sun is more essential to the plant than the hot afternoons. The situation of Haloya favours this idea; and when I say that most of the best growing plants on Crystal Hill are also to be found in situations facing the east, it would appear that there is some truth in the theory. On a recent visit to Cotta near Colombo I was greatly interested with a pepper vine shown to me in his garden by Mr. John Garth, which was then only 18 months old, but in height to feet from the ground with a fair promise of crop. The climate of Cotta with an elevation of perhaps 100 feet above the mean sea level, is, I think, more moist than it is in Matale, and its proximity to the sea in the west which is only five miles distant, always brings to it the frequent showers of rain which arise from the sea, but which as they reach higher regions is dispersed and carried away by different currents of wind. The soil of Cotta is the same as what may be seen in all parts of Colombo—cabook and red clay, and as Mr. Garth's property must have been cleared and planted with coconuts more than 15 years ago, I should think the best of its good qualities must by this time have been exhausted; and I cannot therefore admit that any special richness of the soil, combined with its more favourable rainfall to be the cause of the wonderful growth of the vine I had seen with hardly any attention paid to it, than the full exposure of the field where it grew to the morning sun, and its protection from the heat of the rest of the day. Now compare these facts with what has been said of pepper grown successfully at one time in Batticaloa in the Eastern Province, and the conclusion will be irresistible that it was chiefly due to its exposure to the east and shelter from the west. By advancing this theory of an "eastern situation" I do not mean to say that pepper would not grow in any other aspect of land, for I have seen vines growing without any trouble at all in diverse positions in native villages as well as in cultivated estates. But even then these are only few and far between and should be considered as exceptions. But then these exceptions will not fail to strike even a casual observer as to there being a certain tendency in the smallest plant as well as in the largest vine to incline all its growing powers to a point from whence it gets the most light, and a further glance will show that this light which exercises such a great influence over it, is not of the afternoon, but of the morning. The best specimen of a vine might be seen to be growing over a half decayed jak tree which is fully exposed to the sun blazing from the west; but if one would only examine as to which was the side it had originally struck root, crept along its support and covered itself with the richest foliage, it would invariably be seen that all this was done from the first of the four cardinal points. Now having said this much to the point under discussion, I arrive at the conclusion that where the plant is not afforded natural shelter, it would be always of some advantage to provide artificial shade from the side it gets the afternoon sun. This could always be obtained by putting out the plant always to the eastern side of the tree on which it is intended to grow, but where it could not be had other remedies will have to be adopted.

Unlike some other products of agriculture, I think, we must pay more attention to *change of seed* in pepper cultivation than to anything else. This should not be understood as if I am recommending the adoption of any distinct variety of pepper; in fact I do not believe that even where one could be distinguished from the other, any one variety would grow and bear better than another. If, however, any of my brother planters prefer the "Malabar variety," bought at such exorbitant prices as those recently advertised in the local newspapers, over what could be obtained in the country, they would do well to first see what has been the result of similar experiments with other products and satisfied that the money thus given away would be returned by larger crops, than the native indigenous variety is capable of producing. In my humble opinion any variety would grow in this country only if it could be made to grow, and be it exotic or indigenous, under careful cultivation it would bear crops as good as those of any other parts of the world. It should also be carefully noted that cuttings, plants or seeds for planting should always be procured from a district whose elevation is either higher or lower than that of the district in which it is intended to be planted. There is also another point which should not be lost sight of. History tells us that pepper was an item of fiscal revenue of the island more than four hundred years ago; and if we only consider the length of time the indigenous variety had been growing, multiplying its species up to this day throughout the island, the fact must be patent to every one, that by this time it must have greatly degenerated, and that it does not produce so much crop now as it did before. This is supposed to be also the case with paddy and other grains which in former times turned out from the same extent of land from sixty to seventy fold more crop than they do at the present day. With regard to the latter product we know that several attempts had been made to introduce seed paddy from foreign countries; but the results obtained when compared with those of the native sort, there was hardly any encouraging difference to be found. I think it was the same with coffee. Now all these facts tend to show that it is very unlikely that any foreign variety of pepper would ever supersede the native product; but at the same time I am inclined to believe in the theory that the introduction of a more robust stranger into

CEYLON UPCOUNTRY PLANTING REPORT

HOLIDAY-MAKING AND THE PRESERVATION OF PEACE AT NUWARA ELIYA—ADULTERATION OF CITRONELLA OIL AND THE INGENUITY OF THE PRODUCERS—FAVOURABLE WEATHER—BIG FLUSHES ANOTHER NAME FOR LOW PRICES OF TEA—EXTENSIVE MANUFACTURING OF TEA—MESSRS. VENN AND CO.'S AUSTRALIAN FRUIT TRADE AND PUSHING CEYLON TEA—PROSPECTS OF COCOA CROPS AND PLANTING OF CACAO AT STAKE—THE CHOLERA SCARE AND COAST ADVANCES.

23rd April 1889.

Judging by your Kandy correspondent's remarks in the *Observer* of the 15th inst., the holiday-seekers who resort at this time to Nuwara Eliya for rest and enjoyment, are rather a turbulent lot. He says:—"Considering the Sanatorium is full at this season, and so many more expected during the coming week, and rows and assaults are likely to take place, we are surprised an Inspector of Police has not yet been sent up." To the less fortunate who are unable to afford the time and the money for an outing at Nuwara Eliya, and who may be inclined to regard the lucky ones with the "green eye", the state of things revealed by your correspondent should calm their perturbed spirits. Clearly they have been mercifully preserved. It is rather rough, however, on the padrees who assemble in such numbers at this time on the Nuwara Eliya Plain, to find that the place has a worse character when they are there than it has at any other time! This surely is worth looking into.

The adulteration of citronella oil, which is now going on from bad to worse, and has reached the point, that it is next to impossible to get a pure sample, is surely a style of things which will cease to pay in the long run. The ingenuity of the producer has long ago passed the rude stage when so much of foreign oil was simply mixed with the citronella. Now they distill the two together—kerosine being the principal adulterant—and the result of this is that unless the oil be subjected to a chemical test the detection is more difficult than formerly. I understand that kerosine which has been treated in this way, becomes very unlike kerosine, and fails to answer to some of the tests which the analyst usually applies. But at the same time its detection is easy enough. If the present style of things continues buyers of citronella oil will have to insist on a chemical analysis, and that the oil be sold as we sell cinchona bark. "It's an ill wind that blows nobody good," and it would seem as if our analytical chemists were to benefit by the roguery in the citronella oil trade.

The weather still keeps as favourable for the planter as ever, and its praise is in all our mouths. As to what tea is doing, you hear very little: we are getting rather ashamed of big flushes as being but another name for low prices; and these spicily little paragraphs in the newspapers relating to the rush of flush wherever the planter gives tongue, and puts the exuberance of his heart into words, are not nearly so common as they used to be. It has come to this that some of us hear of big returns with a sigh. In coffee days we came to grief from a failure of crop, and now it would seem as if we had a chance to be "choked off" with a plethora. However we may look at it, the tea goes on growing here as well as elsewhere; and when one hears that fourteen "Rapid" rollers have just been shipped from England—not to speak of the manufacture of local machines—to meet the present demand, an idea of the extent of the manufacturing of tea which is going on, can be realised in a rough way.

Of all the ingenious ways which have yet been devised to forward the interest of tea growers here

and check the glut of the tea market at home, the palm must be given to Messrs. Venn & Co. I can't say that at first the plan commended itself to me but when the "note for the editor" was read, and I saw it was proposed that each member of the Association was to be presented with a case of apples by the Chairman or Secretary, it at once won for itself my unqualified approval. I am bold enough to think that even the most cantankerous member of the P. A. would agree with me and accept the gift with thanks and when there is such unanimity of feeling abroad, for the officials in question to put themselves in antagonism would be a sorry spectacle indeed. It's a grand opening for the Chairman, Secretary, and, I fancy, the most unique in the annals of the Association. If they don't rise to the suggestion, what—but I spurn the base thought and live in hope that my R9 case of Ribstone pippins "all repicked," is now on the way, and that the coin paid for them has been invested in tea.

Cacao is looking wonderfully well, and ripe pods can be gathered every week or so. There is a splendid blossom bursting on those trees which bore heavily at the end of last year, and the prospects of the autumn crop are so far very fair indeed. The acreage of cacao is being increased in a small way here and there when suitable land can be found.

I have heard of a new dodge of planting cacao at stake, that of germinating the seed so as to be sure that the right end is put down. Just when the shoot is bursting is the proper time to plant, and the loss which is so common when the seed is turned upside down, is reduced to almost nothing. Those who have planted cacao at stake know how difficult it is at times to decide which is the upper or the lower end, and the cool planting, however confident he may be, is sure to be out time after time.

The cholera scare is being taken advantage of by kanganies who have sent, or are thought to have sent advances to the Coast, and who are not very sure how many coolies may come in. There will be delays they are sure, owing to the quarantine on the North Coast, and worse still the recruits may desert. They tell you harrowing tales of the death-rate, the highest that I have heard was one hundred victims a day, and when you offer for their exaggerations a true statement of how things really are, they receive the information with becoming respect, but don't believe a word you say. Who would put the statement of a Government against bazaar rumour? This cholera dodge is a rough sort of touchstone; the kangani who has acted on "the square," is troubled, the other fellow is not, and by its means a side-light is thrown which often reveals things which you would be happier not to know.

PEPPERCORN.

KANGRA VALLEY TEA.

The apparent lethargy of Indian tea planters in matters affecting their own interests has more than once been commented upon, and the earlier arrangements in connection with the Paris Exhibition emphasised again the superior enterprise of the tea-growers of Ceylon. Strong remonstrances from commercial authorities at home, who are interested in the tea industry of India, were, however, lately published in the Anglo-Indian papers: and this gave rise to active correspondence and discussion, which are already producing excellent results. In this revival we are glad to see that the tea-planters of the Punjab participate, and active measures are in progress for bringing Kangra Valley tea directly to the front, as its quality undoubtedly deserves; and we may hope that all the planters concerned in this desirable consummation will come heartily forward to lend unity, which is strength

to the undertaking. All that the Kangra Valley requires is a good firm of Calcutta merchants to take some interest in it. The total out turn of the Valley gardens is a mere flea-bite; and it is this, or the number of small gardens unable to place a fair-sized break of tea at a time on the market. This, in turn, leads to the low prices which they too often realize when compelled to go there with their rain crop; for very little if any, of their spring and autumn crop see the market. This year, however, a proposition has been made, confined at first to a few gardens to join together and blend, say, the produce of 12 gardens, and sell as "Kangra Valley Tea," without of course any garden name; and this measure, we feel sure, will do good to both sellers and buyers. It is a fact that more tea is sold in Fleet Street, Ludgate Hill, St. Paul's Churchyard and the Strand as Kangra Valley Tea than the Valley turns out altogether or ever can. There is one old house in the Strand which sells Kangra Valley Souchong as high as 5s. a lb.; but we fancy that the Kangra Valley planters would be glad if they got one-fifth of that price. Now, the proposal in question, which we hear from a gentleman in the Kangra Valley, emanates from Mr. Duncan MacBean of the Clachnacuddin Tea estate, will, if heartily taken up, go a long way towards ensuring this or possibly a better result. We are pleased therefore, to learn that the meeting of the associated planters, held on the 6th instant, displayed an unanimous and decided to work in future for combination. This is all that is wanted to place the Valley's tea in the position at home it should have.—*C. & M. Gazette.*

CEYLON TEA PLANTATIONS COMPANY, LIMITED.

Directors.—David Reid, Esq., Thomanean, Kinross-shire, Chairman; Donald Mackay, Esq., Hereford; Henry Tod, Esq., 20, Mincing Lane; David Reid, Esq., 7, Mincing Lane.

Secretary.—Sir W. Johnston, Bart.

Manager in Ceylon.—Henry Keer Rutherford, Esq.

Report of the directors to be submitted at the second annual general meeting of shareholders to be held at the offices of the Company on Friday 12th April, at 2 p. m. The directors have the pleasure to submit the general balance sheet and profit and loss account for the year ending 31st December, 1888, duly audited

	£	s.	d.
The net amount at credit of profit and loss account, including balance brought forward at 31st December, 1887, and after providing for the general expenses, directors' fees, income tax &c., amounts to	11,987	3	5
An <i>ad interim</i> dividend of 6 per cent was paid on 17th September, 1888	4,571	8	0
A second <i>ad interim</i> dividend of 4 per cent was paid on 26th January, 1889	3,047	12	0
It is proposed to pay a final dividend of 5 per cent (making 15 per cent in all free of income tax) which will absorb	3,809	10	0
To write off an account of "preliminary expenses"	265	0	0
To write off for depreciation of office furniture	12	9	3
And to carry forward to next year a balance of	281	4	2
	£11,987	3	5

It is a matter of satisfaction to the directors to be able again to declare a total dividend of 15 per cent and this, notwithstanding the great fall which has taken place in the selling price of tea during the past year. The gross average realised for the Company's crop of 1888, sold in London, was 10½d while the average for the previous year was 1s 1d per lb. The profit made, considering the low price of tea, is a substantial proof that the Company's affairs have been carefully and economically managed in Ceylon. In the annexed statement of acreages it will be observed that 1,635 acres of tea land have been added to the Company's estates, and this addition has been effected at a cost

of £45,500 and paid for by the issue of 4,550 fully paid up shares of the Company. Since the transfer of these properties the directors have received the Ceylon manager's estimates for the current year: these go to further strengthen the confidence of the board in the future of the Company's property. In view of the lower average rate of capital cost per cultivated acre brought about by the acquisition of the estates of Wallaha, Tillyrie, Scrubs, Aiton and Upcot; and further by reason of this purchase bringing in a new and important proprietary, the directors have decided practically to divide the whole available balance of profit amongst the shareholders interested in the results of the past year's working.

The Directors have again to record their appreciation of the faithful and zealous manner in which their Ceylon Manager, Superintendents, Assistants and Servants of the Company have discharged the duties entrusted to them during the past year.

Under Clause No. 69 of the Articles of Association, Mr. Donald Mackay retires from the Direction, and is not now resident in England.

It will be necessary to appoint an Auditor for 1889 and Mr. R. H. Miller again offers himself for the office.

London, 5th April 1889.

DAVID REID,
Chairman.

For THE CEYLON TEA PLANTATIONS COMPANY, Limited,

H. K. RUTHERFORD,

Ceylon, 1st February, 1889.

Manager in Ceylon.

EXTENSION OF COFFEE PLANTING IN COORG AND MYSORE: AND OF OTHER ALLIED INDUSTRIES.

Not only do our neighbours, the coffee planters of Coorg and Mysore maintain their own against the enemies which have devastated the plantations of Wynaad, Travancore, Ceylon and Java; but they are absolutely adding to their acreage under coffee and increasing their exports! From the official Report on the Administration of Coorg for 1887-88, we take a couple of clauses under "Agriculture" which shew this very clearly:—

The area under coffee exhibits a further increase of 4,088 acres, the total extent of coffee land being now 84,658 acres, as compared with 72,334 acres in 1885-86. As shown in last year's report, coffee cultivation in *bonés* was assessed for the first time in that year, and the increase in the past year consists chiefly of an area of 4,269 acres of *bane*, which though cultivated with coffee, is exempted from assessment under the rules, and on this account has been hitherto excluded from the returns.

The extent of assessed coffee land held by Europeans and natives respectively is as follows:—

	Acres.
European estates	39,239
Native	41,150
	80,389
Add <i>Bane</i> land cultivated but not assessed	4,269
	84,658

and further,—

The demand for labor on the coffee estates was well maintained during the year. The supply from the Mysore country is more uncertain than formerly, but labor is readily procured from Malabar and South Canara. The rates of wages have undergone no change.

It will surely come as a piece of astonishing news to all old coffee planters on Eastern lands to learn that in Coorg, no less than 12,300 acres have been added to the area planted with coffee between 1835-6 and 1887-8. Happy Coorg, and fortunate planters!—we cannot help exclaiming; for with the present prospects of the coffee market, there ought to be a great "financial success" if not a "fortune" before every man with, say, 200 acres of fairly bearing coffee of his own. There are proprietors and planters in Ceylon too, who ought to take heart of grace, to try once more clearings of coffee under shade. There are no advantages of climate or soil in Coorg which cannot be paralleled in many parts of Uva. There is no mystery about the seed or the mode of planting and cultivation adopted in Coorg. The district is close by us, almost at our doors, and can be inspected by any sceptic in our midst who gives himself a fortnight's holiday.

The best test of the position of coffee in Coorg would be the actual crop or export returns and these do shew very satisfactory figures for the latest year, although below those for a bumper crop in 1883-4. But on the other hand, it is stated that the statistics are probably below the real mark, as they are furnished by "toll-gate contractors." We quote as follows:—

EXPORTS: COFFEE.—The exports of coffee produced in Coorg for the past 5 years are as follows:—

	Tons.
1883-84	5,109
1884-85	4,007
1885-86	3,377
1886-87	3,631
1887-88	4,662

These figures are obtained from the toll-gate contractors and are probably understated.

The average selling price locally being taken at R45 per cwt. as in the preceding year, the coffee crop for 1887-88 is valued at about 4½ lakhs.

The quotations of the coffee market were well maintained up to the end of January 1888, when the price showed a tendency to fall, and before the close of the official year it fell to R36½ per cwt., the result being heavy losses to the local traders. As bearing on the seasons and crops, it is interesting to read:—

The rainfall registered during the year under report is as follows:—

	Inches.	Cents.
At Mercara	186	42
" Somavarpet	95	98
" Anandapur (S. Coorg)	78	16
" Fraserpet.	40	22
On the Western Coast (Kadawakal)	255	12

The rainfall on the Mercara plateau was above the average, the mean for the past 10 years being 131.57 inches.

The "blossoming showers" usual in March failed throughout the province, and further mischief was done to the coffee crop by heavy showers which fell upon the blossom in April 1887.

There are other portions of the Coorg Administration Report of local planting and general interest and we give here what is said about products so closely allied to coffee, as cinchona and cardamoms:—

The practice exists of planting CINCHONA in coffee estates, but the plants are usually grown in localities where coffee does not thrive whether from excessive exposure or unsuitability of soil. Ordinarily the cinchona is cultivated as subsidiary to the coffee, but in the Manjakolli estate at the head of the Sampaji Ghat, the principal cultivation is cinchona, which thrives well at that altitude.

The area under cinchona is based on the computation of 800 trees to an acre. According to the returns furnished the area planted with cinchona during the year under report was 1,971½ acres. The outturn of bark amounted to 87,874 lb.

CARDAMOMS.—The cardamom crop was a small one, the outturn, as shown by the export returns, being 580 cwt. as compared with 940 cwt. in the previous year. The selling price, which was about R160 per cwt. at the close of 1886-87, fell to R40 per cwt. in June 1887, but rose again in January 1888 to R100. This commodity is subject to great fluctuations in price.

It will be observed that of cinchona trees, the total number in Coorg does not seem to exceed 1½ million, the crop of bark for the year in review being so moderate as 87,874 lb.—It is strange to find the cardamom crop given in cwt. and the price quoted accordingly. We suspect a great deal of the cardamoms raised do not get officially reported, but find a ready local market. Crops of from 60,000 to 120,000 lb. do not fulfil our idea of the production of so favorite a locality for cardamoms as Coorg has always been known to be.—Under the head of "Experimental Cultivation" we have the following:—

Favorable reports have been received of the "St Michael Orange and Jamaica Lemon," plants which were obtained from the Government gardens and distributed in 1885 for experimental cultivation. The Rev. G. Richter at Mercara reports that a number of cuttings have been taken and established.

The "*Erythroxylon Coca*" plants supplied at the same time have also grown well, and from seeds of these plants 25 seedlings have been raised.

TUNISIAN DATE PALM.—On application from this office in compliance with the suggestions made by Doctor E. Bonavia, the Director, Botanical Department, Northern India, has supplied in March last, 3 lb. of the seed of the *Tunisian Date palm*, and it has been distributed to the Deputy Conservator and several gentlemen (European and native) in North and South Coorg for experimental cultivation.

Finally, for planters dependent on bullock transport there are few more important matters than the healthy condition of the cattle; but in this respect they seem to have had a very serious state of affairs in Coorg during 1887-8; for under the head of "Live Stock" we read:—

Cattle disease of a virulent type has prevailed throughout the province with disastrous results. The rinderpest, known locally as the "*Dodda Roga*" (great disease) seems to have entered Coorg at the north eastern frontier from Mysore about December 1887, and caused great havoc among the large herds in the Ramaswamikanv Hobli, where cattle breeding is carried on to a considerable extent. It rapidly spread and so fatal have been its effects that there is hardly a ryot in the country who has not suffered heavily by the loss of his cattle. It became necessary later, during the cultivating season, to apply and obtain the sanction of the Government of India to a sum of R10,000 being disbursed as advances to the ryots for the purchase of cattle. It was anticipated that with the first fall of the S.W. monsoon rains, the disease would rapidly disappear, but such unfortunately has not been the case.

A serious feature in this epidemic has been the want of any effective means for coping with it. In nearly all the cases which came under notice, segregation of the infected cattle had not been carried out, notwithstanding that this measure had been pressed upon the people. They represented, however, that the disease spread so rapidly that the herds were all infected and separation became useless. The remedies usually tried had failed, and indeed, on European estates, a large percentage of the infected cattle succumbed. In such circumstances the services of an Agricultural Inspector would have been of the greatest advantage; but while the same disease was prevailing in the Mysore and Madras Districts adjoining, it was hopeless to expect that the services of such an officer, if asked for, could have been spared.

The returns for the year under report give the mortality among cattle as 7,874, being 2,775 in excess of the number returned in the previous year. These figures are probably below the mark, for there was great mortality amongst cart bullocks engaged in the carrying trade, and not belonging to people of this District. These must have largely escaped enumeration.

MESSRS. J. R. & S. T. HOOD ON NORTH BORNEO.

(To the Editor "British North Borneo Herald.")

Dear Sir,—Thinking it may interest your readers to know whilst giving myself great pleasure to record, what our impressions are of such an out-of-the-way and so strange a land as North Borneo, I take the liberty of writing the same, and should you think them worthy of space in your *Herald* it may prove of some interest to your numerous readers. Having been so many years in Ceylon we felt great interest in New Ceylon, the more so that a relation of ours owns a large acreage in Sulu, and he having constantly asked us to go and make him a report upon it, we at last made up our minds to do so. We went to Sumatra first in order to see what tobacco cultivation really is. Well, it is useless one telling you that, but I may tell you, if you have not been there, that the hospitality of the planters is unequalled, and I shall never forget the kindness we received at their hands. Nothing was too good, no trouble too great, to be taken on our behalf. The soil here was really magnificent and would grow anything tropical. The climate appears healthy, sickness, is of course, not unknown, but it is by no means prevalent. During our stay there it was delightfully cool, whilst at night it was actually cold. I do not like to say anything of our voyage on the "Spaniel." The very idea once more gives me *le mal de mer*! Ulysses never went through half the hardships and discomforts we did, or he would never

have lived to tell the tale. Another week and we should have succumbed, notwithstanding our planters' constitutions. Oh what horrors the whole thing was made up of! *horror, satis superque!*

We are at Kudat, with its two or three Europeans, its swampy city and its fever, but let us hurry on and see what we can for our time is short here.

Liberian coffee growing at sea level! Cooca growing at the same elevation!!! *mirabile dictu*, nutmegs at the same great altitude! One really begins to wonder if the world is not upside down and wonder why we in Ceylon put everything on the mountain tops!

Mr. Christian has an estate here, but we had not time to visit him; glad as we should have been to meet a fellow-planter, we had to forego the pleasure. Judging from what we saw we should say he would do well on his venture, in which we wish him well.

After more horrors, we arrived at Silam, and if we were charmed with Sumatra and surprised at Kudat, Silam made us almost speechless.

What soil! what cocoa!! I had never seen anything like it. Oh Lanka, Lanka, hide your diminished head. How I weep for you, your day has gone and Borneo wreasts your vaunted glories from you. Oh, Dumbera, oh Matale, you to boast of your soil and your cocoa; and we, who believed in you, how have we all been deceived! You don't know what soil is. Your cocoa isn't cocoa at all.

For real cocoa, for real soil, you must come to Silam. Here your cocoa really is "grateful and comforting," real Epps's, whilst the soil is soil, and "none other is genuine."

The resident here, Mr. Callaghan, an old Ceylon planter, gave us that hospitality for which Ceylon men are famous; to dispense which Ceylon men are so proud. I wonder if it was this great kindness which made us see everything in such a roseate light. I think so! This visit carries with it many reminiscences of kindness given, of hospitality shown.

The Arabian Coffee here, at sea level—mind you only 4 years old—was as thick in the stem as my arm and carrying 10 cwt. of coffee!!! Can you believe it? No! I should not, unless I had seen it, and it is one of those things at which one says, "Are things what they seem or are visions about?"

Then the Liberian Coffee is here too, side by side with its Arabian brother, healthy as healthy can be.

This Coffee you must understand is not growing on estates, but is here and there, and everywhere to all interests and purposes wild; perhaps it is wild. I don't know! Leaf disease is an unknown quantity here—long may it be so.

*** Sandakan strikes one very much at first sight as being a bit of Dimbulla, an abandoned bit, with its town growing up into jungle, its tumbled down buildings, its coffee estate roads with gradients of 1 in 8 &c., &c., but it improved on acquaintance. We met one or two Ceylon men here and they made us at home, as only Ceylon men can; it seems egotism, but there is something about a Ceylon man that no other man has, but they run us very close in Sumatra! Well, to return to Sandakan, which I should be loth to leave without saying a word as to its hotel, replete with every comfort, so clean that it becomes painful, so neat and natty that you feel inclined to speak in whispers, for fear of disturbing something, the boys do everything without a sound, all nature is hushed, everything is most chilling, even the food is cold! We were so sorry to leave it, now to get back to those palatial hotels so well described by S. U. K. E. in the *Ceylon Observer* at Singapore.

We found the officials in Sandakan extremely polite and kind, and they gave us every facility in business matters; doubtless they are very much interested in the welfare of the Company, the "Jeong" of which is identical with their own, which depends upon tobacco for its future. Should tobacco be a success the Company will be one, should the fragrant weed refuse to grow on Bornean soil, then collapse is inevitable; in short, you stand thus "*non fumari ex fulgore, sed ex fumo lare lucem.*" Yes! that is exactly your position. We remain, yours faithfully, J. R. & S. T. HOOD.

BARK AND DRUG TRADE REPORT.

London, April 4th.

A SHELLAC CIRCULAR.—A number of firms interested in the shellac trade received this morning a circular, marked "Private and confidential," and reading as follows:—

"Mincing Lane, London, April 3rd.

"The rash speculation that is now taking place in this article causes me to address a few lines of warning to many of my old clients. "When I see a 'ring' formed each afternoon, mostly composed of inexperienced young brokers and weak speculators, and thousands of cases during the week bought and sold, without any going to the consumer, experience tells me it must end in disaster. "The stock of shellac in the last four years, and the prices of 'ordinary orange' and garnet is as follows:—

	April, 1889	April, 1888	April, 1887	April, 1886
Stock	66,911	78,927	62,104	64,100
Fair				
Orange	70s	45s	46s	50s
Garnet	57s	37s 6d	43s	47s

"The advance is great: what is there to justify this? The usual (false) report that the 'sticklac crop had failed,' whereas in the three months of this year the landings are 8,941 cases, and 17,130 cwt. arrived and on the water, having been shipped in February and March, not included in above figures, and a good quantity is being shipped to America. These are facts which speak for themselves, and plainly prove that buyers are being again deceived. "Even allowing that not so much sticklac has been collected—which I disbelieve—the makers in India are sending enough for trade requirements, leaving a large stock on hand, for it is plain from the falling off in the March deliveries that consumers will not stock at nearly double the price; and in six months hence a 'new crop will be collected,' which is nearly sure to be large at present enhanced prices. "If a 'ring' to advance the price of copper ends in disaster when supported by wealthy institutions, what must be the end of 'the shellac ring' speculators, who buy thousands of cases for months ahead and pay no deposit nor give any security to ensure fulfilment of the contracts they enter into? "To save many of my friends from ruin is why these remarks are addressed. "For obvious reasons I beg to subscribe myself, "AN OLD BROKER."

ANNATTO.—Four packages fair to good bright seed, from Jamaica, sold at 2½d to 3½d today, and 13 packages good bright Ceylon seed at 3d per lb.

CINCHONA.—Only a small assortment of South American barks was offered today, and for these there was no demand. Guayaquil bark all bought in. Eighteen serons flat yellow Calisaya were also bought in at 1s 8d to 1s 10d per lb. For some old Carthagena bark an offer of ¾d per lb. was solicited without success. Forty-four packages hard Pitayo bought in, 5d per lb. being unobtainable. For a parcel of 80 packages good bold Maracaibo 9d per lb. is asked. Two cases good bold East Indian druggists' quill natural succirubra sold at 1s per lb. and 4 packages thin ditto from Java at 8d per lb. The exports of cinchona bark from Java during the last three seasons in the periods between July 1st and January 31st have been as follows:—

	1888-9	1887-8	1886-7
Govt. plantations	Amst. 442,096	467,511	399,391
Private "	" 2,213,960	1,808,880	1,063,221

Total 2,656,056 2,276,391 1,462,612

COCA LEAVES.—For 26 bales good fresh green but broken leaves 11d per lb. was said to be refused. Twelve bales good fresh Huanoco bought in at 1s per lb. Large havesupplies come to hand in Hamburg.

IPECACUANHA.—Only 22 packages were offered for sale, but the whole quantity was promptly withdrawn when it was found that the trade would not be willing to pay the enhanced price of 8s per lb for fairly good partly thin root. An offer of 7s per lb for such quality was refused, and the owners hold firmly at 8s nominally an advance on the last auction rates of 1s per lb.

JALAP.—Prices still keep up, and at today's auction a bid of 6½d per lb for good Vera Cruz was got.

KOLA NUTS.—Although several parcels were shown at today's auctions, none of them were sold. An offer of 2d per lb was made for a very common lot, but declined. A well-known importer of this drug writes to us with reference to the parcel above mentioned; "As one very much interested in the kolanut trade, and in the introduction of this food, I regret extremely that brokers, who ought at least to know whether a drug is simply rotten or not, should allow their rooms to be used to show such perfectly rotten and worm-eaten material as this. There are some nuts out of which the maggots are actually crawling over the boards."—*Chemist & Druggist.*

TEA PRICES, EXPORTS AND ESTIMATES.

The telegraphic report from London this morning is reassuring: "teas firm and dearer." It is possible that the news that the Indian crop was to be a late one, and possibly less in quantity than was anticipated, has something to do with this result, although additional briskness might ordinarily be expected after the Easter holidays.

It is of interest to remark that there is probably no article grown on the earth's surface, the total production of which is more accurately estimated than tea. This is mainly due to the fact, that the growth at present is practically confined to four countries:—China, India, Ceylon and Java. In the case of India, the statistics of the acreage under tea have always been carefully recorded and the work of estimating year by year under the auspices of the Calcutta Tea Association has been very carefully attended to, with less and less risk of error as increased knowledge and experience have been gained. In respect of Ceylon, our reputation for accurate planting statistics is established throughout the world. But neither for India or Ceylon, do the estimates seem to work out more closely than for Java and even China! In the case of the former, no doubt, with the limited cultivation hitherto London brokers have been able to get from their agents reliable information; but the marvel is that under the conditions affecting tea production in China, the estimates even though confined to actual exports, should be so near the mark year by year. For instance the estimate a year ago of the total tea exports from China and Japan to the United Kingdom for 1888-9 was given at 100,000,000 lb. and the result as we know now, is just one million lb. in excess, or 101,000,000 lb! This, it will be remembered, is 21 million lb. less than was sent in the previous year to the United Kingdom—1877-88 giving 122,000,000 lb. As regards the future, a great deal turns on the information which will be made available on the opening and start of the China market. We have made arrangements for Special Telegrams both from China and Calcutta during the busy season lasting over the next five or six months, and Ceylon planters will, in this way, be in a position to judge of the probable course of the tea market as affected by shipments from the great shipping ports at the earliest possible moment.

In publishing yesterday, the comparison drawn between highclass Indian and Ceylon teas through the prices which surprised a Colombo resident, we forgot to offer the all-sufficient explanation. It has been always acknowledged that there are estates in India, more particularly in Darjiling (and as Mr. Stanes showed not long ago, on the Nilgiris also) which produce teas equal to, or finer even than, the very best "Ceylons." "The finest Darjilings" have always been exceptional teas in the home market for delicacy and flavour; and although our own higher districts ought to compete, and in some cases do, yet the prestige of "Darjilings"

goes a long way. So much so that Mr. Arthur Thompson when in Ceylon intimated to the proprietors of tea plantations in the neighbourhood of Nuwara Eliya, that if there were only a sufficient quantity sent to London of distinctively delicate-flavoured high-grown teas from that neighbourhood to justify a separate classification as "Ceylon-Darjilings," the owners would probably be benefited considerably. Meantime, the test of the general superiority of Ceylon, over Indian, tea is afforded by the higher total average of prices for the former, and we trust the difference between these averages is to increase, rather than abate, in the future, of course in favour of the Ceylon planters.

PUSHING CEYLON TEA DOWN SOUTH.

(Extract from the letter of an ex-Ceylon planter to an old chum in Ceylon.)

There is no wholesale sale of tea to be managed at all at invoice prices just now, but I am doing a little with the men who travel with the tea; not quite paying expenses yet, but still only a little short, and it will improve. This morning, however, one of the best men who had sold most, says that most of those who bought first won't buy again! So this is disappointing: one or two of the other men are doing very fairly. I am going to carry on this way of selling the tea for some time yet, and to try if I can get 10 men with sufficient perseverance to carry on until each sells 10 lb. a day. If they can sell 100 lb. per day at 2d per lb. to me profit, that won't be so bad, but they are not people who have perseverance, so I have my doubts, and perhaps this line of business may collapse altogether. I have got a Salvation Army chap started today; if I can get them to go in for it, it will be a good thing, for there are thousands of them here, and they do an immense deal of good. I sent the Colonel a present this morning of $\frac{1}{2}$ lb., at all events he has stood security for one of their men who has started today.

TEA-PLUCKING ON A HILL PLANTATION.

Up the hillside as they go,
 Each along a track,
 Busy plucking up the leaf,
 A basket on each back;
 Silent, advancing, see
 Gather they the flushing tea.
 Down along the slopes they come
 Both the hands at work—
 'Mid the banyan the conductor †
 Sees they shall not shrink;
 From the shrub the leaf they take
 That shall grateful liquor make.
 Round about each bush they go
 Picking all that's good:
 Plucking proper leaf, but not
 The harden'd—as they should;
 Hearty work intelligent
 Yields a good return, as meant.
 So through life, or up or down,
 Should we still endeavour
 Not a more or rich or great
 To become or clever;
 But with sober work and sure
 To build up what shall endure.

ALFRED G. NICHOLAS.

Portswood, Nuwara Eliya, April 11th, 1889.

THE FORESTS OF CEYLON AND RAILWAY SLEEPERS.

We have been much struck by the announcement that the Egyptian Government has been negotiating with the Forest Department of

* The pluckers here use both hands simultaneously, and are very smart at their work.
 † I do not know what conductors generally are. The man here is the soul of honour and the essence of honesty—one who knows it to be true that work should be thorough.

South Australia with reference to the supply by that colony of an enormous number of sleepers required for the railways of Egypt. If arrangements can be entered into for this supply, it is said that its provision will give employment to fully 300 men during the course of the next three years! It would seem to be manifest from this demand made upon a source so far distant, that difficulty is beginning to be felt in obtaining the number of sleepers required from the countries nearer to Egypt which have hitherto afforded the supply. If we are right in drawing this conclusion, it would appear to be certain that a similar difficulty must ere long be experienced by ourselves with regard even to the comparatively limited mileage of local railways. When we consider the enormous areas of forest that must have been annually cleared during the last thirty years or more in Norway, Sweden, and Canada, to meet the needs of railway repair and extension, we may feel no surprise that the drain upon them must be rapidly affecting the capacity of the forests in those countries to meet an annually increasing demand.

The day cannot be far distant, we should say, when a decision must be arrived at in Ceylon either to resort to metal sleepers or to accept reliance upon the products of our own forests. It does seem singular to those of us who, from some of the many commanding points of view which are furnished by our magnificent mountain ranges, have looked down upon the extended spread of forest covering our lowcountry, that with such abundant tree growth close to our hands, we should yet be compelled to draw our supplies of sleepers from far distant lands. Of course we are well aware of the reasons which have led to this arrangement and fully acknowledge their force; but the economic causes now seem likely to meet with reversal in the not far distant future. The weight of our island woods and difficulties of transport have hitherto been the main factors controlling this question in the matter of relative expense. Leaving out entirely several other considerations, it has been proved to be cheaper to obtain sleepers from Europe than to cut them in local reserve forests and transport them over jungle roads to any point as yet touched by our railway system. But, as we have said, this economic condition may shortly be reversed, and it behoves those charged with the conduct of railway affairs in this island to look forward and to consider, in good time, what may be done in advance of the difficulty we apprehend. We hear it constantly said that none of our more abundant timbers, such as pali or ironwood, or the almost equally common satinwood, can be utilized for the purpose of sleepers. The fibre of such woods, it is stated, is too close to admit of their being efficiently prepared by creosoting to resist the attacks of white-ants or the almost equally destructive effect of the damp climate of our higher lands.

If such be the case, would it not be wise for our Forest Department to turn their attention to propagating such trees as may be found suitable for railway purposes, in the several situations throughout the country which must be available for the planting of fresh growths? Experiment has already been made with many trees that are not indigenous to this island, and in many cases those experiments have resulted successfully, and there is no reason why the Forest Department should not institute experiments on an extended scale after the fashion set by the very South Australian authorities whose forests are expected to supply Egypt. On this point, see the official information given on page 812.

"To be forewarned is to be forearmed." We can see that ere very many years a resort to our own forests for our supply of sleepers will be forced upon us unless our engineers can determine that the use of wood, may profitably be abandoned for that of iron or steel, sleepers. But as to this alternative we have repeatedly been told that the non-elastic character of such sleepers, and the diminished "tie" they afford to a railroad, render them particularly unfitted to mountain lines, the sharp curves upon which tend greatly to the disturbance of the permanent way. The matter is therefore one which we think, in view of present warnings, on many sides, calls for early and very attentive consideration, and we strongly recommend that this should be given to it without delay by the responsible local authorities. There is room indeed for a local Commission to consider the best means of supplying the Ceylon Railways locally with sleepers, and the Conservator of Forests, Director of Botanic Gardens, along with the Railway Engineer for Ways and Works, could not fail to furnish a very useful and suggestive Report on the subject if they were called to the duty by the Governor.

WEIGHING TEAS.

Ceylon Association in London, London 12th April 1889.

A. Philip Esq., Secretary, Planters' Association, Kandy, Ceylon.

DEAR SIR,—Referring to my letter of 5th instant, I omitted to mention therein that in weighing teas for trial shipments as suggested, care should be taken to weigh with beam scales only, and it will be well also that the weights of the packages should be made to conform to the custom of weighing here to pounds only. I was instructed by our Committee to mention these points.—I am, yours faithfully,

(Signed.) WM. MARTIN LEAKE, Secretary.

FORESTRY IN SOUTH AUSTRALIA.

The following note is officially communicated to the editor of the *Tropical Agriculturist* from Adelaide by this mail:—

Mr. J. E. Brown (the Conservator of Forests) has just returned from a trip to the north where he has been arranging for the planting operations of the coming season.

At Bundalur 770 acres were laid out for planting, upon which it is intended to put out 700,000 trees consisting chiefly of sugar mana, Tasmanian red and blue gums together with a fine collection of newly introduced forest trees from Queensland, which were presented to the Department by the Director of the Botanical Gardens at Melbourne.

The stock of trees in hand at Bundalur this year consists of about 1,200,000, so that the Conservator expects to have a few hundred thousand for distribution among farmers and others.

INDIAN V. CEYLON TEAS.

A Colombo merchant (not in tea as proprietor or agent) writes:—

"I am struck with the splendid prices obtained for Indian tea as compared with Ceylon. See Gow's last circular. I have been watching this for some time. It does not look as if India had much to fear from us. Any way she can lick us altogether in the matter of price."

(From Gow Wilson & Stanton's *Indian, Ceylon and Java Tea Report*.)

April 12th 1889.

INDIAN.—The recent low prices have at length promoted better competition, and a somewhat improved feeling has been manifested. The scarcity of Teas over 1s is now commencing to be felt, with the result that many teas of this class are being disposed of at rather higher rates. Some exceptionally fine teas from the "Chardwar" estate, realized high prices, the pekoe fetching 2s 8½d; the broken pekoe, 2s 7¼d; and the pekoe souchong 2s 1½d.

CEYLON.—Sales have been very heavy, and in consequence some little irregularity has occurred, but only the lower and medium grades have suffered to any appreciable extent. Good liquoring and fine flavoured teas continue to meet with the chief attention, and realize steady rates. The quality is about on a par with last weeks. The following averages may be mentioned:—"Mayfield," 1s 1½d; "Bokawantalawa," 1s 1½d; "Chapelton," 1s 1d; and "Waverley," 1s 1d. An average of 9½d per lb. was obtained.

TEA IN AMERICA.—The *Hyogo News* of 1st inst. says:—Telegraphic information has been received here of a great fire in Chicago which destroyed thirty thousand packages of tea, about two-thirds of which were the produce of Japan. If this had happened shortly after the opening of the tea season it would have caused more excitement in the local market than is possible at present.—*China Mail*, April 17th.

THE KANGRA VALLEY, tea planters are doing one wise thing with a view to publish the sale of their tea at the Paris Exhibition. They have asked Lord Lytton to do what he can to bring it to notice for the Parisian afternoon tea—which, by the way, is a French verb now; "je afternoon tea, nous afternoon-teas," and so on, especially *elles afternoon-teas*—and to send out some hint as to the sort of blend most likely to catch Parisian taste.—*L. & C. Express*.

SALE OF TEA ESTATE SHARES.—It speaks well for the prospects before the shareholders of the Yateriya Tea Company that shares in this Company should have changed hands at a premium so soon after its formation. A few days ago a number of shares of £100 each sold for £115, and there is every prospect of their going higher, seeing that the estate is likely to yield very handsome profits, notwithstanding the fall in the value of tea. The soil is exceptionally good, and the management of the estate all that could be desired. A substantial dividend is pretty sure to be declared on this year's working.—*Local "Times."*

THE COST OF MAKING QUININE.—One American "expert" in quinine declares on this question that,—"A great deal depends on good management and the location of the factory. However, there can be no question about the cost being in excess of present market values. I will say this much. If you take the price of bark at one and a half pence per unit, the same testing three per cent quinine or 48 ounces per hundred weight, the cost of quinine in the bark on the London docks would be 18·7c. per ounce, and, in addition, it costs 11c. per ounce to take the bark from the London docks until the quinine is delivered in New York. Thus you have 29·7c. as the actual cost of foreign quinine put on the New York market. It is not necessary to go into further details."—This information was given to a representative of the *Oil, Paint and Drug Reporter* during a long interview in which a great deal of useful information was afforded respecting quinine and cinchona bark generally; we are republishing the full report in the *Tropical Agriculturist*.

Correspondence.

◆
To the Editor.

CEYLON TEA IN SOUTH AUSTRALIA.

Adelaide, S. A., 30th March 1889.

DEAR SIR,—Enclosed please find copy of letter sent by us to Secretary, Ceylon Tea Fund, which kindly insert in your paper. Mr. Hughes called on us on his way back to Colombo and was quite in sympathy with our views.—We remain, yours faithfully,
DRUMMOND BROS.

Adelaide, S. A., 30th March 1889.

To the Secretary, Ceylon Tea Fund, Kandy, Ceylon.

Dear Sir,—We duly received yours of 28th January and note contents of resolution passed at Tea Fund meeting. We are now prepared to make a fresh application to the Committee and hope the matter will be settled with as little delay as possible. We do not wish for any grant of tea, but what we want is to represent the Planters' Association in South Australia, and be able to advertise to that effect. We feel quite confident the idea will prove quite a success, and while we have the privilege of using your honorable Association's name, it will cost them nothing and will be the means of making Ceylon tea more widely known. We may add we have had the interests of Ceylon at heart ever since we started business which proved a loss for some time after starting, and we only hope that your honorable Society will grant us a favourable reply.—We remain, dear sir, yours faithfully,
DRUMMOND BROS.

THE FUTURE OF OUR TEAS.

Colombo, 13th April 1889.

SIR,—The news now reaching Colombo from up-country tea districts are all full of the grand *flush* everywhere present. The news now reaching us from the Mincing Lane tea auctions is enough to make any ordinary tea planter's face turn *pale*. What of the future? Are we to see prices still further recede when the question will be asked again, "Watchman! what of the night?" who can tell. Meantime we wish "Godspeed" to the parties rescuing us and now about to enter the lists in the tea tournament in Australia and America. Every well-wisher to Ceylon will, no doubt, pin one of their favours to his or her breast in the shape of a *fully paid-up share*. But where, in conclusion, may I take, in your columns, the liberty to ask the editor of the leading Ceylon paper, is Sir Robert Hart's last words to the Chinese tea growers: his prophecies be they good or evil? The uncertain quantity in today's calculations is the Chinese prospective exports. Are they to continue to diminish, is the most momentous question of today as regards the future of tea prices. Parnell and Pigott and ruby mines have no such interest as this today to a Ceylon tea planter.—Yours truly,
PROPRIETOR OF TEA PLANTATION.

[In deference to the wish of our correspondent Sir Robert Hart's Report is given on page 780; a great deal of additional information and of the criticism in detail to which it has been subjected must be reserved for the *Tropical Agriculturist*. And this every tea merchant and estate proprietor should study.—Ed.]

THE 'BURNING QUESTION' OF THE DAY!

Matale North-East, 14th April 1889.

DEAR SIR,—As a superintendent, whose means of livelihood depends on the success of the tea industry in Ceylon, permit me to appeal to my brother superintendents in other districts on what has now

become the 'Burning Question' of the day. The serious fall in price of our teas and the probable consequences, if new markets are not speedily opened to purchase the increased shipments of 1889-90. As to fall in price, everyone who has the manufacture of tea in his charge is fully aware, and will doubtless maintain that the fault is not in the manufacture, nor in the quality of the leaf, but in the overstocked markets to which he may add, but the fall in the market is not my lookout. On this latter point is the difference of opinion, Have we all done our best to obviate this evil by supporting the Tea Fund specially organized for making our teas better known? I don't know that anyone of us has contributed directly to this Fund, because we were not called upon to contribute, but the opportunity is now offered and every superintendent in Ceylon should avail himself of it, and join in the proposed Ceylon Planters' American Tea Company, the main object of which is the opening up of a new and wide field for the sale of our teas.

If there be any who argue:—this is not our duty, but the proprietor's, or let private enterprise take it up, we have got quite enough to do with the manufacture of the tea, without concerning ourselves about a market for it;—to the first my reply is, that, as we have not hitherto been called on to contribute to the Tea Fund, it is our duty in self-defence to avail ourselves of the opportunity now offered of becoming shareholders in the Company intended for our benefit as well as for that of proprietors. Private enterprise has already done much in the old country, but nearly ten years have elapsed since the first agency was opened and now in most towns it is as it deserves to be the popular tea. But the English market is over-stocked, and how are we to prevail on private enterprise to enter new fields where we do not care to go ourselves. Let us create a demand for our tea by the American public and the merchants now selling Chinas and Japans will very soon draw on our supplies, but until we do so, they are quite happy and contented with the handsome profits they are now making.

It is no matter of opinion, but a fact, that the present state of the tea market is of deep concern to us superintendents and only a few minutes' quiet consideration will be sufficient to prove to most minds the serious results which must follow if nothing is done towards opening new markets. What I therefore ask is that every estate superintendent, who has received a copy of the prospectus of the Ceylon Planters' American Tea Company, should become a shareholder in the Company, now formed for the purpose of making our teas known to a large and wealthy tea-drinking population, but who have not yet had our teas sufficiently brought before them, to enable them to see their vast superiority over the teas they have been accustomed to. The shares of the Company are only R50 of which R5 are payable on application to the C. M. B., R10 on allotment and the balance as required in calls of not more than R10 of which not less than three months will be given.—Yours truly,
AN APPLICANT FOR 2 SHARES.

THE FUTURE OF CEYLON TEA AND PRACTICAL CRITICISM OF A BROKER'S REPORT.

DEAR SIR,—Your correspondent "Quality or Quantity" makes some very sensible remarks, but surely he is indulging in a little hidden satire, when he suggests a column for 'profit per acre.' Had not Messrs. Wilson, Smithett & Co. better add one for 'loss per acre' too? No doubt they know a great deal, and think they know much more,

about the working of Ceylon estates; but surely this is asking them to go a little too far. No doubt a column for 'acreage opened' (this would do better than 'quantity per acre') would be very handy and save a little trouble for those scanning the information; but I venture to say that most planters have one of your Handbooks and Directories, and if they wish to make such a comparison themselves, it would be very easy to do so. And again, those estates which make so much tea, are for the most part large buyers of green leaf; so any attempt at basing the yield per acre on the figures published would be very misleading and inaccurate.*

And is all this trouble to be taken by brokers, for men who ridicule their remarks? "Quality or Quantity" apparently considers that all those estates "giving 400 lb. per acre or over, and fetching prices from an average 11½d to 1d or 1½d above it," will ever and always continue to realize those prices. But when "almost every estate in Ceylon" is giving the "100,000 lb. or over," does he imagine that the home market will swallow all that, without a further reduction of prices?

May I point out, sir, that whilst in the year 1887 only 21 per cent of estates appearing in W., S. & Co.'s annual report realized averages below the shilling; in the year 1888 as many as 55 per cent realized below that figure.

No, sir, despite what men may say, it is imperative that what may be termed 'more careful plucking', not necessarily fine plucking, must be resorted to, to secure anything like paying prices, for good teas are selling now all out of proportion to medium ones.

But let not this be all; let every opportunity be taken to push Ceylon teas in new markets. No doubt "Quality or Quantity" has already taken several shares in the 'Ceylon Planters' American Tea Co.'

And now for W., S. & Co.'s remarks, such as have not yet been criticized. Their hints about 'over sorting' are no doubt very valuable, but directly against their own appeal for fine teas. A few packages of good broken pekoe, selling well, will just put the result of the whole invoice in a good position; while if the lot is all sent home as 'unassorted,' the individuality and fine flavour of that broken pekoe is lost, and a miserable price is given for the whole. The same with regard to two grades only; the inferior mixed with the higher grade, reduces the whole lot to the catalogue of 'inferior,' or 'medium,' for which such disproportionately low prices are bid.

Again, what onesidedness is displayed by all the brokers in their remarks on 'loss in weight'! All the care and all the trouble and vexation is to fall upon the shoulders of the poor planter, and none whatever upon those who reap the most profits. Now, why cannot they relinquish, or cause others to relinquish, the allowance of 1 lb. per package, which falls to the share, I believe, of the brokers themselves, or if not of some equally undeserving individuals. In half-chests of an average say of 55 lb. each, this means at once a loss of nearly 2 per cent; and then comes the farther loss of the very astute mode of 'taring,' which they want us to correct. O tares and lamentations, look at this! We must get our gross just a little over the full pound, and the tare just under, to suit their convenience. What a nice calculation to look to! Lead, nails and hoop-iron, all to be nicely weighed, and boxes planed down till they weigh to the proper fraction of an ounce. O blessing planter!

* We would have added acreage planted say in 1835 were it not for the number of factories in Ceylon now buying leaf.—Ed.

Why don't those who weigh, take into consideration the quarters of a pound? For instance, like this it is very easily done.

	lb. qr.		lb. qr.
Chest A	72 1	gross	12 1 tare
" B	72 2	"	12 2 "
" C	71 3	"	11 3 "
" D	71 2	"	11 2 "
Total	288 0	gross	48 0 tare
Average	72 0	gross	12 0 tare, which

makes 60 lb. nett, i. e., what it should be.

We should not grudge the fraction of a quarter of a pound at all, and the loss would be reduced to a minimum.

Failing this let the brokers (who are so ready with their advice) invent and supply us with chests of even tare, say all of 12½ lb. for half-chests (this would allow of ½ lb. of tea being 'thrown in' to make the gross all right), and which will make up quite airtight (which the metal chests fail to do, and planters will be content.—I am, sir, yours faithfully, G. D.

CHEMICAL CURE FOR COFFEE FUNGUS: IMPORTANT CORRECTION.

Coonoor, Madras, April 23rd, 1889.

DEAR SIR,—Thanks for copy of *Observer* of April 6th 1889, containing letter from "J. G. C. H." re cure for fungus on coffee. I write to say that by a typographical error the Sprayers are said to cost 371 francs each: this should be 37 francs only, on the Continent. As soon as information on the subject of this treatment is in my possession you shall have it. To date, however, the Sprayers have not reached me.

ESTATE MAN GER.

[We are obliged to our correspondent: the price of Sprayers being 37 in place of 371 francs, makes all the difference in the world. We shall hope in due course to hear of the result of the Coonoor experiment.—Ed.]

SPLENDID GROWTH OF TOBACCO IN BADULLA DISTRICT.

Badulla, April 27th.

DEAR SIR,—I enclose a letter written at my request concerning tobacco leaves grown up here. I was really amazed at it when passing through the estate, common hillock soil too. Just try the measurement 32 x 18: it's simply enormous.—Yours, RESIDENT.

Badulla, April 25th, 1889.

"I have cut down tobacco leaves some time ago, and those were much larger than the ones growing now. I give the measurement of some of the latter:—

- No. 1 32 in. long 18 in. broad.
- No. 2 30 in. do 19 in. do.
- No. 3 27 in. do 18 in. do."

THE COLOMBO CLIMATE AND COTTON SPINNING AND WEAVING.

DEAR SIR,—With reference to the remarks in your "Special Correspondent's" letter of 10th April respecting the dampness of the Colombo climate and the question of its suitability for spinning and weaving operations, there must have been some misapprehension on the part of his fellow-passenger, for everyone acquainted with the great cotton industry is aware that a moist atmosphere greatly facilitates spinning and weaving, and you are quite correct in stating in your footnote that this is one of the many conditions that give us a distinct advantage over the mills in India.

The Spinning and Weaving Company are now issuing seed of the New Orleans and Fiji descriptions, which are so very suitable, and before this time next year, I expect to see Ceylon producing a large quantity of cotton, but a most encouraging feature about this product is, that it *cannot be overdone*.—Yours faithfully, W. W. MITCHELL.

[An interesting letter from Mr. Atherton, the Manager of the new Colombo Mills, on the "Climate and Spinning" question will appear further on.—Ed.]

COORG COFFEE SEED SUITED TO HAPUTALE ?

SIR,—Some correspondent of yours lately declared that it was no use planting Coorg coffee higher than 2,500 feet. In that case it is of no use to Haputale. Who *ought* to know if your correspondent is correct in what he says?

PROPRIETOR.

[We should certainly consider that Coorg coffee seed was well adapted for use in Haputale.—Ed.]

JAPAN, AND CEYLON, MADE TEA BOXES; AND TEA LEAD.

DEAR SIR,—In your issue of the 10th inst. your clever contributor "Peppercorn" in his happy and incisive style pointed out how easy it is to have too much advice and how the London brokers in particular are sometimes just a little too ready with their notes and comments on matters closely affecting the tea planter, but of which the brokers know very little.—Another instance of this occurs in the circular issued by Messrs. I. A. Rucker & Bancraft, dated London, 21st March, and which was copied into your issue of 16th inst. In this circular we are told that we should be wary in purchasing Japan tea boxes, because the Japanese are wily enough to make any wood do for exportation to Ceylon. This statement is incorrect and misleading. The facts are that the large numbers of Japan boxes which have been imported into Ceylon have consisted of two kinds of wood only, viz., so-called Cedar or Suji and Momi (the two last are the Japanese names of the woods.) The Cedar or Suji has no doubt a strong aromatic smell, and as far back as 1885 Messrs. Somerville & Co. in their Circular No. 9 of the 26th October mention that planters were then very nervous about using Japan cedar boxes, which at that time were the only kind imported.—Since then, however, boxes made of Momi, a white wood much resembling deal, have been imported and this wood has practically no smell, and is in every way well suited for tea packages.—Hundreds of thousands of cedar boxes have been used in Ceylon and India and are, I believe, used by the Japanese themselves and it is only now that attention is drawn to their strong aromatic smell.

On the 11th Dec. 1885 Messrs. J. M. Robertson & Co. sent you a letter, which you published, and in which they informed the public that Mr. A. Wilson, the senior partner of Messrs. Wilson and Smithett, had telegraphed out that the Japan boxes imported by Mr. Deane had proved a success, and that the smell of the cedar did not interfere with the tea.

Had Messrs. Rucker & Bancraft made their remarks apply *generally* to the woods used for tea boxes, they would have been more to the point, and I suspect that some of the woods which have no doubt come under their observation as unsuitable for tea, owing to the medicinal flavour imparted, were not Japan, but Ceylon made boxes.

Take a walk occasionally through the warehouses at the Wharf and through the merchants' godowns where tea is stored waiting sale and shipment, and you will very soon see that Ceylon made boxes are not ALL made of hal, though the supplier will no doubt try and persuade you that they are. I saw one lot only the other day actually made of *mango-wood*, which the London brokers may mistake for Japan pine? ! Another serious drawback to most Ceylon made boxes is that the wood is not seasoned. I have seen boxes at the wharf during the hot dry weather, the joints of which had opened out wide enough to admit the top of your finger. I was much amused in noticing one lot, sent without doubt from the hands of a canny Scot, which instead of being hooped all round had little bits of hoopiron about two inches long nailed over the joints in the sides and ends!

As "Peppercorn" pointed out planters will always be grateful for hints and advice founded on facts, but advice given in a loose way without first ascertaining facts is calculated to do more harm than good, particularly in the present instance when a check given to the use of Japan boxes would subject the planter to much difficulty and increasing expense.

Messrs. Rucker & Bancraft's remarks *re* Japan boxes have already been greedily seized upon by advertisers to puff the sale of their wares.

One word as to tea lead. Planters would do well to keep in mind the caution and advice given by the late Mr. Cameron (who gave Ceylon so much practical information on tea-making and packing) as to keeping up the thickness of *tea lead*. Owing to the rigid economy forced upon us the tendency is to adopt thin lead. I believe it is quite possible for fine tea to be affected by the taint of unsuitable wood through using thin lead. Some of the lead used for fine China teas, weigh as much as 7 oz. to the foot and seems to be of a particularly *tough* texture and of dark color. I can send you the notes you publish d a few years ago on this subject, while Mr. Cameron was in the island if you would like to see them.

Can it be that the London brokers are interested in the manufacture or sale of patent packages?

I am curious to see the effect of ending a *paper maché* chest without lining of any kind.—Yours faithfully,

TEA BOX.

SALE OF CEYLON TEAS.

SIR,—All well-wishers of Ceylon tea-planters are anxious to find out markets for the sale of their teas. Mention has been made of America, Australia &c. But it strikes me that tea-drinking in Ceylon itself is very limited, and that it could be increased to an enormous extent in the thousands of villages far away from the tea estates. Coffee (and not tea) that is daily hawked about and sold to wa side boutique-keepers by the enterprising Tamil "copee-karan." No doubt in the ordinary course of time these Tamil men will take to selling tea. But don't you think it better not to wait, but to press them into the service by bringing tea within their reach. WELL-WISHER.

COFFEE: THE CULTIVATION OF COFFEE UNDER SHADE IN CEYLON.

April 30th, 1889.

