a tea. In this way the tendency towards lower and lower prices has been greatly accelerated. The teas have not been sold on their merits, but on what was paid or bid in the rooms. Customers come in and "claim" from the dealers teas they have just bought, at a nominal profit of $\frac{1}{2}$ d to $\frac{3}{4}$ d per lb., and the London dealer has thus drifted into the position of a Banker for the country buyer, never able to benefit by his judgment or experience when teas are cheap, and quite unable to get rid of his teas when they were dear, except at great loss. This is in great measure owing to the fact that the price bid in the rooms "ear-marks" a tea. Consequently if a dealer or speculator wants to sell his recent purchase by auction, the "Room" will hardly look at it, and will in all likelihood bid 3d to 6d per lb less than it had previously sold for. "Oh" they say, "Second-hand tea."

Another objection to the old system and this from certain points of view perhaps not so much an objection, is that owing to the public knowledge of cost, and boycotting of second-hand parcels, speculation in tea is almost eliminated from the trade. We are fully aware of the various considerations which lead many to say "so much the better," but on the other hand speculation, or perhaps to soften the term "Buying ahead," on the part of a large operator, would often come to the rescue of a falling market, if the purchaser knew that in due time he could get a fair market value for his stock on its merits.

The advantages of the new system are claimed by its advocates to be as follows:—By printing the mark without the ship-name, or the ship-name without the mark, or by printing the teas with both ship and mark left blank, the trade can buy and sell tea on its merits, quite apart from what was bid in the rooms. Its cost cannot be traced in the country. Travellers can then boldly ask a good price for a good tea, and judgment and discretion play their proper part in business. The

dealers say that if they find they can make the consumer pay a little more on an average for his tea, they, in turn can afford to pay more in the auction rooms, and that the merchant or importer will thus benefit.

They say the old plan works thus: suppose a country traveller in town for samples tells them that if they can buy a certain pekoe in sale at 1s 1d, he can sell it at 1s 2 $\frac{1}{2}$ d or so. The dealer is prepared to go up to 1s 1d. The tea may be sold for 11d—perhaps at a profit to the merchant, perhaps at a loss. Then, the price being thus fixed, the dealer cannot get over 11 $\frac{1}{4}$ d for it. Nine out of ten of his customers would be annoyed with him did he hold out for what he considered its value. With this the merchant has nothing to do. But the result is that this particular pekoe, when next offered at auction, is only valued at 10 $\frac{1}{2}$ d, and worse still, all other teas of about the same quality suffer to some extent.

It is alleged by those who object to the change that it will eliminate a certain amount of competition; that the small and inexperienced buyer will, so to speak, be "out of it;" and that the large dealers will have things all their own way; that they will get larger profits, while the importer has to take just the same or less for his teas. In forming an opinion as to the future effect of so great a departure from the old lines, it is most important to keep an open mind. While we endeavour to do so as much as possible, probably many of our friends would like to see the new system get a fair trial. It may be a strengthening of the broker's hands, enabling him to get his valuations for teas instead of having the "value" fixed in the room by a sporting offer from some one who perhaps has scarcely looked at them. The difficulty of getting an advance after sale, when a low price has been bid in the rooms, is too well known to require further remark. The new system would remove that difficulty, for until the tea is actually sold, the ship and numbers do not transpire, and the buyer does not know whether a tea has been offered before or no. He will buy on the merits of the tea without bias. As brokers we conceive it to be a part of our duty to lay these matters fully before our friends for their consideration. When we have seen more of the practical working of the New System we shall be able more strongly to express our opinion one way or another. So radical and vast a change cannot be made all at once without opposition from some quarters, nor can we anticipate objections which have not arisen in actual practice.—*I. A. Rucker and Bencraft*, London, Jan. 24th.

YAMS.—We have received from Dr. Stork a sample of "kush-kush yams, grown at Comillah," about 10 miles south of Henaratgoda station. These tubers are, we suppose, an introduction from India? In any case their quality is superior. They are of the ordinary size, but they have the purplish-pink tint of the famous gigantic Jaffna roots. Well boiled they are tender and nice, and with a little butter, salt and pepper quite tasty. Roots like these come in well, when, as lately good potatoes have been difficult to procure, and, with sweet potatoes and breadfruit, they are ever welcome changes of vegetable diet.

LORD HAMPDEN'S model dairy at Glynde, near Lewes, is undergoing extensive alterations. At present the dairy is capable of dealing with 800 gallons of milk per day, but last summer the local farmer were anxious to dispose of a much larger quantity. With the new machinery that is being laid down, the additional utensils with which the dairy is being provided, and the measures that are being taken to improve the water supply, it is expected that 2,000 gallons of milk can be received every day. The rapid growth of his undertaking is the more gratifying to the late Speaker, inasmuch as when it was first started, nearly two years ago, the farmers quite failed to realize its usefulness.—*P. M. Budget*.

PLANTING REPORTS FROM THE HILL-COUNTRY OF CEYLON :

A SOLITARY RHODODENDRON TREE—BOTANICAL SPECIMENS—VARIEGATED FOLIAGE.

NANUOYA, Feb. 15th.

The scenery along both routes is grand and beautiful exceedingly, but in some respects that seen from the road which starts from Nanuoya bears away the palm. At the commencement nearly three miles pass through estates, of which only one mile is woodland, likely to be soon cleared, alas! In one bit of transitional forest, the opening of the service road has revealed the novelty on the western side of the Nuwara Eliya range of a rhododendron tree. It is in a ravine, close to a stream, at an altitude of about 5,400 feet, and seems a solitary specimen. It was, when discovered, in fine flower, the blossoms being apparently larger and of a darker crimson colour than the flowers of those which so abundantly adorn the grass lands and line the streams on the eastern side of the range. The leaves of our specimen are certainly much longer and more acute than those of the ordinary variety. A specimen of this rhododendron was sent to Dr. Trimen, together with branches in blossom (lovely white and sweet-scented flowers) of that fine-foliaged *symplocos*, the roots of which when rotting in the ground produce a fungus that poisons numbers of tea bushes to death, generally when such bushes are in their prime. There went to the eminent botanist, in addition, a specimen of the large myrtle-like flowers and the peculiar seed-vessels of a very handsome Australian eucalypt, which in shape and colouring of foliage differs much from its congeners. We have failed to identify it with any of the species figured in Von Mueller's "Eucalyptographia." A conspicuous tree now in full flower in the jungle is one which we popularly distinguish as "the wild toon." The foliage resembles that of *Cedrela toona*, but the timber is said to be poor. But far beyond any floral beauties of the mountain forests, striking as some of them must be pronounced, are the exquisitely rich and varied tints which the leafage is now assuming: ruby red, light pink, orange, yellow, bronze, mauve, shading away to pure white in the case of the "flush" on some trees. The curious feature in our tropical forests is that they choose the spring to put on the livery which the woods of temperate climates wear in autumn. The effect is occasionally so rich that even lengthened experience does not prevent a traveller from fancying that a particular tree has clothed itself fully in flowers of blood-red, scarlet or pink. It is, however, the young foliage which after the lapse of some months deepens into green, of lighter or darker shades. The rounded crowns of the keena trees are everywhere conspicuous from their perfectly circular shape, their predominance in height and the colouring of the dense, minute foliage. But no one who has not seen the spring glories of our upland forests can appreciate the wonderful beauty of some special hillsides and ravines. A curious effect is sometimes noticed, the forest on the side of a hill range appearing to be terraced: one set of trees rising over another set. This is no doubt due to subsidence of the soil from the existence of springs or diffused moisture.

COCOA CULTIVATION IN COLOMBIA.

Cocoa is one of the most important articles of production in Colombia. It is in daily use in every household, rich and poor, in every district of the country.

* From a Consular Report on the Agricultural Condition of Colombia.

to quite as great an extent as tea is in England. The departments of Tolima and Cauca produce the greatest quantity, but it is more or less grown in every part of the hot country. It is mostly planted on newly-deforested land, on the slopes of the mountains, at an elevation of from 1000 to 3500 feet. The variety chiefly grown in Colombia is different to that of Venezuela, which produces the Caracas cocoa, the pods being much larger and containing a greater number of beans; but as the number of pods produced by a tree is smaller, it is probable that on the whole the Venezuelan variety is the more productive of the two. The quality of the Colombia cocoa is little, if at all, inferior to that of the Venezuelan, but it is little known in commerce, as only an insignificant amount is exported, the supply scarcely satisfying the demand of the country. It is cultivated here in much the same way as in Venezuela, though perhaps less care is generally taken here to keep the plantations in proper order. It is a crop which requires constant care and labour to weed and clean the ground, and free the trees from the numerous insects, especially caterpillars, which infest them. A most destructive disease has lately attacked the cocoa trees in the south of the Tolima, which is one of the richest districts of Colombia. One plantation of 12,000 trees near Chaparral, produced only 175 pounds of cocoa in 1887, instead of some 18,000 pounds, which at 1½ pounds a tree would be a fair average crop, according to the general calculation here. These trees were sixteen years old, and therefore in their prime; some cocoa trees, if healthy, bear for from sixty to eighty years. No investigations seem to have been made into the nature of this disease, and no remedy has been suggested. Meanwhile, the cocoa industry over a large portion of the most productive district of the country seems to be threatened with entire ruin. The cocoa tree begins to bear in three and a half years in the hottest districts, and in five years at an altitude of 3500 feet. It is carefully shaded for the first year; plantains, or more rarely sugar cane, being planted for the purpose. Trees are also planted, which as they grow up give permanent shade to the plantations; a species of *Erythrina* is most commonly used for this purpose on account of its rapid growth. Cocoa is one of the most, perhaps the most, paying crop grown in the country when once it is established; but the initial cost of planting it and keeping the plantation in good order for the first four or five years deters many people from growing it. As compared with coffee, a plantation of cocoa of a given number of trees costs nearly twice as much to establish; but once in full bearing, it has the great advantage that no machinery and very little labour is required for preparing the beans for the market, so that the profits are much greater. If land, however, were not so cheap as it is in most of the cocoa districts, coffee would have a great advantage, since four times as many coffee trees can be planted to the acre as cocoa trees, and the value of the produce of a given number of cocoa trees is only from two to two and a half times as great as that of the same number of coffee trees; but as the value of land is merely nominal, cocoa is the more profitable crop of the two.—*Pharmaceutical Journal*.

THE POTATO DISEASE.

For many years past the potato disease has curtailed the cultivation of the tuber on the Nilgiris, and there appears little prospect of the complete extirpation of the epidemic. The present custom of storing the seed is at the root of the matter, as far as a general epidemic is concerned. It is well known to fungologists that fungi have their times and seasons as well as other plant growths, and that certain spores exist, which are called "resting spores," from their custom of biding their time and coming to maturity when the season for their development is present, and are uninjured by changes of temperature and by considerable changes of their physical state, and which are not destroyed unless an actual chemical change is

produced in them. These "resting spores" are produced in abundance in the places in which seed potatoes are ordinarily stored; they bury themselves in the eye of the potato, and are planted with it. These spores will not produce mycelium or spawn unless the proper juices are ready for their development, and not then unless the physical agencies are also at hand, such as a proper degree of moisture, heat, and the proper kind of exhalations from damp, unventilated ground, with some disturbed magnetic state of the earth and air. The tuber is planted with the "resting spore" in its eye; it sends up its haulm with the spore in its tissue. Just about the time of flowering the juices in the plant are matured sufficiently for the "resting spore" to develop; if then, there should be the conjunction of circumstances we have mentioned viz. moisture, undrained ground, and electric disturbances, with luxuriant tops to the plants, the fungus is developed in the most marvellous manner, and millions of spores are wafted over the field, not resting, but immediately growing, sending their mycelium into the stomata, or breathing pores upon the plant, and in a few hours poisoning the whole of the crop by interfering with the proper maturation of the juices. Every potato receiving juice from a diseased haulm will suffer. The growth of the fungus arises from its abstracting an important part of the juice of the plant, so that the character of the circulating fluid is quite altered; and a similar result happens as is the case when a human being is deprived of the oxygen required for active respiration, or if some other gas is respired. The blood is altered, and if the alteration continues long enough death results. No doubt highly manured lands and crops dressed with artificial manures beyond measure more easily succumb to the disease, just as is the case with highly fed, richly seasoned human beings: whenever fever gets hold of them they rot most rapidly. So also if plants are infested with insects, such as the *Eupertyx picta*, they will more easily yield to the disease because they contain less mineral matter in their tissues; but such are not causes for the disease. The cause is the fungus *Botrytis infestans*. The remedy is to destroy the germ before planting, and so to treat the seed—that no fungoid growth shall be possible while stored away. Care should be taken to pick out the best specimens for seed, middle-sized, underformed, and clear-skinned tubers, which is so often contrary to the general custom. These should then be treated with a dressing of some material which prohibits fungoid growths, such as chloralum, preparations of carbolic acid, or creosote, and then stored in a dry, well-ventilated chamber, where the temperature shall range between 35 degrees and 45 degrees. If they show signs of sprouting they should be immediately planted, for the removal of the early sprouts takes away much of the mineral matter out of the tuber. Common sense will dictate the measures which should be taken for the proper ventilation and drainage of the soil in which they are planted. We write these suggestions in the belief that one law governs the action of disease, whether in plants or in human beings, and that it is easier to destroy the "resting germs" than to stay their effects. It may be urged against this view that the tubers used for seed could be destroyed by the germ in the eye, but it is one of the points in the natural history of the *Botrytis infestans* that it feeds upon the juices of the growing plant, and the matured potato is not growing, therefore the concurrent circumstances requisite for its fertile development are not present. The "resting spore" continues such until all the circumstances are favourable for its growth. It is carried upwards in the haulm until its proper season arrives. This may not come; it may be too dry, or there may be no magnetic disturbances, or these changes may come too late, then no epidemic. We should mention that after the tuber has been infested by the *Botrytis*, its destruction is completed by another fungus, the *Fusisporium Solanii*, which changes its form as the work of destruction proceeds, hardening some portion of the tissue of the potato, but changing the major part into a gelatinous, stinking mass, by means of which the starch is destroyed,

while the gluten and the juices proper appear to be the food upon which the *Botrytis* flourishes. If, therefore, it is intended to save the starch, it must be done before the *Fusisporium* is developed.—*South of India Observer*.

DRUG TRADE REPORT.

LONDON, January 31st.

CINCHONA.—The number of packages offered at today's auctions was rather smaller than shown at the first sales of the year, but the deficiency was more apparent than real, being caused exclusively by the absence of the less valuable South American barks. The fourteen catalogues comprised:—

	Packages	2,560 of which 1,665 were sold
Ceylon bark ...	505	152 "
East India bark ...	397	178 "
South American bark ...	283	283 "
Java bark ...	14	14 "
Jamaica bark ...	39	7 "
Total ...	3,798	2,299 "

The sales opened very languidly indeed, and, with the exception of a few parcels which were competed for with some slight flickering of animation, dullness reigned throughout. A very large proportion of the parcels offered was bought in, the figures obtainable falling generally considerably short of the limits placed upon the goods, and some of the brokers withdrew several lots at the time without going through the formality of soliciting bids. It is generally agreed that the prices paid were rather lower than at the previous auctions, the average unit being placed at 1½d to 1¼d per lb. The following are the approximate quantities purchased by the principal buyers:—

	Lb.
Agents for the Mannheim & Amsterdam works	175,992
Agents for the Brunswick works	119,705
Agents for the American, French, &c., makers	101,965
Agents for the Auerbach works	58,014
Agents for the Frankfurt and Stuttgart works	39,965
Mr. Thomas Whiffen	38,705
Messrs. Howards & Sons	14,607
Sundry buyers	15,013
Total sold	563,166
Bought in or withdrawn	276,713

Total quantity catalogued ... 839,879

It is understood that the mere weight of bark purchased affords no guide whatever to the quinine yield presented by it, firms who buy a small quantity of bark by weight frequently taking the richest lots, and *vice versa*.

SOUTH AMERICAN BARK: The auctions were noticeable for the absence of the heavy parcels of old Cuprea and Pitayo barks, which are generally included in the catalogues. On this occasion nearly the whole of the supply consisted of cultivated Bolivian Calisaya quills, of which 144 packages were sold at cheap rates. The following prices were paid: Yellow varieties: Bolivian quill, good strong silvery to thin, rather broken 10d to 6½d; a fine parcel from the Cusilluni plantation, Yungas, being held at 11d per lb. Red varieties: common damaged pieces 2d to 8d thin colourless quill 2d to 3d; dark druggists' quill (one bale) 2s 7d per lb.

JAMAICA BARK.—Fourteen bags of grey character, mostly dust, root, and broken branch quill, sold at 1d to 2½d per lb. The whole lot weighed only 828 lb.

AFRICAN BARK.—Thirty-nine packages were offered, imported via Lisbon, and grown in the island of San Thomé. There were altogether 5,547 lb., but only 7 packages were sold, subject to approval, at 2d per lb for long, partly broken, thin, red quill. The rest included some fairly good strong red quill.

QUININE.—Early in the week the price of Howards' brand was reduced 2d per oz by the makers who now quote 1s 8d for bottles, and 1s 6d for bulk in quantities. Whiffens' is quoted at 1s 5d for bulk. There has been a rather important business (so, at

least, it is reported) in German brands in bulk, several transactions of 10,000 and 20,000 oz lots each being talked about. The B & S agents are said to have been the principal sellers, and the quotations accepted by them have declined from 1s 3^d for May-June delivery to 1s 3d for February, and on Wednesday to 1s 2^d per oz., the lowest official price on record, at which they are said to have sold 20,000 oz for February-March delivery, another 10,000 oz being reported sold by them today at the same figure. Brunswick is said to have sold for August delivery at 1s 3d, and Auerbach for April-May, also at 1s 3d per oz at the beginning of the week, but the agents will now also take 1s 2^d Jobst's and Zimmer's brands have sold at 1s 4^d lately; these makers do not take part in the speculative moment.

SPICES.—Cloves have sold privately at 9d per lb for Zanzibar, both on spot and for arrival, but at auction little attention was paid to the small supply offered. Exceptionally fine bold bright selected Ceylon sold at 1s 3^d per lb; ditto Penang at 1s 3^d per lb., and fair medium at 11^d 1. Black pepper has remained quiet, with transactions at 7^d 1 to 7^d 1 for grey to good washed Singapore on the spot; Atcheen, slightly dusted, 5^d 1; sifted Penang 5^d 1; bright washed Ceylon 7d per lb.

THE AMERICAN MARKETS.

NEW YORK, January 19th.

QUININE has been unsettled, though the tendency of the market has been towards a stronger basis. For the greater portion of the period under review there has been a hesitancy to meet buyers of round lots, but occasionally sellers would relax, and, with assistance of foreign agents, full advantage was taken of the opportunities as presented, and the result has been a considerable business completed. The transactions aggregate 75,000 oz. German in large bulk, brands including "Gold and Silver," Brunswick, and B & S for which 29¹/₂ to 31c was paid. A moderate portion of this quality consisted of store stock, but the larger percentage was contracted for during January, February, and March. The market closed with the feeling decidedly stronger. P & W have shown a disposition to lower their ideas to a point nearer the market, and have revised quotations so that they now stand 38c for large bulk 40c for 5-oz. tins and 45c for vials.—*Chemist and Druggist.*

BOTANICAL.—With reference to specimens referred to in the communication on page 638, Dr. Trimen writes:—"The *rhododendron* is interesting as being from a new and isolated spot, and in differing slightly from the type of the higher regions. The plant you think a *swaygyptus** does not belong to that genus of *myrtaceae*, but to an allied one called from its combined head of fruit *Syzygium*. Its full name is *Syzygium laurifolium*. I remember it at Abbotsford on my only visit there at the time of the gum-tree blight. It is, of course, Australian (Queensland and N. S. Wales), but I am not aware that it possesses any valuable properties but ornamental ones." And most ornamental it is in leafage and flower. But that is not all. Von Mueller, quoting Hartmann and MacDowall, states that "the wood is very durable, mostly used for flooring and cabinet-making, as it takes a high polish (Hartmann); extremely durable, of excellent qualities" (A. MacDowall). The vernacular name is turpentine tree (why, we fail to see, for the scent of the leaves is delicate); it attains a height of 200 feet, with a stem of great thickness, to 30 feet in girth, rather of quick growth; well adapted to shade roadsides. The seed which is now being freely produced on Abbotsford will, therefore, be valuable. Alternated with grevilleas, casuarinas and some of the hard-wooded *swaygypti*, this tree would help to make a beautiful avenue. *Cryptomeria japonica* and *Cedrela toona* would add to the effect of such an avenue.

* We indicated our doubt by a *—the combined fruithead as well as the leaves, which are silvery on the underside, having puzzled us.

AGRAS, 20th Feb.—We have a fine blossom in spike on some of the estates in this district, where the trees are healthy and especially where cultivation has been kept up and the green bug kept down. We want a few light "blossom showers" after all this hot sultry weather. If not much it will do the coffee good, and simply make the tea jump again. A good many cinchonas have died out the last month or two, but it seems to make very little difference on some places, and the estimate for next year is as good as ever.

THE DEHRA DOON FORESTRY SCHOOL is thus noticed in the *Indian Forester*:—"In India itself a very important improvement was introduced in the system of instruction at the Dehra Doon School in 1885. The course originally consisted of only two terms held in two successive years from 1st July to 31st October, the interval of eight months being spent by the students in various divisions where they either learnt a little administration or were employed in counting trees in enumeration surveys. Now that interval and also the five months succeeding the second Rainy Season term are passed in camp with the Deputy Director of the School and other Instructors who carry on a course of combined indoor and outdoor work thus making the teaching as practical as possible."

THE CEYLON TOBACCO COMPANY—whose prospectus has just been advertised—is already so well supported, there being quite a rush for shares, that it scarcely requires any further words from us, unless the Directors are prepared to double their capital! A meeting of the Directors is to take place in Kandy on Saturday next when we have no doubt everything will be found ready to warrant a commencement of business. In our last notice of the Company, when we mentioned the names of Mr. Rutherford, Christie, Armstrong, and Hill as inspiring confidence, we omitted the name of the gentleman who is the very heart of the enterprise, the Managing Director and Secretary Mr. Hugh Fraser. The only suggestion we would venture to make to the Directors, is whether apart from growing the finer, but more delicate, tobaccos chiefly in request in the European market, they should not devote some acreage to the coarser but more easily grown tobaccos for local and Indian use. One enthusiast declares there is 400 per cent to be made by supplying tobacco leaf to the Ceylon and Indian bazaars. *Verb. sap.*

FOREST PRODUCE AND MOVEABLE TRAMWAYS.—There is abundance of good timber trees still in the forests of Ceylon, but they are often unavailable at anything like ordinary cost in consequence of remoteness from consuming centres and absence of proper means of carriage. The following extract from a review in the *Indian Forester* of operations during Lord Dufferin's period of Government is suggestive of a remedy:—"The quantity of produce exported from the forests has increased very considerably. This is due to the opening out of new forest tracts, but is also, to a great extent, the result of improved means of transport. In this latter connection it is interesting to note that Lord Dufferin has urged the advisability of employing moveable tramways, which would be available in time of war or famine. The realisation of this project is only awaiting a further extension of the general railway system and its nearer approach to some of the more important forest areas. The increase in the exports of forest produce is also a consequence of the growing prosperity of the country, which is clearly indicated by the use, in many localities, of sawn scantlings in place of the rough unwrought poles that were formerly put into buildings."

A TRIP THROUGH COCHIN AND TRAVANCORE.

By DAVID HOOPER, F.C.S., Quinologist to the Madras Government.

Leaving the Madras Railway at Shoranur station, a ride of twenty miles takes the traveller to Trichoor, a convenient place to engage a boat for a journey down the back-water of the western coast. The ride is accomplished in a country bullock-cart or in a vehicle called a "tonga." The latter was chosen as being more expeditious, but to be in something like a large packing-case placed on four wheels without springs, carried along by two rat-tailed ponies going at their fastest pace, is not, even on the best of roads, a comfortable mode of transport. The whole distance we passed under an avenue of Ficus and Portia trees (*Thespesia populnea*), from which hung festoons of ipomœas with their blue flowers, and creepers of *Trichosanthes palmata* with their scarlet fruits. Hedges of jatropha, occasionally relieved by the attractive inflorescence of curcumas and wild ginger, lined the way and bordered the small gardens of the natives. Beyond these the broad fields of freshly-transplanted paddy, bright and green in the mid-day sun, told of the industry of the agriculturist in preparing the new season's crop of staple food.

Trichoor is a town in Cochin territory noted for its large Hindu temple. The surrounding country is well cultivated, and the green lanes leading to neighbouring villages recall many a picture of English scenery. From this town a succession of lagoons or backwaters, connected by artificial canals, extend southwards to the principal ports of Travancore. A cabin-boat with ten oarsmen and a *marakan*, or captain, had been sent to the landing-stage to meet me, and I embarked late in the afternoon for the town of Cochin, forty-five miles off. The boat was soon in the middle of a wide channel, and banks of vegetation fringed the rippling sheet of water as it reflected the rich, ruddy hues thrown on the western sky by the setting sun; the horizon was defined by a long row of coconut palms, to which divers birds betook themselves to rest; the darkness hastened over the eastern heavens, but its progress was arrested by the evening star, shortly followed by a four days' moon, taking up their position to guard the first watch of the night.

Cochin, a quaint little town, a relic of Portuguese and Dutch history, was reached next morning at daybreak, and here I enjoyed the hospitality of Mr. A. F. Sealy, the Director of Public Instruction to the State. The town is remarkable from an industrial point of view for its coconut produce. The fibre from the husk is being sorted, pressed, and baled, and merchants' yards are stored with coir matting, twine, rope, and cables. The copra, or dried fleshy portion of the nut, is pressed for its oil, the residue, if fresh, is food for animals and the poorer class of natives; if stale, it is used for manure. Barrels of oil were waiting for shipment. On account of the temperature the oil is always in a liquid state, colourless and transparent, different to the white fat usually met with in England. Cochin is known by druggists all over the world for its large exports of nux vomica. The firm of Messrs. Volkart Bros. are the principal dealers in the seed, and I was interested in visiting their premises, especially this month (October), when the season for collecting was at its height. The tree grows in the dry deciduous forests at the foot of the hills and sometimes at 2,000 feet elevation. The wood is hard, close grained, and bitter, and is not attacked by white ants. It is not, however, adapted for timber, as it warps and cracks. The root is used by the natives as a febrifuge. The nux vomica is sold by the collectors at a low price to small native dealers, who send it in to the merchants. A large quantity of seed is brought round from the eastern coast of the Madras Presidency to mix with the better kind obtained from the Travancore and Cochin forests. This is known as Cocanada nux vomica, and is much smaller than the Cochin. From whatever source they come, the seeds are thoroughly washed with water, to remove the mud and other impurities, and are

laid in the sun to dry for a few hours; they are then sorted by women into bags of about a cwt. each, the larger nuts being separated from the small Cocanada variety. The exports of nux vomica from Cochin are generally sent direct to Europe and New York, but in 1885-6—an unusually heavy season—out of 10,787 cwt., 2,498 cwt. were sent to Bombay, Burma, and Arabia. It is probable that the small nux vomica from Cocanada forms the bulk of the Madras seed, as the latter is not only inferior in appearance, but also gives a lower yield of alkaloids than other commercial samples of Indian seeds. There is such a sharp distinction between those from the eastern and these from the western coasts that it is still an open question whether they are yielded by different species or varieties of *strychnos*.

Ginger is dealt in under the names of white and black. White ginger is the rhizome, scraped, dried, and bleached in sulphur vapour. Black ginger is that collected in the monsoon when the sun is not available for drying purposes, and dried artificially in hot ashes; this kind shows a charring on the surface which slightly diminishes its value in the trade. Turmeric is an important article of commerce on the coast, and a considerable portion is exported from Cochin. The finger turmeric is richer in aromatic and colouring matters than the sliced roots, or bulb turmeric, as it is called, and commands a higher price in the market. The trade in turmeric is somewhat declining on the western coast. Of the shipments from Cochin only about half reach European ports, owing to the large consumption in Asiatic countries. An arrowroot made in the country from one or more species of *curcuma* is used by the Malayalums, and occasionally sent to Bombay. A large trade is carried on in verbena or lemon-grass oil, distilled from *Andropogon citratus*. The oil is obtained in a rough-and-ready way by means of small portable stills which are carried out to the lower slopes of the hills where the grass is abundant. The oil is sent out in flat square boxes containing a dozen bottles, each guaranteed to contain at least 23 oz. The trade in lemon-grass oil is decidedly on the increase, as is shown by comparing the exports of the past four years:—In 1884-5, 228 cases of 1-doz. bottles; in 1885-6, 497 cases; in 1886-7, 1,158 cases, and in 1887-8, 1,756 cases. London and New York received nearly the whole of these shipments. This oil is not very liable to adulteration. Coconut oil is occasionally mixed with it, but this is detected by the smell. Fixed oils, as a rule, interfere with its brightness, a defect which cannot be remedied by filtration.

Among the domestic medicines used by the inhabitants of Cochin are the sliced roots of *Kemferia rotunda*, a favourite aromatic stimulant, called *Kutcholum* in the bazaars. This little plant is often seen in the gardens, throwing up a delicate spray of pink flowers, which dies down, and is followed by the appearance of large radical heart-shaped leaves. The roots of *Curculigo orchioides* are used both in a fresh and dried state as a diuretic and demulcent, under the name of *nelapanna*. The *Samadera indica* is a fine tree, the wood of which is made into sandals; the bark is bitter and tonic. It belongs to the same natural order as the quassia, and the bitter principle is similar to quassin. The oil of the seeds is used for rheumatism. The herb *Anisomeles malabarica* makes a tea for patients suffering from fever; it is called *Carintumba Vyambu*, a fragrant species of acorns, keeps off fleas and other small insects when placed in clothes.

I left Cochin by cabin-boat in the afternoon of Oct. 12 for a row of 30 miles to Alleppy, the chief port of Travancore. During the night the Cochin-Travancore boundary was passed, and the custom-house officer waded out to the boat to ascertain if any contraband goods were on board; but his suspicions were at once removed on seeing a sleepy *sahib* the sole occupant of the cabin. The boat reached the *ghâts* of the Alleppy canal early next morning, and in making my way to the public bungalow I found all the town was *en fête*. This happened to be a very important day in the Dassera festival, and was kept religiously by all Hindus. Offices were closed, trade was suspended

tom-toms were beating, and the people were dressed in their best attire. From the Alleppy lighthouse, 85 feet high, a good view was obtained. Looking out towards the sea, ships could be seen passing down the coast, and nearer land a few fishermen in their small canoes were diligently playing their trade. The custom-house and port-offices were the chief buildings on the sea-front, and near them were the cardamom and salt stores, kept under a military guard. The canal ran into the town at right angles to the shore, stopping short by about two hundred yards, and forming a *cul de sac*. Along the canal for two miles lay the town, the seven principal streets crossing it by as many bridges. Forests of coconuts trees stretched north and south as far as the eye could reach. Eastward, the broadest part of the backwater looked like a silver lake, and behind it rose the well-wooded hills of Travancore.

Alleppy is the depot for the forest products of the State, and is pre-eminently known for its exports of pepper and cardamoms. The Malabar and neighbouring hills are the home of the pepper-vine, and for centuries the commodity has been supplied from this coast to western nations. In January 1793, a peculiar agreement was made between the Rajah of Travancore and the English, by which he was to supply a large quantity of pepper to the Bombay Government in return for arms, ammunition, and European goods; this was known as the pepper contract. Pepper is a special department of the Travancore State, and it is compulsory that all the spice pass out of the ports of Alleppy and Quilon, or by certain routes on the backwater, or by land. The enormous trade done in pepper is seen by the exports, which show, as an average of the past five years, that 3,000 candelies—each equal to 500 English lbs.—leave the country, and this brings in to the State an annual sum of about 6 lakhs of rupees, or 60,000*l*.

Cardamoms are a monopoly of the State, and a source of considerable revenue to Travancore. A special forest officer is deputed to superintend the cultivation of the plant and the collection of the spice in the Cardamom Hills. These hills are situated south of the Anamullies, with an elevation of 2,000 to 4,000 feet above the sea. They are divided roughly into two tracts, known as Margari Alum and Kunni Alum. Both these districts are very malarial, but the latter, influenced by the sea-breeze, has a better climate. The export of cardamoms is about 60 tons annually, worth about 30,000*l*. The Government impose an export duty on coconut produce, arecanuts, ginger, galin-gal, tamarinds, arrowroot, turmeric, kutcholum, pepper, laurel nuts, and laurel-nut oil; the duty has been reduced on lemon-grass oil, and has been abolished on gingelli seed and oil, and on castor seed and oil. The export returns and official books throughout Travancore are kept according to the chronology of the Malabar era—for instance, the present year, from August 16, 1888, to August 15, 1889, is represented as M. E. 1064. Unless this were explained the unconscious possessor of some of these documents might fancy himself perusing records of Anglo-Saxon times.

The port of Alleppy was left the same day in a boat called a "wallum," a kind of large canoe 20 feet long and 6 feet wide, cut out of the wood of Anjelly (*Artocarpus hirsutus*). A gentle wind favoured a sail for the first part of the voyage, but as it afterwards turned contrary, the boatmen had to take to their bamboo poles and push the craft along at the rate of two miles an hour. Cottayam was reached after sunset, and here I spent two days in one of the prettiest stations of the backwater. The town is seated upon several small hills, and the bungalows of the residents overlook well-watered and fertile valleys. The Peermaal plateau of the Travancore mountains, about fifty miles distant, is devoted to the cultivation of coffee, tea, and cinchona, and beyond are the Cardamom Hills. The latter crop was beginning to come in, and every week a quantity was brought under an escort of native soldiers to Cottayam for transport to Alleppy. Here the bad and wood-apple were in full fruit; the Indian cork-tree (*Bursera*) was perfuming the atmosphere with its flowers; the pepper-vine was clasping

the tree, loaded with its green berries; and *Hanregania alata* and *Plumbago rosea* sheltered themselves under the hedges.

A journey in a wallum of two days and one night brought me to the ancient town of Quilon, where I stayed with Mr. Vernece, Conservator of the Forest Department. Quilon is the Coilum of Marco Polo, and was once the greatest port on the Malabar coast. It was an emporium for pepper, Brazil wood, and ginger, the best kind of which was known till late in the middle ages as Columbino ginger. The canals about here were lined with the graceful *Cerbera odalum*, with white and fragrant flowers, and rounded green fruits somewhat similar to a mango. The fruits are extremely poisonous, and every year cases of severe illness, and sometimes death, are reported to the medical officers as a consequence of eating them.

During the journey from Quilon to Trevandrum I passed the little town of Anjengo, where was born Robert Orme, the historian, and where lived Eliza Draper, the lady of Sterne's affections. Lemon-grass oil usually bears a label stating that it comes from this town, but I have before mentioned that it is obtained from the lower slopes of the hills. At Trevandrum my host was Mr. Mateer, of the London Mission, who have interested himself in introducing economic plants into the country, and who has a veritable botanic garden around his house, laid out with great taste, and containing some valuable plants.

At Neyoor, a few miles from Cape Comorin, a very important market is held every week, and it appears to be the centre of the laurel-nut trade. The laurel-nut tree, or Alexandrian laurel (*Catophyllum inophyllum*), is extensively grown in this part of Travancore, and hundred-weights of the round green fruits were being brought into Neyoor by women. A few hours after collection they shrivel and turn black, when they are cracked open, and the white kernels are dried in the sun. The kernels are pressed in mills, similar to those used for making castor-oil, and yield a thick greenish-yellow oil, having an odour of melilot, and used for rheumatism and for burning. The price of this oil is about half that of coconut oil, and fetches a high price in Burma. Laurel-nut oil, called *Puna-Kai*, brings in a revenue of about 60,000 rupees a year to the Travancore Government.

After a visit to the head-quarters of the London Mission at Nagercoil, I continued my journey to Tinnevely, then entered the Aramboly pass, and crossed the Travancore frontier into British territory. —*Chemist and Druggist*.

PINE-APPLES.—A correspondent writing of the cultivation of the above in the West Indies, states that "When grown for fibre the plants should be set in a shady situation inside a wall on the side of a house where the sun cannot get at them. The new growths attain a length of 2 feet in about ten days, when they are cut and soaked in water for several days. They are then spread out on boards and scraped with broken earthenware to remove the skin. If the plants are grown for the sake of their fruits they are planted in the full glare of the sun, when the leaves attain only a few inches in length. Pines bloom about April, and are ready for picking about September." —*Gardener's Chronicle*.

"REVIEW OF THE PLANTING AND AGRICULTURAL INDUSTRIES OF CEYLON."—Mr. John Ferguson has reprinted in the form of a small octavo volume a series of articles that appeared in the *Tropical Agriculturist* and in the *Cult. H. Press*. The papers refer to the staple products of the Island—Tea, Coffee, Cacao, Cinchona bark, Rubber, and other economic plants. We are pleased to get so much authentic information in so handy and accessible a form; and those who, like ourselves, have frequent occasion to consult work on tropical cultivation, will acknowledge that this little volume is a boon to them. It may be had from Messrs. John Hadden & Co., 3, Beaufort Street, E. C.—*Ibid*.

Correspondence.

To the Editor.

TREATING LEAF DISEASE AND OTHER EVILS THROUGH THE BARK.

Coonoor, 6th February 1889.

DEAR SIR,—Has any planter yet tried treatment of the bark for the leaf-disease in coffee. I have a few orange trees which 18 months ago commenced withering. By the advice of a friend (Mr. Nather) I coated the bark with a composition, made up of fresh cow dung, ashes and common salt, and sprinkled the leaves (which were covered with a whitish blight) with a weaker solution; in a few weeks the trees began to recover, the bark to grow rapidly, cankered portions scale off, new leaves came out, and the fruit afterwards produced was the finest I have ever seen on these hills. Since then I have tried the solution on tea for red spider, bug and lichen, with splendid results. The solution helps the formation of new bark and enables the bush to throw off its enemies. For lichen the solution is simply magnificent.

Owing to continual hard cutting of tea, and the exposure of the bark, the bark becomes hardened and lichen readily takes root. This lichen continues to grow and defies attempts to rub it off (to say nothing of the cost of rubbing) till it finally kills the tree. A few applications of the solution cleans the bark quite and causes dead-looking parts to burst out in bud.

But tally ho! be patient of results. Don't expect to conquer in 3 weeks the enemies you have allowed to grow for years, for quarter of a century perhaps!

I see shade is advocated for coffee leaf-disease; and it has just struck me that this composition is equal to shade, while it adds to and does not take nutriment from the already exhausted soil. Make the composition thick and it will stick on for 12 months, at least it does with a rainfall of 50 inches.

I have examined coffee suffering with leaf-disease and find that the bark is almost quite gone. I do not want to say that the dead bark results in leaf-disease, on the contrary the obverse is more likely to be true, but I think that anything that will cause renewal of the bark will help the tree to throw off its enemies.

I am not a chemist nor yet a scientist, so the idea I have formed that chlorine gas is liberated from the composition may be wrong, but let some learned planter work it out for us! Chlorine gas is inimical to animal life and will certainly not agree with the constitution of Mr. Bug or Mr. Spider. Has anyone yet started the idea of an *indurated pan* at point of application of manure for years, to the coffee tree? Such a formation is well-known to the English armer, and the remedy he applies is deep ploughing. The remedy for the planter would be manure at another point and fork bottom of the pan.

T. B.

N. B.—Composition $\frac{1}{2}$ quart dung, $\frac{1}{2}$ quart ashes, $\frac{1}{2}$ ounce salt, water a sufficient quantity. Apply like lime wash with a brush.

[We have very little faith in treatment of coffee trees through the bark, and especially so for leaf-disease; and Dr. Trimen is good enough to give his opinion as follows on the above:—"It is well-known that bark, if injured, renews better under cover, but I never noticed the connection here spoken of between loss of bark and leaf-disease.

An agricultural quack who was in Ceylon some 6 or 7 years ago professed to be able to cure leaf-disease by carbolic acid applied to the stem of the coffee tree, believing that it would be 'absorbed' by the bark!"—Ed.]

DEFECTIVE COFFEE BERRIES.

Siddra Bunnoo Estate, Koppa, Mysore, 31st Jan. 1889.

DEAR SIR,—I should be very much obliged to you if you would give me your opinion on the sample of coffee I am today sending you. The berry, as you will see, has all the appearance of containing well-formed beans, but on opening the same, the inside seems to have rotted. On my estate this year I have a little of this kind of coffee, but only on parts of my tote that got some unusually early blossoming showers (early in February). Estates that early in February got from 1 to 2 inches of rain have a large proportion of this kind of coffee, which, as you will see, is quite worthless. It seems to be owing to the unusually early showers; but, if so, can you explain how the blossom must have set, the beans began to form, and yet the result be only an outside shell? Information on this subject from perhaps some of your numerous readers would greatly oblige.—Yours faithfully,

ROBERT BUCHANAN.

[The sample is of a dry withered cherry, which, when opened, proves to have no substance. Debility of bushes, no doubt, is the main cause, but we daresay Mr. Buchanan is right about the early, partial, forcing rains having to do with the abortive beans. Such coffee has however sometimes been plucked off bushes in Ceylon which have suffered from want of nutrition through soil being washed away, or from extreme drought when the ends of the primaries begin to die and the berries cease to grow, giving only a shell.—Ed.]

FOOD-STUFFS: KURAKKAN AND RICE.

Kandy, 14th February 1889.

SIR,—The relative nutritive powers of *kurakkan* and *rice* cannot be fairly judged by the appearance of the consumer. Whereas rice will make one fat, *kurakkan* or wheat will make one strong and will increase his weight. It is no wonder that a change of diet from rice to *kurakkan* causes dysentery and death. Similar results have followed from Tamil coolies using cooked *raw rice* in Wynaad. Tamils who are not used to European ways cannot entirely subsist on wheat. They say that unless they eat rice they are not satisfied. In the Central Province where there are Canarese coolies there is found *kurakkan* in the next market. They exchange for one measure of rice to two measures of *kurakkan*. It is to be noted that the Canary coolies consume about two measures or more of legumes every week in the shape of curries, whereas the Tamil coolies evince a strong partiality for dry fish, because their stomachs cannot digest legumes except in very small quantities. *Varagu* is one of the grains cultivated in Jaffna, ranking next to paddy with regard to the quantity produced. Persons who suffer from diabetes are recommended either to live on *wheat* or *varagu*.—Yours truly,

K. S. K. M. MURUGASUE.

THE CULTIVATION OF COFFEE UNDER SHADE IN CEYLON.

Haputale, 14th Feb. 1889.

DEAR SIR,—Just as Brazil was the immense cloud hanging over coffee planters, so China is the immense cloud hanging over Indian and Ceylon tea planters; and I think too much attention is not paid to this fact. We are told China is going, in fact *has begun*, to make an effort; and with her immense resources, climate, and knowledge of the tea-plant she can not only *command* the world'

markets but positively swamp them. With this in view we find Ceylon being hurried along on the tea-wave, with most of the coffee cut out, and the remaining fields slowly dying from neglect and disease. A most vital question now arises. Cannot coffee under new conditions, such as shade, change of seed, digging, limited areas under improved treatment—I say cannot coffee still remain an important product; or is it entirely to disappear?

With my experience in India and Ceylon I can confidently affirm that coffee, the most lucrative and simple product we know, can be cultivated with advantage and profit. Other countries have tried new methods and conditions and are reaping the reward. Coorg left the evergreen Ghaut forests and cultivated in deciduous bamboo country with planted shade. Mysore gave up their exhausted Munjarabad trees and planted Coorg coffee with improved shade. Both those districts are reaping their rewards.

I fear on the steep "Ghaut" estates in Ceylon the soil has been destroyed by weeding contractors and surface drains. It is common to say in Ceylon that surface drains save wash. Yes, but they do not save soil, because where does the soil go to that is taken out of the drains? It is passed down and finds its way to the next drain and the next, and so on. The system was all right so long as coffee paid its way; but now it is different. What is wanted is land on the foot-hills, on the spurs and hollows below the mountains, or on flat land. I mention two estates as examples—Roseberry in Haputale, and Lankabarony in Balangoda. These are but samples. I maintain, that if shade such as *Ficus glomerata*, *Ficus indica*, jak, sau tree (*Albizia stipulata*), and other trees, were planted, and digging and manuring incorporated with weeding, and small acreages thoroughly cultivated, then green-bug and leaf-disease could be combated successfully. There are many in Ceylon who feel this to be true; but who among them have first the capital, and second the faith? First the means, second the faith, third the knowledge, fourth the perseverance and energy. Some day China will snuff out your decreasing yields and falling market. Lucky will be the man then, who has his eggs in another basket.

W. A. TYTLER.

[All this is worthy of consideration, although it can yield but small comfort to possessors of old coffee land. We suppose conditions of climate, especially long periods of drought, must account for shade being so great a success in Southern India and so dubious a benefit in Ceylon. It became almost articles of religion amongst Ceylon planters to avoid low positions and shade in coffee culture. Our correspondent, therefore, is correct in desirating much faith and spare capital as prerequisites for the experiments he recommends. At the same time there are the undoubted facts that coffee culture is still a success in Mysore and Coorg, and that in Uva similar conditions ought even now to be found.—Ed.]

THE LOSSES ON CEYLON TEA IN LONDON:
MR. DEANE'S FIGURES.

Kintyre, Maskeliya, 20th Feb. 1889.

SIR,—In your report of what I said at the Planters' Association meeting, it should read "that he had never averaged a loss of over 2 per cent," the amount of tea also should read over half a million pounds, and further down it should read "He had sometimes had 280 and 290 when he had shipped in half-chests"—and last of all "and varied from 2 oz. to 8 oz. according to the gross tare of his packages." These small alterations alter

the sense considerably. My belief is that the first steps that should be taken to reduce loss in weight would be to get the draft allowance altered to say 1 lb. per cent, instead of, as at present, at 1 lb. per package. This latter charge tells most heavily on those estates already handicapped by being far from a cart-road, who have on account of transport to use half-chests, which at once makes their loss in weight a trifle over 2 per cent. With reference to the remaining loss in weight, which we will say averages at present from 80 to 90 per cent. I notice that, however large the break, the proportion remains the same, which should not be the case; as it is obvious that if the loss is only caused by fair sampling, a large break say of 50 packages would only require the same number of samples to be distributed as a break of 20 packages. For instance, the last invoice I sold consisted of 186 packages, and the draft allowance was 186 lb. The balance loss was 109 lb., this being presumably necessary for sampling purposes. Another invoice (containing the same number, viz., 4 breaks) consisting of 84 packages had the usual draft allowance of 84 lb. and the balance loss 12 lb.

96 lb.

so that in the one case, while 12 lb. was only considered necessary for samples on the 4 breaks, in the other case we have a loss of 109 lb. for the 4 breaks—or say 3 lb. per break, against 27 lb. per break. The morality of the Lane evidently being "the larger the invoice the more scope for plunder," provided the average loss in weight is nothing out of common.—Yours, &c.,

H. D. DEANE.

[Our reporter failed to catch what Mr. Deane said, and asked him for his exact figures and words after the meeting was over, but being anxious to get away Mr. Deane could not stay to give him the required information.—Ed.]

"BLUE" AND "GREEN" GRAM: A
DANIEL TO THE RESCUE.

Colombo, 22nd February 1889.

SIR,—I hasten to correct an error with regard to "ulundu" appearing in the February number of the *Tropical Agriculturist*.

Your correspondent Mr. Oinna Tamby writes that "uluntu" is blue in colour, and you correcting him add in a footnote that you have always known "blue gram" as "green gram." Allow me to say that the pea is neither blue nor green but black, and is called "black gram." Green gram is the "mun" of the Sinhalese and "payaru" of the Tamils. There is a thing known as Daltonism or colour blindness, and we must not suppose that Editors and their correspondents may not be altogether free from this disease.—Yours faithfully,
ABA.

"RANDOM THOUGHTS ABOUT TEA."—We call attention to a clever and amusing contribution under this heading on another page, which ought to be an especially curious production in the eyes of lady housekeepers inasmuch as it comes from a rather confirmed bachelor! Probably however, the old home, rather than colonial experiences deserve the credit of the sensible remarks offered to housewives and all others interested on the proper way of "making" and "keeping" their tea. The author does not insist on "copyright," to that the Planters' Association and Chamber of Commerce will be at liberty to reprint the valuable advice and circulate it with boxes of Ceylon tea far and wide!

RANDOM THOUGHTS ABOUT TEA.

HINTS FOR HOUSEWIVES FROM A BACHELOR!

HINTS ALSO TO PRODUCERS AND DEALERS IN TEA.

(Written in a long-arm chair.)

The late Dean of Bangor was assuredly not far wrong, when, a few years ago, he fearlessly asserted there was "Death in the Tea-pot,"—the hubbub made about this *really kind* remark no doubt tended to shorten the worthy Dean's days.

If only from a "Tea" point of view, Carlyle's sneering assertion that the population of the United Kingdom consisted of so many millions "mostly fools" seems not altogether to have been undeserved. His equally cynical prayer to the "great god of shoddy," too, seems also very much to the point.

That the Chelsea philosopher had any sufficiently good grounds for his sweeping contempt for and condemnation of the average brains of his fellow-creatures may be open to question, but *from a tea point of view at all events* he was not far wrong.

Why is it that nothing has ever been done by the leading Indian and Ceylon Tea Associations to attempt to teach not only the people of the United Kingdom but the people of the world, how best to preserve the good qualities of the tea they may buy periodically, and seeing how very little the art is understood, how best to prepare it for the table? How many people still use the quaint old tea caddies left to them as heirlooms by their grandmothers. The *boiling* of the leaves (as one would cook a cabbage) is still persevered in! To foster the taste for our RICH and DELICATE Ceylon teas in all countries some education would seem to be necessary, seeing that the methods now in vogue for *keeping and making tea* in the largest tea-consuming country in the world are so very much at fault.

HOW TO BUY AND "PRESERVE" TEA FOR MONTHS.

The immense strides made in the consumption of strong (because pure) teas from India and Ceylon during the past decade may shortly react against any further development (if not actually to throw it back), if some steps are not taken to assist the *brains* of the millions now using these teas in preference to the wishy-washy because impure China teas. These latter have assuredly but too often been subjected to the palates of the Chinese themselves *before* they were refined and sent to the "foreigners"! Not much harm, therefore, could come upon those who boiled and stewed such worthless teas, in order to extract from them the little strength they retained. Today however, everything is changed. India and Ceylon, aided by tea machinery and railways and the Suez Canal, are now enabled to put their teas in various markets of the world in a few weeks, where formerly it took *months*. *Really good* China (virgin) tea can, I know, be kept *intact* like wine *for years* with considerable advantage; the same it is well-known is the case with coffee. This is done today by the few who can afford to buy tea and store it as they would port wine, but they are very few. Indian and Ceylon teas, it is stated, will not keep for an indefinite time;—this may be however—and I for one think it is—open to question, but it is *not necessary* that they should be kept an indefinite time. It is very necessary, however, that these teas should be kept, not in open caddies or drawers but in airtight canisters. I put them in the plural, for no wise housewife would dream of putting all her summer-prepared plum-jam in *one huge pot*; and tea, to be carefully preserved, should be treated in a similar commonsense fashion, even to the gumming over of the junction (not wider than a crown-piece) of the almost mathematically correct fitting of the round tin tops to the canisters, which before we should be *well seasoned*. This can be best done by subjecting them a few times to hot water in which *spent* tea leaves have been *boiled*.

I have been speaking so far of tea bought in chests or half-chests reaching the consumer with the lead *intact*. If the lead is not intact, then the teas will most probably have absorbed some moisture. Anyway the risk of the tea having done so should be at once

guarded against by the careful housewife who means to keep the tea for *months*. (Here according to *present* practice would come in aptly and appropriately Carlyle's spiteful statement *re* "fools.") She would seize an opportunity, after her half-dozen or dozen *seasoned* canisters were ready and placed near the fire, to throw out upon a large cotton sheet the *whole of the tea*, the aroma of which she wished to "preserve." Turning the tea over for an hour or so before a glowing kitchen-fire, the moisture would soon fly up the chimney, and then the filling of the warm airtight canisters would begin in earnest—say canisters containing about 8 lb. each, which when once seasoned and used would last from one generation to another; so the *expense* could not be an objection. (The *trouble* might be one insuperable objection, and here Carlyle's prayer to the "great god of shoddy" might come in.) Let English wives bestow as much trouble upon the tea *they buy* as their husbands do upon the wines *they buy*, and we should hear less about "bad tea to keep," assuming, of course, that really good tea was purchased. As a rule the middle classes buy the *dearer* teas; the lower classes would also do the same if they could get them at a fair price, but they cannot. The richer the people are the poorer the teas they buy as a rule: this is no empty statement. I will now proceed to point out how CONSUMERS OF BRITISH-GROWN TEAS would be doing themselves and others, many of whom may be engaged in *tea-growing*, A GOOD TURN by listening to a few words more upon *tea-making*—a department so distinctly held to be the "ladies' own" that they would keenly resent any attempt that should be made tooust them out of it, as in my opinion too many of them richly deserve to be.

THRIFT VERSUS PRUDENCE.

With regard to "thrift," &c.—"Thrift" generally accepted to be one of the great virtues becomes a very DEMON when looked down upon and *prudently* considered in the many millions of teapots, now the pride of every English and Australian housewife, and soon it is to be hoped to become equally the pride of every continental one, for, aided by countless British matrons it is due to the *positively harmful* exercise of this *virtue* at the present time that is unquestionably not only arresting the progress of the grandest crusade of modern time, ever engaged in waging war with alcohol, but is actually threatening to block the further progress of the vast battalions of tea until now unceasingly moving to the attack in front—an advance that has hitherto, in fact, been by "leaps and bounds"—and this too at a time when the cost of marshalling such a tremendous force is not one-half what it was twenty years ago, when tea was selling at about double its present (now almost unremunerative) price. Pamphlets printed in English, French, German, and Italian, should by the agency of the countless church and chapel and other temperance societies in the countries mentioned be *sown broadcast* and (wherever, of course, Indian and Ceylon teas were being pushed) giving brief directions for *preserving tea until it is used*, and giving also equally brief and plain instructions for *making it*—of which more anon—ending up by giving extracts from the opinions of the leading London and Continental physicians proving that ill-considered lengthened infusions, boiling and stewing of the leaves, were calculated to work harm *eventually* to the drinkers. Such cautions, carefully worded, should no more alarm the people than if they were told that drinking raw immature spirits would be harmful, while mature spirits, well diluted, might if taken in moderation probably have a beneficial effect. Many doctors at home are now forbidding the drinking of tea to many of their fair patients, because by their unfair treatment of the fragrant leaf they have brought themselves into such a state that they can no longer take it with that benefit they would *always* have enjoyed had they but prepared it from the first in a commonsense sort of way.

HOW TO INFUSE AND DRINK TEA.

To make tea:—1. The water to be boiled should be *fresh and pure*.

2. It should be boiled in a perfectly clean kettle; until steam is emitted through the kettle-spout the water should not be deemed to be boiling—*most important is this.*

3. The tea-pot to receive this water should first be made hot; then the fresh boiling water should be poured into it, and then—and not until then—the tea should be strewn on the top of the water, leaving the steam to saturate it, thus causing it slowly to sink—in this way the tea leaves will not be scalded and the fragrance will be kept at its best.

4. Maximum time of infusion to be five minutes, but better four or three minutes, *adding tea in proportion.* The sooner the water is availed of after boiling the better.

5. With such rapid infusions one can well afford to be generous with the tea, it should not be stinted. This is, after all, as recorded by travellers in China and Japan, *the great secret of good tea making.*

6. As soon as the time fixed upon has elapsed the infusion (*not decoction*) should be decanted into another tea-pot, *first made hot for its reception.* Prepared in this way tea will remain hot and pleasant and wholesome for more than double the time than if cold tea-pots were employed—this stands to reason—and if the tea-cups are heated or warmed so much the better.

7. *Lastly and most important.*—Even newly imported teas infused in this way cannot injure the *weakest stomach.* Instantly, for mercy's sake, treat the spent tea leaves as so much *poison* and cast them aside. To give them even to a beggar to infuse a second time would be cruelty indeed, not to speak of the feelings of the "POOR PLANTER."

TRY IT FOR YOURSELVES, but deal not niggardly with the OREAM.

TEA (especially British-grown tea), having in its manufacture been subjected to very great heat and afterwards packed, *still heated*, in well-soldered lead-lined cases, thus rendering them, practically, hermetically sealed, is, nevertheless, owing to its extreme tendency to absorb moisture, and foreign flavors, carefully packed away by itself in holds of steamers, so that it may, in these respects, receive no damage on the voyage home. On its arrival there it is treated in a similar sensible fashion in the Great Bonded Warehouses prepared specially to receive it.

The good housewife (?) in her innocent way lets it lie for days may even weeks at a time in an open or half open state in her pantry next to hams, bacon, cheese, spices, &c. &c.!

In time the elevation at which tea is grown will be asked for. The higher it is grown the better it is for invalids: vide statements published in the *Ceylon Observer* about a year ago by the Analyst Mr. John Hughes: *Less "tannin"* being the reason of this.

Buyers of tea in fact will no doubt eventually become as fastidious as buyers of wines.

The better the class of tea is the less of it is required to a good infusion. Given good tea say at 2s 6d per lb., what is the price per cup? About 1d per cup, I should think. Really good tea is now so to speak "dirt cheap"!!

Australian squatters in the bush—what can they know about pure tea? They have for years had to be content with *China* (li?) tea: a good deal of which has perhaps already paid the toll of a first *blush* of an infusion in some swell *China tea-drinking saloon.* They soon found out that to extract the shadow of a flavor they had to boil the leaves in a *pannikin* adding more tea and more water and rarely brewing freshly. They would be savages indeed to adopt this vile plan in dealing with pure and strong and still delicate (*if carefully infused*) Ceylon virgin teas.

In conclusion and in regard to PURE TEA. I would say ADVANCE not only AUSTRALIA, but every other country, including those described by the famishing boy, at the mizen-top, in that never-to-be forgotten "Split Pea" song of Thackeray's, viz., "North and South Ameriky."—I am, yours truly, D. L. G.

Since writing the above, my attention has been drawn to the result of experiments by Dr. Hale White of Guy's Hospital on the quantity of tannin extracted from tea by short and long infusion, and also as to the percentage of tannin in different teas. The result

is what might have been expected, as tannin is very soluble in hot water, and nobody who has drunk Assam or any other Indian tea and the choicest China would require any scientific analysis to tell him which would be most likely to disorder the stomach and nerves. It is of course true that any tea which has been infused for some time has a more marked effect than tea which has been infused a shorter time: but this difference is due not so much to the tannin as to strength. The moral, therefore, for persons with weak digestion is to select the best China tea they can get, and not to drink it strong; to be satisfied with flavor and not to desire intoxication. They must be particularly careful, also, to see that the tea is not blended.

After ten years *tanning* of their stomachs no wonder of a revolt against East India teas should take place. Many medical men denounce today East India teas as positively injurious.

The attention of Dr. Hale White should be called to our more delicate highgrown Ceylon teas and also to the importance of proper infusion, so as to get him and other medical authorities to remove their ban, at least, against 'Ceylon' as compared even with the poorest China.

BADLY WANTED.—The World's MODEL TEA CANISTER, for daily use (say 1 and 2 lb.), lettered in black on bronze ground now so beautifully and cheaply done on tin, and so always readable as long as the canister lasts, on its four sides with brief instructions in the four principal European languages. —Yours, D. L. G.

7TH FEB. 1889.

P.S.—HOW THE "MILLION" SHOULD BUY TEA.

These smaller canisters (after being first SEASONED) to be replenished from the larger canisters by those who may buy their Tea in chests; and to be also availed of by the buyers of a pound or two by being SENT TO THE GROCER to be filled from his TEA BINS—a la "Wines from the Wood," thus saving the fragrance of the TEAS through the streets en route HOME. Damp railways, damp omnibuses, and damp streets simply murder TEA packed only in paper in damp climates. About a year ago I made my brother in LANCASHIRE—a damp enough spot as probably everyone knows—a present of a half-chest of Imboolpitta broken pekoe and at my suggestion it was placed in 8 lb. seasoned canisters. When afterwards the GREAT ROW about Tea in the LONDON "Standard" was going on, my brother wrote to me spontaneously to say that he had no complaints to make about his Tea. Each canister as it was opened up being equal to if not superior to the preceding one. Of course the canisters were stored in a DRY place in the kitchen. D. L. G.

TUNISIAN DATES AND THE PRODUCE OF THE CORK FORESTS.

The British Consul at Tunis describes the Dates of that country as much superior to those produced in any other part; "and yet," he says, "they are little known in England. Their great abundance and their cheapness make it difficult to understand why a large commerce is not carried on in this fruit. They are the produce of the extensive oases in the south of Tunis, those of Jerid and Tuzeur being the most extensive. The Date Palm grows all over the Regency, but the few trees met with in the north do not ripen their fruit from want of the requisite heat. Even the Palm Trees of the oasis of Gabes, situated in lat. 34°, produce an indifferent fruit, owing to its proximity to the sea, which reduces the temperature of the air. The Arab saying is that the Date Palm loves to have its feet in the water and its head in the fire, which graphically expresses the craving of this tree for moisture and heat. The best quality of Date is that known by the name of Degla, which is large, tender, very sweet, with skin unwrinkled, and of a golden brown. These are exported chiefly to France. In the market at Tunis this quality sells retail at 3d. a pound.

As steamers coming direct for Liverpool call at Gabes for Alfa, it is surprising that a more extensive trade is not carried on in this fruit. It constitutes the principal food of the Arabs, the Oasis of Tuzeur alone producing annually about 16,000,000 lb. The average annual exportation does not exceed a value of £12,000."

Referring to the Cork forests of Tunis, it is stated that these forests, situated in the north, near the Algerian frontier, have only recently been taken in hand by the government. The surface covered by the forests amounts to 300,000 acres, and forms part of the State domain. The sale of trees last year, it is said, realised as much as £15,000. The duty formerly imposed on this product has just been removed. In the course of a few years a considerable revenue will be derived from the cork, which, as the trees have only recently been begun to be stripped of the virgin bark is not yet of mercantile value.—*Gardeners' Chronicle.*

THE CEYLON COCONUT OIL V. COCHIN OIL.

The School of Agriculture, 28th January.

TO THE EDITOR OF THE "EXAMINER."

DEAR SIR,—It is a known fact that Cochin oil always fetches a higher price than Ceylon oil in the London market. Referring to the mercantile telegrams just published, we note Ceylon oil at £27 5s. and Cochin oil at £30. It is clear, therefore, that Cochin oil is far superior to Ceylon oil, and it will be interesting to account for this superior quality.

During a conversation I had, some time ago, with a gentleman from Malabar, we happened to talk about this subject, and I gathered that this difference in the quality of the oil is owing to the difference in the methods of drying copperah for extracting the oil. In Malabar, copperah is prepared by drying the fruit whole with the husk, over a fire. For this purpose, big pandals have been constructed in which coconuts are stored after they are plucked and smoked by burning coconut leaves, husks, &c., underneath. After the fruits have been smoked in this way for about three months, the water inside the fruit dries up and the kernel is converted into copperah. The husks of the fruits are then removed and the copperah is extracted by the usual process of splitting the shell. A few coconuts which are not properly dried might be found which of course when split are carefully dried in the sun.

Coconuts dried over fire in the above way are called in Sinhalese "kottapol," and a few such fruits are sometimes found in native houses. They are used for eating, and they are dried by being kept on the wooden structure or pandal over the fire place in the kitchen.

It can now be clearly seen, that the oil extracted from copperah dried according to the Malabar method, must necessarily be cleaner and far superior in quality to the Ceylon oil which, as everybody knows, is extracted from copperah prepared by splitting the coconuts and drying the kernels in the sun or over fire.

I hope our coconut growers will gather some useful hints from this letter regarding the method of drying copperah.—Yours truly,

H. D. LEWIS.

[This is certainly the first time we have seen this explanation of the superiority of Cochin oil. Have any of our readers ever heard of the method of making copperah described above? We were told that the higher price of Cochin oil was due partly to its being richer stearin, and partly to commercial jugglery; but we did not know that the water was allowed to be absorbed by the kernel.—Ed. Ex.]

[We have always understood that the superiority of Cochin oil was due to the fact that in the long spells of dry weather all copperah there is sun-dried, while in our moist climate it is fired and smoked.—Ed. T. A.]

PLANTING PRODUCTS.

(From the Thirty-fifth Annual Report of the Ceylon

Planters' Association, held 16th Feb. 1889.)

Coffee.—Your Committee regrets that it has little to say about this product. Green Bug still asserts its sway, though, in some of the districts threatened, it has not made the headway expected. There are still fields of coffee in Uva, Diimbula and Dikoya which will repay care and cultivation. Your Committee learns that the cultivation of coffee raised from Coorg seed is now being tried in some districts, and trusts that the attempt may prove successful. The exports for the year ending 31st December 1888 were 137,793 cwt., value R7,729,241, as against 179,490 cwt., value R11,428,945, for the year ending 31st December, 1887.

Tea.—The cultivation of this product has made extraordinary strides during the past year. The area under plant is estimated to be 187,000 acres and is still being extended. Your Committee regrets to have to record a considerable fall in price for this staple product during the year, the average being 11½d per lb against 1s 1½d per lb for the previous year. It is to be hoped, however, that with the opening out of new markets and the falling-off in the supply of China tea to the London market the downward tendency of prices will be stayed. Still, as was noted last year, the prices for Ceylon tea as compared with Indian tea are satisfactory, while the reported falling-off in the quality of the tea shipped may be accounted for by the severe drought early in the year. Your Committee observes with pleasure that markets other than the United Kingdom have taken 869,681½ lb. The exports for the year ending 31st December 1888 were 23,820,472 lb, value R12,624,850, as against 13,834,057 lb, value R8,300,434, for the year ending 31st December, 1887.

Cinchona.—The falling-off in exports noticed by your Committee in last year's report still continues, the exports during 1888 being 630,250 lb less than during 1887. There can be no doubt that there will be a much larger falling-off in 1889. The exports for the year ending 31st December 1888 were 12,482,817 lb, value R1,804,011 as against 13,113,067 lb, value R2,440,212 for the year ending 31st December, 1887.

Cacao.—The drought of 1888 following that of 1887 has told on the exports and condition of the trees, though your Committee reports a continued cessation of the attacks of *Helopeltis*. The cultivation is no doubt a remunerative and cheap one when the soil and rainfall are favorable. The exports for the year ending 31st December 1888 were 12,231 cwt, value R580,975 as against 17,460 cwt, value R838,097 for the year ending 31st December, 1887.

Cardamoms.—The cultivation of this product has recently been much less remunerative than formerly. There has accordingly been a considerable decrease in the cultivated area causing a heavy falling-off in shipments. The exports for the year ending 31st December, 1888, were 281,925 lb value R285,843 as against 384,015 lb and 55 packages value R416,450 for the year ending 31st December, 1888.

Tobacco.—It is with pleasure your Committee reports serious attention being paid to this profitable product, and from the experiments made and results obtained it appears that good prospects can reasonably be held out for the success of this new industry when the intelligence, energy, and capital of European planters are brought to bear on its cultivation and manufacture. The exports of unmanufactured tobacco for the year ending 31st December 1888 were 57,282 cwt, value R1,236,307.

Liberian Coffee.—The exports for the year ending 31st December, 1888, were 1,316 cwt., value R59,255 against 3,419 cwt., value R153,897 for the year ending 31st December, 1887.

Cotton.—Your Committee is glad to observe that a stimulus is being given to the cultivation of Cotton, which though hitherto confined to natives may assume larger proportions hereafter.

FELLING TREES.—Hitherto machines for felling trees have been driven by steam power, but this is sometimes inconvenient, especially in thick woods, and electric power has recently been adopted in the Galician forests. Usually in such machines the trunk is sawn, but in this case it is drilled. When the wood is of a soft nature the drill has a sweeping motion and cuts into the trunk by means of cutting edges on its sides. The drill is actuated by an electric motor mounted on a carriage, which is brought up close to the tree and shackled to it. The motor is capable of turning round its vertical axis; and the drill is geared to it in such a manner that it can turn through an arc of a circle and make a sweeping cut into the trunk. The first cut made, the drill is advanced a few inches and another section of the wood removed in the same way until the trunk is half severed. It is then clamped to keep the cut from closing, and the operation continued until it would be unsafe to go on. The remainder is finished by a handsaw or an axe. The current is conveyed to the motor by insulated leads brought through the forest from a generator placed in some convenient site.—*O. Mail.*

WYNAAD NOTES, Feb. 12th.—Our hot weather has set in betimes, or rather before time, and the days are exceedingly sultry, though we are lucky in still having deliciously cool nights and mornings. There has been an unusually long spell without rain. The last shower, I think, fell on the 7th of December, and there are no signs at present of any more coming, so that, as you may suppose, the country begins to look terribly backward, and we have had very little land wind to parch it. The weather-wise say that early showers may be expected, and should they prove true prophets, and should the fall be sufficient, we have every prospect of fine crops in the coming season. And really we deserve some such encouragement, for "Times," so far as the last crops are concerned, have been very hard with us. We hear most dismal accounts from all sides, not only of the disastrous shortness of crops, but of the bad quality of the coffee and that in many cases it never ripened at all and had to be stripped green off the trees in December. It is surprising that, with so much uncertainty attending coffee, more is not done in Wynaad in the cultivation of tea. We know that it thrives magnificently, and that the one plantation in the District which is being regularly worked is paying handsomely, and that large new openings will be the probable result of this present success. The secret possibly is the want of capital. If we were like our brethren in Ceylon, whose enterprises are backed up by the large Banking Interests which, it is well known, rule planting affairs in that spicy Isle, we should probably alter the appearance of Wynaad in a very few years, and add comfortably to our present limited incomes. But to start tea profitably requires considerable acreage under cultivation, and a large outlay in the erection of factories and machinery. Few of us at present are in a position to tackle these difficulties singlehanded, and so we drift on and yearn for possibilities as yet impossible to us. If any one were inclined to invest capital in a planting venture, tea would be, I imagine, as safe as anything, and there is no doubt that the soil and climate of Wynaad are exceedingly suitable to the growth and produce of that industry. I hear that very large extensions are shortly to be made in the Ouchterlony Valley for tea. We were much interested in a paragraph which lately appeared in your columns anent the adulteration of coffee. It is a great pity that the matter is not more urgently pressed upon the notice of Government by planters and others. It is a crying evil, which calls for strict redress; and it is wonderful that, in this importunate age, the subject is not more persistently kept before the consideration of the proper authorities.—*Madras Times.*

THE TROPICAL AGRICULTURIST MONTHLY.

Vol. VIII.]

COLOMBO, APRIL 1ST, 1889.

[No. 10.]

SALTPANS RESIDUUM, SALT AND ITS BY-PRODUCTS AS MANURES.

EXCEPT in the case of coconuts and that not to any large extent, the manurial value of salt and its by-products is not, we believe high. Salt is no doubt good for killing white-ants and weeds, and its

associated products in "bitterns"—Glauber's salts or the sulphate of soda and Epsom salts or the sulphate of magnesia, especially the latter,—may be good as antidotes of fungi. But we question whether the fertilizing properties of salt are so great as some imagine. The late Mr. David Wilson raised the whole question, and the subsidiary one of denaturalizing salt (in the interests of the monopoly revenue which cannot be dispensed with) was settled in the negative, the late Dr. Charsley showing, that, even when adulterated with nightsoil, salt could be restored in pure clean crystals by the use of charcoal. If salt is of real manurial value, we repeat what we said once before, that it exists largely in kainit, which, is, admitted free here as a manure. The potash which is associated with common salt in this mineral is undoubtedly beneficial to tea, so that, if kainit could be obtained at a moderate price, it would meet the wants of those who believe in the valuable manurial qualities of chloride of sodium. That "salt is good" we know on the highest authority, but its valuable properties as a component in the food of man and animals do not seem to be so apparent in the promotion of vegetable life. On the other hand salt can be seriously injurious and even fatal to vegetable life. During the specially inclement south-west monsoon of 1882, we had proof, as we ventured to assert at the time and still believe, of the mischief which salt in excess in the atmosphere can work on vegetation. No one can doubt that on the wings of the monsoon winds, and in the globules of moisture with which they are laden, some portions of saline matter captured from the

ocean spray are diffused. In such ordinary proportion the presence of the great antiseptic and purifying substance is valuable. But like other good things, such as fire and water and even the blessed sunshine, salt in excess is capable of becoming a curse instead of a blessing. The records of meteorology contain accounts of salt storms which have inflicted great injury on vegetation, in some cases fatal injury on orchard and forest trees. The stems and limbs of trees exposed to this destructive agency have swelled and festered after the fashion of a diseased human limb. With these facts within our knowledge, we did not hesitate to express the conviction that in the course of the specially inclement south-west monsoon of 1882, when it seemed as if the wind and rain increased in force and quantity day by day, salt storms reached and affected vegetation growing on the higher mountain regions of the island. We did not hear of any special effect on coffee in addition to the effects of the chronic fungous disease, and tea did not suffer much, although the smallpox-like spots which marked the leaves of such exotics as cinchona and the eucalypti created alarm by spreading in some cases to the tea leaves. But it was on the tall, unprotected stems of the Australian "gum" trees, especially the blue gum, that the storms carrying excess of saline matter, we believe, when specially violent and long-continued, told with chief virulence. The stems, at various altitudes, swelled and bulged out, the skin cracked and blackened, the portions of the trees above the swelled part put on a sickly appearance, or died, and there was an instinctive attempt at renewed existence in the shape of the curious primitive foliage coming out below the diseased part.

Mr. J. Mackenzie, a Nilgiri planter, who is a subscriber to the *Tropical Agriculturist*, had seen this theory of ours, and seems to have arrived at the conclusion that what was evil in excess must be specially beneficial in moderation. Accordingly we are in possession, almost simultaneously, of the opinion of a former Haputale planter that exposure to sea breezes is likely to prevent the success of tea in the more eastern portions of Uva and of Mr. Mackenzie's opinion, imparted to the Madras Government, that the superiority of the Ceylon tea, which he admits, is due to the presence of salt diffused in our atmosphere. He, therefore, suggests that the residuary matter in salt "bitterns" would be a valuable application to tea in the Madras Presidency. This suggestion, which Mr. Mackenzie seems to have taken no step to carry practically into effect, although he was offered the chance, led to a most interesting correspondence, which has reached us from the Madras Government. Mr. Bliss, the very able Commissioner of Salt Revenue, on

being referred to, quoted Dr. Ratton's valuable Handbook of Salt (a mine of useful information on the subject) showing that from the chemical constituents of the residual matter left after the concretion of salt, such substances if applied directly to tea were likely to have not beneficial but deadly effects. Various opinions were elicited, generally to the effect that the only really valuable constituent of salt residuum was potash, the expense of eliminating which was prohibitory. Costly refrigerators would be necessary. Finally Messrs. Hall, Wilson & Co. of Cocanada stated their intention, with the sanction of Government, to give a full trial to the preparation of the by-products of salt, in connection with the manufacture of the main product. Government are also ready to facilitate experiments for obtaining gypsum (of considerable value as a manure) and magnesium sulphate from the bitterns and the condensers. We may, therefore, hear more about the value of salt and its by-products as manures. Meantime we quote the main portions of the paper on the subject which has reached us from the Government of Madras. First comes Mr. Mackenzie's curious letter, in which he states:—

You are doubtless aware that tea planters in India are unable to compete with the planters of Ceylon as regards the quality and the quantity of tea produced as evidenced by the very high prices commanded in the market by Ceylon teas. In explanation of this generally accepted fact, planting authorities have come to the conclusion that the climate of Ceylon must be unusually favourable for the cultivation of tea. After consideration I venture to say that I believe I can account for this advantage enjoyed by Ceylon as follows. The sea-breezes from surrounding ocean play freely over the whole of the island, so much so indeed that many accounted for the late disease of the *Eucalyptus globulus* trees in Ceylon as being produced by the excessive saline deposits carried over the island by the monsoon winds.* You are well aware that these saline particles, latent in the ocean breezes, consist of ordinary salt, and that salt is chiefly composed of chloride and various salts of soda. Chloride of sodium and salts of soda, you are also aware, are next in importance to potash and phosphoric acid in the composition of the tea leaf. The superiority then of Ceylon teas I attribute to the presence of these wind-borne saline deposits, and if planters in India could in any way obtain salt as manure, the production of tea in India would be immensely improved both as regards quantity and quality. I have the honor to ask whether there is any deposit or scum of the salt-pans which, useless in a culinary sense, might not be utilised as manure. With regard to using the ordinary culinary salt as a manure, of course the price of that article is utterly prohibitive. I have further the honor to request whether you will be pleased to give this suggestion consideration and a fair trial. If a quantity of useless deposit from the salt-pans was supplied to me at a nominal rate, I should be most happy to give it a careful trial, and I do not wish this suggestion to be made public until a trial has been given it. I beg to invite your attention to a letter I am addressing to the *Madras Mail* on "Functional exhaustion of plant life."

Mr. Bliss, the Salt Commissioner, on being referred to, remarked:—

The concentrated residual brine (better known as "mother liquor" or "bitterns") left in the pans after the manufacture of salt would not, in my opinion,

* That was our theory, and we have no doubt that many intelligent observers agreed with us. The Planters' Association attempted, through the help of Mr. John Hughes, the eminent chemist, to test the amount of salt in the monsoon rainwater. But the use of contaminated vessels for transmission rendered the experiment nugatory. It might well be repeated.—Ed.

serve as manure and would, I imagine, soon kill any vegetation with which it might be brought into contact. 2. A reference to page 235 of Ratton's handbook of common salt shows that at 30° Beaumé, at which strength the bitterns should be discharged, they contain in 100 parts—

16.6 parts of Magnesium chloride,
4.6 " Sodium do.
2.0 " Magnesium sulphate,

a composition which (I speak under correction) is not adapted as manure to any form of vegetable life. 3. I would suggest that Mr. McKenzie should turn his attention to the residual brine available in the fish-curing yards on the West Coast, which would probably form a most excellent manure for tea as well as for other plants. 4. This residual brine is composed not only of a very strong solution of salt, but also of fish-blood, entrails, &c., expressed during the process of curing. 5. At present this brine is either thrown away or is applied to coconut trees, the yield of which, I am told, is enormously increased by such application. 6. Under suitable arrangements large quantities of this brine could be put into casks or other receptacles and sealed up in the yards for despatch to the Wynaad or elsewhere, and I have no doubt the fish-curers would hail such an arrangement with satisfaction as they would thereby recover a portion of their original outlay on the salt they purchase for curing purposes. 7. If Mr. McKenzie, or any one else desires to try the experiment, I shall be glad to do all that lies in my power to further his views. 8. Another possible source from which a supply of salt for manure could be cheaply obtained is the saltpetre factories at Coimbatore and elsewhere. At Coimbatore alone over 3,000 maunds of impure salt is annually educed in the refineries situate at that place and at present there is much difficulty in getting rid of it. Arrangements could probably be made by which persons desiring to have this salt for manure could obtain it on payment of the cost of denaturalisation at the refineries by the admixture of *poudreite* from the municipal latrines, added, perhaps, to a nominal sum paid to the refiners, who will be only too glad to be spared the expense of destroying the salt as they have to do at present.

Agricultural readers will appreciate the practical value of the suggestion to utilize the refuse of the fish-curing yards, and coconut planters will make a special note of the good effects attributed to this material as an application to their staple product. When fish-curing yards in Ceylon increase in number, the practical value of salt and fish refuse will doubtless be fully tested. The only objection we can think of, the breeding of insect life in the fish refuse, would probably be obviated by the proportion of salt present. The correspondence we have quoted took place in 1885. On 4th May 1888 the Board of Revenue recorded a resolution, portion of which we quote:—

In the following year considerable further correspondence followed between this department and Mr. McKenzie on the question of the use of "bitterns" as manure, in which he urged the value of salt as a manure for leaf crops and therefore for tea, and the advisability of utilising the "bitterns" to furnish it. In the course of this discussion Mr. Benson, the Assistant Director of Agriculture, pointed out that young leaf crops required potassium and not sodium salts, and that the "bitterns" in addition to the solids mentioned by Ratton, probably contain a considerable amount of the former salts; and that, though it was not advisable to use the bitterns as a manure direct, they might be utilised for mixing with manure heaps, if the cost of carriage were not prohibitive; and noted that the question whether the separation of the different bye-products could be profitably carried out in India could not be answered. In subsequent letters Mr. McKenzie, though still contending for the general use of "bitterns" as a manure, admitted that the difficulty in dealing with them was the cost of carriage, and agreed with Mr. Benson as to the difficulty in extracting the bye-products.

After this the correspondence ceased. In a letter, however, which appeared in the *Madras Mail* of the 26th April last, signed "Novice," the subject is again alluded to. In that letter the writer states that an artificial freezing chamber to provide the requisite low temperature for the extraction of the bye-products could be cheaply and profitably set up in India, and that a few years ago he had some correspondence with the Salt Department with reference to the use of "bitters" for agricultural purposes but that after the matter had been handed over to the Assistant Commissioner of the Central Division he heard no more of it. The Commissioner of Separate Revenue will be asked whether he can favor the Board with any further information on the points alluded to above. viz.—

(1) Whether Mr. McKenzie actually obtained any "bitters" in 1885 for experimental use as manure.

(2) Whether the extraction of the bye-products from bitters is as feasible as the correspondent of the *Mail* seems to think it is.

Mr. Benson's suggestion of mixing the "bitters" with manure heaps is, like those of Mr. Bliss, good and practical. Diffused in large masses of manure, the chemical substances would be useful and not harmful. The Wynaad Planters' Association decided in Oct. 1888 that

Bitters would be of no practical value for any of the products in Wynaad.

Major-General Morgan, on behalf of the Nilgiri Miners' and Planters' Association, made such safe general statements as these:—

Speaking generally, the use of bitters, when mixed with farm-yard manure, would be decidedly efficacious in killing grubs and in strengthening the straw of grain crops, especially if mixed with quicklime and used in inland districts.

It is difficult to point out its special use unless the price at the salt depôts is known. If quicklime is mixed with the bitters, sulphate of lime is produced, which is very valuable for agriculture.

Mr. MacNab, Chairman of the Chamber of Commerce of Coconada, stated that

In the opinion of this Chamber, bitters, as such, could serve no useful purpose as manure; on the contrary, it is considered that they would be injurious, if not fatal, to any form of plant life, while the cost of carriage would be prohibitive. Of the ingredients of the mother liquor, as already pointed out in these Proceedings, gypsum is readily obtainable from other sources, while magnesium sulphate is valueless; and as regards the potassium salts, which are alone of substantial value, it is feared that the expense of refrigeration in this country, combined with the uncertainty of success and of finding a market even if the salts were successfully evolved, would probably deter any private firm or individual from undertaking the experiment. The improvements yearly being made in refrigerating apparatus may materially modify the risk involved, and there can be no question of the economic value to the leaf crops of the country of a cheap form of potash for use as manure. It appears to the Chamber, however, to be very doubtful, whether, potassium salts obtained by artificial refrigeration in the intense heat of an Indian salterne in the manufacturing season could compete with the imported article manufactured in the natural winter cold of Europe. I am however placing the papers before Messrs. Hall, Wilson and Co., who are already interested in salt manufacture, and I shall ask them to address you in the matter, if they find themselves able to offer any contribution to your consideration of the subject.

The Firm referred to accordingly wrote:—

We have been engaged in the manufacture of salt (at Karassa near Vizagapatam) for the past six years, and from time to time we have had under consideration the feasibility of securing the residual salts contained in the mother liquor, which at present runs to waste. Of these, the only ingredients of appreciable commercial value are the potassium salts, and we have hitherto been deterred from attempting to

rescue them by the condition of artificial refrigeration, which is necessary to their extraction. Refrigerating apparatus is costly, and in our experience it is always (except when applied on a large scale under skilled European supervision) very uncertain in operation in this country. There is also a considerable element of doubt as to whether we could find a market at paying prices for our potassium chloride, even if we were successful in extracting it, and on that point we can form no definite opinion until we know the cost of production, which can only be ascertained in actual working.

We have now before Government, however, an application to be allowed to lay out a new salt factory here at Ocanada immediately adjoining our own premises, and, if this is granted to us, our intention is to irrigate by steam-pumping machinery. We should thus have on the spot the steam power, which, next perhaps to skilled supervision, is the most expensive item in the cost of refrigerating in India, and we should have the inestimable advantage of conducting under our own immediate eye experiments which we should not think of attempting on other conditions. Amongst other experiments which we had already had in contemplation was the extraction of these residual salts, and we are now in correspondence with manufacturers of refrigerators in Europe with a view to finding an economic but efficient apparatus, which would fulfil the requirements necessary to give the thing a fair trial. We have yet to learn, however, whether our proposal will receive the sanction of Government, and we are of course unwilling to commit ourselves to the experiment, until we see clearly what the cost will be. If that, however, should promise to be moderate, we should be fully disposed to give the extraction of these residual salts a fair and exhaustive trial, and in that case we need not say we shall most gladly give you in the fullest possible form the results of our experiment. We will merely add here that there seems to us to be a degree of fitness in selecting Ocanada for the extraction of these residual salts, in that it already produces so largely, probably the best manure in India, castor-seed poonac, combination of which with potassium chloride might give a resultant manure of great value to such of the higher classes of agriculture (tea, coffee, sugar, tobacco, &c.) as could bear the cost.

Mr. Lechler, Hon. Secretary, Shevaroy Planters' Association, wrote:—

The Shevaroy Planters' Association are much interested in the subject of the use of bitters for agricultural purposes. No experiments appear to have been attempted with bitters as manure for coffee, and the association are anxious to give them a trial if a small quantity can be secured, so as to place the matter beyond doubt. With this object in view, I write to ask you to be so good as to obtain for me a small quantity, say 2 cwt., packed in 56 lb. bags, for distribution to members of the association, who have guaranteed to make experiments and report results.

Messrs. Binny & Co. wrote:—

Referring to memorandum, dated the 20th November 1888, requesting a report on the use of bitters for agricultural purposes, we have the honor to state that the manager of our coffee works writes as follows:—

"With reference to the Board of Revenue's memorandum, dated 20th ultimo, which I return under separate cover with the accompanying copies of proceedings, I now beg to inform you that I have made inquiry regarding the use of bitters as a manure for coffee; but I cannot suggest any means of employing same. I assume that that the bitters could only be condensed into gypsum and magnesium sulphate at a comparatively costly expense, and as these salts are only occasionally asked for by planters, I do not think it would be worth while to undertake any experiments in producing them from the bitters."

We have nothing to add to the above, and would suggest that an opinion be taken of the 'Chemical Analyst sent out by Messrs. Matheson & Co. to their estates in Mercara. His address is c/o E. Meynell, Esq. As, however, the papers have already been

submitted to the Ooorg Planters' Association, it is possible this analyst's opinion has already been given through that medium.

Mr. Pringle's opinion, conveyed to Mr. Meynell, ran thus :—

Your memorandum of 31st December and correspondence *re* bitters, asking for my opinion upon that substance duly received.

2. I do not think it would be worth while experimenting with ; it is said to be :—

16.6 parts of magnesium chloride.

4.6 „ of sodium chloride.

2.0 „ of magnesium sulphate.

Neither magnesium nor sodium are essential constituents of any manure, as there is in almost every case sufficient present in the soil ; and nearly every manure, contains them, though they are not often determined, being such unimportant factors.

The mother liquor from the brine springs of Oshshire has been boiled down to dryness and applied, at the rate of one ton per acre ploughed in, the land being left fallow for a year ; it effectually killed all the weeds. Mangolds did well after it, but other crops not so well. It is very soluble, and would be washed out by the monsoon rains. It therefore might be useful to clean very weedy land that could be left fallow for a monsoon. It would be best applied at the beginning of the hot weather. The gypsum would in many cases be useful as a substitute for lime, in some cases it would give better results ; its value would be about the same as that of lime. If superphosphate is used as a manure, plenty of gypsum is applied with it, as it is a natural constituent of the manure ; and it is in that form that it will be most valuable ; accompany a phosphatic manure.

On 25th Jan. 1889, the Madras Board of Revenue summed up the above opinions and added :—

A consideration of the foregoing papers points to the conclusion that Mr. Benson's opinions noticed in paragraph 2 of Board's Proceedings, No. 192, date 4th May 1888, regarding the manurial value of bittern and the possibility of profitably recovering the by-products are correct, viz. :—

(1) that bitters might be used for mixing with manure heaps, if the cost of carriage is not prohibitive ;

(2) that whether the bye-products can be profitably extracted in India cannot yet be stated. The solution of the last-mentioned problem will probably be materially advanced, if not completely attained by the experiments which Messrs. Hall, Wilson and Co. propose to undertake at the salt factory near Cocanada, the establishment of which by them has been recently sanctioned by Government.

A separate set of proceedings ends with the following declaration :—

Agriculturally the potassium salts are the only ones which it is desirable to secure from the brine ; natural gypsum is easily obtainable in the Trichinopoly district, and magnesium sulphate is an undesirable substance.

SALT AND SALINE SUBSTANCES AS MANURES FOR COCONUT PALMS.

After we had written what appears on page 649 on the question of the suitability of salt and its by-products mainly as a manure for leaf-yielding plants, our attention was attracted to a paper in the "Examiner" on the use of salt in the cultivation of a plant famous for many products, but especially renowned for highly developed fruits equally rich, at different stages of their existence, in saccharine and oleaginous properties, and which in the transition stage constitute a large portion of the food of the inhabitants of Ceylon ; the littoral-loving coconut tree. Why does it specially love littoral formations and

flourish in the ocean breezes ? Is it solely for the sake of a soil and atmosphere largely impregnated with salt ? We take leave to qualify to some extent this very popular belief. The sea-side zone which the coconuts chiefly affect, on the south-west shores of our island, possesses the two great advantages of a rainfall ample, but not excessive, such as the palm desiderates, chiefly for the sake of those portions of it which stand above ground ; while, owing to the great prevalence of swamps and backwaters a few miles inland and the gentle slope of the land, there is a constant supply of fresh water, percolating through the soil and sand towards the sea. The brackish fluid from the backwaters doubtless part gradually with their saline particles as they pass through the great earth filter and so the soil is permeated with diffused salt. Not in large quantities or in aggregated deposits, however, but widely spread and constantly and largely qualified by the rainwater which sinks into the soil. With reference to Emerson Tennent's theory, when discussing the coral wells of Jaffna, that sea water can percolate inland and sink into the soil below sea-level as fresh water, we may state that it was impeached by the late Dr. Buist of Bombay as contrary to all dynamical laws. Dr. Buist's protest was published in one of the editions of Tennent's great work, but there is no mention made of it in the fifth and final edition, in which the percolation theory of sea-water flowing inland and downwards is stated without qualification ! Our own inclination is to believe that "all the waters run into the sea," and find their way back to the land only in the shape of evaporated moisture or wind-caught particles which are both deposited from the air. Of course we do not forget the more or less sensible action of tides, and doubtless the natural formations of salt on the sides of marine streams in the Jaffna peninsula and elsewhere prove that sea water projected inland and spread thinly over wide surfaces is compelled to part with much of the substances held by it in solution. But what we do not think probable (is it at all possible ?) is, that sea water flowing up the land sinks to the lower strata filtered into freshness, or that, apart from tides, sea water can gravitate shorewards through the earth and sink below the level of the great ocean reservoir.

When we talk, too, of coconut palms flourishing where their roots are actually washed by the sea-waves, we must remember the grand difference between the amount of salt diffused in sea water and that concentrated in the concreted crystals. Salt in its ordinary state is fatal, in any large quantity, to vegetable and animal life, and is used to get rid of weeds and worms, parasites and fungi. Applied in very large quantities we are perfectly certain it would prove equally fatal to coconut plants as to any others. Residence close to the seaside at Colombo for thirty years has afforded us ample opportunity of observing the positive struggle for existence which coconut plants in the early years of their existence have to wage with the fierce salt-laden winds of the south-west monsoon. We have seen their foliage after a succession of salt-storms blackened as if a fierce fire had passed over them, even the well-grown trees which flourish in an ordinarily saline atmosphere showing signs of distress. We can assert from experience that young trees sheltered from the monsoon storms by fences of cadjans make far better progress than those compelled to expend their energies in renewing foliage periodically salted to death by the south-west monsoon winds. But over-ground shelter is prohibitively expensive, and so the natives in our neighbourhood resort to the expedient of digging very deep holes for the reception of their plants, which are thus largely sheltered up to the second

or third year. The trees have then to fight for life every south-west monsoon until they are seven or eight years old. One reason why the foliage of the young trees suffers so much more than the leaves of the older trees is that, of course the lower strata of the rapidly moving atmosphere are more heavily laden than the higher with saline particles caught in the shape of spray from the tops of the sea waves; those particles being fewer and fewer in the loftier atmospherical altitudes. Some at least of all the salt spray carried by the monsoon storms ought to reach the coconuts at Veyangoda, whence "B." writes rather wildly, we think, for a man so generally sane and sensible, advocating the application of salt in almost unlimited quantities to coconuts. He laments the lapse of the old practice of depositing a quantity of salt with each coconut plant put into the ground. It is all the fault of a backward kind of progress, and he quotes with approval the non-progressive character of coconut cultivators in China, who continue the practice which he laments as obsolete in Ceylon. We would suggest as possible that the main reason for the deposit of salt round a coir-covered nut well able to resist the corrosive effects of the mineral was the destruction of those great enemies of young coconut plants, white-ants? No doubt salt is valuable in absorbing moisture, and, as it stiffens the straw of cereals, we can understand its value to a plant like the coconut, the stem and branches of which require so much siliceous matter which the salt renders soluble for their outside covering. In moderation too, and properly diluted and diffused, salt cannot but be beneficial to coconut palms grown inland. But we must enter a mild protest against such statements as that "salt can never be present in too large quantities in a soil on which coconuts thrive." Of course in one sense this is true: where coconuts thrive, salt cannot be present in excess. But what "B." obviously meant was that no possible quantity of salt can be excessive as an application to soil on which coconuts are expected to thrive. "B." for the moment forgot his Bible lesson about the effects of "sowing with salt." Such a process was and still is death to *all* vegetation. In the interests of moderation, too, and in view of what may not in the abstract be best, but of what is possible in dealing with an Oriental people, we would qualify the dictum of Liebig as to the evils of a tax on salt. Taxes on food and on a condiment so essential as salt ought, *if possible*, to be avoided, and so ought customs imposts, all save a few. But if we gave up grain taxes (the inland and import taxes in Ceylon stand or fall together) and the salt monopoly in this island, Government in the interests of the people would be as impossible as is an income tax (the fairest of all taxes in the abstract) in a country such as this. Beside which, the salt tax falls very lightly on the people; salt is issued at an exceptionally cheap rate for fish-curing, and we cannot doubt that a similar course would be pursued in issues for agricultural purposes, were there any virtues in salt, as a separate application, which cannot be secured by the use of substances more generally valuable, such as potash sulphate, or kainit. We certainly have, as yet, no proof, from actual experiment, that pure salt is so valuable as a fertilizing matter that the undoubted risk of injury to an important branch of revenue ought to be incurred in order to place it, at exceptionally cheap rates, at the disposal of agriculturists generally. If "B." knows of any such experiments in coconut culture, he will doubtless quote them and state their results. If not, it will be his obvious duty now

to institute a series of exhaustive experiments, for which, we doubt not, Government will be ready, under proper precautions and pledges, to supply a few tons of salt at cost price. For ourselves, we remain sceptical as to any special manurial value in salt pure and simple, while we can easily understand why the refuse of fish-curing yards, consisting of offal mixed with salt, should be rapidly and largely beneficial in coconut culture. As an application to tea, we should say that such refuse ought to be mixed with at least an equal weight, perhaps a doubled weight, of castor cake and bones or superphosphate.

Meantime, what have Haputale planters to say to the theory that tea in the eastern part of that district is affected injuriously by the salt carried on the sea-breezes?

As to the DISEASE IN THE COCONUT LEAVES, (spots probably of chemical origin), against which "B." wishes to fight with ammunition composed of salt, we do not think it need cause much anxiety, an opinion which we share with experienced coconut planters. Coconut palms, like other trees, have their enemies, the most formidable of which are beetles, lightning and protracted droughts. These are fatal to a certain proportion of trees in all groves or topes of coconuts. The late Mr. W. Ferguson described a visitation of moths some years ago, by which the foliage of the coconut trees in Slave Island was devoured; and at one time we heard much of locusts near Negombo. But the attacks were, in these cases, local and circumscribed, and we never heard of any trees being killed by such visitations. One of the chief benefits of saline applications would be their destructive effect on insect and fungous life, care being taken that the quantity was not such as to endanger the life of the palm.

Dr. Trimen, we imagine, will be scarcely able to appreciate the distinction between his diagnosis "suffering from innutrition" and that substituted, "suffering from a disease caused by innutrition." When we say that people are suffering from famine, we mentally include all the diseases which are the result of famine, prominently debility. Just as the skin of human beings in Ceylon indicates the effects of innutrition by the loathsome affection of "parangi," so the coconut leaves make signals of distress by blotches in tissue, such blotches being really dead matter in which the circulation of the juices has ceased. A stiff soil, absence of moisture near the surface, and a droughty atmosphere, ever produce such effects, sometimes in an aggravated form. The main remedy is tillage, and to the stirred soil a moderate application of salt is likely to do good, but with the chloride of sodium, which is a condiment more than a food, we submit that it would be wise to mix fish or fish offal if it can be procured, or else ground bones and crushed castor-cake. If plenty of salt fish or fish offal were available, and we trust the multiplication of fish-curing yards may ultimately produce this result, it is obvious that pure or impure salt crystals might be dispensed with. Our experience with hemileia on coffee has taught us that there are some peculiar and specific affections, which even the richest supplies of nutritive matter, phosphatic or nitrogenous, cannot combat effectually; but, happily, there is no suspicion that the coconut, or any other of our cultivated products, is likely to suffer from anything equivalent to the deadly coffee fungus.

In this connection we call attention to the letters on page 654-5 of two of the most experienced coconut planters in the country—Messrs. Lamont and Jardine—with their remarks on the so-called new disease on the coconut palm.

COCONUT PLANTING IN THE LOW-COUNTRY.

HAPYIGAM KORALE.

WEATHER.—We have the usual weather of the season,—a cloudless sky, a burning sun with fierce gusts of dry wind for six or seven hours daily, close evenings and cool almost cold mornings. We have been rather better off for rain than last year, having had two good showers on the 7th and 8th January, and another of about a quarter of an inch on 13th instant.

CROPS.—The crop on the trees is an unusually small one, on most estates in the valley. During the third quarter of last year the most favoured spots in the district had only about two inches of rain, and in consequence the two second best bunches in normal seasons will be wanting; while those of the last quarter's flowers are hardly more than the average. The young fields, however, are worse than the old ones in this respect.

GROWTH.—The last year has been very trying to one and two years old plants; they have generally dropped more leaves than they have developed, and, except for increased length of leaf, are nothing advanced during last year.

PRICES.—In sympathy with the recent small gatherings prices have gone up about 30 per cent on those of six months ago. From this district they are wanted for the upcountry trade.

THE LEAF DISEASE.—The leaf disease is not a new thing so far as I am able to judge; it is neither insect nor fungus, and is not infectious. It only differs in degree from what happens to the leaves of old bearing trees, when they begin to lose their hold on the stem, and the supply of sap that keeps them green fails. There are the same dark specks that in the same way become centres of grey rot. In old trees it is only the mature outer leaves that become so affected, but on the two to six year old plants now suffering, the whole of the leaves in some cases even to the half-developed centre shoot are affected, and the dark specks appear not only on the leaflets but on the leaf-stem itself. During the past year we had two long droughts and two spells of heavy rain. The drought penetrated deep into the soil, and could hardly fail, to dry up the more superficial roots, and weaken them, perhaps destroy their vitality altogether; or where any life was left the saturation by the soil, for six weeks together, may have finished up what the drought began, and thus the plant suffers, till it produces new roots from the common centre to restore the growth. In my own case about 2½ per cent are affected, on a field of grey sandy loam, but with insufficient sand to prevent it from becoming as hard and impenetrable as a stone in dry weather. On the cabook land many young plants died, but not one was or is affected with this disease. The remedy I propose to use is to trench in a cool load of cattle manure round each, when the weather serves.

THE SUPPOSED DISEASE IN THE COCONUTS.

CEYLON vs. COCHIN OIL.

Kadirana, 16th Feb. 1889.

In reply to your inquiry as to whether I have noticed anything of the coconut leaf-disease mentioned by the "Examiner"'s Veyangoda correspondent as prevailing in that district; I may state directly that I have not. Since that letter appeared I have been on the lookout for signs of the disease, but neither upon young plants nor old trees have I observed any. At this time of the year there is always a larger number of leaves spotted and brown than during rainy weather, but they are not more numerous now than is usual, nor are any young fronds attacked in the way described by the "Examiner"'s correspondent. The nearest approach to the disease was observed on a few leaves on five plants about 8 years old growing on a cabook hill; the leaves were well up in the trees and were reddish and blotchy in appearance and evidently dying. I must state

however that these trees were not good well-nourished specimens, but were small for their age, and others of the same age in their immediate vicinity were healthy and had no diseased leaves. Till I see trees attacked with the disease I cannot venture an opinion as to the cause. Has this peculiar feature of disease on the leaves been observed anywhere else in Ceylon? I am inclined to think however that something local will be found to be the cause. Possibly weakening of the stamina of the tree inducing insect attacks, as was the case with cacao a few years ago.

I notice from time to time a good deal of discussion in the local papers as to the cause of the higher price of Cochin oil than is paid for the Ceylon article. I really do not know what the climate of Cochin is like, but have always had the idea that it is much drier than that of our Western and Southern Provinces, and that to this dryness it owes its superiority. I have also been of opinion that the well cured copra of the Northern and Eastern Provinces if extracted alone, would yield oil quite equal to that of Cochin. This is only an opinion and can only be decided by actual experiment. Is there not an oil-mill somewhere in Jaffna? If there is, the prices realized by the oil made there if shipped to and sold in London should decide this question. When I began life as a coconut planter in Jaffna in 1856 to 1859 I remember that large quantities of Jaffna copra used to be shipped to the Coast of India. Did it find its way to Cochin and help to make Cochin oil? Where is the market today for all the Jaffna and Batticaloa copra? I see that some writers deny that any change takes place in the kernels of the coconuts after they are plucked and heaped. Now why should there not? If a very material and important change takes place in cereals after they are stacked, why should it be unreasonable that a change should take place in the constituents of the coconut kernel? Manufacturers of copra will seldom husk coconuts till they have lain one month at least after gathering; and owners of chekkus will tell you that they can extract more oil from copra, the nuts of which had been lying two or more months, than from copra made from freshly gathered nuts. There are many things we do, for which we cannot give a philosophic reason, yet experience teaches us that the custom is a sound and good one; and this of keeping coconuts for some months before converting them into copra seems to be one of them.

W. J.

[The climate of Cochin is very wet at one season,—the S.-W. monsoon—and very dry for many months together, and we suppose the copra is cured in the dry months. The philosophy of keeping nuts for a prolonged period is probably to give time for the conversion of saccharine into oleaginous matter in the kernels. It is not likely that any Ceylon copra went to Cochin. Our information indicated that it went to Bombay and Calcutta, and that rich baboos and native merchants and officials who wished to attain the dignity associated with obesity used the finer kernels as a portion of their food.—Ed.]

THE DIFFERENCES BETWEEN CEYLON AND COCHIN COPRA.

A merchant of great experience in this line is good enough to favour us with his opinion as follows:—

"The reason of Cochin copra being better than Ceylon I believe to be the difference of climate. Then there is more dry weather during the year

than we have in Ceylon, and the most of the Cochin copra is, I believe, made in their fine weather when it can be sun-dried, and very great care is taken in drying the copra and towards keeping it free from all impurities, thus producing an article superior to that of Ceylon."

SALT IN COCONUT CULTIVATION.

[The following is the contribution by "B." to the local "Examiner" alluded to in our article on the manual value of salt and its by-products.—ED.]

It cannot be too often repeated that for the successful growth of any product, it is essentially necessary that we conform as nearly as is possible to the natural condition under which it grows. The natural home of the coconut palm is the sea-coast. On the sea-coast salt and moisture are ever present. When we extend the cultivation further inland, although we may meet with better soil and in many instances situations where moisture is ever present at the roots, yet one of the conditions under which the palm flourishes is absent—a soil largely impregnated with salt.

Observation shows us that salt can never be present in too large quantities in a soil on which coconuts thrive. On the sea shore, the trees seem none the worse for the salt-laden waves that break at their very roots. Indeed, salt does not seem to be able to hurt even the delicate germ in the nut. The spread out of coconut cultivation is due primarily to natural agencies. Trees growing on the sea-shore dropped their nuts into the sea and these have been carried by currents for thousands of miles and thrown upon some coast by the force of the waves, there to strike roots and sow the seed of future topos; and yet though the nuts must have been immersed for long periods in salt water, the tender and delicate germ did not lose its vitality, but developed into a tree. We who have to do with coconut cultivation know how delicate the germ is, and how liable it is to be destroyed. The fact that salt water does not affect its vitality speaks volumes, in my opinion, for the absolute necessity of using salt in all stages of its growth, so as to approach as nearly as possible its growth in a state of nature. Every authority who has written on coconut cultivation, not only in our Island, but in all parts of the world where it is cultivated, speaks of the practice of throwing in a handful of salt into the hole at the time of planting. Some speak of it as a superstitious practice. This is owing to a want of proper appreciation of its value. Why has this very useful and necessary practice been given up? The answer is simple. Every succeeding generation deludes itself with the belief that it knows more than its predecessor about agriculture, and thus it comes about that very useful and very necessary practices are gradually given up as useless. This is observable in all branches of agriculture. Our ancestors cultivated small areas at a time, and were actuated by the belief that what was worth doing was worth doing well. At the present day the boast is, not of the quality of the work one does, but of its quantity and cheapness. This latter word is supposed to be synonymous with low cost. Experience shows it is not. Careless and slovenly work is perhaps more noticeable in coconut cultivation than in any other branch of our Island agriculture. I feel almost tempted to enumerate all the works that are thus slovenly prepared, but I will be travelling out of my subject.

The latest reference I find to the use of salt in coconut cultivation is in the *Tropical Agriculturist* for February. In a report on agriculture in Hainan, it is said that coconuts do best near salt water. Salt is thrown into each hole with a coconut plant. "If they do not flourish salt is again put to the roots." Why, it may be asked, is this necessary practice kept up in Hainan? For the simple reason that the Chinese are a non-progressive people!

It is an axiom in Agricultural Chemistry that, although a soil may abound in all the mineral constituents of the plant food of a certain tribe on plants, and has only one in insufficient quantity, that tribe of plants cannot flourish upon that soil. While if the soil is wholly devoid of one constituent, it refuses to grow

or to come to perfection. What observation shows, analyses have established—that salt plays a no unimportant part in the composition of every part of the coconut tree. From this it will naturally follow, that coconuts grown in a soil where salt occurs in insufficient quantity cannot flourish, and in soils devoid of it will refuse to come to perfection. The latter class of soils it is difficult to imagine as occurring in our Island, exposed as it is to violent monsoon storms. Not so with the former class of soils.

However well coconut trees may bear in certain inland districts far removed from the influence of salt-laden breezes, I do not think their warmest admirers can say that they attain perfection there in the face of the annual experience of wholesale dropping of bunches and branches. This unpleasant experience contrasts very strikingly with coconut trees nearer the sea and with water always within reach of their roots. It must not be forgotten that the dropping of fruit and fronds is a very severe strain on a coconut tree. Leaves play a very important part in the economy of plant life. All the food a plant takes up by the roots is elaborated in its leaves, and is from them distributed for use in its every part. It is through them that carbonic acid is taken up by plants. Drooping leaves are an indication that the roots are not able to supply moisture to them as fast as it is evaporated from their surface. The supply being unequal to the demand gives a severe shock to the vital energies of the trees. How to balance this inequality should be the aim of the skilful agriculturist. As I said before, it is not possible for everyone to apply water to his whole plantation; but it is possible for all to apply salt. Salt has a value all its own. It is not only a manure, but has the valuable property of attracting moisture from the air and keeping the soil to which it is applied quite moist. In works on Agricultural Chemistry we are told that the application of salt to soils devoid of it has been known to produce striking results. I do not think it needs repetition that salt is an essential constituent in the growth of the coconut palm. I shall now chiefly confine myself to the more valuable properties it possesses. It renders available valuable constituents in the soil and is spoken of as a digester of food, it stiffens the straw of cereals, and it has a great affinity for moisture. The latter property is what will most commend it to the notice of coconut planters. In seasons of drought like the present, it will attract moisture from the atmosphere and make it available to the roots of coconut trees.

At the present moment, a disease affecting the fronds of coconut trees is exercising the minds of planters. The causes of diseases affecting plants are generally complex, and often baffle the research of professionals. Opinions as to its cause are divided. For me, with no aspirations to a knowledge of the mysteries of Agricultural Chemistry, to express an opinion as to the cause of this particular disease, will be the height of presumption, if not of folly. All I dare to do is to make a guess as to its cause, and so put professional men on the scent. Dr. Trimen hazards a guess as to its cause. He says the trees must be suffering from innutrition. Innutrition is possible in two ways. 1. Absence in the soil of a necessary constituent of plant food. 2. Inability of the plant to take up nutriment either from want of roots or the absence of moisture in the soil. I suppose, it is too well known to be repeated that plants can absorb food only in a liquid state. It is well known that any disease finds its first victims in weakly constitutions. Infection or contagion then communicates it to healthy subjects. The theory I put forward in the coconut leaf disease is that the trees are possibly suffering from the absence in the soil of salt, or from its presence in too small quantities, and I humbly present it to the consideration of Dr. Trimen.

Many are doubtless under the impression that so soluble a substance as salt, will be washed out of the soil by our violent monsoon rain storms before it can be of any benefit to the coconut tree. They may take their minds easy on that score, for the upland soils on which coconuts are grown are mostly clayey or have a clayey subsoil. One valuable property of such soils is

its ability to absorb and retain all the soluble salts of manures. If even our upland soils did not possess this property, salt washed deep into the subsoil will be absorbed by those roots of the tree that go down deep into the soil to pump up water for its use.

Salt is also said to have the property of favourably affecting natural herbage, making coarse grasses sweet. No animal can exist without it, and its presence in the dietary of cattle has a beneficial effect on their health and condition. If the soils of coconut estates be treated with salt, it is not unreasonable to hope for an improvement in the condition, health and even growth of our cattle.

There is every reason to hope that the application of salt to coconut trees will prove a financial success. Planters know what a cause of anxiety the nuts on their trees are to them during this period of the year. From lack of moisture bunches come down bodily and have to be propped up, a practice said to be unknown all along the sea beach. As forests recede before the operations of the planter, props are becoming scarcer every year. Even with props, experience shows that a large proportion of our crops is lost during the annual droughts. One gentleman with very large proprietary interests told me that on a property of his bounded by the Maha Oya, 3-4ths of his crops were lost during the first quarter of the year. He either made his estimate when suffering with a fit of the "lows": or his experience is exceptional. Still the fact remains, that a large proportion of our crop is lost which good husbandry ought to induce us to attempt to save by growing coconuts as nearly under natural conditions as is possible.

To obtain salt for agricultural purposes Native Agriculturists ought in a body to petition Government to issue it at the same rate as to renters. They ought not to be discouraged by a refusal, which ought to act as an incentive to renewed exertion. Success can be attained only by determination and persistency. I shall conclude this in the words of Liebig, "The impost of salt is of all taxes that which is the most odious, the most unnatural, and the most disgraceful to human reason." B.

CONSUMPTION OF CEYLON TEAS IN THE LONDON CUSTOMS.

City Chambers, 65, Fenchurch Street, London, 25th Jan. 1889.

A. Philip, Esq., Secretary, Planters' Association, Kandy, Ceylon.

Dear Sir,—I have the pleasure to enclose for the information of your Association copies of correspondence with H. M. Customs Commissioners.—I am, &c.,
(Signed) WM. MARTIN LEAKE.

Ceylon Association in London, 65, Fenchurch Street, London, 9th Jan. 1889.

The Secretary to the Commissioners of Customs, London.

Sir,—I shall be much obliged if you can furnish me with a copy of the Commissioners' General Order dated 27th ult. with reference to the classification of teas taken for Home Consumption. This order was mentioned in the City Article of *The Times* of yesterday.—I am, sir, your obedient servant,
(Signed) WM. MARTIN LEAKE, Secy.

Custom House, London, 11th Jan. 1889.

Sir,—In reply to your letter of the 9th instant, I am directed by the Commissioners of Her Majesty's Customs to enclose two copies of their General Order to which you refer on the subject of the classification of teas taken for Home Consumption.—I am, sir, your obedient servant,
(Signed) R. T. PROWSE.

W. Martin Leake, Esq., Secretary to the Ceylon Association in London.

Notice is hereby given that on and after the 1st January, 1889, Merchants and others passing Entries for tea will be required to state upon each Import Entry (whether Prime Entry or Warehousing Entry), and also upon the Home Consumption, Removal and Export Warrants, the Country of Production or origin of the tea. By Order,
E. GOODWYN.

Custom House, London, 27th Dec. 1888.

CLASSIFICATION OF TEA FOR STATISTICAL PURPOSES.

The Lords of the Treasury having been pleased to approve of Tea for Home Consumption being classified in the Monthly Account of Trade in the same manner as Tea imported, under the separate heads of

TEA from British Indies,
" China (including Hong Kong and Macao),
" other Countries,

the Board direct that, with the view of obtaining correct information for the Statistical Accounts, the Registrars in London and the Collectors at the Outports, on the receipt of each Import Entry for Tea (whether Prime Entry or Warehousing Entry) do require the name of the Country of production or origin to be stated on such entry. The Board further direct that the Officers employed in keeping the Warehousing Accounts do require the Merchants to specify the country of origin of the Tea in their Home Consumption, Removal and Export Warrants; this detail is to be checked by the Officers, the Country of origin being indicated on the cover of the Landing Book in which the deliveries are recorded. Separate Landing Books are to be kept for each class of Tea above mentioned in the event of more than one class being imported by the same ship.

The net weights of Tea entered under the proper heads as above specified are to be recorded in columns appropriated to that purpose in the Warrant Book, and Returns are to be made monthly from the Several Stations in London and at the Outports in the Form ⁵³⁴ C "Return of Tea and Tobacco delivered for Home Consumption," showing the quantity, &c., of Tea of each class delivered.

It has been observed that Tea from China is frequently transhipped at Colombo to vessels proceeding from the latter Port to this Country. The Board direct the Officers to exercise great care in such cases to prevent Tea produced in China from being taken to account as Tea from Ceylon or British East Indies.

The Stock of Form ⁵³⁴ C "Return of Tea and Tobacco delivered for Home Consumption" hitherto used, is, after the Account for December, 1888, has been transmitted, to be immediately returned from each Port and Station to the Storekeeper, Custom House, London, to be treated as waste paper, and an application for a supply of the Revised Form which is to be used for the month of January, and subsequently, is to be forwarded to Division IV. of the Secretary's Office in the usual manner.
By Order, E. GOODWYN.

Ceylon Association in London, 65 Fenchurch Street, London, 16th January 1889.

Sir,—I beg to thank you for your letter No. 1,239 of 1889 dated 11th instant, enclosing copies of General Order 145 of 1888 dated 27th ult.

May I ask with reference to the order in question, whether, of the tea for Home Consumption classified in the monthly account of trade under the head of "Tea from British East Indies," the quantity from Ceylon will be given separately from that from India? and in any case whether it could be so given separately in future?

The annual consumption of Ceylon tea is already very large and is increasing rapidly each year. And it will be matter of great interest in future to compare the growth of the consumption of tea from Ceylon with that of tea from India.—I am, sir, your most obedient servant,
(Signed) WM. MARTIN LEAKE, Secretary.

The Secretary, Customs Commissioners, London.

Custom House, London, 23rd January 1889.

Sir,—I am directed by the Commissioners of Her Majesty's Customs to inform you, in reply to your letter dated the 16th instant, that the quantities of Ceylon tea imported into the United Kingdom and delivered for Home Consumption will not be given this year in the accounts of trade separately from those of Indian tea; but that the question of making the separation in future years will be considered.—I am, your obedient servant, (Signed) R. T. PROWSE.

The Secretary, Ceylon Association in London.

HOW TEA SHOULD BE PACKED.

From Court's "Instructions to WILLIAM JOHNSON, Esquire, Supercargo of the Ship "Westworth" bound for CANTON in CHINA, and Mr. JOHN HILLER, Merchant, his Assistant." Dated 10th Nov. 1699.

"10. Tea is a Commodity of that general use here, and so nicely to be managed is its Package to preserve its flavour and vertue, that you can't bee too careful in putting it up. Take special care therefore it be well closed in *Tootenague*, then wrapt up in Leaves and so put up in good Tubs of dry well-season'd Wood, made tite and close enough to preserve it from all manner of Scents, which it is very Subject to imbibe, and thereby become of no Value here. But you must be sure that the wood of your tubs have no Scent, whether sweet or unsavoury, that will Spoil the Tea, So will Camphire and other strong Scented Commodities, wherefore no such Smell must come into the Ship: For the like reason put up no Tea in Potts or Tootenague, till the smell of the Soldering Oyl or other like smells be perfectly cured, Be sure the Tea you buy be very new and the best of its sort, Remembering that in this and every other Commodity, the worst pays as much freight as the best, and many times the same Custom, Keep the Tea in the Coolest places of the Ship, for otherwise the greatest Care in its Choice and package will be rendered ineffectual, and therefore what is put in the Hold open the Hatches in fair Weather to give it air as often as you have Opportunity. But you will see by the Captain's Instructions We have required that our Tea be stow'd between Decks abatt the after hatchway with a bulk head and a little gang way made for Passage, which do you see done accordingly. It being now peace, We being resolv'd to dispense with our old order in this particular of stowing no Goods between Decks, when so great an advantage will accrue, as the preserving the Tea, a very considerable Article in the profit or Loss of the Cargo."—*Diary of William Hedges, esq. by Col. Yule, vol. II.*

TOBACCO AND RAINFALL AT KITULBOKKE.

We stated recently that the German Tobacco Syndicate had some thoughts of trying the vicinity of the Kitulbokke Irrigation Works for tobacco cultivation, and with that object in view Mr. Schappe recently paid a visit to the Kolonna korale, but gave up the idea when he ascertained that the rainfall experienced there chiefly fell in the N. E. monsoon. Maduwanwella Ratamahatmeya has kept the rainfall return since February last, and it has been kindly placed at our disposal, and reads as follows:—

February ...	0-90	August ...	0-42
March ...	7-24	September ...	3-27
April ...	2-22	October ...	19-07
May ...	4-44	November...	9-75
June ...	5-04	December...	13-02
July ...	0-32		
		Total ...	65-69

This is only for eleven months of the year, but January is a month with but a very small fall, and the total for the year is not likely to be raised very much when it is included. It will thus be seen that almost all the rain falls in the North-east monsoon, and as the German Syndicate refuse to have anything to do with land when this is the case, they have abandoned all idea of taking up land in this locality.

We firmly believe they are grievously mistaken in thus laying down such absurdly hard and fast rules regarding tobacco or any other cultivation in Ceylon. To start with the assumption that land *must* be secured on this or that side of the island, and that in any case it must be under the influence of the south-west monsoon, seems to us absurd, and for two good reasons. First, because if a *certain* dry season be required, this can only be secured in districts where the N. E. monsoon chiefly prevails, and secondly, because tobacco so far has always been found to grow best in Ceylon in such districts. The

Jaffna and the Trincomalee districts both grow tobacco very successfully, and they get little or no south-west monsoon. We believe that of the Planting districts, Dumbara, Matale, and Badulla will be found to grow tobacco the most profitably.—"Local Times."

THE POSITION OF COCONUT OIL.

Holders of coconut oil are surprised that large consumers of Ceylon coconut oil are not disposed to anticipate their wants some distance ahead and take advantage of present prices, as various circumstances seem to favor a higher range of values. The fact is that soap makers have been covering their future wants, as recent large transactions in goods on the way would indicate, but that there are many consumers in the interior who are not acquainted with the true situation of the market, is evident from the requests that come to us for information and the slow movement of spot goods is no doubt attributable to a lack of confidence and desire of some prospective buyers to continue their policy of purchasing oil as needed. Every feature of the market seems to favor a higher tendency, and the hardening of tallow values is assisting the upward movement.