DEAR SIR,—In your issue of the 29th instant a "Proprietor" says that some one has declared that "it is no use planting Coorg coffee higher than 2,500 feet." If he refers to my letter on the subject, I must point out that he has taken me up wrongly. *Shade* experiments with Coorg or any other coffee should be carried out at a low

elevation to get the benefit of the forcing power of the climate and soil at that elevation. It must be obvious to all that *shade*, at a high elevation in a climate like Ceylon,* would act deleteriously; and you generally get good soil "at the bottom of the mountain slopes among the foothills."

The "Ghaut" estates, or those on the steep mountain-sides, are so washed and worn that new experiments in coffee would not be worth trying. On the other hand estates like "Rosebury," which have suffered from fierce sun and drought and have good soil, would be just the places to try the beneficial effects of a cool cover, a thick litter, and digging combined with weeding and manuring; and shade would soon grow in the forcing climate.

W. A. TYTLER.

COCONUT CULTURE DISCUSSION.

Colombo, 30th April 1889.

SIR,—You are responsible for putting down "A.B.C." instead of "Aba" below my last communication. *** Do "B." emerge from wherever you are and visit Cambridge Place in the Cinnamon Gardens of a morning when the truth of what I say will be ocularly demonstrated to you. Have your good "B." ever travelled on the sea-side line? and have you really failed to see the bunches of fruit propped up on the trees growing close to the sea at Wellewatta? "None are so blind," they say "as they who will not see." Another of your theories "B."—the "differing" and "toughening" of stems owing to silica—is a thing of the past, for it has been recently proved by carefully conducted experiments that stems may be "stiff" and "tough" without the aid of silica. Once more good "B," I adjure you by all the coconut trees to visit the Cinnamon Gardens and Wellewatta before you sit down to reply.—Yours faithfully,

ABA.

[This correspondence must now cease so far as our columns are concerned.—Ed.]

TEA BOXES:—JAPAN AND OTHERWISE.

Colombo, 1st May 1889.

DEAR SIR,—Your correspondent "Tea Box" was the aroma—and a strong one too—of a Japan tea chest such as is condemned by Messrs. Rucker & Bencraft in their recent circular, and seeing he impugns their honesty of purpose, it is a pity he has not the courage to express his opinion over his own name instead of doing so anonymously. But instead of proving Messrs. Rucker & Bencraft wrong in their statement, "Tea Box" actually confirms exactly what the London brokers say, as will be seen by the following extract from his letter:—

"The facts are that the large numbers of Japan boxes which have been imported into Ceylon have consisted of two kinds of wood only, viz., so-called Cedar or Suji and Momi (the two last are the Japanese names of the woods.) *The Cedar or Suji has no doubt a strong aromatic smell,* and as far back as 1885 Messrs. Somerville & Co. in their Circular No. 9 of the 26th October mention that planters were then very nervous about using Japan cedar boxes, which at that time were the only kind imported. Hundreds of thousands of cedar boxes have been used in Ceylon and India and are, I believe, used by the Japanese themselves and it is only now that attention is drawn to their strong aromatic smell."

It is not "only now" that these boxes have been objected to, for they have long been condemned by one of the oldest and largest tea buying firms

* "In a climate like Ceylon":—no one knows better than our correspondent that we have a large variety of "samples of climate" even within our coffee zone. Would "W. A. T." not agree that almost anywhere in the Uva districts up even to 4,000 to 4,500 feet, the shade experiment with coffee, on virgin or good soil, is worth trying?—Ed.

in Colombo, some of whose purchases have failed to realize within 3d per lb of their value owing to the aromatic taint. Moreover, many of the Japan boxes are of such frail timber that notwithstanding hoops and a plentiful supply of nails, they will not stand a long journey. It was only a week or two ago we were invited by Messrs. Carson & Co. to inspect some chests in their godowns which were much damaged in transit, *direct by cart*, from one of their estates.

While speaking plainly of the worst features of some of the Japan boxes, we do not forget that for appearance and make-up they have been far in advance of Ceylon-made boxes; but now that improved appliances are being used in their manufacture, local boxes are steadily improving in both these respects. With regard to the "quality" we admit there are woods quite unsuitable for boxes, like Japanese cedar for instance; but your correspondent is very much mistaken in supposing *hal* is the only timber that can be used out of 148 kinds already well-known and largely used for a variety of purposes in Ceylon. If he will publish his name to his next communication on the subject in your columns ("as a guarantee of good faith") we shall have much pleasure in not only giving him a list of the woods but showing him these kinds on his calling at our office.

We notice "Tea Box" suggests that planters should use 7 oz. lead in place of 4 and 5 oz. to prevent the taint of cedar wood; but so long as inodorous boxes can be obtained there is no reason why the expense of packing should be so largely increased, particularly at this time when most men are striving to reduce cost of manufacture in every possible way.—Yours faithfully,

W. H. DAVIES & Co.

DEAR SIR,—Allow me to point out that Messrs. W. H. Davies & Co. have twisted and contorted my letter in an unwarrantable manner. Messrs. Rucker & Bencraft do not condemn Japan boxes *in toto*, but caution packers to reject those with a piney or cedary smell.

I do not impugn the honesty of purpose of Messrs. Rucker & Bencraft.

I do not say that *hal* is the only Ceylon wood suitable for tea boxes.

I do not suggest that planters should use 7 oz. lead to prevent the taint of cedar wood.—Yours faithfully,

TEA BOX.

Colombo, May 3rd 1889.

DEAR SIR,—"Tea Box" "greedily seized" (to use an expression of his own) an opportunity of anonymously casting innuendoes at Messrs. Rucker & Bencraft and ourselves, but now that he has been challenged to do so over his own name he says we have "twisted and contorted" his letter.

We reiterate that in the form of a question he suggested that Messrs. Rucker & Bencraft had an interest in the manufacture or sale of other tea packages, hence their condemnation of Japan boxes.

Secondly, he distinctly suggested that *hal* was the only Ceylon wood suitable for tea boxes, and implied that suppliers tried to palm off other woods for *hal*.

Thirdly, "Tea Box" believed it "quite possible for fine teas to be affected by the taint of unsuitable wood through using thin lead," and mentioned 7 oz. as being the weight used in China.

We leave you, sir, and others to judge whether we have "twisted and contorted" your correspondent's letter.—Yours faithfully,

W. H. DAVIES & CO.

Colombo, 3rd May 1889.

SIR,—As the principal importers of cedarwood tea packages from Japan, all of which are made and shipped by a first-class European firm there, we must deny the statement made by a correspondent in your issue of 1st instant that Japanese cedar is unsuitable for tea-boxes.

The trade in these Japan tea packages has existed over five years. During the three years in which we have imported them, we have not only not had any complaint from our clients of loss arising from taint in the wood, but London friends have written (on seeing Messrs. Rucker & Bencraft's remarks) that they have never noticed any taint or smell in the wood.

We are making enquiries with a view to trace the origin of the Japan chests referred to by Messrs. Rucker & Bencraft, and shall be glad to give the information when obtained.—Meanwhile, we are, yours faithfully,
MACKWOOD & Co.

TEA CULTURE AND PREPARATION: ANSWER TO "PRACTICAL ENQUIRIES."

DEAR MR. EDITOR,—In answer to the queries of a practical man, though I am not experienced in the art of tea plucking, I have my opinions on the subject. I think the quality of tea is best from teas four or five months after pruning when the trees are in good heart. The teas from new pruned trees or those which have run too long without pruning, are, I think, always inferior. The application of manure undoubtedly improves the quality of tea in my opinion, as does anything else which will put the bush in good heart, but as manuring is an expensive stimulant, it should not be applied unless the yield has from poverty of soil or other causes fallen very low. Fields which yield with medium plucking 400 lb. of made tea, should not be manured, because it is like feeding an apoplectic man on turtle soup, turkey and ham, and deluging him with champagne and port. Moreover at present prices for medium plucked tea, unless manure can be got for nothing it will not pay to manure. Say that at present the profit on the cultivation to manufacture of tea is 2d per lb. which is the outside profit, and a very handsome one too, with an increase in the yield of 200 lb. per acre for two years, as the effect of manuring, you get £1 13s 4d, per acre. What manure can you purchase and apply at this cost?

There is now-a-days far too much grandmotherly advice given to tea producers; if every one accepted it and acted up to it, where would we be? In my opinion every sensible planter is the best judge of his own interests, and of his surroundings and circumstances and does his level best to promote them. It is not more than three months ago, when the run was altogether on teas for price, fair pekoe Souchong was 9½ per lb. As long as that was the case it was undoubtedly for the interest of the majority of planters to go in for quantity. I am of opinion that the test of what is the correct thing to do is the price of Pekoe Souchong. When the average price of P. S. falls to 6d or below planters will be forced to pluck fine, I think. I do not myself believe in planters chopping and changing the systems of plucking they have found best suited to their circumstances, to meet the whims and wants of London tea dealers, which vary from month to month.

When the supply of medium and low qualities of China, India, and Ceylon teas is excessive then there is a cry for fine and pungent teas to mix with them, but only a limited quantity of that description is wanted. If all the teas from India,

China and Japan were from some unexpected cause to turn out fine, would they sell for 2s per lb? It may soon be better for a great many planters either to pluck fine or to convert all their tea into dust or broken mixed: these are fetching 6d to 7d per lb!

A THEORETICAL PLANTER.

JAPAN TEA BOXES.

SIR,—Seeing that more than one Colombo firm have taken advantage of the paragraph in Messrs. Rucker & Bencraft's Circular to decry the Cedar or Suji packages as introduced by me from Japan, I would submit to the notice of your readers the following facts:—

1st.—Almost without exception (if not quite) the total crop of Japan teas is packed in packages made of this wood, and, in stating this, I state a fact of which I myself was an eye-witness when in Japan, having been through most of the large honges in Kobe and Yokohama.

2nd.—That I myself have shipped at least 600,000 lb. of tea in these packages, and never had a complaint, though I have more than once had the packages praised by my brokers, Messrs. Wilson Smithett & Co.

3rd.—Though it is a fact that "Momi" woods have no smell at all I was forced to abandon the use of them as I found they cracked when exposed to heat.

I tried 500 of these packages, being the first to import them, but had to advise my agents, Messrs. Mackwood & Co., to have nothing to do with them except when specially ordered.

4th.—Though having nothing to say against well-seasoned Ceylon-made packages, it is a fact that at present anyhow, the supply of good boxes would not be equal to the demand were the importation of Japan packages to cease.

Hand-made Ceylon packages are of course out of the question, any supposed saving in the first instance being more than balanced by the loss in weight of tea caused by uneven taring in London. I annex a few testimonials as to the excellence of the cedar packages, and meanwhile shall endeavour to trace the packages complained of by Messrs. Rucker & Bencraft. It is more than likely the damaged packages may have been of "Momi" wood, which cracks easily, and the result in damaged tea ascribed to Japan packages generally, the London people not taking into consideration that more than one kind of packages comes from Japan.—Yours, &c., H. D. DEANE.

Kintyre, Maskeliya.

January 8th, 1886.

Japan Packages.

We confirm our remarks of 20th ultimo, on these packages, viz., that we have invariably found them arrive in excellent condition and the flavor and aroma of the tea fresh and brisk. We think that their lightness, durability and cheapness render them well worthy a trial in all tea factories. (Signed) WILSON, SMITHETT & Co.

CEYLON TEA IN MELBOURNE.—A specimen has been sent us of a neatly-printed post-card, issued by Mr. S. W. Foulkes, formerly of the Kalutara district, now of Melbourne, where he deals in "pure Ceylon tea." We quote as follows:—

The Ceylon Tea Growers' Association. "Chief" Brand. S. W. Foulkes (Late of Ceylon, and the Ceylon Tea House, Exhibition). Begs to notify that he has opened an Agency in Melbourne for the above Association, and is prepared to supply pure Ceylon tea, in small or large parcels, to suit householders. As he deals in Ceylon tea alone, imported by himself, those kindly favouring him can depend on getting pure Ceylon, solely.

BARK AND DRUG TRADE REPORT.

LONDON, 11th April 1889.

Cinchona at the weekly auctions sold at some slight advance, and quinine is also dearer. As regards other chemicals, we find higher prices asked for cocaine, quick-silver and mercurials, sulphate of copper, and cream of tartar. In the drug department proper we note some improvement in castor oil, orris root, rhubarb, and calabar beans; and some falling off in insect flowers, ipecacuanha, and caraway seed.

CINCHONA.—The auctions on Tuesday were of fair average extent as regards the quantity of bark offer, while the quality of the assortment was rather better on the whole than we have been accustomed to see at recent auctions, there being a fairly large number of lots averaging from 4 to 6 percent equivalent of quinine sulphate. The catalogues comprised:—

	Packages	Packages
Ceylon bark	1,895	of which 1,496 were sold
East Indian bark ...	497	412 "
Java bark ...	28	28 "
South American bark	276	187 "
Total ...	2,696	2,123 "

A better spirit pervaded the auctions, partly perhaps on account of the stronger tone of the quinine market, and partly also because no auctions will be held again until May 7th. Nearly all the manufacturers present bought freely, and occasionally there was a fair amount of competition for a desirable parcel. The consensus of opinion at the close of the sales pointed to a slight improvement in the unit price, which may we think, now be placed at fully 1½d per lb.

The following are the approximate quantities purchased by the principal buyers:—

	Lb.
Agents for the American, French, &c., works	104,861
Agents for the Mannheim & Amsterdam works	96,456
Agents for the Auerbach works	93,079
Agents for the Brunswick works	80,997
Agents for the Frankfort o/M and Stuttgart works	76,151
Messrs. Howards & Sons	34,190
Mr. Thomas Whiffen	9,660
Sundry druggists...	14,741
Total sold	510,133
Bought in or withdrawn	117,012

Total quantity catalogued ... 628,145

It may or may not be a matter of any importance in connection with American rumours of a quinine combination, but it is a fact that the agents for the American quinine factories bought a larger quantity of bark at this auction than they have done for several months past.

It should be well understood that the mere weight of bark purchased affords no guide whatever to the quinine yield represented by it, firms who buy a small quantity of bark by weight frequently taking the richest lots, and *vice versa*.

SOUTH AMERICAN BARK.—Of 34,700 lb. Bolivian Calisaya 24,320 lb. were sold; good stout broken, but silvery, from Yungas plantations, 9½d to 10½d per lb. (against 9d to 9½d per lb. at the previous auction); air to dull broken quill 7d to 5½d. Two serons ordinary Lima quill sold cheaply at 1½d per lb.

There was a rather large quantity of Ceylon and Indian root bark offered for sale, and disposed of at good prices. An offer of 9d per lb. was refused for a parcel of renewed crown chips, said to be equal to 6·40 per cent quinine sulphate, and 11d was declined for another parcel said to analyse 7·40 per cent.

COCAINE.—Higher prices are quoted for bulk, say, 14s 6d to 14s 9d per oz., and there are rumours that a portion of the recent coca crop has been packed in a damp state, and arrived at the ports of shipment almost valueless.

QUININE has been very firm this week, and prices on the spot have further hardened somewhat. Between 50,000 and 60,000 oz. German bulk are said to have been sold, mostly by the makers themselves, at 1s 1½d to 1s 1½d on the spot; while some now require 1s

2d in that position. Early delivery sold at 1s 2d per oz. (1s 2½d is now asked), and for distant delivery 1s 2½d per oz. is reported to have been paid. The Fabrica Lombarda still quotes 1s 1½d per oz. on the spot. —*Chemist and Druggist*.

TEA DRINKING.

We have received several letters on the subject of the remarks on Tea Drinking, given in our last issue. We observe, likewise, that one or two of our contemporaries have made a note on the subject. The matter is one that should not be allowed to drop, for it is high time that those interested in China tea should make some vigorous and far-reaching effort to maintain the splendid trade they have had in their hands. One correspondent who backs up our remarks writes:—"We (China) quietly sit down and let these Indian and Ceylon people push and puff their teas to the gullible public, and I consider we have ourselves to thank for losing our business through apathy when we really have a strong case." The strong case being the greater absence of tannin in China teas of good ordinary quality, as against the best Indian and Ceylon growths, which was shown by the figures published in our last issue. These strong Indian growths have undoubtedly a deleterious effect on the nervous system and digestive organs. The evil that is being wrought is not confined to one class or section of the community, for in drawing-room, factory, workshop and cottage, excessive tea drinking, particularly of Indian kinds, which brew out strong in the cup, and apparently give better value for money, as they stand more watering, is commencing to work considerable evil. There is, perhaps, some excuse for the poor classes in selecting Indian qualities for the reason stated in the preceding sentence, but there seems no reason why those in better circumstances should not indulge in something less deleterious to their constitution. In a discussion which took place a few months ago in the columns of a London daily newspaper on the tea we drink, it was pointed out and truly, we believe, that the richer classes paid less as a rule for their tea per lb. than the poorer people. A man who would be ashamed to set an inferior bottle of wine on his table would have tea at a ridiculously low price and of very inferior quality in his drawing-room.

Whenever this subject is being discussed, one frequently hears the remark, "But where can good pure tea be procured?" or to the effect that it was very difficult to find a retailer who kept a stock of pure China. Why should not shops exist which would make a speciality of selling pure China tea of a good quality? Such establishments exist for the Ceylon commodity. Surely those interested in the China trade might exhibit some of the push and go which distinguish their Ceylon *confreeres* who circularise, open special depots, and otherwise force the article into consumption and make a valuable trade. One is bound to admire the energy that Ceylon planters and others interested have thrown into that product. Surely China might emulate its rivals, instead of sitting down and letting their trade be taken from them. They have a strong weapon in the matter of medical opinion, and they might use it effectively.—*L. and C. Express*, 12th April.

MAURITIUS.

Port Louis, 10th April 1889.

THE WEATHER AND THE CROP.

A few complaints reach us from certain quarters of the island with respect to the continued heavy rains that have fallen without scarcely any intermissions since December last. That the season has been a very wet one is universally admitted but on the other hand the majority of our plantations have profited, the plantations are very advanced, and next crop will exceed the present one considerably. For the last few days the weather has been warm and dry and the mills are running off all the syrups which could not be turbined on account of the persisted wet. It is es-

timated by our most competent experts that the present crop, which may be said to have terminated will exceed last year's by at least 15,000 tons, and this figure would have been higher if all the estates had been able to cut their canes at the most opportune moment. It is worthy of note that notwithstanding the unprecedented quantity of water that has fallen and which can be verified in our meteorological intelligence, the island has been free of all signs of cyclones at any rate of those signs which canes object to.

VANILLA.—Owing to favorable news received from Europe by last mail, the market is firm and the demand has been very brisk for fine qualities. We have to quote the sale of a few small lots, first quality at R24 per kilo above 6 inches. A lot of about 110 kilos fetched at auction from R18 to R24 per kilo according to quality and length. Green vanilla has been sold at R3 to R3.50 per kilo, but holders are unwilling to accept today this price and demand R4 per kil. As mentioned in our last the outturn of the coming crop will be inferior to that of last year.

COFFEE.—Prices for good qualities have improved and we quote these from last sales R58 to R60 per 50 kilos and mixed "triage" qualities R35 to R45 per 50 kilos, according to quality. From Bombay we received 80 bags, from Singapore 5 and from Pondichery 10.—*Commercial Gazette.*

QUININE, COCAINE, &c.

Waldhof near Mannheim, 5th April 1889.

QUININE was extremely dull last month and only a few transactions in first hand took place. The second hand sold more freely though at prices which must have involved serious losses, some parcels being disposed of at the remarkably low figure of 1s per oz. Near the end of the month a better tone prevailed; the bark sale on the 25th ultimo went off at an advance of about 5 per cent and 1s 1/4 to 1s 3/4 was subsequently paid for Sulphate. Since there will be only one auction this month on account of the Easter Holidays we may expect the improvement to make further progress.

The reports on the manufacture of Sulphate of Quinine by the cold oil process, recently issued by Messrs. J. A. Gammie and Lawson, superintendents of the Sikkim and Nilgiri Government Cinchona plantations respectively, are of considerable interest in more points than one. It is anticipated that the production of Quinine at the above places, after the erection of new machinery, will amount to 80,000 oz during the first year viz. from April 1889 to April 1890, all of which will be supplied to the Government hospitals and dispensaries. Rumours to the effect that certain quantities would be sold in the open market are contradicted by a private communication which we received from a reliable source. The Government purposes to charge this Quinine at 21 Rupees per lb or about 1s 9d per oz for the present.

There can be no doubt that the object H. M. Government has in view is a noble one, however, we may be permitted to ask: Are the English and Indian subjects really benefited by this new departure? These 80,000 oz could have been bought in London at any time this year at 5s 1d per oz all packages free, delivered in India (we purposely do not take the lowest price) which compared with the above figure would have meant a saving of at least £1,667 0 0 to this has to be added the difference between income and expenditure according to the official estimate Rupees 33,400 £2,226 0 0

making a total of £3,893 0 0 which the Indian population has to pay "extra" for the privilege of being provided with "home made" Quinine. But the loss extends yet in another direction since the English merchants and manufacturers who have hitherto almost exclusively supplied the Indian market will find this outlet for their Quinine closed against them. We feel convinced that even the most strenuous advocate of the measure under discussion will be forced to admit that from a commercial point of view the enterprise must be regarded as a somewhat costly emancipation from European supplies.

COCAINE.—Our anticipation of an early reaction has been fully borne out by the recent events in the market. A very extensive business has been done in crude Cocaine, prices advancing at each sale, until they now have attained the figure at which a short time ago inferior brands of Hydrochlorate were offered. Having advantageously contracted for the raw material at the right moment we are pleased to give our friends the benefit of our foresight, and offer our superior brand below the figure justified by the value of Crude Cocaine.

CAFFEINE.—The "cutting" between the German and English manufacturers has led to ridiculous prices which however have not stimulated the demand. To those who did not know before it must have become clear by this time that the consumption of this article has been greatly overestimated. C. F. BOEHRINGER & SOHNE.

CROP PROSPECTS IN MADRAS.

The following is a summary of the report on the state of the season and prospects of the Crops in the Madras Presidency for the week ending 13th instant:—No rain in Godavari, Kistna, Nellore, Cuddapah, Bellary, Anantapur, Kurnool Madras, and South Canara; very slight in Ganjam and Vizagapatam; fair in Travancore; and slight elsewhere; standing crops generally good; but suffering from want of rain in Ganjam, Vizagapatam, and parts of Bellary, North Arcot, South Arcot, Tinnevely, and Coimbatore. Wet crops withering in parts of Cuddapah, Anantapur and Chingleput. Pasture deficient in Ganjam, Vizagapatam, Cuddapah, Bellary, North Arcot, Madura, Tinnevely, Coimbatore, Nilgiris, Salem and Malabar. Prices almost stationary in Ganjam and seven other districts.

In Mysore and Coorg the state affairs for the week ending 17th is thus summed up:—No rain in Mysore. Crops in parts of the Kolar district are suffering from want of water. Elsewhere they are reported to be in good condition. Prospects generally favourable. Water-supply diminishing in parts of the Mysore and Kolar districts. No material change in prices. Rain wanted for coffee blossoms in Coorg.—*Madras Times*, April 27th.

THE INDIAN GOLD MINES.

The prospects of the leading Indian gold mines were never more rosy than they are now. The four great Colar properties are developing steadily and the results shown in the first two months of this year far surpass those of 1888, though these were extremely hopeful and satisfactory. The Mysore continues to show the way to its neighbours by progressing by leaps and bounds. Its returns for January and February were much better than any last year; for, though the January crushing produced 70 oz. less than that of last May, the yield in money was £9,283 as compared with £8,963 in the best month of last year. The steadily progressive nature of the work and the great improvement in the nature of the quartz now being milled is shown by a glance at the figures for the past four months, which were as follow:—

	Tons.	Ounces.	Value.
November ...	1,476	1,335	£4,923
December ...	1,634	1,506	5,850
January ...	2,066	2,193	9,283
February ...	2,023	2,933	—

These mines, to say nothing of the smaller properties which are making conspicuous headway, such as the Nine Reefs, the South-East Mysore, and others, prove the sound basis upon which the Indian gold industry stands, and the capacity of the Colar Gold field to keep up a steady, if not a sensational, yield of the precious metal. The Indian gold mines are in an incomparably better position now than they have been for many a day.—*Financial News.*

WOOD USED FOR TEA BOXES IN CALCUTTA.

We quote, as of local interest an article on the above subject from the *Indian Forester*:—

A dispute between certain Shipping Agents and Merchants in Calcutta regarding the quality of certain wood used for tea boxes was lately referred to the Director, Forest School, for decision as to the species of the wood, by Mr. Blechynden, the Secretary to the Agri-Horticultural Society of India.

The wood, which is locally called kauru; and comes from Mouluin, or Assam, resembles that of semal (*Bombax maibarium*), but has a dark-brown but soft heartwood, which is said in Gamble's Indian Timbers not to exist in semal wood, and all the specimens

in the Forest School Museum are free from such heartwood. The wood may be that of *B. pentandra*, or some other malvaceous species.

Mr. Blechynden states that the wood, especially the darker portion of it, has a decidedly unpleasant odour. It is improbable however, that if properly dried, any Indian wood would corrode the lead coating of tea boxes, such corrosion being generally due to the use of green wood still containing sap.

Almost any wood of moderate specific gravity will do for tea boxes, provided it is hard and the grain twisted enough to hold nails, and the common mango furnishes one of the best woods for the purpose.

The School Museum does not contain all Indian woods, but chiefly those given in the numbered catalogue of Indian woods, at the end of Gamble's Indian Timbers.

If Foresters all over India would kindly from time to time send to the Forest School well authenticated specimens of other woods not given in that catalogue, the collection there would be far more useful than at present, as the School Museum is apparently the only place in India where woods can be readily identified, and demands for such identification have recently arisen several times.

We may note that Gamble's book states that semal wood has no annual rings, this is not always the case however, and Mr. Angus Campbell, formerly of the Roorkee Workshops, states that semal when old has a very dark, almost black, heartwood, and that most of the semal trees from the Chandri forest, felled for well-curbs for the dam across the Ganges at Narora, had dark heartwood, which appeared strong and was hard, and used to puzzle people when planed and polished, and they were told it was the despised semal.

[*Bombax malabaricum*, or *semal*, is the red blossomed cotton tree.—ED.]

CEDRELA TOONA (RED VARIETY).—Plants planted in last December in a coconut plantation three miles from Mirigama railway station about 100 feet above sea-level are growing very rapidly, and they are now $3\frac{1}{2}$ to $4\frac{1}{2}$ feet high and healthy.

ROYAL GARDENS, KEW Bulletin for April is occupied with a list of new garden plants described and published during the year 1888. It has been extended to include the descriptions of new plants (and name alterations) which have appeared in several horticultural periodicals, that were not included in the former list. The number of new garden plants annually described in various English and foreign periodicals, renders it a matter of considerable difficulty to botanists and horticulturists to keep them in view.

REVIEW OF THE PLANTING AND AGRICULTURAL INDUSTRIES OF CEYLON. By J. Ferguson. (John Haddon and Co.)—Though these papers have appeared in print before, thanks are due to Mr. Ferguson for publishing them in a separate volume. The first item that any interested person will look for is undoubtedly coffee, and next, perhaps, tea. Coffee has never recovered from the blow which the leaf-disease and the removal of Protection struck. In 1874-77, the export of plantation and native coffee reached 988,328 cwt., the estimated crop for 1887-88 being 150,000 cwt. Cinchona, too, has seen its best days; the Ceylon bark is not good enough. Tea, of course, is the coming industry, 23 lb. being exported in 1873, and 22,000,000 lb. in 1887-88; at this rate, in five years the failure of coffee will be compensated,—that is to say, the value of the tea will be as much as the coffee was. Mr. Ferguson gives plenty of details and statistics relating to all the tropical as well as the three principal products, and the short history which he attaches to the accounts of each enterprise are exceedingly instructive and interesting.—London Spectator.

JAPAN TEA.—Favourable reports have been received in regard to the tea crop from several localities, and the prospects throughout Yamashiro are said to have very much improved.—*J. Mail*, March 13th.

COCHINEAL.—The cultivation of cochineal in the island of Teneriffe was commenced about sixty years ago, and in 1831 the first exports (about 19 lb.) were made. The shipment rapidly increased until 1869, when the maximum quantity of 1,888,708 lb. was exported. Since that time the cultivation has been on the wane, and the growing application of aniline dyes threatens to extinguish it in a few years.—*Chemist & Druggist*.

MR. GOSCHEN is fortunate with his budgets, but he is also emphatically the right man in the right place as an able and sound financier and his measures have tended greatly to strengthen Lord Salisbury's Ministry. We, in Ceylon, have no particular reason to regret that the duty on tea is not to be reduced this year, because such reduction would really tell more in favour of cheap China, than of Indian and Ceylon, teas. We call attention to the remarks in detail made by Mr. Goschen in reference to tea, coffee, and cacao.

THE CULTIVATION OF COFFEE under shade after the Coorg and Mysore fashion continues to be discussed and experiments in the Uva Province are likely to be made ere long, with seed got from the Indian districts referred to. The result will be watched with the greatest possible interest here.—In the meantime, not only are there good crops on a considerable area of old coffee upcountry, but we hear that such Liberian coffee as continues to be cultivated in Ceylon is, this season, bearing exceedingly well and in a year when the prices are so high, a profitable return may be anticipated.

UTILIZATION OF OLD RAILS.—The Government of India having issued instructions for the utilization of surplus old rails, sleepers, &c., belonging to the North-Western Railway, a question was raised of constructing a Feeder Railway line between Ludhiana and Ferozepore, on which it was thought that the old stores could be utilized as however it was represented that there would not be sufficient traffic to maintain this line, and as it would also tend to attract away traffic which, it is believed, will go to enhance the revenue of the Patiala-Bhatinda-Bhawalpur Railway, the question, for the time being, has been shelved.—*Indian Engineer*, April 17th.

CEYLINDO.—This word forms a big heading to a page advertisement of Messrs. Kearley & Tonge, Mitre Square, E.C., in the *Grocers' Gazette*. This advertisement says:—

All wishing to extend their tea trade must recognise this Ceylon, whose advance to the front as a tea-growing country is quite unique in the annals of the planting industries, possesses particular advantages for the successful cultivation of tea. Its teas are famous for their grand flavour and quality, and are invaluable for mixing purposes. Ceylon teas came with such a sudden rush into the market that they have somewhat detracted certain buyers from the Indian teas possess characteristics which are not and never can be found in Ceylons, and the point of perfection in tea is reached only by Pure Ceylon cannot for a moment compete with a skilfully blended Ceylon and Indian tea, the latter being the most economical, the finest, the strongest, and the most remunerative of all tea. We know that rubbish is sometimes pawned upon the Grocer under the misnomer of pure Ceylon and Indian tea, and, with a view to protect the interests of our customers and to give everybody the chance of getting the genuine thing, we have registered our Ceylon and Indian Blends—Ceylindo. Ceylindo is now the acme of perfection in tea blending.

CEYLON VS. CHINA TEA.

CEYLON TEA down to an average for the week of 9½d per lb., while Fair Pekoe Souchong is quoted at 7½d is not very encouraging telegraphic news received today for our planters. It is evident that a big struggle is approaching. The China merchants and their London friends have already begun to lift their heads and raise a cry antagonistic to Indian and Ceylon, as compared with their own teas on their merits! They even talk of sending a specially engaged Lecturer all over the United Kingdom to teach the people the risks they run from drinking teas so much stronger in tannin than are the delicate-flavoured China product which has hitherto ruled the market. The *London and China Express* as the organ of Far East mercantile interests is specially loud in declaiming against the China merchants doing nothing to protect themselves. We quoted an extract on our back page two days ago which showed this very clearly and the way in which our contemporary goes to work may be judged from the following:—

All the sinister forecasts must be very unpleasant for those interested in the China product. But before those who stake all on India and Ceylon are satisfied that their cup is getting full, they may have to reckon with a force which has not yet been exerted, and which may prove potential. We refer to the question of medical opinion. For some time the profession has been setting its face somewhat against excessive tea-drinking, and in many ailments the patient is told to leave off tea altogether. Now, however, doctors are beginning to discriminate as to the class of tea that may be used, and instead of banning tea *in toto* they instruct that only China tea may be taken. This will be better exemplified from the following, which recently appeared in a medical contemporary:—

‘As there is some doubt as to the quantity of tannin extracted from tea by short and long infusion, and also as to the percentage of tannin in different teas, the following note of the result of some experiments on three samples, unblended, sent to us by Dr. Hale White, of Guy’s Hospital will be read with interest. A was the finest Assam; B the finest China; C common Congou; no green tea of any kind being used:—

Percentage of tannin by weight extracted by infusion for 3 minutes. Percentage of tannin by weight extracted by infusion for 15 minutes.

Mark of Sample.	Percentage of tannin by weight extracted by infusion for 3 minutes.	Percentage of tannin by weight extracted by infusion for 15 minutes.
A	11.30	17.73
B	7.77	7.97
C	9.37	11.15

The result, Dr. White adds, is what might have been expected, as tannin is very soluble in hot water, and nobody who has drunk Assam or any other Indian tea and the choicest China, would require any scientific analysis to tell him which would be most likely to disorder the stomach and nerves. It is, of course, true that any tea which has been infused for some time has a more marked effect than tea which has been infused a shorter time; but this difference is due not so much to the tannin as to the strength. The moral therefore, for persons with weak digestion is to select the best China tea they can get, and not to drink it strong; to be satisfied with flavour, and not to desire intoxication. They must be particularly careful also to see that the tea is not blended. Sample B is worth about five shillings a pound retail.

To counteract action of the nature described above, it will be needful for the Planters’ Association and the Ceylon Association in London to go to work very energetically, and they have ample material to enable them to carry the war into the enemy’s camp. In this connection, good use can be made of the Melbourne analyses of China, India and Ceylon teas, showing the vast superiority of

the latter and how the China teas are frequently adulterated. We quote one passage as follows from the ‘Australian Tea Circular’ compiled at this office:—

In total extract, which I take to be the real test of tea, the Indian average is 39.42, which is more than 10 per cent above the China congous. Our Ceylon average, even when lowered by including the Congou is 42.20, or nearly 3 per cent higher than the Indian and 13 per cent over the China. But as no congou was included in the Indian teas, the fair course is to exclude it, and also the green, and to take the average of the teas common to both lists. We then get for Ceylon teas 42.95, or 3.53 higher than the Indian average (39.42), and 13.69 per cent above the China congou.

As to objections to the strength of, or the tannin in, our teas English householders can readily be shown that they have themselves to blame, first, in using too much tea at a time as compared with China, and, secondly, in not securing a proper infusion. The infusion should not extend over five,—and indeed one competent judge says three—minutes and if the instructions given on the slip we have issued as a Supplement are noted, no one ought to be ignorant of the best mode of preparing tea.

CINNAMON PLANTING REPORT FROM THE NEGOMBO DISTRICT.

SPLENDID WEATHER—FORTHCOMING CINNAMON CROPS AND FALL IN PRICE—PROPOSED COMBINATION OF CINNAMON GROWERS TO DISCONTINUE EXPORTS—OPINION OF A LONDON BROKER—CINNAMON SEED—COCONUT LEAF-DISEASE IN VEYANGODA AND IS. DRIEBERG’S REPORT.

NEGOMBO, 9th April 1889.

We are having splendid weather, with hot afternoons and wet nights. All vegetation looks as if fresh life has been put into them. Cinnamon has a splendid flush which will give it a good growth. Peeling operations will commence about the 25th of May. I do not think the crop this year will be a large one. Cinnamon has hardly grown and the bushes look very scanty. It will be advantageous to cinnamon planters if crops are small, as they may expect a rise in price. Mr. Jardine, the veteran planter of Goluapokuna, is agitating stopping the scraping of chips. He thinks that if chips are stopped from being exported there will be a rise in quills. I shall feel obliged if Mr. Jardine will get up a meeting of all cinnamon planters to discuss the matter. Some say that they will sell the scrapings to those who distill oil. I remember 20 years back old wood used to be cut down and dried and then sold as firewood. Planters were then so particular that they never sold the coarse wood fresh, as buyers would scrape them. The large quantity that swell the market is from the new districts. People were not particular as to what kind of seed they planted. Seed from coarse wood produce coarse, and unpeelable cinnamon, which helps to increase the large quantity of chips. There was such a demand for cinnamon seed at one time that people paid from R10 to R15 per bushel. Mr. Beven of Veyangoda should also agitate stopping the scraping of chips in his district, as a very large quantity of coarse cinnamon and chips are produced by natives of that district. Coconuts are looking its best in the Negombo district. I hope the disease in Veyangoda has disappeared after the present heavy rains, and we are anxiously waiting for Mr. Driberg’s report on the coconut leaf-disease. I hope the report will be published in the local papers. I enclose a report from a leading London broker as regards cinnamon chips. I shall feel obliged if you will publish it with this letter.—Yours truly, AGRICOLA.

‘Regarding the proposed combination of cinnamon growers to cease shipping cinnamon chips from Ceylon,

the question has been carefully considered and the opinion of our leading spice brokers is that provided the export of cinnamon chips from Ceylon be stopped, *not in part* but *wholly*, it would no doubt exercise an important influence over cane cinnamons sold in London; but there would always be the risk, of some growers breaking through the arrangement, induced by the advance in the value of chips which would probably take place if any small lots came forward. It is estimated that chips have been imported during the past few years to an extent equal in weight on the average to nearly 4,000 bales of cane cinnamon per annum, and there can be no doubt that a large portion has been used in place of quills."—*London Broker.*

RATNAPURA AND RAKWANA NOTES.

April 28th.

I hardly know what to think about the weather. Have we been having the little monsoon since the middle of March I wonder, for it has scarcely ceased raining for about forty days and forty nights. I notice, however, that we are getting it up from the S.-W. now. I hear even tea planters are having too much heat and moisture, for they cannot get over their fields although the order of the day is "pluck fine."

HOW TO MAKE TEA :

LESSONS FROM A COLOMBO BROKER.

The head of the firm of Messrs. A. H. Thompson & Co., tea brokers, was up in Rakwana during Easter week teaching the men of that "puckam" how to make tea. So we may expect to see some of their teas topping the list at no very distant date—at all events Barra estate, where some valuable lessons were given in the way of curing.

PROPOSED COMPANY FOR THE PURCHASE OF RAKWANA ESTATES.

It is rumoured that most of the estates in Rakwana are to be, or have been, already realized for the purpose of disposing of them to a Company about to be floated. May it prove as good an investment as the Ceylon Tea Plantation Company Limited, has done.

AMBROSIAL TEA.

A gentleman who recently returned to Ceylon, says that when he came back he could not drink even half a cup of the vile tea made by his servants. It had gone off on account of its being kept loosely in the sea air, besides which the leaves were left in the pot and allowed to stew. A friend who always drank whisky, as he said that the tea in the morning always disagreed with him. Now, with his tea properly kept and infused, he drinks 2½ breakfast cups every morning as soon as he gets up, and it is really splendid.

TEA CULTURE AND PREPARATION.

A FEW PRACTICAL ENQUIRIES BY A PRACTICAL MAN.

(1) Is not Mr. Armstrong responsible for the statement that the quality of the tea is best when the bushes flush most freely? My own observations lead me to rather an opposite conclusion, and it would be interesting to know what the general opinion on this subject is.

(2) Have you any information to indicate that the application of manure improves the flavour or strength of the tea? As regards *quantity*, several enterprising proprietors in Dikoya and Maskeliya can testify to the efficacy of both natural and artificial manures; but I have not yet been able to satisfy myself that highly cultivated estates produce teas of exceptional merit.

(3) A good deal is now being said about fine plucking and high prices, but surely the men whose success we should emulate are those who combine quantity with quality. These are the people who are making the money and not those who study quality only.

[We shall be glad to have the opinions of practical men on the above question and opinions, for the benefit of planters generally.—Ed.]

NOTES ON TEA.

(By a Colombo Wallah.)

Here is a hint for any enterprising local firm with a big mill house and yard to utilise! I copy from "Rucker and Bencraft," 24th February 1887:—

"There will be room by and bye for a Public Blending Machine at Colombo like the enormous structure at Crutched Friar's warehouse, which planters at home should not fail to see in operation."

Big breaks must go forward or Dealers will not be able to contend with increased number of small ones—lower prices must come if larger breaks are not sent.

Then again, here is a paragraph worth reproducing from the same firm, over two years old:—

"Invalids and doctrinaires may here and there forsake tea for cocoa (until someone tells them they might drink tea with impunity if they did not insist on having it so strong), but the consumption of tea will in all probability continue to increase now that prices are so moderate."

Bad trade in the United Kingdom means always a large increase in the consumption of tea—good trade has quite an *opposite effect*!

TEA NOTES.

Rain is wanted in Kamroop. Tea is doing well in Sibsangor. Tea prospects are good in Durrung. The weather has been warm in Cachar. Tea plucking is in progress in Luckimpore. Hot weather with high winds is reported from Goalpara. Weather dry and warm is the news from Nowgong. Darjeeling, 19th April.—Heavy hail on the 14th and some gardens in upper portions suffered severely. Since then daily showers nearly 2 inches being gauged for the week. Dehra Dun, 16th April.—It is cool here for this time of year, rain has been threatening, but as yet we have not had any. We have made much more tea than last year. 17th April.—Weather splendid for all work on tea estate. The latest news from Muchikandi:—Good rain has fallen in this district and the prospects are now brighter.—*Indian Planters' Gazette*, April 23rd.

COFFEE.

TO THE EDITOR OF THE LONDON "TIMES."

Sir,—One cogent reason why "coffee does not move" might have been mentioned by Mr. Goschen on Monday. I mean the adulteration of coffee which the law now permits, and under cover of which, as the annual reports of the Local Government Board's analysts show, the labelled "coffee mixtures" sometimes contain no more than 20 or even 10 per cent. of coffee. As long as the sale of these mixtures is allowed, or the proportions of coffee to the admixture are not required to be specified, so long will the revenue suffer, notwithstanding the equivalent duty on chicory, and coffee-growers be discouraged. Another result is that consumers, chiefly among the poorer classes, are shamefully defrauded, and large profits made by retailers and others; while probably 19 consumers out of 20 do not know the taste of genuine coffee, and believe it to be, when infused, a black, cloying liquid, thick in the mouth, insipid, and almost sickly, instead of the most refreshing, gently stimulating, aromatic drink which Nature supplies.

Of course people can protect themselves by buying their coffee and chicory separately. But they do not and will not, as experience proves; and the mixtures, which include much cheaper ingredients than chicory, flourish accordingly. Teetotalers might do good service in helping to make popular an eminently temperance beverage. Representatives of working men, again, might consider whether, by further legislation or otherwise, something could not be done to save working men's families from impudent frauds. I can speak for countrymen of ours, growers of coffee in Mysore, Coorg and Ceylon, who produce some of the finest coffee in the world, but are depressed by the facts to which Mr.

Goschen refers, and by the public preference (due in some measure to legislation) for grosser and less palatable drinks. A letter by last mail from the honorary secretary of the North Mysore Planters' Association informs me that they feel strongly, and are acting in concert with other associations of British planters on this question. Of all household beverages coffee, when pure and well made, is, by its properties, the most attractive substitute for spirituous liquors, and their most formidable rival. And now that public attention has been so pointedly called to it by the revenue returns, I hope that the Chancellor of the Exchequer, aided by the able officers of Excise, will consider whether something cannot be done to promote the consumption of coffee by stricter enactments regulating its sale.

Your obedient servant,
FREDERICK OLIFORD,
 Chairman of the Coffee Association,
 Plowden-buildings, Temple, April 16th,

JAPAN TEA BOXES.

Mr. H. D. Deane of Maskeliya has some reason to write with authority on the subject of tea boxes from Japan; for he was the originator of a trade which undoubtedly has conferred considerable benefit on the Ceylon tea planter. Apart from the merits of the boxes, it is clear that if it were not for the competition of Japan makers, the price of locally made boxes would rise considerably. On the merits however, there can be no question that Mr. Deane, and the present agents—Messrs. Mackwood & Co.—of the earliest Japan exporters to Ceylon, have an exceedingly strong argument in the fact that although within the experience of the latter some 12 to 14 million lb. of Ceylon tea have been shipped in their boxes, *not a single complaint has ever reached them of the tea so shipped, being tainted or in any way injured.* It would be well if the case referred to by Messrs. Rucker & Bencraft could be traced and steps are being taken to this end.

BURMAH: A GENERAL GLANCE AT—LOWER AND UPPER.

(Communicated.)

BUSY SCENE AT THE PORT OF RANGOON DURING RICE SEASON—AGRICULTURE AND RAINFALL IN UPPER BURMA—INTRODUCTION OF CAPITAL—ECONOMIC PRODUCTS AND RAILWAY COMMUNICATION—THE GOVERNMENT LAND GRANTS—REVENUE AND ANNEXATION TO INDIA—LABOUR—MINERALS.

The appearance of the port of Rangoon during the rice season—December to April—is suggestive of a high state of prosperity. The river is crowded with native boats of all sizes loaded with paddy, whilst large numbers of ocean-going steamers are continually passing up and down; those outward bound being laden up with rice for Europe, Asia, Africa, and America, not forgetting the Australian colonies. The rice husking mills by the bank of the river and along the creeks are working day and night, week days and Sundays, and the streets are thronged with Indian coolies, who having come over from the Coast to reap the paddy crops, remain to work in the mills. The bankers tell of so many lacs of rupees per day, paid out in silver currency only and the carts at the doors of the banks for transport of so much silver attest the truth of what they say. There is a lively air about the passers-by, as if to say "now we are making money—long may it last." Later on, however, the season will be closed, the mills shut up, and the steamers and coolies departed, and people will complain of the dullness of the times and want of business. Nevertheless, the timber trade, the necessities of Upper Burma and the supplies to our troops and police there and a number of other opera-

tions—export of cutch for instance,—keep things moving, and in spite of a few grumblers, who are never altogether wanting in the best regulated communities, it may be said with confidence that Rangoon is now in a flourishing condition.

There is a general idea abroad that Upper Burma, our latest annexation in that quarter, will develop into a great agricultural country, but I cannot help thinking there is a great mistake somewhere. The want of rain precludes any idea of cultivation of such products as tea coffee, cocoa, &c.; the fall at the capital (Mandalay) being only 30 inches, and in some localities in that quarter not more than half even of that small amount. All the hills that can be seen from the railway line or from the river, are very sparsely covered with trees standing amidst coarse grass, which is regularly burnt off by the natives, and the country left dry and denuded. True there are the Shan hills 40 or 50 miles away from Mandalay, which have more rain and a better description of jungle, but who wants to go 500 miles and more to grow these things where there are plenty of more favourably situated localities available close to a seaport? For such economic products as those mentioned above, it would be far preferable to cultivate them on the Pegu Yoman ranges comparatively close to the seaport, and clothed with dense jungle which incontestably proves the prevalence of plenty of rain, Rangoon itself getting from 75 to 90 inches yearly. It is only natural to suppose that the neighbouring ranges of hills would get considerably more. Moulmein a little to the eastward of Rangoon, has from 150 to 200 inches per annum. It is difficult to say what could be grown to a profit in a large part of Upper Burma. Without resort to irrigation rice cultivation proves very precarious, Mandalay being only about 450 feet above sea-level, at a distance per rail of 386 miles. The only thing I know of just now would be cotton, and at present a considerable quantity is grown at no very great distance from Mandalay and shipped by boat to Bhamo, only a short distance from the frontier of China, and thence forwarded on pack mules and ponies to the interior of Western China. Whether Bhamo is to remain the chief frontier town for trade to Yunnan and China seems rather problematical at present, our Government having cast eyes on another place, more approachable by rail from Mandalay and in some respects more adapted for a great caravan route than is Bhamo. Another product which might perhaps be made to pay in upper Burma would be tobacco for local consumption. Small patches of tobacco are now grown in some places and especially on the banks and islands of the Irawaddy river when the water has fallen during the dry season. The rise and fall of the river averages some 30 feet, though in some places it is 60 feet, whilst in others where the bed widens out to 5 miles, of course it is not so much. Large areas of mud banks are consequently left exposed and the natives rent them from the Government and grow a number of different grains and variety of vegetables, gourds, melons, pumpkins, &c., &c., and a little tobacco. This tobacco is cut and dried in the sun without any fermentation and made into the enormous cheroots that are commonly smoked by the Burmese. That tea and coffee will grow well on the Karenne Hills has been amply proved by the success of an enterprising individual who established himself there some years ago, and produces both tea and coffee. But then this estate is a long way south, not far from Teunghoo, and only establishes what I have advanced above as to the necessity of settling nearer Rangoon and the sea coast. The railway so rapidly constructed from Teunghoo to Mandalay has been built for military purposes not for the development of an agricultural interest that cannot exist. There can be no doubt, however, that this line will be of the greatest possible benefit to the inhabitants of the country through which it passes, facilitating the petty local trades and general traffic of the country. There appears to be but little inclination on the part of the Indian Government to encourage European enterprise and the introduction of capital into Burma. True land is offered for a term of years without payment, but only for a term, and can then be re-

sumed by the powers-that-be. In the meantime a fixed portion must be cultivated, and should the officials opine that the cultivation is not as it ought to be, the land can be promptly resumed. The idea never seems to have been entertained of offering premiums for either discovery and working of metals and minerals, or the cultivation of economic products. In fact the other way would seem to obtain, for the great complaint of the people in Lower Burma is that although surplus revenue last year to the amount of about a million and a quarter sterling was transferred from Lower Burma to the coffers of the Indian Treasury, the Government had in addition imposed the income tax which was so strongly opposed, though ineffectually so, in India. True they say that Upper Burma shows at present a deficit of revenue, and the least that the Indian Government could do would be to make the surplus of Lower Burma pay the deficit in the revenue of the upper province, and then there would still be a considerable sum in hand to expend for the benefit of Burma without the necessity for the imposition of the offensive income tax. As it now stands annexation to India, drains the coffers of Burma to the benefit of the former country. As for Burma being the country for a young man to go to just now, I fail to see what he can expect to do there. There are numbers of young men being continually drafted over from India to fill all vacancies in the Police Force and the Forestry Department. There are no agricultural operations in existence and no immediate prospect of any. The people themselves in Upper Burma have so long looked upon work as slavery, that they are only now beginning to realise that they will be paid for their work, and that when they are paid they may do as they like with the money. Under these conditions they are beginning to come forward when they are wanted, such as for construction of roads, railways, buildings, &c., &c. This will in time (a long time perhaps, but none the less sure to come) lead to the abandonment of the senseless waste of time, money, and skill now incurred in the construction of numberless pagodas and shrines of Gaudama, which are allowed to fall into decay as soon as completed, and which eventually perish without conferring the slightest benefit upon anyone.

The mineral wealth of the country has not as yet been gauged with any certainty. Gold and silver and precious stones exist without doubt, but to what extent is quite unknown, though parties are engaged prospecting. Coal also exists in considerable quantities, and it would appear that coal mining will be the first industry of that description that will be taken in hand, excepting of course the ruby mines.

THE CEYLON TEA MARKET IN COLOMBO AND LONDON.

A tea planter writes:—

"Is it not pitiful to see the present state of the London and Colombo tea market, and one feels inclined to ask—Is the art of tea making lost or forgotten in Ceylon? The fact that broken pekoes are selling for 7d., pekoes for 6d., and pekoe souchong for 5d in the Colombo market would make the late Wm. Cameron turn in his grave if he were only cognizant of it.

"I do not think the tea-house receives now the attention it used to, and too much is left in the hands of the tea-maker. Then of course we have our meeting and our tennis and our cricket to look after and enjoy and how fares the manufacture then?—Of course I would raise a howl of indignation by suggesting such a reason for poor prices, but the fact remains and of that I am perfectly convinced that ignorance of or inattention to manufacture or both, are the principal causes of the extreme low prices which appear in every week's sale."

THE PROSPECTS OF A GEMMING COMPANY AT RATNAPURA.

AN UNWORKED RIVER PROLIFIC OF GEMS.

Writing from Ratnapura yesterday, a correspondent who has been studying the gemming industry, says:—

"Gemming is almost at a standstill for the present, owing to so much rain. The Sinhalese don't like to work in the open during rainy weather, and the water oozing into the pits makes the work very expensive. There is little or no doubt about the success of a Company if started. I am personally aware that there is hardly a pit opened by the natives that does not, at least, pay expenses. This I have learnt from careful inquiry and observation during the gemming season just past. The river—I am told by every native whom I have questioned, that is the Kaluganga—is even more prolific in gems of a very superior quality than the land; but gemming has been prohibited in it for the past 7 years, though doubtless if agitated for licenses could be again obtained as in former years, and were a Company started no doubt the concession would be granted by Government, as it would add much to the revenue. I would not mind having shares in a Company if started."

TEA CULTURE AND PREPARATION:

IN ANSWER TO PRACTICAL ENQUIRIES BY A PRACTICAL MAN.

No I.—*Answer from the Kalutara District.*

1. The best tea would likely be made from trees in good heart; but during dry weather. We only know results and it is impossible to put the cause in a nutshell in this way.
2. No data; but neither are there data to shew deterioration of quality, and so increased quantity justifies the application. Cattle manure gives fine returns for several seasons.
3. The medium course seems the best as in everything else. But fine plucking does not solve the difficulty. Manufacture even with the greatest care, may still be at fault. The best manufacture with fair plucking will no doubt give good results.

No II.—*Kelani Valley.*

4th May 1889.

1. There is no doubt the best quality of tea should be obtained from a bush allowed to grow freely and plucked lightly every fortnight, but the yield would be infinitesimally small.
 2. Artificially manuring tea with bones, poonac, or castor-cake greatly increases the yield in the low-country. Mr. Megginson is my authority for saying that the liquor is poorer than from green leaf grown in unmanured fields.
 3. Medium plucking is certainly the best all round for proprietors and the estates. It will not ensure sensational averages, but will show a satisfactory balance sheet.
- The present system of declaring monthly averages in tea brokers' catalogues is most misleading.
- I recollect in 1883 two estates that averaged 2s and 1s 2d respectively per lb. of tea; yet their profit per acre were identical. W. FORSTME.

CULTIVATION OF COFFEE UNDER SHADE.'

An old planter writes:—

"You forget shade has been thoroughly tried in most districts and by putting in all kinds of coffee but with no good result. Get clear of leaf-disease and then the old king may have a lower step on the throne, not till then. Ask Mr. Ingleton or Mr. Milne of Matale North and see what they say."

But how does our correspondent explain coffee doing so well under shade in Coorg and Mysore?

Leaf-disease is not unknown there, but it takes no hold of the coffee cultivated under artificial shade. In the past history of Ceylon, the shade clearings with coffee were almost entirely made in the natural forest thinned out. Most certainly we consider a shade coffee clearing on the Coorg principle, an experiment well worth trying in Ceylon at present.

PLANTING IN THE SEYCHELLES: MR. E. H. EDWARDS.—This old Rangala and Uva planter has not made his fortune in the Seychelles. So far from it, that after five years' work there in a letter just received, he reports his 'last state to be worse than his first.' Disease had killed nearly all the vanilla in which Mr. Edwards had an interest.

TEA NOTES.—The weather has been warm in Sylhet. Tea plucking has commenced in Luckimpore. The news from Subsauror is, tea is doing well. In Nowgong the weather has been warm for the time of year. Stormy weather with light showers is reported from Durrung. Seasonable weather is the news from Goalpara, Kamroop and Luckimpore. **DARJEELING**, 13th April.—Promising for rain; without it, there will be a closing of manufacture all round. **DEHRA DUN**, 9th April.—So far we have had a very good season and most gardens are a long way ahead of last year. It looks rather like rain.—*Indian Planters' Gazette.*

SYLHET ORANGE trees are being acclimatised in the Lucknow gardens, but as they require some shade from sun-scorching which occurs immediately after the rains, as also in the month of April, May and June, it is proposed to supply the desideratum by planting some thinly branched trees of moderate height among the orange trees to protect them from the sun, without however exhausting the soil to any great extent. For the present a trial will be made with the cultivated baer (*Zizyphus jujuba*) which is hardy and will stand frequent prunings. A good deal of attention has been given to the orange and lemon tribes and several experiments have been made with the old and new varieties, so also with peaches, baers, plum and Arabian date palms.—*Indian Agriculturist.*

THE SEASON IN MADRAS.—The following is the season telegram to the Government of India by the Board of Revenue for the week ending 20th ultimo:—"Rainfall slight in Ganjam, Vizagapatam, Madura, Tinnevely, Coimbatore, Nilgiris, Salem and Malabar; none elsewhere. Standing crops generally good, but suffering from want of rain in Ganjam, Vizagapatam, Chingleput, North Arcot, Trichinopoly, and Tinnevely; wet crops withering in parts of Cuddapah, Anantapur and Coimbatore. Pasture deficient in Ganjam, Vizagapatam, Cuddapah, Bellary, Kurnool, North Arcot, Madura, Tinnevely and Coimbatore. No great fluctuations in prices; prices of rice and ragi falling in Ganjam. General prospects favourable, except in Ganjam; improving in Coimbatore. Labourers employed on last day of week,—on Rushikulya works, 5,618; on Gopalpore Canal, 2,570; decrease due to outbreak of cholera on Taptapani road 433."—*Madras Mail.*

THE VICINITY OF NUWARA ELIYA seems to grow tea as well as it did cinchona, if not better. No one can go through the tea on Scrubs estate without being struck with its vigorous and healthy growth. There was none of that pinched-up appearance which one might expect to find at such an altitude. The trees were large and completely covered the ground, whilst the flush on them was a thing to be seen and remembered. I saw a heavy golden flush on tea which had not been pruned for two years and nine months! What do you think of that, ye Kani Valley planters! The tea was H-ragalla jüt, 100, and the altitude 200 feet above Nuwara Eliya. It requires to be seen to be believed. But the Scrubs estate is very much sheltered. It remains to be seen how the land below—on the Nanuoya road—belonging to Mr. Robertson of the P. W. D., now in Australia, will come on, exposed as most of it is to the full force of the South-West monsoon."—Local "Times."

[Mr. James Robertson, P. W. D., is still in Ceylon.—Ed.]

TEA ON OLD COFFEE LAND.—Mr. A. F. Souther tells us that his oldest tea on Barcaple now about ten years of age, and on one of the poorest fields as regards soil, has never hitherto given more than 200 lb. of made tea per acre. But this season the trees have so much improved in growth and appearance—have the roots at length reached "the virgin subsoil"?—that a crop of 300 lb. per acre is considered quite safe.

THE GERMAN PLANTATIONS IN SAMOA.—Mr. Sewell, the American Consul-General at Apia, in a report which has just been published and which is of special interest at this moment, says that the German plantations in Samoa comprise the greater part of the cultivated land on the north side of the Island of Upolu. The largest covers the entire western end of the island, and has an area of 3,260 acres and a sea frontage of more than six miles. The total area of these plantations is 9,260 acres. Their natural features are very diversified; from the sea they extend far up the mountain sides, down which flow numerous large streams. They have been laid out with great care; and in beauty of scenery and rich fertility the views among them cannot be surpassed. They are highly cultivated and are capable of producing anything that will grow in the tropics. They are mainly planted with coco-nuts, for the production of copra, the dried kernel of the nut. The annual production of this is between 500 and 600 tons. The clearing of the land for plantations is a laborious operation, for it is densely wooded with a tough native growth. There are also many rocks, which prevent ploughing. After clearing, cotton is planted, and this is grown for three years; then coco-nuts are planted and grass is sown, and until the trees are large enough to allow cattle to run among them, some cotton is still gathered. After six years cattle are admitted, for by this time the trees have grown so that cattle cannot injure them. The seventh year the trees begin to bear, and at 15 years after planting they attain their prime. The grass grows luxuriantly in Samoa, for drought is unknown there and cattle find among the coconut trees rich feeding ground. On the two largest plantations there are 1,600 head of cattle, many of them of good breed, imported from New Zealand and the Australian colonies. There are also some fine horses upon them. Next to coconuts and cotton, coffee is the most important product and its cultivation is being increased, for it is the best paying crop. It is of excellent quality, rivalling the finest Mocha, and commands a good price in the Hamburg market, where it is chiefly sent. These plantations are worked by imported labour, for the Samoans will not work. This labour is recruited chiefly from the islands to the west of Samoa, the New Hebrides, Solomon, New Britain, and New Ireland islands; also from the Ellice and Gilbert islands to the north. As a rule the labour trade is humanely conducted by the German labour vessels, yet it is not wholly robbed of its horrors. The labourers are under contract for three years service, at the expiration of which time they are to be returned to their homes. This, however, is sometimes not done, and the unfortunate people are landed among a hostile tribe who speedily kill or enslave them. Men, women, and children are recruited at wages of \$3 a month, paid in trade. On arrival at Samoa the labourers pass an examination before the Consul, and great care is taken that none come on shore against their will. They are well cared for on the plantations. A physician visits each plantation at least once a month. They are well-housed, and are fed on rice, biscuits, and yams. Their hours for work are regular, and Sunday is a holiday. There are about 750 of them upon different plantations.—*London Times*, April 16th.

MR. GOSCHEN ON TROPICAL PRODUCTS AND DRINK.

The following *verbatim* report gives the part of Mr. Goschen's Budget speech in which we are most interested:—

Take the case of dried fruits. Raisins, figs, and plums are up to the Estimate, but currants are 33,000*l.* or ten per cent more than the estimate. This is one of those cases where it is true that is an ill wind that blows no one any good. France has been excluding Greek currants, and, in consequence of this, Greek currants have come in constantly-increasing quantities upon the English market (Opposition cheers), increasing the consumption and adding to the Revenue. Tobacco shows an increase of 145,000*l.*, but it fell short of the Estimate by 41,000*l.* The increase is $1\frac{1}{2}$ per cent. We anticipated 2 per cent owing to the fact that the water clauses did not come into effect until last year. But there is a rather strange point to mention, and it shows the precariousness of some of these taxes. I thought that, with increasing trade, it would be possible to estimate an increase upon the yield on tobacco; but I am told that there was a very large crop of a particular kind of tobacco, which smokes more slowly than the other kinds (laughter.) Consequently, for the same amount of bought tobacco the smoker is able to enjoy himself for a longer time, and to get as much satisfaction out of his pipe (laughter.) Thus, the revenue suffers, but I trust that there is no diminution in the enjoyment afforded to the consuming classes by the tobacco crops. I now come to an interesting head—the great item of drink—and I will give the place of honour to the sober beverages in the first instance. Coffee maintains its character of dull uniformity; cocoa has yielded 6,000*l.* more than before, and that not on a very large revenue. But coffee is 2,000*l.* less. Coffee will not move (laughter); and here, again, some experts give an extraordinary and not uninteresting explanation. I give it for what it is worth. They say that cocoa has actually been puffed into its present more satisfactory condition by the energy of ambitious advertisers (laughter.) “Grateful and comforting” have had their effect (laughter). Tea also enjoys with cocoa a vast amount of advertising. Somehow or other coffee has been neglected in that respect: coffee is dull, and never will yield even a small increase, if increase is taken in the estimate, notwithstanding the increase of population. But cocoa, coffee, and chicory give only a very small revenue compared with the great item of tea. The total yield is only 328,000*l.* which is as nothing to the 4,628,000*l.* we get from tea. Yet, large as is this revenue from tea, it is again disappointing. There is an increase of only 15,000*l.* over the year before, which is one-third per cent., while the population has increased at the rate of one per cent., so that there is practically a decrease per head in the consumption of tea. Experts account for this by two circumstances. They suggest—though they do not rest at all strongly upon the point—that a certain amount of tea has been kept back owing to the expectation and possibility that the duty might be reduced; and secondly, there is the analogous case in tea with that which I quoted as regards tobacco. I explained last year—and I think my predecessors have done—that Indian tea is to a great extent superseding China tea; at all events, it is competing with it to a constantly greater extent. Indian tea is so much stronger than China tea, that again a pound of it goes further, and a larger number of cups of tea may be drunk, notwithstanding the falling off in the revenue and in the consumption of pounds of tea per head. That is an explanation which those who advise me insist is absolutely correct; and, while great benefit is derived by India from the export of tea, there is little doubt that it has an effect on our revenue. Thus, the sober beverages yield together 5,000,000*l.*, but they pay little as contributors to the revenue when compared with the 27,000,000*l.* which are given by spirituous drinks. But I have very good news for the friends of the temperance cause (cheers), though it has

made, and continues to make, a gap in the receipts of the Exchequer. The drink revenue does not increase with the growth of population (hear, hear.) I propose to place before the Committee some very interesting diagrams, which will show how during the last five-and-twenty years the consumption of drink has increased or decreased, as compared with the population, and as compared with the other great articles of consumption. While most of them keep near the line of population, there is a very material and striking fall in the consumption of spirituous drinks (hear, hear). But it might be thought that now that we are at a critical moment, and that a revival of trade would again lead to an increase in the revenue from drink. It has not been so (cheers) There are, however, most interesting facts from a statistical point of view which hon. members will see from these diagrams. There is a most curious relation between the consumption of wine and that of other spirituous beverages. The year which showed the high-water mark of spirits was 1875-76, and, curiously enough, that was the time when the wine revenue also reached its highest point. It rose up to that year, and it has continuously fallen since. The same year, when the mass of the population seemed to have rushed to bottled spirits, other classes seem to have rushed to the decanter of wine; and as the one became more sober the others followed their example. Wine yielded last year 1,210,000*l.* as against 1,085,000*l.* in the preceding year. The increase is entirely due to the extra tax on sparkling wines, which gave 163,000*l.* (cheers.) Otherwise there would have been a decrease of 38,000*l.*, which is about the normal decrease. Since 1876 the total consumption has sunk from 17,000,000 gallons to 13,000,000 gallons; and that includes a larger consumption of lighter wines, which have risen from 6,000,000 to 8,000,000 gallons. Formerly, the lighter wines were only one-third of the whole; now they are one-half. Whatever be the cause—whether due to temperance, or, as some maintain, to the use of the cigarette immediately after dinner (laughter), which arrests the circulation of the decanter—the fact remains that there is this extraordinary decline in wine as an article of consumption. —Standard.

“THE FINEST DEER IN THE WORLD.”

This is the title of an article which appears in the *National Review*. According to the writer, Mr. Seton-Karr, M.P., the finest deer in the world is the Wapiti stag of North America. Though not so large as the Canadian moose, he is infinitely more elegant and graceful, and carries a magnificent head. The following are some selections from Mr. Karr's article:—

THE WEIGHT OF A WAPITI STAG.

A fully-matured Wapiti stag will turn the scale at from 60 to 75 stone, and his antlers of from 12 to 18 times (though anything over a 12 or 14 pointer is rare) will measure 60 inches and over along the curve. The following are the dimensions of a Wapiti, taken by myself. He was a 12-point stag of ordinary size, measured as he lay dead on the ground:—

Height at shoulder	5 ft. 4 in.
Girth behind shoulder	6 ft. 2 in.

The following are the authenticated measurements of the two best pair of Wapiti antlers shown amongst the “Sporting Trophies” of the American Exhibition of 1887:—

No. 1 (16 points). Length along curve	62½ in.
Beam or circumference between bay and tray	...
Span	46½ in.
No. 2 (12 points). Length along curve	60½ in.
Beam or circumference between bay and tray	7½ in.
Span	52 in.

A NEW COLONIAL INDUSTRY:
THE SEASONING OF TIMBER.

A large number of influential gentlemen on Tuesday met at the hall of the City Bank to hear an explanation of the method of a patent now being introduced by Mr. Leon Resier, having for its object the seasoning of Australian timber. It has previously been the practice to pile timber and allow it to remain stored, but as this system occupies from a couple of months to several years the native timber industry has not hitherto been altogether a success. It is claimed that by Mr. Resier's process timber can be thoroughly seasoned and made fit for the most artistic woodwork in from six to eight days. The timber after being subjected to the process does not deteriorate, but rather improves, in quality, and after being put into use will not shrink, as does much of the timber at present used. Mr. Resier gave specimens of his efforts, and the professional and practical experts unhesitatingly pronounced the process to be a great success, Baron von Mueller, who was amongst those present examined the seasoned timber microscopically and tested it as to strength, subsequently expressing a very favourable opinion to the patentee. Baron von Mueller discussed the importance of the discovery to all the colonies, and said he believed an outlet which at present did not exist would be established through the means of the process in various parts of the world for Australasian timber. Mr. Resier was also complimented on his success by others of those present. Negotiations are pending to float a Company to work the patent on an extensive scale. As the manufacture of parquet requires the very best seasoned wood, several specimens of parquet, which were made in 10 days out of green timber, were shown. The new company is to be called the Australian Timber Seasoning and Parquet Manufacturing Company Limited, and the headquarters will be in Melbourne. Specimens of the wood can be seen at Garraway's Land Auction Rooms, Queen's-walk. Further information will be supplied by Mr. Resier, the patentee, or Messrs. A. D. Hunter and Co., Queen's-walk.—*Leader*.

THE ADULTERATION OF THE
ADULTERANTS.

A prosecution for adulteration lately disposed of by the Burton magistrates is far more suggestive than would at first sight appear. The defendant was a local grocer, whose "olive oil," under a little tender pressure, disclosed an indebtedness of 50 per cent. to the less suave product of the cotton-pod. The Bench appears to have been more or less satisfied with the retailer's personal *bona fides*, for it imposed only a nominal fine. But in the course of the proceedings the inspector who had instituted them gravely informed the magistrates that "it had come to the knowledge of the Government that cotton-seed oil was being imported into Italy on an extensive scale,"—of course for translation into the native growth of the olive-producing districts. As little more than eighteen months have elapsed since the British Consul at Leghorn reported exhaustively upon this fraud, the vigilance and activity of the authorities are worthy of commendation.

But while the official mind has been thus posting itself, the more nimble professors of adulteration have not been idle. The alliance between olive and cotton-seed oils is now complicated by the admission of "other and cheaper oils" to the compact. In the year 1883 two million and a half tons of cotton-seed (in excess of the amount required for planting) produced in the United States were practically wasted because the trade in the oil had not then been created. Today the demand for this product is so enormous that, even in the character of an adulterant it is itself

adulterated by the admixture of more questionable oils. In this respect cotton-seed oil has followed the exact course taken by chicory in its commercial connection with coffee. As soon as the English public had satisfied itself that coffee "as in France" was acceptable to the palate, and that a little chicory was perhaps an improvement, the demand for the addition speedily outran the supply. The chicory-root became too dear for profitable use, and one firm alone used several hundred tons of carrots and parsnips in adulterating it. But the public mind seems systematically unable to realize the fact of the second and far more serious substitution. It rests upon the old official platitude, "The public is cheated rather than poisoned." Reassured by analysis and reports upon the comparative innocence of the prime, or nominal, adulterant, it never occurs to many persons that this itself presently becomes the object of as much substitution as the original commodity. The principle involved will appear clearly in a tabulated form; though the following outline is given only by way of illustration, and not as being in any sense comprehensive even in respect of the articles mentioned:—

Ostensible Commodity.	Nominal Adulterant.	Actual Ingredients. Other and cheaper oils.
Olive oil....	Cotton-seed oil.....	Carrots, parsnips, ground date-stones, burnt maize, etc.
Coffee	Chicory	
Pepper	Ground olive-stones (poivrette)	Maize, flour, palm-kernel, dried potatoes, etc.
Butter	Animal fats and oils, justified as being made from the prime fat of healthy animals	Made from the refuse that cannot be more profitably disposed of.
Cheese		
Lard.....	Cotton-seed and other oils and fats	Stearine and "many deleterious stuffs."
Jams	"Inferior fruits"...	Vegetables substitutes of various kinds, gingelly seeds, and "jam colouring."
Raspberry Jelly ... }	"Fruit substitutes"...	Oil of vitriol, impure glucose, algine, aniline and raspberry ether.*
Honey	A syrup made from maize	Various straws treated with oxalic acid.

The manufacture of wine and spirits is far too complicated to be thus dealt with. But it follows the principles laid down. The public, and even the authorities themselves, are cajoled with a few leading adulterants, admittedly innocuous; while these are supplemented by a host of more or less injurious accessories, the application of which belongs to the innermost chemical secrets of the several trades. In the matter of wine it is distressing to learn that the worst practices prevail with regard to so-called "health-wines." So outrageous have been the proceedings of Spanish wine growers, that the Ministry of Public Works in Madrid has lately ordered the erection of twenty chemical laboratories in as many of the chief wine-producing districts. At this moment it is not very reassuring to be told by a writer upon the marvellous products of coal, that we can by means of some of them obtain "wine without grapes, beer without malt, preserves without either fruit or sugar, perfumes without flowers, and dyes without the vegetable or animal substances from which they have been hitherto chiefly derived."

America has been charged with practising adulteration on a larger scale than any other country. But, truth to tell, there is not much to choose between the New World and the Old. A report upon the "falsification of foods," lately published in Germany, discloses practices which it is to be feared are not confined to any particular country.

* "Hard to distinguish from a natural raspberry jelly."
—*American Analyst*.

The Poles, it appears, are adepts in the art. Of forty different samples of tea tested this year by the analysts at Warsaw, twenty were found to contain no trace of any kind of tea whatever. In Russia also the adulteration of provisions is assuming enormous dimensions; and one of the chief Moscow merchants was lately sentenced to banishment to Siberia for life, for having adulterated tea with 50 per cent of an injurious grass known as "kaporkee." As contrasted with our own long-sleeping system, which only occasionally rouses itself to the imposition of petty fines and no imprisonment, this sentence is almost startling in its severity.

Wherever and in whatever form it is pursued, the world-wide system of adulteration is based upon the indifference, and thrives upon the mistaken economy, of the public. In spite of our lavish outlay upon the luxuries of life there is an existing rage for cheapness in its necessities, and the mere cheapness betrays us. The poor invalid who imagines that a bottle of "fine old crusted," of assured vintage and maturity, is to be bought for two shillings wrongs his neighbour almost as much as himself. He is an upholder of that vast system of fraud with which neither science nor personal vigilance seems at present able to cope.—*St. James's Budget.*

NOTES ON TEA.

(*Home and Colonial Mail*, April 18th.)

Later on this year, says the *Grocer*, the home trade will probably have to face the question of the non-arrival of common congous on other than a trivial scale, and the question for them to solve will be whether India and Ceylon are now able (whatever they may be in the future) to provide a substitute for the very decent clean Saryunes, Yonghows, Seemoos, and other sorts of teas, now selling from 4d to 4½ per lb. All these teas brew a very good cup of tea, and when mixed with some of the cheap Indian pekoe at 7d per lb they make a surprisingly good and cheap beverage. These teas are not to be confounded with the rubbish, with a glazy back leaf of the old common congou style, which we used to get some years ago, and which was worthless stuff, and of no use for our wants of the present day; but the common congous lately sold are, many of them, of sappy, clean fruity flavour very useful and low in price.

Foochow has this year shipped us 11,000,000 lb (eleven millions of pounds) less than in 1888, and the shortage mainly consists of these low-priced grades; so it is quite possible a pinch may come later on for this class. Last Oct. or Nov. with only a little enquiry, the above teas rapidly advanced nearly a penny per pound, and for those who have a trade for the descriptions named it would be well if they were to bear in mind the present extraordinary value obtainable for such kinds. The reduced prices that have been ruling must do more than anything to "kill" the production of the cheapest grades; and this state of affairs seems foreshadowed in the reports just received from China, to the effect that the teamen there will confine their efforts to making good teas, leaving alone all common sorts, on which for years past they have been sustaining ruinous losses. Supplies from China for the season 1888-89 are now complete, with the exception of one shipment, so that the stocks of this description of tea will soon rapidly diminish, and the market will thus be better prepared for the new Monings and Kaisows when they arrive here about their usual time.

According to the *Daily Telegraph*, one of the latest forms of fumatory indulgence is the smoking of tea made up in the form of cigarettes. Only the choicest, and consequently most expensive, "leafs" are used. The smell of the burning Bohea or Souchong is anything but pleasing, though the effect on the nerves of the smoker is described as being singularly

soothing for the time being, but afterwards to be exactly the reverse. Ladies are the principal supporters of the new departure." We do not think this indulgence will materially increase the consumption of tea, although, if people wish to smoke the leaf, they had better be sure and secure it pure and unadulterated, and here Indian and Ceylon will have the preference.

MEDICAL VALUE OF VEGETABLES.—Celery, according to the *Hospital*, acts upon the nervous system, and is a cure for rheumatism and neuralgia. Tomatoes stimulate the liver, and spinach and the common dandelion, prepared in the same way, have a direct effect on diseases of the kidney. Onions, garlic, and olives promote digestion by stimulating the circulatory system, with the consequent increase of the saliva and gastric juice. Raw onions are also regarded as a remedy for sleeplessness, and the French believe that onion soup is an excellent tonic in cases of debility of the digestive organs.

A POSSIBLE COCONUT-GROWING AND TRADING COMPANY.—Amongst the passengers by the S. S. "Oceana," which arrived here last Sunday, was Mr. Cecil Millen, a London gentleman who comes here on behalf of a London Syndicate to make enquiries concerning our coconut-growing and trade. Of course, at such an early stage as this, it would be unwise for Mr. Millen to divulge too much; but we gather from him that the Syndicate he represents is composed of English capitalists, who propose acquiring estates, growing their own coconuts, running oil mills, and shipping on their account straight to Europe. Mr. Millen is here to make the preliminary arrangements, and expects he will be in Ceylon from four to six months, during which time he will gather particulars as to value of estates, producing capabilities, &c.; while he will also judge as to whether or not the venture is likely to be successful. He also thinks it likely that his Syndicate may go in for coconut-growing.—*Local "Times."*

THE PLANTERS' AND TRADERS' ASSOCIATION LTD.—The *London Gazette* contains the following announcement—

The Planters and Traders' Association Limited.

At an Extraordinary General Meeting of the Members of the abovenamed Association, duly convened and held at 165, Fenchurch-street, in the city of London, on the 21st day of March, 1889, the following extraordinary Resolution was duly passed:—

"That it has been proved to the satisfaction of this Meeting that the Association, by reason of its liabilities, cannot continue its business, and that it is advisable to wind up the same, and accordingly that the Association be wound up voluntarily."

And at the same meeting, Mr. Walton Fitzjames Turner, of the firm of Messrs. Fox, Greig, and Turner, of 20, Great Winchester-street, E. C., was appointed Liquidator for the purposes of such winding up.

W. C. SEARLE, Chairman.

Sir Roper Lethbridge, M. P., was the Chairman of the Directors of this now defunct Company.

MADRAS SPONGES.—The last number to hand of the "Annals and Magazine of Natural History" contains an interesting account of a collection of Sponges from the Gulf of Manaar, obtained in the neighbourhood of the Tuticorin Pearl Banks, last year, by Dr. Thurston, the Superintendent of the Madras Central Museum. Mr. Arthur Dendy, a specialist in this branch of Natural History, who was entrusted with the description of the collection, speaks highly of its scientific value, which is enhanced by the fact that Dr. Thurston had carefully preserved portions of the species in spirit, and kept a record of their colors in the living state, precautions which proved of great service in distinguishing the species, and investigating their minute anatomy. The collection comprises 24 determinable species, of which 14 are new to science, and 2 are represented by new varieties. Amongst the old species, there are several forms of very great interest, one of them being *Axinella tubulata*, a species hitherto scarcely known at all, while among the new species the most important is *Spongionella Nigra*.—*Madras Times.*

RICE CULTIVATION IN BRITISH
GUIANA.

BY THE HON. W. RUSSELL.

It is scarcely necessary to dwell upon the importance of a cereal which feeds three-fourths. I think of the entire population of the world, or to remind the members of this Society of the important part it plays in feeding a large bulk of the inhabitants of this colony, calling for no less a sum than £223,284.17.3 to be transferred from this colony to India in payment for this food supply. My purpose is to trace out the various steps taken to grow a home supply here, where both soil and climate are apparently more favourable for the plant than in any other part of the world.

In the year 1848 I first saw rice growing, in Berbice; and it affords the best illustration that I can give of rice cultivation on upland. I had been in pursuit of game on the 1st of August holiday, and the dogs gave tongue, indicating that the quarry was at bay in a high bullet tree reef; so with the "yackman," I made for the scene of yelping, and to my astonishment after struggling through a considerable distance of tangled bush I came upon an opening where a lovely green crop, something similar to an oat-field, met my view. The "yackman" himself, an African, at once pronounced it was rice, and told me that this was the labours of the "Timini" people, a race of Africans introduced by Messrs. Laing from New Providence, Nassau. Following up, we found a huge ant-eater backed up against a tree stump, keeping the dogs at bay. My companion soon made short work of the ant-eater, saying it was good meat. Everything is meat to the African huntsman. I now gave attention to the mode of planting this, to me, new plant; and in my after travels in the forests of the interior, I have seen ways of land tillage reminding me of those practised by the Timini rice growers. The forest is felled, all except the huge giants, and then after junking the branches and scattering them over the surface until they are dry, a fire is set, and the whole consumed except a few stumps and the larger pieces. The land in this condition is tickled with a pointed piece of hard-wood, or more generally by the never absent cutlass; a few grains of seed are dropped into holes, which are roughly covered up; and this is the whole work the husbandman bestows upon the land to cause it to produce an abundant crop of rice, maize, ochroes, pumpkins, and the various legumes, such as pea, bonavist, &c., &c. Such had evidently been the cultivation bestowed upon the rice fields in question, which must have been planted to gain the summer rains of June and July, and were then in August almost ready for the sickle.

Having reported my find to the managers—we had even then dual control—they were much interested in this work of industry on the part of the Africans, who had thus provided themselves with a food supply, at the cost of so little labour; and there was much talk about spreading the industry. The time came for reaping the rice, but unfortunately at the same time the cane fields required to be cut, and the rice cultivators could not be made to see that Massa's canes came before their rice. The consequence was that not only the rice growers, but the whole gang became disorganized. They stowed away the rice, tied in bundles over the collar beams to their cottages, until one or two fell in, and there was the mischief to play all round; and what was a short time previously considered a grand industry was now denounced as a perfect curse: for, African-like, while the rice held out, it was a case of pounding rice, and entirely neglecting the cane piece. I need not say that rice growing was put down, and the Timinians soon after removed to some new location.

I have gone somewhat fully into these my early recollections for two reasons. First it explains how rice may be induced on dry land to produce two crops per annum, by simply burning off rough herbage in the dry weather and sowing the seed with the first rain, say in May, in which case the

crop is ready for reaping in October; and in the same way, rice planted in first rains in November would be ready for the sickle in April. The rapidity of the rice growth chokes off all other indigenous weeds; hence there is no call for expensive weedings. Secondly, it shows what in my opinion has kept back the spread of rice cultivation, viz: sugar. While sugar commanded a high price in the markets of the world, the fact of this colony having unlimited room for the extension of sugar cultivation, and having a sparse population, most of whom preferred the planters' cash on the weekly pay day, to the insecurity and time required for rice or other food products to mature, besides risk of robbery, accounted for the small attention given to Minor Industries.

At the present time, with a supply of labourers more equal to the demand, and a dying-out of all gambling in connection with sugar, and when many of the introduced workers from India, China and Barbados, have been taught in this school of adversity that if they want to reap and eat, they must sow and labour, a new departure may be considered as having overtaken the colony.

The praiseworthy attempt made by Mr. Colving to grow rice on a large scale in Canal No I, and by the Company which started under such favourable circumstances at Vive-la-Force, both failed from similar causes—want of practical knowledge of the land and seasons, and also want of a water supply—to which I ought to add, the stubbornness and want of belief on the part of the labourer employed in carrying out details.

The next practical test came under my own observation and encouragement about 1865, when a couple of hill coolies asked me to allow them to have 16 acres in front of Edinburgh house for rice growing. Seeing the heavy work of breaking up the land, I suggested bullocks and the plough, to which they readily agreed, and when I thought I was doing a great thing in adding a couple of Yankee eagle ploughs to the oxen, they said in their looks "Poor buckra, he no sabe." Instead of my ploughs and harness, I found them with a mangrove root shaped into an Egyptian plough with a long stick leading up to the yoke, the latter being a straight courida stick with two holes bored at such distances from each end as to admit of two pins being driven through, one on each side of the bullock's neck; these were tied under the throat with a piece of string. When the team was ready to operate—and the way those coolies managed a pair of oxen direct out of the pasture was a sight worth seeing—they disturbed and worked up the surface of the land into such a puddle as would have disgusted an agriculturist from the old country, and made him think the land ruined for ever. Having reduced it into this state, a plank was set on edge, and with a pole extending to and fastened to the yoke, this blunt rake was hauled backwards and forwards until the surface was as smooth as a billiard table; water was of course admitted all through these operations. On a small paddock of about 4 square roods, was sown the seed rice, much as we see cabbage-seed planted in English gardening. By the time the land was reduced to the puddle above described, these seedlings were seven to eight inches high, and the seed bed being in a state of pulp, they were easily pulled up in handfuls of a dozen to each handful. These were conveyed to their final destination, and the operator separating a single stalk plunged his hand down some four or five inches into the puddle, and by a judicious turn of the hand, left the riceshoot firmly planted in the soil, each plant being set in squares nine by nine inches or thereabout. For the first few days the plants so pulled about looked drooping and seedy, but they did not remain long in this condition, for on the plant taking to its new position it began to throw out shoots more like leeks than a simple cereal. In a month's time the women and children went through and plucked out all indigenous weeds and grasses, and tying these into small handfuls, placed them under foot and firmly imbedded them in the soft soil, there to rot and form manure

for the rice crop. Water was let on from navigation canals at stated intervals, and when the water ran low, recourse was had to the basket with double strings, and the lift being next to nothing, it was astonishing how soon a couple of men could lay an acre under water. When the rice came into ear all the grain-eating birds flocked round the devoted patches, some of them sucking the milky fluid out of the embryo rice. The ryot was equal to the occasion, by planting a series of poles one at every 100 feet with the tops slightly bent, and a kerosine tin containing a few pebbles suspended to each pole; these were joined by an endless line to the outside of the field, and when an urchin gave a pull to the string, all the tin contents gave a sudden clatter, quite enough to dismay and frighten the most pert of the feathered tribe. While this was going on the two men betook themselves to preparing mortars and pestles and a barn ament harvest; the two span of bullocks having become so to say a part of the household, played with and caressed by the women and children.

Harvest arrived, with need of additional hands, to reap the crop while it was crisp and dry; and here came the first clash between manager and rice grower, the one wishing to keep his mill supplied, the other wanting to save his rice. I decided in favour of the rice grower, as the reaping was not likely to employ too long a time. The workers, with a small toothed reaping hook, smaller in size but much the same as the now obsolete tool formerly used for reaping in the old country, cut the head of grain off with about a foot of stalk, which being made into small sheaves after remaining in the sun for a time, were finally conveyed to the barn, a rough structure thatched with cane bands. A stake was driven into the ground at one end of the barn; by freely ramming the surrounding earth, a threshing floor was secured say about 12 feet in diameter. The bullocks were yoked close together and made to walk round this stake, while sheaf after sheaf was thrown under their feet and shaken up so as to bring every part under the tread of their feet. It was simply astonishing how quickly the grain was by this means separated from the straw, the paddy being from time to time swept into heaps and put into bags, for the winning operations. This was done in a clear space, exposed to the wind, by the well known ancient system of letting fall from a sieve. The paddy once ready for market, a ready sale for it was found on the estate.

Harvest over, water was let on, and a fine ratoon crop came up as by magic, little inferior to the first. After reaping this crop, the land was again treated in exactly the same way by puddling as at first, of course the work being much easier.

For want of labour, in 1872 the rice cultivation ended. The whole of the above description can be applied to the venture in rice cultivation which has been carried on for several seasons on Novar and Dundee, in the Abary district, by the coolie proprietors of those estates.

While I was watching the rice industry on the West Coast, the late Mr. Bascom at Anna Regina tried a most interesting experiment among the Chinese of that estate. To gain a reservoir supply of water for his gang and machinery, he constructed that grand reservoir, one of the sights of Anna Regina; a two feet earthenware pipe was placed, conducting the water from Quackabooka which stands at a high level, under ground and through the Chinese quarters. Now, Chin Chin was not slow to grasp the situation, and, unknown to Mr. Bascom, uncovered the pipe, drilled a hole in it, inserted a bamboo, and by that means secured a never-failing supply of water for his gardens which were then covered with eddoes and other vegetables. Having secured water, they set to work in true Chinese fashion, and reduced the height of the land, by digging out certain areas and raising others, making the garden ground what it remains to this day—a picture of Chinese rural scenery. The low plots produce the most magnificent rice and have continued to do so for at least 13 years without rest; and a reason for this may be found in the following passage from De Bow's review:—"The Chinese, who pay the greatest attention to the cultivation of rice

manure their land with all sorts of filth, dung, &c. They preserve all with the scrapings of pig's hair, the barbers carefully preserving the human hair, which is no small quantity where the head is shaved, and the cultivators of the soil readily purchase this compost at a penny per pound and barges are to be seen on the canals entirely laden with nothing else. The Chinese cultivators look upon hair, of whatever nature, as of extreme value in rice cultivation. It is not unusual for them to mix lime with the water of irrigation, which they consider draws off insects and gives warmth to the ground."

Those whose pass to the leeward of the Chinese gardens of Anna Regina in the spring time will readily recognise that this peculiar habit of conserving manurials has not been forgotten in British Guiana. Although the Chinese thus carry out their inborn habit of allowing no matter to go to waste, I do not think the rice plant in the deep rich soil of this colony really calls for manure. We see crop after crop raised on the same land, with a tendency towards improvement rather than a falling off; and when we see the luxuriant crops grown in the bottom of canals where the soil is far under atmospheric influence, this alone shows how well our soil is adapted for rice. By the way, there is a considerable area of fine rice grown in many districts of the colony in navigable canals, when these are out of use. Some planters object, because of the tendency of the sides of a dry canal to break in, and there is reason in this objection. The canal bottoms are specially suitable for a paddy garden because of the ease of irrigation.

These Anna Regina garden lands have been held rent free, being simply the garden grounds attached to the cottages. For several years past the industry has been spreading, the waters of the Quack-a-booka, a fresh water canal, having been laid under contribution; and on the coolies applying for land on which to grow rice on a sound tenure, Mr. Gilzean very readily acceded to their demands, and now there are over 200 acres—it will in a few months be 300—of grand paddy fields adding quite a charm to the surrounding scenery. Before explaining the mode of dealing with Anna Regina paddy fields, I must ask you to allow me to turn for a moment to what I shall denominate "Manna Rice," or that grown in a semi-wild state on the savannahs of the East Coast. The idea of a spontaneous spread of this growth from particles let fall by labourers when working on service canals might have been entertained had these people carried paddy, instead of rice prepared for the pot, which latter is the condition in which all rice is used as food, and is no longer in a condition to germinate. The fact is, small patches of rice have been grown on spots since the East Coast water scheme brought the savannahs into notice; and the fires of '82, '83, and '84 having cleared off all the rough herbage, ferns, &c., &c., the state of the land naturally invited the rice growers to extend their operations, which they did to some effect.

The land behind the La Bonne Intention is very favourable for this wild system of cultivation, as the canal which I dug to gain water has a trunk or syphon underneath the main service canal by which the water behind that section of coast can be regulated. The water connection being continuous, by the navigable canals direct to the sea, to relieve the rice growers' lands throws no additional strain on the drainage of the estate, but rather does good, by keeping the channel open. In this way, every dry season, the water can be lowered to allow of harvesting and burning off the rough surface preparatory for another sowing. In the figures supplied by Mr. Imlach it must be clearly understood that they relate to semi-wild cultivation, as follows:—

A bag of rice for seed will plant about 4	
acres, and costs	\$ 2 40
Weeding and burning	8 00
Planting 1 day 1 man	24
Raping, 4 strong men, 6 days at 52c.	12 48
Threshing and cleaning	96
	<hr/>
	\$ 24 08

Gives in a good season 30 bags rice at \$2 40	72 00
or \$12 00 per acre, in 6 months, profit	47 92
If they clean this rice it will give 15 bags and will cost:	
Growing	\$ 23 12
Cleaning	19 32
	42 32
15 bags cleaned at 32 cents per gallon, equal to \$6.40 per bag, White Rice	96 00

Profit \$ 53 68

The cost for scaring birds in the savannah is nil, the only birds to be seen are a species of wader resembling at a distance "Negro Oop," and they are now harmless.

In putting a price on rice grown on the East Coast, the local selling value for paddy was given; the cleaned rice is white, such as you see on the table, which is sold retail at 36 cents per gallon. I may mention that the command of water to let off and on at pleasure is of vital importance, when attempting to grow anything in such pegass land, which burns up in dry weather to a ciuder.

Turning now to Anna Regina, as the most perfect mode of cultivating rice, entirely by spade and hoe, that I have seen or read of, the arrangement is as follows:—As to the land, the abandoned cane fields, by preference in the lowest lying section of the properties, find most favour, as being the more readily put under water from the navigable canal. The arrangement is eight months rent free; at the expiration of that term \$23.04 annually is paid in monthly instalments. An arrangement which refers more to the question of immigration is also entered into by which three days per week labour when called upon counts half rental, but for the object of this paper I confine myself to the ordinary tenants' agreement of \$23.04 per annum, of course, including water.

The rice farmer, having signed his agreement, enters upon possession, and when land carries sage, waka-baki, and such like, it is preferred, as the land is in better heart than where simple nut and bahama grass forms a complete sod. The bush is now all chopped down with cutlass, and the cuttings when dry are partly carried away for fuel to cook food and the remainder is burned where it lies.

The beds are what are known as round ridged, the small drain in many cases forming a hollow 6 feet at surface, 2 feet at bottom and 4 feet deep. The workman begins by reversing the order of cane culture, and delves the entire surface with all its noxious grasses a foot deep, and buries all in the drains which cost the sugar planters so much to dig. This work at once gets rid of all grass, and the hoe is set to work to chop the ground quite fine to a depth of 4 to 5 inches; water is now let on, and the whole made into a puddle exactly as I have already described at Edinburgh; in fact, the after treatment is exactly the same, and in every way resembles the best system carried out in South Carolina.

The Anna Regina paddy farmers seldom grow a ratoon crop, being satisfied to reap 3 full crops in the year after the preparation and planting. In the eight months allowed rent free first year, they establish and reap one crop, and have another well established, which covers preliminary heavy work in levelling down, &c., &c.

Mr. McPhail, to whom I am indebted for the following figures, writes as follows:—"The first year when the beds have to be levelled, this process alone costing \$16 and \$20, they only secure one full crop, though the second is well established. It is fair to take up the working expenses at this stage, and I may add that the farmers who have prepared the land best are the most willing to pay rent punctually. The land with stubble is burnt off and hoed up, and converted into a proper puddle for receiving the rice plants, which are grown in a nursery. Such a nursery can be prepared for 82 cents. Nine strong women or very ordinary lads can dibble one acre in a day, and the same number can reap the grain

with ordinary grass knives. The birds are kept off by scarecrows, and children knock a tin pan, for which an allowance of \$1.20 per acre may be allowed; weeding and burying the grass and other stray plants, \$1.50 per acre; heading, carrying to barn, threshing and dressing for market, including sack, 15 cents per bag. Thus summing up 1 acre 1 crop:—

½ Bag rice, preparing nursery... ..	\$ 0 82
Cutling and burning stubble	2 00
Hoeing up the seed bed	2 00
Dibbling from nursery, 9 women 24 cents	2 16
Weeding young crop	1 25
Driving birds, &c.	1 47
Reaping, men at 24 cents	1 90
Heading to barn, threshing, dressing and bags, 20 boys at 15 cents	3 00

Cost on crop \$ 14 60

3 crops, one year's expenses \$ 43 80

Rent... .. 23 04

Total cost per acre \$ 66 84

By 3 crops, at 20 bags each, 60 at \$2 \$120 00

Clear gain \$ 53 16

This leaves a fair margin of profit for the labour expended and I feel well within the mark in all my prices.

I think these figures show that I was warranted in stating that "given water, rice can be grown in British Guiana to drive out the imported article." I have carefully studied the question of rice growing as far as I can find it laid down in books, and while 2 crops in a year is considered a wonderful yield in China, Japan, India, America and elsewhere, here we have well authenticated records of 3 crops in the year, and if ratoon crops were taken into account it would raise the return to 5 crops. Twenty-three dollars rent per annum is out of all proportion to the selling value of land. Multiply that sum by 75,000 acres in cane cultivation \$1,728,000? If the land owners could realize half that sum by their canefields, there would be no cry of hard times.

Turning to improvements in threshing and dressing grain, my friend Mr. Cornish has suggested certain minor appliances to deal with the rice in small quantities for local consumption which I have sent for. There have been no end of patents for cleaning rice, but all seem to fail. I have myself introduced one machine by Wilson of London which played such havoc with the rice that it had to be given up. The late Mr. Over introduced a card machine shod with bent steel wire fixed into a band, which ran at a high velocity against a plain roller; but this also failed. So I am afraid there is no high road to rice cleaning. It must just be subjected to mill stones for breaking the rough crust and then to stamps, such as are in use in large rice cleaning factories in Europe; where by the way, all rice is received from the East in the paddy state, as the husk prevents destruction by weevils.

The following description of rice preparation is from De Bow's Review, and embraces the most complete treatment of the subject that I have come across:—

Process of Preparation.—The stones which are used for grinding rice should be five to six feet two inches, diameter, and eighteen inches thick at the centre.

"The whole process of preparation may be described as follows:—From a shed attached to the mill house the rough rice is taken by means of elevators up to the highest apartment in the building, to be passed through a sand screen revolving nearly horizontally, which in sifting out the grit and small grain rice, separates also all foreign bodies and such heads of rice as were not duly threshed.

"From the sand screen the sifted rough of large size is conveyed directly to the stones on the same floor, where the husk is broken and ground off, thence to a wind-fan below, where the chaff is separated and blown off. The grain is now deposited in a long tin placed over the pestle shaft, and corresponding in length with it, whence the ground rice is delivered by wooden-conductors into the mortars on the ground floor

These mortars are constructed of four pieces of the heart of pine seasoned. They are in figure a little more than a semi-ellipsoid and are made to contain four and a half bushels of ground rice each.

"The pestles, also constructed of the heart of pine and corresponding in number and position with the mortars, are sheathed at foot with sheet iron, partially perforated from within by some blunt instrument, so as to resemble the rough surface of a grater. They are intended to weigh each 240 to 280 lb or thereabout, are lifted by levers six feet long attached to the large pestle shaft and make about forty-five strokes in a minute. A mortar of rice is sufficiently pounded in one hour and forty minutes to two hours. The grain thus pounded is again elevated to the upper floor to be passed through a long horizontal rolling screen slightly depressed at one end, where by a system of grading wire-sieves, becoming coarser and coarser towards the lower end, are separated first the flour, second the small rice, third the middling rice, fourth and last the prime rice which falls through the largest web, and forthwith descends to the polishing or brushing screen below, whence it descends through a fan into the barrel on the first floor, where it is packed, and the preparation is completed. The head rice or largest grains of all, together with rough unbroken by the stones, pass off at the lower end of the screen to be pounded over.

"The brushing screen consist of a vertical cylinder or drum, two feet in diameter, by from four and a half to six feet in height, to the surface of which are attached, vertically, shred of sheepskin closely packed; this drum is made to revolve with great velocity within and lightly brushing a cylindrical frame of iron wire made into a fine sieve. In passing down spirally between this clothed drum and the exterior cylindrical wire sieve, the grains are relieved of the particles of flour, which still adhere to them, and which are brushed off by the wool and forced out through the meshes of the wire. The rice thus brushed clean and polished against the wire is packed into barrels constructed of pine staves to contain six cwt. net. The middling and small rice is passed through a fan which blows off from the flour into an apartment kept for that purpose."

In this colony the Chinese have introduced a sort of "quern" with stones, where such can be found; and when not they make a circular casting in clay similar in appearance to a centrifugal machine, letting in pieces of hardwood in such a way that when the centre revolves, rice falls between the outer casing and revolving centre, and the husk is partially broken. Then it is winnowed; the clean rice separated, and grain with husk only cracked is transferred to mortar and pestle, which is an ordinary foo-foo mortar sunk in the ground acted upon by a shod pestle with ferule projecting a little below the wood. The pestle is fixed into a solid beam and this is again fixed on a pivot with the determination of weight towards the mortar. A man or woman at the far end of this lever by means of the foot depresses that end, when the other end rises in like proportion and is then allowed to drop with force upon the rice. Another winnowing, and the rice is ready for market. When brown rice is the aim, the paddy is scalded with boiling water. This swells the grain, and in drying the skin cracks and leaves the kernel much easier to clean than when white rice is the aim. Of course the oil stains the grain, hence brown colour.

In a paper of this nature, treating of such an important agricultural product, it is proper that some allusion should be made to the area of land available for prosecuting the industry. I might spread my hands along the entire delta, from Oorentyn to Barima, and say, wherever water can be stored against brought for purposes of irrigation, there rice can be grown to advantage.

The lower Essequibo coast may be now looked upon as the centre of the industry. Coming further up to that grand well-watered district embraced by the Itooribiscie and Supenam Creeks, rice growing has already taken hold; but the want of water in times of drought causes it to languish. Place barrages across those two creeks, and cause the water to spread along the face of the district as now so well accomp-

lished on the Boerasirie on the West Coast, and the Lama and its tributaries on the East Coast, and the finest rice fields in the world would be opened up. Huist-te-Dieren was selected for a coolie settlement, simply because of its proximity to the Itooribiscie, and the natural formation of the land along the whole of that estate, and that district, which is laid off in terraces by ancient tidal action, affording swamps suitable for rice cultivation, alternately with bands of high loamy land fit for the growth of vegetables calling for drained soil.

The districts embraced by Mahaicony and Abary Creeks are exactly the same; and allusion has already been made to the praiseworthy start made by the East Indian proprietors of Novar and Dundee.

The Canje Creek has long been noted for the superior quality of rice grown on its banks high up country. Within the last few years, the abandoned estate *Prospect* has been taken up by Indian rice growers, and considering the meagre supply of water at their command, they have done wonders, and now with a supply of fresh water from beyond the salt-water compartment of the creek, the whole of the abandoned estates on the right bank will be fit for rice.

From the valuable reports which are furnished to the Agricultural Bureau of the United States by their consular agents from all parts of the world, I cannot forbear transmitting the concise report of the Honorable Horace Capron, written in 1873 on rice culture in Japan, as it is so analogous in many respects to what one finds in the rice gardens of this colony, especially those belonging to the Chinese. I have not been to Hopetown, Camoonie Creek, for years now; but when last there the surface of the land and work done was exactly as described as prevailing in Japan.

The concluding paragraph of this report is so to the point that I copy it. There is nothing in all the agriculture of our country that can compare with Japan. The *grand secret* is, drainage, irrigation, economy and use of fertilizers, and thorough tillage.—

"Rice is the staple crop of Japan. In the present state of the census reports it is impossible to give the exact acreage of rice. The report of 1870 places the number of acres at 8,000,000. Whether the area devoted to cultivation is increasing or not, it is impossible to tell. The production has been controlled entirely in the past by the home demand. Now, that the Imperial edict forbidding its export has been repealed, the production will be stimulated by the world's demand.

"The last 'Red Book' of the Tycoon gives the total income of the Daimios, which was always paid in rice, at 6,000,000,000 pounds, or 111,000,000 bushels. This did not include the income of the Mikado's court at Kieto, for the support of which the income of the five richest provinces of the Empire was set apart. Thus the rice product was able to pay a tax of from seven to eight billions annually. Ninety five per cent. of the rice of Japan is low-land rice; almost the whole of the valley land is devoted to rice growing. It is the richest soil, and is the best adapted to irrigation. The land is divided into small lots, scarcely ever more than an acre in one lot, and often less than one quarter that amount, and banked. This is thoroughly levelled, so as to be entirely flooded. All the soil removed in levelling is put on a lesser space adjoining, which is planted in vegetables. The rice-ground is thoroughly flooded over several times, on different days, in April, after which it is dug up with a heavy hoe. This hoe or spud is unlike any civilized implement. The blade is about 16 inches long and 4 inches wide and will weigh from 6 to 8 pounds. The handle is 5 feet long. With a powerful blow it is sunk the full length of the blade into the soft soil, and with the long leverage of the handle a large amount of earth is lifted up and turned over. This process is slow, but it leaves the soil in a much better condition than can any plow. At 12½ cents as the whole cost of a day's labour, it does not cost much more to dig up an acre of *tilled land* to this depth than it does to plow an acre with us. In May, the seed-

rice—about one and a half bushels, is put upon an acre—is first sown upon a small piece of ground. The 5th day of June is the national thanksgiving (transplanting) day when these thickly sown stalks are pulled up and transplanted in the rice paddy, where it is grown, the soil having been prepared by thorough flooding, till it is completely saturated. After the transplanting it is again flooded, and while in this condition 800 pounds of rape seed oil cake, or sardine oil cake thoroughly pulverized, and costing \$8 to \$12, is sown to the acre. The water is then turned off, leaving this soaked fertilizer at the root of the rice stalks. After frequent flooding during the summer, it is harvested in October. It is cut with a sickle something like a corn-knife, bound in bundles, and carried to high grounds, dried, and threshed at leisure, or rather shelled by drawing the heads of a small handful through a crude heckle. The cleaning or winnowing is done by pouring the rice from a basket or bucket upon mats by one person, while another fans it with a large paper fan.

All this work of cutting, binding, shelling, and cleaning is done by women, who, while cutting and binding, stand bare-legged in the water 10 to 12 inches deep. The rice is then put into small straw bags, about 130 lb in each, and sent to the mills on the backs of men or horses, where it is hulled by water-power, or by the primitive mortar and pestle worked by the feet. From the interior, horses are used to carry the rice, 300 pounds being the average load to a horse. A good horse, with a man to lead him, will earn 50 cents a day, out of which the man is fed and the horse fed and shod.

The average yield is 50 bushels to the acre, and the average weight of lowland rice is $55\frac{1}{2}$ pounds to the bushel, making 2,666 $\frac{1}{2}$ pounds to the acre. It requires 80 days' labour to each acre from the first flooding till the rice is marketed.

The result per acre of rice-raising can be stated as follows:—Labour: \$18; manure, \$8; interest on \$100 @ 10 per cent., \$10; total cost, \$36; 2,666 $\frac{1}{2}$ pounds of rice at 2 $\frac{1}{2}$ cents, \$66,66 $\frac{1}{2}$; total profit, \$30,66 $\frac{1}{2}$.

If the above was a real profit, the farmer could make a favourable showing; but the Government tax is claimed by the farmers to be 50 per cent. of this profit, leaving only \$17 to \$18 per acre.

As I remarked before, 10 acres is a large amount for one proprietor, and many have one acre or less. The upland rice is sown at the same time, and flooded and manured in the same manner; but the yield is far less and the profits proportionately small. The lowlands rest during the winter, but the uplands are immediately dug up and fertilized with rice, bran, or hulls, or horse-manure, rice-straw, or liquid manure from water closets, at a cost of about \$4. to the acre and shown in wheat or barley.

I trust that in this paper I have brought together trustworthy information to guide those who may throw their energies into rice. All the work required is of so light a nature that women and children may find employment at it; and I see no reason why bullocks may not be pressed into the service in the rougher manipulation of the land. In all my remarks, I allude to small cultivators, there being no restriction to the size of the plots; it may be a square rood, or an acre, or a company with a thousand acres.

I take this opportunity of thanking all the gentlemen who have assisted me with reliable information connected with the subject under consideration, especially Mr. Imlach of la Bonne Intention and Mr. McPhail of Anna Regina.

By A. R. GILZEAN.

Some twenty-two years ago an East Indian immigrant on Plantation *Leonora*, cultivated about twenty acres of the front lands of that estate for the growth of rice. He used a bullock-plough for the preparation of the land, and, as far as I can remember, he succeeded in raising good crops. After working for a couple of years he abandoned it, but for what reason

I do not know. I do know, however, that the proportion of the crop which he gave the estate, in the shape of paddy, as rent for the land, was not cleaned for use. Labour was so dear then that it did not pay to clean the rice. About the same time an experiment was made in rice-growing on a large scale at Plantation *Vive-la-Force*. It failed owing to the difficulty and expense of the cleaning operation. A machine was imported for the purpose, but like all the small rice-cleaning machines of which I have ever heard it was not a success.

The East Indian and Chinese immigrants in various parts of the colony, have from time to time planted rice in the estate's navigation trenches and the open savannahs, but with varying success, meeting with great discouragement through the loss of crops from floods and drought.

Sixteen years ago the Chinese on Plantation *Anna Regina* obtained leave from Mr. G. H. Bascom, the manager of the estate, to tap a pipe which supplied fresh water to the factory. With this means of irrigating five acres of low land adjoining their dwellings, they succeeded in raising excellent crops of rice; and, from that day to this, this piece of land has been diligently cultivated. It has yielded on an average three crops of rice a year; and with no rotation of crops and no rest, the land shews no falling off in yield after all these years. No rent has ever been charged for this plot, nor has any charge been made for the supply of water, so that the only deduction that could be made from the success of its cultivation, was, that such land with such a supply of water could be made to yield excellent crops of rice with the utmost regularity and perfectly independently of seasons.

In 1884 I induced two free East Indian immigrants to lease 30 acres of the adjoining land at a yearly rent of six dollars per acre. They sub-let the land in lots of a quarter of an acre upwards. The cultivation was so successful that applications for more land soon began to pour in; and although I raised the rent, including of course a continuous supply of fresh water, to twenty-four dollars per year an acre, I soon had nearly 300 acres taken up. Contracts were entered into with a large number of free immigrants living in the villages in front of the estates, giving each man half an acre, at half price, on condition that he worked on the estates, when called on, for 3 days in a week at current rates; and this arrangement worked most satisfactorily for some time. At the time that so much land was taken up, wages were very low, and they continued to be comparatively so until the very heavy season set in at the end of last year, when the sugar estates had to raise wages to attract labourers to re-establish the cane cultivation which was nearly drowned out. At the same time the rice-growers were suffering from a plague of rats which were doing great damage to their crops. The consequence was that the rice cultivation was practically suspended for about six months. When, however, wages became normal, the labourers again turned their attention to rice, and to-day over 100 acres are in full cultivation, while every day some more is being planted. Very little labour is required to re-establish the cultivation of a bed which has ever been prepared for rice, and the lease of such a bed although subject to rent, with no cultivation on it, is a marketable commodity.

Mr. Winter, the proprietor of *Coffee Grove*, has leased a good deal of his front lands to immigrants for rice cultivation, and it presents a very handsome and healthy appearance. I have heard of no other systematic, or comparatively permanent attempts at rice-growing on a large scale in the colony. No doubt a large quantity of rice is raised in the savannahs, and in some instances with good results; but the difficulty of regulating the supply of water must be ruinous in many cases.

Having given this sketch of the districts of the rice industry in the colony to the best of my knowledge, I now proceed to describe the mode of cultivation, with its cost. The front lands of *Anna Regina* and *Coffee Grove* on which rice is grown, are very low, their average level being 50 Georgetown Datum, or about 2 feet under

the level of the water in navigation trenches. The trenches are supplied with water from the Tapacooma lake, and the supply has never failed. The fields were formerly in cane cultivation, but the land was not suitable for it, as the canes used to suffer from the slightest drought. The preparation of the land for rice necessitated the filling up of the old drains, and the formation of little ridges or smouses, about 18 inches wide and 6 inches high, separating each man's lot from his neighbour's. This is done by agricultural forks and shovels, and costs about \$15 an acre. When a plot has been roughly levelled, water is let on to it from the navigation trench, and the whole surface is then thoroughly levelled and puddled, at a further cost of \$5 an acre. It is then allowed to remain covered with a few inches of water until all the grass and weeds are killed out. In some convenient corner, a patch of about 10 feet square is raised a few inches above the water level, and the ground is thoroughly pulverized; and to give plants for an acre, this patch is thickly sown with 6 gallons of paddy, costing 72 cents. In 4 weeks it gives a thick growth of young rice-plants about 12 inches high, having been carefully watered every day. The plants are then pulled up by the roots and tied into bundles. The seedlings from these bundles are stuck by hand into the mud in the levelled plots, two or three together, about 10 inches apart, with wonderful regularity, and they present the appearance of corn sown with machines in other countries. It takes a man 16 days to plant an acre, and a day's pay for this work is 32 cents. After the transplanting, no further care is given beyond attending to the supply of water which should cover the ground an inch in depth, until the grain ripens. This happens about 3 months after transplanting. When there were only a few acres in rice on *Anna Regina*, some one had to attend to each patch all day to keep off the birds while the grain was ripening; but since the cultivation has been extended, this has become unnecessary, as the birds do not seem to have increased in numbers—at all events, in no proportion to the cultivation. When the rice is ripe, the ears are picked with the top of the stalk, the straw being left standing. The cost of this operation is \$2.40 an acre. The yield of the first crop is more uncertain than the following ones, but the average may be safely put down at 20 bags of paddy, each weighing 100 lb. The grain is threshed out on a piece of levelled ground covered with hard mud, and it is separated from the husk by dropping it slowly from a height of 3 or 4 feet in a light breeze. This costs 4 cents a bag of paddy. Up to this time no rent is paid for the land, and the cost of the first levelling is capital which can always be recovered by the first occupant of a bed from the next one, so I take neither of these items into account in estimating the profit of the first crop.

The value of 20 bags of paddy is	...	\$38 40
The cost of procuring them,		
Final levelling and puddling	...	\$5 00
Plants	...	0 72
Transplanting	...	5 12
Attending to water supply, &c.	...	3 00
Reaping 20 bags at 12c.	...	2 40
Threshing & winnowing	...	80
		\$17 04

Showing a profit, on 3 months' work, of \$21 36

Sometimes the straw is cut down close to the ground, and a second crop allowed to come up from the old roots, but it gives a poor yield; and as a heavy rent has to be met after the first crop, this second crop is seldom taken. Instead of that, the straw is cut off, and the roots hoed up and puddled with the feet, the operation costing about the same sum as the final levelling for the first crop. The ground is now ready for the reception of fresh plants which have been grown in the nursery in anticipation; and the transplanting and following operations are the same as were those for the first crop. The monotony of these operations is never varied, and one crop succeeds another, as the years roll on. The return from an acre is about 20 bags of paddy from each crop; while three crops

can be grown comfortably in a year. As the rent for each crop would therefore be eight dollars, this would still leave a profit of \$13.36 a crop.

These calculations are made on the assumption that the land is worked by hired labour, whereas it is usually done by the lessee in his spare time. A good man can thoroughly cultivate half an acre of rice in 100 days a year. The work is very congenial to East Indian immigrants, and the regular supply of water is a great charm after their experience in this respect in India. For comparison with what I have written about their constant supply of water, I will quote what H. B. Proctor writes in a pamphlet on rice, reprinted from *The Miller*, 1882, with reference to the crop in Burmah:—

"Where so much depends upon rainfall it is no exaggeration to say that an inch or so of water, more or less, determines whether the receding flood shall leave a bright fertile plain full of promise, or a ruined waste of drowned and rotted crops. With a late and heavy monsoon, thousands of acres are sometimes submerged and the crops ruined; should the floods, however, not be too late in the season, the ground is replanted a second time, and sometimes a third time, and the cultivator possibly saves his harvest. In 1876-7 the crops were ruined by floods over no less than 171,000 acres, entailing great suffering on the people."

In that country only one crop is raised in a year, and as all of the planting has to be done at one time, a great strain is thrown on the labour market. Here, as I have stated, three crops can be raised in a year, and no attention whatever has had to be paid to the seasons. It is not at all uncommon to see here one acre with four or five crops of different ages on it.

The limits of this article do not allow of my going very deeply into the question of rice-cleaning. It is done here by pounding the rice in a mortar, the pestle of which is attached to a lever worked by a man's foot. The cost of converting two bags of paddy into one of very well cleaned rice, is about two shillings. I have gone to a great deal of trouble in searching for a machine to clean rice on a comparatively small scale, but can hear of none that is working satisfactorily. Some idea of the difficulty of constructing such a machine may be gathered from the following list of separate and distinct machines used in a rice-cleaning mill in Liverpool: Sieve and Aspirator, Shelling Stones, Scouring Machines, Blower, Decorticators one or more in succession, Blower, Polishers in succession, Blower and Sieve. The Liverpool rice-mills are not constructed so as to be able to deal with paddy. What is cleaned there is called "cargo rice," which is about four parts of clean rice and one part of paddy. All of the cargo rice is shelled and milled in large mills at the rice ports in Burmah, India, &c. When enough rice is grown in the colony to meet its consumption of 250,000 bags, there will be plenty of work for a good mill, but until then I fear we must keep to the primitive "stamper-pot," as the rice mortar is called.

There are infinite varieties of rice (over 200 at all events) cultivated in different parts of the world. In England about 92 per cent. of the consumption is obtained from India, and last year it was worth about 6/6 a cwt. in the shape of cargo rice. The other 8 per cent. is obtained from Patna, Java and Japan, and was worth last year about 12/ a cwt. A sample of the rice grown on *Anna Regina*, which is the same as that grown almost universally in this part of the colony, was cleaned in Liverpool and shewn there in the Exhibition of last year. It closely resembled the finest samples of Java and Italian rice, which are considered the most desirable; and it was very highly thought of by the miller who reported on it. He thought it was wasted in feeding the labourers here who would not appreciate its value, as the English consumer would, at double that of ordinary rice. For some reason, which I have not been able to discover, this kind of rice cannot be grown in the great rice-producing parts of India. There is no difficulty whatever about growing it here, and this is a very great point in considering rice as a future industr

of the colony. When one considers the difficulties under which rice is made to pay in other places, it seems likely that it would succeed here on the low lands that have a supply of water for irrigation. Having seen the disappointment caused by the want of a sufficient supply of water, I should always be particular in ascertaining before giving out land for rice cultivation, that it was below the lowest level of the canal from which it is to be supplied with water.

Whether or not the cultivation of rice in this colony will ever stand as an industry by itself, there is no doubt whatever that it is a very desirable adjunct to cane cultivation. Now that there is a tendency to concentrate the season for reaping canes into a few months at the end of the year, there is some difficulty in finding employment for the gangs in the slack season. Rice-growing seems to be the very thing meets the difficulty, since a crop can be taken off in such a short time. As I have shewn, a good crop of rice can pay a heavy rent and give remunerative and congenial employment to the labourer; and the profit which is made on a good crop is quite sufficient to counterbalance the chance of a bad one.

Steam cultivation, and reaping and threshing machines, may be enlisted in the development of the industry, and it may some day become the great industry of the colony. The formation of the coast lands is eminently suited for it, and the only thing that is required is a constant supply of water for irrigation — *Timchri*.

THE COCOA INDUSTRY AND INSECT PESTS.