There is a diversity of opinion concerning the actual amount of Ceylon coconut oil on spot. Holders decline to give information on that point, and estimates therefore can only be based on guess-work. The highest estimate is placed at eight hundred tons, but the majority of dealers believe that the total amount will not reach over five hundred tons, while others place the amount at three hundred tons. The next arrival is the "Reporter," due early in January with six hundred tons, all of which has been taken out of first hands, and the "Mohur" is due in February with five hundred tons, a considerable portion of which is sold. Then comes the "Gloaming" a month later, with five hundred tons. If the average consumption is four hundred tons per month, the visible supply would be sufficient to last five months, but in case of accident or leakage, which is a common occurrence among vessels from Ceylon and Cochín, the trade would be in a dilemma. During the year considerable damage and delay were caused by disasters to such vessels, but stocks happened to be in better condition than at present to withstand the consequences.

There is another feature of the market which should not be overlooked, and that is the effect of tallow prices on the movement of coconut oil. It is acknowledged that since the important advance in tallow, there has been more demand for oil which would indicate the substitution of one for the other by soap makers. As the position of tallow favors still higher figures and the market is now in a very sensitive condition, the outlook for coconut oil is correspondingly improved. During the reign of high values, therefore, no accurate estimate of the amount consumed can be formed. English oil on spot is quoted at a higher price than the product of Ceylon, but the outlet in this market is small, being limited to about five hundred tons per annum.—*Oil, Paint and Drug Reporter.*

PLANTING IN THE ANDAMANS.

The area of cleared land is some 17,000 acres, of which 10,000 are under cultivation, and 4,000 used for grazing; the remainder consists of roads, tanks, and village sites. About 500 acres are under tea, in charge of a European manager and an assistant. The tea is excellent in quality and has great strength and body, and when mixed with a small proportion of high class hill tea, for flavouring, it cannot be surpassed. Teagrowing is now an assured success in the Andamans; and it is to be regretted that these fertile islands cannot as yet be thrown open to private enterprise; for it is doubtless a State necessity to keep the Penal Settlement as isolated as possible.

Not only is tea a success, but Liberian coffee thrives admirably, and its cultivation is being extended. Cacao is also very promising; all the seed hitherto grown has been planted out; and the *musa textilis* bids fair to become an important local product ere long. Nutmegs, ceara-rubber, arrowroot, the Otaheite potato, and tapioca have been introduced. The mangosteen thrives, and has been planted pretty extensively; the trees, however, are slow growing, and will take some years to come to maturity. Varieties of the nutmeg, tapioca, arrowroot, and vanilla are to be found wild in the jungles. The chief cereals grown are Indian-corn and paddy. Tobacco, though given a full and fair trial under an experienced European grower, appears to have failed.

It is curious that the coconut, which is indigenous at the Cocoa Islands in the north and at the Nicobars to the south, had to be introduced into the Andamans. There are now some 116,000 coconut trees at Port Blair, and in time they will no doubt yield an excellent revenue. The betel-nut palm has been extensively planted; but there seems some difficulty in finding a market for the crops.

Native vegetables, such as the bhindi, pumpkins, brinjal, gourds of sorts, &c., thrive well, and are largely grown for supply to the labouring convicts and for sale. The cold weather is too mild to admit of European vegetables thriving. Tomatoes, lettuce, French beans, celery, parsely, and mint do well, and those are about all.

The author, who paid several official visits to Port Blair between the years 1883 and 1885, noticed a great falling off in the quality of two very important items of food, viz., mutton and bread. The settlement was, in past times, famed for its fat sheep, so much so that vessels calling at the port often begged a sheep or two as a favour. Now the animals may be classed with the proverbial "Lean kine." The bread also is very inferior and gritty; and it surely should not be difficult to start a station bakery on sound principles, using Californian flour and yeast instead of Cocoa toddy. The cost would be somewhat greater, but the extra expense would be compensated by immunity from dyspepsia, which is a common complaint here.

Among the products of these islands are the edible birds' nests and the *beche de mer*; they are exported to the Straits, being dainties peculiar to the Celestials.

The forests are full of valuable timber, such as *Padank*, satin wood, marble wood, and *gurjon*. Teak has been introduced, and bids fair to become of great value in the course of time.

The jungles are for the most part almost impenetrable, owing to the dense undergrowth, matted and tangled as it is with canes and creepers. The foliage affords few varieties of tint; but here and there, during the dry months, one sees a tree with its leaves of flaming red, adding great beauty to the forest.

The pillar palm, the traveller's tree, and other ornamental varieties have been introduced; and a plant of the palm—which yields palm oil—that important product of the Gold Coast—which was introduced from the Royal Botanical Gardens in 1878 by Mr. Horace Man, has thriven, and is now seeding.

Many trees are abundant, but the fruit would probably be much improved if a regular system of *wintering* were adopted. The litchi, papaya, and plantain do well, and of course the pineapple, which loves a moist heat.

The chief attraction in gardens lies in the lovely flowering shrubs and crotons. The latter produce seed freely; and Doctor Reid, a former resident, succeeded in raising a number of hybrids, one of which is a superb variety and has been named *Croton Reidii*. Tropical flower gardening is, however, not very advanced, and even at Government House, which possesses an Indian conservatory, the collection of foliage plants, ferns, and orchids is poor, considering what is possible in that direction in this climate.

Orchids abound in the jungles, but only a few varieties are worthy the notice of the horticulturist.

Among the good sorts may be named *Phalenopsis tetraspis* and *Aerides Emerici*, both peculiar to these islands; also *Dendrobium formosum*, *Aerides odovatum*, *Vanda teres*, and a variety of vanilla. Ferns are equally abundant, and many of them exceedingly beautiful. Kurz details 13 species and 31 varieties. The most striking is the birds' nest fern, *Asplenium Nidus*, which grows to an enormous size. The *Davallias*, too, are very beautiful with their delicate fronds gracefully depending from the trunks of forest trees.

Fish, as may be supposed, is excellent, though not too abundant. The best are soles and mullet, and the rock oysters are very good. Occasionally enormous fish are caught in the harbour. Not long ago the men of the *S. S. Kwangtung* hauled in a rockcod which weighed 165 pounds and measured over five feet in length; and quite recently a 62lb. fish jumped into the station horse-boat as it was crossing the harbour. Sharks are, of course, numerous. Whales are far from rare. The dugong, a species of seal some five to eight feet long, is sometimes captured by the Andamanese, who regard its flesh as a great delicacy. This creature is a mammalian; a female, suckling her young, is said to appear particularly human, and probably gave rise to the mythical mermaid. The saw fish is also caught at times; the largest recorded was 17 feet in length, of which the saw measured six-and-a-half feet. Andaman shells and corals are famous for their variety and beauty. The shells of the large varieties are washed ashore in considerable numbers, but it is very unusual to obtain one inhabited by the living fish; only three are known to have been found since the settlement was started. There are several varieties of the oysters some of which yield pearls of sorts. Black pearls are occasionally found, in a species of *Pinna*, popularly known as the "bouquet holder." It is said that the true pearl oyster exists here, but as it is a deep water variety, and there are no appliances for dredging, pearl fishing is not followed as an industry.

Sea weeds, so common on our British coasts, are conspicuous by their absence on these shores. Two or three lovely varieties of coraline are, however, occasionally met with, and after storms, masses of green bladder sea weed drift to land.—*Englishman*.

AGRI-HORTICULTURAL SOCIETY OF MADRAS: SKETCH OF THE SOCIETY'S HISTORY.

Almost coeval with the reign of Her Most Gracious Majesty, and fostered and encouraged by the peace which has shared her throne in the Carnatic, has been the prosperous career of the Madras Agri-Horticultural Society. To the enthusiasm of Dr. Robert Wight,—the eminent botanist, and author of *Icones Plantarum Indiae Orientalis*, which is to this day the standard work of the kind, and a monument that will endure while libraries exist,—the Society to a great extent owes its being. On the 15th of July, 1835, at a well-attended meeting of Native and European gentlemen held at the College Hall, it was inaugurated. Two days later the first Committee of twelve met, and it was announced that Sir Frederick Adam, the Governor, had accepted the invitation of the Society to become its first Patron, the Honourable Mr. John Sullivan, the Junior Member of Council, being its first President, and Mr. Baynes its first Secretary. A little later the Nabob of the Carnatic and Sir R. Palmer, the Chief Justice, were invited to become Vice-Patrons. In 1836 the Society was in occupation of the land which now forms the larger portion of the Ornamental Garden on the Mount Road, Madras. "This was then," we read in Dr. Bidie's Report, "the only spot available; it was very ill-suited for horticultural experiments, and the Society was long embarrassed by expenses connected with its improvement." The Society has once or twice since been embarrassed,

notably ten years ago, when the shed in which the Office and Committee business was conducted was turned into what it is now,—a house filled with beautiful and luxuriant ferns; the Office was transferred to what was till then the Superintendent's house; a comfortable house was built for the Superintendent in the Experimental Garden on the other side of the Cathedral Road; and the Red Hills water was carried through the Gardens to the native huts beyond. All pecuniary difficulties were, however, from time to time tided over by a small extra grant from Government; by the liberality of the Society's bankers; or by the zeal of the Secretary for the time being enabling the Society to save the pay of a professional Superintendent, and to let his house at a monthly rent.

In 1837, at the time of Her Majesty's Accession, the work of the Society was in full swing, and very successful efforts were being made to improve by the distribution of better seed the class of cotton grown in the various districts of the Presidency,—efforts which ripened their fruit when the American War closed the ports of the Southern States to the buyers at Liverpool, Manchester, and elsewhere. In the same year some tea plants received from China were forwarded by the Society to Mysore and the Neilgherry Hills, and it is believed that some of these very plants still survive in the neighbourhood of Coonoor, so that Neilgherry tea, one of the most important products of Southern India of the present day, is now also celebrating its jubilee. The following year a supply of Mauritius sugar-cane was obtained through the Board of Revenue, propagated, and subsequently distributed. Prior to, and during the year 1840, when Mr. Glasson opened the first coffee plantation in Wynaad, the Society struggled to grow coffee profitably in Madras, and freely distributed it in plants and seeds to more favourably situated places. During the next few years records are found of the introduction of European and West Indian fruit trees, some of which doubtless still thrive, or have been displaced by their descendants, or by superior varieties. More than one species of mulberry was introduced to feed and improve the silkworms, and wonderful strides were made in the cultivation of indigenous and foreign culinary vegetables now classed generally, and consumed even by the poor, as "country vegetables." In 1844 an attempt was made to introduce the use of guano as manure, and a valuable collection of Australian seeds reached the Society. In 1850 the Society successfully sent a case of grafted mango plants to Sir William Hooker at Kew; and seeds of the valuable hurrialee grass, the staple food of Madras horses, was transmitted to Australia and the Cape of Good Hope. In 1853 the Society was largely engaged in raising and distributing vast numbers of the Casuarina for planting on the sand dunes on the coast north and south of Madras, now the source of almost the whole fuel supply of town—the power which moves the railway engine and the spinning mill, cooks the rich man's banquet, and the poor man's rice.

It is possibly invidious to select a few items of good work such as those mentioned above, but it is necessary, as to do more than mention the Society's experiments with cinchona and spices, fruits and flowers, drugs and tanning materials, fibre, plants and dye stuffs, cereals and forage plants, would fill many pages. The Society's Nurseries now contain thousands of such plants for distribution. The work of the Society is borne in upon the senses from every garden and hedgerow in the area as large as Paris which goes by the name of Madras Town; and many of the commonest plants of the roadside are foreigners that were distributed, if not originally introduced by the Society, within the last five years. A stroll round the Society's Garden, limited in extent though they are, is one of unceasing interest. On every side are hundreds of species of the most useful and beautiful of tropical flora; creepers, and herbaceous plants in such rampant growth and luxuriance of leaf and flower as are seen only amidst the warmth of the tropics; indigenous plants, which though doubtless abundant fifty years ago in the immediate neighbourhood.

are now, owing to the needs of the wood-cutter, to the scarcity of fuel, to the enormous increase of population, and to the voracity of goats, rarely to be seen within many a mile of the town, are carefully preserved and propagated. Every step in the Ornamental Garden will unfold some new beauty to the tree-lover. The noble mahogany, from the West Indies; the lichee and the diospyros from China; the Moreton Bay chestnut; the elegant araucaria from Australia; the giant talipot from Ceylon; the graceful date from Arabia; the stately cabbage palm from Brazil; the huge baobab, and endless others are to be seen. Shrubs too are not forgotten, such as the handsome South Sea Islands croton, with its quaint forms and variegations; the butter-cup-like ochna, once common but now rare in the jungles round Madras; jasmynes and begonias of many sorts, and the sweet-scented gardenias and carissas.

Of the illustrious names that have been connected with the Society much might be said. Since the Society was founded each successive Governor has accepted the position of Patron, and in later years Patron and President; Commanders-in-Chief, Chief Justices, and Members of Council have often borne office; high officers of State have served on its Committees; and distinguished botanists have worked as its Secretaries. Wallich, Royle, Wight, Roxburgh, Lindley, Thwaites, the Hookers, Trimen, Schomburgh, Von Müller, Cleghorn, and many others have been its contributors. Nor should the services of the professional gardeners, who from time to time have been in charge of the gardens be forgotten. In 1853 Mr. Jaffrey was sent out to the Society from the Caledonian Horticultural Garden, Edinburgh, and did good work for four years until he obtained a better engagement at Bangalore, after he had contributed to the science of gardening his well-known booklet, *Hints to Amateur Gardeners in Madras*. He was succeeded by Mr. Robert H. Brown, the author of the useful *Handbook of the Trees, Shrubs, and Herbaceous Plants growing in the Society's Gardens and the Neighbourhood of Madras*. Mr. Denham, Mr. Henry, Mr. Storey, and some others came out from England in their turn, and, after doing faithful work, left the service for better-paid appointments. The Society has for the last four years had the benefit of the assistance of Mr. J. M. Gleason, who was sent out by the Secretary of State in 1869 to work at the Government cotton experiments in Central India, and who, besides the regular duties which he has loyally discharged, has compiled and published an admirable *Catalogue of Plants in the Agri-Horticultural Society's Gardens, Madras*, and is now engaged on other useful literary work.—(Extracted from the *Narrative of the Celebration of the Jubilee of H. M. the Queen Empress in the Presidency of Madras*).

"KEW BULLETIN."—The January number of this periodical contains a valuable article on the Coca, *Erythroxylon Coca*, whose leaves are spoken of by many travellers for their valuable property of allaying the effects of fatigue after prolonged exertion, and which contain the alkaloid cocaine now used as a local anæsthetic. The experiments made by the late Sir Robert Christison may be alluded to as confirmatory of the statements here repeated. Other articles refer to beetles destructive to Rice crops in Burmah, to fibre procured from *Houkenya ficifolia*, a Tiliaceous plant from West Africa, to the Yam Bean, *Pachyrhizus tuberosus*, to *Puya edulis*, a starch-yielding Bromeliad, reported to have saved the lives during periods of famine of many people (especially Indian); and other plants. It will be seen that the *Bulletin* is mainly confined to economic botany, and to the work of Kew as the head-centre of Colonial botany. It is to be wished that some addition could be made to it, so as to have a record of matters relating to the current work of the garden and of interest to home gardeners and botanists. A resumption of the publication of authentic lists and synonyms of certain orders and genera is also much to be desired.—*Gardener's Chronicle*.

FORESTRY.—Professor Boulger will deliver a course of ten lectures on this subject on Friday evenings at 8 p. m., commencing on January 11, at the City of London College, White Street, Moorfields, with special reference to the examinations of the Surveyors' Institution. Practical demonstrations in the country will be given during the spring. Text-books recommended:—Hough's *Elements of Forestry*—Orosby Lockwood. Brown's *Forester*—Blackwood & Son. Bagnier's *Elements of Sylviculture* (translated by Fernandez and Smythies)—W. Rider & Sons. Syllabus: Climate and Trees—Land suitable for Arboriculture—The Draining and other preparation of the Land—Nurseries and their management—Planting Operations—Thinning and Maintenance—Felling and Barking—Timber Measurement—Exploitation and management of Coppice—The Distinctive Characters of the various British Timber Trees. Free for the course 10s. 6d.—*Gardeners' Chronicle*.

SULPHATE OF COPPER AS A REMEDY FOR FUNGUS MOULDS.—The value of sulphate of copper for the destruction of fungus moulds is so great when properly applied, but may be so injurious to the plant if carelessly employed, that we think we may be doing our readers a service by calling attention to the method of preparing the mixture as described in the *Revue Horticole*, December, 1888. "One method of preparing this remedy is by dissolving 6 kilogrammes of sulphate of copper in about 88 litres of water, using for the purpose a wooden or stone basin. Another way is by placing in a separate vessel 6 kilogrammes of quicklime, and pouring upon it, little by little, and very slowly, 12 litres of water. It forms a milky liquid, which should be stirred with a stick, care being taken to break up any lumps which may be formed. The lime in mixing with the water gives off much heat. When this milky stuff is quite cool, it may be gently mixed in the solution of sulphate of copper, care being taken that the mixture is well stirred. Thus a rather thin liquid is obtained, which, if the copper employed is pure, should be of a beautiful sky-blue colour. In the formation of this preparation of sulphate of copper and lime, there is formed a sulphate of lime (gypsum), and a hydrated oxide of copper, in such proportions as are not dangerous to plants, but which kill the microscopic fungi on the Potato (*Peronospora infestans*). Finally, the plants must not be watered with the water-can, or the solution will reach the roots and kill the plants. It is only necessary to spray the foliage with the solution."—*Gardeners' Chronicle*.

CALIFORNIA.—After many unsuccessful trials after my landing in this country in 1887 (says a correspondent) I entered the service of the University, and have been appointed Superintendent Botanist of the Agricultural Experiment Station at Jackson, Amador County, in the foot-hills of the Sierra. My area comprises 34 acres in the most wonderful location, on the gently sloping hills now covered with *Quercus agrifolia*, *Douglasii*, *lobata*, *Oeanothus crassifolius*, *Arctostaphylos Andersoniana*, *Esculus californica*, after the grand forests of *Pinus Lambertiana*, *ponderosa*, *Sabineana*, *Libocedrus decurrens*, *Tsuga Douglasii* have all been cut down. The people up here cannot forget the days of old and their hydraulic mining, and they are consequently slow in utilising their beautiful soil of Vines, Olives, Peaches, &c., in the thermal belts at 1500—2000 feet elevation! The mild winters seem to turn all the native sons of the Golden West lazy, and newcomers, the "tender feet" from the East, or the boys from the Old Countries, seem to get easily ahead of them. It is a great pity, though, that even situations like mine seem to be dependent upon the changes in the administration of the civil service. I have done very little scientific work indeed. It takes a long time for a foreigner to make his way; but I am thoroughly convinced that I have chosen the right country, and I took my oath of naturalisation with full faith. My samples of work have secured me the position I fill, and I trust I am on the right track.—*Gardeners' Chronicle*.

ANTHRACITE COAL.—I notice in the last volume of the *Gardeners' Chronicle*, your correspondent, Thos. Christy, on p. 766, highly recommends this fuel for horticultural purposes, and invites some of the large consumers to give their experience of its saving over other fuel. As I am a rather large consumer of this fuel, perhaps it may not be out of place for me to give my experience, which is as follows, I will give one week's comparisons. It takes 7 tons of coke, at 16s. per ton, which amounts to £5 12s. 2d., or 6 tons of the ordinary steam coal, at 15s. 6d. per ton, which amounts to £4 13s., or 4 tons of diamond anthracite, at 17s. 8d. per ton, which amounts to £3 10s. 8d.; so, that by using anthracite I save £2 1s. 6d. per week over coke, or £1 2s. 4d. per week over steam coal. Of course the prices vary very much in different parts of the country, but I am sure if anyone gives it a fair trial, he will be more than satisfied with the results. I may add that there are several spurious kinds of anthracite offered to the public under the name of horticultural anthracite, and which only end in the disappointment and disaster to the purchasers, and I would advise anyone who has not as yet given the best quality of anthracite coal a trial, to avail himself of the offer of Mr. Pascoe, Swansea, to supply coal (from his own colliery), which is very important, as you can always depend upon having the same uniform good quality, and who offers to send to any gardener or nurseryman a sample bag, free of cost and carriage, for trial before ordering the coal in great quantity.—F. L. JENNINGS, The Gardens, Roselands, Woolston.—*Gardeners' Chronicle*.

HORTICULTURAL INSTRUCTION.—The course in horticulture of the Michigan State Agricultural College includes four general topics:—Pomology, vegetable gardening, floriculture, and seed-growing. The instruction is given both by lectures and by practical operations in the field. Of the two methods of instruction, it is intended that the field-work shall be the more important. The juniors are given instruction by the Professor, so far as possible, in sections or squads, in budding, grafting, pruning, filling, harvesting, marketing and storing fruits and vegetables. All vegetables which are suited to the climate are grown in the vegetable garden, and all desirable small fruits in the fruit garden. Apple, Pear, Plum, and Cherry orchards, and two vineyards, are invaluable aids to the observing students. Students who desire to follow fruit growing and vegetable gardening can secure here the necessary practical training. The class-room lectures also cover the practical points of the subjects, and enable the student to enter at once upon his field-work. The lectures also treat of the principles of plant-growth and their relations to cultivation of the classification and nomenclature of fruits and vegetables, of hybridisation and cross-fertilisation, and of plant diseases. Instruction is given in the care of hedges, ornamental trees and flowers, and upon the characters and values of native wild fruits. A few lectures are also given upon the history and literature of horticulture when time permits. A large horticultural laboratory is to be completed by the opening of the spring term, 1889. This will make possible the teaching of the higher phases of horticulture. Landscape gardening is treated as a fine art, and its study is introduced by a discussion of the principles of art in general. Unity, harmony, and variety are discussed at length, and abundant illustrations are drawn from the views and plants upon the college premises. The principles of the art of ornamental gardening once understood, they are applied to the ornamentation of parks, cemeteries, and large estates, after which practice the student is able to discriminate the features which can be judiciously applied to the embellishment of highways, school grounds, and country homes. In practical rural embellishment the subject finds its greatest expansion. Finally, the student is given instruction in rural architecture, in the making of walks and drives, in sodding, grading, &c.—*Gardeners' Chronicle*.

CLEANING PARCHMENT COFFEE IN LONDON.

Colonial Secretary's Office, Colombo, 25th Feb. 1889.

SIR,—With reference to my letter of the 21st June last, I am directed to transmit to you a further copy of a despatch from the Secretary of State for the Colonies forwarding a letter from Messrs. Lewis and Peat on the subject of cleaning parchment coffee in London.—I am, sir, your obedient servant.

A. M. ASHMORE, for Colonial Secretary.

(Circular) Downing Street, 10th January 1889.

SIR,—In continuation of my circular despatch of the 9th of May last, I have the honour to transmit to you, for publication, a copy of a letter from the Royal Gardens, Kew, enclosing a copy of a further letter from Messrs. Lewis and Peat, on the subject of cleaning parchment coffee in London.—I have the honor to be, sir, your most obedient humble servant,

KNUTSFORD.

KEW GARDENS TO COLONIAL OFFICE.

Royal Gardens, Kew, 21st December, 1888.

SIR,—In continuation of my letters of 11th April and 23rd April of this year, I am desired by Mr. Thistleton Dyer to forward a copy of a further letter received from Messrs. Lewis and Peat, on the subject of cleaning parchment coffee in London.

2. It appears that, acting on the suggestions contained in the letters above quoted, which Lord Knutsford was good enough to communicate to the Governors of the West Indian and other Colonies interested in the production of coffee, shipments of coffee in parchment have been made, and, as regards Jamaica coffee, have produced very encouraging results. A small shipment made from Dominica has not proved so satisfactory, as the parchment coffee in the first instance was not sufficiently dried before it was shipped. The brokers draw particular attention to the fact that imperfectly dried shipments are useless.—I am, &c.,

(Signed) D. MORRIS.
Edward Wingfield, Esq.

MESSRS. LEWIS AND PEAT TO ROYAL GARDENS, KEW.

6, Mincing Lane, E. C., 20th December, 1888.

Dear Sir,—We beg to draw your attention to the sale of Some Jamaica coffee sent home in the parchment and cleaned here, and recommend it to the notice of shippers generally.

The parcel D-Pr. per "Nile" sold as follows:—

5 bags bold colory	at 90s per cwt.
5 " medium-size colory	at 87s "
1 " small	at 76s "
1 " pesberry	at 64s "

which is very encouraging result.

We also sold two bags Dominica, but the coffee was not sufficiently dried on the other side, bringing only 76s per cwt. Imperfectly dried shipments are useless.—We are, &c.,

(Signed) LEWIS & PEAT.

D. Morris, Esq., Royal Gardens, Kew.

TRADE-MARK LAW:—TOWER TEA.

An important decision in regard to trade names was given in the Chancery Division of the High Court of Justice on Tuesday, by Mr. Justice North. The case was the Great Tower Street Tea Company v. Hedley Smith, and the evidence submitted occupied the Court for 11 days. The question at issue had reference to the use of the title "Tower" as applied to packed teas. The plaintiff company were incorporated by registration in 1879 to take over the business in the sale of packet tea of Messrs. Lough & Walker, of 41 Great Tower Street. They alleged that shortly after that time their tea became known as, and has ever since been recognised as, "Tower Tea." In 1885 they registered two trade-marks—one for tea and coffee, consisting of the design of a tower or castle, with the word "Strength" connected with it and surrounded by the name of the company in a garter; the other simply of the two words "Tower Tea." The defendant is the successor to a tea business carried on, first at Muscovy Court by one Holland, later at Harp Lane. This business was commenced in 1878. Since the action was brought the defendant has moved his packet business to Leadenhall Street and his loose tea business to Fenchurch Street. The words

"Tower Tea Company" had been used in connection with the defendant's business by both himself and his predecessors. The plaintiff company attempted to make out that the defendant had either never had, or had lost his right to use, the title "Tower Tea Company," and that he had so used it as to pass his goods off as their goods, and claimed an injunction to restrain his using that style, using the fancy name of "Tower Tea," or passing his goods off as those of the plaintiff company; and the defendant moved to erase from the register of trade-marks the plaintiffs' registered trade-mark of "Tower Tea" on the ground that it was not subject-matter capable of registration within the Patents, Designs, and Trade Marks Act, 1883. It was attempted on behalf of the plaintiffs to bring the mark within marks allowed to be registered as enumerated in section 64, subsection 1 (c) of the Act,—namely, "A distinctive device, mark, brand, heading, label, ticket, or fancywords not in common use." No objection was taken to the other registered trade-mark of the plaintiffs.

Mr. Aston, Q.C., and Mr. Carpmal appeared for the plaintiffs, and Mr. Napier Higgins, Q.C., and Mr. Solomon for the defendant.

Mr. Justice North, in giving judgment, said it would be most convenient in the first place to deal with the motion. Mr. Carpmal had argued that the expression was a "fancy word" within the meaning of the subsection. Upon this point his lordship cited the definitions of "fancy words" given by the several Lords Justices, Cotton, Lindley, and Lopes in the leading cases on the subject ("Re Van Duzer's Trade-mark," 34 Ch.D., 623.) relating to the word "Melrose" as applied to a "Hair Restorer"; the word "Electric" as applied to "Velveteen," and adopted by Lord Justice Fry in a still more recent case. Lord Justice Cotton said in respect of a fancy word:—"It must be a word which obviously cannot have reference to any description or designation of where the article is made or what its character is. Lord Justice Lopes said:—"I think a word, to be a fancy word, must be obviously meaningless as applied to the article in question." Mr. Justice North considered both from the nature of the case, and the evidence before him as to the use of the word "Tower" in respect to other articles sold in the neighbourhood and other kinds of business carried on in the same neighbourhood the word "Tower" was obviously descriptive; and therefore "Tower Tea" was not a fancy word. The motion, therefore, to have the trade-mark expunged must succeed. As to the action, his Lordship came to the conclusion on the evidence that the defendant and his predecessors had *bona-fide* used the trade-mark before the plaintiffs; that he had never used it for the purpose of passing off his goods as those of the plaintiffs; and that, in fact, whatever he might have thought without evidence, the evidence clearly established, to his mind, that the two names were not likely to be confused by purchasers; and he dismissed the action with costs, and allowed costs on the higher scale.—*Chemist and Druggist*, Feb. 2nd.

H. A. HERTZ & CO'S REVIEW OF THE TEA MARKET FOR 1888.

This is a very comprehensive broadsheet giving the year's history of the different qualities of China teas, and of Indian, Ceylon and Java kinds, with monthly details of imports, sales, prices, &c. The lowest price for China is frequently quoted at what must be the entirely unremunerative figure of 3rd. per lb.

The History of Ceylon Teas for each month of 1888 is thus given:—

January:—Ceylon Teas.—Weak and drooping for all average grades. Finest descriptions, Bro. Teas, and Dust in good demand and firm. Quality poor; public sales Ceylon, 24,738, import, 1,356,784, delivery, 1,029,318, stock, 3,673,192.

February:—Ceylon Teas.—The tone of the market is strong for parcels of quality, which are in small supply, but continues weak for all other grades. Quality poor; public sales Ceylon, 17,309, import, 1,261,250, delivery, 1,060,546, stock, 3,873,896.

March:—Ceylon Teas.—Prices generally show hardening more decidedly for all Good Teas. Quality shows improvement; public sales Ceylon, 19,464, import, 1,243,966, delivery, 1,084,850, stock, 4,033,012.

April:—Ceylon Teas.—Are advancing in value accompanied by better demand. Improvement in quality-maintained; public sales Ceylon, 19,173, import, 1,106,462, delivery, 1,235,420, stock, 3,901,054.

May:—Ceylon Teas.—All but really Fine kinds, Bro. Teas and Dust suffer a severe decline. Quality shows again falling off; public sales Ceylon, 27,665, import, 2,015,920, delivery, 1,305,960, stock, 4,617,594.

June:—Ceylon Teas.—Improve during latter part of month, and close firmer with better enquiry. Quality remains indifferent; public sales Ceylon, 35,389, import, 2,139,242, delivery, 1,594,208, stock, 5,163,540.

July:—Ceylon Teas.—The better tone is fully maintained, prices continue to harden, and demand is active. Quality slightly improved; public sales Ceylon, 35,360, import, 2,040,094, delivery, 2,266,106, stock 4,937,528.

August:—Ceylon Teas.—Prices generally advance and competition is brisk. Quality improved; public sales Ceylon, 34,079, import, 2,412,362, delivery 2,116,702 stock, 5,283,188.

September:—Ceylon Teas.—Prices remain strong for Fine and Common grades; intermediate descriptions in less good demand, and slightly irregular. Quality good to very good; public sales Ceylon, 27,130, import, 1,452,403, delivery, 1,873,396, stock, 4,812,200.

October:—Ceylon Teas.—Supplies are very moderate, and prices rule higher. Quality well maintained; public sales Ceylon, 25,576, import, 1,691,792, delivery, 1,885,440, stock, 4,616,530.

November:—Ceylon Teas.—Gradual weakening of prices for all Medium grades. Quality declining; public sales Ceylon, 22,463, import, 1,588,964, delivery, 1,689,480, stock, 4,522,650.

December:—Ceylon Teas.—Further distinct decline in prices, and languid demand, except for Finest lines. Quality indifferent to poor; public sales Ceylon, 22,331, import, 2,015,462, delivery, 1,408,134, stock, 5,129,978.

INDIAN TEA CROPS.

Indian Tea Association, Chamber of Commerce,
Calcutta, Feb. 15th, 1889.

DEAR SIRS,—In their circular of the 3rd November last the General Committee gave a revised estimate of the probable outturn of the Indian Tea Crop of 1888, based almost entirely upon actual results up to the 30th September, and showing the following figures:—

Revised Estimate of Crop of 1888.

	lb.
Assam	41,869,554
Cachar and Sylhet	28,731,581
Darjeeling, Terai and Dooars	17,808,714
Chittagong and Chota-Nagpore	1,348,379
Dehra Doon, Kumaon and Kangra	4,000,000
Private and Native Gardens	2,000,000
	95,758,228

The Committee have now the pleasure to hand you the undermentioned figures giving the actual outturn of the crop of 1888 from the returns they have been able to collect from Agents of Tea Gardens and from an estimate of the production of the North-West and of private and native gardens. The figures showing the crop of 1887 are also given for comparison:—

Actual Outturn of Crops.

	1888.	1887.
	lb.	lb.
Assam	41,865,499	37,849,202
Cachar and Sylhet	27,343,505	27,156,589
Darjeeling, Terai and Dooars	18,950,822	14,997,805
Chittagong and Chota-Nagpore	1,148,458	1,538,249
Dehra Doon, Kumaon and Kangra	4,000,000	3,750,000
Private and Native Gardens	3,000,000	1,500,000
	96,308,284	86,791,845

The exports to Australia, America and other places to the end of January exceed 3½ million lb., and if to this quantity be added the requirements of Northern India, estimated at 1½ million lb., there should remain about 91 million lb. for shipment to Great Britain, if the exports during February, March and April should be equal to those of last year.

—Yours faithfully, G. M. BARTON, Asst. Secy.

THE CHINA TEA MARKET EXPORT AND PROSPECTS.

We quote as follows from a Tea Report dated Foochow, 2nd February:—

Now that the Chinese holidays have arrived, little more business is to be expected. Those Teamen who hold the Stock, which is large for the time of year, are much disappointed, that the stoppage of supplies, should not have created sufficient demand to enable them to quit their holdings. Throughout the season the Natives have done well with all good to fine teas while they have learned that even at low prices, common is not wanted: they are now quite alive to the fact that they must improve the quality of the tea. The resolution of the Kung Yeh Tong to stop supplies in the middle of September last, presents a new feature in the Trade of the Port. The tea Hongso so far, have acted loyally in the matter; and there is no doubt, that, if supported by the foreign buyers, this tea Guild must exercise a very powerful control over the future of the Foochow tea trade. Without some such restraining influence, the supply of tea, even at the low prices lately ruling would be practically unlimited. With the departure of the "Ching Wo," and "Glennarn," as given below, the Export to Great Britain and the Continent is virtually closed for the season; and shows a decline as compared with last season to same date of 10,221,730 lb.

The total Export to Great Britain and the Continent of Europe compares with last year as follows:—

	1888-89.	1887-88.
For London, by steamer	33,653,692 lb.	43,512,101 lb.
For the Continent, by steamer	619,090 "	982,411 "
Total	34,272,782 lb.	44,494,512 lb.

The following are comparative Exports to the different Ports of Australia and New Zealand:—

	1888-89.	1887-88.
	lb.	lb.
Sydney,.....	6,466,400	6,139,511
Melbourne,.....	12,302,544	12,902,738
Adelaide,.....	1,317,355	1,234,680
Out-Ports,.....	1,138,249	1,235,209
New Zealand,.....	2,746,592	3,042,729
Total.....	23,971,140	24,554,867

THE STORAGE OF TEA. IMPORTANT ACTION AGAINST TEA WAREHOUSEMEN.

EVIDENCE OF EXPERTS IN THE TEA TRADE.

In the Queen's Bench Division last Saturday, the case of Barlow & Brother v. The Proprietors of the City Bonded Tea Warehousemen came before Mr. Justice Field and a special jury. This was an action to recover damages for negligent storage of a parcel of tea, and the defence was a denial of negligence

and of damage to the tea. Mr. R. B. Finlay, Q.C., M.P., and Mr. Hollams were counsel for the plaintiffs; while Mr. R. T. Reid, Q.C., M.P., and Mr. Stuart Sankey were counsel for the defendants.

Mr. FINLAY, in opening the case, said the plaintiffs, Messrs. Thomas Barlow & Brother, were merchants carrying on business in Fenchurch-street, E.C., and at Manchester, and they had also houses in China and India. The defendants were tea warehousemen, and the action was brought to recover £257 as the loss on a certain parcel of tea which was stored by plaintiffs with defendants, and which, owing to the condition of defendants' premises, or some other cause, was damaged while under defendants' care. The tea in question was consigned from Hankow on May 29th, 1888, by the plaintiffs in China to their house in England. The tea was in two parcels, the first parcel being that in respect of which the action was brought. This first parcel was described on the invoice as A. 1. 2, and consisted of 261 packages of Ningchow congo chopped with the words "Tsing-sing." These parcels, which were identical in quality and counterparts of one another, were stored with defendants on their arrival in England on June 25th. The second parcel was not stored in the same part of the warehouse as the first and this accounted for the fact that while the first parcel was damaged the second was not. Plaintiffs had arranged with Messrs. Ripley, Howse & Co., tea brokers, to sell the first parcel of tea; while the second parcel was confided to other brokers. When the tea arrived the defendants sent samples from the two first chests in each parcel to the importers, and the brokers were supplied on application with their samples to sell from. Mr. Mitchell, the representative of plaintiffs' house in London, inspected samples of both parcels, and found that they were of a very fine quality and absolutely identical, and he also found they were identical with the samples sent to Messrs. Ripley, Howse & Co., the selling brokers. The second parcel was speedily sold to a considerable extent, and fetched the high price of 1s 6d per lb., and the plaintiffs wished to get the same price for the first parcel, as the quality was identical to the second.

His LORDSHIP:—Was this a Mincing-lane sale?

Mr. FINLAY said the tea was not sold by auction but by private contract. Plaintiffs expected to realise the same price for this other parcel, but for some reason they did not succeed. An offer of 1s 5½d was made and refused. The result was the tea remained in defendants' warehouse until after the 22nd August, when the discovery was made that the tea was damaged. On the 2nd August, there being a demand for this tea, Messrs. Ripley, Howse & Co. sent to take further samples of it, and it was then found that during its stay in defendants' warehouse the tea had acquired what was known in the trade as a foreign smell—a damp, appley-cheesy smell. Plaintiffs believed that the tea acquired this smell through being impregnated with the fumes arising from wines and spirits stored in the vaults below. Everyone in the trade knew that tea quickly acquired the smell of various things near it, and it would readily acquire a fine orange flavour if placed beside oranges. The capacity of tea to take up odours of this kind varied at different times, but everyone knew that there was great danger of tea acquiring smells, and that it must be kept in a place where there was no possibility of this contagion. The discovery of the foreign smell considerably surprised the brokers' and plaintiffs' agent, Mr. Mitchell, and the defendants were at once informed of the fact that the tea had deteriorated. The manager to the defendants, Mr. Buchanan, a good judge of tea, admitted that this tea was "rather flat." This gentleman went with Mr. Mitchell and the brokers to the warehouse and took further samples, but they all had the same smell. They also took four samples from the second parcel of tea, which had been kept in a different part of the warehouse. These latter samples did not show the least deterioration from the quality exhibited on their arrival. On Mr. Howse suggesting that the deterioration was due to impregnation with the fumes

of wines and spirits, Mr. Buchanan said: "Oh, that is impossible, as there is three feet of concrete between these warehouses and the vaults below." The brokers were then instructed to sell the tea on behalf of those whom it might concern, and it was sold "according to brokers' marks."

His LORDSHIP:—I suppose the parties agree as to the amount of damages?

Mr. REID:—I am afraid we cannot, because the market fell 2d a lb. in the two months.

Mr. MITCHELL, London manager of plaintiffs' firm, then deposed that part of plaintiffs' business consisted in exporting home manufactures to China, and in remitting home the proceeds in tea. One of these shipments came by a vessel called the "Moyuve," which arrived in England on June 25th. On its arrival the defendants received these two parcels of tea, as had been previously arranged, and Messrs. Ripley, Howse & Co. had instructions to act as selling brokers. This was the first arrival of that season's tea. On taking the goods into the warehouse defendants forwarded witness samples of both parcels of the tea. He inspected the samples and found them exactly identical in quality. He had been in the tea trade as a taster nearly twenty years. [Samples of the teas were then handed to the jury for inspection.] It was tea of a very fine quality.

His LORDSHIP: What is "chopping" the tea?

WITNESS said it was probably the name the tea went by, or the merchant's or seller's name.* The second parcel of tea was sold at 1s 6d. per lb. He sold 120 half-chests on the first day. Fresh samples of the first parcel were taken on the 22nd August to see if it had changed, and it was found that it had a foreign smell, and had very seriously deteriorated. He saw Mr. Howse, the selling broker, and they went together to the defendants' office, and afterwards to the warehouse. They went into the room where the tea was stored, and he immediately noticed a very strong smell in the room, which seemed to him exactly the same as the smell on the samples. On that occasion he took four fresh samples from four different packages and found the same smell in each. These packages were stored one upon another in the ordinary way. He complained to Mr. Buchanan, and more samples were drawn from this tea and from the other parcel. It was found that the second parcel, which was stored in another part of the warehouse, was in perfect condition, while the other was damaged, and felt warm to the hand. The temperature of the room in which the damaged tea was stored was very hot, and that might account for the tea being warm. This damaged tea was sold on September 4th by "broker's marks final at public auction on account of whom it might concern," and notice was given to the defendants. Witness had an account of the sale showing a loss to the plaintiffs of £257 9s. 5d. The counterpart of the tea having sold for 1s 6d. per lb., witness took 1s 6d. as the basis of the claim, and the difference between that and the actual price realised for the damaged tea was the amount of the loss without reference to market.

Cross-examined by Mr. REID, Q. C.: This was the first ship that arrived of this season's tea, and as a rule the first shipment fetches the Highest price.

His LORDSHIP: Don't you give a thousand pounds to the shippers for the first arrival?

WITNESS said that practice had quite gone out of date. The first portion of the second parcel was sold for 1s 6d., but they could not get that price for all of it. Some of it was sold at 1s 5½d., and some was not sold at all. Between June 25th and August 22nd the market price had fallen a little—it might have fallen 1d., but not 2d. When this lot of first parcel was sold at public auction it averaged 1s 1½d. per pound. It was the practice to put two sample packages, representing each parcel in the ship, on the top of the bulk. Sample chests might be carried in the cabin separate from the bulk. The samples taken on the 25th or 26th of June were taken from the sample chests. From the first parcel of tea samples were drawn on several occasions between June 25th and August 22nd by the selling brokers.

* Surely a "chop" of tea is a lot of identical quality?—Ed.

HIS LORDSHIP: How do you describe this smell on the tea?

WITNESS said it was exactly the smell proceeding from a wine or spirit vault. He admitted writing to his principals on the 23rd August saying the samples had a smell resembling apples and cheese. It was not exactly a fruity smell.

MR. REID: Are you a judge of smells in particular?

WITNESS: I hope not. (Laughter.) The marks on the tea "II" meant that it was in fairly good condition, while "I" signified that it was going off, but "A" meant that it was quite gone off. This tea came from Hankow. Before being sent to England tea had to be cured, and if carelessly cured or packed it had a tendency to go off. When cured or packed in damp weather it was more likely to go off. The season of 1888 was very damp in England. He was not in China, so could not say what the weather was there. He had not heard on the market that it was a damp season in China. His firm bought none of this tea.

MR. HOWSE, a member of the firm of Messrs. Ripley, Howse & Co., of 24, Eastcheap, E. C., tea brokers, said he saw samples which were drawn when the tea arrived on June 25th. It was then perfectly sound, and of very fine quality. The tea remained with the defendants until August, and six or eight samples were drawn between June 25th and August 22nd. The samples were 1 lb. samples. A sample drawn on July 6th was all right, but the samples of August 22nd had a peculiar smell, which was something quite different to smells due to bad curing or damp.

MR. REID said it might shorten the case if he stated the defendant's case at once. His first proposition was that whatever was wrong with this tea was the result of improper treatment or negligence abroad, and that would be supported by skilled evidence. His second point was that the counterpart parcel of tea was exactly the same, and that if one parcel was damaged, so was the other. If the plaintiffs said the ventilators admitted foreign smells into the warehouse, his third proposition was that the ventilators had not been opened during the time the tea was in the warehouse.

MR. HOWSE, in further evidence, said the quality of the tea was impaired between June 25th and August 22nd, from a well-known process going on in the tea itself. The difference between this tea and tea which had "gone off" through bad curing, bad packing, or a damp season was that this tea was perfectly crisp to handle, while tea which had been badly cured in China would be quite spongy and soft, with a peculiar sort of rotten smell.

MR. FINLAY: Did this tea present that spongy appearance which characterises tea badly cured?

MR. HOWSE: Certainly not. I have been in the tea trade for 26 years, and I am perfectly familiar with the appearance of tea that has gone off through bad curing. This tea had not that appearance.

MR. ARTHUR CAPEL, tea broker, of Mincing-lane, E. C., said his experience in the trade extended over something like 50 years. In September he saw 12 or 14 samples of this tea. He tested them by tasting and smelling and found them different to the original samples. The samples were more or less out of condition. In his report he stated that he was unable from the examination to state what caused the deterioration in the tea. He saw some further samples the day before yesterday. They were also out of condition and worse than the samples he saw previously. They had a "winey" smell.—Was the condition of the tea due to bad curing or bad packing? Decidedly not.

HIS LORDSHIP: To what was the condition of the tea due, in your opinion? To heat in the warehouse.

Cross-examined by MR. REID: The term "winey smell" was common in the trade. He had experience of tea coming from China with this peculiar smell. He remembered some tea ex "Wild Deer" having this winey smell, but he did not know the cause of the smell.

MR. HERTZ, tea broker, Mincing-lane, gave evidence that he had had 22 years' experience in the

tea trade, and last September he examined samples of this tea. He drew samples from our packages and made a report as to the condition. He was acquainted with the condition of tea which had gone off in consequence of bad curing, or careless packing, or packed in bad weather. The term "O. S.," mentioned in his report, meant that the tea was not in a sound condition. In his opinion the condition of this tea was not due to careless or bad curing.—**Cross-examined by MR. REID:** He had heard the evidence of Mr. Capel, and agreed that the term "winey" smell was common in the trade. The term meant that the tea had a smell similar to that of wine.

MR. ODELL (Fergusson & Odell, tea brokers) said he had been a broker for 15 years. On Dec. 8th he inspected the defendants' warehouse, where the tea was stored. He saw the ventilator open. He had since examined samples of the tea in dispute, and found they had an odd smell about them.—Was that smell due to bad curing or bad packing in China? It was due to the particular smell in the room where the tea was stored. The smell was particularly noticeable at the ventilator. The smell was a "winey" smell. The cause of the smell was the fumes from the wines or spirits that came into the room through the ventilators.

MR. FINLAY said he would be satisfied if Mr. Reid admitted that if the ventilators were open the fumes from the wines and spirits could enter the warehouse.

MR. REID said he was desirous of shortening the enquiry, and therefore would make the admission asked for.

At this point the hearing was adjourned until Monday, when Mr. HAZLEHURST, a surveyor, gave evidence.—This closed the case for the plaintiffs.

MR. REID, for the defence, said his case was that the tea in question was not damaged by these fumes or by any fumes, that there was nothing the matter with the tea, except that it had more or less gone off. The jury might be interested to know that the ventilator was not opened during the whole of the time that this tea was in the defendant's warehouse, and he would call the man who opened the ventilator after the tea left to prove that.

MR. THOMAS WILLIAM LEWIS, manager of the inspecting and sampling departments of Messrs. W. & H. Thompson, tea brokers, said that he had acted nearly 26 years in that capacity. On the 3rd September last he went to the defendants' warehouse and inspected this tea. He inspected about three-fourths of the whole 261 packages which composed this parcel. He took tea out of different parts of several packages and took it to his office to test. He put the whole of the tea to a very severe test in this way. He had the first 25 out of each break of 100 chests brought to him, and he had them drawn from the corners and middle. At the conclusion of the examination his opinion was that the teas were in a gradual state of decay, or "going off."—What do you attribute that to? My impression was that the tea had been hastily prepared, and that the time of firing had not been sufficient to destroy the vegetable moisture.—In your opinion was there any defect in this tea due to the impregnation of fumes of wines or spirits? Not the slightest.—Do you think it was due to heat in the warehouse? Not at all.—On the 9th of January this year did you draw samples from both parcels: the parcel in question we will call A, and the second parcel D? Yes.—Mr. Reid explained that these were the four samples handed to Mr. Howse.—Witness, continuing, said there were two samples of D taken from chests which he had opened at the bottom. The first one opened, chest No. 353, was decidedly out of condition. The other, No. 359, was out of condition, but not so bad as the other. He then had two packages of A opened in the same way, and they were also found to be out of condition.—When you say samples of D were out of condition, was it from the same or a different case as parcel A? Precisely the same.

MR. FINLAY: In lot A was the tea crisp? Witness: Moderately so.—When tea goes off from bad curing is it crisp? It depends upon the nature of the tea; tea of a high quality like this would largely retain its crispness.

MR. WM. THOMPSON (Messrs. W. J. & H. Thompson, tea brokers, Mincing-lane) gave evidence that the last

witness brought to him samples of their tea. He examined the samples carefully twice. He saw samples both in September and in January.—What was the condition of parcel A? It was gone off or going off.—In your judgment was there any defect in that tea caused either by fumes of wines or spirits or by heat? Certainly not.—Do you agree with the last witness as to the cause? Yes, I do.—Does the tea arriving in England first sell better or worse than later shipments? Generally better, if sold at once.

HIS LORDSHIP: What is the usual time for first arrivals? Witness: Quite the end of June or the beginning of July. The 25th of June was very early, and shipments are seldom received before that time.—If a first shipment sells at once, how much more will it fetch than shipments a week later? Probably 1d a lb., because there is nothing like it on the market.—Between June 25th and August 22nd how much did the market fall for tea of this description? I should say 2d or more.—I observe from the catalogue that this tea was put up "brokers marks final," what does that mean? It means that the seller does not guarantee the marks placed on the tea by the broker, and the purchaser buys the tea with that notice.—Does "brokers marks final" in the catalogue diminish the price? Of course; it throws a doubt upon the quality.

Cross-examined by Mr. FINLAY: I think you have some interest in these warehouses, Mr. Thompson? None whatever, Mr. Finlay.—Have you had anything to do with the correspondence about this tea? No.—With regard to selling "by brokers marks final," does that influence the sale?

HIS LORDSHIP: Of course it does. It is like selling a broker a horse with all faults. I daresay you have done that, Mr. Finlay. (Laughter.)

Mr. FINLAY. I cannot say that I have. Your lordship has been more fortunate in that respect than myself. (Laughter.)

HIS LORDSHIP (to witness): You heard what was said by the last witness as to the condition of the tea. Did he tell us great stories? Certainly not, my lord.

Mr. REID said it would save time if Mr. Finlay would take it from him that Mr. Buck and Mr. Grant Scott agreed with the evidence given by Mr. Thompson.

Mr. CRAVEN, examined by Mr. REID, said that for twelve consecutive seasons he had been a buyer of tea at Hankow, where this identical tea was bought.—What do you say in reference to the teas of season 1888? It was the worst season out of the twelve that I have been in China as regards weather.—Would the effect of the bad weather be to make the tea go off? The effect of the weather was to make a great many teas go off, especially in the district where this tea came from. This was due to damp.

Mr. JOHN MURPHY, foreman at defendant's warehouse, also gave evidence.

This was the case for the defendants. Mr. Reid and Mr. Finlay having addressed the jury,

HIS LORDSHIP, in summing up the case to the jury, said they must show by their verdict whether the plaintiffs had satisfied them that the damage was due to want of care on the part of defendants. If they were satisfied from the evidence that the plaintiffs had established the fact that the defendants had been guilty of some neglect of duty or want of care of the plaintiffs' goods, then the plaintiffs were entitled to a verdict, with damages. On the other hand, if the case was not established to their satisfaction, they must find for the defendants.

The JURY left the box and retired for about half an hour. On their return into court they found a verdict for the defendants.

HIS LORDSHIP gave judgment for the defendants accordingly, with costs.—*Grocers' Gazette*, Jan. 19th.

CUSTOM IN THE TEA TRADE.

Yesterday (18th inst.), in the Lord Mayor's Court, the case of *Hodgson v. Caffin* came on for hearing. It was an action brought by the plaintiffs, Messrs. Hodgson & Eckett, tea brokers, carrying on business at 59, Eastcheap, against the de-

fendants, Messrs. Caffin & Co., tea brokers, of Rood-lane, E. C., to recover the sum of £22 16s 4d, which plaintiffs alleged they had lost by reason of the defendants refusing to carry out a contract to purchase a certain quantity of Indian tea.—Mr. J. Hodgson, one of the plaintiffs, stated that on the 30th of April last the defendants purchased from his firm at a sale by auction 27 chests of pekoe tea at 9½d per lb. Prior to that the tea had been bulked and samples were sent to the defendants, who afterwards wrote to the plaintiffs declining to complete their contract on the ground that the tea was inferior. The plaintiffs wrote back stating that the tea had been sold by auction, and the defendants would have to complete. The plaintiffs had to resell by auction. The 27 chests of tea were sold to the defendants for £108 6s, but on the 1st of August were resold, the price realised making a loss of £22 16s 4d, which was now sought for. Cross-examined by Mr. Fullerton: It is not the custom of the tea trade that if you sell for an unpaid prompt, the tea must be sold for cash.—**HIS LORDSHIP:** Supposing the jury find that the tea was inferior, the plaintiffs' only remedy was to resell for cash.—Mr. Fullerton: This action is brought against us to recover damages for a resale, but according to the custom of the tea trade, the plaintiffs cannot succeed. I am going to prove by one of the best tea experts in London that if the plaintiffs take the tea and sell it as they have done they cannot sue, as they had no right to resell, because the tea was our property after the auctioneer's hammer had fallen. The plaintiffs must abide by the usual custom of the tea trade.—Witness stated that when the notice came from the defendants that the tea was defective he went to the docks and sampled the bulk of the tea himself. Evidence having been given as to the bulking and mixing of the tea, Mr. Fullerton, for the defence, contended that the first sale was one by sample, but the bulk was inferior to sample, so they were justified in refusing to carry on their contract.—Mr. Edward Caffin deposed that he had known the tea trade since 1861. He received in April the notice from the plaintiffs of the sale of the Indian teas in question. On the day previous to the sale one of his clerks went and drew a sample, no doubt from the show chest. A Mr. Hayley attended the sale on behalf of the witness, and after the sale on the 1st of May samples of tea were drawn from the bulk. In consequence of what was found more samples were drawn on the 4th of May. They were bad, and witness refused to pay the deposit and returned the weight notes. About the 14th of June Mr. Hodgson called on witness and said that as he was a new merchant with witness he did not wish to reopen the case, but the tea would fall on his hands. Witness told him that in that case he would do everything in his power to help him, but refused to complete his contract, stating that the cause was irregularity in the different chests of tea. Mr. Hodgson demurred, but partly admitted that. The next heard was this action.—Mr. Lewis, secretary of the Tea Brokers' Association, and Mr. Walter Odell having given evidence as to the custom, the jury stopped the case, and found a verdict for the plaintiffs for the full amount claimed. Judgment for the plaintiffs for £22 16s 4d with costs.—*Grocers' Gazette*, Jan. 19th.

WHITE-ANTS AND LIVING PLANTS.

The following paragraph occurs in the *Indian Agriculturist*:—

A controversy is going on in Southern India as to the probability of white-ants destroying plants. A correspondent writing to a contemporary says that such is the fact, which is borne out by native gardeners who are of opinion that these pests are injurious to vegetable life. They say that a plant is seen to be sickly and out of sorts and at last dies; when the dead stock is pulled up it is found that white-ants are entangled in its roots. The point however to be ascertained is whether the ants attack the plants *before* or *after* they have withered away. The insects as is well known attack dead wood and not living plants which are fresh,

* Mr. A. M. Gepp is connected with this gentleman.—ED.

green, and juicy. The latter would have little attraction for an appetite that is gratified by a post or part of a gate. They would certainly attack wood that is already dry and their presence under the circumstances mentioned might lead casual observers to conclude that they would subsist on any wood. But until more careful experiments are made, it would be idle to hazard an opinion.

We long contended that white-ants did not attack living tissues, but only dead matter. We were confirmed in the conviction that the termites spared living plants by a very interesting sight which may any day be seen in the Cinnamon Gardens near Colombo,—a cinnamon bush flourishing while growing in the centre of the pyramidal nest, 3 to 6 feet high, of the white-ants. But the Indian tea planters found that the insects paid no such respect to tea bushes, and accordingly they cleared away all dead wood, instead of allowing it to decay and form fertilizing matter, because the white-ants attracted by the decaying wood proceeded to feed on the living tea plants. On lowcountry estates in Ceylon too, white-ants have proved troublesome, while coconut planters have to apply ashes to their young plants and take great care to preserve them from the attacks of the destructive termites. It remains true, however, that the white-ants generally choose dead matter as their food.

CEYLON UPCOUNTRY PLANTING REPORT.

COFFEE—CACAO—TEA—TOBACCO.

25th February 1889.

As to vegetation, good blossoms should be roasted out, and COFFEE looks as if it intended to do it if it got any kind of chance in the shape of a shower.

CACAO is various. The trees that have just borne a big crop are resting: no sign of blossom whatever, whereas those that did little during the autumn crop are well to the front with a fair show of fruit set. On the whole I think it is looking well.

TEA is all but shut up. We all say "if we only had rain." That too will come; meanwhile everything is parched, and weakly supplies are finding life not worth the living and giving up the struggle.

The numbers of those who intend to make a fortune by TOBACCO go on increasing. I fancy when published there should be a considerable run on your *Tobacco Manual*, where the knowledge will be definite, instead of what obtains at present, which consists pretty much of nods and winks. All the same it is quite astonishing how satisfied a man is with this kind of indefinite information, and how he is prepared to build a happy future on it.

PEPPERCORN.

INDIAN TEA IN AMERICA.

We hear that the project for establishing markets for tea in the United States has been received with favour. Shareholders in tea concerns, as well as brokers and dealers in the Laue, are supporting it in the belief that it is likely to prove a great success. Mr. Macgregor, who has control of the arrangement in America, is very sanguine as to the results, and he is prepared to back his opinion. The directors mean business, and all concerned are firm in the belief that before very long the American market will absorb a large quantity of Indian tea.—*H. & C. Mail.*

THE DEMAND FOR CEYLON TEA INCREASING RAPIDLY.

The Colonies and India says:—The Ceylon Chamber of Commerce export figures from October 1st, 1888, to January 3rd, 1889, are as follows:—Coffee, 20,630 cwt.; cinchona, 3,354,521 lb.; tea, 6,983,686 lb.; cocoa, 1,464 cwt.; cardamoms, 55,761 lb. Over 3,000 tons of tea for a single quarter is not by any means a bad sign for this industry. The demand for Ceylon tea is increasing rapidly on this side, and as the planters appear to be going in pluckily for its production, we may expect to see these figures rapidly rising.

THE YATADERIA TEA COMPANY, LIMITED.

The first annual general meeting of the Yataderia Tea Company, Limited, was held at the offices, 21 Baillie Street, Colombo, yesterday (Feb. 28th) afternoon, Mr. H. K. Rutherford, Managing Director, in the chair.

The following shareholders were represented, viz.:—Messrs. H. V. Masefield, J. H. Starey, J. R. Fairweather, S. L. Harries, H. Tarrant, W. Mackenzie, D. Fairweather, A. P. Crawley-Boevey, W. Church, and G. J. Jameson (by attorney), and the acting Secretary, Mr. T. Wright.

Notice convening the meeting having been read the report and accounts for 1888 were laid before the meeting and taken as read.

The CHAIRMAN said that he trusted the shareholders would adopt the report which the Directors had submitted to them, and he congratulated the shareholders on the favourable position of the Company and strongly advocated their support in keeping the capital outlay per acre at as low a limit as possible, as it was only by having a low capital charge per acre that Ceylon or Indian tea companies could hope to show satisfactory dividends in the future if the price of tea continued to fall as it had so markedly done during the past year. He attributed the low prices of the Company's teas in a great measure to the temporary arrangements for manufacture, but it was to be hoped when the new factory was completed and the machinery installed that the Company's teas would not be below the Ceylon average price. Mr. Michie, the Engineer, had visited the property in the dry season and reported that there was sufficient water with a fall of 250 feet to drive the machinery necessary. A few of the shareholders had lately visited the Company's property, and he was glad to learn from these gentlemen, that they considered the growth of the tea and the condition of the estate in every way encouraging for the future prospects of the Company.

Mr. STAREY said he considered the report satisfactory, and asked if its acceptance involved adopting the policy proposed by the Directors to develop the estate out of profits. The Chairman pointed out that it did so as far as the past year was concerned.

Mr. STAREY then moved and Mr. MASEFIELD seconded—"That the report and accounts of the Directors be adopted."—Carried.

Report of the Directors to be submitted at the First Annual General Meeting of Shareholders, to be held at the offices of the Company on 28th February 1889.

The Directors have the pleasure to submit the General Balance Sheet and Profit and Loss Account for the year ending 31st December 1888, duly audited.

The net profit on the year's working, as shown by the account, is Rs. 2,957-46, and the Directors propose that this Cr. balance be carried forward to the working account for 1889.

Owing, in a large degree, to the imperfect Factory accommodation for manufacturing the teas, and the depressed state of the Tea Market, the Directors regret the price realized for the Company's teas fell short of their expectations. The amount of tea crop, however, exceeded the estimate by 9,940 lb.

The total crop was 69,940 lb., and the plucking area 172 acres of tea, 3 1/4 years old. The yield per acre was 404 lb. This yield is encouraging, and the new lands opened should, the Directors are confident, yield much heavier crops than the 172 acres.

As no prospectus was issued at the formation of the Company, it is considered advisable in this report to inform the Shareholders as to the prospects which may reasonably be looked for in the future.

The Company's property consists of:—

172 acres tea in bearing, planted in 1885.	
208 „ „ do „ „ 1887.	
100 „ „ do „ „ 1888.	
70 „ „ being opened.	
293 „ „ Forest.	

843 acres Total.

The amount of uncalled capital is R10,000 and in order to construct the necessary buildings and New Tea Factory, and equip the same with Machinery, it will probably be necessary to expend R15,000 over and above this sum.

The Directors propose to develop the estate to the extent of bringing 550 acres of tea into bearing and build and equip the Factory entirely out of profits.

By adopting this course the Company would place itself in a very strong position, as it would then possess 550 acres of tea, with Factory and Machinery, and 293 acres of forest at a capital rate of R350, (or say £25 sterling,) per cultivated acres.

The property, the Directors estimate, would thus be capable of yielding gradually increasing dividends up to 20 per cent. and they base this statement on the following calculations:—

A yield of 600 lb. per acre (when the 550 acres are in bearing) with the selling price of tea in Colombo at cents 40 and cost of production „ 28

Profit per lb. cents 12 would yield a return of R72 per acre, which equals 20 per cent on a capital outlay of R350 per acre.

The Directors would therefore strongly advocate the support of the Shareholders to the policy they propose.

It will be necessary for the Shareholders to elect a new Board of Office-bearers and fix the remuneration to Directors.

H. K. RUTHERFORD, Managing Director. DAVID FAIRWEATHER, A. P. CRAWLEY-BOEVEY, Directors. 16th February, 1889.

H. K. RUTHERFORD, Managing Director, }
DAVID FAIRWEATHER, } Directors
A. P. CRAWLEY-BOEVEY, }
GEORGE J. JAMESON, Secretary.

Colombo, 15th February 1889.

Mr. MACKENZIE begged to point out to the meeting that as the Company was a small one, it was absolutely necessary to curtail expenditure of establishments as much as possible, as it could not stand the drain in that respect like much larger companies; he therefore proposed that the office of Managing Director and Secretary be held by one person, and thought the Company could not do better than appoint Mr. J. H. Starey for this work, as the present Managing Director was proceeding to England.—This was seconded by Mr. D. Fairweather and unanimously carried.

The CHAIRMAN then proposed and Mr. A. P. CRAWLEY-BOEVEY seconded the resolution:—“That Mr. H. V. Masfield be elected a Director in place of Mr. A. P. Crawley-Boevey and that Mr. D. Fairweather retain his seat on the board as Director.”—Carried.

Proposed by Mr. W. MACKENZIE:—“That the Directors' and Secretary's remuneration for the year 1889 be covered by the sum of R1,600, the amount to be apportioned by the directors themselves.”—Carried.

Proposed by Mr. J. R. FAIRWEATHER and seconded by Mr. J. H. STAREY:—“That Mr. J. Guthrie be appointed auditor for the year and that his fee be fixed at R52.50.”—Carried.

Proposed by Mr. MASFIELD and seconded by Mr. TARRANT:—“That the retiring directors be remunerated for their services during the past year as follows, viz: The Managing Director R500 and the other two directors at R150 each.”—Carried.

Proposed by Mr. H. K. RUTHERFORD and seconded by Mr. J. R. FAIRWEATHER:—"That the balance of the Company's capital of R 10,000 be called upon the 1st of May next, say R50 per share on 200 shares."

A vote of thanks to the chair terminated the proceedings.

EFFECT OF SALT ON COCONUT PALMS.

A correspondent writes:—

"I had charge of an estate in Kurunegala on which there were a few coconut trees growing near the bungalow—some eight of them I think. They were in a most disreputable state: leaves all beetle-eaten, and generally out of condition. I applied $\frac{3}{4}$ of a bushel of salt to them and the effect was quite *magical*, in a few weeks they had put out new leaves and flower. The elevation was about 1,800 feet above the sea."

Was the ground well stirred, was the salt well-spread or put close to the roots, and was any other application made?

NETHERLANDS INDIA NEWS.

WELCOME RAINS.

A long drought which had prevailed in Java for months did not break up till last month, when the long delayed monsoon rains fairly set in. In several districts, the welcome showers fell too late to save the rice crop. The *Java Bode* points out under this head the remissness of the Government in laying out irrigation works in the island. The protracted drought has proved a benefit to coffee planters by ensuring them an abundant crop on high lying estates.

SUGAR.

The sugar planters on the other hand have every reason to feel uneasiness. A canker called "seroh" has become of late widely prevalent in west Java among sugar estates, where it attacks the roots of the cane. East Java has so far been exempt from its ravages. But the disease has been conveyed thither in plant cane from the stricken districts. Now that the rains are fairly on, it remains to be seen whether the dreaded disease has gained a permanent footing in that part of the island.

REMEDY FOR BERI BERI.

The Batavia *Nieuwsblad*, calls attention to the fact that Mr. Ross, the proprietor of the Cocos islands, a dependency of the Straits Settlements, owns a spring there which possesses medical properties of high value in curing beri beri patients. This fact has long been known in the islands. Mr. Ross has decided upon giving the spring water a fair test. Ten thousand bottles of it have been forwarded by him to Batavia for experimenting with beri beri patients. The *Nieuwsblad* doubts very much the success of the experiment, unless it be conducted under conditions similar to those prevailing in the Cocos. There beri beri patients are taken by boat to the islet where the spring is. The taste of the water is none of the pleasantest, and nobody would drink it for pleasure. But there is no other water on the islet, and the patients must drink it, so that they soon get accustomed to the flavour. Besides, the atmosphere and the soil of the islet are quite different from those to be found in insanitary Batavia, and may form important factors in the cure.—*Straits Times*, Feb. 18th.

[If the water cures beri-beri, it must be by killing the organisms which produce the disease.—ED.]

DELI NEWS.

(From Exchanges to the 9th Feb.)

ASSAHAN.

From all appearances, Assahan is coming into marked favour for tobacco growing purposes. In that line, it ranks next after Deli and Langkat, and evidently has a bright future. Two other districts, Padang and Pagurawan, have come under notice as

fields for planting enterprise, but the estates opened up there have not turned out satisfactorily, and the small area of available land tends only for discouragement. The average price realised for the 1887 tobacco crop from Assahan has proved highly satisfactory compared with Deli. The crop for last year looks very promising, both in quantity and quality. Experts in Europe have a high opinion of the latter, judging from samples shown them. The consequence is a wide extension of tobacco cultivation in Assahan. Last year's tobacco crop there averages $7\frac{1}{2}$ piculs per field. It is manifest that Assahan tobacco now attracts more attention than formerly, and that the quality improves year after year. It can now hardly be distinguished from the Deli article as regards the general appearance of the leaf. Just as is the case in that settlement, Assahan turns out much dark-coloured tobacco which burns below the mark, but that showing clear brown colour cannot, it is said, be improved upon. This year there is every prospect of 2,000 fields being under cultivation, from which, should weather permit, one and a half million pounds of tobacco may be raised. Steps have been also taken to extend still further the cultivation of the leaf. Should the next tobacco sales strengthen the above-mentioned favourable opinion, the future of Assahan will be ensured, and Deli have a formidable competitor to reckon with.

ESTATE SPECULATION IN LONDON.

In London recently, fifteen thousand shares, value one pound sterling each, of the Sumatra Tobacco Plantations Company have been offered for allotment. The company has been set up to buy eighty-two thousand acres of land in Serdang to carry on cultivation and trade in tobacco.

TOBACCO CULTIVATION IN SUMATRA AND BORNEO.

M. Charlier, the Belgian Consul General at Batavia, has brought out an interesting report on an investigation tour he lately made in the Netherlands East Indies. He especially calls attention to the steadily increasing cultivation of tobacco both in Sumatra and Borneo, and turns this fact to account by endeavouring to arouse his younger compatriots to try their luck in these parts of the world.—*Straits Times*, Feb. 18th.

COLOMBO COMMERCIAL COMPANY, LIMITED.

Directors.—John Brown, Esq. Chairman; Edward Conder, Esq.; H. H. Potts, Esq.; L. Famin, Esq.; Norman Stewart, Esq.

Report.—Presented to the Fourteenth Ordinary General Meeting of the Company, on Wednesday, the 13th day of February last.

The following Annual Accounts are now presented to shareholders, viz.:—

Profit and Loss Account for the year ending 30th September, 1888.

Balance Sheet made up to 30th September, 1888. From these it will be seen that, after writing up the sum of £807 16s 11d to Machinery Account, the year's operations have resulted in a Profit of £1,156 18s 11d, which, with the Balance of £11 2s brought forward from last year, gives a total of £1,168 0s 11d at the credit of Profit and Loss.

The Directors propose that the sum of £1,089 be now devoted to the payment of the Dividend in full on the 6 per cent Preference Shares for the year ending 30th September last, and the balance of £79 0s 11d be carried forward to next account.

The sum of £807 16s 11d now debited to Machinery Account, as above stated, is on account tea appliances erected on the Company's estates during the year. This account now stands in the Company's books at £2,408 4s 1d, a portion of which will be written off yearly out of profits as may be deemed desirable by the Board.

During the past year new Debentures to the extent of £2,800 have been issued, bringing the total Debenture Issue up to £10,200.

The planting operations of the Company, so far as the result obtained is concerned, have again proved disappointing to the Board, and it is on this account that the net profit shown on the year's working is less than was anticipated, as the Board have every reason to be satisfied with the progress of the Company's general mercantile business. The Directors fully anticipate that this latter will steadily continue to increase with the improving prosperity of Ceylon, which is yearly being brought about by the maturing of the large areas of tea planted in the island.

The unlooked for result of the planting operations of the Company during the past year was due to circumstances which no foresight could control, and which in a more or less degree affected the whole planting community of Ceylon. During the early part of the past year, Ceylon was visited by a drought of unprecedented severity and duration, and for some three and a half months many of the Company's own and their constituents' Estates were practically without a drop of rain; such a want of moisture would of necessity have a marked effect on a crop like Tea, where the yield is dependent on the bushes constantly throwing out new leaves, and the result was that on very many Estates the yield of Tea fell far short of estimated returns, in several cases resulting in a loss instead of a profit.

The Company, moreover, incurred considerable expenditure during the past year on Tea Factories, Planting, Nurseries, &c., and as only a small portion of the Tea on their properties is in full bearing, it was impossible that the crop secured during such an untoward season could cover expenditure; although the Board are glad to say that some of their Estates gave better yields than they had looked for under the circumstances.

So far as the year has gone the present season has been a favourable one for the growth of Tea, and on the Company's Estates, where there is now a total area of 1,092 acres under Tea, the yield has been very satisfactory and largely in excess of the past season; and as during the present year there is no necessity for the expenditure of any considerable sum on Factories, &c., the Board look forward with confidence to a greatly improved result in the Company's planting operations.

The Board would briefly refer to the other products in which the Company is in a minor degree interested. Coffee, formerly the mainstay of Ceylon, is more and more becoming a thing of the past, and it is unsafe to base any calculations on the future of this product. The Board are, therefore, glad to say that the future prosperity of the Company depends almost entirely upon tea, which product is gradually supplanting coffee on nearly the whole area of their estates.

The Company still has a considerable area of cinchona bark, which is growing well; but the price which this article at present realises in the London market does not warrant the Directors in looking to it for any considerable profit during the year. The supply from Ceylon will now no doubt rapidly decrease, tea having been planted where cinchona formerly stood, and a more paying range of price may then be looked for.

The following figures show the total exports of coffee, tea, and estimates for the cinchona from Ceylon for a series of years and the current season. It will be seen from the latter that a very large increase in the production of tea is expected, and that there will again be a large falling off in the coffee crop as compared with previous years.

Total Shipments of Coffee, Tea, and Cinchona from Ceylon, for the year ending 30th September,

	Coffee cwt.	Tea lb.	Cinchona. lb.
1877 ...	943,000	1,775	56,500
1884 ...	323,000	2,263,000	11,493,000
1885 ...	314,000	3,797,000	11,678,000
1886 ...	223,000	7,170,000	15,365,000
1887 ...	180,400	12,000,000	14,400,000
1888 ...	136,300	20,756,000	11,700,000

Estimate for the year ending 30th September,

1889 ...	80,000	35,000,000	9,000,000
----------	--------	------------	-----------

Mr. John Brown, Chairman of the Board, left for

Ceylon in December, and will inspect the properties in which the Company is interested.

Mr. H. H. Potts, a member of the Board, retires from office on this occasion, and being eligible offers himself for re-election.

Messrs. Deloitte, Dever, Griffiths & Co., the Auditors, also offer themselves for re-election.

By order, J. ALEC. ROBERTS,
London, 5th February 1889. Secretary.

DRUG TRADE REPORT.

LONDON, February 7th.

ANNATTO.—Eight cases good Paste from Ceylon are limited at 2s 6d per lb., a price which is far above the current market rates. Five packages Ceylon Seed sold at 1d for dark to 2½d per lb for good bright; and thirteen bags slightly brown mixed Java seed realised 2d per lb. Of sixteen baskets fairly good Brazilian Roll annatto, six were disposed of at 10d per lb.

CARDAMOMS.—Notwithstanding the rather heavy supply offered today, the first lots sold at very steady prices, and several parcels were practically withdrawn, being held much above market value. Gradually the demand improved, as a rather heavy quantity was bought for American account, and prices advanced irregularly from 2d to occasionally 5d per lb. The following rates were obtained; Ceylon Malabar, good heavy round, pale, slightly warty 3s 1d to 3s 2d; mixed sizes and shapes, pale bleached 2s 9d; fair small to medium round 2s 6d; small yellow round 2s 3d; rather shelly pale 2s; small to medium to very small grey 1s 7d to 1s 5d; specky and brownish mixed 1s 4d. Mysore medium to bold round pale 3s 3d to 3s 5d; long, very pale, but rather light 2s 8d to 2s 9d; medium to bold pale round 3s to 3s 2d; smaller 2s 8d; medium round and long mixed, brownish 2s 4d to 2s 5d. True Malabar good even, medium-sized, round yellow 2s 6d; smaller 2s 4d; grey medium, partly mouldy 2s; shells and pickings 6d per lb. Wild Ceylon, fine bold strong to small 2s 2d to 9d. Seeds 1s 7d up to 2s per lb for good dark. The shipments of cardamoms from Ceylon during the latter half of December and the commencement of January were rather heavy, and nearly the whole of these exports has been consigned to London; but still the shipments are very far below last season's. The figures for the periods between Oct. 1st and Jan. 10th are: 1888-89, 66,719 lb; 1887-8, 108,963 lb; 1886-7, 66,154 lb.

CINCHONA.—There was a good supply of flat Calisaya bark at today's auctions, but only a few packages sold at 1s 9d to 10d per lb for good yellow quality. The following are the figures relating to the shipments from Ceylon in the periods between October 1st and January 10th, 1888-89, 3,506,677 lb; 1887-88, 2,609,122 lb; 1886-87, 4,156,160 lb. Up to the present a quantity equal to 636,160 lb of Java bark is advertised for auction at the next Amsterdam sales, on February 21st. The greater part of this has now been analysed, the average equivalent of quinine sulphate being 3½ per cent.

CROTON SEED.—Five bags good bright Ceylon seed sold at 14s per cwt. very cheaply.

ESSENTIAL OIL.—Citronella remains dull and neglected at 7d to 15-16ths d. per oz. for native brands. The enormous quantity of 636,274 oz left Galle on December 17th for Hamburg, per steamer "Nyanza"; and the shipments now exceed the total of any previous corresponding period. A lot of Cinnamon oil of very dark colour and acrid taste was bought in at 8d per oz. Oil of lemon reported firmer in Italy. Of Fisher's

Nutmeg oil three cases were bought in at 7d per oz., and the same brand of Patchouly oil at 1s 9d per oz.

QUININE has been very quiet this week. Sales of the Brunswick brand at 1s 3d per oz for distant delivery in first hand, and 1s 2½d per oz in second hand, are reported; but otherwise the article has been stagnant.

VANILLA.—The demand continues unabated, though fine beans did not appear to sell quite so well today and must be quoted as a shade easier, but medium and common grades were full up. The whole of the supply offered sold as follows:—Good to fine chocolate slightly crystallised 5½ to 9 inches, 15s to 24s; very fine 8 to 9, 24s to 26s 6d; one lot 7½, 29s; good dark chocolate 6 to 7½, 14s to 18s 6d; 4½ to 5½ ditto 10s 6d to 12s 6d; fair dry brownish 4½ to 8, 8s to 15s; foxy 6s 6d to 8s 6d per lb.—*Chemist and Druggist.*

THE AMERICAN MARKETS.

New York, January 26th.

QUININE for consumptive purposes has sold quite liberally during the past week, but speculative interest has in a great measure subsided. Spot German, in large bulk, is held, and selling in small quantities at 30c to 31c, but for February-March shipment there are sellers at 29c; but this latter figure fails to arouse any special attention from those who are usually looked to as large buyers.—*Chemist and Druggist.*

COMPARATIVE CONSUMPTION OF TEA BY THE LEADING NATIONS OF THE WORLD:

NECESSITY OF CULTIVATING NEW MARKETS.

Well may Messrs. Gow, Wilson & Stanton say, in the diagram-illustrated circular they have just issued, that production has already overtaken consumption, and that the necessity of opening and pushing new markets is urgent. It will be small comfort to Indian and Ceylon planters if, in ousting China teas from the British market, they do so by bringing down the prices of their own superior produce to an unremunerative level. That level has surely nearly been touched, notwithstanding all economies in production, for medium Indian pekoe and souchong have gone down respectively to 9d and 8d per lb. in 1888 against 1s 3d for each in 1879. The present low prices ought to encourage the consumption of Indian teas in Continental and other markets, but we scarcely think there is much margin for further reductions. The heavy duties on tea, in almost all cases heavier than those on coffee, tell against the leaf in many places. But this is not the case in the United States, where both are equally free. So strongly, however, have the cheap coffees of Brazil and the "mild" coffees of Java got hold of the public taste, that America is but little behind Holland in the consumption of the fragrant berry, per caput. And, although the consumption of tea has, of late years, increased in the United States, yet with no duty there, instead of 6d per lb. in Britain and with fully one-third more population, the great republic consumes less than half the quantity of tea used in the British isles, the figures being 90 millions only to 185½ millions in Britain. Apart from the Chinese, many of whom, however, are too poor to drink tea, the British race are by far the greatest consumers of tea of any race in the world. The more recent off shoots from Britain have improved upon the mother-country and the colony which has been called "the Britain of the South," New Zealand, has the proud distinction of using more tea per head of the population than any country in the world, not excepting China, where the rich and the fairly well-to-do drink tea largely, but the poorer millions none at all. The Australian colonies

run New Zealand close, the classification of Britain and her colonies standing in order of pre-eminence thus:—

COUNTRIES.	CONSUMPTION OF TEA PER CAPUT.
New Zealand	7.65 lb.
Australian Colonies	7.50 "
Tasmania	5.40 "
Great Britain	4.95 "
Newfoundland	4.35 "
Canada	3.80 "
Bermuda	3.46 "
Cape Colony	0.80 "
Natal (produces some tea)	0.76 "
Mauritius	0.70 "

Considering the preponderance of the negro race in Bermuda, the figures for that colony are extraordinary. Pity that those for Jamaica and the other West India Islands and for British Guiana and the West African settlements are not compared. The consumption per head in the United States is only 1.46 per head, while Russia, with her enormous population, shows a rate per caput of only 0.70 lb. Holland, although the greatest consumer of coffee per head in the world, comes near the United States in tea consumption, the rate for each head of the population being 1.20 lb. Most of the other countries show miserable figures: Italy, indeed being represented by ciphers! Austria-Hungary, Roumania and Spain are each represented by 0.02! France, Belgium and Sweden by 0.03. Switzerland and Morocco by 0.08. Germany and Norway by 0.09. Portugal 0.12. Persia by 0.13. Then come more respectable fractions: the Argentine Republic (which grows its own mate) 0.30; Uruguay 0.34; and Denmark 0.37. It will thus be seen that there is much room for the introduction of India and Ceylon teas, not only where China kinds have already possession of the field, as in the United States and Canada, Russia and the Australian colonies, but where tea is not used at all or only to a fragmentary extent as a high-priced luxury or a medicine, having, as in South America to compete with a formidable antagonist in mate, not to speak of herb teas elsewhere. Tea missionaries are wanted, men who can conscientiously advocate the use of teas which are absolutely pure against not only alcoholic beverages, but infusions of inferior China, or vegetable substitutes. The idea to form a Company for pushing our teas amongst consumers in the southern hemisphere, could not have been started at a more opportune moment. There is also room for similar combinations to attack the markets of America and of Russia (if that miserably narrow power permits) and the continent of Europe generally, while there is room for action in South and Central America and in parts of Africa. If peace can only be preserved, the Paris Exhibition ought to help our staple: and so much besides that depends on the nations refusing to allow the enormous armaments they have provided to be used.—In the imposition of duties on tea, positive enmity to the article as a competitor with coffee seems sometimes to be shown. Greece has the bad eminence of the highest duty 1s 1½d on tea and only 2½d on coffee. France comes next with 9d to 11½d against 6½d to 9d. Austria-Hungary has 9d against 4½ to 5½d. Germany 5½d against 2d to 2½d and Holland (whose own chief colony grows tea) 2½d while coffee is free. Curiously enough the greatest consumer of tea per head, New Zealand, exacts a duty of 6d on tea.

"GAMBIER."

"Gambier" forms the subject of correspondence in today's issue. From the Eastern Archipelago we carried away vivid impression of the devastating effect on the soil of two pursuits: the

culture of tobacco in Java and the manufacture of the astringent substance called gambir from the leaves of *Uncaria gambir* (a plant belonging to the same natural order as the cinchona) in Singapore. The result in both cases has been the same: large tracts of once fertile land so impoverished, that they can now grow only the *alang* or *alang-alang* grass,—the *ihuk* of Ceylon,—or the ubiquitous *lantana*, although in most cases, "the survival of the fittest" principle has given the coarse grass the victory. We saw some of the remaining gambir plants, straggling and shabby, in portions of Singapore island, which the Chinese squatters had been permitted to devastate, and we believe we have seen similar plants in Ceylon. They are, probably enough, indigenous to Ceylon, but we think not abundant, and with our impression carried away from Singapore, we must express the trust that the culture and manufacture of gambir,—or the manufacture rather,—may be left to the inhabitants of the Riouw group of islands belonging to the Dutch, where there is abundance of the plant in the form of jungle, and where land for other purposes is neither scarce nor valuable. We have small ambition to see Ceylon add the manufacture of one of the most powerful astringents in the world to her large production of a nut, the areca, only second in astringent properties to the leaves of *Uncaria gambir*. The nuts of our graceful palm require no preparation, save drying and decorticating,* while the leaves of the gambir plant have to be stewed and the juice inspissated by fire or sun heat, the processes being somewhat complicated. Besides being used as an astringent in medicine, gambir is largely employed as a tanning and dyeing agent. Before the vegetable origin of this and cognate substances were known, they received the popular name of *Terra japonica*, Japan earth. A substance similar to gambir in its astringent and other properties is obtained from the wood of certain acacias, which are chopped into small pieces and boiled, the juice being subsequently evaporated. The names of the trees are *A. catechu* and *A. suma*. Of catechu from this source the average import into the United Kingdom seems to be about 5,000 tons, while of the superior preparation from the leaves and young twigs of the two plants *Uncaria gambir* and *U. acida*, the import is equal to 20,000 tons. If the cultivation of the gambir plants or the preparation of the product from jungle plants is really taken up in Ceylon, we trust it may be in the secondary and low jungle of portions of the country not suited for less exhausting crops. We hope to have Dr. Trimen's opinion on the question. But even if the plant abounded, we question if labour sufficient and of the right kind would be available. But the enterprise must be left to the decision of small capitalists. The correspondence referred to is as follows:—

Colombo Museum, 4th March 1889.

GENTLEMEN,—I have the honour to enclose a copy of a letter addressed to the Director of the Museum by Mr. W. N. Evans, the publication of which may, I hope, be of use to agriculturists and merchants in Ceylon.

2. As far as I can ascertain from Dr. Trimen's "Catalogue of Flowering Plants and Ferns" published in the Journal of the C. B. R. A. S. for 1885, and from Dr. Thwaites's "Enumeratio Plantarum Zeylanicæ," it seems that *Uncaria gambir* (or, according to Dr. Trimen, *Uncaria dasyoneura* var. *Thwaitesii*), which belongs to the order *Rubiaceæ*, is indigenous to Ceylon.

* *Areca catechu* is, we know, obtained from the nuts by boiling, but we have no information of this process being carried on in Ceylon.

3. Dr. Thwaites states that the habitat of the plant is the Deltota district, at an elevation of 3,000 feet; but he adds, on the authority of Mr. William Ferguson, that it grows near Colombo also.

4. The late Director of the Royal Botanic Gardens tells us that, so far as he could learn, the Sinhalese make no use of the plant.

5. A copy of Mr. Evans' letter shall be sent to Dr. Trimen, to whom it will probably be of interest.
—Your obedient servant, F. H. M. CORBET,
for Director.

[Copy referred to]

66 Stackpole Road, Bristol, Feb. 5th 1889.

W. N. EVANS, F.C.S.

Sir,—I take the liberty of writing to enquire, if among your many tropical plants, the *Uncaria gambir* and *U. acida* are indigenous, as we are now supplied (the dried extract) of same in large quantities from Rho near Singapore. The Chinese as growers and merchants have the trade in their hands, and manufacture it in a very crude fashion, also adulterate it badly. We as tanners are desirous of encouraging its growth elsewhere, and of growing it largely, or at least dealing direct with the growers. We should need from 8 to 10,000 tons yearly at the least if we can get the article pure. Are there any facilities for growing it on your island, in labour, land &c.? Could you furnish me with the necessary information, and could you put me into communication with any respectable or trustworthy firms, who would be prepared to treat with us in the matter?

Any help you may be able to render we shall be thankful to receive. Awaiting the favour of your reply, Yours faithfully, (Signed) W. N. EVANS,

Technological Medallist 1884, Late Editor of "Leather," Technical Teacher and Adviser in Tanning.

COFFEE IN HAPUTALE.—There is good news of coffee from this district: one report speaks of a fine blossom coming out, and another of very good spike, the best seen for some years.

SPONGES.—Professor Oscar Schmidt, of Gratz, in Styria, has suggested that sponges could be propagated by fixing pieces detached from living sponges to sandy coasts by means of wooden skewers, and leaving them to grow. The Austro-Hungarian Government has recently taken steps to protect the sponge industry on the shores of Dalmatia, reckless gathering having threatened extermination.—*Standard*.

COFFEE IN DUMBULA.—The special telegram of Monday from Hattou was intended to indicate that a planter in Dumbula had last year what we suppose is the unique experience during the year of making £3,600 profit by COFFEE. But this was on an estate which had been always liberally manured. In another district the same planter is rapidly converting what was once a fine coffee plantation into a tea estate, and all the profits on coffee were spent for this purpose. The planter in question makes light of green bug in comparison with leaf disease as an enemy of coffee.

TEA.—The Lahore paper writes:—"We have referred to the efforts which the Kangra Valley tea-planters are now making to help themselves; and it would be well if the Punjab Government could see its way to help them a little also. The Government of the North-West Provinces and Oudh, as we stated in a recent issue are endeavouring to popularise tea by abolishing the octroi duty on the article in all municipalities. Now, this is undoubtedly a step in the right direction; and we consider that the same thing ought certainly to be done in the Punjab, where the natives use, we believe, more tea than in Oudh or the North-West Provinces. The Government requires, we fear, occasional reminders of the existence of the little band of adventurous spirits who have struggled so long against reverses in the Kangra Valley."
—*Pioneer*.

LEMON-GROWING in Florida is so successful that the industry is enormously spreading, and the results are affecting Sicily in a very high degree. It is feared that lemon-growing in the latter country will soon become extinct. Moreover, the Florida lemons attain a size far beyond those grown in Sicily. They are not popular, however, in the States because they don't fit the lemon-squeezer.—*Australasian*.

AGRICULTURAL COMPANIES IN NETHERLANDS INDIA.—The Amsterdam correspondent of the *London and China Express* wrote on Feb. 6th:—Several new agricultural undertakings connected with India have been established. The Cinchona agricultural company Langan Ardjo, has been established at the Hague with a capital of 250,000 guilders in shares of 500 guilders. Another, styled "Toengkal" Tobacco company at the Hague, proposes working certain lands in the district of Palembang (Sumatra.) The capital is fixed for 600,000 guilders, divided in 5,000 shares each of 120 guilders, 2,500 of which have been fully paid by transferring the estate, while on the remaining shares a provisionally 20 per cent. will be payable.

CUDRANIA TRILOBA AS A SILKWORM PLANT.—This is the Silkworm Thorn, known in China as the "Tsa" tree. It is evidently of wide distribution in China. Dr. Henry says it is common about Tchang, where "it is considered to be as good for silkworms as the Mulberry, but is not used so long as Mulberry leaves can be got, because the tree is thorny, and it is troublesome to pick off the leaves. It is hence given chiefly to adult silkworms, and as Mulberry leaves soon become finished, it is much used." The tree belongs to the Artocarpaceæ, and attains a height of about 20 feet. The leafy shoots, probably more especially from near the base, are often armed with strong, stout, straight-pointed axillary spines. It is figured in the October number of Hooker's *Icnes Plantarum*, 1888, t. 1792.—*Gardeners' Chronicle*.

SCHWEINFURTH'S METHOD FOR PRESERVING PLANTS.—H. Schenck (in *Bot. Centralt.*, vol. xxxv., p. 175) calls the attention of collectors, especially those travelling in the tropics, to a method of preserving plants for the herbarium recommended by Schweinfurth, and which he found exceedingly convenient and efficient during his travels in Brazil. The plants when collected are at once put between the sheets of a leather portfolio. On his return from the excursion the collector places the specimens between single sheets of common grey, unsized paper (to be had in every "venda" in Brazil), which are firmly held together between two pieces of stout pasteboard by means of a strap. There the bundle is set upright in a tin box, and strong Sugar-cane brandy or common alcohol is poured on the sheets from above, until the paper and the plants are thoroughly moistened and the liquid begins to run off below. The bundle or bundles are kept in the tightly-covered tin box until a quantity of them has accumulated. Then the straps and boards are removed, the single packages are wrapped up in paper and packed as closely and firmly as possible in a tin box about 2 feet high, which, finally is tightly closed by soldering a flat cover to it. Several such boxes are packed in a wooden case for shipping. Some small tin boxes ought to be taken on more extended excursions. The preservation of plants after this method requires very little time (an advantage of the utmost importance for a traveller), for it is not necessary to arrange the specimens carefully between the sheets. The plants remain in good order, soft, pliable, and moist, for years, and may be dried for the herbarium at the collector's convenience, after his return from his travels. They also remain in good condition for anatomical examination, and all kinds of flowers, as well as thick-leaved plants—such as many species of Orchids, Cactaceæ, &c.—will arrive at home in excellent order. Besides, plants may be collected and placed between the sheets in rainy weather.—*Gardeners' Chronicle*.

Correspondence.

To the Editor.

CEYLON TEA IN THE UNITED STATES.

Philadelphia, 29th Jan. 1889.

DEAR SIR,—I am awaiting reply to my letter to the Secretary of the Planters' Association re Dr. Duke's scheme.

In the meantime I am considering the matter in case I am asked to carry out the project. I have come to the conclusion that hotels, that is the largest and most fashionable hotels, ought to be presented with a caddy of tea, provided they agree to put the tea on their bill of fare. I have been speaking to several managers lately, and not without success, but a special effort should be made when pamphlets are circulated and tea given away. I hope this suggestion will be considered by the Association.

I enclose two or three views of my store. It is very deep and rather dark, which makes it rather hard to take, but it will suffice to show that I am in harness. Mr. Vere Millington, late planter of Ceylon, sits in the foreground. Two outdoor salesmen and the young lady who sells over the counter are represented. I think these photos will interest you as being exact representations of what was going on when the photographer put in his appearance.

About the end of February a great Pure Food exposition takes place. I have taken one of the best spaces in the hall, and will endeavour to bring Ceylon tea prominently before the public. I have written for an extra supply of samples from London and will put in a good show.

A shipment of Ceylon oolong and green tea has arrived from Mr. Martin, through Messrs. Darley, Butler & Co. I have seen samples and sent them to New York, and am having them taken to the leading firms of Philadelphia. A full report will be sent later. I may say of them that they are fair teas *resembling* an oolong and a moyune with retaining their individuality as Ceylons. The green appears to me to be like a moyune with a little Ceylon pekoe added; the oolong like a Ceylon souchong with a pretty liberal dash of oolong. Both teas good blenders, and, if not a great success, certainly not a failure, considering it is a first experiment. I shall send reports from different brokers etc. to Messrs. Darley, Butler & Co., who will no doubt show them to you.

As I will be exhibiting a good deal next year, I wonder if it would be possible to secure a perfect model of a Ceylon tea store. Anything like this would attract attention. I am going to lecture in St. George's Hall next month on Ceylon, and if I had such means of illustration, I could make it doubly interesting. As long as I remember, would you mind asking Messrs. Skeen & Co. to send me one of their large photographs of the wild elephants in the kraal, and I will remit whatever may be the cost. They used to have them in very large size as an advertisement, and I would like one to attract attention here.

I have a young man from Galle working with me. His name is *Wouters*, son of Deputy Fiscal, a nice steady young fellow. He does not appear in the photo, as he was out at the time. I received the *Observer* with Mr. Shand's and my own letters. Mr. Shand is of course quite right in a way. I have hope of making a living, and, if possible, a fortune in Ceylon tea. If I do so I will have succeeded in doing good service to myself and to Ceylon as well. If money was my *only* object I would not make Ceylon tea my business. Had I

taken the advice of 99 out of 100 advisers, and 100 out of 100 of such as are *in* the trade, I would have put Ceylon tea out of sight until it had made its own way and was marketable. As I did *not* do that, but for nearly two years put every other tea out of sight, I consider, I did justice to Ceylon at the risk of ruining myself. I have lost money and made a name, which, if I hold out, will be capital to me. As for the little assistance I ask, I will certainly not forget it, and if I am fortunate in making my business (which, if made at all, must eventually be very large), I will most assuredly lend others the aid which has been afforded me.

I am inquiring about Denver, and will try and make some arrangement for the representation of Ceylon tea there. I have never been there myself, but I cannot get anyone to recommend the South and West for Ceylon tea. If I have asked one I have asked twenty who have travelled south and west, and they all tell me the same thing. I do not mean to be a *clam* however. I am willing to send teas there if I can get any one to sell them. I never refuse a willing hand a case or two of tea and as much advertizing matter as they want, and never require returns until the goods are sold, if I have their assurance that they will push the sale of the teas. I can do no more, but what I *can* do I do willingly.

I had sent the following advertisement to the leading newspaper of Denver:—"Wanted to correspond with gentlemen of business with regard to pushing Ceylon tea in Denver as sole agent for the Ceylon Pure Tea & Coffee Co., Philadelphia, Pa. Best references required."

Will let you know if I am successful in forming good connexions there.

No winter here as yet. Scarcely seen snow. Weather quite mild. This is, I understand, unprecedented and inexplicable. We will no doubt have it pretty severe when winter does come.

I do hope Ceylon will turn its attention to America in real earnest. I would be glad to see two or three planters with a little capital come over here and join me, or a good, substantial company formed in Ceylon. Any man with £5,000 can establish a big business now, for Ceylon tea is now becoming a subject of interest. Send a few such over and you will hear of great things.—Yours very truly, J. McCOMBIE MURRAY.

[The photos, which can be seen at our office, are very interesting, especially that which represents a gentleman apparently taking advantage of a notice which is prominent, thus: "FREE! Sample Cup of Ceylon Kootee Tea."]

TOBACCO AND OTHER PRODUCTS IN
CEYLON: PAST AND PRESENT.

Ingram House, 165, Fenchurch Street,

London, 13th Feb. 1889.

DEAR SIR,—As I have read your paper regularly for 40 years, your account of Mr. Barber's lecture at Matale as detailed in your issue of 19th ult. has not escaped me. As the lecturer called on the Government to prohibit lands being sold for tobacco growing and thus deter capital from going into the island for this most profitable cultivation, I have thought it my duty to write the Planters' Association communicating my views, which are not those of Mr. Barber, and I now write you a few lines on the same subject.

Ceylon is a land of fallacies, many of which rise up before me. Opening up the "Wilderness of the Peak" with Dunbar estate and 2,000 acres beyond, pronounced a wild venture at the time, and the

district is now Dikoya! A wild voyage I took in 1851 in the "Calder," brig of 220 tons, to New York with a sample of everything the island produced, — ship full on my own account. Ceylon coffee unknown there, ditto plumbago,* coir and coconut oil, especially citronella oil. It was thought a sort of 'Sindbad' business, but mark you the exports from Ceylon to America now? Cardamoms could not be got in Ceylon, wouldn't grow, only wild ones in Sabaragamuwa, so I got some from the coast of India. Now! what about Ceylon cardamoms? Cinchona, it was said, would not grow in Ceylon; wanted the Andes lava soil, &c. What about cinchona now? Tombs writes a book. Tea won't grow in Ceylon; wants Chinamen, &c. What about tea now? I began to tar my barbecues (about 1850) in Colombo. Want them to dry soon after rain. Get threatening letters from planters. "Will give tarry flavour to bean," &c. For a long time I used big wood wheel peelers pushed round by coolies. I think I will try steam, but suspicious planter says: "Motion too quick. Will break the beans and destroy bloom." There are many more I could give; and now comes Mr. Barber tabooing tobacco. We want every help the island can give us, and it is a fine island with exactly the climate suited for tobacco growing, and no one wants the reserve mountain forest to grow tobacco, but there are thousands of acres in the lowcountry and in the hands of planters along the lines of our railways (Uva would grow as good tobacco as Sumatra) which is fit for tobacco and need never go into tea (let us halt where we are with tea, or the price will be down to sixpence), and if the natives get encouragement as well as the European planter, there should be as fine a tobacco business as anywhere. Granted that tobacco is an exhausting crop, yet it pays hand over fist, and with our railways and roads we should get plenty of bones and other manure such as they apply in America where a farmer has regular tobacco fields in rotation.

Our great advantage is the climate, 3 to 7 north latitude is the very best for fine tobacco.

The drawback in Ceylon is want of skilled curers and a complete tobacco factory where the tobacco planter—European or native—can find a market for his leaf.

I am now doing my best to inaugurate this.—I am, yours faithfully,
THOMAS DICKSON.

TEA BOX TIMBER FROM BURMA: VARIETIES OF THE TEA PLANT, &c.

DEAR SIR,—I am sending you two boards, to show you what kind of timber the tea boxes are made from. You will see that the boards are the best red cedar wood and fine-grained with no aroma, at the same time a beautiful timber that can be brought up to a splendid polish, and I may inform you that the old boxes are much in request in London for the purpose of making of fancy boxes of all sorts, also cigar boxes, and sell in London after being used as tea boxes for more than their original cost in Burma. Indian planters use Burma boxes for this reason, and besides tea shipped in these valuable timber boxes sells much higher in price, as the quality is known not to affect the tea in any way. Planters and merchants will understand what I mean. Will you, Mr. Editor, be so kind as show the sample of timber to anyone who

* A mistake: Ceylon plumbago was known in the United States long prior to 1851. Mr. Joseph Dixon, the founder of the Great American Crucible Company, obtained a shipment of Ceylon plumbago in 1829.—*Ed.*

† If this were enforced, it would obviate the objection which "the Senior Editor" shares with Mr. Barber.—*Ed.*

may wish to see the quality of timber, which speaks for itself and will recommend itself in the market.

I had a splendid blossom out on my coffee, could not have been heavier, some trees bearing at the rate of one ton per acre. "Coffee Liberian" is to succeed well and no mistake with a little shade. Tea is in crop; I want seed for planting up more land. (Tea is to thrive well in Burma.) Of course you know that Burma is the native home of the tea plant of three different varieties indigenous tea. The China tea on the borders of the Shan States near China proper and the eating tea is quite a different variety (*Lee pet Chow*). *Lee Pet Chow* is the wet tea or the eating tea and grows into a large tree with small seeds like mustard. The seeds are in or on the under sides of the leaf something like a fern bearing its seeds in a most peculiar fashion in nature, and the leaves are exactly marked like the small China bush. And another curious thing is that the red ants are always to be found on the trees in great numbers. I fancy there must be some saccharine or a certain percentage of sugar thrown out of the tree. I have a fine tree in the vicinity of my bungalow, and several more up on the ridge of my *Saba Dong* hill. I may mention that the proper name of my place in Burmese is *Shewie Chung*, which means the *golden river*, and when the Shans owned Tavoy they employed themselves here in mining for gold. There are, sure enough, a great many old pits, some of them from 20 to over 30 feet deep, and I have counted more mines than one hundred in number. But gold. Oh! *Observer*, I have not seen the colour of the precious metal. However, there must be something, or those Chinese Shans would not have taken the trouble to go to get much labour for nothing, that is certain, and I live in hopes some day when I get some mining experience on the ground to make a trial to bring the valuable metal to the light; and if I am so fortunate, I shall retire and go home to Ireland and buy a farm.

I had the pleasure of seeing Dr. David Sinclair and Mrs. Sinclair here; they came up to see me and took me by storm. I was much pleased to see them. I nearly run wild when I see any one from Aberdeen here. I was so proud to find that they took the trouble to look me up. Mrs. Sinclair is a very nice lady and cheerful and speaks her mind. She thought I resembled a Chinaman alone by myself. Of course it is rather lonely, and I wish some more planters would come and see Tavoy district and see for themselves what can be done in Burma. I had also a call from Mr. Fryer, the Financial Commissioner, and Mrs. Fryer. Mrs. Fryer takes a great interest in plants and knows a good deal about plants and also their botanical names,—a very nice lady indeed. I had also a call from Mr. Hall, the Director of Agriculture, and Mrs. Hall. Mr. Hall had just returned from Penang from the mining districts. He went down to get information about mining and mining labour, *labour laws*, etc., and also brought specimens of tin and tin made from the indigenous tin and samples of all kinds of ore. He told me you sent him the *T. A.*, and he said he read it with great interest. Mrs. Hall is very pretty with red cheeks and altogether a very handsome lady. It does one good sometimes to see a lady: it brings back kind recollections of mother and sisters, aye and sweethearts left behind us. You will be thinking there's a *bee* in my *bonnet* if I go on like this, so I shall say *adieu* for the present.—Yours most respectfully,

JAMES D. WATSON.

[The specimens of timber sent are of fine "red cedar," the product of *Cedrela toona*, which I

only too valuable for tea boxes.—No doubt the tea plant is indigenous in Burma as well as Assam, but the "eating tea" as described, with seeds on the lower sides of the leaves, cannot be a tea or anything allied to tea. As to the "bee in the bonnet," there can be no possible mistake, but as the Scotch say "Lat be."—Ed.]

WHITE-ANTS AND GUMS.

DEAR SIR,—With reference to your paragraph *re* white-ants, I have seen fine young gums, a tree white-ants are particularly fond of, flourishing one day and beginning to wither the next: on examination found roots being eaten by white-ants. This happens not once, but a hundred times, a clearing of mine being absolutely spoilt by them.—Yours faithfully,

TIMBER TREES.

[That white-ants attack the Australian eucalypti was a fact quite new to us until this letter and the one we published yesterday reached us. At the elevations at which we have observed these trees, white-ants are non-existent. At what elevation has our correspondent had his experience? And has anyone else suffered similarly?—Ed.]

THE CUSH-CUSH YAM AND THE NEW POTATO-LIKE TUBER FROM PERU.

The Nurseries, Nuwara Eliya, 26th Feb. 1889.

DEAR SIR,—In your issue of the 22nd instant I note your paragraph in reference to the "*kush-kush*" yams sent to you by Dr. Stork, and grown in the Henaratgoda district.

Your remarks on this most delicate of ground roots are of much interest to me. You say "These tubers are, we suppose, an introduction from India," and you go on to remark how tender and nice and tasty they are.

These yams were introduced by me 12 years ago from the Island of Grenada, West Indies, along with other varieties of *yams*, *bananas* (plantains), *edocs*, &c., and you gave a very favourable report in the *Observer* on some of the first roots raised at Kandy, stating that you found them "more flowery and light than the best Australian potatoes."

We cannot, of course, expect even the editors of the *Observer* and *Tropical Agriculturist* to remember the history of all the numerous new products tried of late years. That is but a small matter however, and I am very glad to learn that these delicious ground roots are being successfully grown near Henaratgoda. To my own knowledge, they have been raised in some quantity in the Dumbara and Veyangoda districts for years back, and the wonder is they are not regularly obtainable in the Colombo and Kandy markets, I should have cultivated them to a much greater extent, but our Kandy garden is too limited to do so. We got however splendid returns from the small spaces planted,—as much as at the rate of 14 tons per acre, and we still keep up the cultivation at Kandy, where plants are now available. I am sorry we cannot manage them up here, in Nuwara Eliya. If they could be grown at the higher elevations, they would be a great boon, now that potatoes are such a risky crop. The latter are almost invariably attacked with the disease or fungus, as soon as the blossoms appear.

While on the subject of edible ground roots, a few notes on the new tuber from the elevated regions of the Peruvian Andes may be of interest to some of your readers. I have just taken up the tubers from a small patch devoted to this plant, the *Ullucus tuberosus*, and I send you a small lot of them as a sample. I feel sure this introduction

might be of great value to the poor villagers in many parts of Ceylon, and its cultivation is of the most simple description. It throws out rootlets at the joints of its procumbent stems, and on these crowds of small tubers are formed, from the size of a pea to that of a hen's egg. The plot in question was 40 square feet in extent, and the crop we gathered weighed 42 lb., or say 1 lb. to the square foot. The ground was ordinary garden soil, not manured, and no attention was given to the bed beyond giving it a single weeding. With good cultivation and manure I should think that from 8 to 9 tons per acre could be harvested. Mr. Nock of the Hakgala Gardens remarks in the last report, that tubers were raised there to the weight of $\frac{3}{4}$ oz. Among those sent you will be found some of the weight of 1 oz., and we may therefore conclude that with good cultivation they will increase in size, and very probably improve in quality.—Yours faithfully,

ALEXANDER WHYTE,

Florist and Naturalist.

[We are sorry that Mr. Whyte's claim to credit for the introduction should have been for a moment forgotten, but we were misled by reading the name given by Dr. Stork as *kusle-kusle*. The Andean tubers are not floury, but have a good deal the taste of nuts.—Ed.]

THE GAMBIER PLANT.

Paradeniya, 8th March.

SIR,—The letter from Mr. Corbet printed on page 671 requires correction on one point: the true gambier plant does not grow in Ceylon. The species—we have but one—of *Uncaria* found here was, it is true, supposed by Thwaites to be *U. Gambier*, and was published as such in his "Enumeratio" in 1859, but Sir Joseph Hooker has since shown (Fl. Brit. India, iii, 31) that it is not that species, but is to be referred as a variety, var. *Thwaitesii*, Hk.f., to *U. dasyoneura*, Korth., the type of which is also native to the Malay Peninsula, and it is so entered in my Systematic Catalogue of Ceylon Plants, p. 41. It is a common enough plant in the moist region of our lowcountry up to about 2,000 feet, climbing by hooks (whence its name) over bushes and trees, but I am not aware that it possesses any Sinhalese name, or is of use in any way. It affords no gambier; at least, I have been unable to produce from it anything like that substance. In reference to this I may quote here a portion of a letter which I wrote to the Director of Kew Gardens on the subject in Sept. 1880, which was published in the Report of that institution for the same year, p. 37:—"In the urgent demand for 'new products' here one of the first things I tried was to make some gambier from our plant. It grows commonly not far from the Garden. I followed the account given in the books, but could not succeed in producing the correct article. A very excellently astringent extract is easily obtained, but it is black like liquorice or the *Acacia catechu* extract and not at all like 'terra japonica.'" Whether this substance would have any economic value, only a trial of the market could determine. The real gambier plant (*U. Gambier*, Roxb.) appears to be confined, in the wild state, to portions of the Malay Peninsula and Sumatra. I have on several occasions endeavoured to introduce it here from Singapore where it is so largely cultivated. The result of the last attempt is given in my report for 1887, p. 14. We have now no specimen in the Gardens.—I am, yours faithfully,

HENRY TRIMEN.

THE LAST OF THE CEYLON TEA-HOUSE AT THE MELBOURNE EXHIBITION.

(By "Old Colonist.")

On Friday, February the 8th, I stood and saw the last of the Ceylon tea-house in the Melbourne Exhibition. The inevitable auctioneer was there, with all his train of trucking brokers, heartless demolishers of homes; how I hate the whole pack of them!

For six months this bamboo hut has daily been the pleasant rendezvous of many hundreds who never before heard of Ceylon. Unpretentious as the structure was, there has been no more popular meeting-place under the 36 acres of roofing. Dear old ladies dying for a mutual "greet" sought the snug corner in which a drop from the fragrant leaf soothed the pent-up feelings, stimulated speech, and merged the dismal head-shakings into a quiet confab. Gents whose heads racked with recent land booms, or last night's potions, rushed hurriedly in and asked for it pretty strong, while later in the afternoon many a fair stall-keeper cleverly contrived to keep her tryst here, the whole, however, always mixed with a goodly sprinkling of the *bona fide* raw material ready to carry the fame of Ceylon tea into the distant bush. Little indeed does the P. A. wot what unlooked for results may follow this free cup of tea. Thousands may bless the day they drank here, while it is pleasing to think none are likely to have cause to curse the drink.

But rap goes the hammer, and only think! Those costly cups so often kissed by the fairest lips of this and other lands, by titled ladies of noble birth down to the smirking young larrikiness who serves up "nobblers" at yonder bar. Collectors of curious china, where are you that these dainty dishes should pass for a few shillings into the possession of a greasy pawnbroker? Mr. Foulkes saved the photographs from a similar fate, and now for the tea-house—5, 10, 15, £17, and down it goes. "I'll remove it for £25," says a keen artisan with an eye to business; and "I'll do it for £22," says another, "but not a farthing less." Verily this is a paradise for working men. An hour more all is chaos, and the Centennial tea-house provided by the Ceylon planters in a fair way to be forgotten—*commercially*. Well may the planter now ask, what practical results are to follow all this expenditure? Are the favourable impressions undoubtedly made to be followed up by a growing well-organized and remunerative trade, the demand unmistakably created at once and continuously supplied, or as in 1880 is this the most promising tea-consuming country in H. M.'s dominions to be practically abandoned by Ceylon? It is quite clear that no provision for the contingency has, as yet, been made in Melbourne, and it remains for Ceylon men to at once move in the matter. I do not presume to think that anything I can say on the subject can carry much weight with the Ceylon men of 1889, though the proper course to pursue is to myself clear as daylight, viz., to meet directly the wants of the consumer, and cease to treat with the established middle men whose sole interests lie in fostering the China trade. This can only be efficiently accomplished by a well-organized "Ceylon Tea Distributing Co." I have studied this matter for over two years and had frequent discussions with leading tea merchants of Melbourne, who candidly declare, one and all, that they see no object in—nor have they the remotest intention of—pushing Ceylon teas. "Create the demand," they say, "educate the public taste, and with liberal concessions we are quite ready to deal," which simply means "We will take the profits if you take all the trouble and risks" (if any).

Curiously enough several of these gentlemen added: "If it is any satisfaction for you to know, we invariably use Ceylon tea in our own household."

"It is certainly very nice," was the oft-repeated comment in the Exhibition; "but where can it be purchased?" The reply usually was: "There is a grocer somewhere in Swanson Street, supplies the public in the meantime, but we hope by-and-by to make other arrangements," at which the tea drinker looks mystified and wonders what is the real meaning of this strange freak of the Ceylon planter.

As an advertisement appealing directly to the public, the tea-house was as I have said, an undoubted success. Mr. McKenzie deserves every credit for the great amount of trouble he has voluntarily undertaken, and especially are the thanks of the P. A. due to Mrs. Alex. McKenzie whose admirable taste and tact did so much to win the public favour. All the more is it to be regretted in the interests of Ceylon and tea drinkers of Australia that no provision has been made to follow up the favourable impression made.

The Exhibition, as a whole, can scarcely, I fear, be looked upon by anyone as a success; indeed, the great majority of exhibitors pronounced it a *huge failure*. Mismangement and extravagance has prevailed in every department. The judging has simply been deplorable; of course in a community where noble selves bulk so largely in the front, it is difficult to arrive at an unbiassed judgment; indeed our artisan masters in their present temper would not for a moment permit of anything so absurdly unselfish. Take the case of coffee as an instance: a comparison of the poor immature tail parchment from Queensland with the well-matured and beautifully cured beans from Ceylon will prove that one of the most remarkable things in connection with the Exhibition has been the singularly elastic conscience of the judges!

I have brought away both samples of coffee, to which 1st and 2nd prizes were awarded, and shall have pleasure in handing the curiosities to the P. A.*

Financially the result of the Exhibition would be disastrous to any country whose powers of borrowing were less ample than Victoria. English exhibitors complain bitterly of having to pay 25 per cent duty on anything they sell and declare they will never again exhibit in a protective country.

Twenty years it is thought must elapse before Melbourne ventures upon another such show, by which time it is hoped the people may have become sane and unselfish enough to adopt *Free Trade*.

NATIVE PAPERS ON THE CHINA TEA TRADE OF 1888.

We take the following from the *N.-C. Daily News*:—Our two native contemporaries, the *Shen-pao* and *Hu-pao*, have both published reviews of the native trade of Shanghai during 1888, and the facts they record will be read with interest, crude as some of their deductions and considerations of causes are. The more complete one of the two appears in the *Shen-pao*, which begins with the complaint which will have little novelty in Western ears, that "the old solid Chinese system of business is becoming sapped by the growing speculativeness and extravagance of the Chinese merchants, a large proportion of whom in these latter days are people with very little capital at command." Praisers of the past have become a proverb in the west, and Confucius is their prototype in China; at the same time we may well believe that contact with foreigners, their speculativeness and

* In the elaborate Essay on the Mackay district distributed over the Queensland Court, I find it gravely stated that "the famous peaberry variety of coffee has been successfully introduced!"

their systems of trading on credit, cannot have been without its effect on the native traders in the settlements. The *Shen-pao* allows that the black tea merchants have done better than in many previous years, the diminution of demand in the country having kept down the prices paid to the growers, while the foreign demand has continued good. The green tea merchants have also done well, though the profits have not been so large as on black teas, while Pingsueys, the *Shen-pao* says, have been unfortunate. The *Hu-pao* contents itself with saying that 1888 was a brilliant year for the Chinese tea-merchants, and went far to redeem their losses in preceding years.—*Hong Kong Daily Press*, Feb., 6th.

ROYAL BOTANIC GARDENS, PERADENIYA, CEYLON.

A Classified Catalogue of the Library of the Royal Botanic Gardens, Peradeniya, Ceylon. December, 1888. Compiled by Henry Trimen, M. B., F. R. S., E. T. C., Director.

We have received a copy of this very interesting and useful publication from Dr. Trimen. It is prefaced by the following introductory note:—

In this catalogue the books in the Garden Library are classified on a plan which it is believed will be found practically useful to such Botanists, Horticulturists, Planters, Foresters, &c., as may have occasion to consult it. The classification, being based on the actual contents of the books themselves rather than their mere titles, becomes to some extent (so far as the Library goes) a guide to the literature available for inquirers on any particular subject. The adoption of more frequent cross-references would have increased its usefulness in this direction, but added to the bulk of the catalogue.

The many desiderata of the Library are only too conspicuously evident, and there are also many imperfect works. My own private library at present supplies and fills up many of these gaps, but any donations of botanical books wanting in this catalogue, especially of volumes needed to complete series, will be very thankfully received and gratefully acknowledged.

HENRY TRIMEN.

The value of the Library, although it is not so complete as the worthy Director wishes and naturally hopes to see it, is great, as may be seen by the following table of contents:—

- I.—General Systematic Botany (post-Linnean); II.—Partial Systematic Botany, Monographs, &c. (Phanerogamic); III.—Floras (Phanerogamic:—1. Asia, 2. Australia and the Pacific, 3. Africa and Islands, 4. Europe, 5. America); IV.—Cryptogamic Botany (Monographs and Floras); V.—Structural and Physiological Botany; VI.—Economic Botany and Planting; VII.—Periodical Publications; VIII.—Publications of Societies; IX.—Reports and Catalogues of Botanic Gardens, &c.; X.—Forestry and Forest Reports; XI.—Gardening and Agriculture; XII.—Miscellaneous Botany:—1. Pre-Linnean Botany (General), 2. Biographical, &c., 3. Topographical and Travels, 4. Fossil; 5. Bibliographical; XIII.—Other subjects than Botany.

Those wishing to consult books on our leading products—coffee, tea, cinchona, &c.—will find them under the proper sub-headings. To the young Foresters of Ceylon, such a Library of reference ought to be especially valuable.

TEA IN NATAL.

The *Morning Post* has an interesting article on the cultivation of tea in Natal, from which it appears that if all turns out as well as is generally expected there is every probability that before the end of the present year samples of the first crop of bohea ever gathered in South Africa will find their way to the London market. The writer says:—“The climate there is warm and moist, there is, too, an abundance of sunshine, in which the shrub delights, and which is moreover needful for the full development of flavour and strength in the leaves, for in China it is noticed that

the tea made from plants grown in the shade, and not fully exposed, is invariably watery and tasteless. Recently no less than four companies were formed in Natal to test the capabilities of the colony in the matter of tea-growing. Since the Natal Company acquired its estate the colonists have pushed on the work of plantation apace, so that there are now over one hundred acres under cultivation. Thirty acres are planted as a nursery, one of the largest, it is stated, ever laid out in connection with tea-growing and forty acres are ready for seed. Over two million seeds have been planted, and upwards of a million and a-half young plants are already in such forward condition that they are expected to yield a first picking early this year. But Natal is not the only new country in which tea-growing has been commenced in late years with good prospects of success. In the Malay Peninsula the tea-shrub seems to thrive even better than in India or its native place, China. The temperature and rainfall of Johore varies so slightly all the year round that “flushing” goes on every month without intermission. The yield of tea is therefore greater than in India, Ceylon, or China; and as to the quality, it appears to be equal to the very best products of Assam and Ceylon, since it fetches as high a price as either in the open market. What may be the result of the introduction of the *thea sinensis* in the Malay Peninsula, where cheap labour is readily to be obtained,* cannot, of course, as yet be said; but the success that has, it seems, so far attended the efforts made to acclimatise the plant in Natal suggest the reflection that India and Ceylon are not the only rivals which China may, in the future, have to compete with in the tea markets of the world.—*L. & C. Express*, Feb. 15th.

DRUG TRADE REPORT.

LONDON, 14th February 1889.

THE COMMENCEMENT OF THE CINCHONA AUCTIONS this week suffered some delay in consequence of the absence at the time fixed for the opening of the sale of the representative of one of the foreign manufacturers. The brokers first on the list declined to proceed with their sale until competition should be completed by the arrival of this gentleman, and the other buyers were thus kept waiting for exactly seventeen minutes, sundry suggestions, complimentary and otherwise, being advanced regarding the reasons of the delay. At last the missing gentleman hurried in, and the sale proceeded. His absence was caused, it is said, by the receipt, just before the commencement of the auctions, of a telegram from his principals revoking or altering certain limits. But when once the sale had commenced it proceeded with remarkable dispatch, one catalogue of 957 packages being disposed of in the space of twenty-eight minutes.