One of the most pleasing and promising features in connection with the minor industries of the colony, has been the rapid development of, and advance in, an export trade in Cocoa. In 1886, which was the first year of export, the quantity amounted to less than 2,000 lb., while in 1887, it has amounted to more than 13,000 lb. The markedly high appreciation, by English experts, of the British Guiana cocoa and the prices realisable, give promise not only of a continuous successful development, but of a chance of ousting the hitherto more successful competitors from the first place in the market, when the best methods of preparation, on which its appreciation will really depend, have been adopted and become normally recognised. The Government Botanist has already, in his annual report, pointed out the special adaptability of this colony for the successful growth of cocoa—an opinion fully borne out by the quality of that which has been already produced and reported upon—and the special suitability of the industry for agriculturists of limited means; and it is to be hoped that the industry which has received such an impetus at its start will attract the attention which it deserves in the colony. That the cocoa plants are preyed upon by certain pests, is doubtless already well-known. Mr. Jenman, in the report referred to above, mentions a fungous disease, as occurring on plants from the Demerara river, though he was inclined to believe that the fungous growth was the result rather than the cause of the unhealthy condition of the trees. Some time ago Mr. R. J. Kelly shewed me a pod which had been eaten through on one side, and was infested within with flies, producing quite an unpleasant odour; but from the nature of the opening it seemed that some other being had eaten away a portion of the pod, and that the flies had but taken advantage of the opening to make themselves at home. A really serious pest to the cocoa plants, however, exists in certain forms of beetles, the young grubs or "worms" of which bite into the young shoots and bore along the pithy centre of the plants, gradually causing them to wither away until the tree is killed. This "disease" is, I have heard, extremely prevalent in the cocoa plantations in Surinam, and during this last year has been found, though not to any serious extent, in the Essequebo cocoa plantation belonging to Mr. William Smith. Through the kindness of Mr. Bosch-Reitz, through whom the matter was first brought under my notice, I have been supplied with the three stages of the insects which thus attack these

plants in Surinam, and from the resemblance of their grub-forms to those obtained from the Essequebo plantation, it is most probable that the adult forms are identical in the two cases; though as I have not yet been able to obtain adult forms from Essequebo, I cannot express any certainty in the matter. The method of operation in the two cases is at any rate the same. The young shoots or branches are primarily attacked; these wither away, and the death of the tree follows unless steps are taken to chop off the infested parts. When these damaged shoots are examined, it is found that the grubs, which are yellowish-brown or whitish, thick, maggot-like worms, from one to two inches in length, and with extremely strong biting jaws, have bored through the central delicate tissue, the point of access being generally situated towards the basal part of the shoot, where a scarcely visible gummy exudation indicates the puncture or perforation made. The adult forms brought for me by Mr. Bosch-Reitz from Surinam, belong to two species, and specimens of each of these have been exhibited before the Royal Agricultural and Commercial Society and are now exhibited in the Museum. They are both Longicorn beetles; that is, they possess long, jointed feelers or *antenne* on the head, and these are carried like horns. One form, the smaller, is black, rather short and broad, and with longitudinal lines or *striae*, like small ridges; the other is rather long, smooth, nearly black, but abundantly yellow-spotted, and provided with lateral spines on the thorax. They have been examined for me by Mr. C. O. Waterhouse, the Coleopterist of the British Museum of Natural History; and the smaller black specimens belong to the species *Stirastoma depressa*; while the yellow-spotted forms belong to the species *Teniotus farinosus*.

So far I have had no opportunity of tracing out the earlier stages in the life history of these forms; and until this is done it will be impossible to suggest any remedies that are likely to be really effectual. It is probable that the beetles deposit their eggs in the young bark bored out for the purpose or in the inequalities of the old bark, though it is possible that they may be placed about the roots of the tree. In all of these cases, the "kerosene emulsion" is likely to be advantageous. This insect-destroyer is prepared by dissolving $\frac{1}{2}$ lb soap in one gallon of water and adding the mixture boiling-hot to two gallons of kerosene oil. The whole should be well churned by a force-pump, so as to ensure a perfect admixture, otherwise the constituents separate on cooling, and the stuff becomes unsuitable for application. Each gallon of the perfect admixture should then be diluted with nine gallons of water; and this strength is that which is generally applied to plants infested with blight and scale-disease or insect pests generally. The great recommendation of this mixture is found in the fact that while it is a most beneficial insect-destroyer, it has no deleterious influence on the tree, if the ingredients are thoroughly mixed. All parts of the tree on which eggs or young grubs are detected should be thoroughly syringed; though it would be advisable to test first the strength of the mixture, in case further dilution be necessary for the treatment of the tender shoot of cocoa plants.

It is obvious that, as the adult beetles are the real offenders since the grubs hatch out from the eggs deposited by them, they must be ruthlessly destroyed where possible; in fact the trees should be carefully watched so as to prevent as many of the insects as possible from laying. All affected young shoots which shew signs of withering, should be cut off below the point at which the central perforation is visible; and these shoots should be burnt, not buried—so as to ensure the destruction of the grubs and pupæ. It is very advisable that those who have charge of cocoa plantations should observe carefully the method of egg-laying, and the incipient stages of the work of these insects; for not until this knowledge is at hand, will it be possible to know what is the most efficacious and advantageous method of warfare that can be adopted.—*Timchri*.

CEYLON PRODUCTS IN AUSTRALIA.—Messrs. Brown & Macdonald, of Brisbane, announce in our advertising columns today, that they are making an endeavour to open up the market in Australia for pure Ceylon tea. We believe this to be a good firm, and as Messrs. Brown & Macdonald's travellers are all over the colony, we think there is a good chance here for pushing our other Ceylon products, besides tea.

FELLING TREES BY ELECTRICITY.—Hitherto machines for felling trees have been driven by steampower, but this is sometimes inconvenient, especially in thick woods, and electric power has recently been adopted in the Galician forests. Usually in such machines the trunk is sawn, but in this case it is drilled. When the wood is of a soft nature the drill has a sweeping motion, and cuts into the trunk by means of cutting edges on its sides. The drill is actuated by an electric motor, mounted on a carriage, which is brought up close to the tree and shackled to it. The motor is capable of turning round its vertical axis; and the drill is geared to it in such a manner that it can turn through an arc of a circle and make a sweeping cut into the trunk. The first cut made, the drill is advanced a few inches and another section of the wood removed in the same way until the trunk is half-severed. It is then clamped, to keep the cut from closing, and the operation continued until it would be unsafe to go on. The remainder is finished by a hand-saw or an axe. The current is conveyed to the motor by insulated leads brought through the forest from a generator placed in some convenient site.—*Times*.

HORTICULTURE IN CARACAS.—We, *Garden and Forest*, have already referred to Dr. Ernst's first article, published in the *Gartenflora*, on "Horticulture in Caracas." It has been followed by a second chapter that contains much interesting information with regard to the plants which flourish in the Venezuelan climate, and those which, upon trial, have been found ill-suited to it. The cultivation of useful plants, he tells us, has lagged so far behind that of flowering and ornamental plants, that it is no exaggeration to say, not a single new fruit or vegetable has been introduced into the country during the last fifty years. On the other hand, the prices paid for flowers are enormous, running so high in the case of native Orchids, that their re-importation from England may prove profitable. A specimen of *Cattleya Wagneriana*, with twelve leaves and eight blossoms, had recently been offered to the author for 45 dols., and he attributes such demands to the fact, that collectors for English firms have given such enormous sums for white-flowering *Cattleyas*, that the natives in consequence have "lost their heads" to a degree which can only be cured by a persistent abstinence from purchase on the part of local customers. That they have by no means lost their cunning is shown by the statement that they treat the common *Cattleya Mossii* with sulphur fumes so as to make it look like *O. Reineckiana*, bring the plants bearing these blanched blossoms to unsuspecting amateurs in twilight hours, and often receiving high prices for them.—*Gardeners' Chronicle*.

CLAY DRESSINGS FOR LIGHT SOILS.—Few who have to do with light soils exclusively have any idea what good a dressing of clay does, especially if put on during the winter at a time of hard frost, when it can be got on the land easily, and the frost shivers it into powder. In the garden here we are able to tell to a yard, by the look of the crops, where the clay was put; and one quarter that has had several dressings always carries better Strawberries and culinary vegetables than either of the others, which have not had any. The land on the first-named quarter is more holding of moisture, the clay taking in moisture from dew and rain, and which it retains better, and absorbs more of the juices of the manures used than the undressed land. This winter I have dressed a large piece of ground with stiff blue clay, that is at this moment crumbled all to pieces. I wait for drying winds to

render it less sticky, and render it fit to tread on and dig. Some years ago the Pear trees were in a bad state, and I treated them to about eighty cartloads of clay; and this was done by removing a commensurate portion of the gravelly subsoil, and trenching in the former, the trees being left standing on a base of about 3 feet square, and the roots were laid into the fresh mixture as the work went on. By so managing the work the trees were not disturbed sufficiently to check them much, and there was soon a great improvement visible in their appearance; and to-day they bear fine crops of clear-skinned fruit, where before, all of it used to crack, and be scarcely worth the gathering. Roses like it, too, as I have found on lifting them that they will bring it up on their roots. For mixing with light loam for potting Strawberries, clay is of great value, and so it is used in the same way with manure or leaf-mould for growing Melons, which like stiff soils, but in either case it should be such of it as has become ameliorated by exposure to the weather. Some gardeners, no doubt, have too stiff and unworkable a kind of clay, and long for the lighter material, but the remedy in their case lies the other way, and road scrapings, leaf-rakings, and rubbish-heap ingredients, properly and continuously employed, will soon effect an improvement in the staple.—*J. S. Gardeners' Chronicle*.

EXPORT OF BASIC SLAG TO GERMANY.—The question might well be asked, "How is it that English agriculturists do not appreciate the fertilising qualities which lie in basic steel slag?" While in Germany the demand for this class of fertiliser cannot be sufficiently met, in England the call for it is extremely limited. The explanation would seem to lie, says the *Colliery Guardian*, in a want of education on the part of our agriculturists. Be that as it may, however, the fact remains that instead of keeping at home what is a valuable product, English basic steel works are compelled to export it if they are to find a sale. For a long time past great quantities of basic slag have been going away from the north-eastern steelworks and perhaps other northern basic steel establishments also, to the order of German importers, where it is ground to exceeding fineness and sold for manurial and other purposes. And now it is announced that the Staffordshire Steel and Ingot Iron Company (Limited), Wolverhampton, are taking the same course. Some time ago this company went to much expense to lay down grinding plant, but experience has proved that the demand from the English market has been insufficient to consume anything like the whole make, and now the company have obtained orders from Germany to export this product direct to the Fatherland in the raw state. It is intimated that the Germans will take pretty much all the company can produce, and at the present time a stock of 12,000 tons of unground slag and 900 tons of ground slag is about being dispatched from the Staffordshire Works. It is distinctly gratifying that if English steel makers cannot find a market in their own country for all their products a market can be found beyond their own shores; but it seems scarcely creditable to native appreciation of what is valuable that English agriculturists should allow the Germans to buy up our steelworks' waste in this manner. This country is compelled to part with what she should certainly keep at home for her own benefit. It is estimated that at the present time German is grinding up something like 500,000 tons of basic slag per annum. There seems to be hardly any end to the tale of the immense benefits which the discoveries of Messrs. Thomas and Gilchrist, Mr. Riley, and other English steel inventors have conferred upon the continental iron and steel industries.—*European Mail*.

"A MINE OF UNKNOWN WEALTH."
 GEM-DIGGING IN SABARAGAMUWA :
 THE NATIVE "MODUS OPERANDI."

(From our "Special.")

Ratnapura, named as it is "the city of gems," makes one think that the town and its immediate surroundings alone contain the valuable mineral; but this is not so. The town is the centre of an expanse of country from 20 to 30 miles square, in almost the whole of which a strata of gravel exists varying from about 6 to 20 feet under the surface. Go where you like within the above radius, pits are to be seen near all the villages either being worked at the present moment or the remains of abandoned ones, proving conclusively that gems do exist.

Now the native of a speculative turn of mind forms a Company of say 6 or 8 men who obtain a license from the Kachcheri by paying R1 for each man for one month, and off they set out together to the Crown allotment where they begin by marking off a square of about 10 ft. After removing about 3 feet of soil, the sounding rod—a piece of iron about $\frac{1}{2}$ an inch diameter and 6 feet long—is used to sound for the gravel. Should it not be found another foot or two are excavated, then the rod applied again. If successful—which I shall presume they are—the digging is begun in real earnest till about 4 feet deep. Then should the sides be inclined to fall in, the soil being of a frail nature, four jungle posts, one at each corner, are put down, then four cross beams round the sides; also two centre beams. After all have been lashed together inside, the side-beams are driven as stakes to support the sides and prevent them falling in, and as the digging proceeds they are driven deeper and deeper till the gravel is reached.

Usually on the second day the gravel is taken out (with many anxious eyes keeping watch) by means of baskets handed from one man to another, till all within the square is excavated. But should the miners find the soil fairly firm at the bottom of the pit they tunnel all round for about 2 ft., drawing out the gravel and sending it up also to be heaped with the rest, which usually completes the work of the second day, a watchman remaining near it all night.

On the third day it is all washed in wicker-baskets by a circular jerking motion which throws out all surplus light stone and rubbish till a good quantity of heavy gravel is left in the bottom, which is carefully examined. There is hardly a basketful that does not contain some gems of inferior value which are usually sold by the lb. for about R9 and are called "dallam" by the natives. Should no valuable stones be found another pit is sunk, and so on till one or perhaps two or three really valuable gems are unearthed, which of course satisfies our not too ambitious gamblers, and off they set for Ratnapura, abandoning all intention of further gemming for the present. If valuable, say worth a few thousand rupees, the gem or gems are kept secret, and only shown to one or two men of money, who make the owners an advance and look after the safe custody of the precious stones. Then they gamble and drink for some time till another advance becomes necessary, which is asked for, and, as assuredly given, and so on, till perhaps half the value is obtained. Then the party with the mortgage proceeds to Colombo or Kalutara, where rich Moor traders are summoned to purchase, and away goes the gems to London. Mind you, the general public know nothing about these transactions, and the valuable gems are never heard of in Ceylon, and, in fact, they hardly see the light of day till glittering in some shop in Bond Street.

The natives have a great fear of exposing their finds till they are sold, and they have other most extraordinary superstitious ideas about showing them. This narrow-minded system of gemming has been in vogue for centuries past. It is only occasionally one hears of any native having enterprise enough to dig a few feet below the first gravel to see if, by sounding, a second bed of gravel is within easy reach, for they fear the expense of baling out the water, which increases as the greater depth is attained, although the second gravel is well-known to be much richer than the first.

Considering that it is so well-known to the world that Ceylon possesses such wealth within a few feet of the surface in almost every low-lying part of Sabaragamuwa for many, many miles, the wonder is that no European enterprise and capital have been brought to bear upon the rich fields of "Serendib." Why can't a Company be floated in London? or even Colombo, for that matter? Local residents know very well that any amount of land can be bought from the Crown and villagers, rich in precious stones, which only require enterprise to bring to light.

From a few pits sunk on Mr. C. H. de Soysa's tea and cinnamon estates, 8 miles on the Colombo side of Ratnapura, in the usual primitive mode of the natives, without machinery (and abandoning after the first gravel) were found about R20,000 worth of gems, which were sold by auction a few months ago, leaving a handsome profit to the owner, our local millionaire, who only spent a few thousand rupees on them.

If I had money I would unearth every inch of "illan" in the Sabaragamuwa flats and ravines, where a mine of unknown wealth is stored.

INDIAN TEA CROPS AND EXPORTS.

(From William Moran & Co.'s Market Report.)

CALCUTTA, 30th April 1889.

A few private sales have been made during the fortnight, but arrivals are still too small for public auction to be held. The first sales will probably not be until the 16th May.

From most districts weather reports are all that could be desired. Chittagong is still very much in want of rain.

Clearances of New Season's teas to date are about 120,000 lb., against 95,000 lb., last season.

The Indian Tea Association has favored us with the following circular giving the estimate for the current season:—

"In their circular of the 15th February last, the General Committee published figures showing the Revised Estimate of the Indian tea crop of 1888 to have been 95,758,228 lb., which the actual outturn from returns received was 96,308,284 lb. against the outturn of 1887 of 86,791,845 lb.

"The Committee have now the pleasure to hand you the following estimate of the crop of 1889 taken from figures" which they have been able to collect and from other sources:

Assam	44,953,400
Cachar and Sylhet	31,990,400
Darjeeling, Terai and Dooars	20,460,620
Chittagong and Chota Nagpore	1,536,740
Dehra Dun, Kumaon and Kangra	4,500,000
Private and Native Gardens	3,500,000

Total ... 106,941,160

"The exports to Australia, America and other places (principally Bombay, Madras and Rangoon) during the past season have amounted to 4,096,191 lb., and if this quantity together with the requirements of Northern India, now calculated at half a million instead of one and a half million lb. as formerly, be deducted from the estimate there will remain about 102½ million lb. for shipment to Great Britain during the season of 1889."

"In the circular of the 15th February last, it was estimated that about 91 million lb. of the crop of 1888 would be available for shipment to Great Britain, but the actual exports to that market from the 1st May to the 31st March have been 92½ million lb. Such a discrepancy between the estimate for the present year and the actual outturn will no doubt be rectified by the reduction of the requirements of Northern India to the extent

of one million lb. which have been included in the quantity available for export to Great Britain, say 102½ million lb."

Reuter's telegrams received during the fortnight report as follows:—

Indian Tea.

April 25th—Auctions.—Offered about 15,000 packages. Sold 1,300 packages. Generally without material change.

	TEA EXPORTS.

INDIAN TEA EXPORTS.

We call attention to the interesting information afforded above by Messrs. Wm. Moran & Co. of Calcutta, in respect of Indian tea. The total outturn of the Indian tea districts for the season (1888-9) now closing has been 96,303,284 lb. against 86,791,845 lb. for 1887-8, or an increase in round numbers of ten millions lb. The same proportion nearly holds good in regard to the export to Great Britain which was 92,697,073 lb. against 83,140,323 lb. But the great matter of interest now is the estimate for the new season 1889-90. This shows a total crop of 106,941,160 lb. or as nearly as possible another ten millions lb. in advance, and there is precisely the same increase in the quantity which is expected to be shipped to the United Kingdom. This is given at 102½ millions lb. against a little over 92½ millions for the past season.

With perhaps 42 millions of Ceylon tea to be sent in the same direction during the same period, there should be very little room for any 'China' or 'Java' teas in the London market. Last year, the home consumption, it will be remembered, exceeded 185,000,000 lb. of tea, of which India and Ceylon supplied about 105½ millions, leaving less than 80 millions for China and other kinds. This year, even allowing for an increase in the total consumption, there cannot be room for more than 45 millions lb. of China teas in the United Kingdom, excluding the re-export trade. This latter may dispose of some thirty millions lb. more of China and Java kinds. It must be very evident, however, that we are approaching the "beginning of the end" of the China Tea trade with the London market. In Australasia and America, the fight may be protracted longer; but even there, India and Ceylon teas are bound to clear all competitors out of the field before many seasons pass away.

TEA NOTES, April 30th.—Tea is doing well in Sibsaugor. Tea prospects are good in Durrung. Seasonable weather is reported from Sylhet, Kamroop, Durrung, Sibsaugor, and Luckimpore. Darjeeling, 26 April.—Violent thunderstorm accompanied by heavy rain—over an inch being registered on the evening of the 23rd, since the bright sunshine. First flush nearly over and more or less disappointing.—*Indian Planters' Gazette*

COCONUT CULTIVATION AND THE "KANDA PANUWA:"

BLACK AND RED BEETLES—HOW THEY CUT INTO THE STEM OF A TREE—THEIR PROPAGATION AND HOW TO DESTROY THEM—THE YOUNG GRUB—REMEDIAL PRECAUTIONS.

(Communicated.)

Those who had have no opportunities of observing the beetles injurious to the coconut tree, or who have made little use of such as they have had, are apt to be a little mixed in assigning their respective parts in the work of destruction to *kuruminiya* and *kandapanuwa*. Even Dr. Shortt in his monograph has figured the wrong beetle as the true *kuruminiya*—one endowed with a pair of horns longer than its body and which it would find a great inconvenience while eating into cabbage at the head of a coconut tree.

The true *kuruminiya* is a black beetle, one of the largest of the tribe nearly as broad as long and almost hornless. Furnished with powerful mandibles it easily penetrates to the centre of the undeveloped leaves and causes the clipped and rugged appearance that may be noticed on nearly all coconut fields. It seldom kills a tree outright, and that only a very young one before it has made stem. The grub, the biggest and ugliest of the race, dwells in dung heaps or in any mass of rotten vegetable matter.

The red beetle belongs to the coleopteran aristocracy. In its perfect form it is a pointed oval, one inch long with a strong frontal horn, and its dress a red coat with black facings. It needs no food and has in fact no feeding or digesting organs; in the perfect state its sole business is propagating its species. It might be supposed that the use of the frontal horn was to penetrate the outer fibrous shell of the coconut stem, but on examination it is found unequal to this undertaking; it might with its powers as well try to bore a hole in a tombstone, as the main stem and the stem of the green leaf are equally impervious to its unaided effort. It has to search for a weak point such as an accidental wound that has gone through the outer fibrous rind, the splitting of a green sappy leaf at its base by the swelling of the main stem or the breaking up of the shell at the surface by the push of new roots; but by far its most fruitful opportunities are those that arise from trimming the trees.

From the first appearance of the stem above ground till it reaches a height of six feet or upwards, the leaves do not detach themselves from the stem and drop as they wither and die, but continue to cling till they gradually rot and fall off piecemeal. This causes a ragged and untidy appearance disagreeable to the eye of taste and the tidy planter sets about remedying the blunder of nature, the fact being that the young expanding stem is tender and needs this imbricated cover till the fibrous rind becomes dense and hard enough to be safe in the open air. All young quickgrowing trees crack their rind more or less, but while they have the natural shield no harm happens. Remove that, the cracks become wider and deeper and the beetle can easily engineer a proper bed for its eggs. Besides this there is the danger of inflicting a wound on the stem which makes the entrance for the enemy the easier.

When a lodgement has once been made in a tree that suits them all, the beetles in the neighbourhood resort thither and multiply with great rapidity, the fall of the tree being generally the first indication of their presence. I have taken 150 grubs and beetles from a single fallen tree. When they are discovered before they have utterly destroyed the tree any attempt to save it is labour in vain. Chop it into chips, destroy the whole

colony great and small, and lest eggs should remain burn the chips or rather roast them, for they are not easily consumed.

As soon as the young grub is hatched he begins cutting his way inwards, making a crooked and still widening track. When half grown he turns towards the surface, where at his full growth he cuts so close that nothing thicker than a piece of packing paper is between him and the open air; then he wraps up in a cocoon of the fibre of the stem and awaits his transformation. The perfect insect easily bores its way out and begins life on a new footing. As they are night-flyers their habits are not to be traced further, but we may suppose with no great stretch of conjecture that they are very diligent in seeking convenient spots to deposit their eggs.

If the expansion of the stem bursts a strong succulent leaf at the base it should be removed at once, but the operation requires a sharp tool in a careful hand to avoid wounding the stem and making the remedy worse than the disease. If the stem be accidentally wounded the best thing I know is a daub of tar with as much fine sharp sand as it will hold. Notwithstanding all the precautions that can be taken a few trees will be lost wherever the beetle has obtained a footing, and the danger is greatest where the cultivation is highest and the growth consequently quickest. The danger begins with the first appearance of the stem and continues more or less till the flowering begins.

THE CEYLON TEA PLANTATIONS COMPANY, LIMITED.

The report and accounts submitted on Friday to the shareholders of the Ceylon Tea Plantations Company, Limited, were adopted. An interim dividend of 6 per cent. was paid in September last, and a second interim dividend of 4 per cent. was paid in January. On Friday a final dividend of 5 per cent. was declared making 15 per cent. for the year.

In the course of his speech, Mr. David Reid, of Thomanean, Kinross, the chairman, said:—The shareholders will notice in looking through the accounts that nearly the whole of the amount at the credit of profit and loss account has been distributed as dividends. In this the directors had scarcely any option, because at the first of this year an issue of 4,550 shares became necessary to pay for the purchase of the estates to which I have alluded, and so a state of things was brought about analogous to the winding up of an old partnership and the inaugurating of a new one, and under such circumstances it became necessary as a mere matter of accounting that the balance at the credit of profit and loss account should be handed over to those shareholders to which it really belonged. But, gentlemen, although nearly the whole of the balance at the credit of profit and loss account has been divided, the directors have not lost sight of the very great importance of fortifying the position of this company to meet the attack that is being made upon all tea property by the fall in the price of tea; and in order to put clearly before you the way in which this has been done, it will be necessary for me again to refer to what I said to the shareholders when I addressed you at the first general meeting. It will be in your recollection that I said that, speaking in round numbers, the property consisted of 1,600 acres of jungle at £2 10s an acre, and 1,600 acres of tea land at £40 an acre. I am glad to be able to inform you that when we commenced business on Jan. 1st, 1889, taking the price of jungle land as before at £2 10s., the price that your tea land stands in the company's books is £35, instead of £40, a reduction of 12½ per cent. This I consider a most important point. I do not think it is possible for any shareholder to take an intelligent view of the value of his property without considering not merely dividends, but also the margin of profit per pound of tea, and the

margin of profit per acre that the property yields; for it is only by looking at it from that point of view that one can form any adequate opinion of the condition that the company is in to meet the possible fall in the price of tea. Now, I daresay it will be interesting to the shareholders—indeed, I may say it is my duty to explain to you how this has been brought about. In the first place, it has been brought about by the purchase of the estates, to which I have referred, at a much lower price per acre than the price at which the company's original acres stood in the books. And it has also been further brought about by the development of jungle land into tea-planted land of the old estates of the company at a very low cost. Now, I can well conceive that the shareholders will say it is very well to tell us that the price at which the estates stand in our books has been reduced 12½ per cent., but are the acres as good? Well, that is to a certain extent a matter of opinion, but in the opinion of myself—and I may say it is the unanimous opinion of the board—the average of the acres that we started business with on Jan. 1st 1889, is in all respects equal to the average of the acres that we began business with in 1888. I am not going on this occasion, as I did on the last, to describe to you in any detail—in fact, not at all—the condition of the estates, because I prefer that you should receive it at first hand from Mr. Rutherford, our manager in Ceylon who has within the last month come to this country. (Applause.) Now there is another striking feature in this report, which I would just allude to and that is the great fall in the price of tea. I believe that we have suffered in this very much in common with all tea companies. We hear a great many differences of opinion expressed upon the exact grades of tea which have suffered most and also as to whether the Ceylon, Indian, and China teas have fallen equally. So far as I have been able to arrive at an opinion, I think that nearly all teas have suffered, and I think it must be satisfactory to the shareholders that in spite of such a fall in price we can present so favourable a balance-sheet. Tea growers have, no doubt, an anxious time in front of them, but the directors have confidence in the future of the company, and recognising frankly and early that only the fittest will survive in the fierce competition that over-production is bringing about, they will spare no trouble to maintain efficient and economical management of the company's business.

Mr. David Reid (Mincing Lane) said that the shareholders would no doubt like to hear a few words from their Ceylon manager, Mr. Rutherford. (Applause.)

Mr. H. K. Rutherford: I have pleasure in a double sense in being present here today at the annual meeting of the shareholders; first, as a shareholder, in listening to the chairman's clear and explicit statement of the financial position of the company, and, secondly, as your manager in Ceylon, in knowing that the services of those in Ceylon who have taken an active part in bringing about the favourable results as shown in the directors' report are fully appreciated and recognised. (Applause.) The chairman has shown how the capital cost per cultivated acre has, by the purchase of new estates, been brought down from £40 to £35. Now, the fact of the properties standing at £35 per acre would have but little meaning if the statement was not supported by the other important fact that the properties are all in good condition and well worth the value at which they stand in the company's books. (Applause.) Tea estates, as you are aware, may be, from poverty of soil, unsuitability of climate, bad planting, and unproductive bushes, absolutely worthless. I am very pleased indeed to be able to tell the shareholders, from my intimate knowledge of the company's original properties, and those newly acquired, that they have potentialities in them which I am confident will carry them over the stormy waves of low prices; and when unseaworthy craft have sunk, the company's ship, I trust, will come annually into harbour, unloading its cargo of good dividends. (Applause.) The new estates acquired by the company have the following advantages:—They have good soil, some of them considerably above the average. They are all at

high altitudes, thus giving promise of a longer existence than low country estates, and they are giving a fair promise of producing teas of higher value, and yields equal to low country estates. They are all fully equipped with good factories and the latest type of tea machinery, and they are in possession of a large and profitable business in the purchase of green leaf; and the shareholders in this country have the testimony of the Ceylon shareholders and others, who know the estates thoroughly that the company has made an exceedingly good bargain in purchasing these properties. I shall be very pleased to answer any questions the shareholders may wish to put to me regarding the condition or working of the estates. I would desire, before resuming my seat, to thank the board, in the name of my Ceylon staff and my own, for the great consideration it has always shown to their views and wishes, and I trust the harmonious feeling which has obtained in the past between *employes* and employed will continue in the future, as such a feeling always conduces to efficient service. (Applause.)

Mr. Martin Leake said he was sure all the shareholders must be satisfied with the management of the Company, and still more with the extremely clear way in which the information had been put before them by the chairman. They were all gratified to hear the personal explanation of Mr. Rutherford.

Mr. Rutherford was subsequently elected a director of the Company.—*H. and C. Mail*, April 19th.

CEYLON UP-COUNTRY PLANTING REPORT.

THE DEPLORABLE STATE OF THE TEA MARKET AND HIGH PRESSURE OF COMPETITION—THE CHINA TEA BUYERS JUBILANT OVER THE DROP IN THE VALUE OF CEYLON TEAS—ANSWERS TO ENQUIRIES ON TEA CULTURE AND PREPARATION—THE CULTIVATION OF NUTMEGS—WEATHER AND COOLIES.

7th May 1889.

The present deplorable state of the tea market is certainly providing us with food for thought, and does not give us much room for fancying that we are special favourites of Providence. It is rather rough on Ceylon, that it has had hardly time to gird up its loins after the disastrous days of coffee, before it is plunged into a struggle, with a powerful interest like that of the China tea merchants, not to speak of India and other producing countries. But everywhere and in everything there is this high pressure of competition I fancy, and perhaps, after all it is the China folks who have most cause to complain, as it is their domain we have invaded, and have sat down in, determined not to be ousted.

We hear that the China tea buyers have gone out this season rather jubilant than otherwise; the drop in the value of Ceylon teas has given great satisfaction in that quarter, pretty much like what the shrinkage in the deliveries of Chinas have given to us, and it is said they are prepared for a tussle in tea, such as has not yet been seen. India and ourselves are to have our fill of it, and China is to be triumphant. It is well to know what is before us, but it is not safe to prophesy until you do know. Had anyone told us, say five years ago, that the consumption of British-grown teas, was to increase as it has done within the last few years we would have regarded it, somewhat in the light of a flattering tale; indeed the headway we have made against the established interests of China, is so encouraging, that although our way is becoming somewhat rough, and rougher may be in store, still we will persevere. China may flood the market, and prices may be ruinous, but the energy which developed the tea interest here, when the country was all but a wreck, will doubtless sustain it.

In fact, this is our first real check,—a serious enough one no doubt,—but very likely we incline to think more of it than we would have done, had

we been lagging in the race like Java and fighting an uphill battle instead of taking a first place, almost from the beginning. Our pride is offended almost as much as our pocket.

The practical enquiries on Tea Culture and Preparation, which a practical man has sent you, and to which you invite my attention, are for men with a wider experience of tea than I have. Still I am not so modest that I cannot reply to the extent of my knowledge. I agree with your practical man that the best tea is not made when the bushes flush most freely. The tea made from the rush of flush which appears after the early rains, never has seemed to me anything like so good as what was manufactured from the scantier pluckings of the drier weather.

As to the effect of manure on tea, that it increases the quantity there is no dispute; but although I had heard it stated that it also improved its flavour and strength, I cannot say from my own experience that this is so. Manure, I think takes longer to tell on tea than it does on coffee, unless it be that the regular plucking only makes us fancy this.

Everything that the manure added to the coffee tree remained and could be seen, whereas much that is added to the tea bush, is gathered and lost sight of, and a wrong conclusion may be deduced in consequence.

As to the last subject of your practical enquirer, no doubt, the man who can combine quantity with quality is the man we have to follow, but who is he? I know of estates that have been at the top of the market through fine plucking, and have dropped down immediately when the plucking was changed. To increase quantity, you have to take a leaf or half a leaf more, and every remove is a step further away from quality. The man who can produce as good a tea from two and a half leaves as he can from one and a half, is a man whose acquaintance I should like to make, and to learn his secret. I don't think he has arisen yet; but he may be coming, and when he does come there will be a big run on him.

The cultivation of NUTMEGS goes on increasing in a small way. I hear of a place in the low-country where the matter has been tackled with energy and intelligence, and the proprietor is far from unsatisfied with the results. He has had to feel his way pretty much from the beginning, and has already gone dead in the face of established opinion, in so far that he manures his young plants with the happiest results. "Manure and 'Im" did much in the days of coffee; but manure and nutmegs are a combination which we have been taught, all along, would produce nothing but disastrous results. It has been found too, that without sufficient shade the young nutmeg plants suffer very considerably, but with it the failures are less, the growth is quicker, the prospects of a return are good, and the time about seven years. After that the cost of upkeep is next to nothing and except keeping the trees from parasites—to which they are very liable—hardly anything has to be done. On the hills the nutmeg grows more slowly than it does in the steamy plains of the low-country, but then I think the fruit is very much finer and larger in size, and there is compensation in that way.

We are still having very favourable weather for all kinds of vegetation from weeds upwards, and if close, hot, steamy days would make things grow, we have that now. Coolies, although not perhaps abundant, are still sufficient for our wants. The recruits from the Coast don't turn up yet, but it is said they may be expected this month.

PEPPER-CORN.

TEA CONSUMPTION AND INFUSION.

(From a Correspondent.)

With reference to the tannin in tea, your "Tea Slip" gave the substance of Dr. Hule White's statement *re* the harmful properties of Indian and Ceylon teas if judiciously infused.

That the increase in home consumption of tea last year was only 1 per cent more than 1885 requires no comment! The stronger teas have without question been over brewed and stewed, and stewed again in order to extract *not* tea but tannin out of them. If this thing goes on, the stomachs of the people must suffer, and we shall experience without doubt, in time, a FALLING-OFF IN THE CONSUMPTION OF Indian tea; for medical men, as well as the late clear-headed Dean of Bangor, will protest against the use of such strong teas.

Mr. J. Fraser, who lately left for Carlsbad, is said to have owned that *he* is suffering from drinking strong tea, stewed to blackness, and that it has *tanned* his stomach! His doctor has told him that it would have been better for him if he had drunk whisky in place of such tea.

THE FUTURE OF TEA.

It may be well to summarize the figures we gave yesterday as follows:—

	1889	lb.
Required for Home Consumption in the United Kingdom say	...	190,000,000
Required for re-export trade	...	35,000,000
		lb. 225,000,000
U. K. will receive from India in 1889 say	102,000,000	
From Ceylon	40,000,000	lb. 142,000,000
To be made up by } China, Java, &c. }	...	lb. 83,000,000
	...	lb. 83,000,000

THE LONDON MARKET FOR CEYLON TEAS

is by no means so unfavourable at present as has recently been supposed. The average of prices for the week reported today is 9½d, but the very heavy sales of Ceylon teas during the past two weeks, amounting to 29,000 packages or the equivalent of over two million lb. of tea, must be deemed eminently satisfactory. During the same two weeks of last year, the sales of Ceylon tea only equalled 10,200 packages. The advance is very gratifying and, we suspect, does not augur well for China teas being in great demand when the Far East market opens.

FINE PLUCKING OF TEA.

A planter with a big charge, writes:—

"I would like to pluck fine but 400 lb. tea at 10d=4,000 pence; 200 lb. tea at 15d=3,000 pence. It does not require much calculation to say which pays best."

But supposing the price of the coarser falls to 9d or even 8d, while 200 lb. per acre tea realizes 1s 2d, how would the comparison be then, allowing for the saving in labour in the field, factory &c. in attending to the smaller quantity?

A proprietor asks, however, who is to guarantee that prices for fine teas will keep up in this proportion?—Another proprietor asks:—

"If London market can take off middling Ceylon Teas (bulk of which they strongly disapprove of) at the rate of one million lb. per week what would they probably take of teas of the quality of which they entirely approved."

A further remark made has reference to the strangeness of the fact that *three-fourths* of the Ceylon, of the India and of the China teas sent to London are "not approved of" by connoisseurs; that is, they may be classed as common teas. Now every manufacturer is supposed

to study the wishes and tastes of his customers, and why not so in respect of tea. This raises another question: if with medium plucking (the tip, leaf and a half), as much of leaf as will make 600 lb. tea per acre, can be gathered, and the quality depends mainly on its treatment in the factory, will it not pay the owner to increase the supervision, accommodation and machinery, until his 600 lb. receive as careful treatment as the 300 lb. of his neighbour on a less prolific estate? How often is the remark made:—"I could make better tea, if I had not such a rush or quantity of leaf, or if I had more time to give to its treatment, or if I had more accommodation, or another drier, &c." Certainly the circumstances in each case have to be studied, but generally a higher standard of preparation must be aimed at.

THE EASTERN PRODUCE AND ESTATES COMPANY, LIMITED.

DIRECTORS.—Norman W. Grieve, Esq.; C. J. Lindsay Nicholson, Esq.; David Reid, Esq.; Christopher E. Smith, Esq.; Charles H. Stewart, Esq.; Edward Whab, Esq. Ralph A. Cameron, Esq., Managing Director.

REPORT.—To be presented at the Second Ordinary General Meeting, to be held at the Offices of the Company, at 12 o'clock noon, on the 25th April, 1889.

The Directors herewith submit Report and Balance Sheet for the first year's working, ending 31st December, 1888, which it is satisfactory to find fairly accords with the expectations held out at the formation of the Company.

The profit for the year has enabled the Directors to provide for payment in full of the 6 per cent Debenture Interest and 5 per cent Preference Share Dividend, amounting to £11,741 19s 7d, and to carry to credit of Reserve Fund the balance of £435 13s 10d. It will be in the recollection of the shareholders that in terms of the Company's Articles of Association, such Reserve Fund is to be created to the amount of £10,000 for the purposes of ensuring payment of interest and dividend on above Debentures and Preference Shares, the profits of the Company to be devoted to the redemption of £3,000 Debentures yearly after such Reserve Fund has reached £10,000, and next to payment of dividend on the Ordinary Shares, such dividend not to exceed 3 per cent per annum until the Debenture debt is below £50,000.

The Company has now 8,635 acres in tea, of which about 3,600 acres are over four years old, and by end of current year the total tea acreage will be about 9,500 acres. The rapid decadence of the remaining coffee on the Company's Estates during the past year from the combined effects of green bug and leaf disease has prejudicially affected the year's Profit and Loss Account, and has necessitated a considerable acreage being interplanted with Tea earlier than would otherwise have been called for. The yield of tea in 1888 from the Company's estates was 986,800 lb., and the average gross price obtained, including purchased leaf, was 1s per lb., which compares favourably with the market average of 11½d for Ceylon Tea for the same period. The Directors have pleasure in recording their appreciation of the zeal and ability shown by the manager and staff in Ceylon, which has so largely contributed to this satisfactory result. The crop of tea for 1889 is estimated at 1,150,000 lb.

The Shareholders will observe a sum of £4,904 14s 2d standing at credit of Estate Reserve Account. This consists of the surplus arising on realisation of Produce at a value over and above that placed on it by the Liquidators of the Ceylon Company, Limited, and the proceeds of the sale of one Estate. In accordance with the Articles of Association, all the Directors retire from office, and, being eligible, offer themselves for re-election. In the exercise of their powers, under the Articles of Association, your Directors appointed Messrs. Welton, Jones & Co., Auditors of the Company for the past year. It will be for the Shareholders to elect Auditors for the current year, and to fix their remuneration.—C. J. L. NICHOLSON, Chairman.

SCHEDULE OF THE COMPANY'S ESTATES.—Arapolo-kande, Asgeria and Maddawella, Bulatwatte and Maddawella, Belgodde, Colonna (let on lease), Conde-galla, Dandukelawa, Doombagastalawa, Dromoland, Gigran Ella, Hope, Ingurugalla and Berrewella, Kir-rimittia, Koladenia, Kumaradola, Labookellie, Medde-coombrs, Mennickwatte (one-half), Montefiore, Nor-wood, Rothschild, Sinnegodde and Belle Vue (let on lease), Sogamma, Vellai Oya, Vevkellie, and Woodslee.

TOTAL ACREAGE, 17,302 ACRES.

COCONUT PALM DISEASE.

Colonial Secretary's Office, Colombo, 9th May 1889.
To the Editor.

Sir,—I am directed to send for your information a copy of a report by the Superintendent of the School of Agriculture on the coconut palm disease.—I am, sir, your obedient servant,
A. M. ASHMORE, for Colonial Secretary.

Kandy, 20th April 1889.

I beg to report that I visited Veyangoda on the 27th March, spending part of the 27th and 28th in enquiring into the subject of the "disease" affecting the coconut palm. In certain areas in Veyangoda I observed that the trees were in a very backward condition, looking sickly and parched. I brought away with me leaves from affected fronds, and examined the discoloured portions of these leaves under the microscope at the School of Agriculture. (This instrument was neither complete in its fittings, nor powerful enough for the examination of minute fungi.) I was, however, able to discover a parasitic fungus in the specimens I brought away with me. I had hoped to be allowed sufficient time to carry on my enquiry into the subject more thoroughly than I have done, using what intervals of time I had to spare, and availing myself of extraneous aid offered me in the matter of getting at better microscopic appliances. I have, however, been able to visit districts where coconuts are cultivated both far from and near to, the coast, and to note the different modes of cultivation and treatment of the soil adopted in the various plantations; and I have no hesitation in saying that thorough cultivation is the surest way of combating the evil. Where the trees have been helped to maintain their vigour the affection was at a minimum, and in places where I would have expected to see the trees badly affected, but where as thorough cultivation as one would have expected to find in the best agricultural districts in England was adopted there was hardly any indication of the "disease" to be noticed. In areas where the attack was at its worst the soil was generally not in a condition favourable to luxuriant growth. A favourable chemical condition of soil is correlative to a good mechanical condition produced by working, liming, draining, &c. Thorough, deep cultivation must be adopted in soils inclined at all to be heavy even at the risk of temporary loss, followed by liming, and, if necessary, manuring. Deep draining is especially necessary for heavy soils. No one who has seen these operations carried out under necessary conditions, and seen their results, can doubt their efficacy in preventing those conditions in the crops grown which favour attack from fungoid and insect pests.

Now, in enquiring into the cause of a weakly growth, I would enquire first, whether good "seed," from a healthy and well-developed stock was used, whether the planting was properly done, and whether the crop has been well-treated. It is difficult in the case of a perennial like the coconut to get at the remote antecedents of the plant, but to anyone coming from a country where the art of agriculture is practised to perfection, the niggardly treatment of the soil, and especially coconut soils, in the generality is most striking. Where the advantages of a fallow or a rotation are shut out, it behoves cultivators of coconuts to use every artificial means of maintaining the fertility of the soil. As exceptions, I have seen coconut estates under a very perfect system of cultivation, and as I mentioned before they showed no indication of suffering from "disease;" the plantations were moreover, on a comparatively stiff soil, and at a distance from the sea. I cannot agree that salt, and salt only, is necessary to raise the affected coconut tree to a healthy state, but I do not mean to under-rate the value of salt in coconut cultivation, and I may here state that a supply of salt under easier conditions, but with what precautions may be thought proper to preclude it from being used for culinary purposes, is a great desideratum. But it must be remembered that the use of manures must follow cultivation of

the soil; and in heavy soils, without thorough and deep draining the advantage of manuring are nullified. Then all these operations so necessarily to a soil continually growing the same crop, must be regularly and systematically carried out, not in patch-work style. No experimenting is required to prove their necessity. Results must be waited for: it will take time to undo the effects of previous ill-treatment. An outlay of capital is of course necessary, but the increased returns, and the resultant vigour of the tree, enabling it to withstand attack, will more than repay this outlay.
(Signed) C. DRIEBERG.

LOSS IN TEA IN WEIGHT IN LONDON WAREHOUSES.

Planters' Association of Ceylon, Kandy, 2nd March 1889.

The Honorary Secretary, Association of Chambers of Commerce of the United Kingdom, London.

SIR,—I have the honor to invite your attention to the annexed copy of an important resolution unanimously passed at a recent general meeting of the Planters' Association of Ceylon on the subject of the loss in weight of tea at the London docks and warehouses and to request that you will lay it before your Association of Chambers of Commerce with a view to whatever action may be deemed desirable.—I am, &c.,
(Signed) A. PHILIP, Secretary.

Resolution referred to:

"That this Association views with alarm the serious losses sustained by Ceylon planters through bulking, weighing, or sampling of teas at the London docks or warehouses. That the Chamber of Commerce, and especially the London Committee of the Ceylon Association, be asked to co-operate with this Association with the object of gaining the fullest information as to the practices in vogue, for bulking, weighing, and sampling teas in London, and, if possible, checking any undue waste."

Association of Chambers of Commerce of the United Kingdom, 1, Great College Street, Westminster, S. W., 13th April 1889.

SIR,—Your letter was duly communicated to the London and India Docks Joint Committee, and I now beg to enclose the report of their tea superintendent thereon.—I am, yours, truly,

(Signed) JAMES HOLE.

The Secretary, Planters' Association, Kandy, Ceylon.

The Managers.—With reference to the allegation contained in the resolution of the Ceylon Planters' Association, that losses in tea occur in the operation of bulking, weighing, and sampling in the London bonded warehouses, I have to state that no losses arise through bulking or sampling. Both these operations take place after weighing which is carried out by the Customs and dock officers immediately on receipt of the goods, and the weights then taken are those on which the sale is made.

The loss complained of is no doubt that which cannot but occur in weighing and taring to the pound according to the London general practice, together with the trade allowance to the buyer of 1 lb per package weighing over 28 lb. gross. The attached statement shews in detail that the average net outturn will be 2 per cent in chests and 4 per cent in half-chests less than the country weight.

A few years ago some of the principal importers of Indian tea in the case of parcels not requiring bulking, obtained permission from the Customs to ascertain the net weight of tea without taring, by weighing the contents of 10 per cent of the packages of each break as an average so as to lessen the loss of the fractions which occurs as shewn in the statement attached. This plan reduces the loss from an average of 1 lb to ½ lb per package, but the buyers of tea regard the system with disfavour, and it is not likely to continue.
(Signed) A. CHAMP, 9th April 1889.

"MOMI" WOOD TEA BOXES.

In sending us replies to the "practical enquiries" about tea,—in a note which will appear further on—Mr. C. S. Armstrong adds the following:—
"With regard to Japan boxes, I have used no other since their first introduction by Mr. Deane. All of "momi," if I except an invoice or two. I have never had a complaint. I consider a "momi" wood package the best we have in Ceylon at this date. Tares run even, chest is strong and neat-looking."

HIGH-CLASS CEYLON CINCHONA BARK: BEATING THE RECORD.

The other day we were enabled to record the splendid analysis received for Cannavarella bark, a parcel of as much as 15,000 lb. being tested by sample up to 5.87 per cent. of sulphate of quinine. This high rate is beaten by a return with which we have been favoured today. It runs as follows:—

Analysis of Alnwick bark: s.c.
74 bales say 18,000 lb. renewed Crown chips, 6.73 p. c.
44 bales say 10,900 lb. renewed Crown shavings 7.40 p. c.
The analyst in this case is the well-known Dr. Paul of London. The bark has not yet been sold. We suppose these analyses have never before been equalled in Ceylon—at any rate for large quantities of bark? To Udapusselawa district and Alnwick estate will therefore belong the honor, so far, of producing the richest cinchona bark yet seen in Ceylon.

BULKING TEA.

(From a Planting Correspondent.)

I note that Mr. Street says—to turn over the tea with spades on the floor is not sufficient to entitle the tea to be called bulked. I fancy, however, that is the usual method in Ceylon. Throwing the tea into a high bin and taking the same out again for packing through a narrow door in the bottom goes a long way to mix up all together. If in addition to this the tea be turned over twice with the spades the same way as coffee used to be turned over and the bulking be not accepted

in London, the fault is more likely to be in the packing of the chest than in the bulking. [Does this correspondent, and all other planters puzzled in matters of bulking, sifting, cutting, packing, &c, consult the pages of the *Tropical Agriculturist* through the annual index to find hints at a moment's notice? We are not aware of ever passing over a useful lesson or wrinkle for planters, of any kind, without giving it a place in the *T. A.* As we said before, every estate, and every estate agent's office should have a file of the *T. A.* and the time and writing this would save would pay the subscription ten times over.—Ed.]

FIVE DAYS' WITHERING OF TEA LEAF.

(Communicated.)

We are credibly informed that certain planters know how to deal with leaf to advantage when, after 48 hours on the tats, it commences the first stage of becoming, if neglected further, a stinking rotten mass of, if not quite putrefactive, still leaf that should be sent down the stream rather than sent to the London market to work only discredit to Ceylon tea generally. Will those who know how to arrest the decay of leaf after the period mentioned give their knowledge to their brother planters? To do so would, of course, be to the general weal of Ceylon. Also their ideas with regard to availing of the sun for withering which, it is said, sets up a damaging chemical action. Surely the chimneys of siroccos properly protected can safely be run up through the factory withering lofts in place of outside the factory, and without increasing the risk of fire. On this point, too we should like to have experienced planters' ideas. Tea left on the tat for five days owing to bad withering weather must, of course, have become very much decomposed, perceptible even to those whose olfactory nerves are not of the keenest. As brewers send their bad beer down the gutters so should Ceylon planters their BAD TEA.

ESTATE BULKING OF TEA.

(By F. F. Street.)

Proper "Bulking" is so essential both for Teas sold locally and those shipped home on estate account, that a description of a cheap and effectual mode of bulking may be of service to your planting readers, especially as the material is within the reach of all.

Four square wooden posts grooved on two of the adjoining sides and several planks of say 18 inches in breadth are all that are required.

These should be made into a pit or large box, the posts forming the corners and the planks the sides. The pit should be built raised some 4 feet from the ground, the bottom inclining slightly towards the centre being made of wood, and having a sliding trap-door in the centre, so made that the outlet can be enlarged or reduced according to the size of the leaf to be bulked. When the pit is being filled with Tea the trap-door remaining closed.

The Tea to be bulked should be spread out in layers as thin as possible: one quality on top of another until all the Tea required to be bulked is inside the pit. Now open the trap-door and the Tea will run out from the top through the different layers of Tea, and out at the trap-door at the bottom taking a little from each layer on its downward course—the result being a perfect bulk. By means of a zinc tube the current of Tea leaf can be carried direct from the pit into the packages standing on a lever-scale, though perhaps the Tea would get still more mixed if allowed to fall a small distance on to the floor forming a cone-shaped pile of Tea, the packages being filled from the foot of the pile with a wooden or metal spade. The packages might be put all round the pile at a slight

distance from it, a little Tea being placed in each in order as they stand and filled gradually: this would ensure an equal proportion of dust and broken leaf to each package and render unevenness impossible.

A sand-glass will illustrate the principle of this mode of bulking. Watch the sand as it is running out, and you will find it is the top layer that runs and not the bottom near the exit.

TEA IN JAPAN.—The *Japan Weekly Mail* of April 13th says:—"Small quantities of Teas have been made to order, but no new leaf has yet been fired. The temperature in the Tea districts has been rather lower than usual, but this has only checked growth somewhat, no damage being reported from any quarter, and no anxiety is felt for the young leaf. A tenacity muster has been shown. Next week trustworthy information should be forthcoming."

COFFEE UNDER SHADE.—A correspondent writes:—"It is very amusing to see the leading Boss of a show replying to the letters of a 'correspondent' and denying that orders have been given to plant coffee again under shade in Dikoya. Planting coffee under shade or allowing a sucker to grow on each stump, is a distinction without a difference. It is well-known that seeds of the fig tree have been sent from an estate near Kandy to those upcountry estates for growing shade trees. This of itself is utterly absurd—to send a low-country tree to be grown upcountry for purposes of shade. What next!"

ARTIFICIAL COFFEE.—According to A. Stutzer, in the *Zeitschrift für angewandte Chemie*, the manufacture of artificial coffee from burnt flour or meal is carried on by certain firms in Cologne. The artificial beans are made in specially devised machines, and resemble closely in appearance the natural ones. They have been examined by O. Reitmair, who has shown that they consist of 34.6 per cent. of extract soluble in water, mixed with 56.25 per cent. of insoluble organic constituents. The amount of ash on ignition is small, amounting to 1.10 per cent. They can be readily distinguished from the natural beans by their property of sinking when immersed in ether, as genuine coffee beans float on that liquid. Strong oxidising agents do not decolourise the artificial product so rapidly as natural coffee.—*Industries.*

THE STEAM-PLOUGH IN INDIA.—In his paper on "the Mahratta plough" in the *Asiatic Quarterly* Sir George Birdwood made merry over the notion that steam-ploughs could ever be introduced with success in India, giving a comic description of a scene in Khandesh, where the attempt resulted in the plough sticking fast after a few futile snorts and being thereafter laid aside for good, to be presently transformed into an object of worship by the ignorant natives. Having some doubt about the general applicability of such a description, we forwarded Sir George's article to the manager of a large estate in the Dun on which the steam-plough was introduced last year, and received the following reply:—"As for the steam-plough the writer mentions, I consider it a creation of his own imagination. There was never a steam-plough made that corresponds to his graphic and 'funny' description, and I consider it wrong of him to endeavour to embellish an article by such an absurd imaginary sketch. No steam-plough goes 'snorting and hissing into work,' and then sinks into the furrow it has made. There is no such foolish implement constructed. I may tell you that the steam-plough is a great success here, and is doing capital work, rolling over the jungle lands in fine style, and we are rapidly clearing the lands." (Clearly they did not know everything down in the Judee of Sir George.—*Pioneer.*)

AN ENGLISH RUBY COMPANY FOR
BURMA:—WHY NOT A LONDON GEM
COMPANY FOR CEYLON?

NO. I.—INTRODUCTORY: HOW THE RUBIES
IN BURMA ARE TREATED AT PRESENT.

(Communicated.)

The world-famed ruby mine district in Upper Burma which has so recently come into prominence by the concession to Streeter and the formation of a powerful Company for its more effectual working, lies about 100 miles to the north-west of Mandalay. The best route (in fact the only one at present available) by which to reach the mines is to embark at Mandalay on one of the Irrawaddy Flotilla Company's well-found steamers running between Mandalay and Bhamo. About a day's run, or perhaps a little longer according to the state of the river, will bring you to the point from which you have to ride or walk. This place is called in Wyld's Map of Burma Thabeit Kyuz, but the name we print is but little guide to the actual pronunciation by the natives. From this point there is a road to the mines which lie forty to fifty miles further up on the borders of the Shan hills. This is the only spot where anything systematic has been done in the way of mining and washing the gems, but rubies have been found over a very large area, and there is every reason to suppose that now that the despotic sway of the native king has been destroyed a large trade will be developed in other parts of the country. As a matter of fact from time to time valuable stones find their way to market from native hands which cannot reasonably be supposed to have been found within hundreds of miles of the so-called ruby mines. The area set down in the Government maps as containing rubies and sapphires is 60 miles square, of which Messrs. Streeter have obtained the concession of 30 miles. Until very lately this was one of the quietest districts in the newly-annexed country, but it has suddenly become one of the most disturbed, no European being allowed to visit it without an escort, and the British authorities just now are endeavouring to prevent visitors and prospectors from going there, and so being possibly the means of trouble. The present excitement amongst the natives does not appear to have any connection with the mines or their working, but took its rise more especially from some agreement our Government rashly made with one of the Chiefs relating to the road which forms the approach to the district, and which it now wishes to annul.

Messrs. Streeter have sent up a large quantity of washing machinery, which is being erected in a suitable spot, and the ground will now be thoroughly worked. It would seem that other than the Company's employees are allowed to work on the concession, but all rubies found are to be offered to Streeter's agents. If the finder of the gem accepts the agents' offer, it only remains for one-third of the purchase money to be handed over to Government as its share and the remaining two-thirds to the finder. Should, however, the finder feel disinclined to take the price which is offered him—the stone is handed over to the Government—which holds periodical sales at Mandalay. At the sale Streeter's agent has a right to bid, and generally, as may well be understood, has it pretty nearly all his own way, his position keeping other

wealthy experts and purchasers from taking the trouble to reside at Mandalay for the purpose of picking up what Streeter may reject. As regards the native population this arrangement is not likely to cause any discontent as it is a very considerable improvement upon the mode adopted in the time of the native kings. Under that régime all rubies above a certain size were absolutely the property of the king, and anyone found possessing such was promptly punished. As regards the smaller sized ones, the payments made to the Crown were very arbitrary and the finders were very much at the mercy of the local authorities. As far then as the monopoly of the ruby mines, the native population of Burma are not likely to trouble their minds, whatever may be the case with the gem merchants from India and other foreign countries. There is however in this connection another very prolific source of irritation and excitement which affects not only the newly-annexed provinces, but the whole of Burma and especially Rangoon and Mandalay. This is the Ruby Act recently enacted. In this act it is provided that all holders of rubies shall, within a specified period, make declaration of them to the authorities therein named, by whom they were to be registered, weighed, described, marked and a stamped certificate granted. This was to enable the Government to watch the sale, and to facilitate the collection of the duty. As may easily be imagined a semi-civilised race, with many almost savage tribes amongst them, were exceedingly suspicious of such an enactment, and instead of responding to the demand for registration they forthwith concealed their jewels and kept them carefully out of sight. It is supposed that the act was intended to refer only to rubies which were for sale, but no provision appears to have been made for this reading of the act, or for the possibility of people wishing to dispose of their gems at some future day.

Now that the country has been in our possession some three years or more, and the people have begun to gain confidence in our rule and perceive that we purpose retaining possession of the country, they begin to bring forward the gem for sale, when down come the authorities and seize them as *contraband*. The period given for registration has long ago elapsed, and now the rubies are confiscated. In Mandalay the authorities have already so confiscated gems, to the attempted sale of which their attention had been drawn by persons who can claim a reward as informers. This of course is a very unpleasant state of affairs and naturally causes great discontent. The authorities at Mandalay have been appealed to by influential dealers (some of them Europeans) to grant letters of indemnity on condition that the provisions of the ordinance are now complied with as regards stones which are in the market; or would be were such an arrangement made. But so recently as the middle of March, whilst admitting that they would be unable to work the Act as they stood, they were equally unable to make any such concession. And so the matter stands—owners ready to sell and pay the duty, dealers ready to buy, anxiously waiting with the money in their hands, and nothing done. And yet more than this. It has been brought to the notice of Government that the chetties at Rangoon had been sending over to India a large value of rubies by means of the registered parcel post, and an attempt has now been made by the Government to recover the duty amounting to a lac of rupees or thereabouts. It is not supposed that the authorities will be successful in this endeavour, but in the meantime it has caused considerable excitement, and put a stop to trading for the present.

CEYLON TEA IN AMERICA.

The Ceylon-American Tea Company ought to have their share lists very quialko filled up, if local tea proprietors or their agents realize the duty imposed on them by the present prospect of the London market. Everybody is agreed that something must be done to relieve the approaching pressure, but of all schemes of relief as yet started or shadowed forth, the American for the time alone "holds the field" and there is the strongest inducement for all planters to do what they can to see it floated on a full tide. Given a fully-subscribed share list, and his own interests thoroughly identified with those of the Company, Mr. Pineo is not the man we take him to be if he does not do justice to the important commission confided to him. Some are beginning to grumble that Mr. Pineo has not already started for New York; but probably he is wise not to move until he sees the required capital fully subscribed. Impatient proprietors—merchants and planters—have the power therefore in their own hands to fix the time of his departure, and we trust there may be no hesitation in coming to the support of the Company. The sooner, of course, Mr. Pineo does get away the better; for he must have a good deal of preliminary work in the United States, before he can fairly launch Ceylon teas on the market or among the dealers in the Central and Western States. Nevertheless, we trust the day is not far distant when Mr. Pineo and the Company may see their way to run a steamer regularly between Colombo and New York in the tea trade, the saving in duty alone being a consideration, while a market for American cargoes ought to be found between Ceylon and Southern India. We suppose Mr. Pineo will be on his guard against competing with Mr. McCombie Murray, or any other dealer in Ceylon teas now operating in America. From the letter of a gentleman specially interested in the American people being won over to drink Ceylon tea, we quote as follows:—

"If last Wednesday's local sale, and if the latest telegram about tea don't make people take shares in the American Tea Company, one would think nothing will! The worst of Ceylon men in matters of this kind is that they make an objection to one particular item in a scheme an excuse for having nothing to do with it. It cannot be sufficiently insisted upon that every intending shareholder was asked to assist in elaborating the scheme by sending his views in to the first meeting, or by attending it. And it is the height of rubbish to complain of the lack of the Colombo element on the board of directors, when at the time of meeting only one Colombo merchant had applied for shares, and that fact was not known to the meeting, which elected the directors. *Ceylon will not stand another crisis, and tea is the Old Guard which if broken, 'sauve qui peut!'*"

COTTON FOR CEYLON.