ANNATTO.—A large consignment (125 baskets) has arrived from Pará this week.

CARDAMOMS.—The cultivation of cardamoms is being much extended, it is said, in the north-eastern parts of Ceylon, where the best qualities are produced. Some of the Ceylon-grown Mysore cardamoms yield as much as 600 lb per acre of dried fruit; and a shipment of this variety recently sold in London at 2s 5d per lb paid the owners better than any other crop, barring the best qualities of tea, could have done. The boxes are carried to Kandy (30 miles) on the heads of Sinhalese villagers, leaving the estate the morning of one day and catching next morning's train for Colombo, whereby the minimum of risk of injury to the cardamoms is incurred.

CINCHONA.—At the fortnightly auctions held on Tuesday a rather smaller supply was offered than at the previous sales of the present year, the catalogues on this occasion including only

	Packages	Packages
Ceylon bark ...	1,234	of which 1,001 were sold
East Indian bark ...	1,217	“ 1,204 “
Java bark ...	22	“ 22 “
South American bark	203	“ 37 “
Total ...	2,676	“ 2,264 “

* This is new to us, and will be in the Straits, we suspect.—ED.

The deficiency of Ceylon bark was almost balanced, as will be seen by the exceptionally large supply of Indian-grown cinchona, including a large portion of succirubra bark, mostly renewed from the Nilgiri Hill plantations. The offerings of American bark were again confined to Bolivian calisaya quills, which are firmly held by the owners, though the manufacturers seemed prepared to pay a slight advance on the last auction rates. The auctions commenced with a steady tone, and when the principal catalogue was reached the bidding became occasionally lively, but towards the finish competition again flagged a little. There was no decided improvement in the prices paid, but a better feeling prevailed throughout the sales, and the unit may be placed at an average of 1½d per lb. for good parcels. The following are the approximate quantities purchased by the principal buyers:—

	Lb.
Agents for the Mannheim & Amsterdam works	126,080
Agents for the Brunswick works	105,754
Agents for the American, French, &c., works	90,103
Agents for the Auerbach works	55,870
Agents for the Frankfort o/M and Stuttgart works	48,717
Messrs. Howards & Sons	34,301
Mr. Thomas Whiffen	24,750
Sundry druggists...	46,859

Total sold	532,434
Bought in or withdrawn	83,616

Total quantity catalogued ... 616,050

It is understood that the mere weight of bark purchased affords no guide whatever to the quinine yield represented by it, firms who buy a small quantity of bark by weight frequently taking the richest lots, and *vice versa*. The auctions included a somewhat unusual quantity druggists' barks, which accounts for the rather large quantity purchased by various buyers other than manufacturers. An analysis of the catalogues shows that the following prices were paid for sound bark:—

CYLON BARK: Original: Yellow varieties: Chips, poor thin to fair branchy 1d to 1½d; fair to good bright mixed with shavings 2d to 4½d; shavings mixed with branch 3d to 3½d; fine bold chips and quill 10d; good but rather papery brown druggists' quill 7d: bold silvery ditto 7½; root 6½d per lb. Red varieties, weak chips 1½d to 1¾d; weak to good branchy chips 2½d to 4d; weak to good bright spoke shavings 2d to 4½d per lb; grey root 2½d to 6½d per lb. Renewed: Yellow varieties fair to good bright strong chips 4½d to 7½d; shavings dull weak 2½d; good 5½d to 7½d; one parcel 10½d per lb. Red varieties chips 2½d to 6d; dusty small to good spoke shavings 2½d to 6½d per lb. Grey chips and shavings 2½d to 5d per lb.

EAST INDIAN BARK: Original: Yellow varieties, thin twigs and chips 2½d to 4d; fair to fine quilly mossy chips to 8½d; shavings fair to fine rich 3d to 8½d; druggists' quill, good brown to fine bold rich mossy 7d to 1s 4d per lb. Red varieties, thin to good bright chips 2d to 4d; spoke shavings 3d to 4½d; long mossy quill 8½d to 10½d per lb. Grey chips 4½d per lb. Renewed: Yellow varieties, spoke shavings 4½d; fine bold chips and quill 1s per lb. Grey chips 7d per lb. Red chips, fair quilly to good bold stem chips 3½d to 7d; shavings 5d to 7½d; broken to good bold mossy druggists' quill 7d to 10d per lb.

JAVA BARK.—Grey chips mixed with branch quill 5d per lb.

SOUTH AMERICAN BARK.—For brown papery to fine heavy silvery Calisaya quill from 7d to 1s 1½d per lb. was offered and refused. About 3,972 lb. of rather irregular quill sold at 7d to 9½d per lb. Nine serous very bold flat orange, rather dark on the reverse were bought in at 1s 6d per lb. One bale bold Cuprea bought 2½d per lb.

ESSENTIAL OIL.—Citronella, neglected at ¾d to 1s-16ths d. per oz.

QUININE has been almost a dead letter this week. A limited business has been done in German bulk at 1s 3d per oz first hand, and we hear that the B & S agents have refused to submit an offer of 1s 2½d per oz.

THE DUTCH MARKET.

AMSTERDAM, February 12th.

CINCHONA BARK.—The second periodical auction will be held on February 21st, and will include 3,215 bales and 177 cases, or about 280 tons weight, of which 389 bales and 17 cases are Government crop. Of the lot 228 tons are manufacturers' bark and 52 tons druggists' bark. The analysis of the former is as follows:—About 16 tons contain 1 to 2 per cent quinine sulphate; 48, 2 to 3; 68, 3 to 4; 44, 4 to 5d; 30, 5 to 6d; .11, 6 to 7; 6, 7 to 8; 5, 8 to 9— or on the average 3.9 per cent; 228 tons, containing 9,097 kilos. (nearly 9 tons) sulphate of quinine. The bark is divided as follows:—Succirubra quills 109 cases; broken 228 bales, 10 cases; root 176 bales C. Schuukroft quills 18 cases; broken 90 bales, 11 cases; root 1 bale, 2 cases. O. Officialis quills, broken 73 bales; root 24 bales. O. Ledgeriana quills 20 cases; broken 2,043 bales, 7 cases; root 536 bales. Hybrids broken quills 27 bales; root 17 bales— 3,215 bales, 177 cases.—*Chemist and Druggist.*

PLANTING IN JAVA.

AMSTERDAM, Jan. 9.

According to a statement published lately, the exports from Java from July 1, 1887, till June 30, 1888, compared with the three former years, were as follows:—

	Coffee. Govt.		Sugar.		Tobacco.		Rice.	
	Piculs.	Piculs.	Piculs.	Piculs.	Piculs.	Piculs.	Piculs.	Piculs.
1887-88	228,368	286,639	6,641,568	207,361	1,174,494

1885-86	...	457,267	...	1,673,889				
1884-85	...	419,460	...	776,510				

This statement shows an increase of almost all article except coffee, of which the crop has suffered much from the disease of the leaves, and it is to be hoped that the measures taken to check it may lead to satisfactory results towards the maintenance and extension of this cultivation, which is a principal source of revenue for the Java population. Regarding Java sugar, the president of the Java bank, Mr. Van den Berg, has written an interesting article, in which he arrives at the conclusion that the average price of production for the 1885 crop could be estimated at f.8 per picul, and for the 1886 crop at f.7½ per picul, a difference too small to enable to express an opinion about the further existence of the cultivation. However, it may be observed that the general expectation was that the difference in the cost price between the 1886 and 1887 crop would be much larger, and this opinion has now been fully confirmed. According to the reports received there is scarcely any manufactory which has not worked more economically in 1887 than in the two preceding years, and, calculating the cost price without adding interest on working capital and debts, f.6.63 per picul may be taken as the price for 1867. This favourable result has been obtained by the abolition of the excise duty of f. 25 per bow for the manufactories working under Government contracts in December, 1886; but there is also another reason, which is to be found in the energetic endeavours made by the manufacturers to introduce a more economical system of working. These results evidently show that the existence of the Java sugar industry may be considered as secured; but a great danger threatens the cultivation in the screeh disease, which has caused already a decrease of 181,413 piculs in the province of

Djakakarta, or about 27 per cent. compared with the crop of 1887. If the production becomes less as a consequence of this fearful disease the cost of production will be, of course, comparatively higher, and the existence of the sugar industry more uncertain. However, the Government will have to give all its attention to the checking of the serch disease, as the welfare of Java is principally dependent on this cultivation.—*London and China Express.*

COCA LEAVES.

Sir,—I notice your remarks based upon a short paper introducing some of the exhibits that were made at the Linnean Society meeting of December 20, relating to the coca plants of the different varieties by Mr. D. Morris, of Kew. I had to differ from Mr. Morris in many particulars. He brought forward a plant which he wished to name "*novogranatense*," and a quantity of leaves collected from different sources, and stated that the plant with the largest leaf known existed in Paris, and was the only known specimen in Europe. I promised to send him specimens from some of my plants at Sydenham, as I had there four distinct varieties, and as the trees were large it was quite easy to see the difference in the habit, growth, and size of the leaf. I sent him the specimen, and he replied on December 31, as follows—

I have to thank you for the specimens of coca which arrived while I was away last week.

"I should say that No. 1 comes nearest to the Huanuco leaves, and to the plant in Ceylon, which yielded such good results in crystallizable cocaine. No. 2 is apparently the variety I have just described under the name of *novogranatense*."

"No. 3 comes near, but is not quite identical with the Bolivian type. It approaches more than any other to the leaves of the plant received from Dr. Treub, from the Botanical Gardens at Java.

"No. 4 is a very well-marked plant, and appears to be the one figured by Ruiz and Pavon. These leaves I have not notice before.

"We should be glad of a cutting or plant of Nos. 1 and 4 if you could spare them.

(Signed) D. MORRIS."

As Mr. Morris attached great importance to the yield of cocaine, and got Mr. Ernest Howard to support him in his opinion, I stated that in regard to the variety of coca leaves shown being the largest in Europe, even my largest variety of leaf in no way compared in size to the leaves which yield the largest amount of cocaine that comes from Brazil, and which were certainly 3 to 4 inches long.

I referred to Mr. Howard, who was in the room, and he admitted at once that the fact of his having tested these large leaves had entirely slipped his memory. He believed that they could find some of these specimens at their works. This variety is certainly the richest, but we have never seen but the one shipment of Brazilian leaves of this size.

Mr. Morris further put forward the great value of the Java variety, the details of which you give in your Journal. It was a singular coincidence that the very day Mr. Morris made these remarks at the Linnean Society, a quantity of Java coca leaves were offered in Mincing Lane, and the highest bid for them was 2*½*d. per pound.

I am informed that they cannot get this leaf in its natural form, as it is so brittle that it breaks up into almost powder. Some of the similar shipment of these leaves fetched 7*d.* per pound, but there is much remaining unsold.

In regard to the variety of coca leaves from the U. S. Columbia, I mentioned that there were two or three varieties that came from that part of the world, and some that had been tested by Messrs. Howards and Sons, of Stratford, when cocaine was worth 20*s.* per gram, which were entirely neglected for their value of yielding cocaine.

I would call your attention to page 68, No. 9, 'New Commercial Plants,' and you will there see that I

give information and particulars of an analysis, made by Messrs. Howards and Sons, of *Erythroxylon novogranatense*.

I think it will be a great pity if Mr. Morris's conclusions go forth to the world, that one of the most valuable varieties of coca plants known at the present time is that coming from the U. S. Columbia, and is best suited for growing to yield cocaine.

In opposition to this fact I find that those druggists and the houses making preparations of wine mixed with coca find that they have made a great mistake in purchasing only the thin green leaves, and now they are asking for the Bolivian varieties, which are larger, clearer and rounder in form. Therefore it shows it is not only the flavour that medical men think necessary; they require, as do the makers of the alkaloid, the action of the cocaine in the wines they order.—TROS. CHRISTY.—*Pharmaceutical Journal.*

TOBACCO AND BEETROOT SUGAR IN NETHERLANDS INDIA.

The Tobacco Company Arensburg will, it is said, declare a dividend of 120 per cent. on the preceding year. At the meeting of shareholders of the Siak Tobacco Company Holland, held at Rotterdam on the 15th inst., the directors have given information that in view of the present position of the tobacco market the cultivation of tobacco on the Company's estate had not yet commenced, and that it was the intention not to commence with it at any rate before 1890. After a prolonged debate, during which the idea of a liquidation of the company was proposed, it was decided to await further information, and to authorise the directors, in the meantime, to make an investigation with regard to the results of other tobacco companies in Siak, and to convene the shareholders again within six months. Considering the bad results of the working of lands in Siak by the East Sumatra Tobacco Company, and the doubtful results of the above-named company, it seems that the soil of Siak does not possess those excellent qualities for the cultivation of tobacco as Sumatra, and precaution is necessary before investing money in tobacco companies. The Samarang Trading Company, in liquidation, has been converted into the Samarang Agricultural Company. The purpose of this company is the working of agricultural undertakings in general, and especially those possessed by the former company. The capital, 1,000,000 guilders, is divided in 2,000 shares, each of 500 guilders, to be divided again in 10 shares, each of 50 guilders. As full payment for 1,975 shares brought in by the liquidators of the Samarang Trading Company, all its assets and claims will be transferred to the new company. Some other limited companies purposing the cultivation of produce in Java have been established during the last few days. The Kenteng Agricultural Company, established at Haarlem, intends to cultivate coffee and other produce in the district of Kediri (Java). The capital amounts to 190,000 guilders, divided in 76 shares each of 2,500 guilders, which have all been taken. The directors have received authority to increase the capital to 200,000 guilders if necessary, by issuing four shares each of 2,500 guilders. The Agricultural Company Ngoesrie, established at the Hague, purposes working certain lands in Blitar (Java) for the cultivation exclusively of coffee. The capital is 240,000 guilders, in 240 shares each of 1,000 guilders, which have also been taken.

The protection rendered to the Beetroot industry by the various Governments have, no doubt, facilitated the speedy increase of this industry, but without the assistance of chemists and engineers it would never have come to that degree of development which it possesses now. Not only the industry but also agriculture has been benefited by the elucidations of the chemists. People in Java begin now to understand that without these elucidations the agriculture and industry will not be able to develop itself at such a degree as these—both branches in Europe—have done.

Some companies of manufacturers have already established experimental stations, where the development of the sugar-cane was exactly followed in order that it might be possible to improve the cane, and where the manufacturers could make experiments on behalf of their cultivation and industry. But although this is a step in the right direction, these experimental stations cannot satisfy all wants.

The Netherlands Indian Agricultural Company in this city therefore took a resolution, which cannot fail to be profitable. It has engaged some young Dutchmen, who will go to Java in the month of March, and there employ their knowledge and energy for the improvement of agriculture and industry. They will be conducted by Mr. Carp, a clever, technical person, who has already assisted during several years in beetroot manufactures. The company by preference takes such technicals, in order that they may also be of service in the manufactories. These chemists are appointed with the view of examining the soil and the stuffs with which it must be charged, whereas they have also control in the manufactories. The principal object is the improving of the cane, increase of the production of cane per como, improvement of the manufacturing, and thus a larger production per 100 kilos cane.—*London and China Express.*

LIBERIAN COFFEE IN COLOMBO.—Another fine blossom out this morning on Liberian coffee trees in Turret Road. Promise of good crop from former blossom.—*Cor.*

CINCHONA PLANTING in Java has lost a great authority in the person of Mr. G. W. Eeckhout, of Soekaboemie, the president of the Planters' Association. This able man is supposed to have been a relative of the great Belgian artist Eeckhout, of Brussels, formerly president of the Academy of Painting at the Hague, who died in Paris some years ago.—*Burgoyne's Monthly Export.*

NORFOLK ISLAND.—In a recent American consular report an account is given of the isolated British settlement on Norfolk Island, in the South-Western Pacific, about midway between the north cape of New Zealand and New Caledonia, and about 380 miles from each. The island is about 5 miles long by 3 broad, with a total area of 8,600 acres. It is just outside the tropics, the extremes of temperature are never reached, the climate is most equable, and the thermometer never ranges higher than 84° in summer and never lower than 46° in winter. At one time the island was densely wooded with the native Pine (*Araucaria excelsa*) and other trees, but now it is covered with open, park-like downs, interspersed with groups of this Pine. Originally used as a penal settlement it was in 1856 made over to the descendants of the famous mutineers of the "Bounty," who had increased and multiplied beyond the sustaining power of Pitcairn Island, and who were presented with Norfolk Island. The soil is exceedingly fertile, being composed of a dark chocolate loam, or decomposed basalt. There is a complete absence of frost, and almost every temperate and sub-tropical plant grows in luxuriance. But three plants or weeds are so destructive to all other vegetation that a portion of every year is given by the whole community to their destruction; but, in spite of this, they are steadily increasing. These are two *Solanums* and the *Ocacia levigata*. The whole island is parcelled out into 50 acre lots, held at a peppercorn rent; the original immigrants received 50 acres each, and for some years each married couple received the same grant; this was reduced to 25 acres. The native vegetation of the island is wholly peculiar; besides the famous Norfolk Island Pine already mentioned there is a Tree Fern (*Alsophilla excelsa*) and a Palm (*Areca Baueri*); there are besides upwards of thirty different kinds of Ferns.—*Gardeners' Chronicle.*

GREEN BUG AND LONDON PURPLE.—A London correspondent writes to a Colombo firm as follows:—

"Many thanks for your sample of green bug, and the coffee leaves. As you will see in our letter to your firm, we are sending out to you a trial consignment of 'London Purple' to be experimented with on Broughton and I hope sincerely that it will prove a success. Mr. Hemingway guarantees it to kill the green bug, but of course it won't touch leaf-disease. It must be carefully handled, as it is a deadly poison, but I don't suppose it will affect the berry itself."

INSECTS.—The authorities of the Cornell University, Ithaca, New York, have established in connection with their Agricultural Department an "Insectary." The object of this novel feature in agricultural education is to afford means for the study of the life-history of insects in their several stages, so as to ascertain their manners and customs, modes of increase, and the like, to discover what insects are injurious and which beneficial to the farmer, and to devise means for preventing the attacks or of palliating the evil results of insect pests. The establishment is under the direction of Professor Comstock. Were such an establishment suggested here the proposal would in all probability be received with ridicule, but it does not appear in that light to our eminently practical cousins.—*Gardeners' Chronicle.*

FELLING TREES BY ELECTRICITY.—Hitherto machines for feeling trees have been driven by steam-power, but this is sometimes inconvenient, especially in thick woods, and electric power has recently been adopted in the Galician forests. Usually in such machines the trunk is sawn, but in this case it is drilled. When the wood is of a soft nature the drill has a sweeping motion, and cuts into the trunk by means of cutting edges on its sides. The drill is actuated by an electric motor mounted on a carriage, which is brought up close to the tree and shackled to it. The motor is capable of turning round its vertical axis; and the drill is geared to it in such a manner that it can turn through an arc of a circle and make a sweeping cut into the trunk. The first cut made, the drill is advanced a few inches and another section of the wood removed in the same way until the trunk is half-severed. It is then clamped, to keep the cut from closing, and the operation continued until it would be unsafe to go on. The remainder is finished by a hand-saw or an axe. The current is conveyed to the motor by insulated leads brought through the forest from a generator placed in some convenient site.—*Times.*

HORTICULTURE IN CARACAS.—We, *Garden and Forest*, have already referred to Dr. Ernst's first article, published in the *Gartenflora*, on "Horticulture in Caracas." It has been followed by a second chapter that contains much interesting information with regard to the plants which flourish in the Venezuelan climate, and those which, upon trial, have been found ill-suited to it. The cultivation of useful plants, he tells us, has lagged so far behind that of flowering and ornamental plants, that it is no exaggeration to say, not a single new fruit or vegetable has been introduced into the country during the last fifty years. On the other hand, the prices paid for flowers are enormous, running so high in the case of native Orchids, that their re-importation from England may prove profitable. A specimen of *Cattleya Wagneriana*, with twelve leaves and eight blossoms, had recently been offered to the author for 45 dols., and he attributes such demands to the fact, that collectors for English firms have given such enormous sums for white-flowering *Cattleyas*, that the natives in consequence have "lost their heads" to a degree which can only be cured by a persistent abstention from purchase on the part of local customers. That they have by no means lost their cunning is shown by the statement that they treat the common *Cattleya Mossie* with sulphur fumes so as to make it look like *C. Reineckiana*, bring the plants bearing these blanched blossoms to unsuspecting amateurs in twilight hours, and often receiving high prices for them.—*Gardeners' Chronicle.*

MANURES FOR TEA.

The following information interesting to Tea Planters is extracted from the proceedings of the A. H. Society of India:—

From Messrs. Williamson, Magor & Co., forwarding a circular from the Director, Department of Land Records and Agriculture, Assam, and asking for an opinion on the suggestion it contains. The circular deals with green manuring with mustard and its applicability to Tea gardens, and advocates a trial. Without an actual trial it is difficult to form an opinion as to the practicability of green manuring a Tea garden; one of the difficulties which presents itself, and which the Director also notes, is that the portion of the garden so treated would have to be left alone till the crop would be big enough to be dug into the ground; to derive the full benefit of the system the crop should be allowed to grow until it comes into flower, and should be dug into the ground before the seeds swell, a large area could not therefore be easily dealt with unless labor were very plentiful; digging-in a crop requires much deeper hoeing than that ordinarily given, and in fact approaches to trenching; as this operation would be undertaken say two months after pruning, and when the bushes would be making new growth, it seems probable that the growth would be checked, as by the treatment many of the roots would be cut, and some of the new growth might be further injured in clearing the bushes of plants growing close to the stems. It is also difficult to say what effect on the growth of the bushes the young and vigorous crop of mustard in the land would have; and another consideration is, whether the shelter thus given would cause an increase of insect pests. Without practical trial it is almost impossible to say whether, on the whole, green manuring could be beneficially done on a Tea garden. The experiment is simple and easy to make.

Messrs. Davenport & Co. wrote:—We notice from our copy of the "Proceedings of the Society for last month, that our offer to assist in obtaining samples of Tea soil for analysis had been accepted. We shall therefore feel obliged if you will send us instructions regarding the obtaining and forwarding of samples, and shall be very glad to give all information and any assistance we can in this matter." Recorded with thanks: the instructions required were sent to Messrs. Davenport & Co.

From Messrs. Barry & Co., forwarding samples of Tea bushes from Dooloo, Cachar, and an extract from Mr. Aitchinson's letter respecting analysis of Tea garden soils:—"I think what is equally of importance with the analysis of the soil and Tea plant, is the means whereby a Tea planter may know the relative value of oil-cakes and all other manures. All kinds of oil-cake are good manures, and so are all kinds of manure I may say; but I should like to be able to say what I should pay for such and such an oil-cake or other manure. A poor oil-cake would require to be laid on in extra quantity, and so on."

The relative value of different manures can only be found when it is shown what is necessary in the first place for the support of the plant, and in the next, which of the constituents happen to be deficient in the soil. In this connection the following will be interesting: it is an extract from a paper read before the Royal Horticultural Society at Ohiswick, at their meeting on the 17th of October last, by Edmond Tonks, Esq., B. C. L. of Knowle, Wariokshire: the paper is on canker in fruit trees, which Mr. Tonks traces to the want of suitable nourishment in the soil, and he narrates the result of his experiments with artificial manures on cankered trees, which seem to have been eminently satisfactory. He says:—"The food required by a planter is a complicated mixture of many elements, all of which are necessary for its well-being. The complete absence of one of them would be fatal; a deficient supply of one would arrest its development, and render it subject to disease. Nothing is more instructive and conclusive on this point than the copies of photographs of plants grown for the purpose of testing the effect of manures more

or less complete, to be found in treatises on the subject. That of "*Ville on Artificial Manures*," published by Longmans, contain many such illustrations, which clearly show that when the soil contains every element of fertility but one, it remains absolutely barren. For instance, in a soil without potash, the vine makes no growth. It remains to say that the manures necessary to restore a tree to health vary as the soils: although the ashes of the wood of the apple tree contains 71 per cent. of lime—an exceptionally large quantity—it would not be necessary to supply this element on a lime formation; nor would soda be required in a soil near the sea, although, in other geological formations or situations, a deficiency of one or both may be the cause of canker. Like conditions apply to the other elements. Various soils require such manures as will supply their various deficiencies; but as it is most difficult to ascertain, even by analysis, what may be the deficiencies of a soil, the practical way of dealing with the subject is to study the analysis of the ashes of the plant in question, and to use a manure which is composed of these elements."

WHITE-ANTS.

The following very curious details are from the proceedings of the A. & H. Society of India:—

From Mr. J. Cleghorn, Balasore. "By today's dak I am sending you preserved specimens of three Queens of White ants taken this day out of one of the ant hills so common in this district. On previous occasions I had tried to preserve specimens in very strong spirits of wine, but the subjects become discoloured and not recognizable. The specimens now forwarded have been preserved in a solution of Honey, Borax and Boracic acid, which I expect will keep them fresh for 10 or 12 days only, so they should be sent over to the museum to be treated by some proper preservative. The three specimens were removed by me this morning from one nest; the three were found lying extended side by side on a horizontal platform of smooth clay, of about six inches in diameter, domed over. By the natives it is considered a royal find to discover three in one nest, and when so found they are considered to comprise King, Queen and Prime Minister. It is usual to always find two in one nest, King and Queen, as the natives designate them. These grubs are totally distinct species to those found in the district of Shahabad; there the Queens are found singly enclosed in a hollow spherical ball of mud of about two inches outside diameter, the diameter of the cavity being about one and three quarter inches, which cavity is filled up by the Queen grub being doubled up, in which position she lives. White ant hills are very numerous in this district: they sometimes attain a height of 10 or 12 feet above ground level. I have formed an opinion, which may be premature, that the white ants here do not consume the wood and vegetation they attack, but that the material is carried away and formed into combs, which combs are made to produce fungoid spores, and on these spores the ants live and feed their young. These spores on being exposed to light, produce very handsome fungoid growths. In the combs which I have spoken about, the young are found of all sizes crawling about, and the absence of eggs appears to me to be very remarkable. The white ant introduces itself to every trade and profession, and it would be very difficult to calculate the annual money value of the loss it causes to the country. I have been induced to send you these specimens by seeing that Mr. W. J. Simmons of the Microscopical Society has taken up the subject, and as every one in India is daily more or less acquainted with this destructive creature, I hope that a controversy will be started, and that the opinions of many observers may be recorded, so that the natural history of this animal may be discovered, and that these creatures may yet be made to give a return for their depredations."

Several letters on the same subject have been received from Mr. Cleghorn; as he is continuing his researches, and will probably embody the result in paper, they are not reproduced at present.

THE SUPPLY OF TEA ON THE LONDON MARKET.

TO THE EDITOR OF THE HOME AND COLONIAL MAIL.

Sir,—Some few weeks ago you published a letter signed "G. S.," containing a suggestion that importers should arrange among themselves to regulate the supplies put on the market, with a view to preventing the collapse in prices which occurs whenever there is undue pressure to sell.

It was clear, from the manner in which "G. S." handled the subject, that he is a practical man, and alive to the great difficulty of arriving at such a general agreement among sellers as would be necessary to effect what he advocated. The hindrances to such a policy are; (1) that some of the larger agency firms do not feel at liberty to hold back the consignments of one set of clients while realising the shipments of other clients; (2) that some of the principal producers elect, as they have a right to do, to choose their own time for selling, and to keep their hands free; (3) that the bulk of the trade in tea—i.e., the operations of the retailers—being transacted during the eight months between August and March, it is not a wise policy to keep out of the market during those months. While, if these objections were overruled, the fact would remain that the value of the crop in the main is regulated by the amount of total supply in relation to the probable requirements of the year.

But allowing for all these arguments, in theory adverse to the policy suggested, there remains the certain fact that whenever sellers have regulated the supply a solid benefit has resulted; not always immediately perceptible in prices realised, but, without question, eventually strengthening the hands of sellers, and imparting a little of the confidence so much needed to the buyers.

I have chosen this opportunity for supporting "G. S.," because it is tolerably plain to all who have an inside view of the position of the market, that sellers (for the next six months at least) hold the key to the position. During the last few weeks there has been a general recognition of the absence of any reason for forcing sales. Supplies have consequently been reduced, and now the effect is beginning to be felt. It is known within 10,000 chests what the total available for the market is to the end of July; and it is found that this is not much more than half the quantity which, in the ordinary course, the trade will take delivery of. Still, with the reduced supplies, importers are now quitting their stocks at the rate of the actual delivery; surely an unnecessary proceeding.

With a little patience, and a better understanding between the six or eight large firms in whose hands stocks are mainly concentrated, a substantial gain to the whole body of the trade could be secured.

I am not aiming at a corner—far from it; but I know that the dealers like nothing so well as a strong market with an upward tendency; and it goes without saying that this is to the advantage of sellers, rather than an irregular market depressed at one time, unduly inflated at another.

I pen these observations in the hope that as time goes on the subject of co-operation amongst producers may receive more attention than it has done in the past.—Yours, faithfully,

A SELLER.

Feb. 20th, 1889.

REPORT ON THE GOVERNMENT CINCHONA ENTERPRISE IN THE PREANGER REGENCIES, JAVA, FOR THE YEAR 1887.

By R. VAN ROMUNDE, DIRECTOR OF THE GOVERNMENT CINCHONA ENTERPRISE.

(Translated for the "Tropical Agriculturist.")

1. *Weather*.—The year 1887 was distinguished by much and continuous rain. Of a real east monsoon there was scarcely any to speak of. From the middle of June to about the middle of August the weather continued pretty dry, though even during these two

months some rainy days were also recorded. From the beginning to about the middle of the month of February severe storms were experienced, which caused considerable damage to buildings and nurseries as well as to plants, especially at Nagrak on the Tangkoeban-Prahoe mountains. About the middle of October a severe storm from the south-east, which lasted only a single day, caused considerable damage to the plantations on the Malabar mountains, especially to the graft plantation at Tirtasari. Some night-frosts were experienced during the month of July, which however did no harm, as they took place on flat and cup-shaped portions of land, which in former years also had been exposed to the influence of night-frosts and had not been replanted. On the whole the weather was favorable for the nurseries and the young plants, but the great and continuous rains after the pretty wet year 1886 were not favorable for the growth of old plants, and did not exercise a favorable influence on the harvest of 1887.

2. *Increase*.—The number of plants standing in the open at the end of the year amounted to 1,665,500. In spite of the considerable additional planting through the extension of the Tirtasari establishment and the replanting of uprooted portions of the other establishments, the abovementioned figure shows a slight decrease as compared with the figure at the end of 1886, a decrease that cannot be the result solely of the thinning out of close plantations and the uprooting of some bouws of inferior varieties of cinchona, but must be attributed to the counting of the number of plants standing in the open which has since been ordered. A much smaller figure was found in the case of the Nagrak establishment, where the number of plants standing in the open was ascertained by counting. It is to be expected that on other establishments also, in spite of the writings-off during recent years, a smaller number of plants in the open will be found than is shown by the figures recently given. There are in the nurseries under shade 1,595,500 ledgeriana and 680,000 succirubra plants. These figures are very general, as among them are included the still very small plants in beds, the number of which cannot be given even approximately. Among the ledgerianas are included 45,500 graft plants, for the most part intended for the extension of the Tirtasari establishment, of which number about half will be transplanted into the open during the first quarter of 1888. Among the number of plants in the nurseries are not included the recently formed grafts in various stages of development, the number of which amounts to about 25,000. For graft slips use was chiefly made of twigs of the rich ledgeriana, a descendant of the mother tree No. 38, known as No. 38f, which contains some 12.5 p. c. of quinine. Graft slips were also obtained from the finest specimens of the grafts which have been placed in the open during the last three years, from descendants of the mother trees Nos. 23 and 38, which on analysis showed about 11 p. c. in the bark of 6 to 7 year old plants. There were also used for graft slips twigs of a nine year old descendant of the mother tree No. 23, which was analysed during the year under notice and appeared to contain 13 p. c. of quinine. The grafts thus obtained will be treated with special care in order that graft slips may be got from them speedily. The grafts obtained from a pair of rich hybrid of *C. ledgeriana* and *C. succirubra*, which were referred to in the previous report, were planted out in uprooted portions of land at Tjijuroean. The experiments of grafting *C. ledgeriana* upon *C. succirubra* in the open air, which had been abandoned for some years on account of the unfavorable result, were renewed during the year under notice. At first these experiments again gave no favorable results. On being repeated however and performed with greater care the results were pretty satisfactory. Very great care continued to be paid to the raising of ledgeriana and succirubra seedlings. The rich crop of seed especially from the graft plantations at Tirtasari at the end of 1886 enabled us to raise a large number of plants of typical appearance, which however for the most part will not be utilized before the end of 1888 for putting out in the open. A commencement was made at the

end of the past year with the replanting of fields of inferior varieties uprooted during 1887. Insofar as the replanting was carried on with *C. ledgeriana*, exceptionally typical forms were used, and only very well-grown plants were put out in the open ground. For planting out only the tallest plants were removed from the nurseries, by which means the rest had the opportunity, on account of more light and space, of fuller growth. By the strict observance of this rule well-grown plants continue to be obtained without extending the nurseries unnecessarily. The planting out of grafts at Tirtasari was continued even in the driest part of the year. The grafts raised in pots suffer little from being transplanted, and, as two feet deep holes are dug beforehand, there was also no danger that by the setting in of a severe east monsoon the soil should be dried up and the plants consequently die off. Thus the planted grafts, the operation being performed in the driest season of the year, have grown well, and supplies were scarcely needed. In consequence of the mild east monsoon of 1886 the blossoming of ledgerianas and succirubras was very small, so that in the course of 1887 it was possible to hold but a single sale of seed. By means of the large quantities of excellent ledgeriana seed sold at public auction in the latter part of 1886, most of the cinchona planters, at least in the Preanger Regencies, obtained supplies of seed at very moderate prices, so that there was scarcely any need of extending the seed nurseries. In consequence of the diminished confidence in cinchona cultivation only 20 grams of ledgeriana seed found buyers at the sale of 30th December 1887 at the fixed upset price of f1 per gram. A batch of seven hundred grams of succirubra seed was sold at the auction at the upset price of f0.20 per gram. The method (more and more practised) of grafting in the open air is certainly a reason why succirubra seed found more buyers. Of the ledgeriana grafts offered not a single one was sold at the fixed upset price of f10 each. The total result of the sale of seed was f160 gross. Small quantities of ledgeriana and succirubra seed were applied for by botanists and representatives of scientific institutions or foreign Governments. The applications of foresters for succirubra seed were also of little consequence. The extensive seed-beds laid out on the Government gardens in the latter part of 1886 will be able to yield sufficient plants for another couple of years, so that it was not necessary to lay out beds from the small seed crop of 1887. At the end of the past year many original ledgerianas, and also many grafts, began to blossom at Tirtasari, so that in 1888 a tolerable crop of cinchona seed may be expected.

3. *Clearing and Upkeep.*—During 1887 twenty bows of jungle land were cleared, intended for the putting in of graft plants. Near the Tjinjroean establishment also some bows of jungle land were felled and cleared insofar as the pieces of land happened to come within the new roads which were formed for the rounding off of the establishment. This establishment did not however undergo a regular extension, because an equally large extent has to be considered which after the rooting out of the plants therein will not be replanted on account of the difficult position of the land. The planting up of the fields at Tirtasari was commenced as soon as a sufficient number of well-grown grafts was available, whilst a beginning was made during November 1887 with the replanting of the uprooted portions. These operations are being carried out regularly as often as the nurseries yield well-grown plants, and will be brought to a conclusion during the first quarter of 1888. At Tirtasari, where grafts raised in pots were exclusively planted out, which suffered little or nothing from the transporting and planting out, the plantations formed in the latter part of the west monsoon gave the best results. At Nagrak on the Tangkoeban-Prahoe mountains, where the subsoil is very hard and not very rich, the soil also for some depth scarcely allows the rain-water to percolate, and the plants, especially the young ones, suffer from root disease, important alterations in the mode of cultivation were adopted. On the uprooted portions of land no terraces were formed, and the washing away of the

surface soil was prevented by horizontal rows of weeds, which allowed the superfluous rainwater to flow slowly above ground, but to retain all portions of soil. Plant-holes in these plantations were made not larger than was absolutely necessary for the reception of the plants, whilst working of the soil was, to commence with, practised only extremely superficially. The results, insofar as can be judged after the brief practise of this altered method, give every prospect of success: the young plants have grown better and have suffered from root disease to a far less degree than those that in former years were placed in terraces. From the results obtained it appears to be very evident how difficult it is to fix universally applicable rules for the laying out of plantations and stirring of the soil. Whilst in the sandy soil of the Malabar mountains deep plant-holes make their influence on the growth of the plants strongly felt at the end of two or three years, at Nagrak on the Tangkoeban-Prahoe mountains they give rise to nothing but disappointment. Great care was bestowed during the past year also on the upkeep of the plantations. The young gardens were superficially dug with the *patjoel* [hoe] as soon as the plants came in conflict with the upspringing weeds, whilst when the plants developed properly the soil was dug deeper. It is specially the pieces of land that have been replanted for the second or third time that require a continued and often a repeated stirring of the soil, since the plants put into such lands at first grow less vigorously, and less hurtful weeds, consisting chiefly of varieties of grass, which spread by means of rhizomes, usually make their appearance there. In older plantations, where the plants have already finished their warfare with the upspringing weeds, the grounds were dug deep several times, in order to allow the air to obtain free access to the soil, to expose the lower strata of earth to the influence of the air and thus to extend the surface of the soil. On account of the great and continuous fall of rain the stirring of the soil by means of trenches was practised less than in previous years, principally because the excavated earth, consisting for a large part of light clay, was covered by the heavy and continued rain with a less pervious layer, whereby the penetration of the air to the soil was prevented. Trenches were dug principally on those places where the washing away of the surface soil was feared. In consequence of the great pains bestowed on the stirring of the soil the plants as a rule have grown well, less however than in 1886, apparently in consequence of the mild east monsoon of 1886, in which year the surface soil had, owing to the great amount of rain, less opportunity of weathering. Satisfactory though are the results obtained from the manuring of the plantations, the small quantities of manure that are to be obtained on or in the neighbourhood of the establishments were the cause of its being possible only moderately to utilize this means of improving the plantations. At Nagrak and Lembang manurial substances were bought from the population in the neighbourhood of the establishments mentioned. As in previous years the formation and continuance of dense plantations was aimed at. The favorable results, both with regard to crop and economical upkeep of the plantations, obtained with close planting, the chemical and physical improvement of the soil, which is a result thereof, are so many reasons for as closely as possible adhering to the methods of operation practised of late years. In the annual report for 1886 mention was made of the adoption of a system of pruning having for its object the obtaining of single-stemmed trees. The experiments made immediately gave such good results, that the method of pruning was more generally adopted. Sanguine as were the anticipations found regarding it, the results even exceeded anticipations, and it is therefore now universally adopted. In the execution of the directions given, which at first certainly left somewhat to be desired, there was during the past year a manifest improvement, and a body of men is being gradually formed who are accustomed to the practice of a rational system of pruning. The young plants have now generally

the pyramidal form and the older pruned trees are also gradually acquiring this much desired form. The method of pruning followed since the middle of 1886 not only has the advantage, that in pruning only those branches are removed which are borne down by those higher up and thus are of no more use for the further growth of the plants, but it also manifests itself in an increased production, both of manufacturers' and of pharmaceutical barks. The measurements of ledgerianas, begun in 1879, were continued. The mean height of the nine years old plants at Tjibeurem raised from seed was now 5.94 meters with a circumference of 0.40 meter. The maximum height was 6.71, the maximum circumference 0.51 meter. At Tirtasari the measurements of the eight years old grafts and plants grown from cuttings gave a mean height of 5.32 and 4.41 meters, with a mean circumference of 0.36 and 0.31 meters, whilst the maxima of height and circumference respectively were 6.61 and 5.37, 0.56 and 0.47 meter. The *Helopeltis antonii* continued to make its present felt on all the establishments with the exception of Kawah Tjiwidi. In the young plantations the insect was pursued as soon as it manifested itself; and thus the plants did not suffer harm therefrom. At Tirtasari the insect made a pretty severe attack upon some portions of older plantations, which had been very roughly treated by the storm during October and had received a check in their growth by the breaking off of their branches. As the capture of the insect is impossible in the case of the older trees, in the affected portions of the plantations a repeated and thorough stirring of the soil was made use of with a view to furthering the formation of leaf and as far as possible to counteract the damage done by the insect. Little or no damage was caused during the past year to the plantations by caterpillars, and only slight injury was done at Tirtasari to young plants by the larvæ of chafers, which gnawed off the roots of the trees. More damage than by insects was caused at Nagrak by the root disease of the cinchona trees which was experienced in greater or less degree on most of the estates in the Residency of the Preanger Regencies. From an inquiry instituted by us by order of the Government, the result of which is given in a separate report, we appear to be able to draw the conclusion, that the conditions for the existence and propagation of the disease must be sought in excessive moisture in and incomplete access of air to the soil. The altered mode of operation practised at Nagrak in the preparation and upkeep of the plantations is a consequence of the result of the inquiry instituted.

4. *Crop of Bark.*—The crop of 1887 amounted to 703,313 half kilograms of bark, which was dispatched to the Netherlands for sale. No bark was applied for by the Military Medical Service. The bark was obtained principally by the thinning out of dense plantations of ledgeriana and succirubra. At Nagrak three bouws of *C. josephiana* and two bouws of *C. calisaya anglica* were rooted out, the plantations having begun to exhibit a sickly appearance; at Tjinjirean, josephianas that were met with as scattered trees over some ten bouws were dug out and harvested. On the remaining establishments the uprooting of plants was confined to a couple of bouws of *C. succirubra*, a bow of *C. calisaya anglica*, and a bow of *C. lancifolia*. The bark consisted of:—

Varieties of Cinchona.	Numbers.		Net weight in half-kilos.
	Bales.	Chests.	
<i>C. succirubra</i>	770	250	154,145
<i>C. josephiana</i> (<i>C. calisaya schuhkraft</i>)	398	114	84,761
<i>C. calisaya</i> (<i>C. calisaya javanica</i>)	43	2	7,343
<i>C. calisaya anglica</i>	139	20	25,197
<i>C. caloptera</i>	16	9	3,648
<i>C. ledgeriana</i>	2,285	15	369,713
<i>C. officinalis</i>	344	3	51,113
<i>C. lancifolia</i>	45	5	7,393
Total	4,040	418	703,313

From these figures it appears, that the crop of 1887 exceeded that of the previous year by 177,615 half-kilograms. The increase is chiefly due to the outturn of *C. ledgeriana*, the crop of which in 1886 amounted to 238,764 half-kilograms. The remarkable increase of ledgeriana bark, the crop of which in 1886 amounted to only 165,287 half-kilograms, is partly due to the larger area of plants, which for the first time during the past year yielded any bark; to the plants being older; but especially to the universally practised thorough stirring of the soil and rule strictly adhered to during the last couple of years: to harvest *seasonably, often and moderately*. The ledgeriana bark was obtained chiefly by the thinning out of trees that were being or were likely to be weighed down, whilst only those branches were removed and stripped, which were pressed down by higher branches. Very remarkable as is the increase of bark, in connection therewith the fact is worthy of note, that in consequence of the severe depression in the prices of cinchona bark, less and less thin pieces of stem and root were harvested, so that under normal conditions the crop would have been much larger. Finally it may be noted, that by the method of harvesting pursued the formation of a capital of bark remains the chief object, so that the increase of bark in the plants is still left out of view. How great is this increase of bark in the plants, can be judged in some measure from the increasing production, which, inasmuch as it is obtained exclusively by thinning out, may be considered as the interest on the capital. The favorable influence of the generally adopted intensive method of cultivation is also seen by the outturn of the graft and cutting plantation at Tirtasari, where 30 bouws of plants of an average of five years of age gave in 1886 a crop of 36,246 half-kilograms, whilst the same plantation and some five bouws of younger plants in 1887 produced a crop of 53,483 half-kilograms. That the future of cinchona cultivation must be sought for chiefly in the creation and continuance of old plantations, is moreover proved by the fact, that from the original ledgeriana plantation at Tjinjirean, some four bouws in size and about 21 years old, there was obtained in 1887 by thinning out a crop of 10,465 half-kilograms, consisting of:—

2,976 half-kil. bkn. quill containing 7.14 p. c. quin.	
1,861 " " " " 6.63 " "	
2,334 " small pieces " 3.87 " "	
3,294 " root bark " 6.59 " "	

Total: 10,465 half-kil. bark containing an average of 6.15 p. c. quin.

and giving 8.27 quinine sulphate. Deserving of notice also is the fact, that the ledgeriana mother tree No. 89, which had to be dug out on account of disease, produced a crop of 146 half-kilograms of wet and 72 half-kilograms of dry bark. For the artificial drying of the bark a Davidson's T Sirocco was erected at the beginning of 1887 at Tirtasari, which has succeeded very well and answers requirements better than the drying furnaces at Tjinjirean and Nagrak, which however continued to render good services. On all the establishments on the southern ranges buildings have now been erected for the placing therein of six new drying machines like that at Tirtasari, which have been indented for, whereby harvesting, which under the present method of cultivation must experience no check, can be carried on uninterruptedly independently of the weather. The crop of 1886 was sold in Amsterdam in 1887 at eight public auctions. The average price realized at the various sales amounted to f0.54² per half kilogram and the gross return to f285,359.66. The prices of the manufacturers' barks *C. ledgeriana* and *C. officinalis* varied from 103 to 23, those of pharmaceutical barks from 180 to 16 cents per half-kilogram. The high prices which have been paid during the last few years for calisaya quill barks were an inducement to return once more as far as possible to the harvesting of ledgeriana in quills and the packing of it in chests. There is the more inducement thereto, in that the bark of *C. calisaya*

and allied varieties of cinchona will in a few years belong to the past, or at least will be restricted to a minimum. By way of experiment 15 chests of ledgeriana bark in quills out of the crop of 1887 were sent to Amsterdam. From July 1888 the bark from the Government gardens will be dispatched direct to Tandjong Priok instead of to Batavia. During the later months of the year the crop was sent as inland produce, that is to say, the carriage by rail was no longer debited to paragraph 191 of the budget for 1887.

5. *Staff; Finances.*—Among the European staff there were no changes of importance. A second-class overseer was allowed to retire honorably from his post, in consequence of which a third-class overseer was appointed to the second class and a probationer overseer was promoted to the third class. The vacancy caused by the death of a probationer overseer was speedily filled up. The fixed native staff consisted at the end of December 1887 of 5 carpenters, 1 packing house *mandoor* (also postman), 29 *mandoors*, 236 *boedjangs*, and a servant for the chemical laboratory. There was no cause of complaint on account of want of labor. Even during the *sawah* [wet land] working season, when the supply of men for work is limited, there was no break in the regular course of operations, since the plantations have arrived at and are kept in such a condition, that a temporary cessation of field operations, especially those of stirring of the soil and upkeep, has little or no influence. Under the system of harvesting adopted, whereby women and children are required continuously for the stripping of the bark, the lack of these during the coffee-picking was indeed at one time felt, the harvesting having been on this account, though not entirely stopped, yet considerably retarded in some cases. The expenditure on account of the enterprise amounted in 1887 to:—

Salaries of the Director, the Asst. Director, and the other European staff	f32,700-00
Stationery	360-00
Travelling and halting expenses	1,225-75
Planting, gathering, dispatched and sale if cinchona seed and grafts, with expenses connected therewith	96,882-27

f131,168-02

being f6,628-02 more than was estimated in the budget for 1887. As has been stated under the heading of "Harvesting," part of the produce was sent direct to Tandjong Priok instead of to Batavia, and the crop of the later months of the year was sent as inland produce, whereby a comparison of the expenditure with former years must be restricted to the collective cost of management and working with the dispatch of the produce to the railway stations at Bandoeng and Tijahi. For 1886 the expenditure amounted per half-kilogram of bark to f0-22⁰¹ for 1887 0-17²⁵

being thus a saving of 47^{6c} per half-kilogram, which saving is chiefly a result of the so much greater crop. According to their annual report for 1886 the collective expenditure including the dispatch of the produce to Batavia amounted during the year to f124,368-40. The collective cost of the dispatch of the produce to the Netherlands beside that of sale &c. amounted to .. 40,841-96

Total.. f165,210-36

The gross return of the sales held at Amsterdam in 1887 amounted to f285,359-66; so that from the crop of 1886 a bargain was realized of f120,149-30, not reckoning a sum of f1,885, which was produced by the sale of grafts and seed. The pecuniary results of the enterprise for the year 1886 are thus again smaller than those for 1885 in consequence of the great fall in prices of cinchona bark during the year 1887. The collective expenses reckoned per half-kilogram bark including dispatch to Batavia amounted in 1886 to f0-23⁶⁵; those of the dispatch to Europe beside those of sale of the produce &c. f0-07⁷⁶⁵: total 0-31⁴³. The gross return per half-kilogram of bark averaged f0-54²⁸, so that the gain per half-kilogram amounted to f0-22⁸⁸.

6. *Information regarding the Varieties of Cinchona Grown in Java.*—The plants obtained from the seed received in 1880 from the late Mr. Schubkraft were during 1887 subjected to a chemical analysis. From the appended statement of the analyses obtained, it appears that the bark of these trees at five years old contained an average of 2.53 p. c. of quinine. These plants therefore are not worth consideration for purposes of cultivation. Far less still are the plants raised from seed received in 1882 under the names of Fine and Finest Calisaya of Mapiri, Calisaya of Inquisivi, *Zamba meroda*, *Durasmito* and *Coccola*, the bark of which was analysed during 1887. Satisfactory on the other hand were the results of the analysis of the bark of *C. pitayensis*. At five years old the average content of plants raised from seed was 4.85 p. c. quinine. Although in the composition of the bark coming behind *C. ledgeriana*, yet the cultivation of this plant promises to be not unprofitable. The bark has in appearance much resemblance to that of *C. officinalis*. In chemical composition it does not fall behind the latter, in fact has a remarkable agreement therewith, but its growth is considerably stronger. The cultivation of *C. pitayensis* therefore is deserving of recommendation on the higher lands, where the ledgeriana does not succeed at all or but poorly. As the few unisolated trees will yield no seed, from which typical plants can be raised, it is intended to form a graft plantation of *C. pitayensis* for obtaining seed later on. Now that the planting of *officinalis* is continually decreasing on account of the all-powerful *ledgeriana*, and the quill barks of *C. officinalis*, so such in demand in trade, known under the name of Loxa or crown bark, threaten to disappear from the market, the planting of *C. pitayensis* promises very well for the future, and may be of great value for high-lying plantation.

7. *Chemical Analyses.*—The bark of the 1886 crops was as in former years chemically analysed at the Quinological Laboratory of Moens, van der Sleen, Hekmeyer. The results are given in appendix B. The analysis of the barks of the crop of 1887 was also for the most part entrusted to the same laboratory. Since September 1887 the analyses of the bark gathered since that date have been performed by the Assistant Director of the Government Cinchona Enterprise, to whom also the analyses in the interest of the culture continue to be entrusted. The analyses made in the interest of the culture and of the preparation of the bark are given in appendix C. Their objection the first place was to obtain more descendants of the plants raised from seed of the richest mother-trees, in order to reserve these for artificial propagation and create seed plantations therefrom. Of the analysed trees one was found with a yield of 13 per cent quinine, which may be regarded as a valuable acquisition. From the analysis of renewed *succirubra* bark 6 years after the application of the McIvor system, it appears, that bark still continues to maintain its composition unchanged, and shows as yet no return to its original composition of *succirubra* bark. Specially noteworthy are the analyses 29-37, made in connection with the question, to what temperature cinchona bark may be exposed in drying. From the analysis it appears, that a temperature of 105° Celsius can be reached without danger, but that with a temperature of 110° C. a slight diminution in the alkaloids is to be noticed, whilst the decrease is considerably augmented by drying the bark at a temperature of 115° C. The bark intended for experiment was first dried in the sun and then for 24 hours exposed to temperatures of 70° to 120° Celsius. The question whether the influence of these temperatures is the same when practised on freshly gathered bark remains yet to be answered.

8. *Condition and Prospects.*—In the annual report for 1886 it was shown, on the basis of figures which were also given in that report, that no proper relation existed between the cost of production and the prices obtained at sale, and on this ground a considerable reduction in the selling price of cinchona bark was prophesied. Not only has the prophecy been

fulfilled, but the fall in prices in 1887 was even greater than could have been anticipated. Whilst the average price at the sales of 1886 amounted to $\text{f}0.70^{\text{cs}}$ per half-kilogram, that of 1887 went down to $\text{f}0.54^{\text{cs}}$. The cinchona bark market reached its lowest stage at the sale of 20th Oct. 1887, when the average price fell to 40c per half-kilogram. And moreover at this sale also the high average price was due to the relatively high prices which were paid for special lots of pharmaceutical bark, prices which are not regulated according to the quantity of alkaloid present in the bark, but are determined by the form and appearance of the bark. Let us leave these prices out of view and restrict ourselves to the prices obtained at the sale for ledgeriana bark, which varied from 63c to 22c per half-kilogram with an average price of 39 $\frac{1}{2}$ c, and it then appears therefrom that even the lowest price paid gave a large return for the cost of harvesting, drying, packing and sale, which altogether amounted to 15c per half-kilogram, and thus exercised a favorable influence on the financial results of the enterprise, whilst the average price obtained yielded a direct profit of 361c, even if all the expenses, such as those of management, the erection of buildings, laying out and upkeep of nurseries, opening of new land, upkeep of plantations, &c. &c. be taken into consideration. The unit price (by which is understood the price per cent of sulphate of quinine which can be prepared from the bark, and which is found by increasing the percentage of quinine by 1.346) amounted at the sale of 20th Oct. to 8 $\frac{1}{2}$ cents. The average content of the bark therefore amounted to only 3.42 p. c. quinine. It would be a hazardous attempt to forecast, whether the prices of cinchona bark will undergo an appreciable reduction in the near future. The price must rule according to demand and supply, but it is also true, that the market price of satisfactorily productive land (if which alone in Java

there is no lack) is in the end regulated according to the expense of production, added to an appreciable profit for the planter. And on these grounds we should venture to prophesy a regular decline in the market price of cinchona bark, if not in the near future, at any rate certainly in the course of a longer or shorter period. The returns of the far from ideal original ledgeriana plantation at Tjinjroean may give an idea of what an estate can be and yield, even though such high returns may not be obtained every year through thinning out. But at the same time we do not forget, that the growth of cinchona bark, the increase of bark in the plantations is here left out of consideration. We refrain from speculations as to what unit price cinchona bark may fall, to but simply remark, that the estimate of expenditure of the enterprise may be still largely reduced, when new extensions shall be things of the past, and the expenses of laying out and upkeep of plantations shall have been reduced to a minimum. Even less than any private concern has the Government enterprise come to the maximum of its yield. That maximum, insofar as the market prices exercise no influence thereupon, will not be reached in a quarter of a century. If we have ventured to append these remarks to our report, the simple and sole aim thereof is to show, that, even if the cultivation of cinchona has not, after a few years of trial, answered the expectation that was based on the high prices which were given a few years ago for cinchona bark, the complaint of low prices and the distrust in the culture are not entirely justified. On the contrary, we consider, that, from the facts recorded in this report, we may draw the conclusion, that with continued intensive cultivation and rational working the growing of cinchona can become a rich source of income, both for the proprietor and for the people engaged in the culture.

Tirtasari, 20th March 1888.

APPENDIX A.—Statement of the condition of the Government Cinchona Plantations in Java for the year 1887.

Situation and mean height above sea-level of the plantations. (The height expressed in meters.)	At the end of	Plants in the nurseries.				Plants in the open.				Grand Total of Plants.

ARTIFICIAL COFFEE.—The machines for the preparation of artificial coffee beans of which I gave some particulars a short time ago seem to be in operation. At any rate some of the artistic "berries" were recently confiscated in a shop at Dortmund by the police in the presence of an official analyst.—*Berlin Correspondent, Chemist and Druggist, Feb. 9th.*

COFFEE IN AMERICA.—It will be interesting to Brazilian producers to know that one of the large roasted coffee firms of the United States, located in Boston, advertises its merchandise as "Warranted not to contain a single Rio bean." The Brazilian planter should see to it that his coffee hereafter is so well prepared that no one can safely make use of an advertisement of this character. Rio coffee has deservedly suffered much from bad preparation, but there is no need of permitting this reputation to continue any longer.—*Rio News, Feb. 11th.*

BLACK AND GREEN TEA FROM DIFFERENT TREES!—The old standing Ceylon joke of the proprietor at home who wrote to his manager out here to grow only the peaberry variety of coffee has given place under the reign of the new king to other not less amusing ones. We have heard of the man who refused to take broken pekoe from the dealer, and insisted on being supplied with pekoe, saying: "None of your broken stuff for me"! We have also had the old story served up again, with the substitution of "broken pekoe" for "peaberry." But the height (or depth) of ignorance and impudence is reached in an advertisement which we notice in a home paper, where a certain "blender of good tea only," who calls the stuff he sells (at 2s per lb.) "liquid joy," illustrates his advertisement with representations of "Liquid Joy Tea Plant Black" and "Liquid Joy Tea Plant Green"! Unfortunately the illustration is on too small a scale for us to detect the differences between the two plants; and unfortunately also Dr. Trimen has just left the island, or he might have been able to solve the difficulty. We may add that the illustration is "registered"!

TOBACCO IN CEYLON AND BORNEO.—Curiously enough, coincidentally with the appearance in our columns of correspondence between Mr. Thomas Dickson and the Chairman of the Planters' Association, on the subject of tobacco cultivation in Ceylon, we have had a visit today from Mr. van Gogh, the well-known Java and Borneo planter, who is returning from Europe by French mail steamer after witnessing the successful floating of the London and Amsterdam Borneo Tobacco Co., Ltd.,

a prospectus of which has reached us by this mail from Mr. Thomas Dickson, who has written on it "Why not Ceylon?" The objects of the company are set forth in the following paragraph which we take from the *London and China Express*:—

The prospectus has been issued of the London and Amsterdam Borneo Tobacco Company (Limited) which has been formed to purchase eight valuable tracts of land, on which to cultivate tobacco, in the East Coast district of British North Borneo, each tract containing an area of 5,000 acres, 40,000 acres in all, namely, 20,000 acres situate on or near the Labuk River, and the other 20,000 on or near the Kinabatangan River. The lands to be acquired will be for 999 years free of quit rent, from the British North Borneo Company, subject to an export duty of one cent of a dollar per pound avoirdupois, on the tobacco grown on the land, to begin to be paid after Jan. 1st, 1892. The capital of the company is £150,000, in 14,990 shares of £10 each, and 10 founders' shares of £10 each, and 8,700 shares are now offered for public subscription. Of the remaining 6,290 shares 1,300 fully paid shares will be allotted to the vendors in part payment of the purchase money (£40,000) of the properties to be acquired by the company. The directors are all practical men, and the prospectus has evidently been drawn with great care. One of the leading features we desire to call attention to is that the profit to the vendors is made subservient to the profit of the general shareholders. Thus the 1,300 shares allotted to the vendors only receive a dividend when 10 per cent. has been paid on the other shares, and provision made for the reserve fund. When 100 per cent. in dividends has been paid on the ordinary shares, these 1,300 shares have equal rights. Similarly the 10 founders' shares receive no profit until 100 per cent. has been paid on the shares issued to the public, but then they are entitled to one-fourth of the profits after a 20 per cent. dividend has been paid, and provision made for the reserve. We desire to point this out, as on these matters the prospectus entirely coincides with remarks that we have made of late on more than one occasion.

Mr. van Gogh (who was introduced to us by Mr. W. W. Martyn, who has returned to Ceylon by the same steamer) was anxious to stay a week or so in Ceylon, in order to judge of the prospects of tobacco cultivation in the island, but he is unable to do so. However, he took with him a copy of our new book "All about Tobacco," and we supplied him with information as to rainfall &c. With such influential direction and experienced managers as it has, the new Borneo Tobacco Company ought to succeed.

THE REPORT FOR 1888 ON THE
BOTANICAL GARDENS OF CEYLON.

ECONOMIC PRODUCTS:—COTTON, TOBACCO, LIBERIAN
COFFEE, INDIARUBBER, PEPPER, &C.

As usual the principal portions of Dr. Trimen's report are circulated as a *Supplement* with this number of the *Tropical Agriculturist*. The report is specially interesting on this occasion as dealing fully with the two "new products" which are at present engaging special attention: tobacco and cotton. It will be seen that Dr. Trimen quite supports our views as to the exhausting nature of the first, while as regards the second he points out, that, if objections as to damage from monsoon rains and insects can be obviated and good crops obtained realizing profitable prices, the area over which cotton can be cultivated in Ceylon is very wide indeed, embracing vast tracts in our hot lowlands, while Mr. Blackett's experiments have shown how well suited the medium hill zones are for the culture of the better species of *gossypium*. The extension and success of the cotton enterprise amongst Europeans as well as natives, we have all good reason earnestly to desire, for the danger is imminent now that before new markets for tea can be opened up, that product will be almost as much overdone in Ceylon as cinchona has been. There are so many varieties of cotton scattered over Ceylon, while seed of the best kinds is being introduced, that we cannot doubt the fulfilment of Dr. Trimen's hope that a kind or kinds suitable specially for our climate as affected by monsoons may be discovered and widely cultivated. The early working in our midst of a spinning and weaving factory places the cotton enterprise in Ceylon on a very different and a much more favourable footing than ever before, and we are now sanguine of success in the case of a product, the permanent establishment of which will prevent that exclusive devotion to one culture which, having been our bane in the past, is likely to be our peril in the future. Such being the state of the case, Dr. Trimen's utterances on cotton, tobacco, tea and other cultures will be read, as they deserve, with special attention. The good doctor's surprise, however, that Liberian coffee is not more grown would probably disappear if he had the trying experience of many of us regarding the refusal of a large portion of the fruits of this coffee to ripen, the enormous proportion of waste matter and the difficulty of pulping it off, and finally the liability of the gigantic leaves to leaf disease in proportion to their size. The market for vanilla is not large and could be easily overdone. The culture seems to suit our neighbours in Mauritius and Réunion.

A very interesting account of an experiment with large indiarubber trees is given, from which the conclusion is drawn that forests of *Hevea* rubber trees may yet be sources of great profit in Ceylon. The want of success in previous experiments was due largely to the immaturity of the trees and probably to wrong modes of obtaining the gum. Dr. Trimen recommends gutta percha and rubber cultivation to the attention of the Forest Department, and he might well have added the Australian eucalypts and acacias. Planters who have preserved

their rubber trees will now wait till they are well-grown. The prospects of ordinary pepper are good, but the official variety or species called cubebs has not yet been introduced into Ceylon. The cultivation of ipecacuanha, the great remedy for dysentery promises to be successful.

Both Peradeniya and Hakgala gardens have been greatly improved and beautified, and it is now likely that in the latter a large number of other European fruits in addition to superior grafted plums, already established, will be successfully cultivated. It is curious that both at Peradeniya and Hakgala the great want is a perennial water supply. Last year there was deficient rainfall at Peradeniya and a period of fifty-five days' drought at Hakgala. We commend to the notice of our readers the description of the new form of cheap conservatory for ferns and foliage plants, so successful at Peradeniya, the roof being not glass, but coconut netting over wire. The only disadvantage is that such a conservatory will not afford shelter to persons desiring to escape from rain. For such a purpose there is a glass-roofed conservatory. Our only regret in reading this Report is that all the botanical gardens of Ceylon are so far away from the capital. Pains should be taken to supply Victoria Park with all possible ornamental trees and flowers: and we are glad to learn there is a chance of seeing the *Victoria Regia* in the basin of Sir Arthur Gordon's fountain in the Fort. Dr. Trimen suggests the provision of a Government resthouse at Henaragoda for the convenience of visitors, the train arrangements involving so much delay. Anuradhapura and Badulla gardens both suffered from want of rain, but the former can now receive the benefits of irrigation from tanks filled by the Yodacla with water from the grand lake of Kalawewa. White-ants are a great pest at all the gardens except Hakgala, which is too elevated for the termites. "White" ants is a name now scarcely appropriate as a black variety of termites exists in the island: "black white-ants"! The interchange of seeds and plants goes briskly on; the herbarium has been very greatly improved; there is the nucleus of a good library and careful drawings of plants are being constantly added to the already large collection. Finally there is a new and important departure in the provision at Peradeniya of a botanical laboratory, in which Mr. Potter, M.A., F.L.S., of Cambridge, is at work, we cannot doubt with great prospective advantage to the science of vegetable physiology

THE BOTANIC GARDENS AND CINCHONA
PLANTATION OF NORTHERN AND
SOUTHERN INDIA.

The Reports for 1887-88 have, with many other documents, been waiting for a convenient season which we must now make. The contents are of considerable interest, for the importance of the great febrifuge-yielding plants to humanity has increased instead of decreasing with the fall in price which has told so disastrously on the enterprise in Ceylon. The interest of the report of our good friend Mr. Gammie on the Sikkim Cinchona Plantations centres in the progress made, first in the preparation from the bark, where it is grown, of a useful febrifuge of mixed alkaloids, and then the discovery of a cheap and effectual mode of separating pure sulphate of quinine. The whole narrative of the triumph of

intelligent perseverance in this matter reads like a romance. In recent plantings only the quinine-yielding ledgerianas and hybrids have been put out. The replanting of a piece of land which had rain fallow for ten years after the original cinchonas had been uprooted promises to be a great success. Several new species of cinchona promised well, but trials with the plants yielding cuprea bark had proved a failure. Except for their botanical interest we do not see why trouble should be taken with these plants, which are not cinchonas at all. The issues of febrifuges in the year had exceeded 8,000 lb. The plants, including nursery stock, numbered 5,335,000, of which nearly 3 millions were ledgerianas and superior hybrids. Counting sales of medicine, the plantations have yielded large profits; and as the Lt.-Governor of Bengal was to bring Mr. Gammie's services to the notice of the Government of India, we hope soon to hear that besides a more substantial reward Mr. Gammie will receive the C. S. I.

The giant lily, *Victoria regia*, had flowered in several of the lakes in the Calcutta Botanical Gardens, which leads us to express surprise that all experiments in this more genial climate of ours have failed. No doubt we have beyond comparison the largest flower in the world in the grand spike of the talipot (a specimen of which is now in fruit in Peradeniya), but the great lily ought to be amongst the attractions of Peradeniya and also of Victoria Park, Colombo, as well as of the Fort Fountain tank. The "rain tree" (*Pithecolobium saman*) has flourished exceedingly in Ceylon, but we have never heard that here, as in Calcutta, cattle greedily eat the nutritious pods. We surely cannot afford to despise any form of forage. In noticing the Lloyd Botanic Gardens at Darjiling the disastrous effects of the potato disease are remarked on and the recommendation made that fresh seed be introduced from Malta or Australia. The correspondence of Dr. Wallich from 1794 to 1849 had been transferred from Kew to the Library of the Calcutta Gardens.

The Madras Cinchona reports indicate considerable damage and destruction of plants by severe frosts in January and February 1888, over 3,000 cinchona plants having been killed outright. Such frosts are very rare in the Nuwara Eliya plateau. Drought and strong winds are also reported as damaging the Nilgiri plantations, the first plot of succirubras planted at Naduvattam, and to which special interest attached, being described as so shaken as to be doomed. Wind is bad enough in some parts of Ceylon, but if any one wants to see evidence of the destructive fury of the north-east wind, he must go to the edges of the Nilgiri plateau. Manure, cattle, haystacks, silos, deep tillage are all mentioned in connection with the Nilgiri cinchona plantations. Mr. Hooper had visited Darjeeling and obtained all information from Mr. Gammie, so that now quinine will be manufactured in Southern India as well as in the North. In Mr. Hooper's report it is shown that in the case of ledgers as well as other cinchonas the covering of the bark leads to a large increase of quinine. It was proved that while cattle-manure increased the proportion of quinine lime led to an increase in the inferior alkaloids. Cattle-manure gave an increase of 48.8 per cent in quinine over the bark of unmanured trees. Poonac also led to a large increase in quinine. Manure and renewing both lessen the amount of the most inferior alkaloid, cinchonine. A great deal of interesting information is given regarding the value of robust hybrids, which will be reprinted in detail in the *Tropical Agriculturist*. The approximate number of plants at the end of the year was 1,740,000. This does not include plants in nurseries as in the case of the Bengal report.

PLANTING IN THE LOWCOUNTRY OF THE WESTERN PROVINCE.

A SIYANE KORALE CORRESPONDENT ON THE TREATMENT OF COCONUT TREES—RICH MANURE A STIMULANT OF THE GROWTH OF PLANTS—THE TREATMENT OF THE ORCHARDS OF EUROPE AND THE ROOTS OF COCONUT TREES—THE FORCING OF YOUNG TREES TO EARLY BEARING BY DIGGING AND MANURING—THE DISASTROUSLY LOW PRICE OF ANATTO—NONBEARING DIVIDIVI TREES—HEAVY SHADE AND SUPERABUNDANT MOISTURE AS A CHECK TO RIPENING OF PEPPER.

The paper that called forth so much indignation on the part of a Siyane Korale correspondent some time ago was not all in opposition to him. I there stated and opposed views on the treatment of coconut trees, that I am not aware he held, even in his most benighted days, but that are still held and defended by some who pretend to a knowledge of coconuts, but do not assert themselves in the *T. A.*, and who never obtain greater light from our discussions of the principles of agricultural chemistry, so that some of the tarest hits in that article were not aimed at him.

It is evident that on more than one of my views my young critic has not understood my meaning, no doubt from want of precision of statement. I never thought of denying the patent fact that a rich manure stimulates the growth of plants. What I did say, or at least meant to say, is, that the growth of plants is not governed by the abundance of some of those constituent elements in the soil, but by such of those elements as are least abundant. The specific sap of a plant is composed of its constituent elements, in definite proportions derived from earth and air, and in the case of any of those elements being deficient in the soil, the plant will only thrive in proportion to the success of the roots in observing the specific proportion of the deficient element. If the roots take up indiscriminately the soluble elements of the soil, how comes it, that many of those elements are not found in the tissues of the plant? By what organs is the final selection made? and how is the rejected matter disposed of? To my mind it seems much more consistent with the simplicity of nature, that the power of selection should be in the roots than in any other organ. There is no transmutation of elements either in nature or art, and no plant is known to accept a substitute for a deficient element.

The S. K. writer seeks for analogy in the treatment of the orchards of Europe. He is no doubt aware that most of the fruits cultivated in Europe are exogenous, but even in that case occasional ploughing of orchard grounds is by no means an unfrequent practice in England. The roots of most exogenous plants are few in number near their origin, but ramify below ground, much as the branches do above, waxing in girth as the stem and branches wax. To cut those large roots would be very injurious to the tree that was fed through them, and in some species would as surely kill the tree as ringing the stem. The roots of indigenous plants are very different in character. In the case of the coconut the main roots radiate from the common centre in all directions and in uncountable numbers, and all about an inch in girth from origin to extremity. To a plant thus furnished there is no hardship in the loss of such main roots as intrude on the space reserved for the operations of cultivation: so far indeed from suffering by the loss of superficial roots I have never seen a tree so treated that did not respond gratefully and almost immediately.

As regards the forcing of young trees, I am not half so sanguine as some other planters I hear of, who propose to have their trees in flower in the fourth year, a feat beyond my experience and my knowledge; I would do the same if I knew how, but I believe on specially suitable soil with liberal cultivation a large percentage may be brought into bearing by the seventh year, and the balance before the end of the tenth. I have elsewhere stated my opinion that coconut trees do not suffer from over-bearing, as they drop all the crop that is beyond

their power of ripening. I have never seen a coconut tree produce a fertile flower with a head of less than twenty green leaves, and the most vigorous often have a head of thirty before they show a spathe. That early maturity is inconsistent with longevity is one of those closet maxims that is not confirmed by experience in the field. The earliest bearers, so far as my observation extends, continue to keep a foremost place for twenty years on a line, and in all probability throughout their whole period of life. My young critic may object that this may be true of natural but not of forced plants. Let us clearly understand what meaning we respectively attach to the word forcing. If he holds that digging and manuring is forcing, then we are at one and understand each other. There are spots of land that are topographically, mechanically, and chemically perfect. Did any man ever object to plant coconuts on such land because of its forcing qualities? I think not. To break up and manure land of inferior quality is only a feeble and imperfect endeavour to supply some part of those qualities that the other has by nature. If the introduction of a limited supply of fertilizing elements into a poor soil is so adverse to the staying power of the coconut tree, it seems to me to follow that a soil naturally rich beyond all that art can do for a poor one will be much more adverse to longevity than the poor one that can only be kept up to the mark by repeated applications of manure. If it has been observed as a rule, that trees on naturally rich soil die off early, then I am shut up, and will confess my error. If, however, it should be proved that the trees on such land yield larger crops at fifty than they did at twenty years, I will hold to my system of digging and manuring inferior soil up to the measure of my means, without the fear of those operations promoting premature defunction. I could not sit down content with an annual average yield of 20 nuts from a mature tree after having seen the yield of such trees increased five-fold at a cost that left a handsome profit.

It is matter for regret that the price of annatto has come so low, that to anyone paying for the small amount of labour it demands a loss would accrue. A few great bushes of this *Bixa orellana* near my bungalow are breaking down under the weight of their crop, though thousands of the bunches of pods, have rotted before they ripened in all this wet weather.

I have a couple of divi-divi trees, six year old, that each shade a circle of twenty feet in diameter, and for the last three years have been periodically covered with flowers, yet give no fruit; I begin to fancy that they are more ornamental than useful.

There is a good crop of pepper on a few vines, I have growing on forest trees, but it obstinately refuses to ripen, though the succeeding crop is already well forward, the heavy shade, and the superabundant moisture being the culprit.

PALMYRA TIMBER.

We have repeatedly advocated in this journal a more extended cultivation of the palmyra palm and have pointed out how many useful purposes may thereby be served. We have been inclined to lay the greater stress on this recommendation, because, owing to many causes, there has of late years been an absence of effort to replace by planting the vast number of these trees which have from time to time been destroyed, either in the course of road extension or for the sake of the price which can be obtained for their timber for construction purposes, locally and for export. It is not, perhaps, generally recognised that this timber is possessed of a strength surpassing that of nearly every other wood. A good many years ago now,

very full experiments were made by Mr. Byrne of the Public Works Department to test the relative strength of the varied descriptions of timber either grown in, or imported into this island from abroad. The *modus operandi* of these experiments was as follows:—From the soundest wood obtainable, pieces two feet long and of a square inch in section were cut. These were supported in such a way that each piece tried had a bearing of one inch at either end. A special hook of iron exactly fitting on the section, and so made that the trial weight applied hung exactly below its centre, was placed on the wood, and from this was suspended gradually increasing weight until the breaking point was reached. The result was to establish the fact that palmyra was possessed of a pre-eminence in strength even over the finest procurable specimens of Moulmein teak, and, indeed, beyond that of any other of the several woods experimented with. We have heard it stated that the fracturing of the palmyra was attended by a curious circumstance which would doubtless add a value to the use of it for constructive purposes. It invariably gave audible warning of approaching fracture some little time before finally yielding. As is the case with all palms, the structure of the timber is composed of independent fibres, these being embedded in a sort of pith which hardens as the tree approaches maturity until it acquires almost the density of the fibres themselves. These last, in the case of the palmyra palm, look exceedingly like magnified elephant hairs. They are unbroken in their course from the top of the tree to the root, and are laid spirally with a slow twist throughout their whole length. Some of these fibres are naturally weaker than the others, and in every case some of these broke during the experiment cited with a loud and sharp report some time before the mass of them gave way. From this cause it is always possible to learn when timber is being unduly strained before the final rupturing factor is reached, so affording a warning which might in very many presumable cases prevent serious accident.

In the southern parts of Ceylon this timber has been but little used, for it is comparatively scarce within them;* but in the north of the island it has for centuries been used for roof and bridge construction almost to the entire exclusion of any other timber. The old Dutch residences of Jaffna have roofs framed with it, and unsupported by trusses, of a span which is quite unknown in practice among us here in the South. The adoption of such unsupported space is, of course, to be condemned, as the outward thrust upon the walls is very dangerously increased; but the fact that roofs constructed of them have stood safely for a century and more evidences how great is the strength of palmyra and how lasting its high qualities are. For purposes for which additional strength beyond that obtained from single scantlings is desired, such as the bearers of bridge platforms, &c., two or more such scantlings are trailable together, and if these be of sound timber and are closely joined they are as free from internal decay as any beam of other timber cut from the solid can be. There is, however, one disqualification to this timber which to some extent militates against its employment for certain purposes, and that is

* We were glad to notice recently that a large quantity of seeds had been obtained for trial in the Hambantota district.

that it cannot be employed with iron in connection with it. There seems to be a mutual reaction between this metal and the timber. Iron nails inserted in it rapidly waste away, while at the same time the fibre of the wood around them decays; so that a very few months suffices to loosen the attachment by such nails. Trenailing—or trennelling, to employ the usual term,—has therefore always to be resorted to, because of this mutually antagonistic action.

But on the other hand, no wood known to us so successfully resists the attack of white-ants as does palmyra—always supposing that matured wood is used. It does not, as does jak, contain an acid which is repellent to the taste of these destructive insects, but it simply resists their attack by the hardness of its fibre and its structure generally. In a country therefore like Ceylon, in which timber of nearly every kind soon succumbs to the ravages of the white-ant, this timber must be exceptionally useful for constructive purposes. The same qualification would make it admirably adapted for use as railway sleepers, were it not for the repugnance it exhibits against contact with metal. For ages past the high qualities of this timber have been duly appreciated in Southern India, and there has existed a large export trade of it from the ports of the Jaffna peninsula to those of the Madras provinces. We have before suggested that the food products of this tree, the value of its leaves for thatching, and the many other useful purposes which it serves during its life,—purposes which have been the theme of Tamil poetical effusions,—might well direct the attention of our Forestry Department to its cultivation in many localities unsuited to ordinary forest growth. The high value of it as a timber-producing tree should surely be a further and strong inducement to the Government to extend its cultivation. Altogether, as an economic question likely to affect the future of our timber supplies, our Forestry officers should, it seems to us, make every effort to propagate its growth, for it will flourish in soils and under conditions of climate which are inimical to the growth of any other tree known to us.

ANNUAL REVIEW OF THE CEYLON TEA TRADE.

We call attention to our *Special Supplement* containing a reprint of the very valuable and elaborate Report of Messrs. Wilson, Smithett & Co. on the course of trade in Ceylon teas in the London market during 1888. As usual, a table is compiled, showing, with as much accuracy as is possible, the total quantity of tea sold under each mark and the average realized, for the whole year. It is important in looking at this return to make allowance for the quantity as well as the prices. Thus, if reference be made to successive issues of our Directory, a fair idea can be formed, from the acreage planted, of the instances in which extremely fine plucking—with an unduly small yield of crop—has been practised in order to get up a name for a high average. It would be manifestly unfair to rank K. A. W. with its 500,000 lb. of tea, or even marks with 200,000 or 100,000 lb. against

estates which have realized fancy prices for a total of 17,000 to 30,000 lb. of tea all told in 1888.

The next table, summarizing the sales as respects districts, will excite a good deal of attention, as also the interesting statistics which follow. In the course of their Report it will be observed that Messrs. Wilson, Smithett & Co. are very outspoken in their advice to Ceylon planters. They call on the managers of high estates to do all in their power to try and rival the fine teas, with delicate flavor, that are typical of the finest Darjeelings and Kangra Valleys. In finer plucking generally, they at present—pending the opening of new markets—can alone see the antidote to low prices, and as a further aid they deprecate the tendency to “over-sorting.” We have no doubt that the whole of the remarks of this eminent London Broking Firm will receive that careful consideration at the hands of our planting community which they deserve, and we trust that 1889 may witness both the opening of new markets and the despatch of finer teas from Ceylon, resulting in a general improvement in the average prices realized.

THE TRUEST BENEFACTORS OF CEYLON IN THE PRESENT DAY.

It has been said that he is the truest benefactor of his country, who has made two blades of grass to grow where only one grew before. Henceforward it may emphatically be said that he is one of the greatest benefactors of this colony who causes two cups of Ceylon tea to be drunk where only one was drunk before! How both native and European interests are bound up in “tea” we need not point out. Every day makes plainer the duty which is most pressing before all well-wishers to the prosperity of the general community of the island. The production of tea has reached such a point that it may be said they are no benefactors of the common weal who after this season, go on adding to the planted acreage, unless indeed they simultaneously do equal work in endeavouring to extend the demand for, and consumption of our teas. There is, in fact, no other question before the local public equal to this in practical importance.

The problem of Raliway Extension to the north and to the south, skins into absolute insignificance when compared with the means of disposing profitably of the 15 to 20 millions lb. of Ceylon tea which will shortly be added to our present annual export. Indeed, we may say that there is no piece of legislation engaging the attention of Sir Arthur Gordon and his Councils which concerns the material welfare of the general community in any degree proportionate to that of our tea problem! Under these circumstances it behoves the Ceylon public, and especially our tea planters, to regard with special gratitude all agencies established for the advertising and sale of locally-produced teas. The men who have quitted our shores, even from among the planters themselves, in order to start and push such a trade must be regarded as benefactors of the Colony albeit that their ruling motive may have been a purely selfish one. The lines may be applied to them which were originally written for a very different class of exiles:—

True patriots they, for be it understood,
They left their country for their country's good!
All interested in Ceylon tea property must feel
that they are bound by the very law of self-preservation to give their very best support to any

certain quarters as to the wisdom guiding the distribution of this fund, we trust there will be no owners of estates so shortsighted, or unpatriotic, as to withhold their support during the current year. The Board of Management is a widely representative one, and it should be easy for any proprietor to get a hearing at that Board for his criticism or advice.

There is moreover every reason to desire that adequate support may be extended to such schemes as Mr. Whitham's Ceylon-American, and Mr. Sinclair's Ceylon-Australian, Tea Companies. We earnestly trust that both these projects may not only be successfully floated, but steadfastly prosecuted to the creation of a very considerable and independent demand for our Ceylon teas. We feel sure that there is room both in America and Australasia for a very important trade in teas from Ceylon. Some of the reasons for anticipating financial success for the shareholders have already been fully discussed in these columns. It remains now only to add that the success of such Companies must always depend mainly on "judicious management." Now in this all-important respect, very seldom have shareholders been so fortunate as in the present instances. Mr. Pineo knows the American people well and has had special experience of the American tea market, while he is recognized by his brother planters to be a careful and shrewd man of business. Of Mr. Sinclair and our Ceylon Australian tea trade, we can speak in equally confident terms. His special experience added to his well-known native caution and shrewdness should inspire a general feeling of trust in any commercial proposal made by him and one with which his own interests would be as largely identified as those of the other shareholders. We conclude therefore by pressing on all who have an interest in Ceylon tea to do everything in their power to give the necessary support to such new Tea Trading Companies. For the present, the American Company is the only one before the public claiming support, and we trust to hear that all the shares are taken up, before Mr. Sinclair returns from London to conclude his arrangements on behalf of an extension of the tea trade between Ceylon and the Southern Colonies.

THE TEA TRADE.

(From the *H. and C. Mail*, Feb. 22nd.)

There has been some slight modification of the new departure in the Indian tea sale room, Mincing Lane, in some cases the garden marks are now given, but not those of the ship. The new method of selling meets with but little opposition, the idea amongst importers being that the tea is now sold on its merits rather than on any fancy reputation it may have acquired. On the other hand, where teas have hitherto commanded a high price by reason of some imaginary superiority attaching to the mark, the new plan tells against the owner of such tea.

The attempt to establish an independent tea market in Glasgow has entered upon its first phase, viz., a public auction of tea. Prices were not wildly high, but perhaps the teas were not of the sort to induce high prices. A noticeable improvement has taken place of late in regard to the supply of Indian and Ceylon tea in the London market. The supply is now regulated with some view to the eternal fitness of things, and not let loose upon the market like a flood. Prices are not high enough to permit a glut to tea. It is evident that importers have seen the error of their ways in this respect, and that there is a judicious holding back when occasion requires.

The position of the various Indian tea companies in London merits some comment at the hands of city editors. We are glad to find that the *Standard* is favourably impressed with the comparative statement

showing the working of twenty-two of the leading companies in the season 1887, drawn up by Mr. Henry Barrshaw, and printed on page vii. It says:—"Out of the varied information given in this statement, the most striking feature seems to be the remarkable manner in which the British tea planter in Indian has managed to reduce the expenses of working, so as to meet the very serious drop in prices which his produce has had to bear. All these companies made profits ranging from 2.38 to 18.67 per cent., or an average of 10½ per cent., but only 8 per cent. was the average divided among the shareholders, the different payments being—one company, 16 per cent.; two, 15 per cent.; one, 12 per cent.; six, 10 per cent.; six, 7 to 84 per cent.; two 5 per cent.; one, 1 per cent and three, nil. Among the nil companies, however, is the Land Mortgage Bank of India, whose losses and commitments in other directions in years gone by swallow up the profits of tea growing. The largest tea company of all, and one of the oldest—viz., the Assam, gave its shareholders 10 per cent., which was not a better yield than that of new companies like the Jokai."

We have heard so much of the excellence of tea in Russia that it is quite a startling change to be told how the adulteration of that and other articles of produce thrives in that country. A large proportion of the cheaper kind of tea is "rubbish," notwithstanding the romantic stories told of the peasant and his Samovar. The adulterants employed are tea which has already been used, but principally the willow herb, *Epilobium angustifolium*, which grows in profusion in some parts of Russia. Coffee is also made the subject of fraudulent manipulation, being mixed with chicory, burnt beans, barley, and other substances. In a recent case at Odessa, a retail dealer promised a reward of £30 to anyone who would find a trace of chicory in the coffee he offered for sale. When analysed, the coffee in question was certainly found not to contain a single particle of chicory, but at the same time it was equally innocent of coffee, the mass consisting entirely of ground burnt barley.

"SPATHODEA CAMPANULATA."—Have we this flowering tree in Ceylon? Noticing one which had been destroyed in the November cyclone, Mr. Gleeson of the A.-H. Gardens, Madras, states:—"When in flower it was a really glorious sight, and far superior in richness of colour to the famed 'gold mohur' tree (*Poinciana regia*)."

A NOVEL CONTRIVANCE.—A contemporary reports that:—"Mr. W. Bull has planned a coolie baffle, and it may be seen at work at Allahabad by any one with a turn for inspecting ingenious contrivances. The lazier a coolie is, the harder his work; he has but to do justice to his employer, and his labour is child's play." Our contemporary apparently also possesses a turn for planning "baffles," of which the foregoing specimen will no doubt be as much appreciated by its readers as Mr. Bull's contrivance is by the coolies.—*Indian Engineer*, March 6th.

THE CHEMISTS' TEA TRADE.—It will be seen from an announcement made in this issue by Messrs. J. Watson & Co., of 14 Jewry Street, E.C., that the trade is now to have opportunity of obtaining tea in unlabelled packets. The advantages of this are apparent. A chemist's shop is not a good place to stack tea in chests, because the many odours present in the atmosphere would soon find their way to the tea, and the resulting "cup" would not be so cheering as desired. Hence the packet tea trade only is possible for chemists. Yet there are many who prefer to label the teas with their own names, so that they may secure any reputation which the quality might engender. It is for such that Messrs. Watson & Co. will cater, and we commend their scheme to those interested. It will be noticed that they supply labels at a small additional charge.—*Chemist and Druggist*, Jan. 26th.

["The more the merrier," and we only hope the publicans may take to selling tea, provided it is the best,—that is Ceylon produce.—Ed.]

THE BITTERNESS OF COMPETITION.

We do not pretend to feel any surprise that those whose interests have become affected by the active measures taken to push the consumption of Ceylon tea feel sore at the success which those measures have achieved. It is, however, going beyond what is legitimate criticism when, in the endeavour to check that success, the growers of Indian and importers of China tea apply terms of disparagement to that of Ceylon. Only very recently our London correspondent stated that in a conversation had by him with Sir Alfred Dent, that gentleman, who is one of the chief traders in the productions of China, stated his view that a taste for Ceylon tea, as compared with one for that in which he is himself interested, must be vitiated. Now, we have in our London Letter by this mail the opinions expressed by a gentleman largely interested in the growth and marketing of Indian tea. According to this authority, not only is Ceylon tea far inferior to the growths of Darjeeling and Assam, but there is no guarantee for the permanence of its production. In his view, apparently, every cultivation undertaken in Ceylon is destined to comparative extinction after a certain cycle of years. He specially instanced to our correspondent in support of that view the cases of coffee, cinchona, cinnamon and nutmegs. We have scarcely ever seen a weaker argument put forward than this employed by a gentleman who, we are assured, holds a high status in connexion with one of the largest tea-growing concerns of India. According to him no cultivation of any kind undertaken in Ceylon is assured of permanence. It is comforting no doubt, to our rivals to be able to lay this "flattering unction to their souls," but let us just see upon what sort of basis such an assurance rests.

Taking the first instance named, that of coffee, we would ask whether the failure that has occurred has been confined to Ceylon? Has it not spread throughout, in a greater or lesser degree, every coffee-producing country of the Eastern tropics? And has it not been experienced with a severity almost if not quite equal in intensity to that felt by ourselves, in the very country, India, with which Ceylon has been compared to the disparaging of the latter? In this instance, therefore, the ground of objection taken cannot be of true application. Then as to cinchona, it is true that our exports have diminished, but this has been due solely to the fact that it has not paid our planters to prepare their full yields of bark for export. One critic asserts, apparently of the whole cultivation in this island of cinchona, that after a certain growth the roots of the trees reach unsuitable soil, and that this has produced a canker fatal to the tree. While we may admit that in the early days of cinchona planting many sites may have received adoption for its growth which have proved to be unsuitable, and that this may have led to a proportion of diseased trees, those who know the circumstances are fully able to deny the wholesale conclusions adopted by this Indian pessimist. It is quite certain that, were the price of quinine to rise tomorrow to a paying level, it would not be long before our planters could furnish a full refutation of the allegation made against this particular form of our cultivation. Strong, however, as our case is in relation to the two foregoing products, it is even stronger as regards the remaining two which were cited to our correspondent, viz. cinnamon and nutmegs. We must say it argues either a very prejudiced prepossession, or a very remarkable degree of ignorance, on the part of anyone who may state that the cultivation of cinnamon has died out in Ceylon owing to unsuitability of

the soil to longer maintain it. As fine cinnamon can be and is grown now in Ceylon as was ever exported from it, the cause of the falling off in production has been the enormous yield obtained in our own and other eastern countries, which has caused prices to fall to an extent which has removed inducement to continue the planting of cinnamon to any large extent. The growth of nutmegs, as of many other spices, has also fallen into desuetude here from a similar cause, the strength of outside competition; though we fully believe that the tide in this respect has so far turned that the growth of many descriptions of spice plants—especially that of the nutmeg—might be again undertaken to advantage among us. It is simply shooting very wide of the mark to assume that several of our past industries have failed owing to natural disqualifications rather than from economic causes.

We make every allowance, of course, for the very natural dislike in certain quarters to see Ceylon coming in first in the race. When the winner of a race nears the post, we may be certain those who ride horses making a bad second and third will have no amiable feelings towards their more advanced rival. Such feelings, however, should not cause them to attempt to "put the saddle on the wrong horse." We may be quite certain of this, that if Ceylon tea were not what it is represented to be, no amount of advertisement would insure its winning the race any more than any amount of punishment will make a bad horse reach the goal first. Of course, we can recognize that these sweeping disparagements of our local industries must have in some degree an ill-effect. The fact that they are circulated should stimulate our making every endeavour to prove their falsity; and if all of them are based on such fallacious grounds as those we have above dealt with, we may be sure that this ill-effect cannot but prove to be transient.

COTTON CULTIVATION.

MR. F. H. PRICE, ASSISTANT GOVERNMENT AGENT,
KEGALLA, TO THE HON. W. W. MITCHELL, M. L. C.
Kegalla Kachcheri, 28th Feb. 1889.

Sir,—I have the honor to annex for your information a copy of rules for cotton cultivation in the district of Kegalla which I propose to print and distribute among the villagers.

2. I drew up these rules after a visit to Jacktree Hill with Mr. Blackett, who agrees with their tenor.

3. It would be well, I think, if the promoters of the cotton industry would collect information from everybody in Ceylon who possesses either practical experience, or is able to speak with authority on the subject, with the view of publishing a pamphlet of instructions in as simple a form as possible in English and the vernacular languages.

4. Some of the results obtained by Mr. Blackett and myself are noted below for your information.

(1) The uncleaned cotton of 612 pods (American variety) weighed 3 lb. 8 oz. It was then separated from the seed: the weight of the seed was 2 lb. 12 oz. while the weight of the cotton was 12 oz.: therefore (deducting 12 pods for wastage) 50 pods produce 1 oz. clean cotton.

(2) 4,433 seeds (American variety) weighed 1 lb. (one acre planted 3 ft. x 4 ft. two seeds in each place requires 7,200 seeds) therefore two pounds seed are sufficient to plant one acre.

(3) The largest number of pods counted on one tree was 130. The largest number of pods counted on two trees planted in one hole was $128 \times 104 = 232$.

(4) Mr. Blackett and I consider 30 pods to a be very low and safe estimate of the average produce of each tree. Assuming that on one acre planted 3×4 , two seeds in each hole, only one out of every two seeds grows. We have $3,600 \text{ plants} \times 30 \text{ pods} = 108,000 \text{ pods} = 2,160 \text{ oz.} = 135 \text{ lb clean cotton.}$

You are better informed than I am as to the market value of cotton, but this crop at the lowest price cannot fail to be remunerative. The profit on seed (which would in this case weigh about 400 lb) has to be added.

(5) You will observe that Tinnevely seed is entirely excluded from the purview of this letter and of its annexure.

(6) I think that it would be well to endeavour to induce tea planters at low elevations to plant cotton in their clearings. It would be useful, as shade would almost certainly be profitable on its own account and would serve to bring the industry under the notice of the neighbouring villagers.—I am, sir, your obedient servant,

(Signed) F. H. PRICE,
Actg. Asst. Govt. Agent.

The Hon. W. W. Mitchell, Colombo.

COTTON.

HINTS FOR THE CULTIVATION OF THE AMERICAN AND EGYPTIAN VARIETIES IN THE DISTRICT OF KEGALLA.

I.—The richer the soil the better. Avoid shade. Chena land, even though steep and rocky, is suitable.

II.—The seed being very oily, loses its vitality quickly. Do not allow it to become damp, but keep it spread out in a cool place. Sow as soon as possible after its receipt, but wait for a wet day.

III.—It is of primary importance to sow at such a time as will result in the crop being ready for picking in dry weather.

Secondarily, the seed must be planted on a showery day.

IV.—Two pounds of seed are sufficient to sow one acre.

V.—Plant the seed in places 3 ft. × 3 ft. or 3 × 4 apart. Before planting break up each place with a fork or mamoti, 4 to 5 inches deep and 6 to 8 inches square. Plant 2 seeds, 3 to 4 inches apart, in each place, at a depth of not more than an inch.

VI.—If one out of every two seeds grows, there will then be 4,800 plants to an acre, if planted 3 ft. × 3 ft. 3,600 plants to an acre, if planted 3 ft. × 4 ft.

VII.—The season for sowing is approximately from 1st July to 15th August. The crop will be ready from 1st January onwards. The American variety ripens 2 or 3 weeks earlier than the Egyptian.

VIII.—Pick the cotton when the capsules burst, leaving the capsules on the tree.

IX.—Thoroughly dry the cotton in the sun, clean it and separate it from the seed.

X.—The cotton should be separated from the seed by a gin which is easily worked and very cheap.

OF EUROPE—LAND FOR TOBACCO CULTIVATION.

11th March 1889.

The rain we had about ten days ago was very welcome, but we want more. There are signs however that it may be back soon, which would be cheery enough, for there is no big rush of flush or small rush either. The trees are pretty much at a standstill, and what is willing to lead a forlorn hope and show the way has to struggle with the cold wind, and does not come to much. All the same it has been a very much better season than last year.

The rain brought out a blossom on the coffee, which however is not so good as one would like, especially with the price at the 100s. From higher up I hear of really good blossoms, refreshing to the eye, and filling the heart with hope. If they but set well, there should be a good me in store for the fortunate possessors. It is no

wonderful that the high prices ruling for coffee is creating a desire to try the planting again, and already there are several who purpose making the experiment on a small scale. One company, I hear, has received instructions from home, to have a fair-sized bit planted up with coffee as a trial, and to extend if there be any kind of promise of success. The planting is to be done under shade, and the seed to be imported. Doubtless there is a good deal of risk in a venture of this kind, but when it is spread over the many, the loss should not be very heavy if it be a failure; while it has the advantage that several districts will be tried, and in some perhaps the fates may be favourable.

One thing is pretty clear,—that the coffee which abides at present but poorly represents the vigour of the old: neither will it stand the invigorating treatment of the days of yore. It would be easy enough to stimulate it into over-bearing and snuff it out. Indeed, even a very moderate crop sadly tries it, and those who may be tempted by the high prices to indulge in high cultivation will doubtless get a return, for coffee is very willing, but the effort may prove like the song of the dying swan, sweetest, just before it expires. The chance to be run is that it may over-bear itself and go out. Still, who that has any coffee left does not want to see it do well; all the same there is the fear that it may be killed with kindness?

The need of fuel for our factories and the impecuniosity of the native are bringing about rather an unfortunate state of things in the villages of those districts where wood is scarce. You don't like to see and hear of jak trees being cut down for the furnace, for the fruit forms a part of the food of the people; and although the ready money which is got for the fuel means for the time being a season of plenty, still there are the lean years in store when a jak-fruit would prove a godsend and when it won't be got. Later on this unthinking devastation will, without doubt, have very unpleasant results; in the meantime Appuhami hears how Thinappu has made so much a yard for firewood, and at very little trouble, save that of felling a tree in the ancestral eighth of an acre, and piling it up. As he too is in need of money and has been ever since he can remember, he also goes in for the cutting of fuel; as his domain has none of the princely proportions of Thinappu's, there is no room for choice, and so if the money is to be got the jak has to come down, and alas! does come down. The Sinhalese villager has lots of patience, but it tries him waiting for another jak to grow. Until then he helps himself to his neighbour's, with the usual results.

How is it that in the different classes of goods of which the railway authorities give us, regular weekly returns of cacao is omitted? We have tea and coffee, cinchona and rice, coconuts and plumbago, but cacao is nowhere.

Travellers on the Continent of Europe tell us that the low prices for which good tea can now be got is very much stimulating the consumption, and is likely to continue to do so. Coffee is said to have got its hold there when tea was at a prohibitive price, but now that it is getting come-at-able by all, through tea approximating to coffee in value, and tending as if it were to be the cheaper of the two, it stands a fair chance of running a successful race with the old favourite. In foreign hotels there is no difficulty now to get a good cup of tea, and as the ease with which it is made gives it a marked advantage over coffee, the prospects of its mor-

general use are decidedly good. When tea was selling at 6s a lb. on the Continent and coffee could be bought at 2s, hotel-keepers and others were willing enough to take the extra trouble to prepare the coffee; but now, the heavy fall in tea and the rise in coffee having altered the old conditions, we may hopefully look forward to a considerable expansion in the tea trade of the Continent of Europe.

The hunt for land for tobacco cultivation goes on. I hear that the local company has decided not to take up any below the big tank, but to try elsewhere.

PEPPERCORN.

DRUG TRADE REPORT.

LONDON, February 21st.

ANNATTO.—Fair Brazilian Roll annatto is selling privately, we hear, at 9d per lb. Ceylon Seeds of good appearance bought 2½d per lb in sale today.

ARECA NUTS.—An offer of 14s per cwt, was refused for a lot in sale today.

CARDAMOMS.—A rather heavy supply of 263 packages was offered at today's auctions. The finer qualities were well represented, but a large quantity of the highly-esteemed Mangalore variety did not reach the hammer at all, the whole being withdrawn. A pretty good competition prevailed, but most of the brokers were not at all eager to sell, and altogether only 101 packages were disposed of at very full rates to an occasional slight advance for the better grades. The prices realized ran as follows:—Mysore, fine bold long well bleached 3s 4d to 3s 5d; good heavy pale 3s 3d, rising to 3s 6d; bold heavy yellow 3s 3d; medium-sized pale round 2s 9d to 2s 10d; small 2s 8d; medium long yellow 2s 6d; small ditto 1s 9d to 2s; small pale round 1s 9d; medium to bold brown mixed and split 1s 9d per lb. Ceylon-Malabar, good round medium grey 2s 4d; fair small to medium pale 2s; good heavy brown 2s 3d; round small to medium yellow 1s 4d to 1s 10d. Wild Ceylon, good heavy bold 1s 10d. Aleppy, brown, shelly, and badly clipped 10d, seeds 1s 8d to 1s 10d per lb. The following quantities were exported from Ceylon in the periods between October 1st and January 24th:—1888-9, 91,810 lb; 1887-8, 123,662 lb; 1886-7, 103,056 lb.

CINCHONA.—Very high prices were paid today for some of the better grades of South American druggists' barks:—Loxa, good bright silvery to thin brown quill 2s 2d to 1s 7d; broken and damaged 10½d to 1s 6d. Huanoco, brown to fair 9d to 1s 4d per lb. Guayaquil 7d to 1s 4d per lb. Fifty bales good bright Lima were bought in at 4d per lb. Of Soft Columbian and Pitayo barks a parcel of 51 serons, mostly imported in 1873 sold at ¼d to ¾d per lb., the whole lot (about 7,600 lb) realising less than 16%. Calisaya, good bold flat orange, sold at 1s 4d; damages at 1s to 1s 2d per lb; spurious Calisaya quill 2½d to 4d per lb. For next Tuesday's auctions 2,149 packages are at present declared, composed of 700 Ceylon, 711 East Indian, 475 Java, and 263 South American bark. The arrivals this week have been rather heavy, both from British India and from Ceylon. The shipments of bark from Java during the second half of the year have been:—

	1888	1887	1886	1885
	lb.	lb.	lb.	lb.
Private plant	1,854,888	1,635,729	282,105	429,879
Government plant	335,433	381,477	359,591	253,062

Total 2,190,321 2,017,206 641,696 682,941

The shipments from Ceylon between October 1st and January 24th have been:—1888-9, 3,346,843 lb; 1887-8, 2,990,041 lb; 1886-7, 4,999,055 lb.

CROTON SEED.—Five Robbins rather dark seed from Bombay sold at 11s 6d per cwt.

CUTTLEFISH.—Ten cases good bold and fairly white bone sold cheaply at 5½d per lb. Sixteen cases very common damaged bone from Ceylon are held at 1½d per lb., and it is said that that price is being privately paid for the quality.

PLUMBAGO.—Prices have been advanced.

VANILLA.—Of 114 tins offered today nearly the whole was sold at an advance of 1s 6d to 2s per lb on fine lots, of which a good proportion existed: Fair uncrystallised chocolate 5½ to 7½ inch, 13s 6d to 17s; 7½ to 8½, 18s 6d to 19s 6d; fair rather brownish 5½ to 8, 11s 6d to 14s 6d; common 5 to 7, 8s to 8s 9d; low foxy 2s 6d; and fine crystallised 7½ to 8, 23s to 24s 6d per lb.

THE AMSTERDAM CINCHONA AUCTIONS.

Telegram from our Correspondent.

AMSTERDAM, February 21st.

At the public auctions of cinchona bark held here today 2,982 packages, out of a total of 3,392 catalogued, were disposed of at lower rates, the unit not averaging over 80 per ½ kilo, or say, 13d to 1½d per lb. For manufacturers' barks, in shavings, chips, and quills 11c to 107c per ½ kilo (equal to 2d to 1s 7d per lb) was paid; ditto root brought from 12c to 29c (equal to 2½d to 5d per lb); druggists' barks, chips and quills, broken and long, from 4c to 75c (equal to ¾d to 1s 1½d per lb); and druggists' root bark from 35c to 56c, or 6½d to 10d per lb. The principal purchasers were the Brunswick Quinine Works, the Amsterdam Factory, and Messrs. C. L. Schepp & Zonen, of Rotterdam. The manufacturing bark which was sold alone contained an equivalent of 285,000 oz. of sulphate of quinine.—*Chemist and Druggist.*

TRAVANCORE PLANTERS' ASSOCIATION.

Minutes of proceedings of the annual general meeting, held at the Club, Trivandrum, on Wednesday 20th Feb. 1889.

Present:—Messrs. D. G. Cameron, J. Fraser, Wm. Marshall, R. T. Miller, J. P. Mackay, B. Nelson, J. S. Valentine, and E. C. Chisholm, Honorary Secretary.

The resignation of Mr. John Cox as Chairman having been laid on the table, Mr. James Fraser was asked to occupy the chair till the new office-bearers were elected. The Hon. Secretary then read the report for last year, which showed that the members who had paid their subscriptions were 19, as against 18 in 1887. Finances were also in a satisfactory state, there being a large balance in the hands of the Secretary. Very liberal grants had been given by H. H. Government to construct new roads and for maintenance of the district roads, and in this respect the Government has not been unmindful of the interests of the planters' The application for a further grant of land where desired, to the extent of 10 per cent on present holdings, is still before Government; as is also the question of timber on private property, the planters considering themselves hardly treated in this matter.

At the request of the Dewan a paper on the cultivation of tea was drawn up by Mr. Clarke, and forwarded to Government, who, in reply, requested the Secretary to communicate the thanks of Government to the members of the Association, who so readily complied with the request.

The subject of destruction of insectivorous birds had been brought to the notice of the Association by the Board of Revenue, and the Secretary replied that, "As far as can be found out, there is not a very great slaughter of insectivorous birds in Travancore either by gun-men or trappers, yet from the knowledge of the immense evil carried on in other countries by the destruction of these birds, the Association consider that it would be very desirable to take further steps to protect these useful creatures."

The Secretary then having resigned, the following office-bearers were elected for the coming year, viz.:

Messrs. D. G. Cameron, Chairman, and J. S. Valentine, Honorary Secretary.

The following resolutions were then put before the meeting and carried:—

I.—"That the attention of H. H. Government be called to resolution III. passed at last general meeting, asking for grant to the holders of land near

the 'Coffee Waste Lands Regulations,' extension of property at a fair valuation, not to exceed in extent 10 per cent of original grant."

II.—"That application be made to H. H. Government for a grant on account of planters' roads."

III.—"That a vote of thanks be conveyed to Mr. John Cox for the great services he has rendered to the Association."

Mr. JAMES FRASER, in proposing this resolution, spoke as follows:—"I feel sure that in rising to propose a vote of thanks to our retiring Chairman, I only express the sentiments of every member of the Association, when I say, how deeply we regret the resignation of Mr. John Cox, who has devoted more of his time and trouble, for the benefit of the planters, than any other man in Travancore. The frequent occasions on which he has been elected Chairman, testify to the sincere respect and esteem, in which he is held, and to the great value the planters placed on his experience and guidance. It is more especially in looking back upon the vicissitudes of the last few years, that we realized how greatly indebted the planting community is to Mr. Cox. The many concessions and grants obtained from Government are ample proofs of his influence and position, which he always placed so readily at the disposal of the Association. I therefore propose that a vote of thanks be conveyed to Mr. John Cox for the great services he has rendered to this Association."

The meeting then terminated with a vote of thanks to the retiring Secretary.

J. S. VALENTINE, Honorary Secretary, T. P. A.

WHITE-ANTS AND BLUE GUMS, &c.—The elevation of the estate referred to in my former letter was from 3,000 to 4,000 ft. in Uva Province. The white-ants did an immense amount of damage, eating the young plants until they got a few feet high. They did not attack *Grevillea robusta* or *Cedrela toona*, but the jarrah, *Eucalyptus marginata*, suffered a great deal from them. "Jak" seemed the only wood we could get about there that they did not care for much in buildings. Above 4,000 to 5,000 ft. they have not yet got.—TIMBER TREES.

COTTON IN CEYLON.—We suppose the cotton plant is as much indigenous to Ceylon as it is to Continental India. But America, which originally received the plant from India, has, in the course of nearly three centuries of intelligent cultivation, developed species or varieties so valuable, that our hopes of a revived cotton enterprise in our island must rest largely on the success of seed introduced from the United States. And looking at the tendency to degeneration of the plants in this climate, fresh supplies of such seed must be periodically available. Mr. Mitchell, who is the leading spirit of the enterprise, knows all this and has made arrangements accordingly. Meantime, Mr. Blackett is ready to supply seed, which being only one remove from American must be of high quality. We hope the time will soon come when large supplies of cotton seed will be available, not merely for sowing, but for use as good cattle food, thus supplying one of the greatest wants in Ceylon. The letter from Mr. Price, the Assistant Agent of Kegalla, to Mr. Mitchell, which we publish elsewhere is largely encouraging, and we trust that ere long not merely European planters but natives generally in all parts of the island will take up the new culture heartily, so rendering certain the success of the spinning and weaving manufactory now in progress of erection. We may mention as a curious fact that the best Sea Islands cotton resembles the coconut palm by flourishing in the saline breezes which have passed over the ocean.

IMPORTS OF PARA RUBBER.—From a report of the quantity of caoutchouc brought into this country during the year 1888, it seems that the Para crop from *Hevea brasiliensis* for the half year ending June 30 showed an exceptionally large increase over the previous one, this increase amounting to 2200 tons, or equal to about 17 per cent. The large surplus in the market in the previous year almost entirely disappeared this year, owing to the heavy consumption in the United States and a decided increase in the European wants. The quantity of Para rubber imported into London and Liverpool during 1888 amounted to 5,080 tons.—*Gardeners' Chronicle*.

OAK TREES FOR FUEL.—A difficulty is now being felt for fuel in some of the Tea Gardens in Darjeeling, and a good tree will soon be sought for to plant for fuel. Mr. Gammie, the Superintendent of the Cinchona Plantation at Mungpoo, was written to respecting the fuel plantations there. He wrote:—"We have two species of Oak in our fuel plantation, *Quercus Griffithii* and *Quercus semiserrata*, both natives of the Khasia hills. Of *Q. Griffithii* we have a score of trees eighteen years old, now bearing acorns * * * our oldest trees of *Q. semiserrata* are only seven years of age, and will not be bearing acorns for many years to come. It is a stronger and quicker grower than *Q. Griffithii*. For its introduction to these parts we are indebted to Mr. G. Mann, Conservator of Forests, Assam, who I have no doubt would readily arrange for a supply of acorns for you." Mr. Mann was accordingly written to and responded very courteously, and a quantity of seed of *Q. semiserrata* will shortly be received from him; this, as well as the seed of *Q. Griffithii* already received from Mr. Gammie, will be made over to Messrs. Davenport & Co. for distribution amongst the Darjeeling gardens in their agency.

[The above is from the proceedings of the Horticultural Society of India. We should think the Oaks referred to might flourish in and around Nuwara Eliya?—Ed.]

TEA CHESTS.—I have already informed you of the success which has attended a trial shipment of Ceylon and India teas packed in the "Stanley-Wrightson" papier maché tea chests. The packages from Ceylon were shipped by Messrs. C. Strachan & Co., on the "Coromandel" and proved an undoubted success, as evidenced by reports on the condition of the packages and their contents by four of the leading tea brokers of this city, viz., Messrs. Arthur Capel & Co., Messrs. W. J. and H. Thompson, Messrs. George White & Co., and Messrs. Wilson, Smithett & Co. The latter firm say they had seen the packages of tea in question and write to the patentees to say that in their opinion they have arrived in excellent condition, and show scarcely any signs of the knocking about attendant on shipping and discharging. The tea in the packages they found to be quite brisk and fresh. This patented package has several very obvious advantages over the old style of chest. In the first place a considerable saving in freight is effected, as about 30 per cent more tea can be packed in these chests having the same outside measurement as wooden ones; again, greater uniformity in the tares is obtainable; in appearance they are extremely neat; and the ease with which they are opened does away with the necessity of having recourse to the chisel and hammer; and the packages in consequence do not afterwards require to be packed and coopered. Messrs. George White & Co., add to the above, "The scribing (cut since their arrival in the warehouse) and the garden marks are legible, and the special lining used in lieu of the ordinary lead appears to answer well, as there is no soldering required." In all these reports I do not find a single drawback to their complete success; at the same time nothing is said as to their price as compared with the cost of wooden packages, but of that we shall no doubt be fully advised by-and-by by the promoters of the proposed Company which, I am informed, is in a fair way of being floated, some of the directors being already named. Mr. W. M. Leake will be connected with the enterprise, and specimens of the "S. W." chests will in a few days be seen in this office at 65, Fenchurch Street.—*London Cor.* "Times of Ceylon."

Correspondence.

To the Editor.

THE COCONUT LEAF DISEASE.

Negombo, March 8th, 1889.

SIR,—The coconut leaf disease, which is causing much alarm in the Veyangoda district, has induced me to go over many districts and see for myself, as I am greatly interested in coconuts. I have seen much of the Negombo and Ekala districts, and have not found any trees infested with the disease. The trees in these districts are in a most flourishing condition, especially that of Ekala. I was surprised to see the Veyangoda district. Even though the drought is almost at its beginning, the sight of the trees with their drooping branches and bunches of nuts propped up by sticks is a sad sight. The drought seldom or never affects coconut trees in the Negombo or Ekala districts or those bordering the sea-coast. As you go further inland the trees seem to grow worse. I am of opinion that the coconut trees in the higher districts will not thrive for long. They flourish at the beginning, but you will find that after 20 years or more they gradually go down and do not last long. In the Veyangoda and Henaratgoda districts and higher up as you go as far as Ambepussa, there is no depth of soil. After a certain depth the roots reach a slab rock and the trees suffer. The leaves look yellow and as if they are scorched by fire. I witnessed this 10 or 12 years ago and expressed my opinion to a friend. An estate in Jaela belonging to the late Mr. David Wilson is suffering in similar manner to the Veyangoda trees. The soil is hard and does not take in moisture. The late owner terraced the grounds and drilled holes near about the trees, so that they may take in moisture, but it was of no avail, as the roots had reached the slab rock. I believe Mr. Jardine of Golua Pokuna was in charge of this estate many years ago. Any amount of ashes or manure will not benefit the trees, as the soil is hard and stiff like concrete and will not take in manure. I fully agree with Dr. Trimen and Mr. Jardine to feed up trees, but on the above-mentioned soil nothing will have effect. I saw a place in Katana, Negombo district, with the leaves affected like the Veyangoda trees. This place has been neglected, I believe nothing has been done to improve it for the last 25 years, but the soil unlike Veyangoda is not stiff and with proper cultivation perhaps may be brought round. I have seen Mr. Driberg of Ekala, and he is of opinion that the trees in such soil as of Veyangoda ought to be worked up during the heavy monsoons. Applying manure in dry weather is a wastage of money and labour, and will have no effect in the trees.

PLANTER.

[This correspondent talks of slab rock and stiff subsoil as if they were the equivalents of each other, which they certainly are not. We observed no evidences of slab rock, but hard subsoil, which can be ameliorated, does prevail.—Ed.]

THE NEED FOR A CEYLON-AUSTRALIAN
TEA COMPANY LIMITED, AND THE
GOOD OPPORTUNITY NOW PRESENTED
FOR FORMING ONE.

Naseby, Nuwara Eliya, 12th March 1889.

DEAR SIR,—Resting here awhile as a preparation for another spell of close unremitting labour in newspaper editing and "book-building," it is not difficult even in a few days to lose touch with topics attracting public attention and challenging opinion. How far, therefore, the thought has entered the mind of the community that the opportunity

presented by Mr. A. Sinclair of making a new departure in the Ceylon-Australian tea trade should be availed of, I am not able to judge. But I feel constrained, as a private individual, to say how great will be the pity, if not the blunder, if our tea planters ignore what seems one of the most practical and businesslike proposals yet suggested for increasing the consumption of Ceylon teas.

There are no tea drinkers in the world in whom Ceylon planters should take a greater interest than in our fellow-subjects throughout Australasia. They are well-known, individually, to be the largest consumers of tea in the world. They afford us the nearest market for our staple. Ceylon is not unknown to them. To the more intelligent and travelling portion, our island is ever an object of interest and they are ready to be influenced in its favour or in favour of its products. To show that an article comes from Ceylon, is likely to secure its acceptance by a large proportion of Australians.

There is moreover, the other evident and grand fact that unlike the United States and the Continent of Europe, Australasia is already a tea-drinking country. The Ceylon planter in canvassing Australians has not to create a taste for tea *per se*, nor for the particular brands he is ready to bring to market. The population of America and Europe (always excepting the United Kingdom) are emphatically coffee and cocoa rather than tea drinkers; and it is uphill, though very commendable, work trying to supersede the taste for "green" and artificially "faced" Chinese and Japanese teas, by one for the pure and more robust and refreshing Ceylon or Indian product. But as already said, the people of Australia and New Zealand are in exactly the same position as those of the United Kingdom were, say ten years ago, in 1879, when 127 million lb. of China teas were consumed against some 27 millions of Indian, the latter being chiefly used in blending. They are as ready to reverse the positions as have been the drinkers in the mother-country when the better, purer teas were brought to their markets and to their very doors in a businesslike and persistent way that commands their attention and ensures a constant steady supply. We have precisely the same class of tea-drinkers to deal with as in the mother country; only a population in the mass far better able to afford, and to appreciate a really good class of teas. Can a single reason of any weight be advanced why if a systematic and adequate attempt be made to push our teas into every distributing town and centre of trade in Australasia, in five years (or less) from this date, the position of China, and Indian and Ceylon, teas in the Southern Colonies should not be entirely reversed—and twenty to thirty millions lb. of our tea be annually shipped thither against one or two cargoes, four or five millions lb. of China teas?

Is there anything in the relations subsisting between the Australian Colonies and Celestial Empire to justify the adherence of the former to a China, rather than a Ceylon, tea trade? Is there a reciprocal trade, or any other compensating advantage, or even any bond of union between the peoples? Our tea planters must know well that on every head an emphatic negative answer can be given. As the Melbourne *Argus* said only a few months ago in discussing the Ceylon tea at the Exhibition, the Chinese do not buy £1,000 worth of Australian produce in return for the large amount of Australian gold annually paid for China teas; while Ceylon and India are ready to deal increasingly in Australian meat, frozen, or in live stock, in horses, in wines, fruits, &c., &c. There are no reciprocal advantages whatever to the Australians from the China trade; and moreover there has sprung up

lately, and still exists, such an antipathy to the Chinese as settlers, or even traders and temporary servants, within Australia, as must make the Colonists more anxious than ever before to cease all commercial connection with China and do business in British-grown teas. (I am not expressing sympathy with Colonial treatment of the Chinese, nor discussing this subject one way or the other, I am merely stating a fact which has a most important bearing on the question of pressing Ceylon teas at this juncture, on the notice of consumers in every one of the Southern Colonies). It is a case therefore at present for "striking while the iron is hot" if Ceylon tea planters wish to take advantage of the anti-Chinese feeling prevailing throughout Australasia.

But it will at once be asked, in the face of this picture, how is it that the China-Australian tea trade continues to flourish—the shipments from Foochow &c. to the Colonies being larger for the current, than the previous, season—while commercial reports from Melbourne and Sydney represent an overstocked market for Indian, and it may be for Ceylon teas? How is it in the face of all that was done at the Melbourne Exhibitions of 1881 and 1888 to advertise the pure quality of Ceylon teas, and in the former year, to expose—by a series of analyses and discussions in the press—the inferiority, nay the absolute impurity and unwholesomeness of much of the China supplies,—that the demand for our own and Indian teas continues so limited and that shippers dare not send Ceylon teas to the Australian market on chance of a profitable sale? There are, I believe, plain and satisfactory answers which can be given to these questions.

In the first place, I am not at all inclined to link the fact that China teas undersell those of India and Ceylon in the auction rooms and wholesale markets of Melbourne and Sydney—and that, in consequence, the Australian tea importers, dealers and distributors can make far more profit out of the cheap China teas they import from Foochow than out of Ceylon and Indian teas. No doubt there is a certain quantity of highclass tea imported thence and sold at a high price to the wealthy who, it may be, have to be educated to appreciate the taste and flavour of our Ceylon Pekoes. But the large proportion of imports is of cheap inferior stuff which, however, *does not reach the mass of the consumers, save at a price which would well cover the cost of average Ceylon teas after leaving a fair profit to the shippers and distributors.* Therein lies the whole secret of the maintenance of the China Tea Trade with Australia. Why should tea importers and wholesale dealers, down south, trouble themselves, to buy or encourage an article on which they cannot do much business with a profit of more than 5 to 10 per cent to divide, when by going on in the established groove, they may have 15, 20 or even 30 per cent to divide. But how is it, the Ceylon planter will ask, that the people who have learned of, perhaps tasted, the superiority of Ceylon teas, do not by asking for the same create a demand which must be supplied—what in fact have the Exhibitions and all the outlay thereon from our exchequer and purses done for us? In the large towns, it may be answered, a certain limited demand in select circles has been created which has to be met; but outside, the householder, the farmer, the shepherd who may enquire for another tea is no doubt met by the statement that there is none in stock, that it is much dearer and altogether a fancy article unknown to minor or country grocers. It is quite true too that even in the supply to the Melbourne market, Ceylon teas in consequence of difficulties about freight for small quantities, have

gone forward very irregularly; while as the result of practical experience and enquiry, "Old Colonist" went so far in one of his letters some months ago from the south, as to say that for Ceylon teas at 1s per lb. in bond at Melbourne, there should be an unlimited demand in the Australian Colonies.

It is plain in fact that the vast mass of the consumers do not know how to get, or anything about the price at which they should be able to buy, good pure Ceylon teas. No Exhibition, or discussion in the press, can take the place of actual *commercial distribution, advertising and canvassing.* The China-Australian tea trade has been built up, and is maintained, year by year, in this way. The utmost business energy and enterprise are displayed by the men mainly interested in its maintenance. Let me illustrate from my own experience. I travelled to Marseilles in 1887 with two gentlemen largely engaged in the China tea trade; one mainly buying for the Russian, the other for the Australian, market. The latter reckoned to spend several months every year, or at least, every second year in the Colonies, booking his orders, canvassing, seeking new constituents and generally making himself agreeable while maintaining and promoting the trade in China teas. He was not alone; there are perhaps half-a-dozen or more shipping firms at Foochow that send partners or responsible agents to spend three or four months in the Australian colonies to canvass and book orders for China teas. What can the Indian or Ceylon tea merchants or planters be said to have done to push a trade in contrast with this systematic business arrangement? Almost nothing.

I have not met Mr. Sinclair yet, and am not acquainted with the details of any scheme he may have mentally formulated, or put on paper, in connection with the establishment of what I may call a "Ceylon-Australian Tea Trading Company." But, I understand that part of his plan would be the establishment of depôts in the principal towns where supplies of Ceylon teas could always be obtained by the suburban and country dealers on terms almost as advantageous as those allowed for China teas after satisfying the different superior middlemen. The large land-owners, squatters and others, who send their employees big supplies of tea among other rations from town, would find that they could get at such depôts a greatly superior article at, perhaps, as favorable a price—considering how much further a lb. of Ceylon tea will go—than was paid for China "posts and rails," the tea stuff which has made "bush tea" so often the subject of satire. Mr. Sinclair would also, no doubt, recommend the Company's supporters to canvass and advertise freely at the outset, assured of a due, if not handsome return. It would, moreover, be to the interest of every Ceylon tea planter to make the Company's work and depôts known to friends or to the friends of friends in the Colonies. With a steadily increasing tea trade, we might well expect other branches of commerce between Ceylon and Australia to develop and to find bonds of union in many ways which would gradually bring this little island into closer, and even more beneficial relations with these splendid Austral countries.

But leaving the future prospect alone, and returning to the problem now I venture to lay before the Ceylon tea planting community, it may be asked, how is this Tea Trading Company to be formed. Already I regret to understand that in one quarter cold water has been thrown on the idea of a local formation. It has been said that Mr. Sinclair must go to London for the shareholders and capital. No doubt indirectly, some of the capital may come from home from owners of

Ceylon tea estates. But it seems to me that a Company of the kind can scarcely in the first instance be publicly floated in London with the object of, at least to some extent, diverting trade from that port any more that it can among the tea importers and distributors of Melbourne or Sydney. The Company must be started and mainly supported here, in Ceylon, or the whole proposal will fall to the ground. And it seems strange that at a time when shareholders and capital have so readily come to establish a local Cotton-spinning, and a tobacco-growing, Company—and when indeed, apparently, the promoters of a Company to sell Ceylon teas in far distant America, have met with ample encouragement—and I wish such projects every success,—that there should be doubt as to a sufficiency of local support for a Company to promote the sale of our teas among our fellow-subjects, next door to us and who are already noted as the biggest tea-drinkers in the world! I have heard that Mr. Sinclair proposes a capital for the Company at first of £5,000, a sum which is surely within the compass of the "Ceylon tea community" in order to promote their own immediate interests.

It has been truly said that the tea-planting industry of Ceylon differs from any other agricultural pursuit under the sun in giving "a ready money" return all the year round, there being no month of the year here in which there is not some leaf to be plucked and manufactured on most plantations where pruning properly is distributed. In the same way it may be said that the proposed Company would do a "ready money" business in Ceylon teas and ought therefore to make early and regular returns to its shareholders. There can be no doubt of a large and promising field of operations, and it is not likely that a better Managing Director could be secured than Mr. Sinclair, if he will accept the office, with his recent experience of the Colonies and their tea trade, as well as his acquaintance with the general conditions of planting in Ceylon.

Already it is gratifying to learn that not a few Colombo tea estate proprietors and agents have expressed themselves as favourable to the project. Among the resident planters, perhaps, Mr. Wm. Mackenzie is the one who could give the weightiest opinion, from his acquaintance with Australia and his special interest in tea. It may be said that Ceylon planters have (like poor Goldsmith) "the knack of hoping" in reference to each new proposal in connection with their products; but at least in regard to tea the need of doing all in their power to create new markets must be patent to our estate proprietors; and it is because it seems to me that the present offers an exceptionally good and timely opening that I venture to place the above remarks before our planting community.—I am, &c. J. F.

POLGHAKANDE TEA.

Polghakande Estate, Neboda, 13th March 1889.

DEAR SIR,—In regard to the Polghakande tea sale at an average of 8d per lb. in Messrs. Gow, Wilson & Stanton's catalogue of the 15th of Feb., in justice to myself, as already misapprehension has been created, which, if left uncorrected, will do me injury, I beg to state, although the leaf was plucked on this estate (Polghakande), the tea was made on an adjoining estate, and I had nothing whatever to do with the curing.

MIL0 MACMAHON.

COTTON CULTIVATION IN CEYLON.

Colombo, 14th March 1889.

SIR,—Mr. Price's letter in your last night's issue is very interesting because it contains a good deal of valuable information, especially as to the time

of sowing. I have been laughed at for suggesting August as the best time for sowing cotton, but as the suggestion now comes from a European, I am glad to know that it will be quietly accepted. Thank you, Mr. Price, very much. The great point in cotton cultivation is that the crop should be ready for picking in dry weather, otherwise the staple gets damaged.*

My own experience, both in India and Ceylon, is that the crop should be ready for picking in January onwards, and this cannot be brought about unless the sowing is done in August or towards the end of July.

It is not generally known that cotton cultivation once flourished and that cloth was woven in the island, before the introduction of Manchester cotton goods. But the native looms were unable to compete with the spinning jenny and the Arkwright machinery, yet this ancient industry still lingers in far-off villages where a coarse but useful kind of cloth is manufactured from chena-grown cotton.

The cotton which grows in native villages is commercially known as the "Pernambuco." The peculiarity of this variety is that the seeds adhere in conical masses. Before introducing the American and Egyptian cottons into the villages I should like to see the cultivation of the native plant encouraged, because it is as good as if not better than any imported variety, and it has the further advantage of not degenerating in the climate as the imported varieties would.

The planting may be done according to V of Mr. Price's valuable hints, but the seed must be put out 4 feet by 4 feet, as the plant grows very large. Turn over the soil 3 times during the growth of the crop each year either by hoeing or by ploughing. The plants should last 4 or 5 years. After each yearly picking all the green wood should be pruned off and the land manured.

The success of the Americans is largely due to the high cultivation they adopt on their lands. Therefore Ceylon cotton planters please plough, and then manure as Cato of old days.—Yours faithfully, ABA.

[With this letter came three specimens of cotton wool, viz:—Egyptian, fine but with a yellowish "nankin" tinge; Pernambuco, fine and beautifully white; and Tinnevelly, short-stapled but capable of improvement and valued by the natives of Southern India not merely for the wool, but for the large quantity of seed yielded as food for cattle.—Ed.]

TOBACCO CULTIVATION IN CEYLON.

Mutwal Lodge, 18th March, 1889.

DEAR SIR,—Tobacco may with some degree of truth claim to be the *burning* question of the day, and though sceptics may not hesitate to tell us jestingly that it is all sure to end in smoke, we are continuing to receive daily assurances of its probable success in Ceylon.

Among those who have espoused the sacred cause of tobacco it is gratifying to notice the name of the old colonist, Mr. Thomas Dickson, whom I had the pleasure of meeting at London in 1886 on the memorable occasion when Mr. J. L. Shand read a paper on British-grown teas, to a deeply interested London audience. On this occasion too, I remember a theory being advanced by one of the Indian visitors, Dr. Watt, to the effect that our teas were hastily manufactured, on which a discussion ensued, when some of us took part in combatting his views.

But Mr. Dickson does himself and me injustice

* In Ceylon, with two heavy monsoons, this is the great danger to be avoided.—Ed.

in supposing for a moment that I endeavoured to influence the Ceylon Government against the grant of lands for tobacco. On the contrary I have myself acquired lands in Matale, part of which I hope to see in tobacco at no distant date, and I hold shares in the Tobacco Company, floated by Messrs. Rutherford, Fraser, and others. Mr. Dickson labours under the disadvantage of having read only a review of the lecture and confessedly not the paper itself.

What I pointed out as mischievous in its ultimate and permanent result to the colony was the system of cultivation said to be adopted by the tobacco growers of Sumatra and the thriftless grain cultivators of Ceylon on the hills. Entire ranges of hill and stretches of beautiful flat land on which the lantana and iluk are now struggling for existence where luxuriant forests stood before, demonstrate to us amply the permanent evils resulting from a reckless use of land in the past, not to tolerate it in the island in the future.

The husbandry of the Sinhalese which recognised neither drainage to prevent wash nor fertilizers to restore the losses to the soil is answerable for the existing state of things. And the tobacco planter of Sumatra is said to be converting forests primeval into ready money in this fashion, abandoning the lands after a crop or two. Have I spoken too soon or out of place, in sounding a note of warning on the eve of the enterprise in Ceylon? While forest land was abundant and the country was unopened this system of cultivation may have been permitted or tolerated. But one can hardly say it is to be desired in the Ceylon of today. It may be remembered that about the time I read my paper in Matale a German syndicate, as it was stated, had applied for land in the neighbourhood, for tobacco growing: so that while I was discussing the suitability of our soil for this product among others grown in Ceylon, from tea down to arecanut and pepper, I incidentally referred to the destruction in Sumatra of magnificent forests, only for the sake of securing one or two crops; and I expressed a hope that we may take to heart the lesson before us, taught by the chena cultivators of Ceylon. It will be seen on reference to my lecture that I pointed out on the contrary with approval the very intelligent methods adopted by the tobacco growers of Ceylon, who regularly and systematically manured their fields; and the editor describing in a footnote his own experience indorsed my views then, as he even now says in a footnote to Mr. Dickson's letter: "If this were enforced it would obviate the objection which the senior editor shares with Mr. Barber." Mr. Dickson's argument also is nothing more nor less in the end. This is what he says himself: "Granted that tobacco is an exhausting crop, yet it pays hand over fist; and with our railways and roads we should get plenty of bones and other manure such as they apply in America." Precisely. We have then only differed to agree in the end.

I will now add as we are seriously contemplating cotton in Ceylon that we shall be able to follow up with cotton such fields as may be found unsuitable for repeated crops of tobacco. And the cotton seed will afford us, found on the spot, without any cost of transport, one of the best known fertilizers in the world for our tobacco.

Mr. Dickson has referred to American farming; and I now enclose extract from the 1885 Report of the Commissioner of Agriculture for the United States, also a table by Sir J. B. Lawes showing the value of cotton seed as a fertilizer.

In conclusion, I confess, I am in no way sorry for the little misapprehension which led to this corres-

pondence, as it has brought into our concern the hearty support of so earnest and influential a colleague as Mr. Thomas Dickson.

You have good-humouredly recommended me, Mr. Editor, to consign the correspondence of Mr. Dixon to the bowl of a tobacco pipe, and dispel it into thin air.*

Let us now all join in smoking the calumet of peace, and singing the praises of tobacco. It is no bad thing to ring a change on the hackneyed *Tea Deum Laudamus*.—Yours faithfully,

JAS. H. BARBER.

(Extract referred to.)

COTTON SEED.

As the most indispensable requirement for the commencement of civilization of a people has been fertile soil, it ought to follow that a people possessing, in a product of agriculture—from a source therefore, inexhaustible—the most valuable fertilizing material, should be capable of the greatest progress. It is well said, "the more manure the more crop," but to no country can the reverse of the saying, "the more crop the more manure," be applied with as much force as to these United States of America. No crop is less exhaustive of the fertility of the soil than cotton, and none yields as a secondary product, a material so valuable and so rich in all the elements of plant-food as cotton seed. It naturally follows, however, as the valuable elements contained in this estimable product must have been derived from the soil, it devolves upon every patriotic, intelligent, and economic southern farmer to see to it that they be returned to it in order to prevent the exhaustion of its fertility. Chemists have demonstrated by analyses and farmers have corroborated the fact, that it is the most concentrated food for stock known, and after having been fed to animals, that the manure is richer in fertilizing matter than that resulting from any other food.

Food.	Total dry matter per ct.	Total mineral matter (ash). per ct.	Phosphoric acid reckoned as phosphate of lime. per ct.	Potash. per ct.	Nitrogen. per ct.	Value of manure from 1 ton (2000 pounds) of seed.

[Go ahead with tobacco, if we are assured, that the land, when exhausted, is duly manured.—Ed.]

* If that were all, smoking would be a comparatively unobjectionable practice to non-smokers. But the smoke is inhaled, rolled round the smoker's salivary glands, and after touching the gullet and windpipe (possibly diseased) is ejected with the vitiated air from the lungs, to be breathed again by innocent non-smokers, including ladies! Analyze the practice and see. Of the value of tobacco as a soothing narcotic most valuable in certain forms of disease, we have the highest opinion. But gentlemen do not usually take their medicine in public or force their neighbours to share it with them.—Ed.

SALT IN THE MADRAS PRESIDENCY AND IN CEYLON.

We refer again to the interesting papers from Madras discussing the results, actual and possible, of the adoption of the excise system.

Although the substitution of the excise system in the Madras Presidency in lieu of the absolute monopoly, under which Government officers were responsible for the quality of salt purchased from the manufacturing ryots, was brought about by the influence of parties interested in the Cheshire brine salt, yet the result has not been and is not likely to be the substitution of English for Indian salt in Southern India, for however much purer the former may be the natives have a prejudice against it, and its introduction would not pay unless the price of the indigenous article rose to 12 annas per maund,—nearly four times the old monopoly price and fully twice the average under the excise and license system, by which the purchase and distribution of salt has fallen to middlemen. And in the interests of the poor natives amongst whom the operations connected with internal salt manufacture, storage, carriage and distribution spreads a great deal of very welcome money in the shape of wages, cart hire, &c., it is not desirable, in either Madras or Ceylon, that foreign salt should supersede the native product, whether naturally formed, or manufactured by a complicated system of brine channels, evaporating "pans," composed of mud lined with sand, bunds, platforms and stores. We trust that English reformers, who view all economic as well as political questions through the media of western ideas, will keep their hands off our Ceylon salt monopoly (under which the people get better and cheaper salt than if all restrictions were removed) and our grain and cotton cloth taxes, without which irrigation works, roads, railways, and similar improvements would have but a poor chance, if any. There is a great deal of general information scattered over the Madras minutes, reports and orders, from which we can advantageously quote. Mr. Garstin, for instance, stated that

In making the salt, the crystals that first form are the purest, that is, most free from the magnesium and calcium salts which crystallise more slowly, so that there may be a good deal of difference in chemical purity between the salt scraped one day and that scraped two or three days afterwards out of the same crystallising bed. There is also a considerable difference in dampness between salt which is free of magnesium chloride and that in which it is present in any quantity; while as to dit, no one who has had any practical experience of salt-making is ignorant of what a difference there may be between the cleanliness of salt scraped when the land winds are not blowing, and salt scraped while they are blowing and much dust is flying over the beds.

This question of wind-blown dust as injuring the manufactured salt was noticed by the Ceylon Salt Commissioners of 1857, Messrs. Lee and Braybrooke, and they recommended that in seasons of drought water should be pumped up to keep a portion of the great plain near Puttalam, where the salt manufacture is chiefly carried on, in a moist state. The influence of the weather on salt is

very considerable, but our readers will scarcely be prepared to learn that at Hambantota and at Puttalam also, the removal of salt to the permanent stores has to be delayed until the rainy weather has produced grass to afford food for the cart cattle. Irrigation grass fields and ensilage would be most valuable in such places as also in the north-western, north-central, eastern and northern portions of the island generally; and we trust the Superintendent of the Agricultural School will bring his Cirencester training to bear on a series of experiments in this direction. We may notice that under the monopoly system as it formerly prevailed in Madras and as it still prevails and as we hope it will continue to prevail in Ceylon, it was a principle which guided the respective Governments, that, to provide against the contingency of seasons when salt could not be manufactured, the great obstacle being persistent rains, a quantity equal to two years' consumption should be always kept in store. One of the great complaints made against the excise system is that the licensees do not feel bound to observe any such condition, and by an inexplicable omission in the agreements made with them, are not really so bound. Mr. Garstin wrote again:—

Not the least serious objection, however, to the excise system is the absence of all control on the part of Government over the stocks in the hands of the licensees and the consequent possibility of a salt famine. Indeed, the stocks during the last year have been so low that at some factories they are exhausted,—a state of affairs which has distinctly tended to raise the price of salt. The Salt Commission of 1876 feared that this result might ensue, though they consider that any shortness of supply would probably right itself; but under the monopoly system, though failures of supply at particular factories occasionally occurred, it was generally from causes beyond the control of Government; and, as a rule, there was always a good reserve of about a year's supply at all the large factories,—a provision which there is no means of securing under the excise system.

As regards the leading constituents of salt, the committee already mentioned reported:—

The ordinary impurities of bay-salt may be divided into those which are (1) soluble and (2), insoluble in water.

The soluble impurities consist principally of calcium sulphate and of the salts of the bitters—magnesium and calcium chlorides and magnesium sulphate—with a small proportion of other salts which are of no practical importance as impurities.

Magnesium sulphate is not likely to exist in any quantity in salts manufactured on the coasts of India, a low temperature being required for its separation in presence of sodium chloride. Calcium sulphate in excessive proportion indicates insufficient concentration of the brine in the condensers; and the magnesium salts and calcium chloride are indicative of overconcentration in the crystallizing beds, or of insufficiently frequent or imperfect removal of mother-liquor, or other faults in manufacture. The deliquescent salts of the bitters are a cause of dampness and of wastage in a salt.

The insoluble impurities are earthy and organic matters derived mainly from the salt-beds. Their presence in excessive proportion may be due to faulty construction of the beds, improper gathering or insufficient washing of the salt, storms and other causes.

Water is an impurity which always exists in salt and may account for as much as 10 per cent of its weight. The presence of the deliquescent bitter salts in large proportion tends to keep a salt moist; but there exists no constant proportion between the amount of these salts and of water. These deliquescent salts absorb moisture from the air, and a salt becomes naturally purified, with some wastage, as they drain away after the salt is stored.

What is regarded as an ordinary sample of a good Madras salt will analyze thus:—

		per cent.
Moisture...	...	1.769
Insoluble matter	inorganic ...	4.090
	organic ..	0.300
Sodium chloride	...	92.702
Magnesium do	...	0.899
Calcium do	...	1.301
Calcium sulphate	...	4.539

Of course it would be desirable that all the salts save chloride of sodium should be eliminated, but that cannot be managed by the present mode of manufacture and it remains to be seen if steam and other machinery can, at any expenditure leaving a profit, produce perfectly pure salt. Meantime a mixture of 6 to 7 per cent of salts of magnesia and lime does not appreciably detract from the wholesomeness of the Indian and Ceylon salt. Europeans and well-to-do people generally, of course, use refined English salt for their tables, and into Bengal foreign salt to the amount of 400,000 tons is imported, of which 300,000 tons are from England. The Committee stated:—

The question of a test to determine the relation between the volume and weight of salts was also considered. An examination of the table (enclosure No. 2 of report) showing the weights per cubic foot of the forty-one salts analysed for the Committee proves that such a test would afford no reliable indication of purity. It is true that the best salts are generally heavy; but exceptions to this rule are numerous, and good light salts and bad heavy ones are not uncommon. The Board of Revenue in a resolution of August 1887 stated:—

It is unnecessary to recount the history of the introduction of the excise system into Madras, as all the facts must be fresh in the recollection of the Secretary of State and Government of India; it is sufficient to say that, owing to the agitation of the Salt Chamber of Commerce of Cheshire and Worcestershire, based on the results of the observations of their President taken during a hurried tour through India in 1874, a Commission was appointed to make full inquiry into the Salt Administration of the Presidency, one of the points to which their attention was specially directed being the desirability of substituting a system of excise for the monopoly which then subsisted. The result of the exhaustive investigation which was held in 1876 was to show that, although the Madras salt was in some respects capable of improvement, the picture of it drawn by Mr. Falk was altogether exaggerated; certain administrative changes were recommended to which effect has since been given, and as regards the question of Excise *versus* Monopoly, the following conclusion was arrived at:—

"To sum up, then, we are of opinion that there are no insuperable practicable difficulties in the way of change from monopoly to excise, and that the measure is not likely to prove injurious to the interests either of the consumers of salt, or of the Imperial revenue. We regard it as the most hopeful means of bringing about the improvement which is desirable in the quality of the salt, and of giving to the Madras Presidency the share in the trade for the supply of other parts of India and of Burmah and adjacent countries which its natural advantages and geographical situation should enable it to command. We, therefore, recommend that steps be taken for the introduction of excise."

The following paragraph is interesting as showing the danger of neglecting certain principles, under the license system, essential to the manufacture of pure salt:—

Although the experiments of the committee have established the fact that there is no *absolute* relation between the weight of a salt and its purity, there is no doubt that chemical impurities are more or less associated with physical defects and that much of the light salt which finds favor with the trade is of very indifferent quality. This inferiority is due to haste and want of care in the manufacture. The

brine is let into the pans before it is sufficiently concentrated, and in some few places the use of condensers has even been abandoned so as to utilise the space for crystallizing beds; hence the large quantity of calcium sulphate which is noticeable, the bitters are not removed with sufficient frequency, and hasty crystallization under the forcing action of residual salts is the rule; hence the undue proportion of magnesium chloride and consequent excess of moisture, the deliquescent properties being generally attributable to the presence of magnesium salts. Magnesium sulphate is noticeable to a greater extent than formerly, probably owing to the scraping commencing in the early morning instead of being carried on during the heat of the day. Dirt at present in large quantities owing to hasty scraping. The defects in physical properties are mainly attributable to the shallow irrigations adopted according to the prevailing method of manufacture. As long as the licensees can get rid of their salt irrespective of quality, they are not likely to devote much attention to improvement of quality, as that involves not only trouble, but some expense in laying out their pans afresh so as to provide an adequate condensing area, and the means of discharging the bitters. As has been frequently pointed out the demand is for light salt, and to quote the remarks of the Salt Commission (paragraph 360) "the same measures which will produce a chemically pure salt will also tend to improve its physical qualities, *i.e.*, make it heavy," which is not to the advantage of the manufacturers, seeing that light salt, owing to the fact of its being purchased by *weight* at the factory and retailed by *measurement* in the bazaar, finds most favor with their customers.

Again:—

There has been no attempt to introduce any improvement in the method of manufacture except in the case of two European firms who have made a trial of steam pumps for raising the brine, Messrs. Stuart, Hall and Co. at Karasa near Vizagapatam, and Messrs. Best and Co. at Manambadi near Porto Novo. It is believed that the experiment has not proved a success financially owing to the fact that the machinery has not been worked up to its full capability; a much larger area might have been irrigated at little additional cost; as worked at present the use of steam pumps does not appear to have been productive of any saving of cost.

The Board calculate the consumption of salt per head in the Madras Presidency at 15 lb. per annum, and we believe the rate of consumption in Ceylon is very much the same. In the report of 1857 it was calculated that the cost to the consumer in Ceylon, with all monopoly charges added, was only 3d per lb. or say 3d retail price; so that the annual cost per head was 7½d, a fair average day's wages for an adult male. It is curious to note that the commissioners of 1857, estimated the population of Ceylon at 1,750,000. If this was an approximation to the truth, the population of the island has increased by a full million in the 32 years, a little short of the usual estimate of a generation. Our inclination is to believe that next census will show a population of three millions for Ceylon, or only a little less than that of the whole of the great Australian colonies. The estimate of 1857 was probably too low. We cannot accept the figures supplied to us by a friend, who estimates the population at only 2½ millions, and the consumption of salt at so high a figure, deduced from the other, as 17½ lb. We have reason to believe he is equally out in his information that the average consumption per head in British India is less than half the Ceylon rate. In Indian jails, however, 7 lb. per head of salt has been found more than sufficient. But let us quote the words of the gentleman referred to:—

"My opinion with regard to the Ceylon salt monopoly is simply this, that although it is objectionable in principle, yet it is an unhappy necessity in an oriental country. The tax is easily collected and it is not felt by the people.

"Sir Emerson Tennent, who was Colonial Secretary in 1846, said that 'the policy of raising an income from this source, however it may be repugnant to the opinions and habits of those at home, is neither opposed to the feelings of the population of Ceylon nor felt to press unduly on their pecuniary means. Amongst every eastern people and in many countries of Europe a tax upon salt has been a favorite source of revenue from time immemorial. It exists among the vast population of China; it was inherited by the East India Company from the Muhammadan sovereigns of Hindustan, where it universally prevails, and from a conviction of its accordance with the habits of an oriental people it has been adopted by the Dutch in their flourishing colony of Java.'

"The present consumption of salt is about 400,000 cwt. annually, which, being issued to a population, say of two and half millions, allows $17\frac{1}{2}$ lb. for each inhabitant in Ceylon.

"The average annual consumption of salt in the three Presidencies, viz. Bengal, Madras, and Bombay, is about 694,000 tons, on which the duty collected is £4,878,665. In Ceylon the averages have been 16,250 tons and £74,734 (our population being say $2\frac{1}{2}$ millions). We have therefore a consumption of nearly 7 tons per 1,000 heads; while India averages only about $3\frac{1}{4}$ tons per 1,000. We may, therefore, fairly conclude that the people of Ceylon are much better off as regards salt than their neighbours in India.

"On the 6th January 1857, Sir Henry Ward, the ablest Governor that Ceylon ever saw, appointed a Committee for inquiry into the various points noticed in a Minute drawn by His Excellency, with relative to the salt question. The Committee consisted of Messrs. George Lee and P. W. Braybrooke, who made strict enquiries into all matters concerning the manufacture, collection, and sale of salt, and stated elaborately their views generally on the whole question of the management of the salt system in Ceylon.

"They were of opinion that the salt monopoly as then constituted did not afford much room for practical objection. Salt of good quality was abundantly supplied by the Government at a moderate fixed price; and they added what is perfectly true, that the same amount of revenue could not be raised so cheaply and with so little inconvenience to the community in any other manner.

"The manufacturers contract to furnish salt at a fixed rate, and the Government dispose of the salt also at a fixed price (R2/36 per cwt.) through their own agents, to the dealers and others who resort to the Government stores for their supplies; but beyond the first sale, the Government do not meddle. The manufacturer can only make for Government, and the purchaser, in the first instance, must buy from Government, but afterwards he may sell his salt where, and as he pleases, without further interference.

"With regard to the question put by the Government of India whether weightment cannot be substituted for measurement in the sale of salt I may observe that in Ceylon salt is received into Government stores by weight, and the sale therefrom to wholesale dealers is also by weight. But in retail sale transactions the measurement by seers and bushels still continues. It is a difficult task to induce orientals to give up their long cherished customs and predilections."

So far our correspondent, but there are some points in the report of 1857 to which we must subsequently advert. Meantime we return to the Madras papers. The Board of Revenue truly stated:—

The salt-tax is justified by State necessity, and in many respects has much to recommend it; by its means a very large revenue is collected at a moderate cost with the least possible risk of speculation and without any inquisitorial interference with the people: it reaches every individual and cannot be evaded if preventive measures are efficient; it is capable of immediate adjustment to meet State necessity or the varying conditions of the people, and if properly worked, it need not be burdensome to the poorest in the land, but it behoves Government to take such measures as will prevent not only any failure of

supply, but anything approaching to a scarcity as well as any rise in price which is not due to enhanced taxation. The interest of the people generally for whose benefit the tax is raised require that as large a proportion as possible of what is paid for the salt consumed should reach the public exchequer, and as far as the public are concerned, the interception of any portion of the price by new intermediaries is just as injurious as speculation in the course of collection would be. If it were certain that the people would eventually benefit by the change, it might be desirable to run a certain amount of risk; but even then care should be taken that during the transition period no serious consequences would be likely to ensue; so far the outlook is not hopeful, and it would appear necessary to take some measures for recovering the control which Government have lost. As to heavy and light salt, the following is interesting:—

Mr. Bliss reverted to the subject again in his letter recorded in Board's Proceedings, dated 13th September 1883, No. 2,819. Meanwhile the Collector of Tanjore had pointed out, in connection with the proposal to force Vedarniem swamp salt on the market, that such a course would be unwise. His remarks may be quoted as in this passage attention was first drawn to the fact that light salt need not necessarily be bad salt and that the reason for the preference where it exists may be that such salt is better suited to the conditions of the trade.

The fact is that the spontaneous salt is a kind not suited to the conditions of the Madras trade. That trade does not require a very dense, heavy or very perfectly crystallized salt,—at any rate in the Southern districts. These qualities in a salt are valuable as enabling it to stand a long and rough transit, breaking of bulk and prolonged storage at depots at great distances from the coast; and where these are the conditions of the trade, as in the supply of the Central Provinces and Hyderabad from the Northern factories, we find that the qualities named are highly appreciated by the traders, who are ready to go far out of their way to get salt of the right kind. In the Southern districts, however, the salt is carried to a great extent by rail, the trade goes on all the year round, the salt is carried on the average for short distances only, and passes through very few hands—(See paragraphs 493—496 of the Salt Commission Report.) In a trade of this kind, the relative advantages of heavy and well-crystallized salt disappear, and I should not quarrel with a salt on the sole ground that it is light, provided that it is pure and dry. These are almost synonymous terms; for the presence of water in a salt largely depends on the presence of magnesium salts. In salts equally free from such impurities, it is of no consequence whether the merchants make their profit on sale by weight by a direct addition to the price in the case of a heavy and dense salt, or on sale by measures. The prices in both cases may be left to adjust themselves; and Government officers should, it seems to me, make no attempts to force the sale of heavy salt as such, but should direct their endeavours to the production of salt as nearly chemically pure as possible.

The Government accepted this view and disposed of the reference in the Proceedings above quoted as follows:—

"Here it may be observed that in his remarks regarding quality of salt, Mr. Bliss attaches the chief importance to the physical properties, size, and hardness of crystals, which are obtained by slow crystallization. These, however, Government regard as of minor consequence compared with chemical purity. Light may be as pure as heavy salt; and if the traders prefer the former, it is no doubt because it better suits the conditions of the trade, especially in the Southern districts."

The following notice of principles to be observed in the manufacture of salt is interesting:—

The causes of the impurities present in Bay salt are known, and they can be reduced to a minimum by the observance of the following precautions, the importance of which has already been impressed on all officers of the department:—

Concentrate the brine in reservoirs, and do not let it into the crystallizing beds until it reaches 25 dg. Beaumé or as near thereto as may be. The calcium compounds will thus be almost completely excluded from the crystallizing beds and from the salt there made.

Scrape the salt when the brine reaches 30 dg Beaumé. No magnesium compounds will then be deposited with the salt, for the least soluble of them (Magnesium sulphate) does not crystallize until the brine reaches 32 dg. Beaumé, unless after several irrigations and evaporations.

To prevent the concentration in the bitters or *mother liquor* of the deleterious residuum of consecutive irrigations and scrapings and the consequent incorporation thereof with the salt and the coating of the salt crystals, therewith, discharge the bitters after, at the very most, every fifth scraping, better after every fourth or third.

It might be well if such rules were possible of enforcement in Ceylon. One of the final conclusions of the Madras Board of Revenue was:—

In the peculiar circumstances of the salt-tax a monopoly system is justifiable; it is the duty of Government in levying a heavy tax on a *necessary of life* to see that supplies are ample, prices moderate, and that as large a proportion as possible out of that price reaches the Public Exchequer; the necessary control can only be exercised by a reversion to monopoly partially, if not entirely.

But the Government of Madras did not accept this doctrine. They want to give the excise system a further trial, with a fair warning to the licensees that if good salt is not by them supplied to the people at a moderate price, the excise system will be abolished and the absolute monopoly of Government reverted to.

In one more article we shall deal with the supply of salt generally in India, including rock salt from mines in the Punjab and the product of the enormous inland Sambhar Lake in Rajputana; while further details will be given of salt manufacture and collection and its distribution in Ceylon.

SALT AS A MONOPOLY AND A SOURCE OF REVENUE IN INDIA AND CEYLON.

Mr. P. L. Simmonds in an article on salt in the *Journal of the Society of Arts*, which we have seen while writing this series of articles, suggested by the Madras papers on monopoly and excise, gives the rates of consumption in India at

	Per head per annum
Madras 13 lb.
Bengal 13 "
Bombay 10½ "

The average would be a little over 12, but of recent years much salt has been used in the Madras Presidency, especially for the curing of fish. So, to some extent in Ceylon. The consumption of salt in India for 1887 is given at 33½ millions of maunds. The imports of salt into India had increased in quantity from 274,000 tons in 1879 to 424,000 tons in 1888, but the average value per ton had fallen from £3 to £1.10. English salt goes chiefly to Bengal as ballast. The export of salt from India to bordering states is 50,000 tons annually. Mr. Simmonds's account of the manufacture of salt in Ceylon is as follows:—

In Ceylon, salt is a considerable source of revenue, and is carried on as a monopoly of the Government, the manufacture is mainly conducted by two Government establishments on the west and south coast of the island. The salt water is drawn from an extensive lagoon, about 28 miles long, and from 4 to 8 miles broad. The water within this lagoon evaporates under the influence of the sun and wind, so that it becomes considerably denser and more concentrated than sea water. The collection of salt usually takes place twice in the year, the first operation is to enclose

a certain area of the lagoon by means of a dam, so as to exclude the influence of the tides, while encouraging evaporation, and enabling the organic impurities to settle in the pure water. After a certain time, the water is drawn off into shallower and smaller basins, when the evaporation is still more rapid, and subsequently into the crystallizing beds, where the salt is deposited in crusts, varying from one to two inches in thickness, and is then drawn out. At the factory on the west coast the output varies from 50,000 to 500,000 cwt. yearly. The work is carried on by contractors who own the land, and under the supervision of Government officials. The southern formations of salt in Ceylon are of course those in the "lewas" or lagoons near Hambantota. It is a curious fact that as Ceylon has drawn on Dravidian sources for architects, sculptors and tank builders, so in the manufacture of salt in Ceylon natives of the Madras Presidency, hereditary salt makers, are employed to a considerable extent.

An extract from the discussion which followed the reading of Mr. Simmonds' paper shows the correctness of our statement that no means of denaturalizing salt for agricultural purposes had been discovered:—

Some years ago the Indian Government offered a reward of £25,000 to anyone who would suggest a means by which salt could be so far treated as to render it unfit for human food, and at the same time acceptable for cattle and fit for manure, but up to the present time no one had claimed this reward. In France they mixed the salt with various kinds of earth, making it into the shape of a brick, the object being to evade the duty, but the addition of earth added considerably to the cost of transport.

We quote some interesting information regarding salt and salt revenue in India:—

The principal sources of salt production in India are the salt range in the Punjab, the salt Lakes of Rajputana, a few other scattered salt lakes in various parts of the country (such as the Chilka Lake in Orissa), sea water, and the European imports of about 400,000 tons. Salt is sold from ¾ to 1d a pound, according to the distance it has to be taken, on an average it retails at ¾ a pound,* of which two-thirds go to the Government as duty. The total consumption is now about 1,100,000 tons, of which 700,000 tons is obtained locally. The annual consumption per head in Bombay is 10½ lb., and in Sind 8 lb. The duty charged is two rupees per maund (of 82 lb.), which brings in a net revenue of over £6,000,000 sterling to the Government.

From figures quoted, it would appear that the Indian revenue from salt had risen so high in 1882 as £7,305,000, but a reduction in the duty had sent the figures down to £6,624,000 in 1887. To quote again from Mr. Simmonds' paper:—

There are four kinds of country salt met with in the bazaars of India:—

1. Rock salt, regarded by the natives as the best, mainly, because it has not been boiled. It is obtained from the Cis-Indus and trans-Indus salt mines.

2. Sea salt, extensively manufactured in the Madras Presidency under a system of Government supervision, the revenue obtained being over a million and a half pounds sterling.

3. Lake salt, procured from the Ajmer salt lakes, the water naturally evaporating during the hot season.

4. Earth salt, which is common salt of a very impure quality, obtained by washing certain soils. †

In the Madras Presidency a small quantity of spontaneous salt is obtained at Kistna (Masulipatam), Tanjore, and Madura, but the quantity made is declining.

Figures are given to show that the collection of "spontaneous" salt had gone down from 6 mil-

* Exactly the figure for Ceylon in 1857, while better means of communication must have lowered the price since then.—Ed.

† Now forbidden.—Ed.

lions of maunds in 1884 to 2 millions in 1887. The truth is that in many cases natural salt formations give such poor returns in quality as well as quantity, that in the interests of the consumer as well as the revenue such formations are destroyed and it was doubtless some of the recommendations of the Ceylon Commission of 1857 which the "Examiner" editor had in his mind when he recently stated as a proof of the iniquity of a salt monopoly that collections of salt were destroyed. Messrs. Lee and Braybrooke wrote in 1857:—

OODOPANCARRE.—Should supply the retail store at Chilaw, and all the Salt should be removed thither as soon after the collection as possible. The manufacture at Poolicbancolom should be discontinued, and immediate steps taken by the Assistant Agent, to prevent the formation of Salt there in future. This, we believe, can very easily be done, as the Salt pans lie on the very margin of a large lake, called Moondane Kalapoo, which would afford every facility for destroying the Salt works.

CARATIVOE.—Should supply the Calpentyn stores, and no issue of Salt should, on any account, be allowed at the former place. The collection of the naturally formed Salt of Tiliady (Calpentyn) should be entirely discontinued, and sea water should be let in at the proper periods, to destroy the formation of Salt. That place yielded 111 cwt. last year, and its ordinary produce is from 120 to 130 cwt. only.

On the Island of Carativoe also, where Salt forms naturally, and where, on account of its remoteness from superintention, plunder extensively takes place, which has sometimes led to collisions with the Government officers, care should be taken to prevent the Salt from forming. It is of an inferior description and never gathered by Government. Fishermen from Negombo and other places, resort thither in the fishing season to cure their fish, and to evade the monopoly.

The HAMBANTOTTE Stores are supplied from three Leways in the immediate vicinity of the town, and a sufficient quantity is sent to Tangalle by sea, for the retail trade of that portion of the Province, with little expense and trouble.

A quantity of 4,919 cwt. of Salt was collected last year from the Jamboorokalla Leway in the Girraway pattoo, situated about midway between Hambantotte and Tangalle; because the stock of Salt on hand was low, and the prospects of collection elsewhere very unpromising. The cost of this Salt was very high (7½d. a cwt.) and its quality is so inferior that no purchasers can be found to take it. A portion of it was sent to the Tangalle store, for retail consumption; and there the people complained of its being very impure and unwholesome. We found that 1,482 cwt. had been already sold with an admixture of good Salt, but even this did not prevent the outcry against it; and this was not to be wondered at, as it was largely impregnated with sand and mud, and deficient in grain. We consequently advised the Assistant Agent to discontinue its issue, and to apply for leave to strike the quantity remaining off his returns, as we felt satisfied from personal inspection, that it was not fit for use, either for culinary purposes or curing fish. This salt would probably have been suitable as manure, judiciously mixed with other substances or with the soil. But for the existence of the monopoly, and government supervision it would probably have been used for curing fish. To quote again from Simmonds:—

The mines of Mandi and Kohat, in Northern India, produce about 550,000 to 600,000 maunds (says 2,000 tons). Kohat producing four-fifths of this.

About 1,500 tons of salt are brought into India by Thibet; but, though imported free of duty, it is not profitable to bring it down to the plains in competition with Indian salt, which has to pay the duty of two rupees a maund of 82 lb.

The Indian export trade in salt is large and increasing, averaging now about 50,000 cwt. It is sent principally to Upper Burma, Nepal, and Kashmir.

That taken by Kashmir and Nepal has to pay the Government duty of two rupees per maund. That which goes Kashmir is Punjab rock salt; that exported to Nepal is mostly, if not altogether, Sambhar lake salt, and in either case the duty is paid at the mines or the lake before removal. The salt sent to Kabul and Bajaur is the great salt of the Trans-Indus districts, which for political reasons, pays only half the duty, or eight annas the maund.

The salt taken to Upper Burma is all either Cheshire, Italian, or Sicilian salt, which pays a duty of three annas per maund, when taxed for consumption in British Burma; and of one per cent, *ad valorem*, at Rangoon, when forwarded to Upper Burma. It is sent up the Irrawaddy in the flats of the Flotilla Company.

The imports of salt into India have increased in quantity from 274,000 tons in 1879, to 424,000 tons in 1888, but the average value per ton has fallen from £3 to £1 10s.

The only noticeable feature of the Indian trade is the commencement of large imports from Aden, where, under concessions granted by the local administration, an Italian company has commenced to manufacture on an extensive scale.

The Ceylon Commission of 1857 was constituted by Sir Henry Ward, who, in one of his able minutes, exposed serious defects in the system then in operation, which were subsequently cured. The result of the full inquiry, however, was to show that absolute fraud was by no means so prevalent as the Governor had been led to believe. From Sir Henry Ward's Minute we quote as follows:—

The justification of a monopoly of this kind, is its productiveness. The more it yields, the greater is the return, which the Government is enabled to make for it, in Public Works, or useful Institutions, and the less the necessity for other taxation. It should, therefore, be strictly, but equally enforced; and the Government, which undertakes this responsibility, is bound to see that there be no temptation to fraud, in its own arrangements,—that the people shall not be taxed for the benefit of the illicit dealer, but that it shall have the entire fruit of the sacrifice, which, it is called upon to make, by foregoing the use of an article, which the soil produces spontaneously, but the value of which is raised by law, from three pence three-eighths of a penny, to 4s and 8d per cwt.

The value of the Natanda Canal and "Brodie's Road" was dwelt upon in 1857, but what we now want is railway construction bringing the salt pans of Puttalam into connection with the system of land and sea carriage which radiates from Colombo. When the seaside railway has reached Matara, it will be time to agitate for its extension to the other great source of salt supply in Ceylon, the "leways" of Hambantota. The evaporating pans at Puttalam are private property: the leways at Hambantota are the sole property of Government and convicts are now employed to collect the southern salt. Regarding the monopoly, which some decry so much, we quote as follows from the report of 1857 by Messrs. Lee and Braybrooke:—

It is, of course, generally known that a Government Monopoly exists in Ceylon with regard to Salt; and as far as that Monopoly itself is concerned, we cannot express our own opinion on the subject more forcibly than by quoting the words used by Mr. Plowden "the Commissioner appointed to inquire into and report upon the manufacture and sale of, and tax upon, Salt, in British India." In his Report laid before Parliament in 1856, with respect to the Salt Monopoly under the Madras Presidency, he says: "Regarded simply as a plan for the realization of an indispensable revenue, the Salt Monopoly under the Madras Presidency, as at present constituted, does not, it must be admitted, afford much room for practical objection. Salt of good quality is abundantly supplied by the Government at a moderate fixed price, and the Revenue is easily and cheaply collected; the exportation of Salt

by sea is now free from duty, and all restrictions. * * * Only the manufacture and the first sale of Salt are a Government Monopoly," and he adds, that "the same amount of revenue could not be raised so cheaply and with so little inconvenience to the community in any other manner."

These observations apply, in our opinion, most fully to the Salt Monopoly in Ceylon; the article is abundant, the price most reasonable, the revenue derived from it considerable, and the tax on the people is moderate in the extreme, and easily collected.

Here, as at Madras, the manufacture or collection of Salt is conducted exclusively on account of the Government. The manufacturers contract to furnish Salt at a fixed price, and the Government dispose of the Salt also at a fixed price, through their own Agents, to the dealers and others who resort to the Government stores for their supplies; but beyond the first sale the Government do not meddle. The manufacturer can only make for Government, and the purchaser, in the first instance, must buy from Government, but afterwards he may sell his Salt where, and as he pleases, without further interference.

Some of our readers may be interested in the details of the manufacture and collection of salt, which are as follows:—

The Proprietors of Pans at Putlam engage Natives of India, as well as residents of the District, to prepare the pans, making advances of money to them. Each of these pans requires two or three labourers, never more than three. At the end of May, after the rains, they begin to prepare the beds, which process occupies about a month and a half; first of all, the water is let in from the lake upon the beds, and allowed to remain a sufficient time thoroughly to soak the ground. It is then drawn off to the adjoining pans, and the mud is all removed from the beds, which are then finally prepared by stamping and a coating of white sand, when the water is let in again upon them, and the Salt is produced in due course by evaporation. As soon as the first crop is gathered fresh water is let in for a second formation, and thus the process is repeated three times, and sometimes, though rarely, four times in a season. A kind of rake with iron teeth is used for breaking up the Salt, and a wooden scraper for gathering it. The Salt is thus collected without the slightest admixture of mud, and is left for two or three days on the dividing dams to dry, when it is removed to the kottoos by labourers especially engaged for the purpose by the proprietors the manufacturers not being required to perform this service. At the termination of the Salt-harvest, the residents depart to their villages, and the natives of India return to their homes.

The system of collection and storage pursued at Jaffna, as detailed in the papers received from Mr. Dyke, is as follows.

As soon as the formation of salt in the pans at Seviaterrue is sufficiently advanced to admit of its being gathered, the manufacturers commence operations; the Salt collected each day is heaped on the high grounds, or bunds, which divide the rows of Salt-pans; here it is allowed to remain exposed to the sun, for 5 or 6 days, in order that it may go through a process of sweating, and become dry enough to be stored. At the expiration of this time, it is weighed and received over from the manufacturers, who are generally paid on the spot, but sometimes at the Cutcherry, the sums due to them. Under any circumstances no delay takes place in settling with them, as soon as the Salt is sufficiently dry to be received into the stores on the margin of the Salt-pans, or removed at once to the stores of issue; and no delay is allowed to take place in the removal of the Salt left at the pans, to the stores, whence alone it is issued on sale.

The cost of weighing at the pans at Seviaterrue, is 8½d. per 100 cwts. The Salt is weighed in the presence of a person nominated by the storekeeper, and is then removed in carts, under his charge, to the stores, where it is received over by the Storekeeper, without any further verification.

The cost of weighing and transporting the Salt is entirely borne by the Government, the manufacturer

being required simply to carry it from the dams or bunds, where it is heaped, to the margin of the pans, where it is weighed and taken over from them, at 115 lb. the cwt., for which they are paid 3½d.

In addition to the large produce of the artificial manufacture, considerable quantities of naturally formed Salt are obtained from the Leways at Karnavay and Velliparaway. Here the labourers, who work from 6 a.m. to 3, p.m., deliver the Salt collected each day, at the rate of 115 lb. to the cwt., for which they receive 3½d. After being weighed, the Salt is made up into heaps on the high ground near the Leways, and properly secured against the weather, until it can be removed to the permanent stores at Tondamanaar. The removal is effected both by carts and coolies; the latter carrying on an average, 75 lb. each.

At Hambantotte, where only naturally formed Salt is produced, the system, as ascertained in the course of our enquiry, is somewhat different. The Salt is carried by labourers to the margin of the Leway, where it is measured the same day in bushel measures, and the weight of a few bushels having been taken, an average is struck by which to calculate the total weight of the day's collection. The labourers are paid at a daily rate of hire, varying from 9d to 1s 3d, and sometimes 1s 6d per diem, and are required to collect a certain number of bushels, according to the nature of the formation, and the difficulty of collection. It would not be practicable to take the account by weight at the Leways, on account of the strength of the wind, to which they are greatly exposed; and also because it would cause great delay in receiving over each day's collection from the gatherers. The Salt is formed into heaps at the Leways, each heap containing from 1,000, to 2,000 cwt. or more. The heaps are covered with cadjans, so as to be properly protected against damage by rain. There is always a reduction of from 9 to 12 per cent. on the estimated quantity, when it comes to be weighed and received into store, owing to the drying and draining process which the Salt undergoes, whilst lying at the Leways: for, of course, as the Salt is measured the same day that it is collected, it is heaped in a very moist state. As soon as the weather permits, that is after the rains of October and November have ceased, the removal of the Salt into store commences. This is effected by carts employed on contract, at a certain fixed price per cwt. according to the distance at which the heaps are from the stores. It is carried on with the utmost expedition, not only to save the cost of watching the Salt at the Leways, and to diminish the chance of loss by speculation, but also to complete operations before the dry weather sets in, and destroys the pasturage for the Bullocks in the neighbourhood of the Leways.

With some modifications in the direction of better storage and the employment of convicts at Hambantota, the processes of manufacture and collection are still, we believe, much the same as they are above described.

The result of our reading and reflection is, that, except the Pearl Fishery monopoly, which, Miss Martineau's nonsense to the contrary notwithstanding, is beyond question, there is no monopoly more justifiable, innocent and beneficial than that of salt as it exists in Ceylon. Relaxations have taken place in favour of fish curing and we have no doubt a similar course would be pursued in regard to agriculture were a good case made out.

BRITISH BORNEO TRADING AND PLANTING COMPANY.

An extraordinary general meeting of the British Borneo Trading and Planting Company (Limited) was held at Cannon-street Hotel yesterday, for the purpose of sanctioning an agreement for the sale of 15,878 acres to a company entitled the Segaliud (Borneo) Tobacco Company (Limited.)

The Chairman, in moving the resolution, stated that it would be in the recollection of the shareholders that at the ordinary general meeting held on January

14th last he had stated that their estates, amounting to 100,000 acres, were far larger than they could cultivate with their own capital, and that he then and now recommended the forming of subsidiary companies as the best means of obtaining the necessary capital to develop them on a large scale. Out of the 100,000 acres, they had two estates which had been proved by actual planting to be capable of growing tobacco equal to the best Sumatra. They therefore, were justified in asking people to subscribe capital for the purpose of developing these two estates on a large scale. One of the estates, as they were aware, had been formed into a company, under the title of the Suanlambah (Borneo) Tobacco Company (Limited), the capital of which had been over-subscribed. It was now proposed to deal with the Segalind Estate in a similar way. In discussing the future prospects of the company, and comparing them with companies which have been in operation for some years in Sumatra, and who are paying heavy dividends of over 100 per cent., the Chairman said: We have to bear in mind that the question of tobacco cultivation is very little understood in this country, and therefore its importance is not appreciated as it should be by merchants here. The class of tobacco called wrappers has hitherto been almost a monopoly of the Dutch colony of Sumatra, and the Dutch have not only realised profits of 100 per cent. on its cultivation, but have also developed a large and profitable business to their merchants in Holland by the sale there of the tobacco so grown. Their land in Sumatra, however, has become played out, and from lack of virgin soil the quality their tobacco is deteriorating while it has been proved that the virgin soil of British North Borneo produces a better quality of tobacco than if now produced by Sumatra, and that consequently it fetches a higher price. It is not surprising, therefore, that the Dutch should view the possible destruction of their monopoly with the greatest alarm, and in order to avoid it have themselves commenced planting in British North Borneo. Large numbers of Dutchmen have already gone to North Borneo. This is a very significant fact, and means that the Dutch anticipate that as soon as sufficient tobacco is produced by North Borneo it will not be worth while cultivating their estates in Sumatra, which does not produce such a good quality. Another consideration is that the working expenses in North Borneo are about 25 per cent less than in Sumatra. I think it is important that English merchants and capitalists should turn their attention to the matter, and see if they cannot follow the example of the Dutch by undertaking the cultivation of tobacco, so as to bring the market for that product to this country. The subject is, perhaps, worthy of the attention of the London Chamber of Commerce.

The Chairman then formally moved the resolution, which was seconded by Mr. Travers, and carried unanimously.

The proceedings then terminated.—*L. and C. Express*, March 1st.

A DELI PLANTER IN BRITISH NORTH BORNEO.

The planter whose experiences in the territories of the British North Borneo Company are set forth in the *Delhi Courant* thus sums up to his verdict on the evidence before him, so far as it bears upon cultivation there.

THE SOIL.

The soil generally consists of white clay with an intermixture of humus in a thin layer above. On the shores of Marudu Bay and on the banks of the Sugut river, the soil is somewhat sandy and has need of irrigation. The planters on the spot deem that the rainfall will meet requirements in ordinary years. The Deli planters who have seen the country for themselves generally think highly of the soil. The ground is less heavily timbered than in Deli. Building materials abound

on all sides. Where timber fit for posts happens to be scarce, the "Nibong" may be had in any quantity. Nipa for thatch is everywhere available.

CLIMATIC ADVANTAGES.

Notwithstanding the fact that, on many estates, the mortality has been enormously high, the climate is as healthy as in Deli, if not more so. The tobacco grown, which so far, has been brought to market only in small quantities, seems to suit admirably the wants of customers, in Europe. This is said to be especially the case with the Suan-Lamba tobacco. The only uncertain element to be reckoned with in planting adventure arises from the little knowledge of how the monsoon sets, and how it stands with the rainfall.

LABOUR.

Another element of difficulty lies in the coolies question. Chinese labour may easily be counted upon. In securing it from China or Singapore, the difficulties are hardly any greater than those met with in Deli. There, is, however, greater risk of Singapore coolies absconding, especially at Labuan. The greatest hindrances lie in the way of finding suitable native coolies. It is well known what bad characters Singapore, Javanese and Malays usually turn out to be. Owing to direct coolie immigration from Java being impracticable under existing conditions the refuse of China and the Straits will long find a ready market for their labour in Borneo. The Kadyans, a tribe from Brunei territory, and some Brunei Malays settled in Labuan, are preferable to them in every way. The latter seldom enter into contracts for more than 6 or 8 months in duration. They get 8 to 9 dollars per month, and work sometimes only eight hours a day. Years will have to pass away before the native population of north Borneo will feel any inclination to labour on the estates. What has been done in this respect by the Acting Resident on the West Coast calls for the warmest thanks of planters. The sudden extension of planting enterprise has resulted in a heavy demand for coolies, who prove hard to get, even with the utmost efforts to secure success. There are not even men in the land able to make thatch from the nipa palm,* which abounds in the country. As may readily be imagined, the position of the pioneer planters has been greatly affected for the worse by these difficulties, and by the great distances to be traversed at sea, &c.

COFFEE.

We will now glance at the prospects of coffee cultivation. The hills suitable for cultivating are not high enough, and have too hot a climate to agree with Java coffee. Even, however, if coffee did grow luxuriantly, there are no men to gather in the crop. In the eastern districts, the country has hardly any inhabitants. The people on the north coast are either too shy or too hostile towards Europeans to be at all helpful in the next few years. The other planters cannot naturally spare their own coolies, not for a day even. The chances are that most of the coffee crop will remain unplucked. It is only in Marudu Bay that the co-operation of the people may in some degree be reckoned upon.

OTHER ARTICLES.

Sugar and pepper have been experimented with, but no sensible planter will as yet begin with them as a mainstay. These articles cannot at present be grown there on a scale to pay expenses. Gambier, hemp, and other produce articles have

* This is what is called the 'water coconut' in Ceylon. It is curious that, while it is so largely utilized in the Eastern Archipelago as a superior thatch, it seems to be turned to no useful purpose in Ceylon.—Ed.

not come into prominence, and have been subjects of experiment only. Success in planting there depends upon prudence and foresight carried out with sound judgment and on intelligent principles.—*Hongkong Telegraph*, Dec. 18th, 1888.

DRUG TRADE REPORT.

LONDON, 28th February 1889.

CINCHONA.—The auctions held on Tuesday included a rather large aggregate of bark, although the supplies from Ceylon were smaller than usual. This deficiency was made good, however, by a large number of packages from India, nearly all *Succirubra* bark, and by a good assortment of Java cinchona. The following is the number of packages offered:—

	Packages	of which	1,068 were sold
Ceylon bark ...	1,522		
East Indian bark ...	1,072	"	819
Java bark ...	475	"	475
South American bark	315	"	217
West African bark	22	"	22
Sundry odd lots ...	132	"	132
Total ...	3,538	"	2,733

A very quiet tone prevailed at the auctions, and there was a marked absence of competition, while a good many parcels had to be bought in because the limits placed upon them were unobtainable. The unit value may be placed at 1½d per lb for good bark, with an occasional lapse to 1¼d for inferior grades. This shows an all round decline upon the previous London auctions, but certainly no decline upon the prices obtained at Dutch sales last week.

The following are the approximate quantities purchased by the principal buyers:—

	Lb.
Agents for the Mannheim & Amsterdam works	133,588
Agents for the Brunswick works	116,399
Agents for the Auerbach works	81,676
Agents for the American, French, &c., works	67,145
Agents for the Frankfurt o/M and Stuttgart works	61,262
Messrs. Howards & Sons	42,688
Mr. Thomas Whiffen	26,770
Sundry druggists...	30,847
Total sold	560,375
Bought in or withdrawn	197,612
Total quantity catalogued	757,987

It should be well understood that the mere weight of bark purchased affords no guide whatever to the quinine yield represented by it, firms who buy a small quantity of bark by weight frequently taking the richest lots, and *vice versa*. An analysis of the catalogues gives the following prices for sound bark:—

CEYLON CINCHONA.—Original: Yellow varieties: Chips, weak and dull, 1½d to 2½d; fair to good 3d to 5d; fine branchy mixed stem chips 5½d to 6d; shavings, ordinary dusty to fair 3d to 4d; fine rich spoke shavings 8d; broken papery and dull druggist's quill 4d per lb. Red varieties: weak dull twigs ¾d per lb refused, the price being 1d; ordinary weak to fine bold spoke shavings 2d to 5½d; ordinary chips mixed with branch 2½d to 4d, one lot 1¼d; fair to good bold stem chips 2d to 5½d; root 2½d to ¼4d; per lb. Grey and hybrid varieties: root 3½d; ordinary thin twigs 1½d; chips 4d per lb. Renewed: Yellow varieties, fair chips to good branchy stem chips 2½d to 5½d; fine bold chips 7½d to 8d; shavings 5½d to 6d per lb. Red varieties, dusty weak to fine bold branchy chips 2½d to 5½d; good to fine shavings 5½d to 7½d per lb. Grey and hybrid varieties, chips 7½d per lb.

EAST INDIAN CINCHONA.—Original: Yellow varieties, root 5d; spoke shavings 5d; branchy chips 2½d to 3½d. Red varieties, twigs and twigs mixed with chips 1½d to 1¼d ordinary to fair chips 2½d to 3½d; bold ditto mixed with branch 5d; shavings 1½d to 3½d; root 1½ to 3d. Grey and hybrid varieties, root 2d to 5½d; shavings 2d to 2½d; chips 2½d to 3½d per lb. Renewed: Yellow varieties, shavings 3½d to 4d; chips

5d. Red varieties, ordinary weak to fair spoke shavings 2½d to 4½d; good ditto 5d to 6d; dull small chips 1½d to 2½d; medium to good 4d to 6½d. Grey and hybrid varieties, chips 3d to 7½d, shavings 3½d to 4½d per lb.

JAVA CINCHONA.—Yellow varieties, fine broken chips 9d to 10d; damaged ditto 8½d; branchy chips 4d to 7½d; good bold root 4½d to 7½d; ordinary chips 2d to 3½d; thin twigs 1½d; broken and damaged but fairly good silvery druggists' quill 3d to 5d; bold and long heavy druggists' quill, partly rather brown and thin, and all damaged 5½d to 7d; red chips 3d per lb.

SOUTH AMERICAN CINCHONA.—The whole quantity of cultivated Bolivian Calisaya quills offered, viz. 116 packages, about, 11,920 lb, was disposed of at 7½d to 8d for rather thin to fair sound quill. Eight bales newly-imported *Ouprea* sold at 2½d per lb; while parcels of Soft Columbian and Pitayo bark were bought in. Three serons spurious and damaged Calisaya quill sold at 3½d; and one bale common colourless flat Red bark at 1s 7d per lb. Fifteen bales fair Carthagens realised 4d per lb.

WEST AFRICAN CINCHONA.—Twenty-two bales o *Succirubra* from the island of San Thomé, ordinary brown papery broken quills, partly damaged, sold at 2d to 5d per lb.

A quantity of different varieties of cinchona, partly mixed and of old import, said to be the stock of a firm whose experience has led them to relinquish the cinchona trade, was sold without reserve at very low prices from ½d to 1s 2d per lb. The exports from Ceylon between the periods from October 1st to January 24th have been: 1888-9, 4,377,188 lb; 1887-8, 3,176,093 lb 1886-7, 5,354,190 lb.

CINNAMON.—A fairly heavy quantity, viz. 2,105 bales, Ceylon cinnamon was offered for sale on February. Nearly the whole of this was sold at a trifling decline on medium grades, of which the bulk consisted, while low-class quills brought steady rates, and a few parcels of very fine brands sold with good competition at 2d to 4d per lb. advance. Chips were lower. Prices now range as follows: Superior 1s 4d to 1s 7d; firsts 8d to 1s 3d; seconds 7d to 1s 4d; thirds 6d to 1s 3d; fourths 5½d to 11d; broken 5d to 6½d; chips 2½d to 6½d per lb.

ESSENTIAL OIL.—Citronella, very dull at ¾d to 1s-16ths d. per oz. for native brands.

QUININE.—A rather large speculative business is reported in Brunswick and B & S bulk quinine at 1s 2½d from the agents for forward delivery up to October. On the spot 1s 2d per oz. would probably buy.

VANILLA.—According to the latest mail advices from Mauritius (January 23rd) the crop of vanilla for the season is only estimated at about 27,500 lb. The shipments from Réunion also are very small this season, having been, from its opening until January 10th, 25,600 lb., against 90,000 lb. in 1888, and 48,000 lb. in 1887.—*Chemist and Druggist*.

COCA AND COCAINE.—The *Hospital Gazette* has the following:—"When the discovery of the anæsthetic properties of cocaine first created an enormous demand for the leaves, it was fondly hoped that the cultivation of the plant might prove a source of revenue to our subtropical colonies. As a matter of fact, however, the normal production of the leaves in South America alone is so enormous that an eightieth part of the yield would 'swamp the coca markets of the world. The leaves are now no longer exported, it having been found much more economical to extract the crude alkaloids *in situ*, the purification only being carried on in this country. Apart from the cost of freight when leaves were imported, a notable loss in the total quantity of alkaloids was remarked as taking place in transit." This is not good news for planters who have been trying to cultivate coca in Ceylon,

Correspondence.

To the Editor.

THE GREEN BUG AND "LONDON PURPLE."

60, Mark Lane, E.C., London, 5th March 1889.

DEAR SIR,—Our attention has been called to some recent articles and letters in your journal inquiring whether our "London Purple," which is so largely used in America for the cotton worm, potato beetle, canker worm and similar pests, would be of any avail against the green scale bug. We may mention that some years ago inquiries were addressed to us as to the likelihood of its being of use in Ceylon for the coffee-leaf disease, for which purpose we were unable to recommend it, though doubtless if used as a paint for the stems of the trees it would prevent the fungus creeping up, but we felt sure that if once the fungus got on to the leaf the quantity of "London Purple" required to kill it would certainly harm the leaf itself. For the green bug however we are confident that our insecticide will be found of the greatest assistance if used with only ordinary intelligence. The poison should be applied to the leaves as soon as the eggs are hatched and before the young insect assumes the scale form. It would probably be wise to begin spraying as soon as the young leaves are sufficiently matured to afford food for the bug.

Any force-pump can be used for spraying, but the finer the spray the stronger the solution can be used, the object being to insure a very light coating on every leaf. We have known an acre of cotton plants covered with a quarter of a pound of "London Purple."

We should also recommend that the stems of the coffee plant should be painted with a mixture of "London Purple" and water applied pretty thickly like a whitewash, and for this purpose a much stronger dose could be employed than on the tender leaves. This would not only attack the scale bugs, but also prevent the borers and put a stop to any fungoid growth creeping up the stem.

In his letter to you we think that Dr. Trimen lays too much stress on the dangerous nature of the remedy. With ordinary care no danger need be apprehended, the lime in the combination will attack the nostrils and warn the operator long before any harm can be done by the arsenic. Of course, if used in the dry method, care should be taken to keep out of the dust as much as possible. Its colour proclaims its presence and shows which trees have been treated with it. During all the eleven years that "London Purple" has been in use in America we have not heard of a single accident; but should such occur the proper antidote is oxide of iron such as is produced by adding ammonia to a solution of green copperas—sulphate of protoxide of iron.

In conclusion we have learnt from experience that it is of little use looking for the dead insects. After eating the poison nature evidently prompts them to hide themselves away to die. The efficacy of "London Purple" will best be proved by the cleanliness of the plants and the increased crops resulting from its use.—We are, sir, your obedient servants,
HEMINGWAYS "LONDON PURPLE" CO., LD.

HOW TO PUSH CEYLON TEAS.

9th March 1889.

DEAR SIR,—I sometimes think that, notwithstanding the great efforts made by Ceylon men engaged in this now truly immense enterprise, say in pushing their teas in the great International Ex-

hibitions, not only in their own country, but elsewhere, many other equally grand (but much less expensive) means of making their teas known to the whole world are left neglected. As far as my own experience goes I find it is today almost impossible to buy a small leaded packet of 1 or 2 lb. of enjoyable tea *even in Colombo itself!* The good tea is all shipped home; if any really good tea is sold locally at auction, it is at once packed off either to the United Kingdom or to Australia or elsewhere. A thought here strikes me with regard to really fine Ceylon teas. How is it in the much talk we have heard lately of a Tea Syndicate that no company has ever been formed to corner all the really good teas, say a syndicate working secretly at the Mincing Lane, Calcutta and Colombo auction-rooms? Such a thing is feasible, for unfortunately the required capital would not be very large owing to the great dearth of really fine teas to be bought just now, and considering present low prices for even really splendid tea, consumers who were determined to have them would not mind paying even 6d per lb. more than they do at present in order to get them. If in Colombo it is so difficult for a resident who has time at his disposal to procure really good tea, what must the experience be of the multitude of passengers who on their way to and from all countries pass and re-pass our port? Well one can imagine what it probably is. Now why not change all this and take advantage of this great advertising medium especially as it would probably result in a handsome profit rather than a loss. And what is easier than that—every estate proprietor or agent should permit his superintendent to send small lots of tea once or twice a year to the, say, "Ceylon Tea Growers' Island Distributing and Advertising Company, Limited," worked under the auspices of the Ceylon Planters' Association and managed in Colombo by three or more heads of firms representing large tea interests. Samples of the teas to be first submitted for approval (of course, only tea out of the best breaks would be sent, say to the extent of 100 or 200 lb., for some limit to each estate must be fixed upon). If approved of the Colombo representatives would assess its value and give the estate credit for the value. No estate would be permitted to advertise its own brand, but the teas, if kept separate and blended or strictly speaking *bulked*, would be sold in 1 lb. and 2 lb. packets under *one brand*, viz., the "Ceylon Planters' Tea Distributing and Local Advertising Company's brand." A boat and a small hand van or vans nicely painted and bearing in large letters the style of the Company would, on the arrival of passenger steamers, be sure to attract the attention of tens of thousands of passengers either on board or on shore in the course of a year, and the sales would, I have no doubt, soon mount up very considerably, as the reliability of the teas thus sold became more and more known. Carried east and west and north and south, such teas would eventually make themselves a name in probably every quarter of the globe. A uniform rate of R1 per lb. would be readily paid, and this would leave a margin of profit to the company after all expenses were paid, for the latter could not amount to much after the cost of the tea boats and tea vans had once been recovered.

This may seem to be a very strange idea and interfering with shopkeepers' privileges; but even storekeepers' privileges are bound up in the general prosperity of our great tea industry, and they should not complain. Some of them no doubt do retail very fair teas at a moderate price; but how many do *not*?—and what

is the effect? A large city like Colombo drinking almost vile Ceylon tea and passengers by the thousand leaving our shores with withering contempt expressed everywhere with regard to the much vaunted *rich* and *delicate* Ceylon teas! I submit the idea for what it may be worth.—Yours,
A BELIEVER IN GREAT RESULTS FROM APPARENTLY INSIGNIFICANT MEANS.

P. S.—Talking of the bad quality of tea at present to be had in Colombo, a very great authority on, and one of the largest engaged in the tea enterprise, and who has just gone home (H. K. R.), gave his reason for it thus. He said there was a great deal in the water used. Tea that might not taste very pleasant in Colombo might prove to be very pleasant tea upcountry; it was more or less a *question of water*. The Colombo shopkeepers might be able to get some special teas made for them in such a manner that they would give good results with Labugama water. Any way it is worth the trying, for there ought to spring up a large demand for tea in the district of Colombo ere long, seeing that coffee is likely to prove too dear soon for the natives to buy even if the berry does not disappear altogether from our midst, as some assert it will before many more years are past. An effort should be made to supply coolies at the wharf in the Fort with good wholesome tea at a trifling cost; thousands of Tamil immigrants might be tempted to try it at the coolies' stall and to carry away a fondness for the beverage when they return to India, where a large local consumption of tea must eventually take place. Suitable premises for coolies where they could get cheap and good refreshments, and not too far distant might help to free our streets of objectionable and insanitary coolie eating shops in our midst proving themselves offensive in every possible way. What cannot apparently be effected *legally* may perhaps be effected *philanthropically*: even at Home it has been proved quite recently that dinners for the poor can be made for an infinitesimal sum. How much cheaper here with rice and fish!

BOURBON COTTON.

Mutwal Lodge, 14th March 1889.

DEAR SIR,—Can you inform me whether the cotton I now send you, along with a flower and leaf from the tree, is a variety worthy of our attention? If so, it is a perennial, and grows from sea-level to an elevation of 2,500. That is as far as I have seen; but it may flourish higher. If it is a worthless cotton, commercially, we should know it, in order to avoid the danger of cultivating a useless variety. If as good as the American and the Egyptian in staple and quality, then it is a variety best suited to the Sinhalese, whatever its merits and recommendations to the European planter, from the circumstance that it is a perennial.

You will notice also that the seed can be taken out clean, without any loss arising from cotton adhering to it.—Yours truly, JAS. H. BARBER.

[The cotton is beautifully fine, and we recognize it as Bourbon cotton, a superior variety, which is, as our correspondent remarks, a perennial. In cultivation, however, it is found generally advisable to treat all cotton plants as annuals. It is better also to grow plants from introduced seeds.—ED.]

THE PROPOSED CEYLON-AMERICAN TEA CO., LTD.

DEAR SIR,—While waiting for the issue of the prospectus of the company proposed to be formed to

trade with our teas in America, I amused myself with drafting a few clauses I thought such a document should contain. The prospectus has since appeared, and is all that is good and necessary; but as "every little helps," I may, perhaps, be allowed to put some of the ideas I then set down in the form of a letter.

The necessity that exists for the "speedy opening up of new markets" is a fact for which our pockets vouch. Such new markets we find in Germany, the Argentine Republic, France, the Australian Colonies, and America. The principle of "companies" to work each of these separately is a good one, and ought to be forthwith put into practice: a separate company for each country. America is in the field first, let it, therefore, have the start; then Australia, and the others in the order in which the "right man" to work them may turn up. For America we have Mr. Pineo; for Australia Mr. Sinclair, and I know that a German firm in Colombo is working earnestly for Germany; and Ceylon is about to have a tea-room in Paris.

At the low average of THREE pounds a head of the population the United States would at once jump into the position of being the greatest consumer in the world. The people spread over its vast extent do not drink our teas because they cannot get them. Let these be made known and the supply be kept up, and they may be trusted to make their own way everywhere as they have in Britain. Let them only be brought into competition with the cheap, low grades from China, and their success is assured, as proved by the decision of the discriminating tea-drinkers of Great Britain.

But for the purposes of a "company" there are other reasons why America offers inducements to operate on a large scale, boldly, and with confidence. The absence of "duty" and the low purchasing power of the American dollar will enable the company's agent in America to nett a price per pound for all he sells that could not be obtained elsewhere in the world. This will put the "agent" in his mettle, but he can be trusted for that.

It would be useless to form a company at all if the "working capital" is not large, and pluckily employed. The profits will, undoubtedly, be very large, and the secondary advantages springing from the company's operations will also redound to the prosperity of the supporters as well as to the general good.

Those large estate owners first in the field, who, for so many years have reaped the profits arising from high prices, should now take the lead in this and all kindred efforts, and small thanks to them seeing how profitable such investment is sure to be.—Yours faithfully, R. W. J.

THE COCONUT LEAF DISEASE.

Veyangoda, March 20th, 1889.

DEAR SIR,—All interested in coconut cultivation will hail with pleasure anything that will throw light on the above subject. The letter of a Negombo planter in your issue of the 18th, though it pretends to, gives us no information on leaf disease, though it certainly does give one an insight into the qualifications of the writer to form an opinion. The communication under notice is distinguished for rash assertions, hasty generalizations, and a hazy idea of manuring and its effects.

First, as to rash assertion. What are the means your correspondent had for forming so damaging an opinion of the depth of soil of the districts between

Henaratgoda and Ambepussa? Has he travelled through the length and breadth of these districts and examined their soil and found everywhere slab rock underlying the surface soil? I venture to think he has not, and because he perhaps has seen an occasional slab rock peep out of the soil, therefore he indulges in hasty generalizations and says that slab rock underlies all these districts. What authority is there for the statement that slab rock underlies the whole of the late Mr. Wilson's estate at Jaela?

What is the meaning of the statement that the soil of the above estate is so hard that it "will not take in manure"? What is done by it to the manure applied to the soil? Sent back to Colombo? Mr. Jardine or Dr. Trimen said nothing about "feeding up" trees. Indeed, Dr. Trimen recommended nothing. He only threw out the suggestion that perhaps a basket or two of manure to the affected trees may do good. About working up soils during the "heavy monsoons" I have a very decided opinion, but I do not feel called upon to discuss it just now. Why I wonder is it a "wastage of money and labour to apply manure during dry weather," and why will it not have effect on the trees? What I wonder becomes of manure applied during dry weather? Spirited away? I suppose your correspondent meant to say the effect of such application will not be immediate. Well, if he did, it perhaps would have been better if he said it instead of leaving it to be guessed.

It is no new discovery that the drought affects coconut trees in the upland districts more than those on low-lying lands on the sea-borde. The cause is not far to seek. Water is within easy reach of the roots of trees in the latter localities. A coconut tree is a huge pumping machine. It requires a large lot of water to mature its fruit and to make good the loss by evaporation from its leaves. When the supply is unequal to the demand, as a natural consequence the leaves droop. As to the cause of the bunches requiring to be propped I have a theory. It is owing to an insufficiency of salt in the soil, for propping becomes necessary in inland districts even when trees grow in moist situations, while on the sea-borde the stems are strong enough to support the fruit without the aid of a prop. It is very kind of "Planter" to give his opinion without being asked for it that "trees in the higher districts will not thrive for long," and that "after 20 years they go down." On the contrary my observation goes to show that the older the tree grows the higher will it go up. If he refers to the roots it is true; they are constantly going down, and my observation goes to show that the lower they (the roots mind you) go down, the better the chance for the tree resisting the effects of drought and being more fruitful. In the district from which I write the oldest trees are the best. No district suffers more from drought than the Mahoaya valley, and yet it is the district with the best soil among upland districts. I hope your correspondent will excuse my presuming to place the opinion of so inexperienced a man as Mr. Jardine against his. Mr. Jardine thinks we can go on for years without manure if we only unlock the vast stores of manure present in the soil.

Let it not be noised abroad that all the proprietors of coconut estates in the condemned districts are in hot haste to part with their properties for what they will fetch. There is to be a general exodus and all are going to invest in coconut properties in the district from which your correspondent dates his letter. —Truly yours, B.

SALT FOR COCONUTS.

Veyangoda, 22nd March 1889.

DEAR STR,—A grand mistake is made by those who say that because authorities rate low the manurial value of salt therefore the benefits of its application to coconut trees are problematical. The fact is lost sight of that every available authority speaks of salt only in relation to the cultivation of cereals, roots and grasses. Now all the salt these crops require (a very small quantity) is found in the soil, being carried to it by natural agencies. The case is

different with the coconut, the home of which is the sea-shore, the soil of which is impregnated with salt and where the atmosphere must be heavily charged with saline particles. When extending the cultivation of this palm inland, none of the natural conditions under which it grows and flourishes is present. In the place of the free sandy soil of the seashore we grow it in a hard stiff soil, often with a hard gravelly bottom. On the seacoast the vertical roots have free access to water—an element that plays a no-unimportant part in its growth and development. Inland though the vertical roots are in a permanently damp soil, yet it is only the roots of the older trees that have access to sufficient water to mature their nuts and to replace what is lost by the leaves by evaporation. Last though not least the soil inland has perhaps about a hundredth part of the salt present in the soil on which the palm naturally grows. Actual analysis does not show I admit that a large quantity of salt is present in the ashes of the tree, but, as the late Mr. Davidson of Jaffna says, a property belongs to salt which chemical analysis cannot take cognizance of. I do not say that the soil in the inland districts is devoid of salt, for that would be nonsense in the face of the monsoon storms that sweep across the island. All I say is that perhaps it does not exist in quantities sufficient for the requirements of the tree, not only to be taken up as food, but also to play another important part, to which I shall presently advert. Now agricultural chemistry teaches us that if the soil is deficient in one constituent of the food of a certain tribe of plants, that tribe of plants cannot flourish on that particular soil. I have given the habit of coconut trees in the inland districts, unlike those on the sea-coast, being unable unaided to support their bunches of fruit, a good deal of anxious thought. I am of opinion that this want of stamina is entirely due to an insufficiency of salt in the soil. In addition to salt being a direct fertilizer, it possesses two very valuable attributes: one is its action as a solvent, the other its hygroscopic properties. Salt, we read, sets free in the soil its inherent store of phosphoric acid, nitrogen and potash. In addition to this it renders silica soluble. So much for its great chemical value. It exerts as I said a great mechanical influence as well. Its affinity for moisture is well known. Its application to a soil keeps it free and moist, and salt-saturated soil will absorb much moisture at night. This will be condensed during the day, and the vapour moving in the soil will naturally be condensed on the coolest substance it will come in contact with—the roots. Experiments have proved that roots absorb moisture in dry weather in the form of tiny drops of dew deposited on their surface.

Now as to the proper dose of salt per acre, a correspondent in your columns spoke of having applied $\frac{3}{4}$ bushel per tree to a few trees with wonderful results. At 70 lb. per bushel this will be 52 lb. per tree or 1 ton 14 cwt. 92 lb. per acre of 75 trees. This seems an enormous dose—does n't it? But I have an entry in my notebook that from one to two tons of salt per acre is injurious to vegetation. This refers presumably to cereals, root crops and grasses; but no sane man is likely to experiment with too large doses of salt and kill his trees. Half a ton per acre scattered broadcast over the whole surface of the soil after ploughing or working with the mamoty will, I am sure, not be considered an overdose. One difficulty in the way of asking that Mr. Drieberg, the Superintendent of the School of Agriculture, experiment with salt, is that the School is situate within the full influence of salt-laden breezes. If there be any effect on the trees then it will not be so marked as inland and on soils inclined to be stiff and clayey. I would apply salt not exclusively with other manures, but also as a top dressing to the soil to ameliorate its mechanical condition. Salt is said to act as a prophylactic against cattle disease. Why not kill two birds with one stone by applying it to land and thus give it to them in the herbage? B.

[We, of course, never meant that Mr. Drieberg should confine his experiments to the seashore. —Ed.]

RECENT CRITICISM ON COCONUT ESTATES
AND DISTRICTS SATISFACTORILY
DISPOSED OF BY ONE OF THE
OLDEST PLANTERS IN
THE ISLAND.

23rd March 1889.

DEAR SIR,—The writer of the letter on coconut estates and coconut leaf disease, signed "Planter," which appeared in the Supplement to your issue of the 18th instant, seems to me to make very sweeping assertions; and with the coolest *non-chalance* condemns individual estates and whole districts as utterly unsuited to grow coconuts, and the plantations already in existence in those districts as likely to speedy decay and death, for he says: "I am of opinion that the coconut trees in the higher districts [what does this mean?] will not thrive for long; they flourish at the beginning, but you will find that after 20 years or more [how many more?] they gradually go down and do not last long." He then enumerates Henaratgoda, Veyangoda, and Ambepussa as coming under this designation, and says they have no depth of soil, and that after a certain depth the roots reach slab rock and the trees suffer. This is really an alarming picture, and, if true, should call forth our sincere pity for the unfortunate owners of estates in those districts. Poor people! Surely they are on the brink of despair at the ghastly prospects before them thus suddenly brought to light by the *ex-cathedra* judgment of this new Daniel. I would counsel them however not to be too much cast down, as this opinion is only that of one person who, whatever his claims may be (and we know nothing as to them except what we may infer from his letter) to pass a judgment, is not infallible. I dispute his verdict.* I know somewhat of the districts in question and have met with some very good soil in them. True there is much stiff and clay soil too, but this is only a drawback so long as cultivation is neglected, and the no system of cultivation ordinarily pursued by the ignorant native prevails. When enlightened, fearless and judicious working of such soils is taken in hand they prove that as a rule they are richer and more lasting than the free sandy soils of the sea-borde and its vicinity. The stiff and clay lands should be broken and turned over in clods to a depth of full 18 inches by means of strong steel-bladed tramp picks, and afterwards treated with 30 to 40 bushels of *freshly* slaked coral lime to the acre, scattered broadcast and allowed to be washed in by the rains. The clods would permit of free aeration, and all the rain would be absorbed and percolate through the soil instead of, as at present, more than one-half being lost owing to the impervious condition of the soil. In about six months the clods will disintegrate and the soil will be friable and easily worked, and should after this be kept in this condition by ploughing once a year, for the more clay soil is exposed to cosmic influences the more available fertilizing elements will there be for the roots to take up, and the easier will it be for the roots to travel in search of what they want. "Take care of the roots, and the stem will take care of itself," is a sound agricultural maxim. Lime in addition to tendering the soil friable acts on the silicates in it, and potash, so necessary to most plants, and particularly to coconuts, is set free. The cost of digging and liming would probably be from R30 to R35 per acre to do *thoroughly*. I emphasize the word *thoroughly*, as I consider it would be a

* So did we.—Ed.

great squandering of money if the work were done perfunctorily. Much supervision would be needed to get the required depth done by the labourers. Should anyone demur to the expense I would beg to remind him that R25 to R30 per acre is the cost once in two years on well cultivated estates for manuring, and it pays handsomely, the directors of the Horrekelly Company to the contrary notwithstanding.

Today I saw one of the unfortunate owners of land in the condemned districts alight from a railway carriage not a hundred miles from Ambepussa. He looked a determined man, and possibly in the box a servant was carrying, there lay hid a divining rod and a geologist's hammer, to be used in his search for that slab rock spoken of by "Planter." From the fierce set of his moustache I could see that "wild cats" were awake, and I would not give much for "Planter's" cuticle if he fell into his clutches. What the owner of the estate near Jaela will do to him I should be sorry to think. Poor "Planter"—what a hornet's nest you have disturbed! I have learned by experience that it is awkward to dogmatize, particularly when you don't know. I still hold to the innutritive theory as the cause of the so-called leaf-disease, while I am bound to confess that there are some circumstances which seem to point dead against it. I hope for the sake of all concerned that someone competent to give an authoritative opinion will soon be forthcoming to investigate the matter and relieve our minds of the present suspense.—Yours truly,

W. J.

COTTON CULTIVATION IN LOWER
DUMBARA.

Colombo, 23rd March 1889.

DEAR SIR,—The following particulars regarding the experiments made by me in the cultivation of Cotton in Lower Hewaheta are sent in the hope that they will be considered as of sufficient interest to your readers:—

Description.	When planted 1888.	Age: mos. days.	Distance.	Avg. height in inches.	Avg. plants in blossom.	Avg. blossoms for plant.	Ht. tallest plant inches.	Largt. no. blos. on plant.
Egyptian	Nov. 10th	5.15	4 × 2½	25	88	15	45	32
Tinnevell	" 14th	3.11	3 × 2½	18	100	10	24	15
American	" 28th	2.29	4 × 2½	16	60	8	46	12

From the above it will be observed that three varieties of cotton were planted, the seeds of which were obtained from Messrs. Darley, Butler & Co., the secretaries of the Ceylon Spinning and Weaving Co., Ltd. Of these the American has been considered the best in growth, the tallest plant of which was 46 inches in height at the age of three months. The Egyptian seed germinated in 6 days. 4 seeds were planted in each hole and the vacancies were 37 per cent for the Egyptian and 24 per cent for the American. The Tinnevelly seed unfortunately got damaged in transit. Mylepitiya in Lower Hewaheta has reddish sticky soil, in some parts containing loamy subsoil. It is supposed to contain mica.—Yours faithfully,

p. p. C. H. DE SOYSA, S. PETER SOYSA.

TOBACCO.—It is expected that not over 1,000,000 pounds of tobacco will be raised in Egypt this year, although the average crop is 13,000,000 pounds. The light crop is owing to the excessive tax lately laid on tobacco land.—*Florida Dispatch.*

THE SPICE TRADE OF NEW YORK.

The trade in ginger is very large. The importations here last year were 18,855 bags of Calcutta, 8,880 bags of African, 6,246 bags of white Cochinchina and 3,535 barrels of Jamaica. These figures are given in detail because they are not generally known, even among importers. The total was 1,286,160 pounds. The ginger plant is a native of India and Southern China, but is extensively cultivated in tropical America and West Africa, as well as in its native soil. Most of the ginger of commerce comes from Calcutta, but is also exported considerably from Jamaica. There are likewise large exports of pre-erected ginger from China and the East and West Indies. This consists of the young roots preserved in sugar after being boiled. What is known as black ginger is first scalded and then dried; it is scalded to prevent sprouting, since it is only the root of the plant which is used as a spice. White ginger is the root scraped and washed, and sometimes bleached with chloride of lime. White and black ginger are merely relative terms; the white is not perfectly so, nor is the black perfectly black. The ginger plant either lasts two years or else considerably longer, according to the particular species. It is herbaceous, with creeping and somewhat tuberous roots, and is generally three or four feet high, with smooth, arrow-shaped leaves, and flowers about the size of a man's thumb, of a whitish color, with the tip streaked with purple. In a suitable climate it is an easy plant to cultivate, and is seen at an altitude of 5,000 feet in moist soil on the Himalaya Mountains of India. Ginger is used as a flavoring for food and medicines; it has valuable medicinal properties. It generally reaches the consumer in a powdered state, and said to be considerably adulterated. Various compounds are prepared from it. For example, essence of ginger, much used for flavoring; syrup of ginger used chiefly by druggists; ginger tea, and infusion of ginger in boiling water, a domestic remedy for flatulence; ginger beer, a far-famed beverage, which, like another famous plant of Asia, "cheers but not inebriates;" lastly, there is ginger wine, a cheap liquor, to which alcohol is often added. Ginger comes to New York in bags holding from 110 to 120 pounds, and in barrels containing 180 pounds. Vessels regularly engaged in the West India trade bring Jamaica ginger to New York. English steamers bring the other kinds.

Many of the spice vessels stop at Calcutta on the way to New York, and there they take on what is termed in the trade "Calcutta" ginger. It is a great city of the East Indies, with a population of nearly 900,000. In a single year 668 sailing vessels and 301 steamers have arrived in its harbor. Its exports are numerous and large, and the city is the headquarters of the Governor-General of India. The name is derived from two words, Kali-Ghatta, signifying the landing-place of the Goddess Kali. It has had an eventful history, and is identified with the rise of the British East India Trading Company and the establishment of British supremacy over a wide tract of India. It is sometimes called the "City of Palaces," because it has so many fine buildings. The Government edifices are especially imposing. The dwellings of the English residents are spacious and attractive, but most of the large native population live in houses built of mud or bamboo.

Last year, mace was imported to the extent of 175,890 pounds, in boxes containing sixty-six pounds each. Mace is obtained from the fleshy part which envelops the nutmeg. It is the second coat or aril, a thin, yellow substance, of waxlike texture, which covers the nutmeg, and is very fragrant and aromatic, and has a strong but agreeable taste. It is raised mostly in the Spice Islands, but Penang and Singapore are the largest shipping markets. It comes to New York on the ships bringing general cargoes of East Indian merchandise. Part of our supply of mace comes from the Banda Isles, a group in the Molucca Archipelago. The Moluccas, or Spice Islands, as they are generally called, are of volcanic

formation and very fertile. They produce cloves, nutmegs, mace and other spices, not to mention sago, decorative woods and fruits, while the pearl and trepang fisheries have long been well known. The Banda Isles were produced by some fearful convulsion of nature, perhaps ages before man appeared on the globe, and are among the loftiest of the group. The Island of Goonong-Apee rises 7,880 feet above the sea. The four larger of these fruitful volcanic isles are devoted to the production of nutmegs and mace. The group is in constant danger of earthquakes, and the lofty island already mentioned is known as one of the most active volcanoes in the archipelago. The islands are little more than an open conservatory bearing odorous spices, with volcanic heat to stimulate the growth of the wonderful vegetation. The houses are mostly of wood, roofed with leaves, owing to the danger of earthquakes. Spices from the Banda Isles often find their way to New York by way of London, whence they are shipped on the regular steamers.

Mustard is a popular condiment, and has been known for many centuries. California raises a large crop. The mustard tree of the Scriptures still abounds in the East, and though the seed has no aromatic pungency, it is used like ordinary mustard. The most important spices known to commerce are black mustard and white mustard. The plants are natives of all parts of Europe, and are also cultivated in gardens. The white and the black seeds are ground together. Mustard is not only useful as a condiment, but is valuable as a medicine. It has stimulating properties, known to every household, and it is beneficial in some cases of indigestion. In England, white mustard, in the seed leaf, is sometimes used as a small salad, having an agreeable pungency. In India, the oil of mustard-seed is much used for lamps. In China, a species is cultivated as greens for the table, as we use spinach.

The bran of ordinary European and American seed is used in making French mustard, which is very popular. The finest mustard-seed is the black, or, as the brokers term it, the brown, which is received from Trieste. The next in point of quality is the English brown, and then comes the Dutch seed, though of the two last-named descriptions very little is received here. Large quantities of the white, or more properly, yellow, California seed, are used annually by the spice-mills of New York. It is cheap, and it makes itself felt. The Trieste sells at 7 to 8 cents a pound at wholesale, and the English and Dutch from 5½ to 6 cents, but the California is obtainable at 4½ to 4¾ cents. When there is an especially brisk market, the California seed is sent overland by rail to New York, but usually it comes in sailing vessels that go around Cape Horn, as in the "good old days" before regular mail steamers to the Isthmus and the Panama railroad were ever dreamt of on the Pacific Coast. It takes from 80 to 150 days for these ships to make the Cape Horn voyage, according to the wind, and, besides mustard-seed, they bring wool, raw sugar, wine, and the salmon of the Oregon, which assuredly hears something besides its own dashings in these days of feverish activity in trade and commerce. The foreign seed is often sent from the Mediterranean to London, and then transhipped to New York, though it also comes direct from Sicily. Some comes from Bombay. The fruit-steamers from Sicily bring considerable quantities.

Curry-powder is a preparation borrowed from India. It is composed of turmeric and various spices. In India and elsewhere it is largely used as a seasoning for a large variety of dishes. It often consists of turmeric powder, coriander-seed powder, black pepper, fenugreek, ginger, Cayenne pepper and cumin-seed. Sometimes the recipes include scorched mustard, mace, cinnamon and cardamoms. This agreeably stimulating preparation is largely manufactured by the various spice companies of New York.

Sweet marjoram is extensively used as a seasoning in cookery. The plant is a native of Greece and the East. Thyme is a half-shrubby plant long known

as a flavoring for various dishes. The garden thyme is the most fragrant. It grows in all parts of Europe and in the north of Asia, but is not indigenous in this country. "I know a bank where the wild thyme grows" is a familiar line from Shakespeare. It is an humble plant, but grateful to the smell and the taste. Wholesale houses here sell it in powdered form in boxes and barrels. Savory is largely sold here. The plant has lilac or white flowers. It has a strong and agreeable aromatic taste and smell, and is used for flavoring dishes. Winter savory and summer savory are used for the same purposes. Sage in powdered form flavors not a few dishes, and it is also used in the leaf. It grows wild, and is also cultivated. The whole plant has an aromatic smell, penetrating and peculiar, somewhat like that of camphor; and it has also an aromatic taste, rather bitter, but nevertheless agreeable, and is more generally known in the household kitchen than other sweet herbs. It is much used in flavoring meats and sauces. Italian sage is sold here by the bale.

Pickles are really a condiment, and are therefore worth a word in passing. If used judiciously, they stimulate the appetite; properly made, they are not unwholesome, and are often, indeed, decidedly agreeable additions to the table. There is the celebrated Spanish pickle; it is a mixture of the red cabbage and slices of the large Spanish onion. Gherkins are very young cucumbers prepared with especial care to preserve their green color. Sometimes in cabbage pickles, in which the red vegetable is always employed, a few slices of beet-root are added. Cochineal is sometimes used to improve the color and ginger, mace and white and black peppercorns are used as spices. French beans, onions, eschalots, walnuts, mushrooms, nasturtiums, cauliflowers, capers and other vegetables and fruits are extensively used in pickling, and the trade requires large quantities of spices annually. Pickles are sometimes colored by boiling the vinegar in copper vessels, and thus forming the green-colored acetate of copper, or even by directly adding that poison—a fact that has led to serious results; but this baneful practice is believed to be much less prevalent than formerly.

Capers are the delight of the *gourmand*, and have long been used as a condiment and as an ingredient in sauces. It is more particularly used with boiled mutton, though also employed with other meats. They are simply the pickled flowers of the caper-bush, of a slightly bitter and yet agreeably pungent taste. The caper-bush is a native of Southern Europe and of other countries near the Mediterranean Sea. It is found on Mount Sinai. It decorates ancient ruins, clothing them in a trailing garment of green as beautiful as the English ivy. It is a rambling shrub, in other words, that flourishes most in dry places and it is often found growing on rocks and the walls of ruins. It flowers from early summer till winter. The caper, which contributes so much to the satisfaction of the epicure, is simply the half-opened buds of the caper-bush. They are gathered every morning, and at once put into vinegar and salt. At the end of the season they are sorted according to their size and color. The larger buds are packed in small barrels, but the smaller and greener, being the most prized, are sent to market in bottles after having again been put in vinegar. The fruit of the bush is a small berry, and that is also pickled in some parts of Italy. Sometimes acetate of copper has been used to change the grayish-green color of the pickled capers to a brighter or more emerald-like hue, and this, of course, makes them dangerous. The presence of copper in a jar of capers can be detected by thrusting a polished iron rod into the vessel. If copper is present the rod will soon become coated with it. The English and French steamers annually bring large quantities of various spices, condiments and sweet herbs to New York to gladden the epicure and satisfy the popular demand for stimulants, which is unquestionably very great in a nation of such restless energy as ours.

Olives are a condiment highly esteemed after a

taste for them has been acquired, but at first they are not especially agreeable. Large quantities are imported every year. The consumption in New York is large, partly by reason of the cosmopolitan population. The olive-tree is indissolubly connected with sacred history. The Mount of Olives is a name as familiar as that of Jerusalem. The tree itself is so hardy that the olives now standing in what is termed the Garden of Gethsemane at Jerusalem are alleged to be identical with those named in tax-rolls as existing a thousand years ago, and there is a tradition—regarded by many as not altogether improbable—which makes them date back to the time of Christ. The tradition as to the extreme longevity of these trees still to be seen in the neatly-kept Garden of Gethsemane, and carefully watched by a sacred Order, is undoubtedly based on the well-known fact that the olive-tree is the hardiest fruit tree that grows. It survives the severest frosts, even sharp scorching by fire, and almost any degree of mutilation. It sprouts from the roots if everything else is dead. It is known to survive for centuries after the heart and all but the outer layer of young wood are gone. Often a large trunk is not only hollow, but split lengthwise into several distinct stems, all healthy and bearing fruit. Olive oil was known to the writers of the Old Testament, in whose time it was used for sacrificial libations, for illumination, for food, and for anointing the hair and body. Homer mentions the olive-tree. It was conspicuous in Roman agricultural literature. The Romans used olive oil in the kitchen and at the table instead of butter, which was scarcely used in the Roman *cuisine*.

In Palestine, and in some of the Mediterranean islands, the olive tree is as lofty as the tallest oak, but in Europe it does not often exceed twenty feet in height, being kept down by pruning for the sake of convenience in gathering the fruit. It grows in Asia-Minor, Syria, Northern Africa, Southern Europe, the Greek Islands, Spain, Portugal, France, Italy, California, and even to some extent in the Crimea. Olive trees are planted from fifteen to twenty-five feet apart, and with careful husbandry, will bear every year. Italy produces an enormous supply of olives and olive oil, and the crop in California is steadily increasing. The olives are gathered when fully grown but still green; they are first steeped for a day in weak limewater or lye of wood ashes; then in fresh water changed every day for four or five days, or until they have lost their bitter flavor. Then they are salted or pickled in a strong brine. This is the practice when the harvest is simply for the olives themselves. When it is for olive oil, the fruit is allowed to remain on the tree until it is of a dark wine color. Then the olives are dried a little, and then compressed for the oil. The best oil is from unground fruit, but it is also ground and subjected to repeated pressure, sometimes with the aid of hot water.

Olive oil is adulterated with lard oil and cottonseed oil. There are large exports of the American oils mentioned, and they come back from Europe, notably from Marseilles, travelling under the disguise of the best oil of Italy or Provence, really being largely an extract of American lard and cottonseed, which unscrupulous French and Italian merchants foist upon us with smirking complacency. In the fiscal year ending June 30, 1887, no less than 744,766 gallons of olive oil, valued at \$662,197, were imported into the United States, mostly at New York. Olives and olive oil come to this port in the English, French and Italian steamers.

The total importations of spices into the United States in the fiscal year ended June 30th, 1887, were 30,980,725 pounds, valued at \$3,431,412. Pepper is the most extensively used of any of these spices known to commerce, and nearly \$2,000,000 worth is consumed in this country every year. Spices are admitted free of duty except when ground.

But it is well known that spices are much adulterated. Burnt crackers, buckwheat and ground cocoa-shells are used to adulterate pepper. Ground almond shells are mixed with cassia and cinnamon. Flour in mixed with mace. Meal and starch help to mak

full weight and good measure of ginger. Pimento is too cheap to make adulteration profitable. Nutmegs have never been adulterated except in Connecticut, where a very successful imitation is said to have been made many years ago by some of the thrifty deacons who happened to keep country stores.

There are no wooden nutmegs now in market. Cloves are adulterated with clove-stems, which are very cheap. At one time they cost only one and a-half cents a pound at wholesale. Mustard is adulterated with flour and tumeric, which is yellow in color, and gives it its pungent taste. Tumeric itself is the root of a plant found in the East Indies and in Cochin China. It is sold in the form of dried root or powder, and besides being used so extensively in coloring mustard, it is employed in the dyeing of silks and wool, as well as in medicine and chemical analyses. As originally used in Europe, mustard was simply the finely ground seed, but in time a demand arose for an improved yellow color, the natural tint being rather dull and unattractive, and then the flour of mustard was introduced, this merely being the interior portion of the seed, the bran being rejected as in the case of wheat in making flour. The result was a loss of the pungent taste peculiar to mustard, which is largely due to the presence of a bitterish oil in the husk of the seed, and to supply this deficiency the next step was to introduce tumeric, Cayenne pepper and other foreign ingredients, with wheat flour to increase the bulk and lightness of color. There is little or no pure mustard to be had anywhere; it is practically a druggist's compound, and in New York mustard-seed is sold by drug brokers.

But the shipping element of the mighty commerce of New York is always more interesting than its formal array of statistics. Here at a wharf on the East River, near old Rutgers Slip, is a ship with big tan-colored spars and a brave array of rigging, pulleys, ratlines, cordage, chains and white decks. Her sides are barked and rusty with the long voyage from Hong Kong. A companionway is lowered to the wharf, and a notice close by announces that there is no admittance to the ship, though this warning is but slightly regarded. A queer little floating house on one side of the ship contains the steam winch, by which the cargo is hoisted from the depths of the sombre hold to a slanting skid, down which the merchandise is sent to a platform supported by wooden horses. From the platform the men take the bales of rich goods and pile them up, according to their marks, further along the wharf, or else put them on trucks to be taken to various parts of the city. On the dusty and splintered wharf are bales of cassia, bags of ginger, boxes of preserves, china-ware, rattans and curios, bales of straw braid and rolls of matting, bearing such labels as "Kee Ning," "Hong Kong Fancy" and "Mandarin," packed in bales of native grass. There are boxes of soys, a kind of sauce or flavoring made in China from a small native bean; there are cases of lacquerware, such as cups, saucers, trays, pots and dishes. The cargo contains no less than 500 cases of native preserves, and nearly 5,000 pounds of ginger. There is chinaware consigned to a Chinese firm in New York, Lin, Fong & Co., besides rattan chairs. In all, the big ship will yield up more than 18,000 rolls of the matting, which is so much neater and better than carpets for certain rooms of the dwelling, and so much superior to the cheaper carpets or the chilling oilcloth for halls. Big red trucks are being loaded with this merchandise from the far East, and every few minutes a team of stout horses, with flanks and harness glistening in the afternoon sun, rumble along the wharf out into noisy South street, where the stout lunged driver is speedily reveling in wordy and profane warfare with the driver of a horsecar, whose observations on the truckman's parentage, physical appearance and mental characteristics call forth a vituperative deluge in response from that maligned but fluent individual. Truckmen, as a class, are probably the same all the world over, as profane and abusive at times as parrots with a bad "bringing up."

Most of the steamers in the East Indian trade take their cargoes to London or Liverpool, and consignments for America are there transhipped in the regular steamers plying to New York. A new line of steamers between New York and Calcutta was established some months ago, and cargoes of East Indian merchandise are now more frequently brought hither direct. Some of these steamers also go to Bombay, Madras and Colombo in Ceylon. They bring cinnamon, ginger, coffee, indigo, jute, cinchona bark and other products. Seven steamers of 4,000 tons each are in the trade. They usually make the trip from Calcutta to New York in about thirty-five days, though occasionally it takes longer. The steamers have a great advantage in this trade, as they always go and come by way of the Suez Canal, that wonderful engineering feat that connects the Red Sea with the Mediterranean, whereas the sailing vessels, by reason of the high tolls on the canal, are obliged to go around by the Cape of Good Hope—certainly a commercial misnomer in this case. Every Anchor Line steamer pays four hundred pounds sterling or two thousand dollars, to go through to India, and the same amount coming back, making four thousand dollars in canal tolls for the round trip. The famous Peninsula and Oriental pay even more—four thousand dollars each way.

"There is one interesting fact about the spice trade," said a large importer, "and that is, the consumption of spices is increasing in this country out of all proportion to the increase of population. This is true not only of the staple spices, but of all kinds of fancy condiments. The increasing wealth of the country accounts for the enormous demand. Another thing: it would be a very important matter to us if the Prohibitionists should be more generally successful. In States where the Prohibitionists have the strongest hold, it is a curious fact that the consumption of spices is proportionately the largest. There is a certain class of persons who are determined to have some to warm them up."—*Frank Leslie's Popular Monthly*.

COFFEE IN SOUTH INDIA.—It is stated that the quality of last year's plantation coffee, sent to the London market, with "Coonor" and "Nilgiri" marks, is spoken of as having been superior to the generality of Wynaad coffee; the comparatively inferior quality of the latter being attributed to exceptional circumstances, such as unfavourable weather for picking, and the setting in of the monsoon on the Malabar coast, before many of the crops could be shipped. Fortunately the demand for coffee at home, has been good for almost all kinds, and high prices have been realised.—*South of India Observer*, Feb. 28th.

THE ALOE AND ITS USES.—A few years ago the discovery was reported in these columns of the singular property which the juice of the Mexican Agave plant has of half-digesting meat, or of converting it into peptone, and it was pointed out at the time how valuable from a commercial point of view would be this cheap and cleanly method of peptonizing, compared to the ordinary methods of extracting the peptonizing ferment from the stomachs of pigs and other animals. The discoverer, M. Marciano, announces that the method has been in industrial use in Venezuela by pharmacists for three years, during which it has worked perfectly. He finds now that if the crushed tissue of the leaves is added, as well as the juice, the whole process can be completed at blood heat in six hours, instead of 36, as it takes with the juice alone. The discovery is a very singular one, and one which ought to have received more attention from physiologists and physicians than it has so far. It is quite remarkable that the cells of the clumsy Mexican plant should be able to perform so easily the most important function of the human stomach.—*Australasian*.

THE
TROPICAL AGRICULTURIST
MONTHLY.

COLOMBO, MAY 1ST, 1889.

[No. 11.]

MR. J. G. LEAR AND TEA AT NUWARA
ELIYA.

WHEN we ("senior editor") arrived in Ceylon in November 1837, Mr. J. G. Lear was already some months in the island as a plant collector for Mr. Knight, the great Chelsea nurseryman. On the death

of Mr. Watson Mr. Lear acted for a time in charge of the Peradeniya Gardens. He was subsequently connected with coffee planting and subsidiary pursuits, until ill-health drove him from the island. Then we heard of him in connection with the establishment at Malvern, but for a long time we had lost sight of our good old friend, and we thought it possible he had gone over to the majority. But he is still to the fore, as a letter recently received from another former Ceylon resident shows:—

"I occasionally see some old Ceylon residents: During the summer I had a visit from a very old gentleman named Mr. J. G. Lear. He says he was one of the pioneers of the coffee enterprise in your island, having opened the first coffee estates in Hunasgiriya. In 1837 he planted at Nuwara Eliya the first tea bushes that were ever planted in Ceylon. He was subsequently Curator of the Peradeniya Gardens. On my asking him if he knew Mr. A. M. Ferguson, his reply was: 'As well as my own brother.' He also mentioned Dr. Elliott. I enclose a note he wrote me after his return to Malvern. His wife was also with him; they are two dear old people, and it was a real pleasure to chat with them. They must be very old, but they look hale and hearty, and good for another ten years."

In this letter came a note to the writer from Mr. Lear, who, we gather from the heading of the paper, had established a business with his son, at Malvern, as auctioneers, house and land agents, assurance agents, &c. Mr. Lear wrote:—

"I beg to return you the 4 copies of the Ceylon paper you have been kind enough to lend me; I

have been much interested in reading them, the whole country being so changed since I was familiar with it. Please don't forget to remember me very kindly to Mr. Ferguson when you write him."

On receiving the above letters we wrote to Dr. Trimen, telling him our recollections of our old friend, Mr. Lear, and asking if the tea plants put down in Nuwara Eliya could be traced. It will be seen that Dr. Trimen answered in the negative (that is our reading of his note), and we would now ask if any members of the Cotton or Kellow families, or any other old residents in Nuwara Eliya, remember anything of the matter, or whether any of the tea bushes are still in existence. The following is Dr. Trimen's interesting response to our inquiries:—

"I am quite surprised to learn that J. G. Lear is still in the land of the living. Your reminiscences of him are correct. He was sent out as collector by Knight, the then great Chelsea nurseryman; and after Watson's death in 1838, he was appointed officiating Superintendent of the Botanic Gardens in September of that year and continued to act till the arrival of Normansell in Jan. 1840.

"Lear left his mark on the Gardens by planting the fine grove of palms at the entrance.

"The handsome convolvulaceous plant named after him, *Ipomœa Learii*, appeared in Knight's houses and was supposed to have been the produce of seeds sent from Ceylon by Lear. This was, however, probably an error, as the plant is South American and not known here.

"All I know about the introduction of tea in Nuwara Eliya is given in my report for 1836. It appears that in May 1840 some Assam plants were put out there and a man placed in charge. He may have been Lear.

"I am sorry to have disturbed your mind as to the giant bamboo,* but I am not easy myself. The fact is it seems there are two giant bamboos, and I am not quite clear as to which we have. I have however this year obtained the 'other one,' *Dendrocalomus Brandisii*, the true Burma one, and shall see in due course whether it be really different to what we have already (*D. giganteus*)."

We remember hearing that Mr. Lear got £50 from Knight for introducing the creeper referred to, the blossoms of which are so beautiful that a lady visiting Knight's garden and seeing it in bloom burst into tears at the sight of such exquisite loveliness. Lear opened land in Hunasgiriya for a company got up by Messrs. Crowe & Co.

* We had expressed our surprise that in the Handbook of the Peradeniya Gardens, Malacca and not Burma should have been given as the habitat of the great bamboo.—Ed.

COCONUT PLANTING.

HAPITIGAM KORALE, 28th March 1889.

We have had lots of rain this month: beginning on the first day, it has up to date rained on 12 days with an aggregate of 9.72 inches.

The grass is once more green and abundant, and the coconuts have taken a fresh start. Many of those that suffer from the disease have developed centre leaves without a speck, but we must not holla till we are out of the wood. This seems to be exactly the same as the Jamaica disease, but there every tree attacked is said to die ultimately; whereas here, so far as I can learn, no tree has absolutely died yet, and Dr. Stork tells me that under his treatment of trenching and manuring some of his trees have perfectly recovered.

The price of coconuts last gathering has run to R30 and over per 1,000. It is however the fate of the coconut planter to have only the smallest gatherings for the highest prices; I have sold the February gathering for R40 when the rupee was more valuable than now, and have sold that of the April following for R25.

NOTES ON PEPPER CULTIVATION.

(By an Old Planter.)

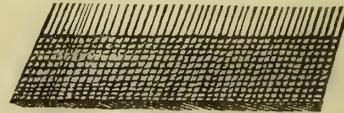

Seven or eight years ago I discovered that branches of the pepper vine, sometimes under favourable conditions, struck root and became plants; but that such plants never threw out running vines was an after discovery. Still it did not strike me, that this could be turned to account in cultivation, till about a year ago, when one of those branch plants came into bearing, and produced a very decent crop. It then occurred to me that to cultivate the plant in the form of a low bush, would be more convenient than any of the methods in common use. In growing the plant on living trees you can only put a plant where there is a tree, at irregular distances, not more than about 100 to the acre, fighting with the old established tree that supports it for a share of the plant food, and suffering from too much shade. Again, if posts be set up for the vine to run on, they are in the first place expensive, and in the second the most durable only last for a few years, when the whole affair tumbles down, and is not easily set up again. The branch plants can be put out at regular distances, say 6 x 6 feet, they can be easily cultivated and manured, can be pruned back as required, and the only other work needed is a few pegs and a piece of coir yarn to keep the branches from trailing on the ground. The chief difficulty is at the beginning to get the branch to strike root, but that can no doubt be overcome by proper arrangements to be taught by experience, even the vine is by no means a ready rooter.

That pepper requires shade is a common error; I have found it much more fruitful in the open than in the shade, but in or out of shade its cultivation will only be satisfactory on tolerably good soil. I understand that many of both natives and Europeans are trying this plant. It is one of the things that will pay, and pay well, under proper conditions of soil, climate, and cultivation, and I wish them all success.

[A modification of the bush system might be tried after the viticulture which we saw in the neighbourhood of Stuttgart. One or two branches only of a vine were allowed to grow, and all the strength of the plant went into these. When the branches had attained the length desired and the proper season had arrived, they were curled round so as to resemble a hoop and then tied so as to compel them to retain this position. Those who understand the physiological laws of plants will understand how the branches, with the flow of their juices thus checked, put forth blossom and fruit at every pore. What gave the maximum of fruit in the case of grape vines might be equally successful in the case of pepper vines.—Ed.]

Another practical planter reporting for a small clearing writes:—

PEPPER.—It was, I believe, decided to plant the remaining forest land, about 12 acres, with this product; all the undergrowth and small trees should be cut down so as to admit abundance of light, at the same time affording a moderate degree of shade. Trees to support from 250 to 300 vines to the acre should be retained. The stuff cut should, before becoming too dry, be piled in small heaps and burnt, care being taken to do as little harm as possible to the standing trees. This work can be done in January and February, and in the meantime a space of about one acre should at once be cleared in the above way, the ground dug about a mam-motie deep and all small and fibrous roots removed: stumps need not be touched. In this space pepper cuttings should be laid down about an inch apart—12 inches buried under the soil and six inches exposed thus:—

Exposed

Buried

the cuttings should be about 18 inches long and the branches cut from off the portions to be buried, but not from the portions exposed; for the 12 acres about 15,000 cuttings will be necessary. By May next year these should all have made roots and shoots, and be less liable to fail when planted out than if put out as simple cuttings; another consideration is that there will be no time lost in searching for vines, which might be the case where so many are required. After the undergrowth has been cut down and burnt, holes should be dug at the root of each tree close up to the stem: one on each side, if the tree is large in girth, but only one if small. The holes should be 18 inches long, 12 inches broad and 9 to 10 inches deep, all stones and roots removed and filled in with surface soil, any ashes near being mixed with it. In planting out all that portion that was underground in the nursery should be buried and the exposed portion laid close up to the stem of the tree; two cuttings should be placed in each hole, a few inches apart and about 4 inches deep and the earth firmly trodden down. If these directions are carefully attended to failures will be few. I cannot too strongly urge the necessity for tramping down all the soil round plants freshly planted and of beating down the soil over seeds as soon as sown, it is not necessary here to give the scientific reason for this; let it suffice that experience teaches that when this is not done many plants are sacrificed and much seed wasted.

PEPPER CULTIVATION IN JOHORE.

(From an old Resident.)

Black pepper is grown in Johore by the Chinese gambier planters who utilise the spent gambier leaves to manure the pepper vines. Some Europeans are planting pepper in Johore. The high price now obtainable for this article has induced Chinese and Europeans in British North Borneo, Malacca, Perak, Selangor, Sunjei Ujong and on the island of Singapore to plant extensively. A few years ago it could be bought for \$7 per picul (133½ lb.), today it fetches \$20 85-100ths per picul. It flourishes in Johore, both soil and climate seems to suit the plant excellently. In the year 1886 98,074 piculs valued at \$1,829,220 of black pepper was sent to Singapore from Johore and 313 piculs valued at \$3,630 was also sent to that port. This value must be a mistake because the manufactured white pepper fetches nearly as much again as the natural black. At present it is \$36 per picul. The above statistics are taken from the Straits Settlements Blue Book for 1886. Singapore Exchange Market Report states that in 1883 89,936 piculs black and 25,955 piculs white were exported from that port and in the year 1888 72,864 piculs of black and 19,172 piculs white were exported. As long as the war between the Dutch and the Atchinese lasts prices of pepper will keep up.—March, 1889.

THE FUTURE OF COFFEE AND OF JAVA PLANTATIONS.

A well-known Bogawantalawa proprietor, now in Europe, sends us a copy of the *Morning Post* with the following article on coffee, chiefly referring to Java and Sumatra, which he rightly judges is worth reading, if only to afford amusement, in Ceylon:—

A matter of considerable interest to coffee drinkers all over the world is just now engaging the attention of the Dutch Government. For some years past there has been a great falling-off in the quality and quantity of the coffee produced in the Dutch East Indies, where the berry is cultivated; and latterly the decline has become so serious that a Commission has been appointed, under the presidency of M. Canne, to consider the decadence of the Government plantations in Java and Sumatra, and suggest means for improving them. Our principal supply of coffee, as most people are aware, is derived, not from the islands of the Eastern Archipelago, held by Holland, but from Brazil, which, indeed, grows nearly as much as all other coffee-growing countries combined. But the quality of that produced everywhere in the New World is greatly inferior to the growth of the East; and since genuine Mocha is almost unobtainable now-a-days, and the coffee gardens of Ceylon are being grubbed up to make room for the more profitable tea plantations it is to Java and Sumatra that coffee drinkers must look in the future for a supply of really good beans at a reasonable price, and these, as every householder has no doubt discovered, have been dearer and more and more difficult to obtain in the last two or three years. Allowing for the effects of the disease which has attacked the coffee shrub in many parts of the East, where it has long been successfully grown, it is still difficult to account for the extraordinary decadence of the Dutch plantations, bearing in mind the peculiar conditions under which coffee culture is carried on in both Java and Sumatra.* It is not, as in any other part of the world, an industry in which people may or may not engage just as they please. Coffee cultivation is compulsory in the two islands. Every head of a family, every villager, is obliged to cultivate a specified number of trees each year. He is compelled, moreover, to plant a certain number of young shrubs every season, to replace old ones no longer profitable, or in bearing, and a large staff of Dutch inspectors supervises the culture, and sees that due compliance is made with the several prescriptions of the law. And neglect in any particular is punished with the utmost rigour and severity.

And not only does the Dutch Government prescribe to the Javan and Sumatran peasant how many coffee-shrubs he must cultivate, and in what way they are to be planted, but it compels him to sell the produce to the authorities at their own price. In fact coffee is a strict Government monopoly, with the notable addition that every family is compulsorily engaged in it for the benefit of the State. For the convenience of cultivators small store-houses are constructed all over the islands wherever coffee is grown, and thither the cultivator carries the beans as soon as he has gathered and ripened them. From these local depôts they are transferred to the larger towns and sea ports of the coast. Padang is the great centre of the Sumatra coffee trade and the shipping port for Europe, as Batavia is for Java. The so-called Padang coffee is the product of the Western portions of the island of Sumatra and the highlands of the south. The shrub, curiously enough, objects to lowlands and an excess of heat, so that none is grown in the low-lying regions near Padang. The plant thrives at an altitude of eighteen hundred to two thousand feet, and does best on the declivities of mountains and hilly terraces, in soil where forest trees have formerly grown, and where the woods have been cut down in such a way as to leave a certain number standing at intervals to shelter the tender young

coffee plants. In Sumatra the yield of the coffee bush is exceptionally heavy owing to the favourable climatic conditions of the island. The bush is covered all the year round* with the small snowwhite blossoms that precede the fruit, while ripe and unripe berries are found on the stem at the same time. Picking is, therefore, always going on at regular intervals and the cherry-like little fruit is dried, removed from its thick outer covering, and then laid out in the sun until the husk enveloping the berry can be rubbed off. In Sumatra the fruits are just thrown down upon the ground and left where they are until the husk is loosened, hence Padang coffee often contains many small stones mingled with the beans when they have been carelessly gathered from the drying heaps on the bare earth. This is never the case with the finer produce of Java. The Javanese are rather particular in the matter of drying their coffee-berries, and spread them with the greatest care upon straw mats, which are then placed in the sunshine. The shrub in the Dutch Indies begins to yield in its third year, and continues in bearing condition until it is about twelve years old. After this time the plant assumes its mantle of moss, precursor of decay, and slowly dies off.† The natives of Java and Sumatra make use of the leaves of the coffee plant in exactly the same way as we do tea. They make an infusion of them—of course, after first drying them, and this is not only as good as coffee in the opinion of many connoisseurs, but actually contains a greater proportion of caffeine, the active constituent of the berry, on which its exhilarating and stimulating effects entirely depend.