In addition to the interesting account of the progress made with the Colombo Cotton Spinning and Weaving Factory and the collateral information afforded,—see page 847—we include special encouragement for the intending Ceylon cotton planter in the Liverpool report and valuation on Mr. Blackett's samples of cotton (page 854). This cotton, it will be remembered, was grown on an old estate not far from Gampola which Mr. Blackett had cleared for tea, and into which in October last year he interspersed cotton seed with the tea. The rapidity with which the cotton plants appeared and grew up was an advantage in offering temporary shade to the young tea. The cotton was ripe for gathering in the dry spring months and Mr. Blackett had the bushes all out of his clearing before damage could

be done to the tea—indeed the latter may rather have profited by the subsidiary culture. But we suspect that the high valuations now afforded through the eminent London House of Messrs. Antony Gibbs, Sons & Co. will send planters and natives into the cultivation of cotton for its own sake as a permanent industry, so far as a shrub which is not perennial can be so called. There will be as much enquiry probably after good cotton—as after good tobacco—land, with this difference that the former is much more readily and widely available. There is every prospect in fact that the Ceylon growth of cotton will more than supply the demand of the local mills before they have been long at work.

TEA LEAF SELLING AT 7½ CENTS PER LB.!

"Leaf is being sold freely in the Kelani Valley I hear at 7½ cents.—IOHABOD!"

But probably the cause is found in the inability to overtake the tremendous "flush": better to sell leaf at 7½ cents than to abandon the clearing for a time for want of means to manufacture? It is pointed out however that 7½ to 8 cents with a proper allowance for manufacture is not far short of the equivalent of 47 cents per lb. of made tea in Colombo, which is rather more than equivalent to 9½d, the London average for last week.

COTTON, COFFEE AND TEA.

"Coffee and Cotton." Many besides tea planters may not grasp the immensity of the trade done in coffee. Well! looking at the figures given in the *Observer* of 11th April last, it is there stated that the coffee consuming power of the world in *non-producing countries* is between 1,500,000,000 lb.; and 1,600,000,000 lb. and now take the figures given in your contemporary the local "Times" of 9th inst., in the article asking the question "Can Ceylon swamp the cotton market?" and we find that the "imports of cotton into Great Britain" represent figures only about the same as those just given by me—in fact not so large! Truly the coffee trade is immense, viewed in this somewhat strange light, which is thrown only that we may the better grasp such enormous figures and also to show what a formidable opponent we have to tea in our once valued ally—coffee.—*Cor.*

HOW TO SECURE WELL-MADE TEAS.

(From a Practical Proprietor.)

About a year ago at Streatham I met T. G. of B., who was then complaining of the "drop in tay." I pointed out that many proprietors made too often this grand mistake. To save an assistant's or a second assistant's salary they too often murdered their tea and sacrificed their own interests. I said take an estate yielding yearly 100,000 lb. made tea. If made of a quality the dealers liked, it would command, say 1d more (more often 2d or 3d, but say 1d) over the average London price. Well 100,000 pennies meant quite £400 sterling, or R6,000, enough to pay for two or three extra assistants in the factory and field and enabling one to have nothing to do with unreliable volunteers. Every man should be well up to his work, and one of these may go on a trip in search of renewed health and wrinkles—no one overworked. The tea selling sharp on arrival at home, and if more than 1d per lb. extra was got, it went into the proprietor's pocket. Of course T. G. said good-bye and rather winked his eye. I hope he may see the point now.

CEYLON'S NEW INDUSTRY:

COTTON SPINNING AND WEAVING
AT COLOMBO.

A VISIT TO THE MILL.

Hitherto Ceylon's periods of prosperity and depression have depended almost entirely upon the state of agriculture in the country; a new era is about to be commenced—the era of an industry which has wrought so many changes wherever introduced. It is not very long ago since the idea of following in the train of Bombay and other Indian cities in respect to the manufacture of cotton goods was first mooted, but when the question was fairly put, and the various advantages Colombo would enjoy as a cotton manufacturing town fully set forth, a good many of the most practical and successful men in the island were not slow to show their interest and belief in the benefits that would result from the establishment of this industry. A Company was therefore floated, and after much careful inspection a site for the proposed mill was selected, and building operations commenced, Mr. W. Atherton, — a gentleman of great experience and good judgment, having been engaged in mill work 5 years in Bombay and 2½ in Madras, besides a long experience in Lancashire, being appointed manager. It was to see the progress that had been made with "the mill" that our representative journeyed down to Wellewatta on Saturday afternoon, meeting Mr. Atherton, by appointment, on the spot.

THE SITE.

It would have been very difficult, if not impossible, to select a more suitable site for the mill than the one which has been decided upon. It is only after looking carefully round, and noticing all the various conditions that are required, that the wisdom and judgment exercised in the selection strike one the most forcibly. A plot consisting of about 29 acres has been purchased along the south side of the Wellewatta canal, and close to its junction with the old Bambalapitiya road. The greater portion of this space has now been cleared of the cinnamon jungle that grows so thickly in this neighbourhood. The whole length of the building is intended to front the canal, so that it has not been quite possible to build from east to west as mills are generally built. A good cartroad has been made from the main-road to the site of the building operations. The scene is thoroughly a country one, and might be a hundred miles from Colombo, so very quiet it is. From the mill a pleasant view is commanded over stretches of cinnamon and paddy fields and patches of thicker jungle and taller trees.

THE BUILDING.

With the building a good deal of progress has been made. The first sod in connection with the work was turned on February 5th last, and now, in fact, the walls are finished with the exception of the two end ones, which will be put in after the roof and pillars are fixed. These end walls when put up will, however, only be temporary ones, so that in case of extension being necessary they can either easily be pulled down, or allowed to remain as partition walls. The ground, of course, admits of extension almost indefinitely on all sides, except that on which the engine room is situated. The present length of the structure is 230 feet, with a width of 170 feet. The cinnamon soil has been found a substantial ground for building upon, though the walls have had to go down to a depth of 10 feet in some places. Under the

surface there is a red sandstone rock all through the cinnamon gardens, and they have gone down to that in all important places. In point of security Mr. Atherton evidently prefers to err on the safe side. The walls—which are of brick—are 17 feet high, and the top of the roof will be 22 feet 6 in.—*i.e.* the top of the ridging. As a matter of fact the average height of the building will be 17 feet, like the walls, for in some places the roof will be only 14 feet and in others 22 feet. The ridges are 22 feet 6 in. The roof will be of iron, and very little wood work will be used in any part of the building, which will be thoroughly fire proof, so that the rate of insurance will be very low indeed. The window frames even would have been of iron had it been possible to get them conveniently, but as it was not they will be of wood. Windows will be placed round the sides, and also in the roof, being made to open for ventilation. It might be thought that the sun shining upon the glass would make the place fearfully hot, but the windows in the roof will be so arranged that they will get scarcely any sun, being protected by the ridges. The chimney is already two or three feet above the surface of the ground, work on this important factor being only commenced on Friday. Below the brick-work a 3 feet thickness of concrete was placed—100 barrels. The base is 30 feet square, and the height of the chimney will be 100 feet, with a 5 feet opening. The contracts have all been placed in good hands. The supply of materials and the building have been taken by separate persons, Mr. Bastian Fernando having the former, and Mr. Joseph Fernando of Moratuwa the latter, and Messrs. John Walker & Co. of the Colombo Iron Works, will supply the roof. With respect to the latter it may be mentioned that part of the structure is now up, including the pillars and trusses. The foundations of all the pillars are completed. The spinning section will be divided from the weaving section by a rope alley, in which the ropes and pulleys communicating with the engine at the end will be placed.

A START IN AUGUST.

If all goes well, Mr. Atherton hopes to have made a start with the manufacture of cotton in Colombo in August next. Some of the machinery should be here early in July, if not in June. The engine arrived a month ago, and he is only waiting for the engine-room to be got ready. The roof is already on the ground, and will shortly be put up.

THE ENGINE.

The engine is a compound horizontal one, which was working at the Glasgow Exhibition, where it drove the dynamo machinery. Having been made for the exhibition it is altogether a very beautiful engine, of 300 horsepower, with all the latest improvements.

THE MACHINERY.

The first order is for 10,000 spindles, and 150 looms, all of which are to be of the best and latest pattern, the former being supplied by Messrs. Dobson & Barlow of Bolton, and the latter by Messrs. Wm. Dickinson & Sons of Blackburn. None of them have come yet, but the first portion of the spinning machinery is expected early in July, as it should be delivered in Liverpool on the 1st of June. Of all sorts there will be close upon 1,000 tons of machinery, and it will be rather a heavy undertaking getting it all down to Wellewatta from the Colombo wharf. The site along the canal bank admits of so much extension as to accommodate 100,000 spindles, and the necessary looms. The spindles will always be well in advance

of the looms, so that the Company will have yarn as well as cloth to sell.

A VILLAGE OF THEIR OWN.

"But where will you get all your work-people from," Mr. Atherton was asked, for from the mill itself there is scarcely a habitation visible. "I suppose they will come tramping for miles like they used to do to the old coffee mills." "Oh, we don't fear any difficulty about getting plenty of work people," said Mr. Atherton; "they would doubtless come from a good distance, but it is our intention to build a village of our own close by. You see we have plenty of room. Just come and see the plan, and from it you will be able to see the extent of the ground at our disposal." Adjourning to the cadjan-covered mud-structure, with open sides, from which the manager at present directs the proceedings, and the plan being produced, it was seen how little in extent was the ground occupied by the present buildings compared to the area of the whole plot. This village will consist of decent cottages, both cabook walls and tiled roofs, which are likely to be much more comfortable than those to which the ordinary "working-classes" of Ceylon are accustomed.

THE CLASS OF GOODS TO BE MADE.

"Ah, that will be rather difficult to say," explained Mr. Atherton in reply to a question as to what kind of goods they would go in for manufacturing, "as there is such a variety of cotton—from Mr. Blakett's downwards. I want to begin with about 20's, and from that we would go up to the American drill, and in the course of time become producers of the finer qualities of yarn and cloth,—but that, of course, can only be after the workpeople have become sufficiently expert. Our start will be drills, sheetings, and the plain white cloths that the natives wear, towels, tablecloths, napkins, &c. All these things will be made on the premises. As far as I can see there will be a good demand for those honeycomb towels, as I find that they are not only used as towels, but as sheets and wrappers for the natives in colder parts of the island. From these qualities we shall seek to work our way to the finer quality of goods. The things to aim at producing in this country are camboys, which are made out of 40 yarn, but producing them means a dyeing establishment."

PUNKAHS PULLED BY STREAM.

In all the offices connected with the mill it is Mr. Atherton's intention to have punkahs, which will be worked from the engines. He has nearly completed a model of a little thing which he thinks is an almost perfect imitation of the motion of a punkah-puller's arm. Without this particular motion it is impossible to drive or pull a punkah properly. A straight pull would give a jerk to the punkah, and would not allow it to get back before the other jerk came.

WORKING HOURS.

The working hours in the new mill will be from daylight to dusk, no artificial lights ever being required. They will, however, only work six days a week, and not as in nearly all the Indian mills, and even for a beginning about 400 people will be employed altogether including men, women, boys and girls.

THE SUITABILITY OF THE CLIMATE: ARTIFICIAL HEAT.

Referring to one of the Australian letters from the senior editor of the *Observer* in which he gave publicity to the fear of a gentleman engaged in the cotton-trade that Colombo would be too damp for the manufacture of cotton, Mr. Atherton said he could not understand what the gentleman referred to (whom he knew), could mean, unless he was thinking of the south-west monsoon season.

But the monsoon was no worse here than in India, and he thought the climate of Colombo was simply perfection. True, the heavy monsoon showers were not wanted for spinning, but they could overcome the difficulty thereby entailed. Although they were in a warm climate, and although they were putting on an iron roof, there were nights in the cold weather when they would have to have the place artificially heated! And very often in the day-time, too. There would be at least 600 lineal feet of steam-pipes in the spinning mill, which would answer the purpose of heating and drying the atmosphere. These steam-pipes will of course absorb the moisture.

THE WATER SUPPLY.

The great thing required about a mill is to have lots of water for condensing and boiler purposes, but freedom from floods. At Wellewatta there is any amount of water for working purposes, but the highest known flood level could not come near the mill. In looking round for a suitable place, those engaged to select a site saw very many places that appeared suitable at first sight, but some fault was always to be found until the present one was discovered. The water required for the engines will be drawn from the canal, about 500 gallons per minute being used. It will not, of course, be absolutely used, but it will always be returned in a very hot state, and unless there was a very large supply it would soon get too hot for condensing purposes.

THE CANAL: MEANS OF TRANSPORT.

The canal has been widened and deepened by the Company as far as from its junction with the river to the bridge on the road, and the Government have in hand the portion from this place to the sea, so that when this is deepened it will be easy to get to the railway from the Mill, thus saving a lot of cartage. At Wellewatta station there is already a siding running close to the canal. The canal is in communication with both rivers—the Kelaniganga on the one side, and the Kaluganga on the other, so that it is possible that some raw cotton may be brought down by the river to the mill itself. The canal, of course, will be of most use in enabling them to get fuel, which will consist solely of wood. It would cost four times more to burn coal than wood, the latter being so very cheap, and the whole of it being brought down by water. Close by the bridge the canal has been dammed, the sides having been walled in and landing piers built. A culvert will be made from the deepened part of the canal to the engines, and a road will be made to go right down to the landing place. The average depth of the canal from the dam to its junction with the river is 5 feet.

INDIA AND CEYLON AS RIVALS TO LANCASHIRE.

Seizing the opportunity of getting the opinion of a thoroughly practical man on the present Indian cotton trade in comparison and in rivalry to the Lancashire trade, our representative asked Mr. Atherton about the different conditions and prospects of both, and especially of Indian and Ceylon manufacturers. In reply to his remark that Lancashire must labour under a great disadvantage by reason of having to import all her raw material, pay far higher wages, and work fewer hours than was the case with the Indian mills, Mr. Atherton said:—"The hours in India are certainly longer, but labour is not cheaper, for my experience has been that it takes from $\frac{3}{4}$ to $\frac{1}{2}$ native workmen to do as much as one average Lancashire man. The pay is smaller individually, but when you come to reckon up the total, the amount is quite as much in an Indian as

in a Lancashire mill. In fact with the salaries of European managers, engineers &c., it almost comes to more. Taking it altogether labour is dearer in India than in Lancashire. I know that the people at home think differently, but it is quite a fallacy. If the hours were shortened, the cost of producing would be considerably higher than in Lancashire, for of course you could not shorten the people's pay at the same rate. Then the principal market for Indian manufactured cotton is India itself, and not only that, they have the raw cotton on the spot, which is another great advantage. Altogether the Indian mills have 1d per lb. of a local advantage—it costs $\frac{3}{4}$ d per lb. to press and send cotton to England, and another $\frac{3}{4}$ d per lb. to bring it back to India. That is an advantage the Indian mills have, and of course we shall have the same advantage here in Ceylon if cotton is grown in the island, as it undoubtedly will be. Neither the Manchester Chamber of Commerce nor any Act of Parliament can affect that 1d. And then exchange is another thing in favour of the Indian manufacturer. Supposing exchange were to go down it would be all the better for the Indian mills. The rupee in India itself, and as far as Indian goods go, buys as much now as it ever did."

"But nearly the whole of the cotton manufactured in Lancashire is obtained from America, is it not, and supposing the Americans are able to send it over 1d cheaper, would not that affect the prosperity of the Indian trade?"

"India sends about a million bales a year to Lancashire," replied Mr. Atherton, "and America sends three or four times that quantity, but the exchange is against the home trade in both cases. Poor England suffers tremendously in that way. China, Japan, and India are the great markets for cotton goods, and in all these the home manufacturer has to run the risk of exchange. Although the Indian mills do not make such profits now as they did a few years ago, it is more on account of their own opposition. I do not think there is any limit to mills in the East except the supply of cotton. Indian mills may go on extending and extending until they use up the whole of their cotton. Nearly all the existing mills are extending very rapidly, and there is now a tremendous number in Bombay. Already the Indian mills not only supply the local demand, but they send out large quantities to China, Japan, Aden, and the Red Sea ports, and a lot also goes to Zanzibar. In India they work from daylight to dark, and seven days a week.

Mr. Atherton has not the least doubt about the success of the cotton industry in Ceylon, and expresses his confidence in a practical way, for he is willing to risk every cent he is possessed of, and—as he puts it—every cent that he can "borrow or steal honestly."

COTTON GROWING BY EUROPEANS.

It is assuring to learn that there is every likelihood of European planters in the island taking to the cultivation of cotton. Many old firms such as Messrs. Geo. Steuart & Co., and Messrs. J. Murray Robertson & Co., have been making enquires about seed from the agents—Messrs. Darley, Butler & Co. A number of experiments are being tried, and a lot of cotton will be planted from July to September. The only thing the agents fear is that they will not have enough seed to supply all the applicants. We understand that several books on the cultivation of cotton are in course of preparation. The Hon. W. W. Mitchell, who is an authority, informs us that he is greatly in favour of planting the native *kapu* or *kidney* kind of cotton, for, as it is a perennial, it will give the minimum of trouble, and bear all the year round, the staple besides being just what is wanted.

CEYLON TEA IN AMERICA.

(From a Correspondent.)

Keep pegging away about the Ceylon Planters' American Tea Company. We must not let it fall to the ground; our very existence will depend upon it, I believe. And rather than let it fall, Mr. — and I intend doubling our shares. When thoroughly understood I believe everyone in the country interested in tea, will join.

THE TOBACCO INDUSTRY AND BIG TOBACCO LEAVES.

We have received from the Badulla correspondent (Mr. E. Heanly) who wrote the other day about big tobacco leaves some specimens of the same in their green state. They certainly are "prodigious" measuring up to 2 ft. 4 in. in length by $1\frac{1}{2}$ foot wide. The owner of the garden in which they grew, says: "these are not so large as the ones already harvested." Can any other district beat them for size? As regards the quality a Colombo authority to whom they have been shown, writes:—

"They are of a very good size, but with few exceptions coarse in proportion. I am sorry they are not cured in order to submit them to an expert." Could Mr. Heanly induce the owner to send a few of his best-cured leaves to refer to an expert?—We see that a Kandy correspondent of a contemporary reports as follows:—

The land known as Velate estate, midway between Kandy and Peradeniya, has been bought by Mr. Harrison, for the cultivation of tobacco. There are other lands for sale in the neighbourhood of Kandy, one being the property of the late Shroff of the Chartered Mercantile Bank, on the Halloluwa road near the ferry. This land, too, is said to be suitable for tobacco.

WITHERING TEA.

(From a Proprietor.)

Withering on tats accounts no doubts for a lot of bad tea, and, as the acreage and yield of tea increase, this evil of bad tea and consequent losses may also be expected to increase!

Leaf is often left in the tats for days together before a wither can be got. At — it has been on the tats for five days.

Bad withering weather is generally the best weather for flushing! so it does seem strange if no one can be found to cope with this peculiar state of things.

Even in tolerably fine weather, I believe, to avail of the direct rays of the sun is not at all good for the future flavor of the tea. So some think a safe artificial method of withering quickly by heated air will have to be discovered.

AN OLD CEYLON PLANTER IN CALIFORNIA.

There may be some still in Ceylon who remember Mr. Edward Llewellyn who was superintendent of Gilston estate, Ambagamuwa, somewhere in the "fifties." We believe too that Mr. Llewellyn had to do with importing tea seed from Assam which was put out on Penylan, some big trees grown therefrom being still to the fore. Last mail brought a long letter from him from California addressed to the Editor, *Observer*, from which we quote as follows:—

I am an old Ceylon coffee planter, a brother-in-law of Mr. Hy. Ritchie of Wilson, Ritchie & Co., a firm which existed in your city. I have often heard indirectly of the little country where I spent many of the happiest years of my life. I have been pretty well all over the world, and I have finally

settled down in this country, but my heart still clings in fond remembrance to the dear little spice island; it is a sunny spot to me, full of kindly associations; 'twas there a loved sister lived, and in whose company on Slave Island I spent many happy hours. I often sing that well-known song, "Oh would I were a boy again, when life seemed formed of sunny years," and tears well up in my eyes as I think of that little spot, and all the scenes pass in rapid succession through my mind. The last person I saw who came from there was Rev. Mr. Carter, Baptist Minister. I met this gentleman in Auckland, New Zealand, and you may be assured we had many hours of pleasant conversation over the place we both knew so well. How is the island prospering? Is coffee planting still the rage, or has it given place to tea? Please give me all the news. If you can manage it, I would be exceedingly obliged by your sending me a small packet of tea and coffee seeds; I am very anxious to try how it will succeed here; the climate is well-suited for it, the only drawback being want of rain, but they have irrigation, and that will answer the purpose. This is a grand country, and this part of it in particular (California) is very fine, the climate on the Pacific sea coast cannot be surpassed. You have a mild winter with a beautiful summer; where I am, it is about 100 miles inland, and hotter in the summer, the thermometer stands at 110 degrees in the shade most of that time; in the winter we have it down to 16 degrees above zero. There is another great advantage we possess, that is, that we have no heavy storms; now in the east part of this continent they are subject to terrible storms and snow blizzards, the thermometer in many places going down as low as 60 degrees below zero. This state is very favoured, is a splendid wheat country, and can grow all kinds of fruits. Railroads are being formed all over the country, and you can make the trip across the Continent from San Francisco to New York in 4 or 5 days, and in case you want to go to England steamers take you in between 7 and 9 days. I suppose you have railways pretty well over Ceylon now, and Colombo must be much improved by the erection of its breakwater. I am glad to find that the Government has restored those fine irrigation works, which had fallen into a ruinous condition; this will be the means of restoring that valley to its former prosperity.

TOBACCO COMPANY OF NORTH BORNEO.

In compliance with the provisions of section 39 of the Companies' Act of 1867 the first ordinary general meeting of the shareholders of the Tobacco Company of British North Borneo (Limited) was held at Winchester House, Old Broad-street, London, on the 17th inst. Mr. J. Guthrie Davidson was in the chair. There were also present Mr. E. Bunge, Mr. Frank Shaw, Mr. David Brown, Mr. L. R. Glass and Mr. J. A. H. Wrought.

The SECRETARY having read the notice convening the meeting,

The CHAIRMAN stated that the meeting had been called in compliance with the articles of association. There was absolutely no business to transact, but the directors were glad to meet the shareholders and to have the opportunity of communicating to them what had taken place since the company had started. The directors had first of all made arrangements for Mr. Menzies, a gentleman of large experience in tobacco planting, to visit the company's property and to report upon it. He was a gentleman of very large experience in opening tobacco plantations in Sumatra. Mr. Menzies was at Singapore, and left that day for Borneo. According to the latest advices they had received they had a staff on the plantation consisting of a manager and four European assistants, who were required for the purpose of selecting the ground. Operations for opening up the new estates would be commenced as soon as they had arranged for native labour. At present there were on the plantations about 200 Javanese and Malays and about the

same number of Chinese coolies. The Singapore agent was negotiating for the shipment of coolies direct from China. They could, of course, be put on the plantation much cheaper by direct shipment. All this, however, took time. The manager had reported that he was well in hand with the preparations for planting over 250 fields for the next crop. The weather had been unusually rainy, but nevertheless the work was well forward. A telegram from the agent at Singapore of the 12th inst. stated that fair progress was being made with the plating. Last year's crop, which was purchased along with the property, had yielded over 140 piculs, but it had not yet been shipped. According to advices from the manager, this was the produce of twenty fields. This crop, however, had been grown under considerable disadvantages. It was planted late, and had suffered from a very trying season, there being an unusual number of insects. Notwithstanding this the property gave a yield of 7 piculs per acre, which would doubtless be larger under more favourable circumstances. The quality of the tobacco was reported by the manager to be excellent. Indeed, they had received information, from the spot that the quality of the tobacco from the Segannan estate was equal to, if not finer, than that grown on the Lanakat plantation. The following is an extract from Governor Creagh's despatch, dated Nov. 27th 1888:—"Mr. O'Callaghan, who is the Resident of the district, informs me that 100 bales will be exported from the Segannan estate, which is most satisfactory, having regard to the reverses of the company during the beginning of the season. One of the assistants of the Lahat Datu Estate told me that the Segannan tobacco is of finer quality than theirs, and as Count Geloos speaks in very high terms of Mr. Voorwik's crop, the 100 bales from Segannan may be expected to realise a high price." (Applause.) The demand for tobacco land in Borneo seems still to be increasing. The last news from Borneo with regard to tobacco is contained in a telegram, which states:—"The Arendsberg Deli Company have taken up large concessions for tobacco. Planting prospects favourable." The manager of the North Borneo Company remarks in writing to the secretary:—"This is the company which paid 152 per cent last year, so that the fact of their going to Borneo for land should be reassuring to British investors in tobacco enterprises in our territory." Speaking of the prospects of the company, he said that the demand for land for tobacco cultivation in Borneo was increasing, and it was evident that this kind of property was much appreciated in this country. As evidence of this he alluded to the rapid manner in which shares of the recently formed tobacco companies had been taken up by the public, and argued from it a sound position for this company in the future. In conclusion, he said the directors would be glad to furnish the shareholders with any information they might desire that it was in the power of the board to give.

Mr. PYKE drew attention to the clause in the articles of association which gave the directors power to issue debentures to the extent of £50,000. He thought this too large a sum for the directors to be authorised to issue without consulting the general body of the shareholders. He asked the board if they would be prepared to take the matter into their consideration and refer to it at the next meeting?

The CHAIRMAN said he thought himself that the power of the directors in this particular was excessive, but it was not likely that they would ever exercise it, at any rate not in his time.

Mr. DAVID BROWN explained that the clause in question had been inserted from some old articles of association, and because it was the cheapest way to go to work with advances. £50,000 had been put in the articles to enable the company to work on the same system if they wished, instead of calling up a large amount of capital. The position of the company was that they had really more money than they required, because they were obliged to call up £3 in order to get the settlement, instead of £2 as they originally intended. If the majority considered it advisable, the directors were quite willing not to issue debentures

in this way. The matter, however, would receive the attention of the board, and no debentures would be issued without the sanction of the shareholders.

Another shareholder thought that the meetings of the company should be half-yearly. He thought twelve months was too long a time for the shareholders to hear nothing of the affairs of the company.

Mr. BROWN said there was only provision made for yearly meetings, but he thought they should be very glad to call a meeting when Mr. Menzies' report came. Mr. Menzies is a very skilful and experienced planter, and we were sorry we could not get him to go direct to our property; but he had an engagement to visit some estates in Sumatra. His report would say whether they could work on a very large scale or not. Mr. Menzies was the gentleman who selected the estates of the Lanka Plantation Company, which gave from the commencement over 100 per cent.

The CHAIRMAN intimated that another meeting would be called when the board received Mr. Menzies' report. He further stated, in reply to a shareholder, that nearly 37,000 had been applied for in shares.

The meeting then terminated.—*L. & C. Express.*

TOBACCO.

AMSTERDAM, April 16.

Several companies have declared dividends during the past week. The Deli-Langkat Tobacco Company has issued its annual report, from which it appears that the crop harvested in 1887, from two undertakings, was 3,415 bales, which realised an average price of c. 132 per half kilo. The accounts were adopted, and the dividend was fixed on 730 guilders per share, f. 95,250 have been transferred to an extraordinary reserve fund, and f. 205,049 to the ordinary reserve fund. Besides the usual writing off on buildings, &c., required by the statutes, a further writing off f. 59,200 has been made on possession in land concessions. It also appears from the report that the 1888 crop of four undertakings will be about 1,000,000 half-kilos, the prospect for which seems to be satisfactory.

The Amsterdam-Deli Company has also issued its report, which is somewhat disappointing, the result being below expectation. A large quantity of the tobacco was decidedly of inferior quality, in consequence of which prices and commissions were lower this year. Moreover, the increase of the capital to 1,000,000 guilders has exercised its influence on the percentage of profit. The dividend for 1888 has been fixed at 25 per cent; the reserve fund amounts to f. 1,415,304. The 1888 crop—which will be sold this year—so far as quantity is concerned, is satisfactory, and more than that of the preceding year. As regards quality nothing can be reported as yet; but the first arrivals appear to be satisfactory. The report further refers to the emigration of Chinese coolies. The existing arrangements are to be improved. The managers also mention that in the beginning of this year two estates were purchased—one in Deli, and one in Lakat—and that the 1889 crop is already being worked on account of the company.—*L. and C. Express.*

PLANTING IN NETHERLANDS INDIA.

(Exchanges to 24th April.)

The Surabaya *Courant* has been informed on good authority that leaf disease is spreading far and wide throughout the coffee growing districts in Java, but it has taken a less malignant form. The branches bearing the most heavily fair the worst.

The German New Guinea Company has some intention, so it is said, of choosing Surabaya as the terminal point for a line of steamers running to Finschhafen in German New Guinea via Macassar.

In different parts of Java, marble of excellent quality has been found. Specimens of the article have been taken to Batavia to be put into shape for transmission to the Paris Exhibition. Large consignments not only of Netherlands India products, but also of the people of the land, have been forwarded there.

In Acheen the enemy continue to harass the army of occupation, but cannot do them much harm owing to the strength of the lines. The losses they inflict in killed and wounded are slight. The evacuation of Acheen seems further off than ever during the sixteen years the war has been going on. Meanwhile negotiations are going on with the titular Sultan of Acheen with a view to end the war by restoring the Sultanate under Netherlands protection.

The German ship "Emma Romer," laden with copra, has been destroyed by fire at Macassar.

"A SYMPOSIUM" ON TEA CULTURE AND PREPARATION

of a very practical and instructive kind, will be found begun on page 861, several instalments of considerable value having still to follow. Although the questions to which answers are more directly given refer mainly to the quality of the flush at different seasons, the effect of manuring and fine *versus* coarse plucking; yet, incidentally, opinions on the tea industry generally are afforded, and it is interesting to see how the majority of writers seem to adhere to the view that to shut out China teas from the London market, it is necessary that Ceylon planters should not pluck too fine. It is evident however that no general rule can be laid down, applicable to the great variety of elevation, climate, soil &c. appertaining to Ceylon tea plantations in different districts, and that managers in many cases are still only learning the peculiarities with which they have to deal. The Ceylon tea planters as a whole, in fact, may be said to be learning, season by season, more and more about the capabilities of their tea bushes, and the proper use of their factories and machinery. They are bound to become the best cultivators and makers of tea in the world: if we only give them a little more time. Of that our London friends may rest assured. The competition to make good teas compatible with a decent paying crop is very keen in most of our districts. The fact too that with the tea land already planted we are bound to go on increasing our exports until a hundred million lb. in one season are reached, ought to go forth as a warning to our Indian and Java neighbours. They cannot possibly compete with this moist tropical island and its very cheap ample supply of labour, in supplying Europe with tea at a low price. Ceylon is bound to be first in the race. Indian and Java planters had better not plant another acre with tea (any more than Ceylon planters) until they see what the next few years may bring forth. In India, a policy of contraction of the tea area cultivated rather than expansion, had much better be observed.

NEW PRODUCTS: COTTON, TOBACCO, LIBERIAN COFFEE, &c.

Fortunately, at this crisis in Ceylon, there is a new product claiming attention under auspices sufficiently attractive to arrest the purpose of the irresponsible planter who may be bent on opening more land for tea. Mr. Blackett's experiment in cotton near Gampola on an old coffee estate, shows that cotton may be grown with advantage over a very considerable area of country in Ceylon by Europeans as well as natives. A number of experiments with cotton on established plantations are now to be made, so far relieving the pressure on tea and affording another string to the bow of the planter, against the day of trouble.

"Tobacco" is also the object of attention; but the difficulty of getting suitable land anywhere in

the Central Province for the operations of the local British Company is as great as it proved in the experience of the German Syndicate. A clearing intended to be opened near Matale after further inspection has been given up. The land offered by Mr. H. Fraser, by Mr. T. C. Owen, by Mr. Christie and others is all reported to be condemned as not up to the "tobacco" standard. It is very evident therefore that whatever may be done with the coarser kinds by natives, Ceylon is not to become a prominent tobacco grower under European auspices. Mr. Dickson's London Company, however, in place of looking to the Central Province, are reported to be in treaty with Government for a grant of lowcountry land. This may lead to more extended business if only a suitable location is taken up. Meantime in Dumbara, the gentleman who first gave the present start to the product continues to cultivate 40 to 50 acres of tobacco year by year with success.

Another product pointed out this week as once more worthy of attention at this time is our old friend "Liberian Coffee"! Alas how many planted it and after what they deemed a full trial, gave it up; and yet, were they not premature, may now be asked? For undoubtedly there are cases where Liberian coffee in the lowcountry is doing fairly well for its owners in the present season. Coorg coffee under shade after Mysore fashion is likely to have more than one trial in Ceylon; but we regret to learn that coffee in and out of shade in Dumbara is not doing so well as usual this year.

Nutmegs too are being experimented with by several European planters, and it is claimed that remarkable success has attended their cultivation with manure added to the soil at an early date. Pepper must shortly come to the front in our exports: one parcel from a Ceylon plantation figured in a recent Mincing Lane sale.

FUEL COMBUSTION.—The following statement by a "bachelor of science" in an Australian contemporary is of practical interest to a large number of teamakers:—

In connection with the notorious waste of energy in even our best engines it is interesting to watch the strenuous efforts of scientific engineers to at least stop up every outlet within their power. Much attention is being given to the perfect combustion of fuel. The idea of using pulverized fuel is an old one, but till recently it has never been successfully carried out on a practical scale; but now Mr. McAuley, in the United States, has got into satisfactory working order a method by which powdered fuel can be perfectly burnt. The coal, coke, or anthracite is ground in the new and interesting cyclone pulverizer, which consists essentially of a small strong chamber in which two very strong screws revolve in opposite directions opposite one another. By their revolution they produce a terrific miniature cyclone in the space between. Any solid bodies dropped in are whirled about in such a fashion that they grind one another to the finest powder. The powdered fuel is fed in automatically to the furnace, into which only just the right amount of air to burn the fuel is admitted, thus no heat is wasted in heating useless air. The whole combustion of course is beautifully under control—a matter of importance to the metallurgist. A very large saving of fuel is said to have been effected in some American ironworks where the process has been applied. It is possible that before long we shall see all large consumers of fuel using coal sent out in the form of fine powder in bags. The idea of using powdered coal is only the logical outcome of the success than has attended the introduction of the two gaseous fuel producers, gas and water gas, and also the use of refuse petroleum oils. In some of the most recent oil-burning boilers steam for a four-horsepower engine can be got up in sixteen minutes.

THE CULTIVATION OF TOBACCO IN ABERDEENSHIRE.—Among the experiments conducted during the past year by Mr. Thomas Jamieson, Lecturer on Agriculture in Aberdeen University, on the experimental farm at Glasterberry, Cults, by Aberdeen, has been that of Tobacco culture. From the results of the experiments it has been proved that the soil of Aberdeenshire will produce Tobacco of a quality which when manufactured meets with the appreciation of smokers. From the results obtained Professor Jamieson concludes that Tobacco might be easily grown, ripened, and cured in this country, and that with the skill that comes by experience, even the finer varieties might be successfully made. Plants were grown upon an experimental plot, and on a larger scale in the field; they were late in being planted, yet the produce is described as being heavy, and though not thoroughly matured, it was manufactured into three forms of tobacco and "smoked with appreciation." The trouble entailed to the grower and the Inland Revenue officers, however, by the frequent inspection of the crop, has led to the abandonment of the experiments.—W. K. *Gardeners' Chronicle*.

PLUM CULTURE IN BOSNIA.—The most important product of Bosnia is Plums, and the food in a dried state is the principal article of export. The poorest peasant (says Mr. Consul E. B. Freeman of Serajevo) has a few Plum trees by his hovel, wealthy landowners never think of planting any other kind of tree by their country houses, and on the result of the Plum crop, more than any other, depends the well-being of the agricultural population. Accurate statistics of the crop are not available, but in a good season about 40,000 tons of dried fruits are exported, representing a money value exceeding £200,000. The fruit is not only grown for dessert, however; a large quantity is consumed in the making of a spirit commonly drunk in the country, and known as Slibovitz. The Bosnians, moreover, are great makers of jam, and they prepare from the Plum a large quantity, which is manufactured without sugar. The export of dried fruit is almost entirely to Austria and Hungary; it does not appear that any of it comes to this country. Possibly, however, a market may hereafter be found for it in England; for the product is increasing, and the local Government has turned its attention to the establishment of drying ovens of a superior description to those hitherto in use. A large proportion of the crop of 1887 is said to have been lost, owing to the primitive and inefficient way in which the fruit was dried.—*Gardeners' Chronicle*.

DRUG SALES.—In the Mincing Lane reports during the past fortnight some interesting facts connected with vegetable products appear. Thus it is stated that six bales of Deer's-tongue leaves (*Liatris odoratissima*) were offered for sale at 3*l.* per pound. Some time ago it is said they were becoming popular as a substitute for Tonquin Beans. In America the plant is known as Wild Vanilla and is used for scenting cigars and Tobacco. If the plant is trodden upon the aroma is abundantly given off. This aroma is due to the same crystallizable odorous principle which is found in the Tonquin Bean and the sweet-scented Vernal-grass. It is stated that in America, many of the flavouring fruit essences and vegetable perfumes are obtained from the *Liatris* leaves. Under the head of Gum asafetida, which our readers are aware is a fetid gum obtained from two or more species of *Ferula* from Kashmir and Persia, we read the following startling announcement:—"It is said that a peculiar adulteration of this article has recently been observed in Hamburg, where wholesale drug firms offered to their Swedish customers a gum from trees which was composed of crystallised gypsum coated with true asafetida, the amount of adulteration varying from 20 to 80 per cent." Of *Strophanthus* seeds, it is reported that large quantities have recently been imported and that good greenish seeds have realised 4*s.* per pound. A good deal of uncertainty prevails as to the botanical identity of the species yielding the *Strophanthus* seeds of commerce, some kinds being more pointed than others or of different tints, or smooth or hairy.—*Gardeners' Chronicle*.

Correspondence.

To the Editor.

THE CLIMATE OF COLOMBO AND THE NEW COTTON MILLS.

The Mill, Colombo, May 3rd, 1889.

SIR,—Referring to the remarks of your correspondent in his interesting account of his voyage in the "Parramatta," as to the suitability of this climate for spinning and weaving, will you permit me to correct the impression which my friend Mr. Hardman's opinion may create. We cannot hope to have perfection in this world, but the climate of Colombo, for our work, is a very near approach to it. For the spinning we could well dispense with the heavy monsoon rains, which we have to overcome by having a thoroughly waterproof building and a system of drying and heating for extreme occasions. For weaving we can scarcely have it too wet. It is well-known that in England steam jets are very generally used in weaving mills during dry weather, and in India the floors are kept continually watered. A very dry atmosphere does not suit for spinning either. During the dry hot winds in Indian upcountry mills, the atmosphere has to be artificially moistened. One of the most favourable conditions for the spinning and weaving industry here is the entire absence of such dry winds, and altogether, so far as I have yet seen, the climate of Colombo is all that could be desired.

As to cotton, our expectations have been exceeded. We did not dream of such beautiful cotton as Mr. Blackett has shown us. Our machinery is adaptable to any quality of cotton, and we shall produce such yarn and cloth as the cotton produced in the island may be suitable for, and we can use five or six different qualities at the same time. We hope to be at work in September, and are now quite ready to buy cotton of any quality, in any quantities.

Yours faithfully,
W. ATHERTON.

A WARNING TO CINCHONA PLANTERS NOT TO HARVEST BARK.

Colombo, 7th May 1889.

DEAR SIR,—Your notice in yesterday's issue of the probable turn for the better in the cinchona market will, it is feared, have the effect of inducing some planters to harvest and ship bark; and should this be the case, the anticipations of the London merchants, to which you allude, will not be realized.

There is, at present, a large quantity of bark, some of which has been held by some proprietors for 3 years (I know one who has held all harvested on his estates since November 1885) awaiting a rise in the market and until these large stocks are disposed of in London and the market has shown a decided improvement, it would be very unwise to harvest and ship bark, except that which must be harvested from dead and dying trees.

The remedy for the present exceedingly low and unprofitable prices is in the hands of Ceylon planters and merchants. All they have to do is to hold until present stocks go off, and then only to ship moderate quantities, when they will receive their reward in enhanced prices.—Yours faithfully,

A PROPRIETOR.

JAPAN (MOMI) TEA BOXES.

DEAR SIR,—As the largest and, I believe, the only importer of Momi Japan boxes, allow me to state that they are now used all over the island and

by several of the largest tea shippers in Colombo. One firm has just booked an order for 5,000 for this month. It is thus quite certain that they are excellent tea packages, and none of the firms have made any complaint as to their cracking. Mr. Deane says the cracking occurs when they are exposed to heat, but does not say what degree of heat. I fancy any tea box would crack when exposed to undue heat? I have a number of sample boxes in my office verandah, which have been there all through the present hot season and the sun shining on them, part of the day, but they show no sign of cracks. Anyhow as Mr. Deane says it is a fact that momi woods have no smell, and there is therefore no risk of taint from them.

As you truly remark in your editorial, if it were not for the importation of Japan boxes the price of locally-made boxes would rise considerably, and, again were there only one importer of Japan boxes, the prices would also rise considerably.

Mr. Deane goes out of his way and endeavours to decry momi boxes by mistaking recent occurrences. He says: "It is more likely the damaged packages may have been of momi wood." The truth is Messrs. Rucker & Bencraft do not write about damaged packages at all, but of piney or cedary odour imparted to the tea, and, as Mr. Deane states that momi has no smell, it is not possible that the tea referred to by Messrs. Rucker & Bencraft can have been tainted by momi boxes. No honor is due to Mr. Deane for trying to mislead.—Yours faithfully,
E. B. CREAMY.

TEA ROLLING AND THE WORKING OUT OF KADIENLENA TEA CROP.

Colombo, May 8th, 1889.

DEAR SIR,—Some time ago Mr. D. Fairweather wrote to a local paper saying that he estimated the second size Barber roller as being "quite capable of meeting the requirements of an estate turning out 100,000 lb. tea per annum." We have now the pleasure to annex copy of a letter from Mr. James Gray, of Kadienlena Factory giving the outturn of his machine for six months, and the prices realized for his teas during that period—information that will no doubt be interesting to your planting readers. It will be noted that the prices realized were very satisfactory seeing there was no fine plucking.—Yours faithfully,
W. H. DAVIES & Co.

Kadienlena Estate, 6th May 1889.

Messrs. W. H. Davies & Co.—Dear Sirs,—I received yours of 30th ultimo in due time, and in answer I send you the true "canonack" done by "Barber's 25" Blackstone Roller during the course of six months on this estate.

Viz.	B Pekoe.	Pekoe.	P Souchg.	Con.	Total
July 1888..	2,464	2,399	2,059	...	6,922...67c 57c 51c
August ..	4,250	3,743	3,805	100	11,898...78c 59c 66c
Sept.	3,314	3,130	3,172	100	9,716...75c 65c 58c
					33c
Oct.	5,045	5,018	4,872	100	15,935...1s 1d 1s 0½d
					10½d 38c
Nov.	3,678	3,577	3,313	100	10,668...72c 55c 50c
					37c
Dec.	3,200	2,884	2,343	...	8,427...1s 10½d
					9d 34c
	21,951	20,751	19,564	400	62,666

Also the prices at the end in order. This included every thing. You will see that two of the invoices were sold at home; of course it was not sent away in "breaks" same as the monthly outturn; it was sometimes more or less. I had lots of night work; and could not have managed the dry six months, viz. from January 1889 on.—Yours faithfully,

(Signed) JAMES GRAY.

P.S.—No fine plucking.—J. G.

A HINT TO THE TEA FUND COMMITTEE AND TO TEA FIRMS.

May 8th, 1889.

DEAR MR. EDITOR,—I think the "Tea Fund" would do a good thing for Ceylon, if they framed a treatise, and send it in a stereotyped form to all the provincial papers in England, Scotland, and Ireland, showing at what low rates Ceylon teas are being sold at present in Mincing Lane, and on the other hand the prices that are being paid by the consumer.

It is a wonder that no really large packet trade has been opened between Ceylon and the old country. What an opening for some firms with capital and go.—Yours faithfully,
U. S. A.

THE CEYLON TEA MARKET IN COLOMBO AND LONDON.

SIR,—If what a tea planter writes under the above heading in your issue of May 6th be correct, one would expect to find prices lowest when the tea was made by the votaries of cricket, tennis &c. But this is hardly the case, I fancy. I would rather say prove "inattention to manufacture" and let the blame and punishment fall on the guilty parties; but don't forget that many good men and true, play both cricket and tennis. Until your correspondent gives soberer consideration to the subject and gets nearer the truth of the matter, he need not fear "howls of indignation." People will just content themselves by observing that he is not very wise in his attempts at solving a difficulty which many feel as much as he.
T. P. R.

WEIGHING TEAS IN LONDON.

SIR,—It seems useless to moralize! For years a very loose way of conducting business to the disadvantage of the tea producers has been going on and now that the shoe begins to pinch, the planter's foot is becoming more energetic than the Dock people like! Wait till the ship canal is opened and the produce business is started in Manchester for the whole of the districts of Lancashire and York, teeming with population and wealth beyond any other port of the United Kingdom. Then if worked on modern principles we shall see a rival to Mincing Lane opened up, and it is hoped all these aggravating allowances to the trade and deductions will be swept away as relics of a barbarous age! CRITIC.

JAPAN TEA BOXES.

Kintyre, May 9th, 1889.

DEAR SIR,—*Re* Japan boxes, I can assure Mr. Creasy and your readers that I in no way wish to mislead them in their choice of Japan tea packages, but on the other hand would give them the benefit of experience, as I introduced both kinds of packages; in the first place to Mr. Creasy, and then to the public, and as I can import either kind of wood from my Japan friends, it will be obvious to the impartial reader that I have no personal interest to serve in declaring in favour of one sort or another.

In writing to Messrs. J. Murray Robertson & Co. on 15th January 1886 (who at that time were my agents) for Japan boxes Messrs. Fraser, Farley, and Venum of Yokohama say:—"We find 'Momi' wood brittle and not suitable for 3th boxes." (They add also) "We call your attention to the fact that 'Matsu' or pine is not suitable for boxes; it warps and is ruinous and we should advise you not to book any orders of this wood."

After hearing this I decided myself to give "Momi" wood a trial *only in ½ inch packages*; and accordingly on 21st May 1886, ordered through Messrs. J. Murray Robertson & Co. 1,000 packages for Christmas delivery, explaining that I gave the order so long beforehand to ensure seasoned wood being used. In due course the packages arrived and 60,000 lb. of tea was despatched in them, but I found the packages cracked and split after they were done up, and though I had no *serious* damage done, my London friends advised me they preferred the *Cryptomeria* boxes, and on 1st April 1887, I wrote to Messrs. Murray Robertson & Co. as follows:—"Kindly order me the following Japan boxes for June delivery, 500 chests ½ inch wood, 200 half-chests ¾ inch wood, all of *cedar*. I find the 'momi' wood very apt to split in this dry weather, so return to the *Cryptomeria Japonica*."

This then, sir, will prove that I had no animus against rival importers; but it was and is a true opinion whatever that may be worth, and at the time it was given Mr. Creasy was not importing "Momi" packages only as at present. Live and let live is a good maxim; and I am sure for my part the more competition there is in boxes the better for myself and other planters, as it is in the reduction of prices I look to for my profits and not in the sale of packages—my share of profits in which has been some 300 rupees after nearly five years' work in getting the business which gives the tea planter (whether it be of "momi" or "cedar" wood) a better and a cheaper package than he had before or could have at present, and probably gives a regular income to those who import them for sale to the public. If the public are satisfied with the remarks of Messrs. Wilson & Smithett in their circulars of December 1885 and January 1886 and many other favorable notices that from time to time have been printed respecting boxes made of *Cryptomeria japonica*, then I advise their purchasing boxes of that wood, whether from Mr. E. B. Creasy or Messrs. Mackwood & Co. is immaterial, as I believe the wood to be tougher and stronger, and to also have a value in itself as a handsome wood in England; the small dealer probably getting a better price for it than for "momi" which resembles deal.

In conclusion I would ask you to add the notice given of the *Cryptomeria japonica* in the preface to the Tea Planters' *Vade Mecum*, a valuable book, compiled by the late editor of the *Indian Tea Gazette*:—

(Extract from page XX of "Tea Planters' Vade Mecum.")

It has long been notorious that our heavy and unsightly packages meet with much disfavour at home, although the trade have had, hitherto, to put up with them; but they like them none the better for that, and it should be borne in mind that a reform in this respect is being attempted in Ceylon by the use of a new wood obtained from Japan, of which tea boxes are now being manufactured. *Cryptomeria Japonica* bids fair to supersede all other woods now in use, and we strongly recommend a trial of it being made in India.

And I remain, sir, yours faithfully,

H. D. DEANE.

P. S.—In the same valuable work, sir, one of your articles on the same subject is given at length on page 217, headed *Cryptomeria japonica* as a timber for tea boxes.

COTTON GROWING NEAR GAMPOLA.

Dotel Oya, Aranayaka, 11th May 1889.

Dear Sir,—I enclose copy of Report and Valuation of samples of my Jack Tree Hill estate cotton. They speak for themselves and must interest a large num-

ber of your readers.—Yours faithfully,

JAS. BLACKETT.

Liverpool, 15th April 1889.

Messrs. Antony Gibbs, Sons & Co.

Gentlemen,—In reply to your valued favour of 11th instant, handing us samples of two parcels of Ceylon cotton, we now beg to enclose description and value of same, if for sale in Liverpool today. In a very long experience these are the first samples we have seen of Ceylon cotton, we have therefore taken the liberty of showing them to several of the best judges of fine cotton in this market, and taken their opinion—as to its merits generally compared with the established growths with which it would have to contend. The opinions confirm our own that both samples represent cotton which would be valuable additions to the growths now in common use and might always be relied upon, to realize a comparative value as follows, viz. :—

No. 1. Grown from American seed about $\frac{3}{4}$ d per lb. less than fine medium Sea Islands, grown in America.

No. 2. Grown from Egyptian seed, about the same value as good white Egyptian; or good fair rough Peruvian.

These are both well ginned and carefully cleaned cotton being free from dust, sand, leaf or neppy cut cotton, all of which is injurious, particularly in the fined qualities, with which these would rank. The No. 1 quality if white instead of creamy would be worth $\frac{3}{4}$ d per lb. more.—We are, gentlemen, yours very respectfully,
(Signed) EDGAR MUSGROVE & Co.

REPORT AND VALUATION ON TWO SAMPLES OF CEYLON COTTON.

Quantity	Mark	Description	Staple	Classification	Value per lb
Sample No. 1	Grown from Sea Island Amcan. Seed	} Very long, fine and strong	} Good	14d to 14½d*	
Sample No. 2	Grown from White Egyptian Seed				

General remarks:

* Very clean, free from nep or cut cotton, but slightly creamy in color.

† Very clean, free from leaf, dust or sand.

(Signed) EDGAR MUSGROVE & Co.

Liverpool, 15th April 1889.

TEA: QUALITY AND QUANTITY.

DEAR SIR,—The replies so far published to the questions under 3 heads circulated by you are of very great interest and value, and are likely to do more to diffuse a knowledge of tea-growing and making than anything that has been published yet. While you were about it, it is a pity the questions were not better formulated and more in number. As it is the most valuable remarks are voluntary additions the occasion suggests to the various writers. I am making a careful abstract of all these replies and formulating the lessons they teach under various heads. For instance one only has touched on "pruning" as yet, and he says:—"For quantity prune low; for quality prune high." Here is a lesson in nut-shell.

I notice that as yet none of the writers venture to speak authoritatively on "quality" as might have been expected—the words "I am of opinion" not being of much value. But against opinion let us set a recently published facts. See the Kadi- enlena return made to and published by Messrs. W. H. Davies & Co. as follows :—

	Tea made.	Pekoe sold for.
	lb.	c.
July	6,922	57
Aug.	11,898	59
Sept.	9,716	65
Oct.	15,085	1 00½
Nov.	10,668	55
Dec.	8,427	10½

These figures show that the best flushing months produced a rather better quality of tea than the other months, in opposition to the generally expressed opinion. We have much yet to learn.
A PLANTER.

JAPAN TEA BOXES.

DEAR SIR,—Kindly give me space for a few lines in reply to Mr. Deane's letter of 9th instant.

As Mr. Deane has only now mentioned that he can import either Momi or Suji wood boxes, I submit that it was by no means obvious to the impartial reader on seeing his first letter that he had no personal interest in cracking up cedarwood boxes.

Wood of $\frac{3}{8}$ inch thickness, no matter whether Momi, Suji, Ceylon or any other kind, is quite unsuitable for chests, and in my opinion for half-chests also, but is excellent and sufficient for boxes of smaller sizes.

Live and let live—a most excellent motto—though I fear not well understood by the people of Ceylon in these degenerate days. It is evident Mr. Deane himself does not act up to it, for he tells us his share of the profits after working five years is R300! This scarcely fits in with "live." As his agent in 1885 "let live" worked out in the same proportion!

It is paradoxical to say that the more competition there is the better for Mr. Deane, although it certainly is for other planters, as also to say that he looks for his profits not in the sale of the boxes, but in the reduction of prices! If this is really the case, why did he wait till I commenced regular imports before he came down in his prices, and why not now go lower and according to his calculation make more profit?

For myself, it is also immaterial to me whether my constituents buy momi or cedar boxes. I am ready to import cedar boxes to any extent, for anyone who wants them at the same price that I charge for Momi. I contend however that Momi is better than Suji, as there is no risk of taint.

The question of taint can be easily tested and settled. Let those interested take a box of each kind of wood, fill them with tea, without lining, previously sampled and tasted. Keep the boxes closed for 24 hours and then retaste and note the result!—This should set the question at rest?—Yours faithfully,
E. B. CREASY.

THE PLANTING PESSIMIST PAR EXCELLENCE ONCE MORE ON "THE SITUATION."

DEAR SIR,—Whenever anything happens, such, for instance, as the fall of tea, it is pitiful to observe how straws are clutched at to prove every reason, but the right one, to be the cause. Tennis and cricket were made the leaf disease scape-goats and, now, they are, once more, called upon to do duty. Neither has the slightest connection with the present state of things, although those who see nothing in tennis and who regard tennis conversational "shop" as an unutterable bother, would not break their hearts, were it blamed, justly or unjustly. One would have thought it would have been within the competence of a fool to have foreseen that what is now happening was inevitable and that the present fall in prices is mere child's play, compared with what has still to follow. The real cause is that the supply is far beyond the demand, caused by a comparatively novel tea being rushed, to glut the market, years before it has been given sufficient time to be adapted by the multitude. The estimate for this season is only 34 million lb. and has already worked the damage which we see; so that, what on earth is to happen, when 100 millions come in? And there is enough tea planted in Ceylon to produce

this huge amount. It might be argued that people are not to blame for this result, because, when coffee died, what else was there left for the land to be put under and what was there else to be done? To which the reply is, that there were plenty of other devices. Very little land when coffee died was worth R10 per acre, so that little or no sacrifice would have been made by abandonment.

Tea does not exactly cost nothing, and vast sums have been outlaid upon it: how much better it would now be, were these in safe English securities, instead of in their present great jeopardy. Or, if the money which tea has cost much needs have been invested abroad, why was not much of it taken to places offering more varied resources than only the one or two which Ceylon has reduced to the cheapness of dirt. Had tea but been left, as it stood, about 4 years ago, it would have been a splendid thing for the country and a fortune to those who owned it.

Even in Ceylon itself, large sums could have been diverted from the everlasting tea, by investments in the lowcountry for the cultivation of Liberian coffee, which is becoming very valuable, owing to coffee *Arabica* failing throughout the world. The coffee crisis of 1848 was brought about by the high prices paid for the first few limited arrivals and when the article was a novelty:—it was then extended and rushed, before it had properly established itself in the market, with this result: that estates were abandoned or parted with for sums which their store roofs had cost. A gentleman of great experiences, who recently visited the island, and who had gone through the 1848 crisis, since having made his fortune from coffee and possessing also now a splendid tea property, declared that tea was following the same identical course, and that in its case the coffee crisis of 1848 would be shortly repeated.

Wise and competent persons have made their preparations, based upon calculations; and it is computed that tea giving 300 lb. per acre will weather the storm; but that without other resources, anything giving less must be given over to the weeds. One thing, however, is that tea is only a jungle plant and unlike coffee takes no harm from abandonment; so that it would still always be available for re-opening when the time for safely doing so came.

The opinion is now very generally expressed by people who do not live upon the Uva side of Wilson's Bungalow, but who formerly thought differently, that under the altered conditions, the Government should be called upon to give compensation to the Haputale railway engineers and relieve them of their engagements leaving the line in abeyance, until it is seen what is going to happen. Because, were force of circumstances combined to stay the extension of tea throughout the Province of Uva, it would be a bad day and a bad business for the survivors attached to the fragments of a dilapidated enterprise to be called upon, in addition to their own necessities, to make good a huge debt standing to the account of a gigantic white elephant. The Government and the planting member should look this matter in the face without finching; because by and bye, if disaster follows, they will have neglected a great responsibility.

H. P. X.

WRINKLES FOR PLANTERS.

DEAR SIR,—Your remarks on your *T. A.* come very timely just now to merchants and planters; the former (now that tea has run down so low) are often pestered with inquiries which could be determined on the spot by the latter if they had as

they ought to have your "Planting Encyclopædia" (for such you well style your *T. A.*) always ready for reference. The cost is absolutely infinitesimal and the value simply incalculable. At any rate such is my opinion and probably the opinion of very many others who have subscribed to it from its commencement.—Yours truly, PROPRIETOR.

FINE, MEDIUM AND COARSE PLUCKING.

May 13th, 1889.

DEAR SIR,—Will you kindly define "fine, medium, and coarse" plucking? Also say the probable increase in yield from "medium and coarse" plucking over fine plucking?—Yours faithfully, H.

[Has "H." been reading the answers to questions under the head of "Tea Culture and Preparation" He will find his present question very nearly answered by "S. A."—a well-known tea proprietor with experience—who offers the following illustration:—

Fine plucking 100 to 120 lb. per acre.
Medium " 400 to 500 lb.

That is, we infer, on land capable of giving for coarse plucking (?) 700 to 800 lb. On old coffee land, perhaps the ratio should run (1) 70 to 80 lb. (2) 150 to 250 lb.; (3) 300 to 350 lb.—Ed.]

RE ACACIA DECURRENS' BARK.

Elephant Nook, Nuwara Eliya, 13th May 1889.

SIR,—Enclosed may be worth publishing in your columns and especially in *T. A.* The bark sent home was from trees over 40 feet in height, and just about 3½ years from seed grown here. The trees were planted about 4 feet apart and the yield averaged about ¼ cwt. per tree. The balance of the bark I used for the bungalow stoves; the heat it gives out after it has ceased flaring and is in its red hot stage being intense. I shall be glad to give any further particulars.—Yours faithfully,

WALTER TRINGHAM.

Colombo Commercial Company, Limited,
Colombo, 6th Aug. 1888.

W. R. Tringham, Esq., Nuwara Eliya.

MIMOSA BARK.—(*Acacia decurrens*. [W. R. T.]