The coffee berry is not only a favourite with a large section of mankind, but many members of the animal world show a strange predilection for it. The red envelope in which the bean is contained is a favourite edible of a notable proportion of the wild creatures of the forest in all coffee growing lands. In Java and Sumatra the "mussang," better known as the "musk cat," visits the nearest plantations night after night in search of this vegetable delicacy, though it is notable that the creature is unable to digest or assimilate the brown berry itself. So, too, the "kolong," a huge Sumatran bat, with wings four feet across, commits its nocturnal raids for the purpose of securing the dainty, which it appears to highly appreciate. It is, however, not the depredations of such and similar creatures, or even the leaf disease to which the plant has become subject, which is wholly responsible for decadence of the coffee plantations of the Dutch East Indies. If fine Java and Sumatra coffee is now expensive, comparatively speaking, and difficult to obtain, it is because the antiquated system of compulsory cultivation in vogue in the islands, the expense entailed by method of storage, and the army of officials required to superintend the industry combine to make it so. This is the more to be regretted as there is good reason to believe that the falling-off in the consumption of coffee, in England especially, is due rather to the fact that really good and well prepared coffee is so rarely to be had, than to any lack of appreciation on the part of Englishmen of the merits of the genuine berry. Somehow few people in this country can discriminate between ordinary and inferior qualities of tea, while the coarsest palates seem readily to distinguish good from bad coffee, and will, therefore, have none of it. It is a pity that coffee is not more generally consumed, for it is an undoubted fact that those who are habitual coffee drinkers very seldom care for spirits. Indeed, it has been pointed out that in those parts of South America where coffee is the recognised beverage drunkenness is extremely rare, and even emigrants who have brought with them a love of alcohol abandon it and take to coffee in preference, owing to its stimulating effect upon the brain and nerve centres. Still, in spite of our insular preference for tea, the number of people who

* Certainly not: often the blossom and flower are only seen for a few days.—Ed.

* The leaf fungus is quite enough to account for the falling-off.—Ed.

† Absurd: the coffee tree bears for 30 up to 50 or 60 years under favorable conditions.—Ed.

appreciate really good coffee is by no means insignificant here, and on their account it is to be hoped that the attempt of the Dutch Government to prevent the further decay of its East Indian plantations may prove as successful as the Hollanders themselves would desire.

CULTIVATION OF COFFEE UNDER SHADE.

The cultivation of coffee under shade is, we believe, an experiment well worth trying at a suitable elevation and under judicious management in Ceylon. We have already referred to the subject and urged that there are some reserves of good soil in Uva which might well be devoted to such coffee clearings. If there are no individual proprietors prepared to take the risk, in this era of Companies might not a limited Company be organized to give coffee a fair trial?

We refer to the matter again, in view of the receipt of the following communication from Mr. Alex. Primrose of Mercara, Coorg, who will be remembered in Ceylon when he held a responsible post in the office of Messrs. Alstons, Scott & Co. By the use of carefully selected seed from Mysore, and the cultivation of the proper shade trees, we do not see why Ceylon—the Uva districts especially—should not have clearings of coffee as free from disease as the fields referred to by Mr. Primrose as follows:—

Chickmagalur, 20th March 1889.—In the Coorg and Mysore districts (the latter I am now going through) shade is universal, and by it the coffee and the planter have been saved from ruin. In Wynaad where it was not adopted the coffee has gone to the bad just as in Ceylon. The article is selling at unheard-of prices here. Ungarbled native R68 per cwt. Parchment R80. The season is just closing. There is little jungle in these districts that has not been taken up, and the yield has been greatly increased by the introduction of new plants.

Since writing the above we have had a visit from well-known estate proprietors—Messrs. W. H. Wright and Akbar—in reference to the alleged coconut disease of which more anon, and we have pressed the subject of coffee on their notice with the result that Mr. Akbar will probably try 50 acres with plants grown from Mysore seed and interspersed with suitable shade on his Kadugannawa property; while Mr. Wright is confident that coffee will yet come to the front. When his coconut plantation is fully established, Mr. Wright will probably look out for land suited for coffee under shade between 1,500 and 3,500 feet above sea level. There can be no doubt that coffee is to be one of the scarcest and dearest of tropical products within the next five years.

THE MONARAGALA PLANTING DISTRICT.

PROSPERING WITHOUT TEA—HOW TO GET TO MONARAGALA—THE NEW ROAD TRACE—CACAO—LIBERIAN COFFEE—PEPPER—TOBACCO—COOLIES—RICE.

It is refreshing in these days of everlasting tea when *toujours tea* is becoming as monotonous as *toujours perdrix* to visit estates which are doing well without the assistance of that ubiquitous product.

Such may still be found here and there throughout our planting districts and amongst other places at Monaragala, in the extreme east of Uva. Although the cart road from Wellawaya at the foot of the Haputale range is only two-thirds completed, and it is necessary to ride by tavalam and bridle roads for the last few miles of the journey, this is now probably the easiest way of approaching the district. Some 150 pioneers are now engaged on the road near the 15th milepost, and it is hoped the work will be completed to Mupane, 21 miles, before the close of the year.

The country traversed on the first part of the journey cannot be called fertile, but after leaving Buttala, an oasis in the great Sahara, which stretches from the Uva coffee districts to the sea-coast, the soil improves and the road passes through heavy jungle with signs of a little rainfall.

It may be said, in passing, that the road, a gravelled one, appears to have been well traced and well cut throughout, and this, including several heavy culverts at a cost of about R3,000 per mile. At present the terminus will be Mupane, but there is some idea, scarcely one would imagine, yet "within the range of practical politics" of carrying it on to the sea-coast.

Cultivation on the corner part of "The Hill," and on this occasion the higher estates were not visited, is chiefly confined to the following products:—cacao under the shade of jak, dadap, *Albizzia stipulata* and *moluccana* (the latter for choice), *bois immortelle*, &c., &c.—Liberian coffee decreasing, but still remunerative, pepper and tobacco.

The cacao is looking particularly well just now with no sign of *helopeltis* or other pests and a very fair crop set all over. But surely the cacao tree must be of the feminine gender, so fickle is she and yet, sometimes, so true. Else why is it that one tree should be loaded with fruit (on a 4½ year old tree I counted 80 well-grown pods), while the next of equal vigour and appearance without a sign of crop?

The short rainfall of 1888, bad especially as regards distribution, naturally resulted in a poor crop, but with a return to the wet seasons of 1880-1885 satisfactory results cannot fail to be secured.

Pepper is here a very promising product and is far more likely to do well in this soil and climate than in the moist lowcountry of the Southern Province and Kegalla district with when all is said, has a poor soil and a leaf forming climate. The older vines are now coming into bearing and the cultivation is being considerably extended.

Tobacco of the Havana variety is being tried on Sirigalla, and the progress of this experiment will be watched with the greatest interest. The plants when seen by the present writer had been in the ground about 9 weeks and were growing in an old cardamom nursery of rather poor soil. This notwithstanding they averaged 2½ to 4 feet in height, some of the leaves measuring 30 in. x 18 in. In the growth therefore there is nothing wanting, and if the curing is equally successful it should lead, and that before long, to the opening up of a large acreage under the most paying of products. It is indeed surprising that the hill has not been already visited by some of those enterprising capitalists now prospecting for tobacco land, for there must be close on 1,000 acres of virgin soil available for the nicotian weed. It should be remembered that the chances of failure, such as that experienced in Kurunegala, are here minimized, the N.-E. monsoon being practically a certainty, and as regards curing the fact that Mr. Sparkes's cacao fetched an average last year of R54 net goes far to show that his tobacco also is likely to take a high position. "Uva," said a recent writer, "will grow as good tobacco as Sumatra," and I know of no land in Uva which would grow it better than Monaragala.

It is satisfactory to note that the health of the coolies on the estates is much improved. Whether this is only to the opening up of land and the establishment of a dispensary, or, as a cynical friend remarked, is merely an example of the "survival of the fittest," cannot here be argued; but the fact remains, that the experience, so common in the western tea district, of 30 or 40 per cent of one's labour force down with fever, is here unknown.

It is curious too that rice (from Batticaloa) can be supplied to coolies at a lower price than in Haputale, and rates for transport of crop, now moderate enough, will soon be further reduced on the completion of the cart-road. B.

THE CULTIVATION OF PADDY (RICE).

EXHAUSTION OF SOILS—MEANS OF IMPROVING—MANURING—TILLAGE—SEED PADDY—ITS SELECTION—ADVANTAGES.
28th March 1889.

There are many simple means to improve materially the produce of the chief article of food in this country. It is no easy task to remove the long inflated prejudices of a people, but still it is not impossible. Much has been said about improved tillage, transplanting &c., and now their benefits are proved beyond question, and if they are brought before the cultivators and generally adopted they would in time improve the health and wealth of the cultivators bringing most of the starving to share in plenty.

There are some who think that it is not wise to change the present native forms of cultivation because they have adopted those from long experience according to the requirements and nature of the country. There is nothing to change in the ordinary methods of cultivation if they have proved successful. Has it been so? is the question which comes before us. The fact is plainly seen daily that though the present methods are adopted from long practice, they cannot fight with the lands of nature. Any goyia would tell that his field is not producing as it did long ago. The reasons for its not being so are, first the exhaustion of the soil by the continuous growth of the same crop, with hardly any manure or proper form of tillage, and secondly the degeneration of the seeds used.

Manure, if judiciously applied, can prevent the exhaustion of soils, but for the goiyias to adopt a judicious system of manuring is out of the question until they are versed in the principles of agriculture. But still there are means and forms of manuring, by which the exhaustion of soils could be prevented to a certain extent within the means of the poorest cultivator. Cattle droppings, chaff, straw, leaf refuse, ashes &c. are easily obtained and if applied with a mixture of bones at least would form a good manure. Another most important branch which the cultivators should have recourse to for preventing the exhaustion of their fields is a proper system of breaking up the soils and bringing its hidden treasures to the surface. To work up the soil well, we require better implements and by the use of such we have seen the produce of paddy fields doubled and trebled in many cases. Closely connected with improved implements comes the question of cattle which requires serious attention. Under the head degeneration of seed opens a large question on which very little attention has been paid in Ceylon. Ceylon cultivators should pay more regard to the selection of seed in the cultivation of paddy than they do at present. In European countries a great deal of attention is paid to this subject and hence they have improved their seed grains to a great extent. I have read in the Continental letter of agriculture in one of your issues that they have passed an Act in France to guide the sellers of seed, so that a good seed might be obtained. The chief point to be observed in improving seed grains is to make the plants grow well and obtain only good seed for replanting, and when this principle is continued an excellent seed might be obtained in time. To make the plants grow healthier for obtaining a supply of good seed the following are essential, viz:—The proper preparation of the seed-bed and the putting in the seed at the proper season with a due supply of fertilizing matter. But if the seeds are allowed to grow of their own accord it would tend to spoil the kind by degeneration. Good seeds always grow better and yield heavy crops. It is the duty of every cultivator when he finds a good characteristic seed to improve and preserve it from degenerating. Several experiments lately carried on in

England to test the value of good seeds have shown its advantages. Though it was not with paddy, we can infer the same for our grain too. Professor Tanner cites the following:—

“Two crops were grown upon similar land under like circumstances as regards climate, &c.; in the one case good and suitable seed was used, and in the other case the selection and improvement of the seed had been neglected. The results were:—1012 lb of grain from good seed 37½ lb only from the other. This shows that the selection of good seeds increased the produce by three times.”

“There are no doubts about our being able to increase the yield of paddy by selection of good seed, and so this branch of the cultivation should not be neglected.”

W. A. D. S.

[Our correspondent has laid down excellent general principles which few of our readers will dispute. Good tilling implements, good tillage, judicious manuring, good selected seed properly treated, a good supply of cattle, would vastly improve the crops of paddy and the condition of the goiyias. But what is wanted is that the goiyias should be induced (induced meaning the compulsion which native headmen can apply) to adopt improved methods of improved culture. But how, for instance, can good seed be selected by people so improvident that most of them have to borrow (at 50 per cent!) such seed as the lender may find it convenient to give? And how can plenty of good cattle be provided by people too lazy to prevent the grass which grows on fallow paddy fields and the neighbouring uplands from being overwhelmed by weeds and such shrubs as lantana, which flourish on the doctrine of the survival of the fittest? What is wanted is that the Agricultural Instructors scattered about the country should make all possible efforts to induce the native cultivators to carry into practice the great principles of husbandry which the Instructors have learned so aptly and which they can repeat so clearly. See the article we quote below from the *Indian Agriculturist*.—ED.]

FOOD-GRAINS AND THEIR TREATMENT.

The report of a late interview with Sir J. B. Lawes in respect to the results of his experiments in agricultural science which, in conjunction with Dr. J. H. Gilbert, he is known to have been carrying on for nearly half a century at Rothamstead, a little town in Hertfordshire, has brought to public notice some facts which cannot be too widely made known among agriculturists and the classes whose material prosperity is closely bound up with the successful prosecution of agriculture. These facts are of special value to India, where the tillage of the earth is the staple industry of the overwhelming majority of the population and the annual produce of the crops is the gauge of the prosperity or otherwise of the country. But it is in the food-crops that agricultural enterprise is centred in all parts of the world. Any new knowledge of the conditions, under which their cultivation can be improved and extended, should therefore, be disseminated as widely as possible; and the knowledge derived from Sir John Lawes' experiments at Rothamstead, may without any hesitation, be accepted in most cases, as representing the certainty of a mathematical demonstration. Among other information, which Sir John Lawes communicated at this interview, the following remarks of special value. “Five years ago” he is reported to have said “we left the upper end of this wheat-field uncropped; allowing the corn to fall when ripe. In three years there was scarcely a single ear of corn left; those which I could find were short in the stalk and with perhaps a single grain. Now there is not one. This shows that food products are almost entirely artificial; and that in a few years the land would be a perfect wilderness, if uncultivated. But I myself was surprised at the rapidity with which the wheat disappeared.” Sir John Lawes continued; “The weeds were stronger and killed out the artificial grain. Weeds are hardy and it is really the survi-

val of the fittest' or the hardiest. The same thing I can show you in the turnip field, where the unmanured plot is almost barren; the plants having scarcely in any case formed a bulb. It is the starch we want as food. Cultivation and fertilization give that starch." This truth cannot be too forcibly impressed on the minds of our Indian peasantry who are apt in too many cases to leave nature to its unaided resources, when their ignorance or their want of means prompts them to take things as they come. It may be said that it is a perfect truism that cultivation is an indispensable condition to the production, propagation and maintenance of the more delicate and frail forms of vegetable life. But the Indian peasantry are unfortunately apt almost as a rule to trust to the chance that are a minimum of cultivation in a soil, originally fertile, but now generally exhausted, may secure for them a maximum of results. Doubtless, they do not neglect carrying through in their due time the several processes which are considered essential to the successful prosecution of agriculture. But, then, there are two ways of doing a thing; that is a thorough way and a partial way, and the latter is, we fear, very generally followed in most parts of India. Again it is not that the more valuable food grains are wanting in vitality. It is matter of notoriety that some grains of peas or corn disinterred with a mummy from an Egyptian pyramid and put into the ground after more than two thousand years' seclusion from the outer air, freely germinated and fruited abundantly, showing thereby that under favorable conditions vegetable life in its humblest forms possess an amount of vitality inconceivable as to any part of the animal world. Putting these two facts together we arrive at the natural conclusion that careful culture under the most favorable conditions is calculated to secure an outturn of food-grains, such as is beyond the conception of our Indian agriculturists with their primitive implements and processes struggling with a soil of failing fertility and a climate liable to startling changes, such as we are constantly observing. If Sir John Lawes' experiments teach any lesson of the least value it is this, that, while neglect of cropping gradually leads from the deterioration to the absolute failure of food-grains, their careful cultivation must by parity of reasoning, contribute to their progressive development into the most improved forms.—Sir John Lawes has declared it as his opinion, founded on his experience of fifty years, that weeds are harder than wheat and that when both are left to themselves, the weeds kill out the corn. This truth was revealed nineteen centuries ago in that beautiful parable of the wheat and the tares familiar to all; but it was left to our time to be demonstrated by practical experiments, conducted with special care and ability by men whose whole hearts and minds have been and are in their work. The necessities of the country leave no choice to the peasantry if they really wish to escape from the present condition of abject poverty, but that they should use their utmost efforts to secure for their crops not only a much larger outturn than is now obtained, but produce of a quality that will enable them to compete on equal terms with other agricultural countries. The rapid and progressive increase of population is in most parts of India treading closely on or even outstripping the normal pace of its production; and the demands of a largely expanding export trade which is the only source whence we can reasonably hope to derive the means of promoting the material prosperity of the country cannot possibly be neglected or ignored. In order to adapt it to the altered requirements of the times, agriculture must obviously be carried on under improved conditions. Better ploughs, that will go lower down than the surface of the soil, should be brought into use; stronger breeds of cattle, or the present breeds fed up, should be employed in the field; seed of the best quality only should be selected for sowing; and every process of cultivation should be carried out carefully with a view to the complete and absolute elimination of weeds from amidst the growing crops. In a previous issue we have pointed out how natural manures can be set free for use in the fields, if the cultivation of fuel bearing trees is systemati-

cally introduced and maintained. These things, the ryot cannot, almost as a rule, do, and the zemindar will not ordinarily do; but as the State can largely reinforce its present revenue from land through a fuller development of its agricultural produce, it is for the Government with its larger interests and larger resources to engage in and carry out measures which the poverty of the ryot and the *insouciance* of the zemindar have hitherto prevented them from undertaking.

DRUG TRADE REPORT.

LONDON, March 7th.

SAMPLING OF CASCARILLA.—At today's drug Auctions some discussion arose with regard to the alleged habitual unreliability of the samples of cascarilla which are shown in the brokers' sale rooms, and which serve as guide to buyers of that article in making their purchases. At present one sample is made to do duty for a whole "pile" of goods; thus, at today's auctions one sample was drawn to represent 48 bales, and another 62 bales. Mr. Ziegele complained that sometime ago he purchased ten packages of cascarilla for shipment to the continent, and when they arrived there it was found that five of them contained dust only while the sample represented good quality bark. Mr. Charles Christy, the presiding broker, said that the fault did not lie with his firm, but with the dock company who drew the samples. Mr. Richard Barron asked why every bale of cascarilla offered should not be separately sampled, to which Mr. Christy replied that the expense would be too heavy. Mr. Ziegele, however, formally proposed, and Mr. Horner seconded, that in future a sample should be shown of every bale of cascarilla offered for sale. This was put to the vote, and carried by about 25 votes, no one voting on the other side.

ANNATTO.—None was offered at today's auctions. In Liverpool good Cayenne annatto is held at 1s to 1s 2d per lb, good brands of Guadeloupe selling in a small way at 2½d per lb.

CARDAMOMS are rather freely offered, and at today's auctions 118 cases, out of a total shown of 211 were sold at very irregular rates, the better grades being generally dearer, but medium and ordinary qualities experiencing a decline of from 2d to 3d per lb. Ceylon Malabar, medium to bold heavy pale, 3s to 3s 1d; good pale, slightly warty and specky 2s 11d; good medium round pale yellow to brownish 2s 7d to 2s 4d; medium sized brown 2s; small brown mixed and rather skinny to very specky 1s 9d to 1s 6d; very small 1s 2d.

CINCHONA.—A rather large quantity of flat Calisaya bark was offered for sale today, but only a few packages sold cheaply, bold but thin 1s 4d per lb: damaged 1s 3d per lb. Guayaquil in good grey silvery quills sold at 1s 3d; damaged rusty brown to stout 7½d to 10d. Good mossy Loxa 1s 11d per lb. Fine bold bright Maracaibo, via Hamburg 7d to 8½d per lb. From Java the exports during the last three years have been:—

	1888	1887	1886	1885
Amst. lb. Amst. lb. Amst. lb. Amst. lb.				
Private plant.	3,136,086	2,223,466	1,626,115	849,551
Government plant.	529,942	682,319	546,279	436,977

Total 3,666,028 2,905,785 2,172,394 1,286,528
At the Amsterdam auctions, on March 21st, about 171 tons Java bark, representing about 205,000 oz. quinine sulphate will be offered.

CBERS.—Nine bales bold spurious berries were bought in at 28s. per cwt. today. The shipments from Java in 1888 were 148 piculs.

ESSENTIAL OIL.—Of Cinnamon oil 1 case, much adulterated with leaf oil, sold at 2½d per oz.; fair quality is held at 1s 2d per lb. Citronella, dull with enormously heavy exports from Ceylon. At auction today 20 cases were reported sold at ¾d per oz.

QUININE, slowly but steadily easing off in price. At the close of last week the Brunswick agents accepted 1s 2d per oz. for forward delivery in bulk, and since then numerous transactions by second-hand holders of the same brand are reported at 1s 1½d to 1s 1d per oz. On Wednesday a firm of speculators are reported

have bought 30,000 oz. Brunswick from a second-hand holder at 1s 1d, March delivery, and all kinds of reports are current with regard to the quantities—some say 250,000 oz.—which this second-hand holder is credited with intending to throw upon the market. The B & S agents ask 1s 2½d per oz.; they might perhaps sell at 1s 2d per oz. Two thousand oz. Zimmer's quinine in bottles are reported sold at 1s 4d per oz. A firm, who are placed in a position to know the market very well indeed, write us today:—"It may interest you to know that it is said some of the very low prices at which quinine is stated to have been sold lately are forfeits paid to avoid delivery.—*Chemist and Druggist.*

A BATCH OF INDIAN TEA COMPANIES.

The following summary from the Calcutta correspondent of the *Pioneer* shows the profits and losses in tea, though on the whole the companies here mentioned have done fairly well:—

TEA: MOTHOLA COMPANY.—The report of the directors shows a profit on the season of R16,083, and adding the balance from last season a credit balance at Profit and Loss of R16,590. An *ad-interim* dividend of 8 per cent has already been declared, and it is now proposed to pay a final dividend of 4 per cent and to carry R50 forward. The crop weighed out 1,734 maunds against 1,488½ maunds in 1887, and the net average realised was As. 9-7 against As. 11 last year. The area under cultivation is 335 acres. The estimates for 1889 are for 1,900 maunds.

CHANDIPORE TEA COMPANY.—The report of the directors discloses a further loss of R7,241 and a debit balance of R35,535. The outturn was 186,111 lb. against 156,355 lb. in 1887, and the average price realised As. 6-8½ against As. 7-7. The estimates for 1889 are for a crop of 208,000 lb. at an expenditure of R83,000.

BANNOCKBURN TEA COMPANY.—The report of the managing agents discloses a profit of R3,869, but interest and depreciation and a previous balance of R8,558 reduce it to a debit of R9,895. The crop weighed out 1,077 maunds against an estimate of 1,054 maunds and a crop in 1887 of 1,050 maunds. It was sold in London at an average of 9½d or As. 7-6 locally. The estimate for 1889 is for a crop of 92,000 lb.

PHOENIX TEA COMPANY.—The report of the directors discloses a profit R4,509. Depreciation, however, reduces this to R3,457, and adding the balances from last year the amount at credit of Profit and Loss is R32,705. The crop weighed out 278,890 lb., against an estimate of 358,400 lb. and a yield in 1887 of 339,973 lb. The unfavourable result is attributed to hail, blight and prolonged bad weather. The estimates for 1889 are for 348,800 lb.

ARCUTTIPORE TEA COMPANY.—The report of the directors shows that the net profits were R3,407 and the amount at credit of Profit and Loss is R4,858, which it is recommended should be carried forward. The outturn was 217,392 lb. against 221,611 lb. last year, and the average price realised As. 7-5½ against As. 8-2½. The estimates for 1889 are for a crop of 2,942 maunds at a local outlay of R67,865. The area under plant is 933½ acres. The season has been very unfavourable, cold and sunless, with an excessive rainfall, and as a consequence the quantity and quality of the tea were seriously affected.

AMLUCKIE TEA COMPANY.—The report of the managing agents shows that the season closed with an outturn of 3,622 maunds, against an estimate of 3,000 maunds and a crop in 1887 of 2,615½ maunds. The average price realised was As. 8-2 against As. 10-8½ last year. The accounts show a profit of R34,844 and a credit at Profit and Loss, including last year's balance of R67,451. An *ad-interim* dividend of 5 per cent has exhausted R22,285, and a final dividend of 2 per cent is recommended, carrying forward the balance. The estimates for 1889 are for a crop of 3,500 maunds. The area under tea is 900 acres.

DHUNSIRI TEA COMPANY.—The report of the managing agents show a loss of R5,362, and there is altogether a total deficiency of R19,034. Debentures for R1,00,000 have been issued at 7 per cent. The

Saw Mill showed a profit of R2,472. The outturn was 708 maunds of tea against an estimate of 1,000 maunds and a crop in 1887 of 872 maunds. The estimate for 1889 is for 800 maunds. The average price realised was As. 7 against As. 9-3 last year. The area under tea is 368 acres.

KORNAFULI ASSOCIATION.—The report of the managing agents shows a net balance of R46,454 at credit of Profit and Loss, which it is proposed should be transferred to working capital account with a view to writing down the value of block. The crop reached 4,139 maunds, against an estimate of 3,910 maunds and a yield in 1887 of 3,996 maunds. The average price was As. 9-8 against As. 9-6 last year. The estimates for 1889 are for 4,200 maunds at a cost R1,60,000. The area of the gardens is 1,075 acres.

HOLTA TEA COMPANY.—The result of the working is a loss of R8,592, and there is now a balance of R4,011 at credit of Profit and Loss which it is proposed to carry forward. The outturn was 98,020 lb., against an estimate of 110,000 lb. and a crop in 1887 of 104,908 lb. The average price realised was As. 9-4 against As. 12-1½ in 1887. The company's retail sales have fallen from 40,473 lb. to 23,665 lb., and this has affected the profits. The estimate for 1889 are for 100,000 lb.

COCHEELA TEA COMPANY.—The report of the directors discloses a loss of R4,721 and the debit balance at Profit and Loss is increased to R9,566. Unfavourable weather, deficient rainfall and so forth account for this. The outturn was 103,145 lb. against a crop in 1887 of 102,505 lb. and the average price realised was As. 6-5½ against As. 6-10. The estimates for 1889 are for 114,000 lb. at a cost of R47,533, and unless a better price is realised this means a further loss. The area under tea is 481 acres.

SECOND MUTUAL TEA COMPANY.—The report of the managing agents shows that the outturn was 1,666 maunds against 1,930 maunds last year, and the average price As. 7-9½ against As. 9-4. The result of the working is a loss of R851 and a debit balance of R142. The estimate for 1889 is for 1,500 maunds fine and 600 maunds coarse tea for an outlay of R84,999, including R11,588 for new extension, &c. The area of the gardens is 725 acres under plant.

ANTHELIA.

I have been following with much interest your notices of anthelia, and was about to add my mite to the information given, when, by the mail just in, I have your issue of October 25th last, wherein is a notice of the phenomenon as observed in Ceylon. I have witnessed it there scores and scores of times in my early tramps bird collecting, and I have also seen it at the Cape, in Brazil, on the Amazon, in Fiji, and in this island. On turning up my dear old friend Sir E. Tennent's book on Ceylon, I find that at p. 73, vol. i., he gives a very fair figure of the effect produced. It may be, as he says, that the Buddhists took from it the idea of a "halo" or "flame" for the head of Buddha, but there is one peculiarity about these flames that always struck me. In whatever position you find the Buddha, the flame is invariably in a straight line with the body even if the figure is recumbent. In form it always resembles the "tongues of fire" depicted by old painters as falling on the apostles on the Day of Pentecost.

I have seen many instances of what I suppose may be called "anthelia" in calm water, but the appearance is usually more *rayed*. I have an exquisite engraving in my print collection of the "Madonna and Dead Christ" by Aldegrever (1502-58.) It has often occurred to me, in looking at it, that the artist has taken his idea of the halo round the Virgin's head from the appearance presented by the "anthelia" in water. There is the same luminous centre, and then the divergent rays. The halo round the head of the dead Christ in her lap is a four-cornered luminous star, issuing rays, of which three points only are visible—like nothing in nature with which I am acquainted.

E. L. LAYARD.

British Consulate, Noumea, January 3rd.
—*Nature.*

Fiji TEA.—The year 1887 was the first in which the export of tea attained to any dimensions, the figures having been as follows:—1884, 236 lb.; 1885, 968 lb.; 1886, 220 lb.; 1887, 20,950 lb. The local consumption is also considerable, the tea being considered of excellent quality. The population of Fiji is 124,658, of which 2,105 are Europeans.—*Chemist and Druggist*, March 9th.

CHEAP QUININE.—It is, perhaps, worth recording says the *Gardeners' Chronicle*, that at the drug sales during the week ending February 23rd, 15,000 oz. of German manufactured quinine were sold at 1s 1d per ounce—the lowest price on record. Quinine at 1s an ounce seems to be not far off—a very rapid decline, when it is remembered that less than twenty years ago it sold for a guinea an ounce.

"TABLE TALK," a monthly periodical published in Philadelphia, contains in its January number a short paper on the "Cultivation of Coffee" by Mr. J. McCombie Murray. It is written after an interesting fashion and winds up with an exhortation to Americans to see above all things that they get pure unadulterated coffee and tea for their household use. Finlay Ackers & Co. in the same issue have a whole page advertisement on "the coming tea for Americans,"—namely, Ceylon tea.

KOLA NUTS FROM SIERRA LEONE.—The Governor of Sierra Leone, writing from Cassie on the Casseh Lake, reports that there is a considerable trade between the colony and Germany, as well as France, in dried kola nuts. Observing a quantity of rotten kola nuts drying in the sun, he asked the owner, who is the largest trader in the village, for what purpose they were intended, and he replied that when dried he sent them to Freetown, where he got 2d per lb. for them, for shipment to Germany and France, to be made into cocoa.—He added that the trade commenced two years ago.—*Chemist and Druggist*, March 9th.

FIBRE OF HIBISCUS ESCULENTUS.—Besides rhea or ramie, the aloes, pineapple and bananas, there are scores of plants in India and Ceylon which yield fibre excellent for textile purposes and the manufacture of paper. The one great difficulty is to obtain the substances, in sufficient quantity in convenient localities, and to secure their preparation, so that the fibre may remain clean and undiminished in strength, while the cost of the decorticating and retting processes is moderate. A few years ago a Mr. de Renzy, who trades largely in Indian products in Melbourne, made a journey specially to India with reference to fibrous plants other than cotton and jute. He called on us when returning, and stated that he was most hopeful of good results from a variety of *Hibiscus esculentus*, well known in India and Ceylon as *bandekai*, the edible fruits (glutinous pods with pea-like seeds, exceedingly wholesome) being called by the English "ladies' fingers." In America the plant is known as okra, and some time ago a characteristic Yankee hoax went the round of the papers, about a wonderful cotton which had resulted from a cross between the okra plant and one of the gossypiums. A few days ago Mr. Foenander of the Surveyor-General's Department brought some *bandekai* fibre to our office, where it may be seen. We sent it to Mr. W. W. Mitchell with the query whether this and other fibres might not, by a process of teazeling and carding, be fitted for textile use. The reply is as follows:—

"I put the sample of *bandekai* fibre before Mr. Atherton and the directors at their meeting yesterday, and it was examined with interest, but nothing could be done with it I fear in connection with cotton or with cotton machinery. It is more akin to jute, and could probably be manipulated by machinery adopted for jute. The fibre, I believe, to be *splendid*, and I remember De Renzy spoke to me about it

when here, but nothing seemed to be practicable. I cannot help thinking that if anything could have been made of it, it would have been done already."

GUM: A CHANCE FOR CEYLON GUM "ARABIC" (?)—The Mahdi has had a good deal to answer for, but the users of Indian postage stamps will be astonished to hear that he is indirectly responsible for the inconvenience they complain of in the matter of labels which will not adhere to envelopes. Such, however, appears to be the case. Messrs. De la Rue have explained to the Secretary of State that in consequence of the supply of gum from Khar-toum and the Upper Nile having failed, they have been compelled to fall back upon an artificial composition for their stamps and envelopes. This has not withstood the effects of a tropical climate, and hence the outcry against the innocent Indian Post Office. We may add that in more than one Club in this country the envelopes supplied by the great London stationery firm have been found to be as badly gummed as the postage stamps.—*Pioneer*, March, 23rd.

COCONUT LEAF DISEASE.—Veyangoda, 21st March.—I had the unexpected pleasure this morning of a visit from Mr. M. C. Potter, the lecturer on Botany at Cambridge, who has been residing for the last three months with Dr. Trimen at Peradeniya, studying tropical flora. He came to have a look at the coconut leaf disease, a subject in which he seems to take very great interest. The disease he says is present at Kadugannawa. As he was on his way to Colombo *en route* for England, he unfortunately had not his microscope with him. Considering that there is hardly a tree that has not more or less of the disease, he seems to think it a matter for serious consideration. No decided opinion could be given without the microscope whether the attack was due to insects or to a fungus. All he saw inclined him to attribute it to the latter. He took away with him specimens of leaves from trees of different ages, with the disease in its various stages, and promised to put them in spirits directly he reached Colombo and examine them as soon as he reached Cambridge, and also submit them to Mr. Marshall Ward, the Mycologist, who investigated coffee leaf disease here about 10 years ago. He took away as well roots from a diseased tree, which to all appearance were healthy. I also gave him specimens of cinnamon and other leaves attacked with fungus.—*Cor.*, Local "Examiner."

RUBBER PAVEMENTS.—Ordinary caoutchouc seems very capable of being applied to an extraordinary variety of purposes. A glance at the patent records would surprise one at the many useful parts this valuable gum play. In various Continental towns, we learn, rubber street pavement is being introduced with a great deal of success. It appears, however that this application of rubber is not a novelty in this country, for we are told that Messrs. Charles Macintosh & Co., the original patentees of vulcanised indiarubber, supplied the Midland Railway Company 13 years ago with large slabs of rubber, which were laid down on the roadway underneath the hotel at St. Pancras on the arrival side of the station to prevent the objectionable noise and tremor caused by the constant heavy vehicular traffic. This pavement has answered so admirably that other slabs were laid down in another roadway the same station, and in 1881, we understand this example was followed by the London and North-Western Railway Company. This rubber pavement has been found to be of great durability, and whilst it retains its elasticity it is neither affected by heat nor cold. This kind of pavement, being supplied in slabs, can readily be removed or replaced if necessary. More enterprise is now being shown on the Continent for the adoption of this class of rubber pavement than in this country. This is probably due to the fact that its advantages are very imperfectly known.—*Mechanical World*.

Correspondence.

To the Editor.

COTTON CULTIVATION IN CEYLON.

[The following letter sent originally to a local paper, has been forwarded to us by Mr. Barber.—Ed. L. R.]

Mutwal Lodge, 22nd March 1889.

DEAR SIR,—It gave me great pleasure to learn from your article of last morning, that the cotton I sent you, found in this garden, is probably different from the cotton found in many parts of the Island, as it only goes to establish, that, instead of one, we have two good varieties of proved excellence already flourishing in Ceylon, and both of which can be cultivated as perennials. The cotton, of the sample I sent you, has been declared to be Bourbon; and I shall have occasion to refer to it fully later on. The plant is about 8 feet high, and about 9 feet across, where it is widest, and judging from its wood, it seems to have flourished here for some years. The soil is ordinary, but the crop is a heavy one. Since writing my last letter to you, I had the opportunity of utilising my leisure in Colombo, in making myself acquainted with the growth of the several varieties of cotton found in Colombo. I have been shewn by Mr. John Auwardt, in his garden at Slave Island, four different varieties growing close to each other under similar conditions:—the Tinnevely, an insignificant slender plant; the American, and the Egyptian of luxuriant habit, resembling each other very much, and finally, the robust Pernambuco or Peruvianum, (which is found in many parts of the Island,) asserting itself above all others in luxuriance and crop.

This last with conglomerated seed cannot easily be mistaken for any of the other varieties. Its vigour and wealth of crop point to its suitability for general cultivation among the natives, in common with the Bourbon variety; I have also visited the experimental garden in connection with the School of Agriculture, and I am indebted to the courtesy of Mr. Driesberg and his assistants, for another opportunity of ascertaining the comparative merits of the varieties grown in these grounds. I found the same varieties here; and the Pernambuco was again found to flourish and crop best. So that, while we are left to select for ourselves such varieties as we may find best suited to our elevations and different climates on estates, the native agriculturists may find it, perhaps, safest to keep to the cotton already found in his garden.

It may be convenient to refer your readers to some literature on cotton in this connection. The Bourbon and the Pernambuco or Peruvianum count among the six valuable varieties given by Wheeler in his "Cotton Cultivation in the Madras Presidency," Para. 21:—"Six leading varieties of cotton, viz., Indian, Bourbon, New Orleans, Pernambuco, Egyptian and Sea Island."

To keep to the two that we are dealing with at present. "*Bourbon*, so named from having been grown in the Isle of Bourbon, where it is supposed to have been introduced by the French from the West Indies. "It was first cultivated in India during the latter part of the last century and commencement of the present. "*Pernambuco* or Brazilian, upon which some experiments are still being made by private individuals. "This cotton is marked by the peculiarity of its seeds, which adhere together in conglomerations." This simplifies identification for this variety, although with cotton generally it is not so easy a matter. Isaac Watts, Secretary to the Cotton Supply Association, in his paper to the British Manufacturing Industries, declares that "the Botany and plant history of cotton has ever been a perplexing and difficult question. The proper classification, though it has received much careful attention, and been made the subject of frequent discussions, has not yet by any means been authoritatively settled."

"The real points of difference are so slight that the systematic botanist has scarcely ground to go upon in the determination of species and affinities."

Baron Von Mueller, however, in his "Select Extra-Tropical Plants" describes these varieties as follows:—

"*Gossypium religiosum*, Linné. (*G. peruvianum*, Cavan.), Tropical South America, Kidney Cotton, Peruvian or Brazilian Cotton. Leaves long-lobed, Petals yellow. Seeds black connected. The cotton is of a very long staple, white somewhat silky, and easily seceding from the seeds. A tawny variety occurs. This is the tallest of all cotton bushes, and is probably this species which occurs in the valleys of the Andes as a small tree bearing its cotton, while frosts whiten the ground around."

"*Gossypium Barbadosense*, Linné, West India, Sea Island Cotton. Leaves long-lobed. Petals yellow. Seeds disconnected, black, after the removal of the cotton. Fibre naked. The cotton of this species is very long, easily separable and of a silky lustre. This species requires low-lying coast tracts for attaining to perfection. Perennial, and yielding like the rest a crop in the first season. Cultivated largely in the Southern States of N. America, also in South Europe, North Africa, Queensland and various other countries. M. Delchevalerie has drawn attention to a new and almost branchless plant of tall size and exceedingly prolific in bearing, raised in Egypt, called *Bamia* cotton, which Sir Joseph Hooker regards as a variety of *G. Barbadosense*. The *Bamia* cotton bush grows 8 to 10 feet high, ripens (at Galveston) fruit in four or five months, and produces 2,500 lb. cotton and seed per acre. It is remarkable for its long simple branches, heavily fruited from top to bottom. Its cotton is pale yellow."

The New Orleans Cotton (*G. Sanguineum*, Hassk.) is here classified under the head *G. arboreum*. We need not enter into further botanical details. It is sufficient for all practical purposes to know that cotton went to Bourbon from the West Indies, and that we have what is called "Bourbon" in Ceylon flourishing luxuriantly and yielding a beautiful cotton.

But it may be of importance as regards crop to notice that Baron Von Mueller, who was interested in Australia, speaks of as many as 700 pods from a single plant at one time; 12 to 20 capsules yielding an ounce of Mercantile Cotton. "Intense heat," he further observes, "under which even maize will suffer, does not injuriously affect cotton." "Dry years produce the best returns, yet aqueous vapour in the air is necessary for the best yield." "Porous soils, resting on limestones and metamorphic rocks are eminently adapted for cotton culture." He also tells us the statistical fact, that the area under cultivation in the Southern States of North America came to 7 million acres before the civil war, cultivated by 1½ million negroes.

India had 14 million acres at the date of the publication of this edition of his work, 1880.

To return to our inquiries regarding the Bourbon Cotton, it appears to have owed its introduction into Southern India to Dr. Anderson, and its subsequent reputation in the Liverpool market to Mr. Hughes, a planter in Tinnevely, (Royle's Memoirs Parl. Returns 1847) Wheeler. According to the eminent botanist, Dr. Wight, who in 1842 succeeded Capt. Hughes as Superintendent of the American planters in India, and who for eleven years watched the cotton plant through the experimental stages, says, speaking of the comparative merits of the varieties, "The Indian cotton plant is of slower growth than the American, and takes deeper root. The American root penetrating so deeply into the soil, thrives best on the lowlying portions of the Redland towards which the moisture of the upper ones is drawn; and again, it thrives well in alluvial soils, which from their position are naturally laden with moisture."

The Bourbon again takes very deep root and bears the climate even better than the Indian plant! "Dr. Wight treated the cotton plant as an annual, that is, he had annually rooted out the old plants of the preceding year, then resown the ground. He found, however, that the Bourbon variety was constantly treated as a biennial in India, as was also the Sea Island in Egypt. Accordingly, he proposed to try the experiment with New Orleans cotton, of pruning the plants nearly down to the ground, and leaving the roots to yield a crop of fresh wood for the 2nd year. By this

method, he believed that during the second year, the roots would penetrate much deeper into the ground, than they did the first. The roots would thus pass to an unexhausted soil, and would therefore be better nourished; whilst a considerable saving would be effected in the expenses of cultivation during the second year. This experiment however ultimately turned out a failure.—Wheeler. It remains to be seen, whether the Bourbon fared better in intelligent hands, Mr. Hughes of Tinnevely has been referred to already. His cultivation of the Bourbon cotton is mentioned as a triumph. "For more than twenty years, Hughes's cotton continued to be quoted in the Liverpool market, as the best in India."

Mr. Hughes had ascertained that the plant would continue many years, that is, that the plant might be cultivated as a perennial. Here is his method.—"The plants should be sown 8 feet apart in rows which should be again 8 feet asunder, in order to afford facility for ploughing and hoeing, and for a free circulation of air.

Pruning should be practised twice in the year; the first and most important pruning should take place between the 15th and 31st December, when the shrub is cut down to 2 feet high and 2 feet wide, only the free firm wood being left with a strong white and brown bark. In January, during the five days, the plantation should be ploughed three or four times. In less than two months, the whole of the plants will be again in the finest foliage and full blossom, and continue in full bearing throughout the months of March, April and May. Early in June, a good many pods still remain, and a second pruning should be practised of the long, straggling, twisted, soft shoots with diminutive pods. Subsequently, from July to September, good produce may be obtained unless the plants are damaged by rain. Cleaning was practised on Mr. Hughes's plantation in a most careful manner, the wool being cleaned by hand."

The foregoing mode of cultivation as practised by Mr. Hughes cannot fail to be of value to those who may hereafter cultivate cotton as a perennial in suitable districts. But whether it would pay at the present prices to adopt this mode of cultivation, or whether the native cultivator, who has any command of land, would prefer his time-honoured practice of taking all he can get out of a clearing, and then abandoning it for fresh fields and pastures new, is yet to be seen. At any rate, the Assistant Government Agents in the future cotton-growing districts, will no doubt see to it, that the cotton industry of Ceylon, after it has been properly developed, will carry with it the conditions necessary for its permanence; and not merely what is comprehended in the three words, clearing, harvesting and abandoning: the Alpha, and the Omega of the *œna* cultivator's creed.

I must not dismiss this subject without a further reference to the Sea Island variety, which, being the most costly, would naturally create some inquiry. I could do no better than refer to a speech made on the 13th day of August 1862 by Mr. J. Cheetham, President of the Cotton Supply Association of Manchester, at a Conference in the Council room of the Horticultural Society, South Kensington, London, between a deputation from the Cotton Supply Association of Manchester and the Commissioners and other representatives of countries showing cotton samples, in the International Exhibition of that year. Referring to Australia, he said, "There is an immense opening for our colonists in Australia. There is one hint I wish to give them. Probably influenced by the high rate of labour they have to pay, they have selected at their commencement the very finest quality—the Sea Island quality. They should remember, though they have been successful in producing it, the consumption is only one per cent of the whole cotton consumed in the world, so that if they mean to employ their energies upon that quality, they will very soon overdo the market. Of course we shall not object as consumers to take in their fine Sea Island qualities at 6d. per lb.; but I am quite convinced from what they have achieved in the cultivation in the Sea Island quality, if they would only take American seed and produce the ordinary American

quality, probably, though it is sold at a less price, the increased quantity per acre would make it quite as profitable."

Report of proceedings published by the committee, Cotton Association, Manchester:—

The cottons of 35 different countries of the globe were exhibited on this occasion, and the discussion in which the growers took their full share of responsibility, is full of instruction on matters pertaining to cotton culture generally, and which cannot fail to be of value to Ceylon growers. In conclusion, it may be added, if the question be asked, whether cotton would pay in Ceylon, that the area under cultivation in America, as reported by the Commissioner of Agriculture, was at the beginning of 1886 in excess of eighteen millions of acres, and that active extension was then going on beyond the Mississippi, so that there can be no reason why, with the cheap labour at command of Ceylon, it should not become an established industry here at no distant date. We have not thought of it because of the more paying products which we grew. The European planter, who betook himself to the hills with a climate that suited him best, kept to coffee, cinchona, and tea, with a little cocoa and cardamom as well; the native, meanwhile, stuck to the lowcountry, which suited him best, with coconut and cinnamon. But cinchona and coffee are all but gone, and tea alone remains, though with a downward tendency, and occasionally threatening us with the maximum of anxiety and the minimum of profits; while cinnamon with a limited consumption, and with slender returns, is not the "fine thing" it was once upon a time.

Cotton is the very thing suited for the country about and beyond Matale, Kurunegala, and Anuradhapura, if taken in hand energetically and intelligently.

Not the perfunctory cultivation by a few headmen to satisfy their immediate superiors, but a systematic cultivation, such as was done in India, in the Madras Presidency, under the Government of Lord Elphinstone and his successors during the infancy of the enterprise. Yours truly, JAMES H. BARBER.

COFFEE IN SOUTH INDIA.—It is stated that the quality of last year's plantation coffee, sent to the London market, with "Coonor" and "Nilgiri" marks, is spoken of as having been superior to the generality of Wynaad coffee; the comparatively inferior quality of the latter being attributed to exceptional circumstances, such as unfavourable weather for picking, and the setting in of the monsoon on the Malabar coast, before many of the crops could be shipped. Fortunately the demand for coffee at home, has been good for almost all kinds, and high prices have been realised.—*South of India Observer*, Feb. 28th.

THE ALOE AND ITS USES.—A few years ago the discovery was reported in these columns of the singular property which the juice of the Mexican Agave plant has of half-digesting meat, or of converting it into peptone, and it was pointed out at the time how valuable from a commercial point of view would be this cheap and cleanly method of peptonizing, compared to the ordinary methods of extracting the peptonizing ferment from the stomachs of pigs and other animals. The discoverer, M. Marcano, announces that the method has been in industrial use in Venezuela by pharmacists for three years, during which it has worked perfectly. He finds now that if the crushed tissue of the leaves is added, as well as the juice, the whole process can be completed at blood heat in six hours, insisted of 36, as it takes with the juice alone. The discovery is a very singular one, and one which ought to have received more attention from physiologists and physicians than it has so far. It is quite remarkable that the cells of the clumsy Mexican plant should be able to perform so easily the most important function of the human stomach.—*Australasian*.

TAR IN CHINA TEA.

(To the Editor of the *London and China Express*.)

Sir,—The following, gathered from Northern Chinese teamen whose knowledge and experience are reliable, may perhaps, interest your readers, as well as dispel some of the over-refined prejudice exhibited both by the trade and exporters to the mis-called "tarry" teas this season. Nearly all these last have now been disposed of with great difficulty, and at severe losses to the owners, whilst intrinsically far inferior quality, but considered "pure" by London buyers, has throughout been taken readily for home consumption, the Continent and Russia.

The fault of "tar" lies mainly in the curing. In the larger districts where fine teas are produced "tar" is pretty well unknown, because the teas are fired over charcoal. In smaller and inferior districts the natives cannot afford charcoal, and must use wood more or less green. If the weather be bad, damp, and the leaf not picked on a sunny day more firing is required, and upon the character of the wood used depends the question of "tar" more or less. In some of the teas from the interior districts "tar" is constantly present—"Oanfas" and "Tow Yuens" are almost always more or less "tarry," "Pingkongs," "Lyelings," and "Lowyongs" are always "tarry," excepting the best head chops. "Tar" is caused, not by anything in the leaf itself, but—although it may in a measure depend upon the weather during which the leaf is picked—there seems little doubt that the characteristic arises in the firing.

As, therefore, the virtue or the defect of "tar" seems to have existed since above-named districts were known—about 1865, we believe—it appears somewhat hypercritical to proscribe it now, nearly a quarter of a century subsequently. Tea which is inherently pure, although "tarry," must be quite as wholesome as the self-styled "pure" descriptions, which probably owe their absolution more to the accident of dry weather than to having been "cured" solely over charcoal instead of wood "firing."—We are, sir, yours faithfully,

VERBATIM ET LITERATIM.

London, Feb. 21st.

HOW WE RID OUR VINES OF MEALY-BUG.

With the exception of Phylloxera this is the worst pest the Grape grower has to contend with. When I took charge of these gardens I found two vineries very badly infested, and the Vines were also in very bad condition, and most of the bunches of Grapes were full of the bug. I had been told it was impossible to clear Vines of bug, but I determined to try what could be done with those in one house. A few of the bunches were not affected, and by tying pieces of wadding round the stalks of these the fruit was kept clear until it was ripe. When the fruit had been consumed the laterals were shortened back, and the spurs, which were only 9 inches apart on each side of the rods, were thinned out to about 18 inches apart; the Vines were then heavily syringed with warm water in which 1 oz. of soft-soap and one tablespoonful of paraffin per gallon was mixed, taking care to keep it well stirred. This operation was repeated several times until the leaves had fallen, and it reduced the numbers of the insects considerably. As soon as possible after the fall of the leaf the Vines were pruned, the loose bark pulled off, and the crevices and spurs scraped with a knife; the glass, woodwork, and iron trellis thoroughly washed with hot water and soft-soap, and the wood and iron painted all over with paraffin. Finally the houses were filled with fumes of sulphur, and the walls were scraped and then dressed with hot lime-wash in which some sulphur and carbolic acid had been mixed. The top soil was taken off the border to a depth of 3 inches, the Vines were scrubbed with hot water and soft-soap at the rate of 9 oz. to the gallon, and were then painted over with a mixture of gas-tar and stiff blue clay, the latter being dried and rubbed into a powder before being well mixed with the tar, the whole forming a stiff paste, with which the Vines were coated all over, care being taken not to injure the buds. Some fresh loam was put on the border, and we thought that the last of the

mealy-bugs was killed; meanwhile steps were taken to assist the roots by renewing the outside border which had got into a very bad state. The Vines having started gently on January 5, all went well, and on traces of bug were found: but as the sap began to rise the coating of clay and tar expanded, and no examining the Vines, just as the buds were breaking, three or four young bugs were discovered—a proof that not as yet were all killed. As a last resource a gallon of boiling water was procured, and into which were put five wineglasses full of paraffin, five of carbolic acid, and half a pound of soft soap; this was carefully applied all over the rods, with the exception of the growing buds, and decided the fight in our favour, as we have not had any bug on the Vines since that time. This last application may appear to be too strong to be safely applied generally, and I have no doubt it would have injured the Vines had they not have been partially protected by the previous application of clay and tar, which formed a hard coating all over them.—W. H. DIVERS, Ketton Hall, Stamford.—*Gardeners' Chronicle*.

COFFEE GROWING AND CURING.

The recent effort which has been made to enlist public interest in coffee-growing by the formation of a chartered company to engage in it on a large scale, under the patronage and supervision of the Government, has unfortunately terminated in failure by the refusal of the King to approve the bill providing the sum which was deemed necessary by its friends to ensure its success. That the finest coffee in the world can be grown here is a fact that is patent to everyone; but how to grow it on a large scale in a manner to make it profitable remains yet to be demonstrated. It was the same formerly with sugar and rice; every venture in either of these staples resulted in embarrassment and failure, and, prior to 1876, there was never a plantation of sugar or rice that paid a profit to its owner from its earnings. It was only after the Government took the matter in hand and secured from the United States what is tantamount to a bounty of two cents per pound on every pound of sugar and rice produced here, that a reasonable profit was secured, which may in time lead to our plantations being placed on such a solid basis as to continue to pay small profits after the termination of the treaty, which must eventually cease. All that was sought in the recent effort to secure legislative aid was, that the Government should co-operate with private parties and endeavor, by the introduction of new and improved machinery and the service of competent coffee-growers, to make a trial on a scale which it was thought would ensure success. It might have proved a failure; but if so, it would have been a satisfaction to know that with every advantage that could be secured by Government aid and patronage, the fact was demonstrated that Hawaii could not compete with Brazil, where liberal Government aid is given, or any other country in growing coffee and that the thousands of acres on Hawaii, supposed to be adapted to it, must still be allowed to run waste to lantana weeds and forest.

Coffee-growing is a branch of agriculture that holds out greater inducements in Hawaii than any other product, except sugar and rice. The duty of three cents a pound levied on coffee imported here amounts really to a bonus of three cents on every pound grown in the country, and to this extent is a protective duty, as may be seen by the present price, which fluctuates in Honolulu according to quality from 18 to 22 cents a pound. Even at the first-named figure it ought to pay any person or company engaging in its cultivation after the enterprise fairly becomes established. For this reason we regret very much the failure of the recent effort to aid coffee-growing on such a basis as might have given a permanent impulse to a new and profitable industry, which seems to need only national help to demonstrate that it may become a successful industry, in which native and foreign labor can be advantageously combined, and Hawaii receive the credit and profit derived from a product which is incomparably superior to that grown in any other country.—*Planters' Monthly*.

LOWCOUNTRY NATIVE PRODUCTS IN CEYLON.

WEATHER—THE CHARACTER OF THE GOYIYA AS
REGARDS IMPROVEMENTS—COTTON AND INDIAN CORN.

January 1889.—This year we are not likely to experience any bad weather as was the case during this season of 1888. In most places slight showers have fallen and the sky is laden with clouds.

In regard to the cultivation of the two main products of the lowcountry natives, viz., rice and coconuts, various methods prevail in different districts, some of which are far behind and primitive for the present day. In several parts of the Colombo and Negombo districts, where intelligent planters have set to work coconut estates, we see a great deal of improvement among the villagers in its cultivation. We find most of the gardens there planted in lines, regularly weeded and manuring carried on to some extent. We find a vast difference when we compare the coconut gardens of other districts with them. In some districts, notably in the southern parts, there is no regular cultivation at all, the trees stand so close that we may compare them to nurseries. There is hardly any care bestowed on the plants when they are past the damages of cattle. On account of this want of a systematic cultivation the produce is comparatively low when the favourable conditions of soils and climate are taken into consideration.

When we come to reason why some of our goiyias in one district do better than the others, we see that they have followed the example of some of their intelligent neighbours. We cannot possibly accuse our poor goiyias of indolence for not adopting improved systems at once; they are in most cases ignorant and hence follow their time-honoured customs. Not only ignorance but there is another thing which stands on their way; that is the want of capital. On account of this want, they try to do their work with as little capital as possible sacrificing the efficiency of the work done. We can hardly expect our goiyias under such circumstances to go in for new ventures and far from experiments; because of their meagre means, they wouldn't like to lay it out without being perfectly sure that they are to get their profits in return. But when they see that improved forms of cultivation and new products are paying, they would watch the benefits patiently and would go in for those after being perfectly sure of their being successful. Such is the case in the districts mentioned before; they have observed with care the results of the various improved systems and when perfectly assured of their success, have begun to follow it.

Though there is some want of spirit in not going in for new things owing to their ignorance, we should in one sense praise their patience and discretion in not risking their small capitals without being sure of success. Instances are common enough where the sanguine expectations from various new products have proved futile. And if the poor goiyia devoted his lands and means in those and made a rush at them he would have been a ruined man. It is not the case with his well-to-do brothers who when they fail in one will still have means to carry on other works. Such are the main aspects of our goiyia's character so far as I have observed, and the means that should be employed to improve them in their cultivations should be according to the requirements of their character. Example would be the best and most suitable for such an end; whether be it in the cultivation of rice, coconuts or other new products. A knowledge of the simple facts and principles of agriculture spread among the growing set of goiyias to whom when young it can easily be imparted, will also in the end go towards the improvement of agriculture. The establishment of model gardens as you have ably advocated in different districts and the successful cultivation of various products in such will have a healthful effect on the goiyias, but to ensure a proper success these model gardens should be continued for some length of time till all the doubts in the sceptical neighbours have been put down.

It is encouraging to see that the cotton grown in most of the lowcountry districts as an experiment have thrived well, and many individuals going in for the same in their village gardens. Out of the several varieties experimented upon the Egyptian has by this time carried off the palm as best suited to the soil and climate; whilst the Tinnevely which is grown extensively in Southern India has stood back for want of a suitable soil. Tinnevely cotton requires a black deep soil and such soils are very rare in the lowcountry of Ceylon. Indian-corn, one of the easily cultivated cereals, could be grown very easily together with cotton. And if the cultivation of this product is extended not only will the cultivator get a crop of cotton and corn but he will get a large supply of fodder in the form of Indian-corn stalks and leaves, which at the same time will prove to be a great boon for his stock. W. A. D. S.

COCA AND COCAINE.

The 'Bulletin of Miscellaneous Information' periodically issued by the authorities of the Royal Gardens, Kew, is a publication that has probably a very limited circulation as compared with the value of its contents, though it frequently contains matter that is not only in the highest degree interesting, but also very useful. The number for January, for instance, contains an excellent article upon the coca plant, which has lately become of importance as the source of material from which cocaine is manufactured, and as it gives some useful chemical information bearing upon the cultivation of the coca plant we have extracted that portion which will be found at page 569 of the present number. In the article referred to the early history of the coca plant is briefly given, and it is curious to note that it has been known to and described by European botanists and travellers for more than three hundred years. The original home of the coca plant in South America has not, according to de Candolle, been very clearly defined; he states that most of the authors who examined it had only seen cultivated specimens, and there is some doubt about those supposed to be wild by Peppig and Andre, while Triana does not admit the species is wild in New Granada. At present coca is cultivated to a very large extent in the Andes of the Argentine Republic of Bolivia, Peru, Ecuador and New Granada. It is also cultivated in the mountainous part of Brazil. The largest plantations, called locally *cocals*, are said to be in the province of La Paz in Bolivia. In a good harvest the yield of coca leaves is estimated by Weddell to be about 900 pounds per acre. The total production is stated to amount to something like 40,000,000 pounds. There are many points of difference between the coca plants grown in different parts of South America, resulting no doubt from seminal variation and the influences of soil and climate. Similar differences appear to obtain in regard to the amount of cocaine in the leaves, as will be seen from the chemical report on coca in the present number. Thus, for instance, it is there suggested that the plant yielding small-pointed pale green leaves is the best to cultivate at high elevations and if the object be to obtain a large yield of crystallizable cocaine. On the contrary, the variety yielding leaves rounded at the apex thrives at the sea level in the tropics, but a large proportion of the alkaloid they contain is uncrystallizable.

In the Andes the coca plant succeeds best in the mild but very moist climate of the lower mountains, at an elevation of from 2000 to 5000 feet. Like coffee, it thrives best on slopes where the soil is rich in humus and the drainage good. Shade is said to be unfavourable to the development of alkaloid in the leaves. In Peru the plants yield the first crop of leaves three years after planting, but in poor soils they are often left until the fifth year. The full-grown shrub yields a harvest every 13 or 14 months, but in many plantations the collection of leaves goes on throughout the year, since the ripeness of the leaf depends much upon the soil and

situation as well as the age of the plant. In some localities two or three good crops are gathered in the year. The ripeness of the leaf is proved by its breaking when bent in the hand, and the largest as well as most mature leaves are sought for as containing most of the alkaloid which renders coca leaves a marketable product. The leaves are usually dried in the sun and then allowed to undergo a slight sweating in heaps. When the drying is rapid the leaves have a beautiful bright green colour and are quite smooth. Such leaves fetch a high price in South America, while the brown leaves that are more slowly dried are cheaper. But it is important to bear in mind that the estimate of value formed by the South American Indians may be based upon facts very different from those which would influence the manufacturing chemist. Thus Dr. Rusby points out that the amount of cocaine probably forms no element of the Indian's estimate of the quality of coca any more than the percentage of nicotine would establish the quality of tobacco. It is probable therefore that sufficient attention has not yet been given to ascertaining the conditions of drying that would be most favourable to the production of a good raw material for the manufacturer of cocaine. This is a point that is eminently deserving of careful inquiry and the very irregular quality of the crude cocaine imported from South America proves that there is great need of better knowledge of this matter. Some of the best samples of this crude product will yield as much as 70 per cent. of true cocaine, but others yield very much less and some scarcely any. Since the manufacture of this crude product in South America the demand for coca leaves has fallen off so much that it is doubtful whether there is any inducement to cultivate coca in any of the tropical colonies for export to this country, but the question is one that can scarcely be decided in the present state of knowledge as to the means by which a good yield of cocaine of good quality is best to be ensured.—*Pharmaceutical Journal*.

CEYLON UPCOUNTRY PLANTING REPORT.

"ALL ABOUT TOBACCO" NOTICED, AND COMMENTS ON TOBACCO-GROWING—MR. ARTHUR SINCLAIR'S SCHEME FOR PUSHING CEYLON TEA IN AUSTRALIA—THE FINE WEATHER.

26th March 1889.

In your new manual *All About Tobacco*, there is certainly a wide sweep of the net; and the haul that has been landed for the benefit and profit of the tobacco planter of Ceylon is multifarious.

Since tobacco growing has come into such public favour as it has of late, the men who had any definite knowledge on culture and curing possessed a very considerable advantage over the multitude. But then little could be made of them; these local oracles were, as a rule, dumb oracles; or if they did speak, the tale they told as to the expense and risk was most depressing. If there was another and a brighter side of the shield, its glitter was studiously withheld.

Now that the new Manual is out, the table are completely turned; and instead of suffering from a lack of knowledge the fear is that the fulness of information which is now accessible to any man who likes to try his luck as a tobacco grower, is somewhat likely to embarrass. To have "too much of a good thing," is, however, a kind of perplexity which is easier borne and remedied than having too little; and the various methods of culture and curing, which the reader of the new Manual will find fully explained in its pages, will doubtless be all tried by someone or another and their merits tested. Certainly there's choice and to spare.

You can learn how tobacco is cured in Australia, in Burma, in Ceylon, in Connecticut, in Cuba, in England, in India, in Japan, in Java, in Maryland, in Persia, in Sumatra, and in Virginia; and the various sources of knowledge which have been drawn from to enrich the pages of the manual are simply world-wide; touching the *Encyclopædia Britannica* at the one extreme, and the local press at the other.

As an Appendix, there is a special paper written by a practical man for Ceylon planters. It is a pity that the writer has withheld his name, for it would have added much to the weight of what he has to say. He is second to none in his knowledge of Ceylon, and as a cultivator he has had a wider and more varied experience than any other half-dozen planters rolled into one.

In a perplexity the appendix can always be a court of appeal, and the planter who goes there can rest assured that its ruling will have the grit of experience in it, and be safe enough to follow.

The "All About Tobacco" Manual is like a box of colours, which, in different hands, will produce different results. If you have brains to mix with them the outcome cannot but be satisfactory, but without that admixture it is quite possible to conceive the reverse. The mere wealth of suggestion may prove a stumbling-block and the choice of methods a snare.

The compilers and publishers may congratulate themselves on having added another to the many useful Manuals they have issued from time to time and have placed within reach of the planters of Ceylon and elsewhere.

The thirst for tobacco land is still keen, and the intending growers are very hopeful. One man, I know, has made up his mind to plant 100 acres at once. Whether he may modify this when he reads Dr. Trimen's opinion that tobacco-growing is essentially for the garden, remains to be seen. Certainly there is pluck and enterprise enough in Ceylon to upset any established rule. Before the year is out we are likely to know a good deal more about tobacco than we do, and those who are coying with it will have made or lost. Growing it has all the excitement of a revolution. Events hurry: if success is yours the reward is great and grasped at once, but a reverse means "sudden death" pretty much, and no room left for repentance.

It is a pity that Mr. Sinclair left the island without being more explicit about his scheme of pushing teas in Australia, for it is a good scheme, and would likely have got substantial support from many of the tea planters. Mr. Sinclair knows well what he is about, and the three years he has spent in the Colonies of the South have put him quite abreast of things there. One fact he is convinced of is, that unless we push our own teas nobody else will. In Australia there is more profit dealing with the thriftless China; besides it has the field, and needs no introduction. Mr. Sinclair's scheme, as I understand it, is a modest one to begin with. A capital of £50,000 in £10 shares, and the campaign which is to end in winning the continent of Australia is to be opened in the towns of Melbourne and Ballarat. From these centres it is hoped there will in time radiate to every township in the empire of the south a branch of the new Company of Ceylon Tea Growers and Sellers. Mr. Sinclair's idea was to start two places in Melbourne, and one in Ballarat, and employ one or two travellers in pushing the tea outside. In time the capital would be increased, as well as the range of the business field. Mr. Sinclair is quite sanguine of success, and feels pretty confident that a fair dividend will be de-

clared even the first year, and that as an investment, not to speak of it at all as a means of opening up thoroughly the Australian market, it can be recommended to the public. Mr. Sinclair would launch the craft himself, and take the helm. That fact alone should inspire confidence, for he is not a man who has never sailed before. I fancy the public will hear more from Mr. Sinclair by and by in regard to his new Company: meanwhile, instead of issuing a prospectus and calling for local support, we learn from a paragraph in the *Observer* that he is off home, to consult some London company.

I cannot close this letter without a word in regard to the fine weather we have been enjoying. As compared with last year, it is a striking contrast, and everything seems to be doing well. The frequent showers of rain keep nature green and growing, and although the sun is hot enough and the atmosphere muggy enough, life is more worth living than it usually is in the hot season.

PEPPERCORN.

TIN AND COPPER IN PERAK.

From the Administration Report on the Hwetta district for 1888 we quote as follows:—

Mr. Pike, the Inspector of Mines in Kinta, recently collected at the tin mines of Lahat a large specimen of what was thought to be grey copper ore; and, at the request of the British Resident, sent it to the Museum. On examination it was found to be the mineral known as stannine, or bell metal ore, so called from its being a combination of the sulphides of tin, copper, and iron, and yielding, when smelted, an alloy much resembling that used in the manufacture of bells.

Mr. Taylor, the Manager of the Lalang Mine near Gopeng, in Kinta, also reports the finding of some masses of copper ore in the *karang* or "wash-dirt" at that mine; while a sample of tin-sand from Kinta, assayed as far back as 1883, was found to contain 2 per cent of copper: a result which, was, however, discredited at the time, the presence of the copper being attributed to accidental causes. But in the light of the two cases above mentioned there seems to be every probability of the copper having been a natural constituent of this sample of tin-sand. The remarkable way in which tin and copper ores are associated in the great mineral lodes of Cornwall is well-known, and the discovery of a like association in the mines of Perak is an encouraging one, as it points to the similarity existing between the tin deposits here and the celebrated ones of Cornwall, and leads to the hope that some day real tin-mining will be established and so continue the prosperity of the State, after the best of the alluvial deposits have been worked out.

DIMBULA "AS SEEN BY A STRANGER" FOR THE FIRST TIME.

From paragraphs in the newspapers and the sad lamentations about the unnatural end of old King Coffee, somehow one gets the impression that the acreage under coffee cultivation must be very small, and when you travel through a district like this, where you find hundreds and hundreds of acres of coffee trees looking healthy and vigorous, you are apt to think that you must have been misled by some of those despondent souls with which society everywhere is so liberally sprinkled. The old favorite seems good for many a long day yet, at least that's the hope of those who are interested and have anything at stake, and the hope has been considerably deepened by the very promising blossom of the last few days. It is said to be the best for many a long year and to further give confidence the weather has been all that could be desired. The few showers have rather helped than hindered the "setting." The anxiety is past, and the fortunate ones are confidently counting on 1 cannot tell how many bushels of parchment to an acre. Tea also looks well and the "flush" is suffi-

cent to keep the coolies going. Should the showers we are having daily continue for a week or two longer, all hands will have to be mustered to overtake the rush of leaf, but this is a prospect, although pleasing, scarcely expected.

COCONUT PLANTING BEYOND CHILAW.

(From a Correspondent.)

You will be interested to hear that another European is buying land for coconuts in this vicinity. I now hope to see a few more Europeans place confidence in our much despised but productive palm. Surely tea can spare a few of the many now engaged in cultivating it, with benefit to both. Nowhere have I seen trees growing and thriving so well as in the Rajakadaluwa district.

PLANTING IN WYNAAD:

TERRIBLE DROUGHT—COFFEE SUFFERING—SERIOUS FIRES ON ESTATES—POOSHOLAH ESTATE BURNT OUT.

WYNAAD, March 16th.—Every year is bad at this season, but we cannot help thinking that this "hot weather" surpasses all former experiences. The sky is like brass, not a cloud to be seen, and the country reeking with smoke, and dismal with blackened ashes; we are in a really terrible state of anxiety. The spike is fortunately very backward on most places this year, but this frightful heat is a great trial to it, and, unless the rain comes soon, I fear much of our promised "bumpers" will be lost to us. This is especially distressing, as we really had a splendid promise of crop. Prices are so encouraging also that we dared to hope for better times. The drought is so excessive that the cattle are at starvation point, and the nullahs are nearly dried up. But the worst result of the excessive heat is the disastrous fires which it has been a great means of causing. Last Monday, a fire broke out in the Poosholah Estate, the property of Mr. Hockin, and, in a few hours, a really magnificent estate, of about 129 acres, was reduced to a heap of ashes. The flames were blown over from a neighbouring clearing, which had just fired. Unfortunately, there was a large quantity of felled timber, very dry, lying amongst the Poosholah coffee, and this took light like so much tinder. The coolies had been lately paid off, so but little assistance was available. A crop of 50 tons was expected this year off the place, which made it all the more distressing. Of course, the neighbours were only too anxious to express their deep sympathy with Mr. Hockin; by rendering all the assistance in their power, and I was very glad to learn that it is hoped that a large proportion of the trees may be saved by sawing them down at once. But, of course, the loss *must* be considerable, and, in a planter's eyes, the catastrophe is a most lamentable one. The same day Mr. Castle Stuart's office just escaped destruction, and would probably have been burnt down but for the presence of mind of our Munsiff, who, seeing the flaming jungle, rode out with all his subordinates, and energetically assisted in beating out the fire. It must have been rather nervous work, as the building contains all Mr. Stuart's Settlement Records and Title Deeds, etc. The Belliaparrah Bungalow was also burnt, and a new cattle pen on another estate, and I have just heard of yet another estate which barely escaped the fate of Poosholah, last night, the coolies having been obliged to work all night to keep the fires down.—*Madras Times*.

THE PLANTING AGRICULTURAL INDUSTRIES OF CEYLON.

Review of the Planting and Agricultural Industries of Ceylon, and Statistics of the Planting Enterprises in India and the Colonies. By J. Ferguson. Pp. 165. (Colombo: A. M. and J. Ferguson, 1888.)

This is a reprint, in a form of a small octavo volume, of information contained in "Ferguson's

Ceylon Handbook and Directory," specially relating to the tropical cultures of Ceylon. It affords much authentic information in a handy and accessible form, and is a valuable summary of the results attained in the cultivation of most economic plants suited to a tropical country. Ceylon itself is a singularly interesting island. It is usually described as the largest, most populous, and most important of the Crown Colonies of Great Britain. It has in recent years become the seat of planting industries which have in one or two instances almost monopolized the markets of the world. It is six times the size of Jamaica, and about five-sixths the size of Ireland. Of its sixteen million acres, at present only about three millions are under cultivation, and these support a population of exactly the same number. The value of the imports and exports amounts to about ten millions sterling. The total number of European residents in Ceylon is under five thousand, while the mixed or coloured population called Eurasians or Burghers amounted to about nineteen thousand. The bulk of the population, amounting to nearly two million souls, is composed of Sinhalese—a remarkably tractable and inoffensive people—while the remainder is made up of Tamils, Moormen, Malays, and Veddhas. The latter are an aboriginal race, comparatively few in number, inhabiting the forests of the north-east.

Although the number of the Sinhalese is relatively so large, they contribute very little to the labour supply of the European plantations. Plantation labour is furnished by Tamil coolies from Southern India. According to a report published by the Government of Madras, out of a population of thirty-five millions of human beings in that Presidency there are sixteen millions whose annual earnings do not average more than £3 12s, or a little over 2½d per day. Thus it is that the plantations of Ceylon, paying about 6d or 9d per day, are abundantly supplied with cheap free labour.

The purely European enterprises consist of tea, coffee—both Arabian and Liberian—cacao, cardamoms, rubber, annatto, vanilla, pepper, fibres, nutmeg, cloves, dyeplants. In these is invested English capital to the amount of about eight millions sterling. The native industries are associated with the cultivation of the cocoa-nut palm—yielding oil, coir, and copra—rice, cinnamon, palmyra palm, kitul or jaggery palm, areca palm, citronella and lemon grass, tobacco, cotton, sugar-cane, dry grains such as kollu, millet, kurakkan, maize, and numerous vegetables and fruits. It is estimated that there are nearly fifty million cocoa-nut palms in Ceylon, and the yearly yield cannot be less than about 500 million nuts. Next to the cocoa-nut palm, the palmyra palm (*Borassus flabelliformis*) is regarded as one of the richest plants known. According to a Tamil proverb "It lives for a lac of years after planting, and lasts for a lac of years when felled." Jaggery sugar is made from the sap, and in the dry, arid regions of the north-east of Ceylon more than seventy million nuts are annually produced. The young sprouting nuts are used as a vegetable. The kitul (*Caryota urens*) is another sugar-palm, which, in addition, yields a coarse black fibre used in broom-making. Cinnamon is essentially a native industry. The island has been famous for this spice "from the dawn of historical records." There is a Sinhalese caste of cinnamon peelers, and these, the Chaliyas, hold practically a monopoly in preparing the bark for the market. The dry grain cultivation is associated with that baneful *chena* practice of recklessly cutting down and burning virgin forests—now, we are glad to notice, in

course of being kept within proper bounds. The natives of Ceylon have imitated the Europeans in many industries, but by far the greater number are content to follow in the footsteps of their ancestors, and cultivate only such plants as cocoa-nuts, rice, fruits, and vegetables, necessary to supply their daily wants.

For many years the chief European industry was that of coffee. From 1825, when Sir Edward Barnes started the first upland coffee plantation near Kandy, to 1875, when Ceylon exported nearly a million hundredweights, "coffee was king." In 1869, a microscopic fungus (*Hemileia vastatrix*) made its appearance on the leaves of the coffee-plant. This spread with such rapidity, and with such destructive effect, that within a few years the Ceylon coffee plantations were doomed. The disease extended also to Southern India, to Sumatra, and Java; it invaded Mauritius, Madagascar, and Natal, and reached even the young and promising plantations of Fiji. After twenty years' experience of this pest, the Ceylon coffee plantations have so dwindled that the present exports are only one-tenth of what they once were. Fortunately the decline of coffee was accompanied by the extension of cultivation of cinchona, cardamoms, cacao, and tea. Ceylon cinchona has been produced in such quantities that the markets have been completely glutted. In consequence the price of bark has fallen so low that the cultivation is unremunerative. The attention of Ceylon planters is now being concentrated, with their accustomed energy, on the cultivation of tea. Coffee, cinchona, and everything not immediately remunerative are being uprooted to give place to the new staple. Although the industry is not more than ten or twelve years old, Ceylon tea is already being exported to the value of £600,000. Tea therefore bids fair to take the place of coffee, and thus the cloud which has overshadowed the prosperity of the island during the last few years is gradually passing away. Ceylon cacao is excellent, but the industry is small and apparently stationary. It is doubtful whether the island possesses any really large extent of land suitable for the growths of the cacao-plant. The rubber industry in Ceylon, as elsewhere, is mysteriously unproductive, while the cultivation of vanilla, pepper, and fibres, is only in the experimental stage. The total areas under the various cultivations at present are: tea, 183,000 acres; coffee (Arabian), 77,000 acres; coffee (Liberian), 916 acres; cinchona, 36,000,000 trees over two years old; cacao, 12,000 acres; cardamoms, 5,000 acres; rubber-trees, 386 acres; croton, castor-oil, aloes, cinnamon, vanilla, pepper, cloves, plantains, and citronella grass, 7,400 acres; gum-trees, fruit-trees, sapan, sapu, cocoa-nuts, areca-nuts, nutmegs, 4,600 acres.

Such are a few of the gleanings from this useful account of the planting and agricultural industries of Ceylon. Mr. Ferguson is favourably known as a successful journalist, and as the author or joint-author of numerous publications connected with the island in which he has spent the greater part of his life. Indeed, it would not be too much to say that Mr. Ferguson and his uncle have contributed by their writings in no small degree to promote the various industries upon which the prosperity of Ceylon depends. To those whose interest or whose business is connected with tropical cultures this summary will prove most useful. It covers a wide field, but, so far as Ceylon is concerned it contains information available in no other way. The historical and statistical facts, no less than the points respecting the treatment of tropical plants, are collected from trustworthy sources, and

are of interest wherever such plants are cultivated, and we may add scarcely a single tropical product, is passed unnoticed.

D. M.

—*Nature*, London, Feb. 14th.

COTTON CULTIVATION.—It is a bad sign when—as reported by a Chilaw correspondent yesterday,—cotton plants of from 6 to 12 inches in height begin to “flower profusely.” They ought to be 3 to 4 feet or more before this result came about. Poverty of soil or prolonged drought can alone explain the premature flowering, and the crop will not be worth gathering we should say.

PROSCRIBED MEDICINES.—The police authorities of the City of London have just now published a list of about 200 patent medicines which are no longer to be publicly advertised. Among them we find a number of well-known ones, as, for instance, American Consumption Cure, Barella's Powder, Brandt's Schweizer Pillen, Haarlem Drops, St. Jacob's Drops, Richter's Pain Expeller, Shaker Extract, Simpson's Lotion, Warner's Safe Cure, Dr. Bock's Pectoral, &c.—*Chemist and Druggist*.

CEYLON TEA IN WESTERN AUSTRALIA.—We are glad to learn that Mr. H. Pressenne, who recently passed through Colombo from London, has established himself as an agent for the sale of Ceylon teas in Albany, the steamer port of Western Australia, and now a rising township as well as connected by rail with the capital, Perth, 250 miles distant. Mr. Pressenne has already had considerable encouragement in business, and was the first to establish a Ceylon Tea Agency in Western Australia. He ought certainly to be the recipient of a grant from our “Tea Fund,” so soon as there are funds or teas to spare.

ARTIFICIAL TEETH.—The number of artificial teeth made in America last year by three of the largest business houses engaged in the trade was nearly 20,000,000, and this was not more than half the actual production of the country. One peculiar feature of the business is that the houses which do the most extensive export trade are obliged to prepare teeth of different colours for different countries. In Canada, for instance, the demand is for molars as white as snow, while in South America no such teeth could be sold. There they require teeth that are almost yellow, and the trade from China, which is a lucrative one, is for nothing but black teeth.—*Pioneer*.

TEA NOTES.—Rain is wanted for tea in Kamroop.—In Cachar the days are warm and the nights cool.—The weather has been warmer than usual in Luckimpore.—Seasonable weather is the news from Sylhet, Coalpara, Durrung, and Sibsaugor.—Weather in Golaghat and Jorehat District very hot, rain wanted. Moriani district manufacturing from 1st of month.—Dehra Dun, 12th March.—We are having lovely weather, although a bit warm for this time of year. All the gardens are looking very well, and there is every hope of a good spring crop.—Nagarakata, 15th March.—The weather here is very dry and beginning to get rather warm. No rain has fallen for a month but we are two inches ahead of last year. One or two gardens have commenced manufacture and others thinking of doing so during the next week. Leaf coming out well, and labour plentiful. Sootca, 11th March.—Weather begins to get hot during the day time, but the evenings and nights are still cool and pleasant. Rain is much wanted, and if the drought which has lasted since the 20th ultimo continues new nurseries and transplants must suffer. The tea season, however, has opened rather earlier than that of last year.—*Indica Planters' Gazette*.

KOLAR GOLD FIELD, MYSORE.—We have received from the Madras authorities a very elaborate Report on the “Kolar Gold Field and its Southern Extension, in which the Auriferous Rocks are Traced from the Mysore State into the Madras Presidency, with Maps and Sketches, by P. Bosworth-Smith, Esq., F.G.S. Associate of the Royal School of Mines (Bessemer Metallist), and Government Mineralogist to the Madras Presidency.” The Report deals with the Topography, Geology, Petrology, Mining (lodes and old native workings, old implements &c., supposed modes of working, modern mining and milling), Prospects of the Kolar Gold Field and its Southern Extension into the Madras presidency, Mineralogy, Washings and Assays, and Maps. This summary will indicate the very elaborate nature of the report; but the most practically interesting portion is that which deals with the future prospects, from which we quote as follows:—

There can be no doubt that the Kolar gold field has a future before it. But that the expectations that were first started when gold mining in India was revived in 1880 will ever be realized in this (or any other gold field in any other part of the globe) is very doubtful. Some of the mines are now paying expenses, and there can be no doubt that managed economically and under scientific supervision several others should easily pay their way at an early date. If regular dividends are to be paid, it will be found that prospecting work must be kept going side by side with the more pleasant task of stamping and crushing what pay stone has already been found. It will not do, after finding a pay shoot, to concentrate all the energies of the mine on getting out that shoot and rushing it through the stamps to find, after taking all its quartz that has been left by the old men above 400 feet, that the rich shoot is getting out of your control and that it must practically remain untouched whilst a new shaft is sunk to cut the shoot lower down.

It would be invidious to take each mine separately and write on its merits and demerits, but it can do no harm to mention the names of some of the best mines. That the oldest mines are the best is due to the fact that they have been more thoroughly prospected, and that, when the field was started, the number of old workings on a block were taken (and very rightly too) as an indication of its value. The Oorgaum and Mysore mines as will be seen from the map contain a great number of large old workings, and without doubt these are the pick of the mines. Balaghat has a rich shoot opened out for over 200 feet and Nundydrug has been returning an average of about 400 oz. per month for some time past. The mines that have crushed and sent home gold are the Nine Reefs, Balaghat, Nundydrug, Oorgaum, Mysore, Incian Consolidated (Kolar Section) Mining Companies, and the South-East Mysore Company is expected to crush very shortly. Good shows of gold are certainly to be found in the Baramahal on the Madaipalle and Karikuppam folds, but I should never advise the expenditure of money here on deep mining. If, however, such were tried, the pit Bangargunta would be the best spot to try at. Mining on the Adakonda hills or at Malapankonda I should not advise, there being very few quartz veins, and all of them poor. Better prospects are found at Chigaragunta, Guvalgunta (Gulguntur) and Nundydrug, but not so good as to warrant the expenditure of much money. Certainly here the expenses would be smaller; drainage could be done to some extent by tunnels, and water-power could be used to some extent, but with large tracts of auriferous country practically unknown, there could no doubt be found better places for mining enterprise than the central fold of schistose rocks, south of Malapankonda; and this remark applies well to the whole of the extension of the field, south of Yerrakonda. From this, it may be judged that gold mining in Southern India, as nearly everywhere else, is a great lottery.

THE HAKGALA GARDENS, NUWARA ELIYA.

Apart from the references to these Gardens in Dr. Trimen's annual report, they deserve some more particular notice in view of recent improvements, and especially at this season of the year when they constitute the most popular place of resort to the many visitors now at Nuwara Eliya.

A special feature in the Hakgala Gardens, is the new fruit-garden, which is about 100 feet long by 80 wide, and is laid out in beds 4 feet wide, with paths 2 feet wide between. The soil has been stirred to a depth of 3 feet and thoroughly drained, good drainage being essential to the successful cultivation of fruit trees. The bad soil was removed and replaced by that of a suitable nature. The work was expensive, but it was thought best to give the plants the full advantage of the most favourable conditions in order that the trial might be as perfect as possible. All the plants were supplied by Messrs. Richard Smith & Sons of Worcester, were brought out by Mr. Nock on his return from furlough, and were planted at the end of February. They are set at a distance of 6 feet apart every way. There are altogether 112 plants in 71 varieties; and the full lists of the varieties runs as follows:—Pears 14, plums 7, apples 14, peaches 6, nectarines 3, apricots 3, cherries 4, raspberries 3, figs 3, damsons 3, crabs 3, quinces 3, nuts 2, hop 1, bilberry 1, gooseberry 1; total 71. Nearly everyone has started well and the young trees look very healthy. The raspberries are in flower, and there is some fruit on the cherries. In the vacant spaces between the trees are planted a few sets of 20 different kinds of potatoes which Mr. Nock brought out from England for trial. All the sets were counted and weighed, so that he may be able to compare their yields, the one against the other.

The grubs have been troublesome, but on the whole, the plants look very promising. The sorts on trial are:—Magnum Bonum, Vicar of Laleham, White Rose, White Elephant, Myatt's Prolific, Mona's Pride, Adirondack, Weber's early white Beauty, Racehorse, Tom Price's Black Prince, Reece's Kidney, Cheswick Favourite, Bowyer's Kidney, Imperator, Premier, Beauty of Hebron, Cosmopolitan, Yorkshire Hero, Myatt's Ashleaf and Sutton's Seedling.

In the propagating house, there is a large number of recently introduced things, both ornamental and economic, such as camellias, azaleas, fuchsias and the grape vine. Of the latter there are now specimens of nine varieties. The young plants are all healthy, but they are not expected to do much good at this elevation, except under glass, and are here more for propagating than for anything else.

Some plants have been sent to the Badulla Gardens for trial there. There is also a pan of healthy plants recently raised from seed brought from Port Said grapes.

A couple of young plants of the *Adiantum* tree—*Salisburia adiantifolia* promise to do well here. The foliage of the tree is exactly of the same shape as that of the maiden-hair fern, but of course larger. The tree is a native of China and Japan and grows to a height of 60 or 80 feet.

The kernels of the fruits are thought by the Chinese to promote digestion and oil is extracted from them.

Another interesting plant, the snowberry tree *Symphoricarpos racemosus*, looks quite at home; and *Deutzia gracilis*, the plant which bears the long white flowers so much used in En land for bouquets.

Sapageria rosea, a lovely rose-colored creeper, several variegated shrubs, and a fine batch of rooted cuttings of the new fuchsias, &c., are looking healthy.

Outside are nice plants of variegated eucalyptus, golden leaved privet, gent azaleas, golden and Irish yews and the silver holly, variegated box, Lauristinus, double-flowered peach, double-flowered gorse, *Cryptomeria elegans* and several other interesting conifers which have lately been introduced.

A nice bed of *Stachys tuberosa*, the Chinese or Japanese artichoke, is just beginning to grow, and being a vegetable of easy culture and nice flavour, no doubt it will prove a very useful addition to the vegetables of the hill country. The yield is said to be above 5 tons the acre. The crop of *Ullucus tuberosus* (a plant from the Andes, of Peru and Bolivia) has just been lifted and the yield is equal to about 6 or 7 tons to the acre. One small plot of fairly good soil yielded at the rate of 9 tons to the acre.

NOTES FROM AUSTRALIA.

A RAILWAY TRIP ON THE NEW SOUTH WALES SOUTH COAST LINE—PICTURESQUE SCENERY—INTERESTING VILLAGES AND TOWNS—THE OVERLAND JOURNEY TO BRISBANE—THE GREAT COALING SEAPORT—THE DEPRESSED COAL TRADE—RACE HORSES—MORE TOWNS AND VILLAGES—THE LARGE DEMAND FOR KANGAROO SKINS AND THE PROBABLE EXTINCTION OF THE ANIMALS—SNAKES—QUEENSLAND—THE NARROW GAUGE RAILWAY—BRISBANE, ITS BANKS AND BOTANIC GARDENS—MACKAY AND ITS SUGAR PLANTATION—WANT OF CHEAP LABOUR AND CAPITAL—PLANTERS' BUNGALOWS—GARDEN VEGETABLES—BLACK LABOURERS FROM THE NEW HEBRIDES—THE SUGAR COMMISSION—DESTRUCTIVE FIRES—THE WEATHER AND THE FOLIAGE—TOWNSVILLE AND ITS NEIGHBOURHOOD—ROCKHAMPTON AND MOUNT MORGAN GOLD MINES.

Rockhampton, North Queensland, March 6th, 1889.

On my return from the Blue Mountains a couple of days were devoted to a run down the south coast line as far as Kiama. For the first 20 miles the railway passes through poor uninteresting country, already largely taken up by speculating land companies who hope some day to dispose of the small allotments marked out. Shortly, however, the scenery becomes more picturesque and hilly, there being no less than eight tunneled in the space of ten miles. As we gradually approach the sea the stratification in the numerous cuttings indicate the presence of coal and at Clifton, 35 miles from Sydney, we pass a thriving colliery, the coal being drawn from under the mountain range and carried down to the sea close by for shipment, very little being sent by rail on account of the high rates charged. The train now makes frequent stoppages as we are passing through a more populous district which owes its prosperity to the coal measures. Wollongong, 48 miles out, is a rising place with its harbour full of shipping, waiting for coal; it is also the centre of a large dairy and grazing district, its annual Agricultural Show being perhaps the best in the whole colony. The fresh green fields were a pleasant sight after the burden upcountry travelled through in the western districts, and there was an English look about the homes: eads that suggested its being a favourite locality for settlement. Indeed the line for the remainder of the distance to Kiama, 71 miles, passes through excellent dairy country, and large quantities of milk are daily sent into Sydney. Had time permitted the return

journey would have been made by coach to Illawara and Mossvale (the latter the country residence of the Governor,) but in order to catch the evening train to Newcastle it was necessary to return direct to Sydney.

The overland journey to Brisbane is a long one, 723 miles, and in order to fully appreciate the scenery it is necessary to devote at least three or four days. The seven iron-girder bridge across the Hawkesbury river not being completed, we have to leave the train at Mullet Creek and take the stern-wheel ferryboat and as we have the English mail the delay in transshipping is considerable and allows time for a substantial meal, and one has to take advantage of such opportunities, as on these long main lines they are not too numerous. The great coaling seaport has been very appropriately named Newcastle, for the combined effects of a strong sea-breeze and plenty of spare coal dust gives the town a dirty appearance not usual in Australia, but the air is dry and the people seem full of energy and anxious to oblige and at the railway station there were several lads offering to carry your luggage, whereas in Sydney and still more in Melbourne one has to wait some time before the services of a porter can be obtained. The coal trade was very dull and work scarce on account of the recent strike, and instead of the harbour being full of ships waiting their turn to come alongside the cranes, it was the other way about and the latter were waiting for ships. It is feared that it will be some time before Newcastle recovers its former prosperity, as shippers will be very loath to send ships there as long as a strike may spring up at any time, and keep them waiting cargo for weeks. That the miners were badly off was forcibly shown the following day by the poor attendance at the race meeting, notwithstanding that the rain had made the course in excellent condition, and the temperature delightful for outdoor exercise. The horses with their long tails at first appear singular and different to what we should expect in a racehorse at home; also the custom of removing all the shoes immediately before the race is quite new; but one soon sees that plenty of speed is got out of them, and the public clock with its large face divided into 60 spaces enables one to note the time, and also indicates the importance attached to the time occupied; much more so than in England where the state of the weather varies and causes the ground to be light or heavy, so that the actual time occupied would not be of importance in forming an estimate of a horse's powers.

Resuming my journey north on the following morning the line passes through some fine agricultural land, about Hamilton, Lochinvar and Allandale. At Greta the coal measures crop up, and trucks of coal are added to our train, in fact the country round is full of coal waiting development. About Singleton the country opens out into immense plains, capital grazing ground in good seasons, but now looking bare and dried up. Musclebrook, a nice clean town on rising ground with a large market enclosure, seems an important centre, but appears to be suffering severely still from the drought, the grass in the country round having been not only eaten down to the ground, but the roots pulled up out of the soil, so that it must be some weeks before there can be any substantial feed for stock. Here and there one sees the bones of a sheep or ox, and other remains still more recent, where the flesh has not been removed by birds and dogs. At Aberdeen a large advertisement intimates that Messrs. Moffin & Co., Sydney, require 1,000 dozen kangaroo skins per week, which, if complied with, must soon exterminate these curious

animals, which, in many parts, are already getting scarce.

As we leave the station a large dead snake thrown across the wire fencing warns us to be careful in our walks; and makes one regret that at present snakes' skins have no commercial value.

Scone is a poor looking township and the cattle in the fields are awfully lean and miserable in appearance, though the land is good. The morning had been dull and gloomy, and at last we fairly steamed into heavy rain and running mountain streams, the temperature falling, so that a thick overcoat and rug were very acceptable. At Murrurundi we leave the valley and slowly ascend the range, the railway winding round the hillside and finally passing through a tunnel over the highest portion, the rocks having a distinctly volcanic appearance. The scenery is very grand, the rain having stopped, and the sun again shining, we are able to enjoy the view of the hills covered with trees as the evening closes in, and we find ourselves at Tamworth with its rich red soil and famous crops of maize.

Here the night is spent and the temperature being quite cold the mosquitoes, usually such a nuisance, did not annoy one, and we slept in peace. Next morning the through mail train was taken, and after passing through the fertile and well watered New England districts we arrived at Wallangarra in the evening, and enter Queensland through a very wild bit of country where kangaroo are still to be seen from the train. The result of protection is felt in the extra charge for refreshment as soon as we cross the border, while the oscillation of the carriage at once tells the effect of the change of gauge from 4 feet 8½ inches New South Wales to the miserable 3 feet 8½ inches Queensland. With such a narrow gauge and gradients sometimes as great as 1 in 33 smaller wheels are necessary to get a better grip of the rails, and the speed is consequently reduced, so that travelling in this young colony is much slower than in the older ones. Thus the 233 miles from Wallangarra to Brisbane took upwards of 12 hours, and it was 6-15 a.m. before we reached our destination. Being night time there was no opportunity of seeing the famous Darling Downs which have suffered greatly from the drought, many of the farmers being utterly ruined in consequence of loss of stock and failure of corn crops.

Brisbane with its 70,000 inhabitants is a busy dusty town on the banks of the river whence it takes its name, some 25 miles up from Moreton Bay. The houses are chiefly of mud, but there are several large banks built of stone, notably the Queensland National Bank with its handsome Italian columns of solid stone brought from New Zealand, facing the London Chartered Bank, both being in the same street (Queen). Indeed in all Australian towns the banks are among the best buildings, far surpassing most of the Government offices. The Botanical and Acclimatisation Society Gardens are interesting and well kept and members of the latter who pay an annual subscription of a guinea can obtain any reasonable number of plants of various kinds, as they may require them for their new gardens, which appears an excellent way of introducing new flowers and shrubs at a very moderate expense, as the intelligent Director has better opportunities of ascertaining whether a plant not indigenous, will or will not be induced to flourish in this climate.

After a few days' stay, and having received many kind hospitalities from friends and fellow-passengers the journey north was continued in one of the A. U. S. steamers to Mackay, one of the great sugar districts of Queens-

land. Here ten days were spent visiting estates, riding or being driven to some new place every day, walking of course being out of the question, as the managers and superintendents always ride, many of the estates are several thousand acres in extent. It was an agreeable change to find oneself in a country where all looked so green and flourishing, for Mackay is specially well favoured with rain compared to many other districts, and the canes far along the plains were shooting up rapidly under the influence of recent rain and present hot days with a gentle breeze which sets in from the sea about ten o'clock and lasts till near sundown about seven. And yet the canes had suffered very severely, I was told, from the drought before Christmas and the crops for the next crushing season commencing in July, was likely to be a very poor one and on several plantations would not be worth cutting at all.

In fact, for the last two or three years, the seasons have been quite different from what is required to produce good sugar returns. There has been too little rain, and when the rain did come, it was at the wrong time to suit the requirements of the cane. Then frost on certain spots lying far back from the sea nipped the growth and produced artificial ripening, so that the crop had to be hastily crushed to avoid complete loss. Sugar planters have had other difficulties than the climate, thus the great fall in the price of sugar, which occurred some few years back, changed the profits in many cases into an absolute loss, as owing to the opposition to the importation of cheap black labour, which the democratic element of the late Government used to the fullest extent, the planters were compelled to fall back upon expensive white labour which for field operations in certain months in the year, is totally unsuitable in sugar growing countries. On the other hand a judicious combination of white and black labour would make Australian sugar growing a most profitable investment for capital. At the present moment the two things most required by Queensland are *capital and cheap labour*, and both of these are being effectually kept out of the colony by the strong democratic elements aided by manhood suffrage, where the vote of the loafing larrikin of the street counts as much as that of the man who has spent the best years of his life in opening up the country in attracting capital and finding employment for the surplus population of other lands.

With cheap labour, irrigation and manuring would be possible; but without it the sugar interest must come to a *standstill*; in fact, I saw hundreds of acres of abandoned cane fields which had been allowed to go back to grass. How can it be otherwise: sugar must have plenty of water either naturally or artificially supplied? With good soil and sufficient water, canes may be grown for many years without manure, as I had a proof on one estate, the soil of which was submitted to me for analysis some fifteen years ago by the late Mr. R. Daintree, then Agent-General in London for the colony. On this estate crops of cane are still being grown, but it is only on the best soil successive crops can be taken without manure. In Demerara, Mauritius, Barbadoes and the South of Spain manure of some kind is largely used; the planters like the farmers at home knowing full well that to obtain good crops manure must be applied.

The sugar planter's house is much like that of the coffee or tea planters' bungalow of Ceylon, except that the dwelling rooms are all on the first floor, there being a space of eight feet between it and the ground which is used as a shelter for his buggy and other traps. With a broad verandah running round the house, more air is obtained, also a good view over the

surrounding cane fields, while one is farther removed from the heavy dew, which, in the early morning may be seen hanging just over the tops of the canes. The roofs are always made of corrugated galvanized iron and large round tanks made of the same material and capable of holding several thousand gallons are fixed at the four corners, if a large supply of water is required. By this arrangement sufficient water for all domestic purposes can be obtained to last all the year through in ordinary seasons, and is greatly to be preferred to the well water, which, on the rich vegetable soils where cane flourishes best, is largely charged with organic impurities. As in Ceylon the planter here, too, often has no vegetable garden whatever, everything being given up to canes, which are grown quite close up to the house, affording ample accommodation to mosquitoes, which are a sad torment to the workers during the day time, to the master's folk in the evening when there is no breeze. At a few estates, however, it was pleasant to see the canes kept at a respectable distance, and in the immediate locality of the house a well stocked fruit and vegetable garden, so that at every meal there was something besides meat, bread and potatoes to partake of. As a rule however, where green vegetables are obtained, they are purchased from the poor Chinaman, who, whatever defects he may have as regards his personal habits, possesses the ability to produce an abundant supply of excellent vegetables for the table of the white man, who shows his gratitude by endeavouring to turn him out of the country. Jealousy however is always a sign of weakness, and as time fights ever on the side of truth, the period must come, if Australia is to act up to her motto and *advance*, when there shall be freedom of labour as well as freedom in trade throughout this great Continent. At present next year will be the last during which the black Kanakas can be brought over from the New Hebrides and the adjoining islands under a three years' agreement with the planter who has to pay £30 to Government for each man, while to the labourer he gives an abundant supply of food, good lodgings and clothes, also six pounds wages per annum, which latter must be paid half-yearly in the presence of a Government official. At the end of the three years he will be sent back free of cost, or he may be re-engaged at a higher rate of wages. I have seen hundreds of these black men who seem perfectly satisfied and well in appearance, and yet these are the men that the white emigrant wants to keep out, though he is physically quite unable to take their place in field operations. The Sugar Commission, however, now travelling about taking evidence, will doubtless see that a stop to such useful black labour shall not be allowed to come into force in 1890, and if so with favourable seasons a new era of prosperity may be opened up for the sugar industry. During my stay a large fire occurred in the town of Mackay, three miles distant, which resulted in the complete destruction of the principal hotel and 15 wooden houses in about 2 hours' time. As usual the fire originated in a small house heavily insured, while many of the others were only partially insured, as the rates for wooden houses have of late become very high in consequence of the numerous fires, and the almost impossibility of procuring an immediate large supply of water. The weather is still very hot, the temperature, while these lines have been written, being 96° F. in the shade of a verandah, supplemented by two beautiful Ponciana trees with their fernlike leaves, which furnish an excellent shade tree for gardens in North Queensland, while the *Hibiscus grandiflora* with its rich red flowers and luxuriant

green leaves contributes an effectual boundary hedge between the dusty road Townsville, 400 miles further north of Mackay, reminds one of Aden except that instead of the arid black hills, there are grass-covered mountain slopes at the back with patches of trees here and there, but the heat is nearly as great. Charters Towers, 82 miles distant by rail, takes four hours to reach, the gradients being heavy and the stoppages long; but the total elevation of the Towers is only 1,000 feet and during the day the heat is great, though as usual with its elevation the nights are cool, and during the winter months fires are acceptable. The mines are of course the only object of interest, as the country mud is dried up and barren, so that after visiting a few of them, such as the Day Dawn Freehold, the Pyrites mines and the large town crushing works where auriferous stone from different openings is treated by the old amalgam process with mercury, one is glad to return to the sea breezes of Townsville to await the steamer for Brisbane on my homeward journey.

A few days were spent at Rockhampton, a thriving township on the Fitzroy river, in order to visit the celebrated Mount Morgan Gold Works, distant 25 miles. The first ten miles are done by train, and after breakfast at Kabra we take the coach and have a delightful drive, everything looking so fresh and green. There is the full number of passengers, twelve with the driver, and five horses, three as leaders together, and the first few miles being flat, we go at full gallop, as the mails have to be delivered by a fixed time. The road, however, is simply a track through the bush with only just room between the trees to pass, and suddenly one of the leaders takes the wrong side of a tree and gets swung round in a second, while the other horses are thrown all of a heap together, and the pole narrowly escaped being broken. We were all soon on our legs and glad to find no serious damage had been done. The remainder of the journey was done more quietly, the track getting both hilly and rough and one part the razor-back so steep that we all had to walk up. We passed numerous waggons with twelve horses, carting stores and huge casks to the Mount. In a few years the railway already surveyed, will be made and cause a great saving in horse flesh, for at present the state of the road is a disgrace to the Company which pays away something like a million a year in dividends.

Arrived at the Mount we present our passes, and are shown over the works commencing with the quarry on the top of the hill whence the stone is removed in cuttings 35 feet deep extending over an area of about ten acres each cubic yard of rock weighing about $1\frac{1}{2}$ tons.

In this manner the top of the hill is being sliced away, and the stone which evidently varies greatly in composition, is mixed together and sent down by a nice tramway to the old works $\frac{1}{2}$ mile off, while trains run down an incline to the new works. From assays made daily on the works the quality of the stone varies greatly from less than an ounce of gold per ton to upwards of seven or more ounces. At present the shares are falling rapidly in value, a few months since they fetched £17 each and now they may be purchased for £7 10s each. All mining speculation is paralysed in consequence, the public not knowing what is going to happen. The works themselves are most complete, the machinery of the most improved pattern, all covered in under good sheds which with their tall substantial smoke stacks, gives an idea of a well arranged and prosperous industry, which has evidently been put up with a view to being also a permanent one.

All depends upon the average quality of the stone continuing equal to what it has proved up to the present time.

More water must be available before the works can be enlarged, as a good supply of water is absolutely necessary for the new chlorination process, and the present supply is being fully employed.

Mount Morgan as a township is prettily situated on a series of small hills surrounded by larger ones covered with timber with a green undergrowth of fresh grass, and is far more picturesque than dusty Charters. Moreover, although the total inhabitants does not exceed 4,000, the output in auriferous metal fully equals the total output of the Towers with its 12,000 inhabitants, plainly indicating that the proportion spent in wages must be less and that in dividends far more. After calling at Bundaberg and Maryborough to see a few more sugar estates I return south to Sydney in order to catch the P. & O. "Valetta" on the 16th March for England. JOHN HUGHES.

"ALL ABOUT SPICES."

To aid us in making this Manual as complete as possible, we shall be obliged if any of our planting or other readers who may have special information by them in respect of Pepper, Nutmegs, Cloves, Cinnamon, Vanilla, or other spice, will give us a reference to the same. Our own Library of works on sub-tropical Products—apart from our *Observer* and *T. A.* files for a long series of years,—is a very full one; but it is just possible there may be useful authorities outside our lists, and the names of any in our readers' possession might aid in making the Manual the more useful.

JAFFNA NOTES.

Jaffna, 27th March 1889.

TOBACCO.—The superintendent of Ayananghi coconut estate (Mr. Koch), who has been trying tobacco planting, has been successful. I have just heard from Mr. S. F. Toussaint, the proprietor of Ayananghi that Mr. Koch only tried about 2 acres, and the half profit he expects will be about £600. The other half goes to the working people. This is not bad for a trial.

COTTON.—I send by post under separate cover a specimen of cotton which grows in my garden, and should like to have your opinion about it.* I have never manured or taken notice of the plants, but they are full of blossom at the proper time.

THE TEA TREE IN CHINA.

The history of the tea tree in China shews that it became famous first for the qualities of the leaf when infused, and some centuries later was accepted as a national beverage. The native herbalists found out that the infusion of tea leaves was not only bitter in taste, but has the power of preventing sleep. The first mention of it is in

* We submitted this specimen to Mr. W. Atherton of the Colombo Cotton Mills, and he kindly reports as follows:—"The sample of cotton sent has all the characteristics of Tinnevely except one:—the fibre leaves the seed more easily and cleaner, and would be less trouble to gin. It may be deteriorated American, but it is difficult to say, unless I saw the tree itself. The cotton is quite suitable for our work, and I think would be valued by Messrs. Darley, Butler & Co. at 20 cents per lb. free from seed."

the *Er-ya* or about a thousand years before Christ. It is then only spoken of as bitter. Medical books began to be written about B. C. 600, and from that time to B. C. 200 there was much study of natural history undertaken to learn the tastes and healing qualities of plants and minerals. The herbalists of that time must have known that tea leaf infusion tends to keep from sleeping, but the first plain statement of this which is now accessible is in the *Kwang-ya* of the third century, a useful dictionary where many of the results of research in the properties of plants are briefly recorded. This was the time when Buddhism was spreading its monasteries rapidly throughout the country, when Hindoo medical knowledge was at the disposal of the Chinese, and medical plants were more than ever cultivated. Alchemy was flourishing, having sprung up in the third century before Christ and having been much favoured by the Han dynasty emperors. Alchemy always embraced two departments, botanical alchemy and mineral alchemy, and it was the former that favoured the examination of the properties of all plants. All through the five centuries of the Han dynasty and the Three Kingdoms, the physicians of China were busy in experimenting on the cure of disease by vegetable and mineral medicines under the fictitious light of the theories of alchemy. Of this we see the result in the book of Ko hung belonging to the fourth century of our era. He is the most voluminous author in alchemy the Chinese had ever had, and his very audacity of statement leads the reader to lose all confidence in his veracity. But his book is lively in style, plain-spoken in dogma, and rich in contemporary facts and stories, so that it constitutes a living picture of the time. In this book tea is only spoken of as a bitter plant, and the physicians and alchemists had evidently not directed much of their attention to it, nor had they foreseen that in a short time it was to become the universal beverage of the Chinese nation. Yet in western China along the Yangtse in Hupeh and Szechuen on both sides of the Gorges the people in the third century made cakes of rice and tea leaves, the first form of the brick tea of which modern Russia is so fond. The old account says that these cakes were ground to a powder and boiling water was poured on the powder for drinking. There seems to be no doubt then that brick tea infusion was drunk in China in the third century after Christ to freshen the mental faculties. There is no instance mentioned earlier than this, though the plant being well-known long before it is very likely to have taken place. As to the habits of the Han dynasty, occupying the four preceding centuries, we only know of broth and wine being the common beverages of the Chinese. The wine was never distilled, nor was it made of grapes. It was in fact brewed from glutinous rice.

In regard to the part of China where tea was first introduced as a beverage there is no question that it was Kiangnan. The tea of the hill in Kiangnan has an extremely good flavour and many celebrated kinds are produced there. The accounts say that it was in the third and fourth centuries that the practice of drinking tea began to extend in that region. It was used occasionally in place of wine in the Imperial court of Nanking in the time of the Woo kingdom, as we know from the History of the Three Kingdoms. Yet in the novel of that name tea is not mentioned. The author being aware apparently that tea was not commonly used in China till the Tang dynasty, has not, it is believed, made any of his many heroes on any occasion drink tea. It was, however, occasionally drunk then at Nanking as history shews. If however it be asked why tea drinking spread in Kiangnan it may be

answered that the monks on the hills planted trees and among them medical plants in the near neighbourhood of their monasteries. Very likely it was in this way that tea drinking originated. The Buddhist monks are teetotallers and abstain from animal food. On both these accounts they seek refined kinds of food and drink, such as are furnished by the vegetable kingdom in abundance. The excellent gustatory qualities of the Buddhist *cuisine* in monasteries are well-known. They cultivate vegetables largely both for their own use and to send to market. Their avoidance of pork and wine is not without its compensations. We know from other grounds how Buddhism flourished in Kiangnan in the third century, and to the fact that tea was first used as a substitute for wine in that province, we may add as a likely hypothesis that the priests of that religion had much to do in the early spread there of the habit of tea drinking, which by the sixth century had probably extended throughout China.

In the China of Confucius broth made of animal flesh was very commonly used, as was rice wine. But probably the staple beverage in the absence of wine was hot water in which vegetables or animal food had been boiled. They then had neither carrots, nor cabbages, but they had plenty of fish, of fowls, and of the other domestic animals. Beef was not prescribed at that time by sovereigns controlled by Buddhist superstition. Milk might be used as a beverage when cows were more numerous in proportion to the population than now. Altogether the ancient Chinese were not badly off in those days, although the delicate flavours of a hundred choice kinds of tea leaf infusion brought from as many mountains, were still unknown.—*N.-C. Herald.*

DRUG TRADE REPORT.

LONDON, 14th March 1889.

CINCHONA.—At Tuesday's auctions a moderate quantity of bark was offered for sale, the East Indian varieties again being almost equal in bulk to the offerings from Ceylon. The catalogues comprised:—

	Packages	Packages
Ceylon bark ...	1,273	of which 1,135 were sold
East Indian bark ...	1,206	" 1,161 "
Java bark ...	54	" 54 "
South American bark	119	" 12 "
West African bark	7	" 7 "

Total ... 2,659 " 2,369 "

Nearly the whole of the supply was disposed of, if not with much competition, at least without a further reduction from the previous auctions' rates, the unit being generally placed at 1½d per lb.

The following are the approximate quantities purchased by the principal buyers:—

	Lb.
Agents for the Mannheim & Amsterdam works	157,907
Agents for the Auerbach works	86,926
Agents for the Brunswick works	72,295
Agents for the American, French, &c., works	63,232
Agents for the Frankfort o/M and Stuttgart works	56,044
Messrs. Howards & Sons	48,568
Mr. Thomas Whiffen	31,476
Sundry druggists...	18,122
Total sold	534,570
Bought in or withdrawn	89,102

Total quantity catalogued ... 623,672

It should be well understood that the mere weight of bark purchased affords no guide whatever to the quinine yield represented by it, firms who buy a small quantity of bark by weight frequently taking the richest lots, and *vice versa*.

JAVA BARK.—Yellow chips, fair to good bright 2½d to 5d; root 7d; grey chips 3¼d per lb.

SOUTH AMERICAN BARK.—Of 58 bales Carthagena bark only 6 were sold at 3½d to 4d for partly damaged to sound. A supply of 59 packages cultivated Calisaya quills was nearly all bought in, 6 bales, of 100 lb each being sold by private contract.

WEST AFRICAN BARK.—Seven bales, together about 980 lb, from the island of San Thomé, fair medium to stout brown quill of *Succirubra* character, partly damaged, brought from 4d to 5½d per lb; weak ditto 3d per lb.

QUININE.—It is reported that at the end of last week very considerable transactions were made in some German brands at 1s 2d per oz, for forward delivery, but we have reason to believe that the quantities named as having changed hands are much exaggerated. At present the market is firm at 1s 2d for forward delivery for German bulk, B & S Brunswick or Auerbach. On the spot second-hands lots could no doubt be had at 1s 1d per oz. Howards' brand has been reduced to 1s 6d for bulk and 1s 7d per oz. for vials for large quantities, and Whiffen's to 1s 5d and 1s 6d per oz. respectively. The Oil, Paint, and Drug Reporter, which has been interviewing the American dealers on the quinine situation, with the usual result of eliciting a number of irreconcilably different opinions, is responsible for the statement that the Brunswick factory declared a dividend of 40 per cent last year, and that the owners of another quinine works have expressed themselves as being "perfectly satisfied with the situation." It is understood that the dividend in the first case was made from quinine, and this alleged fact has caused considerable comment in certain circles, where the belief is firmly fixed that all makers are constantly losing money. It is stated that the two bark auctions held this year in Amsterdam represented together about 550,000 oz. quinine sulphate, against about 900,000 oz. for the four corresponding London auctions.

THE DUTCH MARKET.

AMSTERDAM, March 12th.

CINCHONA BARK.—The sales to be held at Amsterdam on March 21st will consist of 1,856 bales and 227 cases; total about 169 tons, made up as follows:—Java bark, from Government plantations 368 bales and 33 cases; about 33½ tons. From private plantations 1,434 bales and 194 cases; about 131 tons. British India bark 54 bales; about 4½ tons. There are of Druggists' Bark—*Succirubra*, quills 10 bales 119 cases; broken quills and chips 316 bales 14 cases; root 90 bales. *C. Schuhkraft*, quill 15 cases; broken quills and chips 29 bales; root 27 bales. Manufacturers' Bark (about 137 tons): Officialis, broken quills and chips 34 bales; root 9 bales. *Ledgeriana*, broken quills and chips 952 bales 68 cases; root 265 bales 11 cases. Hybrids, broken quills and chips 84 bales; root 40 bales. The manufacturers' bark contains about 5¼ tons of sulphate of quinine, or 3·82 per cent on the average. About 16 tons contain from 1 to 2 per cent of sulphate of quinine; 33 tons, 2 to 3 per cent; 47 tons 3 to 4 per cent; 12 tons 4 to 5 per cent; 11 tons 5 to 6 per cent; 7 tons 6 to 7 per cent; 7 tons 7 to 8 per cent; 4 tons 8 to 9 per cent.

CUBERS.—A small lot of 4 bales good genuine berries, recently imported, was sold today at 3·25f. per ½-kilo. equal to 27l. per cwt. The new crop has been bought up in Java for American account at very high prices and it is generally believed that this year's crop will again be a small one.—*Chemist and Druggist*.

THE SEASON IN MADRAS.

The following is a summary of reports for the week ending 16th March: Rainfall very slight in Madura and Salem; nil elsewhere. Rain wanted in Ganjam, Vizagapatam, Trichinopoly, Tinnevely and Coimbatore. Standing crops generally good; withering in parts Cuddapah, Trichinopoly, Coimbatore; affected by disease in parts Bellary. Stock suffering very badly, chiefly from rinderpest, in South Arcot and Tinnevely and badly in Cuddapah, Kistna. Anantapur, Trichinopoly, Tanjore and Madura. Pasture deficient in Ganjam, Coimbatore, Bellary, Salem, and Tinnevely. Prices, rising in eight districts, falling in six, and stationary in others. General prospects favorable, except in Ganjam; improving in Coimbatore.—*Madras Mail*.

THE PROSPECTS OF CEYLON AND INDIAN TEA FROM THE DEALERS' POINT OF VIEW.

We make no apology to our readers for occupying a considerable space with a wholesale quotation from the able review issued by Messrs. Reinach's Nephew & Co. We consider this circular of such interest to Ceylon and India that we transfer it bodily to our present report. Some idea of the importance of such a frank and full recognition by such an authority of the altered position of China, as compared with Ceylon and Indian, tea may be formed by those who are not familiar with the Messrs. Reinach's Circular, when we point out that China has been always the prominent feature in their quotations.

In the present circular the prices of seventy-five qualities of China tea are quoted, as compared with five qualities of Ceylon, five Assam, and four Java.

The following is the text of the circular we refer to:—

"We have no change to report in the tone of our market for China cargoes, as the depressed feeling we signalled during the past months is still the main feature. Better grades of Foochow have again declined in value and the market seems to be quite disorganised, fine Soomoo costing 1s 5d in China selling at 1s, and 1s 3d tea realising 9d in public sale. This may, as is argued in some quarters be partially attributed to the very poor crop and owing to so-called fine teas having been driven out of consumption by the high prices paid for them; but we are inclined to think that whatever the quality might have been, the result would not have been very different. The chief cause must be looked for in the change in the taste of the public which evidently prefers the flavour of fine Assams and Ceylons to that of China tea. This opinion is substantiated by the fact that although the Hankow teas were fully up to the average of late years, the consumption of fine Monings in England has fallen off nearly as much as that of Kaisows, and had it not been for the unexpected Russian demand, we should probably see at the present moment fine Monings in a very similar position to that of fine Foochow teas. If we compare Indian and Ceylon growths with China teas we can only come to the conclusion, taking the intrinsic value of the article, that the public are right, and although we hear of the wonderful teas China used to produce in the old East India Company's days, we are somewhat sceptical on that point. The teas were fine because there was no other standard to gauge them by, and as China produces at the present moment as fine Oologons and as fine green teas as we have ever seen, there is no tangible reason why black teas should have so much deteriorated. We are not in a position to judge whether the climate and soil in India and Ceylon are more favourable to the growth of the tea plants than the respective districts in China, but it is evident to the least initiated that the difference in the handling of the leaves after they are gathered must be of paramount influence.

"As we have on previous occasions pointed out there are no large tea gardens in China, very small grower gathering his own leaves, which are left uncared for and exposed to the inclemency of the weather till they are collected by middle men. When they finally reach the Hongks where they are prepared, they have often lost the best part of their quality; and if we compare this to the manner in which teas are prepared in India or Ceylon and the careful way in which the leaves are gathered, sorted, protected against rain and damp, it is not surprising that the result is shown by a more desirable article.

"But we go further, and believe that even if China Teas were as fine as India or Ceylons, the latter, through the nature of the cultivation, have a marked advantage. Although the consumer is the final judge of the article the caterer who provides it to the consumer is a very important factor. We all know by experience that teas—particularly fine teas—are generally at their best within two, say the outside, three months, after they have been prepared. In China fine teas are gathered and prepared within one month of the opening of the China season, and arrive all on this market nearly simultaneously. We have for three months crisp fresh China teas and during the remainder of the year a more or less stale article, whilst with Indian or Ceylon teas we have gathering and preparing of fine teas for fully six months during the year.* The distributing trade naturally buys the freshest and most fragrant article it can get, and it stands to reason that for many months in the year their choice falls on Indian or Ceylon in preference to China tea.

"We do not pretend that the days of Foochow teas are passed, we only mean to prove that unless the Chinese entirely change their mode of making teas, they must be satisfied to supply the English market at least with common to medium sorts. With regard to fine Hankow teas the position is very different, the London market having become of secondary importance. Russia so far has not taken to Indian or Ceylon teas, and Russian buyers, will particularly if the exchange keeps so high, continue to compete keenly for all fine teas.

* In the case of Ceylon, all the year round practically.—Ed

TEA FOR AMERICA: ANOTHER GRAND SCHEME.

(By the "Peripatetic Planter.")

It is too early yet to report progress re the "Associated Tea Planters" (American Scheme); but I am now at liberty to be more precise in reference to that rival enterprise which I hinted at in your issue of the 25th December last, as being *already planted* upon information *already* carefully collected by a special prospecting tour in the United States; whilst the Syndicate here have been busy attending to prospectuses in lieu of "prospeoting."

Mr. S. O. Davidson of Sirocco renown, is the enterprising spirit, inspiring, directing, and financing this rival, and *senior* venture. For a long time Mr. Davidson has been employing a special representative in collecting all the necessary preliminary information, and in making his preparations. These are most detailed and complete, as goes without saying when Mr. Davidson is the responsible chief. The head Dépôt is in Holland house, No. 1436, Broadway, New York, and the complete fittings for that Dépôt have been constructed under Mr. Davidson's personal supervision—to measurements and plane in Belfast, and these fittings are in that Oriental style which makes his dépôts in Belfast, &c., such a special feature of that and other towns. These fittings have even been erected in Belfast, exactly as they will be in the Dépôt itself, in New York, to make sure of every detail. Mr. Arthur, the Manager, is an old planter, not a New-Yorker, either by birth or adoption. He sails tomorrow, with every point at his fingers' ends concerning the start and the carrying on of the "Sirocco Crusade" over in America. The campaign is to be conducted as a Planter's effort, not a Trade one, and Mr. Davidson has hopes that he may be able to hold his own even among the sharp New Yorkers. As the preparation, for this start have been going on for more than a year it will be evident that this enterprise takes precedence in rank of priority, to that of the "Associated Planters." It will also be evident that a year spent in judicious prospecting and planting is a year's start well spent. To most people it will also appear that an enterprise, managed by one capable chief, unhampered by any distant and only partially informed Directorate, stands a good chance of distancing any hampered rival, even had the start been equally well organized. Moreover, Mr. Davidson has special facilities for landing his tea in New York at a rate considerably below that of any rival, which facilities he has taken infinite trouble to obtain, but I have not received his permission to mention what they are. Suffice it, that knowing what they are, I can attest, that except by purchasing *exceptionally* cheap lines in London—which Mr. Davidson is equally in a position to do—I do not see how a rival can acquire the equivalent of these special advantages, without taking an amount of pains and trouble scarcely to be looked for from a Directorate. "Sirocco Tea" will be purchasable in New York (to start with) in any quantity from lb. to chests, next month. Thus, it will be seen, that once again has Mr. Davidson come forward in the interests of Indian tea, which already owes so much to him for the success with which he has popularized it all over the North of Ireland, parts of Scotland, and the North of England. It is devoutly to be hoped that similar success may attend his new departure in America, as a much needed relief to the London market. It will be very interesting indeed, to watch the comparative success and progress of the two methods of opening new markets; the one governed by a multitude of councillors, the other by one chief. May they both live long and prosper, in friendly emulation.—*Indian Planters' Gazette.*

TEA LOOSENS DR. TALMAGE'S TONGUE.

(From the New York Observer.)

The bottle rules the sensual world, but the tea-cup is queen in all the fair dominions. Once this leaf was very rare, and fifty dollars a pound; and when the East India Company made a present to the king of two pounds and two ounces, it was

considered worth a mark in history. But now Uncle Sam and his wife every year pour thirty-four million pounds of it into their saucers. Twelve hundred years ago, a Chinese scholar by the name of Lo Yu wrote of tea, "It tempers the spirits and harmonizes the mind, dispels lassitude and relieves fatigue, awakens thought and prevents drowsiness, lightens and refreshes the body and clears the perceptive faculties." Our own observation is that there is nothing that so loosens the hinge of the tongue, soothes the temper, exhilarates the diaphragm, kindles sociality and makes the future promising. Like one of the small glasses in the wall of Barnum's old museum, through which you could see mountains bathed in sunshine, so as you drink from the tea-cup, and get on towards the bottom so that it is sufficiently elevated, you can see anything glorious that that you want to. We had a great aunt who used to come from town with the pockets of her bombazine dress standing way out with nice things for the children, but she would come in looking as black as a thunder-cloud until she had got through with her first cup of tea, when she would empty her right pocket of sugar-plums, and having finished her second cup would empty the other pocket, and after she had taken an extra third cup, because she felt so very chilly, it took all the sitting room and the parlor and kitchen to contain her exhilaration. Be not surprised if, after your friends are seated at the table, the conversation depends very much on the kind of tea that the housewife pours for the guests. If it be genuine Young Hyson, the leaves of which are gathered early in the season, the talk will be fresh and spirited, and sunny. If it be what the Chinese call pearl tea, but our merchants have named gunpowder, the conversation will be explosive, and somebody's reputation will be killed before you get through. If it be green tea, prepared by large infusion of Prussian blue and gypsum, or black tea, mixed with pulverized black lead, you may expect there will be a poisonous effect in the conversation and the moral health damaged. The English Parliament found that there had come into that country two million pounds of what the merchants call "lie tea," and, as far as I can estimate, about the same amount has been imported into the United States; and when the housewife pours into the cups of her guests a decoction of this "lie tea," the group are sure to fall to talking about their neighbours, and misrepresenting everything they touch. One meeting of a "sowing society" up in Canada where this tea was served resulted in two lawsuits for slander, four black eyes that were not originally of that color, the expulsion of the minister, and the abrupt removal from the top of the sexton's head of all capillary adornment.

The above from Dr. Talmage is characteristic of the man, and his method of preaching. If this tendency to exaggeration is due to tea we trust the distinguished clergyman will soon substitute therefore cocoa shells or milk. According to Dr. Battershall, United States chemist, charged with examining teas imported into the United States, "lie-tea" is seldom met with in this country, and we therefore absolve Dr. Talmage from any suspicion that he has been drinking that sort. Why couldn't he have told us what sort he used? for there are countless thousands who would gladly buy that kind, an infusion of which "makes the future promising."—*American Grocer.*

INSECT PESTS.

An important initiative experiment towards combating the various insect pests that from time to time cause such devastation to our crops is, we believe, occupying the serious attention of the local Agricultural Department. A vast number of laborious experiments have been carried out in America under the auspices of the "Bureau of Economic Entomology" of the Department of Agriculture in that State, with the result that certain preparations have been perfected, and methods and appliances for applying them with success invented. But what concerns this country more immediately is that the insect pests

of India have been found, or are believed to be, almost without exception, allied to American ones—in some cases being almost identical with them; so that there is every reason to presume that insecticides that have been found valuable in America will be also applicable in India. The castor oil plantations in one of the districts of this Presidency were found infested with certain "caterpillars," specimens of which were furnished to the Madras Central Museum for identification, where, in consultation with the Indian Museum, Calcutta, they were identified as the *pupa* and *larva* of a moth *achaea melicerta*, which, being a leaf-feeder, it is believed, will be probably destroyed easily by spraying on an insecticide, such as "London Purple," a refuse obtained in the manufacture of aniline dyes, and consisting of lime, arsenious acid, and carbonaceous matter, a compound combining cheapness with efficacy. The Agricultural Department have received, through the Agency of the Central Museum, a supply of the "London Purple" and an American Force Pump for applying it, and we shall watch with interest the results of the experiments that the Department may carry out with these appliances.—*Madras Times*, March 26th.

MAURITIUS.

(From the *Commercial Gazette*, 11th March.)

Port Louis, 9th March.

VANILLA.—The market is firm and the demand very brisk for best qualities. We have to quote the sale of 300 kilos fine quality above 6 inches at R22 per kilo. A lot of 400 kilos from Seychelles, was offered for sale this week and sold at R20 per kilo. The heavy rains, we have experienced since last month were very unfavourable to the plantations. As we mention in our last the outturn of the coming crop will be inferior in quality to that of last year.

COFFEE.—Only 10 bags from Colombo have arrived since our last. Good quality continues to sell at R50 to R52 per 50 kilos, and mixed "triage" qualities are worth R30 to R40 per 50 kilos, according to quality.

TOBACCO.—No arrival of Coringhy leaf to report and this description is selling according to quality from R120 to R130 per 50 kilos. Calcutta continues to fetch R105 to R106 per 50 kilos, according to quality. Cavendish "Kobinoor" has somewhat advanced and is worth today R200 to R204 and other descriptions are selling at from R180 to R192 per 50 kilos according to quality. Imports are 180 bales from Calcutta, 10 cases from Marseilles and 46 cases and 10 bales from Reunion.

PAPER FROM SUGARCANE.—The *Revue Scientifique* states that it has long been known that the stalk of the sugar cane might be used in the production of a paper of the best quality. It is therefore surprising that with the constant decline in the value of sugar owing to over-production, and the steadily increasing use of paper, it has never occurred to sugar planters to embark in the manufacture of paper as a supplement to sugar producing. The fibres of the cane give an excellent paper, and the necessary mechanical processes are easily carried out. A correspondent of the French National Acclimatisation Society reports that Mr. Walter Forbes, of New Orleans, has lately exhibited there a dozen samples of white paper made from the sugar-cane which were pronounced very good. The first quality costs 21 frs. per 100 kilogrammes; 500,000 kilos of the stalk would produce 10,000 kilos of paper worth 2,100 frs. The *Revue Scientifique* concludes by recommending the planters in the French sugar-producing colonies to introduce paper-making.—*O. Mail*, Feb. 22nd.

ALOES AND THE CASTOR OIL PLANT are two plants of which much more might be made in Ceylon for commercial purposes. Gardens and fields of the castor-oil shrub are very common in India and it grows like a weed over large districts in Ceylon yielding seed full of oil, in abundance. So again with aloes: look at the latest report from Mauritius:—

ALOES FIBRE.—This product continues to draw great attention, and the manufacture is pushed to the extreme. The last sales made for good qualities were at R390 to 400 and for inferior qualities from R350 to 374 per ton.

COCONUT OIL.—It is not generally known amongst pharmacists that Liverpool presses and refines the greater part of the fine coconut oil used in England and on the Continent. Dried coconuts arrived here in cargoes of 600 or 700 tons from the South Sea Islands, and more recently from Java and Singapore, and are taken mostly by one firm. Smith's coconut oil is quoted as the standard for quality and price in the Liverpool, London and Continental markets. The pressed cake is ground into meal, and is sold as a nutritious cattle-food—*Chemist and Druggist*, March 16th.

CEYLON TEA AND COFFEE IN PHILADELPHIA.—We read in the *Philadelphia Times* of February 26th:—Huyler's cocoa has a show adjoining, and then comes a great array of Rae's olive oil from Leghorn. Just across is an array of Dutch cocoa, and adjoining it a pyramid of salt bags from Alex. Kerr, Bros. & Co. The Favorite Cooking Extracts, including all the flavors ever heard of, make a handsome exhibit, and hundreds of bottles were given away. At the end of the aisle the Ceylon Pure Tea and Coffee exhibit is very attractive, and cups of the beverages are handed around.

THE CINCHONA PLANTATIONS.—When it was urged by the Chamber of Commerce two years ago, that the Government should divest themselves of their cinchona plantations, in order that they might not be open to the charge of interference with private enterprise, one of the side issues of the question was, whether anybody could be found with capital sufficient to pay for the plantations at their full value in the present depressed state of the cinchona market. This difficulty was removed when a Syndicate at Madras offered recently to take all the estates off the hands of Government at a fair valuation. Government, however, declined the offer on the ground so often put forward before, viz., that there are many problems in cinchona cultivation still unsolved, and that it would be premature therefore to part with the estates which offer such excellent opportunities and facilities for experiment.—*S. I. Observer*.

RUBIES AND RASCALITY.—The *Pioneer* states:—In the discussion which followed the reading of Mr. Streeter's paper on the Burma Ruby Mines at the Society of Arts recently, Sir Charles Bernard told a curious story of the way the mines of India are sometimes "cooked." Before Mr. Streeter visited the mines at Mogok, he had met with a Shan trader who had come to London to dispose of some rubies. The rubies were sold, and Mr. Streeter, curious to know what the Shan did with his money in England, had his movements watched. The first thing he did was to go to Birmingham and lay out a considerable share in glass stones to take out to Siam and Burma for the purpose of "salting" the mines. When Mr. Streeter visited the Ruby Valley he found some of these identical stones being offered to British soldiers and officers as the genuine article. The trust of Thomas in human nature must have sustained a rude shock when he discovered that the gems got in so outlandish a spot as Mogok were nothing more than Birmingham glass.

Correspondence.

To the Editor.

COFFEE AND THE TREATMENT OF
FUNGOID DISEASES:
AN OLD INDIAN COFFEE PLANTER TO THE
RESCUE OF HIS BRETHREN.

Lausanne, Switzerland, 13th March 1889.

DEAR SIR,—It is nearly five years since I saw the last of my little coffee plantation, "Benhope," on the Coonor Ghaut, Nilgiri Hills. During this period mine has been no exception to the general experience of coffee planters of most serious loss from *hemiteia*. Matters seem also from late accounts to be far from improving in this respect. As to anything in the way of palliatives, not to speak of remedies against it, I have heard nothing from India.

However, since I have, in God's providence, been led here, I have, within the last two or three months, learnt of methods of treatment, which are in general use for combating a very serious form of fungoid disease known as mildew. This was introduced a few years back from America, and has caused very great damage to the vines grown on the Continent of Europe. These remedies as a preventive treatment against the ravages of the said fungus are found to be positively efficacious. Though I am no botanist, I understand mildew is a parasitic fungus, which feeds on the leaves of the vine known as *Peronospora viticola*, and that it is quite distinct from our too well-known fungus *Hemiteia vastatrix*, which feeds on the leaves of the coffee tree. But it takes no special *acumen* to note—that mildew and *hemiteia* are of the same vegetable order—that they are both propagated and developed in a like manner, that their destructive action is of the same kind, and that the enormous power of rapid reproduction of spores is a like feature. When we further bear in mind that the organic structure of the spores of the *hemiteia* are known to be of a very delicate nature, it is but a natural conclusion that what would be inimical to the growth of the one mildew would be equally as to that of the other *hemiteia*. The preventive treatment against mildew on the vines, consists in short of spreading over the leaves of the vine in the form of minute drops, by means of spraying machines made for the purpose, of a chemical substance which without damaging the leaves, destroy the action of the spores and prevent their entering the leaves. Seeing that these remedies have succeeded so well in the case of mildew on the vines, why should not we have great reason for hoping that like treatment will prevail over the *hemiteia* or over coffee trees?

I am so far impressed with this view, that I have forwarded the information I have acquired to the manager of my plantation, and also sent him ten spraying machines, that he may put the treatment at once to a practical test.

I do not introduce this treatment to your notice with any claim to full confidence in it, and my first thoughts were to test it quietly and to refrain from publicity till I could come forward with some authoritative information based on practical demonstration. But I have subsequently concluded it would be better to endeavour to make it generally known, that as much interest as possible might be awakened, and investigations made from as many quarters as possible, in the hope of thus arriving more speedily at confirmed results. Besides as the matter is one of such supreme importance to coffee planters, I feel unwilling to keep it back, as there is to my mind a way of hope in it, and some fellow-planters now hopeless and possibly thinking of sacrificing if not abandoning their plantations may be led to stay from such a course on hearing of this, and if the remedy prove a real one their properties will be saved to them by hearing of it in time. Knowing well your purpose of mind, I do not hesitate in applying to you for your kind help in dealing with this information for the public good.

which, unless my manager has forestalled me I believe will be new to you. So I forward to you by this mail Mr. J. Dufour's pamphlet on mildew, and a literal translation in English from which you will get all information on mildew and its treatment, and be able to form some first impressions of its likelihood in dealing successfully against *hemiteia* or not. Though difficulties and objections may present themselves, I would say do not let these stand in the way of practical experiment, which however cannot be done without the aid of spray producers. I have seen Mons. J. Dufour, who is the Professor in the School of Viticulture here, and he has expressed great interest in our proposed application of the treatment against *hemiteia*. If you seek any further information I shall be glad to help in obtaining it. And if you or any other planters should wish for pulverisation or spray machines I can procure these here of the Japy make, which I understand is as good as any other, and if funds are provided I can order them to be sent out at the retail price of 371 francs each plus transport charges and packing.—I am, dear sir, yours faithfully,
J. G. C.-H.

[We are much obliged to our correspondent and shall hope to hear from his Coonor Manager of the result of his experiment. Meantime we shall give in full detail in the *Tropical Agriculturist* the very interesting report by Mr. Dufour of Lausanne, on "Mildew and its treatment," see page 761.—There is much in it which we can commend very earnestly to the consideration of our coffee planters.—Ed.]

IRRIGATING COFFEE.

S. India, 29th March 1889.

SIR,—I shall be much obliged if any of your correspondents who have the means of irrigating coffee, will give me a few details.

My district has a rainfall of 85 inches; altitude 3,800 feet. No rain falls after end of December till the casual showers of April.

When should irrigation commence? and for how long continued and how often?

Is irrigation considered such an advantage, that with water available the process should be undoubtedly adopted?—Yours obediently,
N. T.

THE CEYLON-AMERICAN TEA COMPANY AND
THE FALL IN PRICE OF TEA.

31st March 1889.

DEAR SIR,—The fall in tea is becoming so serious that I hope every brother planter will see the necessity of giving his support to the Ceylon Planters' American Tea Company. Those who cannot take two or more shares are encouraged and invited to take *one share*, to prove that they have really an interest in the prosperity of the country. The object of the Company is to push the sale of Ceylon tea in one of the largest markets in the world, and if the Company is supported as it ought to be by every proprietor, agent, and superintendent, it is bound to succeed in making our teas known; and once they are known the demand for them will increase. If prices do not rise, the increased demand may help to spare us from these falling below a figure, at which tea cannot be manufactured to pay. Meantime we are in a very critical position, and Mr. H. Whitham and other gentlemen at much expense and trouble have organized a company to help us out of our difficulty, but, however willing these gentlemen may be, they cannot carry on without funds, and it is to each and every individual they look for support.

The object in view is of so vital importance to Ceylon, that Chairmen of district Associations should lay the prospectus of the company before their Associations, and take as much interest in advocating the benefits to the country of such a company as they did in advocating the Elwood May scheme.

The "Tea Fund" has done as much as lay within its means, but these means were the contributions of a few estates, for many have yet to be enrolled, but this company is the "Ceylon Planters' American Tea Co.;" and as planters we should acknowledge how heartily we support the company, by at once communicating with Mr. Harry Whitham, who will be pleased to enroll all who have not yet taken one or more shares.—Yours faithfully,

A MATALE SUPERINTENDENT.

A NEW CEYLON TOBACCO COMPANY.

Colombo, 4th April 1889.

DEAR SIR,—Mr. Thomas Dickson, whose letter advocating the cultivation of tobacco in our colony you recently published, has not been long in giving effect to a project in that direction which he had in view, for we learn from him by the last mail that he has formed and registered a Company, the prospectus of which we hope shortly to lay before the public with the usual forms of application for shares.

In the meantime we are informed that it is called the Ceylon Tobacco Company, Ltd., with the following office-bearers:—

Directors:—Thomas Dickson, Esq., Ingram House, 165 Fenchurch, Street E.C., (Director, Scottish Trust and Loan Co. of Ceylon, Ltd.); J. Wilson, Esq., 64 Chester Square, S.W.; F. Shaw, Esq., Rochester House, Surbiton (Managing Director, Anglo Dutch Tobacco Company, Ltd.); D. Brown, Esq., 46 Lancaster Gate, W. (Managing Director, Lankat Plantations Company, Ltd.; Sumatra).

Bankers:—Royal Bank of Scotland, Bishopsgate Street, and the New Oriental Bank Corporation, Ltd., Colombo.

Solicitors:—Messrs. Hollams, Son Coward & Hawksley, Mincing Lane, E.C.

Agents in Ceylon:—Messrs. Cumberbatch & Co.

With the exception of £2,000 reserved for issue in Ceylon the whole capital of £20,000 has been subscribed in London, and is divided into 19,950 shares of £1 each and 10 founders' shares of £5 each, one shilling is payable on application and two on allotment; further calls will be made as required of which one month's notice will be given.

The Company has been formed for purchasing and curing tobacco in Ceylon both for local sale and for export and also to further develop the business and cultivation of tobacco commenced by planters and native growers in the island. The business will be carried on at the Ambewatte Mills, part of which extensive premises will be made available for a factory, and operations will be commenced as soon as the services of European overseers experienced in all the branches of tobacco manufacture have been secured.—We are, dear sir, yours faithfully,

CUMBERBATCH & CO.

[This letter was received at too late an hour last evening for insertion: the prospectus, when fully developed, will no doubt find a place in our advertisement columns as usual.—Ed.]

COCONUT LEAF DISEASE:—CONTRA TO MESSRS. WRIGHT AND AKBAR.

Veyangoda, 4th April 1889.

DEAR SIR.—Just as I was thinking of sending you a few lines on the further development of the coconut leaf disease, my attention was arrested with the report of an interview Messrs. W. H. Wright and M. S. J. Akbar had with you on the above subject. You have perhaps unconsciously unmasked the real object of their visit to proclaim "as full confidence as ever in coconut plantations." They seem to think that to acknowledge the presence of a disease affecting coconuts, is to depreciate the value of their valuable properties.

Personally I have unbounded respect for both Messrs. Wright and Akbar, and I wish there were many more Wrights and Akbars in our varied community. It is for this reason that I regret to see them make themselves ridiculous by crediting a "certain quarter"—presumably me, for I have been the only person who has kept the subject before the public—with a statement I never made and characterizing it as "unmitigated bosh." It would not have detracted at all from the reputation of these estimable gentlemen had they taken the trouble to inform themselves of what I really did write before they formed a deputation to an editor to refute my statements. I have repeatedly stated that this is no new disease, but an aggravation of what had been noticed for years back. I said this more particularly when forwarding for publication Dr. Trimen's views that the affection was but an exaggeration of what is always noticed in palms. With these gentlemen I have noticed this disease before, but on isolated trees. In December-January when trenching a young plantation I noticed more of the disease than before, and thought nothing of it even then, till at the end of January when in Colombo, a gentleman interested in coconut properties asked me if my trees were affected with a disease which seemed to be general. That was what first alarmed me and induced me to draw public attention to it.

Mr. Wright's statement that "there is no appearance of any disease throughout the Hapitigam Korale" is directly contradicted by your correspondent from that Korale. In a very recent issue of the *Observer* he said that the rain had done the trees good in that the young fronds are not affected, but that it was not safe to cry out till we were well out of the wood. Whose statement do you give credence to: Mr. Wright's or Mr. Lamou's? Perhaps Mr. Wright spoke only for himself and of himself.

Before Mr. Wright's or Mr. Akbar's opinions on the soil of the Veyangoda district can be accepted, it will be interesting to know the opportunities they had for forming an opinion of the district as a whole. It was particularly unfortunate for them of all others to say that this district is "peculiarly liable to suffer from drought," for it is notorious that no region suffers more from droughts than the Mahaoya Valley, where both these gentlemen own their valuable properties.

My object in keeping this subject before the public is not to pose as an alarmist, but because having a lively recollection of the spread and effect of leaf disease on coffee, I wish those interested in coconuts to be on the alert. I have not forgotten that when the late Dr. Thwaites gave his opinion on leaf disease, it was looked upon as the utterances of an old croaker and was pooh-poohed. The natural buoyancy of the planter caused him to look at the disease as nothing serious. Wasn't he acquainted with black bug before, and did not Dr. Gardner predict in the same way the extermination of coffee? No; these scientific gentlemen always look at these questions through darkly colored spectacles. We, as practical planters, know that after a disease has run its appointed course it must die out. I have not forgotten how Mr. George Wall as Chairman of the Planters' Association repeatedly challenged anyone to show him a coffee tree killed by leaf disease, nor have I forgotten the attack on Sir William Gregory led by the *Observer* and sustained by the planters for venturing to state his opinion on leaf disease and its effects. And to come to more recent times, I have not forgotten how persistently Mr. William Mackenzie was attacked for saying that coffee was doomed and what hard names were showered on him. Why was all this? Because planters were buoyed up by "eternal hope" and tightly shut their eyes to patent facts. Year after year they saw their coffee becoming more and more enfeebled and yet their condition of mind was such that they steadily and consistently refused to believe that leaf disease was slowly but surely sapping the constitution of their coffee bushes. We ought not to forget that disease had done serious damage to coconut plantations in the West Indies, so that

it behoves us to be up and doing betimes. To be forewarned is to be fore-armed, and if we know what our enemy is and with what weapons he can be exterminated, half the battle will be gained when the fight really begins. So far the disease has not been serious.

The first disease I drew attention to was in its first stages similar in appearance to *Hemileia vastatrix*. We have a new development of it now. The leaf discolors along its entire length and eventually withers. I was at first inclined to attribute it to the action of the sun, but it is spreading with the rains. We have scaly bug too, the disease that has proved fatal to the palm in the West Indies, but happily its attack is limited. Herewith samples. See whether it is "unmitigated bosh."—Truly yours, B.

"B." begins by saying:—"I have repeatedly stated that this is no new disease, but an aggravation of what had been noticed for years back." Well, that makes all the difference between it and the coffee-leaf fungus which was never known in connection with coffee anywhere the world over, either to scientists or planters, before it appeared in Madulima, Ceylon, in 1869. That was Dr. Thwaites' opinion and it has never been disproved.—It is of no use for editors or even scientists to interfere in the present instance, until old coconut planters settle the point whether the present "development" has not been one familiar to them off and on at intervals for many years back and whether it has always followed a bad drought and disappeared again after a time. In some cases, attacks by "poochies" and fungi seem to have followed on the drought, but in Mr. Akbar's experience, good cultivation and a change of conditions have resulted in the disappearance of the trouble. The case as now presented is just one where the "Ceylon Agricultural Association"—if in existence—might well have been asked to appoint a Committee of coconut planters to inspect, take evidence and draw up a report.—Ed.

CEYLON TEAS AND HOW TO PUSH THEM: NO. II.

DEAR SIR,—If Mr. Rutherford has not inserted in his note book (and I see no mention of it in the published index) a list of duties levied on tea in all countries he has omitted, I think, a very valuable table. Now what, for instance, is the import duty on tea levied in France? I leave you to inform your readers.*

This is what Mr. J. L. Shand, our great tea prophet in the world's wilderness of Exhibitions, proclaims it to be, in his attempt to prepare the way in the forthcoming Paris Fair of all nations:—"The duty on tea imported from Ceylon direct is £208 per 100 kilos, say 2s 3d per lb., and sent from England it is £268 per 100 kilos, say 2s 9d per pound, more, so a considerable saving is effected by importing direct."

In a local print I find it given:—"The duty on tea imported from Ceylon direct is £. 208 per 100 kilos, say 9s 3d per lb., and sent from England it is £. 268 per 100 kilos." Duty on tea if sent direct from grower to France 2s 3d per lb. and if sent via England 2s 9d per lb!! (Mr. Shand says 2s 9d per lb. "more", but this is evidently a slip). No wonder that France is not yet a tea drinking country! A "miracle" of some sort will have to be performed by some one before it is, and that will be no doubt done in time by "the people," seeing that the years of the "lean kine" are now about setting in with respect to the Frenchman's much beloved coffee. He must either fly to tea

*To our inquiry today the French Consul (M. Ruinat) is good enough to reply as follows:—"At present, duty on tea in France is £208 per kilog. It has been reduced from £350 which was paid for many years before. Of course this means (£208) duty from foreign ports." A kilogram being 2 1-5th lb. we make this 9½d per lb.—Ed.

or cocoa as a subsistence. The barriers to tea should be broken down from WITHIN at once if France is to be saved from becoming one of the greatest alcoholic drinking people of the world as already there are signs in the afternoon teas of the Parisians. But if I give Mr. J. L. Shand credit for sending to the Ceylon Planters' Association true information re duty on teas in France, what am I to do with Messrs. Gow, Wilson & Stanton, the great creators of tea diagrams, statistical tables, &c. &c.? Their offices lie nearly opposite to Mr. Shand's in Rood Lane, E.C.; well they must be left to fight out among themselves any rudeness that this question of duty on tea in France may engender. This is what Messrs. G., W. & S. say it is:—

	Tea.	Coffee.
France	Duty.. 9d to 11½d	6½d to 9d

Now who can make head or tail of these two statements. One man distinctly has "won the kettle." Again G., W. & S. in their latest pyramidal diagram, showing the world's consumption of tea, accord 4 blocks, each representing one million of lb. to Germany. How can this be reconciled with their figures given in their table attached to the diagram? Here they are, say for Germany. Comparative quantities of tea (in lb.) exported from Great Britain during 1884-85 and 1887:—

	Average exports during	
	1884 & 1885.	1887.
Germany	17,879,000	8,617,648

So much for our great authorities on tea!

Again in G., W. & S.'s diagram they place the consumption of tea in that country (France) at 0 03 per head. If such a country still taxes its people at the rate of 2s 9d per lb. per duty on tea, the sooner that the head of the country is changed the better.

A baker or butcher would certainly know better how to administer the revenues of France to the benefit of the people, but "the people" must be a poor lot to stand such nonsense; they evidently require waking up! Well, send Ceylon emissaries into the poorer quarters of Paris, Lyons, and all the great manufacturing towns. Here is a grand mission for Ceylon planters who know the "lingo," clad in blouses during the day and appearing as "Mashers," not of tea, but after the manner of not Arabian, but of Ceylon (k)night, armed with thousands of packets of Ceylon tea, they would open if necessary—in the poorest quarters small shops or boutiques) (one active man might easily supervise a dozen) where they could get at the MILLIONS and with pamphlets printed in French (and assisted by G. W. S.'s grand diagrams—war maps they would be) they would preach the great gospel of tea to the people, who would soon begin to open their eyes and to ask why they were longer to be debarred from a beverage so much enjoyed in England by the working man there and at so cheap a rate? France is a perfectly free country and the people would soon assert their rights as regards tea at all events, moreover, they would if assailed, no doubt protect their teachers who would sell good tea to them without profit and at the lowest possible price. British tea growers must, in fact, get in amongst the teeming millions of the world—anywhere and everywhere. If the tea planters will not attempt this great work (and every great reformation has sprung from the people, due perhaps at first to a few apparently, at the time, insignificant leaders), then let them form an alliance with the Temperance Societies whose organization everywhere is already complete. This new means of doing good would, no doubt, be hailed by them with enthusiasm. These Despised World's Reformers at the present day are doing an incalculable amount of good!—Yours,

A CITIZEN OF THE WORLD.

P. S.—In Lancashire manufacturing towns today

may be found men doing a profitable business in cups of hot coffee, cocoa or tea outside the factory and foundry gates when the workpeople are out for meals, or are leaving work for a long trudge home. The men engaged in this work have rather handsomely got up big barrow-shaped carts and the steaming cans are resplendently bright and adorned with brass, each vendor vying with his fellow caterer in the business in making his display as attractive as possible. In some such way the millions of the toiling poor of France, Belgium and other countries might be taught to appreciate a beverage they have probably never yet tasted in its purity, so it is all nonsense to say they don't like it. Certainly our nearest neighbours require attention equally with our own race in countries far distant. The difficulty in getting people to take to tea who have never tasted it, may not be so great as getting others to change the tea they have been accustomed to—

C. OF W.

COFFEE—TEA—AND STRONG DRINK.

Colombo, 6th April 1889.

SIR,—I extract from the *Ceylon Observer*, 21st March 1889, giving S. Rucker & Co.'s Circular of 28th Feb. 1889, with statistics *re* coffee:—"The world's consumption of the berry for 1888-89 is estimated at 671,500 tons or 1,504,160,000 lb." The average selling price per lb. of the world's production of coffee *today* is probably about 84s per cwt., or say 9d per lb. The average selling price per lb. of the world's production of tea *today* is probably just about the same, say 9d per lb. But the world's estimated consumption of TEA for 1888-89, (rapid as the increase has lately been) is estimated at only 1,357,500,000 lb.*

So that the disparity between the world's consumption of coffee and of tea today is still something enormous; I imagine much more so than most British tea growers and others think, and if so the above figures may assist to open their eyes!

Of course, a few years hence we may see vast reductions in the world's annual consumption of coffee, owing to coffee disease spreading, *but we ought not to reckon on this*. Messrs. S. Rucker & Co., I see, put down their probable reduction from lessened crops of coffee for 1889-90, at no less than 100,700 tons or 225,568,000 lb. These latter figures should cause a slight access of joy in the desponding hearts of British tea growers, but they must not relax their efforts to spread throughout the *whole world* a taste for their pure teas. There is without the shadow of a doubt, ample room for all the tea, coffee and cocoa the world can produce, for the population of the world is ever increasing at a greater speed than the production of these, soon to become universally indulged in necessities, *not* luxuries. The following extract, too, is calculated to put the spurs on to both tea planters and parsons!—Yours,

C. T. W.

LAST YEAR'S NATIONAL DRINK BILL.

The following novel calculations have been made by Mr. John Cook, District Secretary of the West Cumberland District Lodge of Good Templars, for the purpose of enabling the public to gain a better conception of the large amount expended each year in drink. Last year's drink bill, as taken from Parliamentary returns, was £124,611,439. This amount would give £3 7s per head to the estimated population of the nation; and £16 15s for each average family. Its weight in sovereigns would be 976 tons, while it would cover a space of 628 acres with sovereigns laid edge to edge. If the coins were placed face to face they would reach 115½ miles, or make a golden cord

* See Ferguson's *Ceylon Handbook and Directory*.

reaching from Carlisle to Liverpool or Manchester. Placed edge to edge they would extend a distance of 1,720 miles. To count these coins at one sovereign per second would take four years less a fortnight. For each letter in the Bible the amount last year expended in liquor is set down at £34 18s 9d.

COCONUT AND COFFEE LEAF-DISEASE.

Veyangoda, 7th April 1889.

DEAR SIR,—In your foot-note to my letter you state that as the "coffee leaf fungus was never known in connection with coffee anywhere the world over either to scientists or planters before it appeared in Madulsima in 1869," therefore it makes all the difference between it and the coconut leaf-disease. You are right when you state that the fungus was unknown to scientists before 1869. For on its making its appearance in Madulsima in a virulent form Dr. Thwaites' attention was called to it, and he not being able to identify it, referred the fungus to Messrs. Berkeley and Broom who found it quite a new fungus and not included in the list of "more than a thousand species of fungi" from Ceylon. But the fact that *Hemileia vastatrix* was unknown to scientists is not conclusive proof that it did not attack coffee before 1869. All it proves is that it was not noticed before then by scientists.

You are in error when you state that the fungus was unknown to planters as well, before 1869. Planters have borne testimony in your columns that they were acquainted with it for many years before it attracted attention. Amongst other Mr. Halliley, the famous advocate of weeds, wrote that he and his coolies came out of the coffee years before covered with yellow dust of which nothing was thought, as it did no harm then. In your Directory for 1873 in page 200 Mr. Nietner says he knew the disease for 15 or 20 years, but he did not include it in the list of his enemies of the coffee tree as it did no material harm till recently. So that I am right that coffee leaf-disease like the coconut leaf-disease *was* in existence long before it attracted attention.

Now that Mr. Potter has taken specimens of the affected leaves to be submitted to Mr. Marshall Ward we may look out for an authoritative opinion as to what the disease really is.—Truly yours,

B.

[B. quotes planting opinions given in 1873, which were afterwards set aside as untenable: *Hemileia vastatrix* existed in the jungles of Ceylon before 1869, but never touched cultivated coffee; so decided both Thwaites and Marshall Ward, and even Nietner was deceived in supposing that what he had seen on coffee before was the same fungus. Of course this fact can be used the other way in reference to B's coconut trouble, but we took him at his own word. Meantime it is satisfactory to know that Marshall Ward is to have specimens of the coconut leaf with the alleged fungus or discoloration laid before him.—Ed.]

COFFEE—TEA—AND STRONG DRINK.

April 10th, 1889.

SIR,—“The world's consumption of *tea versus coffee*?” The figures for tea you have introduced in my letter of last evening have been inserted by you without due reflection; they are altogether misleading, and have, in fact, destroyed altogether the point I sought, to make, *viz.* the *great disparity* between the two staples. This should be corrected at once, of course. So take S. Rucker & Co.'s lines showing how they arrived at their figures for the world's consumption of coffee for 1888-1889, and place against them in *parallel lines* the figures for the so-called world's consumption of tea. If you do this then the immense disparity will be clearly seen. S. Rucker & Co.'s figures for coffee have reference, of course, only to the consumption going on in countries *importing* coffee and do not include *imaginary* figures representing assumed consumption in the countries producing coffee: *not* being on parallel lines with S. Rucker's for coffee. Kindly correct and oblige,

C. T. W.

ONE OF THE RESULTS OF THE FALL in the price of cinchona bark and its products has been that the manufacturers are endeavouring to enter into closer relations with the bark producers, and thus to avoid the commissions now paid to middlemen. At a recent meeting of the Soekaboemi Agricultural Association in Java, for instance, a letter was read from Messrs. Zimmer & Co., of Frankfort-on-Main, in which that firm expressed its desire to enter into negotiations with cinchona growers for the purchase of their entire production of bark outright, in order to save charges.—*Chemist and Druggist*, March 16th.

A PATENT has been applied for here which seems worthy of investigation. It is a portable drying ground for coffee, and consists in a combination of large sieves made of wire on which the coffee may be exposed to the sun. The advantages are evident, for the coffee may be exposed to the sun as fast as gathered, whereas under the present system it is carried to the *terreiro*, called in Ceylon *barbacues*, and there dried. The new invention would also be more readily covered over in case of rain, and if the ventilation is good, there should be no danger of fermentation, which constantly threatens coffee dried on the old fashioned *terreiros*.—*Rio News*, Feb. 11th.

MADRAS PRESIDENCY DIAMOND FIELDS.—MR. Pate-man Smith's report for the fortnight ending the 31st December is as follows:—"I am glad to be able to report that the winding engine has been started and is working very well. I shall now be able to get on quicker with the sinking of the shaft. The stuff I am going through is very hard in some parts of the shaft and will require blasting. This I will do as soon as I get a license from the Collector of the district. Depth from surface 23 feet. The washing machine is being erected, and I hope soon to have it at work. The bore hole is still in blue ground and down 106 ft. 6 in. I may mention that all the people who have been here have told me that I ought to put through the washing machine every bit of stuff that comes out of the shaft and all the surface soil on the property; and all say that diamonds must be here, but wants finding. Several very fine ones have been found here lately. Labour employed on the above and miscellaneous work. This being the festive season we have been taking a little rest.—*Indian Agriculturist*, March 9th.

TEA CULTIVATION ON THE BORDERS OF BURMA.—The *Rangoon Times* of 28th Feb., in an article on "Wild Tribes adjoining Burma," says:—

Between the plains of Yunnan and the plains of Keing Hung and other Shan States there are apparently wide belts of hills which none but savages care to live in. As long as they confine themselves to their hills, and do not interfere or molest their more civilised neighbours, we are not likely to interfere with them, and we must hope that they will be eventually tamed and acted upon by the example of the Shans and others in the Shan States, who will, we may be sure, in a very few years, reach a high stage of prosperity. The savage races are said to grow maize and hill rice as well as opium and ganja. Tea is also cultivated by some of them, which looks as if the Chinese had been settling near them. The tea grown in Ngwan Lon is said to be in great request in China, going overland to Jehan, and thence down the Yangtsee to Shanghai. By the time it reaches Pekin it is so expensive that none but the wealthiest classes can buy it. The Shans do not like the variety, saying it is too bitter. Mr. Hildebrand points out that if it were carried west to Rangoon, the carriage would not amount to a tithe of the present amount.

We presume that the tea referred to is the celebrated Puerh tea spoken of by Mr. Colquhoun and other writers.

THE CHINESE TEA MERCHANTS of Kiukiang are said to be much elated at the success of Chinese teas last season, giving good hopes that the tide has turned, and that the competition of the Indian leaf will be less and less keenly felt. We hear that contracts of from Tls. 700,000 to Tls. 800,000 have been already settled with up-country growers for the ensuing season.—*Shen Pao*, in *China Mail*, Mar. 27th.

COIR FIBRE ROOFING FOR FERNERIES.—In an account of the effects of the November cyclone on the Gardens of the Madras Agri-Horticultural Society, we find the following passage:—

Proceeding onwards we come to our large Fern House which was entirely unroofed, the bare rafters only remaining. However, by the assistance of a few extra coolies we re-roofed it before nightfall with the new plant shade material made of coir fibre introduced into the garden by Lieut.-Colonel H. W. H. Cox, but which was not largely adopted before, as it was thought probable that squirrels, &c., would help themselves to the fibre, and thus leave very dangerous holes through which the severe tropical sun might spoil any unique specimens that were underneath. Such happily has not been the case, and it remains untouched save by the omnivorous white-ant which can however be well guarded against by either having stone pillars to support the roof of the house, or what is perhaps better though more expensive, iron supports.

We suppose this is the open coir matting such as is in use in the Peradeniya Gardens?

NETHERLANDS INDIA SUMATRA TOBACCO Co.—With a capital of 125,000*l.* in 1*l.* shares, the Netherlands India Sumatra Tobacco Company has been formed to purchase and further develop about 33,000 acres of land in the province of Serdaang on the east coast of Sumatra. Of this property 28,500 acres belong to Messrs. Huttenbach and Co. of Deli, Sumatra, who have since the year 1883 been engaged in the cultivation of tobacco upon portions of it. Of the capital 123,000 shares are ordinary, and 2,000 founders', which latter will be allotted to the vendors, as also 41,000 ordinary shares fully paid as part payment for the properties sold to the company. The remaining 82,000 shares are now offered for public subscription. After payment of a dividend in any year of 10 per cent. on the ordinary shares, one moiety of the surplus net profits will be set aside to form a reserve fund until such fund reaches 100,000*l.*, the other moiety being distributed as an increased dividend to ordinary shareholders. After the reserve fund has reached the above limit the surplus net profits will be distributed as follows—namely 25 per cent. on the founders' and 75 per cent. on the ordinary shares.—*O. Mail*, March 15th.

THE PROSPECTS OF CEYLON AND INDIAN TEA are dealt with after an interesting fashion from the dealers' point of view by Messrs. Reinack's, Nephew & Co. in a review quoted by Messrs. Rucker & Bencraft. We shall give the review in full in an early issue, but meantime may mention that the prices of 75 qualities of China tea are compared with 5 qualities of Ceylon, 5 Assam and 4 Java. It is fully admitted that the public taste in England has changed and the flavour of fine Assams and Ceylons is now preferred to that of China tea. One advantage India and Ceylon are said to have over China is that while for the last there are "fresh crisp teas" for but three months of the year, and for the rest only a stale article, in the case of India and Ceylon fine teas are gathered and prepared "for fully six months during the year." We need scarcely say that Ceylon has a great advantage over India in this respect; for it may be said that tea is being gathered and prepared at the different elevations in Ceylon, "fresh and crisp" for ten if not twelve months, in the year, though not over the same acreage continuously.

MANUAL OF INDIAN AGRICULTURE.—We have to acknowledge the receipt today of a copy of a volume just published by Messrs. Higginbotham & Co. of Madras entitled "A Manual of Indian Agriculture" by that indefatigable compiler, Dr. John Shortt. From a glance at the volume, which covers some 320 pages with illustrations, we can see that it contains a good deal of useful information covering in some cases that taken up by our "All about" Manuals, but including besides indigo, date palm, plantains, castor oil, millets, arrowroot, vegetables, &c.

COFFEE GROWING IN ENGLAND.—At the meeting of the Royal Botanic Society on March 9th, a branch of coffee, thickly set with ripe fruit, from a plant growing in the Society's conservatory, was shown. Dr. Prior mentioned as a curious fact that in parts of Abyssinia the fleshy outside husk only was eaten, the part we use being thrown away as worthless. [Dr. Prior is a veteran Botanist: we met him at a Linnæan Society-anniversary and talking about the palmyra palm, he felt some difficulty in identifying it unless we could give him the scientific name. On rolling out: "Borassus flabelliformis," he at once said, "oh yes, I know exactly what you mean!"—ED.]

INDIAN TEA NOTES.—The weather has been warmer in Cachar. The days are becoming warmer in Durrug. On the 22nd South Sylhet had the first rain for 5 months. Seasonable weather is the news from Sylhet, Goalpara, Nowgong, Sibsaugor and Luckimpore. **DEHRA DUN, 19th March.**—We are having rather hot weather now for this time of year. The flush is coming on well. **MUCHERANDY, 20th March.**—Lushkerpore, South Sylhet.—Gardens are now beginning to suffer from drought. "Tipping" has not yet been commenced and it is likely the season will open later than last. **DEHRA DUN, 18th March.**—The weather is fine and warm, the bushes in the whole of the district are full of young leaf. Manufacturing will commence much earlier than last year, and we look for a bumper spring crop of a real good quality and a pretty tea. It is cloudy. If we get a good shower gardens will indeed look up in real earnest. **DARJEELING, 17th March.**—Slight thunder showers accompanied by hail have occurred during the week. There was very good muster of "A" Company Volunteers at Inspection Parade. The warm weather has commenced without doubt. **22nd March.**—"Tipping" commenced on some factories. Hot; rain would do good.—*Indian Planters' Gazette.*

COCONUT LEAF-DISEASE AND THE VALUE OF SALT AS A REMEDY.—We have been reading two notices of the disease which affects the leaves of coconut trees near Veyangoda, one addressed to the "Examiner" and another to ourselves. The latter which appeared in our columns recently seems inclined to trace the disease to slab rock or hardness of subsoil generally. The "Examiner" correspondent believes in salt as a remedy, as is evident by a paper which we quote, and, in view of differences of opinion on this important subject, we would suggest that Mr. Drieherg, the new Superintendent of the Agricultural School, should institute an exhaustive series of experiments so as to test the value of salt as a manure for coconuts and other products. We never said that salt had no manurial value, but that its value was exaggerated, and we held and hold still that to say that there cannot be too much salt in a soil even for coconuts, is a dangerous error. There are vast tracts in India rendered barren by a saline inflorescence. Both papers and a good deal more will be given in the *Tropical Agriculturist*. We call attention today, to two letters from Veyangoda on the subject, as also the valuable advice given by "W. J." in disposing of the superficial criticism in a letter signed "Planter" published last week.

COCONUT BEETLES.—The Superintendent of the Forest Department in the Straits Settlements is engaged in investigating the life history of the coconut beetles, which, it seems, are very destructive at the Straits. He mentions the fact in applying for a copy of "All about Coconuts."

RAMIE OR RHEA FIBRE.—On the recent trials of machines and processes at Paris, a broker arrives at the following general conclusions:—"An eminent firm of brokers recently informed me:—'There is no doubt that ramie is exciting great interest in many parts of the world, and many people are experimenting with various processes for extracting the fibre cheaply and quickly. We cannot say that any results submitted to us up to the present time are quite satisfactory. The fibre is either imperfectly freed from gummy matter, or the process breaks down in the matter of cost, or owing to the local conditions under which it must be carried on. We consider that no system of preparation which cannot produce the clean, unbleached fibre under £30 per ton is likely to succeed in establishing this article firmly in the estimation of English textile manufacturers.' This opinion expresses very briefly and clearly the conclusion at which I have arrived in connection with the preparation of the ramie fibre. It is quite possible that some machine or process will eventually solve the problem, but the exploitation of ramie, in spite of years of labour and the expenditure of large sums of money upon it, cannot be said to have yet emerged from the experimental stage."

PRICE OF PADDY has fallen very low in Rangoon. An upcountry correspondent writes to a contemporary that paddy which cost there R90 was sold at R80 at Rangoon. This is generally the case after the first two months of the year are over; but the tightness of the money market and the high rate of interest charged by the local banks have also had something to do with it. The Chinese merchants, who have exported rice to the Straits Settlements from Rangoon during last month, have made a good thing out of the business inasmuch as consignments of rice from Java and Siam which find their way to Penang, Singapore &c. have been short this season. In Rangoon itself the time honoured custom of purchasing rice according to the number of baskets has given place to the more rational system of buying by weight. This induces sellers to bring good grain into the market, instead of the rubbish brought in previous years, that gave a very poor return in the shape of rice.—*Indian Agriculturist*, March 16th.

SIR ALFRED DENT ON CEYLON TEAS.—Some time ago in one of our London letters there was a statement to the effect that Sir Alfred Dent—who has very extensive interests in Ceylon—had made remarks disparaging to Ceylon teas in comparison with China kinds. We could not help at the time, thinking there was some confusion, and we now learn from a correspondent who writes with authority that Sir Alfred Dent's interference was in a very different direction:—

In connection with the recent prosecution, Sir A. Dent has stated "that he thought great caution should be exercised in any prosecuting, as if dealers get to fancy that an Association had been started with the object of worrying everybody who chooses to mix Ceylon and China tea together, there is some risk of Ceylon tea being tabooed altogether amongst a set of men who might hitherto have been doing their best to introduce the new tea to their customers." Sir A. Dent therefore seems really to have been moved by a desire to do the Ceylon tea industry a good turn, and there is much in his statement requiring the careful consideration of the London-Ceylon Committee.

TEA IN SINGAPORE.—Mr. A. Annamalai brings us a sample tin of Singapore grown tea from his plantation on the Bukit Timah Road, and the tea will be duly tried. It is intended to sell it in tins, retail, at a dollar a pound.—*Straits Times*, 1st April.

THE PROSPECTS OF COFFEE in respect of high prices in the markets of the world, probably never were so good as at the present time. Stocks are comparatively low, and Brazil can only show short crops while there is no other coffee country to make up the deficiency.

CINCHONA BARK PROSPECTS.—While the anticipated increase in the supply of Java bark this year, is by no means formidable at 838,268 lb. (even if this averages 4 to 5 per cent sulphate of quinine) and while the Ceylon exports really seem at last to have received a check,—there is a new feature to be considered in the increasing supply from Continental India. The planters of Southern India following those of Ceylon appear to have begun to cut down rather recklessly, and as a consequence, at recent London sales, Indian bark has been offered almost as freely as Ceylon. The consumption of quinine, however, is steadily on the increase and there is good reason to anticipate a better market for bark ere long.

ANOTHER CEYLON TOBACCO COMPANY.—Mr. Thomas Dickson made it plain by his letters in our columns, that tobacco growing in Ceylon was engaging the attention of home capitalists, and Messrs. Cumberbatch & Co., now afford us definite information on the subject. Our compilation "All about Tobacco" has evidently appeared in the nick of time, for one effect of the working of two strong Companies in our midst will undoubtedly be to encourage careful garden cultivation—many planters and farmers who would not think of preparing and curing themselves, being ready to cultivate 5 to 20 or 30 acres with tobacco if they know that their crop is likely to be bought off their hands at a remunerative rate. It will be very satisfactory if the new enterprise brings life and activity into one or more of our almost deserted Colombo mill establishments.

DR. TALMAGE, the popular American preacher, has been lecturing on "tea" in a way that ought to help the movement for an increased consumption in America. His utterances are quoted by the *American Grocer* which characteristically takes exception—see page 743—to the reverend Doctor's depreciation of green and other similar teas. Now we maintain in the face of our contemporary, that all the Japanese teas, to the amount of 45 millions lb., imported into America, are artificially "faced." We have it on the authority of the largest American buyer with whom we travelled from Yokohama to San Francisco in 1884. The tea-drinking people of the United States, he said, will have their teas from Japan and largely from China, specially treated; the treatment and substances added (prussian blue, &c.) being distinctly deleterious. Now in the case of Ceylon teas, their absolute purity and freedom from all artificial matter can be guaranteed. We shall take care that copies of this *Observer* reach both Dr. Talmage and the *American Grocer*.

CINCHONA IN JAVA.—The Secretary of the Soekaboemi Agricultural Association, Java, sends us several copies of a sheet of "Statistics of the Java Cinchona Bark Crop" prepared by that Association. A list of 114 estates, with their managers, is given, the various Residencies being specified. Then come the headings:—1888: estimated crop in kilograms, content of sulphate of quinine, sulphate of quinine in kilograms; actual crop in kilograms, content of sulphate of quinine, and sulphate of quinine in kilograms. The estimates for 1889 follow in the

same manner. Out of the 114 estates 32 sent no returns, some had been abandoned, others had not yet come into bearing, and one had replaced the cinchona with tea and another with coffee. The totals are as follows:—

	1888 crop.		1889 crop.	
	Actual sulph. in crop in kilos.	Content of quinine in kilos.	Estimated crop in kilos.	Content of quinine in kilos.
Total..	1,326,687	414 54,861	1,605,900	420 67,509
Govt. cinchona enterprise*	350,000	4 14,000	450,000	4 18,000

Grand total ..1,676,687 411 68,861 2,055,900 416 85,509
* The content of sulphate of quinine is here given approximately, as the Association have received no reply from the Director of the Government cinchona enterprise to their request for statistics.—*Secretary*.

We shall be happy to send a copy of the circular to anyone wishing for it.—It will be observed that at 2,055,900 kilogrammes, the Java Cinchona Bark Crop for 1889 is estimated at 4,522,980 lb. or an increase of 838,268 lb. on that of 1888.

THE SO-CALLED COCONUT DISEASE.—We had a call yesterday from Messrs. W. H. Wright and Akbar—the well-known, enterprising estate proprietors, the former looking as hardy and well as if he were still coffee pioneering in Haputale, in place of coconut-planting in the lowcountry of Hapitigam Korale. But Mr. Wright does nothing by halves; he takes care of himself, his family and his coolies, by building thoroughly comfortable well-ventilated quarters, and then he takes special care about the water supply. Half the fever and dysentery among coolies in the Kelani Valley, Mr. Wright considers, is due to bad water: "now I do not allow my men drink poisonous surface water: I have a good deep pukka cemented well for them and they keep as healthy as coolies in Colombo." We commend the plan to estate owners in the Kelani Valley.—Mr. Wright is as full of confidence as ever in his coconut plantations, and both he and Mr. Akbar simply pronounce the outcry in a certain quarter about a palm leaf disease never seen before as unmitigated "bosh"! Mr. Wright says, that fifteen years ago the late Mr. Wm. Ferguson showed him in Kollupitiya a big group of coconut palms with drooping dying leaves, the result of the work of a small fly, appearing after prolonged drought. Very frequently since he has seen patches and trees similarly affected for a time. In 1884, a year of drought, Mr. Akbar had a number of trees in one of his Negombo fields affected, but by fumigation and manuring he speedily brought them round. The Veyangoda district, these gentlemen affirm, has, as a rule, a hard dry soil, and palms there are peculiarly liable to suffer from drought; but there is nothing new nor serious in the whole business. Mr. Akbar's Irrigation works continue to do splendid service, and the result in dry months such as have been experienced of late, is peculiarly satisfactory. The Mirigama district where Mr. Wright is located is the scene of greatly extended and successful cultivation of late years and throughout the Korale (Hapitigam), there is no appearance of any disease. Mr. Wright and other residents speak in high terms of the energy and public spirit of the Korale Mudaliyar (Dissanayake) whom we have long known as one of the most intelligent as well as experienced headmen in Mr. Saunders' Province. There is no question of low-caste folk being oppressed in Hapitigam Korale: all are treated fairly in coming before Mudaliyar Dissanayake. Belonging to an old and renowned family and with a long roll of good service of his own, this gentleman may possibly be selected by a new Governor as successor to the Maha Mudaliyar when the time comes for the latter to retire.

Mr. W. B. HUDSON, Secretary of the Behar Planters' Association, has gone on a voyage of discovery to Burmah, to find out if that rising young country can provide a means of livelihood for the numerous embryo planters who are now overcrowding Behar with precious little chance of ever obtaining enough to keep them decently. More power to your elbow, Paddy.—*Indian Planters' Gazette.*

THE CEYLON PLANTERS' AMERICAN TEA COMPANY.—We call attention to the Prospectus and Circular of this Company issued as a *Supplement* today and have to urge on all who are interested in the opening of new markets for our teas to do their best to support the Company. Possibly many of our readers may have already taken shares, but as we urge in our Overland Summary, it is the concern of all connected with our Tea Industry to wish well and, if possible, take part in the Company. The prospects of a remunerative business seem very good, apart from the indirect benefits.

THE AMERICAN TEA COMPANY.—A planter writes:—"Now is our time to show that we have the interests of Ceylon at heart, and in advocating the enrolment of the whole planting body as members of this Company is it not to the interest of every individual member that our teas should be better known and demand for same increased?"

OUR EXPORTS this week do not show much movement in coffee, cocoa, cardamoms, coconut oil, coir, or other palm produce, plumbago, ebony and minor exports, the additions being very trifling or *nil*. The only shipments worth speaking of have been about 157,000 lb. cinchona bark; over 680,000 lb. tea; 30,000 lb. cinnamon (bales) and 28,136 chips. The total of cinchona bark is now only 700,000 lb. in excess of last year at same date and much below previous years.

THE WORLD'S CONSUMPTION OF COFFEE AND TEA COMPARED.—There was an error in the figures given in a letter on this subject yesterday, inasmuch as our correspondent gave the consumption for coffee in non-producing countries, while we added that for tea all over the world. Taking the figures given in our estimates in Directory—as correct we believe as any to be got,—the comparison will run as follows:—

Total consumption of coffee throughout the world including that in producing countries...	1,917,440,000 lb.
Do. do. of tea...	1,357,500,000 lb.

Excess of coffee ...	559,940,000 lb.
----------------------	-----------------

We may be quite sure that the proportions will by-and-by be reversed.

UPCOUNTRY COWS.—We heard a very good and authentic story the other day, as illustrating the advance of civilization and the presence of native 'cuteness in our planting districts. In one of these not 100 miles from Nawalapitiya, a Colombo lady with young children took up residence in an estate bungalow and one of the first enquiries was about the milk supply. The appu went off on an exploring expedition and returned with a bottle of milk saying a man near boutiques on the roadside below, said he could supply any number of bottles 'missis' wanted and for 20 cents a bottle too. The milk was different from the Colombo article—put down to different feeding of the cow, &c.—but it seemed wholesome enough and the children got on all right for some days, until it struck the 'missis' that she ought to know more about the cows that yielded so freely, where they were kept, how fed, &c. The appu went down again with strict orders to spy out the land and he returned ere long with the news that "there were no cows at all: the bottles of milk were prepared from preserved tin milk, of which there was an unlimited supply in the boutiques." Tableau!

THE AUERBACH QUININE FACTORY, we understand has just secured an important contract from the Austrian Government for the supply of quinine. This contract was allotted to the factory in question after a thorough and most careful comparative examination of the purity of its quinine, and the Vienna agent for the Auerbach Works was informed by the authorities charged with the analyses that the samples submitted by him had given complete satisfaction. The Auerbach Factory has also secured contracts from the Russian and Dutch Governments this season.—*Chemist and Druggist*, March 23rd.

WE UNDERSTAND THAT APPARENT SUCCESS has attended the application to trees affected with GREEN BUG of a spray of carbolic soap and water followed immediately by a powdering of lime. Our informant says that neither the soap and water nor the powdered lime used separately acts so satisfactorily as the two together. He puts half a coconut shell of soft carbolic soap to an ordinary bucket of water and applies the liquid with an ordinary garden syringe to the under part of leaves upwards from beneath. The powdered lime is likewise thrown upwards from below and adheres to the wet undersides of the leaves. We can vouch for the bona fides of our informant, though neither he nor ourselves can vouch for the recipe as a certain remedy, but he is sufficiently satisfied with the effect hitherto obtained to persevere with the treatment. Considering the fatal nature of the pest where it has had undisturbed possession of the trees, we think our planting friends would do well to try the remedy. The cost of soft carbolic soap is about £35 per ton.—*Independent.*

COFFEE IN MYSORE AND COORG.—Mr. J. S. Middleton has just passed through Colombo on one of his periodical visits, this time on his way home after spending some time on his big property in Mysore. Mr. Middleton has on this occasion paid special attention to his coffee—some 300 acres of which are doing very well. He maintains that throughout Coorg and Mysore, coffee continues to flourish most satisfactorily, and he strongly advises Ceylon men—he is an old Ceylon planter of the "fifties" himself—with "coffee," not to lose heart, but to do their best for the old staple in the full hope of a good return. We know there are some fair coffee crops to be gathered this year in Ceylon. One lucky proprietor in a high district expects 4,000 bushels, a crop which will fully justify his reluctance to supplant the coffee with tea. To plant coffee with fresh seed after the Mysore fashion, in Ceylon, Mr. Middleton considers "an experiment well worth tryin'."

SALT FOR FARMERS.—As we are only anxious to ascertain the truth regarding the value of salt as a manure, we readily copy the following paragraph:—

The increase of the salt tax affects our meals and our industries. Salt is required for the formation of blood and various animal genes. Salt is given to cattle to prevent rot, scabid, intestinal worms and other diseases. It improves their appetite and promotes the power of digestion and modifies their natural timidity. It can be given in moderate quantities twice or thrice a week. Although salt is beneficial to the higher animals, it is decidedly pernicious to the lower orders. It operates fatally on cold-blooded animals, and it is therefore used to destroy worms, newts, and insects. Common salt is largely applied as manure for cereals and some of the root crops. Salt is also a good manure for coconut plants. The antiseptic properties which common salt possesses regulate the decomposition of farmyard manure. It is therefore a farming economy to cover the ready-made or sufficiently fermented heaps of dung with a layer of salt when the dung cannot be carted at once, in order to prevent the loss of valuable fertilizing constituents of this dung by too prolonged a fermentation, and at the same time adding salt itself to the value of the manure.—*Industrialist.*

What we now want is a series of careful experiments in Ceylon.

"BENEFACTORS OF THE CEYLON TEA INTEREST!"

With reference to our remarks on the immense importance of multiplying Agencies all over the world for the sale of Ceylon teas, it is of some interest to place on record the names of those who have already opened Establishments: *pour encourager les autres!*

Special Agencies for the sale of Ceylon Teas:—

London:—Messrs. Shand and Haldane.

" " John Tyndall & Co.

" " Buchanan Bois & Co.

" " Mr. W. A. Massingham.

Bournemouth:—Mr. F. J. Horsfall.

Sheffield:—Mr. J. A. Robertson.

Glasgow:—Messrs. Jas. Wight & Co.

" " Rogers & Bett.

Edinburgh:—(?)

Aberdeen:—Mr. Wm. Westland.

Dublin:—(?)

Philadelphia:—Messrs. J. McCombie Murray & Co.

Melbourne (Victoria):—Mr. S. W. Foulkes.

Adelaide (S. A.):—Messrs. Drummond Brothers.

Sydney (N. S. W.):—Messrs. D. W. Campbell & Co.

Albany (W. A.):—Mr. H. Piessene.

New Zealand:—Mr. J. F. Wingate.

Tasmania:—Mr. Geo. Finlayson.

The above are apart from a great body of selling agencies which blend Ceylon with other teas. There are some blanks in our list and no doubt many other names to be added which we shall be glad to learn. A member of the mercantile community remarks:—"I cannot add to the enclosed list. There are many people like myself who try their best to get people to take Ceylon tea and who do get them and their friends to take a fair quantity, but there are no other special agencies I know of. But I do think that the Clan Line of steamers, and I think the Norddeutscher also, take nothing but Ceylon tea, and by doing so do spread the taste for Ceylon tea far and wide." Another member says:—"I think I might also claim to be a 'benefactor' in view of the many thousands of pounds of Ceylon tea I have disposed of direct to the consumer in all parts of the U. K. ever since 1883, *vide* my advertisement in your *Overland* issue. I might almost say that I set the ball a rolling in this line."

TEA IN RAKWANA.

Ratnapura, April 3rd.

The veteran planter and merchant, Mr. O. Shand, looking hale and hearty, has escaped from Colombo heat to the hills of Rakwana where he intends to stay a month for a change. He could not have arrived at a better time to see what Rakwana tea can do in the way of flushing, for the late rains have sent out flush after flush, faster than it can be secured.

Several natives have got tea properties in Rakwana, and one specially enterprising man named Nicholas has got 50 acres of fine jāt in full bearing, and he is going in for every European appliance for curing, even to a Jackson's hand roller, which is being erected in a fine new iron-roofed store, now almost finished.

The villagers from the surrounding lowcountry make 50 lb tea boxes, from the jungle mango wood, and deliver them at the tea stores for 75 cts. each, and transport to Colombo only costs 1 ct. per lb, which rates cannot be complained of, and ought to help to make Rakwana tea a paying investment, should prices keep up.

Spring Vale estate was sold by Fiscal last Friday, at the instance of the mortgager, who let it go for R9,000, about $\frac{2}{3}$ of the mortgage amount. Mr. Justice Dias' superintendent of Depedene, the adjoining estate, purchased for his chief, who is lucky to get nearly 150 acres of fine tea almost all in bearing for such a low figure.—*Cor.*

WOMEN AS DEALERS IN TEA.

20th March 1889.

(Extract from "Ceylon Observer.")

WHAT SHALL WE DO WITH OUR SURPLUS WOMEN?

"I am very patriotic and I cannot understand why America should be so much to the fore just now; why American newspapers should take offices and publish themselves in the Strand, without even changing their names, or why American women should secure so many prizes in the English matrimonial market, when we are left with a superabundance of spinsters in our midst. It made me sad to be told, too, on good authority by an English official, that at a recent declaration by the Government of thirty vacancies for female clerks in the Post Office, all of whom must be educated young women, able to pass a somewhat difficult examination, there were 8,600 applicants. What are we to do with our surplus women? This is, I think, one of the most important question of the day! *How can we help to solve it?*" PENELOPE."

DREAMY THOUGHTS INDUCED BY THE ABOVE MOMENTOUS QUESTION—BY A KNIGHT OF THE CEYLON TEA BUSH.

"The women then began
To quarrel with the men."

(Old English song.)

What has been the net result of the heap of nonsense that has been written of late years upon the still vexed questions, "women's rights" and "what shall we do with our daughters?"

Well! assuming that, with regard to the first question, women *have* "rights," why do they not combine and set about vigorously to exercise them; if they would carry out thoroughly the following suggestion, they would at once solve the second question "what shall we do with our daughters?"

My plan is simply (?) this. As probably not one man in a thousand cares, or, if even he did, *dares*, to interfere with the tea department of his household, why should not the ladies make this department distinctly their own? It only requires a good leader and my proposed transformation would speedily be accomplished. One has only to consider the thousands of women at present employed by the Post Office, and the thousands more employed as clerks, to see that "want of organization and business habits" could scarcely be the causes which would result in the failure of my scheme, supposing it were taken up with something like the enthusiasm it deserves. From the buying of tea in Mincing Lane, or even its importation direct from India and Ceylon, down to its final distribution amongst *all classes* of the community, why should not the grand enterprise be conducted throughout (excepting of course the "haulage" where men's services must be employed) by women and women alone?

How many gentlemen of the present day, retired officers of the Army and Navy, men from our universities, &c. &c., find profitable employment in establishing themselves as agents for the sale and distribution of products which closely concern their sex and in which business women, as a rule, do not care to interfere. I refer, of course, to the enormous business done in the supplying of wines, spirits, cigars, tobacco, &c., &c. &c.—a far vaster business than the tea trade could be ever expected to become!—Well, let the gentlemen keep to this class of business and *as gentlemen* leave the tea business to the *ladies!* Surely there is no

great hardship in this proposition, seeing that men have for years past very ungalantly pocketed vast profits from tea and yet all this time marriage has assuredly been going slowly more and more "out of fashion"! Let these profits out of tea go in future to the ladies, and who can tell in how short a space of time the prospects of the marriage market may not become improved? What article of commerce so well suits women to administer as tea? It is, in this respect, without an equal. The demand for tea is ever on the increase, the supply never fails, but is always augmenting, and prices have now got down to so low a level that losses in the retailing of tea would seem wellnigh impossible. Fashion in tea changes not: unless tea is absolutely unmerchanted, a customer for every ounce of it can eventually be found, as we poor tea planters know to our cost. One can hardly suppose that, seeing they are the principal drinkers of it, women would be as guilty as men have been in foisting off worthless rubbish on their sisters. But in the struggle for "bawbees" perhaps there would not be a pin to choose between some of them in this respect! I might comment on the anomaly of men administering ladies' dress departments. Anyway we men would consider it an anomaly if the ladies were to take up our tailors' rôle—but I would not attempt to interfere here or the ladies will all be up in arms for my *daring to interfere with their rights*!!!

Well let the fiat go forth, after the "Ladies' Tea Rose League" has been floated, and let the women of England for ever afterwards carry out their determination never again to buy tea except from women, and the boycotting of the men will be complete! Victory would speedily be proclaimed all along the line and (well! surely not!) the men would, or rather could, not dare to complain. Women of all classes of the community would be enrolled. Unless women administered the tea departments in the Army and Navy and other large household stores, women would at once cease to buy their teas there. The same down to the smallest shops in old England; and women of every degree would be free to enter upon the business without let or hindrance. Their success would be assured from the moment that their millions of sisters carried out their resolve to purchase tea *only from women*. If only to secure the fortunes thus made, men would soon be found bowing the knee, as of old, to women! This is how I would solve the above question put by your London correspondent "Penelope."

MIND YOU MY SUGGESTION REFERS ONLY TO TEA.

Honors (of various grades) à la "Primrose League," would of course be annually distributed by the annually installed Worshipful Mistresses to the most deserving dames and spinsters. *Secrecy*, fortunately, not being required; my scheme could be safely worked on FREEMASONRY lines as regards its organization and ramifications. Women dealing in tea would be free to buy it wherever they liked and of any quality (or absence of it) as best suited to their particular circle of customers; there would be no interference here. But in time no doubt we should witness a revolution even in this, for why should not special "tea trade mark brands of the League" be eventually established, the names becoming just as much "household words" as Epps, Fry and Cadbury for cocoa, Huntley, Palmer & Co. for biscuits, or even greater examples still Bass, Allsopp and Guinness? The retailing of tea in a loose state will soon be confined to those who cannot afford to buy even the smallest leaden packet; thus the trade will become in every way

more and more suitable to women. The time is ripe for the change,

AND HALF-MEASURES WOULD BE SIMPLY FATAL.

SALE OF ESTATES.

Wilton estate, Kelani Valley, the property of Mr. A. J. Thackwell, has been sold, we are told, to a native for R17,000, while according to our Directory, the property covers 145 acres of which 100 are planted and plucking is going on over 80 acres we believe. The advertisement stated a total of 183 acres and 80 planted. This is an extraordinary bargain and the more strange because we heard that there would be brisk competition on the auction day. It has been sold though by private arrangement; although specially advertised for sale on the 11th at 2-30 p.m., nothing being said about "unless sold privately." Now, gentlemen who have inspected the property calculating on an auction sale will have cause to complain if not a claim for expenses?

Another sale is of Chertsey estate in Kelani Valley by Mr. Ross-Wright to Mr. Fyler: this is a small place of 55 acres, 50 planted.

Ittaliadde estate, the property of the late Mr. Luke F. Kelly, was put up, says the Kandy correspondent of a contemporary, for sale at Queen's Hotel, Kandy, last Saturday, at 1 p.m., by Messrs. Jansen & Co. The estate is 1½ miles from the town of Matale, and it is said to be well adapted for tea, tobacco or cocoa cultivation, and is 60 acres in extent. There were two gentlemen competing at the sale. Mr. A. M. Hurst's bids ranged from R1,000 to R2,150, and Mr. J. H. Barber's from R1,000 to R2,500. The estate was finally bought in by the administrator, Mr. L. H. Kelly, after Mr. Barber's bid. Mr. F. A. Prins, the administrator's lawyer, was also present during the sale.

HOW TO PUSH CEYLON TEA.

Every little effort helps. No suggestion tending to promote a demand for British-grown teas should be despised. And accordingly we would direct attention to one possible means of moving a certain considerable section of good people in the old country to give up entirely patronising China tea, in favour of the Ceylon or Indian article. When last in England, in the interests of our cinchona planters we addressed the editor of the *Friend of China*—the organ of the Anti-Opium Society which has Sir Joseph Pease at its head—a long letter which he was good enough to publish, demonstrating that the best possible means of checking the craving for opium in large districts of the Celestial Empire, as of the drinking of laudanum in the low flat malarious Fen districts of England, would be to promote the distribution of quinine which had fallen to a price that might enable philanthropists to distribute it among thousands if not millions of poor people.

Our present appeal to the good friends who raise a big cry every year in England, over the opium iniquity, would be on different grounds, and it is an appeal in fact that might be supported, if not forwarded, with practical effect by our Planters' Association. Perhaps some of our readers may have heard how in the days of the great anti-Slavery agitation, sixty years ago or so,—in many homes in England, slave-grown sugar was forbidden to be used and the greatest care was taken, even at enhanced prices, to buy only sugar grown through free labour. That was one means adopted by earnest opponents of slavery to try and check its influ-

ence. In the present session of Parliament a notice of motion has been given as follows:—

Sir Joseph Pease will move at an early day.—That this House is of opinion that the system by which a large portion of the Indian Opium Revenue is raised is financially unsound and morally indefensible, and would urge upon the Indian Government that they should cease to grant licenses for the cultivation of the poppy, except to supply the legitimate demand for opium for medical purposes. We would now venture to call on all good people in the United Kingdom who earnestly desire to see no Indian-grown opium imported into China, to remember that there is one way in which they can practically check such importation. The only means by which the Chinese can get the money to pay for the opium imported is by selling their products to be exported, the greatest of which exports by far is tea. Let every member of the Anti-Opium Society then give up drinking China tea, and do all in his power to influence others to give up drinking such tea, and to take to the pure Ceylon or British-grown article only, and each one so doing may depend upon it that a decided step will be taken to check the opium traffic with China. In fact, this will be giving a direct blow at a trade which is considered accursed by so many good people in the old country. As regards Ceylon tea, we need scarcely say that while it is a thoroughly pure, wholesome article in itself, it is grown and prepared by free labour.

TEA BENEFACTORS.

Our contemporary of the local "Times" in taking over our list of Ceylon tea Agencies, makes a regular muddle in his attempt to add to it by including all the "Sirocco" Agencies of Mr. Davidson, Belfast, although that gentleman has never set himself up specially to sell Ceylon, but rather Indian, teas. We do not suppose that even Mr. Garioch in Aberdeen nor Mr. R. B. Arthur in New York devote their chief attention to the Ceylon product. Mr. Davidson is known to get a great deal of the tea he sells from his own gardens in Assam. We attract attention to an extract on page 743 from the *Indian Planters' Gazette* giving an account of the New York Sirocco Agency.

Our list was specially confined to Agencies which had been established primarily for Ceylon teas and the business of which was chiefly confined to our product. If we went in for Tea Agencies generally, such as the Sirocco, our list could be made to cover some columns. The only names properly added by the local "Times" are T. Gray & Co., London; the Ceylon Teagrowers Company, Limited; Mr. N. D. Galbraith, Ontario (?). Since writing the above we have been favoured with the following additional and full list from a well-informed quarter:—

CEYLON TEA FIRMS IN LONDON AND ELSEWHERE
(ADDITIONAL.)

The Ceylon Tea Growers, Ltd., Basinghall Street, London.

The Ceylon Tea and Coffee Co., Ltd., (Ames's) Golden Lane, London.

The Ceylon Tea Co., Mincing Lane, London.

The Ceylon Tea Co., (Hewetson's), Mark Lane.

The Ceylon Tea Agency, Lower Thames Street, London.

The Ceylon Tea Producing Agency, (J. R. Tyler's), Seething Lane, London.

The Ceylon Planters' Stores and Agency, (W. H. Davies & Co.), Catherine Street, London.

The Pure Ceylon Produce Co., Seething Lane, London (J. M. Robertson).

West End Agency (Mr. Tranchell, junr.)

William Ronald (and brother), King's Road, London.

Reginald Sparkes, Goldalming.

Do. do., W. Brompton, London.

Frank Davies, (W. H. Davies & Co.), Wolverhampton.

T. Luker, Senr., Stroud.

Many of the above commenced doing business in Ceylon tea when the exports were counted by thousands and not millions of lb.—*Cor.*

A Merchant writes:—

"The local 'Times' gives credit to Sirocco Tea Co. as being exclusively sellers of Ceylon tea, but this is not so. Davidson has his own estates in India, but he does occasionally buy Ceylons. You should suggest that Davidson should take at least half and half (India and Ceylon.) They do a good business, and are very enterprising. R. B. Arthur will, I'm sure, have the greatest possible pleasure in pushing pure Ceylon teas if Davidson permits him to do so."

AGRICULTURE IN INDIA.*

The globe trotter that scampers round the world in three months more or less, has the chance of picking up a great deal of knowledge of the lands he visits and of the customs of the people who inhabit them,—social, political, and commercial. Many of those who make the grand tour in those work-a-day times, condescend to enlighten the stay-at-home world, with the facts and fancies they have gathered by the way; in newspapers, magazines, and pretentious volumes of four or five hundred pages. As the bare facts that have come under the notice of the writer would be but dry fodder for the reading public of Britain to make the article interesting or the book saleable, he must draw on his imagination; he must extend his notes into something more interesting than facts. "Travellers' tales" have ages ago passed into a proverb, so that intelligent readers take their fare with a grain of salt, but they often salt the wrong mouthful and swallow unseasoned the least wholesome morsels. The power of disseminating crude and hastily formed opinions among the untravelling public is in proportion to the social standing and the literary ability of the writer. Not the least misleading of those travelling story-tellers is the man who has enquired some reputation as a specialist, who has on scanty evidence formulated certain opinions on subjects in his own department connected with a foreign land, and goes abroad to collect evidence in support of them.

Robert Wallace, Professor of Agriculture in the University of Edinburgh, seems to be one of this latter class, a man of amazing energy and boundless self-confidence, who came out two years ago to study Indian Agriculture on the spot. During the 126 days of his visit, he travelled at the average rate of over 100 miles a day, exclusive of a sea voyage to Ceylon. One would imagine that it was hardly possible for even the most powerful and voracious intellect to master the details of a subject so large and complicated as Indian Agriculture under such circumstances, especially as he seems not to have gone always to the most trustworthy sources of information. With such facts as he collected in the course of his rapid movements, he proceeded on reaching home to promulgate very decided views in his lecture room in agricultural journals, and finally in a volume of some considerable dimensions.

Mr. Benson of the Madras Agricultural Department, has just published in pamphlet form a review of this work, which is well worthy of pe-

* "India in 1887 as seen by Robert Wallace." A Brief Reply by C. Benson, M.R.A.G., Assistant Director of the Department of Land Records and Agriculture, Madras. [Addison & Co., Madras, 1889.]

rural by all who take an interest in the subject. Only a few in Ceylon have probably seen the Professor's book, and those who read Mr. Benson's review are not likely to purchase a copy, as it is heavily discredited by one who has had all the advantages of the special education that the Professor himself enjoyed, to which however he has added fifteen years of Indian experience in his department.

The matters dealt with in this pamphlet are quite as important to Ceylon as India, and the opinions of a man of Mr. Benson's attainments and experience is worthy of full consideration.

INDIAN TEA COMPANIES.

On page 757 we have reproduced a table which cannot fail to receive attention from our tea planters who want to form some idea of the working of the great Indian Tea Industry. The statistics given by Mr. Henry Earnshaw are very full and apparently compiled with the greatest care. We proceed to remark on the more prominent facts.

This table of results is for some of the large Indian Tea Companies (registered in London) in season 1887 and it reads unpleasantly in April 1889, for a fall of at least 2d or more per lb. in the interval, in the selling price at home, seems to sweep away the bulk of the profits mentioned in line A. "Commission to managers," we see, ranges (reckoning exchange,) at from $1\frac{1}{2}$ to $3\frac{1}{2}$ Ceylon cents per lb. These commissions to managers will also be in danger of being swept away, we should imagine.

The two largest Companies mentioned are the "Assam Company" yielding 2,118,106 lb., and the "Land Mortgage Bank of India, Ltd.," yielding 1,969,168 lb. The first (costing £23-10-8 capital value per cultivated acre) is said to have a reserve fund (on capital of £187,160) of 20-62 per cent, or say roughly £37,432. The gross proceeds of the tea in 1887 are stated to have averaged 1s 1-41d per lb. yielding a profit to the shareholders of 1-86d per lb. Now the average price of 1,787 packages of this estate's tea for week ending 22nd Feb. 1889 was but 11-4d per lb., or a loss of fully 2d per lb. compared with 1887. At this rate of loss on an annual crop of, say 2,000,000 lb. of tea, it will take only about two years to swallow up the reserve fund. In the case of the second Company (the Land Mortgage Bank of India, Ltd.) instanced, there appears to be no reserve fund to fall back upon and as the capital paid up is said to be rather more than £344,000 representing capital cost £42-15-11 per cultivated acre and the profit in 1887 was only 1-76d per lb., it seems impossible for such a huge Company, yielding nearly two millions lb. of tea in 1887, to go on many years longer, unless indeed prices improve.

The Borokai Tea Company, Ltd., with a paid-up capital of £43,560 and 1,038 acres cultivated costing about £42 per acre—(say roughly R630)—the yield being 331 lb. per acre giving a crop in 1887 of 310,800 lb., average cost of which is stated at 9-82d per lb. seems to have yielded a profit in 1887 to the shareholders of 6-27d per lb., the average gross proceeds per lb. being 1s 4-09d. Ceylon men might gather some useful hints from the factories and mode of plucking adopted on this estate. Where is it situated and what is the distance from the shipping port, and what is the mode of transport? Perhaps some of our correspondents and readers in India can give us this information. Notwithstanding the high cost per acre of tea the shareholders' profit per cent on capital in 1887 is placed at 18-67 per cent (D)—topping in this respect every other Company.

The British Indian Tea Company deserves notice, because the cost per acre of tea is put down at no

less than £119 8s 9d, say 2,039 cultivated acres representing a paid-up capital of £243,300: this estate must be well managed; for, over its 688,886 lb. the average total cost per lb. was apparently only 7-02d although the gross proceeds average per lb. was only 9-15d per lb. After giving 0-11d per lb. to the manager in commission, it left a profit to the shareholders of 2-02d per lb., the yield per acre being 396 lb. shareholders' profit in capital being very low only 2-38 per cent. But before long, where will be the capital representing £119 odd per acre cost of tea? The table in its fullness is an extremely interesting statement to lay before Ceylon tea planters at the present moment, as it clearly proves, we think, that they have much to be thankful for. Indeed, unless Indian tea gardens can afford to work much cheaper than they appear to have been doing, many of them it is evident must soon be snuffed out.

THE FISH-CURING INDUSTRY IN MADRAS AND CEYLON.

We have received a copy of the proceedings of the Madras Board of Revenue submitting to the Government a report on the fish-curing operations in that Presidency during the year 1887-88. It appears that the number of yards on the Madras coast actually worked during the year, was 145 against 141 in the previous year, and the weight of fish brought to be cured was 37,495 tons against 30,373 tons in the previous year, so that 23-4 per cent increase was shown on 1886-87.

The figures given for fish-curing in Ceylon look insignificant, indeed, when compared with the above. In 1887-88 there were only three yards worked even at Hambantota and Gandara in the Southern, and at Udappa in the North-Western, Province. The fish cured in these three yards was only 524 tons against 37,495 tons in Madras.

The financial results of the operations in the opposite Presidency during 1887-88 were also very satisfactory. The receipts during the year amounted to R100,378, and the charges to R86,325, resulting in a net profit to the Government of R14,053. Whereas in Ceylon the total receipts were R3,726-56 The expenditure being 2,862-45

leaving a net gain of R864-14. Nevertheless, if we calculate the percentage of gain upon the amount expended, we get the following results:—

Madras.. ..	16 $\frac{1}{2}$ per cent.
Ceylon	30 $\frac{1}{2}$ per cent.

The reason for this great difference is apparent. The expenditure incurred in Madras for buildings, clerical establishments and contingencies is on the whole rather considerable, whereas in Ceylon the yards are cheaply constructed and a very small amount is expended for establishments.

The Hon. Mr. Ravenscroft, Auditor-General, who has devoted much of his time and attention to this subject, properly observes that the ordinary rule "will it pay?" should not be too strictly applied to the fish-curing experiment at least while it is still in its infancy. In this opinion the Board of Revenue in the Madras Presidency seem to concur. They say any increase in price beyond what is necessary to secure the Government from loss is to be deprecated as likely to check the growth of the industry. The tendency, therefore, to make a profit by increasing the price of salt should not, we think, be encouraged.

We agree with Mr. Ravenscroft when he says that the fish cured in the Government yards is far

HENRY EARNSHAW, 14, ST. MARY AXE, E.C.

superior to the preserved fish procurable at the bazaar; but the Madras Board of Revenue correctly observe that the fishermen evince little or no interest in these curing experiments. It is so also in Ceylon. This should not, however, discourage the officers in charge who, as in so many other instances, in dealing with orientals, must just systematically carry on their operations until their labour is at length crowned with some measure of success and native ignorance and apathy gradually overcome.

One question to be answered, however, seems to be, "Have we sufficient fish in Ceylon for curing purposes?" It is said that the fresh fish conveyed daily by the seaside railway to Colombo is by no means sufficient to meet the requirements of the population of the metropolis. During certain seasons of the year it is true fish is very plentiful, especially at the ports where the curing process is carried on at present. But as the railway is extended southwards, may we not find the available fish supply more and more drawn on for Colombo and the Central Province? One good result may be an increase in the number of fishermen and of fishing boats, and no doubt with so dense a population as occupies our South-western coast districts, a wider market for the "harvest of the seas" would lead more of the Sinhalese to turn their attention to the occupation of those who venture over the coral reefs in order to earn a livelihood.

COCONUT CULTIVATION.

FUMIGATION.

(By an Old Planter.)

In conversation with a recent convert to the smoke bath theory, he said I was setting up my single opinion against the experience of many practical men, as well as the teaching of the local Agricultural School. I replied that I would always do my little best in battle with unscientific nonsense wheresoever I met it; that I had met very few practical coconut planters, who either observed facts accurately or reasoned logically. As for the Agricultural School, if it is really teaching us absurd and scientifically groundless theories as any it proposed to supersede, the sooner it was closed up the better for the interests of true knowledge.

When this smoke theory was first promulgated about eighteen years ago, its inventor claimed no more for it than that it drove the kurumia (beetle) out of the trees. That after a time the ravages of this insect was greatly moderated there is no doubt, but simultaneously with the application of the smoke cure a reward was offered for the delivery of grubs. It was a populous district with plenty of idle boys and soon every dung heap, every rotten tree, every heap of decaying vegetable matter in the neighbourhood was ransacked. Grubs were brought in thousands and the search continued till it became unprofitable. All the effect was ascribed to the smoke and nothing to the grub hunting to which it was really due.

The coconut field subsequently under the management of this gentleman, was of small extent under thirty acres. It was in good heart when he took charge, and its crops had been annually increasing for seven years; within or adjoining it were coolie lines, watch huts, cattle sheds, and cinnamon wāliyas. Here the smoke treatment was carried out in full swing, and to it was ascribed the fact, that mature coconut trees, on a specially suitable soil, continued not only to maintain their former rates of bearing, but occasionally exceeded it; all the sources of natural and artificial manuring were ignored and smoke alone was declared the one all-sufficient manure for coconut trees.

Those who have no tincture of agricultural science are easily led by any big mouthed charlatan, who puts forth a high sounding claim on their credulity. Who would go the trouble and expense of accumu-

lating dung heaps, manipulating the soil, and purchasing costly artificial fertilizers, if their credulity extended to the belief that an occasional smoke bath was all the coconut tree needed to flourish and yield large crops?

A fact that no one disputes is that in the vicinity of a set of lines, a bungalow, a watch hut, or any other building where men or animals dwell, young coconuts take an earlier start, and keep ahead of the outlying field. The old Sinhalese way of accounting for this fact is the assumption that the coconut plant loves the human voice and feels lonely and dejected when deprived of its music. A more rational theory is that wherever men and animals have their home a process of natural manuring is in constant action, quite equal to the effect in question.

I offered this solution of the problem to an esteemed friend, who gravely told me, that the small quantity of nitrogenous matter brought to the spot by the living creatures located there was quite inadequate to the effect produced, but that the smoke from time to time raised in or about the dwelling was the true cause.

Being a rather slow thinker, and not having the facts and arguments on which a long unchallenged opinion rested in battle array, I could on the instant only state my dissent from both my friend's propositions. Since that time, however, I have been frequently called on to turn my attention to this subject by information, that the belief in the efficacy of smoke, and the practice of raising it, was rapidly spreading and finally as above stated that it had been taken up by the teachers of the Agricultural School and thus likely to become a leading feature in the coconut cultivation of the future. I have therefore accepted it as a duty, to do what I can to refute an erroneous theory, and check a useless practice.

The standard authorities in such matters tell us that the food of plants consist of certain elements derived from the soil in a state of solution through the roots and of certain atmospheric elements absorbed by the leaves.

That more than nine-tenths of the bulk and weight of all vegetable tissues consist in varied specific proportions of the four elements,—carbon, oxygen, hydrogen, and nitrogen.

That the elements derived by plants directly from the atmosphere are only carbon and oxygen and that all their other specific component elements are derived from the soil.

That the conditions of the perfect healthy development of any given terrestrial plant are sufficient room above ground and an unfailing supply underground of its specific elements in a soluble state with water enough to solve them.

Oxygen and carbon being permanent constituents of the atmosphere there can be no question about their sufficiency for all the animal and vegetable wants of the globe. Were it possible for a deficiency of these elements, to take place, mankind would cease to care for the life of plants and seek only to save their own.

If it is believed that coconuts absorb smoke directly, such belief can only rest on the supposition that there is a deficiency of carbon in the air,—a proposition beyond the region of demonstrable facts. It has been ascertained that the proportion of carbon in the air differs at various times and in different places, but at no time and in no place has the question ever arisen as to its sufficiency for the wants of vegetation. It is more probable that the supply of carbon in the atmosphere is in excess of the wants of vegetable life, but if such should be the case plants will absorb no more than their due specific proportion of that or any other of their constituent elements.

I am reminded of an anecdote of Charles II. by the speculations of "Siyane Korale." At a *seance* of the Royal Society, H. M. proposed to the assembled savants the following problem:—

If you put a basin with water into one scale of a balance and a corresponding weight into the other, how, or by what law of nature is it that if you put a fish into the water in the basin it will not turn the beam?

The wise men went to work on the question and several explanations were offered, when his Majesty, turning to a member who had remained silent, demanded his opinion.

"I beg your Majesty's pardon, but I deny the fact," was the prompt reply.

"Od's fish man, you're right," cried the king.

S. K. is not prepared to admit that coconut trees gulp down smoke in mouthfuls like a hungry dog, but he is not prepared to deny that good may be done to the tree in some indirect way. It would have been easier to deny the fact like the sage who would not be humbugged even by a king.

To return to the original argument, a field of coconuts is planted and a watch hut erected in the midst of it. In the course of a few months the plants in the immediate vicinity of the hut take the lead of all other parts of the field, those nearest the hut being foremost; but the more rapid growth being more or less marked within a radius of one hundred feet. My friend and myself are in perfect agreement as to the fact, but we differ widely as to the cause: "Smoke," says he; "Manure," say I. "There is not sufficient manure made on the spot," says he. "No amount of smoke can produce any beneficial effect," say I. "I have seen the most wonderful results from occasional fires," says he. "I take you up on the proposition that the amount of manure, made on the spot, is not adequate to the effect," say I. The watchman establishes himself in his hut, in company with a dog; later on he adds to his stock a cock and three hens, and finally he buys or borrows a bullock. The annual manurial value of a single fowl has been authoritatively estimated at ten pence; let us say fifty cents. We cannot value the dog at less than two fowls, or the man and the bullock at less than six fowls each. The value of the whole annual produce of manure being thus R8 00. This sum will purchase and place on the spot nearly 300 lb. of castor cake, a manure, of which we know the market value and its measure of fertilizing matter. It contains everything that a young coconut requires from the soil; the quantity named will give each of 70 plants over 4 lb. yearly, thus supplying an amount of fertilizing matter much beyond the requirements of the plant, during the first three or four years. In natural manuring all the fertilizing matter being left on the surface, one half of its effect is wasted in weathering, so that the same amount of manure turned into the soil, three or four inches deep, will give a double result.

The advantages of manure in coconut cultivation are already fully established, scientifically and experimentally, but those of smoke have still to pass those ordeals, before they can meet with acceptance by any man with a tincture of scientific knowledge and a habit of scientific enquiry. Such an one will set no value on a loose assertion, but will probably ask you to select a tree whose stem has gradually dwindled from one foot to six inches with eight or ten leaves, six or eight feet in length and that has long ceased to produce even barren flowers. Restore this tree to a moderate measure of fertility within three or four years by the application of smoke without stint or limit, but *smoke alone*; the most sceptical will then be silenced, unless a flaw can be found in the experiment. It should always be kept in mind that when great results are claimed for an agent hitherto overlooked by practical men, and in which scientific men have not discovered any of the qualities necessary to the production of such results must be subjected to the severest tests before it can gain the confidence of any but the most ignorant and the most credulous of the people.

Those who believe in the manurial value of vapour—Fumists as they may be called—do not belong to the class of minds that need philosophic tests to base their opinions on. The last fumist with whom I conversed had nothing stronger to urge in its behalf than the naming of several parties that were practising smoke raising, and the teaching of the Agricultural School. These were in his view proofs positive. On the other hand, those who know that the claims put forward by the fumists are incompatible with well

settled facts, will probably allow it to run its course, and end as it began in smoke.

[Our old correspondent is, doubtless, justified in making light of the manurial value of smoke, which must, even if of good volume at starting, be largely attenuated by the time it reached the heads of the palm trees at an average altitude of say 70 feet; but we cannot help thinking that the smoking process must have a beneficial effect in clearing or keeping clear of insects, rats, &c., the fronds and spathes of the trees?—Ed.]

COFFEE AND TEA CONSUMPTION.

We confess we did not realize the importance of the question started two days ago in our columns and referred to again yesterday, in regard to the relative consumption of tea and coffee throughout the world. The common belief probably is, that tea is in far more request and that the quantity grown and passing through the markets of the world is far greater of tea than coffee. This idea has no doubt been fostered as much by the figures used in statistics as by the fact that tea is so much the more popular beverage throughout Great Britain and its dependencies. Tea being always given in lb., while coffee is referred to in tons, bags, piculs or cwt., has, we think, made the totals of the former look the more formidable. But we think the comparison we afforded yesterday is enough to show our readers that there is actually, weight for weight, far more coffee than tea grown and consumed in the world.

Our correspondent, however, returns to the charge, and he asks, with much force and pertinence, 'what have we tea planters and dealers to do with the consumption of tea in China, Japan, Java or in any other producing country—what is the practical use of giving us a comparison which includes the home consumption of the tea producers?' What is wanted is a comparison between the quantities of coffee and tea actually thrown on the markets of the world; for it is out of these figures that a lesson of much practical importance at this time can be evoked for the benefit of those who fear for the future of tea.

We all know that the production of coffee is falling off, and that there is not a little risk of Brazil crops failing after the fashion which we have witnessed in the case of Java, Ceylon and a great part of India. Already the rule of alternate crops seems to be established in Brazil in a very marked degree, and we all remember how in our own case, within the leaf-disease era, a good crop, buoying up our faith in coffee, would be followed by a miserably short one, then by a decent gathering, and this by a still shorter alternation. Now, if Brazil is going to run down in this way, what are the enormous multitude of coffee drinkers—more especially in the United States and on the Continent of Europe—to do? Are they not bound to take to tea, and it is to show how large is the field for the aggression of tea on coffee that the comparative figures asked for by our correspondent are of interest. We have more faith in our own estimates of the production and consumption of our staples as given in the *Agricultural Review* prefixed to our Directory, than in any furnished by London Brokers, though the latter doubtless sometimes consult our, among

other, statistics. But we give two sets of comparisons as follows:—

Consumption of COFFEE in non-producing countries (as per Ferguson's "Ceylon Handbook and Directory") ...				1,595,596,800 lb.
Do.	do.	TEA...	do. do...	503,101,000 lb.

Excess of coffee...	1,092,495,800 lb.
---------------------	-------------------

Consumption of COFFEE in non-producing countries (per S. Rucker & Co.'s) ...				1,504,160,000 lb.
Do.	do.	TEA	(per Gow, Wilson & Stanton's) ...	403,000,000 lb.

Excess of coffee...	1,101,160,000 lb.
---------------------	-------------------

The enormous excess of coffee, is, of course, partly explained by the fact that a lb. of tea will go much further than 1 lb. of coffee in the quantity of refreshing beverage afforded; but making all such allowance, the excess of coffee sold through the markets of the world is still very great. Now, if, as we anticipate, the production of the berry is steadily falling off, may we not anticipate that the demand for tea to take its place will become a very important factor in the future of the world's requirements of what is not only the staple of China, but of Ceylon and a large part of India? For ourselves, we think there is enough in the figures we present to enable our tea planters to take courage and to go about their work with unabated confidence.

GUM ARABIC.—Formerly a large quantity of gum acacia was imported into and held in Liverpool. As far as can be ascertained there is not now a single case or seron here—the whole stock consisting of a few brokers' samples. The gum as it arrived from the Soudan was so dry that it paid to keep it for a time in warehouse. A seron of about 400 lb. would always increase in weight, sometimes to the extent of 15 lb. or 20 lb. No such increase results from keeping Brazilian and Indian gums.—*Chemist and Druggist*, March 23rd.

VETERINARY LECTURE.—A large assembly, including General Galbraith, c.b., Colonel Grant, c.b., 7th Dragoon Guards, the polo visitors, &c., took place at Umballa on Tuesday, the 12th instant to listen to Veterinary Surgeon J. H. Cox's lecture on "Practical Horse Judging." Several horses of various classes were submitted to critical examination. The lecture is said to have been highly instructive, and was much appreciated by all present.—*Pioneer*.

CEYLON TEA FOR PERSIA.—We are much interested in learning that as the result of a series of samples sent to Persia by a local banker, an order has been issued for 20,000 lb. of Ceylon Tea. We have always been aware of a considerable consumption of tea in Persia, a great part shipped from Bombay (of both Indian and China kinds) while some comes back from London. There is no reason why Ceylon should not get a big share in the supply and there is a wide field for extension; for Muhammadans of that region and adjacent countries very readily take to tea when they cannot readily get coffee.

TEA NOTES.—Plucking has begun in Sibsaugor. Durling has experienced hot weather. The weather has been warm in Cachar. Seasonable weather is the news from Gokpara, Nowgong, Luckimpore and Sibsaugor. **DARJEELING.**—Weather continues hot and dry with high winds—Bad look out if no rain falls before long. Fair amount of leaf coming in on some factories. **SOUTH SYLHET**, 26th March.—During last week this district had over 4 inches of welcome rain, and the weather is at present unsettled, promising more. Prospects have therefore improved. **DEHRADUN** 26th March.—It is very hot here now. Some gardens have begun making tea, I expect we shall be all hard at work manufacturing in a few days. The

weather has been all that any planter could desire, and the bushes on all estates are looking most promising for a bumper Spring crop.—*Indian Planters' Gazette*, April 2nd.

A MEETING OF SUGAR AND COFFEE BROKERS in the Clearing House was held on Monday at the London Commercial Sale-rooms, when the two following resolutions were carried:—"That the members present form themselves into an association for concerted action in matters connected with the Clearing House, and that any broker joining the Clearing House shall be required to become a member of the association." "That the authorised brokers pledge themselves not to pass a contract in the Clearing House with any person acting in the double capacity of agent and broker, unless with the payment of the usual $\frac{1}{2}$ per cent brokerage in any branch, sugar, coffee or otherwise. That this resolve be in force from and after Monday next."—*H. and C. Mail*, March 22nd.

CEYLON AND CHINA TEA.—MESSRS. Geo. White & Co. furnish a very elaborate annual report on Indian, Ceylon, and China Tea for 1888. It is accompanied by a very neat and convenient map showing the positions of the principal tea districts both in India and Ceylon. This affords a very good idea of the relative position and extent of the various large Indian districts as contrasted with the Tea country in Ceylon. The estimated acreage under tea in India is given at 307,500 acres and the outturn for 1888 at 93,000,000 lb. of which $1\frac{1}{2}$ is, for local consumption and $3\frac{1}{2}$ for Australia leaving 93 millions for Great Britain. Ceylon in the same way is put down at 180,000 acres, a large portion not in bearing, with 24 millions lb. of tea in 1888 of which 23 millions for Great Britain. Meantime we give here one passage of significance about Ceylon teas last year:—

The slightly better quality of some invoices prevented any further marked decline in the monthly average and imparted a stronger tone to the market for all fine grades, which has been well sustained to date. Poor liquoring parcels, on the other hand, continued to sell at prices in favour of buyers, as they are not considered to afford such good value as low-priced Indian teas which are stronger in cup.

WYNAAD NOTES, 3rd April.—It is always pleasant to be the bearer of good tidings, and it is especially agreeable to be able to inform you that the terrible anxiety of the last fortnight has been relieved by an ample and very general rainfall. The spike all over the district is simply magnificent; and where the blossom has already opened, it has been exceptionally fine and healthy. At present our anxieties have veered round, and we are actually afraid of *too much rain*, that is to say, of extra heavy down-pours, destroying the open blossom. The next week will pretty well settle the fate of most of us, and if we can get through this without hail-storms, or too heavy rains, our outlook should be a more cheering one than has befallen us for many a year. I fear, however, that all have not been equally fortunate, and that here and there, where the estates were extra open and unshaded, the spikes must have suffered considerably from the lengthened drought. And lest we should get "above ourselves," we are judiciously kept down by your pleasing announcement of coffee flat, 95! However, those who ought to know still assert their belief in a probably strong market for some time to come, and already some of our coffee has sold at splendid prices—the sorrow of it being that there was so uncommonly little of it to sell. Cinchona is a thing we don't even mention in any gathering where good spirits (mental) are the desired object. We who planted coffee and cinchona together some years ago feel a sort of gentle pity for those who scorned our innovations. There is this, by way of consolation: Cinchona will keep—and its cultivation does not cost much; perhaps it will get its turn again, and when we think of the lovely plantations in the district, we very sincerely hope that this turn may exist in a near future.—*Madras Times*.

ANOTHER TEA PREPARING MACHINE.—We hear that "another Ceylon planter" has invented a little machine which is likely to be found in every Tea Factory ere long: it is pronounced perfect of its kind by competent judges. Steps are being taken to get the needful patent.

NETHERLANDS INDIA NEWS.—A disease among sugar-cane in Java, which strikes at the roots of the plants, has spread so alarmingly that the Government of the island has taken measures against it. Plant cane from the stricken districts is shut out from the unaffected ones, and its export from that island to lands beyond sea has also been forbidden. Heavy penalties are attached to breaches of the prohibition.—*Straits Times*, April 1st.

THE COTTON INDUSTRY.—The following is from the *Times of India*:—"News from the Lancashire cotton centres indicates that the depression in manufacturing continues, and that in many warehouses stocks are accumulating at a serious rate. A Manchester correspondent says that apart from the general depression—amounting in some cases to something approaching stagnation—several important questions are just now agitating the cotton trade. A petition to Government praying for legislation to prevent the oversizing of cotton warp and the blowing in of steam has been signed by almost a quarter of a million of people. Heavy sizing began during the cotton famine in 1862-3-4. Up to this period an ordinary Indian or Chinese shirting was made up of 7 lb. to 7½ lb. of cotton yarn (twist and weft) and 1 lb. to 1½ lb. of size, composed of flour, farina and tallow, but of late years a kind of soft white clay, known as China clay, mixed with zinc, salts, alum, &c., has been used as a substitute. In order to enable this obnoxious size to be woven into the cloth, steam is blown into the sheds, and the operatives complain that their health is very seriously injured thereby. They allege that working in a steam-laden air, often at a very high temperature, and with the superadded evil of offensive odours, enervates and undermines health, directly inducing very many cases of consumption and bronchial affections, inflammations, rheumatism, &c. A good deal of interest has also been excited over the proposal to amend the Limited Liability Act so as to check the floating of bogus companies."

SHILLING (OR 25 CENTS) QUININE.—The American quinine dealers are greatly exercised at the prospect of quinine selling at 25 cents—a shilling—an ounce! The *Drug Reporter* of New York publishes a long series of opinions on the situation. One of the best-known in the trade, a gentleman interested in Bolivia plantations from whom we got a good deal of information in 1884, is reported as follows:—

Mr. John McKesson, Jr., of McKesson & Robbins. —As regards 25 cent quinine, I might reply in the words of Captain Bunsby—I think that is the name—"if so be, why not?" There seems to be no scarcity of quinine, but there is little chance for much lower prices because the margin left for a further decline is very slight. Irrespective of the cost of growing bark there are various charges which must be considered in arriving at the true value of bark and quinine, such as cutting bark, pressing it into bales, baling, transportation to vessel, freight and insurance, warehousing, commissions, sampling, testing, getting bark to factory, grinding, labor of preparing quinine, and cost of putting it upon the market, including vials, commissions, advertising, &c. If the bark was given away these charges would have to be paid, and they have something to do in fixing the price of quinine. Overproduction has caused the low prices, and I don't think manufacturers are making any money.

Another well-known firm, Messrs. Power & Weightman of Philadelphia, favor the imposition of a heavy import duty on foreign quinine entering America to counterbalance the greater dearth of labour! Messrs. Keasbey & Matheson take credit for having prophesied "25 cents quinine" in their circular of December 1887. They now consider that,—

In the absence of speculation or syndicates, quinine will rule as follows: probably not below 20 cents per ounce, and probably never above 30 cents. Twenty-five cents, more or less may be taken as about the rate at which manufacturers in the absence of a "Convention" will supply their product to purchasers. When full of contracts for future delivery, they will be "firm" in their views. When they have stock to place, they will quote about 25c, and intimate that "possibly an offer of a shade lower may lead to business, if a round lot is wanted." * * * The wholesale drug trade of the United States should carry a three months' supply of quinine at all times. When quinine advanced without other than speculative cause or false rumours of decreased bark supply, &c., they should steadfastly decline to buy, and by this means and at an expense of a small interest charge, they would keep the future in their own hands and get a small but sure profit in handling sulphate of quinine. Everyone connected with the trade in quinine should remember that through all the manipulation of both bark and quinine, the wonderful protoplasm engenders, diffuses and secretes quinine. Quinine! Quinine! Houses may come and go, trusts and speculators ditto, but the wonderful can keep steadily at its work storing up quinine, ready to put upon the market at any time when the price may be unjustifiably advanced.

SILK IN INDIA.—In another column we publish an interesting letter from Mr. Cunliffe Lister, the pioneer of silk cultivation on a large scale in the Eastern Dun. For years past Mr. Lister has been expending large sums in experimental sericulture at the Lister Grant; and as there has hitherto been no return, those who have been watching his persevering efforts have naturally begun to shake their heads. Of late, moreover, it has been specifically asserted by silk experts in this country that it is useless to attempt to rear the silkworm in India on a large scale by means of hired native labour; and that Mr. Lister was therefore doomed to failure from the first. It will be seen from the letter we print that the person chiefly interested takes a very different view. He writes in the most confident tone, and declares he is now, after years of trouble and expense, on the eve of a great success. Whether his hopes will be realised or not we shall have to wait till after the present year's crop to see; but meanwhile it is important to note that Mr. Lister considers two points already established by his experiments. In the first place disease, when the worms are properly fed and attended to, is unknown; and, in the second place, the seed of the Italian and French *Bombyx mori* reared in the Dun has, we are assured, produced as good cocoons as imported seed, so that Mr. Lister no longer finds it necessary to import any. This at once settles the question as to the possibility of raising good cocoons in this country, and so far the experiments in the Dun seem to have been eminently successful. It remains to see whether the European supervision and the hired native labour which Mr. Lister considers essential to successful sericulture, can be got at a price which will leave a profit sufficiently large to attract capital. On this point Mr. Lister's letter is clearly not conclusive. His capital has been attracted without any profit at all; but enterprise like this is rare, and though he is assured in his own mind of a profit in the near future, other capitalists will probably wait till it is actually realised before sharing his enthusiasm.—*Pioneer*.

MILDEW AND ITS TREATMENT.*

NOTICE BY MONSIEUR J. DUFOUR OF LAUSANNE, 1888.

The question of mildew has for some years been of the highest importance for our vineyards. This new disease has spread with such rapidity, it has caused in many vineyards such great harm, that it is worth while to occupy oneself seriously about it, and to consider henceforth the application of sulphates as the foremost of the regular labours of the vineyard.

We wish to try and summarize in the following pages the opinions gathered so far on the disease and its treatment, and that in a manner as concise as possible without enlarging much on the scientific characteristics of mildew or of the theories given out on the subject of the application of sulphates. Our aim is essentially practical.

1.—NATURE OF THE DISEASE: ITS ORIGIN.—Mildew is a new disease introduced from America in the wake of so many others. It has only been known in Europe since 1878. At the beginning of this year, it made rapid progress in France, and ended by invading the greater part of the vine-growing countries of the Continent.

In Switzerland, it must have made its appearance already in 1880, but it was only some years later that attention was seriously drawn to this new enemy of our vineyards and to the means for combating it.

CHARACTERISTICS OF THE DISEASE.—Yellow spots, which appear first on isolated points of the leaf, constitute the first indications of the invasion of mildew. At the end of a short time, the spots become brown, and the tissue dries in the centre of the points of attack. When the disease declares itself severely, the isolated points unite, and soon the leaf is found attacked on the greater part of its surface. Then it dries and finally falls.

If one turns over the leaves attacked by mildew, one finds generally on the lower surface, on the parts which correspond with the yellow spots on the top of the leaf, a whitish powder, resembling finely-pulverised sugar.

THE PARASITE.—The characteristic spots which have just been described are due to the development of a parasitic fungus, the *Peronospora viticola*. This fungus penetrates into the leaf, and lodges itself even in the thickness of the tissue. It nourishes itself at the expense of the juices of the leaf, and soon it throws into the air white filaments which produce seeds (or spores) of ovoid form. These fructifications which appear in abundance, constitute precisely the whitish dust which is found on the lower face of the leaves attacked by mildew. The spores are easily carried by the wind, and germinate on other leaves of the vine: the fungus soon penetrates into the healthy leaf, and the attack propagates itself thus from vine to vine. At the end of autumn, the fungus may form other large seeds, the *winter spores*. It is often in this form that they live through the winter season, to reappear anew in the following year.

CONDITIONS OF THE DEVELOPMENT OF THE PARASITE.—It has been calculated that a single vine attacked by mildew can produce on the surface of its leaves several millions of spores, of which each one is capable of infecting new vines. With a power of reproduction so enormous, it is not surprising to see the disease spread with extreme rapidity. It may even appear surprising that it is not more pernicious than it is in reality. But the development of mildew is happily limited by somewhat special conditions which the parasite requires in order to run through the different stages of its existence. It requires for its development heat, it requires also moisture. In order that the spores of mildew may germinate on the surface of the leaf, it is necessary that the latter should have been moistened either by rain or dew.

For the fungus to grow and propagate itself rapidly in the interior of the leaves, sufficient heat is required. When these two conditions are not found united, the disease does not develop in a manner sufficiently serious to compromise the growth.

TIMES WHEN THE DISEASE MAY APPEAR.—If the conditions of which we have just spoken, heat and mois-

ture meet in the month of May, the disease will already appear at this time. This conjunction has not yet occurred with us, but it has in Algeria and in the south of France. In our country the mildew generally shows itself later. Last year, for example, the first leaves were found attacked towards the 10th July.

To foretell in advance the precise time of the invasion of the disease, is to expose oneself to disagreeable surprises. All depends on meteorological circumstances, impossible to foresee.

EFFECTS OF MILDEW.—Premature fall of the leaves; arrest of growth, incomplete maturity of the grapes, and vine-branches, such are the usual consequences of the disease. The vines are weakened in a sensible degree and resist frost less well in consequence.

A vine attacked with mildew is recognised from far off from its yellow and partly dried up foliage. In general it is the leaves at the bottom of the stock which are found first attacked: the vines throw off little by little those leaves which are precisely the most necessary to nourish and protect the grapes.

There exists besides a form of mildew which is manifested on the grapes themselves. The parasite develops in the clusters and denotes the appearance of the spots or rounded depressions, of a grey or violet colour, under which the pulp generally hardens. The alteration shows itself often in the first place in the neighbourhood of the peduncle (flower-stalk). The spore ends by shrivelling; it dries and falls.

This form of mildew has been often found in the Canton of Vaud. In America and France it is known under the names of "grey rot" or "brown rot," and has caused great loss in certain vineyards.

POSSIBLE CONFUSION WITH OTHER DISEASES.—When the vine commences to bud and develop to a certain extent, one finds very frequently on the leaves rounded spots, whitish below, often red or brown on the upper side of the organ. Many persons mistake these spots for the commencement of an attack of mildew, but these alterations are due to a quite different cause—to the prick (fly-blow) of a little insect of the order acariens, the *Phytoptus* vitis.

This disease known by the name of *érinose* is easily distinguished by the following characteristics: the leaves are swollen and crimped in the parts attacked, but they do not usually become yellow, and do not dry up rapidly as in the case in mildew. In the leaves attacked by mildew, the white powder comes off with the least friction. In *érinose* the whitish spots are strongly adherent to the tissues of the leaf. They recommend against *érinose* repeated applications of sulphur.

Another disease which may be confounded with mildew is *brûlon*. Brown spots, round or of irregular forms, appear on the leaves and the tissue dries up rapidly in the parts attacked. These spots are in general distinctly defined: they are not yellow in their circumference, as are those caused by mildew. On the lower face of the leaf, one sees no appearance of white efflorescence. The *brûlon* is due to the action of cold dews, and to the sudden changes of temperature. It is not a parasitic disease like mildew and *érinose*.

THE TREATMENT. AIM OF TREATMENT: ACTION OF SALTS OF COPPER.—Once installed in the interior of the leaf, the parasite is invulnerable. In order to destroy it, one must destroy equally the leaf which encloses it.

PREVENTIVE TREATMENT is then the only possible one. The spores of mildew must be prevented from germinating on the surface of the leaves: the parasite must be prevented from penetrating the plant. After numerous fruitless attempts, we have succeeded at last within the last few years, in discovering modes of treatment which are positively efficacious. It was in 1884 that attention was first drawn on several sides to the valuable property which salts of copper possess in acting energetically against the development of the parasite and in killing the spores, or at least in preventing their normal development.

The aim of the treatment is to spread on the leaves salts of copper in a soluble form before the arrival of the mildew. There remain thus on the leaves spots constituting true reservoirs of copper,

* Referred to in letter of "J. G. C. H" on page 745.—ED. L.R.

which yield to drops of water coming from rain or dew, small quantities of copper, sufficient to kill the parasite in its germ. Besides, the epidermis of the leaf absorbs a certain portion of the copper mixture, and when the germ of the fungus succeeds in forming, it is powerless to penetrate into the interior of the plant.

CHOICE BETWEEN VARIOUS METHODS.—The substances spread over the leaves of the vine must be adherent: they must be easy and economical of application.

When one has to treat vines far removed from springs or fountains, the employment of powders may be recommended, but they must be employed only under certain conditions which will be enumerated further on.

When the vine is near water there is advantage in using *bouillie bordelaise* or eau céleste. These two remedies have been tried last year in our country. They have both given good results. In places where the comparison could be established, the *bouillie bordelaise* has however been shown to be the more efficacious. It presents, it is true, the disadvantage of being a little longer, and more complicated in preparation than eau céleste.

A third very economical remedy, the preparation of which is very simple, is the mixture of blue vitriol and soda. It may supplant eau céleste and even *bouillie bordelaise* if the experience of this year are favourable. But this mixture has not yet been applied on as large a scale as the two remedies of which we have just spoken. As it is economical, we advise vine-growers to experiment with it on a part of their vineyards. They could also make a trial of the new *bouillies* of lime and vitriol in reduced doses.

SULPHURIZED PROPS AND TIES.—In former times they founded great hopes on the simple methods of the sulphurization of props and the straw used for attaching the vines. With our mode of culture these proceedings are certainly insufficient for combating mildew. The sulphurization of the props is however a very commendable practice with regard to the preservation of the wood.

POWDERS AND THEIR APPLICATION.—In later times we have heard a great number of powders cried up against mildew. The advantage of powders is to facilitate operations in vineyards where water is not available, their disadvantage is some uncertainty as to the efficacy of this treatment. There are powders which contain sulphur and sulphate of copper as essential parts. To them lime is added, quick-lime or other substances in various proportions. Such are the powders Podechard, Skawinski, Sulfatine Estève, sulphates of salts of copper (among others Sebastian powder). The sulphur contained in these powders may act at the same time on oidium (a vine disease): however the effect on this last malady is, it appears, more irregular than when the application of sulphur is made separately in hot and dry weather. Other powders do not contain sulphur, but sulphate of copper is fixed on a substance very finely pulverised, such as talc (Sulfostértite) or plaster (poudre Coignet). We find besides in trade, mixtures more complicated, such as fungivores or fungivores. In powders well prepared, what acts against mildew is the sulphate of copper which they contain. This substance can only exert its action when the powders are fine, adherent and spread over leaves moistened by rain or dew. Applied in dry weather, the effect of the powders is very unequal.

Several of the powders abovenamed have not yet been experimented on in the Canton de Vaud. The sulphates of salt of copper and in particular the powder Sebastian have generally given good results. The fungivores (powders) have not always kept their promise in places where mildew has raged in a severe form.

The application of the powders must then be made by spray with a bellows or other appliance used for sulphurization against oidium.

LIQUIDS.—In the various remedies which we have passed in review, blue vitriol is found combined with lime (*bouillie bordelaise*) with ammonia (eau céleste) or with soda (Masson mixture). Finally, one may

employ, but under certain conditions only simple solutions of sulphate of copper.

The sulphate dissolves rather easily in hot water. One may accelerate its dissolution by placing the crystals in an old basket which may be steeped in the upper layer of the liquid. For the preparation of all these remedies, vessels of stone, glass, or copper should be used.

(A.) *Bouillie bordelaise.*—This is the formula which we can recommend for general application:—

Dissolve 3 kilogrammes of blue vitriol in 10 litres of hot water.

Add 80 litres of water.

Take besides 2 kilogrammes of good pure quick lime. Measure 4 litres of water which add LITTLE BY LITTLE to the lime, so as to make it dissolve first and then to transform it into a thick brew; this is to be poured slowly into the solution of sulphate of copper, stirring it carefully with a stick so as to render the mixture of the same consistency.

In the first formulas indicated by Mons. Millardet, the proportions of blue vitriol and of lime were very large: 8 kilogrammes of the first to 15 kgs. of lime. Lately they have considerably reduced the doses and the present formulas experimented with much care and patience of method by Mons. Millardet are infinitely more simple.

The formula which we have indicated above is that which was generally employed in the Canton de Vaud last year. The excellent results which have been obtained by it induce us to reproduce it here, and to recommend it for the next season. For owners of vineyards who wish to make a trial of it, we will indicate besides two new formulas of *bouillie bordelaise* reduced.

(a) 2 kilogrammes blue vitriol, 1 kg. lime, 100 litres water.

(b) 1½ kg. vitriol, 750 g. lime, 100 litres water.

Some practical details on the fabrication of these three *bouillies*:—Take care to make the solution of blue vitriol and of milk of lime in two different vessels. Take lime (*grasse*) pure quick lime—in preference to lime maigre, *i.e.*, weak and impure; avoid using lime which is exhausted or kept too long in store. Throw the milk of lime into the solution of sulphate of copper and not the contrary way. Wait to mix these until the solutions are cold.

Prepare the *bouillie bordelaise* at least some hours in advance.

(B.) *Eau céleste.*—One can make eau céleste oneself; one can only buy from tradesmen or chemists a concentrated solution to which you add a determined proportion of water.

This is the usual formula for those who wish to make the liquid for themselves.

Dissolve 1 kg. of sulphate of copper in 4 litres of hot water. AFTER COOLING add little by little to this solution, stirring with a stick 1½ litres of the ammonia of commerce at 22° Baume.

We obtain thus a limpid solution, dark blue, which attenuate to 200 litres. The addition of ammonia produces quite at the commencement a precipitate which should be bluish white, while the solution takes a fine blue tint. If the precipitate be greenish or yellowish, the sulphate of copper contains some sulphate of iron as an impurity, which lessens its value. Do not employ more ammonia than the quantity indicated, that the solution may not be too caustic.

It is necessary to weigh and measure carefully the substances employed. If this prescription is neglected, one runs the risk of seeing burns produced on the vine leaves.

If you buy eau céleste (azurine) concentrated, and it is a system which appears to us very practicable for vinegrowers, it is well to buy only of houses known and trusted. Ask exactly the quantity of water to add to the concentrated solution.

(C.) *Masson process.*—Instead of employing a mixture of blue vitriol and ammonia, M. Masson, Professor of the School of Vine-culture of Baumé, has proposed to add soda to the solution of blue vitriol. This substance is much less costly than ammonia, and the liquid obtained has given up to the present time good

results. It will perhaps be well to await the result of the experiments of this year before employing it on a large scale, but if its efficacy is conformed, the Masson process is certainly called to play a great part in the struggle against mildew. They will also doubtless succeed in making up the mixture under a concentrated form as in the case with eau céleste.

The following is the mode of preparation:—

Dissolve hot and separately;

1 kg. of blue vitriol in 4 litres water;

1 kg. 300 grammes of soda (carbon of soda of commerce) in 4 litres water.

Allow these two solutions to cool. Throw the solution of soda into a receptacle containing about 90 litres water. Add gradually the blue vitriol, being careful to stir the liquid constantly, so as to facilitate the mixture of the two substances. One can prepare the two solutions at home, and mix the water only on the side of the vineyard. Avoid putting the sulphate of copper and the soda to dissolve together hot, for it produces a vivid reaction between the two salts.

(D.) *Simple solutions of blue vitriol.*—Solutions of sulphate of copper have often been employed at 3, 4, and 5 per mille, for combatting mildew, and that with a certain amount of success. But this simple process presents disadvantages: the copper fixes itself much less on the leaves than by the employment of the preceding remedies, and the treatment has in consequence to be repeated oftener. On the other hand there is a risk of burning the leaves, especially if the spray be applied under a hot sun and if the prescribed doses be repeated.