Dear Sir,—Referring to the sample of this we sent forward for you, our Secretary writes thus under date, London, 20th July 1888:—

"We tried all round the trade, to get a value on this without having it analyzed, but we were obliged to analyse it at a cost of £1 1s 0d. It shows 34.35 per cent of tannin, and is therefore worth from £10 to £11 per ton. The old bark should be shipped, not the new. I have today posted to you a sample showing the size it must be sent home. This sample shows nothing, but size required." I now enclose the original certificate of analysis referred to in the above extract and under separate cover forward the sample our Secretary sent out for your guidance in harvesting. You will observe that we have incurred some expense in obtaining the above valuation &c. for you, and this we charge to your debit.—I am, dear sir, yours faithfully,

JOHN G. WARDROP, Manager.

BULKING OF TEA.

SIR,—Tea planters are indebted to Mr. Street for his plan of obtaining a perfect bulk in the chests as they stand in the tea factories. But now comes a question, which deserves equal consideration and perhaps Mr. Street can further instruct tea planters what to do in the matter.

When chests of tea are despatched even a short distance by cart (not to mention a twenty days' journey to Colombo from Haputale), what becomes of all this trouble and cost in bulking? Some of the chests are packed perhaps one way and some another in the carts. Supposing however that

the chests are loaded carefully with their lids all uppermost, so that on opening the bulk shall appear all the same (notwithstanding the shaking they have had on the journey) WHICH SIDE OF A CHEST SHOULD BE MARKED SO AS TO INSURE THE TOP, *i. e.* the lid as it is put on in the factory, only being removed when the tea is inspected in London?—
Yours,
C. H. J.

YESTERDAY'S TEA SALES—THE CRISIS— AND GOOD ADVICE.

Colombo, May 16th, 1889.

DEAR SIR,—You cannot too seriously impress upon the planting community the imperative necessity of looking facts straight in the face and preparing for what may almost be termed a "crisis" in tea. Low as the rate may be at which many estates can lay down their produce in Colombo, you have only to glance at yesterday's sale list to see that the prices offered must leave, in a number of instances, been an *absolute loss* to the proprietors. Out of 140,214 lb. put up only 44,613 lb. were sold, and probably when the unsold teas reach the London market there will be a still further decline in price. London brokers have, for a very long time past, incessantly urged planters to go in for *QUALITY*, not quantity, but how many men have acted upon their advice? Men who have secured high averages have been pointed to as "fine pluckers" who could not go on for long, but how do they stand now? They are not only getting a profitable return from their properties, and able to look with equanimity upon current prices, but have been the sole means of keeping up the average of Ceylon teas. Had every planter gone in for his 400 to 600 lb. per acre the average would probably now be 6d instead of 9½ per lb., and what then? Simply absolute ruin for many men. It is not too late to mend, and I hope you, sir, will use your powerful influence and persuade planters first, to go in for *quality* not quantity, and so materially curtail the output; secondly, to stop all further opening up of tea land; thirdly, to plant other products as auxiliaries to tea; fourthly, to economize more in estate and personal expenditure; where possible and lastly to assist in opening up new markets for their produce.

I am not a tea planter, but am closely connected with the planting community, and offer these remarks through being profoundly impressed with the present outlook of the tea market.—Yours faithfully,
A COLOMBO MAN.

COTTON GROWING IN UVA.

Wilson's Bungalow, 13th May 1889.

SIR,—I send by today's post to your address a parcel of cotton grown by me at Welimada. Please let me know your opinion of the same.—I am, sir, yours faithfully,

HENRY E. DAMBWINNE.

[We are pleased to be able to give Dambawinne Ratemaha maya a favourable report on his cotton. The Secretaries to the Cotton Spinning and Weaving Company are good enough to report follows:—"The cotton you send us sample of is the *rata-kapu* of the Sinhalese or *Peruvian* or *kidney*, but the natives know it by the first-mentioned name. It is excellent stuff, and we shall gladly buy all we can get at from 20 to 25 cents a lb. We had some exactly similar from Mr. Fisher, Badulla, a few days ago. It is not necessary to put it up in the 'finger lengths' as in the sample: we only require it as it comes from the pods. The *rata-kapu* is the kind

for the natives to extend the cultivation of."—There can be no doubt that Uva is well adapted to become a great cotton-growing country. The sample sent to us is very neatly put up and can be seen at this office.—Ed.]

COFFEE.—A telegram from the Governor-General of Netherlands India, dated the 17th inst., mentions that the Government's coffee crop in Java for this year, it is estimated at 530,480 piculs.—*L. & C. Express*, April 26th.

THE MATCH INDUSTRY is flourishing in Japan. According to returns, issued at Kobe, there were no less than 8,007 cases exported from Hiogo-ken and Osaka-fu during last month. There was an increase of 2,465 cases.—*China Mail*.

TEA-BOXES.—Mr. F. Street has sent us for inspection one of the Scotch tea-boxes referred to in his advertisement today: it is certainly a very serviceable and workmanlike article as might be expected, from the country in which it was made. The package is of inodorous pinewood, good in quality, very strong but light and should we think compare favorably with any in the market. We can only add what Mr. Street himself says:—

"To show you how these packages were approved of I may mention that the first planter who saw them snapped 5-6ths of the whole trial consignment and has asked me to get out more. This speaks volumes from so good a planter as Mr. _____ of _____, Dikoya."

LIBERIAN COFFEE TO THE FRONT!—We are much pleased to learn from Mr. F. H. Shelley of Mousava estate, Madawalatenna district, that "the Liberian coffee on the estate, in spite of leaf disease, bug and neglect, gives good crops year after year. It is, in my opinion, a grand product, which, with cocoa, receives very poor treatment." *En passant*, we may recall the rumour that "Mousava" with its fine cacao and Liberian coffee was the estate, we believe, that Kandy Kachcheri officials under a previous regime wanted to take possession of under the ordinance for abandoned estates!—so much knowledge had they of a property in continuous cultivation. Mr. Shelley's present welcome news ought to encourage everyone who has still Liberian coffee trees, as well as cacao, to the fore, to do justice to these products. May we not see a renewal even of the planting of Liberian coffee in view of the approaching scarcity of the berry?

CHRISTMAS ISLAND—one of the most recently-acquired of British possessions—is about to be settled by the well-known Ross family, who have enjoyed possession of the Keeling Islands since 1825. It is not perhaps generally known that the Keelings—sometimes called the Cocos Island—possess the richest coconut plantations in the world and the output of copra from them is considerable. The nuts are of an excellent quality, and they have been introduced at various times in Fiji and other copra-producing countries with marked success. In 1857 the islands were taken possession of by the British Government, the father of the present owner, Mr. George Clunies Ross, being recognised as Superintendent. The colonising proclivities of the sturdy Scotsman who pioneered the Keelings over 60 years ago seems to animate the present representatives of the Ross family. Christmas Island lies some 200 miles to the south-west of Java and about 500 miles from the Keelings, and it was landed upon some time ago by Captain J. G. Clunies Ross. Shortly afterwards the Union Jack was hoisted upon it, and now we learn that the youngest of the Ross family, with his wife, and thirteen natives of the Keelings, have permanently settled there. We heartily wish them success in their new enterprise.—*Colonies and India*.

HELLRIEGEL'S THEORY : NITRATES.

(Communicated.)

How it is that leguminous crops which are so rich in nitrogenous matter yet do not leave the soil exhausted of its nitrates and other compounds of nitrogen, is a question that has long bothered the minds of Agricultural Chemists and Botanists. In fact, it has almost been given up as a problem without a solution. Hellriegel, a well-known continental authority and Director of the Experimental Station at Bernberg, propounds a theory to account for this peculiarity of the leguminous plants. In carrying out some experiments with regard to the amount of nitrogenous manuring required by different crops, he was struck by the fact that the application of these manures to leguminous crops gave results far short of what might have been expected. The cereals showed results varying almost proportionately with the supply of nitrogenous manure. On artificial soil devoid of any nitrogenous ingredients the cereals failed entirely, while the legumes thrived. This gave Hellriegel sufficient grounds for believing that the leguminous crops found a source of nitrogen elsewhere than in the soil. The roots of clovers, beans, &c. have wart-like protuberances, the functions of which have long remained a puzzle. The contents of these warts, when pressed out and subjected to microscopic examination, turn out to be of the nature of fungi, bacteria, or organisms like bacteria—bacterioids as they have been called. It is known to Agriculturists that certain bacteria, known as nitrifying germs, have the power of attacking the inert nitrogenous material in soil, and converting them into nitrates in which form they are more available as plant food. Hellriegel, however claims for the bacterioids contained in the warts on leguminous roots, that they are able to work up the uncombined nitrogen of the air into valuable compounds. This is a very natural conclusion considering the fact that leguminous plants thrive on soils totally destitute of nitrogenous matter; and what is more, leave a store of nitrogenous plant food behind. What an opportunity there is for improving our sandy soils without the expense of manuring, on this theory!—Local "Examiner."

A TRIP TO BRITISH BURMA.

THE BURMAH STATE RAILWAY—FOUR HUNDRED MILES OF PADDY FIELDS.

Of all the dreary uninteresting stretches of country to pass through by rail, I commend the tract of level land lying alone the course of the Sittang, with the Karenee Hills on the one side and the Pegue range on the other. This line of Railway, on the metre-gauge, passes Pegue, the ancient capital of that portion of Burma—now entirely destroyed—Toung-hoo, a large military station, and Yemethen, a new station rapidly increasing, and was opened into Mandalay on the 1st of March, being 386 miles in length.

At six o'clock on a cool, misty morning the train ran out of the busy, dusty port of Rangoon, with its hundred tall chimneys giving forth volumes of smoke from the paddy husks and sawdust which are used as fuel, out into the almost boundless stretch of paddy fields, as far as the eye can see on all sides—at this season dusty and dried up, and the stubble burnt off. A few little huts and heaps of straw, and a few small villages at lengthened distances, a buffalo here and there, and a few paddy stacks, a few hawks and crows, and a few vultures—such a dreary, dusty, arid waste I never saw before! But Burma dry and Burma wet are very different places, and I found it easy to conceive the difference when this plain is green with paddy, and everything looking lively, though where the population comes from, to bring the land under cultivation is, to a stranger, one of those things which "no fellar" can understand; the only solution being, I believe, the real one, that immense numbers of Indian

coolies come over and work for the proprietors of the fields, and, when the crop is reaped, find occupation at the mills and in the town, or return to their own country much in the same way as the Irish were accustomed to do before the introduction of steam machinery into the agricultural counties of England. For the first fifty miles or so the stations seem to be in very unpromising situations, where population is very scant at this season, and they rejoice in such elegant appellations too! For instance, Togyang-gale, Pynbouggi, Paungdawthe, Nyaungbyidaik, &c., &c., in fact—one might as well be in Wales as regards unpromisable names. All manners and conditions of folks are to be noticed travelling by rail, and crowding the train to overflowing. Perhaps, after the extravagances in turbans and head-gear of the Indians, the most noticeable individuals are the Shans, the men with broad flapping straw hats, four feet wide, short jackets and loose, short, blue trousers; the women in long smocks, bedecked with bits of tassels and fringes, and the cloth reaching to the ankles, much after the representations of Jewesses in the old picture-Bible of childhood's happy days. Men and women alike carry on their backs funnel-shaped baskets, tied with a band round the forehead, and some of them carry about the children in the same way. Almost all the employes on the line—signal men, station coolies, &c., &c.—are Indians, most of them wearing shoes or boots of some kind, and a few swells with stockings as well, mostly of a dull red color. By-and-bye we get up into rising lands where bamboo jungle prevails at intervals, or in clumps between the paddy fields, and again long stretches of plain, with a few trees dotting it, and a house or small village with its ruined dagoba or residence of the priests. In one place there were a few plants of manna grass apparently cultivated as a curiosity. Still further along the line, one hundred and fifty to two hundred miles from Rangoon, there are tracts of jungle, with tall grass rising to four or five feet in height, and still further a stretch of cactus, precisely similar to the cactus of Hambantota, with a broad oval-leaved species at one spot only. The rise above the sea-level is small and gradual, totalling so small an amount in the whole length that I am afraid to put it down. Everything is dry and dreary; the grass in some instances burning fiercely right up to the line; but the whole of this country is suitable for paddy (which is grown without help from artificial irrigation), having at one time been under water, and is many feet deep in the deposit brought down from the upper course of the rivers—probably the Irrawaddy, which now takes its course from Mandalay more to the west and runs down 600 miles to the sea. By casual observation, of course, errors are naturally fallen into, but there seems a happy-go-lucky system, or want of system, in dealing with the native passenger traffic which is amusing in the extreme. The carriages are entered at the end, and there is a short connecting platform with a step on each side. The natives often sit or stand on these for want of better accommodation, and there is nothing whatever to prevent them from getting out on the wrong side when the train stops and clearing off alone the line; and, when the engine is being watered, they do get down in numbers for various purposes and move about just as they like. By-and-bye more restrictions will have to be used in order to secure everyone paying for the use of the line. How they manage to stow away their goods and chattels is another matter. One sees a fellow with a pingoe and two large flat bamboo cages, each three to four feet in diameter; men with bundles of bamboos six to eight feet long; big boxes and bundles of all kinds; a woman moving through the crowd with a big baby and a great chaty containing a flowering plant with straggling branches two or three feet long getting into her own eyes and those of everyone else; everybody laughing and joking, and the railway people shouting in Hindustani or Tamil and letting the passengers take care of themselves. And, when everyone seems settled down—with water from the big jar on the platform, or tea from the

itinerant vendors, water melons and cucumbers, milk, sherbet, cakes and sweetmeats, cigars an inch thick or more, and all the extraordinary compounds one sees hawked about—than somebody says the train might be moving, and a coolie seizes a hammer or piece of iron and strikes three times three on a bit of broken rail suspended by a wire, the engine gives a whistle, and off they go again. This scene is repeated at each of the 59 stations on the line. No wonder we are an hour and a half behind time when we reach Mandalay, and we have to pick up and pack up some hundreds of armed police who have been guarding the line during the construction of the last 200 miles or so during the past two or three years since the occupation of the country. The look of the country improves as the traveller reaches the neighborhood of Mandalay, but, as the last two or three hours are run in the dark, it is not possible to say much about it. The Karennee hills seen from the line are very bare and burnt, looking similar in contour to those of Uva near Fort Macdonald, and apparently rising up to 3,000 or 4,000 feet.—Ceylon "Times."

TO THE NILGIRIS AND BACK.

[By MR. T. FARR.]

THE NADUVATAM CINCHONA GARDENS—A FOREST OF CINCHONA—SAMBUR GALORE—PRIVATE ESTATES—ENTIRE ABSENCE OF CANKER—FUTURE PROSPECTS OF NILGIRI CINCHONA—TEA IN COONLOOR.

The Nilgiri planters are sanguine about the prospects of cinchona, but its position commercially appears to me unsatisfactory, in view of the quantity of bark now being, and likely to be, produced in other countries. With regard to its growth and permanency, the Ceylon grower can form no idea, from the partial failure which has attended its cultivation here. How striking is the contrast with the cinchona estates in India! At Naduvatam the Government gardens are a great and palpable proof of the permanency of the tree on the Nilgiris, at an elevation of some 6,500 feet above sea-level. These gardens are, at the present time, forests of all varieties of cinchona. My road from Ootacamund to the Wynaad plateau led me through them, and I was able to appreciate in some measure their extent and age. Well-kept paths, bordered in some instances with thick hedges of "box," led in all directions, under the dense shade of succirubras and hybrids, whose thick foliage excluded almost every ray of sunlight.

Birds flitted about in this forest gloom, feeling security in the dense cover around them, and were it not for the strong wire-netting with which the gardens are protected, I can well imagine that sambar and red deer would seek the leafy shade in herds in the hot noontide hours. Gnarled and bent stems of officialis, clothed with lichens and moss, indicated the age of this valuable forest, and continuous rows of succirubras, with but few vacancies, were a proof of the absence of root canker, I noted a few cases of stem canker, but this was not more common than obtains in any primeval forest.

Along the Government road running through the gardens tracks of sambar, where they had left the thick "nilloo" of the jungles to roam around this forbidden shelter, were abundant, and of a size to stir the heart of the Ceylon "elk" hunter. Many a grand old stag nightly rubs his thirty-six inch antlers against the posts to which the wire is attached, and in places one could see the netting bent and bulging, where probably some impatient stag had tried to remove the hated obstacle to his nocturnal roamings. These cinchona gardens lie on the very verge of the mountain range, which descends in bold, rocky precipices to the Wynaad and Mysore plateaux below. Later extensions, leaving the shelter of adjacent hills, have crept over towards the plains, braving the fierce winds which rage at some seasons amongst these rugged spurs. High above the cultivated lands are grassy ledges and peaks, the home of the Nilgiri ibex, and many an old patriarch "saddle back" makes his home in these inaccessible retreats.

There is a large acreage of cinchona in private hands in Naduvatam, of all ages, and the proprietors are to be congratulated on the agricultural success that has attended their enterprise. Through the courtesy and hospitality of the Manager of Liddesdale, I was fortunate enough to be able to walk over a considerable portion of that magnificent property. Liddesdale consists of some 800 acres, most of which is under cinchona cultivation, and a more perfectly even cover of any cultivated product it would be hard, if not impossible, to find. Planted 4 ft. x 4 ft. some seven to nine years ago, the estate presents a rich dark-green appearance from end to end; and, although rain had not fallen for some weeks, not a red leaf was visible. Here and there the somewhat sombre coloring of the foliage was relieved by the brilliant red blooms of rhododendrons, which, in sympathy with the beauties of nature, the ruthless hand of man had spared.

In the dense shade of these cinchona groves, weeds struggle for existence, but it is considered necessary to hoe occasionally. The cost per annum is trifling; indeed, expenditure generally, on the Naduvatam estates, is of the most moderate description. Harvesting operations are constantly going on in some form or another. Branch bark is taken from "loppings," and, as it is fairly rich in quinine, the annual revenue from this source probably covers the total expenditure of the year. I was much impressed with the great care bestowed by the Manager of the property upon shaving his trees. Of the many thousands I passed, I did not detect a single case of injury to the *cambium*, and the renewal of bark seemed perfect and healthy. Owing to the apparently entire absence of canker, the Naduvatam planters are enabled to confine their harvesting to "shaving" and "lopping," and in this they have a tremendous "pull" over us. They can afford to wait until the market may improve sufficient to make coppicing a really remunerative operation, when they will probably thin out their trees judiciously.

The remaining trees will quickly and gratefully respond to this in growth and vigor, and, so far as I can judge, there is a fairly substantial revenue derivable from shavings for years and years to come. The soil varies in quality as in Ceylon, but is all free from clay. In the sholas the growth of the trees is excellent, but on the slopes and ridges, which were originally patana land, it hardly reaches our standard here, even at the highest elevations. The absence of springs and running water generally was a very noticeable feature, and to this, coupled with a light rainfall, is probably due the immunity from canker which the trees enjoy.

It is estimated—by, I believe, competent authorities—that the annual yield from all India in the future is unlikely to exceed five millions of pounds of bark from shaving alone; but, in the event of a substantial rise in the value of quinine, there would doubtless be a great increase. Coppicing would be resorted to at once, which would again depress the market. The only natural enemies the cinchona planters have to contend against are "sambur" and frost. The former do incalculable harm to young clearings, and are, in fact, as destructive to young fields bordering forests as hares used to be to the corn-fields in England. Once the tree has reached the height of five feet or so, the damage by these nocturnal visitors is confined to barking the trees with their horns.

Young plants are sheltered from forest with ferns, but one, and even two-year-old trees suffer severely at times, and in some places are killed outright. On Liddesdale estate the bark is pressed, or baled, or in tea parlance, is "factory bulked," and as much as 400 lb. is put into a bale.

From what I observed, it appeared to me that far more attention is paid to cinchona cultivation on the Nilgiris than in Ceylon. The planters there make a study of it, as we in the old days made a study of coffee, and as it is their staple product this is only natural. The distinction between different varieties, as laid down by the late Mr. MacIvor, is

recognized, but, in these latter days, ceases to be of such absorbing interest as formerly. It is sufficient for the Nilgiri planters to know that they have on their properties a large number of healthy trees, representing so many thousands of pounds of bark sufficiently rich in alkaloids to be of great value when shipments from Ceylon shall have ceased to flood the world's markets.

Upon my suggesting further extensions, I was met with the remark that they had enough to satisfy them for many years to come. There is an immense acreage of patana and forest land around Naduvatom eminently suitable for the cultivation of cinchona, but it is improbable that much of it will be brought under cultivation, at any rate within the next ten years.

In dealing with the subject of tea on the Nilgiris, I am necessarily bound to confine myself to what I saw, which was little enough, and must, therefore, abstain from conjecture as much as possible. Taking Coonoor as the first locality in which I saw a tea bush in South India, I am inclined to think well of the prospects of that district in this product. The soil is doubtless well adapted for its vigorous growth, and the climate appeared in most respects favorable. I do not anticipate anything extraordinary in the way of yield, for lengthened periods of drought, and, at high elevations, cold nights, will prevent this. But I feel confident that the Coonoor planters have a safe resource to fall back upon should coffee fail them in the future. There is a considerable local demand for the Nilgiri teas, and this materially assists in making its cultivation a very profitable one. Upon two estates I visited the system of "panning," by which process green teas are made, yielded a very valuable article of commerce in "Oolongs," but I am not in a position to say whether it would be found to pay on a large scale. The teas I saw and tasted made by this process sold uncommonly well in London, and anyone having a Greig's Witherer in his Factory would, I think, do well to give it a trial.

Upon the higher slopes of the Nilgiris, around Naduvatom and Ootacamund for instance, I should not be inclined to put much faith in tea as a paying product. Forests are severe, and only a moderate yield can be looked for, but the flavour of the teas from Khotgiri and the Ouchterley Valley is very marked and of a superior order.—Ceylon "Times."

MORE ABOUT JAPAN TEA BOXES.—We call attention to the letter of Mr. E. B. Creasy on the subject of Momi wood boxes. The original orders from leading local tea planting Agency and proprietary firms ordering supplies of these boxes have been placed in our hands, and it is quite evident that Momi wood must be all right in the estimation of some of the shrewdest men in tea in the place.

COFFEA BENGALENSIS.—An interesting free-flowering stove shrub, for many years cultivated at Kew, where it now flowers in one of the stoves. It is a yard high, copiously branched, deciduous, the new leaves developing with the flowers. These are in clusters at the ends of all the branchlets, and are formed like the flowers of a *Jasminum*, but much larger, being nearly 2 inches across the obovate lobes; they are pure white and sweet scented. This species, although of no value economically, is entitled to a place in all collections of stove plants. It was, according to Roxburgh, cultivated for some time in India under the idea of its being the real Coffee plants of Arabia. *C. travancorensis* and *C. myrtifolia* are also pretty flowered, fragrant stove plants, which are cultivated at Kew, where they flower annually. The last named is almost unknown in English gardens, but is not uncommon in Belgium. It is dwarf and compact in habit, the leaves are small, as in *Gardenia radicans*, and the flowers are clustered and pure white. It is catalogued by Makoy & Co., from whom the Kew plant was obtained several years ago.—*Gardeners' Chronicle*.

COTTON-GROWING.—Mr. Blackett, it seems, has not rooted out his cotton shrubs on Jack-tree-hill, as he at one time spoke of doing, and we learn they show signs of supplying another crop before long—in fact of becoming a perennial in place of a bi-ennial plant in Ceylon!

ECONOMY IN TEA.—A proprietor writes:—"Every planter who is worth his salt must now economize in his work so as to cut the cost of tea down to the lowest possible amount compatible with good work." Another adds:—"Every $\frac{1}{4}$ per lb. must now be saved; Street's tables on 'Freight and Dock Charges' alone as regards sizes of packages in order to save charges is worth a lot; and Ceylon men must see and attend to these matters now!"

JAPAN BAMBOO.—The following further particulars have been received from Mr. Sandford regarding the Japan bamboo alluded to by him (January Proceedings):—"You asked me some time ago to get you further particulars about the bamboo I had referred to, as growing vigorously at Somastipore in Tirhoot. Their name is *Kotong* Bamboo of Japan, I believe, and the seed was received from Gazpore from Mr. Schlich of the Forest Department. The *Kotong* is said to like a rather sandy alluvial soil, but it will also grow in ordinary black soil, and at Jubbulpore it has been planted with remarkable success. This variety is believed to have a life period of 55 years, and it grows to the height of 60 feet under favorable circumstances. It is probable, the name I have given will identify it as a comparatively well-known species, and I trust what I have said will at least put you in the way of getting fuller information." Copy of Mr. Sandford's letter has been sent on to Mr. Gamble, to whom the specimens obtained from Somastipore through the kindness of Mr. Gladew-Newcomen, had been forwarded. It seems probable that the bamboo is the Indian *Katang*, (*B. arundinacea*) and that the Japanese origin of the seed is a mistake.—*A.-H. Society of India*.

CINNAMON.—The trade in Ceylon Cinnamon, once a prosperous business, seems doomed to perpetual paralysis. The miserable prices obtained for the article in this market must be grievously felt in your island by growers and shippers. Looking at the figures of trade, from the Ceylon side, the cause is not far to seek. Enormous production fully accounts for current values, a very large proportion of your shipments being represented by chips. To this fact the present range of prices is largely due, more than which it is to be feared that the produce bought by merchants from dealers is not always genuine. Notwithstanding the large quantity which Ceylon sends to Continental ports direct, the still larger shipments to the United Kingdom are nearly all re-exported, the home consumption of the spice being infinitesimal. The figures for the past two years are as follows:—

	1887.		1888.
Imports ...	1,109,973 lb.	...	1,351,990 lb.
Exports ...	1,222,500 lb.	...	1,121,324 lb.

Whatever difference of price exists between chips and baled Cinnamon, no doubt arises from the superiority of quality of the one over the other, yet in actual use a portion of a stick from a bale, and a chip of genuine spice of equal quality, do not differ as regards value for use. Looking at the course of the trade for years past, it would appear that the great decline in price has taken place since the shipments of ships from your island. Over and over again it has been pointed out to growers and shippers that, if they would see better prices, there must be a resolve amongst them to refrain from the export of chips in any quantity; but, so far, this advice has been disregarded, and instead of utilizing chips for the purpose of oil-making, they continue to be sent over here to weigh down prices by flooding our market beyond any hope of recovery.—*London Times*.

TEA CULTURE AND PREPARATION.

FEW PRACTICAL INQUIRIES BY A PRACTICAL MAN.

1. Is not Mr. Armstrong responsible for the statement that the quality of the tea is best when the bushes flush most freely?

2. Have you any information to indicate that the application of manure improves the flavour or strength of the tea?

3. A good deal is now being said about fine plucking and high prices, but surely the men whose success we should emulate are those who combine quantity with quality?

(Answers to the above.)

[Four answers, including "Peppercorn"'s, have already appeared—see pages 817, 824 and 840.]

No. V.

Agrapatana, May 5th, 1889.

1. I do not think quality so good in a heavy flush as in a moderate one.

2. Cattle manure has nearly doubled the yield in one field, i.e. the manured field is giving nearly double an unmanured field adjoining. I notice no difference in quality.

3. Where estates have little or no tea of their own and insist on their neighbours who sell them leaf, plucking fine, it pays undoubtedly. Personally I would rather get 400 lb. per acre and sell at 10d than 250 lb. and sell at 1s 1d. I do not believe in fine plucking. R. W. W.

VI.

Hatale, May 5th, 1889.

1. Where has Mr. Armstrong made this statement? Your querist should give chapter and verse. I do not think that, as a rule, such good tea can be made from a free-growing sappy flush as from one of less vigorous growth. Apart from this, it is seldom possible to do full justice to the leaf during a rush.

2. The effect of manure on quality of tea is probably still a matter for experiment and investigation, though from the influence that various soils have on the quality of tea, it would appear probable that manure would have some effect. Manuring no doubt increases the quantity, but I much doubt its paying at present prices.

3. Where are the men who can combine quantity with quality under all circumstances. I fear that the two are not compatible except in a few cases when good jät, soil, and climate combined give a specially fine character to the leaf, and by good management a high class tea is made from apparently ordinary leaf. Under all circumstances as quality is aimed at, cost of production is increased and quantity diminishes, and the skill and experience of the manager must be directed to determining what is the most profitable system of working under his particular circumstances. T. C. O.

VII.

May 5th, 1889.

1. I am not aware that Mr. Armstrong made this statement. I am of opinion that better tea is made when the bushes are *not* flushing freely.

2. Not having done any manuring I can give you no information under this head.

3. I believe in medium plucking, which should give quantity with quality. A DIMBULA PLANTER.

VIII.

May 5th, 1889.

1. My experience (limited) is the same as "Armstrong": in fact I agree with him in most things.

2. As to quality of tea after manuring, I am not in a position to give any information owing to having done only a few acres, but there is no question as to quantity.

3. "Rather vague": a planter will not get quantity and quality if all circumstances are taken into consideration; at same time I believe should fine plucking be systematically carried out quality will be improved and quantity will not be much reduced. I could give instances (*many*) where fine plucking has

been laughed at, but the laugh is on the other side at the end of the year. At present when our teas are at such low prices, for P. and P.S., all should endeavour to get the prices up by fine plucking; by doing so your B. P. is not only better, but P. and P. S. and even your dust increases in price.

MASKELIYA PLANTER.

IX.

Hoolankande, Madulkele, 5th May 1889.

1. In reply to your inquiries, I most decidedly agree with your correspondent, that the quality of the tea is best when the bushes are *not* flushing freely. I find my own tea produces best quality during the coldest period of the North-East monsoon:—December, January, and February (the two former invariably) are my best quality months.

2. My experience in manuring tea is very limited; I have treated a few acres to farmyard compost, cowshed, and stable manure mixed with lime sweepings and old thatch, forked in, one basket between 4 trees; some backward tea so treated 2½ years ago still flushes about 2 days in advance of the surrounding tea. *Actual* results I have not been able to ascertain, either as regards increase of yield or development of quality. It would be natural to suppose that manuring would show *some* result in quality favourable or otherwise, though probably only a very temporary result.

3. I imagine your correspondent when speaking of men who are successful in combining quantity and quality, means *moderate* quantity and *moderate* quality. If there are men who attain a maximum yield and a maximum value, these results do not appear to the public; but if it can be done I have no doubt the Ceylon planter will do it. I am at issue with your correspondent on this particular point of plucking, and think it would be well for each proprietor to study his own circumstances:—given a low elevation, rich soil, and even rainfall, let him consider well whether quantity alone would not pay him best. Given a medium elevation, the case becomes more complex, the jät, soil, climate must be considered and besides this any peculiarity of flavour which it may be worth while to stretch a point to still further develop: a medium plucking will probably be the best for the medium elevation. At the highest elevations the jät principally will decide the case; if good all round it will probably pay to pluck fine; if a mixed or poor jät the cost of fine plucking would be prohibitive. There are 4 qualities in tea,—strength, flavour, appearance and "keeping;" and perhaps the greatest of these is the "*keeping*." The first three may be gained by fine plucking; when ever the flavour is naturally present, and manufacture properly attended to; but alas, no system of plucking will cause Ceylon tea to keep, and it is useless and unprofitable to make fine teas which lose half their flavour on the voyage and the rest within another 3 months. The London dealer requires a tea of a certain character, viz. a tea that will keep for a year or even two years, and surely it will be profitable to estate proprietors to consider the requirements of the dealer to a greater extent. It has been the fashion of late to abuse the brokers, but all things considered, it is probable the broker knows best what is wanted; and concealed in those apparently dry and formal circulars, there is every now and again a hint well worth paying attention to, and moreover, worth having enforced in the factory. E. G. R.

X.

(From Matale.)

I consider in answer to the first query, that tea is best when the bushes flush most freely, if the flush is taken in time, but the general experience is the flush runs away ahead of the pluckers, and the quality of course under these circumstances will be poor, compared with tea plucked, when one is up with his flush, say in the months when the bushes don't flush so freely.

Another cause of bad results in manufacture in the freely flushing months, is the invariable want of withering space to get a good wither. Then you get your leaf placed into the roller, over-withered, withered, and under-withered, making it impossible to make a first class tea. I consider the reason such a large concern as

Mariawatte has been getting such good averages during the recently lowering markets, is that they have ample withering accommodation.

2. Cattle manure in poor land certainly figs up the tree and produces a softer leaf where before it was generally of a poor nature and very bangy throughout. Inference, improvement in quality possessing both strength and flavour.

3. Quantity with quality is the only way to get returns in the face of these low prices.

XI.

"A Practical Man" should define more clearly what he means by "tea bushes flushing most freely." Does he mean the quantity of leaf each coolly averages from yields of such bushes, because that means flushes getting ahead of pluckers and the result *poor tea*. Bushes pruned low give you lots of leaf, but that leaf is not equal to that from trees pruned high.

Manure in my opinion only gives you a larger quantity of the leaf the bush would naturally give. You can't make a silk purse out of a sow's ear.

"Practical Man" hits the nail on the head when he writes: "Surely the men whose success we should emulate are those who combine quantity with quality." Let me beg of my brother planters to take up shares quickly in the Ceylon Planters American Tea Company for that means a large increase to purchasing power in local market. Colombo merchants, bankers, brokers, should also support it. What is the good of *Pineo* going to Uva or anywhere else. Let him go to America and start his business. If the Company are sure of R120,000 of capital, *go ahead*. Time is everything.

OLD HAND.

XII.

Madawalatenna, 5th May.

1. With regard to whether the quality of tea is better when the bushes flush freely I cannot say; it all depends on the weather. I have made better tea in one month than another, though in each the same quantity was obtained. I consider the best tea is made when the bushes are hardening up towards the end of season whether flushing freely or not; but this is such a changeable climate that one year is quite different from another.

2. I have not noticed any improvement in teas made from manured bushes, though I have tested to see; as to quantity there is no doubt that manure is efficacious.

3. What is fine plucking? Nearly all men pluck the same; ask half-a-dozen men "what do you take" and they will reply tip, first leaf and $\frac{1}{2}$ second, yet to get this one man has to wait 10 days, sometimes 12, whilst another finds that he gets this by going round every 6 days and sometimes he would like to go round in 5. Do any take more than the leaves I mention? Each man must pluck as he finds suitable to his bushes. Some men find by taking tip, first leaf and second leaf all in one, that their bushes go on flushing fast and well, whilst others lower their estimate and make no better tea. I have been in four different districts, and on each estate I have had to pluck in a different way; on one estate I could not pluck too close or too fine; on the other did I attempt to pluck to the half leaf above the fish leaf I was left in the lurch and had to wait. Each planter must study his own estate. Pluck as much as you can and make as good tea as you can. Some soils will give good tea even if very coarse plucking is resorted to; others, however fine the plucking is, will give no better teas, though they may sell a little better for appearance. To explain all about plucking &c., would fill a volume, and yet in this island we would not be able to lay down a fast rule, as such might not suit the very next month. So many are the soils, such differences in climate, in such a little island: I don't think the vast Continent of India can come up to it. H.

XIII.

Old Coffee District.

1. QUALITY OF TEA.—My own firm conviction is that no ordinary unscientific planter can give any

opinion on this subject worth having. He may look back through his past accounts to ascertain if his largest flushes realized the highest or lowest prices making due allowance for the fluctuations of the market. This in my opinion, is all his information is worth. The Colombo tea experts only ought to answer this question.

2. The first part of query No. 2 belongs also to the question of quality. As regards QUANTITY: tea is no exception to the law established by universal experience, that cultivation, manuring and pruning judiciously done—promotes production.

3. This is not a matter of opinion, at all, but a matter of fact easily solved by the Rule of Three. IOTA.

XIV.—From a Shrewd Old Hand.

New and Old Districts.

1. I am not aware that Mr. Armstrong has committed himself to any such opinion. *Quality* generally speaking is gauged by the price, which again depends in a great measure on the caprice of the market, or of the buyer. At one time a bright outturn with weaker liquor is in request; a month after, a darker outturn with strength is demanded. Within the last month I saw a report from a leading tea taster and expert on two such teas, sent him at the same time. He gave the preference with great hesitation to the former, but added the strength of the latter was "very attractive." I think the conclusion arrived at by most planters is, that from this standard (one, by the way, which experts treat with scorn), the best liquoring teas are not made when the bushes are "running away" after the April rains set in.

2. No. Perhaps Mariawatte is the only estate where manuring has been carried for several years on the same field. The results in *quantity* we know. But it would probably be difficult even for the careful and experienced manager to give the results as regards *quality*; as large quantities of high grown and therefore flavouring teas made from the purchased leaf, get mixed with the homegrown tea. It would be interesting if Mr. Jamieson could give a definite answer to this question. But "facts" in a matter of this kind, unless perfectly accurate, are misleading and mischievous.

3. "Let each be convinced in his own mind," and work his garden as it pays him best. Men with plenty of water power and large reserves of firewood may make *quantity*, more profitably than their neighbours with engines, for which they have to purchase fuel. There can be no doubt which is the best thing to do, if your practical enquirer is correct in his concluding sentence, when he asserts: "These (the men who combine quantity and quality)" are the people who "are making money, and not those who study quality only." The truth about this question of alleged falling-off in quality is, that the teas, as a rule, are equal to those made one, lb two, or three years ago. But with a glutted market and trembling prices, buyers are getting more exacting, and harder to please. They want a better Pekoe at 8d than they bought 3 years ago at 1s 1d, and that seems to be admitted, in the following involved and illogical sentence contained in a recent report from London, published in our local papers:—"Though prices for all grades of Ceylon teas are not much quotably lower, yet better value seems to be obtained for each sale." In tea reports the language, as a rule, is made to conceal the thought; but if there be any meaning at all in the above extract, it must be that buyers get better value for their money at each sale. X

XV.

Bogawantalawa, 6th May 1889.

1. I think, other things equal, the quality of the *leaf* is best when the bushes flush most freely; but the quality of the *tea* is best when the atmospheric conditions at the time of withering and making are most favourable. What these conditions are I don't know, except that the best *tea* is made when the weather is fine with sufficient occasional showers to keep the air moist, *i.e.* hot and rather moist weather appears the

best. But even then, when the apparent conditions of the atmosphere are the same, tea will vary greatly on different days; on one day you can get an excellent fermentation and a liquor that clouds well; on another day you cannot do so. A continuous series of experiments by an analytical chemist, as suggested some time ago by Mr. Rutherford, would no doubt help us in these matters.

2. I have not yet experimented with manuring tea myself.

3. I think really fine plucking cannot pay as the yield obtained would be too small. Hoolankanda is the typical example of this at present, of fine plucking and high prices, I mean, and it would be interesting to have figures for that estate. The popular rumour is that the yield is only some 80 lb. an acre and the profits per acre only about £1 sterling. What requires more attention than is often given to it is *careful plucking*, in other words the carrying out more thoroughly in practice the system of plucking which most planters would adopt in theory, and this requires very constant supervision in the field. It is the hard leaves (whether large or small) that spoil the wither, and to a great extent the resulting tea; and if the green leaf is free from these, the quality of the tea is much improved, while the yield is not much lessened. Careful medium rather than fine plucking is what I advocate. I think the *Observer* is wrong in lending its countenance to fine plucking by quoting the prices of broken pekoes only. The highest priced of these are more often than not fancy teas. The truer test is the *average price*, though even this is not much guide unless we know at the same time the approximate yield per acre. G. F. W.

XVI. (From an Old Tea Planter.)

1. I do not think anything has been proved by analysis, and nothing more than opinions are available at present. My opinion is that the quality of the tea is *not* best when the bushes flush most freely, or when there are heavy flushes from manuring, but rather that the contrary is the case. Better looking tea may be made from the softer and more tender leaf, but I would expect that it would be deficient in "quality."

EXPERIENCE OF MANY DISTRICTS.

XVII.

St. George, 6th May 1889.

1. I really could not say whether or not Mr. Armstrong is responsible for the statement "that the quality of the tea is best when the bushes flush most freely." I am of opinion that there must be a free and healthy flush to give good quality of tea, but that any "rush" or excess of flush, is overstraining the bush and means deterioration in quality.

2. There is no doubt as to suitable manuring giving quality, and I think that where the soil is naturally good &c. it will *also* give quality or keep this up; but that where the soil on the other hand is poor and washed it is not likely to do this. I have some 100 acres on one estate two to three years old tea planted in land with naturally good soil and where the coffee had been regularly manured with bone and castor cake and occasionally with bulky manures, and this is giving some 250 to 300 lb made tea an acre this year and the tea has been specially valued at home for strength and flavour. All this for such young tea with an average expected at not less than 1s for the year, points to a good deal of it being due to the previous manuring. At any rate we have given the manure credit for part of this most exceptional result from two to three years old tea planted at stake under thick coffee.

3. I think the "happy medium" applies here as elsewhere. Too coarse leaf should be decidedly avoided, but on the other hand too fine plucking means much less in quantity, and I am of opinion works out to a loss in the end. W. J.

XVIII.

Haldukkulla, 5th May.

No! Mr. Armstrong stated that the best flushes were the first, *good flushes* after pruning, but that though

the quantity of yield was then greater the quality was poorer.

2. I have not had any experience of the results of manuring tea.

3. I should certainly say that the loss of leaf caused by *very* fine plucking would not be made up for by the extra price. I should say a medium plucking which gave, say '60 to '65 per lb. of pekoes would pay best. Of course where tea is being purchased, the finer it is, the better it pays the purchaser, but in manufacturing one's own tea one has to look to the cheapness of plucking.

XIX.

Sogama, Pussellawa, May 7th, 1889.

I am not in a position to answer your first two questions. With regard to No. 3—I think fairly fine plucking to be necessary to good prices, but should be inclined to lay most stress on the regularity with which the plucking is conducted. J. G. C.

XX.

Dolosbage, May 7th.

1. Yes, when in full flush, but not till four months after pruning.

2. Yes, the better the soil, the better the quality of tea.

3. Yes, medium, but careful plucking, I find pays better than fine plucking—J. B.

XXI.

1. I cannot say whether Mr. Armstrong ever made any such statement; but I believe the quality of the tea is best when the bushes are flushing rather well (say an average of 12 lb per cooly). When they flush very freely, such as in April this year, the tea made is generally weak, wanting in flavour and often dull infusion.

2. Artificial manuring certainly increases the quantity, but so far as my experience has gone it affects the quality injuriously. I am writing of castorcake, and applied on good soil. Of course on poor land a high-class fertilizer ought to improve the quality, but I doubt if manuring any tea, at present prices, will pay.

3. In my opinion no rule can be laid down as to plucking, soil and climate decide the matter. To give an illustration, if I owned an estate in Kelebokka or Kandapola I would at any rate at present, if not always, pluck fine, but if I owned an estate in Kelani Valley, I would now as always pluck hard; all *practical* men know that if it is not in the soil, you cannot make a high-class tea, however fine you pluck. Any intelligent superintendent, who knows his work, can soon tell what his bushes are capable of doing, he should know best how to pluck them, under different fluctuations of the market.

WIDE EXPERIENCE OVERDIFFERENT DISTRICTS.

XXII.

Dikoya, 7th May.

1. I was once of the opinion that when the most tea was plucked the best tea was made, but since less frequent pruning has come into vogue I do not consider this now to be the rule. I obtain better leaf during the south-west monsoon (it is my wet season) than in the north-east. Perhaps in Uva it is the other way about. I undoubtedly get the best leaf when my tea has been pruned down, from about 7 to say 12 months, and if then the weather be favourable and free from dry winds the leaf is both plentiful and excellent. Later on when it is almost time for pruning, especially if this should happen towards November, December and January, the leaf is apt to be hard, the tea takes no form or appearance, breaks in rolling, and the flavour falls off. The liquor may be strong, but the whole lacks character; it is broken in appearance and brown in colour. Flavour seems now most in request at home, and this with me improves from June to September; strength prevails from September to January; and then from January to June the quality is very variable. It is often difficult to deal with leaf when it comes in abundantly: indeed there are so

many factors at work that it is hard to say what is best. I am very fond of a good wither, but even this gives weak tea with the first rains after February's dry weather. I think districts which flush the most evenly all the year round as a rule make the most even teas, all things considered.

2. I have not had sufficient experience in manuring, to answer this question, to my own satisfaction.

3. Upon plucking I am convinced as follows:—Fine plucking, pure and simple, if generally adopted would be providing pabulum for the China tea market; it would be simply an incentive to induce our London friends to mix as much China tea with it as it would stand. We cannot, to please these gentlemen, give them too much fine tea: "Give! give! give!" is their cry. The only way to shut out China is to pluck in our ordinary way; then their cheap teas have the smallest possible chance of competition, and there is a chance of our pekoes and souchongs again coming into demand. Increase our fine teas and we only make a channel to let in China. Also, inasmuch as we have to go over our estate plucking twice a month at least, the extra cost of what we pluck a little coarser is nothing compared to what we pay for trailing over the estate. So if we can oppose China so cheaply, I do not think the opportunity should be lost. Another view is, provided we acquiesced with the demand for fine teas, has anyone any idea to what limit it would extend? Our only ultimate chance is to crush in ourselves now and crush out others, and the strongest will survive.

W. F. L.

XXIII.

1. February to July is generally accepted as the best flushing time for tea bushes; if one may judge by ruling market rates for tea, the quality is certainly not so good then, as later on in the year. Pruning is also one of our principal factors for producing heavy flushes, and it is a well-established fact, that weak liquor and poor teas are the result for some months afterwards.

2. I should certainly expect an "all round" improvement in tea that had been "manured and highly cultivated." I am not, however, in a position to offer a decided opinion as to whether the application of manure gives extra flavour and strength to tea, and I doubt if Ceylon planters have yet given the matter a *reliable test*, or that anyone will be found bold enough to say yea or nay to this query.

3. My experience of fine plucking and high prices are not so satisfactory, as quantity combined with a certain amount of quality. I mean by quantity 400 to 500 lb. of made tea per acre; and quality, an average of 1s sterling per lb. in London. The difference between fine plucking and quantity I take it to be

100 to 120 lb. per acre

vs.

400 to 500 lb. "

This is too great for fine plucking to pay. I quite agree with "A Practical Man:" those who *can* combine quantity with quality are the men one should emulate.

S. A.

XXIV.

Hapatule, 7th May.

1. I think the best teas are made in dry weather when the bushes are not flushing freely.

2. No.

3. Certainly.

XXV.

Bogawantalawa.

1. My experience is, quality is best when the tea bush has plenty of moisture, whether it be the N.-E. or S.-W. When rains are on, the leaf is full of sap and liquor is good; in dry weather I find it next to impossible to make a good thick liquoring tea.

2. None; but I am inclined to think it does improve quality. Manure adds to yield of tea bushes largely. The mere torking-up of the soil does so, when no manure is added, to a certain extent.

3. I advocate medium plucking, never omitting to pluck round 3 times a month sometimes oftener.

I think these last months of March-April and so far of May have been perfect for tea, both for quality and quantity.

W. A.

XXVI.

Kandapola, 7th May 1889.

1. I cannot say whether Mr. Armstrong is or is not responsible for the statement that the quality of the tea is best when the bushes flush most freely; but personally I am of opinion that such is the case.

2. I am strongly inclined to think that it will be found that the efficiency of either natural or artificial manures will stop short at increased *yield*. I have certainly never heard it advanced that strength or flavour was improved, nor have I known of an estate's *prices* running up after the application of manure.

3. I think there can be no doubt that on the great majority of estates in Ceylon finer plucking will have to be adopted, than rules at present. But again I think there is the happy medium between so-called 'fine' and 'coarse' plucking to be discovered, and the medium will vary according to altitude and climate. For instance, on Kandapola estate I formerly plucked around every 13 days. This was changed to 12 days, but no difference in *quantity* of leaf was noticeable. I then changed to 10 days, or plucking round the estate thrice a month. Still, I noticed no difference in *quantity*, though a material difference in *quality*. To pluck around in 9 days I find my quantity diminishes a good deal in the month. So I have determined that to pluck over every ten days (no matter how the flush looks) is my happy medium. In Upper Ramboda it is 9 days, and so on. By allowing the bud and two leaves to remain on the bush longer than every 10 days, I find I gain nothing in weight (unless a third leaf is taken which reduces quality), while by taking same bud and two leaves at the 10 days, they are still young and tender, and make a tea of much finer quality and flavour than if taken when tougher and older.

If attention were paid to this, I believe many men would find, as I have done, that by hitting off the right time (according to altitude and climate), within which to take in their flush, they would increase their quality without decreasing their quantity to any great extent. I am of opinion that this style of medium plucking, leaning towards fine perhaps rather than *coarse*, *i. e.*, a day earlier rather than later in the round of plucking, will be found to give the best returns as regards an estate's annual profit.—T.

XXVII.

Dikoya.

1. I think very rapid flushing detracts from both strength and flavour. Look at quality of tea most commonly made in April and May, when flushing is particularly rapid, and how it improves when the colder weather of June and July has slightly checked the luxuriance of the flush.

2. I believe manure if anything rather detracts from strength and flavour, but if it does the difference it makes is slight and is amply made up for by increase in quantity with tea at say 10d per lb.; but it is a matter I have not yet gone into. How will it pay shortly with manure going up and tea as steadily falling in price!

3. This is a matter that could only be satisfactorily decided by production of accounts from representative estates, and I think it would not be a bad idea if the Committee of the Planters' Association were to persuade Colombo agents and managers of Companies to show them in confidence accounts of two or three such estates from each firm or company when they could at once give an authoritative opinion that would be of use to planters and proprietors at large and save us all from a lot of gratuitous advice from people, who know very little about the subject. For myself I believe in medium plucking and making it as well as I can. This district will always give fully average rates and in quantity from 350 to lb.500 lb. per acre according to the estate.—W. T.

XXVIII.

Mahaoya, 8th May.

1. I find that at a medium elevation tea flushes best about 6 mos. from pruning. Quality is not obtainable in very wet weather, but I get the best teas immediately after a spell of wet weather, and usually the heaviest flushes. At a higher elevation on same estate I get the best results as far as quality is concerned 10-12 mos. from pruning. Plucking "fine" you get quality nearly all the year round, wet or fine, only if withering space is not stinted. I get better flavour in south-west than south-east monsoon.

2. A good many manuring experiments have been tried on this estate. During wet weather I could not find much improvement, if any, in the liquor of leaf, from a manured "field;" liquor again from an area where castor cake was applied was far ahead of that from an unmanured area, it was twice as thick; leaf in the latter instance was plucked during dry weather. I don't think that flavour can be added unless you pluck for it.

(3.) Where quantity and quality can be got go in for fine plucking.

On some estates quantity can be got without much quality; go in for medium plucking. There is quality enough in the teas, from off most old coffee soils, if we could afford to pluck fine enough for it; but we cannot, the best thing we can do under the circumstances is to pluck all we can. We may be able to pluck finer as the trees age. It is to be hoped there will be a smaller stock of "Heathen Chinese" at 4d per lb. in the London warehouses when that time comes round. The prices that are given at present for fine teas do not encourage growers of that staple to hold on as an ensample to others.

D. M. D.

XXIX.

7th May 1889.

1. Bushes flush most freely from 5 to 6 months after pruning (time varying according to elevation and season). If *strength* denotes *quality* of tea, then it is at its best at this time, but the *flavor* goes on improving up to 12 months; after this, unless the bushes have been assisted by manure or the soil is specially good, both strength and flavor fall off.

2. Application of manure, assuming that it is applied soon after pruning has exactly the same effect as a heavy pruning in producing a *gross sappy* leaf, and until this is worked off by frequent pluckings, the quality of the leaf is decidedly not improved. It possesses strength but not flavor. Applied at a later period, say 5 or 6 months after pruning, it then improves both the strength and flavor of the tea.

3. *Fine plucking*.—I am not at all satisfied on this point; but as far as my experience goes at present, I should say pluck all you can, so that you manufacture to secure a price for your teas equal to the London weekly average for all Ceylon teas sold. We must remember that it is not the first but the third class passenger traffic that *pays* on any railway.

3,000 FEET ELEVATION.

XXX.

Rookwood, 8th May 1889.

1. I think quality of tea (make and liquor) is best when (where) the bushes flush most freely on *good ripe wood*, and provided the weather is not too wet. Pruning, *when, and how done*, affects liquor, more perhaps than some people imagine.

2. Provided the soil is not impoverished, cattle manure improves the liquor and yield, and its effects last for several years. Castor cake tried in 1880-81 on *good soil* improved yield—I have no data for liquor, and effects lasted for years.

3. As a general rule, medium. O. S. A.

XXXI.

Pandulooya, 9th May 1889.

1. I am not sure what Mr. Armstrong said; but I do recollect when a discussion was taking place some time ago—I think about this time last year—about bad prices, it was generally believed by those who kept

up the correspondence that our worst teas were made during the dry months. My own opinion is that the flush is best, and the teas made from it best when the bushes are in full flushing vigour. "Weakly begets weakly and strength begets strength." You will, I think, generally find a kind of standard worked up to on most estates, and where the plucking is always carried on the same, as a rule, the same quality of tea will be made, excepting for 4 months or so after pruning.

2. I cannot at present say whether manuring alters or affects the outturn of made teas, but that it increase the *quantity* there is no room for a doubt, and in some cases to a very extraordinary extent. In the case of cattle manure the result is permanent; in that of artificial one begins reaping the result in a few months.

3. "Exceptional merit" means "exceptional plucking," all other phases being equal, but of course high cultivation gives you more of it. H. L. E.

XXXII.

Lower Dikoya, 10th May.

1. On this point observation leads me to a middle opinion—my belief being that the best tea is made from freely flushed leaf; avoiding the two extremes of rank leaf, the product of excess moisture and heat, and feebly grown leaf, which is inclined to be tough.

2. That the quantity of crop can be greatly increased requires no proof; but for quality there is less data, as the leaf taken from manured fields is seldom kept separate. I have noticed, however, on an estate under my observation, where a considerable amount of manuring is done, that the teas made fully maintain their place on the market. Leaf produced by rich manure must surely contain greater strength and less moisture than leaf produced by moist forcing weather only. The probable overforcing of the trees and soil by strong artificial manure is, of course, another matter not to be treated of here.

3. Coarse plucking will never give a good *average* price; though no maker ever admits that he plucks fine. Medium plucking, varied according to weather, will give both quantity and quality. When the weather is open and leaf soft it may be taken a little large; but in high districts, where the young leaf is apt to be hardened prematurely by cold morning and evening winds, or, at another period, by the bleak burst of the monsoon, it is a matter of necessity either to pluck it somewhat fine or pluck it *bangy*.

D. K.

XXXIII.

Pussellawa, 9th May 1889.

1. My experience is that *quality* of tea is best when bushes are in good heart and consequently flush freely. Being, however, in a district exposed to the cold hard N.-E. monsoon my worst flushing months are those early in the year when the leaf has very little juice, and anything but the gentlest rolling results in broken tea. No hard and fast rule can be laid down for Ceylon on the point in question. What suits one district is poison to another.

2. Have only tried cattle manure, the effect of which on tea good and bad is most encouraging. Pity it is so expensive. A neighbour of large experience as a tea planter has tried artificial manures, and his opinion is that though these without doubt increase yield; but he is sceptical as to their improving quality, is in fact inclined to think that they do the reverse. Someone of your correspondents suggested "bones": surely these would give us seed.

3. Fine or coarse plucking or high prices *vs.* yield, as a rule, but not quite so, as some few soils won't give quality pluck you ever so fine, and some give good tea with coarser than medium plucking. It is sweet to see one's self high up in the Lane when that blue paper (you so kindly send us gratis) comes in, but does this pay the proprietor. Mark the difference in prices from estates managed by their proprietors now and a year ago. It strikes

me that the proprietors of Blackstone, Agar's Land, Beaumont, Rookwood &c. are hard-headed men who know what they are about, and have an eye to the main chance, so "hit the happy medium," say I. You know who.

XXXIV.

Kaipoozalla, Pundaluoya, 10th May.

As I do not manufacture, having no factory here, I got what information I could from those that do, and the result is that the quality of the tea is worse when the bushes flush more freely. A quick flush gives weak tea; a slow flush strong tea. No one here has had experience with manured tea. They agree with No. 3 in the paragraph.

XXXV.

Maskeliya, 10th May.

1. Best tea is always made here in July in spite of wet leaf, and I believe that it is owing to the rapidity of the flushes having been checked by the rain which causes the increased strength in liquor; anyhow be that as it may July and August teas are generally speaking better than those made at any other time of the year unfavorable weather notwithstanding.

2. So far have not tested whether manure improves quality, but there is no doubt about its increasing the quantity largely.

3. Everyone must work out this problem for themselves, but quality can be got with fair medium plucking; *vide* Glenugie and Gorthie estates, also Ovoca and many others no doubt. On the three estates mentioned, the yield is a fine one and the plucking certainly not fine. SHADOW OF THE PEAK.

TOBACCO IN THE EASTERN PROVINCE.

There is a great deal of "talk" and writing about tobacco now-a-days, and a little chat about it may not be uninteresting to your readers.

Jaffna tobacco is coarse and rank, thick ribbed and large leaved; and the generality of it makes execrable cheroots, as no one will deny who has ever passed to "windward" of a Jaffna Trader or Dhongman, in full blast! A very little of the Jaffna tobacco is of a better kind, more delicate in leaf, and of it is composed those cigars sold by Jaffna traders, in bundles of 10 cigars each, in all the post towns of Ceylon, as well as in the interior.

An Englishman, Mr. Hardy, grew and traded in tobacco in Jaffna many years ago, but failed to make a fortune by it. And a high caste Native, Muttu Velce Chettiar, used to supply Jaffna tobacco to the "Travancore Sirdar" under contract, but after many years he failed, and died in Benares as a pilgrim.

The late Henry Edward O'Grady, whose last appointment in the C. C. S. was that of G. A. of Trincomalee, was a great smoker and a first rate Judge, and he stated that the finest tobacco for smoking grew in Uva and Batticaloa, and that the finest tobacco in the E. Province was grown at Sengelay, which remains true to the present day.

The greater part of the Batticaloa tobacco is grown either in tobacco gardens or on high spots on paddy fields. Nearly every paddy field has its plot of tobacco, and all the best tobacco grown here is every season shipped off to Jaffna (and probably the Coast of India) by Jaffnese settled here, either as Government employés, traders, or agricultural residents, who advance sums on coming crops a long while before the plants have matured, and the eagerness with which it is snapped up is a plain proof of its superiority over Northern produce.

The soil at Sengelay and its neighbourhood is red with a very small percentage of small gravel and is exactly like the soil all round Mauepy, Mallagam, and Copai, near Jaffna, called there the "Chembatu-Poomi," and the neighbourhood is famous for its oranges, mangoes and jacks, and of the same kind is the Chavakucherry soil which produces the finest vegetables in the North Peninsula.

The Sengelay tobacco is small leaf, thin in rib and varies from dark brown to pure black in colour. The seed is first sown broadcast then planted out in rows, slightly ridged, and plentifully watered, the young plants being carefully shaded at first start! The only manure applied to the plants is that of cattle.

When a place is selected for a tobacco garden, it is well fenced, and cattle-penned on it for (say) 20 days in succession; (the more the better) and the ground having been well matted, and turned up, is prepared for the young plants, (which may afterwards get dry manure applied to them as a surface, or top dressing). The plants are never allowed to run to flower, (except a few for seed) and the leaves in due gradation are picked as Nos. 1, 2 and 3 on the list, the lowest leaves being the least valuable.

They are then tied up in bundles of 16 leaves each, which are suspended under cover, and under a smouldering wood fire.

The last process is that of sweating, when the tobacco is fit for either sale or consumption. It sometimes happens that when too much sweated the tobacco gets rotted slightly, but some of those who chew tobacco among the Natives prefer it in that condition.

Tobacco is sold, either in bundles (of 16 leaves each) at the market place, or to wholesale purchaser by the talam, consisting each of 24 bundles, and is valued at 12s. 6d. the tulam, for chewing, and 6d. the tulam, for smoking tobacco. The intermediate kind sells for about 6s. a tulam, or even less.—R. A.—"Independent."