The solutions indicated may be applied when vines are being grown for furnishing grapes for the table. We thus avoid the disagreeable marks produced by bouillie bordelaise or eau céleste. But the solutions must be employed with precaution, and the treatment repeated from three to four times during the summer. The doses may be varied according to the growth, putting for example 300 grammes to 100 litres of water for the first aspersion, 400 grammes for the second, 500 grammes for the third.

ANTIPERONOSPORA.—A manufactory of German Switzerland offers for sale under this name a concentrated liquid, brown coloured, of which the pretended advantage is its not containing salts of copper. We see there on the contrary an especial drawback, and we cannot advise the employment of this substance, of which the efficaciousness is far from being demonstrated.

THE CHIEF INGREDIENTS.—The blue vitriol or sulphate of copper is the essential base of all the remedies against mildew. It is unfortunately a product relatively rather costly, and it happens sometimes that it is adulterated by the addition of different substances, especially sulphate of iron (green vitriol) or sulphate of zinc. It is well to examine carefully the blue vitriol which is delivered, which can be readily done in the following manner:—

Dissolve some crystals in a glass of pure water, then add a small quantity of milk of lime. It forms a blue precipitate if the sulphate of copper is pure,—bluish green or rusty blue when the matter contains green vitriol. If there is any sulphate of zinc the precipitate becomes of a dirty white.

The ammonia, for the manufacture of eau céleste must then be called 22° Baumé. That which one finds is often weaker, especially if it has been kept so long while in store.

The Lime for the bouillie bordelaise is the fresh pure lime, as we have indicated above.

The Soda (Masson process) is the carbonate of soda of commerce. It must be used in crystals.

PRACTICE OF SULPHURIZING.—Spread the copper liquids with the spray producer so that it may be found scattered as equally as possible on all the surface of the foliage of the vine, such is the end of the operation of sulphurization. The workmen must give all their care to this work: they must seek to reach all the leaves. Manipulating the tube of the pulvérisateur: A fine spray should fall on the leaves; they must not be sprinkled too near, nor too long, for then the little drops unite and fall on the ground. Walk through

the vines with a slow and even step. Sprinkle everywhere on the upper surface of the leaves: it is in effect on the leaf that the spores of mildew usually fall. The operation is dirty, the clothing must be in accordance. Two rows may be treated at once, but for persons who are not accustomed to use pulvérisateurs, it appears preferable to treat only one row at a time. The clothes are soiled much less if the tube of the pulvérisateur is held a little elevated, leaving always a row between oneself and the line of vines being treated.

As a general rule, one must avoid using the pulvérisateur under a very hot sun, especially with eau céleste and the simple solutions which readily produce burns.—A little rain succeeding the operation is not to be feared, for it aids in the dissemination of the copper on the entire surface of the leaves—One need not therefore fear to spray in cloudy weather. On the other hand, a violent rain naturally exercises an unfavourable influence in washing the foliage too much.

TIME OF TREATMENT: QUANTITIES TO APPLY.—As the development of mildew depends essentially on meteorological conditions impossible to foresee, it is difficult to indicate beforehand, in a manner absolutely certain, when the treatment should be applied. Doubtless, the sulphurization must be preventive, but it must not be done too early for the numerous leaves which would develop after the operation would then not be protected against the attack. A little while before the "attachment of the vines" and the "raising" it becomes difficult to go about among the vines without doing damage. On the other hand, if the branches are freshly impregnated with blue vitriol, persons occupied in "raising" must use precautions not to have their hands burnt.

It seems to us then preferable, in our country, to delay the first treatment until after the "raising." But then it must be applied without delay before the leaves have retaken their normal position. That would bring us down to the end of June or the commencement of July. According to experiments made up to the present time, sulphurization can be applied immediately before or after the flowering (it is said even during the flowering) without injuring the development of the grapes in any sensible manner. Perhaps we may thus succeed in driving away the worms from the vines.

A second treatment must be made in August, a little earlier or a little later, according to the development of the disease. Finally, if the mildew declares itself strongly, apply the treatment again at the end of August or at the commencement of September.

What quantity of liquid must be applied at each application per pose (i.e., 4,500 sq. metres)? According to the state of the vegetation, according to the number of workmen charged with the sulphurization and the apparatus which they employ, these quantities may be varied within certain limits. On an average we count about 15 to 20 litres per fossorier, (i.e., 450 mètres,) which amount to from 150 to 200 litres for an application.

A trained workman can treat one pose (4,500 mètres) each day and even more. Here again it varies much according to the workman and their appliances.

The blue vitriol costs from 60 to 70 cents the kilogramme, the soda 15 cents, the lime 2 to 3 cents, the ammonia about 80 cents the litre.

We thus arrive approximately at the following figures for the price of substances required for the treatment of one pose, i.e., 4,500 mètres.

For the bouillie bordelaise 4 francs: eau céleste fr. 1 c. 85, the mixture of soda and vitriol fr. 1 c. 70.

THE SPRAYING MACHINES.—It is important to have a machine which is truly a spray producer, that is to say, which divides the liquids projected in five little drops which may cover the leaves equally on their entire surface. The appliance must be solidly constructed, easily transportable, not too heavy and simple in mechanism. The receiver should be of copper, in sheet iron leaded or in wood. Between the sheet iron leaded and the copper, the preference seems to us to be given to the latter metal. Receivers of elliptical section in the shape of "boilles" are more convenient to carry than apparatus with cylindrical reservoirs.

Among the numerous new appliances of French origin, we have seen employed with advantage the spray producers Vermorel Japy, Albraud and Gastine. Certain constructors of Germany and Switzerland also deliver very practical instruments; we cite in particular the spray producers Sequin, Borman and Esholin.

ASSOCIATIONS.—The more general the struggle against mildew is, the more assured will be the results. Some communes have taken the happy initiative in making the treatment authoritative, dividing afterwards the expense among the proprietors, at the rate of the surfaces sprinkled. Elsewhere proprietors unite to purchase the spray producers in common, or the substances required for the preparation of the remedies. They thus succeed in sensibly diminishing the expense of operations.

EFFECTS OF TREATMENT.—In the vineyards sulphurized with care, the leaves remain green and fresh, even where the mildew causes the adjacent vineyards not treated to become yellow. The wood is riper, the grapes richer in sugar. As has been demonstrated in a preceding work the treatment exercises a positive influence on the quality of the crop. The must (crude juice of the grape) coming from vines treated are sweeter, the vines more alcoholic, and therefore better preserved.

COPPER IN WINE.—This question appears definitely settled. We only mention it as a reminder. It has been proved by numerous analyses that the wines of sulphurized vineyards contain no copper, or only excessively weak traces of this metal.—(Signed) J. DUFOUR.

THE ADULTERATION OF CITRONELLA OIL IN CEYLON.

A correspondent (evidently a native) reported as follows to a contemporary some little time ago:—

"A few weeks ago about 650 cases of kerosine oil were taken to the Weligama Custom-house by boat, either from Galle or Colombo. Of these about 500 cases were taken to Matara, Akurassa, Weligama and Kumburupitiya. It is highly improbable that such a large quantity of kerosine oil would be used for lighting purposes by the people of those districts. The reason for such a large consignment of kerosine oil is easily explained. Kerosine oil is now being largely used for adulterating citronella oil, and so there is now a large demand for it. Villagers in the places mentioned may be seen conveying kerosine oil to places where citronella oil is stored, the two oils are then mixed in certain proportions and sold to several European firms in Galle and Colombo as good citronella oil. If European merchants think that the citronella oil as supplied them by their contractors, and that supplied direct by the proprietors of citronella estates, are the same, they make a great mistake; for the oil supplied by proprietors and manufacturers is pure and free from any adulteration. It will now strike European merchants as strange that, in the contract which they entered into between themselves and the contractors, there is generally a conditional clause to the effect that the oil supplied by contractors will be *market oil*. If any dissatisfaction is ever expressed by a merchant as regards the oil thus supplied, the contractor's plea is that it is market oil and they are not responsible for its quality; but such an excuse could not be made by a proprietor."

We asked the opinion, on this subject, of perhaps one of the best authorities in the island, at least of those resident in citronella planting districts, and he reports as follows, adding an important remark about Ceylon tea:—

"Some five years ago I took a trip to the principal citronella producing district to investigate this very matter, and was much surprised on being told by one of the largest buyers of this oil that the great bulk of citronella was largely adulterated with kerosene. Indeed he said that up to 25 per cent, detection so far as he knew was impossible. The increase of cultivation since then has been out of all proportion to the increase of citronella exportations, while a large acreage of the old grass must by this time be decreasing in yield; therefore, I do not doubt that the adulteration is increasing in proportion.

"Lately at Nuwara Eliya I met a gentleman from England, who is a large buyer of Ceylon citronella oil, who informed me that he could not get it pure in the market. He also asked me if I could tell him where he could get some good tea. He said he and his friend wanted to take home 100 lb. each, and I was surprised to hear him say that they had not tasted a good cup of tea in Ceylon. I think the hotels should keep the very best tea. I recommended him to a Colombo firm."

COFFEE CONSUMPTION.

Messrs. S. Rucker & Co. of London have been putting forward some very interesting figures by way of estimates for the coffee production and consumption of the world in 1888-89 and in 1889-90. The total production for the current season—1888-89—of coffee is made out to be 691,000 tons (against our maximum estimate of 719,000 tons); while the world's consumption is given at 671,500 tons, leaving a surplus of 47,500 tons; but next season, the total production is estimated not to exceed 495,600 tons in consequence of the great falling-off in Brazil! On August 1st, 1889, Messrs. Rucker & Co. estimate that the total stock of coffee in America and Europe will be 124,000 tons; add next crop 495,600 tons and we get 619,600 tons against which they put consumption (less by 100,000 tons than in 1888-89) at 570,800 tons, leaving for stock on August 1st, 1890, only 48,800 tons.—But the great fact brought out is that the world is to have 100,700 tons less of the fragrant berry to consume next season than in the current twelvemonth. Say that this makes room—3 lb. of coffee equalling 1 lb. of tea as a beverage—for even 30,000 additional tons of tea to go into consumption and the gain—67,200,000 lb.—would be enormous!

The following particulars, collected by Messrs. S. Rucker & Co., show the total production and consumption of the world for 1888, and the estimated amount for this year. If correct, it would appear that stocks, which are already exceptionally low, will be still further reduced:—

SUMATRA TOBACCO PLANTATIONS COMPANY.

The first ordinary meeting of the Sumatra Tobacco Plantations Company, Limited, was held on the 27th inst. at the Cannon-street Hotel, Mr. H. H. Nelson presiding.

Mr. W. M. Reeves (secretary) having read the notice convening the meeting, the Chairman said: I have very little that is new to you, because the prospectus has been quite recently in your hands, and the position as stated in the prospectus is very nearly the position today. There is just one little point I would like to mention, and that is, that in the prospectus it is stated that the amount of land that has been acquired by the company consists of about 8,200 acres. Well, now, it is a satisfactory circumstance that I am able to inform you that the amount of land we acquired has, upon measurement, turned out to be considerably more than this; that is to say, on the Pulu Kemiri estate we have 2,700 acres, of which only 300 have been cultivated. On the Soengie Besamit the survey is not yet completed, but we are pretty confident that that will turn out to be about 9,000 acres; so instead of 8,200 we shall possess somewhere near 12,000. In addition to that since the prospectus was issued we have purchased another estate, which we were in negotiation for at the time the company was brought out, but as nothing was settled it was not mentioned in the prospectus; but over and above those estates I have mentioned we are possessors of an estate called Kotosan, 3,500 acres, of which about a third—1,000 acres—have been cultivated. Hence we are, at the moment, owners of 15,300 acres, of which are 14,000 are virgin soil, and balance will, in due course, be ready for cultivation again. Now, virgin soil for tobacco-growing in Sumatra is not only valuable, but of increasing value, and that is so far satisfactory. The statements of our prospectus in this respect are fully confirmed, and I may say that any information that has come to hand since the company was floated confirms the knowledge we had then, that we are possessed of a large quantity of very good tobacco-growing land. (Cheers.) Now there is another very satisfactory circumstance which I may mention—that within three miles of Pulu Kemiri we have the railway station, and down to the railway station we have excellent roads and the consequence is, we are able to send our tobacco down by rail, saving time and saving a good deal of expense, inasmuch as the insurance, especially, is much less that way than by sending it down in boats. You know from the prospectus that by arrangement with the vendors a profit upon the 1888 crop was guaranteed of £5,000. Now, to obviate any misapprehension on this point, I may mention that this was not a part of the original bargain with the vendors; but upon Mr. Bernard, who was representing himself and the other vendors, arriving in England, he had no hesitation, at our request, apart from the bargain made by him, in entering into that guarantee, because, having seen the quantity and quality of the tobacco of the 1888 crop, he felt

perfectly justified in doing so, because he saw no chance of any possible loss. We hope, and we believe, that the amount of our profits over last year will be in excess of that £5,000; but at any rate, gentlemen, we know that we have that at our disposal; and, as by our arrangement with the vendors, our agreement leaves out the shares given to the vendors for the purchase of the estate, in any dividend divided during this year, this sum, whatever it may be, £5,000 or perhaps more—we know it will be somewhere in the neighbourhood of that—is available for the payment of dividend upon the £25,000 now paid up by the purchasing shareholders of the company. Therefore, gentlemen, you have the satisfaction of knowing that within the next few months, when the crops are realised, you have, at any rate, the certainty of a very handsome dividend of somewhere in the neighbourhood of 20 per cent upon the paid-up capital—that is to say, the paid-up capital by the purchasers of this company. (Cheers.) I may say that it would have been, perhaps, a little more satisfactory—to you, certainly, and, I think, to my co-directors—if we had been able to give you a little less than this, and put a portion of this to reserve, because a reserve is a very desirable thing to have in any company, and especially in a company newly started like this; but as the vendors' shares are not entitled to get any portion of this, if we had put it into reserve, of course, we, in a manner, should have given to the vendors what they are not entitled to receive. It was stated in the prospectus that we had a bargain with the vendors to pay them the cost of producing the crop—£3,000. This, I may tell you, gentlemen, and it is right you should know it, represents about \$19,000 of actual coin paid out by Mr. Bernard in working the estate. It does not fairly represent the cost of producing that tobacco upon the market, because there are additional charges for finishing and getting ready for shipment, and so on; and, moreover, Mr. Bernard was at that time his own administrator, which would reduce the cost; but, as a matter of fact, if we had been working this company in the way we are working now, it would have cost at least £1,000 more to produce that tobacco for the market. I may mention this, because those who understand tobacco-planting may have been astonished at the economy with which the thing had been worked, and might reproach us, a year hence, that our expenses for the production of tobacco had been increased. 160 acres will be cultivated this year. I can only hope that the result will be approximately satisfactory. There is no reason to suppose it will not. In the following year—that is to say, 1890—we do begin work in real earnest, and hope to have then about 500 acres under cultivation, which, if worked in as thoroughly satisfactory a manner, will show very handsome profits. It is impossible to exaggerate the very great importance of having a really first-rate man to look after our affairs out there. It is the life and soul of a company of this kind, and it is with great pleasure that I state that our own impression confirms what we have heard on all sides; that in A. P. Bernard we have secured as good a man as we possibly could have—a straightforward, hard-working, energetic man, who is thoroughly to be relied upon to work well and economically for the interests he has in his hands. The venture we are in, I think, we all believe a thoroughly good one. Without wishing to make disparaging comparisons between our shares and Consols, or even Goschens, we think we are embarked on a straight, honest undertaking, that has been acquired at a reasonable price, and will be worked well and thoroughly and faithfully for the interest of those who are shareholders; and we have every confidence that the results will be excellent, and possibly even brilliant. (Cheers.)

Mr. Drought (a director) stated that he had received a letter from the chairman of the United Lankat Tobacco Company, stating that the average price realised for shipment was 1 guilder 55 cents, 1888 crop, and it contained nearly 50 per cent. of broken leaf. It was satisfactory to know that the 1888 crop was turning out excellent. (Cheers.)—*L. & C. Express.*

GEO. WHITE & CO'S ANNUAL INDIAN
CEYLON AND JAVA TEA REPORT.

LONDON, 31, FENCHURCH STREET E.C.,

21st March, 1889.

INDIAN.

The market for Indian tea has not been subject to great fluctuations in value during the present season, and any changes that have occurred have been gradual. To continue from the date of our previous Annual Report, on the 19th March last. During the remainder of that month, after Easter and throughout April, an improvement took place in the value of all the lower grades, but the demand becoming slack, prices commenced to fall away, and continued weak and irregular, especially for the better descriptions, until the arrival of the new crop in June. The quality of first shipments was not liked, and having to compete with unusually large supplies of New Ceylons, opening rates were consequently low. Later on, when some improvement was apparent, the market strengthened, though, owing to the earlier and more rapid arrivals this season, any material rise was prevented, and occasionally, under heavy sales, weakness was shown. Trade generally was quiet during the autumn and up to Christmas, but as importers refrained from unduly pressing their teas, a better tone was noticeable after the turn of the year—particularly for fine and finest—as it became evident that the excess in the outturn over the previous season had been already received, and the greater portion sold. During the first weeks of this month, however, sales were heavier, as importers were desirous of securing the improved prices established, and the quantity forced on the market proving too much for the trade, there was a general decline for all except choice parcels, country buyers, as is usual on "a fall," holding off, and thus adding to the general depression.

Probably, owing chiefly to the crop as a whole, this season having been under the average, we have had a large proportion of the medium grades, composed principally of undesirable Pekoes and Broken Pekoes, to deal with, and a comparatively small supply of fine and good liquoring Teas. The latter have therefore generally been in request, but the former, throughout most of the period under review, have continued more or less depressed. A most noticeable feature was the unprecedentedly low range of prices ruling for medium Pekoes, say during September to December, sales having been made at only a little above the rates obtained for Pekoe Souchong, which, as well as Broken Teas, until after the turn of the year, were selling as fast as they arrived. Broken Pekoes from 8d to 1s per lb. were also unusually cheap, the Teas being much mixed in leaf and many of them thin in cup.

The total import for the season which ended 30th June, 1888, was 86,729,000 lb. against 78,632,000 lb. in the previous year, though, as deliveries were proportionately increased, being 85,381,000 lb. against 76,199,000 lb., the stock was not materially added to, as it stood at 20,150,000 lb. against 18,803,000 lb. on the 30th June, 1887. This season the trade has still further expanded, and we shall probably receive about 93 millions from all ports, while up to the present deliveries are nearly keeping pace with the increased supply. Considering the severe competition which exists, the position is not an unfavourable one, though, looking at the tendency to probable further shrinkage in values, it calls for continued effort on the part of those interested to endeavour to keep up the quality of their produce, and at the same time to exercise the strictest economy with regard to expenditure.

CEYLON.

The principal feature in the Ceylon Tea industry is the enormous stride which has been made in its development during the current season, the imports from 1st July, 1888, to 28th February, 1889, being 15,832,000 lb., against 9,109,000 lb. last year, while deliveries (15,099,000 lb. against 8,169,000 lb.) during the same period kept up so well with the increased supply that the bonded stock was not materially

added to, considering the large production, and stood at 5,901,000 lb. on the 28th February, against 3,874,000 lb. at the close of the same month in 1888. The total outturn for the season ending 30th September, 1889, is estimated at about 32 million lb., whereas, ten years ago the crop was under 100,000 lb. After the issue of our Annual Circular last year the market improved for a time, but, consequent on heavier arrivals of inferior teas, there was a general decline in value, the lowest monthly average recorded to that date being 10½d per lb. for 35,500 packages in June. After that month some improvement in quality took place, with a proportionate rise in prices until October, when the average of 1s 0½d per lb. was secured for 27,100 packages. A slack autumn and winter trade caused a dull market, with drooping and irregular rates for all except choice flavoured parcels. The largest monthly quantity yet brought to auction was in January, when 41,600 packages were sold at an average of 10½d per lb. The slightly better quality of some invoices prevented any further marked decline in the monthly average and imparted a stronger tone to the market for all fine grades, which has been well sustained to date. Poor liquoring parcels, on the other hand, continued to sell at prices in favour of buyers, as they are not considered to afford such good value as low-priced Indian teas JAVA which are stronger in cup.

Shipments from Java to Great Britain, were rather larger than those of the previous season when the crop was short, but, as deliveries also increased, the stock on the 28th ulto. was not much in excess of the same month last year, standing at 1,064,000 lb. against 861,000 lb. The quality, on the whole, was fully up to the average, and many of the teas were equal to, while others were little behind Indian, some descriptions to which they approach in character, being raised from seed introduced from that country. The low prices current for many grades of Indians and Ceylons throughout the season, adversely affected the value of common and medium Java teas, but at the same time their cheapness and improved quality no doubt rendered them useful, both for Home Trade and Export, and thus stimulated consumption.

It is noticeable that the average prices, ranging from 8½d to 9½d per lb., realised during August and September, for several large invoices, were comparatively good.

ALTERATION IN DAYS AND MODE OF SELLING.

An alteration was made in August last as to the days for selling Indian and Ceylon tea at auction—Monday and Wednesday being set apart for Indian, Tuesday for Ceylon, and Thursday being common to both. Javas follow either the Indian or Ceylon sales as heretofore. Since the middle of January the name of ship, date of import, and sometimes the marks, have been omitted from the sale catalogues, a change which has met with the approval of most of the trade, as it avoids publicity which formerly attached to sales by auction.

The average prices obtained this season have been—say, for Ceylon, 11½d. per lb. Indian, about 10½d per lb. China, 8d per lb. as compared with 1s. 1d, 11d and 8d during 1887-8, and 1s 1½d, 11d and 8½d in 1886-7.

According to the Board of Trade returns, the total Home consumption of all Tea in the United Kingdom shewed an increase for the year 1888 of nearly 2 million lb. over that of 1887—the figures being 185,556,000 and 183,636,000 lb. respectively; while the export trade—including a small increase of Indian and Ceylon, also was expanded from 34,741,000 lb. in 1887 to 37,957,000 lb. in 1888, an excess of nearly 3½ millions—or say, a total addition to the deliveries of over 5 million lb. was made during the year 1888.

The China export for the current season will probably close at rather over 20 million lb. less than the previous one. This important reduction, together with a larger export to Russia than was anticipated, has enabled the market to take, without much inconvenience, the increased supplies from India and Ceylon, so that a larger business has been done, while the total bonded stock in the London warehouses remains much as in 1888—the figures on the 28th February being 107,805,000 lb., against 107,469,000 lb. at the close of the same month in 1887.

With regard to probable requirements and supplies for the coming season we may estimate that

Home Consumption will be increased to	190,000,000	lb.
Export demand will absorb, say	35,000,000	...
Total requirements, say	225,000,000	...
Shipments from India will be say	100,000,000	...
Ditto Ceylon and Java	45,000,000	...
Leaving China to send	80,000,000	...
Total supply	225,000,000	...

As the bulk of the Export trade is in China Tea, it will be seen that allowing, say, 7 millions for Green and other descriptions, the quantity required from this quarter for Home consumption will be reduced to 52 million lb.

Hitherto the Customs authorities have not distinguished between China and other growths in their returns, but as it is now under contemplation to do so more accuracy will be possible, an greater interest will attach to them in future.

PROSPECTS.

With regard to the coming season there is at present very little reliable information as to the outturn from India during 1889, but we may look for a steady increase with a probable export to this market of upwards of one hundred million lb.; while from Ceylon, taking the imports from 1st July 1889, to 30th June 1890, for better comparison with India, we may expect *over* forty million lb. From all accounts there will no lack of tea in China, as they point to a "bumper" crop in the north, and it remains to be seen whether merchants will ship to this market with some regard to our diminishing requirements from that quarter, or whether we are to be over-supplied, as has hitherto been the case. *Over-supply* has been the bane of the London market for years past, and has brought about the present low level of value, which there seems little probability of raising until a further marked falling off in China shipments is brought about, or fresh markets can be found for the sale of Indian and Ceylon growths. It is to be hoped that these latter will shew considerable improvement during the coming season, as it is evident that to a large extent the unsatisfactory results of Calcutta purchases, especially where they have been held, is to be attributed to the non-keeping qualities of the larger portion of the year's shipments. Added to this, the teas lose their identity when in mixed invoices, and it is patent to everyone on this market that they do not receive quite so much support from the trade as teas shipped on garden account, when dealers can count upon a regular supply of certain marks. Allowance should be made for this when estimating the laying down cost of teas for our market, or merchants should endeavour to secure entire invoices in the Calcutta sales, where they might be sold in one lot at an average price, as chops of green tea are dealt with in China.

MANUFACTURE.

In view of the increased supply from both India and Ceylon, and of the probable further development of these industries, it becomes a question as to whether some changes cannot be effected which will both lessen the labour of buyers here, and also be to the advantage of garden owners. During the current season, especially in the autumn months, when sales were heaviest, it was almost impossible for the trade to properly value the number of samples which represented the teas offered (one day 540 of Indian and Ceylon), and consequently many parcels were either sacrificed at the time, or taken out to meet a doubtful market later. This seems to suggest that, whenever practicable, the breaks should be made larger, which probably could be done on many gardens without much trouble or inconvenience. When Indian tea contributed only a small portion of the trade deliveries, breaks of a few packages were not objected to, but now, when it represents about one-half of the total consumed in Great Britain,

there is need of an alteration in this respect, and a growing wish among dealers to be able to purchase larger parcels, particularly of low priced teas. To the many who now make a speciality of "Blended Tea," an arrangement of this nature would be most welcome, and breaks of 300 to 400 chests of Pekoe Souchong, or Broken Pekoe Souchong would not be too large, as has been shown by those which have been offered realising quite as much as smaller breaks, and being well competed for. Throughout most part of the year, the difference between the prices ruling for Pekoe Souchongs and common Pekoes was very small. In many cases the former have been similar to the latter in cup, while the slightly better appearance of the Pekoe has not sufficed to command an appreciably higher price. If this condition is to continue, it becomes a question as to whether it will not pay growers to cease making the distinction which they have hitherto done between these grades, and to send them home under one classification, or, as "unassorted." In this way expenses might be lessened, the size of the breaks increased, and relief would be afforded to buyers, while the average price would probably be as good if not better than at present.

With regard to Ceylon, where, as a rule, the gardens are smaller than in India, it would perhaps not be possible to make very large breaks, although they might be increased when accommodation admitted of storing several days' manufacture. As the out-put grows it may also be feasible to centralise more even than at present, which would facilitate the making of larger breaks. In face of the expansion which has taken place in the export from Ceylon and the probable further development of the industry, it is well that those interested in the production of the leaf should consider the present situation. Two courses appear to be open, and it must be left to planters to decide which will remunerate them best. Will they go on increasing their production and compete with the heavy supplies from India and China with the certainty of a lower range of value, or will they find it more to their interest, provided climatic influences do not interfere with manufacture, to pluck finer and supply a better quality, selling at a higher average, for which there is nearly always a good market?

FRESH OUTLETS NECESSARY.

In consequence of the glut of Tea with which our Market is threatened from all the producing countries the need for action in the direction of opening up new channels for distribution, although for some time past recognised by a few, is now becoming patent to everyone connected with the industry.

In addition to what has already been done in our Colonies by the Agents of both Indian and Ceylon growers, a syndicate, recently formed into a limited liability Company, has commenced operations from London, while a considerable effort is also being made by private enterprise, especially by one leading firm, largely representing the interests of garden owners, to expand the consumption of Indian Tea, not only in the United States and Canada, but also in South America, by educating the taste of the public in those countries where the produce of China and Japan has hitherto been chiefly used. At the same time, Ceylon planters, early recognising the need for fresh outlets, have taken an active part in the work. These efforts, at present meeting with varied success, have on the whole been productive of good, especially in the Australasian Colonies.

The demand for Indian and Ceylon on the Continent of Europe, although of slow development, is gradually increasing, and should ere long be of importance. If this can be attained it will be of special value, as it would sometimes relieve the London market in times of depression, as in the case of Javas for several years past, prices for which have not only been supported, but often stimulated by export orders.

The different Exhibitions in London, Liverpool, and Glasgow have contributed largely to familiarising consumers with British grown tea, while the exertions (almost amounting to friendly rivalry) already being made to bring it to the notice of the French nation

and their foreign visitors at the forthcoming Paris Exhibition, deserve success. To thoroughly attain this however, experience in the past suggests that facilities should be provided for the purchase of the article afterwards, in a retail form, in convenient localities, or the trouble and expense incurred will be to a great extent thrown away.

It is somewhat surprising that, while such efforts are being made among Western nations and in the Colonies to increase the consumption, so little comparatively has yet been done towards utilising the vast field existing among the large native populations of India and other parts of Asia, where so many are already by their religion debarred from the use of alcohol, and would seem naturally constituted to regard tea as a beverage.

For instance, would it not be feasible to develop the trade with Thibet and adjacent countries, where in past years a fair business was carried on, and was a useful outlet for both black and green tea, mostly made in the North-West Provinces, though, owing to various causes, traders latterly have been forced to draw their chief supplies, as in times of yore, from China, principally in the form of brick tea. To meet this demand a considerable portion of common kinds, often unsuitable for this market, might be pressed by machinery into bricks, in the way for some time past adopted by the Russians in the North of China.

BULKING AND PACKING.

We referred at length to these subjects in our Annual Report last year, and it is gratifying to record that some progress has been made in this important part of the planters' work during the present season, both in India and Ceylon, and it is to be hoped that increasing facilities and gathered experience will bring about a still further advance in this direction. The saving in expense on this side and the depreciation in value caused by the damage done to the leaf in repacking are powerful inducements for garden managers to undertake the work themselves, and to do it so that no need may arise for incurring the cost here. The leaf must present as even an appearance as possible, and should not be "crushed" into the chest. It is desirable that the whole break, comprising one description of Tea, should be subjected to the same final firing, or bulked afterwards, otherwise the character will vary and the Tea require re-bulking in London. Care should also be taken to regulate the quantity in each chest so as to take advantage, as much as possible, of the scale of charges adopted by the London bonded warehouses. Except in the case of fine Teas, it is not desirable to send too many half-chests, as they cost more to pack, and the freight is heavier than for chests, while the price obtained often does not differ materially. Boxes of Pekoe and Pekoe Souchong (under 28 lb. gross to save draft), suitable for self drinking, often recoup the extra expenditure incurred.

In some districts there appears to be a scarcity of proper wood for making chests, and in them, especially, the patent packages will no doubt grow in favour. Several kinds of these are now in use, and as they offer many advantages, they may in time supersede the wooden chests to a great extent, being cheaper and effecting a considerable saving in freight.

MARKING.

Name of garden, description of Tea, and number is all that is required on the package. Weight and tare are superfluous, only lead to confusion, and can always be checked from the garden invoice.

NET-WEIGHING.

Notice has been given by the Wholesale Tea Dealers' Association that "net weighed" Teas will not be taken after the close of this season, the result of this system of weighing having been considered unsatisfactory, on account of the quantities in the packages being irregular. Whether this is carried out or no, care should be taken to make both weights and tares as even as possible.

DETAILS OF OUTTURN OF THE DIFFERENT DISTRICTS FOR THE PAST SEASON.

Assam, 113,000 acres under tea, outturn of 1888,

42,000,000 lb.—Inferior on the whole in liquor to last season, partly owing to unfavourable weather, even the best marks, with few exceptions, lacking quality until the last invoices, which were in some instances much better and sold well. Results of some gardens good, owing to large yield, notwithstanding reduced average price.

Cachar and Sylhet 92,000 acres under tea, outturn of 1888, 29,000,000 lb.—In some parts a heavy but poor out-turn from the majority of gardens. The one or two which made fine tea commanded high figures, but the averages for the two districts were low and disappointing.

Kursioug, Darjeeling, Terai and Dooars, large extensions recently made, but not yet in bearing, 70,000 acres under tea, outturn of 1888, 13,500,000 lb.—From the first three a very varied crop has been sent. At the commencement of the season, as is usual, thin in cup, then better for a time, afterwards inferior again, and finishing with some very poor and a few very choice Darjeelings. These Teas have to compete now-a-days, with Ceylons, and unless first-rate have been much out of favour this season. From Dooars some very useful Teas have been received, but the bulk has been poor. Some high prices were realised for a few closing invoices with full autumn flavour.

Kangra Valley, Kumaon, and Dehra Doon, 17,500 acres under tea, outturn of 1888, 4,600,000 lb. Chota Nagpore, 2,000 acres under tea, outturn of 1888, 700,000 lb.—A worse crop has hardly ever been seen, especially from the former, the percentage of fairly good being small and that of fine almost *nil*. Kumaon and Dehra Doon have been only sparsely represented, and the little received has been mostly of an undesirable character. Supplies from Chota Nagpore have also been unimportant, the chief produce of this and the two last-named districts going into consumption locally, so that the amount shipped to this country is small but the quality from the latter has shewn some improvement.

Chittagong, 3,000 acres under tea, outturn of 1888, 950,000 lb.—Some fairly useful teas, but proportion of fine small, the bulk being only ordinary and lacking the distinctive merits of this district.

Neilgherries and Wynaad, 6,000 acres under tea, outturn of 1888, 1,500,000 lb.—Unless all the choice-flavoured descriptions (similar to those received in former years) are disposed of on the spot, the yield generally this season has been more devoid of desirable characteristics even than that of the two previous ones, the teas on the whole being thin and wanting flavour.

Travancore.—Including land recently cleared and planted, but not yet in bearing, 4,000 acres under tea, outturn of 1888, 750,000 lb.—Some very useful parcels have come to hand, with a fair sprinkling, possessing fine full flavour, which have been much appreciated by the trade. Quality, on the whole, has been above that of most other districts.

Totals, 307,500 acres under tea, outturn of 1888, 98,000,000 lb.—From which, deducting, say $1\frac{1}{2}$ million for local consumption and $3\frac{1}{2}$ millions for export to Australia and America and elsewhere, will leave about 93 millions for Great Britain.

Ceylon.—Large portion planted, but not yet in bearing, 180,000 acres under tea, outturn of 1888 24,000,000 lb.—Of which 750,000 lb. exported to Colonies, &c., and 250,000 lb. used locally, leaving 23 million lb. for Great Britain. An increasing yield, with a decreasing proportion of really choice-flavoured invoices, has contributed to lower the average price. A larger quantity of overfired and burnt teas has been shipped to this country, which has not met with favour from buyers. Quality must be kept up if the prestige of these growths is to be maintained.

Java, 20,000 acres under tea, outturn of 1888, 4,500,000 lb.—Of which about 3 millions shipped to Great Britain. As compared with former years, these have held their own well, as regards style of leaf and liquor, there being less of that undesirable flavour which they used to have. Blenders now buy them in large quantities, whilst the enquiry for export has also been good.

GEO. WHITE & Co. TEA BROKERS.

CHEMICAL NOTES ON COCA.*

As the value of coca leaves outside of South America depends almost entirely on the amount of cocaine yielded by them, it has been considered desirable to furnish such chemical information as bears directly upon the cultivation of the coca plant in various parts of the Colonies and India. In the preparation of this information we are indebted to Mr. Alfred G. Howard, F. C. S., F. L. S., grandson of the late Mr. John Elliott Howard, F. R. S., the well-known authority on cinchona. By the aid of correspondents in the West Indies, Ceylon, India and Java, numerous samples of coca leaves grown in those countries were obtained with full particulars as regards the circumstances under which the plants were cultivated and the methods adopted in drying the leaves. These leaves were carefully analysed by

Mr. Howard, and the results are of a very interesting character. They point out not only the best plants to grow, but also the circumstances best suited to produce a high percentage of alkaloids, and the best methods for gathering and curing the leaves.

It is important to point out that the percentages of alkaloids often quoted in regard to coca leaves cannot be compared with one another, owing to different methods pursued in dealing with them. Mr. Howard states that the alkaloid determined in all his analyses "is simply cocaine in a pure state which is split up into crystallizable and uncrystallizable cocaine as nearly as could be done when working with such small quantities."

The following analysis of coca leaves, for convenience of reference, have been divided into four series:—

Analyses of Leaves of Coca.

Localities.	Per cent. Crystallizable.	Per cent. Uncrystallizable.	Total Cocaine.	Elevation.	Remarks.
				Feet.

In the 'Annual Report of the Botanic Gardens,' Ceylon, for the year 1887, Dr. Trimen, F.R.S., states that the coca plants at Peradeniya, and possibly all the plants now in the colony, have been derived from a Kew plant received in 1870. As there has been only one coca at Kew, such plants would necessarily belong to the variety *novo-granatense* already described. The specimens of leaves received from Dr. Trimen for analysis with his letter of February 27, 1888, appear, however, to belong to the typical Peru plant. They are in some cases $3\frac{1}{2}$ inches long and $\frac{1}{3}$ inch wide; they are oval-pointed, dark green, and correspond very nearly with specimens collected in Peru by Mr. Pearce. The analyses of the Ceylon leaves show exceptional richness in crystallizable cocaine; they have no uncrystallizable cocaine and the total yield is the highest, with two exceptions, of any received. Of the two specimens grown at the Botanic Gardens, Peradeniya, it will be noticed that the leaves dried in the shade yield 60 per cent. of cocaine, while the same leaves dried in the sun yield only 47 per cent. Leaves grown in Ceylon at 1,500 feet and 3,000 feet respectively show the same results. The difference of elevation has apparently not produced any effects on the yield in cocaine.

The leaves received from British Guiana are not distinguishable in general characters from the Ceylon leaves. They are perhaps less coriaceous, but have the same dark green colour on the upper surface and are quite as large. The yield of cocaine is somewhat less, but while in the Ceylon leaves there is no uncrystallizable cocaine, in the British Guiana leaves the amount is 33 per cent. If it should be proved that this is a highland plant it would not be likely

to be so productive in alkaloids at sea-level in the tropics.

The Java leaves represent cocoa grown at 800 feet, 3,000 feet, and 5,000 feet respectively. They belong to the intermediate forms provisionally classed as Bolivian with narrowly oblong leaves, pointed, dark green above and glaucous beneath. They contain chiefly crystallizable cocaine, the result of the most favourable sample yielding 34 per cent. crystallizable cocaine and 09 per cent. uncrystallizable cocaine. The leaves grown at an elevation of 5,000 feet show a less favourable result than those grown at either 800 feet or 3,000 feet. This may be owing in part at least to the fact that they were dried in the sun. Mr. Howard states that the Bolivian leaves which usually reach this country from South America contain 40 per cent. of crystallizable cocaine and 05 of uncrystallizable.

The plants grown at Jamaica and St. Lucia are characteristic of the variety *novo-granatense*. They are all apparently derived from the Kew plant. The leaves are obovate, blunt, or emarginate, and membranous, and of a light grassy green colour when dry. In one instance the total yield in cocaine is exceptionally high. This occurs in leaves forwarded by the Hon. W. B. Espuet grown at Spring Garden Estate. The larger proportion of the cocaine is, however, uncrystallizable. These leaves were from plants only six months old grown at nearly sea-level and dried in the shade. The same leaves dried in the sun appear to have lost 36 per cent. of cocaine. Leaves grown at the Castleton Gardens at an elevation of 600 feet, in perhaps less rich soil, yield 65 per cent. of cocaine, of which 45 per cent. is uncrystallizable. A good series of such leaves were obtained from Mr. W. Fawcett, F. L. S. There is apparently a considerable difference in the yield of

* From the Kew 'Bulletin of Miscellaneous Information,' January, 1889.

cocaine in leaves gathered at different seasons in the year. This may account for the different yield of plants grown at sea-level in Jamaica and exactly similar plants grown at sea-level at St. Lucia. In the one case the yield is '76 per cent. of cocaine, in the other it is only '55 per cent. The general conclusion would point to the variety *novo-granatense* as being a lowland plant capable of growing in hotter conditions than those suitable to the type. Leaves taken from plants grown at Kew yielded '44 per cent. of cocaine, of which '10 per cent. was crystallizable. Of leaves grown in India one sample forwarded to Kew by Mr. Sackville Cresswell, grown at Darjeeling at an elevation of 900 feet, gave the highest percentage of total cocaine, but a large proportion was uncrystallizable. The other leaves forwarded by the Secretary of the Agricultural and Horticultural Society of India have been already very fully discussed by Dr. Warden, M. D., F. R. O. S., in a "Note on *Erythroxyylon Coca* Grown in India," published in vol. viii., part III., new series of the Journal of the above Society. An interesting point connected with these leaves is brought out by Mr. G. Peppe, of Ranchi, Bengal. One set of leaves, dried in the sun, yielded '53 per cent. of cocaine, of which '23 per cent. was uncrystallizable. The same leaves "dried in the shade on cloth for twenty hours, then rolled by hand like tea, then fermented two and a half hours," dried over a charcoal fire and put in a closed tin box," yielded '58 per cent. of cocaine, of which only '17 per cent. was uncrystallizable. These latter leaves were obtained from plants imported from Paris; the other Indian leaves were from plants introduced by the Agricultural and Horticultural Society of India. In general character they are all very much alike, approaching the Bolivian form perhaps in shape and colour, but evidently possessing the characteristics of Truxillo coca in the high percentage of uncrystallizable cocaine contained in them.

The above results confirm the opinion already formed that there are several varieties of *Erythroxyylon Coca* existing in South America, some of which have been now introduced into the Old World. These varieties have no doubt their own range of elevation at which they may be successfully cultivated, as well as characteristics more or less marked in the yield of crystallizable cocaine.

The typical plant appears to be the best plant to cultivate at higher elevations, and if the object is to obtain a large yield of crystallizable cocaine. The variety *novo-granatense* thrives at sea level in the tropics, and yields nearly, if not quite, as high a percentage total cocaine, but a large proportion of it under present chemical methods is uncrystallizable. The latter plant, judging from cultivated specimens in this country, appears to yield a large crop of leaves than the type, but fruits somewhat sparingly.

As regards yield of crystallizable cocaine we have apparently amongst coca plants very much similar conditions as amongst cinchona plants. In the latter, *Cinchona succirubra* yields a large proportion of total alkaloids like the variety *novo-granatense*, but only a small amount of crystallizable quinine. On the other hand, *Cinchona calisaya* (like the typical coca plant) yields a smaller total of mixed alkaloids, but a larger yield of crystallizable quinine.

OTHER SPECIES OF ERYTHROXYLON.

There are numerous other species of erythroxyylon distributed throughout the inter-tropical regions of both hemispheres. The headquarters of the genus is in tropical America, whence more than one hundred species have been already described.

The important properties which exist in the leaves of *Erythroxyylon Coca* have naturally drawn attention to other species, in the hope that their leaves might contain the same or similar principles. It is well known that the wood of numerous species is hard and yields a red dye. The young shoots of *Erythroxyylon areolatum*, a native of Jamaica and of the northern parts of South America, are said to be a mild stimulant; the bark is a tonic, and the juice of the leaves is used externally against herpetic affections.

Erythroxyylon monogynum (*Sethia indica*), a native of the East Indies, known under the Madras native

name of *Gadava*, possesses a timber that is slightly fragrant, and Ondaatje records that a creasotic oil has been prepared from it. The leaves of this plant were used by the natives of India to mix with their food during the last famine.*

During the course of the present inquiry an effort has been made to procure as many samples as possible of leaves of various species of erythroxyylon in order that they may be analysed by the same method as that adopted for the coca leaves. It might be naturally supposed that the two species already mentioned (*E. areolatum* and *E. monogynum*) which have gained a local reputation for medicinal properties would contain the larger amount of the characteristic coca alkaloids. The leaves of *Erythroxyylon areolatum*, grown in Jamaica, received from Mr. Fawcett, and dried in the shade, contained '033 per cent. of cocaine, while similar leaves dried in the sun yielded '023 per cent. of cocaine. Leaves of *Erythroxyylon coca* from the same island have already been shown to contain '76 per cent. of cocaine—so the quantity yielded by the indigenous plant is therefore only about one twenty-fourth part of that yielded by *E. Coca*.

No leaves of *E. monogynum* were obtainable for Mr. Howard, but reference may be made to an analysis undertaken by Dr. Warden of leaves obtained in Calcutta which "yielded '04 per cent. of a principle which, however, did not possess the physiological properties of cocaine."[†]

At the Botanical Gardens at Java, Mr. Eykman formerly Professor of Chemistry and Pharmacology at the University of Tokio, carried on researches into the properties of local species of erythroxyylon, which are fully borne out by the analysis of Mr. Howard with similar leaves sent to Kew by Dr. Treub. Mr. Eykman analysed the leaves of *Erythroxyylon montanum*, *E. laurifolium*, and *E. retusum*. The amount of alkaloids found in them was in no case higher than one-tenth of that contained in the leaves of *E. Coca*. The bark of *E. montanum* and *E. retusum* contained an inappreciable amount of alkaloids, while the fruit contained only a trace.‡ The Java leaves analysed by Mr. Howard contained the following percentages of alkaloids; *E. montanum* '03 per cent.§ The highest percentage reached by leaves of *E. Coca* received from Java (already noted) was '43 per cent. Hence, according to these figures, the indigenous species yielded only one-ninth to one-fourteenth of the alkaloids yielded by *E. Coca*. Leaves of *E. macrophyllum* received from Mr. Jenman, Botanic Gardens, British Guiana, contained not a trace of alkaloids, while the leaves of *E. ovatum* yielded '02 per cent. of alkaloids. The latter species is found in many of the West India Islands as well as in South America. It is known at Dominica as *Bois vinette*. A specimen in the Kew Herbarium, collected by Lechler in Peru in 1854 and named by Grisebach *E. ovatum*, was marked "cultura sub-nomine coca, San Govan." From the character of this specimen there could be little doubt that it was only a form of *E. Coca*, and the amount of alkaloids contained in the leaves would have fully justified its being accepted as the true thing.

To summarise the results obtained from an examination of the leaves of local species of erythroxyylon, it is pretty clear that no species yet examined yields alkaloids at all comparable in quantity to those found in *E. Coca*. The bark of these species appears to contain even less than the leaves, while the fruit and seed contain only a trace of alkaloids. The following table will show the results as far as they are now obtainable.

The yield of *E. Coca* is placed at the head of

* Official papers of the Government of Madras Rev. Depart., 29th Sept., 1885. No. 1105.

† "Note on *Erythroxyylon Coca* Grown in India," by C. J. H. Warden, M. D., F. R. O. S., reprinted from *Journal Agri.-Hort. Soc. India*, vol. viii., Part II.

‡ 'Annales du Jardin Botanique de Buitenzorg,' Dr. M. Treub, Directeur, vol. vii., Part II., pp. 224-229. Leide, E. J. Brill. 1888.

§ Mr. Howard states that these results are not quite free from doubt. They are however, very near those obtained by Mr. Eykman, and give almost identical proportions as compared with *E. Coca*.

the list for comparison:—

Species.	Percentage of Alkaloids.	Habitat.
<i>Erythroxylon Coca</i>	0.760	Grown at Jamaica.
„ <i>areolatum</i> ...	0.083	Jamaica; dried in shade.
„ „	0.023	Jamaica; dried in sun.
„ <i>macrophyllum</i>	0.000	British Guiana.
„ <i>ovatum</i>	0.020	„ „
„ <i>montanum</i>	0.030 ?	„ „
„ <i>laurifolium</i>	0.050 ?	„ „
„ <i>retusum</i>	0.030 ?	„ „
„ <i>monogynum</i>	0.040	India.*

—Pharmaceutical Journal.

A VISITOR FROM NATAL.

Six years ago, Mr. A. H. Bisset of the Matala district left for Natal where his father General Sir John Bisset had taken up a wide extent of land on the banks of the largest river in the Colony about 100 miles south of Durban in order, as he hoped, to establish a planting colony. Mr. Walter Bisset, also a Ceylon planter, had preceded his brother. The latter is now manager of a gold-mine in the Transvaal with an income about equal to that of our best paid public officers next to the Governor. Mr. A. H. Bisset is still planter and farmer in the lowcountry, having communication twice a month by steamer round the coast with Durban. Mr. Bisset has come to Ceylon on a few weeks' visit by the S. S. "Pongola," and we heartily welcome him back here, hoping he will have a pleasant and profitable time, even to the extent of carrying away to Natal all the useful wrinkles he can pick up in reference to our tea cultivation and preparation, and the treatment of any other products suited to his plantation in the far south. The "Pongola" is one of two steamers now regularly running between Durban and Calcutta in the interests of cool labour for the colony. They are likely always to call at Colombo or Galle *en route*, so that the means of getting to South Africa will be made very accessible, and few trips could be more pleasant to those who like a longer voyage than usual now-a-days, with some weeks of holiday in one of the finest countries under the sun. The return trip could then be made by the next steamer up. But it is possible that we may have passengers from Ceylon going off to the gold fields, rather than for visits or holiday trips; for there can be no doubt that there is a grand future before South Africa with its wealth of minerals of the most precious description. Already the Colonists talk of a thousand miles of rich gold-yielding reefs, besides (alas!) hills of silver and, apart from, apparently, exhaustless diamond fields. All this is pretty well realized by the outside world, and as a consequence Mr. Bisset reports that the amount of capital which has been, and is being, thrown into South Africa and especially the Transvaal is quite fabulous, and the population is also being rapidly increased through the influx of would-be miners of every grade. Mr. Bisset goes so far as to think that Durban may eventually become another Melbourne. At present though a very busy port with an enormously developed trade, a great many of the inhabitants have run away to the gold-fields and there seem only to be men enough left to look after the families! The railways are being rapidly extended inland, but South Africa is, of

* Analysis of Dr. Warden.

course, a country of magnificent distances, and as yet there is much hard, expensive work in transport. For this reason, among others, to planters and farmers on the Coast whose cool labourers have been tempted away and for whose produce the market offered on the gold fields is far too distant, the rush after gold is by no means an unmitigated blessing. The farmers in the Transvaal, on the other hand, will be certain to reap a golden harvest through the mere sale of their produce and stock.

But on the whole, Mr. Bisset is well-pleased with his planting home in Natal, out of the tropics, being in 31° South, but with so mild a climate by the riverside that frost is never experienced, the temperature scarcely sinking below 42°. Coffee, tea and other sub-tropical products are cultivated, a good return being got by supplying the local markets. Labour is, of course, the drawback, but coolies from India are likely now to be more abundantly and regularly introduced; and where the Natal planter-farmer has the pull is in raising all the grain, vegetables and stock required by him and his staff on the property, as in the case of the Brazil planters. This makes the cost of cultivating the tropical products, wonderfully low. But again, Mr. Bisset says that he and others have so many strings to their bow; for instance his is one of the most successful fruit-growing countries in the world: the finest mangoes he has ever seen are growing close to grand strawberry beds; while oranges, bananas, apples, &c., &c., prosper amazingly and there is a good and steadily improving market at Durban for all the fruit that may be produced. The planting of orchard trees and garden cultivation generally constitute therefore a very important branch of the planter's work and property in Natal. The South African Colony has certainly suited Mr. Bisset in health; he never looked better although the voyage up has been a trying one through the great heat experienced, more especially in the Mozambique Channel. This heat affected the horses brought by the S. S. "Pongola" unfavourably; but no doubt they will soon get over this and there are some serviceable animals among them.

TARRED PAVING.

Preparatory to again visiting the Australian colonies after an interval of eight years, our "senior" was engaged for some ten days in "redding up" (as the Scotch say), a vast heap of papers brought by him from Melbourne, and which he meant to deal with in that leisure time that never came! He felt special self-reproach for not earlier bringing to the notice of the Municipality and others, the process of the laying down of tar paving, which was so conspicuous and so useful in the (1881) Exhibition grounds as well as in Melbourne city. From the City Surveyor he received a paper of directions, from which we now quote:—

DESCRIPTION OF THE PROCESS OF LAYING DOWN TARRED PAVING, AS ADOPTED BY THE CITY COUNCIL.

In the first place all the metal and screenings must be thoroughly mixed with tar, turning it over and over again, until every particle of metal and screenings is coated with the tar, but not to such an extent as will admit of any tar running away from the bottom of the heaps.

The tar for the metal is applied cold; but for the screenings it is applied heated from an iron boiler. If the screenings are wet, they must be dried either by the sun or on iron plates by the fire. About 1½ gallons of tar are required to each superficial yard of paving.

Prepare the footpath (to receive the metal) by boxing out to a depth of three inches below the tow of the

kerb leaving an even surface, and on this prepared surface, lay down a coat of the prepared metal ($2\frac{1}{2}$ in. gauge) three inches thick, and well rolled and consolidated same; on this spread a coat (about one inch thick of the prepared machine metal screenings (from which the fine screenings have been removed by sifting through a quarter-inch screen); on this spread a coat (about a half-inch thick) of the prepared screenings, which have been sifted from the first coat of screenings; and finish off with a light coat of sand.

Each coat (except the coat of sand) must be well and thoroughly rolled and consolidated as it is laid down. The weight of roller used is about fifteen hundred-weight. Well ram, with iron rammers, those parts which cannot be reached by roller.

The coat is about two shillings per square yard. It is advisable that the tarred metal and screenings should remain in heaps for a few days to drain, particularly if they are to be used for roadways for vehicles.

The following shows the quantity of tar required for each description of material used in the process, viz:—

	per cube yard.]
Metal Screened... ..	7 gallons
Screenings as they come from the Machines	17 gallons
Screenings Screened	11 gallons
Screenings for Last Coat	28 gallons

The excellence of this paving (the screenings being of the lava rock known as "blue stone") was beyond question. The considerations in Colombo would be the expense and the influence of our hot, moist climate.

CEYLON UPCOUNTRY PLANTING REPORT.

THE CEYLON TEA PLANTERS AND THE LONDON BROKERS—TEA CIRCULARS—THE YEARLY REVIEW OF THE CEYLON TEA TRADE BY MESSRS. WILSON, SMITHETT & CO.—"BOUGHT LEAF"—TEA SALES IN GLASGOW NOT A GREAT SUCCESS—QUALIFICATIONS OF A TEA-MAKER AS STATED BY HIMSELF—THE WEATHER AND TEA FLUSHES—BLOSSOM ON COFFEE AND THE RAINS.

8th April, 1889.

The Ceylon tea planter has been and still is the subject of much advice. It will not be for want of counsellors if he fails in the race of life. We are all very grateful to those big London BROKING HOUSES, who have taken us under their care, and who, besides the usual monthly hints, which make their circulars so valuable, have a big "round up" at the end of each year, when the past is reviewed, the future foreshadowed and the planter advised. These yearly efforts are evidently the result of much labour and trouble: they put prosaic trade into a handy and picturesque form ready for reference and redolent of ideas, and they have all the ring of complacent authority about them. The firm that gets up one of these documents is clearly entitled to something like gratitude on the part of the planter and the business public generally.

Human nature is however human nature, and the tendency of most teachers is to go beyond their text and often too beyond their knowledge. With an intelligent audience like the Ceylon planters such a temptation, however fascinating, should be at once resisted, as an indulgence in it is sure to lead to grief, and is apt to weaken the effect of what is otherwise valuable.

We have had an unhappy example of this lately in the yearly review of the Ceylon tea trade of Messrs. Wilson, Smithett and Co., dated February 1889; and although the London brokers are perhaps a trifle more sensitive to adverse comments on their circular wisdom, than the planter is on the qualities of his tea, still what is good to give can't

be bad to take. In the circular in question we are favoured with advice on dull, pointless teas and the causes. "Bought leaf" is one of the factors which the keen eye of the London man has marked down as tending towards that absence of individuality which is so much desired, and he wants us to make bought leaf "sit up" in this way:—

"As regards 'bought leaf,' we throw out the suggestion whether it would not be possible to have the leaf manufactured by hand in an unassorted form, or at any rate withered and fermented, undue fermentation being checked by 'panning' on the estate producing it, before purchasing."!!

I hardly know what to make out of a curiosity of planting literature of this kind, and which comes to us with the *imprimatur* of authority; for a more hopeless muddle could hardly be, or a clearer example of the folly of talking authoritatively about things of which one knows nothing. The writer of this extraordinary advice must be closely related to the man who maintained that it was Solomon who said in his Pilgrim's Progress that "A man's a man for a that." Anyhow that happy humble of authors and books does not appear more absurd to the literary student than does Messrs. Wilson, Smithett & Co.'s suggestions upon "bought leaf" to the Ceylon tea planter.

If Messrs. Wilson, Smithett & Co. should in the future condescend to instruct the Ceylon tea planter in regard to his work, I would throw out the suggestion that when a bright idea occurs to them in London in connection with "how to do it," before giving it a place in their valuable circular, they might submit it to a practical planter, so that they may avoid the pitfalls into which the uninstructed are sure to fall.

The TEA SALES IN GLASGOW, however much they may suit the local grocers, don't seem from the prices obtained likely to enrich the tea grower much. I have before me the catalogue of 237 packages Indian teas which were put up for auction on the 15th Feb. by Messrs. Simons, Jacobs & Co., of that city and the prices got: Souchong highest is $5\frac{1}{2}$ d and the lowest $4\frac{1}{2}$ d; pekoe is better, highest $9\frac{1}{2}$ d lowest $8\frac{1}{2}$ d; broken pekoe there is but one lot, $12\frac{1}{2}$ chests, and it attains into the magnificent figure of $5\frac{1}{2}$ d. It got a farthing a pound more than some congo that was sold, which is better of course than, say a farthing less. It would want the charges in Glasgow to be very much less than those of London before we would take kindly to the new opening with its ideas of price.

It is well that a man should have a good opinion of himself; but perhaps with but eight months' experience of a tea factory the following from a tea maker's application may seem somewhat high:—

* * * "I have been lately learning tea work for nearly eight months, and have thereby acquired a thorough knowledge of tea making, both Merchantile and Fancy.

"I possess a profound sense of the vast importance that is attached to the tea making, and accordingly my qualifications backing me, I can fulfil the respective duties most laudably, especially make tea—'fine leaves provided'—to meet the topmost market." &c., &c.

In case there should be a run on this chap, I beg to say that he is at present employed.

The WEATHER still continues all we can desire. It is a lively time we have been having with our flush, and although we have been doing our best to get full musters, there are always some who stay in and are a worry. All the same, labour is not scarce: we have just a big spurt on as is usual after the early rains, which makes us all feel for the time being as if we were shorthanded.

The rain we are having every few days, although just what we want for tea, is killing our hope as far as another blossom on coffee is concerned. The first blossom seems to have set fairly well, but unless we get more, the crop will not be up to much, I fear.

PEPPERCORN.

BARK AND DRUG TRADE REPORT.

LONDON, March 28th.

CINCHONA.—The periodical auctions held on Tuesday were lighter than they have been for some time, the aggregate catalogued weighing less than 500,000 lb. while the total equivalent of sulphate of quinine would probably show a still greater discrepancy, nearly all the bark offered being of very poor quality. Many holders are evidently keeping back their supplies in the hope of obtaining better prices in a few weeks' time, and during the auctions a parcel of about 100 bales of Ceylon bark was withdrawn upon the receipt of a telegram from Ceylon, which was hinted to convey strongly "bullish" views of the position of affairs there. The following are the quantities included in the catalogues:—

	Pkgs.	Pkgs.
Ceylon bark	1,237	of which 1,034 were sold
East Indian bark	608	" 520 "
Java bark	191	" 176 "
South American bark	295	" 295 "
	2,331	2,025

It should be stated that the quantity of East Indian bark offered was less than might be supposed from the number of packages catalogued; one consignment of 165 bags from Mangalore, for instance, only weighed 40 lb. per bag. About three-fourths of the whole supply sold was imported in the course of the present year.

At the opening of the auctions prices were decidedly lower, nearly 200 packages South American Calisaya being cleared at 9d to 9½d. per lb.—for part of which, in a recent auction, offers of 11d to 11½d. per lb. had been refused. As the auctions proceeded the tone slightly improved, and the balance of opinion seems to indicate a fairly steady market, though we should not think that the unit averaged more than 1¼d per lb.

The following are the approximate quantities purchased by the principal buyers:—

	Lb.
Agents for the Mannheim & Amsterdam works	109,455
Agents for the American, French, &c., works	87,810
Agents for the Brunswick works	85,101
Agents for the Auerbach works	65,946
Messrs. Howards & Sons	36,220
Agents for the Frankfort o/M and Mannheim works	16,090
Mr. Thomas Whiffen	9,000
Sundry druggists...	4,484
Total sold	414,106
Bought in or withdrawn	71,733
Total quantity catalogued	485,839

It should be well understood that the mere weight of bark purchased affords no guide whatever to the quinine yield represented by it, firms who buy a small quantity of bark by weight frequently taking the richest lots, and vice versa.

SOUTH AMERICAN BARK.—A quantity of 32,714 lb. of Calisaya quills from the Bolivian plantations sold cheaply at 6½d to 8d for dull and damaged lots; one lot bringing 5d; and 9d to 9½d (one lot 10d) for good silvery quill from the Yungas plantations. At last week's Amsterdam auctions the following equivalents of quinine sulphate were bought in bark by the principal buyers:—

	Kilos.
Gustav Briegleb, Amsterdam	1,450
Auerbach Quinine Works	1,120
Amsterdam and Mannheim Quinine Works	1,000
O. L. Schepp & Zoon, Rotterdam	830
Brunswick Quinine Works	400

CUBEBS.—Fine bold genuine cubebs are held in Holland at £22 10s to £25 10s per cwt.

QUININE.—The speculative movement to which we referred in our article of last week as not unlikely to set in for a while after the 1s limit had once been touched seems to have actually taken place to some extent. If reports are to be believed, though there is nothing definite to substantiate them, about 80,000 oz. of German Quinine have been sold since our last report, commencing with B & S at 1s 0½d to 1s 1d; Brunswick at 1s 1d, and Fabbria Lombarda at 1s 0½d per oz. on the spot, and closing at 1s 1d for B & S and Brunswick on the spot, and 1s 1d to 1s 1½d for forward delivery up to November.—*Chemist and Druggist.*

CEYLON TEA IN NEW ZEALAND.

From Mr. J. F. Wingate we have received a file of New Zealand papers showing that he and Mr. Beckett are not idle in their work of introducing our teas into the Britain of the South. From the *Waimate Journal* we quote the following paragraph:—

Pure Ceylon Tea.—We have received, per favour of the Planters' Association of Ceylon, two samples of their Ceylon tea—pekoe and pekoe souchong. The association claims absolute purity for their teas, the cultivation and manufacture of which is fast becoming the most important branch of trade in the island of Ceylon. In 1873 the exports of tea from the island were only 23lb, while in 1886—thirteen years later—they had increased to nearly 10 million lb. Judging from the samples sent us, the tea is most pleasant in flavour, especially the pekoe souchong, a better drinking tea than which could not be desired. Mr. W. H. Beckett, Crosby, is the agent for Waimate.

In the Commercial Report of the *Lyttleton Times* of March 9th, we read:—

Sales of tea have been disappointing, while we can note a fair quittance of Indian and Ceylon sorts to the trade.

Mr. Wingate has been distributing a circular on "Tea in Ceylon" got up very neatly in Christchurch, with a good deal of information. We quote a few sentences:—

It has been said that, if to be an Englishman is to eat Beef, to be an Englishwoman is to drink Tea. True it is that the article which in the sixteenth century was a luxury, costing ten guineas a pound and consumed by a hundred people, has in the nineteenth century become a necessity, costing two shillings a pound and consumed by millions. Did the people of Britain thoroughly understand the difference between British-grown Tea—such as Ceylon's—and that of China or Japan, it is certain that those who could get the pure, clean, machine-prepared leaf which is turned out from the Planter's factory, would never touch the far from pure article prepared by the hands and feet of the unwashed Mongolian. In China and Japan Tea is mostly cultivated in small patches by the peasantry, who gather the leaves and prepare the Tea in their huts in a very unfastidious manner. The Tea, either in a half-manufactured or finished state, is sold to petty dealers who in turn sell to larger dealers. The larger dealer mixes and manipulates Teas, packs and sells them to the European Merchants for shipment to England, Australia, or America. The manipulation of Tea is an art in which the Chinaman excels, and in many of the inferior kinds the quality is infinitely deteriorated—thus "the dust of the leaf is mixed with clay and manipulated into the form of the ordinary leaf"—this is with appropriate philological coincidence termed "lie" Tea. "Tea leaves which have been already used are again manipulated and rolled into shape and sold as genuine Tea." The Teas of Japan, which are almost entirely consumed by our American cousins, are frequently and admittedly "faced" with a mixture of Prussian blue and soapstone.

The Ceylon estate cultivation and manufacture is very different, and it may not be uninteresting to give a brief account of how pure Tea is made. * *

CEYLON TEA stands unrivalled for its combination of strength and flavour; and the pure Tea gives a beverage pleasant and beneficial to those who drink it. One cannot doubt that were the well-meaning evangelists in the cause of temperance to realize the difference between pleasantly-strong well-flavoured stimulating Tea and the "wishy-washy" decoction infused from the cheaper China Teas, their efforts to substitute "the cup which does not inebriate" for that which does, might be made much more successful.

In addition to the other good qualities Ceylon Tea possesses that of being economical; for it is generally admitted that two pounds of Ceylon will go as far as three pounds of China.

The Tea you drink should be—

- | | |
|---------------|----------------|
| 1.—Pure. | 3.—Pleasant. |
| 2.—Wholesome. | 4.—Economical. |

And CEYLON TEA justly claims pre-eminence on these grounds.

Would-be purchasers of Ceylon Tea must be warned that there is danger (just as there is with everything which has earned a good name and become popular) of a spurious or admixed article being sold instead of what is genuine.

THE REAL WEALTH OF BURMA.

There can be no doubt that, although, we have in Burma abundant evidence of vast mineral wealth, we have also in the fertility of its soil a cause which has everywhere acted as a stimulus to human energy in the creation of wealth, and as a consequence civilisation. In Egypt, centuries ago, the periodical rising of the river Nile covered a narrow alluvial deposit which enabled cultivators of the soil to acquire a rich return for their labours. As a natural result wealth was accumulated and the country bordering the Nile became a contrast to the adjoining lands, whose inhabitants had not emerged from their pristine state of barbarism and ignorance. From the examples of all history we may learn how to take advantage of the fertility of most parts of Burma. Already in Lower Burma we find the Karens abandoning their old and barbarous methods of cultivating a hill for a few years, and then emigrating to another, when they found their returns decreasing. This interesting people encouraged by the American missionaries who have so long and successfully laboured among them, are now yearly in increasing numbers settling on the plains, and finding the advantages of doing so in their being able to obtain more leisure for the purpose of educating themselves and their children and rising higher in the standard of civilisation. We have room in the fertile parts of Burma and the Shan States for some millions more agriculturists, who will be able to derive from cultivation of the soil not only ample present subsistence for themselves and families, but a less precarious and more absolutely certain means of acquiring wealth than any afforded to the dwellers in our towns and cities. We must hope that under such favorable existing circumstances, agriculturists will be attracted to the country, and whether they are from India or China matters but little so long as they come. The opening out of the country by the extension of railways and the increase of river steamers is likely to afford increased facilities to settlers, and is therefore earnestly to be desired. With a few thousand more foreign settlers on the land, such lawlessness and anarchy as has prevailed in remote parts of Upper Burma, since the death of the King Mindoon, would be impossible, and thus the increased population we require in Burma would not only increase the wealth and happiness of the people engaged in cultivation, but would make pacification and good government easier and less expensive. Government therefore should do all that is possible to attract to Burma the settlers we so much require, and we hope that it will offer inducements to well behaved sepoys both of the native infantry and the military police, to remain on in Burma after their period of service has expired. This might be done either by

giving such settlers land on easy terms, or by granting free passages to a certain number of individuals of the families of each, to join them if they wished. The establishment here of such settlers,—men who have been drilled and disciplined would have the happiest effect, and and the Burmese villagers, would we are sure, tired as they are of dacoity and lawlessness, be only too happy to have such colonies formed in or near their own settlements.—*Rangoon Times.*

EXPERIMENTS IN MANURES.

Professor Kinch, of the Royal Agricultural College at Cirencester, has printed an account of some important experiments upon the value of manures. He deals only with barley and pasture. In each case a number of plots were treated with different manures, and the resulting crops were carefully compared. So far as the barley is concerned, it appears that on the average of four years the application of two hundredweight of nitrate of soda to each acre produced eleven and a quarter bushels of grain and eight and three-quarter hundredweights of straw more than the same soil would otherwise have yielded. The quality of the grain was less affected, but it was decidedly best from those plots which received both nitrate of soda and superphosphate. On the pasture plots the influence of manures differed widely. Thus kainit produced little or no effect, and superphosphate by itself was hardly better. Guano gave a good thick crop, but not so large a yield or so long a grass as either sodium nitrate or ammonium sulphate. These nitrogenous manures both yielded very heavy but somewhat rank crops, the ammonium salt seeming to be particularly advantageous to the growth of plants of the clover and vetch family. A mixture of superphosphate and nitrogenous manure gave the heaviest and rankest crop. It is curious to note that when superphosphate is mixed with ammonium sulphate one grass is specially abundant, while if it is mixed with sodium with nitrate the herbage chiefly consists of another. The promised continuation of these experiments ought to be very useful to the owners of pasture farms.—*Daily News*, March 15th.

CEYLON TEA IN GERMANY AND RUSSIA.

The following is a brief summary of the article in a Stuttgart paper referred to in our correspondence column:—

"The island of Ceylon hitherto known by the production of the finest quality of coffee and spices, will soon attain an equal fame for producing the finest tea." Then follow statistics and general information on the preparation of tea and the superiority of our Ceylon manipulation, these being mainly culled from "Ceylon in the Jubilee Year;" a clear woodcut of Tientsin in Bogawantalawa illustrates the letter press. "Every Ceylon planter," says the writer, "is willing to guarantee his tea as pure and unadulterated, as long as it is in its original packages.

"In Russia in the beginning of the year, out of 200 samples of tea examined, 40 were found to be mixed with *Epilobium* (French willow leaves or willow herb) in the proportion of 14 to 50 per cent.

"It has lately been ascertained through a lawsuit in Moscow and also by various testings in St. Petersburg that tea is abominably adulterated in Russia. Out of 44 samples officially examined, 4 consisted of a mixture of tea and 'Koporny' grass, 4 of Koporny grass alone and 5 of tea that had already been used. In Moscow, where there are regular methods of adulterating tea, the police have discovered a number of vessels containing sweepings which were destined to be mixed with tea. As tea contains considerably more oxide of iron and oxide of manganese than coffee, it is to be specially recommended to consumptive or anemic people. The owner of the plantation Tientsin, H. Sixtas, in Bonn, has begun introducing his tea into Germany, and is ready to grant samples," &c.

SAPPHIRES (?) IN TASMANIA.

(The Anglo-Australian in London.)

We have, off and on, heard a good deal about precious stones from Australia, but hitherto nothing very grand in this direction has been realized. The South Australian "rubies" turned out to be garnets, and the Queensland opals were a disappointment. Now, however, Tasmania is apparently coming forward, and may possibly prove an exception to the rule in regard to Australian precious stones rarely being up to the expectation roused on the subject. Mr. Dobson, who is now over here (the solicitor to the Main Line Railway), has with him some specimens of sapphires from the eastern coast. I say sapphires provisionally, because that is still, I believe, a question for the "experts" to determine. I hope shortly to be able to report definitely on this matter. Should Mr. Dobson's gems prove to be genuine sapphires, the find may be of commercial importance, as I believe there are plenty of like stones to be had whence these samples came.—*European Mail*, March 29th.

COFFEE NOTES FROM BRAZIL.

Advices from the district of Bom Jesus de Itabapoana Rio de Janeiro, to a Campos journal, state that the drouth has paralyzed the coffee trees for two years, for they are burnt into their very centre. The large receipts in Brazil have not ceased, and stocks are increasing. Revisions of their estimate of the present crop by Phipps & Co. place the yield higher than their former computations. The guess now is on the market. Another estimate is that of the *Journal of Commerce* of Rio, which places the figures at 5,000,000 for the present crop. Both these authorities also estimate the coming crop, the former at 3,250,000 bags, and the latter at 4,000,000.—*St. Louis Grocer*, Jan. 10th.

From a private letter received in this city, it is learned that in the province of Minas the panic is general throughout the entire population, over the alarming drouth that rules in the interior. Generally the sun has burnt up the coffee beans; and the coffee orchards are almost entirely destroyed. The crop will not produce sufficient to cover the cost of preparing it. Cereals have also seriously suffered. Despondency has seized upon all the planters who have before them only the prospect of a total loss.—*Diario do Commercio*, 21st February. This is pretty good for a single letter from Minas; when others commence to come in their effect will be terrifying.—*Rio News*.

CINCHONA CULTIVATION IN COLOMBIA.*

The cultivation of the cinchona tree on a large scale in Colombia is rather a dream of the future than an accomplished fact; though the eminent suitability of the soil and climate in those districts where it was originally found wild are almost a guarantee for its success when attempted. In 1884 the Government of the Republic passed a law for the purpose of promoting the plantation of cinchona, indiarubber, cacao, and eucalyptus trees. This law authorized the President to award prizes for the plantation of cinchona trees at the rate of 1,000 dollars for each 10,000 trees, to be payable when the trees had arrived at the age for cropping. The trees to be planted were required to be of certain species, namely, *C. Ledgeriana*, *C. officinalis*, *C. lancifolia*, and *C. pitayensis* (the two latter being the best indigenous sorts). Certain smaller prizes were also to be given for the plantation of caoutchouc trees, and especially of a native species called in this country "caucho virgen," which grows in the cold country from 6000 feet upwards. The President was also authorized to purchase up to 1,000,000 trees for distribution to intending planters. This law has remained a dead letter, however. No prize has been awarded under its provisions, and no new plantations have been made since it was passed.

There are three important cinchona plantations in Colombia at present. The oldest is near the village of Colombia, in the south of Tolima, belonging to the

* From a Consular Report on the Agricultural Condition of Colombia.

Compañia de Colombia, a company which for many years exported large quantities of the bark of the native *C. lancifolia* whilst the supply of wild trees held out. Their plantation is composed of 80,000 trees, all *C. lancifolia*, and is situated exactly where the wild trees formerly grew. They have lately sent small quantities of the cultivated bark to Europe, and the quality is pronounced to be fine, with about 6 per cent. of quinine. Another plantation, also in Tolima, at Ohaparral, on the Central Cordillera, has 450,000 trees from one and a half to five years old, many fit for cropping. The owners have secured the services of Mr. Robert Thomson, formerly Superintendent of the Botanical Gardens in Jamaica, to manage the plantation. The trees there are of various sorts, including *C. Ledgeriana*, *C. succirubra*, *C. officinalis*, etc., besides the native species. The following analyses of specimens of bark from the Ohaparral Company's plantation, made by Mr. D. Howard, show that the barks cultivated in Colombia compare well with the average of those of any other country, excepting, perhaps, the choice Java *Ledgerianas*.

These analyses, considering the age of the trees, give very good promise.

	Sulphate of Quinine.	Quinine.	Cinchonidine.	Cinchonine.	Quinidine.
1. <i>C. Ledgeriana</i> , 3 years old, grown at 8,000 feet...	4.33	3.24	0.66	trace	0.20
2. <i>C. succirubra</i> , 3 years old, grown at 7,500 feet...	5.00	3.75	3.03	0.17	0.07
3. <i>C. succirubra</i> , 3½ years old, 8 months renewed without moss, grown at 7,500 feet	7.00	5.25	1.90	0.67	0.06
4. New species from Ecuador, not named... ..	5.70	4.28	0.43	—	—
5. <i>C. Thomsoniana</i> (named provisionally), 2 years old, 8 months renewed without moss	3.30	2.48	0.07	0.55	0.25
6. <i>C. officinalis</i> , 3½ years old, grown at 8,000 feet	4.66	3.49	0.21	0.06	0.05
7. <i>C. officinalis</i> , 8 months renewed with moss ...	4.30	3.22	0.23	0.07	0.07
8. Jamaica hybrid, 3½ years old, grown at 7,500 feet	3.12	2.34	2.46	0.62	0.02
9. <i>C. Ledgeriana</i> , 22 months old, grown at 7,500 feet	2.71	2.03	0.55	0.13	—

The third plantation is near Bogotá, but I have been able to procure no details respecting it. These companies have exported little cultivated bark as yet, owing to the low price of quinine in Europe, and are waiting in expectation of a possible rise in the price.

Of the two indigenous species, *C. lancifolia* and *C. pitayensis*, cultivated in the country, the former is the more valuable from the amount of quinine it contains, but it contains only a small quantity of other alkaloids. The *C. pitayensis*, on the contrary, is not very rich in quinine, but it is the richest known bark in the valuable alkaloid quinidine; it is, in fact, the only variety containing quinidine in anything like considerable quantities. Analyses made by Mr. Howard of Pitayo bark have shown from 2 to 3.75 per cent. The Ohaparral plantation is close to the district in which the *C. pitayensis* tree originally grew.

The best altitude for the cultivation of the valuable barks in Colombia is from 6,000 to 8,500 feet, in a temperature of 56° to 62°. The tree producing the Cuprea bark (*Remijia purdicana*),* and which grows as low as 2,000 feet, is not worth cultivating. The large exportation of this bark in 1841-83, which somewhat disturbed the minds of the planters in

* The botanical names of these trees have evidently been transposed.—*Ed. Pharm. Journ.*

India and Ceylon, has nearly ceased. It was profitable only so long as the tree existed wild in large quantities within easy reach of the Magdalena river, and whilst the price of quinine was high. The allied species, *Remijia pedunculata*,* which is to be found in considerable quantities on the slopes of the mountains bordering the llanos, has not been largely exported, owing to the cost of transport.

Various sorts of trees producing caoutchouc, mostly castilloas, are indigenous to Colombia, but only one sort is cultivated, and that, at present, to a very small extent. This is a hitherto undescribed species of the family of the Euphorbiaceæ, allied to the Ceará and the Hevea of Brazil; but it grows at a greater elevation than any of the Brazilian species. In Chaparral there is a plantation of 70,000 trees, at 6500 feet, which are doing well. They are ready for tapping in six years from the time of planting.

Eucalyptus trees have been largely planted during the last twenty years in many parts of the country, especially on the savana of Bogota. *E. Globulus* is the species which has been most planted, though others, such as the *E. citriodora*, *E. rostrata*, and *E. sabigna*, have been tried. Many attempts have been made to introduce some species of the tree into very hot districts, such as Carthagena and some parts of the Magdalena valley, but I believe without success.—*Pharmaceutical Journal*.

COFFEE &c. IN BRAZIL.

"The Municipalities of Cape Frio and Araruama have not, unfortunately, been spared by the great drouth that has devastated the province of Rio de Janeiro. The plantations of maize made during the latter part of Oct. and in Nov. are completely lost; the coffee crop which would have been much smaller than last year is also lost. Fire has destroyed entire coffee orchards and sugar-cane fields. The Conceição and Papicú plantations have lost all their cane. In S. Matheus, Sapucaia, Araáa and other points of the two Municipalities, the destruction has been terrible; coffee-trees, pastures, manioc-fields, hedges, everything has been devastated by the terrible element of destruction. Many cattle have died from want of pasture, and water is scarce in some localities. The heat has been horrible, the thermometer marking 33dg. C. (91.4dg. F.) in the shade and there is no atmospheric appearance of rain. At night the sight that is presented to our eyes is horrible; in whatever direction one looks the glare of fires is seen; it appears as if we were in a great pot completely surrounded by flames. A veritable calamity."—*Gazeta de Noticias*, 12th Feb. [Quoted in *Rio News* of Feb. 18th.]

JAVA TEA COMING TO THE FRONT.

We have been favoured with the following copy of memorandum sent to a London firm by Messrs. Rucker & Benckraft, 37 Mincing Lane, on 26th March 1889:—

We send you three samples of a very desirable quality of "Pekoe Souchong." It possesses great strength as well as flavor and a bright infused leaf. It is a very useful class of tea and sold today for 9½d.

As showing to what perfection tea making is brought in Java we send a sample of fine Pekoe. It is rather destitute of flavor and strength, but realized 1s 6d per lb.

Hoolankande Pekoe made in same style realized 2s 6½d.

TEA PROSPECTS IN BENGAL.—A correspondent writes to a Calcutta contemporary:—"The tea season has commenced in the Darjiling Hills. On account of the abundant rain in the cold weather it was supposed that the season would commence with an early bumper flush. I am sorry to say these prognostications are not verified. The flush is a very thin flush, in some places banji, and perhaps will not weigh more than half the flush of last year."—*Pioneer*.

* The botanical names of these trees have evidently been transposed.—*Ed. Pharm. Journ.*

OPIUM.—Mr. W. J. Moore writing on the subject of opium, and Mr. Caine's resolution on the Indian trade in opium says:—"There are so many false impressions abroad with regard to the use and effects of opium that it will be well that a few facts on the subject should be plainly stated. The prevalent idea is that the person using opium descends from bad to worse, that he continually increases the amount of the drug consumed, that he cannot, having once taken to the habit, break it off, and that he becomes emaciated, decrepit, feeble, and physically and mentally incapacitated for all business. Now these are not the facts. No one denies that the immoderate use of opium is eventually most deleterious; but this may be said of the immoderate use of almost anything. The moderate use of opium—as it is consumed by the very great majority of those either eating or smoking it—is not prejudicial, and to very many persons, and in many positions, it is actually beneficial. Among the Rajpoots, for example, the majority use opium in one form or other—either swallowed in the shape of little pills, or drunk as 'umal pawnee,' or smoked as *chandul*. Yet the Rajpoots, speaking generally, are as fine a race of men as any to be found in the Eastern Hemisphere. I have known middle-aged men, hale and hearty, and capable of the greatest fatigue, who have used opium from their youth upwards. It is very rarely, these people exceed the accustomed quantum, and I have occasionally known individuals break off the habit. But, as a rule, finding it does them no harm, and that they are exhilarated and strengthened thereby, the habit is not left off. Again, in the more malarious districts of India, as, indeed, in some other malarious countries, opium eating is very prevalent. Opium has long been noted as an antiperiodic, and there is no manner of doubt that it is prophylactic against ague and malarious febrile diseases generally. If it were not for opium, the mortality from malarious fevers in India would be very much greater than it is. It is also an inestimable boon to the very poor, and especially in times of scarcity and famine, for it enables persons to exist upon less food than they otherwise could live on. Neither is the consumer of opium mentally incapacitated. I had for many years a Mussulman servant, who travelled with me thousands of miles, and whose duty was to rise in the early hours, prepare tea, and otherwise get ready for the march. Although a confirmed opium eater he never forgot anything, and was always at his post. A telling commentary on the assertion that opium dulls the mental faculties is the practice of the Chinese, who take their opium before business bargaining, and not like a Briton, who takes his glass after the business is concluded. All this, however, refers to a moderate use of the drug. An immoderate consumption will, doubtless, produce all that anti-opiumists assert; but, comparatively, the number taking opium to excess is not so great as the number taking liquor to excess. But opium has been ignorantly said to induce the very ailments for the relief of which it is resorted to. Travellers visit opium shops, and find therein people suffering from all kinds of maladies, and an erroneous inference is drawn that opium is the cause of such maladies, the fact being that individuals so afflicted resort to the opium shop for relief. Others of the poorer classes resort to the opium shop because they know opium will allay the pangs of hunger. I will not trespass longer on your valuable space, nor is it necessary, for any one desiring to learn something about opium may do so from my book, entitled 'The Other Side of the Opium Question,' and 'The Opium Shops of Bombay.'—*H. & C. Mail*.

CEYLON TEA IN AMERICA.

One special reason for encouragement in the big campaign which may be said now to be fairly opened for the distribution and sale of Ceylon and Indian teas throughout the United States, is found in the very favorable rates of *Customs duty on tea* entering the ports of the Republic. The United States Customs tariff indeed shows that tea, coffee and chicory, pass in free of duty; but on any other substitute for coffee save chicory, a duty of 3 cents per lb. (equivalent to 1½d or 2d) is imposed. It is rather hard on coffee to have even free chicory competing; but as regards tea, the product is, to cheap to encourage substitutes and the encouragement which freedom of customs taxation affords, ought to act as a great spur to extension of business. But unfortunately as the United States Consul shows in a letter appended, exemption from duty depends on the produce being carried in American vessels, and even then produce coming from east of Suez has to pay 10 per cent *ad valorem*, while if carried in British ships another 10 per cent is levied. On our teas however, even 20 per cent *ad valorem* (or 15 cents on, say, 75 cents value) will be far less than the English duty of 6d per lb. while if the trade prospers as we hope it may, an American steamer might be got to take a load of Ceylon teas direct from Colombo to New York.

Remembering that in the year commencing July next, the supply of coffee—hitherto the great beverage of Americans—is to be very short, there could not be a more opportune time for bringing in and offering as a fitting substitute a liberal supply of good, pure teas,—teas, we venture to say, such as when properly infused, our American cousins have hitherto had little or no experience of. Coffee and tea seem to be free of duty in Canada save if they are imported from the United States when there is a levy of 10 per cent *ad valorem*. Canada however is already a free consumer of tea, the ratio being 3·80 lb. per head of population against only 1·46 lb. for the States. If the latter only came up to the standard of the Dominion, during 1889-90, it would mean an additional consumption for America of wellnigh 150 million lb. of tea! This is too much to expect all at once, but in the course of four or five years if coffee does not take a turn in Brazil, it is quite possible such result may be attained.

Meantime, we are glad to learn that "Oolong" tea has been very successfully prepared on well-known Ceylon estates, one invoice selling in London at 3d. per lb. above the average got for ordinary teas. A large shipment is now being prepared, and it is not unlikely that in order to suit the prevalent American taste, a good deal of "Oologs" may ere long be sent from Colombo to New York. It is encouraging, moreover, to read in an article in the *American Grocer* "on developing trade":—"if the average buyer demands tea of ordinary quality go to work to induce him to use a higher grade that will better please his palate and at the same time afford the seller a more generous profit." Such is the advice tendered to American dealers in tea, and we trust they may try to put it in practice.—We append the useful letter with

which Mr. Morey has favoured us as follows:—

United States Consulate at Ceylon,
Colombo, 18th April 1889.

Tea is free of duty in the United States when imported direct from the producing country in *American bottoms*.

All merchandize produced east of the Cape of Good Hope is liable to 10 per cent *ad valorem* duty if imported from a country west of the Cape of Good Hope. Therefore tea or any other product of the so-called East may become subject to 20 per cent duty in the United States as *underrated viz:—*

If in a foreign bottom differential duty 10 per cent
If from a country East of the Cape 10 " "

— 20 per cent

A test case has been going on in the United States Courts for some years on the grounds that these duties were waived and abolished by the Tariff Act that placed tea and many other products on the free list. A judgment was got against the Government in the United States Circuit Court of New York, and the case went in appeal to the United States Supreme Court, where, I believe, it still remains unsettled.—Yours truly,

W. MOREY.

P. S.—The duty would be levied on cost f. o. b. of the goods at port of shipment.—W. M.

United States Consulate at Ceylon,
Colombo, 22nd April 1889.

SIR,—Please correct error in my letter of the 18th instant *re* duty on tea in the United States. The correction should read:—

"If from a country east of the Cape of Good Hope but shipped west of the Cape 10 per cent."

One salutary effect of this impost is, the prevention of intermediate manipulation of an article originally shipped pure from the producing country.

The Americans like good things, and won't have anything bad when they can help it. No tea could be sold there at a penny per lb. as has lately been done in London. Such stuff would not be considered lawful merchandize.

The laws of New York forbid its importation, and tea that is either spurious, adulterated, or seriously damaged, is condemned to destruction.

You are right about the feasibility of chartering an American steamer to take a cargo of tea to New York, thus securing its delivery there *free* of duty.

The American ship "South American" brought kerosene oil here two years ago, and was chartered back from Hongkong with a cargo of tea to New York. The same manœuvre could be easily made in the case of an American steamer.

W. MOREY.

PROGRESSIVE CEYLON.

The rivalry that exists between the planters of Ceylon and of Southern India gives special interest to any sign of progress or retrogression on the part of either as compared with its competitor. In his report for 1888, the Director of the Royal Botanic Gardens throws much light upon the course of planting enterprise in that island. Dr. Trimen may fairly be regarded as a scientific guide and monitor, a man who suggests new ideas and weighs suggestions made by others, who experiments with the object of introducing novelties or making improvements, and who watches closely the progress made by the general run of planters. His report may be accepted as sound and impartial, based upon ample scientific knowledge, a close acquaintance with facts, and a keen desire to

encourage the growth of the export trade of the island. In his "Notes on Economic Plants and Products," Dr. Trimen alludes to some products, which have but little interest for this Presidency, and we do not therefore purpose to comment upon all his remarks. There are some products, however, which are deserving of the notice of our planters, either on account of the rivalry already existing, or, where the plants are not now grown in Southern India, with a view to investigations being made as to their suitability, and the prospects of working them to advantage.

In view of the requirements of a Cotton mill to be erected in Colombo by the "Ceylon Spinning and Weaving Company," a vigorous effort is being made to increase the production of the plant, various descriptions of seed having been distributed on behalf of the Company for experimental culture. Tinnevely seed soon showed itself only suitable for the dry region of Ceylon, where it grew vigorously, producing its usual rather scanty crop of pods in less than four months, *i. e.*, early in October. Egyptian is only fairly reported upon, and has not, like Tinnevely, been free from the ravages of the insect world. The Fiji has fared similarly, and there has not yet been sufficient time to form any conclusion about Sea Island seed. Dr. Trimen is probably aware, though he makes no allusion to the fact, that exotic cottons are only too apt to deteriorate year after year. The supply of foreign seed need to be constantly replenished if the staple is to be maintained, and we have seen no reports yet that would justify our considering that Ceylon has already established her capacities as a cotton-growing country. We cannot altogether shake off an idea that Bombay, or even Madras, has little fear at present from the rivalry of Ceylon in this direction, but her progress will doubtless be watched with interest by the cotton cultivators and spinners of India, and perhaps our planters may also derive a useful suggestion or two from some of their neighbour's report of experiences or progress made in other classes of cultivation.—*Madras Times*, April 4th.

TEA-GROWING IN JAVA.

The Report for 1888 of the Planters' Association at Sukabumie in Java has just reached us. Sukabumie lies amid districts which afford ample scope to planting enterprise in many directions set forth in the Report. In that of tea cultivation, which of late years has been steadily extending the fall in prices has worked for good in enforcing economical management. Working expenses have been lessened, and improved machinery has come into greater favour. Tea plants from Assam are covering larger stretches on the estates, and ousting the other cultivated kinds. Planters look confidently to the time when these will enable them to meet successfully the keen competition of India and Ceylon. How increasingly the outturn of Assam tea in Java grows may be seen from the fact that on one estate alone the yield reached 150,000 Amsterdam pounds. Another encouraging sign lies in the indisputable fitness of West Java in soil and climate for this branch of cultivation, as proved by a quarter of a century's experience. That part of the island has the regularity of rainfall to which counts much in tea planting. Official discouragement bars the extension of it from the hindrances laid by the Government in the acquisition of waste land. Large tracts of the latter in West Java are kept out of the planters' hands. It only needs a reversal of this policy of looking the land up to draw capital and labour there so as to increase still further the productive wealth of the island. Taxation too weighs heavily on Java tea planters, and places them at a serious disadvantage with their rivals in Ceylon, who less handicapped, have shot a long way ahead of their Java fellows. The latter have to contend against

fiscal demands and official obstructiveness. Were Government to lend more readily a helping hand, tea cultivation would, in the opinion of the Association, soon advance with gigantic strides in Java. The tea shrub in that island has, however, a destructive enemy in the shape of an insect styled the *Helopeltis Antonii*, whose ravages cost the planters hundreds of thousands of guilders. No remedy for it has been found, so that, what with insects, fiscal burdens, and obstructive land laws tea planters in Java must, we fear, look forward to a hard struggle.—*Straits Times*, April 2nd.

CHINA TEA IN 1888.

A very comprehensive work has been issued by the Chinese Imperial Maritime Customs on the tea-trade of China, dealing chiefly with the causes which have contributed to the decline of this great trade. As we reported some time ago Sir Robert Hart addressed circulars to the Commissioners of Customs at the various treaty ports requesting full reports with regard to the position of the tea-trade, accompanied by whatever recommendations they might have to make for its improvement. The result is the issue of a bulky volume under the title 'Tea, 1888.' The work contains reports from the Commissioners at Hankow, Kiukiang, Wuhu, Shanghai, Ningpo-Tamsui, Foochow, Amoy, and Canton, the ports most engaged in the tea trade. Appended also is correspondence between the Chamber of Commerce in China, the principal tea firms, experienced Chinese dealers. It is impossible of course to give anything like a summary of such a work, but we reproduce in full the report by Sir Robert Hart addressed to the Tsung-li Yamèn, with which the book opens:—

Report on Tea addressed to the Tsung-li Yamèn by the Inspector General of Customs.

Inspectorate General of Customs, Peking,
31st August 1888.

1.—In 1885 and again in 1887 I submitted my views respecting the increasing demand for Indian tea, the deterioration of Chinese tea, and the suggestions that had been made regarding preparation and taxation; and having received the Yamèn's order to instruct the Commissioners of Customs at the ports concerned to examine and report, I directed them to do so by my Circular No. 387 of the 30th August, 1887. The replies of the Commissioners at Hankow, Kiukiang, Wuhu, Shanghai, Ningpo, Tamsui, Foochow, Amoy, and Canton have arrived: that there are faults of preparation to be remedied, and that taxation ought to be reconsidered, is the general result of their inquiries. After a careful examination and comparison of what the Commissioners write from their several local standpoints, I have now the honour to submit this Report for the Yamèn's consideration.

2.—Not only is China the native place of tea, but Chinese tea is superior in flavour to all other teas; and yet, although the export of Chinese tea has gone on increasing, a large proportion of the increasing number of tea-drinkers in England take Indian instead of China's black teas, and in America take Japanese instead of China's green teas. The cause of this is not that the raw product—the leaf—has deteriorated in China, but rather because India and Japan take so much greater pains to prepare their Teas well that not only do the Teas keep without changing, but they can be sold cheaper than Chinese Teas—so well, too, do their painstaking producers know how to save wisely. China's failure to take the same pains is partly because of the old reason—it was always so,—and partly because falling prices have disheartened producers: old conditions are, in fact, beaten by new methods. Thus the result is that every new advance gives competitors an additional hold on the market; and although China's export trade has not yet fallen off, it is widely asserted that in time it must cease to exist. That other Teas should be sold cheaper is explained in two ways:—

(a) *China's Teas are more heavily taxed.*—Although all Teas pay the same Import Duty at their destination they are differently taxed on departure; *e.g.*, while

Japanese Teas pay only a fourth of what Chinese pay, Indian Teas pay no Export Duty whatever.

(b) *India's Teas are more economically prepared.*—In India the work of a large plantation is managed by one head from first to last, but it is not so in China; Tea growers on the hill-side own only a few shrubs each,—the pickers sell to the collectors,—the collectors to Chinese traders,—and the latter, again, to Foreign merchants; thus, expenses are greater, and Tea therefore dearer.

3.—The merchants' recommendations are that taxation ought to be reconsidered and defects remedied, but they are not all in accord respecting taxation. Some assert that if Likin and Duties are not entirely repealed, the Tea trade will be destroyed; while others are of opinion that to lighten taxation will be of no advantage to trade. A comparison of these views shows that while to lighten taxation would be of certain and immediate disadvantage to revenue, to do so would be, at best, of but uncertain advantage to trade. In the case of the Indian competition, for example, Indian Tea can be sold in England, and at a profit, for about 6d a pound, whereas Chinese Tea cannot even be sold at a profit for 9d; therefore, supposing the tax on Chinese Tea, viz., about 2d a pound, entirely abolished, Indian Tea would still undersell it 1d a pound. I am therefore of opinion it is useless to touch either Export Duty or ordinary Likin. But the Hankow Commissioner suggests that a certain tax named the *Shan-ti*, or 'hill tax,' collected from the owner; of the Tea plants, might be remitted with advantages it amounts to 760 cash, or Tl. 0.4.6.0 a picul, and its removal would encourage peasant growers and help them to take more care of their plants. I think it would be well to give effect to this suggestion; national revenue will not feel the loss, and the abolition of the tax will encourage that carefulness in tending the plant which is demanded at the very starting-point of any effective attempt to remove defects.

The opinion just expressed about taxation refers mainly to the Black Teas which go to England. As regards the Green Teas which go to America, the Amoy merchants point out that during the last ten years, although Chinese Green Teas have not gone forward in less quantity, there has been no increase; while, on the other hand, Japanese Teas have increased during the same period from 25,000,000 lb. to 42,000,000 lb. The Japanese duty on tea, they say, is only \$1 a picul, while the Chinese amounts to as much as 34 per cent. *ad valorem*; and they add that if the Chinese duty were made something like the Japanese, or, say, about $\frac{7}{8}$ per cent. *ad valorem* the Chinese green teas they refer to would be sold in great quantities. The merchants are presumably quite right in their statistics; but as to the change they propose in the duty, I think the consideration of it may be deferred without danger, although I do not deny that it might result in larger sales.

4.—As regards what merchants allege respecting defects to be eradicated, British merchants point out that less tea is sold in London than formerly, and explain that the cause of that is deterioration in quality. It does not appear to me that this explanation can be accepted. Changes have taken place in the trade; for instance, the Russians used to buy in London but now buy in Hankow, and the result of the opening up of a sea route is not only that tea goes to Russia direct, instead of through London, but Russian buyers competing for tea have raised prices at Hankow and, disappearing from competition, have brought down prices in London, and thus English merchants, buying in a rising market while they send their tea to be sold in a falling one, naturally find also that their business is not what it was; but this falling off in quantity and its attendant badness of business result not so much from any deterioration in the quality of tea as from changes in the trade. Less tea arrives—less tea passes through England; but the cause of that is not that Chinese tea has deteriorated. And it must be remembered, too, that although a less quantity passes through England, the total quantity which leaves China has gone on increasing, and cannot yet be said to be decreasing.

5.—Quality, however, is a very important factor, and all that is said about it merits serious consideration. Although quality necessarily differs from year to year and with the producing localities, it is nevertheless true that preparation has much to do with it; care in preparation may possibly convert indifferent material into reasonably good tea, but carelessness will assuredly spoil the very best leaf. Comparing the tea of present and former times, the defects the merchants complain of are these:—

(a) Too long an interval is allowed to elapse between picking and firing; the firing is inadequate; and while the Tea is deficient in strength and loses its flavour, it also does not keep.

(b) Spoiled leaves are not rejected but are packed with the good, and the consequence is that the good are also damaged. Too much Dust is put in each box, and the whole is sometimes further adulterated by the intermixture of the leaves of other plants.

(c) The boxes in which Tea is packed are not strong enough or well enough made for its protection.

(d) The Tea when delivered is often not up to muster.

6.—The remedies recommended are as follows:—

(a.) There ought to be a sufficient depth of soil where the Tea shrub is planted, and the ground ought to be weeded and manured.

(b) The Tea shrub ought to be well cared for; pruning ought not to be neglected; aged shrubs ought to be removed, and young ones planted instead.

(c.) All the leaves should not be removed from the same shrub at the same time, but only such as are ready for gathering. The leaves which are ready ought to be picked from all the trees in the plantation at the same time, and each picking ought to form a separate chop. The leaf ought not to be picked too soon or too late: although a 10 days' overgrowth gives an increase of 25 per cent in weight, it causes a decrease of 35 per cent in value. In India there are as many as 16 pickings; that is, each shrub contributes to 16 chops.

(d.) After the leaves are picked, the subsequent processes—withering, rolling, fermentation, firing—ought to be at once proceeded with. The greatest care should be exercised at each step, and the leaf ought to be well protected from the weather, especially just after picking and while awaiting the other processes.

(e.) The inner and outer cases in which tea is packed ought to be more solidly made and more securely closed.

(f.) Musters ought not to be sent on ahead of the chops.

In this connection merchants add that Indian tea owes its success to the fact that the exact and faithful performance of all that these recommendations involve is there the rule, and that this is easy for India, where a single tea plantation means thousands of shrubs on the same plot, where picking, withering, rolling, firing, packing, and despatching are all proceeded with at once and under the same supervision and management, and whence the teas are forwarded to and sold in the London market, so that proper attention is given to each leaf at each stage, and while the tea produced is first-class tea, expenses are reduced to a minimum—only one profit is looked for, and consumers can purchase cheaply; whereas in China it is just the opposite that takes place, and the result is inferiority of quality and elevation of price.

The merchants further recommend the appointment of a joint Commission of intelligent experts to spend one season in Chinese tea districts and another among Indian tea plantations, to study in person the processes, practice and custom of each, and, after a proper comparison, advise as to what China ought to charge or drop or adopt.

It is also recommended that China should either open a Tea School, or establish a Model Plantation, or place a given Tea district under the supervision of properly appointed Government experts, or charter a Company to conduct the business of a Tea plantation on the Indian plan. I am of opinion that any or all of these would be beneficial to both trade and commodity; the idea is, of course, to provide a fitting pattern for all to study and imitate. In this connection the attention of the Yamen is more especially

requested for Mr. Hannen's despatch, Foochow No. 588, and Mr. Chalmers' despatch, Tamsui No. 326, regarding the establishment of model plantations at Pakling and Tamsui.

7.—In conclusion, it is evident that there are causes for the representations put forward by merchants; nor am I the only one who has called attention to them. In the *Peking Gazette* I have noted what the Viceroy of the Min-Ché provinces said about the collapse of the Tea markets in a Memorial to the Emperor, and also what the Viceroy of the Two Kiang afterwards said in another Memorial about the success and cheapness of Indian and Japanese Teas and the losses of Chinese merchants, and how the Likin had been slightly reduced in consequence, in the hope of benefiting an industry of so much importance to China and the Chinese. An evil so widely known and recognised ought, of course, to be cured. It is true that at the start China alone produced Tea and everybody bought from China, and that while the ever-growing populations of Russia, America, and the Pacific prefer Chinese Tea and scarcely touch Indian, even England does not yet take less, although latterly buying more and more Indian Tea; in fact, so many places want Chinese Tea that no matter what quantity is produced there is but little fear of its finding a market. And moreover, Indian Tea, although possessing the good quality of strength, is now pronounced to be in some way harmful, while Chinese Tea is not harmful, and, although not so strong, possesses in a high degree another excellent quality—flavour,—in which Indian teas are deficient; as long as teas possess this flavour they will find purchasers. Accordingly, the important point to attend to is flavour: growers must take care of their plants and keep them in good condition, and those who conduct the various processes which fit the leaf for use, must exercise the utmost care at every step to ensure that the tea will keep and that its flavour will not be lost. The 'hill tax' apart—which ought to be repealed for the encouragement of growers,—I do not consider that any good will attend the reduction of ordinary Likin and Export Duty; but there is unquestionably room for improvement in every step and every process in growing and preparing tea, and it is most important that whatever can be done shall be done.

8.—Copies of the letters, and despatches received and issued connected with this question are submitted for the Yamen's consideration, and also some figures from the tea statistics of the last twenty years.

ROBERT HART,

Inspector-General of Customs.

—*China Mail.*

BARK AND DRUG TRADE REPORT.

LONDON, March 21st.

BAEL FRUIT.—Two cases, together 3 cwt., of recently imported sliced fruit are held at 2½d per lb., a price which was not obtainable at auction.

CARDAMOMS.—Arrivals have been more plentiful lately and it was generally expected that some decline would be established at today's drug sales. Such, in fact, was the case, and only 93 out of the 372 packages catalogued were sold at an irregular fall in price, from 2d to 5d per lb. Nearly all the holders decided to hold back for higher rates, and some of them withdrew the whole of their supply without going through the form of offering it. The following prices were paid: Ceylon Malabar, medium to bold good pale but warty round 2s 7d; small to medium heavy round, rather dull in coat 2s 5d; pale and yellow, mixed sizes 2s 2d; fair medium size, brownish coat 1s 8d; good partly bleached unclipped, shelly and split 10½d per lb. Mysore, fine medium to bold and heavy, very well bleached 3s to 3s 2d; small to medium ditto 2s 8d; medium to bold good yellow 2s 10d; medium to small pale 2s 5d; small to medium yellow and pale mixed, good appearance 1s 8d to 1s 9d; small long yellow 1s 5d; very small pale 1s 3d

per lb. Mangalore, good pale M M M, at 2s 11d per lb., a very cheap lot. Wild Ceylon, bold heavy 1s 10d; ordinary thin 10d per lb. Dull seeds 1s 4d to 1s 6d per lb. The exports from Ceylon during the periods between October 1st and February 21st have been: 1888-9, 136,336 lb; 1887-8, 159,430 lb.; 1886-7, 148,147 lb.

CINCHONA.—Fine genuine loxa bark brings very high prices 2s 1d to 2s 2d per lb. being paid today for two lots. Two parcels, together 160 bales, flat yellow calisaya were shown, but bought in, there being no offers. Twenty-eight bales bold fine bright Maracaibo were bought in at 9d to 10d per lb. Guayaquil sold well at 1s 7d to 1s 8d for fine grey mossy quill, and from 4½d up to 1s 1d for common damaged to good brown silvery ditto. Fifty bales Lima good broken yellow quill were offered, and an offer of 2½d per lb. was refused.

COCA LEAVES.—Ten bales good fresh green, but broken, leaves are held at 1s per lb. but, there were no bids at 11d per lb. Two bales common brown leaves, from Java (?) sold at ½-1 per lb.

CROTON SEED.—Eleven bags fair brown Ceylon seed sold at 13s per cwt.

CUBEBS.—Six bags bold spurious grey fruit imported from Singapore were bought in today at £23 10s per cwt.; genuine cubebs are held at £24 10s to £25, but scarcely any are here at present.

OILS (ESSENTIAL).—Fine Cinnamon oil sold today at 1s 6d to 1s 7d per oz., and Cinnamon leaf oil at 1½d per oz. Citronella oil is very neglected, and native brands on the spot cannot be quoted over ¾d to 1d per oz., according to quantity. At the auctions 150 cases Lemongrass sold cheaply at 1½d per oz.

QUININE.—Prices still continue to decline, and the week under review has witnessed the first transactions in shilling quinine, about 20,000 oz., including B. & S., Auerbach, and Brunswick, being reported sold at that price by second-hand holders. Today's auctions were looked forward to with considerable interest by the trade, 37,500 oz., being advertised for sale partly without reserve. There was not very much bidding, and 12,500 oz. B. & S. were sold to brokers at 1s 0½d to 1s 0¾d per oz. Another broker refused 1s 0¾d for B. & S. 1s 1d being his limit. 5,000 oz. Jobst, 2,000 oz. Zimmer, and 2,000 oz. Italian quinine are all limited at 1s 1d per oz., and offers of 1s 0½d to 1s 0¾d were refused.

VANILLA.—At today's sales 96 cases met a pretty brisk demand, and sold at again higher rates: fine fresh chocolate, but without much flavour, 6 to 8 inches, 16s 6d to 20s; brown, 3½ to 6 inches, 10s 6d to 12s; good crystallised chocolate, 6½ to 9 inches, 16s 6d to 22s; 5½ to 6 inches, 14s 6d to 16s per lb. A case of 44 lb of varying lengths, partly mouldy, from Macassar, sold at 3s 8d per lb.

THE AMSTERDAM CINCHONA AUCTIONS.

(Telegram from our Correspondent.)

AMSTERDAM, March 21st.

At today's bark auctions the whole of the supply offered, consisting of 2,083 packages bark, was sold at lower prices as compared with the last auctions, the average unit value being fully 7½c per half kilo, or 1½d per lb. Manufacturers' barks, chips and quills, realised from 7c to 60c per ½ kilo (=1½d to 11d per lb.), ditto root from 14c to 18c (=2½d to 3½d per lb.) Druggists' barks, chips, broken quills, and quills sold at 9c to 71c (=1½d to 1s 1d per lb.), and druggists' root at 22c to 55c or 4d to 10d per lb. The principal buyers were the Auerbach quinine factory, Mr. Gustav Briegleb, of Amsterdam, and Messrs. C. L. Schepp & Zoon, of Rotterdam.

TIN MINING IN JOHORE.—The last mail from Singapore brought us news that Mr. E. A. Watson, the old Ceylon planter who is reported to be on the road to fortune in connection with some newly discovered tin mines in Johore is at present in the Native States along with his brother-in-law Mr. Gibson.

RECENT ADDITIONS TO THE COLOMBO MUSEUM.

DREDGING EXPEDITION TO MANNAR.

We have been favoured by Mr. Haly, the Director of the Colombo Museum, with the following particulars respecting the recent additions to the Colombo Museum:—

Colombo Museum, April 13th, 1889.

In answer to your inquiries with regard to the success of my dredging expedition to Mannar, I am sorry to say that I have little information to give you. The specimens obtained were mostly small species which will require to be carefully looked through, and I have had as yet no time to do so.

I had two principal objects: 1st to obtain a second perfect specimen of the great star fish *Luidia maculata*, which I could mount in fluid (the Museum has a very fine dried specimen which I procured some years ago), and 2nd to compare the fauna of the great flat that runs from Colombo to Mannar with that of the strait between Karaitivu island and the mainland.

With regard to the first point, I was unsuccessful. This magnificent starfish is as far as I yet know only to be found on the beach in the south coast of Mannar. Here you may see fine specimens washed up; but nearly always in such a state as to be unfit for preservation as the creature has a habit of breaking itself into small pieces when uncomfortable. I never succeeded but once in getting a good specimen, and the handling and preservation of that was a work of much difficulty. On this occasion I took a cross between trawl and dredge of my own invention which does not collect the sand and mud in the way the ordinary dredge does; but I was most unfortunate. The star fish was caught in abundance of all sizes when the ordinary dredge was down; but I could never get on their ground when the trawl was down. Brought up buried in a heavy mass of sand the specimens were always broken to pieces and nothing could be done with them.

This may at first sight appear very extraordinary; but there is nothing remarkable about it to anyone accustomed to dredge on the coasts of Ceylon. Species of all classes of animals lie close together, the first haul of the dredge perhaps brings up three or four dozen corbeles (which by the bye are excellent eating), then a great quantity of sponges, then the net is full of some small crab; the next haul perhaps has a number of fine *Nudibranchiata* in it and so on all day long. Thus the chances against procuring a particular species in any given haul are very great.

With regard to the comparison of the fauna of the coast generally and of the Karaitivu strait, I was not so successful as I could have wished. The ship, a native brigantine manned or rather greatly overmanned with a Hindu crew, had no cargo and scarcely any ballast; the consequence was that it was only with the gentlest breeze that the dredger could be made to keep in the bottom, however much rope might be paid out. However the coast from Mannar to Tallaimannar was well explored and the coast south of Mannar to Karaitivu fairly well. We were nearly wrecked off Dutch Bay and in trying to dredge in the deep water off Kalpitiya all the nets were torn to pieces by coral rock, and I could not get them mended before I reached Negombo, and then our time was nearly up.

A glance at the Admiralty chart will show that a great plateau runs far out at sea off Colombo to within a mile or two of the coast of Kalpitiya; it then runs out in a deep curve towards the north

to Adam's Bridge, so that for twenty miles south off Tallaimannar it is impossible to get above 5 or 6 fathoms of water; between Colombo and Kalpitiya the water is not quite so shallow, 10 to 20 fathoms being about the ordinary depth at some miles from shore (I am open to correction not having the chart with me). I expected to find in these shallow northern waters a rich fauna allied to that of the Karaitivu strait. The peculiarity of this strait at least near the north point of Karaitivu is the abundance of two fine species of star fish *Oreaster turritus*, a species with strong vermilion coloured spines and *Oreaster orientalis*, a species so variable that it is almost impossible to find two specimens alike. Of the first *O. turritus* I only procured one specimen, and that was in 9 fathoms of water off Negombo. This shows how the dredger may miss good things, for it is abundant on the pearl banks off Arippe, Captain Donnan having sent me many from there. I also saw them at Dutch Bay in the pearl kottus. *Oreaster orientalis* is abundant all the way north of Karaitivu; but most so off Arippe; but it does not, I fancy, attain to the size of those in the very shallow water of the straits. I also found *comatulas* (feather stars), but not nearly in the abundance or of the beauty of those off Trincomalee. However, I learnt the art of preserving them, and am therefore prepared for the Trincomalee ones when I go there again. The *nudibranchiates* were of extraordinary size and beauty especially on a patch just south of Arippe; but it is only sketches from life by an artist that can give any idea of these lovely molluscs. As for the rest, small crabs of the family *Leucosiada* swarmed in the nets; in fact they were generally alive with them. Small fishes were also tolerably abundant. One of these, a species of pegasus, I believe, will prove to be new to science, and most of them I expect will be new to the Museum collection. Shells were not abundant, chanks were the commonest, and there were a few common olives; however, I have found nine or ten small species new to the collection already, and hope eventually to find more. The sponges are likely to prove of great interest, and are being reserved to be sent to some specialist. I also dried a number of specimens of mud and sand from various depths for Dr. Brady, who has lately presented the Museum with a beautiful series of *Foraminifera* mounted for the microscope which he procured from sand dredged of Kalpitiya some years ago.

THE USE OF OPIUM.

[The following letters in the *Standard* of 29th March bears out what we have so often said about the use of opium in the Fen and other malarious districts of England. If we could only get the good people suffering from ague to take to quinine instead. All planters and others who have friends in the Fen districts ought to make the value of cheap quinine known.—Ed.]
To the Editor of the "Standard."

Sir,—With reference to Mr. W. J. Moore's letter in *The Standard* of today, it may interest your readers to know that there are many habitual opium-eaters much nearer than India. Opium has always been a favourite remedy for ague in the English Fen country, and, although malaria has very much diminished since the draining of the Fens the habit of opium-eating has remained with a great many people who are now getting into years.

I have occasion frequently to see professionally some of these English opium-eaters, and I cannot say that they are injured so much by the habit as one's reading on this subject would lead one to expect. Many of them are seventy and some over eighty years of age, and mentally they are not inferior

to the average aged rustic. As Mr. Moore observes with regard to Indian opium-eaters, they do not appear to exceed their usual weekly quantity; but I do not think they ever give the habit up.

The usual method of taking the opium is chewing the crude drug; but, perhaps, taking it in the form of laudanum is nearly as frequent.

I am, Sir, your obedient servant,

M. B.

Wainfleet, Lincolnshire, March 26th.

THE NEW DEPARTURE IN TEA SELLING.

(BY THE "PERIPATETIC PLANTER.")

The London Wholesale Tea Dealers' Association are not satisfied with the resolution recently come to by the Indian Tea Districts Association on the question of continuing the present system of selling Indian teas on nett weights. They desire a return to the old system of taking the tares; which meant the turning out of the teas here and exposure of the teas in a damp climate, in order that the boxes might be weighed, as well as tea, and a deduction made for the tare. Your readers will remember that this old system was abandoned in favour of taking the weight of tea in a few boxes out of an invoice, and upon these, an average for the whole invoice is struck. This plan was adopted both in the interest of the grower and of the dealer, inasmuch as the garden's reputation was less liable to suffer by its teas "going off" after exposure here in a more or less damp atmosphere; and the dealer obtained his tea with all the garden "freshness" upon it—or as much as possible of that "freshness." Now complaints have been heard that short weight is received by this system. The fact assumed by the importers is, that those people who have benefited by a slight excess obtained by the chances of averaging, and some of those who have received exact weight, say nothing; but some of those few, who, by the same changes of averaging, have received a trifle less than their old-fashioned "over-draft," which they had grown used to under the old system, and which have come to be looked upon as a right; or bonus (!) have raised an outcry against the change which has caused them this "loss." The I. T. D. Association did not think a case had been made out by the wholesale dealers of any loss of sufficient consequence, to justify a reversion to the old system, with its manifold drawbacks, now that planters had got used to the new plan. The I. T. D. A. nevertheless requested more detailed information of the losses experienced, as the wholesale dealers had not supported their case with any figures of weight. The wholesale dealers have now drawn up some figures showing claims made for some 800lb. short weight, or an aggregate of over 1,200 chests, divided among various invoices. It is a pity that even that much foundation should exist for their grievance, and planters will do well if they can prevent such claims happening; but the figures advanced now, are not likely to be deemed important enough by the I. T. D. Association to cause a change, back to the old system of taring the boxes. The London Wholesale Tea Dealers' Association, on the other hand, threaten that they will only buy teas which may be subjected to that ordeal! So if they stick to resolution, and if importers, on the other hand, support the views of the I. T. D. Association to the extent that they do now in this matter, then the London wholesale tea dealers will find that they will only have $\frac{1}{3}$ to $\frac{1}{2}$ of the Indian teas to select from! This shrinkage of their selection, will, it is assumed by importers, soon cause the wholesale dealers to abandon their decision.—*Indian Planters' Gazette.*

A WHITE ANT POISON.

Sir,—In reply to your enquirer, who wanted to know a good white ant poison, I beg to tell him of a specific never known to fail when properly applied. Take of

common aloes (*aloe vulgaris*)—called by the natives clethale—a quantity and extract the juice by passing the leaves through an old mangle, or any such contrivance, first having placed a trough to catch the juice in; now boil the substance so extracted to a creamy consistency, adding six ounces of pounded camphor to every gallon of juice; then, having excavated your white-ant hill to a depth of about a foot or two, pour in a quart of the stuff, taking care to cover as much space as possible; fill in the excavation and leave the ants to their fate. This preparation is extensively used in America for destroying various insects, and it is said that coffee borers and other vermin of that species that attack plants succumb to it marvellously. In these cases it is mixed largely with water and sprinkled on the leaves of the tree so attacked through a garden pump or watering can. Aloe juice is also used to preserve wood which has in any way to float or be submerged in water, by mixing it with the preparation of white lead used to paint the article. As an authority for this I quote a part of the article on aloes in the *Encyclopaedia Americana*:—"The juice of the aloes was formerly used in eastern countries in embalming, to preserve dead bodies from putrefaction; and as the resinous part of the juice is not soluble in water, it is sometimes adopted, in hot climates, as a preservative to ship bottoms against the attacks of marine worms. One ounce of its mixed with turpentine, tallow and white lead is considered sufficient for covering about two superficial feet of plank and about 12lb. is sufficient for a vessel of 50 tons burthen. In proof of the efficacy of this method, two planks of equal thickness, and cut from the same tree, were placed under water, one of them in its natural state and the other smeared with this composition. They were suffered to continue in the water eight months and when, at the end of that time, they were taken out, the former was perforated in every part, and in a state of absolute decay, whilst the latter was as perfect as at first. In the East Indies, the juice of these plants is used as a varnish to preserve wood from the attacks of destructive insects; and skins and even living animals are sometimes smeared with it for the same purpose."

COBRA DE CAPELLO.

—*Madras Mail.*

PLANTING IN DELI.

The *Deli Courant* again calls attention to the prevalence of desertion among estate coolies there. The other day, on one estate in that quarter, the Controller of Serdang found no less than 69 coolies with doubtful or decidedly forged discharge certificates, who were at once taken into custody.

On the Kwalla Bingei estate, an outbuilding containing 200,000 attaps has been burned down through incendiarism. The supposed fire-raiser, a Battak, has been arrested.

The "Deli and Langkat Tobacco Company Limited" has just been started in London with a capital of £230,000. It will take over three estates in Deli and Langkat, which have been eight years under planting management. A profit of 35,000 pounds sterling on last year's tobacco crop is counted upon, admitting of a dividend of 22 per cent. The working capital of the Company has been fixed at £75,000.

On the 29th March, riots took place among the Chinese coolies on Helvetia Estate, in which one of them was murdered.

The "Anglo Sumatra Tobacco Company" has been floated in London with £80,000 as capital, for buying the Pakan Barn estate in Siak.

The Netherlands Consul General at Singapore reports that in 1888 about 5,600 emigrants arrived there from different portions of Netherlands India, of whom some 2,700 went to the East Coast of Sumatra under contract, an increase of about 800 compared with the previous year. These figures rest upon returns by native recruiting agents. There can be no question that the extension of tobacco cultivation on the East Coast of Sumatra has materially furthered immigration thither.—*Straits Times*, 9th April.

THE ORIENTAL BANK ESTATES COMPANY, LIMITED.

The Company has been in operation since June, 1886, and has regularly paid dividends at the rate of seven and five per cent per annum respectively on the preferred and ordinary share capital, and through the economy now proposed to be effected by the issue of debentures, the prospects of the ordinary shareholders will be correspondingly improved.

The Company was formed to purchase from the Official Liquidator of the old Oriental Bank, the large estates and assets in Ceylon and Mauritius referred to in the Company's original prospectus. The Company has since purchased other valuable estates and assets, both from the Official Liquidator and other persons—the cost of their present holding being over £400,000, the whole of which has been paid, and the latest valuations of the properties are considerably in excess of this sum. It will be seen, therefore, that these properties alone—without taking into consideration the value of the crops—constitute ample security for the debenture issue.

ESTATES IN CEYLON AND MAURITIUS THE PROPERTY OF THE COMPANY.

Ceylon.—Bellwood, Craigie Lea, Dangkande, Darrawella, Delmar, Dene, Dodangalla, Donoughmore, Forest Creek, Glen Devon, Haviland, Haddington, Henegahawelle, Hunugalla, Kondesalle, Kuda Oya, Lindupatina, Lonmay, Loolecondura, Mahaberiatenne, Mahawatte, Naranghena, Newmarket, Nilcomally ½ths, Sinnapittia, Stellenberg, St. Coombs, Summerhill Walya, Wattewella.

Total acreage 12,953 acres.

	acres.		acres.
Under Tea	4,129	Under Cinchona ...	1,153
„ Coffee	637	„ „ Cardamoms	80
„ „ „ „ „ „ „ „	604	Grass, Forest, &c.	6,345

Mauritius.—Britannia, Cent Gaultettes.

Acreage 3,547 acres.

The Company is also interested in the following Estates:—Beau Sejour, Constance, La Paix Mon Choix, Mon Songe, Mont Piton, Bon Air, Highlands, Combo.

Acreage 9,572 acres.

The Company has thus become the owner of 30 free unencumbered properties in Ceylon, having a total area of over 12,500 acres, of which in round numbers over 4,000 acres are cultivated with tea of different ages, not all yet in full bearing; 600 acres with coffee 600 acres with cocoa; 1,000 acres cinchona, and 80 acres cardamoms, the rest being grass land, virgin forest, &c. The Mauritius Assets purchased from the Official Liquidator, comprise the Cent Gaultettes Estates, and large interests in the Beau Sejour Estates, and the Highlands Estates, also in the Bon Air Estate. The Company has since purchased and paid for the very valuable estate called Britannia, free and unencumbered. The factory on this estate has been entirely reorganized and fitted by the Company with the best modern appliances and the whole provided with an abundant water supply. These changes have greatly increased the value of the property. The total area of the Mauritius properties is about 13,000 acres.

The estates both in Ceylon and Mauritius are well cultivated, in excellent condition, and supplied with first class machinery and are within easy distance of the local railways which pass through or close to many of the properties.

The crop of Tea from the Company's estates for the present season is estimated at about one million lb. of made tea, and the yield is expected to increase annually as the properties come into full bearing. The Company's teas command a good price in the London market. Large quantities of Cinchona, Coffee, Cocoa and other produce are also grown on the Company's estates in Ceylon and sold in the London market. The Sugars are mostly sold abroad. The total value of produce which the Company is selling annually, from its own estates and from those in which it is interested, is over £160,000, and the amount is expected to increase considerably.

AN IMPORTANT RULING IN COMMERCIAL LAW.

The opinion handed down Tuesday, March 5th, by the United States Supreme Court in the case of the Liverpool and Great Western Steamship Co. is one of paramount importance in commercial law and of special interest to the business world. The great question involved was whether a steamship company can limit its liability for its own negligence. The decision of the Court is that it cannot.

In this case the company had stipulated in its bills of lading that it should not be liable for the negligence, default or error in judgment of the navigators of the vessel. The vessel was stranded on the coast of Wales. On the trial in the lower court it was found that the stranding was due to negligence on the part of the vessel's officers. The company then claimed that even in that case it was exempt from liability by the express stipulation in its bills of lading.

The Supreme Court holds that the stipulation was not valid in law, for the reason that no steamship company nor any other common carrier has any right or power to make such a condition. The Court says: No public carrier is permitted by law to stipulate for an exemption from the consequences of negligence.

The fundamental principle upon which the law of common carriers was established was to secure the utmost care and diligence in the performance of their duties.

A carrier who stipulates not to be bound to the exercise of care and diligence seeks to put off the essential duties of his employment.

Nor can those duties be waived in respect of the servants of the common carrier, especially where the latter is incapable of acting except through others.

To admit such a proposition as that the law merely demanded abstract carefulness and diligence in proprietors and stockholders who take no active part in the business would be subversive of the very object of the law.

The Court further holds that English law cannot make such a stipulation valid in case of a contract made in this country, for in such case our own law governs. "The fact that the vessel went ashore on the coast of Great Britain is quite immaterial."

The far-reaching importance of this decision is apparent when it is considered that it settles, by the highest court of the nation, a vital point in the law governing not only ocean carriers but also all railway companies. In the case of land carriers the question has often been discussed, but not always with satisfactory or harmonious results. State courts have sometimes decided one way and sometimes the other—holding both that a common carrier can and cannot limit its liability for its own negligence by a stipulation to that effect in its bill of lading.

All controversy must now end, and all doubt is removed by the decision of the United States Supreme Court. This decision will have a revolutionary effect on both ocean and land bills of lading. It will make a dead letter of the clause exempting the company from liability for its own negligence.

That accords with justice. To permit common carriers to escape liability by a stroke of the pen would be to put shippers at their mercy. Merchants must ship goods by steamer and by rail. They are forced to accept the terms and conditions of the carrier unless protected by law. But the law as now interpreted by the Supreme Court imposes an important limitation on the power of the carrier. The carrier is not permitted to take an undue advantage of the shipper, is not allowed to force upon him a one-sided bill of lading.

It must use care and diligence in the transportation of goods. It must pay for losses due to its own negligence. It cannot escape that liability by a stipulation in its bills of lading.—*N. Y. Herald*.—[All this is sound commonsense and applicable to the Ceylon Government Railway.—ED.]

TEA PROSPECTS.

We are fast approaching the very busiest time of the year both on the majority of our tea plantations and in the shipping port of Colombo. The months of May, June and July current may be expected to show unprecedented shipments of the product, and it is no wonder therefore though the gathering cloud of "low prices" should be viewed with discouragement in planting circles. But there are more than faint streaks of silver lining to this dark cloud and nowhere in the world can a band of agriculturists be pointed to who believe more thoroughly in the aphorism "God helps those who help themselves" than among the planters of Ceylon. They and their friends among merchants, bankers, editors, &c., have not been idle while all this gloom has been gathering in the London market, and we are able to point to several redeeming features which it would be well for friends of Ceylon at home to take to heart, before they begin to think that the tide of prosperity so lately welcomed through tea, has been arrested disastrously. We will endeavour to summarize as briefly as possible the reasons which seem to justify faith in the future of tea at this end:—

(1) Ceylon teas have admittedly acquired a very strong hold on the taste of a large body of British consumers.

(2) The maintenance of quality is alone required to continue this hold and secure an average of remunerative prices, and in accordance with the call from Mincing Lane, on a large proportion (at least) of our estates, "finer plucking" and careful manufacture are the order of the day.

(3) Possibly, the order to pluck fine, may affect the estimate of coming crops to the extent of some millions of lb.

(4) The local consumption of tea-dust, red leaf, &c. among the natives is rapidly extending in Ceylon.

(5) After the current planting season a check will probably be put on a further extension of the planted area.

(6.) The majority of Ceylon tea planters can undoubtedly hold their own in any contest with India or Java, while so long as the present "squeezes" are maintained, China cannot compete successfully.

(7.) The Ceylon planters are determined to make an impression on their own account on America: they have Messrs. Pineo and MacCombie Murray to represent them.

(8.) With the short supply of coffee from Brazil, there ought to be a consumption of 100 millions lb. of tea additional in the United States between 1st July 1889 and 30th June 1890.

(9.) The Ceylon planters and merchants are sanguine of making an impression in favour of their teas throughout Australasia, and of gradually superseding inferior China teas, more particularly as we are prepared to take payment of a good deal in Australian food products.

(10.) There is much to be done with Ceylon teas on the Continent of Europe. A direct trade with Germany and France should be developed; and also with Russia through Odessa, since a special Russian Agent has just established himself in Colombo.

(11.) A market for some of our teas is likely to be found in Persia, a beginning in trade having been already effected through the influence of the New O. B. C.

(12.) Nowhere else in tea growing countries, can the grower adapt himself more readily to his market and other circumstances than in Ceylon: if he finds that "plucking very fine" pays best, that system can speedily be adopted, even the abandonment of a field for a time will not affect its future, and in a good many cases, there are still other products to occupy attention and help the planter to pay his way till tea improves. The inference therefore is that the Ceylon tea planter is under no circumstances to give way altogether in the coming struggle; but rather that by the law of "the survival of the fittest"

he ought to be eventually well in front; although our hope is that increased consumption will take off all our Ceylon tea, as well the Indian and Java, and some China tea at remunerative prices.

THE ICERYA OF THE ORANGE PLANTATIONS.—In addition to the introduction of parasites to prey on the scale, Mr. Coquillet, after various experiments, finds that the vapour of hydrocyanic acid gas kills the insects without injuring the trees. The "dry gas" process consists in acting on the cyanide of potassium (5 lb.) dissolved in 1 gallon of boiling water, by sulphuric acid (one half ounce to every ounce of the cyanide solution), and passing the evolved gas through sulphuric acid. Violent action occurs as the acid is poured on the cyanide, and the gas is given off as a dense white vapour. It is obvious that such operations should not be entrusted to careless workmen.—*Gardeners' Chronicle*.

INSPECTION OF STEAM-BOILERS.—The annual report of the Commissioners for the inspection of steam-boilers and prime-movers in Bengal has just been issued. It states that during 1888 the total number of boilers examined was 1,100, and that the inspection in the newly added area fully justified the extension, boilers which were dangerous having been discovered. The qualification of those in charge appears to have been generally satisfactory, no certificates having had to be withdrawn on account of the incompetency of engine men, though in some cases certificates were withheld until a competent man was appointed. After providing for all expenses the fees realised yielded a surplus of over R15,000.—*Pioneer*.

EXTRACT OF TEA.—It would be useful to know in what form extract of tea is to be placed upon the market. A company, entitled the Santha Tea Company Limited, with a capital of £8,000 in £10 shares, has just been formed "to carry into effect an agreement intended to be made between G. Christopher and R. W. Leftwich of the one part, and the company of the other part, and to carry on the business of manufacturers of extract of tea. The first subscribers are:—P. Cooper Lane, 5, Shoe Lane, E.C., 1 share; A. R. Parkhouse, Hornsey House, Highgate, 1; T. B. Allison, West Hill Lodge, Highgate, 1; H. Lawford, 452, Camden Road, N., 1; R. W. Leftwich, 167, Brixton Road, S. W., 1; W. Leftwich, 20, Derrington Park, West Hampstead, 1; G. Christopher, 6, Barrow Road, Streatham, 1. The first directors are H. Davenport, G. Christopher, and R. W. Leftwich. Remuneration chairman £120, and £100 each other director.—*H. and C. Mail*, March 29th.

NEW COCA (AND TEA) PREPARATIONS.—Ceylon Tea is after all not unknown in France, witness the following:—The French Hygienic Society of London have for some time (says the *Chemist and Druggist*), made a speciality of preparations of the coca leaf, such as coca-tobacco, which were calculated to be used as articles of daily consumption; and they now add to their list several which are designed to maintain the popular use of the Peruvian invigorator. Coca tea—an excellent blend of the coca leaf and a choice Ceylon tea—is likely to be a favourite, for it makes a pleasant beverage of good aroma which is powerfully restorative. Their coca elixir is a good idea. It is intended for use along with any table wine, 15 to 20 drops of it making with a glass of sherry a good coca wine, possessing the full flavour of the leaf. This flavour is a marked characteristic of all the preparations especially the tablets and lozenges, and is an indication that care has been exercised in their manufacture. The tablets and lozenges may be used for throat troubles; and those without borax are a portable form of the restorative for use by athletes and pedestrians. All these specialities are put up in attractive style.

To the Editor.

COFFEE AND TEA: A HINT TO LONDON BROKERS.

DEAR SIR,—If Mr. John Hamilton of Messrs. S. Rucker & Co. would publish for the year 1888 in pyramidal diagram (on the same lines as Messrs. Gow, Wilson & Stanton's diagram for tea) showing the so-called World's Consumption of Coffee as set forth in their statement for 1888 as included in their Coffee Trade Review dated 28th Feb. 1889, everyone would then be able to see at a glance how coffee and tea stood in relation to each other in regard to the so-called World's Consumption. Of course, in both diagrams the consumption of both staples in non-producing countries only would be included, for it is for instance simply impossible to gauge China's home-consuming power for tea. Besides the question of most importance for British growers of tea and coffee to consider is in what proportion are these articles consumed in non-producing countries.

If Messrs. S. Rucker & Co. tried to build up a pyramidal coffee diagram in cubes of same size as Messrs. Gow, Wilson & Stanton's tea diagram, each cube representing one million of pounds weight only, then their coffee diagram would be thrice or quadruple the size, I am inclined to think. It would certainly be better to continue using the same size of cubes, so that when the tea and coffee pyramidal diagrams were laid side by side a glance would suffice to show in what relation they stood towards each other. The tea diagram would state as now that each cube represented one million lb. The coffee diagram would state how many pounds each of the same size of cubes represented in coffee.

Such diagrams on a large scale placed at the principal railway stations or conspicuous places in every great city in the world would attract universal attention and people who never perhaps and ever tasted British-grown tea might see for themselves, how it formed the everyday drink of millions in other countries, be tempted to give it a trial. That a few miles of sea between such important countries as Great Britain and France should today be the principal reason why tea is almost unknown in the latter country, is of itself extraordinary; it could be explained years ago when communication between these countries was so difficult and tedious, but now no such impediments exists. The French like the Germans only require to be educated, and they will all in time like British-grown tea; but they must be told to partake of it at least half-a-dozen times before finally declaring against it. O. T. W.

COCONUT CULTIVATION.

Colombo, 27th March 1889.

SIR,—“B.”’s letters in your issue of last night contains the following:—“As to the cause of the bunches requiring to be propped up, I have a theory. It is owing to an insufficiency of salt in the soil, for propping becomes necessary in inland districts even when trees grow in moist situations, while on the sea-borde the stems are strong enough to support the fruit without the aid of a prop.”

This is quite new to me as I have no doubt it will be to a great many practical men. “B.” seems to want a little salt in everything, but without staying to discuss the question of salt or no salt, may I venture to suggest that the bunches require to be propped up entirely owing to a physical cause, viz. the mode of growth of the branches upon the stem of the coconut tree. In young trees the branches are placed far apart on the stem and they allow the bunches to hang down between them necessitating artificial support, but in older trees the branches grow very close together in a whorl which support the bunches of fruit, and there are no spaces between the branches as in the case of young trees to allow the bunches to hang down. Further it is a mistake to suppose that trees growing in the sea-borde do not require artificial support to the bunches of fruit.

All young trees do require propping up whether they grow near the sea or otherwise, and where I own lands on the seacoast a cent or a cent and a half is usually paid per tree for propping up. I have been brought up under the genial shade of the coc-nut tree in the premier coconut growing district of Ceylon, and in the garden where our home is there are trees of different ages. There is the tall giant of more than a 100 years, while under it grow plants of two years and trees 10 to 15 years old, and I write with the experience of a life time so to say.
A. B. O.

RICE CULTIVATION IN CEYLON: THE NEED OF CHANGE OF SEED AND OF MAKING HEADMEN DIRECTLY RESPONSIBLE.

Galle, 3rd April 1889.

DEAR SIR,—My attention having been directed to a communication from “W. A. D. S.” on the subject of paddy cultivation, which appeared in the *Overland Observer* of the 1st inst., I beg to forward for publication copy of a report sent by me on the 3rd March 1887 to Mr. Elliott, the Government Agent.—I remain, dear sir, yours faithfully,
WILLIAM JANSZ.

Galle, 3rd March 1887.

E. Elliott, Esq., Government Agent, Southern Province.

Sir,—Referring to previous correspondence on the subject of improving the cultivation of paddy in this Province by changing of seed, I have now the pleasure to send for your inspection a sample which grew in the field cultivated under my direction at Halpato in Gangabodapattu, from seed imported from Batticaloa.

For want of a piece of land in a convenient locality, I was obliged to select a field on which a crop had been gathered scarcely a month previously, and which was therefore unsuited for immediate cultivation, the ground not having lain fallow for a sufficient time.

Besides this the season for sowing had advanced when the seed from Batticaloa arrived, and I had therefore no time to adopt any other but the ordinary appliances and the usual manure (bone dust) used by natives in cultivating their lands. This circumstance though much to be regretted has, I am glad to observe, tended to demonstrate more conclusively that without the aid of any extraordinary means change of seed alone is sufficient to give a good crop.

In addition to this impediment, another of a more serious nature occurred, which wellnigh threatened the success of the experiment. A considerable portion of the seed plants when they were about 5 or 6 weeks old, were injured by cattle trespassing on them during a great part of one night.

In spite of these disadvantages the crop would have been more than double the present yield, were it not for a most unfortunate mistake made by some one in having mixed up three different kinds of seed coming to maturity at three different periods. When one kind had ripened and was almost fit to be reaped, another of a more luxuriant kind made its appearance, the first crop was therefore allowed to stand till the second had ripened with the result of the former crop having been wasted and lost, and when the second had ripened a 3rd crop sprang up. Fearing that the 2nd would also be wasted if it were allowed to remain till the 3rd had ripened, it was reaped and gathered, and the crop amounted to 11.5 fold of the whole quantity of seed sown which is 3 or 4 fold more than the average native yield. But this figure is misleading as to the true proportionate yield, calculating the crop in proportion to the parent seed from which it was gathered I may safely count upon 25 to 30 fold.

People who looked on with stolid indifference to this new departure from their time-honored system of cultivation and who were sceptical as to the benefits occurring from what they believed to be an “unnecessary innovation” have been so thoroughly convinced of the success of my venture, that they have sent me letters addressed in Sinhalese acknowledging their error and complimenting me on my efforts to benefit them.

To ascertain the difference of grain in the new crop and the home grain, I had an equal quantity of both kinds converted into rice with the result that in every bushel there are 16 measures of rice in the imported seed, whilst there are only 14 in the home grain seed. Looking merely at the difference in figures it may perhaps be considered as a matter of no great importance, but when it is looked at with the eye of a political economist the difference would be startling, being no less than a gain of 6.25 per cent. Leaving aside the question of a better crop to be obtained from change of seed, the comparative difference in rice alone would be a sufficient inducement for agriculturists to cultivate imported seed.

Calculating the probable yield from imported grain to be 20 bushels and the average natives yield 8, there is a gain of 12 bushels in every bushel of paddy sown, and as there is a gain of 2 measures of rice in every bushel of imported seed, the whole question resolves itself as follows:—

1 bushel native sown paddy yields 8 bushels paddy, which is 112 measures rice at 14 per bushel.

1 bushel imported grain sown yields 20 bushels paddy, which is 320 measures of rice at 16 per bushel.

∴ on 1 bushel imported grain there is a gain of 320 - 112 or 208 measures rice.

∴ on 100 bushels imported grain there is a gain of 20,800 bushels = 650 i.e. a gain of 650 per cent in rice.

32
Allowing a large margin for unforeseen and unavoidable circumstances, say of about 300 per cent, there is yet 350 per cent to be obtained from the cultivation by changing of seed, a matter which commends itself to the serious consideration of the people of the country, as well as of Government and others interested in the welfare of Ceylon.

I beg that the result of my experiment which you were the first to recognise and approve may be communicated to Government and my application for a supply of seed from Calcutta, Negapatam, and other approved centres of grain cultivation may be kindly recommended by you. I shall be prepared to meet the demand for the value of the seed whenever called upon to do so. I am convinced that any little capital I may invest in promoting the welfare of the people of my country would be well laid out.

Information on the following points should be obtained if the Government think my request worthy of consideration and encouragement:—

1. The season in which the seed is sown?
2. When those seasons begin and end?
3. The time the crop takes to mature from the date it is sown to the time of reaping?
4. The nature of soil best adapted for its growth?
5. The length of time it may be preserved and found fit for seed?
6. The length of time which the grain may be preserved without deteriorating in quality or quantity.
7. If the land is manured what is the kind of manure used?

I have already overcome the prejudice of natives for change of seed and have drawn out from them a cheerful and a willing testimony as to its beneficial results, and my object now in wishing to experiment with foreign seed is to find out the seed of which country gives the largest yield and is best adapted to the climate and soil of Ceylon.

I enclose herewith for your perusal three letters in Sinhalese addressed to me by respectable and intelligent agriculturists of the neighbourhood in which my field was cultivated.—I remain, &c.

(Signed) WILLIAM JANSZ.

A CEYLON TEA PLANTER DISCRIMINATINGLY CRITICIZES THE ANNUAL CEYLON TEA REPORT OF MESSRS. WILSON, SMITHETT & CO.

8th April 1889.

DEAR SIR,—I have been looking over Messrs. Wilson, Smithett & Co.'s Tea Memoranda for 1888, which is for the most part very instructive and interesting.

We used to flatter ourselves that the advantage we had over India in price was due to our finer quality, but it is very evident it was not so, as that advantage is rapidly disappearing, and we can only hope that we may keep on a level with India in price and quality, and that together they will see Chinas out of the market.

I annex an analysis of quantities and prices from different estates which sent 100 000 lb. and over into the market during last year, and I think you will be struck with the uniformity in prices obtained. A few estates got exceptional prices, which may be for the most part accounted for either by their finer plucking (with perhaps a correspondingly short yield) or by their exceptionally favourable situation, as there is no doubt that some localities give a much finer flavoured tea than others. In other cases the credit undoubtedly belongs to the superintendent, especially where he is ahead of the general average both in quantity per acre and price obtained. The analyses would be much more interesting if one could add two more columns to it—"quantity per acre" and "profit per acre."

Almost every estate in Ceylon will eventually be giving about 100,000 lb. or over, so I consider that to take all estates over that figure gives a fairer idea of what Ceylon tea is and the position it will eventually hold than if all estates with smaller quantities and higher prices were included.

Messrs. Wilson, Smithett & Co. like other home authorities on tea always want us to pluck finer, and so keep up the quality, and we all agree with them that fine plucking would help to do so, and we also would, each of us, like to see all the rest plucking as fine as possible, though many of us would continue to go on as before and be quite content with average yield and average prices or better still heavy yield and prices slightly over the average.

I believe there is little doubt that the bulk of the best paying estates will be found amongst those giving 400 lb. (four hundred) per acre or over and fetching prices from the average 11½d to 1d or 1½d above it.

The suggestions in the Memoranda as to the treatment of bought leaf will not recommend themselves to many. They are something on a level with the suggestions and hints given by Artemus Ward when he went temporarily to edit the *Agricultural Gazette*. Again as to sorting and size of breaks.

We can all understand that it is much more convenient for brokers and buyers to deal with large quantities, but we cannot help observing that most of the high prices are obtained by small invoices and small breaks: in fact in some instances the whole crop of some estates for 1888, which fetched the highest prices, would barely make one decent invoice from a broker's point of view. I think then that there is room for doubt whether it is for the interest of the grower to send very large breaks and that more particularly where the tea is of very high quality. If the small break does not get the attention of the largest buyers, I take it, it has a wider field amongst the smaller buyers, who are naturally more numerous and who perhaps are prepared to give quite as high a price for what they want as the larger dealers.

In conclusion, we are all much obliged to Messrs. Wilson, Smithett & Co. for their yearly statement, which must have cost them much time and trouble to work out, and if next year they would arrange it in some such way as below, I believe it would make it more interesting still to most of us here, and if we could only get the other two columns I spoke of above, filled in correctly, we

would then be better able to give an opinion on the vexed question as to which is best for the grower,—
QUALITY OR QUANTITY.

Estate.	Quantity.	Average.
Over a quarter million lb.		
K A W	510,000	0 11 $\frac{1}{2}$
Mariawatte	302,000	0 11 $\frac{1}{2}$

FUMIGATION IN COCONUT CULTIVATION AND THE AGRICULTURAL SCHOOL.

Colombo, 10th April 1889.

SIR,—In a communication on fumigation in coconut cultivation on page 759, there are frequent references to the Agricultural School as recommending what the writer terms the "smoke bath theory." Let me at the outset deny that the efficacy of smoke as a manure (smoke-manure!) has ever formed part of the "teaching of the Agricultural School." A report of this nature on the authority of "An Old Planter," and given publicity in a paper of acknowledged weight in agricultural matters, cannot but reflect discreditably on the reputation of the school, and I could not expect less than that the writer of the article in question would, as a point of honour and from a sense of fair-spiritedness, retract the unfounded charge of our 'teaching' the absurd 'nonsense' he writes of.

The analogy which brings in the old story of wily King Charles and the members of the Royal Society is not complete. I am not inclined to deny *in toto*, like the sage referred to, the efficacy of burning at the base of the tree. In your footnote you mention the beneficial effect of smoke in ridding the palm of insect and animal pests. There is, moreover, the manurial value of the residual mineral ashes to be taken into account. Where the operation of paring and burning is carried on in clayey and peaty soils (and I am told it is practised in parts of the island), the improvement of the soil, both chemically and mechanically, is very great. The soil is thereby made open and porous, and is brought into a condition favourable for the absorption of moisture and ammonia from the

atmosphere. Potash is liberated, the proportion as shown by analysis increasing from .269 to .94. The old roots of tough grasses and weeds, together with their seeds, are destroyed where they exist. Insects and their eggs are also destroyed. Thus, where paring and smother-burning is properly carried out, I say there is much good derived.

There is some confusion when the subject of the sources of carbon in the plant is taken up. The leaves take in carbonic acid gas from the atmosphere, and not carbon, as your correspondent imagines. The former is a colourless transparent gas, and the volume of smoke rising from a fire bears no proportion to the volume of carbonic acid gas produced: in fact the denser the smoke the greater is the amount of unoxidized carbon atoms, and it has yet to be proved that plants take in particles of carbon through their leaves.

Again the writer says that "it is more probable that the supply of carbon (*sic*) in the atmosphere is in excess of the wants of vegetable life." It is not a probability, but a certainty. Prof. Roscoe estimates the weight of C⁰₂ in the atmosphere at three billions of tons. Prof. Crum Brown asserts that if all breathing ceased, plants would have a sufficient supply of CO₂ in the atmosphere to flourish for "very many years": while Archibald McAlpine, the eminent agricultural botanist, fixes this period at about a thousand years. We must not lose sight of the many great sources of CO₂ besides the expired breath of animals.

The whole performance entitled "Fumigation" reminds one of a favourite game among very little children, of setting up a dummy as an imaginary enemy and knocking it down with a great flourish. We may next expect to see two columns of an article written with the object of upsetting the theory that the coconut tree flourishes on the sound of the human voice—"the efficacy of voice-manure" might be the title of the article. There would be no objection to this, but let it not be said—and falsely said, mind—that the School of Agriculture taught the new theory.

I am a raid that the School is not likely to be closed on "Old Planter's" recommendation, and may I beg that it will not again be so carelessly misrepresented?—Yours faithfully, C. D.

CEYLON IN THE PARIS EXHIBITION.

Castlereagh, Dikoya, 15th April 1889.

DEAR SIR,—The enclosed copy of a letter from Mr. H. K. Rutherford is of such importance to all interested in tea, that I venture to ask you to publish it. With regard to his suggestion that agencies be established in Paris to sell pure Ceylon tea, I have written Mr. Leake our London representative, on the matter (one that the Tea Fund will attend to). All interested in Ceylon tea may rest assured that their interests are safe in the hands of the London Committee and Mr. Rutherford, the originator of the Tea Fund.—Yours truly, L. H. KELLY, Chairman, Ceylon Planters' Association.

Paris, 23rd March 1889.

My dear Kelly,—I arrived in Paris from Ceylon yesterday, and a few hours after my arrival I was wandering through the "Exposition Universelle" courts and buildings under the guidance of Mons. Joubert, the constructor of the Ceylon tea-house, the Indian Palace and the Queensland Wine chalet.

I write you merely to give you my opinion of the site conceded to the Planters' Association of Ceylon for their tea-house.

In one word it is simply the most perfect that could have been given to us. It is close to the base of the great Eiffel tower, and at the end of a

spacious terrace overlooking gardens, fountains, band-stands, &c.

If the tea-house is properly managed, I predict that thousands of people will crowd it daily and it will be found to be about five times too small.

The site is the envy of all refreshment caterers, and should be worth to Mr. Shand, if taken full advantage of, several hundreds of pounds after refunding the Association the R6,000 voted in aid of the scheme.

The Indian Palace will have about 20 bazaars with a tea verandah and bar. The building is in an out-of-the-way place, and I fancy for every pound of tea consumed in the Indian tea-house there will be ten pounds in the Ceylon house.

M. Joubert who has had to do with previous Exhibitions in other countries informs me that without doubt the Paris Exhibition will eclipse everything. I can well believe it, for what I have seen of the various arrangements and structures &c. 6 weeks before the opening, has given me some idea of the magnitude and magnificence of the show when complete.

The fittings of the Ceylon tea house are being made by M. Joubert's firm in London and are expected here about 1st April and all will be in readiness by the opening day.

Some means ought to be taken to follow up the effects of the Ceylon tea-house, by providing for the sale of Ceylon tea in several shops in the city of Paris.

I have gone into several shops here which sell tea and enquired for *Ceylon tea*, but they never heard of it. Steady enquiries by all Ceylon friends during the Exhibition period for *Ceylon tea* in Paris will prove a good advertisement for us. It is a mistake to think there is very little tea drunk in Paris. There is a considerable quantity, but it is most vile stuff.

I do not suppose the Ceylon tea-house at the Exhibition should require more funds from the Association, but should it do so, I would strongly advise the Association not to hesitate for one moment in increasing the vote.

Being on the spot and having seen the site conceded to us, I can with almost absolute certainty predict that the tea-house will be a magnificent success.—Yours sincerely,
H. K. RUTHERFORD.

THE REMEDY FOR THE TEA CRISIS.

DEAR SIR,—The suggestion to pluck fine and reduce our exports by 25 per cent is a good one, for not only would the shipments of Ceylon tea be appreciably reduced, but what went forward would probably meet with a ready sale on arrival—"a consummation devoutly to be wished"—in place of "hanging fire" as now. The tea would in fact go off like gunpowder or more vulgarly speaking "hot pies"! At the very low prices tea, even of *good, rich quality*, now is selling at, the working man would not hesitate to pay an extra 6d per lb. to obtain what best suits his palate. I believe that if 40,000,000 lb. of *really good Ceylon tea* were sent home it would all find buyers. Teas without any redeeming feature would, under such circumstances decline still further *and these alone, and rightly so would continue to suffer*. Listen to what the leading Mincing Lane Brokers say by the mail of 29th March, just to hand.

The production of tea as everyone connected with it unfortunately knows is ever increasing. In the good old days of King Coffee we used often to deplore bad blossoming seasons, causing short crops in Ceylon, the same experience often overtaking coffee planters in Brazil and elsewhere. There was in consequence in coffee prices, always an element of uncertainty prevailing, one year they would be down in the gutter and the next up in the skies! When we Ceylon planters took to growing tea it was pointed out how immensely the tea enterprise would be benefited by the absence of such crop fluctuations; but this picture seems

to have been overdrawn, and it is now shown only to be a pleasing one so long as consumption was equal to, or exceeded, the supply of tea. Today the tea markets open to us, are rapidly becoming glutted, and it takes no prophet to point out what this must end in unless new markets are speedily found. Mr. Chalmers (of 20 years' experience in the tea trade principally in China) foresaw this difficulty and warned Ceylon tea planters of it about a year ago and he urged them—*nay pleaded* with them—to make only good tea. Some of your correspondents accused him of writing as he did "from interested motives and in the interests of China." His advice was scoffed at and held up to derision. It is but due to Mr. Chalmers that they should now be brought back to the memory of some who were *guilty* of very "bad form" in combating Mr. Chalmers' views in the ungentlemanly way they did. One of your correspondents, I see, refers to TEA as the "burning question" of the day; to many it is certainly becoming a most serious question, especially to those who are shipping BURNT TEA.

FINANCIAL RESULTS OF FINE PLUCKING OF TEA: IMPORTANT CORRECTIONS.

DEAR SIR,—Allow me to point out to you an error in the letter signed "Quality," in your paper of 20th instant, and another in your second note appended to the letter.

100,000 is 25 per cent more than 80,000; not 20 per cent more. That is the error in the letter.

Your note is wrong in stating that the gain by selling 80,000 lb. at 1s 3d, instead of 100,000 at 1s, is, of course, in the less expense, not in larger receipts. If the word "receipts" do not mean money received by the grower, it is misleading. For 80,000 lb. sold in London at 1s 3d the grower would receive about R2,400 more than would accrue to him from the sale of 100,000 lb. at 1s; or 78 cents per lb. instead of 60 cents. The gain by "less expense" is actually not so large as that already shown, being R1,600 or the cost of manufacturing 20,000 lb. of tea, the cost of the whole of the raw leaf being about the same in each case. J. S.

[We are much obliged to our correspondent for his corrections, which tea planters will do well to note carefully.—Ed.]

FINE PLUCKING AND ITS CONSEQUENCE.

DEAR SIR,—I see your correspondents advise fine plucking; but don't you think, if we were all to go in for it that there is a possibility of the existing markets becoming overstocked with fine teas, and the prices of these will also fall? What keeps up the prices of the fine teas is their scarcity, as they are mostly used for mixing purposes; but when the article gets plentiful in the market, is it not likely to fall considerably in price? We have not far to go to seek for illustrations of the kind.

What we all must do is give every assistance in our power to suitable efforts now being made, and which must yet be adopted for the opening of new markets. It has been remarked with reference to the American Tea Company that a great mistake is that none of the Colombo gentlemen were placed on the Board of Directors by the shareholders at their meeting in Kandy last month. This was explained at the meeting. It being impossible to place any on the Board who were not shareholders, but at the shareholders' next meeting they will have no difficulty of the kind, let us hope, as they will have every influential member of the Colombo

Community on the shareholders' list by that date to select from, to add to their Board of Directors.—Yours truly,
PLANTER.

THE LOSSES ON TEA AT THE LONDON WAREHOUSES.

DEAR SIR,—Since writing to you concerning the taring of tea packages, I have read what your London correspondent says on the subject. He quotes a gentleman as having assured him of "every endeavour being made...to prevent waste and to secure accuracy of weighing;" whilst in the same breath the same informant acknowledges that 1 lb. is allowed on every 50 lb. package of tea for the draft of scaling, equal to 2 per cent; and that the mode of taring resulted in another loss of 2 per cent. This then is the boasted accuracy of weighing! and is 4 per cent loss a mere trifle?

Let me put it in another way. Supposing an estate shipped 60,000 lb. of tea and netted 10d per lb.; this would be equal to £2,500 sterling. Now deduct this 4 per cent loss; the total is reduced to 57,600 lb. of tea, which at 10d per lb. means only £2,400 sterling, or in other words a loss of £100, and at exchange of about ls 4 $\frac{3}{4}$ d, R1,432.83. Put in this way the loss is seen to be by no means insignificant.

I venture to say that your correspondent's informant would feel very aggrieved and would not speak so nonchalantly about it, if his money being invested, say in a concern yielding 5 per cent interest, the dividends were suddenly reduced to 1 per cent.

Again, is it legal on the part of the Custom House to allow the 1 lb. on every 50 lb. package of tea for the draft of scaling, or to ignore the fractions of a lb.? I doubt it. Custom is not legality, as planters have learnt to their cost in respect to monthly labourers. I would advocate a test case being instituted by the Ceylon Association in London. Let a few half-chests of tea be bought in Colombo and shipped by the Tea Fund Committee, and when the certain deduction is made, a case instituted in a court of law. The Committee would be using the funds to very good purpose, if thereby it succeeded in getting this impost done away with.

Your correspondent says, referring to the 4 per cent loss: "Of which, of course, the buyer obtains the advantage." Does not the buyer gain enough profit on his purchase, without this illegal one obtained at the cost of the producers' pockets? Why should he then have the advantage of it? I believe that planters as a body would be quite satisfied if quarters of a pound only were taken into consideration, and that they would not wish to push matters further; but the iniquitous allowance of 1 lb. per 50 lb. packet should be entirely done away with.—I am, sir, yours faithfully,
D. G.

CEYLON TEA IN WESTERN AMERICA.

DEAR SIR,—In reference to the correspondence between Mr. J. M. Murray, and the establishment of an agency for our Ceylon teas at Denver, Colorado, I am glad to hear of Mr. Murray's efforts to push our teas. Mr. Murray was my next door neighbour on Eppelwatte, in Dolosbage. I was on Malgolla at the time, and used to lend him my spare labour, and go down and work the coolies at Mr. Murray's request.

I also know his agent, Mr. H. N. Tod, whom he has appointed in Denver. And I should say a better and more likely person could not be found than Mr. Tod, and one who, I feel sure, will do his best for us. Mr. Tod and I were planters to-

gether in North Travancore, Peermaad. He was in charge of an estate and a store at the time, of my arrival in the district from Ceylon; this was in 1880. The store Mr. Tod was in charge of belonged to Mr. Probyn, who at the time had gone home on leave. And it was a general store, where you could get almost anything—coolies' coats, biscuits, liquor, &c.; so that Mr. Tod will be quite the business man wanted to handle and push our teas.

Mr. Tod says he is no doubt acquainted with 'some of your Ceylon friends', and so I write this, and trust he will make more friends soon, and shall always be glad to hear of his good fortune and success, which in his hands cannot fail.—Yours truly,
JAMES GRAY.

TEA: WHO MAKES THE PROFITS?

DEAR SIR,—In a letter received from home only by the last mail from a mater-familias, she writes:—"Tea has gone up in price since Christmas. I always make a point of asking for Ceylon tea, and now pay 1d to 1 $\frac{1}{2}$ d more than at the stores."!

Who makes the money now lost by the planters at present wholesale prices? T. GROWER.

[Echo answers, *Who?*—ED.]

COCONUT CULTURE: "OLD PLANTER" AND THE AGRICULTURAL SCHOOL.

The Jungle, 16th April, 1889.

DEAR SIR,—I think that instead of owing an apology to the teachers of the Agricultural School, I have laid them under an obligation in affording them an opportunity of officially contradicting a report injurious to their scientific reputation. I regret, however, that it did not occur to me to call on the head of the institution to plead to the indictment.

The thing happened exactly as stated, and the gentleman who appealed to the teaching of the A. S., assured me that he had it direct from a student of the institution. "C. D." can hardly be aware of the number of planters of no mean standing, who accept the smoke bath theory, and who have seen marvellous results from its use. It might not be so very far amiss to tackle the human voice theory in the event of a number of otherwise intelligent and well-informed gentlemen accepting and trusting to it.

The custom of burning rubbish and the suggested plan of paring and burning, are outside the smoke bath controversy, and stand or fall by their own merits.

Though I used the word "carbon" improperly, it was not in ignorance of the fact that plants take their carbon in the form of gas only; but my scientific education was neglected in my youth, and in picking up bits and scraps afterwards, I attended more to facts than forms. Self-teaching is not favourable to precision.

I sincerely hope that the Agricultural School may flourish, and grow in reputation and usefulness till the crack of doom. O. P.

[This letter has been delayed in transmission. We considered "C. D.'s" letter quite sufficient in defence of the Agricultural School, and we can find no room for the letters of "W. A. D. S." and "H. D. L." on much the same lines.—ED.]

COCONUT CULTIVATION.

April 24th, 1889.

DEAR SIR,—I had almost forgotten "A. B. O.'s" letter attempting to controvert my theory that the inability of coconut trees in the inland districts to support their fruit bunches without artificial aid may be due to a

deficiency of salt in the soil. He says the habit is not peculiar to inland districts.

Without journeying with him to his ancestral home in "the premier coconut growing district of Ceylon" to see the mighty giants of 100 years old with their branches closely packed in a whorl so as to support the bunches of fruit or the trees from "2 to 10 years old" with their branches so well spaced out as not to afford support to the bunches the older trees bear, let us saunter down to a more accessible quarter—the Cinnamon Gardens of Colombo. "Well, what do you see here, 'A.B.O.'?"

The large and in some cases enormous bunches with artificial supports? "No" you say. Why not? Has Dame Nature arranged the branches of the young trees here closely and in a whorl, foreseeing the difficulty people residing in the metropolis will have in receiving props? Will I be permitted to express my opinion? It is that a "little salt" I want in everything that has rendered soluble the silicates in the soil? These being taken up by the roots and assimilated by the tree have tended to stiffen and toughen the stems of the coconut bunches amongst other parts of the tree. At least that is my opinion.—Truly yours, B.

HOW TO AID THE CEYLON TEA PLANTER: A BUSINESS EXAMPLE WORTHY OF BEING COPIED.

DEAR SIR,—We have taken ten shares in the *Ceylon Planters' American Tea Company, Limited*. As business men we think all who can for the prosperity of Ceylon should do likewise more or less. Prosperity to the planting community means prosperity to us. We hope every firm in Ceylon will take shares, and make the Company a success. "Why not send the forms to every firm in the island."—Yours faithfully, W. J. & Co.

TEA PLUCKING: FINE AND OTHERWISE.

April 19th, 1889.

DEAR SIR,—There is no doubt that fine plucking, such as Mr. Armstrong advises, *i. e.*, two entire leaves and the tip (leaving on the shoot one full leaf for the next shoot and the seed leaf) pays best. By this method one gets three flushes the one month and four the next.* If coarse plucking is gone in for, the shoot must be allowed to grow higher to take, say three leaves and the tip, leaving, as in fine plucking, one leaf and seed leaf. In the latter case, there are two flushes the one month and three the succeeding one; so that really the quantity of fine crops almost equals that of coarse tea. From my own experience the proportion is as near as possible as eight is to ten.

When manufacturing coarse plucked, the finer leaves get crushed to a certain extent by the coarser ones, and the firing is not so even; again in sifting, the fine teas get "grayed (*sic*)" by the coarser.

There is another objection to coarse leaves; I feel almost certain that they contain some objectionable chemical substances, which the softer ones do not possess, and these obnoxious juices, getting mixed with those of the finer leaves, deteriorate them.

Then again, the extra quantity of tea, though small necessitates more boxes, lead, solder, nails, fuel, withering-room, outlay on plucking, rolling, firing, sifting, transport, &c.

The wither of coarse is never so even as that of fine leaf.

As an experiment, let anyone pluck off the same field on the same day 100 lb. of two leaves and the tip, and make it against 100 lb. of three leaves and the tip; compare the result in the cup, after sifting off B. Pekoes, Pekoes, and Pekoe Souchongs:

* Is this fine enough? Most estates at present follow the "fine" rule above quoted.—ED.

and tip lot will be far superior in appearance and liquor and fetch proportionately a much higher price, which price will more than make up for the loss in quantity.

To conclude, I may mention that with fine plucking on an estate I had charge of, the made teas fetched 1s 5d and 1s 6d per pound; but directly the proprietor instructed me to get in more leaf, that is to pluck coarser, the prices fell down to about 1s! and the quantity as near as I could make it (on comparison with previous year's return) over fine plucking, was only about 20 per cent Compare 100,000 lb. coarse tea at 1s against 80,000 lb. fine tea at 1s 3d.*

QUALITY.

MANUFACTURE OF "OOLONGS" AND GREEN TEAS IN CEYLON—AND THE AMERICAN MARKET.

DEAR SIR,—With reference to your editorial remarks regarding the sale of the little lot of "oolong" tea I made last Christmas when I visited the estate, the result was so far satisfactory as showing that that description can easily be made here if there is a market for it.

I have, however, been warned by a gentleman of great experience, that years ago the manufacture of oolongs was tried in Assam, and abandoned, because it was found when the tea got to England, there was no sale for it. It will not therefore do to raise hopes founded on a small experimental trial, which may have been competed for at the sale more as a curiosity than for its intrinsic value.

Last week we made a larger break, with the view of testing the-market better, but for a variety of reasons the utmost caution will have to be exercised in making shipments, as we may easily fall out of the frying pan into the fire.

America is no doubt the proper market for green teas. The difficulty is to get American vessels to convey shipments, without sending them via Japan. Have the promoters of the Company formed to push the consumption of Ceylon tea in America taken this difficulty in hand?—Yours truly, C. S.

TEA INFUSION.

26th April 1889.

SIR,—I have tried tea with 3 minutes' infusion—"Glenugie" tea. It is simply beautiful and very different from a 5 minutes' infusion (of the same tea) which extracted *too much of the "tannin."* Of course a little more tea is necessary, but it is wiser to incur that trifling expense rather than by not doing so, to be made ill and have to pay doctor's fees. If the proper duration of infusion of British-grown tea was more generally known and acted upon, the makers of three minute sand glasses would, I opine, soon be doing a roaring business. The sooner it takes place the better for the stomachs of the millions now persistently poisoning themselves with TANNIN.

THE TRAVANCORE PAPER MILLS.—The construction of the Travancore Paper Mills at Poonaloor near Quilon has been suspended for a fortnight on account of cholera which was raging there in the cooly lines in very severe epidemic form. Although Mr. Lucas, the Superintendent, tried his utmost to allay the panic, yet he was reluctantly compelled to suspend work. Mr. Lucas is trying his best, assisted by his staff, to complete the Bandworks before the setting in of the monsoon. We think that Messrs. Cameron, Chisholm & Co. should insist on the Travancore Government to maintain an hospital or a Dispensary and a police Station at the mills.—*Madras Times*.

* The gain is of course in the less expense, not in larger receipts.—ED.

"PERSIAN INSECT POWDER."—A Russian journal devoted to the industrial interests of the Caucasus describes the cultivation of the pyrethrum plant in the Caucasus. Flowers of the pyrethrum (*pyrethrum roseum*) are used for making the powder, which is sold under various names—"insect powder," "Persian powder," "death to insects," &c. In Europe these flowers are only found in Dalmatia, but these are white, and not rose-violet, like those of the Caucasus. The Dalmatian pyrethrum is greatly appreciated, and when its crop is scarce the Caucasian flowers are eagerly sought for, and their price increases by from 200 to 300 per cent.; this was the case in 1837 and 1838. Prices, which had varied between three and seven roubles for the previous ten years, reached all at once, in 1887, 15 and 16 roubles at Tiflis. Formerly a certain quantity of pyrethrum in powder was exported from the Caucasus, but Europeans were not satisfied with receiving this delicate article in this form because it was discovered to be mixed with foreign substances, and growers in the Caucasus could not reduce it to the impalpable state requisite to preserve its efficacy. At the present time the flowers only are exported. It is necessary that they should be cut as short as possible at the stalk, gathered when ripe, dried in the shade and in a current of air, because in the sun the bloom and rose colour are lost, and, lastly, that they should not be mixed with other herbs when being gathered. Recently a fraud has been noticed in the packages of Caucasian flowers, other flowers resembling the pyrethrum, and dyed the same colour, being found. The exports amounted to between 175,000 and 200,000 killogrammes last year; of those three-fourths were badly prepared, the season having been a very rainy one.

THE FUTURE OF CINCHONA BARK: ADVICE TO CEYLON PLANTERS.—MESSRS. BROOKES & GREEN, the well-known London Brokers, in their latest report offer some pointed advice to the cinchona planters of Ceylon, advice which is well borne out by the statistics of bark supply they append. We quote as follows:—

843 bales sold at yesterday's and the two previous auctions at 1d to 2d per lb.; these miserable unsatisfactory prices are worse than disappointing to everybody in the Trade, and yet these wretched qualities continue to be sent forward in quantity, scarcely covering charges and all the time damaging the market for better Barks the same owners hold. One-third of the year has gone, let Ceylon merchants limit the quantity they thought of shipping and get, by this means, a respectable figure for the Bark. If they will insist upon keeping up shipments, it is useless complaining of prices obtained; but it does seem a pity to see Cinchona Bark selling at 1½d per unit, when the merchants in Ceylon could quickly remedy it.

The total supply of Bark at the London auctions held this year is:—

THE TROPICAL AGRICULTURIST MONTHLY.

Vol. VIII.]

COLOMBO, JUNE 1ST, 1889.

[No. 12.]

THE PROSPECTS OF TEA IN CEYLON, INDIA AND CHINA.

“**P**ROPRIETOR of Tea Plantation” in his letter on page 813, indulges in some rather lugubrious reflections, more or less justified however by the out look which he pictures. In addition to the news

of splendid “flushes” in Ceylon, we are bound to admit the fact that the tea-making season has begun under very favourable circumstances in many of the North Indian districts, while our latest report from South India shows that in Wynaad tea cultivation is rapidly extending. When in addition we know that in Java, planters are busy adding to the area under tea, while superseding China by Assam plants, and that the prospects in China are decidedly in favour of a larger quantity of tea being available for export than in 1888, it is impossible not to feel the seriousness of the position as regards the immediate future of the chief planting industry in Ceylon.

The key of the position our correspondent rightly judges will be found in the movements of “China” teas, and in this connection he asks some pointed questions. Sir Robert Hart’s Report, taken by itself,—it will be found in full elsewhere—does not at all lead to the conclusion that the China tea growers are about to make any new departure. On the contrary, as already mentioned, Sir Robert instead of taking up that part of the question peculiarly within his province and urging the Chinese authorities to abate some of the “squeezes” at present sadly interfering with fairplay to China tea exports, launches out into the question of how to improve the production and manufacture after the fashion adopted by the Indian and Ceylon planters. To use a homely expression common in Scotland, Sir Robert Hart might have spared his breath to “cool his parritch.” He gives some excellent advice of course which, how-

ever, will be quite thrown away on the conservative upcountry Chinaman, but he also writes egregious nonsense as when in one of his proposed remedies for existing defects, he says:—

All the leaves should not be removed from the same shrub at the same time, but only such as are ready for gathering. The leaves which are ready ought to be picked from all the trees in the plantation at the same time, and each picking ought to form a separate chop. The leaf ought not to be picked too soon or too late: although a 10 days’ overgrowth gives an increase of 25 per cent in weight, it causes a decrease of 35 per cent in value. In India there are as many as 16 pickings; that is, each shrub contributes to 16 chops. The part we have italicized reads like a piece of sarcasm at the expense of John Chinaman, or else it shows gross ignorance on the part of Sir Robert Hart.

His report has not passed scatheless of criticism through the hands of Anglo-China editors and merchants. These gentlemen can scarcely speak with authority on the subject of improved culture, but on other points they take the Inspector-General of Customs severely to task. His statement to the “Yamen” that China tea is superior in flavour to any other teas is challenged in the face of “Ceylon” superior kinds; and his price of 9d a lb. as the lowest for which Chinese tea can be sold at a profit in England is condemned by a merchant who says that it is well-known that the commonest kinds can be laid down in England at 5½d and ordinary sound common about 6d (2d to 2½d of which about 40 per cent consists of the Chinese taxes). Sir Robert argued that as Indian tea could be sold profitably in England at 6d and China only at 9d, it was no use taking even 2d a lb. off the latter! One thing is certain now, namely that the Chinese Yamen will not take off any taxation—a policy they have been at all times disinclined to—in view of Sir Robert Hart’s opinion that a reduction would not benefit the producers or people of China. Two of the Inspector-General’s lieutenants—Mr. Hannan at Foochow and Mr. Chalmers at Tamsui—recommend the opening of model plantations on the Indian fashion; but as an experienced mercantile resident writes:—“The idea of inducing the innumerable peasant proprietors of China to change their ancient methods of cultivation in favour of Indian methods (involving large gardens, machinery, &c.) is too stupendous to come within the region of practical politics” (? economics). Nevertheless as mentioned above, the latest accounts from the China tea districts through the shipping ports seem to indicate a more abundant supply this coming season of good quality teas than came forward last year. But all agree that the lookout for “China” teas in the markets

of the world, is an exceedingly poor one in the face of the increasing competition offered by India and Ceylon not simply in England, but in America and Australia. One point of which Sir Robert Hart makes a good deal in his Report is, that Russia which formerly bought largely through London, now receives almost its total supply of teas direct from China, Russian merchants and agents having established themselves at the export ports. This suggests to us that Colombo merchants and some of our tea planters should make a special effort to secure a considerable portion of the valuable Russian tea trade. It is well-known that the Russians buy some of the most expensive teas, and superior "Ceylons" should be well-suited to their market. Possibly, some attempts may have been made, apart from those recorded in our columns by Sir Græme Elphinstone, to get a share of the Russian trade; but we ought not to be content until a local agency is established to ship tea direct from Colombo to Odessa.

No effort should be wanting at this end towards palliating the approaching crisis by endeavouring to divert as much of our Ceylon teas as possible to other than the London market. The American Company in this connection affords a most commendable agency in the interests of the Ceylon planter. So will the Australian Company when it begins business as we hope it may before the end of the year. No doubt of the teas sent from Colombo to London an appreciable and increasing proportion goes direct to special agencies and dealers without troubling the Mincing Lane market, and in this direction also there is probably room for Ceylon planters and other local residents to aid in development and extension. No more than "Proprietor" are we inclined to minimise the gravity of the approaching situation and the news that the average price of the Ceylon tea sold last week in London had fallen to 9½d will come upon our planters as a certain presage of truly trying times to follow. If the month of March showed tea shipments from Colombo exceeding 3¼ million lb. what may be expected for June and July? We may see the export up to 5 or 6 million lb., and even this quantity exceeded later on, say in November or December. It behoves all concerned therefore to exert themselves in every way possible to aid in relieving the pressure on the London market; while planters ought to consider very seriously the question whether, after the present planting season, they should plan to add any more clearings—for the present at least—to the tea plantations or gardens of Ceylon.

PRECIOUS STONES.

The wonderful fact that the common charcoal is substantially the same material as the diamond has a parallel in the equally wonderful result of the chemical analysis of the ordinary red and yellow clay, so common and abundant, which is shown to have for its base the same material—alumina as the group of minerals to which the general name of corundum is applied, including the incomparable stones, the ruby and the sapphire, which have the highest rank among coloured gems. The various forms of corundum are found by the chemist to contain more than half their weight of that peculiar metal widely known as aluminium, which much resembles silver in colour and lustre, yet is very different from it in its extreme lightness. The oxide of this metal is called alumina, which in its natural state forms the mineral corundum. The transparent crystals of corundum present the alumina in a state of purity, with just a trace of certain metallic oxides, from which the exquisite tints of colour are derived. The name of each variety of the corundum

is determined by its colour—the red being known as the ruby, the blue as the sapphire, the yellow as yellow sapphire or Oriental topaz, the green as green sapphire or Oriental emerald, and the purple as Oriental amethyst. All varieties of the corundum can be scratched by the diamond, but by no other mineral, and its extreme hardness has suggested the theory that the *adamas* of the early Greek writers was not the true diamond, but a form of corundum. In such a passage as the following: "The sin of Juda is written with a pen of iron and with a point of diamond," the original word translated "diamond" no doubt refers to *emery* or some similar form of corundum, which has been used for ages as material for polishing other minerals. Although specimens of various colours have been found in many parts of the world, and during the last ten years in North Carolina especially, the chief source of supply is India. The red variety of corundum is known as the ruby. The kingdom of Burma furnishes the greatest number of rubies, and, by command of its king no Europeans are ever allowed to visit the mines. They are a royal monopoly, and the rarest and finest specimens are retained for the king's own use, and one of his titles is "Lord of Rubies." One of the former kings had a wonderful ruby of the size of a pigeon's egg, which he wore as an eardrop. By a law which compels, under the penalty of death, the giving up of all rubies of over a certain size to the financial department of the Government, many rubies of large size are lost, because the finder of them will break them up into smaller pieces in order to retain them. Very few persons are aware of the great value and rarity of really fine rubies. From the beginning of civilization to the present time the ruby has been the type of concentrated preciousness; "Her price is above rubies." About fifteen years ago the financial necessities of the Burmese Government caused the appearance in Europe of two of the finest rubies of their size ever seen. After being recut one weighed about 32 carats, and was sold for 50,000 dols., and the other weighing about 40 carats, found a purchaser at 100,000 dols. Two such stones were not to be found in any European regalia, and their sale caused intense excitement in Burma, a military guard being considered necessary to escort the persons conveying the packages to the vessel. Rubies vary in colour from the lightest rose tint to the deepest carmine, and are occasionally approached so closely, both in colour and general appearance, by the spinel as to render a close examination necessary to distinguish them apart. The spinel is composed of alumina and magnesia, and has a wide range of colour. The Rev. O. W. King states that "all the great historic rubies now extant are pronounced spinels by modern mineralogists." The blue variety of corundum is known as the sapphire, and differs from the ruby only in its colour. It is very slightly harder than the ruby, and occurs in much larger crystals. They were originally obtained from Arabia and Persia, but now come principally from Ceylon and Burma. The characteristic colour of the sapphire is a clear blue, very like to that of the blossom of the little "corn-flower," and the more velvety its appearance, the greater the value of the stone. The Oriental sapphire retains its exquisite colour by gas light, while that of the inferior specimens becomes dark. The ruby and sapphire forms a distinct class of the corundums by their being alumina in a pure and unmixed state crystallized, while the other varieties present the alumina in combination with other substances. The true chrysoberyl is alumina combined with glucina. The colours range from light asparagus green, brownish yellow, to columbine red. Of the three varieties the best known are the cymophane, or true Oriental catseye, and the alexandrite. The catseye is found in Ceylon, is always cut in highly convex form, and has a remarkable play of light in a certain direction, resembling a drop of water or the pupil of an eye moving about inside of it, or a band of light floating on its surface, ever shifting, like a restless spirit from side to side as the stone is turned. No wonder that an imaginative and superstitious people regard it with awe and wonder, and, believing it to be the

abode of some genie, dedicate it to their gods as a sacred stone. The particular variety of chrysoberyl which was originally found in the Ural Mountains, and owes its celebrity to its remarkable transformation of colour from green to red as viewed by natural or artificial light, was named alexandrite after the former Czar of Russia.—*Kuhlow's Trade Review*.

THE SEASON IN MADRAS.

The following is a summary of reports for the week ending 9th April:—Rainfall *nil*. Ganjam, Godavari, Nellore, Madras, Chingleput, South Arcot and South Canara; fair Nilgiris. Standing crops generally good, but suffering from want of rain in Ganjam, Vizagapatam, Bellary North Arcot, Trichinopoly, Tinnevely and Coimbatore; wet crops withering in parts Cuddapah, Anantapur and Chingleput. Stock suffering very badly, chiefly from ringerspest in Tinnevely, and badly in Anantapur, Tanjore, Cuddapah, Madura, and Malabar. Pasture deficient in Ganjam. Vizagapatam, Cuddapah, Bellary, North Arcot, Madura, Tinnevely, Coimbatore, Nilgiris, Salem and Malabar. Prices, falling in Ganjam, Vizagapatam and seven other districts, rising in eight and stationary in others. General prospects favorable, except in Ganjam; improving in Coimbatore. Laborers employed last day of week, Rushikulya works 12,747 Gopalpuo canal 7,979, Taptapani road 408.—*Madras Times*.

THE TEA DISTRICTS OF CHINA AND THE CULTIVATION AND MANUFACTURE OF TEA BY THE CHINESE.

(EXTRACTED FROM WILLIAMS' "MIDDLE KINGDOM.")

[Vol. I, p. 109.] The province of Nghanwin was so named by combining the first words in its two large cities, Nganking and Hwinchan. * * * most of the GREEN TEA districts lie in the south eastern parts, particularly in the Sunglo range of hills in Hwinchan prefecture.

[“ p. 111.] The province of Kiang-si' (*i. e.*, West of the River) lies south of Nghanwin and Hupeh, between Chehkiang and Fuhkien on the east and Hunan on the west, reaching from the Yangtze to the Meiling on the south. The soil generally is productive, and large quantities of rice, wheat, silk, cotton, indigo, TEA, and sugar are grown and exported.

[“ p. 114.] The maritime province of Chehkiang, the smallest of the eighteen, lies eastward of Kiangsi and Nghanwin, and between Kiangsu and Fuhkien north and south, and derives its name from the river Cheh or “Crooked,” which runs across its southern part. * * * The whole province produces cotton, silk, TEA, rice, ground nuts, wheat, indigo, vegetable tallow (*stillingia*), and pulse in abundance.

[“ p. 127.] The province of Fuhkien (*i. e.* happily established) is bounded on the north by Chehkiang, north-west and west by Kiangsi, south-west by Kwangtung, and east by the Channel of Formosa. * * * * BLACK TEA, camphor and other woods, sugar, China-ware, and grass-cloth are the principal exports.

[“ p. 146.] The province of Hunan is bounded north by Hupeh, east by Kiangsi, south by Kwangtung and Kwangsi, west by Kweichan and Sz'chuen. * * * The productions of Hunan do not represent a very high development of its soil or mines. TEA and Coal are the main exports: TEA-OIL, ground-nut and tung oils, hemp, tobacco, and rice, with iron, copper tin, and coarse paper make up the list.

[“ p. 154.] The province of Sz'chuen (“Four streams”) * * * is now one of the richest in its productions. It is bounded north by Kansuh and Shensi, east by Hupeh and Hunan, south by Kweichan and Yunnan, west and north-west by Thibet and Kokonor. * * * The exports consist of raw and woven silk, of which more is sent abroad than from any other province: salt, opium, musk, croton (*tung*) oil, gentian, rhubarb, TEA, coal, spelter, copper, iron, and

insect-wax, are all grown or made for other regions [Vol I, p. 241.] (In Thibet) the food called jamba is prepared by cooking BRICK TEA during several hours, then adding butter and salt, and stirring the mixture until it becomes a thick broth. When eaten the stuff is served in wooden bowls, and a plentiful supply of roasted barley-meal poured in, the whole being kneaded by the hands and devoured in the shape of dough pellets.

[Vol II, p. 39.] The subjects of TEA CULTURE AND THE PREPARATION OF ITS LEAF have engaged the attention of writers among the Chinese and Japanese; while its effects on the human system as a beverage have been discussed most carefully by eminent western chemists and pathologists. Its virtues in restoring the energies of the body and furnishing a drink of the gentlest and most salubrious nature has been fully tested in its native land for many centuries, and is rapidly becoming known the world over. The following are some of the leading facts relating to the plant and the preparation and nature of the leaf, derived from personal observation in the country or from the writings of competent observers:—

Tea does not grow in the northern provinces of China and Japan; its range lies between the twenty-third and thirty-fifth degrees of latitude, and reaching in longitude from Yedo to Assam. No accounts have come to us of the tea-shrub being cultivated for its infusion till A. D. 350. The people in different parts of China gave different names to the successive pickings of the leaves, which have now become disused. Our word *tea* is derived from the common sound of the character for the plant at the city of Amoy, where it is *tay*: at Canton and Peking it is *cha*, at Shanghai *dzo*, at Fuhchan *ta*. The Russians and Portuguese have retained the word *cha*, the Spanish is *te* or *tay*, and the Italians have both *te* and *cha*. Tea is so nearly akin to the various species of camellia that the Chinese have only one name for all. The principal difference to the common observer is in the thin leaf of the tea, and the leathery glabrous leaf of the beautiful *Camellia Japonica*. When allowed to grow they both become high trees. The tea flower is small, single, and white, has no smell, and soon falls, its petals are less erect than the *Camellia*. The seeds are three small nuts, like filberts in color, enclosed in a triangular shell which splits open when ripe, with valves between the seeds. Its taste is oily and bitter. Two species of *Camellia* are cultivated for their oily seeds, the oil being known as tea-oil among the natives: it is used for lamps and cooking. There is probably only one species of the tea plant, and all the varieties have resulted from culture; but the *Thea viridis* is most cultivated. The nuts are ripe in October. They are put in a mixture of sand and earth, dampened to keep them fresh till spring; they generate heat and spoil if not thus separated. In March they are sown in a nursery, and the thrifty shoots transplanted the next year in rows about four feet apart. Leaves are collected when the plant is three years old, and this process is continued annually to a greater or less extent according to the demand and strength, until the whole bush becomes so weak and diseased, that it is pulled up for firewood to give place to a new shoot. On the average this is about the eighth year. The plants seldom exceed three feet; most of them are half that height, straggling and full of twigs, often covered with lichens, but well-hoed and clean around their roots. All tea plantations are merely patches of the shrubs cared for by small farmers, who cultivate the plant and sell the leaves to middle-men, or more often pick the crop themselves if they can afford to do so. The great plantation or farm, with its landlord and the needy laborer, each class trying to get as much as possible out of the other, are unknown in China: the farmer has not there learned to employ skill, machinery, and capital all for his own advantage, but each farmstead is worked by the family, who rather emulate each other in the reputation of their tea. Tea is cultivated on the slopes or bases of hills, where the drainage is quick and the moisture unailing. This is of more consequence than

the ingredients of the soil, but plants so continually deauperated and stripped require rich manure to supply their waste. In Japan the tea shrubs are sometimes grown as a hedge around a garden lot, but such plants are not stripped in this way. In gathering the earliest leaves, the pickers are careful to leave enough foliage at the end of the twigs; and the spring rains are depended on to stimulate the second and full crop of leaves. When these are scant or fail the tea harvest diminishes, and the regularity of the rains is so essential to a profitable cultivation that it will be one of the causes of failure where everything else in soil, climate, manuring, and manufacture may be favourable.

The first gathering is the most carefully done, for it goes to make the best sorts of black and green tea; and as the greatest part of the leaves are still undeveloped, the price must necessarily be very much higher. Such tea has a whitish down, like that on young brick leaves, and is called *pecoe* or "white hair," and is most of it sent to England and Russia. In the last century the green tea known as Young Hyson was made of these half-opened leaves picked in April and named from two words meaning "rains before." The second gathering varies somewhat according to the latitude, May 15th to June, when the foliage is fullest. This season is looked forward to by women and children in the tea districts as their working time; they run in crowds to the middlemen, who have bargained for the leaves on the plants, or apply to farmers who have not hands. The average produce is from sixteen to twenty-two ounces of green leaves for the healthiest plants, down to ten and eight ounces. The tea when cured is about one-fifth of its first weight, and one thousand square yards will contain about three hundred and fifty plants, each two feet across. They strip the twigs in the most summary manner, and fill their baskets with healthy leaves, as they pick out the sticks and yellow leaves, for they are paid in this manner. Fifteen pounds is a good day's work, and six to eight cents is a day's wages. The time for picking lasts only tea or twelve days. There are curing houses where families who grow and pick their own leaves bring them for sale at the market rate. The sorting employs many hands, for it is an important point in connection with the purity of the various descriptions, and much care is taken by dealers, in maintaining the quality of their lots, to have them cured carefully as well as sorted properly. The management of this great branch of industry exhibits some of the best features of Chinese country life. It is only over a portion of each farm that the plant is grown, and its cultivation requires but little attention compared with rice and vegetables. The most delicate kinds are looked after and cured by priests in their secluded temples among the hills; these often have many acolytes who aid in preparing small lots to be sold at a high price.

When the leaves are brought in to the curers they are thinly spread on shallow trays to dry off all moisture by two or three hours' exposure. Meanwhile, the roasting pans are heating, and when properly warmed some handfuls of leaves are thrown on them, and rapidly moved and shaken up for four or five minutes. The leaves make a slight crackling noise, become moist and flaccid as the juice is expelled, and give off even a sensible vapour. The whole is then poured out upon the rolling table, where each workman takes up a handful and makes it into a manageable ball, which he rolls back and forth on the rattan table to get rid of the sap and moisture as the leaves are twisted. This operation chafes the hands even with great precaution. The balls are opened and shaken out, and then passed on to other workmen, who go through the same operation till they reach the headman, who examines the leaves to see if they have become curled. When properly done, and cooled, they are returned to the iron pans, under which a low charcoal fire is burning in the brickwork which supports them, and there kept in motion by the hand. If they need another rolling on the table it is now given them: an hour or more is spent in this manipulation, when they are dried to a dull green

colour, and can be put away to sifting and sorting. This colour becomes brighter after the exposure in sifting the cured leaves through sieves of various sizes; they are also winnowed to separate the dust, and afterward sorted into the various descriptions of green tea. Finally, the finer kinds are again fired three or four times, and the coarse kinds, as Twankay, Hyson, and Hyson skin, once. The others furnish the Young Hyson, Gunpowder, Imperial, etc. Tea cured in this way is called *luh cha*, or "green tea" by the Chinese, while the other, or black tea, is termed *hung cha* or "red tea," each name being taken from the tint of the infusion.

After the fresh leaves are allowed to lie exposed to the air on the bamboo trays over-night or several hours, they are thrown into the air and tossed about and patted till they become soft; a heap is made of these wilted leaves and left to lie for an hour or more, when they have become moist and dark in colour. They are then thrown on the hot pans for five minutes and rolled on the rattan table, previous to exposure out of doors for three or four hours on sieves, during which time they are turned over and opened out. After this they get a second roasting and rolling to give them their final curl. When the charcoal fire is ready a basket shaped something like can hourglass is placed endwise over it, having a sieve in the middle on which the leaves are thickly spread. When dried five minutes in this way they undergo another rolling, and are then thrown into a heap until all the lot has passed over the fire. When this firing is finished, the leaves are opened out and are again thinly spread on the sieve in the basket for a few minutes, which finishes the drying and rolling for most of the heap, and makes the leaves a uniform black. They are now replaced in the basket in greater mass, and pushed against its sides by the hands in order to allow the heat to come up through the sieve and the vapor to escape; a basket over all retains the heat, but the contents are turned over until perfectly dry, and the leaves become uniformly dark.

It will be seen from this that green tea retains far more of the peculiar oil and sap in the leaves than the black, which undergo a partial fermentation and emit a sensibly warm vapor as they lie in heaps after the first roasting. They thus become oxidized by longer contact in a warm moist state with the atmosphere, and a delicate analysis will detect a greater amount of oxidized insoluble extract in an infusion of black than green tea. The same difference has been observed in drying medicinal plants, as hemlock, belladonna, &c, for the apothecary's shop.

Green teas are mostly produced in the region south of the Yangtze' river and west of Ningpo among the hills as one goes toward the Poyang Lake in Chehkiang and Ngauhwin. The black tea comes from Fuhkien in the south-east and Hupeh and Hunan in the central region: Kwangtung and Sz'chuen provinces produce black, green, and brick teas. While the leaves of each species of the shrub can be cured into either green or black tea, the workmen in one district are able, by practice, to produce one kind in a superior style and quality; those in another region will do better with another kind. Soil, too, has a great influence, as it has in grape culture, in modifying the produce. Though the natives distinguish only these three kinds, their varieties are far too numerous to remember, and the names are mostly unknown in commerce.

Of black teas, the great mass is called *Congou*, or the "well-worked," a name which took the place of the *Bohea* of one hundred and fifty years ago, and is now itself giving way to the term English Breakfast Tea. The finest sorts are either named from the place of their growth, or more frequently have fancy appellations in allusion to their color or form. Orange Pekoe is named "superior perfume;" pure Pekoe is "Lantz's" "eyebrows;" "carnation hair," "red plum blossom," "lotus kernel," "sparrow's-tongue," "dragon's pellet," "dragons' whiskers," "autumn dew," "pearl flower" or *Chu-lan*, are other names; Souchong and Powchong refer to the modes of packing.

In the trade, teas are more commonly classified by their locality than their names, as it is found that well-marked differences in the style of the produce continue year after year, all equally well-cured tea. These arise from diversities in soil, climate, age, and manufacturing, and furnish materials for still further multiplying the sorts by skilfully mixing them. Thus in black teas we have Hubean and Hupeh from two provinces, just as Georgia Uplands and Sea Island indicate two sorts of cotton; Ningyong, Kai-san, Ho-san, Sing-chune-ki, &c, and many others, which are unknown out of China, are all names of places. One gentleman has given a list of localities, each furnishing its quota and peculiar product, amounting in all to forty-five for black and nine for green. The area of these regions, is about four hundred and seventy thousand square miles.

It will have been seen already that the color of green tea, as well as its quality, depends very much on rapid and expert drying. When this kind is intended for home consumption soon after it is made, the color is of little consequence; but when the hue influences the sale, then it is not to be overlooked by the manufacturer or the broker. The first tea brought to Europe was from Fuhkien and all black, but as the trade extended probably some of the delicate Hyson sorts were now and then sent at Canton, and their appearance in England and Holland appreciated as more and more was sent. It was found, however, to be very difficult to maintain a uniform tint. If cured too slightly, the leaf was liable to fermentation during the voyage: if cured too much it was unmarketable, which for the manufacturer was worse yet. Chinese ingenuity was equal to the call. Though no patent office was at hand to register the date when coloring green tea commenced, it is probably more than one hundred years since. The three hundred and forty-two chests and half chests which were so summarily offered on board the "Dartmouth," the "Eleanor," and the "Beaver," when their contents were thrown overboard in Boston harbor, on December 16, 1773, furnishes probably no index of the consumption of tea in New England at that time. It was all called Bohea by John Adams, who speaks of three cargoes, as if the vessels had nothing else of note in their holds.

Dr. Holmes, in his ballad on the Boston Tea Party at its centennial celebration, says in the last verse:—

The waters in the rebel bay
Have kept the tea-leaf savor
Our old North enters in their spray
Still taste a Hyson flavor;
And Freedom's teacup still o'erflows
With ever fresh libations,
To cheat of slumber all her foes
And cheer the wakening nations.

It has been noticed that emigrants to Australia, who had seldom tasted green tea before leaving England, usually prefer it in their new homes, as new settlers do in this country. [United States.—Ed.] The prevailing notion that green tea is cured on copper arose, no doubt, from the conclusion that real verdigris was the only source of a verdigris color, and the astringent taste confirmed the wrong idea. A more difficult question to answer is the inquiry, why is it still believed?

The operation of giving green tea its color is a simple one. A quantity of Prussian blue is pulverized to a very fine powder, and kept ready at the last roasting. Pure gypsum is burned in the charcoal fire till it is soft and fit for easily triturating. Four parts are then thoroughly mixed with three parts of Prussian blue, making a light blue powder. About five minutes before finally taking off the dried leaves this powder is sprinkled on them, and instantly the whole panful of two or three pounds is turned over by the workman's hands till a uniform colour is obtained. His hands come out quite blue, but the compound gives the green leaves a brighter green hue. The quantity is not great, say half a pound in a hundred of tea: and as gypsum is not a dangerous or irritating substance, being constantly eaten by the Chinese, the other ingredient remains in an almost infinitesimal

degree. If foreigners preferred yellow teas no doubt they could be favored, for the Chinese are much perplexed to account for this strange predilection, as they never drink this colored or faced tea. Turmeric root has been detected too, in a very few analyses, but probably there were lots that needed to be refined at Canton to cover up mildew or supply a demand. The reasons for not drinking this tea are, however, owing more to the nature than to the color of the leaf. The kinds of green tea are fewer than the black, and the regions producing it are less in area. Gunpowder and Imperial are foreign-made terms; the teas are known as *sian chu* and *ta chu* by native dealers. The first is rolled to resemble shot or coarse gunpowder: the other is named "sore crab's eyes," "sesamum seeds," and "pearls." Hyson is a corruption of *yu-tsien* "before the rains," and of *Hi-chun*, meaning "flourishing spring." The last is alleged to be the name of a maiden who suggested to her father as long ago as 1700, or thereabouts, a better mode of sorting tea, and his business increased so much as his fine Hyson became known, that he gave it her name. Members of this same family are still engaged in making this same tea, and the chop, known as the *Li yih-hing* or Li's extra perfume, is now in market and has maintained its reputation for nearly two hundred years. Oolong is obtained in Fuhkien—a black tea with a green tea flavor, named Black Dragon from a story that Su was struck with the fragrance of the leaf from a plant where a black snake was found coiled. The great mart for green tea is Twankay in Chehkiang province.

A *chop* is a well-known name in the tea trade: it is derived from the Chinese word "chop" or stamp" such as an official uses, and in the tea trade denotes a certain number of packages from the same place, and all of the same quality. In the course of years the uniform excellence of a certain chop, like that of a certain vineyard, gives it a marketable value. A lawsuit arose in 1873 between two American houses at Canton in regard to the right to a certain chop of tea, between two brokers, each of whom claimed to sell the genuine lot. Such chops range from fifty to one thousand two hundred chests, averaging six hundred. English tea tasters have learned that an admixture of scented teas in common sorts of Congou adds much to the flavor and sale. This is not often done for native drunk tea, and is chiefly practised at Canton. The flowers used are roses, olea fragrans, tuberose, orange, jasmine, gardenia, and azalea. The stems, calyx, and other parts are carefully sorted out, so that only the petals remain. When the tea is ready for packing, dry and warm, the fresh flowers are mixed with it (forty pounds to one hundred pounds for the orange), and left thus in a mass for twenty-four hours; it is then sifted and winnowed in a fanning mill till the petals are separated. If the odour is insufficient, the operation may be repeated with the jasmine or the orange. The proportion of jasmine is a little more than orange; of the azalea nearly half and half. The length of time required to obtain the proper smell from these flowers differs, and among them all tea scented with the azalea is said to keep its perfume the longest.

The mode of scenting tea differs somewhat according to the flower itself, for the small blossom of the olea cannot be separated by sifting as rose or jasmine leaves can. Tea thus perfumed is sent to England as Orange Pekoe and Scented Oaper. It is mixed with fine teas: and there is much to commend in thus increasing the aroma and taste of this healthy beverage. The Scented Oaper comes in the form of round pellets, which are made of black tea softened by sprinkling water on it for a good while till most of the quantity takes this form; as soon as perfumed it is packed for shipment. When rolled and dried, such tea needs only a facing to make it into Imperial and Gunpowder among the green teas.

The Chinese have been charged with adulterating their tea by mixing in other leaves with the true tea-leaf, and adding other ingredients far worse than rose, jujube, and fern-leaves, and the cases

which have been proved of *lie-tea* being sent off have been applied to the entire export. The stimulus for some of this adulteration has come from the foreigner, who desires to get good pure tea at half its cost of manufacture. The foregoing details will plainly show that an article which has to go through so many hands before its infusion is poured out of the tea-pot on the other side of the world, and where the only machinery used is a farming mill and a roasting pan, cannot be furnished at much under twenty-five cents a pound for the common sorts. The villainous mixture known at Shang-hai as *ma-lu cha*, or "race course tea," was the answer on the part of the native manufacturer to the demand for cheap tea, until the consumers in Great Britain protested at the deception put on them, and its importation was prohibited. Which of the parties was most blameworthy may be left for them to settle, but in our own papers, of course, most of the blame rested on the tempted party. It is not to be inferred, however, that all cheap tea is adulterated. The process of manufacture leaves a large percentage of broken material, which can be worked into passable tea: the produce of many regions has not the flavor of the finest sorts, and, as it is with wines, will not bear so much cost in curing. The tea-brokers know this, and things equalize themselves. The dust, the leaf ribs, and the siftings are all consumed by the poor natives, who mix other leaves, too, with the real leaf. Tea can perhaps bear comparison with any other great staple of food in this respect; and when we can fairly estimate the consumption of tea sent out of China and Japan at more than three hundred millions of pounds, it must be conceded that it is a very pure article—not as much, probably, as even five per cent. of false leaf.

One mode of using tea known among Tibetans and Mongols remains to be noticed. The rich province of Sz'chuen in the west part of China, furnishes an abundance of good tea; much of which is exported to Russia by way of Si'-nganfu and Kansuh, to supply the inhabitants of Siberia. This brick tea is cured by pressing the damp leaves into the form of a brick or tile, varying in size and weight, eight to twelve inches long and one thick: in this form it is far more easily carried than in the leaf. In Tibet, as we have seen, it appears more as a soup than an infusion. The brick tea is composed of coarse leaves, or of stalks moistened by steaming over boiling water, and then pressed till dry and hard. When used, a piece is broken off and simmered with milk and butter and water, with a touch of vinegar or pepper. The dish is not inviting at first, but Abbé Huc endorses its refreshing qualities in restoring the failing energies. The pressing and drying is assisted by sprinkling the mass with rice water as it is forced into the moulds. The Chinese mix other leaves with real tea to eke it out, in districts where it is not commonly grown, but they do not regard this as adulteration. Willow leaves are common in such mixtures. Large caravans cross the plateau laden with brick tea.

Packing tea is mostly done in the interior where it is cured. The large dry leaves frequently found inside are usually furnished by a peculiar species of bamboo: the lead is made into thin sheets by pouring the melted lead on to a large, square brick, covered with several thicknesses of paper, and letting another brick drop down instantly on it. In order to test the honesty of the packing, the foreign merchant walks over the three hundred to six hundred chests which make a chop, and selects any four or five he may choose for examination. If they stand the inspection the whole is taken on their guarantee, and (they) are then weighed, papered, labelled, and mottled ready for shipping. In all these matters the Chinese are very expert. It is impossible to calculate the number of persons to whom the tea trade furnishes employment: nor could machinery well come into use to displace human labour.

The introduction of tea among western nations was slow at first. Marco Polo has no notice of its use. The Dutch brought it to Europe in 1591

according to some accounts; but a sample or two did not make a trade, and there would have been reference to it if it had been used. In 1660 Samuel Pepys writes, Sept. 28th:—I did send for a cup of tea (a China drink), of which I had never drank before. Nearly seven years after he says: "Home, and there find my wife a making of tea, a drink which Mr. Pellin, the apothecary, tells her is good for her cold and deflexions." In 1670 the importation into England was 79 pounds: in 1685 it was 1,207 pounds: most of it came from Batavia and sold for a long time between £10 and £5 a pound weight. In 1657 Mr. Garney [Garraway?] opened a shop in London to sell the infusion, and paid an excise of 8d. per gallon. * * * Russia takes more good tea than any other nation and pays more for it, because the former overland trade to Siberia could not afford to transport poor tea. * * * Tea is a native of Assam, but its discovery only dates from 1836 or thereabouts. It is cultivated in Java and Brazil,* but there is not much to encourage the manufacturer in any country where coffee supplies a similar beverage and the price of labour makes it equal to the imported article.

The remarkable work on agriculture of Paul Sü, a convert to Christianity in 1620, contains a brief account and directions for cultivating tea. In concluding the chapter he urges the greater use of tea as against spirits. "Tea is of a cooling nature, and if drunk too freely will produce exhaustion and lassitude. Country people before drinking it add ginger and salt to counteract this cooling property. It is an exceedingly useful plant: cultivate it and the benefit will be widely spread; drink it and the animal spirits will be lively and clear. The chief rulers, lords, and great men esteem it: the lower people, the poor and beggarly, will not be destitute of it, all use it daily and like it."

The chemical analyses which have made known to us the components of the four or five substances used as warm beverages, viz., tea, coffee, mate, cocoa, guarana, and kola, indicate three constituents found in them, to which, no doubt, their virtues are owing.

A volatile oil is observed when tea is distilled with water; about one pound comes from one hundred pounds of dried tea † possessing its peculiar aroma and flavor to high degree. Much of it is pressed from the leaves when rolled and cured, but little as still remains, its effects upon the human system are noticeable and sometimes powerful. Tea tasters who continually taste the quality of the various lots submitted by sample for their approval, do so by breathing upon a handful of leaves, and instantly covering the nose, so as to get this volatile aroma as one important test. They also examine the infusion in several different ways, by its taste, color, and strength. Long practice in this business is alleged to have deleterious influence upon their nervous systems. The other beverages we drink, as well as tea, derive their peculiar and esteemed flavor and aroma from chemical substances produced in them during the process of drying and roasting; at least nothing of them can be perceived in their natural state. Another substance in tea regarded as the chief inducement and reward in its effect on the system is the peculiar principle called theine. If a few finely-powdered leaves are placed on a watch glass covered with a paper cap and placed on a hot plate, a white vapor slowly rises and condenses in the cap in the form of colorless crystals. They exist in different proportions in the different kinds of tea, from one and one-half to five or six per cent in green tea. Theine has no smell and a slightly bitter taste, and does not therefore attract us to drink the infusion; but the chemists tell us that it contains nearly thirty per cent of nitrogen. The salts in other beverages, as coffee and cocoa, likewise contain much nitrogen, and all tend to repair the waste

* Ceylon not deemed worth of mention in 1833, is, in 1837 likely to take rank far before Java as a tea-exporting country.—Ed.

† That is 1 per cent.—Ed.

going on in the human system, reduce the amount of solid food necessary, diminish too the wear and tear of the body and consequent lassitude of the mind, and maintain the vigor of both upon a smaller amount of food. Tea does this more pleasantly, perhaps than any of the others; but it does more than they do for old people in supplementing the impaired powers of digestion, and helping them to maintain their flesh, and uphold the system in health longer than they otherwise would. It is no wonder, therefore, that tea has become one of the necessities of life; and the sexagenarian invalid, too poor to buy a bit of meat for her meal, takes her pot of tea with what she has, and knows that she feels lighter, happier, and better fitted for her toil, and enjoys life more than if she had no tea. Unconsciously she echoes what the Chinese said centuries ago, "Drink it and the animal spirits will be lively and clear."

The third substance (which is contained in tea more than in the other beverages mentioned) forms also an important ingredient in betel-nut and gambier, so extensively chewed in Southern Asia, viz., tannin or tannic acid. This gives the astringent taste to tea-leaves on their infusion, and is found to amount to seventeen per cent. in well-dried black tea, and much more than that in green tea, especially the Japan leaf. The effects of tannin are not clearly ascertained as apart from the oil and the theine, but Johnston considers them as conducing to the exhilarating, satisfying, and narcotic action of the beverage.

A remaining ingredient worthy of notice in tea, in common with other foods is gluten. This forms one-fourth of the weight of the leaves, but in order to derive the greatest good from it which proper methods of cooking might bring out, we must contrive a mode of eating the leaves. The nutritious property of the gluten accounts for the general use of brick tea throughout the Asiatic plateau. Huc says he drank the dish in default of something better, for he was unaccustomed to it, but his cameleers would often take twenty to forty cups a day. If the sanitary effects of tea upon the system are so great and wholesome, its influence since its general introduction among occidentals cannot be overlooked. The domestic, quiet life and habits of the Chinese owe much of their strength to their constant use of this beverage, for the weak infusion which they sip allows them to spend all the time they choose at the tea-table. If they were in the habit of sipping even their weak whiskey in the same way, misery, poverty, quarrels, and sickness would take the place of thrift, quiet, and industry. The general temperance seen among them is owing to the tea much more than any other cause. It has, moreover, won its way with us, till in the present generation the associations that cluster around the tea-table form an integral part of the social life among English-speaking peoples. One of the most likely means to restrict the use of spirits among them is to substitute the use of warm beverages of all kinds by those whose system has not become vitiated. Tea is one of the greatest benefits to the Chinese, Japanese, and Mongols, and its universal use for at least fifteen centuries throughout their territories has proven its satisfaction as a nerve, a stimulant, and a beverage. If one passing through the streets of Peking, Canton, or Ohosaka, and seeing the good-natured hilarity of the groups of laborers and loiterers around the *cha-kwan* and the *cha-ya* of those cities, doubts the value of tea as a harmonizer and satisfier of human wants and passions, it must be taken as a proof of his own unsatisfied cravings.

It is a necessary of life to all classes of natives, and that its use is not injurious is abundantly evident from its general acceptance and increasing adoption: the prejudice against the beverage out of China may be attributed chiefly to the use of strong green tea, which is no doubt prejudicial. If those who have given it up on this account will adopt a weaker infusion of black tea, general experience is proof that it will do them no harm, and they may be sure that they will not be so likely to be deceived by a colored article. Neither the Chinese nor Japanese use milk or sugar in their tea, and the peculiar taste and aroma is much better perceived without those

additions. Tea, when clear, cannot be drunk so strong without tasting an unpleasant bitterness, which these diluents partly hide.

[p. 373. Vol. II.] The history of the culture and trade in tea by Samuel Ball of Canton in 1835, may yet be considered as an authority upon the subject. The growth in the use of tea is instructive too, rising from an importation of about eighty pounds into England in 1670, till it had so well vindicated its virtues and enlarged its use among that people, that in 1880 one hundred and eighty million lb. were required to supply them; and more than that was exported elsewhere from China.

Export of Tea from China during ten years.

(The Pecul weighs 133½ lb.)

[The import of tea from China into Britain alone, culminated in 1886, with 104,229,313 lb. In 1887 the quantity went down to 90,531,753 lb. in consequence of inferiority in the China article and the rapid advance in public favour of Indian and Ceylon tea of which the imports, in 1887 were: Indian 83,112,272 lb; Ceylon 9,941,860 lb.; total 93,054,132 lb.—*Ed. T. A.*]

A TEA EXHIBITION IN JAPAN.—Says the *Japan Weekly Mail* of March 16th:—Arrangements are being made to open an exhibition of tea at Kobe during next month.

THE AMERICAN TEA COMPANY is the subject of reference in two very pointed letters in our columns today, and we see that Mr. Pineo is to canvas Uva on the Company's behalf. We have no doubt that a canvass of this kind will be specially successful.

MICA.—Messrs. Richard Baker & Co. the well-known brokers, of Mincing Lane, have recently drawn up a report on some samples of mica submitted to them. We give some extracts from this report, as it ought to be of considerable interest to our colonial readers, considering the discovery in mica recently made. Messrs. Richard Baker & Co. report that the sample submitted is the best and largest they have ever seen of Australian mica, and it certainly denotes a valuable deposit of sound, clear, and large slabs of merchantable mica. The sample brought in is from the surface, the clay and cracks about it proving this, but as one digs deeper better quality will be obtained. Regarding the shipment of mica from Australia, it is advised that small shipments should be sent at first of as good mica as can be obtained, the slabs to be as large, clear, and sound as possible, and to be well trimmed of waste and cracky mica. The kind of mica most desired are slabs so large that 3 inches by 4 inches, minimum sizes can be cut, and prices depend entirely on how much can be got out of a slab, and its size and quality, and freedom from cracks. The price ranges from 4s to 7s per lb. and upwards for cut mica, perfect quality and sizes, from 3 by 4 to 8 by 10 inches. It is no use shipping slabs that would cut less, perfectly sound, than 3 by 4 inches, —*Colonies & India.*

RICE CULTIVATION IN CEYLON.—There is too much truth in Mr. W. Jansz's contention that without official pressure on the headmen and indeed a mild form of "Rajakariya" it is useless expecting to improve or extend rice cultivation in Ceylon. It is all very well contending in long-winded columns where involved sentences simply serve to cloud meaning, that radical fiscal reforms would be the salvation of the Ceylon rice-grower. In other words, sweep away the food-taxes and leave the people alone?;—and the result we verily believe would be a reduced, in place of extended, area under cultivation. At any rate, it is a fact that this was the result of granting remission of taxation in a certain well-known district. But apart from this, everyone knows that the alternative to the abolition of the "food taxes" is a universal land-tax, one of the greatest curses which could fall on the natives, or the planters, of Ceylon.

JAPAN AND THE COTTON TRADE.—Now that attention to cotton culture in Ceylon has been revived, the following details by an Indian contemporary, are interesting:—

We have already in these columns dealt with the long and elaborate report by Mr. Longford, our Vice-Consul at Tokyo, collating all the facts and figures in regard to the native cotton industry in Japan. The subject, however, is of such interest, both to the country generally and to Bombay particularly, that it will bear reverting to. Mr. Longford gives some very curious information in regard to the cultivation of the cotton plant by the Japanese farmer. Though grown generally, cotton is only a secondary crop, the seed being sown in narrow trenches between rows of standing wheat or barley. The most suitable land for the crop is one of sandy soil, with the admixture of earth and sand, about the proportion of two parts earth to one of sand. The first manure applied is a combination in equal parts of chopped straw ashes, green grass, rice bran, and earth from the bottom of stagnant pools. This is liberally sprinkled by hand along the trenches about ten days before the actual sowing takes place. The seed is steeped in water for one night before being placed in the ground. It is then sown, slightly mixed with straw ashes, the seeds being placed at intervals of a few inches, covered with earth to the depth of half an inch, and gently trampled down by foot. The buds appear above the earth four or five days after sowing, and the standing wheat or barley is then ripe for the sickle. After this is harvested, the cotton buds are carefully thinned, five or six plants being left in each foot of length. There are three further manurings, and when the plant has reached a height of six or seven inches the head is pinched off by the fingers, with the object of checking the excessive growth of the stem and of directing the strength into the branches, which usually number five or six. All minor branches springing from these main ones are carefully pruned off as they appear, so as to prevent their impeding the full growth of the pod. When the pods are fully opened the field is constantly watched, and each plant is picked the moment it appears fit, the cotton not being allowed to fall to the ground, as this would detract from its value. The cotton is next spread out on mats, and allowed to dry and swell in the sun for two or three days. The Japanese farmer then, as a rule, puts it aside till leisure from other agricultural operations enables him to deal with it. The average yield from the best land is about 120 lb. per acre.

TOBACCO CULTIVATION NEAR NEGOMBO AT THE BEGINNING OF THE 18TH CENTURY.—The German traveller Heydt, who spent some years in Ceylon between 1730 and 1740, gives in his book an interesting account of tobacco cultivation near Negombo. After a description of the town and fort of Negombo he proceeds:—

Round about Negombo moreover there is a very good and fruitful stretch of land, and the Hollandish

soldiers are very willing to be stationed there on account of the plentiful supply of all kinds of provisions in spite of its being very lonely there, since the garrison is small and there are few European inhabitants there. They also cultivate round Negombo all kinds of the country fruits (of which the commonest is the coco tree), and also a great deal of tobacco, which grows in that region very readily and in superabundance, and is then sent in large quantities to Colombo and other adjacent places; for the natives also use it in their *Pynangh* [*i. e. betel*] chewing, and are everywhere accustomed to smoke it. But in order to do this they do not use any pipes, but they simply roll up a leaf slit in the middle, put one end into their mouth, and let the other stick out, and thus they smoke, until it begins to burn close to their mouth, when they throw it away. It is a clever contrivance, by which also the cost of pipes is saved. The Hollandish soldiers, in the absence of pipes, also make use of this method of smoking. And this is the common custom among the Portuguese, who, I believe, were the ones to introduce it. This tobacco is, as compared with ours, very light, and in smoking has a powerful drying effect: still, in the absence of European or Hollandish it is much used by the common folk, such as soldiers and sailors, as it can be had much cheaper than the latter. It is however of more value in other distant places, and is sent as a rarity not only as far as the Cape of Good Hope but even now and then to Holland to gratify this or that connoisseur.

It is amusing in these days to read of cheroot smoking as a novelty: but, as our readers may be aware, the very word *cheroot* is a corruption of the Tamil *śuruttu* 'rolled.' (See Col. Yule's *Hobson-Jobson* s. v.)

COOLIE DIFFICULTIES SEEM GATHERING IN PERAK.—The collector of Matang reports that seventeen coolies have absconded from one estate, owing \$475, most of them old hands. Two of them were re-captured and sentenced to a rattaning. None of the Deli (Sumatra) coolies desert. The offenders were men picked up locally who got an advance and then bolted. The Chinese employers of labour are not inclined to contribute very liberally to the Famine Fund, giving as a reason the conduct of the Chinese Government in discouraging emigration to the estates here. From a humanitarian point of view says Mr. Welman this argument is, perhaps, hardly sound, but expresses what is felt to be a grievance by the sugar planters, who object to the Dutch Colonies being favoured at their expense. At Selama there were threatenings of trouble in consequence of increased hours of labour being demanded; a compromise, however, settled the question. Mr. Brewster, holding Court, had the Court-House filled with discontented coolies complaining of the additional hour; he advised them to return peacefully to work but they would not do so, for several days. Subsequently the employers discussed the matter with him and agreed only to employ such as would work seven hours, all has since gone on quickly. This is an advance on the English eight hours labour agitation which betokens much cunning on the part of the coolies. The Superintendent of the Intelligence Department says that during 1888 a greater number of coolies absconded than has ever yet been recorded; not one-fifth of those absconding have been arrested and the Discharge Ticket system has proved no protection. Crimping has been carried on with great activity and the men have been taken quite out of the colony to Deli, Selangor, Tongkah, Kédah and Pahang. There are now absconding 6,000 coolies a year and the system effects little if any good. Photographing coolies has become optional since the end of the year; it was never of any value (so says Mr. Wagner) so far as could be discovered.—*S. F. Press*, April 11th.

CULTIVATION OF PEPPER AT 1,400 FEET ATTITUDE IN CEYLON.

[By a Practical Ceylon Planter.]

Matale East, the district of my residence since 1879, I always thought to be about the best for the cultivation of pepper, seeing how freely it grew in the villages round about; but I could not make a beginning till 1884 when the management of Crystal Hill estate was handed over to me. Before my time pepper had been planted on the place by the proprietor, Mr. A. G. K. Borron, and by my time many of the vines were in full bearing. These were all under shade trees among the cacao; and encouraged by the progress they had made, it was resolved to plant pepper under all other trees, especially arecanuts with which we had about 30 acres planted 10x10 feet and 6 to 8 years old. The S.-W. monsoon was then just setting in and a start had to be made at once. This gave us no time to consider about raising plants in a nursery; in fact, we attached no importance to such considerations as cuttings from old vines were supposed to be all that was required and these could have been got in any quantity from the immediate neighborhood. Accordingly, as was the custom in the country (a practice evidently introduced by some planters) coolies were sent to purchase cuttings. These were usually 18 inches in length and cost from Rs 5 to Rs 10 per 1,000; and anything that came to hand in the shape of a pepper cutting was readily dibbled into the ground. About 20,000 plants were put out in this manner and the weather being all that could be desired, these were all of course expected to grow up satisfactorily. About a month elapsed and we were still being favoured with occasional showers; but what was my disappointment to find, after all that trouble and expense, about 50% of my plants completely destroyed—some rotted and some dried—and even out of those that were still keeping fresh only a few growing. A week or so after this, the weather had changed to a series of dry hot days, and fancy the magnitude of my horror when I beheld day after day that even those that were growing succumb to what we thought to be the effect of the rays of the sun. As the only remedy to save even those that were still remaining, resort was at once had to shading the plants with leaves. To a certain extent this proved to be successful. But notwithstanding all that shade and constant looking after, I made out about 80% of my plants to have failed before the next rainy season had set in.

It is not necessary to dwell on the various theories that had been advanced to account for the failures of our first attempt as the facts connected with our second attempt to supply those failures will show what they were.

Long before the N.-E. monsoon set in arrangements were made to get cuttings and have them kept in a nursery so as to be in readiness for planting out with the first rains. Nursery beds were prepared where water was easily accessible and cuttings obtained from the villages as before. But in obtaining these cuttings this time I had to be more cautious, for I found only when it was too late that a good many of the plants of my first planting were of a kind what we call wild pepper which use to grow in the jungles. The best method of detecting these whenever an attempt is made to palm them off as genuine, is to compare the leaves of both species: the leaf of the wild one is somewhat pubescent, while the other is glossy. By this means the best cuttings were collected, but a difficulty arose when they were to be put in the nursery: Which is the best way to place the cuttings in the bed? No one could say exactly, but still the differences of opinions on the subject were many. The inexhaustible *Tropical Agriculturist* which I consulted first could not help me at all. My native neighbours could tell me only how they planted a vine long ago, but did not know how to raise a nursery as they never heard of one. At last commonsense had to be relied upon, and one of our theories was (1) that, as they grew from every joint, the longer cuttings should be bent into a bow and both ends buried in the ground at least 6 inches deep; another (2) was to bury the middle of the cutting and have both ends jutting out a few inches above the ground; (3) cuttings which were shorter than 12 inches were put about three inches apart in the ordinary way six inches deep. All the beds were shaded with branches of trees except one bed which was sown with seeds, and were watered as was found to be necessary. But, alas, what was the result? When the time came for planting them out, hardly one-half of the cuttings were alive! Theory No. 1 was a complete failure, No. 2 partly so, but No. 3 so far a success, at least not so disappointing. On the whole, as the saying is, after many failures comes success, I was not discouraged by the failure of this experiment, for herein I conceived the idea how to raise a pepper nursery with any description of cuttings successfully. Here I must remark that by whomsoever the system had been introduced, a great blunder had been committed in regard to the manner pepper cuttings are bought and sold now-a-days. As the branch cuttings when grown do not prove to be good climbers but rather inclined to grow into a bush for some time and then die off, the cuttings from the root, or shoots growing out

from the parent vine and creep on the ground are always preferred for raising plants. These shoots are usually several yards in length with roots hanging down from almost every joint. The native style of planting was to pull out the whole of one of these shoots and bury it round a tree in two or three coils; they must therefore count each shoot as a plant. But according to the rule in vogue at present, a shoot will be cut into a dozen lengths and sold as a dozen plants. It does not concern us as to whether it is the practice in India or in the Straits Settlements: we should adhere to the rule which was in force here from time immemorial.

But to return to my cultivation. As might be expected we planted out all the surviving plants and made up the difference for supplying our failures by buying fresh lots of cuttings from the villages, but this time I insisted on getting and planting only the cuttings that had plenty of roots in them, as I found these to grow better than those without roots. The cuttings that came without roots, I cut into pieces of 9 inches in length so as to have three or more joints in each piece, and put them into a nursery over which I had a thatched roof, 6 feet high, so as to prevent the rays of the sun falling on its beds, but which at the same time gave it plenty of airy room and plenty of light. I felt that these two conditions were absolutely necessary for raising pepper plants in a nursery either from seed or cuttings. These plants I expected to leave in the nursery for at least 6 months before the next planting season. I am now of opinion that to leave them in the nursery for a whole year, 6 months under shade and 6 months exposed to the sun by removing the roof, would be so much the better for them as the sequel will show. The supplying of my first season's failures having been done during the first week of the regular N.-E. rains, the plants I put out from the nursery, as well as the rooted cuttings I so carefully selected and planted, had plenty of time to grow. The rains that year continued from October to January, and so far as my observation went, I found not a single failure for four months among any of my second season's planting. The dry season began in February and the heat was intense in March, and although I took the precaution to have all my plants shaded in good time, the drought at an elevation of 1,400 feet above the mean sea level was too much for even the growing plants to withstand, and consequently a large percentage died out again. It was very strange to observe the different conditions in which the plants that survived the drought had been placed; and when I compare them with the conditions of those that had succumbed were placed, my bewilderment became still greater. If one were to suppose that sufficient shade would keep a pepper plant alive in any dry weather, here then is an instance to prove the contrary, for I could have counted hundreds of them under trees with abundance of foliage which afforded them the best natural shelter, all dead, while in another more open situation hundreds might be seen to be growing satisfactorily. Here again is an open patch where the best plants had been put out, but now hardly one to be seen; while a few yards farther is a clump of shady trees under whose sombre foliage they are growing like common ferns. This strange anomaly as might be expected led me to the conclusion that there were different varieties of pepper growing in the island, and that of these some grew under shade and some exposed. If this was the case, surely cuttings can be chosen and planted according to the suitability of each locality. But the theory does not reconcile with the results of my nursery experiments where under a given condition all the plants thrive, till they are removed and planted out. If any of these plants had been of the variety that did not grow under shade there would have been a perceptible number of failures. But such was not the case, and so the failures outside could not be attributed to such a cause. Being then but a beginner as I was, my next impression was that the soil which had been an abandoned field of coffee was old and exhausted, and though some old vines growing thereon were growing luxuriantly and bear good crops, they had been planted when the soil was still fertile and new, but now the plants would not grow as the soil had lost its fertility. But I do not believe in this theory with the experience I have gained up to the present day, as I have reason to believe that pepper could be cultivated in any poor soil provided only the rules necessary to encourage its propensities be strictly observed; that is to say, we must allow the plant to grow as it will, when it will grow as we want.

Since beginning the cultivation I had two seasons for planting, both of which were taken advantage of as already stated. The survivors of the first season were now 12 months old, while those of the second were 6 months. The scarcity of rain still continued and by about the middle of April the drought had done its worst. What with soil, climate and elevation, here was the saddest picture to behold! So much money and labour absorbed and not a single plant of either the first or the second season to be seen alive! All hopes blasted and gone! Even the older vines that looked so lovely with their rich foliage and a promising crop were now quite bare and looked as if they were about to go off. This afforded me an opportunity to observe the influence which the trees on which the vines grew exercised over the vines. Those that grew on any deciduous trees as the Inga Saman, dadap or erabodda, kapok, &c. were the worse for it; while those which grew on jak, arecanut, kekuna, and such other trees which were not deciduous, were still holding on. Even these latter would doubtless have passed off like their companions of the vegetable world, but for the timely rains of the month of May and once more the drooping hearts of the poor Matale planters were cheered? June followed with more rain, and the ravages of the drought were to a considerable extent repaired. And it was then that I found out the advantage of having a plethora of roots in the pepper cutting or plants, before it is planted out and allowed to take care of itself; for wherever this had been the case I found the plant which was given up for dead during the drought, immediately after the rains spring up in beautiful suckers and those that sprang up in this manner were not a few, but thousands. Here then is one of the secrets of the pepper plant—if cuttings without roots are planted out, they die immediately those with a little root hold on for some time, and rot in the ground, but those with more root grow during the rains, and though a

drought may follow and destroy all that is of the plant above, they keep alive under the surface, and spring up again. The advantage of planting well-rooted plants will now be quite obvious; and to get plants of this description as I have said before, it would be necessary to allow them to remain in the nursery for 12 months, treated in the same way as we did with cinchona under thatched roofs. These hints apply only to plants raised from cuttings. Where plants have been raised from seed (sown when fresh and ripe 5 or 6 inches apart) they should be kept in the nursery for at least 18 months, and then put out. I do not think there is any difference in longevity between plants raised from seed and plants from cuttings, and neither do I believe as to there being any difference in their fecundity or crop-producing powers. In fact, from thousands of old vines now flourishing in the district I cannot get anyone to point out which one has been grown from a cutting and which from a seed. It is said that seed plants take longer to bear; but I have not yet found an example, and neither an authority for supposing that it is true. I have already mentioned that branch cuttings are not much sought after for raising plants as they do not grow up the tree as a climber, but rather grow into a bush and soon die off. I have some plants of this description now four years old with a few bunches of crop on each. One of these is just beginning to throw out shoots, which are all climbing up an arecanut palm! So it would appear that after a time branch cuttings do grow up a tree. But, from this would again appear that its power of producing foliage and gaining new roots is really very slow, and that this is the cause of its short existence. The slightest drought deprives it of its nourishment owing to the paucity of its feeding roots. I do not therefore think that it is quite safe to try the experiment of growing pepper gooseberry fashion into small bushes by plants raised from branch cuttings, as has been suggested by some correspondents in the local newspapers recently. Hitherto it was thought sufficient simply to dibble the ground with a fork and put in a cutting. But since it is of paramount importance to afford the plant every facility for the development of its roots within the shortest space of time, I think the holes should be made large and freed from stones and other roots. For putting 12 months' old nursery plants the holes should be at least 9x12 inches. When planting out care will have to be taken not to allow the roots to bend upward; it would therefore be more advisable not to pull out the plant from the nursery with a ball of earth, but rather to thoroughly loosen the bed and then pick up the plants one by one doing as little injury to the small rootlets as possible and avoiding all chances of crushing or breaking the tender leaf-bud of the growing shoot.

The preceding remarks whether or not of practical interest to those who are about to embark in the cultivation of pepper under circumstances similar to those in which I was placed, refer only to experiences gained during a period of two successive planting seasons; and it must be mentioned that were I to enter into the details of going over more ground, as the cultivation was extended during several seasons, it would be simply repeating the same story again. But it would be expected from me to place on record any observations I may have made during my progress for the last five years; but in this I fear I would only qualify myself very poorly. Two years back when my oldest plant may be said to have been three years of age, and was only from 12 to 18 inches from the ground, where it happened to creep in a single shoot over an arecanut or a jak tree, or where it was spreading on the ground in several shoots round the trees, it was supposed that a topdressing or pruning would induce it to throw out more shoots and grow more vigorously, and this was accordingly done over a small area. But it may be remarked that the experiment was not a success; for about 12 months after when I expected to see them greatly improved, they were no better than they were before. It is therefore conclusive that the system is unsuitable to this climate. Instead of pruning, I have so found out that it is a greater help to the plant to train it up the tree by tying it with some bark of trees or soft strings as soon as the plants begin to grow, and great care should be taken to leave them unmolested till they have thrown out tendrils and taken hold of the tree. But there are great drawbacks to this being achieved. Jak trees bear fruit and the coolies are apt to climb upon them to pick, and thereby trample or otherwise injure the vine by breaking the shoots which retard its growth materially. Those growing on arecanut trees also share the same fate; it is however not the case with vines growing on other jungle trees. I have already stated that pepper can be grown on any poor soil, and will now go a step further and add that it can also be grown in any kind of climate within the tropics. When my oldest plants were four years (an age at which pepper usually begins to crop) the bulk of them were only from two to three feet from the ground, while the others had grown up from ten to fifteen feet high. At first it was supposed that the latter grew on richer soil than the former; but having found some of them to be growing on comparatively poor soil as well, the secret of their success still remained a mystery. Just about this time there appeared a notice in the local papers advertising pepper plants for sale at Lower Haloya estate near Peradeniya, the property of Mr. R. J. Farquharson, and it being desirable to try a change of cuttings, as agriculturists always try a change of seed I visited that place about twenty months ago, and endeavoured to obtain some cuttings from some of the best pepper vines that I have seen growing in the Central Province. These I have now in a nursery which of itself is a thing of beauty to see. What impressed my mind most at Haloya was to see the ground shoots of the vines growing on rocks and bearing crop; and then the parent vines which were twelve months old would beat any of 8 years of age in Matale. With an elevation of 2,000 feet, the climate more moist, the pepper seems to have here just what it wants. But when Mr. Farquharson told me that he got his cuttings originally from Negombo in the Western Province, I had to look more about me to know the secrets of his success. I must therefore leave climate and elevation aside and look elsewhere for its cause; and I think I have got it—a secret which is very little thought of in this country, although the greatest importance is attached to it by cultivators in the Straits Settlements and countries about it. For growing pepper the Chinese and Malays always select a piece of land which faces the east and is sheltered from the west. If there was any virtue in this selection, it must be, I suspect, that the morning

sun is more essential to the plant than the hot afternoons. The situation of Haloya favours this idea; and when I say that most of the best growing plants on Crystal Hill are also to be found in situations facing the east, it would appear that there is some truth in the theory. On a recent visit to Cotta near Colombo I was greatly interested with a pepper vine shown to me in his garden by Mr. John Garth, which was then only 18 months old, but in height to feet from the ground with a fair promise of crop. The climate of Cotta with an elevation of perhaps 100 feet above the mean sea level, is, I think, more moist than it is in Matale, and its proximity to the sea in the west which is only five miles distant, always brings to it the frequent showers of rain which arise from the sea, but which as they reach higher regions is dispersed and carried away by different currents of wind. The soil of Cotta is the same as what may be seen in all parts of Colombo—cabook and red clay, and as Mr. Garth's property must have been cleared and planted with coconuts more than 15 years ago, I should think the best of its good qualities must by this time have been exhausted; and I cannot therefore admit that any special richness of the soil, combined with its more favourable rainfall to be the cause of the wonderful growth of the vine I had seen with hardly any attention paid to it, than the full exposure of the field where it grew to the morning sun, and its protection from the heat of the rest of the day. Now compare these facts with what has been said of pepper grown successfully at one time in Batticaloa in the Eastern Province, and the conclusion will be irresistible that it was chiefly due to its exposure to the east and shelter from the west. By advancing this theory of an "eastern situation" I do not mean to say that pepper would not grow in any other aspect of land, for I have seen vines growing without any trouble at all in diverse positions in native villages as well as in cultivated estates. But even then these are only few and far between and should be considered as exceptions. But then these exceptions will not fail to strike even a casual observer as to there being a certain tendency in the smallest plant as well as in the largest vine to incline all its growing powers to a point from whence it gets the most light, and a further glance will show that this light which exercises such a great influence over it, is not of the afternoon, but of the morning. The best specimen of a vine might be seen to be growing over a half decayed jak tree which is fully exposed to the sun blazing from the west; but if one would only examine as to which was the side it had originally struck root, crept along its support and covered itself with the richest foliage, it would invariably be seen that all this was done from the first of the four cardinal points. Now having said this much to the point under discussion, I arrive at the conclusion that where the plant is not afforded natural shelter, it would be always of some advantage to provide artificial shade from the side it gets the afternoon sun. This could always be obtained by putting out the plant always to the eastern side of the tree on which it is intended to grow, but where it could not be had other remedies will have to be adopted.

Unlike some other products of agriculture, I think, we must pay more attention to *change of seed* in pepper cultivation than to anything else. This should not be understood as if I am recommending the adoption of any distinct variety of pepper; in fact I do not believe that even where one could be distinguished from the other, any one variety would grow and bear better than another. If, however, any of my brother planters prefer the "Malabar variety," bought at such exorbitant prices as those recently advertised in the local newspapers, over what could be obtained in the country, they would do well to first see what has been the result of similar experiments with other products and satisfied that the money thus given away would be returned by larger crops, than the native indigenous variety is capable of producing. In my humble opinion any variety would grow in this country only if it could be made to grow, and be it exotic or indigenous, under careful cultivation it would bear crops as good as those of any other parts of the world. It should also be carefully noted that cuttings, plants or seeds for planting should always be procured from a district whose elevation is either higher or lower than that of the district in which it is intended to be planted. There is also another point which should not be lost sight of. History tells us that pepper was an item of fiscal revenue of the island more than four hundred years ago; and if we only consider the length of time the indigenous variety had been growing, multiplying its species up to this day throughout the island, the fact must be patent to every one, that by this time it must have greatly degenerated, and that it does not produce so much crop now as it did before. This is supposed to be also the case with paddy and other grains which in former times turned out from the same extent of land from sixty to seventy fold more crop than they do at the present day. With regard to the latter product we know that several attempts had been made to introduce seed paddy from foreign countries; but the results obtained when compared with those of the native sort, there was hardly any encouraging difference to be found. I think it was the same with coffee. Now all these facts tend to show that it is very unlikely that any foreign variety of pepper would ever supersede the native product; but at the same time I am inclined to believe in the theory that the introduction of a more robust stranger into the existing native family, would improve the blood and give new vigour to the latter; and on that consideration only would I recommend any of the so-called new varieties of pepper, but not as producers of larger crops in which I do not believe. At the Agri-Horticultural Show in Kegalla last year I saw some pepper corns of the Malabar variety exhibited, each grain about the size of a seed of the *Jalapa Merabilles* (4 o'clock flower). To the taste it was not so strong as our puny little native grain. The Indian variety of the Long Pepper (Tippily) also produce beans three or four times larger than those produced by our native creeper; but for medicinal purposes the latter is more sought after than the former.

In conclusion I must apologise for the disconnected style in which this essay is presented to the readers of "All About Pepper." A planter who is occupied with his work from the gray morn to the dewy eve can hardly be expected to give much time to writing—may therefore some indulgence be allowed him not as a privilege but as his right!

CEYLON UP-COUNTRY PLANTING REPORT

HOLIDAY-MAKING AND THE PRESERVATION OF PEACE AT NUWARA ELIYA—ADULTERATION OF CITRONELLA OIL AND THE INGENUITY OF THE PRODUCERS—FAVOURABLE WEATHER—BIG FLUSHES ANOTHER NAME FOR LOW PRICES OF TEA—EXTENSIVE MANUFACTURING OF TEA—MESSRS. VENN AND CO'S AUSTRALIAN FRUIT TRADE AND PUSHING CEYLON TEA—PROSPECTS OF COCOA CROPS AND PLANTING OF CACAO AT STAKE—THE CHOLERA SCARE AND COAST ADVANCES.

23rd April 1889.

Judging by your Kandy correspondent's remarks in the *Observer* of the 15th inst., the holiday-seekers who resort at this time to Nuwara Eliya for rest and enjoyment, are rather a turbulent lot. He says:—"Considering the Sanatorium is full at this season, and so many more expected during the coming week, and rows and assaults are likely to take place, we are surprised an Inspector of Police has not yet been sent up." To the less fortunate who are unable to afford the time and the money for an outing at Nuwara Eliya, and who may be inclined to regard the lucky ones with the "green eye", the state of things revealed by your correspondent should calm their perturbed spirits. Clearly they have been mercifully preserved. It is rather rough, however, on the padrees who assemble in such numbers at this time on the Nuwara Eliya Plain, to find that the place has a worse character when they are there than it has at any other time! This surely is worth looking into.

The adulteration of citronella oil, which is now going on from bad to worse, and has reached the point, that it is next to impossible to get a pure sample, is surely a style of things which will cease to pay in the long run. The ingenuity of the producer has long ago passed the rude stage when so much of foreign oil was simply mixed with the citronella. Now they distill the two together—kerosine being the principal adulterant—and the result of this is that unless the oil be subjected to a chemical test the detection is more difficult than formerly. I understand that kerosine which has been treated in this way, becomes very unlike kerosine, and fails to answer to some of the tests which the analyst usually applies. But at the same time its detection is easy enough. If the present style of things continues buyers of citronella oil will have to insist on a chemical analysis, and that the oil be sold as we sell cinchona bark. "It's an ill wind that blows nobody good," and it would seem as if our analytical chemists were to benefit by the roguery in the citronella oil trade.

The weather still keeps as favourable for the planter as ever, and its praise is in all our mouths. As to what tea is doing, you hear very little: we are getting rather ashamed of big flushes as being but another name for low prices; and these spicy little paragraphs in the newspapers relating to the rush of flush wherever the planter gives tongue, and puts the exuberance of his heart into words, are not nearly so common as they used to be. It has come to this that some of us hear of big returns with a sigh. In coffee days we came to grief from a failure of crop, and now it would seem as if we had a chance to be "choked off" with a plethora. However we may look at it, the tea goes on growing here as well as elsewhere; and when one hears that fourteen "Rapid" rollers have just been shipped from England—not to speak of the manufacture of local machines—to meet the present demand, an idea of the extent of the manufacturing of tea which is going on, can be realised in a rough way.

Of all the ingenious ways which have yet been devised to forward the interest of tea growers here

and check the glut of the tea market at home, the palm must be given to Messrs. Venn & Co. I can't say that at first the plan commended itself to me but when the "note for the editor" was read, and I saw it was proposed that each member of the Association was to be presented with a case of apples by the Chairman or Secretary, it at once won for itself my unqualified approval. I am bold enough to think that even the most cantankerous member of the P. A. would agree with me and accept the gift with thanks and when there is such unanimity of feeling abroad, for the officials in question to put themselves in antagonism would be a sorry spectacle indeed. It's a grand opening for the Chairman, Secretary, and, I fancy, the most unique in the annals of the Association. If they don't rise to the suggestion, what—but I spurn the base thought and live in hope that my R9 case of Ribstone pippins "all repicked," is now on the way, and that the coin paid for them has been invested in tea.

CACAO is looking wonderfully well, and ripe pods can be gathered every week or so. There is a splendid blossom bursting on those trees which bore heavily at the end of last year, and the prospects of the autumn crop are so far very fair indeed. The acreage of cacao is being increased in a small way here and there when suitable land can be found.

I have heard of a new dodge of planting cacao at stake, that of germinating the seed so as to be sure that the right end is put down. Just when the shoot is bursting is the proper time to plant, and the loss which is so common when the seed is turned upside down, is reduced to almost nothing. Those who have planted cacao at stake know how difficult it is at times to decide which is the upper or the lower end, and the cool planting, however confident he may be, is sure to be out time after time.

The cholera scare is being taken advantage of by kangannies who have sent, or are thought to have sent advances to the Coast, and who are not very sure how many coolies may come in. There will be delays they are sure, owing to the quarantine on the North Road, and worse still the recruits may desert. They tell you harrowing tales of the death-rate, the highest that I have heard was one hundred victims a day, and when you offer for their exaggerations a true statement of how things really are, they receive the information with becoming respect, but don't believe a word you say. Who would put the statement of a Government against bazaar rumour? This cholera dodge is a rough sort of touchstone; the kangani who has acted on "the square," is troubled, the other fellow is not, and by its means a side-light is thrown which often reveals things which you would be happier not to know.

PEPPERCORN.

KANGRA VALLEY TEA.

The apparent lethargy of Indian tea planters in matters affecting their own interests has more than once been commented upon, and the earlier arrangements in connection with the Paris Exhibition emphasised again the superior enterprise of the tea-growers of Ceylon. Strong remonstrances from commercial authorities at home, who are interested in the tea industry of India, were, however, lately published in the Anglo-Indian papers: and this gave rise to active correspondence and discussion, which are already producing excellent results. In this revival we are glad to see that the tea-planters of the Punjab participate, and active measures are in progress for bringing Kangra Valley tea directly to the front, as its quality undoubtedly deserves; and we may hope that all the planters concerned in this desirable consummation will come heartily forward to lend unity, which is strength

plant above, they keep alive stage of planting well-rooted plants of this description as I wish to remain in the nursery with cinchona under thatched in cuttings.