PLANTING IN JAVA AND SUMATRA:
TOBACCO, CINCHONA AND COFFEE.

The Deli Tobacco Company held its annual meeting on the 30th April, at which the directors presented the report of the last year. The quantity brought to market was 21,162 bales tobacco grown on the company's own estates, and 47,879 bales shipped by consignment to the company. The average price realised for their own tobacco was c. 132, against c. 173 in the previous year. This unfavourable result is mainly owing to the unfavourable weather which diminished the quantity of the crop, while the quality was prejudiced to the extent that the late arrivals were difficult of sale. The balance sheet was approved, and a dividend declared of f. 452 per share. As regards the 1888 crop the weather has been more favourable, and the production larger than in 1887, and the quality seems also to be better. The possessions of the company in Deli and Langkat were increased by the purchase of two further estates known as Poengey and Paya Bacon, both of which are favourably situated, and besides these another estate will be opened up near the Batang Seranjan. The increase of capital sanctioned at the meeting of the shareholders in November last has now been accomplished, the shares being taken up at the rate of 200 per cent. This increase of capital has enabled the company to purchase the new estates referred to. With regard to the cooly difficulty it is expected that Deli will be able to provide its wants of Chinese coolies by direct immigration. The negotiations of the commission sent to British India for the purpose of regulating the Kling immigration seem to have had a good result. The ratification of this regulation, however, has met with some opposition on the part of the Dutch Government, but it is expected that a satisfactory agreement will be made, as the proper settlement of this matter is of much importance to the whole of Sumatra. The import of Javanese workmen has increased considerably of late. The Artesian well at Medan is so far unsatisfactory, as on a depth of 230 metres being reached no quantity of water was found.

From the report of the West Java Cinchona Agricultural Company for the year 1888 it appears that the condition of the estates was satisfactory, but as the market for cinchona has not been so good, the expectations at the beginning of the year have not

been fully realised. The cultivation of the four estates amounts to about 3,600,000 Ledgerianas and 150,000 Succirubras, making a total of about 3,750,000 cinchona trees. The coffee cultivation has been also enlarged, there being 940,000 trees, which is an increase of about 360,000 trees. The depressed condition of the Cinchona market has induced the directors to look out for other cultivations. The cinchona crop was estimated at about 140,000 kilos, while about 159,750 were received, which realised f.98,750. The crop of coffee was about 215 piculs, which were sold at f.45in Java. The profit and loss account shows a profit on goods and commission of f.90,326, including the balance of 1887, form which is to be deducted expenditure, and the sum for writing off purposes amounting to f.52,514, the balance being thus f.37,812, of which f.37,000 will be paid as a dividend being 3 3/4 per cent. of the capital.

The Agricultural Company Solo has issued a prospectus for a subscription on 300 shares and 540 bonds. The purpose of the company is to continue working the following undertakings in Java:—Troetjoek and Temoeles in the Vorstenlanden, and Djolong and Poenggal Woeloeng in Japara. As regards the production of these undertakings, the following information is given as to the results of the years 1883 to 1888. Troetjoek delivered 7,694 bales tobacco; or net about 1,183,388 half kilos.; after a deduction of freight and all charges incurred on the sale, the proceeds were f.409,484. Further 1,314 cases indigo or net 139,002 half kilos., the proceeds being f.465 743, or the total proceeds of tobacco and indigo f.875,227, free on board at Samarang, amounting to f.479,741. The net annual profit of this undertaking was f.395,486, or f.79,097. Temoeles yielded 3,549 bales tobacco, or net 568,687 half-kilos., the proceeds being f.179,013, or a total of f.365,565. After a deduction of rent, &c., amounting to f.202,922, the net profit was f.152,642, or f.32,528 annually. For both estates there was thus annual profit of f.111,625.

The coffee undertaking Djolong and Toenggal Woeloeng is situated in Japara, district Selawesi. The existing coffee estate consists of 300 bouws, on which were 470,500 trees old cultivation and 40,000 new cultivation (1888-89). Further, there are 3,500 nutmeg trees 2 1/2 years old. The coffee production during the last five years has varied from 280 and 559 piculs per year, and has amounted to 2,018 bags, which, after a deduction of freight and all charges, have given a net profit of f.87,972. The above mentioned estates are the property of Mr. J. van Blaricum, to whom an amount will be paid of f.830,000, f.630,000 being in money, and 200,000 guilders in shares of the Agricultural Company Solo. The capital of this company is f.500,000, in shares of 1,000 guilders each, and f.600,000 in 5 per cent. bonds, each of 1,000 guilders.—*London and China Express.*

TEA IN INDIA.—The season for holding tea auctions has arrived, and the sales will commence by the mid of this month, but the quantity offered will probably be small. About 120,000 lb. have been exported to European owners' account, against 95,000 lb. at the corresponding period of last season. The reports from the districts are not altogether favourable, for while the weather has been abnormally cold in Assam rain is much wanted in Sylhet, the Terai, and Chittagong, and hail storms have done considerable damage to the plants in Cachar. To add to the planters' troubles, cholera has been raging in parts of the Dooars, and in some gardens great difficulty has been met with in persuading the coolies to work at all.—*Indian Agriculturist*, May 11th.

SOUTH AFRICAN AGRICULTURISTS' ALMANAC.—We have been favoured by Messrs. John Haddon & Co., 3 and 4 Bouverie Street, Fleet Street, London, with a copy of this very elaborate and interesting publication for the current year. Within nearly 300 pages of closely printed matter we find a great variety of useful and practical information on the subject of farming, stock-raising, cheese-making, cropping, farm buildings, &c. Though the almanac is prepared primarily for the wants of Cape farmers, still it is a capital shilling's worth for all engaged in the pursuit of agriculture, whether at home or broad.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

July 27th, 1888.

13, ROOD LANE, LONDON, E. C.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	54,838 packages.	40,027 packages.	8,627 packages.
1888.	59,417 "	68,831 "	6,481 "

During the week

10,095 packages INDIAN }
4,871 " CEYLON } Total 16,813 packages have been offered in public auction.
1,847 " JAVA }

The firm tone lately noticed continues. All Teas with flavor and quality meet with good competition, and in many instances, command somewhat higher prices.

Owing to the increasing Imports of both Indian and Ceylon Tea, it is proposed after the first week in August to hold auctions of Indian Tea on Mondays and Wednesdays, and of Ceylon Tea on Tuesdays; sales of both descriptions being held on Thursdays only.

The New Indian Teas were readily disposed of with general competition. The proportion of this season's Tea continues large for the time of year, and although offering excellent value meets with only indifferent attention from the trade.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4½d.	1887.	4¼d.	1886.	7½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5½d.	"	5d.	"	7½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7¼d.	"	7d.	"	8½d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	9d.	"	9d.	"	10¼d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	10d.	"	10½d.	"	11¼d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	8d.	"	7d.		
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8¾d.	"	9d.		

CEYLON. The offerings this week were unusually small, being only 4,871 packages, against 10,012 the week before, and were consequently readily taken by buyers. General firmness continues and only such teas as which at all "stand out" from the rest through superior flavor, are in strong demand and command better prices. The following averages may be mentioned:—"Hope," 1/2¾; "Mindagalla," 1/2½; "Glassaugh," 1/1½; "St. Leys," 1/1¼; "Rahatungoda," 1/0¾. The 4,871 packages sold at an average of 11¼d. per lb.

We understand that arrangements have been concluded, whereby Ceylon Tea will be represented at the Exhibition to be opened in Paris next year.

JAVA. Sales comprised 1,847 packages, in which only two Estates were represented. "Ardjaja" contributing 1,147 chests and "Dramaga" 700 chests. No material change has taken place in the market. The 1,847 packages of direct import sold at an average of 7¾d.

MOVEMENTS OF TEA (in lbs.) DURING JUNE.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

August 3rd, 1888.

13, ROOD LANE, LONDON, E C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	56,528 packages.	44,178 packages.	9,192 packages.
1888.	78,432 "	78,830 "	8,216 "

During the week

19,015 packages	INDIAN
9,999 "	CEYLON
1,735 "	JAVA

Total 30,749 packages have been offered in public auction.

Auctions this week have been the heaviest since March; they have been generally well supported by buyers.

The Indians consisted almost entirely of New Season's Teas, many of which are beginning to show improved quality, the selection as a whole being now of very useful quality and good value.

Sales have passed with some irregularity, and it is probable that the present heavy auctions being limited to two days a week have somewhat taxed the powers of buyers. The new rule concerning sale days will come into operation next week, and it is generally expected that both Indian and Ceylon Teas will benefit by the alteration.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4½d.	1887,	4½d.	1886,	7½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5¾d.	"	5d.	"	7½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7¾d.	"	7d.	"	8½d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	9d.	"	9d.	"	10¼d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	10d.	"	10½d.	"	11¾d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	8d.	"	7d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8¾d.	"	9d.	"	

CEYLON. It is gratifying to note that offerings are beginning to show distinctly improved quality—happily a regular occurrence at this period of the season,—as we have pointed out upon previous occasions. It is therefore to be hoped and expected that invoices arriving during the next few weeks will confirm the experience of former years.

The deliveries for July are most encouraging to this enterprise—having not only overtaken the imports, but having also exceeded the deliveries in any previous month by over 40 per cent.

Recent low quotations have evidently driven the Teas very largely into consumption and opened up new channels; it is significant that the better prices latterly ruling have in no way checked consumption—deliveries for July having been 40 per cent above those of June, in spite of the higher prices; it is therefore probable that the gradually improving quality has to some extent been the cause of the increased deliveries in July. The 9,999 packages sold at an average of 11½d. per lb.

JAVA. Although the quantity brought to auction was not much in excess of last week, a larger number of Gardens was represented; the selection on the whole being of fair useful quality. There is very little change to report in quotations. The 1,412 pkgs. of direct import sold at an average of 7½d.

In these tables all the packages are half-chests unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices are thus represent the highest offer in the room.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

August 10th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	70,740 packages.	52,458 packages.	9,710 packages.
1888.	83,527 ,,	83,128 ,,	9,306 ,,

During the week

5,095 packages	INDIAN	} Total 10,483 packages have been offered in public auction.
4,298 ,,	CEYLON	
1,090 ,,	JAVA	

Bank Holiday falling in this week, auctions were held only on Wednesday and Thursday.

The small supply of Indians was easily taken by the trade, and prices generally ruled firm at last week's rates. Broken Pekoes still offer exceptionally good value.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4½d.	1887.	4¼d.	1886.	7½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5¾d.	"	5d.	"	7½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7¾d.	"	7d.	"	8½d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	9d.	"	9½d.	"	10½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	10d.	"	11d.	"	11¾d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	8d.	"	7½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8¾d.	"	9½d.	"	

CEYLON. The selection was of fair quality, and arrivals now appear to show that a pretty general improvement in quality has set in. Competition was animated and last week's rates were fully maintained. Broken Pekoes are dearer, especially those with good liquors. A few invoices which stood out from the rest on account of fine flavor, attracted considerable attention. Amongst the most noticeable invoices may be mentioned the following:—"Goatfell," 1/4; "The Sogama Estate" of the "Ceylon Co., Limited," 1/3¼; "Yuillefield," 1/2¼; "Mayfield," 1/2; "Mooloya," 1/2. The 4,298 packages sold at an average of 11½d. per lb.

JAVA. The Javas passed at about previous rates, good Liquoring parcels selling readily, but for descriptions showing a rather dragging tendency. Some very fair Teas were catalogued from "Madjonagara" and "Djatti Nangor" 968 pkgs. of direct import sold at an average of 7½d. per lb.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st JULY, 1888.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

August 17th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	90,749 packages.	56,729 packages.	11,653 packages.
1888.	111,002 ,,	89,545 ,,	10,239 ,,

During the week

27,475 packages	INDIAN	} Total 34,825 packages have been offered in public auction.
6,417 ,,	CEYLON	
933 ,,	JAVA	

The large auctions of the past week have induced a considerable amount of irregularity in quotations of Indian Teas. Although a tendency towards cheaper rates has been exhibited, any Teas possessing special features in liquor have sold for high prices.

In spite of the unprecedentedly low rates still ruling for Broken Pekoes, sufficient attention has not yet centred upon these grades to promote a re-action from the present level of prices.

Generally the selection has been of a useful character, but few really fine invoices have as yet come to hand. Amongst the highest averages may be mentioned the following:—"Margaret's Hope," 1/6; "Castleton," 1/5³/₄; "Goomtee," 1/5.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4 ¹ / ₂ d.	1887.	4 ¹ / ₂ d.	1886.	7 ¹ / ₂ d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5 ³ / ₄ d.	"	5d.	"	7 ¹ / ₂ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7 ¹ / ₂ d.	"	7d.	"	8 ¹ / ₂ d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	9d.	"	9 ¹ / ₂ d.	"	10 ¹ / ₂ d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9 ³ / ₄ d.	"	11d.	"	11 ³ / ₄ d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7 ³ / ₄ d.	"	7 ¹ / ₂ d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8 ¹ / ₂ d.	"	9 ¹ / ₂ d.	"	

CEYLON. The week's offerings were comparatively light, and consequently almost insufficient for the increased requirements of the trade. A firm tone thus characterized the bidding throughout, resulting in a fractional though distinct advance in nearly all descriptions; this improvement is most pronounced in all better liquoring kinds, of which we are glad to record an increasing proportion. The following averages may be mentioned:—"Loolecondera," OBEC, 1/6; "Rahatungoda," 1/2³/₄; "Dedugalla," 1/2¹/₄; "Poengalla," 1/1³/₄. The 6,417 packages sold at an average of 11¹/₂d. per lb.

JAVA. Of the 933 packages Java Tea brought to auction, 733 only were of direct import, and these consisted chiefly of Medium Teas which sold at rates similar to those current last week. The 733 pkgs. of direct import sold at an average of 7¹/₂d. per lb.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st JULY, 1888.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

August 24th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	102,487 packages.	63,715 packages.	12,761 packages.
1888.	127,837 "	95,205 "	11,756 "

During the week

16,835 packages	INDIAN
5,660 "	CEYLON
1,517 "	JAVA

Total 24,012 packages have been offered in public auction.

A temporary reduction in the weight of Tea placed on the market this week has had the effect of modifying the irregularity in prices noticed last week. Quotations for most descriptions have remained practically unaltered. The few fine Teas catalogued met with a better demand and for these kinds more satisfactory prices have been obtained.

The exceptional value in Old Seasons Tea has attracted more attention and prices have somewhat improved from the low level current during the last few weeks.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4½d.	1887,	4d.	1886,	7½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5¾d.	"	4½d.	"	7½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	6½d.	"	8½d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	9d.	"	9d.	"	10½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9¾d.	"	10½d.	"	1/-
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7¾d.	"	7¼d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8½d.	"	8¾d.	"	

CEYLON. Again only a moderate amount has been placed on the market, and this, having consisted principally of useful liquoring kinds, has attracted the attention of buyers of Fine Tea, who have taken the offerings at slightly hardening rates. Among the most noticeable Teas, invoices may be mentioned from "Portswood," averaging 1/4; "Mayfield," 1/3¼; "Hillside," 1½; "Kellie," 1/1¼. There were also some invoices of particularly Fine Teas, selected from the Colombo market. The 5,660 packages sold at an average of 11½d. per lb.

JAVA. Of the 1,517 packages brought to auction, 1,221 were of direct import, representing Teas from Ardja Sarie, Dramaga, Jonlapa, and Semplak gardens. They consisted for the most part of poor liquoring Teas, but were well competed for at slightly improved rates. Catalogues were issued for 3,516 packages to be sold next week. The 1,221 pkgs. of direct import sold at an average of 7d. per lb.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st JULY, 1888.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

August 31st, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	126,255 packages.	67,092 packages.	13,531 packages.
1888.	161,849 "	105,518 "	15,272 "

During the week

34,012 packages	INDIAN	} Total 47,841 packages have been offered in public auction.
10,313 "	CEYLON	
3,516 "	JAVA	

The heavy weight of Indian Tea brought to auction has consisted principally of medium and weak liquoring descriptions, and *these* coming on an already depressed market have caused a further decline in values.

Teas for price have again suffered least, only $\frac{1}{4}$ d. decline being established on the week; all other sorts except the few very finest parcels, which maintain the advance previously noticed, are $\frac{1}{2}$ d. id. per pound lower.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4 $\frac{1}{2}$ d.	1887,	4d.	1886,	7 $\frac{1}{2}$ d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5 $\frac{3}{4}$ d.	"	4 $\frac{1}{2}$ d.	"	7 $\frac{1}{2}$ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7 $\frac{1}{2}$ d.	"	6 $\frac{1}{2}$ d.	"	8 $\frac{1}{2}$ d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8 $\frac{1}{2}$ d.	"	9d.	"	10 $\frac{1}{2}$ d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9 $\frac{1}{4}$ d.	"	10 $\frac{1}{2}$ d.	"	1/-
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7 $\frac{1}{2}$ d.	"	7 $\frac{1}{4}$ d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8 $\frac{1}{4}$ d.	"	8 $\frac{3}{4}$ d.	"	

CEYLON. The large sales which have taken place have been composed for the most part of good liquoring descriptions, a sprinkling of less desirable kinds was however noticeable, doubtless presenting Invoices of earlier manufacture which had been detained in Ceylon.

Competition has been brisk and prices are fully maintained for all useful Teas, the commonest kinds alone showing any irregularity. The following Invoices may be mentioned:—"Blackstone," $1/4\frac{1}{2}$; "Hope," $1/4\frac{1}{4}$; "Bogawantalawa," $1/4$; "Goatfell," $1/4$. The 10,313 packages sold at an average $11\frac{1}{2}$ d. per lb.

JAVA. A better selection was offered consisting of Invoices of direct import from nine Estates, amongst which Sinagar and Bagelen were the most attractive. Bidding was brisk and the offerings were all disposed of at slightly hardening rates. The 3,288 packages of direct import sold at an average of $8\frac{1}{2}$ d. per lb.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st JULY, 1888.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

September 7th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	149,855 packages.	73,369 packages.	14,001 packages.
1888.	189,708 "	115,889 "	17,391 "

During the week

27,859 packages	INDIAN	} Total 40,349 packages have been offered in public auction.
10,371 "	CEYLON	
2,119 "	JAVA	

The bulk of the offerings has again consisted of inferior and unattractive Teas, which have tended to further accentuate the depressed condition of the market noticed last week.

Prices for all but finest liquoring Teas have shown a cheapening tendency, but owing to a marked irregularity in quotations, it is difficult to accurately gauge what actual fall in values has taken place.

In considering the figures for last month the most striking feature is the increase of 4 $\frac{3}{4}$ million lbs. in the stock as compared with the corresponding date last year, this is to be accounted for, not by any shrinkage in the consumption, but by increased imports, the Teas having come to and more rapidly than last season, when a large proportion was shipped in slow Steamers.

The delivery of over 2 million lbs. of Ceylon Tea is a most satisfactory feature.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4 $\frac{1}{2}$ d.	1887.	4d.	1886.	7 $\frac{1}{2}$ d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6d.	"	4 $\frac{1}{2}$ d.	"	7 $\frac{1}{4}$ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7 $\frac{1}{2}$ d.	"	6 $\frac{1}{2}$ d.	"	8 $\frac{1}{2}$ d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8 $\frac{1}{2}$ d.	"	8 $\frac{1}{2}$ d.	"	9 $\frac{3}{4}$ d.

CEYLON. Again these growths have been in fairly large supply and the improved quality already noticed in many marks has been maintained, though some Estates are still represented by the same "undesirable" and "over-fired" Teas complained of a few months back; prices for these have shown a fall of $\frac{1}{2}$ d. per lb. during the week, but really attractive liquoring Teas have fetched fully previous values. Invoices from "Erroll," average 1/3; "Hope," 1/2; "Kabragalla M," 1/0 $\frac{1}{4}$; were noticeable, while "Glendevon," average 1/5 $\frac{1}{4}$; and "Portswood," average 1/5 $\frac{1}{4}$; sent exceptionally choice Teas. The 10,371 packages sold at an average of 11d. per lb.

JAVA. The selection offered represented consignments from four Estates, the most attractive invoice being 919 packages from Tjicadjang, which were of nice flavor and quality.

The bidding for the better sorts was brisk, other kinds were rather weak in sympathy with Indian growths. The 2,119 packages of direct import sold at an average of 9 $\frac{1}{2}$ d. per lb.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

September 14th, 1888.

13, ROOD LANE, LONDON, E. C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	179,607 packages.	76,082 packages.	14,001 packages.
1888.	220,312 ,,	122,162 ,,	19,525 ,,

During the week

30,604 packages	INDIAN	} Total 39,011 packages have been offered in public auction.
6,273 ,,	CEYLON	
2,134 ,,	JAVA	

The lower prices established for Indian Tea last week have been maintained without noticeable alteration in any grade.

The general selection has continued somewhat poor in quality, varied by an occasional invoice of fine Tea, amongst which some Darjeelings proved most attractive, the following averages being worthy of note:—"Dooteriah," 1/11; "Poobong," 1/9.

The recent fall in quotations is not surprising, when it is remembered that since the 1st June public auctions have exceeded those of the corresponding period last year, by 40,000 packages Indian, and 46,000 packages Ceylon Tea.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4½d.	1887,	4d.	1886,	7½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6d.	"	4½d.	"	7½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	6½d.	"	8½d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8½d.	"	8½d.	"	9½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9½d.	"	10½d.	"	11½d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7d.	"	7d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8d.	"	8½d.	"	

CEYLON. The smaller supply catalogued consisted of only 4,784 packages on Garden account, the remainder being Invoices bought in the Colombo market. The demand has been brisk for all descriptions, the better liquoring sorts again attracting most attention, though no advance can be quoted: a better tone however prevails and the market is decidedly hardening. Arrivals are small, in fact at present hardly sufficient to meet the requirements of the trade. The following Invoices realized high averages:—"Hoolankande," 1/11½; "Pundaloya," 1/2; "New Valley," 1/1½.

The 6,273 packages sold at an average of 11½d. per lb.

JAVA. The 2,134 packages were disposed of without quotable change in rates current last week. Of the total offerings "Sinagar" contributed 1,295 packages.

The 2,134 packages of direct import sold at an average of 8d. per lb.

MOVEMENTS OF TEA (in lbs) FROM 1st JUNE TO 31st AUGUST, 1888.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

September 21st, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	211,727 packages.	79,994 packages.	14,460 packages.
1888.	243,759 "	127,023 "	21,649 "

During the week

23,147 packages	INDIAN
4,861 "	CEYLON
2,124 "	JAVA

Total 30,132 packages have been offered in public auction.

The amount brought to auction has been smaller than for some weeks past, a decrease having taken place in offerings of both Indian and Ceylon Teas.

The smaller supply of Indians was mostly disposed of, at prices showing a slight recovery from the lowest point, the irregularity so noticeable during the last few weeks having disappeared.

Generally speaking, Teas of fine quality are somewhat dearer, owing in a measure to the comparatively small proportion of this description.

Offerings have included a few very desirable Teas from Assam and Darjeeling.

Calcutta telegrams place the exports to 15th inst., at a million and a quarter pounds only in excess of last season.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4½d.	1887,	4d.	1886,	7½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6d.	"	4½d.	"	7½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	6½d.	"	8d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8½d.	"	8½d.	"	9½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9½d.	"	10d.	"	11d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7d.	"	6½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8d.	"	8d.	"	

CEYLON. A further diminution in supplies has accentuated the tendency of prices to harden, which was noticed last week. Bidding for all sorts has been brisk, and has in some instances occasioned slightly advanced quotations. The quality of offerings generally has been medium, very few Invoices possessing really fine liquors.

Should supplies continue upon a similarly moderate scale, it is not unlikely that they will be insufficient to meet requirements, and that stocks will in consequence be largely depleted. As it seems probable that imports for some months to come will scarcely exceed their present rate, it is doubtful whether the Market for Ceylon Tea can suffer much from any over pressure of Indian Tea, the outlets where Ceylon Tea constitutes a speciality being apparently sufficient to obviate any serious depression in prices.

A very fine Invoice of Charley Valley Tea attracted considerable attention, and sold at an average of 1/6½ per lb. The following averages may also be mentioned:—"Sogama," 1/2¼; "Mocha," 1/4; "Silver Kandy," 1/2. The 4,861 packages sold at an average of 11½d. per lb.

JAVA. Thirteen different estates were represented in the auctions. With few exceptions the bulk comprised Teas of poor quality. Sales in consequence passed with rather a dragging tendency, prices for the inferior grades being lower, especially when the liquors were indifferent. The 2,089 packages of direct import sold at an average of 7½d. per lb.

MOVEMENTS OF TEA (in lbs) FROM 1st JUNE TO 31st AUGUST, 1888.

In these tables all the packages are half-chests unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

September 28th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	244,933 packages.	82,590 packages.	14,901 packages.
1888.	273,180 "	133,041 "	22,473 "

During the week

29,721 packages	INDIAN
6,018 "	CEYLON
824 "	JAVA

Total 36,563 packages have been offered in public auction.

Auctions have exceeded last week's amount by 6000 packages, Indian Tea constituting the main portion of this surplus.

There is very little alteration to notice in the condition of the Indian market, the feeling being rather towards increased firmness. Teas for price are in strong demand, and all kinds with really good liquors attract greater attention.

An average of 1/9 was obtained by the "Nagri" garden, and of 1/7 by the "Moondakotee" garden, of the Land Mortgage Bank.

A few boxes of Fancy Tea from the "Glendale" Estate, in the Neilgherries, sold at unusually high prices, one lot bringing 6/-, and another 7/6 per lb.

It is worthy of note that recent Calcutta telegrams give the increase over last seasons exports only one million pounds, while the arrivals in London to the end of August were nearly two million pounds in excess of last season's. It is therefore improbable that the weight of Tea to be offered during the next six weeks, can be heavier than that of last year.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4½d.	1887.	4d.	1886.	7½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6d.	"	4½d.	"	7¼d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	6½d.	"	8d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8½d.	"	8½d.	"	9¼d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9¼d.	"	10d.	"	11d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7d.	"	6½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8d.	"	8d.	"	

CEYLON. With a continuance of small supplies prices have become harder. The proportion of Fine Liquoring Invoices has been greater than last week and the quality generally is superior; hence with a firm market the average for the week has reached a higher figure than has been recorded since the middle of last May. The following Invoices obtained high averages:—"Coatfell," 1/7; "Alnwick," 1/6½; "Glenugie," 1/4½; "Blackstone," 1/4; "Chapelton," 1/4; "Mahatungoda," 1/3; "Hope," 1/3. The 6,018 packages sold at an average of 1/- per lb.

JAVA. Only 824 packages were brought to auction, the small sale passing at about previous rates. A good liquoring Invoice from Tjiboloe, sold at firm prices. The 824 packages. of direct import sold at an average of 7¼d. per lb.

MOVEMENTS OF TEA (in lbs) FROM 1st JUNE TO 31st AUGUST, 1888.

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

October 5th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	273,519 packages.	86,757 packages.	14,901 packages.
1888.	301,900 "	137,648 "	22,595 "

During the week

28,720 packages	INDIAN
4,607 "	CEYLON
122 "	JAVA

Total 33,449 packages have been offered in public auction.

The position of both Indian and Ceylon Tea is stronger than a month since.

The increase over last season in the receipts of Tea from India, which at the end of August was nearly five million pounds, has now been reduced to slightly over two millions above last season's arrivals;—the deliveries to date exceeding last season's by a million and a quarter.

Under these circumstances, and with only a moderate quantity of Tea offering, and that showing rather more useful quality, it is not surprising that the firmness noted last week should be more pronounced. The value of all grades has hardened, and finest kinds show a distinct advance, many of these Teas being of a particularly attractive character.

INDIAN. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4 ³ / ₄ d.	1887,	4d.	1886,	7 ¹ / ₄ d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6d.	"	4 ¹ / ₂ d.	"	7 ¹ / ₄ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7 ¹ / ₂ d.	"	6 ¹ / ₂ d.	"	8d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8 ¹ / ₂ d.	"	8 ¹ / ₂ d.	"	9 ¹ / ₂ d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9 ¹ / ₂ d.	"	10 ¹ / ₄ d.	"	11d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7 ¹ / ₄ d.	"	6 ¹ / ₂ d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8 ¹ / ₄ d.	"	8 ¹ / ₄ d.	"	

CEYLON. The position of Ceylon Tea is strong. The deliveries during September exceeded the imports, and the stock is consequently less than at the end of August. Should deliveries continue at the present rate, it appears probable that stocks must suffer considerable reduction.

Owing to the generally fair quality of arrivals, and the continuance of a strong demand, the average price for the week is again comparatively satisfactory. Many Invoices of good flavor have been disposed of, and where quality has been at all exceptional, high prices have been readily paid. The following averages may be mentioned:—"Sheen," 1/6¹/₂; "Bogawantalawa," 1/6; "Hope," 1/3¹/₂. The 4,607 packages sold at an average of 1/- per lb.

JAVA. Only a small sale was held; the quality of the Teas being poor, low prices only were obtained. The 63 packages of direct import sold at an average of 6¹/₄d. per lb.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

October 12th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	303,375 packages.	88,085 packages.	15,181 packages.
1888.	334,914 "	143,579 "	22,605 "

During the week

33,014 packages INDIAN
5,931 " CEYLON
10 " JAVA

Total 38,955 packages have been offered in public auction.

Now that the present season is well advanced, it is interesting to know that the Home Consumption of Tea during the past *nine months* shows a substantial increase over the corresponding period of last year.

The following figures, illustrating this expansion, show the increased proportion of British Grown Tea which has been consumed. The Indian deliveries appear to indicate the absorption of this seasons crop without difficulty. The increase in the use of Ceylon Tea is remarkable.

Amount of Tea (in lbs.) taken for HOME CONSUMPTION, from 1st January to 30th September.

	1886.	1887.	1888.
Indian	48,047,000	58,910,000	62,658,000
Ceylon	4,524,000	7,401,000	13,570,000
China, etc.	79,410,000	69,811,000	62,264,000
Total lbs.	131,981,000	136,122,000	138,492,000

Taking these facts into consideration the active demand lately developing for Indian and Ceylon rowths is not surprising, and with Indian Tea at its present low quotations the tendency towards reaction in price is natural.

INDIAN. During the week a firmer tone has been evinced for all grades—High class Teas now an advance, specially attractive parcels being keenly competed for. As an idea of the comparative prices of Indian Tea in London we quote:—

	(Fair ordinary, dark liquor)	1888.	4 $\frac{3}{4}$ d.	1887,	4d.	1886,	7 $\frac{1}{4}$ d.
DUST.	(Fair ordinary, dark liquor)	"	6d.	"	4 $\frac{1}{2}$ d.	"	7 $\frac{1}{4}$ d.
FANNINGS.	(Red to brown, strong rough liquor)	"	7 $\frac{1}{2}$ d.	"	6 $\frac{1}{2}$ d.	"	8d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	8 $\frac{1}{2}$ d.	"	8 $\frac{1}{2}$ d.	"	9 $\frac{1}{2}$ d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	9 $\frac{3}{4}$ d.	"	10 $\frac{1}{4}$ d.	"	11d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	7 $\frac{1}{4}$ d.	"	6 $\frac{1}{2}$ d.	"	
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	8 $\frac{1}{4}$ d.	"	8 $\frac{1}{4}$ d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"		"		"	

CEYLON. The great increase in the consumption of Ceylon Tea, alluded to above, is sufficient evidence of its extensive popularity. With offerings continuing upon a moderate scale the market has remained very steady; advances in some instances being paid for fine flowering Pekoes and Broken Pekoes. Quality continues to be maintained throughout, and some of the "higher grown" Teas are of fine delicate flavor. The following averages may be mentioned:—Portswood, "1/4 $\frac{1}{4}$ "; "Agar's Land," 1/2 $\frac{3}{4}$; and the "Andangoddie Estate" of the Ceylon Land and Produce Co. 1/2. The 5,931 packages sold at an average of 1/0 $\frac{1}{4}$ per lb.

JAVA. No auctions have been held. Catalogues are issued for 732 packages to be offered next week.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 30th SEPTEMBER, 1888.

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

October 19th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	330,766 packages.	91,623 packages.	15,688 packages.
1888.	361,211 "	147,349 "	23,337 "

During the week

26,297 packages	INDIAN	} Total 30,999 packages have been offered in public auction.
3,970 "	CEYLON	
732 "	JAVA	

As a general rule, October commences the period in which the heaviest deliveries take place in British Grown Tea:—nearly one half the amount of Indian Tea annually consumed is removed from the Bonded Warehouses during the five months between October and February.

The deliveries of Indian Tea in October and November last year, reached the unusually high figures of 8,294,094 lbs., and 8,602,236 lbs. respectively, the latter figure being the highest yet recorded in any month.

Latest telegrams place shipments from Calcutta at 3,200,000 lbs. in excess of last season's exports to date—but it appears that cold weather has set in rather earlier than usual, an event which must exercise considerable influence upon the output. So far, the deliveries of Indian Tea during each month of 1888 have exceeded the corresponding month of 1887. Should the rate of increase continue during the next few months the season's crop may not be very difficult to absorb.

INDIAN. With a smaller quantity offering and continued good demand from the provinces, the firm rates have hardened into an advance. Teas for price are $\frac{1}{4}$ d. to $\frac{1}{2}$ d. dearer, and fine descriptions are very keenly competed for, tippy Teas being again higher. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	4 $\frac{3}{4}$ d.	1887.	4d.	1886.	7 $\frac{1}{4}$ d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6 $\frac{3}{4}$ d.	"	4 $\frac{3}{4}$ d.	"	7 $\frac{1}{4}$ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7 $\frac{3}{4}$ d.	"	6 $\frac{3}{4}$ d.	"	8d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8 $\frac{3}{4}$ d.	"	8 $\frac{3}{4}$ d.	"	9 $\frac{1}{4}$ d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9 $\frac{3}{4}$ d.	"	10 $\frac{1}{4}$ d.	"	10 $\frac{3}{4}$ d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7 $\frac{3}{4}$ d.	"	6 $\frac{3}{4}$ d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8 $\frac{3}{4}$ d.	"	8 $\frac{3}{4}$ d.	"	

CEYLON. Probably owing chiefly to the difficulty of obtaining freight from Ceylon, this week's offerings have been the lightest recorded for several months. The market has been very strong, and good Pekoes and Broken Pekoes have further advanced. Quality continues good, but in some few instances the fault of "overfiring" is still noticeable. The following averages may be mentioned:—'Campion,' $\frac{1}{3}$; 'Hope,' $\frac{1}{2\frac{1}{4}}$; 'Adam's Peak,' $\frac{1}{2}$; 'Rangbodde,' $\frac{1}{2}$. The 3,970 packages sold at an average of $1/0\frac{1}{2}$ per lb.

JAVA. Only 732 packages were brought to auction. Teas for price are dearer in sympathy with Indians, other descriptions show little alteration. 1,532 packages are advertised for auction next week. The 732 packages of direct import sold at an average of 8d. per lb.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 30th SEPTEMBER, 1888.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

October 26th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	362,191 packages.	93,370 packages.	16,916 packages.
1888.	398,357 "	152,881 "	24,869 "

During the week

37,146 packages	INDIAN	} Total 44,210 packages have been offered in public auction.
5,532 "	CEYLON	
1,532 "	JAVA	

The Indian sales this week have been the heaviest recorded, and Wednesdays auction comprised the largest quantity of Indian Tea ever offered in one day viz., 14,275 packages.

Latest telegraphic advices now place the exports from Calcutta at 2½ millions over the same time last season, and it is worthy of note that up to the end of September, the imports into London had exceeded those of last season to same date by 2¼ million lbs.

INDIAN. In spite of the volume of Tea prices have been well maintained, although here and there some slight irregularity has been manifested. Teas for price show a further advance of fully farthing per pound, while fine dark liquoring descriptions of Broken Pekoe are again higher, as much as twopence to threepence per pound advance having in some instances been paid. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	5d.	1887,	4d.	1886,	7¼d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6¼d.	"	4¾d.	"	7¼d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7¾d.	"	6¾d.	"	8d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	9d.	"	8¾d.	"	9¾d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9¾d.	"	10¼d.	"	10¾d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7¾d.	"	6¾d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8¾d.	"	8¾d.	"	

CEYLON. The market continues strong, and last weeks rates are fully maintained, good liquoring Pekoes and Broken Pekoes being still very keenly competed for and showing a further advance. The selection has comprised a large proportion of Tea from Estates which generally obtain comparatively high averages on account of quality and flavour, and as the arrivals have been of good general quality throughout, the weeks average shows a marked increase, which must be very satisfactory to growers. The following averages may be mentioned:—"Chapelton," 1/4¼; "Geddes," 1/4¼; "Moray," 1/4; "Hindagalla," 1/3½; "Yuillefield," 1/3¼; and the "Andangoddie state," of the Ceylon Land and Produce Co., 1/2½. The 5,532 packages sold at an average of 1/1 per lb.

JAVA. The quality of the offerings shows some improvement, and some of the Teas from "Parakanalak" and "Sinagar," were especially noticeable for attractive liquors. The market has continued strong, Teas for price fully maintaining the late advance. The 1,532 packages. of direct import sold at an average of 8d. per lb.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 30th SEPTEMBER, 1888.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

November 2nd, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	392,331 packages.	96,820 packages.	16,916 packages.
1888.	440,423 "	160,800 "	24,877 "

During the week

42,066 packages	INDIAN	} Total 49,993 packages have been offered in public auction.
7,919 "	CEYLON	
8 "	JAVA	

The quantity brought forward during the week exceeds any previous record, Thursday's sale also being the largest ever held, viz. 15,364 packages Indian and 1,710 packages Ceylon. The deliveries of British Grown Tea are most encouraging;—the Indian figures exceed those of any previous month. Ceylon Teas show an increase over last month's deliveries, notwithstanding the advance in the average price.

INDIAN. General steadiness characterized the bidding for all descriptions during the earlier part of the week, and until yesterday no change could be quoted from last week's rates. The bidding in Thursday's heavy auction flagged considerably, and medium Teas both Leafy and Broken from 10d. to 1/2 per pound showed decided irregularity, the energies of buyers being severely taxed by the number of breaks to be tasted, followed by the prolonged duration of the sale.

A meeting was held at the office of the Indian Tea Districts Association to consider the representation of Indian Tea at the approaching Paris Exhibition. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	5d.	1887,	4d.	1886,	7 1/4 d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6 1/4 d.	"	5d.	"	6 3/4 d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7 3/4 d.	"	7d.	"	7 1/2 d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8 3/4 d.	"	9d.	"	8 3/4 d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9 1/4 d.	"	10 1/2 d.	"	10 1/4 d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7 1/2 d.	"	7d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8 1/2 d.	"	9d.	"	

CEYLON. A larger quantity has been catalogued and the maintenance of the high quality of recent arrivals has resulted in good general competition. With the more varied selection, buyers have been able to choose their Teas with greater freedom, and hence a slight irregularity has occasionally been apparent in prices. It is however very satisfactory to note that the average price exceeds that of last week, and it is worthy of comment that this figure had not previously been attained during the present year. The estimated outturn from Ceylon for the coming season, viz. 1st October 1888 to 30th September 1889, is placed at 32 1/2 million to 34 million pounds, an amount which should be easily dealt with, especially when the requirements of the Australian and other markets are considered. The 7,919 packages sold at an average of 1/1 1/4 per lb.

JAVA. No auctions have been held, but catalogues will no doubt be shortly issued for Teas just arrived per s.s. "Taroba."

During the week

42,197 packages INDIAN }
 5,172 ,, CEYLON } Total 47,369 packages have been offered in public auction.

The weight of Indian Tea brought to auction during the week has exceeded the heavy total of last week. The power of the market to cope with these enormously increased supplies can be more readily comprehended by reference to the following figures, which illustrate in striking contrast the increased Home Consumption of British Grown Tea and the falling off in the use of China Tea. The reduction in the Imports of China Tea during the present season has still further strengthened the position of Indian and Ceylon growths when looked at statistically.

The revised Calcutta estimate places the amount of Indian Tea available for London at 92 million lb.

Amount of Tea (in lbs.) taken for HOME CONSUMPTION, from 1st January to 31st October.

	1886.	1887.	1888.
Indian	54,666,604	67,204,094	71,584,065
Ceylon	5,207,770	8,409,950	15,455,440
China, etc.	88,595,258	77,175,327	69,159,311
Total lbs.	148,469,632	152,789,371	156,198,816

INDIAN. A general irregularity has been noticeable in the bidding. The Teas least effected are the finest liquoring kinds and Teas for price. Medium Broken Pekoes have declined fully one penny, poor liquoring Pekoes a half-penny, and Darjeelings of poor quality fully twopence per lb. As an idea of the comparative prices of Indian Tea in London we quote:—

	(Fair ordinary, dark liquor)	1888.	5d.	1887,	4d.	1886,	7½d.
DUST.	(Fair ordinary, dark liquor)	1888.	5d.	1887,	4d.	1886,	7½d.
FANNINGS.	(Red to brown, strong rough liquor)	6½d.	6d.	5d.	5d.	6d.	6½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	7½d.	7d.	7d.	7d.	7d.	7½d.
PEK. SOUG.	(Blackish greyish, useful liquor)	8½d.	8d.	9d.	8d.	8d.	8½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	9½d.	9d.	10½d.	10d.	10d.	10½d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	7½d.	7d.	7d.	7d.	7d.	7½d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	8½d.	8d.	9d.	9d.	9d.	8½d.

CEYLON. Offerings have again been on a moderate scale. Although Tuesday's auction passed with some irregularity, the tone was recovered on Thursday, when the small quantity offering and the prospect of light auctions next week, had the effect of inducing a firmer tone. The following averages may be mentioned:—"Alnwick," 1/8; "Loolecondera," 1/6; "Portswood," 1/6; "Rahatungoda," 1/3½; and amongst the low country gardens an invoice from "Mipitiakande," realized 1/0½. The 5,172 packages sold at an average of 1/- per lb.

JAVA. No auctions have been held. Catalogues are issued for 2,610 packages next week.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st OCTOBER, 1888.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

November 16th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	455,502 packages.	105,069 packages.	17,793 packages.
1888.	512,755 "	169,198 "	27,487 "

During the week

30,135 packages	INDIAN
3,026 "	CEYLON
2,610 "	JAVA

Total 35,771 packages have been offered in public auction.

Although auctions have been much lighter, the recent strain upon the market has severely taxed its strength, and late abundant supplies have proved rather more than adequate to immediate necessities.

INDIAN. The lower level of prices established last week has been about maintained, although some irregularity has taken place in the bidding. Teas for price, which remained steady during the previous week, have now been affected by the general weakness. Speaking generally, the quality on offer has not been quite as attractive as arrivals of a few weeks since.

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	5d.	1887.	4d.	1886.	7½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6¼d.	"	5d.	"	6¾d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	7¼d.	"	7d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8½d.	"	9d.	"	8½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9¼d.	"	10½d.	"	10d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7¼d.	"	7d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8¼d.	"	9d.	"	

CEYLON. Very few garden invoices were comprised in the limited selection. The proportion of Colombo bought Teas, reprints, and second hand lots, amounted to nearly one half of the offerings. Little change has taken place from last weeks rates; wherever invoices stood out through prominence of liquor the bidding was generally animated. The following averages may be mentioned:— "Silver Kandy," 1/3½; "Chapelton," 1/3. An average of 1/0½ per lb. was obtained.

JAVA. The assortment has been larger and more varied, comprising many very useful liquoring teas. An invoice of 1,240 packages from "Sinagar" included a large proportion of white tipped pekoe in boxes. The market continues fairly steady for all grades, medium Pekoes however, being still comparatively cheap owing to the limited shipping demand. The 2,610 packages. of direct import sold at an average of 8d. per lb.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

November 30th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	507,162 packages.	109,545 packages.	18,281 packages.
1888.	566,291 ,,	181,794 ,,	27,529 ,,

During the week

21,946 packages INDIAN } Total 25,285 packages have been offered in public auction
 3,339 ,, CEYLON } as against 40,889 packages last week and 35,771 packages during the
 previous week; while the aggregate for the fortnight ending 8th inst., totalled 97,362 packages.

The auctions for the week have thus been upon a very moderate scale. With so considerable a diminution in the supplies, there has been less difficulty in absorbing the offerings, the relaxed pressure to sell having enabled purchasers to deal with their accumulated holdings.

INDIANS remain without material alteration from last week's rates, except that all Teas deficient in liquor are somewhat weaker, especially the lower grades of Pekoes and Broken Pekoes. Teas with character and point in cup being on the other hand more enquired for. High averages were obtained by the following gardens:—"Dootariah," 1/4½; "Borokai," 1/3.

Travancore has been represented by a larger number of invoices than usual. An average of 1/- per lb. was obtained for "T.P.C.," of 10¾d. for "Penshurst," and of 10½d. for "C.E."

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	5½d.	1887,	4d.	1886,	7½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6¼d.	"	5d.	"	6¼d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	7¼d.	"	6¾d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8d.	"	8¾d.	"	8¼d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9d.	"	10d.	"	9¾d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7d.	"	7d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8d.	"	8½d.	"	

CEYLON. The decline noticed last week has become more pronounced. Although the auctions were very light, prices were irregular and showed considerable weakness in Medium Pekoes and Broken Pekoes. Pekoe Souchongs show a fractional decline, the lowest grades of Tea for price one maintaining their value. Quality has been generally fair, although there have been few invoices which have stood out from amongst the rest. The following averages may be mentioned:—"Court Lodge," 1/2¾; "Kabragalla M," 1/-; "Culloden," 1/-. An average of 11¼d. per lb. was obtained.

AVAS have not been represented. 362 packages ex "Jason" are printed for sale next week.

MOVEMENTS OF TEA (in lbs), FROM 1st JUNE TO 31st OCTOBER, 1888.

In these tables all the packages are half-chests unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON,
Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

December 7th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	536,492 packages.	114,165 packages.	18,929 packages.
1888.	588,053 "	189,067 "	27,891 "

During the week

21,762 packages	INDIAN
7,273 "	CEYLON
362 "	JAVA

Total 29,397 packages have been offered in public auction

Auctions have again been comparatively light, but ample for immediate requirements. Buyers are reluctant to further accumulate stock so near the close of the year. Figures for November show slightly increased delivery of Indian Tea over last November, and a marked increase in the consumption of Ceylon Tea; the statistics from the commencement of the season still more forcibly illustrate both these points.

INDIAN. Quotations are nearly the same as last week, but competition is somewhat better, and during the last day or two a slightly improved tone has been noticeable, with more disposition to compete for desirable parcels. Teas for price are very steady and the demand is strong for Fine Broken Pekoes; Weak Liquoring Pekoes and Broken Pekoes continue depressed. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	5 $\frac{3}{4}$ d.	1887,	4 $\frac{1}{4}$ d.	1886,	6 $\frac{1}{4}$ d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6 $\frac{1}{4}$ d.	"	5 $\frac{1}{4}$ d.	"	6 $\frac{1}{4}$ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7 $\frac{1}{2}$ d.	"	7 $\frac{1}{4}$ d.	"	6 $\frac{3}{4}$ d.

CEYLON. We have again to chronicle a depressed and falling market. Broken Pekoes show a further decline of a halfpenny to a penny per lb., Medium Pekoes of nearly a halfpenny, and Pekoeouchongs a farthing. The lowest grades for price still maintain their value. The quality continues fair and with present low quotations, further impetus may be given to the increasing consumption. It is worthy of note that deliveries from 1st June to date have exceeded the imports. The following averages may be mentioned:—"Hoolankande," 1/9 $\frac{1}{4}$; "Glendevon," 1/5 $\frac{1}{4}$; "Mipitiakande," 1/0 $\frac{3}{4}$.

The imports from China to date are eleven million lbs. less than last year, and the deficiency thus created is to a great extent being supplied from Ceylon Tea. An average of 11 $\frac{3}{4}$ d. per lb. was obtained.

JAVA. Only one auction has been held, comprising 353 packages from the "Ardja Sarie" Estate. The sale passed without quotable change in price. An average of 7 $\frac{3}{4}$ d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) DURING NOVEMBER.

GOW, NILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

December 14th, 1888.

13, ROOD LANE, LONDON, E.C

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	563,284 packages.	117,803 packages.	19,621 packages.
1888.	615,961 ,,	199,616 ,,	27,891 ,,

During the week

27,908 packages INDIAN }
 10,549 ,, CEYLON } Total 38,457 packages have been offered in public auction.

This quantity although heavier than last week has not been excessive; buyers however continue to operate with caution, and little disposition is manifested to increase stock at the present time of year.

The undermentioned figures showing the Home Consumption during the past eleven months are instructive. It is also satisfactory to note an increase over last year in the quantity exported from Great Britain.

Amount of Tea (in lbs.) taken for HOME CONSUMPTION, from 1st January to 30th November.

	1886.	1887.	1888.
Indian	61,825,072	75,806,330	80,206,956
Ceylon	5,774,010	9,199,960	17,144,920
China, etc.	97,308,041	84,399,143	75,266,424
Total lbs.	164,907,123	169,405,433	172,618,300

Amount EXPORTED from 1st January to 30th November.

1886.	1887.	1888.
41,587,677 lbs.	31,736,362 lbs.	35,631,875 lbs.

INDIAN. The steadiness noticeable at the closing sales of last week has been maintained, good liquoring kinds occasionally showing an advance, especially in Teas over 1/6. Pekoe Souchongs and Broken for price continue in strong demand, but low Pekoes with poor liquor are somewhat neglected. As an idea of the comparative prices of Indian Tea in London we quote:—

	1888.	6d.	1887,	4½d.	1886,	6½d.
DUST. (Fair ordinary, dark liquor)	1888.	6d.	1887,	4½d.	1886,	6½d.
FANNINGS. (Red to brown, strong rough liquor)	,,	6½d.	,,	5½d.	,,	6½d.
BROKEN TEA. (Brownish to blackish, strong liquor)	,,	7½d.	,,	7½d.	,,	6½d.
PEK. SOUG. (Blackish greyish, useful liquor)	,,	8d.	,,	9d.	,,	8½d.
PEKOE. (Greyish to blackish some tip, useful liquor)	,,	9d.	,,	10d.	,,	9½d.
PEK. SOUG. (Blackish greyish, inferior liquor)	,,	7d.	,,	7d.	,,	7d.
PEKOE. (Blackish, greyish, some tip, inferior liquor)	,,	7½d.	,,	8½d.	,,	8½d.

CEYLON. Larger auctions have somewhat further depressed the market, and prices generally must be quoted fractionally easier. Medium Pekoes are fully a farthing lower; Broken Pekoes about a halfpenny cheaper, except for the finest liquoring kinds, which in sympathy with Indian Teas continue in request. Ceylon Tea as a whole is now cheaper, taking quality into consideration, than it has been for some considerable time, and present prices are likely to cause increased consumption. Quality this week has not been quite equal to that of the last few weeks. The following averages may be mentioned:—"Charley Valley," 1/9½; "Hope," 1/2½; "Oodewelle," 1/1¼; "Gars Land," 1/0½. An average of 10¾d. per lb. was obtained.

JAVA Tea has not been represented. 1,633 packages are advertised for public auction next week.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 30th NOVEMBER, 1888.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

December 21st, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	589,092 packages.	122,700 packages.	19,621 packages.
1888.	638,045 "	204,336 "	29,524 "

During the week

22,084 packages	INDIAN
4,720 "	CEYLON
1,633 "	JAVA

Total 28,437 packages have been offered in public auction.

The offerings, which were not excessive, have sufficed for immediate necessities of the trade. With yesterday's auctions the market closed for Christmas. Last week we gave the figures for Home Consumption and Export from 1st January to date. The following table gives similar figures for the present season.

Amount of Tea (in lbs.) taken for HOME CONSUMPTION, from 1st June to 30th November.

	1886.	1887.	1888.
Indian	33,899,250	40,875,204	42,769,320
Ceylon	4,190,330	6,117,130	11,425,332
China, etc.	54,170,887	46,259,267	40,651,126
Total lbs.	92,260,467	93,251,601	94,845,778

Amount EXPORTED from 1st June to 30th November.

	1886.	1887.	1888.
25,389,272 lbs.	18,375,074 lbs.	21,968,924 lbs.	

Stocks of Tea at the end of November compared more favourably with previous years than would appear from the figures given at foot, for the following reasons:—

In 1886 about 4,700,000 lbs. had arrived which were not included in Stock, about 4,250,000 lbs. of this quantity being Indian and Ceylon.

In 1887 about 4,000,000 lbs. had arrived which were not included in Stock, about 2,800,000 lbs. being Indian and Ceylon.

In 1888 everything was included in the Stock.

INDIAN. The better disposition to buy Teas for price which was noticeable last week, still continues. The supply of good liquoring Teas over 1/6 is small, and fine Teas generally are wanted. As an idea of the comparative prices of Indian Tea in London we quote:—

	1888.	1887.	1886.
DUST. (Fair ordinary, dark liquor)	6¼d.	4¼d.	5½d.
FANNINGS. (Red to brown, strong rough liquor)	6¼d.	5½d.	6d.
BROKEN TEA. (Brownish to blackish, strong liquor)	7½d.	7½d.	6¾d.
PEK. SOUG. (Blackish greyish, useful liquor)	8d.	9¼d.	8¼d.
PEKOE. (Greyish to blackish some tip, useful liquor)	9d.	10d.	9¾d.
PEK. SOUG. (Blackish greyish, inferior liquor)	7¼d.	7¼d.	
PEKOE. (Blackish, greyish, some tip, inferior liquor)	7¾d.	8¾d.	

CEYLON. Quotations are again lower, and buyers would only take the small offerings at prices which show a further reduction. The decline, which until this week had been most pronounced in Pekoes and Broken Pekoes, has now become very prominent in Pekoe Souchongs, this class having latterly sold at relatively better prices than the higher grades. Although several Estates with poor quality have been represented in the auctions, the average quality continues to be about maintained. Exceptional value is now obtainable in Broken Pekoes, which are now relatively cheaper than Indian Tea. 39 packages from the "Portswood" Estate realized an average of 1/5½. An average of 10d. per lb. was obtained.

JAVA. The 1,633 packages were nearly all sold, with good competition. The "Sinagar" Estate was represented by an invoice possessing excellent quality. An average of 7½d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 30th NOVEMBER, 1888.

In these tables all the packages are half-chests unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

December 28th, 1888.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887.	589,092 packages.	122,700 packages.	19,621 packages.
1888.	638,045 "	204,336 "	29,524 "

The market has remained closed since our last report, and will not re-open until Monday next.

With this circular we print a table, showing the Imports and Deliveries of Indian and Ceylon Tea during each month of the past few years, with the Stocks at the end of each month; and giving also the China figures for the total seasons.

Since the 1st June the Home Consumption of Tea in Great Britain has consisted of the following proportions:—

	INDIAN. Per cent.	CEYLON. Per cent.	CHINA, ETC. Per cent.
1st June to 30th November, 1888	46	12	43
1st June to 30th November, 1887	44	6	50
1st June to 30th November, 1886	37	4	59

The comparison for the three periods given above is instructive, and appears to indicate that the heavy fall in the price of Indian Tea in the latter period of 1887, caused a rapid increase in Consumption, a similar effect following the fall in the price of Ceylon Tea during 1888.

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1888.	6½d.	1887,	4¼d.	1886,	5½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6¼d.	"	5½d.	"	6d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	7½d.	"	6¾d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8¼d.	"	9¼d.	"	8¼d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9¼d.	"	10d.	"	9¼d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7¼d.	"	7¼d.	"	7¼d.
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¼d.	"	8¼d.	"	8¼d.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 30th NOVEMBER, 1888.

GOW, WILSON & STANTON,

BROKERS, 13, Rood Lane, London, E.C.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

January 4th, 1889.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	601,980 packages.	126,947 packages.	20,270 packages.
1888-1889.	650,353 "	208,844 "	29,892 "

during the week

12,308 packages	INDIAN	} Total 17,184 packages have been offered in public auction.
4,508 "	CEYLON	
368 "	JAVA	

The temporary cessation of auctions, previous to the close of the year, has had the natural effect of creating rather more animated competition than was noticeable before Christmas. The market opened on Monday with a steady tone, which has been maintained throughout the week.

Although the deliveries of Indian Tea during December compare unfavorably with last years figures, and the Ceylon deliveries are lower than many people expected, these figures do not appear disappointing when the quietness which prevailed in the country trade during the month is taken into consideration; the deliveries of China Tea were nearly *two and a half million pounds* less in last December, being 6,772,988 lbs. against 9,172,750 lbs. in December, 1887.

INDIAN. The small offerings have been critically tasted, and wherever a Tea has been discovered to possess special attraction in liquor—especially in flavor—buyers have competed for it with some degree of eagerness. As an idea of the comparative prices of Indian Tea in London we note:—

DUST.	(Fair ordinary, dark liquor)	1889.	6d.	1888,	4½d.	1887,	5½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6d.	"	6d.	"	6¼d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	7¾d.	"	7d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8¼d.	"	9d.	"	8½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9¼d.	"	10d.	"	10d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7¼d.	"	7¼d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¾d.	"	8¾d.	"	

CEYLON. The average price of all the Tea sold in London during 1888, was 11½d. per lb. The weeks auctions have passed with better spirit, showing some recovery from the recent dull tone. Broken Pekoes are very steady and where the liquors possess special character, advances varying up to two-pence per pound have in some instances been obtained. Pekoes and Souchongs continue firm, the demand for the latter being very strong. Quality generally has been fair. An average of 10¾d. per lb. was obtained.

JAVA. Only one sale has been held, comprising an invoice from the "Ardja Saric" Estate. Prices ruled very firm. An average of 6½d. per lb. was obtained.

MOVEMENTS OF TEA in lbs. DURING DECEMBER.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

January 11th, 1889.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	628,657 packages.	133,340 packages.	22,073 packages.
1888-1889.	684,804 "	218,378 "	29,892 "

ing the week

34,451 packages INDIAN }
9,534 " CEYLON } Total 43,985 packages have been offered in public auction.

It is satisfactory to learn that the Home Consumption of Tea during the past twelve months, the heaviest on record, being 185,556,214 lbs., against 183,635,885 lbs. in 1887, and 178,894,151 lbs. in 1886. The poor deliveries of all Tea which took place last month, and which gave rise to much disappointment, appear therefore to indicate only a temporary slackness in trade, which must be counterbalanced sooner or later by more extensive clearances.

Amount of Tea (in lbs.) taken for HOME CONSUMPTION, from 1st January to 31st December.

	1886.	1887.	1888.
Indian	68,419,618	83,112,272	87,210,294
Ceylon	6,245,220	9,941,860	18,553,054
China, etc.	104,229,313	90,581,753	79,792,866
Total lbs.	<u>178,894,151</u>	<u>183,635,885</u>	<u>185,556,214</u>

Notice has been issued by the Customs to the effect that the name of the country of production should be stated, when Tea is removed from any warehouse, either for Export or Home Consumption. This will doubtless enable the Customs to distinguish the *Exports* of Indian and Ceylon from those of China Tea, a matter which has now become of great importance to the Tea trade.

INDIAN. Auctions, although heavier than for many weeks past, have not been excessive. The market was easily absorbed, and prices all round have remained very firm, the higher grades of Broken Pekoe, with marked point in cup being decidedly dearer. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	6d.	1888,	4½d.	1887,	5½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6d.	"	6d.	"	6½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7½d.	"	8d.	"	7d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8½d.	"	9½d.	"	8½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9½d.	"	10½d.	"	10d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7½d.	"	7½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7½d.	"	9d.	"	

LONDON. Under the influence of larger auctions, the market has lost the recovery noticed last month and prices have receded to their former level. Good liquoring and flavory Teas alone command steady rates and attract competition, all other kinds being neglected by buyers. A range of 10½d. per lb. was obtained.

A. No auctions have been held, catalogues are issued for 727 packages, to be offered on the 21st, amongst which are invoices from the "Bagelen" and "Bodjonagara" Estates. Catalogues also just been issued for 922 packages to be sold on the 21st and 22nd inst.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st DECEMBER, 1888.

In these tables all the packages are half-chests unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked with a dagger represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

January 18th, 1889.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	666,766 packages.	137,065 packages.	22,740 packages.
1888-1889.	715,625 "	227,436 "	30,619 "

During the week

30,821 packages	INDIAN
9,058 "	CEYLON
727 "	JAVA

Total 40,606 packages have been offered in public auction.

The slightly brisker tone noticed last week has not been quite so pronounced, and auctions have thus passed with some irregularity. As an outcome of a movement amongst the trade, a public auction was held on Thursday, in which the Indian Teas were sold without the Mark, Dock number, or Ship's name, being printed in the catalogue. The sale passed off with spirit, and the Teas were well competed for. Several catalogues are already issued in similar style for next week.

INDIAN. The offerings have been fully adequate to requirements, and except where special quality has been noticeable, prices have been slightly weaker. Taken as a whole the quality has not been attractive, and has thus resulted in a somewhat lower scale of quotations. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	6d.	1888,	4½d.	1887,	5½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	6d.	"	6¼d.	"	6¼d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7¼d.	"	8¼d.	"	7d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8d.	"	9¼d.	"	8½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9¼d.	"	10¼d.	"	10d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7d.	"	7½d.		
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¼d.	"	9d.		

CEYLON. The market remains without quotable change except for Teas with special *flavor*, or point in liquor, which continue to be much sought after and command enhanced prices. The supply of such Teas is very limited, and the general quality does not quite come up to the standard desired by buyers. The following averages may be mentioned:—"Portswood," 1/2½; "Bogahawatte," 1/2; "Chapelton," 1/0¼; "Dimbula," 1/0½. An average of 10½d. per lb. was obtained.

JAVA. Sales have passed with spirit, and prices for all good liquoring Teas are distinctly firmer. An invoice from "Bagelen" comprising many Teas of nice flavor, met with good competition, and realized fair prices. An average of 9d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st DECEMBER, 1888.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

January 25th, 1889.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

	FROM 1ST JUNE TO DATE.		
	Indian.	Ceylon.	Java.
1887-1888.	694,264 packages.	143,597 packages.	23,120 packages.
1888-1889.	746,033 "	237,513 "	31,565 "

During the week

30,408 packages	INDIAN
10,077 "	CEYLON
946 "	JAVA

Total 41,431 packages have been offered in public auction.

The new style of printing catalogues without Mark, Dock Number or Ship's name has been slightly modified, and Indian Garden Teas are now being generally printed with the Mark, but without name of Ship or Dock Numbers—a plan which has also in some cases been adopted with Calcutta bought Teas. A few Ceylon Garden Invoices have also been printed in similar style.

INDIAN. The general tone of the market has lacked animation for any Teas except such as possess striking quality or point in liquor. Such Teas continue to be sought after, and to command high prices, but other kinds are neglected, and sell at easier rates. Pekoes for price and Low Broken Pekoes have declined in value, as also the poorer liquoring kinds of Pekoe Souchong. Closing Invoices were offered from three of the Land Mortgage Bank's Darjeeling Estates; the Teas being of excellent quality realized a high average; $2/0\frac{1}{4}$ being obtained by the "Moondakotee" Estate, and $1/4\frac{1}{2}$ by the "Nagri" Estate; an average of $1/6$ was also obtained by the "Luckimpore Tea Co.," and $1/5\frac{1}{2}$ by the "Borokai Tea Co." As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	6d.	1888,	$4\frac{1}{2}$ d.	1887,	$5\frac{1}{2}$ d.
FANNINGS.	(Red to brown, strong rough liquor)	"	$5\frac{3}{4}$ d.	"	$6\frac{1}{4}$ d.	"	$6\frac{1}{2}$ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7d.	"	$8\frac{1}{4}$ d.	"	7d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8d.	"	$9\frac{1}{4}$ d.	"	$8\frac{1}{2}$ d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9d.	"	$10\frac{1}{4}$ d.	"	10d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	$6\frac{3}{4}$ d.	"	$7\frac{1}{2}$ d.		
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	$7\frac{1}{2}$ d.	"	9d.		

CEYLON. A rather larger quantity has been offered, making the week's offerings unusually heavy, although not in excess of probable supplies in the near future. The quality was about on a par with the Teas sold last week. Fine liquoring Teas still continue scarce and are badly wanted, on that account commanding high prices, while poor liquoring or Medium descriptions, which are in full supply, sell about previous rates with an occasional easier tendency. The following averages may be mentioned:—"Hoolankande," $1/11\frac{1}{2}$; "Sheen," $1/6\frac{1}{2}$; "Goatfell," $1/4\frac{3}{4}$; "Mayfield," $1/2$; "Campion," $1/1\frac{1}{2}$; and "Rahatungoda," $1/1\frac{1}{4}$. An average of $10\frac{1}{2}$ d. per lb. was obtained.

JAVA. The Java selection contained many useful liquoring Teas. A good invoice from "Sinagar" realized firm prices, and rates generally continue steady with brisk competition. The export market has of late been somewhat more animated, and Pekoes with tip have recently been in better demand at rather improved rates. An average of $7\frac{1}{2}$ d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st DECEMBER, 1888.

In these tables all the packages are half-chests unless otherwise stated. b stands for boxes ; c for chests ; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON, Brokers

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

February 1st, 1889.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	714,831 packages.	149,282 packages.	25,000 packages.
1888-1889.	768,514 "	246,758 "	32,852 "

During the week

22,481 packages	INDIAN	} Total 33,013 packages have been offered in public auction.
9,245 "	CEYLON	
1,287 "	JAVA	

Smaller auctions coupled with some revival of trade in the country had the effect of creating improved competition and a better tone was thus imparted to the market.

As a general rule both Indian and Ceylon Teas are now being printed with name of estate, but without name of ship or dock numbers.

INDIAN. The Indian Teas sold at firm rates; the bidding being generally animated produced slight hardening in prices, except for poorer liquoring Broken Teas. Good liquoring and really avory Teas continue to attract marked attention and command relatively high prices. Invoices from the following estates were noticeable and realized the following averages:—"Rungmook," $1/5\frac{3}{4}$; "Borokai," $1/5\frac{1}{2}$; "Borboroa" division of the Upper Assam Co., $1/5$; and the "Scottish Assam Co.," $1/3\frac{1}{2}$; As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	6d.	1888,	$4\frac{1}{2}$ d.	1887,	$5\frac{1}{2}$ d.
FANNINGS.	(Red to brown, strong rough liquor)	"	$5\frac{3}{4}$ d.	"	$6\frac{1}{4}$ d.	"	$6\frac{1}{4}$ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7d.	"	$8\frac{1}{4}$ d.	"	7d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8d.	"	$9\frac{1}{4}$ d.	"	9d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	$9\frac{1}{4}$ d.	"	$10\frac{1}{4}$ d.	"	$10\frac{1}{2}$ d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	$6\frac{3}{4}$ d.	"	$7\frac{1}{2}$ d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	$7\frac{1}{2}$ d.	"	9d.	"	

CEYLON. The position has altered very little since last week. Good liquoring and Fine flavored Teas continue in strong demand and sell at full valuations. Common kinds are practically unaltered although some slight irregularity has taken place in the bidding. The quality remains about the same. The following averages may be mentioned; "Mayfield," $1/2\frac{1}{2}$; "New Forest," $1/2\frac{1}{2}$; "Protoft," $1/2$; and "Pine Hill," $1/1\frac{1}{4}$. An average of $10\frac{1}{4}$ d. per lb. was obtained.

JAVA. The Javas sold at firm prices. The selection being varied and comprising a number of fine liquoring Teas elicited considerable competition. The "Bagelen" Estate was represented by 20 packages, amongst which were several fine flavored Teas. "Tjarennang," "Tjikembang," "Bodjonagara," and "Tjiomas," were also represented in the auctions. An average of $8\frac{1}{2}$ d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st DECEMBER, 1888.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

February 8th, 1889.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	737,965 packages.	153,681 packages.	25,497 packages.
1888-1889.	794,986 "	256,302 "	32,949 "

During the week

26,472 packages	INDIAN
9,544 "	CEYLON
97 "	JAVA

Total 36,113 packages have been offered in public auction.

After a period of quiet, business in the country has somewhat revived, and deliveries of British Grown Tea during January were again upon an encouraging scale, Indian Teas especially being so largely cleared as to exceed the deliveries of any previous month.

On the whole bidding in the auctions was more general and there was evidence of a desire on the part of the trade to purchase at fully current rates for all Teas with any character.

INDIAN. Indians ruled with a somewhat improved tone, Teas with quality being very firm. Dark thick liquoring Broken Pekoes over 1/1 are in strong demand, and show a marked recovery from recent depressed rates. There is a scarcity of fine liquoring Pekoes, and the few on offer thus command steady rates. The following averages are worthy of note, "Tukvar," 1/5³/₄; "Pusumbing," 1/5¹/₂; "Margaret's Hope," 1/5¹/₄; "Ghillidari," 1/5; the "Barnesbeg" division of the "Lebong Tea Co.," 1/3¹/₂; and the "Darjeeling Co.," 1/3¹/₄. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	6 ¹ / ₄ d.	1888,	4 ¹ / ₂ d.	1887,	5 ¹ / ₂ d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5 ³ / ₄ d.	"	6 ¹ / ₄ d.	"	6 ¹ / ₄ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	7d.	"	8 ¹ / ₄ d.	"	7d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8d.	"	9 ¹ / ₄ d.	"	9d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9 ¹ / ₄ d.	"	10 ¹ / ₄ d.	"	10 ³ / ₄ d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6 ³ / ₄ d.	"	7 ¹ / ₂ d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7 ¹ / ₂ d.	"	9 ¹ / ₄ d.	"	

CEYLON. The Ceylons, wherever the liquor was attractive, commanded attention and sold with good competition at firm rates. Poor Teas and low Pekoe Souchongs are easier, showing a drop in some instances of a farthing to a halfpenny per pound. There is not much change to note in regard to quality; although there is a slight sprinkling of good Teas, a large proportion of the offerings consisted of medium and poor kinds. The following averages may be mentioned, "Chapelton," 1/2; "Geddes," 1/1³/₄; "Bogawantalawa," 1/1¹/₂; "Kew," 1/1; and "Midlands," 1/1; "Lippakelle," 1/0¹/₄. An average of 10d. per lb. was obtained.

JAVA. No Teas of direct import have been brought to auction. Catalogues are issued for 1735 packages.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

February 15th, 1889.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	761,954 packages.	157,033 packages.	25,663 packages.
1888-1889.	817,424 "	262,578 "	34,717 "

During the week

22,438 packages INDIAN } Total 30,582 packages have been offered in public auction,
 6,276 " CEYLON } against 26,472 packages Indian, 9,544 packages Ceylon and 97
 1,768 " JAVA } packages Java, catalogued last week.

The increased activity noted last week has been somewhat accentuated and a decided upward movement has taken place in the price of all Teas with quality or flavor.

Amount of Tea (in lbs.) taken for HOME CONSUMPTION, from 1st June to 31st January.

	1886-1887.	1887-1888.	1888-1889.
Indian	47,903,634	56,286,264	58,704,585
Ceylon	5,196,820	7,888,348	14,779,398
China, etc.	69,742,062	59,655,274	51,414,336
Total lbs.	122,842,516	123,829,886	124,898,319

Amount EXPORTED from 1st June to 31st January.

	1886-1887.	1887-1888.	1888-1889.
29,980,343 lbs.		23,776,574 lbs.	26,970,259 lbs.

INDIAN. Good liquoring Teas show a distinct advance, most noticeable in Pekoes and Broken Pekoes over a shilling, these Teas being just now in very strong demand. Amongst the week's offerings there was a larger proportion of fair liquoring Teas, which was most marked in recent arrivals from "Darjeeling" and the "Dooars." This improvement in the average quality has appreciably effected the bidding and produced somewhat better quotations. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	6½d.	1888,	4½d.	1887,	5d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5¾d.	"	6½d.	"	6d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6¾d.	"	8½d.	"	6¾d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8½d.	"	9½d.	"	8¾d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9¾d.	"	10½d.	"	10½d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7d.	"	7½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¾d.	"	9½d.	"	

CEYLON. Catalogues were mostly composed of Teas with only poor quality, and thus quotations for the week are somewhat disappointing. The proportion of better liquoring and Flavoury Teas was small, and the demand for such descriptions strong; the improvement which consequently occurred in price helped to steady quotations for the week. Lower grade Teas continue depressed, and rates must be quoted easier, the poorer descriptions showing in some instances a further drop of a farthing to a halfpenny per pound.

We would again impress upon Planters the importance of maintaining the standard of quality, and of steadily upholding the good reputation which Ceylon Tea has acquired. The following averages may be mentioned:—"Glenugie," 1/5¾; "Waverley," 1/2½; "Agrakande," 1/2¼; "Kotagala," 1/1¼; "Mahanilu," 1/1¼. An average of 10½d. per lb. was obtained.

JAVA. The selection comprised several fair liquoring Teas and the sales passed at firm rates. Even Estates were represented in the auctions, and the general quality was about up to the usual average. Very few Tippy Pekoes were offered. An average of 7½d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st JANUARY.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

February 22nd, 1889.

1, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	783,295 packages.	162,554 packages.	2761 packages.
1888-1889.	840,506 "	267,940 "	3001 "

During the week

23,082 packages	INDIAN
5,362 "	CEYLON
1,284 "	JAVA

Total 29,728 packages have been offered in public auction,

With moderate auctions and a good demand from the provinces, buyers have been ready operators in the sales. The chief feature in the market continues to be the increasing competition for all Teas with quality and flavor. Telegraphic advices from Calcutta pace the amount of this season's crop available for London at ninety-one million pounds.

INDIAN. About the same quantity was offered as last week. As the selection comprised a number of fair liquoring Teas, mostly of recent import, the auction passed with spirit and rates were generally firm, strong and flavory Broken Pekoes and Pekoes commanding in many instances extreme prices. The improvement in quality is pretty general, and not confined to any district or locality. The following averages are worthy of note:—"Meenlas," 1/6³/₄; "Dooteriah," 1/5; "Darjeeling Co.," 1/2¹/₄; "Ohat," 1/2¹/₄; "Nahor Rani," 1/1¹/₂; and "Mokalbari," 1/0¹/₂.

RAVANCORE. A larger number of gardens than usual was represented in the auctions, and the better liquoring Teas attracted good competition. This district is now commanding some attention on account of the good general quality of the Tea. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	6 ¹ / ₄ d.	1888,	4 ¹ / ₂ d.	1887,	5d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5 ³ / ₄ d.	"	6 ¹ / ₄ d.	"	6d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6 ³ / ₄ d.	"	8 ¹ / ₄ d.	"	6 ³ / ₄ d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8 ¹ / ₄ d.	"	9 ¹ / ₄ d.	"	8 ³ / ₄ d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9 ³ / ₄ d.	"	10 ¹ / ₄ d.	"	10 ¹ / ₄ d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7d.	"	7 ¹ / ₂ d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8d.	"	9 ¹ / ₄ d.	"	

CEYLON. Smaller auctions, combined with better quality, have resulted in generally higher quotations. All Teas with flavory liquor are again dearer, Pekoes and Broken Pekoes being in particularly strong demand. Teas with poor quality are also firm at last week's prices, and occasionally exhibit a tendency to harder rates. The following averages may be mentioned:—"Mayfield," 1/3; "Wavendon," 1/1¹/₂; "Lagalla," 1/1¹/₄; "Queensberry," 1/1¹/₄; "Summerville," 1/1; "Campion," 1/0³/₄; "Nilloomally," 1/0¹/₂; "Mipitiakande," 1/0¹/₄; "Woodstock," 1/0¹/₄; "Wallaha," 1/0¹/₄; and "Dunsinane," 1/- An average of 10¹/₂d. per lb. was obtained.

JAVA. The offerings were mainly of only poor quality, the Teas selling with fair competition at about previous rates. Teas with good liquor are wanted. An average of 6¹/₄d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st JANUARY.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AN JAVA TEA REPORT.

March 1st, 1889.

1, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	803,754 packages.	165,810 packages.	2050 packages.
1888-1889.	866,214 "	277,695 "	3803 "

During the week

25,708 packages	INDIAN	} Total 36,265 packages have been offered in public auction, against 23,082 Indian ; 5,362 Ceylon ; and 1,284 packages Java last week.
9,755 "	CEYLON	
802 "	JAVA	

The quantity brought forward has been somewhat in excess of offerings of the past few weeks, but has not been sufficient to overweight the market. Buying continues general and operators appear to have more confidence now that importers are not overburdening them with an unnecessary weight of Tea.

INDIAN. The slightly larger quantity consisted mainly of useful Teas from recent imports, showing a continuance of the good quality noticed last week, and thus maintaining the improved quotations lately current. Teas with poor or undesirable liquor have not as yet participated to any appreciable extent in the late advance in price, except for the lower grades of Pekoe, which are now being taken more freely for export. The following averages are worthy of note:—"Dooteriah," 2/1½; "Meenglas," 1/11; "Darjeeling Co.," 1/8¼; "Rungmook," 1/8; "Borokai Co.," 1/3¼; "Turzum," 1/3. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	6¼.	1888,	4½d.	1887,	5d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5½.	"	6¼d.	"	6d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6¼.	"	8¼d.	"	6¾d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8½.	"	9¼d.	"	8¾d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	10.	"	10¼d.	"	10¼d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	7.	"	7½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	8.	"	9¼d.	"	

CEYLON. Auctions have been comparatively heavy. Good liquoring Teas continue firm, savory kinds being in special demand. Teas with poor quality are depressed and difficult of sale, except at slightly reduced rates. Quality continues without material alteration, except that here and there an improvement is noticeable, giving rise to the hope that better Teas will shortly be in larger supply. The following averages may be mentioned:—"Portswood," 1/5; "Norwood," 1/4¼; "Bogahawatte," 1/3¾; "Chapelton," 1/2¾; "Le Vallon," 1/2½; "Kirkoswald," 1/2¼ and "Bogawantalawa," 1/2. An average of 10¾d. per lb. was obtained.

JAVA. Only one auction was held, comprising Teas from two different Estates, the quality of which was indifferent, and hence, although competition was fairly good, low averages were obtained. Catalogues are issued for 1,608 packages to be sold during next week. An average of 6¼d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE TO 31st JANUARY.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

March 8th, 1889.

13, ROOD LANE, LONDON, E C.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	820,010 packages.	171,942 packages.	27,773 packages.
1888-1889.	898,871 " "	284,522 " "	38,492 " "

During the week

32,657 packages	INDIAN	} Total 41,173 packages have been offered in public auction, against 25,708 Indian, 9,755 Ceylon, 802 Java last week.
6,827 " "	CEYLON	
1,689 " "	JAVA	

The deliveries of both Indian and Ceylon Tea during February were good, and totalled 922,123 lbs., as against 8,453,860 lbs. in February, 1888.

The week's auctions have again been heavy, and exceeded the large offerings of last week. The market was unprepared for so great a volume of Tea, and showed decided signs of weakness.

It is not unlikely that the publication of last months satisfactory deliveries will induce many exporters to supply the market somewhat less abundantly.

INDIAN. Monday's auction passed with fair spirit, but the large quantity brought forward on Wednesday—12,460 packages—proved more than buyers were willing to take at current rates. As many sellers declined to accept the prices offered, an unusually large proportion was withdrawn. Thursday's sale showed little recovery, and prices for the week closed irregularly with a drooping tendency for all but specially attractive parcels.

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	6 $\frac{1}{4}$ d.	1888,	4 $\frac{1}{2}$ d.	1887,	5d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5 $\frac{1}{2}$ d.	"	6 $\frac{1}{4}$ d.	"	5 $\frac{1}{4}$ d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6 $\frac{3}{4}$ d.	"	8d.	"	6 $\frac{1}{2}$ d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8 $\frac{1}{2}$ d.	"	9 $\frac{1}{4}$ d.	"	8 $\frac{1}{4}$ d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9 $\frac{3}{4}$ d.	"	10 $\frac{1}{4}$ d.	"	9 $\frac{3}{4}$ d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6 $\frac{3}{4}$ d.	"	7 $\frac{1}{4}$ d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7 $\frac{3}{4}$ d.	"	9d.	"	

CEYLON. The offerings were more moderate than last week, and contained a fair sprinkling of teas with quality and flavor. Competition was good for all Teas with "point," Teas for price being also very steady at last week's rates. The improvement in quality noticed last week continues. The following averages may be mentioned:—"Agrakande," 1/4 $\frac{1}{2}$; "Wattegodde," 1/3 $\frac{3}{4}$; "Waverley," 1/2 $\frac{3}{4}$; "Goatfell," 1/2 $\frac{1}{2}$. An average of 11d. per lb. was obtained.

JAVA. Sales passed with fair competition but quotations remain unchanged. Quality continues poor, as is frequently the case at this season of the year. An average of 7 $\frac{1}{4}$ d. per lb. was obtained.

MOVEMENTS OF TEA in lbs. DURING FEBRUARY.

In these tables all the packages are half-chests unless otherwise stated. b stands for boxes ; c for chests ; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

March 15th, 1889.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	839,952 packages.	175,200 packages.	29,445 packages.
1888-1889.	924,114 "	294,404 "	41,674 "

During the week

25,243 packages	INDIAN	} Total 38,307 packages have been offered in public auction, against 32,657 Indian, 6,827 Ceylon, 1,689 Java last week.
9,882 "	CEYLON	
3,182 "	JAVA	

Auctions have again been heavy, although not quite equal to last week's. A depressed tone has characterized the market for all but the best liquoring Teas, the supply of which is somewhat limited.

Amount of Tea (in lbs.) taken for HOME CONSUMPTION, from 1st June to 28th February.

	1886-1887.	1887-1888.	1888-1889.
Indian	54,790,314	63,679,578	66,711,594
Ceylon	5,691,340	8,948,894	16,694,512
China, etc.	76,678,470	66,456,099	55,921,623
Total lbs.	137,160,124	139,084,571	139,327,729

Amount EXPORTED from 1st June to 28th February.

	1886-1887.	1887-1888.	1888-1889.
32,327,910 lbs.	26,544,746 lbs.	29,839,956 lbs.	

INDIAN. Although the quantity brought forward showed considerable reduction from last week, was above the immediate requirements of the trade, and as the offerings consisted mainly of teas with only poor quality, bidding was very slack and numerous parcels were withdrawn, the market being slightly lower for all but really good liquoring descriptions.

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	6d.	1888,	4½d.	1887,	5d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5½d.	"	6¼d.	"	5d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6½d.	"	8½d.	"	6d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8d.	"	9¼d.	"	8¼d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9½d.	"	10¼d.	"	9¼d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6¾d.	"	7½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¾d.	"	9¼d.	"	

CEYLON. The larger auctions met with good attention from the trade. Wherever Teas were found to possess quality or flavor they were well competed for and prices were frequently higher; poor and weak Teas ruled slightly under last week's rates. Quality shows little alteration from last week, the proportion of attractive Teas although small continuing to be noticeable. The following averages may be mentioned:—"Glenugie," 1/5¼; "Drayton," 1/3; The "Wallaha," Estate of the Ceylon Tea Plantations Co. Limited, 1/2¾; and "Mayfield," 1/2¼. An average of 10¼d. per lb. was obtained.

JAVA. The large supply consisted principally of only poor Teas as frequently occurs at this season of the year. The market was slightly easier for all but strong or flavory kinds. A very handsome Tippy Flowery Pekoe in boxes from the "Nangoeng Estate" realized 2/8¼ per pound. An average of 6¼d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE, TO 28th FEBRUARY.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

March 22nd, 1889.

13, ROOD LANE, LONDON, E.C.

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	866,592 packages.	180,739 packages.	31,807 packages.
1888-1889.	940,413 "	301,429 "	42,594 "

During the week

16,299 packages	INDIAN
7,025 "	CEYLON
920 "	JAVA

Total 24,244 packages have been offered in public auction,

With a total stock of Tea in the London warehouses no greater than at this time last year, and comparatively little to come forward, there seems no occasion to hurriedly force sales or to overweight the market with excessive supplies. While the stock of Indian and Ceylon Tea exceeds that at the corresponding period of last season, it is well to bear in mind that the China stock is unusually light. The contingency must not be overlooked that the shortage in the export from China may throw a still larger proportion of the trade upon Indian and Ceylon Tea.

The market just now is sensitive to a degree, and responds almost immediately to the great irregularities occurring in the volume of Tea with which it is supplied.

The auctions for the past few weeks have been far above trade requirements, but during the present week have fallen to almost the lowest point yet recorded this season.

INDIAN. With unusually moderate offerings the market has somewhat recovered its tone, and good competition was maintained throughout. Quotations closed firm for all grades, with an upward tendency for any Teas with attractive liquor. An invoice of 95 packages from the "Luckimpore" T Co. realized an average of 1/7½; another invoice of 390 packages from the same Company realized an average of 1/3. As an idea of the comparative prices of Indian Tea in London we quote:—

	(Fair ordinary, dark liquor)	1889.	6d.	1888,	4½d.	1887,	5d.
DUST.	(Red to brown, strong rough liquor)	"	5½d.	"	6½d.	"	5d.
FANNINGS.	(Brownish to blackish, strong liquor)	"	6½d.	"	8½d.	"	6d.
BROKEN TEA.	(Blackish greyish, useful liquor)	"	8d.	"	9½d.	"	8½d.
PEK. SOUG.	(Greyish to blackish some tip, useful liquor)	"	9½d.	"	10½d.	"	9½d.
PEKOE.	(Blackish greyish, inferior liquor)	"	6¾d.	"	7½d.	"	7½d.
PEK. SOUG.	(Blackish, greyish, some tip, inferior liquor)	"	7¾d.	"	9¼d.	"	9¼d.

CEYLON. The offerings were lighter than last week. The position has scarcely altered, but good Teas command attention, and anything with special character in liquor meets with keen competition at hardening rates. Common or undesirable Teas are unchanged in value, although perhaps not selling quite so freely. Several parcels of extremely low grade Tea have recently been received from Ceylon and sold at prices under five-pence per pound. The export of such Teas from the London market can do no good to the name which Ceylon Tea has acquired for its high quality. The following averages may be mentioned:—"Hoolankande," 2/2¾; "Karagastalawa," 3½; "Mayfield," 1/2; "Alnwick," 1/2; and "Taprobana," 1/1¼. An average of 10d. per lb. was obtained.

JAVA. Only 920 packages were brought to auction, mostly from the "Bagelen" estate which was represented by an invoice of 818 packages, the Teas being mostly of fair quality realized an average of 8¾d. A small invoice was also sold from the "Perbawatie" estate, which was very similar in quality to Indian, and realized an average of 11d. An average of 8¾d. per lb. was obtained

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE, TO 28th FEBRUARY.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

March 29th, 1889.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	877,789 packages.	184,886 packages.	32,803 packages.
1888-1889.	961,897 "	308,775 "	43,726 "

During the week

21,484 packages	INDIAN
7,346 "	CEYLON
1,132 "	JAVA

Total 29,962 packages have been offered in public auction,

The position of the market has experienced very little change from last week. Auctions, although slightly heavier have not been excessive, but trade has been too quiet to induce buyers to operate extensively, even at the very low prices current. This has resulted in slightly weakening quotations for poor, characterless Teas and still further widening the gap between these and the few attractive parcels offering, which even in the present depressed state of the market continue to command steady rates.

The events of the past months of this season illustrate more forcibly than has ever before been the case—the absolute necessity that exists for Planters to make every effort to uphold the quality of their Teas. The trade has been disappointed with this season's Indian crop and Planters have suffered heavily on this account; a recurrence of similar experience next season might possibly be accompanied with more serious results to the Tea producing community.

INDIAN. The week's offerings comprised 21,484 packages, against 16,299 last week. The quality as a rule was unattractive, and prices were inclined to drag, except for the few Teas with point in cup. Poor liquoring Pekoes and Brokens are a shade easier. Low Brokens were in larger supply and sold at easier rates. The Final Invoice from the "Scottish Assam Co." realized an average of 1/4³/₄. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	5 ¹ / ₂ d.	1888,	4 ¹ / ₂ d.	1887,	5d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5d.	"	6 ¹ / ₄ d.	"	5d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6 ¹ / ₄ d.	"	8 ¹ / ₄ d.	"	6d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	7 ³ / ₄ d.	"	9 ¹ / ₄ d.	"	8 ¹ / ₄ d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9d.	"	10 ¹ / ₄ d.	"	9 ³ / ₄ d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6 ¹ / ₂ d.	"	7 ¹ / ₂ d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7 ¹ / ₄ d.	"	9 ¹ / ₄ d.	"	

CEYLON. 7,346 packages were brought forward against 7,025 last week. Bidding as a rule was carried on with but little animation, except when an invoice of exceptional quality was under offer.—At such times competition became spirited and prices were generally strong; but for undesirable and poor Teas rates current last week were difficult to obtain, and many lots were in consequence withdrawn from sale. The following averages may be mentioned:—"Portswold," 1/5; the "Wallaha" Estate of the Ceylon Tea Plantations Co., Limited, 1/1³/₄; "Drayton," 1/1³/₄; and "Kirkoswald," 1/1¹/₄. An average of 10¹/₂d. per lb. was obtained.

JAVA. Java was represented by 1,132 packages, all of which were of direct import with the exception of 130 packages second hand Tea. Six Estates were represented, the quality of which was about on a par with recent arrivals. The market continues fairly firm, for all but the poorest descriptions, the export demand helping to steady quotations. 3,120 packages are advertised for sale during next week. An average of 6¹/₂d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE, TO 28th FEBRUARY.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

April 5th, 1889.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	878,269 packages.	184,886 packages.	32,83 packages.
1888-1889.	978,105 "	314,645 "	46,05 "

During the week

16,208 packages	INDIAN
5,870 "	CEYLON
2,309 "	JAVA

Total 24,387 packages have been offered in public auction,

Judging from the figures just issued it would appear that last month's low prices have stimulated the consumption of British Grown Tea, the quantity delivered aggregating 10,281,737 lbs., against 8,517,074 lbs. in March last year. Of this quantity Indian contributed 8,143,899 lbs., against 7,432,224 lbs. last March, and Ceylon 2,137,838 lbs., against only 1,081,850 lbs. in the same month last year. The fact that the stock of all Tea is rather below last year's amount should not be overlooked, especially when it is remembered that the quantity to arrive from India and China is now extremely limited. The market this week was not over supplied, and buyers were more willing operators at the low prices current, fine flavored Teas still continuing to engross the largest share of attention.

INDIAN. The lighter auctions have resulted in better competition and slightly firmer rates. Offerings consisted principally of Garden invoices, Calcutta bought Teas being just now brought forward only sparingly. The proportion of "last of the Season" invoices sold up to date, is rather in excess of last Season. A last invoice from the "Moabund Tea Co." realized an average of 1/5¼; an invoice of 148 packages from the "Upper Assam Tea Co." also realized 1/5¼.

TRAVANCORE was fairly represented in the auctions, but the Teas are somewhat disappointing in quality. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	5½d.	1888,	4½d.	1887,	5d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5d.	"	6¼d.	"	5d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6½d.	"	8½d.	"	6d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	7¾d.	"	9¼d.	"	8¼d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9d.	"	10¼d.	"	9¾d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6½d.	"	7½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¼d.	"	9¼d.	"	

CEYLON. Offerings were slightly below last week. The average selection shows little alteration as regards quality, whatever change there is being towards improvement; advices from Ceylon appear to indicate that a larger proportion of good Tea may soon be arriving. The market has remained steady for all but the poorest liquoring Teas, and competition has on the whole been fairly well maintained. The following averages may be mentioned:—"Sheen," 1/3¼; "Chapelton," 1/2; "Frotoft," 1/2; and the "Wallaha" Estate of the Ceylon Tea Plantations Co., Limited, 1/1¾. An average of 10¼d. per lb. was obtained.

JAVA. Offerings this week were upon a more extensive scale, but operators found no difficulty in absorbing the rather larger quantity without any quotable alteration taking place in the market price. Java Teas at the present low prices usually attract competition from a number of foreign markets, which help to steady quotations. An average of 6½d. per lb. was obtained.

In these tables all the packages are half-chests unless otherwise stated. b stands for boxes ; c for chests ; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON,

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

April 12th, 1889.

QUANTITY BROUGHT TO AUCTION IN LONDON

	FROM 1st JUNE TO DATE.		
	Indian.	Ceylon.	Java.
1887-1888.	895,012 packages.	193,044 packages.	36,309 packages.
1888-1889.	998,886 "	326,558 "	47,769 "

During the week

20,781 packages	INDIAN
11,913 "	CEYLON
1,734 "	JAVA

Total 34,428 packages have been offered in public auction,

The heavier auctions of the week met with a fair demand from the trade, but the quantity brought forward is above immediate requirements, especially when the near approach of the holidays is considered. The official figures published since 1st January, show that 29,591,595 lbs. of Indian and Ceylon Tea were taken for Home Consumption during the first three months of this year, against only 16,948,480 lbs. of China Tea. They also indicate that a considerable quantity of Indian and Ceylon Tea has been re-exported from this country.

Amount of Tea (in lbs.) taken for HOME CONSUMPTION, from 1st June to 31st March.

	1886-1887.	1887-1888.	1888-1889.
Indian	61,941,314	71,111,802	74,855,493
Ceylon	6,307,570	10,030,744	18,832,350
China, etc.	83,897,889	72,732,870	60,635,924
Total lbs.	152,146,773	153,875,416	154,323,767

Amount EXPORTED from 1st June to 31st March.

	1886-1887.	1887-1888.	1888-1889.
35,946,201 lbs.		29,475,745 lbs.	33,270,920 lbs.

INDIAN. The recent low prices have at length promoted better competition, and a somewhat improved feeling has been manifested. The scarcity of Teas over 1/- is now commencing to be felt, with the result that many Teas of this class are being disposed of at rather higher rates. Some exceptionally fine Teas from the "Chardwar" Estate, realized high prices, the Pekoe fetching 2/8½; the Broken Pekoe, 2/7¼; and the Pekoe Souchong, 2/1½.

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	5½d.	1888.	4½d.	1887.	4½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5d.	"	6½d.	"	5½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6½d.	"	8½d.	"	6¾d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	7¾d.	"	9¾d.	"	8¾d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9d.	"	11d.	"	10½d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6½d.	"	8d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¼d.	"	9½d.	"	

CEYLON. Sales have been very heavy, and in consequence some little irregularity has occurred, but only the lower and medium grades have suffered to any appreciable extent. Good liquoring and Fine flavoured Teas continue to meet with the chief attention, and realize steady rates. The quality is about on a par with last weeks. The following averages may be mentioned:— "Mayfield," 1/1¼; "Bogawantalawa," 1/1¼; "Chapelton," 1/1; and "Waverley," 1/1.

An average of 9¾d. per lb. was obtained.

JAVA. A large selection was offered this week. Prices were irregular and rates tended in favor of buyers for all the lower grades. Finest liquoring or tippy parcels commanded better attention. An average of 6¾d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE, TO 31st MARCH.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

April 18th, 1889.

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	917,940 packages.	196,971 packages.	38,078 packages.
1888-1889.	1,009,986 "	331,979 "	48,355 "

During the week

11,100 packages INDIAN	} Total 17,107 packages have been offered in public auction,
5,421 " CEYLON	
586 " JAVA	

The light auctions held, in view of the nearness of Easter, were well supported by the trade, and the more general bidding which is noticeable, points to the depletion of dealers stocks through increased sales in the country.

INDIAN. The auctions consisted to a great extent of poor and medium Teas. As the opinion is gaining ground, that prices are unlikely to further recede, but that any changes will rather be in the direction of firmness, the bidding was fairly good. All Teas with point in cup, and especially Teas over 1/- are badly wanted. The closing sales of the "Assam Co." were held this week—three weeks earlier than last season and realized an average of 10d. per lb.

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	5½d.	1888,	4¾d.	1887,	4½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5d.	"	6¾d.	"	5½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6½d.	"	8¾d.	"	6¾d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	7¾d.	"	10d.	"	8¾d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9d.	"	11d.	"	10½d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6½d.	"	8¼d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¼d.	"	9½d.	"	

CEYLON. Sales have been lighter than last week and passed with spirit for all Teas with quality, poor liquoring kinds also selling without difficulty at about last weeks rates. The market is practically unchanged, but the tendency is towards harder prices for all Teas with quality and flavour. The attention of Exporters is now being more drawn towards Ceylon Tea. The following averages may be mentioned:—"Labukelle," 1/3; "Glenugie," 1/2¼; and the "Wallaha" Estate of the Ceylon Tea Plantations Co., Limited, 1/2¼. An average of 10½d. per lb. was obtained.

JAVA. Only one sale has been held, and prices ruled firm. The quality shows a slight improvement in some instances. A white tipped Pekoe from "Tendjo Aijoe" sold at 1/2 per lb. An average of 6¾d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) FROM 1st JUNE, TO 31st MARCH.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

3, ROOD LANE, LONDON, E.C.

April 26th, 1889.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	936,645 packages.	202,720 packages.	39,595 packages.
1888-1889.	1,011,394 "	334,929 "	48,355 "

During the week

1,408 packages INDIAN
2,950 " CEYLON

Total 4,358 packages have been offered in public auction,

The market remained closed for the holidays until yesterday, when sales of both Indian and Ceylon Tea were held. Very little alteration has taken place in quotations, but the bidding at yesterday's auction was fairly animated.

INDIAN. The small amount catalogued for this week was readily disposed of at steady rates, with occasionally a tendency to advance upon Teas for price.

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	5½d.	1888,	4¾d.	1887,	4½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5d.	"	7d.	"	5½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6½d.	"	9d.	"	6¾d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	7¾d.	"	10d.	"	8¾d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9d.	"	11d.	"	10½d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6½d.	"	8½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7½d.	"	9¾d.	"	

CEYLON. The auction on Thursday passed with fair spirit at previous rates, the only change being a somewhat improved demand for Broken Pekoes. 12,595 packages are advertised for sale next week. The following averages may be mentioned:—The "Wallaha" Estate of the Ceylon Tea Plantations Co., Limited, 1/2; and "Bellwood," 1/-. An average of 10d. per lb. was obtained.

JAVA. No auctions have been held, but 2,841 packages are catalogued for next and the following week.

Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

3, ROOD LANE, LONDON, E C.

May 3rd, 1889.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	952,803 packages.	209,406 packages.	41,708 packages.
1888-1889.	1,029,073 "	350,914 "	50,128 "

During the week

17,679 packages	INDIAN
15,985 "	CEYLON
1,773 "	JAVA

Total 35,437 packages have been offered in public auction.

With the re-opening of the market, buyers have exhibited keener interest than of late, and competition has been generally more animated.

Deliveries of British Grown Tea during April, amounted to 9,831,924 lbs., against 8,709,170 lbs. last April, a satisfactory and encouraging increase, when it is remembered that the Easter Holidays, which fell wholly in April this year, occurred partly in March last year.

INDIANS have been firm with a strong demand. Teas over 1/- are badly wanted and sell readily. As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	5½d.	1888.	4¾d.	1887.	4½d.
FANNINGS.	(Red to brown, strong rough liquor)	"	5d.	"	7d.	"	5½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6½d.	"	9d.	"	7d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	8d.	"	10d.	"	9½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9d.	"	11d.	"	11d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6¾d.	"	8½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7¼d.	"	9¾d.	"	

CEYLON. The deliveries for April amounted to 2,105,016 lbs., against only 1,238,420 lbs. during the corresponding period last year; although a very substantial increase, larger deliveries will be necessary to work off the approaching increase in the imports. This week the largest quantity yet brought forward in one week was offered, and met with a steady demand. Chief attention is bestowed upon Teas with quality, and fine flavory parcels are sought after; although bidding has naturally been briskest for these kinds, all descriptions have sold steadily with the exception of the lowest grades, which are slightly easier. Quality shows little alteration, except that there is a somewhat more plentiful supply of the commonest descriptions. The amount so far catalogued for next week is 15,953 packages, and we must now look for considerable auctions during the next few months. The following averages may be mentioned:—"Portswood," 1/3; "PDM," 1/3; "Bogahawatte," 1/2¾; and "Mooloya," 1/1¾. An average of 9¾d. per lb. was obtained.

JAVAS have passed with fair spirit at about previous rates. The quality begins to show signs of improvement, but there is no special feature to note in the week's selection. An average of 6½d. per lb. was obtained.

FROM 1st JUNE, TO 30th APRIL.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

May 10th, 1889.

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	966,771 packages.	216,778 packages.	42,301 packages.
1888-1889.	1,055,632 "	367,202 "	52,868 "

During the week

26,559 packages	INDIAN
16,288 "	CEYLON
2,740 "	JAVA

Total 45,587 packages have been offered in public auction.

As regards quantity, this week's offerings have ranged amongst the heaviest of the season. The entire stock of Tea in London is now very little above last year's figures, owing to the shrinkage in the imports from China, which are eighteen millions less than last season;—a feature which is not without its effect upon the Indian Tea market.

INDIAN. The auctions which were much heavier than last week contained a number of losing invoices, and were largely composed of Calcutta bought Teas. Bidding was fairly brisk, and any Teas with at all attractive liquors were slightly dearer, Teas with fine quality being specially wanted. Common Broken kinds are in full supply and rather cheaper; several Calcutta bought invoices which had been held over for some time also sold at lower quotations.

As an idea of the comparative prices of Indian Tea in London we quote:—

	(Fair ordinary, dark liquor)	1889.	5d.	1888,	4½d.	1887,	4½d.
DUST.							
FANNINGS.	(Red to brown, strong rough liquor)	"	4½d.	"	6½d.	"	5½d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	6d.	"	8½d.	"	7d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	7½d.	"	9½d.	"	9½d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9d.	"	10½d.	"	11d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6½d.	"	8½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	7d.	"	9½d.	"	

CEYLON. This weeks was the heaviest sale yet held. Tuesdays auction of 15,953 packages, contained 657 breaks, a number which it was physically impossible for buyers to taste carefully in the limited time at their command. A fall in price was inevitable under the circumstances, and all Teas have suffered, especially such as through quality or flavor, required critically valuing; Good Pekoes and Broken Pekoes have frequently sold from 1d. to 2d. under last weeks rates, and Pekoe Touchongs as much as a halfpenny. Parcels withdrawn from the auction and leisurely tasted later on, were in many instances disposed of at an advance of 2d. to 3d. per lb. over bids made in the sale. Many of the Teas now coming forward are of attractive quality, and on this account equally good value has never before been obtainable in Ceylon Teas; it is however to be regretted that there is still a large proportion of Tea with unsatisfactory quality. The following averages may be mentioned:—"Goatfell," 1/3; and "Tommagong," 1/1½. An average of 9½d. per lb. was obtained.

AVAS passed at firm rates and were readily disposed of, Pekoes being slightly dearer. A fine flavored parcel of Flowery Pekoe in boxes, from "Parakan Salak" realized 1/5½; and an Orange Pekoe in boxes, from "Dramaga," 1/5¼ per lb. The general quality shows a slight improvement upon earlier arrivals. An average of 7d. per lb. was obtained.

MOVEMENTS OF TEA (in lbs.) DURING APRIL.

In these tables all the packages are half chests unless otherwise stated. b stands for boxes; c for chests; p for packages. † Prices marked thus represent the highest offer in the room. In calculating these averages two half-chests or four boxes are taken as equal in weight to one chest.

GOW, WILSON & STANTON,
Brokers.

GOW, WILSON & STANTON'S INDIAN, CEYLON, AND JAVA TEA REPORT.

13, ROOD LANE, LONDON, E.C.

May 17th, 1889.

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1887-1888.	975,458 packages.	223,467 packages.	43,081 packages.
1888-1889.	1,076,139 "	378,991 "	53,695 "

During the week

20,507 packages	INDIAN
11,789 "	CEYLON
827 "	JAVA

Total 33,123 packages have been offered in public auction.

Auctions have again been very heavy, although lighter than last week; nevertheless their effect upon the market has been greater, and has caused a relapse in quotations of all but the best liquoring Teas.

The lower grades of fair liquoring Whole Leaf Tea both Indian and Ceylon, are now cheaper than they have ever been.

Amount of Tea (in lbs.) taken for HOME CONSUMPTION, from 1st June to 30th April.

	1886-1887.	1887-1888.	1888-1889.
Indian	68,707,286	78,582,552	82,582,401
Ceylon	6,964,990	11,272,164	20,937,366
China, etc.	91,634,826	79,916,523	65,572,871
Total lbs.	167,307,102	169,771,239	169,092,638

Amount EXPORTED from 1st June to 30th April.

	1886-1887.	1887-1888.	1888-1889.
38,735,580 lbs.	32,527,832 lbs.	36,603,718 lbs.	

INDIAN. The market has fallen for all but specially attractive Teas; other kinds are difficult to quit even at a reduction of a halfpenny on recent prices;—the large quantity of earlier Calcutta bought Teas in the auctions having overweighted the market with pointless and weak Teas, both Whole Leaf and Broken. Travancore was represented by a fair selection.

The first sale of the New Season was held in Calcutta yesterday, and comprised 4,000 packages, in sympathy with London good Teas sold fairly well, but common kinds were depressed.

As an idea of the comparative prices of Indian Tea in London we quote:—

DUST.	(Fair ordinary, dark liquor)	1889.	4½d.	1888,	4½d.	1887,	5d.
FANNINGS.	(Red to brown, strong rough liquor)	"	4½d.	"	5½d.	"	6d.
BROKEN TEA.	(Brownish to blackish, strong liquor)	"	5½d.	"	7½d.	"	7½d.
PEK. SOUG.	(Blackish greyish, useful liquor)	"	7½d.	"	9½d.	"	10d.
PEKOE.	(Greyish to blackish some tip, useful liquor)	"	9d.	"	10d.	"	11½d.
PEK. SOUG.	(Blackish greyish, inferior liquor)	"	6d.	"	7½d.	"	
PEKOE.	(Blackish, greyish, some tip, inferior liquor)	"	6½d.	"	9d.	"	

CEYLON. Auctions although heavy were lighter than the two previous weeks, and probably less than must be expected in the near future. Quality as a rule was fair, although there were but few striking invoices. The lower grades, and poor liquoring Teas generally are again easier, but the most desirable parcels remain firm. The following averages may be mentioned:—The "Wallaha" Estate of the Ceylon Tea Plantations Co., Limited, 1/2½; and "Labukelle," 1/1½. An average of 9½d. per lb. was obtained.

JAVA. Only one auction has been held. Three Gardens were represented, and the Teas sold without change in prices. Catalogues for 2,821 packages are advertised for next and the following week. Some of the Teas now come to hand are beginning to show the improvement in quality which usually takes place at this season of the year. An average of 6½d. per lb. was obtained.

FROM 1ST JUNE, TO 30th APRIL.

IF IT BE POSSIBLE, AS MUCH AS IN YOU LIES, STUDY TO LIVE AT PEACE WITH ALL MEN.

WAR!!

"O World!
O men! what are ye, and our best designs,
That we must work by crime to punish crime,
And slay, as if death had but this one gate?"—BYRON

THE COST OF WAR—"Give me the money that has been spent in war, and I will purchase every foot of land upon the globe; I will clothe every man, woman, and child in an attire of which kings and queens would be proud; I will build a schoolhouse on every hillside and in every valley over the whole earth; I will build an academy in every town, and endow it; a college in every State, and will fill it with able professors; I will crown every hill with a place of worship consecrated to the promulgation of the gospel of peace; I will support in every pulpit an able teacher of righteousness, so that on every Sabbath morning the chime on one hill should answer the chime on another round the earth's wide circumference, and the voice of prayer and the song of praise should ascend, like a universal holocaust, to heaven."—RICHARD.

"WHAT IS MORE TERRIBLE THAN WAR?"

Outraged Nature. She is never tired of killing, till she has taught man the terrible lesson he is so slow to learn—that nature is only conquered by obeying her. Nature is fierce when she is offended, as she is bounteous and kind when she is obeyed.

Ah, would to God that some man had the pictorial eloquence to put before the mothers of England the mass of preventable suffering which exists in England year after year!"—KINGSLEY.

How much longer must the causes of this startling array of preventable deaths continue unchecked?

FOR THE MEANS OF PREVENTION, AND FOR PRESERVING
HEALTH BY NATURAL MEANS, USE

ENO'S "FRUIT SALT,"

prepared from Sound Ripe Fruit. You cannot overstate its great value in keeping the BLOOD PURE; as a means of keeping the system clear, and thus taking away the groundwork of Malarious Diseases, BLOOD POISONS, and all Liver complaints, or as a HEALTH-GIVING, COOLING, and INVIGORATING BEVERAGE, or as a gentle Laxative or Tonic in the various forms of Indigestion.

AT HOME, MY HOUSEHOLD GOD; ABROAD, MY VADE MECUM.

A GENERAL OFFICER, writing from Ascot on January 2, 1886, says: "Blessings on your 'FRUIT SALT!' I trust it is not profane to say so, but in common parlance I swear by it. Here stands the cherished bottle—my little idol—at home my household god, abroad my *vade mecum*. Think not this the rhapsody of a hypochondriac; no, it is the outpouring of a grateful heart. The fact is, I am, in common, I daresay, with numerous old fellows of my age (67), now and then troubled with a tiresome liver. No sooner, however, do I use your cheery remedy than exit Pain—'Richard is himself again.' So highly do I value your composition that, when taking it, I grudge even the sediment that will always remain at the bottom of the glass. I give, therefore, the following advice to those persons who have learned to appreciate its inestimable benefits:

"When ENO'S SALT betimes you take,
No waste of this elixir make,

But drain the dregs, and lick the cup
Of this the perfect pick-me-up."

WRITING again on January 24, 1889, he adds: "DEAR SIR,—A year or two ago I addressed you in grateful recognition of the never-failing virtues of your world-famed remedy. The same old man now salutes you with the following:

"When Time, who steals our years away,
Shall steal our pleasures too,

Eno's 'FRUIT SALT' will prove our stay,
And still our health renew."

FEVERS, BLOOD POISONS, &c.—"Egypt.—Cairo.—Since my arrival in Egypt in August last, I have on three occasions been attacked by fever, from which, on the first occasion, I lay in hospital six weeks. The last attacks have been, however, completely repulsed in a short time by the use of your valuable 'FRUIT SALT,' to which I owe my present health at the very least, if not my life itself. Heartfelt gratitude for my restoration and preservation impels me to add my testimony to the already overwhelming store of the same, and in so doing I feel that I am but obeying the dictates of duty. Believe me to be, Sir, gratefully yours, A CORPORAL, 19th Hussars.—May 26, 1883.—Mr. J. C. ENO."

Caution.—Examine each Bottle, and see that the Capsule is marked ENO'S "FRUIT SALT."
Without it you have been imposed on by a worthless imitation.

SOLD BY ALL CHEMISTS. Directions in Sixteen Languages HOW TO PREVENT DISEASE.

Prepared only at ENO'S "FRUIT SALT" Works, London, England.

THE DAWN OF ANOTHER DAY.

“ Out of eternity this new day is born,
Into eternity at night doth return.
Behold it aforesaid no eyes ever did,

So soon it for ever from all eyes is hid.
Here hath been dawning another blue day;
Think, wilt thou let it slip uselessly away?
—Tennyson.

QUEEN'S HEAD HOTEL, NEWCASTLE-UPON-TYNE, 4th June, 1877.

SIR,—Will you to-day allow me to present you with this Testimonial and Poem on your justly celebrated FRUIT SALT? Being the writer for several first-class London Magazines, and my occupation being a very sedentary one, I came here for a few weeks, in order to see what change of air would do for me, and at the wish of some personal friends of mine here I have taken your FRUIT SALT, and the good results accruing therefrom have been my reason for addressing you.—I am, Sir, yours truly, A LADY.

Free from danger, free from harm,
It acts like some magician's charm;
At any time a dainty draught,
Which will dispel disease's shaft;
More priceless than the richest gold,
That ever did its wealth unfold;
And all throughout our native land,
Should always have at their command
Eno's famous Fruit Salt!

Cool and refreshing as the breeze,
To headache it gives certain ease;
Biliousness it does assuage,
And cures it both in Youth and Age;
Giddiness it will arrest,
And give both confidence and rest;
Thirst it will at once allay,
And what the best in every way,
Why, Eno's famous Fruit Salt!

“ MANY sick people looked upon me as a physician. For a long time we had been in the centre of Africa without any medical man. Natives came with all manner of diseases. One day we had a man that was said to be mad. In some of his fits he had wounded a neighbour with an arrow. Whether he was mad or not, he was evidently far from well, and I gave him a large dose of ENO'S 'FRUIT SALT.' The poor fellow came back next morning to tell us that he was better. His breath was no longer offensive, and he looked cheerful. We were sorry when our supply of Fruit Salt was done; it was a favourite both with natives and Europeans, and is much used along the malarious coasts.”—“Africana,” by the Rev. DUFF MACDONALD, M.A., B.D., Vol. II., p. 207.

INDIA AND ENO'S "FRUIT SALT."

“ DILBERUGHAR, UPPER ASSAM, INDIA, March 6, 1880.

“ DEAR SIR,—I desire to state the advantage which I, and many others, in this part of the world, have derived from ENO'S "FRUIT SALT." Unlike other Saline Aperients, it is not lowering in its action. I have used it on board ship in tropical latitudes, and both there and here I can honestly bear witness that its use has warded off fever over and over again. When taken in time it is invaluable. As far as I am aware it is most popular in this part of NORTH-EASTERN ASIATIC INDIA, and I consider that you are distinctly entitled to this testimonial from me. I need not add, it is wholly unrequited. I enclose my card; but from my extreme individual inconvenience arising from publicity, I do not wish my name to appear, and merely subscribe myself, most truly yours, 'A PLANTER.'—J. C. ENO.”

A WHITE MEDICINE-MAN ON THIRST TRIALS IN MASAI LAND.

“ A medicine had to be prepared for the disease, which I did by laying out a small medicine-box, with the lid open, showing all the array of phials, &c. Taking out my sextant, and putting on a pair of kid gloves—which impressed the natives enormously—I intently examined the contents. Discovering the proper *dava*, and getting nearly some ENO'S FRUIT SALT, I sang an incantation over it. My preparations complete, and Brahim being ready with a gun, I mixed some of the Salt; simultaneously the gun was fired, and, lo! up fizzed and sparkled the carbonic acid, causing the natives to shrink with intense dismay. . . . The chiefs, with fear and trembling, taste as it fizzes away.”—*Through Masai Land.* By Joseph Thomson, F.R.G.S.

ENO'S "FRUIT SALT,"

(prepared from sound ripe fruit) acts as a natural aperient; its simple but natural action removes all impurities, thus preserving and restoring health. If its great value in keeping the body in health were universally known, no family would be without it.

Caution.—Examine each Bottle, and see that the Capsule is marked ENO'S "FRUIT SALT." Without it you have been imposed on by a worthless imitation.

BY J. FERGUSON.

PRICE FIVE RUPEES.

TWO MAPS (Worth the price of the Volume) and 42 other Illustrations; 428 pages letterpress. (By post 5'26; outside of Island R6.)

ROYAL ACKNOWLEDGMENT.—Windsor Castle, March 12, 1888.—Sir Henry Ponsonby is commanded by the Queen to thank Messrs. Haddon & Co. for the copy of Mr. John Ferguson's "Ceylon in the Jubilee Year," which they have had the kindness to present to Her Majesty.

Opinions of the Press.

Everything of interest about Ceylon has been carefully collected in this volume, and for any one who wishes to visit the island a better guide book is not to be found.—*Pall Mall Gazette*.

Ceylon in the Jubilee Year, by John Ferguson (Haddon & Co., London; Ferguson, Colombo), "a third edition, revised, enlarged, and brought down to date," gives an account of the present condition of the island, its resources, and the prospects which it holds out for the remunerative investment of capital.—*Spectator*.

To the cultured class who study Oriental history and Buddhist archæology, and to the large fraternity who are concerned in tea, coffee, cocoa, cinnamon, cinchona, and the many fragrant and spicy products of our colonial Eden, the work is invaluable.—*Christian World*.

Previous editions of Mr. Ferguson's valuable book have received full review in these columns, but the present edition contains much more matter—among other additions being strong criticism of the administration of the present Governor, Sir Arthur Gordon.—*Colonies and India*.

Mr. Ferguson's book on Ceylon seems to us a most valuable one, and it ought to be in the hands of every one in any way interested in the island. It gives an excellent account of the country, its inhabitants, railways, government, pearl fisheries, exports, &c., with notices of archæological remains and of the picturesque districts most worthy the attention of visitors.—*Literary World*.

The first part consists of some sixteen chapters, in which Mr. Ferguson shows himself possessed of the instincts of the true journalist. There seems scarcely a subject relating to the "spicy isle" which is not touched upon, the treatment being always effective, if sometimes brief. Anything like an outline of the various chapters is, as we have indicated, impossible in the space at our command.—*Aberdeen Free Press*.

This is a very complete handbook of Ceylon and everything Cinghalese from Government to snakes or tortoises, and from tea, sugar, coffee, and cinchona to polyandry, shooting, races, clubs, Buddhism and missionaries—in fact about as complete a fund of information about the island as it is possible to pack into 400 pages, of a handsome volume, with good maps and many illustrations. Any one who wishes to visit Ceylon, or employ his capital there, would do well to get this book.—*Overland Mail*.

Mr. John Ferguson has published a very handsome volume with the above title. For an account of the climate, scenery, and natural advantages of Ceylon, we must refer our readers to the work itself, merely adding that Mr. Ferguson's statements can be accepted with confidence, as no one knows Ceylon and its resources better than he does. The new volume will be welcomed especially by old Colonists who have witnessed the rise and the depression of Ceylon, and who may probably agree with the author that fortune seems about to smile on the old isle once more.—*Nairnshire Telegraph*.

In this re-issue of his book on Ceylon, Mr. Ferguson has brought the mass of information respecting the Colony contained in former issues up to the most recent date, and he has fitly given it a designation commemorative of the present eventful year. No effort has been spared by Mr. Ferguson to make his latest work as complete in every respect as possible, and the result has been that no book can be more replete with information about this valuable island. As the most important of our Crown Colonies, Ceylon has a special claim to consideration, and we can strongly recommend "Ceylon in the Jubilee Year" to everyone who takes an interest in colonial matters. A word must be said in praise of the numerous illustrations.—*European Mail*.

Mr. Ferguson, of Colombo, published a considerable time ago a careful and much-needed description of the island, but there was quite room for the full, clear, and picturesque statement which he has now made of the actual condition of CEYLON IN THE JUBILEE YEAR. The earlier chapters of a book which is crowded from cover to cover with interesting facts and impressive statistics, is devoted to the political and social history of Ceylon both before and since it came under the English flag. The concluding portion gives a curiously minute and vivid picture of the life, customs, caste, and occupations of the natives, and also describes the tea industry, life on the plantations, the pearl fisheries, the legislative progress of England's chief tropical colony, and the present condition and prospects of the trade of the island. The book presents a vivid picture of every phase of the life of the colony, and so far as we can discover, there is not a single point on which information is likely to be needed which has been slurred over, much less neglected. The maps and illustrations heighten the value of an extremely interesting volume.—*Leeds Mercury*, April 9th.

I got your most charming book, "Ceylon in the Jubilee Year" the other day, and have gone most carefully and delightedly through it. The get-up of the book is really first-class, and so many pictures make it very lightsome. To me, an old Ceylon man, every line was of interest, and I fear your book had to answer for a considerable quantity of midnight oil burned in my establishment. In fact, I think your "Ceylon" is Emerson Tennent brought up to the present date, and put into a more handy and readable style, and when I was reading it, I, more than once wished I was back in the dear little island.—A. H. D.
